The American Convention on Human Rights of 1969 is the only senior international text that explicitly protects the unborn child and settles that the right to life must be protected "in general, from conception" (art. 4, para. 3); also implicitly, art. 6, para. 5, the final part of the International Covenant on Civil and Political Rights does the same, by prohibiting the execution of a death sentence on a pregnant woman, hence the right to life itself of the child that the woman convicted will give birth to, is protected. Recommendation nr. 874 of October 4, 1979 of the Parliamentary Assembly of the Council of Europe on a European Charter on the Rights of the Child, under which the right to life of every child should be recognized from conception [28] is also added to this international text. An implicit protection confers to the unborn child also Recommendation nr. 1064/1986 of the Parliamentary Assembly of the Council of Europe, on the use of the embryo and human fetus for diagnostic, therapeutic, scientific, industrial and commercial purposes, under which surgery on the human fetus is not legitimate unless it seeks to protect the existence of "the child to be born" [29].

The other international texts speak of a right which protects the living being, not the being to be born; the Universal Declaration focuses on the spiritual element in order to define the human being, with prevalence on the spiritual life criterion rather than on the criterion of biological life (art. 1: "*All human beings are born free and equal in dignity and rights. They are endowed with reason and conscience and should act towards one another in a spirit of brotherhood*") [30].

Even the Oviedo Convention on Human Rights and Biomedicine [31] (adopted in the Council of Europe on April 4, 1997 and entered into force on December 1st, 1999) is not very explicit, since it does not define the concept of "person" (its legal definition would have been an important step in giving a more detailed characterization of the concept of "life"), by referring to the national legislation of member states.

As in the case of other human rights, the interest protected by regulating the right to life has a double component: a private

interest, of the individual directly involved and a public interest, of the entire society; it is worth noting that both the private interest and the public interest are at the top of the hierarchy of human rights, whereas the most important value for an individual is his life and for the society, the most significant value that needs protection is the life of the individuals who compose it.

As said in French doctrine, the right to life should, however, be viewed as a "moderated principle", even if we deal, apparently, with a paradox: moderating is involved when inviolable rights are debated. However, the paradox is only apparent, as "the absolutism of the hard core of human rights does not preclude a certain realism which, without accepting genuine exceptions to the principle, still allows for some flexibility and thus moderations" [32].

Logistics Platforms – Optimization Factor of Transportation and Distribution Processes

Lăpăduși Mihaela Loredana
Căruntu Constantin

„Constantin Brâncuși” University, Faculty of Economics and Business Administration
loredana@utgjiu.ro, căruntu_ctin@yahoo.com

Abstract

The logistics company is challenging and at the same time is a necessity to introduce it in the management activity, which in our opinion means more than just the supply of means of transportation with goods since the company's manager of logistics problems should know very well which are the existing internal and external infrastructures and organized in logistical platform that will be introduced in the company's strategy to save resources and surface sizing storage.

The purpose of this paper is to show that creating an efficient logistics system by a company leads to the reduction of the negative effects of freight transport, but also creates conditions for a sustainable development. It is designed to allow the use of an information system that will enable the implementation of effective programs for optimal routing of transportation means in order to achieve the objectives, meaning the transportation of goods to the customer at deadlines and respecting quality conditions.

Key words: logistics platform, logistics system, transportation, logistics manager, efficiency.

J.E.L. classification: L91, M16, P47

Developing a well thought logistics infrastructure can bring profit both for local companies who will benefit from cost savings by outsourcing the logistics activity and also for companies developing logistics parks that can be storage sites ((with the associated logistics services available) for international deliveries transiting Romania .

The goal of designing and using logistics platforms consists in the optimization and the efficiency of the processes of distribution of

goods and also the reduction of costs. The concept of logistics platform is a relatively new that seeks to reduce the costs of transportation of goods through the promotion and use of efficient logistics systems for companies.

As for the logistics platforms, they meet a series of activities that could be divided into two broad categories:

Basic activities: providing complete services to customers, purchase, transportation, inventory control, processing orders.

Support activities: storage, handling, packaging, logistics information flows related activities

The 20th century witnessed a series of global structural changes that had a significant impact on the logistics industry.

Globally, the development of multimodal infrastructures was a key factor in business integration, supporting complex processes of exchange on an unprecedented scale.

Following the enormous changes in the global economy, in general, and in production and distribution systems, particularly, the concept of logistics has been modified and is now a key factor for the industrial and commercial competitiveness.

In the current global economy, affected by the financial crisis extended to all sectors of the economy, the access to credits is more difficult and with a higher cost, companies have become more cautious, and as a measure to adapt to market reality, most customers with needs of expansion or relocation increasingly prefer the option of renting spaces than that of acquisition and own development.

It is required to build a national strategy to ensure the necessary infrastructure for interconnecting logistics centers, both on land and at sea checkpoints - land - rail. Thus the efficiency of the investments in logistics

will increase, generating profits for developers of logistics space, by attracting not only local customers but also international.

The logistics platform is regarded as a synchronization of several companies involved in the supply chain and transportation and will give rise to complex logistics systems based on synchronization process and feedback, information leading to methods and multi-modal transportation modes. It is defined according to the characteristics of transportation, distance, time, geographical position, in order to benefit the competitiveness of transportation. In this sense, logistics platforms are of utmost importance, not only do they contribute to solving the problems of congestion, but also to the establishment of some strategies aimed at minimizing total logistics costs and address growing consumer market volatility.

In simple terms, a logistics platform can be defined as a specialist area with the necessary infrastructure and necessary services for transportation and value-added services, in the case in which different agents coordinate their activities to benefit from the competitiveness of the products by using this infrastructure.

Based on the above definition, it is important to distinguish between different types of logistics platforms, depending on their operational complexity and operational integration:

a) unimodal distribution centers aim to manage products and stocks flows and can be used by one or several companies, and do not require the involvement of joint operations. This type of infrastructure is usually unimodal and aims primarily road transportation.

b) logistics areas;

c) multimodal platforms.

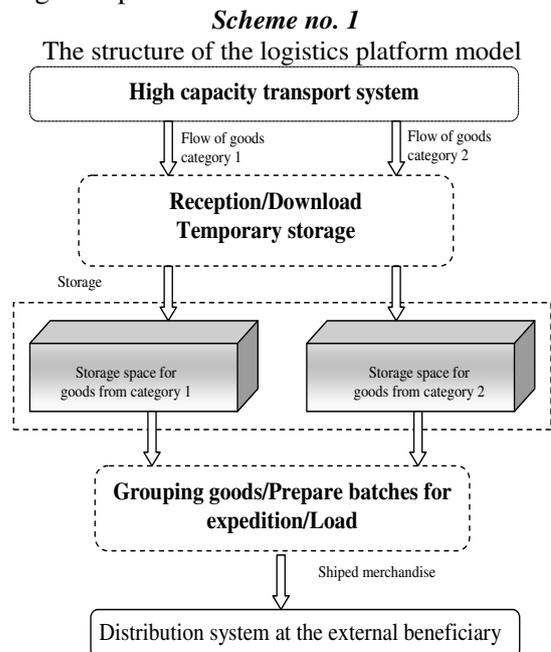

The projects of logistics platforms tend to realize connections through the "door to door" system by water and railways as main means of transportation which can compete with the road transportation system.

A prime cost component in this system is intra regional transportation. Most congestion is to the "door to door" and here the predictability time for connecting with the end user will be strongly enhanced. The development of concrete and sustainable

logistics platforms projects should be focused on:

- a better use of transportation capacities, of the existing transportation infrastructure,
- the use of best practices of logistics solutions;
- the creation and usage of international logistics corridors;
- the development of "door to door" systems logistics in the main logistics corridors of the participants in business life;
- participants and implementation of innovative logistics solutions;
- development and implementation of logistic support tools;
- establishing viable commercial organizations in order to find effective logistics solutions.

Because of the particularity of the processes taking place in logistics platforms - meaning goods arrive in batches of a certain size, and the shipment is made in smaller batches, consisting of several categories of goods -the sizing problem can not be solved with analytical models. Solving this problem can be achieved by using simulation models. In scheme no. 1 is presented a simulation model for evaluating the transit capacity of a logistics platform.

Source: Costescu D., Roşca M.A., Platforma logistică – soluții eficiente pentru economisirea de resurse, Buletinul AGIR, no.1/2007, January-March.

The model made for simulating the transition process of merchandise from the two categories has been structured in three modules: „Data entry”, „Simulation” and „Processing/displaying results”.

The module "Data Entry" includes the procedures to read the data entry and their processing, for each category of goods are introduced the following information: the average intensity of inflows λ_1 respectively λ_2 , the size of a batch of incoming goods q_1 respectively q_2 and the maximum permitted quantity which can be stored per unit area. To characterize the flow output is required the following data: the average time between two shipments, the empirical distribution of times between two successive shipments, the size of a batch shipped q_e and the types of groups of goods from categories 1 and 2. Also, in the module "Data Entry" there will be established the admitted probabilities of denial for the batches received of each category and the number of simulations performed. Based on the entry data set introduced are established the initial numbers of buckets allocated for storage of goods in both categories.

The module "Simulation" is the basic module which performs the shaping of the transit activity from the warehouse through simulation. The simulation is performed for the parameters imposed, on a period of six months. It starts from the initial number of compartments set to be for each category of goods, for which is simulated the storage and shipping activity. After each period of simulation is calculated the probability of refusal and is done an analysis of changes in inventories. If the probability of rejection is greater than that established in the module "Entry data", it is added the number of compartments and the simulation is resumed. For each batch arrived is checked if the departments are filled. If there is one free slot, it is fully occupied. After filling the compartment we check the existence of shipping applications not sent because of stock outstanding. If there is no free slot, the consignment arrived is recorded in the range of expectation.

The module "Processing / displaying results" shows information on the situation of the of the state variables characteristic to the warehouse during the simulation and displays

the final report of the simulation. This module includes procedures that count:

- incoming flows lots: lot number, the moment of arrival;
- the situation of filling the compartments: each compartment status (free, busy); if is busy, lot number, the moment of storage and existent quantity;
- batch flow shipped: consignment number, quantity of goods in each category, dispatch moment;
- the list of the batches awaiting storage: lot number, time of arrival;
- the list of batches that were not sent to external customers due to lack of stock, the quantity of goods in each category, the moment scheduled for delivery time.

The logistics platform concept tries to reduce the freight costs by promoting efficient logistics systems for both for companies and the society. Being a relatively new concept, there are not enough studies and models to solve problems that arise when designing a logistics platform: location, sizing, technology, administration. Solving the problem of sizing can be done using simulation models, whereas analytical models are not appropriate in this case. A first difficulty that arises in making a simulation model is the large amount of resources needed to perform a complex structure, to conduct a detailed simulation of the processes within a logistics platform. Secondly, it represents a problem the lack of specific databases on the distribution of goods (cargo quantity, frequency, customers), that allows to calibrate the model.

3. Conclusions

According to the findings of a survey [11] reference for professionals, leaders in the production domain and that aim to achieve excellence in logistics apply a series of basic strategies that are successful. Among these successful strategies we have the following [11]:

- a) the design and implementation of global logistics networks, fast and reliable, for production and distribution;
- b) assuring some processes of production and conducting a customer oriented order

made by the supply- delivery chain management ;

c) purchasing globally to reduce the dresser and a fast pace of innovation;

d) establishing value added partnerships with suppliers, and service providers;

e) performing a high speed logistics, through information and communication systems;

f) applying of strategies to protect its leadership position.

On the basis of the statements it can be said that the logistics platforms allow:

- the realibility of the supply and distribution processes;
- the continuous improvement of the stock levels: accelerating flows (cross-docking), continuous analysis, mass customization through kitting or the assembly (post-manufacturing) , active and passive security ;
- facilitating the operations of handling and capturing space in own units;
- improving the quality of services provided by the distribution networks.

In conclusion, we consider that using logistics platforms can get a number of advantages:

- in upstream, they provide advanced inventory management, quality control, mass customization of semi-finished products, synchronous delivery at the production line, secure logistics processes and operations of assembly, coordination and continuous optimization of the flows.
- downstream, they can be designed particularly for the distribution of finished products: managing distribution platforms, preparing the orders of the handling unit per piece , co-packing, quality control, customized packaging, managing presentation and promotional kits etc.

Early Warning System – a Strategic Instrument for Turbulent Times

Leon Ramona – Diana
„Alexandru Ioan Cuza” University of Iasi
ramona.leon@feaa.uaic.ro

Abstract

This paper aims to identify the elements that an early warning system should include in order to facilitate the strategic planning of an organization during turbulent times. In order to achieve this goal a content analysis has been used on 27 articles which have been published during 1996 – 2011 in the databases from SAGE Publications, Emerald Group Publishing and Science Direct. We had been selected only the articles that included in title, abstract or keywords one of the next phrases: “uncertainty”, “turbulence” or “early warning system”. Most of the selected papers belong to journals from the area of general management and knowledge management which shows a reduced interest for this instrument in the strategic management field.

In this article we have been showed that the early warning system is mainly oriented towards outside the organization and includes demographic, economic, legislative, financial, market and product range indicators.

Key words: turbulence, early warning system, strategy, artificial neural network.

J.E.L. classification: L10.

1. Introduction

The current economic environment is usually described as being uncertain [22] and based on knowledge [8], [20], [29]. In other words, researches reflect the importance of knowledge as a production factor and the impact that creation, dissemination and the use of knowledge has it on the business environment.

In this context, strategic planning which may be described as “the process of determining what a business should become and how it should achieve its goals whilst

capitalizing on its opportunities and addressing its challenges” [3] have become an extremely difficult duty. Because of the unpredictable changes that appear in the technological environment and on the market [15], the level of confidence in the forecasts made for a three, five or ten years period has considerable decreased together with “the average period for which firms are able to sustain competitive advantage” [30]. Not only has the lifetime of a competitive advantage changed but also the source of it. Thus, knowledge became an essential competitive resource based on its capacity to provide value to organizations [13], [21].

So, in such a turbulent time when changes appear inside and outside company’s boundaries, any manager must anticipate what is going to happen on the market and must develop a proper strategy. In order to do this efficiently, an instrument for analyzing and evaluating the transformations that appear on the market have been created. This is usually called “early warning system” because it offers an image of how the factors that influence the organization’s performance evolve and, in the same time, reflects some potential vulnerabilities or opportunities that may affect the company’s evolution.

But what are the components of an early warning system and how does this system really looks like?

2. Methodology

This paper aims to analyze the articles published from 1996 until 2011 in order to identify the main elements that should be included in an early warning system which is developed for facilitating the strategic planning of an organization during uncertain times.

Lying in the area of strategic management, this research explores a number of issues like: what are the steps that need to be taken for developing an early warning system and

which are the elements that this one should take into account?

In order to obtain an answer to these questions we used the Sage Publication, Emerald Group Publishing and Science Direct Databases and search for articles, regardless of time period, in which "uncertainty", "turbulence" or "early warning system" were present in title, abstract or keywords. The most relevant works were found in *Journal of Management*, *American Journal of Economics and Business Administration*, *Management Decision*, *Journal of Leadership and Organizational Studies*, *Organization Studies*, *Administration & Society*, *Security Dialogue*, *Foresight*, *Industrial Management & Data Systems*, *Journal of Small Business and Enterprise Development*, *Business Information Review*, *Journal of Knowledge Management*, *The Journal of Knowledge Engineering and Electronic Journal of Knowledge Management*. Based on the reference section of some of these papers we identified relevant articles in *Academy of Management Journal*, *Harvard Business Review*, *Strategic Management Journal*, *International Journal of Neural Systems*, *Scandinavian Actuarial Journal*, *Journal of Quality in Maintenance Engineering* and *Chinese Management Studies*.

27 articles were selected and most of them were found in two journals – *Journal of Knowledge Management* (4 articles – 14,81%) and *Electronic Journal of Knowledge Management* (3 articles – 11,11%). All the others contributed with an article each. One interpretation of this distribution reflects the fact that the problem of adapting to an uncertain and turbulent environment through an early warning system have been of much interest to general management and knowledge management as compared to the field of strategic management.

To all these articles a content analysis has been applied in order to determine the methodology used and the contribution made to the development of the research area. Thus, in a first stage, we remarked the fact that most of the analyzed papers used case study as a research method. Regarding the contribution made to the development of the research area, this will be presented in the third part of this paper. This will highlight

the sources of turbulence and will present the structure of an early warning system – a strategic instrument for managing a company through uncertain times.

3. Building strategies in turbulent times

In the current economic environment the law of action and reaction is more visible than ever. Each company reacts to the actions of its competitors by mobilizing its capabilities in order to obtain a competitive advantage. This reactive chain facilitates the appearance of turbulences every time "the intended and unintended consequences of individual actions intersect, build up and trigger unpredictable changes in the field" [27]. But the continuous competition between the economical agents is considered a common situation and not a source of turbulence.

Usually, when it comes to turbulence, the attention is focused on the technological progress [11], the rules that are governing the competition in an industry, the emergent public policy issues, and social problems [27] and on the legislative changes [2]. In other words, turbulence is generated by what is happening outside the company and not inside its boundaries. This is not really true if we take into account that internal and external environment of an organization are interconnected and they tend to influence one another. A company's behavior on the market is determined by its goals and capabilities. Based on these, a strategy is developed. Its purpose is to offer an action plan that will allow to efficiently using the company resources in order to achieve the specific goals. The way in which an organization will act on the market will not only influences the behavior of its competitors, clients, collaborators and providers but also the actions of the other economic agents from different fields of activity.

So, in the economic environment, turbulences appear as a result of the way companies understand, interpret and react to the internal and external environment [1].

In this context marked by a highly level of complexity, uncertainty and risk, building a convenient strategy became a difficult duty. Every manager must know very well the

environment in which the company operates in order to anticipate the special situations that may arise (risks / opportunities) and to control the effects that these situations may have on the organization's performances. For this purpose, a new instrument has been introduced at the organizational level: an early warning system.

From a financial perspective, the purpose of an early warning system is to anticipate economical crises and to measure the bankruptcy risk of companies. It includes mainly financial indicators which are processed using advanced neural networks [14] or statistics methods like Kolmogorov – Smirnov test, Mann – Whitney – Wilcoxon test and logit regression model [17].

In order to predict the bankruptcy risk of companies, Laitinen and Chong (1999) used the Argenti's A Model for developing a questionnaire capable of reflecting the elements that determine the bankruptcy of the small and medium enterprises from Finland and United Kingdom. The elements that had been taken into account were: incompetence of the management, the owner's role in the business, deficiencies in accounting systems, deficiencies in operations, attitude towards customers, industrial factors and general economic and political factors. With the help of this instrument, the two authors remarked the fact that the management's incompetence, deficiencies in accounting systems and the attitude towards customers have the biggest incidence on bankruptcy.

From the strategic management perspective, the purpose of an early warning system is to assist the organization in "detecting weak signals which can be perceived as important discontinuities in an organizational environment" [26]. So, it allows the company "to identify and track the changes that are occurring daily and determine what should be done in order to capitalize on these shifting patterns" [28]. In other words, an early warning system aims to facilitate timely adaptation to the market requirements and capitalization of the challenges posed by the turbulences from the environment in which the company operates.

The structure of an early warning system used for anticipating economic phenomena is the same as the one that concentrates on the natural disasters and it consists of three phases: "forecasting, warning and reaction"

[9]. At the organizational level, these phases are transposed in collecting information (identifying the weak signals), diagnosis (in-depth analysis and determining the trend evolution of the identified signals) and strategy formulation.

In order to identify the weak signals an environmental scanning is needed [26]. This means that the environment in which the company operates is systematically analyzed for identifying relevant information that could influence its performance. The analysis must be made from an inside and outside perspective.

An outside approach favors scanning activity with a 360° focus and provides a complete picture of the environmental factors' evolution. Although it's a remarkable attempt of avoiding blind spots, it leads to information overload which affects the efficiency of the whole process. On the other hand, the inside approach reduces the volume of information that must be processed but, in the same time, offers a limited perspective to what is really happening in the environment.

So, choosing between an inside or outside approach is not efficiently as long as they are complementary. Beside that, a state of equilibrium between these two approaches may be achieved by collecting information that covers the external environment (it is highly recommended to take into account demographical data – the size and the growth rate of the population by age, sex and ethnic origin –, economic statistics – inflation, interest rates and employment –, and information regarding legislative and regulatory environment), internal environment (reports on sales and profitability), competitors (the number and the size of competitors, barriers to entry, exit barriers, diversity of competitors), consumers (market size and share) and products [10]. On the other hand, no matter how correct and complete the collected information is, the early warning system may fail if "the available information is misinterpreted" [4].

To avoid this situation it is necessary that the managers clearly define the company's goals. After that, they may debate in order to find an answer to the next questions "What were in the past our vulnerabilities? What is happening now in these areas? [...] There is no analogy instructive for us in another sector? [...] Which are the important signals

that we ignore without offering a rational argument? [...] In our business sector, who knows better how to identify the weak signals and how to react to these ahead of everyone else? [...] What are the nonconformists and the ones who have a different opinion trying to tell us? [...] What future surprises could really affect us (or help us)? [...] What emerging technologies could change the rules? [...] Are there any unbelievable scenario?" [7].

But an early warning system is not always taking the form of a debate or of a logit regression. It can be "a managerial informational system, a decisional support system, an expert system, a fuzzy or an artificial neural network" [6]. Among these, the most commonly used are the neural networks because they are "able to adapt over time, to incorporate new experiences in a short time and to generate hypotheses" [12].

An early warning system which is designed as an artificial neural network has three fundamental elements: inputs (that are describing the decision aria), hidden layers (that are presenting the indirect consequences of the factors that have been identified in the decision aria; their number reflects the problem's complexity level) and outputs (which presents the possible responses to the described situation). Within these a couple of parameters are incorporated. These include "hidden nodes, the learning ratio, momentum, threshold, number of cases and presentation" [24].

On the other hand, an artificial neural network may be described by the next system of equations:

$$(1) \quad \begin{cases} x(k) = f_{NL}(x(k-1), u(k-1)) \\ y(k) = q_{NL}(x(k), u(k)) \end{cases}$$

where " $x(k)$ – input, $u(k)$ – hidden layer, $y(k)$ – output, f_{NL} and q_{NL} – nonlinear functions" [5].

Taking into account the specific of the current economic environment, we sustain that an early warning system based on an artificial neural network is more appropriate for developing a strategy in turbulent times than the regression models. The last ones can not be applied anymore because of the fact that "most of the contemporary problems are nonlinear" [23].

Thus, it appears that the early warning system is a tool of analysis and evaluation that addresses the need of anticipating the evolution of the influence factors in order to reduce the risks induced by the turbulence from the environment. What the reviewed research skipped is the connection that exists between what is happening inside and outside company's boundaries. Although this relation is mentioned in most of the reviewed papers and "the strategy needs to be aligned with organizational characteristics and the external environment to achieve better outcomes" [19], some fundamental elements from inside the company are not taken into account when the early warning system is created. We are referring to the human capital – the most important resource that an organization has it. Despite the fact that all the other resources are transformed only through the effort (intellectual or physical) of the human capital, information about employees is not included in the structure of the early warning system.

4. Conclusions

First of all, the article has described the importance of an early warning system in the process of developing a strategy in an uncertain time. Because of the fact that in the current environment everything is changing faster (information is traveling from one continent to another in just a couple of seconds, the technological progress has accelerated, consumers are better informed and more insecure, the law of competition have changed and the size of the market became less important than the time in which this is served), developing a strategy in order to assure a successful evolution of the company have become a difficult thing to do.

So, an instrument that could help managers prepare for what is going to happen on he market is needed. An early warning system is just the type of instrument that managers need because it offers a complete image of any phenomena that may affect the performance of the company.

As we showed in this article, the early warning system may be a model regression – although it is not recommended if we take into consideration the fact that the current problems are nonlinear –, a debate between managers – regarding the future of the

company and the steps that need to be taken for achieving the goals – or an artificial neural networks. No matter the chosen form, the early warning system will include the factors that influence company's performance, the possible consequences that the variation of these factors may have and potential responses to the future situation. In other words, an early warning system consists of an analysis of the past, a forecast of the future and an anticipated way of reaction.

In order to create an early warning system, we must define its purpose, to collect information from the environment, to analyze and determine the trend of evolution of the identified factors, to develop potential images of the future and to choose potential strategy / strategies.

Beside all that, we sustain that the analysis should concentrate both on what is happening inside and outside the organization. Information regarding demographical environment, economic environment, competition, customers and market are important but if we don't take into account elements that are reflecting the quality of the human resources (like: the employees' satisfaction, participation to training, motivation, retention, competencies, knowledge), no matter how good the early warning system will predict what is going to happen on the market the strategy developed wouldn't be the best. This will happen because of the fact that an essential resource of the organization has been overlooked. It seems that when the early warning system is created managers tend to forget the fact that the human resource is the only one capable to transform all the other organizational resources and to raise the company's value.

So, human capital must be included in the structure of an early warning system together with all the other elements that are referring to the external environment.

All these elements will be taken into account in a future research paper called "Designing an early warning system for a sustainable knowledge based organization" in which we will try to answer to the next questions: what a sustainable knowledge based organization is, what are the factors that influence its performance and how does an early warning system that is conceived for this kind of organization looks like?

Supervision of Applicants of the Structural Funds Finance Projects

Lesconi Frumușanu Mihaela,
Breuer Adela,
Jurchescu Dorel

"Eftimie Murgu" University of Reșița, West University of Timișoara
mihaleafrumusanu@yahoo.com

Abstract

The paper addresses the issue of control of projects financed through structural funds. We consider such a research as appropriate because accessing structural funds is a topical issue which is referred to within any field in which an investment will be made. In this context, we consider it necessary and useful to know which institutions are involved in achieving the control of the way in which these projects are managed.

Key words: control, design, structural funds, irregularities, fraud.

J.E.L. classification: M42

1. Conceptual delimitations concerning the notion of projects' control

When it comes to control of the projects we can think of control (monitoring) performed by each beneficiary, financial control done by the financial accountant, monitoring conducted by the Management Authority and, not least, control conducted by the Court of Accounts through the Audit Authority.

According to the International Standards of Internal Audit, control is any action taken by management, board or other parties, to improve risk management and increase the likelihood that the goals and objectives are met [1].

The project control conducted by the monitoring team is the last stage of planning and monitoring the implementation cycle of a project, consisting on gathering information on performance, comparing them with the plan, analysis of the causes of these differences and take steps to correct them.

Controlling the project involves to establish ways to track, highlight and correct each project so as to keep everything "on time and on budget." Controlling a project begins with a detailed plan, with good communication and clear administrative procedures. In order to really have enough control means to be able to cope with change, problems and unexpected events.

Regulation (EC) number 438/2001 stipulates in Article 3 the key principles of management and control of the management and paying systems.[3].

- clear definition of functions, a clear division of functions;
- adequate separation of duties (as needed to ensure a sound financial management practice);
- efficient systems to ensure satisfactory performance of functions;
- reporting requirements concerning intermediate bodies to carry out tasks and methods used.

In literature, according to the provisions of European regulations, there is talk about controlling the EU funded projects carried out at the European Commission level and the control exercised by Member States. Manifestations of control over such funds may be [2]:

- Commission Control exercised on its own initiative, according to control plans; this activity is communicated Member States and it allows the participation of agents and officials;
- Member States control on the Commission initiative; in this case the commission officers will participate only if this is requested by the Member State.
- Member States control on their own initiative in accordance with their plans which must be communicated to the European Commission, following the

provisions on coordination of control activities;

- Monitoring conducted by officials of Member States which is based on its mandate according to the protocol signed; in this case the participation of representatives of the Commission is requested by the Member State, if it considers it to be appropriate.

Regarding projects control in Romania's national legislation, the following terms are found:

- *preventive financial control* - the activity that verifies the legality and regularity of transactions by public funds or public property, prior to their approval [6];
- *public internal financial control* - the whole system of internal control of public sector which is composed of public entities control systems, government structures and a central unit responsible for harmonizing and implementing the principles and standards of control and audit [5];
- *internal control* - all forms of control exercised on the public entity, including internal audit, established by management in accordance with its objectives and regulations, to ensure that funds are administered economically, efficiently and effectively; it also includes organizational structures, methods and procedures [7].

Over time, in literature, the terms "control" and "audit" was expanded to include more activities. For example, certain audit or control activities check whether the outputs were produced with an appropriate degree of efficiency and quality and if it provides value in relation to money spent. Other activities examine whether the results and performance recorded are similar to those of other comparable interventions (in this context there is a greater similarity between this version of the audit and evaluation) [4].

2. National Supervision of projects financed from structural funds in EU countries

As regards control over EU funds by each Member State, before presenting the control bodies in Romania, we consider it necessary to

present such bodies in other European Union member states.

In *Spain*, the control bodies of the structural funds are: the General Administration of state intervention (the Administration Intervencion General del Estado (IGAE)), as an internal control body and the Court of Accounts (Tribunal de Cuentas), as an external control body, conducted according to the General Law of subsidies (Ley General de Subventiones). The financial control of EU funds is made by IGAE, which can exert control on its own initiative, at the request of the European Commission or it can participate in joint inspections (rear controls) carried out together with EU representatives included in the annual audit plan.

In *Greece*, the control system is characterized by the creation of a specialized division on community funds within the Ministry of Economy; it has a special way to achieve this type of controls and it is entitled Directorate of Planning, Public Investments and Regional Policy. It is responsible for leadership, coordination and collaboration in carrying out controls on EU funds, achieving an annual plan for the control of the final recipients of funds and veiling that the communitarian regulations in the field are respected.

In *Italy*, the control of EU funds is made by the General Inspection of Finances and the Ministry of Economy and Finance, the peculiarity arises from the fact that the General Inspectorate of Finance is an independent body by the Ministry of Economy and Finance and is responsible for the performance of control carried out in collaboration with European Union representatives, until the Ministry of Economy and Finance makes the control achieved at regional and local level. In Italy, as well as in Romania, the control of these funds is done at two levels; the first level requires a financial control at the final beneficiaries and shall be conducted by inspection bodies at a regional or local level, and the second level involves a supervision of previous inspections, activities conducted by the General Inspection of Finance in cooperation with EU representatives and monitors the compliance with Community regulations, being responsible directly the Commission.

One last example that we will mention is *Portugal*, which is characterized regarding the control of EU funds by the existence of three

levels of control and a plurality of competent organs.

The highest level of control is exercised by the General Inspectorate of Finance which is responsible with the coordination and the functionality of the other two levels. The second level of control mainj objective is to assess the effectiveness of the nearest degree of control, being able to distinguish the following types of control: control of the FEDER funding conducted by the General Inspection of Territorial Administration of the General Directorate of Regional Development, the control on funding from the FSE conducted by the Directorate for European Social Fund, the control of FEADR funding conducted by the General Inspection and the Management Audit of the Ministry of Agriculture and the Institute of Financial Support for Agricultural and Fisheries Development, the control of the Cohesion Fund made by the General Directorate for Regional Development.

The last level of control is exercised on beneficiaries of EU funds through a financial audit conducted externally.

3. National Supervision of projects financed from structural funds

Regarding the situation in Romania concerning the control of the projects financed from structural funds, in all ministries involved in implementing the operational programmes, there have been established internal audit units, independent structures with specific responsibilities in comparison with managing authorities (or intermediate bodies) which are directly subordinated to the heads of the institutions concerned.

The management authorities will work closely with the Authority for Certifying and Paying in order to accomplish the tasks of management and financial control.

Their methodological coordination is ensured by a special unit within the Ministry of Economy and Finances, namely the Central Harmonizing Unit for Public Internal Audit.

The Ministry of Economy and Finances is the institution designated to act as the Authority for Certifying and Paying for all Operational Programs, and responsible for certifying statements of expenditure and payment requests before they are sent to the

Commission, in accordance with Article 61 of Council no. 1083/2006.

The Authority for Certifying and Paying within the Ministry of Economy and Finances is the body responsible for receiving all payments made by the European Commission for all Operational Programmes through the European Regional Development Fund, European Social Fund and Cohesion Fund.

Romania has established an Audit Authority for all Operational Programs established by Law No. 200/2005 concerning the approval of OUG No. 22/2005 to complete the Law No. 94/1992 on the organization and functioning of the Court of Accounts, which will perform the functions set out in Article 62 of Council Regulation 1083/2006, including the preparation of audit strategy and the transmission of annual control reports. In accordance with Community legislation and national standards of internationally accepted audit, the Audit Authority provides system audit and operations audit.

The Audit Authority reports to the European Commission on the use of structural funds and the main findings and recommendations from audits are included in the annual public report of the Court of Accounts.

The Audit Authority shall have unrestricted access to the instruments, documents and information necessary to perform its duties, irrespectively of the legal or natural persons holding them. In order to fulfil its duties, this institution may enter into contracts with specialized companies or experts authorized to conduct business.

Anti-Fraud Department is the body created to protect EU financial interests in Romania. The department has the power to control EU funds, being the national coordinator of the fight against fraud.

This department operates under Law No. 99/2008 for the approval of OUG No. 25/2007 on establishing a set of measures meant to reorganize the Governmental staff. The Governmental Ordinance No.94/2009 was approved in 2009 in order to ensure continuity of the structures within the Government, which provides in Article 7 "The Fight Against Fraud Department – DLAF, hereinafter Department, without legal personality within the Government, and

financed by the General Secretariat of Government, is directly subordinated to the Prime Minister and coordinated by Deputy Prime Minister and is headed by a chief secretary of state, helped by one or more secretaries of state, appointed, irrespectively dismissed by the decision of the Prime Minister, on the Deputy Prime Minister's proposal. "

The powers of the department can be structured in three main categories:

- controls on the spot concerning the projects financed from European funds;
- coordinating all national institutions involved in the fight against fraud;
- cooperation with the European Anti-Fraud Office - OLAF and the corresponding structures of European Union member states.

The department operates controls on the spot after complaints made by the European Anti-Fraud Office, the competent authorities in the management of Community financial assistance or ex officio.

Given the need for a joint effort of all institutions involved in the management of structural funds, the Department has built a national coordinated anti-fraud system aimed at early detection of possible cases of irregularities or fraud, coordination of controls depending on the specific scene and referral to prosecutors in the event of criminal elements.

Fiscal and financial control bodies, as well as police and gendarmerie have an obligation to provide operational support for the exercise control team.

The Department has the duty to report possible fraud affecting EU financial interests, the minutes concluded by the inspection team constituting evidence in criminal trials. In case of detection of irregularities, the Department shall transmit the control document to the authorities with competence in managing EU funds and related co-financing funds, in order to take the necessary measures to remedy deficiencies and, where appropriate, recovery of unduly paid amounts.

Annually, DLAF prepares a report on its activity based on the protection of EU financial interests.

The national controls, which we discussed earlier, must be synchronized with the community controls, and, in this respect,

there are regular meetings and standing collaboration between national and community control bodies; an example, in Romania's case, is the link between the Anti-Fraud Department and the European Anti-Fraud Office.

The European Anti-Fraud Office (OLAF) has the mission of protecting the financial interests of the European Union, to fight against fraud, corruption and any other irregularities, including irregularities in EU institutions. By fulfilling this mission in a responsible, transparent and efficient way in terms of cost, OLAF intends to provide quality services for all European citizens. The European Anti-Fraud Office was created on 1st of June 1999 by the Commission Decision No. 1999/352/EC.

The Office exercises all the powers of the Commission to make administrative inquiries in order to enhance fraud combat, corruption and other illegal activity adversely affecting the Community's financial interests, as well as any act or activity that contravenes the provisions of Community.

As I stated earlier, the European Anti-Fraud Office notifies the anti-fraud departments of the Member States to carry out operative controls on the spot where there is suspicion of embezzlement of EU funds.

The European Court of Accounts is another EU institution established by treaty in order to conduct audits of EU funds. As external auditor of the European Union, it contributes to improving EU financial management and acts as the independent guardian of the financial interests of EU citizens. It provides audit services through which it evaluates the collection and use of EU funds. The Court examines whether the financial transactions were properly recorded and disclosed, whether they have been executed in compliance with laws and regulations and if they have been managed according to the principles of economy, efficiency and effectiveness. The Court communicates the results of its audits through clear, relevant and objective reports. The Court also issues opinions on various aspects of financial management.

The Court makes three different types of audit: financial audit, compliance audit and performance audit. They address the following three issues:

- whether the accounts present fairly, in all material respects, the financial position, results and cash flows for the year, in accordance with the applicable financial reporting (financial audit);
- whether the operations comply with all material respects, legal and regulatory frameworks that apply to them (compliance audit);
- whether the financial management is good, in other words if the funds are used to a degree as small as possible (economy), if the results are obtained with the lowest possible level of resources (efficiency) and whether objectives were met.

EU Court of Accounts audit is conducted in accordance with international auditing standards (International Standards on Auditing - ISA), which applies to both public and private sectors. Though, existing International auditing standards do not cover to the same extent the type of compliance audit conducted by the Court. The Court participates actively with the national audit institutions to the development of international standards by standardisation bodies (International Organization of Supreme Audit Institutions - INTOSAI, International Federation of Accountants - IFAC).

An Empirical Study Regarding the Impact of Foreign Direct Investments over the Gross Domestic Product of Central and Eastern Europe Countries

Lipară Daniel

„Alexandru Ioan Cuza” University of Iași, Doctoral School of Economics

danl_02@yahoo.com

Abstract

This paper aims to explain if there is a connection between foreign direct investments (FDI) and gross domestic products (GDP) of Central and Eastern Europe (CEE) countries.

Through a regression model we look for a correlation between these two indicators.

CEE region has always been attracting investors in order to invest here. It has always been a magnet for investors who wanted to expand and to grow their businesses.

Is there a significant relationship between FDI and GDP? What is its impact? Does FDI have a direct impact over GDP in CEE countries?

Key words: foreign direct investment, GDP, regression model, economic growth

J.E.L. classification: F21, E01, C29, O47

1. Introduction

Being seen as one of the most suitable places for making large profits, Central and Eastern Europe (CEE) countries attract each year multinational companies with their solely main objective of developing themselves and increasing their turnovers.

The “process of courtship” [2] is rational and very calculated. There must not be any mistake in choosing where to make the foreign direct investments (FDI). Each decision takes account of some key factors, such as: taxes, interests, labor costs, infrastructure banking and of course competition.

Although for many years, Czech Republic, Hungary, Slovakia and Poland were the most wanted markets for investments, in the last

years countries like Romania, Bulgaria and Croatia made an incredible step in attracting investors.

CEE market justifies its importance in absorbing investments even in the European Attractiveness Survey done in 2009 by Ernst & Young. In this survey, CEE and Western markets are ranked first ahead of China as one of the most attractive foreign investment regions. According to the same survey, 52% of investors are confident that the attractiveness rate of CEE market will increase over the next three years, while only 61% show confidence in the power of this region to overcome this economic crisis [7].

2. Factors that influence FDIs

There is no doubt that the financial decision has the biggest impact when investing or relocating an activity to another region. This procedure is considered the basics of all investments. The transition is towards cheaper areas, with low operating costs and low labor costs. Otherwise, that company that decides to invest will not obtain that main objective that drives every firm – the profit.

When deciding to invest in a country, there are a lot of factors a company take into consideration in order to achieve its goals. Therefore, depending of the type of investment, of the field in which FDIs apply the importance of these factors is quite different.

Generally speaking low labor costs and low taxes are the main factors that tip the balance toward choosing a country against another when using FDIs. Referring offering incentives, the majority of investors believe that it is not a decisive factor for investment.

The first step an investor must do when deciding to make a FDI in a CEE country is to lay down all the factors that somehow can influence the investment and that compare them in order to search for the advantages and disadvantages of each one. Then, the difficult part in the investment process comes. And we refer to the political decisions that accompany the investment. Fortunately, this is not only the case of CEE governments, but of all states. We recommend a quickly decision, otherwise the investor will cross the border and will decide to invest in the neighbor country.

The main factors that attract or reject FDIs in CEE countries are depending of the type of project: the cost of land, real estate taxes, construction costs, the corporate profit tax, value added tax, the personal income tax, the export tax, availability of EU Structural and Cohesion Funds, the minimum monthly wage, the average gross monthly wage, social security costs, the level of employment protection legislation, the unemployment rate, infrastructure and not at least the economic stability factor determined through GDP, inflation rate, interest rates and currency stability [2].

The number and complexity of these factors make difficult a FDI decision in a CEE country. That is why the reports and analysis made by investors with the help of specialists are detailed and well calculated. No information is put aside.

3. And the crisis came...

After five years of FDI growth between 2003 and 2008, the crisis killed the investor's dream of continuing their business at the same high levels. The credit crisis started simultaneously with a decrease of FDI inflows to the CEE area. The most affected sector was the real estate field.

The economic crisis had a decisive impact on job creation. 2008 is the fifth consecutive year in which the employment rate decreased.

The new economic changes made the investors to revise some points from their agendas. A market adaptation is compulsory. Now the investment decisions regard market proximity, infrastructure, labor productivity, taxes, public incentives and quality of life [7]. The focus is on stability and quality.

Some industries restraint their activities (real estate, automotives), others develop (training and education companies, renewable industry).

The battle of still investing in CEE countries or relocating somewhere else is fiercely. In 2009 CEE market was the second most attractive area for FDI projects (39%), after Western Europe (40%) [7].

Looking into the future, investors will continue to use FDIs in developed countries, such as CEE region, because of their desire to expand and grow.

4. Literature review

GDP is one of the most important factors that an investor takes into consideration when deciding to invest in that country.

Researchers focused a lot on explaining the link between the two indicators. Consequently, there are a lot of studies which investigate the role of the factors that influence the level of FDI in emerging economies. Frenkel, Funke and Stadtmann (2004) explain the FDI flows from industrial to emerging economies by using bilateral capital flows [8, p. 282]. Meanwhile, Carstensen and Toubal (2004) show that the key factors that determine the investment in CEE countries are the market potential, the low labor costs, a skilled workforce and the level and method of privatization and the country risk [4, p. 3].

Continuing the idea of interdependence between FDI and GDP, Alfaro, Chanda, Kalemli-Ozcan and Sayek (2010) emphasize the role of FDI in achieving economic growth. The result is outstanding. They admit that FDI has a more powerful impact over economic growth in financially developed economies. [1, p. 242].

But there are researchers that believe that there is no connection between FDIs and economic growth in developing countries. Even so, one thing is sure. The majority believe that there is a heterogeneous relationship between FDIs and economic growth in the CEE countries. Analyzing 28 developing countries, Herzer, Klasen and Nowak-Lehmann (2008) didn't find any influence of FDIs over growth. In other words, they demonstrated that there is no impact of FDIs over the level of incomes and the level of financial market development in

developing countries [9, p. 808].

CEE countries are indeed a magnet for FDI. Looking for big profits and market share, investors decide to invest in CEE market. The intense flow of FDI towards CEE region led to a question. Is this flow a result of FDI's redirection from Southern Europe countries? Buch, Kokta and Piazzolo (2003) investigated it by using gravity model equations and concluded that a decrease of FDI flows to Southern Europe and an increase of FDI flows in CEE market is not the effect of a redirection of FDI [3, pp. 94-95].

The last annually indicators show that European transition economies are the lucky winners when attracting FDIs. Speaking about what makes the difference between CEE region and other markets, Demekas, Horváth, Ribakova and Wu (2007) explain that a FDI-friendly policy regarding labor costs, corporate taxes, infrastructure and foreign exchange determine a higher rate of FDI attraction in comparison with the other countries [5, pp. 369, 381].

Based on 11 CEE countries, Eller, Haiss and Steiner (2006) investigate the influence of FDI over economic growth in the financial sector through efficiency channel, concluding that the level and quality of FDI have a crucial impact over economic growth in CEE countries [6, p. 300].

Using the model of Romania between 2000 and 2009, Misztal (2010) shows the strong and significant relation between FDI flows and economic growth. Through an auto regression model, he concludes that FDIs are the main reason for a GDP increase during that period [11, p. 48].

5. Empirical study

Through this paper we try to show if there is a relation between FDIs and GDPs of CEE countries, how strong and how significant this relation is.

In order to do so, we studied these indicators in CEE countries for a period of 34 years, from 1976 to 2009.

We studied the data from the following CEE countries: Albania, Bosnia and Herzegovina, Bulgaria, Croatia, Former Czechoslovakia (until 1989), Czech Republic (from 1990), Estonia, Germany, Hungary, Latvia, Lithuania, Poland, Romania, Serbia

and Montenegro (until 2007), Serbia (from 2008), Slovakia, Slovenia and TFYR of Macedonia.

Table no. 1. FDI's and GDP's values from CEE countries between 1976 and 2009

Indicators	FDI (millions USD)	GDP (millions USD)
Year		
1976	6.00	135138.03
1977	5.00	156899.01
1978	25.00	177352.11
1979	30.00	182645.25
1980	10.00	187253.06
1981	18.00	198089.21
1982	14.00	219622.05
1983	16.00	225243.39
1984	28.00	203708.19
1985	15.00	209017.99
1986	16.00	229073.60
1987	12.00	236142.59
1988	15.00	247369.09
1989	11.00	254122.56
1990	3773.24	1930658.23
1991	7256.68	2003617.85
1992	1680.25	2343389.66
1993	6152.87	2294365.50
1994	12556.22	2471138.55
1995	27282.58	2922288.00
1996	17992.44	2866165.83
1997	27434.12	2585794.32
1998	44690.74	2645831.60
1999	78369.25	2584123.18
2000	222403.93	2335170.63
2001	48993.61	2368212.40
2002	80397.32	2555993.79
2003	53427.60	3091479.06

2009*	63184.16	4670136.38

Source: Processed data from <http://unctadstat.unctad.org>

* Estimation made by UNCTAD

The data are processed from the statistics provided by the United Nations Conference on Trade and Development (UNCTAD) and are shown in Table 1 [12].

Foreign Direct Investment (FDI) is the independent variable or predictor. It refers to FDI inflows or capital provided by investors in a reporting economy. We will note this variable with X.

Gross Domestic Product (GDP) is the dependent or resultative variable. We will note this variable with Y.

Both indicators represent the sum of the values of all CEE countries in each year and are measured in US Dollars at current prices and current exchange rates.

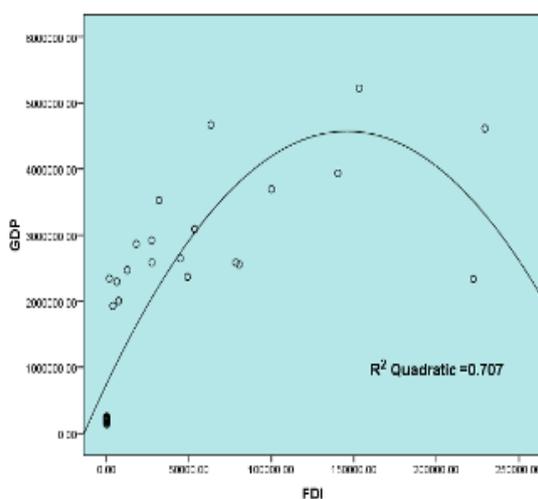

To prove the existence of a connection between these indicators we will build a regression model using SPSS 17.0.

Using regression analysis, we will investigate how the dependent variable can be explained through the independent variable and in the same time we will calculate the regression coefficients.

Regression analysis starts with the estimation of the model and with the model equation.

Using Scatterplot, we show that the correlation between FDI and GDP in CEE countries can be approximated as a quadratic regression model.

Figure no. 1. The correlation between FDI and GDPs in CEE countries

Source: Processed Scatterplot from SPSS

In conclusion, the equation for the quadratic model is:

$$Y = a + b_1X + b_2X^2, \text{ where:}$$

Y = Gross domestic product;
X = Foreign direct investment;
a, b₁, b₂ = regression coefficients.

One very important indicator that reveals the existence of a correlation between the dependent variable and the predictor is the coefficient of correlation or Pearson coefficient, r. In our study, r is 0.841, which shows a direct relationship and a very strong correlation between FDI and GDPs. Correlation is significant at 1% level, which means with less than 1% of mistake that there is a significant correlation between FDI and GDP in CEE countries during 1976 and 2009.

To test the significance of r we must use Student's t Test.

$$t_{\text{calculated}} = \frac{r\sqrt{n-2}}{\sqrt{1-r^2}}$$

Where:

r = Pearson coefficient;

n - 2 = degrees of freedom; n = number of x and y values.

The value of calculated t is 8.7931. We must compare this value with tabulated t value. Tabulated t value for 32 degrees of freedom and a significance level of 0.01 is 2.750 [13].

So, $t_{\text{calculated}} > t_{\text{tabulated}}$, which means that between FDI and GDP is a significant relationship, so the correlation coefficient is statistically significant.

For model interpretation we use the correlation of determination, R². Its value is presented in Figure no. 2. Model Summary for cubic regression model.

Figure no. 2. Model Summary for cubic regression model

Model Summary^b

Model	r	R ²	Adjusted R ²	Std. Error of the Estimate
1	.841 ^a	.707	.688	8.84724E5

a. Predictors: (Constant), FDI^{sq}, FDI

b. Dependent Variable: GDP

Source: SPSS Output

$R^2 = 0.707$ means that 70.7% of the variation of GDP is explained by the variation of FDI. The other 29.3% is determined by other factors. The high value of R^2 leads to a direct and very close relationship between the 2 variables.

Through *F test* we will test the regression model. A big *F test* value (37.351), plus a Sig. value less than 0.05 (in our case 0.000) means that FDI explains the variation of GDP and vice versa. So, the risk of being wrong saying that between FDI and GDP is a very strong correlation is less than 5%.

In the end of our analysis, we will calculate the regression coefficients and so, we will determine the equation of the quadratic model. The Figure no. 3 shows the regression coefficients.

Figure no. 3. Regression coefficients

Coefficients ^a					
Model		Unstandardized Coefficients		t	Sig.
		B	Std. Error		
1	(Constant)	749367.516	200077.33	3.745	.001
	FDI	52.431	7.557	6.938	.000
	FDIsqr	-0.0001798	0.0000368	-4.874	.000

a. Dependent Variable: GDP
Source: Processed SPSS Output

The 3 regression coefficients for our quadratic model are: $a = 749367.516$, $b_1 = 52.431$ and $b_2 = -0.0001798$.

The equation of the model is:

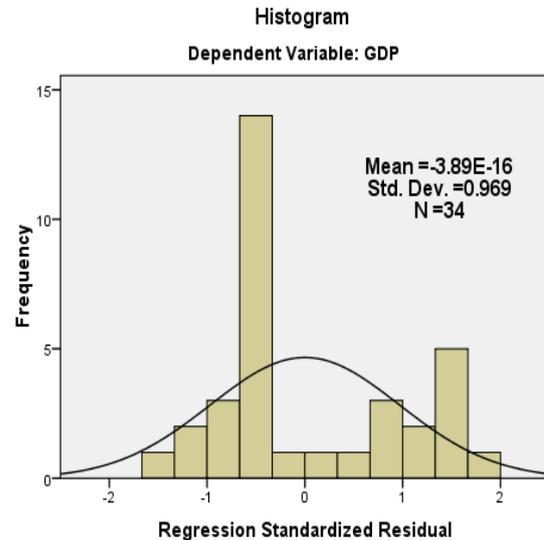

$$Y = 749367.516 + 52.431 * X - 0.0001798 * X^2.$$

In the end, we must test the regression coefficients using *Test t*. For our study, Sig. value = 0.000 is less than 0.05, meaning that between the 2 analyzed variables is a significant relationship. So, the quadratic regression model is valid.

This equation may be used to determine the value of the gross domestic product in CEE countries when knowing the value of foreign direct investments.

By analyzing the residuals, we will test the linearity of the quadratic regression model. The histogram represented in Figure no. 4 shows a relatively normal distribution of the residuals around the mean, confirming the linearity of the quadratic model.

Figure no. 4. Testing the linearity of the quadratic model

Source: Processed Histogram from SPSS

6. Conclusions

CEE countries have always been a magnet for FDIs and will remain so even in the next years. The CEE market will continue to grow because of the investors desire to expand their activities there.

This paper explains that between FDIs and GDPs of the CEE countries is a direct and very strong correlation.

The impact of FDI over GDP in CEE countries was explained through a regression model that emphasized the significant relationship between the analyzed variables.

The quadratic regression model that we use is validated, so we can use it to determine the value of the gross domestic product in CEE countries once we know the value of the foreign direct investments.

Through this empirical study we have also express our point of view regarding the impact of FDI over economic growth as a reaction at some researchers' opinions.

The research in this field remains open. It would be interesting to investigate in other studies the impact of GDP over the attraction of FDI in order to see if there is the same influence or the same significant relationship.

Why Is Human Capital a Driver for Economic Growth?

Lipară Daniel

„Alexandru Ioan Cuza” University of Iași, Doctoral School of Economics
danl_02@yahoo.com

Abstract

This paper aims to explain if there is a link between human capital accumulation and/or formation and economic growth.

In a knowledge-based economy, investing in human capital is a representative of a country's economic power. Migration of brains or so called "brain drain" to developed areas is a result of human capital accumulation.

This type of investment means an increase in labor productivity. Basically, with the same effort, individuals will achieve better results because of their superior training. Education is the base of human capital formation and the education level is directly proportional with the income level. Together with technological progress, they lead to economic growth.

Human capital is an important factor that expresses the productivity of an individual and of a society too, thus having a crucial role in a knowledge-based economy.

Key words: human capital, economic growth, labor productivity, education

J.E.L. classification: J24, O47, P46

1. Introduction

Although at first glance it seems to be a difficult concept to explain, a simple yet comprehensive definition considers human capital as a set of abilities, skills, knowledge and competences which people acquire them through education, training and experience. From this point of view, human capital investment involves three parts: the state/the government, private firms and individuals. Why is it investment in human capital important? What benefits this investment brings? Can be human capital considered a driver for economic growth?

Being or not a driver of economic growth one thing is certain. European Council from Lisbon established in 2000 that one of the main objectives of the European Union is to become the most competitive knowledge-based economy in the world, placing in the centre of its strategy the human capital development.

2. Interpretation and measurement of human capital

In order to explain the impact on economic growth we must firstly understand properly the concept. Thus, in the narrow sense, human capital encompasses all the skills that people can rely on the labor market. Structurally, human capital has two components: native capital, acquired at birth, so biological (which includes people's physical skills) and capital accumulated through the existence of the individual, through training in schools and beyond. Human capital can lead to economic growth only if it generates income through work. But the ability to produce an income through work is based on an initial training cost (consumed during the period of schooling), and on a future income. If that cost of training, schooling can be calculated easily, the future value of present earnings to which an individual gives to in order to prepare, to train is much harder to estimate. In other words, educational capital demonstrated by the number of diplomas and certificates can be easily measured individually, through several ways: by measuring the years of schooling, the number of diplomas. Instead, education acquired outside the formal education process leads to an educational capital which is difficult to estimate.

Investing in human capital is effective and therefore we can see it as a gain, only when the future value of present earnings exceeds the income that the individual would get if he

gives up additional training and would start working.

3. Brain drain

Investing in human capital is a representative of a country's economic power. The more people are better educated and continue to prepare in order to develop individually, the more the economy of that country is stronger. The downside is the migration of brains that can lead to a decrease in the power of the country. Migration of brains or “brain drain” as it is known in scientific world is an important issue that arises in many developing countries, and Romania is no exception. The migration of intelligence may therefore not only lead to an increase in the power of a country but to a decrease in the power and the country people migrate from, as it is natural for people to exercise their skills and to migrate to countries where they are better rewarded. The loss in the countries people migrate from is double: on the one hand is lost the intellectual potential of people, on the other hand is lost the investment in their education and training. In this case the investment is unprofitable as long as the money used in human capital formation will not be recovered. Basically, the society will not get that extra value expected from an investment in training the individuals.

When referring to a country's level of development, or of a community's, we must take into consideration the concept of aggregate national human capital. This indicator that represents the sum of individual human capital shows the development of a country and explains its growth. Such an example is the economic boom period that have experienced some Asian countries - South Korea, Taiwan or Hong Kong - in the second half of the twentieth-century. And it was due to large investments in education done by their governments.

We believe that the brain drain is a phenomenon that has a negative impact over the country of origin because it leads to a loss of the production that could be created if people would emigrate. However, the solution should not be blocking the migration, as it has happened in many former communist countries.

We mentioned earlier that people migrate to countries where they are paid better. Migration of human capital leads, paradoxically, to increased competitiveness between individuals, or to increased welfare for all market participants. The concept of welfare is purely subjective, depending on the wishes and preferences of each individual. For some individuals the fact that they can move freely in search of a job is more important than any material wealth. For others, it is more important the environment in which they live, they work, rather than the material differences. Consequently, by increasing competition among individuals, the migration of capital creates incentives in order to improve and achieve economic growth. If it is known that a coach is well paid, then individuals will accumulate human capital to become a coach. But what will happen if the earnings are low or if there are many coaches? There is no doubt that a rational individual will choose another job with higher incomes.

The desire to accumulate new human capital makes the brains to migrate to developed areas. This would not be harmful when it comes to resource-poor areas, with no chance of development. In other words, brain drain may lead to extinction of disadvantaged areas.

Investing in human capital means an increase in labour productivity. Basically, with the same effort, individuals will achieve better results because of their superior training. Future revenues must cover both young professionals and the older generation who supported and financed human capital formation in order to talk about a vector of economic growth. Otherwise, that country will suffer. Specialists searched for various solutions to prevent this phenomenon. Former communist countries limited the right of individuals to travel free over the borders. Today these countries adopt a policy of encouraging the young brains to return home. The measures used – whether it concerns a much better salary, similar to European offers or even incentives for those who return home with the purpose of starting a business – are meant to improve the state management of investment in human capital. In this way, the government can reduce the migration phenomenon by establishing an educational system quality management policy,

especially by allocating a larger budget to this sector.

However, if we only take into consideration the management issue, it is difficult to explain why private firms do not face the same problems as the state does. Private companies offer employees more human capital investment programs. Good examples are the training programs that banks use to achieve excellence in sales and quality. Yet if we look at their gross income, the migration of human capital does not seem to affect these institutions. If brain migration phenomenon can be reversed by certain management techniques, then why does not the state use them to achieve maximum efficiency? In this case, we think the problem is solely the lack of incentives to reward human capital and the lack of property owned. In private firms, the money belongs to shareholders; in public institutions the money belongs to every citizen, therefore there is no question of their property.

4. Correlations between human capital, labor productivity, education and economic growth

The education level has a decisive impact on the income level. We can even speak of a directly proportional relationship between education and income. Thus, as an individual decides to invest more in personal and professional development, he will gain a greater profit in the future than if he had dropped further accumulation of human capital or his personal development would have been stopped at a certain level. We believe that there is a double impact on economic growth: firstly, on the microeconomic level, a decrease of investment in human capital means a waiver of the individual to the chance to be better, more competitive and more successful than others are; secondly, we speak of an impact at the macroeconomic level, where the whole society would be deprived of the existence of grey eminences of which to be proud of. Did the Romanian government consider an increase of the investment in human capital when it decided to include the ninth grade in the secondary school education system, the one that is responsible for achieving a minimum level of knowledge? It seems hard to believe...

However, the state must guarantee a basic level of knowledge, and in time, each individual will have to accumulate other information that will help him become one of the best in society. The investment that each of us make in his personal development is the one that makes the difference between a mediocre and a developed society.

Both physical and human capital are the determinants of economic development. Human, unlike physical capital, leads to economic development in two ways: by the added value it creates in the economy through participation in the production process and also by the growth rate of this added value through the innovative capacity of human capital. We believe that ensuring the health and education of the population can enhance the effects of the two issues mentioned above. Any expenditure in health and education is an investment in human capital that provides accumulation and avoids its depreciation. No need to say that in Romania, both the allocation of GDP spent on education and the health expenses are much lower than in most European countries.

Human capital accumulation and formation are the main pillars of a long term developed economy.

Education is the base of human capital formation. Education expenses are primarily an investment but also a consumption. Generally, when talking about human capital we refer to an investment, where everyone can use anytime and anywhere, without any restriction their native and gained skills. The investment must be continuous, because otherwise individuals would not be able to use the innovations from every field and therefore they would not be able to add value to their work and to the society in which they live. Investing in human capital refers to either the development of capital through training courses either the maintaining of capital at a certain level, which, however, hinders economic growth. We talk about consumption too, because there are a lot of expenses that form the human capital (with health, with education).

A large accumulation of human capital means greater labor productivity, so a higher amount of labor and a consistent remuneration. Moreover, a higher level of education requires greater flexibility in

adapting to specific conditions of the labor market, thus helping to reduce unemployment.

The solution for economic growth should consist of improving the abilities of the less skilled individuals and eliminating the gap between the highest and lowest wages. This means an additional investment in human capital formation as a path of combating poverty. In recent years there has been an increase in jobs with high degree of specialization. Investing in human capital is fundamental to reduce the risk of unemployment. It favors the companies that can achieve a higher return from investing in the education of their employees, becoming more creative in finding solutions to solve the problems encountered.

The existence of a well-educated and healthy human resource in a company leads to a high labor productivity, a better organization of the economic activity, a higher production and also higher incomes. Higher incomes mean new investments in education and health, with which human resources will get healthier and better educated. At microeconomic level, the company is winning; at macroeconomic level, the whole society enjoys human capital's investments.

Those who invest more in their professional training, even specializing in certain areas look for the best paid jobs. In other words, the chances of those who decide to invest in human capital formation and to obtain a future earning are much higher. So, once training decreases the risk of increasing unemployment and poverty.

There is an indissoluble connection between economic development and human capital resources. A rich society is an educated society with healthy citizens. The higher the education level of individuals is, the more their incomes increase. Conversely, individuals with higher incomes are expected to hold several diplomas, demonstrating their practical training. We can discuss the relationship between human capital and incomes at county level. Rich counties attract a more skilled workforce, being the main candidates for reaching the economic growth, while poor districts have some people with low education and skills.

If we refer only to school training, we can admit that governments can essentially

contribute to the formation, development and financing of human capital through public budget. Not the same can be said about training outside the education system, where the private sector has the central role (for instance companies that pay employees' studies).

Investing in human capital is crucial in raising labor productivity. Human capital is an important factor that expresses the productivity of an individual and of a society too, thus having a crucial role in a knowledge-based economy. The employees of a company who have attained a high level of investment in human capital contribute to a raise of labor productivity, as an unlimited source of creativity and competitiveness in the company.

Employees who decide to invest in human capital accumulation perform more than those who invest less in their personal and professional training. Human capital accumulation means developing communication skills, as well as solving problems. Those who are prepared to continuously learn to be better are the best performers followed by the others. Due to continuous investment, they can use new methods, sophisticated and efficient devices that will automatically increase labor productivity, economic growth and development. Why? Because this economic growth achieved is nothing else than the basis for a new investment, a new human capital accumulation, a higher labor productivity, culminating with a new economic growth. Like a snowball, we invest in human capital in order to overcome our limits, to achieve better results, results that will lead to another investment, and thus overcoming another limits, with the sole purpose of growth. The process is continuous and once started it must never end.

The number of years of school can be an instrument for measuring the accumulated stock of human capital. Although many skills are learned through formal education, on-the-job training may help to increase employee's productivity and ultimately a company's economic development. This kind of human capital accumulation is as productive as expensive. Through on-the-job training every employee receives support from a specialist who will help him to develop his abilities and skills. He will first make a short diagnosis in

order to identify the strengths and the points for improvement. With this diagnosis, the specialist will highlight the skills of the employee that make him become the best in his field and will correct those that diminish his success. On-the-job training means creativity stimulation and also raising the bar for other employees of the company, a benchmark for long-term stimulation of competition.

We believe that all employees should enjoy the benefits of specialized training at the workplace and not only those who are best performers or are endowed with certain special skills that make them different from others. The company is interested primarily, in terms of uniformity, to improve all the results and not to increase the best ones. In other words, the company aims to reduce the gap between the highest and lowest results, so that average labor productivity is sufficiently high enough to cause an overall economic growth.

Human capital investment occurs naturally and as an employee's desire to cope with technological progress. What if an IT specialist should install and test a new version of an application in a company without knowing the functions of the program, the updates and the previous versions? Certainly we cannot call him a specialist. It looks that there is interdependence between the rate of technological innovation and the demand for labor that has invested heavily in human capital accumulation and formation. Thus, if this highly skilled workforce adapts quickly to new technologies, then an expansion of revolutionary new techniques will determine a greater demand for individuals that decide to invest in human capital, creating the basis for economic growth.

Technical progress depends on the company's economic decisions, in the same way as human capital accumulation. Entrepreneurs wish to obtain bigger profits and one of the ways to do this is by producing new ideas. Since profit is the ultimate goal achieved by the production of knowledge and innovation, knowledge creation and innovation should be incorporated into a growth process in a way that stimulating economic growth to be in turn driven by economic growth.

The quality of human capital is fundamental for a company's economic growth. Improving the quality of education should be the starting point of all human capital formation policies.

Talking about the quality of human capital, we can say that it differs in time and space according to the place of life, age, sex, religion and people's own values. Certainly graduates want to learn as much as they can, from different fields of interest, but in most cases the quality of information is poor. People with some experience know how to prioritize the activities and to focus on things that are really useful to their work and personal development. Individuals living in urban areas find technical progress easier to understand, are more accustomed to the idea of new, while those in rural areas may face difficulties in these situations.

5. Conclusions

In conclusion, human capital is indeed a driver of economic growth, one of the engines of development both individually and collectively. Human capital's formation and accumulation mainly determine economic growth. Therefore, human capital accumulation rates explain the differences between the income growth rates of individuals from different economies.

Human capital shows the ability of an economy to innovate or to achieve the performances of more developed economies, which, in turn, determine economic growth. A sustained economic growth can be achieved only in those sectors where technical progress and innovation are key words that use technology and/or human capital as an input.

Inside a company there is a very close correlation between investment in human capital and employee's productivity. The investment is beneficial in terms of employee's creativity, who wishes to invest in training and human capital development. These employees are standing examples of creativity, but especially of highest competitive levels. Individuals choose how to allocate time between production and accumulation of skills and abilities, taking into account increases in future productivity and wages as a result of investment in education and training.

Investing in human capital shows a country's economic power. Better educated and trained people are a force in the economy in which they work. The downside is the migration of brain that can lead to a decrease of the power in the country of origin. Brain drain is considered a very important issue that affects both developed and poor countries. However, the main problem of brain drain is not a system of mismanagement of human capital formation, but the lack of incentives to reward it.

Measures to increase the quantity and quality of human capital stock must represent the contents of each economic growth policies package. Human capital is a key factor in increasing firstly the individual and secondly the general productivity, investment in human capital being more important in a knowledge-based today's economy.

The Role of Local Government in Waste Management

Lisieviți Brezeanu Alexandru Petru

Brașoveanu Florica

"Ovidius" University of Constanta, Faculty of Law and Administrative Science,
floriordache@yahoo.com

Abstract

"The earth is polluted - Commoner says - not because the man is a very dirty animal, nor because the species is too large. The blame is on society - how society understands to possess, distribute and use the wealth that human labor extracts from planetary resources (Barry Commoner, The circle which closes (The Nature, Human and Tehnique), Politică Publishing, Bucharest, 1980, p. 261.).

In addition to strategies and various recoveries and transformations, it is absolutely necessary to implement the National Plan of Waste Management and the Guide in order to underpin local and regional implementation plans, which have remained mere pieces of paper".

Key words: environmental protection, sustainable development, waste management.

J.E.L. classification: K 32

1. Introduction

The statutes designed to combat environmental pollution by means of waste and hazardous substances are multiplied within States.

The legal system reacts first by using known techniques and, then, in a progressive manner, by creating new techniques.

The bet with the environment will go ahead and it represents a powerful element that will determine the improvement of the fundamental concepts of environmental protection through prevention, according to the principle *"that it is better to prevent than to repair the environmental damage."*

The application of the principle is inevitable taking into account that the

protection of the environment has become a global objective of international society, which leads to the harmonization of environmental laws and the radicalization of international cooperation in environmental protection.

2. The Matter Seat

In the context of the globalization of environmental protection, the economic factors play an important role in *the fight to safeguard the environment* and the States are taking steps in order to protect the internal environment, but also the regional and the global ones.

States take measures in order to create environmental funds, with the special destination of sectorial and trans-sectorial prevention of natural eco-factors, both partially and in their entirety and interdependence.

The States taking action in order to protect the environment must take into account the costs and efforts that will affect their own economy. Certainly, the long-term investments made in order to eliminate pollution costs are profitable because the restoration of damaged natural resources is very expensive. However, the short term costs involved by environmental protection are the ones which are felt and not the long-term savings.

Whether the cost of the measures taken in order to protect the environment will be borne by manufacturers or by service providers or whether these measures directly rest with public authorities, the economy will always be the one that will withstand the short-term consequences and the additional costs will reflect upon export prices.

The States which protect their own environment may be penalized in international competition because of the

distortions created in its disadvantage. These distortions are particularly felt in the interstate systems based on the freedom of trade.

Another factor in the internationalization of legislative, administrative and institutional measures is the danger of pollution by hazardous substances and wastes. A step forward on this line is the Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and Their Disposal, ratified by Romania by Law no. 6 / 1991.

Also, the post-Chernobyl conventions on Nuclear Safety concluded in Vienna in 1986 mark a new era in the protection against nuclear pollution and in the cooperation of States in this area.

According to the law suit, the pursuit of activities within the nuclear field is done only under a permit from the National Commission for Nuclear Activities Control, issued at the demand of the units engaged in nuclear activities, provided that they comply with the rules that consider security facilities, professional staff, population and environment protection.

The introduction within the social and economic circuit is subject to authorization, for the use or consumption by the population of the products that have undergone irradiation, and the medical treatment and diagnostic of radio-nuclides, radiation sources and pharmaceuticals containing radioactive materials. The authorization is issued by the Ministry of Health, at the request of the units, according to Article 14 of Law no. 111/1996.

When locating the units operating nuclear activities, the following elements will be considered: the direct effect of nuclear activities on population and environment, both in normal operation and in case of nuclear accident; the quantities and means of disposal of radioactive waste; the density and average age of the population in the area, and its specific food.

The main measures for effective protection against radiation are: adequate building facilities used by nuclear facilities; safe organization and storage of hazardous waste disposal; radiation and dosimetry monitoring of water and atmosphere in the entire territory, particularly in crowded areas; providing protection against radiation

for all units using in one form or another ionizing radiation.

Another important convention on the prevention of the negative impact of industrial activity on the environment in a transboundary context is the Convention of February 25, 1991 at Espoo, Finland, on Environmental Impact Assessment in a Transboundary Context.

The international environmental law, still evolving, is founded on several traditional principles of international law, according to which it is prohibited to cause damage to other States through waste and hazardous substances.

3. Conclusions

1. Defining in legal regulations concerning waste management of several terms from the Strategy and National Waste Management Plan, such as: storage area, collection points (in rural areas), isolated settlement, transfer stations, composting plants. On approval by H.G. 1470/2004 of the Strategy and National Waste Management Plan in waste management legislation the terms used in implementing the requirements of the European legislation in this field were not defined.

The strategy and the National Waste Management Plan aimed at creating the necessary framework in order to develop and implement an integrated waste management system, economically efficient and environmentally-friendly in the existing legal regulations upon its coming into force.

For example, the legal framework for the implementation of the Directive 99/31/EC was created by GD no. 162/2002 regarding waste disposal, the Order of the Minister of Waters and the Environmental Protection no. 1147/2002 for approving the Technical Norms on waste storage - construction, operation, monitoring and closure of landfills and the Order no. 867/2002 defining the criteria to be met by waste in order to found it on a specific store list and on the national list of wastes accepted in each landfill class. In 2005, the Technical Norm on storage was repealed, being promoted the Order 756 – the technical documents relating to storage, the Order no. 867/2002 was replaced by the Order 95/2005, the GD 162/2002 was repealed by H.G. 349/2005. The new

regulations were ensuring the compliance with the European regulations on waste disposal, in terms of construction operation, monitoring, closure and post-closure follow-up of new deposits, as well as of the existing ones. Some of the terms mentioned (storage area, isolated area) were explained by HG 349/2005.

2. The amendment of Art. 3 of Order no. 95/2005 on the establishment of the acceptance criteria and preliminary procedures for waste storage acceptance and the national list of wastes accepted in each storage class, mentioning the competent authority as an entity that can fulfill this order. In this order, MMGA, ANPM and ARPM are mentioned although waste storage acceptance is complex, being closely related to the economic activities ran in the territory and to the real possibilities of the local landfill. Moreover, the documentation related to the requirements of this order is submitted to local agencies.

3. The differentiated approach to the issue of deposits in rural areas, if there was stored only waste generated in the localities which they serve. The approach will consider both the practical means of closing the landfills in these areas, and the new possibilities for storage (temporary) of the generated waste.

A very important issue related to integrated waste management is the closure of old landfills. These deposits have a significant impact on the environment: polluted groundwater, biogas emissions, odors, degraded lands, uncontrolled waste storage, including hazardous waste, possible harm to the health of the population of surrounding areas. Operators of old waste deposits were not required to provide funds for their closure and post-closure monitoring. Most warehouses are owned by town halls and were not given in concession to certain operators. Taking the responsibility for closing them requires significant funds for: conducting studies and projects, implementation of proper closure, post-closure monitoring, securing the site.

In H.G. 162/2002, closure and post-closure follow-up of deposits were seen together regardless of location, within the urban or rural environment. Thus it is necessary to promote a guide for the closure of non-hazardous waste landfills in order to impose certain requirements on their closure,

according to the results of the environmental assessment.

4. *Developing a waste management strategy on medium and long term, strategy embodied by the Local Waste Management Plan.* Its main purpose is to highlight the waste streams and the treatment options of these wastes.

Local Waste Management Plan is an important instrument contributing to the implementation of waste management policies at national and European level.

Current possibilities for selective collection of recyclable waste, household and equivalent waste disposal possibilities. Also, a cost study was presented at the level of EU Member States, on municipal waste management, which included: the costs of waste collection, including the selective collection and recycling, waste treatment, disposal.

In order to achieve the recycling targets for packaging waste, as well as the targets of Directive 99/31/EC on waste disposal, mechanical-biological treatment capabilities, composting capabilities, transfer stations, selective collection systems for packaging waste will be proposed within this plan.

The costs can not be equated to the Romanian specific conditions, which highlight the high level of the costs for the proposed waste management systems. An important aspect is related to their local/regional location (for example, the location of the capacities of mechanical and biological treatment, the composting capacities near the zonal deposits) and to their number.

5. The projects carried out locally in order to attract funding in household and similar waste management are important.

In conclusion, before carrying out a waste management project, there should be considered:

- for all waste management activities, the public agreement should be obtained, especially for composting stations, mechanical and biological treatment plants, incinerators, landfills.

- public awareness campaigns are useful for all investment projects, regarding:

- the issues related to the achievement of national, regional and local objectives and targets;

- alternatives for achieving the set goals and targets;
- the environmental impact of each alternative, technical, economic aspects, financial implications in terms of the required fees.

Highlighting the Response of Real Economy to the Changes of Fiscal Policy Variables. The Romanian Case

Lobonț Oana-Ramona

West University of Timisoara, Faculty of Economics and Business Administration

oana.lobont@feaa.uvt.ro

Abstract

In this paper fiscal policy is defined through the totality of government decisions in which it builds and shapes the state's fiscal system, in line with the financial - monetary objectives and expectations, drawing on the resources needed to cover public expenditure. Also addressing the tax policy, will take into account the decisions manifested in the socio-economic plan, on the correction and guidance of market mechanism and influence the redistribution of gross domestic product, in a desired direction of the economic behavior of various categories of taxpayers but with certain limits. In this article, for highlight the response of real economy to the changes of fiscal policy variables, is used the classification of tax revenues according to the nature of their distortion, in the 1993-2013 period.

Key words: fiscal policy, sustainability, budget revenues and expenditures

J.E.L. classification: C22, H22, H3

1. Introduction

Starting from the idea that taxation has displayed in time the „operant ability” to influence the economic climate and rebalance growth, we believe that the adjustments made by that it should be comprehensive, immediate and lasting.

The sustainability of fiscal policy depends on measures taken to limit or to stabilize, the public budget deficits, that failure or success rates. Although there is a perception that a relaxed fiscal policy, with large budget deficits, it is necessary for economic growth, the literature shows without doubt that, discretionary fiscal policy volatility and uncertainty increases the

further development of gross domestic product, implicit of development growth.

2. Theoretical background

In this regard, the relevant works of Canto and Webb (1987), Cashin (1995), Dowrick and Nguyen (1989), Easterly and Rebelo (1993), Garrison and Lee (1995), Mendoza, Milesi-Ferretti and Asea (1996), Engen and Skinner (1992), Afonso (2005,2008,2009), for taxes, and Anders, Domenech and Molinas (1996), Barro (1991), Cronovich and Gazelle (1998) which, whether used for highlighting the impact of taxation on economic growth, econometric methods such as regression pooled cross/section/time-series, cross-section regression or comparisons in pairs were obtained as a result, the negative impact of significant revenue tax on the rate of growth and significant negative effect, positive or inconclusive on the impact of public spending.

The ambiguity of effects generated by public expenditure can be explained by the fact that, the regression takes into account the total amount and not their structure. In this connection may be mentioned the work of Barro (1991), Ansari, Singh (1997), Baffes, Shan (1998), which tested the impact of project expenditures for the education budget, giving them significant positive effects, Easterly and Rebelo (1993), which highlighted, analyzing a sample of 119 countries that public health investment does not significantly affect the growth rate of gross domestic product, Baffes and Shah (1998) who obtained negative impact of defense expenditure, inhibiting economic growth.

Most empirical studies on the impact of fiscal policy on economic growth explains the evolution of gross domestic product per capita, or growth rate of gross domestic

product, according to a set of exogenous factors, in a regression, by estimating the coefficients of exogenous variables, identifying direction and intensity of their influence on the growth process. For this reason it will test the impact of taxation on gross domestic product, considering its growth rate, while noting the low rate of growth of income and expenditure compared to growth of gross domestic product in most analyzed years.

3. Method and results

Between discretionary and non-discretionary fiscal policy occur similarities (caused by characteristics of fiscal policy, public policy as a species adjustment), differences (generated by different syntax of each tax policy category discourse constructs its own) and interacting (practical issues arising from the operationalization of fiscal policy). As desirability, non-discretionary fiscal policy should prevail "tax philosophy", in general.

The classification of income and public spending will follow the approach of Barro (1995), subsequently developed by Bleaney (2001) and others. In addition, we apply some changes based on the features of the tax system in Romania, and the interpretation of basing their analysis on statistical data.

This classification allows us to analyze the influence of each category of tax revenue on economic growth models, provide theoretical arguments and explanations for the negative effects of distortionary tax revenue and insignificant effects of income tax and on other revenues non distortionary.

On the other hand, is not ignored the destination of these taxes, so overall, the negative effect induced by the tax savings could be canceled by the positive consequences of their use in the development of productive expenditure.

Unfortunately, although is wanted a breakdown of public expenditure as productive and unproductive expenditure, the available data do not allow such a group, because we have no scientific basis to establish whether a category of expenditure is productive or not.

It is difficult to measure the potential benefits of spending financed from tax revenue, because tax revenues are not

necessarily used for those expenses that would lead to economic growth. To estimate the impact of various types of tax revenues, it may appeal to a methodology based on Kalman filter (*Kalman filter accepts, as a starting point, to formulate a model application form equations of state considered. Resulting recursive algorithm is much faster and less dependent on statistical characteristics of input data, but requires a significantly increased volume calculation*) with time dependent parameters. Such methodology has the advantage of taking into account the uneven impact of the tax levies on real output growth over the period of analysis, namely that, the tax is considered exercising influence through transmission channel with an elastic amplitude business cycle phase with dependent impacts traveled.

Thus, the tax revenues determines certain structural and functional adjustments in relation to their cyclical or counter nature, and, stimulate a supply response given in quantitative terms and in terms of prices charged by producers subsumed response elasticities. This flexibility reflects how the producers estimated the intensity of inhibitory effects of fiscal pressure and/stimulating it.

Comprehensive description of the model is:

$$\begin{aligned} \text{GDP}_t &= \alpha_{1t} \text{Trd}_t + \alpha_{2t} \text{Trfn}_t + \alpha_{3t} \text{Atr}_t + \varepsilon_t \\ \alpha_{1t} &= \beta_1 + \alpha_{1t-1} + \mu_{1t} \\ \alpha_{2t} &= \beta_2 + \alpha_{2t-1} + \mu_{2t} \\ \alpha_{3t} &= \beta_3 + \alpha_{3t-1} + \mu_{3t} \end{aligned} \quad (1)$$

where:

GDP = Real GDP growth;

$\mu_{1t}, \mu_{2t}, \mu_{3t}$ = „white noise”;

Trd = distortionary tax revenues;

Trn = non distortionary tax revenue;

Atr = other tax revenue.

Empirical estimation of this model parameters of this model consists in the following resolution:

Table no. 1. Kalman model results with time-dependent parameters

	Coefficient	Eroare standard	z-Statistic	Prob.
β_1	-0.653287	0.286933	-2.276790	0.0228
β_2	1.163577	0.557082	2.088701	0.0367
β_3	1.101764	0.542767	2.029902	0.0424

	Final State	Root MSE	z-Statistic	Prob.
$\hat{\alpha}_1$	-10.76433	0.300239	-35.85247	0.0000
$\hat{\alpha}_2$	14.24783	0.361234	39.44213	0.0000
$\hat{\alpha}_3$	27.73069	0.883646	31.38211	0.0000
$\hat{\mathcal{E}}$	0.000000	3.181624	0.000000	1.0000

Log likelihood	-89.60763	Akaike	8.915012
Parameters	4	Schwarz	9.113969
Diffuse priors	4	Hannan-Quinn	8.958191

Looking at *z-Statistic* levels and *Akaike*, *Schwarz* și *Hannan-Quinn* information criteria, and the main features of the residual series variables, can appreciate the fact that, overall, the model has a satisfactory quality. Also, its predictive quality analysis suggests that the model can generate estimates of real output for the future, made in the current period, with a good degree of accuracy (except 1999, for which the estimated level is significantly lower than the actual observed):

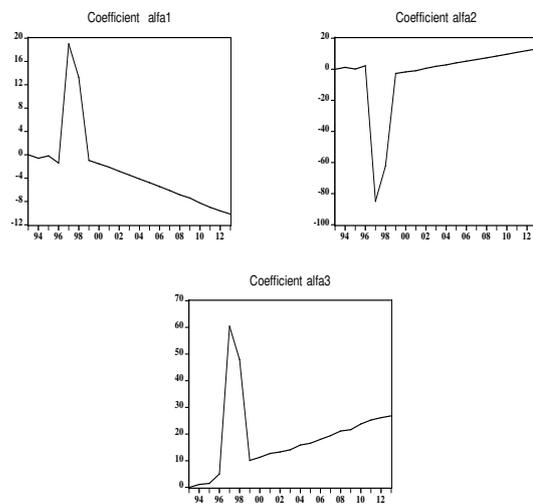

Chart no. 1. Representation of the estimated levels of GDP growth in Romania during 1993-2013 period

Of course, such a result should be considered with caution, both because the list of determinants of economic growth can not be restricted to fiscal policy variables, and due to the inclusion in the database of predicted values of the evolution in terms of real gross domestic product.

It is interesting to note that this model allows the highlighting of changes both in nature and in the magnitude of the impact of these types of tax levies, on real output growth:

Chart no. 2. Evolution of tax revenues parameters

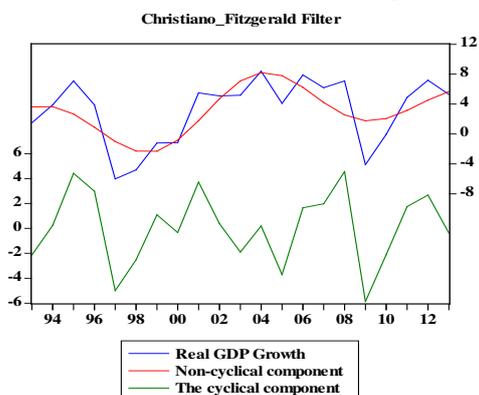

The analysis of recorded parameters α_1 , α_2 , α_3 reveals that, from 1996 to 1998 period is a period of "functional change", in the sense that, the influences sense and level are diverging from the rest of the period analysis. More specifically:

- during this period the fiscal pressure exerted by distortionary tax revenues and gross domestic product growth, evolve in the same sense, because, then, the influence of these levies will be inhibitory against the development of a supply of real assets;
- correspondingly, non-distortionary tax revenues have a contrary trend to real output, and later, their evolution is a stimulant one;
- at the same time, other tax revenues exerts a stimulatory effect overall, but whose amplitude is restricted in a significant manner, starting from 1999.

Overall, this model indicate that there are two stages in the analysis period, the first stages, the years 1993-1998, the real sector

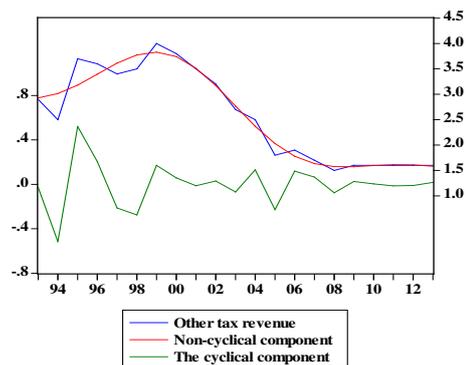

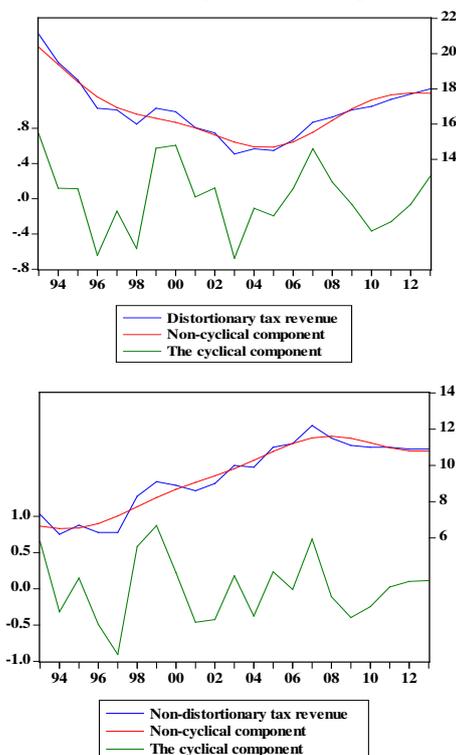

response to tax policy evolution of these variables is "atypical", and a second stage, 1999 -2013, the volume of supply adjustment are adopted in accordance with the conceptual framework for this advanced analysis.

Chart no. 3. The dynamics of real output in Romania between 1993-2013 period

More detailed clarification of these results can be achieved by taking into account, the patent evolution of real output and the tax burden on the three types of components: distortionary tax revenue, non distortionary tax revenues and other income tax:

Chart no. 4. Dynamics of tax revenues in Romania during 1993-2013 period

The application of *Christiano-Fitzgerald asymmetric filter* allows a decomposition of time series on the cyclical and non-cyclical component, thus can be achieved comparing progress made by these components.

It should be noted that the application of this methodology is criticized by the fact that such a filter is used in high frequency data, and not annual values. However, in my opinion, the principles underlying this methodology can be applied to the general statistical characteristics of variables are preserved on different frequencies as "big enough". Therefore, due to the autoregressive nature of the dynamics of the real sector and due to inertia of specific hysteresis effect that characterizes the economy's real sector development can be considered as a possible application of this type of *asymmetric filter*.

4. Conclusions

Comparative analysis of the cyclical components highlights the following:

- for distortionary tax revenues, the cyclical component is designed, in the first period of analysis to overlap compression of gross domestic product, ie, distortionary tax revenues have an adaptive nature, following the evolution of economic climate, then they continue to follow a downward trend, at least until the end of 2008, which explains the negative correlation between them and the dynamics of gross domestic product;
- a contrario, the non-distorsionare tax revenues have a cyclical component with an opposite trend in real output during 1993-1998 period, and the same sense with that in the last period of analysis;

- Similar considerations can be drawn for other tax revenues, in the sense that their dynamics is rising in the first period of analysis, and follows a downward trend in the latter part of the period of analysis.

It can thus be appreciated that, these components of the tax revenues, are adjusted in an active manner to the business cycle phases, but this is only a partial adjustment, the share of components "reactive" in fiscal policy are significant.

With all these evidences, I consider necessary to analyze economic growth theories and empirical studies in an interdisciplinary framework, with the argument that, the complexity of economic growth, can not be captured in a regression equation, is important to identify the most important interdependencies that capture interactions between growth, production factors, demographic characteristics, culture, specific institutions, the degree of income distribution, macroeconomic and political stability, government policies etc.

The Coordinates of Good Governance between Design, Proportions and Guidelines

Lobonț Oana-Ramona

oana.lobont@feaa.uvt.ro

Abstract

The approach of this article is a critical analysis of different theories on how that can be perceived "quality of governance" or "good governance". One such type of analysis derives from the need to formulate quality of public policy that can be achieved, not only through regulatory instruments, but also through other instruments, with a less interventionist character, primarily by identifying the conceptual level the quality of governance.

The starting point of analysis lies in the spotlight that the economy provides a possible behaviors in a context configuration, which abounds with random effects, spontaneous results, unexpected and key trends, consequences, unintended effects.

Legitimacy of analysis the incidence of public decision requires different approaches because it is an endless series of uncertainties, ambiguities, errors, compromises, and enforceability hardship due to the fact that state representation is the subject to a number of factors, including gross domestic product size, the public spending, monetary and demographic factors, social factors and political and social importance of moral values, transparency of decisions, the degree of preference and desirability of effective involvement in the acquisition and exercise of public power, also, etc..

Key words: Good Governance, the measurement process of good governance, components of good governance

J.E.L. classification: C82, E61, H11

1. Introduction

The obsession with governance continues to grow throughout the world, as does the debate about and further elaboration of the

concepts of local, national and even world governance. Governance is mentioned in international forums and accords and cooperation agreements, while almost all of the aid agencies have incorporated it into their main areas of work.

Addressing the concept of good governance, in an exegetical manner, brings forward a multidimensional perspective of public policy, namely the *institutional dimension, normative and content dimension and procedural dimension*.

Therefore the challenge is to achieve an agreement, rather abstract, in the approach to be taken, between reductionism at the level of concepts and factual balance between objectivity and intersubjectivity in approach.

Correlating political institutionalization in the sense of stability, social desirability and their consistency over time with economic and social efficiency governance and cultural contexts in which a given policy community manifests, should impart a greater degree of objectivity in the analysis that we propose, this analysis is based on both *conceptual and political models, selected by type*:

- *institutional model* in which public policies are the result of existing institutional arrangements because public policy is not policy until it is adopted, implemented and enforced by some governmental institutions;
 - *institutional rational choice type*, understood institutions as internal or external constraints (or scenarios) in which, if we add descriptions of actors' preferences, we can obtain descriptions of the results, predictions, etc
 - *constructivist institutionalism*, identify the limits of established institutionalist approaches, (of historic, the rational choice, sociological), seeks to provide ways of understanding the timing of the imbalance of institutional change

(the situation is more difficult to theorize in traditional approaches).

- *procedural model* - public policy process can be seen as a series of political activities that involve identifying problems, determining program formulation, legitimation, implementation and evaluation;

- *model of group*, interaction between groups is the central factor of public policy, because people with common interests come formally or informally together and impose their demands to government;

- *elite model* in which government policy can be seen as a result of preferences and values of governing elite;

- *rational model* brings into focus the fact that governments should select those policies that make society a maximum social benefit, ie, a rational policy is made when the differences between values of those slaughtered are positive and larger than any other alternative policy ;

- *incremental model* by which public policy should be implemented as a continuation of the previous government activities, with only some incremental changes;

- *game theory model* - the study of rational decisions taken in situations where two or more participants have a choice and the outcome depends on the choice made by each participant;

- *model of public choice* - public policies are the result of collective decision-making processes made by individuals, voters, taxpayers, candidates, legislators, bureaucrats, interest groups, political parties, bureaucrats and governments pursuing their own interests and try to maximize their personal benefits in politics as well as in the market;

- *system model* in which public policies are the result of the political system;

Although none of these models has been created specifically for the study of public policy, yet each offers a separate way of understanding it and even suggests some general causes and consequences of public policy without compete each other, but complementary. Although some policies appear, at first sight, to move towards a single model to be explained, most policies are a combination of rational planning, incrementalism, business interest groups,

preferences of the elite forces of the system, games political options of public policy processes and institutional influences.

In conclusion, the quality of governance must be seen in its scope, because it is not sufficient an approach in close contact only with economic growth and development, but also implies taking into account the significant effects induced on various non-economic phenomena, including subjective happiness, support and confidence of the citizens, the incidence of civil wars, etc.

2. Theoretical background

Unfortunately, in literature, the definition of "good governance", is suffering, or have external wide approach, or approaches focused only on its level of a single descriptor thereof.

Therefore, there is not a unique and comprehensive definition of "good governance", as there is no delineation of its target, would require a universal acceptance. This term is used with great flexibility, which may be an advantage but also a source of difficulty at the operational level.

Broadly speaking, government is both the traditions and institutions by which authority is exercised in a country, including the process by which governments are selected, monitored and replaced, and government capacity to formulate and implement appropriate policies with the respect that citizens and state bears for institutions governing it economic and social interactions among them.

There are currently at least three initiatives to "measure" good governance, respectively sponsored by the World Bank, the United Nations University and the Development Assistance Committee of the Organization for Economic Cooperation and Development (OECD), and the International Monetary Fund, to which should be added the efforts of individual researchers and universities.

World Bank, in 20 countries in transition, sets the overall quality of governance, in accordance with the following criteria:

- type of political regime;
- process by which authority is exercised in the management of the economic and social resources, with a view to development; and

- capacity of governments to formulate policies and have them effectively implemented.

The International Monetary Fund declared in 1996 that „promoting good governance in all its aspects, including by ensuring the rule of law, improving the efficiency and accountability of the public sector, and tackling corruption, as essential elements of a framework within which economies can prosper.”

The United Nations emphasizes reform through human development and political institution reform. According to the UN, good governance has eight characteristics. Good governance is: Consensus Oriented, Participatory, following the Rule of Law, Effective and Efficient, Accountable, Transparent, Responsive, Equitable and Inclusive.

According to the UN High Commissioner for Human Rights, the true test of “good” governance is the degree to which it delivers on the promise of human rights: civil, cultural, economic, political and social rights. The key question is: are the institutions of governance effectively guaranteeing the right to health, adequate housing, sufficient food, quality education, fair justice and personal security.

Knack (2000) and others tend to use good governance in a very narrow sense and limit its meaning to institutions only. The focus on institutions and their prime role in development has been increasingly important in the policy debate since the 1980s. As North (1995) puts it, institutions are the rules of the game, and the incentive structure of society. Institutional quality, fostered by the government, is necessary to provide a suitable environment for growth and development. As Stern et al. (2002) point out, “countries that have combined institutional improvements with market oriented policy reforms and greater engagement with the world economy saw their capita incomes grow in the 1990s at the very rapid pace of 5 percent per year”.

Others authors extend the meaning of governance not only to the rules of the game, but also to the ‘players’ of the game, such as politicians and bureaucrats: Kaufmann, Kraay and Zoido-Lobaton (1999 a,b, 2002). Neumayer (2003b) uses a similar definition of governance that incorporates elements of

human rights, democracy and military expenditures. As for Levy (2002), he separates governance into two distinct components: while the first one relates to institutional governance and is measured by the extent of formal rule-bound governance as well as the credibility of political authority, the second component relates to organizational governance and is measured by the quality of the bureaucracy.

The literature defines “quality of governance” from keymaps highlighted these important economic organizations, which is why, in my opinion, I think it is important to distinguish between “political good governance”, which we are interested in this article, and “corporate good governance”.

Political good governance is the effective, ethical and efficient management of public affairs and resources by democratically elected leaders and their appointees and *corporate good governance* is the effective, ethical and efficient management of an organization’s affairs and resources by persons chosen in accordance with the existing laws/rules. It is applicable to the management of organizations – especially in the non state sectors.

3. Method and results

Although we know that a healthy governance solution, it does not mean that real situations are not perfect in time.

The idea underlying this article is optimistic, because I hope that it can influence the quality of governance by monitoring itself to all the elements that define quality, identify the elements defining the institutional architecture, as essential:

- Degree of Democracy, democracy is seen as three interrelated elements, represented by Institutions and procedures through which citizens can express their preferences about alternative policies and leaders, Institutional constraints regarding the exercise of power by the executive and Ensuring civil liberties of all citizens;
- The Quality of Governance through its six dimensions: Political Stability and Absence of Violence/Terrorism, Government Effectiveness, Regulatory Quality, Rule of Law, Control of Corruption;

- The Corruption, by the three indicators to measure it: Corruption Perceptions Index, Bribe Payers Index and Global Corruption Barometer;
- Level of Integrity, by defining elements: Civil Society, Public Information and Media, Elections, Voting and Citizen Participation, Election Integrity, Political Financing, Government Accountability, Administration and Civil Service, Oversight and Regulation, Anti-Corruption and Rule of Law;
- Fiscal Policy items as automatic fiscal stabilizers by Tax Revenues, Public Expenditures, Budget Deficit, Public Debt;
- Political Conditions for Economic Reform, by means of indicators that relate to elections, electoral rules, type of political system, the composition of the opposition parties and coalition government, and the degree of influence of the military system of government;
- Economic freedom as evidenced by the ten components: Business Freedom, Trade Freedom, Fiscal Freedom, Government Spending, Monetary Freedom, Investment Freedom, Financial Freedom, Property Rights, Freedom from Corruption, Labor Freedom.

At the same time, understanding the defining elements of good governance, they must be joined with the subsequent growth processes, and in this regard should be avoided this error handling in a reductionist manner, considering that growth it would be limited to an increase in social output. From this point of view, along with macroeconomic variables commonly used in measuring the results of economic activities, it is necessary to take into account as dependent variables, those variables that can be associated with human development and the long term social balance:

- GDP per capita;
- Growth rate of gross domestic product;
- Human Development Index with the three basic elements: Longevity measured by life expectancy at birth, Environment Education - calculated as a weighted arithmetic mean between the level of adult literacy (with a share of two thirds) and the gross enrollment rate all education levels (third) and Standard

of Living, measured by gross domestic product per capita calculated at purchasing power parity;

- Sustainable Development Index with the three dimensions, dimensions that concern: society, economy, environment - climate change, transport, preservation and management of natural resources, public health, social inclusion, demography and migration, poverty level;
- Income distribution in society.
Improving policy and governance stability, effects targeted by the political system, are not ends in themselves, but means that need to be accompanied by democratization of relations between rulers and the ruled, redefining the role of citizen, absent the actual manifestation of the Romanian political system.

4. Conclusions

From the above discussion it should be clear that good governance is an ideal which is difficult to achieve in its totality, because:

- ↳ good governance is a key factor for development;
- ↳ governance is measurable, and for solving various problems it can be applied to a wide range of different measures;
- ↳ governance agenda is very important in dealing donor – recipient relation;
- ↳ non-governmental actors play a crucial role in maintaining the governance aspects of the plan's development agenda.

Bearing in mind the controversies in the field, with the openings and limits, the good governance, as an element of political system, should be considered in all senses of what is given, as an element of the overall social system, that includes, both political consciousness, in its psychological and ideological form and political relations also, alliances of groups, categories or social classes, or intermediate relationships between institutions and mediating role of political organizations with political ideology of transposition of the social communities in a practical political conquest, consolidation, control, preservation or protection of their political power.

The Politics of Ethical Consumption

Manea Ioana Livia

Oboroceanu (Popa) Anda

„Alexandru Ioan Cuza” University of Iași

ioanna02manea@yahoo.com

a_oboroceanu@yahoo.com

Abstract

Ethical consumption as a political project is often rejected because it is considered too individualized to achieve a collective consciousness; companies simply take avoiding action; it is immoral for corporations to respond -unless it is clearly profitable for them to do so or that ownership of all resources would be a preferable way to ensure environmental stewardship. The idea of deploying consumption preferences in the market fits the neo-liberal concept of 'consumer sovereignty', that theory presupposed only individualized self-interest being expressed by consumers. This uncertainty leaves some debate about the nature and efficacy of ethical consumption.

Key words: ethical consumption, consumption choice, market politics, consumer behavior, Corporate Social Responsibility

J.E.L. classification: M39, I19, Q59

1. Introduction

While notions of consumption choice as market politics can be traced back at least to the early 20th century (Fetter [1907], cited in Dickinson and Carsky, 2005), the reasons for the apparent rise of 'ethical consumption' during the last quarter of the 20th century have attracted academic interest (e.g. Harrison et al., 2005). In seeking to understand the growing interest in ethical consumer concern, some commentators have cited the 'increased media coverage' (Roberts, 1996; Strong, 1996), increased levels of information (Smith, 1995; Strong, 1996; Berry and McEachern, 2005) and the

greater availability of 'alternative' products (Strong, 1996) as possible reasons.

Other academics have been interested in the changed conditions of consumption. Borgmann (2000) argues, for example that our paradigm of consumption is characterized by being disassociated from production, products requiring little effort in use and the promise of pure pleasure is unencumbered by 'reality'. In mostly affluent societies, freed from basic needs, consumers, it has been argued (Hansen and Schrader, 1997; Dickinson and Carsky, 2005), become responsible for their behavior. It is consistent with this view that Brooker (1976), drawing on Maslow's hierarchy of needs, found that consumers adopting socially conscious consumer behavior scored high on 'self-actualization' (see also Etzioni, 2004).

In a similar way, both Parkins and Craig (2006) and Harrison et al. (2005) have referred to Beck's (1992) concept of 'risk society' to explain in part the apparent 'rise' of ethical consumption. Drawing on the notion of risk, it is observed that in an individualized culture we increasingly face the consequences of our consumer choices without the benefit of traditions to guide us. As Barnett et al. (2005) express this, commodity consumption has been 'problematical' such that 'Ethical consumption involves both a governing of consumption and a governing of the consuming self'. Parkins and Craig (2006) deliberately offer a more positive spin by arguing, 'Everyday life [. . .] has a creative and ethical potential; and [. . .] it must be reflexively negotiated and managed by contemporary subjects'.

2. Decision-making, information, complexity and the moral self

Although not specifically aimed at understanding ethical consumption as a project, the Hunt-Vitell model (Vitell et al., 2001) assumes a rational consumer employing a deontological and/or teleological evaluation of a clearly defined ethical problem. Some more recent work has suggested that a consumer's approach to ethical issues is part of their 'moral self-realization' (Kozinets and Handlman, 1998), where green and ethical consumers are 'obtaining a part of their identity through their consumption' (Langeland, 1998). Occasionally this is an 'oppositional' (Thompson and Arsel, 2004) or a changed identity (Cherrier, 2005). Since such identity concerns a consumer's virtue (Barnett et al., 2005a), ethical consumption is not best understood just as a rational calculation. Nevertheless, 'processes on self-actualization are determined increasingly by individual decisions about employment and labor, as well as consumption and leisure' (Parkins and Craig, 2006).

Thus, whilst one school of research has sought to model ethical consumer decision-making, another has sought to understand the construction of consumer identity from the discourses of ethical consumption. We look at these in turn. The notion of a rational consumer is apparent in Strong's (1996) assertion that information is the key to ethical consumption. 'The increasingly well-informed consumer is not only demanding fairly traded products, but is challenging manufacturers and retailers to guarantee the ethical claims they are making about their products'. Similarly, the importance of information, about company practices, in consumers' decision making has been the subject of research (Griffin et al., 1991; Creyer, 1997; Folkes and Kamins, 1999). However, Pearce (1999) notes that in consumption situations there is an information asymmetry.

To the extent that we see information as crucial to a good decision, ethical consumers are at a disadvantage and the market cannot, pearce argues, function according to the perfect 'laissez faire model'. Concepts of the consumer as rational allow decision-making models to be proposed, studied and refined.

Consumers perceive needs, gather information, set this within their attitudes and their perception of the social context and develop behavioral intentions. In this way primary causes of attitude changes and consumer behavior can be studied. Attitude is central to theories of consumer decision-making particularly in relation to attempts to bridge the so-called attitude-behavior gap. It is not surprising, therefore, to find research seeking to model ethical consumer decision-making which attempts to build on existing attitude-behavior theories. Exploring attitudes and behaviors Ellen (1994) examined the relationship between these dimensions and objective and subjective knowledge. Ellen (1994) raised concerns that consumers may not have the knowledge required to make sound ecological decisions and require cooperation from marketers, government and NGOs to support the development of effective consumer labeling and advertising programs. Minton and Rose (1997) examined the effects of attitude and norms on behavior and behavioral intention and found that 'personal norm had a primary influence on the behaviors while the [general environmental] attitude had the primary influence on behavioral intentions'. Follows and Jobber (2000) explored environmentally responsible behavior in the context of cloth diaper purchasing and found a values-attitudes-intentions-behavior hierarchical relationship.

The Theory of Planned Behavior (Ajzen, 1991) supports the proposition that behavioral intentions are explained by attitudes and subjective norms, while also highlighting the impact of perceived barriers to successfully carrying out a behavior. The issue of barriers to behavior was considered important in an ethical context where Shaw and Clarke (1999) found problems of availability, choice and information as obstacles to desired ethical consumer behaviors. A number of studies subsequently adopted the Theory of Planned Behavior as a framework by which to examine ethical consumer decision-making. The core framework of the theory has been broadened to include additional measures of 'ethical obligation' (Sparks et al., 1995; Shaw et al., 2000; Shaw and Shiu, 2003; Ozcaglar-Toulouse et al., 2006) and 'self-identity' (Sparks and Shepherd, 1992; Shaw et al.,

2000; Shaw and Shiu, 2003; Ozcaglar-Toulouse et al., 2006) found to be pertinent in ethical consumption contexts. Elements of the Theory of Planned Behavior have also been reconceptualised. Nuttin (1987) argued that while intention is undoubtedly an important precursor to action, its meaning and role need to be clarified. Bagozzi (1993) argued strongly that research is needed to understand the intervening processes linking attitudes and behavior and proposed a theory of volitional processes as the central mediators. In their study exploring intentions to avoid sweatshop clothing, Shaw et al. (2006) found that in addition to intention, desire and plan are also pertinent precursors to ethically motivated behavior.

In each of these studies there is a desire to more clearly understand the relationships between attitudes and behaviors. In an ethical context, however, concerned consumers may find themselves confronted by uncertainty in terms of information available to aid decision-making and the consequences of their decisions. Under such circumstances it could be considered hardly surprising that an attitude-behavior gap has been reported in terms of a weak relationship between what consumers say, and what they do (Burke et al., 1993; Roberts, 1996; Boulstridge and Carrigan, 2000). Carrigan and Attalla (2001), for example, say 'although we are more sophisticated as consumers today, this does not necessarily translate into behavior'. We cannot assume, therefore, that information will lead to action since higher prices and effort will often put would-be consumers off (De Pelsmaker et al., 2005). At one end of a spectrum of researchers addressing the words/deeds inconsistency, Ulrich and Sarasin (1995) claim that any research asking consumers any question on ethical buying behavior will not elicit reliable answers. At the other, narrowing the gap is a matter of refining the models (Follows and Jobber, 2000) or methods (Foxall, 1984). Newholm (2005) has argued that 'attitudes cannot be "read off" behavior or vice versa, not least because of social mediation and the varied meanings associated with particular practices'.

Additionally, since consumers seem willing to discuss their 'inconsistencies' (Burke et al., 1993), it might alternatively be suggested that a more interpretive approach

to an understanding of consumer morality in consumption practice would be appropriate.

Much of the research exploring ethical consumption practices has been carried out in relation to fair trade (Strong, 1996, 1997; Langeland, 1998; Shaw et al., 2000; Nicholls, 2002; Shaw and Shiu, 2003; Golding and Peattie, 2005; Low and Davenport, 2005; Fridell, 2006; Hira and Ferrie, 2006; Ozcaglar-Toulouse et al., 2006). In marketing terms this is the most successful and high profile element of ethical consumption. Conversely, Newholm (2005) has argued that from the consumer perspective it is the accumulation of consumption issues, dynamism in the market and complexity of competing ethical consumption claims that characterizes the environment within which a notion of consumer as ethical must be maintained.

This complexity of the consumers' decision-making environment has been noted (Newholm, 2005; Barnett et al., 2005) along with the consequent variety of legitimated consumer responses (Shaw and Newholm, 2002; see also Bekin et al., in this volume). Cook (2004) offers perhaps the most vivid rendering of the complexity in ethical consumption in his examination of the supply chain for papaya. The (single) end consumer in his research does not buy papaya and, therefore, need not be concerned with the ethical issues that arise frequently in the supply chain. However, she is unaware of the many papaya by-products used in the manufacture of products she does buy. Given the complexity of modern production, we might infer that any notion of a fully informed consumer is unattainable. Moreover, Newholm (2005) presented the spectre of the ethical consumer acting swiftly on 'prejudice'; conversely Ehrich and Irwin (2005) argue that whilst consumers might ask for 'ethical attribute information' they will not always use it. The overwhelmed ethical consumer sometimes finds additional information unwelcome (Shaw and Clarke, 1999; Newholm, 2005). Nevertheless, as many have argued in both the US and UK (Smith, 1995; Berry and McEachern, 2005), we have entered a period where consumers can make more informed decisions.

Arguing that too much emphasis has been placed on the individual, Barnett et al. (2005) recently looked at the collective spaces for

ethical consumption. Similarly, Cherrier (2005) sees ethical consumption more as a 'search for meanings in life' where those meanings are partial and continually socially (re)negotiated (see also Kozinets and Handelman, 1998). Such views are considered within the interpretive stream of marketing (Thompson et al., 1989) where consumers work-up their moral selves in complex cultural conditions (Barnett et al., 2005).

3. Individual consumer behavior, citizenship, spaces and collective (political) action

The boycott is the archetypal semi-organized (Gabriel and Lang, 1995) consumer action. Smith (1990, 1993) wrote the seminal work arguing that through such market oriented behavior consumers attained a degree of sovereignty. Whether consumers have to perceive a favorable outcome to take part in a boycott is debatable.

On the one hand Shaw et al. (2006) show how ethical consumers evoke 'vaguely conceptualized perception of a wider collective participation'. On the other, the research of Barnett et al. (2005) into campaign group localities showed how ethical consumption could 'enroll ordinary people in active political engagement. Roles of consumer and citizen would not necessarily, therefore, be exclusive'. Although 'success perceptions' might be seen as influencing participation (Sen et al., 2001), Kozinets and Handelman (1998) argue that in addition to the notion of a collective action, consumers frequently express their behavior 'as a vehicle for moral self-realization'. Again considerations of individual virtue (Barnett et al., 2005) are important motivators.

Over the last decade research has suggested that the number of boycotts organized worldwide has been increasing (Friedman, 1999). Indeed, the examples of boycotts against Shell (Brent Spar) and GM foods and boycotting (Friedman, 1996) of fair trade products highlight the deliberate use of consumer behavior as a tool to further ethical goals. Connolly and Prothero (2003) argue that such message sending through consumption and no consumption behaviors reveals the consumer as the holder of power.

Thus, whilst from an economist's utilitarian value perspective boycotting and boycotting are fundamentally different, through the voting metaphor both behaviors are seen to signal discontent to the market. This rather stronger notion of consumption as voting is presented in its most strident form in the work of Dickinson and Hollander (1991) and Dickinson and Carsky (2005). They argue unequivocally that consumers are responsible for the impact of the consumption choices they make and ought to be educated to be aware of this.

Using game theory Paavola (2001) tries to examine this relationship between individual consumer action and collective outcomes. However, perhaps the most interesting paper to address the individual/collective conundrum was not specifically directed to understanding ethical consumption. Sirsi et al. (1996) used social network analysis to study the consumption of a group of animal rights activists. Their finding of individual consumption patterns partially organized around a loosely held set of ideas of key and peripheral members captures something of the framework of 'consumer micro cultures' within which consumption patterns are negotiated and re-negotiated.

4. Encouraging pro-social (sustainable) consumer behavior

An enduring concern in the study of ethical consumption has been to understand how such pro-social and pro-environmental consumer behavior might be encouraged. As early as 1976, Brooker was interested in the personality traits of consumers exhibiting 'socially conscious consumer behavior' (1976). Since then, for example, researchers in both the US and Europe have considered barriers to extending the market for various fair traded products (Strong, 1997; Dickson, 2001; Nicholls, 2002); seen potential expansion in the morals of older consumers (Carrigan et al., 2004) and the morals of everyday consumption (Barnett et al., 2005); advanced theories for the encouragement of 'green consumerism' (Muldoon, 2006); 'positive purchase behavior' (Carrigan and Attalla, 2001; Belk et al., 2005) and to empower or encourage consumers towards sustainable lifestyles (Pieters et al., 1998; Thøgersen, 2005). These studies have sought

both to learn from the practice of self-styled ethical consumers and to apply marketing expertise to the extension of such consumption.

In criticizing the economist approach to consumption, Hansen and Schrader (1997) state 'In view of the reality of modern societies, it is neither possible nor ethically justifiable to make purchase decisions according to the individual maximization of utility only'. They present an alternative ethical model for sustainable consumption. In this context Jackson (2005) is one of the key writers in terms of encouraging sustainable consumption. Newholm (2000) has suggested a complementary observation that the moralities of ethical consumption could be seen as a resource to gain foresight into emerging trends.

5. Corporate Social Responsibility

Corporate Social Responsibility (hereafter CSR) is currently presented as a tool to involve corporations in the sustainability agenda. As the European Commission titled a communication about the issue, CSR is the "corporate contribution to sustainability" (European Commission 2002). CSR is seen as an effective mechanism to raise social welfare, especially where regulation has failed or in those countries where either there is an absence of rules or public authorities are unable to enforce them (for further information see Blowfield 2005; De la Cuesta and Valor 2004; Jenkins 2005).

It is accepted in the literature that companies will not act responsibly out of benevolence, but because it pays. Although CSR may be justified using economic and moral arguments (Michael 2003), the economic justification, the so-called business case, is frequently used to defend CSR, especially in the political realm (De la Cuesta and Valor 2004; European Commission 2002, 2006). The business case defends that companies will increase shareholder value by becoming more appealing to a wide range of stakeholders (Williamson et al. 2006). As Vogel (2005) puts it, "[w]hile profitability may not be the only reason corporations will or should behave virtuously, it has become the most influential."

Although CSR may pay in different ways (e.g., by attracting human capital, increasing efficiency or reducing risk), this paper focuses on consumers' attraction and retention. Strategists (Crosby and Johnson 2006; Fielding 2007; Lindsey 2007; Parnell 2005; Salzman and Matathia 2007) posit that companies would obtain a competitive advantage by leveraging their CSR efforts in the consumers' eyes. Therefore, undertaking a CSR programme is justified in economic terms: being responsibly will help, inter alia, increase corporate sales. This line of reasoning holds if consumers are willing and able to reward companies with better social and environmental performance. But, are we? This is a vital question within the business case for CSR. This paper focuses on individual consumers and their ability to offer economic incentives in business to consumer relationships, so that companies will improve their social and environmental performance. Many studies have tried to identify why, who and how consumers buy responsibly. This paper reviews the studies conducted within the marketing and consumer research discipline to critically evaluate whether consumers can or cannot buy responsibly.

This analysis leads to conclude that there are several obstacles that prevent consumers from buying responsibly. As Vogel (2005) noticed, the very structure of market impedes consumers to use markets as a site of political activity. The paper concludes by giving suggestions to policy-makers to correct these market failures. In the light of the previous discussion, the business case for CSR may not hold. To a large extent, studies on responsible consumer behavior cast doubts on the argument that CSR may give companies a competitive advantage. Actually, the business case implicitly assumes that consumers can behave responsibly in the marketplace. The previous review has evidenced the obstacles experienced by consumers, thus supporting those scholars who refute the existence of real "consumer sovereignty" (Smith 1990; Gabriel and Lang 1995; Hansen and Schrader 1997; Lodziak 2002). Applying Rezapakhsh et al. (2006) framework of consumer power, one can posit that consumers lack expert, sanction and legitimate power, because of the existence of market failures (Varian 2003).

Unless these failures are corrected, consumers will not be able to buy responsibly. Then the argument that CSR pays cannot be invoked, at least as far as consumers are concerned. This diminishes the motivation of companies to undertake CSR plans. Therefore, correcting these asymmetries so that consumers gain power in the marketplace is of outmost importance as part of a global strategy towards sustainability.

6. Conclusions

Despite the increasing eco-awareness in contemporary Western market economies, it is generally recognized that there are still considerable barriers to the diffusion of more ecologically oriented consumption styles. In lay discourse as well as in much of consumer research, these barriers are usually attributed to the motivational and practical complexity of green consumption (for a review see, e.g. Moisander, 2000). Owing to the conceptual and moral complexity of 'ecologically responsible consumer behavior' and to the perplexity of ecological information, different consumers have different conceptions of ecologically oriented consumer behavior and, thus, myriad ways of acting out their primary motivation for being green consumers (Hutton and Ahtola, 1991; Kempton, 1991; Bell, 1994; Niva and Timonen, 2001; Collins, 2004). Moreover, environmentally responsible behavior usually involves difficult motivational conflicts, arising from the fundamental incompatibility of environmental protection-related collective goals and individual consumers' personal or self-interested benefits and the resulting free-rider problem (Uusitalo, 1990; Wiener and Doesher, 1991) and finally, there are usually severe external constraints to green consumerism, arising from the cultural, infrastructural, political and economic circumstances in the markets and society (Auld, 2001; Casimir and Dutilh, 2003). Hence, environment-friendly consumption may be characterized as highly a complex form of consumer behavior, both intellectually and morally as well as in practice.

In conclusion, environmental policy the focus of attention needs to be shifted from the individual consumer/decision maker to whole communities of consumers. Moreover, there is a need for critical accounts of the social and behavioral dynamics of environmental problems that question, perhaps radically, the dominant individualistic techno-economic discourse on sustainable development, and open new alternative views and perspectives to the human dimensions of environmental policy. Such a critical voice should not be viewed as liquidating, but as something that invites an appropriate humility and fosters a pluralist politics, thus opening the environmental policy to multiple voices from the culture more generally (Gergen, 1997). A valuable potential contribution that consumer sciences can make to sustainable development and environmental policy would seem to be to feed into and to bring about such transformative criticism, exploring, building and introducing new kinds of subject positions for consumers as citizens.

Replacement Value - Representation of Fair Value in Accounting. Techniques and Modeling Suitable for the Income Based Approach

Manea Marinela – Daniela

*“Valahia” University of Târgoviste, Faculty of Economics Sciences,
“Alexandru Ioan Cuza” University of Iași, Post-doctorate researcher
marinelamanea7@yahoo.com*

Abstract

The term fair value is spread within the sphere of international standards without reference to any detailed guidance on how to apply. However, specialized tangible assets, which are rarely sold, the rule IAS 16 "Intangible assets " makes it possible to estimate fair value using an income approach or a replacement cost or depreciation. The following material is intended to identify potential modeling of fair value as an income-based approach, appealing to techniques used by professional evaluators.

Key words: method of capitalization, actualized treasury cash flow, discount rate, capitalization rate, gross revenues to date.
J.E.L. classification: M41.

1. Introduction

Fair value has its origins in the more and more obvious evolution of accounting targets. This evolution occurs as a consequence of recent changes in the economic environment. Recently, an idea imposed itself more and more, that of accounting certain expenses, but mostly sustainable elements of financial statements like assets fixed at the estimated value of future cash flows that they are able to bring in for the company (recoverable amount or recoverable value). As a consequence of this concept one can take into account the possible resale price of an asset, in order to ensure a value in the accounts. This major change in vision aims to account for future flows of incomes rather than for past expenses, which means a considerable disruption in accounting. According to this perspective, accountings' purpose is that of

deepening and analyzing the future in order for it to be transposed into financial statements, this approach having a strong effect on the annual financial statements.

2. General consideration

The IASB has adopted this new trend in accounting since 1997: the accounting rules have to be set as to favor the provisions of the managers' and decision factors' forecasts etc.. Thus the accounting rule IAS 1 referring to financial statements ("Purpose of Financial statements") requires that the information shown in the accounts "to help users in their predictions regarding future cash flows and, especially on the reliability of obtaining cash or its equivalent." This change in accounting which has a deep impact on the economic environment, also favoring the appearance of the concept of fair value, has been made possible by the development of market operations and especially of complex financial instruments and derived products. In general, derived products (swaps, ...) are negotiated initially without involving cash flows. By not having an original cost, these financial products are not, according to the traditional accounting model, accounted for in the balance sheet. Nowadays, the entities use massively these financial instruments, thereby exposing themselves to great risk without even adjusting the informational content of their annual financial statements. Furthermore, the present economical context, being strongly influenced by the globalization process, contributes to the purchase of entities, very often at high prices, which contributes to the appearance of new methods of evaluation. Finally, the purchase price of an entity is based on information on its future, in other words on its future flows. Under these

circumstances the accounting value of the past, referring to the assets purchased is not, in fact, of much importance to the buyer. In order to respond to the users' need of information and in order to ensure the transparency of the informations, *fair value* must be used. For now, the term fair value is spread within international standards without reference to any detailed guidance on how to apply. Nevertheless[1], the FASB issued an Exposure Project on how to measure fair value and the IASB is expected to materialize in the near future its final version. The FASB project identifies three levels of fair value, the highest being that of market transactions that can be observed for the same type of asset, the second being that of market transactions which can be observed for similar assets, and the third level consists of using models with the same contributions from the market or with another base. When using the fair value, the entity has to present what level was used, and if it is the third, which was the model.

According to the financial theory, the value of an asset is the present value of future cash flows corresponding to that asset (utilization value). The instruments which have to reflect this value at any time, are no others than the markets themselves. It is required to ensure an essential condition: the market must be perfect, meaning organized and active. If the requirement is met, after BARTH and LANDSMAN [2], the fair value of an asset equals its market value. It's that market to market evaluation (evaluation by reference to a market). Market value is, therefore, the price that can be obtained for an asset, if there is an active exchange market, accessible to all, for the category of items the asset belongs to. An active market involves trading of homogeneous assets, among the actors permanently present on this market - buyers and sellers – the prices being known to the great public. In some fields of activity, the difficulty is the existence of an active market is obvious (for example, for derived products or specialized fixed assets, unique objects, etc..) in such situations - imperfect market - we will value the respective object by calculating its *fair value*. This fair or venal value, can be defined as the price for which an asset can be changed in a balanced transaction. One may talk about an estimation and not a statement as for the

market value. As we saw above "fair value is the amount for which an asset could be exchanged willingly between two knowledgeable parties, in a transaction with the price objectively determined." Using an evaluation technique is an alternative evaluation method, in the absence of a price established on the market. Two approaches can be met, namely:

- the first is characteristic to the analogy method which means to turn to the market value of a similar asset, with identical or at least similar characteristics as the asset under review;
- the second approach means valuing an asset by using the model technique. The method of determining the value of an amount by analogy or similarity is, theoretically valid but in practice this is difficult to accomplish, since the notion of similar characteristics is often difficult to establish and demonstrate.

The second approach used to measure fair value a model which is at the companies' disposal. In resorting to such a technique one is safe to say that we stand in front of a market to model valorization (referring to a model). For many, the concept of fair value knows only one reality: the market value. But this [3] only represents one way of measuring fair value, the one providing the greatest objectivity because its being based on information exterior to the company, and which cannot be influenced by it in any way.

The rule IAS 16 states that "*if there is no data on the market on fair value because of the specialized nature of the item of property, and the item is rarely sold, unless it is part of a continuous activity, an entity may need to estimate fair value using an approach based on income or replacement cost of depreciation.*"

Approaching the replacement value in terms of the definition given by the rules, it represents the amount or investment a company needs to make in order to replace an existing asset. The new asset may be different from the one replaced, but it has to must the maintenance of the activity in the field the asset changed is a part of. The technical progress and the continuous improvement to assets creates difficulties in measuring actual replacement value. An asset will very rarely be changed with a new identical one. Under these conditions fair

value measurement will be based on calculations made by qualified evaluation professionals. According to the income approach the information relating to income and expenses for the fixed asset evaluated are taken into account and its value is estimated by converting the income generated by the respective's asset value. This is not usually applicable to individual machinery and equipment, but nevertheless it is frequently used to evaluate a group of assets or individual machine units that are used together in order to obtain a marketable product, and this generates a flow of income. The approach of income includes two methods:

- The capitalization of income method;
- Updated cash flow method (DCF updated cash flow).

3. Capitalization method

Using this method, expected future revenues are converted into value by sharing the revenue, usually annually, with a capitalization rate or by multiplying the income by a multiplier (which is the inverse of the capitalization rate). The two stages of implementation the capitalization method are [4]:

- Estimating the annual income;
- Determining the capitalization rate.

The estimation of annual income is to be found as the income generated by a specific asset - the gross income, minus operating expenses, it is an *annual net exploitation income*. In the first place the capitalization rate is determined, rate which includes all those elements that an investor would normally take into account, such as the profitability of the investment, the degree risk the investment has, investment quality, or degree of liquidity of the investment. If the fair value minus the costs of disposal of a fixed asset are known, one can construct a multiplier by reporting an income at the fair value which is then to be used in order to estimate the value of another asset, starting from the income the latter generates using the formula:

Income capitalization rate = Annual income / fair value without any sales charges.

In order to determine the income capitalization an evaluator will use the formula:

Value = Income / Capitalization Rate or
Value = Income x multiplier (which is the opposite of the capitalization rate).

Example 1:

This example aims at establishing the fair value of the own capital a dental office has to have, using the income capitalization method, for its being purchased by a doctor on October 30, 2010. The following information are known: the office functions in a rented apartment - the remaining time of the contract being eight years, annual rent is 24000lei and will increase by 3% every year, in real terms (there are no renewal clause for the contract after the expiration of the contracted period); annual wage costs (a secretary and a nurse) – 84000 lei, increasing by 3% per year (in real terms); annual leasing rate for dental equipment – 14000 lei and will increase by 3% every year (in real terms); medical insurance – 3500 lei per year and increase by 3% per year (in real terms); income tax of 16% , other charges - 7000 lei, increasing by 3% per year (in real terms); number of working days - 250 days / year; average revenue per day – 1000 lei, annual revenues will increase by 3% per year; the dental office's purchase will be financed from two sources: 50% equity[own capital] of the dentist with a real cost of capital of 14 %, 50% by long-term credit, real interest rate of 8%.

The value of the dental clinic is estimated by applying an annuity FVPA to the annual net income from exploitation (which is reflected as net cash flow available to the investors). First the annual net operating income is measured, using the methodology below:

A. Total Annual Income	250000
(250 days x 1.000 lei / day)	
Annual Expenses:	
- Rent	24000
- Wage costs	84000
- Leasing rate	14000
- Health Insurance	3500
- Other expenses	7000
B. Total annual expenses	132500
C. Gross Profit from exploitation	117500
Income tax	18800
D. Net operating profit	98700

The average balanced cost of the k capital is calculated, representing in fact the update rate as follows: $k_r = cmpr_r = (14\% \times 0.5) + [8\% (1 - 0.16)] \times 0.5 = 7\% + 3\% = 10\%$. Since the capitalization rate r_c is obtained by deducting from the update rate r_g increase using the formula $r_c = k_r - r_g$ - in our case the actual rate of capitalization is $r_c = 10\% - 3\% = 7\%$.

FVPA annuity factor is obtained from the following equation:

$$FVPA = \frac{1 - (1 + r_c)^{-8}}{r_c} = 5,971$$

The fair value of the dental clinic by using the income capitalization method is determined as follows: $V_{cs} = CFN \times (1 + r_g) \times FVPA = 98700 \times 1,03 \times 5,971 = 607018$ lei. From the total value of 607018 lei that the dentist buyer will negotiate when purchasing the cabinet, his own capital is 303509 lei: $V_{ca} = 607018 \times 0,5 = 303509$ lei.

If the direct capitalization method involves the use of current annual income, obtained now, *discounted cash flow method* (DCF) attempt to estimate the annual net operating income forecast to a range of forecasting based on current information. Thereafter periodic net income from periodical explanation forecasted will be converted into updated value by using a discount rate applied to the annual income for each year in the considered period. The DCF method may lead to the determination of market value only if two conditions are met at the same time, namely:

- annual net operating income has to be the income that an medium investor normally estimates and not the revenue a certain investor is able to obtain;
- discount and capitalization rates are to be taken over by the market.

If those two conditions are not met, ie when the net operating income forecast is made in terms of a certain investor's criteria, the type value which results is the *value of utility* IAS 36 "Impairment of Assets ". The stages to be followed are:

- *estimating the gross income forecasted* normally expressed by the turnover generated by such fixed assets;

- *determining the size and periodicity of the projected gross income* (turnover) forecasted for the projected holding period;
- *determining the size and periodicity of the costs* associated with achieving projected gross revenue;
- *the reduction of the annual projected operating costs from the projected annual gross revenues*, in this way an annual gross operating profit is obtained, which the asset generates during the forecast period from whose value the entity will start in *determining the net cash flow available for invested capital*, using the formula [5]

Gross operating profit:

- (-) Income tax
- (=) Net Operating Profit
- (+) Depreciation and other non-cash expenses
- (=) Gross cash flow (gross cash flow)
- (-) Capital expenses
- (-/+)Changes revolving funds
- (=) Net treasury cash flow available to invested capital,

- *determining the discount rate* required by the investor;
- *estimating an eventual residual value* of any asset at the end of its life;
- *calculate the present value* of the asset under review.

Example no. 2:

The determination of the market value of the investors' capital and the capital invested in a restaurant is required, determination made by using the income-based approach, for its acquisition by a buyer. The following information are known: on August 31st 2010: number of seats - 70; occupancy - lunch 70%, 80% evening (at dinner), open 300 days per year and closed 65 days per year; daily revenues 100lei/seat/ lunch and 200lei/seat/dinner; annual wage costs - 1.3 million lei, the cost of food and beverages - 35% of revenue; the annual rent paid to the owner of the building - 1.48 million lei; the annual growth rate of net operating profit In nominal terms, was set at 5% per year over the next three years; and 3% per year starting with the 4th year to infinity, the cost of own capital is calculated by the CAPM model (Capital Asset Pricing Model), based on - the financing structure which means 95% equity and 5% long-term loans, nominal annual interest rate on borrowings is 10%; corporate

tax rate is 16; the coefficient β in the range - 1.1; the risk premium on the stock market - 6%; risk-free basic rate - 5%; long term loans at evaluation time - 2.75 million lei.

The income based approach by discounting net cash flow available for investors-meaning the owner and lender- is adopted by the evaluation specialist in order to obtain the market value of the restaurant. Net cash flow available for shareholders is firstly measured, considered to be equal to net operating profit because: it was accepted that the projected annual investment is equal to depreciation, and annual changes of net revolving capital is insignificant. The discount rate reflects the average cost of capital in nominal terms.

The amount of capital invested is calculated in two ways:

- From the original owner's position, namely,
- From the position of the future owner will inevitable suffer a loss of the customers, those attached to the former owner.

A. For the original owner, the restaurant's market value starts from the calculation of net cash flow available.

<i>Income</i>	<i>lei</i>
Lunch	1470000
Dinner	3360000
Total	4830000
<i>Expenses</i>	<i>lei</i>
Food + beverages	1690500
Wages	1300000
Rents	1480000
Total	4470500
Operating Profit	359500
Operating Profit (0.84)	301980

The update rate is determined:

$$k_r = cmpr = [5\% + (1,1 \times 6\%) \times 0,95] + [10\% \times (1 - 0,16) \times 0,05] = 11,44\%$$

The market value of the restaurant is calculated considering, at the end of the third year of use, a residual value of 2.43 million lei.

Net operating profit increases by 5% per year during the first three years, and by 3% during the fourth year, the following values being obtained: 317079 lei (1st year), 332933 lei (2nd year), 349580 lei (3rd year), 360067 lei (4th year). Knowing that the update rate is 11.44%, a discount factor of 0.897343 in the first year is obtained, 0.805226 for the second year, 0.722564 respectively in year 3.

Income and residual value have the following values: first year $-317079 \times 0.897343 = 284529$ lei; 2nd year $- 332933 \times 0.805226 = 268086$ lei; 3rd year $- (349580 + 2430000) \times 0.722564 = 2008424$ lei.

After three years of use, the restaurant has a market value of 2561039 lei.

B. A loss of current customers, loyal to the present restaurant owner is admitted, estimated at about 10% of all the customers, respectively that the occupancy degree will decrease after taking over the restaurant to 65% at lunch, and 74% in the evening at dinner. The other hypotheses for the assessment remain the same. Calculation of net cash flow available:

<i>Income</i>	<i>lei</i>
Lunch	1365000
Dinner	3108000
Total	4473000
<i>Expenses</i>	<i>lei</i>
Food + beverages	1565550
Wages	1300000
Rents	1480000
Total	4345550
Operating Profit	127450
Operating Profit (0.84)	107058

The calculation of the restaurant's market value, considering a residual value of 1.85 million lei at the end the 3rd year of use, involves in the first place an increase in net operating profit by 5% per year, resulting the following values: 112411 lei (1st year) 118032 lei (2nd year), 123934 lei (3rd year). Knowing that the update rate is 11.44%, an update factor of 0.897343 the 1st year is obtained, and 0.805226 in the 2nd year, respectively 0.722564 during the 3rd year.

Profit and residual actualized value have the following values: first year $-112411 \times 0.897343 = 100871$ lei; 2nd year $-118032 \times 0.805226 = 95042$ lei; 3rd year $- (123934 + 1850000) \times 0.722564 = 1426294$ lei.

The amount of own capital retained to negotiate the transaction price is 1426294 lei. If the former owner agrees to work for the new owner after selling the restaurant, the own capital value retained for the negotiation is of 2561039 lei.

Calculating the market value by using the income-based approach raises modeling and estimations that are the privilege of professional evaluators.

4. Conclusions

Nowadays, national destinies are strongly influenced by worldwide forces of global competition [6], so that operating financial and investments decisions, have international implications. As most of these decisions are founded on accounting information for the smooth running of the business the knowledge of national and international accounting rules becomes essential. We are thus witnessing a transformation of the accounting system, which required to ensure clear, credible and internationally comparable sources for the ones using the information - investors/ shareholders, creditors, etc in order to substantiate decisions.

In the past, global accounting opposed two traditions: the Anglo-Saxon, which serves the interests of the investors, having as its main objective the comparison of financial performances, namely the continental tradition, controlled by the state and oriented towards the partners of the entity-tax administration, creditors, employees, owners.

While the continental accounting system likes the historical cost measurement, the Anglo-Saxon one proposes to adopt the fair value.

From the examples presented above one can easily see that the technique of modeling the fair value based on the income approach is a complex process, which requires estimations and modeling of the value that are not always available to accounting professionals, so that entities are forced to appeal to the contribution of expert evaluators. And as the Romanian entities, especially in this time of deep economic crisis, do not have, most of the times, enough resources appeal to outside experts, the fair value modeling will encounter difficulties. One of the solutions could be setting up an evaluating department, for each entity, but this involves quite high costs.

Food Security in Romania

Manole Victor

Istudor Nicolae

Academy of Economic Studies, Bucharest,

Faculty of Agrifood and Environmental Economics

Abstract

Theoretical definitions are given within the article regarding food security and independence and also there are presented the agents that influence them. Moreover, a description of the security at global and national level is given, illustrated by a series of specific indicators and trends of their evolution. Finally, it is described the perspective of food security in our country.

Key words: food security, food independence, food crisis, price volatility, food consumption.

J.E.L. classification: L66

During the last three years, under the impact of crisis the global community faced, the problems related to food security aggravated. Predictions are no longer necessary to be made for Romania in regards to food crisis for a great part of the population is already affected by it. Romanians' precarious food security is not yet the direct consequence of the lack of food, but of the decrease of the purchasing power generated by at least four factors: salary adjustment, VAT increase, recalculation and taxation of pensions and inflation increase. The aforementioned agents highly contribute to the decreasing of the food consumption, both from quantitative and qualitative point of view, and to the volatility of the prices for food, to the decreasing of self-consumption at the same time with the substantial increase of imports.

From ONU's perspective, the national and international (collective) security notion is a single whole of the following dimensions: economics, food, environmental, community, demographics and military. All these dimensions of the security concept are highly connected and interact with each other.

According to many field specialists, the food security of a country is the most important dimension of the national security. A state has food security when it has sufficient agricultural and food products in order to cover the feeding necessities of all inhabitants within its borders and to assure, at the same time, the necessary reserves of feeding stuff for animals and water in cases of natural disasters, war, crises etc. Not being able to ensure food security may lead, within the country, to social tensions, to the physical and psychical health deterioration of the population and may create economic and political instability. And outside the country, it may create diplomatic, economic and political pressures, triggering unwanted and dangerous influence upon national security.

Hunger has become an endemic phenomenon in the world. According to FAO, presently, the number of the persons that suffer from hunger exceeds 1.26 billions, compared to the estimated amount of only 862 millions during 2000-2004. The existence and amplification of food penury is favored mainly by the following factors: demographic increase; cataclysms; drought; climatic disorders (mostly generated by global warming); oil appreciation; poverty; financial crisis; economic crisis; urban development; cleavage augmenting between production and food consumption etc.

According to ONU, for over 8 years humankind has been consuming more food than it produces. Until now the food penury was mitigated by consuming the reserves gathered in the favorable agricultural years. The issue has become more serious as since 1999 until now, at a global level, the cereals reserves have been reduced to half of the total amount. Thus, if in 1999 the global cereals reserves could have ensured around 116 days for the whole worldwide population, nowadays it can only provide for 56 days, a period which is below the

acceptable period of time for the food security assurance.

A few years ago, field experts estimated an imminent food crisis within the world, with serious manifestation forms for 2018-2020. Such crisis may have significant influence upon national and international security and may generate instability within economic, social, political and military environment. If unethical people or terrorist organizations should take the lead on such times, „food weapon” could cause unforeseeable effects that may outrun the ones caused by weapons of mass destruction. In fact, the World Bank Group and the International Monetary Fund have already noticed the state leaders from all over the world to take all necessary measures and to

lodge all immediate efforts in order to prevent such crisis from happening.

Influenced by crises that affected during the last three years the global economy and by the political instability in many Arab countries that generated into food appreciation, the issues related to global food security aggravated. The Japan nuclear crisis, generated by the earthquake of approximately 9° on the Richter scale and the serious drought China and other Asian countries are confronted with, will aggravate much more the aforementioned issues. In this case, we can consider that the estimated food crisis will take place sooner than expected. There are already visible signs, that is the evolution of the price volatility to the mainly agro-food products. (see tabel 1 and chart 1)

Table no. 1.

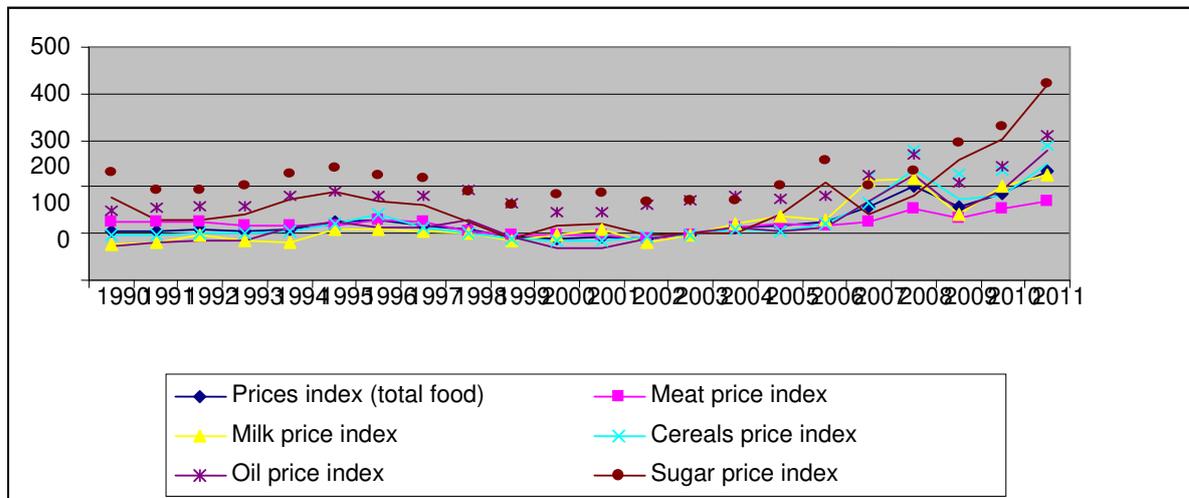

Annual indexes of the prices of primary food on a global level (1990-2011)

Year	Prices index					
	Total food	Meat	Milk	Cereals	Oil	Sugar

Chart no. 1

The evolution of annual indexes of the prices for primary food on a global level
(1990-2011)

Both from the table and the chart above it results a significant price increase (price volatility) that occurred in the last two years for primary food on a global level. This evolution forebodes the start of a food crisis of great proportions within the world.

After Romania has adhered to NATO – being a full rights and obligations state member- politicians with national security responsibilities have rightfully considered, taking into consideration some of our troops’ participation to several potential conflict areas, our country as a security insurer. It would be „magnificent” if we made the same statement about food security. Unfortunately, this is not possible because, nowadays, Romania is a „net importer” of food and thus, of food security.

Most advantaged countries in what concerns the insurance of food security are those that have a great agricultural potential and can provide great quantities of food raw materials and food above the national demand. Romania is one of these countries and has a generous agricultural potential, being on the 5th place of EU countries, and can provide food demand for approximately 80 millions people. We can state that such countries may have – and most of them have – food independence. This advantage that Romania has is not sufficiently valued because, according to experts’ estimations

and some of national and international institutes in domain, approximately 70% from the food aggregate demand is covered by import of such products.

In such conditions, the current status of Romania’s food independence and security is unacceptable.

Predictions of food crisis are no longer useful because a more increasing part of the population is affected by it. This food crisis is not yet the consequence of food lack on the market, but the decrease in the purchasing power, generated by at least four factors: public workers salary adjustment with 25%, re-calculation of pensions and health insurance taxation (5,5%), and from these, VAT increase with 5% and inflation increase (the biggest in all EU state members).

After the National Institute of Statistics published the consumption price index in February 2011, it was considered that Romania was in food crisis, emphasizing that food prices have increased, at least in the last three years, more than those of non-food products or other services.

We also mention the prognosis made by Nomura Bank in Japan, which states that Romania’s food problem will accentuate. According to it, our country is on the 12 place in the world in what concerns the food risk generated mostly by food price volatility (vulnerability). (tabel no. 2)

Regarding the disorders generated by food price vulnerability on the global market, Robert Zoellick, World Bank President, states the following: „We should be alarmed because price increase tendency causes pain for all poor people in the world”, but he advised the international community to be aware of this risk and not to aggravate this problem by imposing measures, such as interdicting exports or setting administered prices. Moreover, he requested G20 leaders to consider food as number one priority of 2011. Angel Gurría, Secretary General of the OECD, asserts that „Agricultural markets have always been unstable, but if governments collaborate such extreme price variations can be diminished and vulnerable consumers and producers may be protected.”

All the abovementioned regarding current situation and the perspectives of Romania's food security are supported by unfavourable trends of indexes evolutions by means of

which population alimentation is characterized, respectively: monthly average consumption per person of agrofood products, the share of self-consumption in the total consumption of agrofood products and the evolution of external trade with agrofood products.

The annual average consumption per inhabitant for the primary agrofood products during 2000-2009 (Tabel no. 3) had oscillating evolutions. An increase tendency was registered for Romania during the period before adherence to the European Union, and afterwards a slight decrease. Moreover, it results that in the last three years a series of basic products for population's alimentation (cereals and cereal products, potatoes, vegetables, fruits, sugar, milk and dairy products, beer and wine) have suffered a decreasing trend (chart no. 2), highlighting a deterioration of Romanians' alimentation.

Chart no. 2.

The average monthly consumption evolution of primary food products and beverages in Romania during 2000-2009 (kilo/pers./month)

In 2009 self-consumption (Table no. 4) had significant shares in the primary agrofood products consumption, as it follows: eggs (52%), vegetables (37%), milk and dairy products (32%), potatoes (29%), pork (29%), poultry meat (25%), wine (75%) etc. The high level of agrofood products self-consumption influences the performance of agrofood system, the respective products are not validated on the market under no kind of performance in what concerns quality, safety and their prices. Economic agents resort to bigger and bigger imports of agricultural raw materials or finite food products in order to ensure continuity in providing manufacturing and distribution processes and satisfy the consumers' demand. In chart no. 3 it can be noted that, in the last three years, almost all products have registered self-consumption decreasing trends.

This situation could have a positive effect if subsistence and semi-subsistence farms (population's households) provide a greater quantity of products to the market. As it results from charts no. 4, 5 and 6, milk* imports (raw material), pork, meat products and sugar have an increase trend (in a negative sense) and the abovementioned farms have provided less and less quantities. For cereals and especially for oleaginous seeds, the evolution was favorable because, with few exceptions, during the entire period a substantial net export was registered.

* Imports are written with a minus sign and they are in the chart under the abscissa. Exports are written with a plus sign and they are in the chart above the abscissa.

As a conclusion, the evolutions in the first years regarding prices, average consumption, self-consumption per inhabitant, and also the external trade with agricultural products highlight an unfavourable evolution

regarding agricultural production and, especially, population's food security.

The increase of the valorification degree of agricultural potential may transform Romania in an independent state in what

concerns the assurance of population's food security, and also into a provider of such type of security for other countries by means of net export of agricultural products, raw materials and food. This can be made only by adequate strategies and policies, meant to stimulate investments in this area and to increase performance and competitiveness in agrofood sector and in all economic organizations that compound it. Thus, OCDE considers that „Agricultural investments in developing countries will be highly important for increasing the quantity of available food, and for obtaining income and creating new jobs.”

Without a systemic approach and fare financial and investment support together with agricultural and rural development strategies and policies, the food security of our country may be seriously affected in the future. We must take into consideration that this issue will be aggravated by the effects of global warming and climate instability, by the increase of drought manifestation on land and other natural phenomenon that will have a negative impact on agriculture.

Romania's adherence to European Union on the 1st of January 2007 is only the beginning of a complex and – we hope- not long process of full integration within EU's structures. At least on the economic level, this process generates many challenges Romania must face. Due to the small level of performance and the degree of compatibility between agricultural sector and rural economy in Romania and similar entities from EU developed countries, we can consider that most challenges may occur in this domain. In order to reduce the aforementioned deviations, now Romania may benefit from two European funds: European Agricultural Guidance and Guarantee Fund and European Agricultural Fund for Rural Development. The main purpose of the second fund is to contribute to the increase of productive performance and

competitiveness in agrofood and rural economy and to the food security of the country and reducing the deviations of development and standard of living in villages and towns, between different agricultural areas and economic regions.

Abstract

In this paper is presented a general overview on the indirect fiscal burden and the impact on consumption in EU member states in the context of economic crisis.

Some EU member countries choose to increase the tax burden on consumption for covering the budget deficit. The question is if it was a real solution for reducing the budget deficit and to sacrifice the consumption.

In this analysis we try to capture the correlation between the indirect taxes and consumption in the European countries. For realizing this purpose first we follow the changes of consumption tax rates in EU member states.

Than is made a short analysis of indirect tax burden as percentage of GDP and finally the impact of consumption on the consumption tax revenue.

Key words: indirect taxation, tax burden, final consumption.

J.E.L. classification.: H62, E21, E62, E63 1

1. Introduction

The economic crisis has affected consumption, which generally implied a decrease in budget revenues. The need to cover public spending led to growth rates, especially for VAT. Any rate increase will be reflected on a decreasing of consumption, but will at least temporarily solve the needs of state funding and budget shortfalls.

The purpose of this study is to reveal the consumption trend in this context of economic crisis under the impact of increasing rates of VAT and excise duties

and how have evolved the budget revenues collected from these taxes comparative with GDP.

Our analysis considers the major categories of indirect taxation. Firstly, value added tax (VAT) which in all EU Member States is the single most important indirect tax, typically accounting for around half of indirect tax receipts. Secondly, excise duties or other taxes on consumption, in which context we generally distinguish between taxes on energy (fuel duties), tobacco, alcohol and others.

Tacking into consideration this fact we try to reveal if in the context of economic crises the tax burden of indirect taxation is changed because some countries consider that is essential to change the VAT rate, for the increasing the budget revenues. Starting with 2008 governments has introduced a wide range of fiscal measures to support the economy or to consolidate public finances.

The huge budget deficit and the decreasing the economic growth becomes a major issues for all EU countries which requires special fiscal measures, many of this only for a short period of time or only for special sectors.

Indirect taxes are less distortive on the economic growth comparative with direct taxes, because they don't fall on accumulated assets, or investment.

For indirect taxation the fiscal policy of EU countries is oriented on harmonization. In this area there are made important progress for VAT and excises, particularly through the minimum rates imposed for all the countries.

Reforms of the VAT, as well as some excise rate increases, have often involved large amounts of tax receipts. As general overview on the tax measures adopted by UE members, cuts dominate in corporate and personal income taxation, while increases

were clearly prevalent in excise duties and VAT.

In the case of VAT, the most of the countries decide to increase rates, but also a high number of measures narrowing the base. Base narrowing was in many cases linked to equity considerations, as some countries reduced the tax burden on food or necessities.

Generally, however, the measures increasing the standard VAT rates have had a much larger (positive) budgetary impact than the base narrowing measures; for the cases for which we have information, the ratio is almost 5:1 (Taxation trends in EU, 2010).

Overall, therefore, given also the widespread increases in excise duties, one of the effects of the crisis on tax systems seems likely to be a reinforcement of the trend of the last few years towards higher consumption taxes.

Because the economic crises have a negative impact on consumption contributing of decreasing of household and company consumption, the governments try to adopt the appropriate measures for stimulating the consumption and the economic growth.

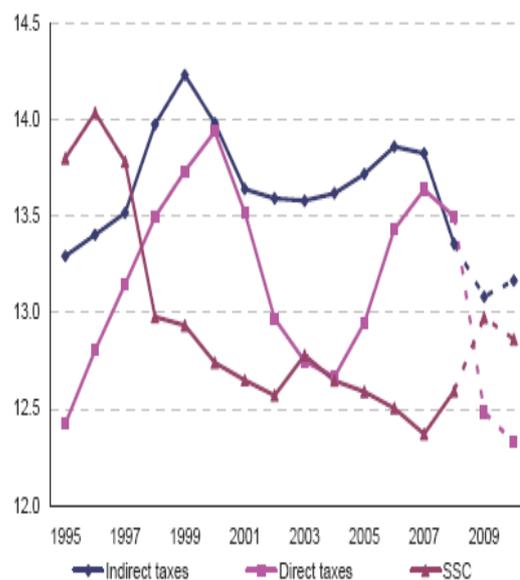

2. Indirect taxation – fiscal measures

The indirect taxation plays an important role for the state budget in any EU member states, especially for the new member states because the fiscal policy of these states try to impose a higher burden for spending the income, because the weight of the consumption in the total income is very high.

The significant fall in the ratio of indirect taxes to GDP since 2008 greatly exceeds its (moderate) previous increase until 2006/07, in sharp contrast to the symmetric pattern observed in the previous cycle. While this might point to negative confidence effects of the current crisis, leading to heightened precautionary saving, it also reflects discretionary tax cuts in some countries.

With such measures partly expiring in 2010 and private consumption to recover slowly, the ratio is set to pick up again (European Commission, 2010).

Figure 1. Structure of tax burden in EU 27

Source: Commission services.

The most important fiscal measures are referring to VAT rates, particularly standard VAT rate. Because VAT revenues are collected every month the governments decide to increase the rate and this thing was happening until 2011 in countries like Czech Republic from 19% to 20, Estonia from 18% to 20, Greece from 19% to 21% and again to 23%, Spain from 16% to 18%, Latvia from 18% to 21% and again to 22% (2011), Lithuania from 18% to 21%, Finland from 22% to 23%.

But the most important increase takes place in Hungary from 20% to 25% and Romania from 19% to 24%. Surprising or not this decreasing are continued in 2011 in UK with a increase from 17,5% to 20%, Poland from 22% to 23%, Slovakia from 19% to 20% and Portugal from 20% to 21% and even 23%.

There are two categories of states who decide to increase the rates, some new member states, like Baltic states with huge economic decreasing and the second category old member states but with huge budget deficit like Greece, Spain, Portugal and even UK.

In this context only in seven countries we have standard rates below 20% (Germany, France, Spain, Cyprus, Luxemburg, Malta and Netherlands).

Some EU member states choose to decrease some VAT rate for encouraging investment in the construction sector (for instance Romania 5% for social houses) or to strengthen the structural competitiveness of firms.

Other countries like Cyprus applied a temporary reduction of the VAT for hotel accommodation and restaurant services by 3 percentage points to 5 % (originally till 30.04.2010 extended to 31.12.2010). These kind of measures are adopted the tourism sector or restaurants. In Belgium VAT rate reduction (from 21 % to 12 %) for food served in restaurants and catering services in 2010. This measures even if will reduce the tax revenues almost with 0.15 is important for stimulating the food industry.

Also in this country was adopted VAT rate reduction (from 21 % to 6 %) for the construction of private (for € 50 000) and social dwellings.

Another important measures introduced by many EU countries is acceleration of VAT restitutions for improving the liquidity of businesses and individuals, by stretching out the payment terms.

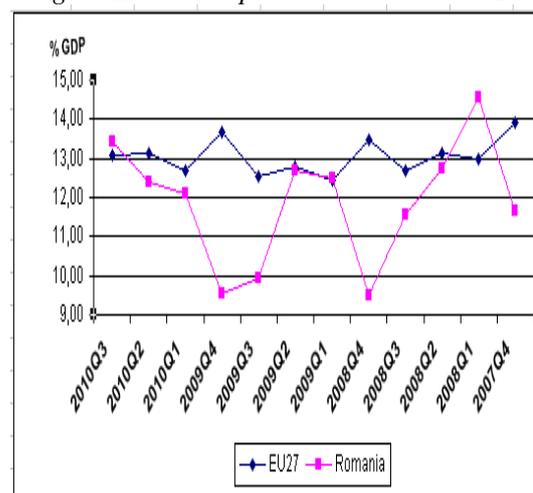

In Finland quite similar measures of decrease in the VAT rate on food from 17 % to 12 % as of 1 October 2009 and decrease of the VAT rate on restaurants from 22 % to 13 %. The same kinds of measures are taken by France and Germany.

Ireland is the only country which decreases the standard rate from 21.5 % to 21 %. This brings back the VAT rate to the value it had before December 2008 when the standard rate was increased from 21 % to 21.5 %.

For excises there are wide ranges of increasing in countries like Estonia, Greece where there are important increase in fuel taxes, increase in excise duties on cigarettes and alcohol.

Our analysis consider the period of the last quarter of 2007 until in 2010 the third quarter. In this period the tax burden of consumption tax have a slightly evolution in EU 27 (as average), maximum 2 percentage points change from 14% in 2007 to 13% in 2010, with a minimum in 2009 12,5%.

Figure 2. Consumption tax burden % GDP

Source: Based on Eurostat database

Consumption tax burden in Romania varies very much in this period with a maximum before the economic crisis started at almost 15 % of GDP and the minimum at the end of 2008 and 2009 below 10%.

Table 1. Indirect tax burden evolution

Source: Own calculations based on Eurostat

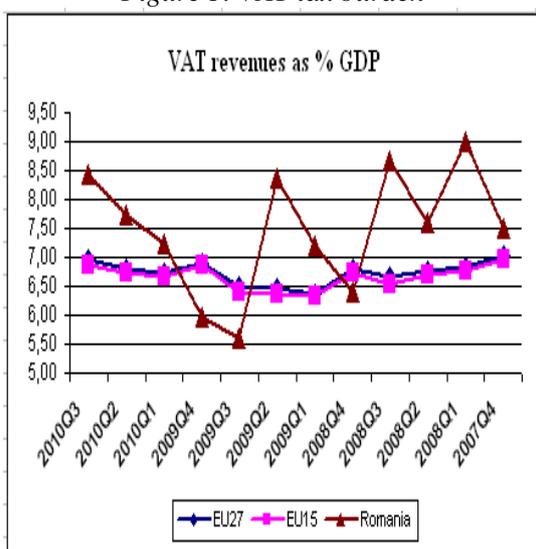

Analyzing the evolution of consumption of tax burden as % of GDP only in eight countries we have increases, especially in countries with VAT increases.

In Hungary and Romania we have the highest increase of the consumption revenues because the tax rates of VAT have increased with 5 percentage points.

The most important decreases are registered in countries with the lowest standard VAT rate like Cyprus with 5% (VAT rate is only 15%) and Malta with more than 3%.

For the Romania there is a huge decreasing almost 6 percentage points in 2008. The increasing of VAT rate from 1st July in 2010 was a good measure because we have a increasing of tax revenues and at the end of 2010 the consumption burden is higher in Romania comparative with EU 27. This is a good thing for the state budget even if it is not so good for the population.

Figure 3. VAT tax burden

Source: Based on Eurostat database

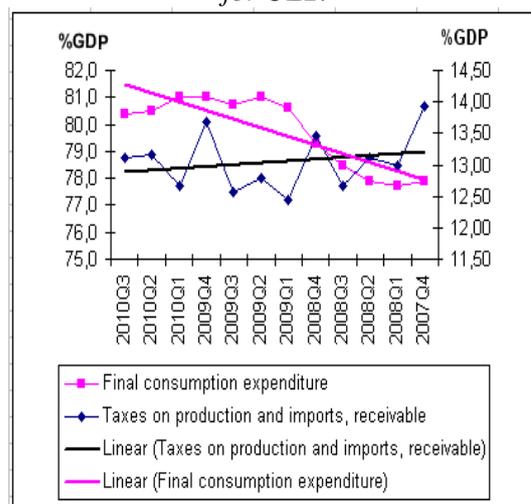

From the previously graph it can be seen a continuously increase for VAT as % in GDP starting with the end of 2009.

3. Evolution of consumption in EU 27 and Romania

For the EU space the final consumption expenditures was strongly affected by economic crises, but starting with the end of 2008 was registered an increase of this indicator as % of GDP.

The trend of weight of taxes on consumption in GDP varies quite weak on this period comparative with consumption as it can be seen in the next figure.

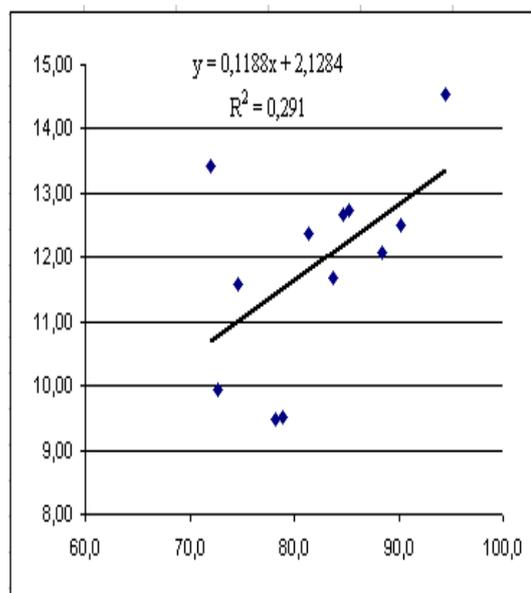

Figure 4. Consumption and consumption tax for UE27

Source: Based on Eurostat database

Analyzing the relation between the final consumption and consumption tax in Romania we find a low correlation almost 30%. If the final consumption increase with one point than the consumption tax increase with 0,11 (both indicators are expressed as % of GDP) and is a direct correlation.

Figure 5. Correlation between final consumption expenditures and consumption tax burden in Romania

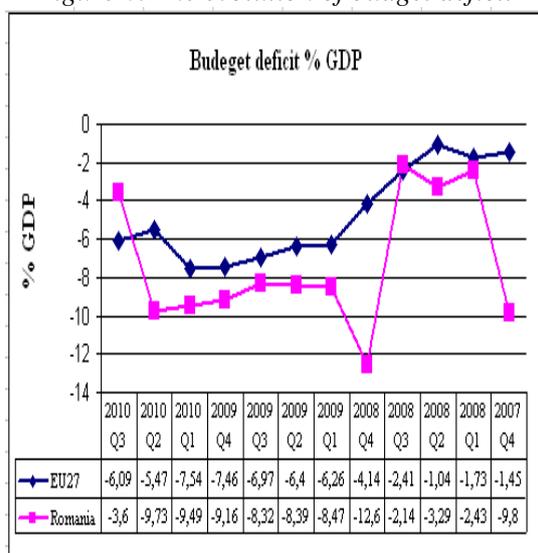

Source: Based on Eurostat database

Concerning the indirect tax revenues in Romania in the 1st quarter of 2009 comparative with the same period of 2008 it can be observed the follow trends (Mara, 2009):

- decreasing of VAT receipts with 16.8% (this is a consequence of decreasing consumption);
- increasing excises receipts with 6.2% (because the excise rates were increased starting with 2009).

There is a low correlation between economic growth and excises in Romania, this low correlation is explained through the fact that excises revenues are a stable source of public budget financing, because are imposed on the goods with inelastic demand and for this reason the evolution of economy has a reduced impact of excise receipts. (Mara, 2010)

Figure 6. The evolution of budget deficit

Source: Based on Eurostat database

The budget deficit was reduced in EU countries but is so far from the limit of 3%, but in Romania for the third quarter of 2010 is very closed by the 3% of GDP.

4. Conclusions

Although a shift of tax burden towards consumption taxation appears more desirable than the use of income taxes considering potential effects on growth, the widespread increase in VAT rates might potentially lead to distortions of trade flows and the allocation of capital.

The analysis reveals a strong dependence between the revenue from indirect taxes and consumption dynamics. Explosive growth of consumption has been tempered by economic crisis fact that increases the budget deficit. In

most European countries now economy is recovering and there is again economic growth and budget deficits were reduced.

Reducing the budget deficit was based on fiscal measures that focused increase in VAT standard rate. What will be the new trend of the EU fiscal policy concerning the indirect taxes after economic crises passed? We consider that for the countries with huge deficit is necessary to maintain these solutions and particularly the highest rate of VAT for assuring the budget revenues.

For Romania VAT rate increase was a proper solution for covering the public expenditures, but unfortunately it wasn't a good solution for households because of reducing the purchasing power. Express our opinion in favor of this 24% VAT rate because even if the government reduces the rate the prices don't decrease. But for increasing the budget revenues are necessary measures like elimination the tax evasion and fighting against underground economy. Indirect taxes even if there are very sensitive to the economic fluctuations are the most efficient instrument used by the governments for assuring the budget revenues for the state.

The Purpose of the Information Accounting System for the Process of Taking Investment Decisions

Marcu Niculina
„Constantin Brâncoveanu” University
n_marcu@yahoo.com

Abstract

Extremely useful in decisions making, real, clear, complete, credible and relevant accounting information are essential to the management.

Financial accounting provides financial - accounting information publishing the financial statements useful for all those interested in adopting decisions on investments, profitability analysis, quality management evaluation, entity diagnosis, assesment at its fair value of the financial position and performance, etc.

At the same time, management accounting is considered as a relevant and reliable source of information if it is adapted to the investement decision, collects all the needed data and accurately models them.

Key words: information, decision, accounting, management.

J.E.L. classification: M42

1. Introduction

In the overall information flow, of great importance is gathering and synthesizing the information to make them useful in decision making and optimising the decisions, information quality having a strong role on the choice, both on certain or uncertain situations.

Decision-making process identifies, collects and evaluates information including financial and accounting data on the analysed situation, identifies the need for a decision, identify alternative trends , choose the best action, then apply the chosen solution.

Looked upon as a comprehensive information system, accounting is and remains the mainstay of economic information systems, each of the parties

interested in running the entity making use of accounting information – as the only source that can provide the image of its work and its situation.

2. The role of data processing systems in financial accounting

The information accounting system plays an essential role in the transmission of economic data to all the departments of a company and all the third parts interested in the company.

The information systems used in the processing of accounting and financial data of a company have to meet the following minimal criteria:

- to provide accounting data according to the current laws and regulations;
- to provide maximal security in the processing of the accounting data;
- every data recorded in the books of the company has to be proved in documents available both to investors and to authorized external auditors;
- to list in a chronological order the economic activities of the company on the basis of documents in proof, without ulterior insertions or eliminations of data;
- to provide an automatic calculation of the total balances of the accounts at every new entry in accounts;
- to provide the storage of the data on a period of time in conformity to the Accountability Law 82/1992, reissued;
- to specify the storage devices for the recorded data, financial statements and other documents and the possibility for the reintroduction in the system of the archived data;
- to not allow ulterior insertions, changing, eliminations of data with regard to a closed period;

- to provide the following constitutive elements for the accounting entries: the date when the book was performed; the initial account book where the registrations are found; the ordinal number of the documents in proof assigned by the issuing entity;
- to provide the confidentiality and the protection of information and programs by using paroles and codes of identification for the access to information, back-ups for data;
- to provide clear, intelligible and complete lists with the following elements of identification on the heading of the document or on every page: the type of the document or statement, the name of the issuing entity, the period the respective information refers to, the date of the list, the chronological order of pages, the specification of the processing program used and its version;
- to provide the listing of the whole financial statements and centralized documents necessary to the operational management;
- to provide the correct content of the information for the respective printing forms;
- to allow in every moment the reconstitution of the content of the accounts, lists and information to be audited; all the balances of the accounts has to be the sum of a list of recordings and of a previous balance of the respective account; every entry has to contain elements of identification of the processed data;
- to not allowed: the opening of two accounts with the same symbol, the change of the symbol of an account if data were booked on that account, the elimination of an account in the current financial year or related to the previous financial year, if the respective account has records or balance, the issuing of two documents of a similar type with the same ordinal number and with a different content of information;
- to allow the elimination of an account which has no record in the previous two financial years;
- to stipulate in the documentation of the program the type of the processing system: for one or many companies, network, the portability of the files etc.
- to specify how the data are gathered: entries of groups of data that will be ulterior verified, entries of data immediately verified, a combination of the first two types;
- to allow a no limited number of entries in books;
- to posses the necessary technical documentation for the use of the program;
- to observe the current regulations regarding the security of the data and the accuracy of the information system for the processing of data.

The accountability represents the financial core of the managerial system of information and presents both to the management of the company and to third interested parties a complete image about the organization of the company.

The financial accounting records in books all the economic and financial operations of a company and presents a synthesis of this information in the financial statements. In the external medium of the company, financial accounting represents an instrument of financial language through the information furnished to the external users, while in the interior of the company it is an instrument of administration at the disposal of the management.

The informational activities specific to the accounting domain have in view the creation and the use of the accounting data. These actions consist in the creation, gathering, storage, processing and transmission of data and imply operations of booking, calculation, analysis, interpretation, grouping and the use of information in the process of taking decision.

In order to ground some correct decisions, the accounting information has to meet the following characteristics: clearness, relevance, credibility and comparability. More than that, in order to be credible, the accounting information resulted from the financial statements has to be convenient and to have a good ratio costs/ profit.

The balance sheet presents information related to the financial position, the profit and loss account speaks about the performance

and the changes in the financial position of the company are found in the explanatory notes.

The financial position of the company, defined in principal by structures of assets, debts and net assets, is determined by the economic resources of the company, by its financial structure, liquidity and solvability, and also by its capability to meet the changes in its external medium. The information resulted from the financial statements of a company can be used for different purposes, as follows:

- the information regarding the resources of the company are useful to forecast the capability of the company to generate cash flow in the present or in the future;
- the information regarding the financial structure are useful to forecast the needs for future credits and in which way the future profits and flows will be allocated between the people interested in the company; in the same time these kind of information are relevant for the chances of the company to attract future financing;
- the information regarding liquidity and solvability speak about the capacity of the company to meet its due debts. In this context, the liquidity is seen as the capacity of the company to use its cash-flow in the near future, after subtracting the short-term debts; solvability means the capacity of the company to use its cash flow on long term in order to meet its due financial debts.

The performance of the company is frequently measured by profit and is represented in the financial structure by the correspondent incomes and costs. The performance of a company is determined by a lot of factors beginning with the management and ending with the economic resources at the disposal of the company.

The information regarding the performance of the company in particular its profitability is useful to forecast the capacity of the entity to generate future cash flows with its available resources. At the same time they tell about the efficiency with which the company is able to manage new resources.

The changes in the financial statements provide information for the evaluation of the activities of exploitation, financing and investment of the company.

The financial statements are elaborated taking account of the engagements of the company and these are booked in accounts at the moment when they are assumed. This principle allows the users to know both the past transactions that already have generated payments and returns, but also the past ones that will generate in the future payments and returns.

At the same time, the financial statements are elaborated on the principle that an entity will carry on its activities in the future, what means that there is no intention and need to liquidate or to diminish significantly the activity.

The decisional processes in the economy cannot be conceived without the help of accounting information, characterized by the following attributes [1]:

- The grade of certitude and relevance of the accounting information is without doubt the highest within the whole informational economic system;
- It emphasizes relations of interdependence between economic phenomena and processes, which cannot be perceived with other instruments;
- It gives possibility to some comparative analyses in time and space, inclusive an objective estimation of the realized efficiency;
- It confirms or denies the profitability of any economical activity;
- It provides through specific means (account, calculation, account sold and financial statements) a global, general, but also analytical knowledge of the studied phenomena. Therefore, the possibility to elaborate the vital economic strategies of the company;
- Through its nature and structure it tends to describe the purpose of performance of the company.

The most part of the financial information is under the risk of lack of credibility. That is not due to partiality, but more to the inherent difficulties to identify the transactions and other elements that are going to be evaluated, or to conceive and apply the technique of evaluation.

In these cases the measurement of the financial effects of the events could be so uncertain, that the companies in general do not recognize them in their financial statements: for example, although the

majority of the companies generate goodwill, this element is very difficult to be evaluated in a credible way.

In these situations a possibility would be the recognizing of the respective elements, together with the risk that accompanies their evaluation.

3. Accounting information system auditing

The financial statements present the financial results of the transactions and other elements grouped in homogenous and large categories, according to the characteristics of the elements that form a given structure so:

- The balance sheet comprises structures related to the evaluation of the financial position as: assets, liabilities, net assets;
- The profit and loss account presents structures that evaluate the performance and is concretized in the incomes and the costs of the company on a certain period.
- The situation of the modifications in the financial position reflects structures that belong to the profit and loss account and to the balance sheet.

Checking the accuracy, compliance and reliability of the information provided by the accounting system is done through financial audit.

The audit of the financial statements elaborated through the systems of computerized information is structurally the same as the ordinary audit proceedings. As a difference, the auditor has to know the programs used in the processing of the accounting data, how these programs work and how they meet the needs of the users.

The computerized processing of data can improve the internal control by replacing the old proceedings of control through some new proceedings executed by computer.

The results generated by computer with the help of an algorithmic determination of information are more accurate but they do not exonerate the auditor from a rigorous control.

In practice the information generated by computer are considered too often veridical and it is no more verified, the auditors forgetting that a computer cannot do but the programs he was set to run. Therefore the auditors have to understand and to test the

computerized proceedings before they conclude the accuracy of the information processed by computer. A medium where the computerized technique is mainly used can affect:

- The proceedings used by the auditor in order to come to a sufficient understanding of the accounting system and of the system of internal control;
- The determination of a inherent risk regarding the correct application of the procedures of risk evaluation;
- The planning realized by the auditor and the performance of the verifying tests and of the procedures used to fulfill the objective of the audit

The use of the computerized proceedings supposes an improvement of the internal control of a company but in the same time can affect very serious the audit. A series of risks specific to the use of computers can appear as it follows [2]:

- The dependence on the functionality of the computer (hardware and software);
- The losing in visibility as regards the accounting information, inclusive the path of the audit;
- The diminishing of the implication of the human factor;
- The unauthorized access to the data basis and to the accounting programs;
- Systematic errors versus incidental errors;
- The lost of information, sometimes the lost of some whole files of accounting data;
- The decrease of the possibilities to separate the tasks;
- The absence of the traditional authorization;
- The necessity of experience in work with informational systems.

The risks can increase the potential of fraudulent activities in the specific applications, data bases or master files or in the processing of data. For example, the errors are identical in the systems that perform logical operations or complex calculation.

The system of internal control in the domain of informatics, which supervises the administration of a company in the processes of computerized processing of data comprises to types of controls- general and specific.

The general control provides the flows of processed data within a company well equipped with computerized technique and specialized staff.

The general control is a guarantee of an accurate function of the computerized systems of information. But it is not a sufficient condition of obtaining accurate accounting information. The certitude and the credibility of these information depends especially on the specific controls.

If the auditor has the information that the general control does not work in normal parameters, then it is obliged to take into account the influence of this problem on the specific controls. The credibility of the applications can be concluded.

The specific control refers to the booking and processing of data, in order to comprise the whole range of documents specific to every component of the financial statement: balance sheet, profit and loss account, cash flow, changes in the structure of the capital, the content of the explanatory notes.

The general controls and the specific controls enable the auditor to evaluate the quality and the functionality of the internal control and the importance of the logistic of the department of informatics as follows: the existence of some computers of latest generation, the proceedings of data processing, the complexity of the applicative systems, the efficiency regarding the strictness and the certitude of the procedures and of the information processes [2].

4. Conclusions

The financial statements – a final result of the financial accounting – represent the way in which the users receive the information necessary to ground the decisions regarding the orientation of the activities of the company in the future. Here are included the balance sheet, the profit and loss account, the statement regarding the financial position of the company and the explanatory notes added to financial statements.

The auditors have to understand and to test the computerized proceedings before they conclude the accuracy of the information processed by computer.

The auditor must continuously enhance their professional knowledge to know and understand his clients accounting system or consult a skilled IT professional that can be part of the auditors team or outside it, so resolving these issues lead to a quality audit.

Objectives and Principles in the Statutory Audit

Marcu Niculina
„Constantin Brâncoveanu” University
n.marcu@yahoo.com

Abstract

Statutory audit is conducted by an financial auditor in accordance with international auditing standards.

Unlike the statutory audit, financial audit covers the full range of services within the IAASB: audit services, review services, services upon agreed procedures development services (compilation) of information.

Therefore, global perspective on statutory audits ia looked upon as a part of the whole.

Key words: statutory audit, audit objectives, financial situation cycles, professional skepticism, reasonable assurance

J.E.L. classification: M42

1. Introduction

Statutory audit is the audit conducted by authorized persons in accordance with the provisions of GEO 90/2008 with subsequent amendments and additions, under the International Standards on Auditing issued by the IAASB and IFAC adopted, regardless of the type of entity to which they apply.

Financial audit is the whole of the assurance and non-assurance services that an auditor may perform, under the law, as a member of the Chamber of Romanian Financial Auditors (CFAR), no matter the entity for which the services are rendered.

2. The Goal of Performing a Statutory Audit of the Individual and Consolidated Financial Situations

The goal of an audit of the financial situations is that of giving the possibility to the auditor to express an opinion about the financial situations, if these are drawn under all the significant aspects according to an applicable frame of financial reporting.

According to the requirements of the International Standards of Audit, the audit shall give a reasonable assurance that the financial situations regarded as a whole, do not have significant misrepresentations, either as a consequence of embezzlements, or of errors.

It results the fact that, even if the auditor is not a guarantor or an institution giving absolute assurance about the fact that the accountancy information are right in the financial situations, he takes an important responsibility about the need of informing the users about the reliability of the financial situations. If the auditor reaches the conclusion that the financial situations do not give a faithful picture or if he finds himself in the situation of not being able to express appropriate conclusions, as a consequence of the fact that the evidence are scarce or of some given circumstances, then he has the whole responsibility for presenting this situation to the users by his report.

The general principles of an audit mission imply the following:

- The auditor shall act according to the requirements of the Code of Ethics, issued by the International Federation of Accountants (IFAC);
- The auditor shall perform the mission according to the International Standards of Audit (ISA);
- The auditor shall plan and perform a mission of audit with an attitude of professional skepticism, admitting the idea that, under certain circumstances, the financial situations might be misrepresented in a significant way;

In order to understand the role of collecting the evidence by the auditor, the auditor analyzes the stages to be gone through in order to define some objectives specific to the audit mission; in a general way, those are: understanding the objectives and the responsibilities of the audit; the segmentation of the financial situation in

cycles; knowing the declarations of the management about the accounts; knowing the general objectives of the audit about the categories of accounts and operations; knowing the specific objectives of the audit about the categories of accounts and operations.

An audit mission on the financial situations requires the segmentation of these ones in smaller and as homogenous as possible parts. This segmentation allows a more efficient management of an audit mission, thus making easy a rational sharing of the tasks between the members of the audit team. After closing the audit of every segment including the mutual connections with other segments, the results are interconnected. As a consequence of closing this part of the audit process, one may draw a conclusion about the whole of the financial situations.

In the audit practice, one meets different methods of segmentation of an audit mission. A first approach could be the audit of every balance of account of the financial situations as a distinct segment, but for different reasons, such an approach is not efficient for the accounts tightly correlated.

A more efficient, widely spread in the practice of the professionals is the including the tightly connected types of transactions and account balances in the same segment. This technique is known as the cycle method. One meets the following groups of cycles: the cycle sales-cashing; the cycle purchases – payments; the cycle human resources salaries; the cycle stocks – depositary; the cycle of capital operations.

According to the method of cycles, the auditors perform the missions of audit by applying tests of audit on the transactions which make the final account balances, but also applying some audit tests upon the balances of the accounts themselves. Out of the practical activity, one has reached the conclusion that a more efficient way of audit of the accounts consists in getting a number of combinations of assurances about each transaction, as well as the final account balance associated to the respective operations.

For any type of transaction, one may associate more audit objectives which shall be solved before the auditor can be able to reach the conclusion that the transactions

were correctly rendered by the account, these ones being known as audit objectives related to transactions.

Likely, one identifies a series of audit objectives which are to be reached about the balance of every account known as audit objectives related to balances.

A complete approach of these audit objectives cannot be done if the auditor does not understand the declarations of the management.

The declarations of the management are implicit or explicit statements about the categories of transactions and the accounts of the financial situations affected by these transactions; they are directly related to the criteria used by the management in order to record and present the accountancy information in the accountancy situations and the exact understanding by the auditors of these declarations leads them to perform high quality audits.

Analyzing carefully the audit objectives related to transactions and those related to account balances, one notices a lot of differences, among which two are more significant, one about the reference field, transactions and balances, and the other about the number of the audit objectives, i.e. the audit objectives for transactions are six and there are nine balance audit objectives.

The auditor shall get, within the frame of an audit mission, appropriate and enough evidence to confirm all the management declarations in the financial situations. As it results of the above mentioned facts, the audit evidence shall justify an appropriate combination of audit objectives related to balances and transactions. This thing is done by auditors applying an audit procedure based on a well-defined methodology of organizing an audit so that they could be sure that the audit evidence are appropriate and enough for the goal they wanted to reach.

After the auditor passes through all the procedures for every objective of the audit and for every account of the financial situations, one requires the grouping of information got and their being analyzed in order to reach a whole conclusion about the faithful picture presented in the financial situations. This is a very subjective matter and it is based on the professional reasoning of the auditor who is himself subjective. When the mission is ended and the auditor

issues a report, it shall respect a series of technical conditions.

The audit report is the final stage of the audit mission, the product of the auditor's activity by which the final conclusions are presented as a consequence of analyzing the financial information of a body, the auditor's opinion, the financial situations being drawn or not under all the significant aspects, according to an applicable financial reporting frame.

3. Regulations in the field of the Statutory Audit

The aspects about the statutory audit in Romania are approved by the Law no. 82/1991, The Law of Accountancy, with its subsequent changes and additions, OMFP no. 3055/2009 for approving the Accountancy Regulations according to the European Norms, with its subsequent changes and additions and beginning with the 29th of July 2008, by the Government Emergency Official Decision no. 90/2008 about the statutory audit of the yearly financial consolidated situations.

The yearly financial situations are accompanied by the managers' report, by the audit report or the report of the commission of auditors, as it is the case, and by the proposal of sharing the benefit or covering the accountancy loss. The yearly financial situations of the legal persons of public interest are subjected to a financial audit which is done by financial auditors, certified natural or legal persons. The financial situations drawn up by the bodies being compelled to do it are also subjected to an audit according to their specific legislation. The financial situations drawn up in order to merge, share or ceasing activity of the persons whose task is the audit of the yearly financial situation are also subjected to an audit. (Law no. 82/1991, art.34)

One may find other aspects about the audit in the Public Finance Minister's Order no. 3055/2009 which mentions the obligation of auditing the financial situations for the bodies which overpass at the balance time two of the three size criteria mentioned by the Fourth EC Norm.

The yearly financial situations drawn up by legal persons which at the balance time overpass the limits of two of the following three criteria : total assets: 3.650.000 euros, net turnover: 7.300.000 euros, average number of employees during the financial exercise: 50, are subjected to an audit according to the law. [1]

The yearly financial consolidated situations of the bodies are also subjected to an audit by one or more certified natural or legal persons under the circumstances stipulated by the law.

The Government Emergency Official Decision about the statutory audit expresses aspects included in the Norm 43/2006 CE, such as: certifying legal and natural persons, professional education and lifelong preparation, the public register, professional ethics, independence, objectivity, confidentiality and the professional secret, audit standards and reporting the Audit, quality assuring, the responsibility of the statutory auditor and of the audit company, the system of public surveyance, investigations and penalties

All the statutory auditors and the audit companies are the object of a system of assuring the quality, obeying to a least the following criteria:

- it shall be organized so that it should be independent from the controlled statutory auditors and audit companies and it shall be the object of the public surveyance;
- the financing of the system of assuring the quality shall be done without any influences from the statutory auditors or of the audit companies;
- the system of assuring the quality shall have enough resources. The Chamber and the Body of Public Surveyance shall assure the raising of the resources necessary to its functioning;
- the persons who perform the controls for assuring the quality shall have an adequate education and relevant experience in the statutory audit and in financial reporting, combined with specific preparation in the field of assuring the quality;
- the choosing of the persons who perform the controls of assuring the quality, is done on the basis of some objective procedures, designed so that one should be sure that there are no conflicts of interests between those who perform the

- controls and the statutory audit or the audit company;
- the applicability area of the control for assuring the quality, supported by an adequate testing of the audit files chosen include an assessment of the conformity to the existing audit standards and with the requirements of independence, of the quality, of the quantity of the spent resources, of the audit fees paid and of the internal systems of controlling the quality of the audit company;
 - the controls about assuring the quality are done at a period of time set according to the qualificatives got at the previous controls, but no more than 6 years, or 3 years, in the case of the auditors/public interest bodies, under the circumstances set by the regulations issued by the public surveyance body;
 - the general results of the activity done by the system of assuring the quality are published yearly;
 - the recommendations formulated at the end of the controls done in order to assure the quality shall be put into practice by the statutory auditor or by the audit company within the time set by the persons performing the controls for assuring the quality.

The Chamber is the competent authority in order to perform controls about assuring the quality.

The statutory auditors or the audit companies take the responsibility for any damage caused to their customers willingly or carelessly for which they shall conclude a compulsory insurance for covering the professional risks.

Performing the activity of statutory audit without having the quality of an auditor is a law infringement and it is punished according to the criminal law.

The national system of public surveyance of the activity of statutory audit is represented by all the bodies having approval responsibilities in the field of statutory audit, accountancy, by all the representatives of the professional bodies, the representative of the Justice Ministry, of the patronates and of the academic environment and all the relations and procedures which are set among these ones in order to perform the surveyance for the public interest.

All the statutory auditors and all the audit companies are the object of the public surveyance. The system has final responsibility about: approving and registering the statutory auditors and of the audit companies; adopting the standards about the professional ethics; the lifelong professional education; assuring the quality and performing control in order to assure the quality; assuring the investigation and discipline systems.

The penalties to be put into practice shall be efficient, proportional and discouraging and appropriately presented to the public.

The infringement of the stipulation of the Official Decision about the statutory audit of the yearly financial situations and of the consolidated financial situations by the statutory auditors and by the audit companies draws administrative, disciplinary, civil or criminal responsibility, according to the case.

The following ones are regarded as contraventions:

- The deeds of the associates, of the managers of the employees who do not have the quality of a statutory auditor in the independent exercise of the profession of an auditor on behalf of the audit company.
- Using the quality of a statutory auditor or of that of an audit company under other circumstances but those stipulated in OUG 90/2008.
- The exercise of the statutory audit activity without the yearly visa or by persons who are not recorded in the Public Register.

Steps: those stipulated at letter a above, with fine between 10.000 lei and 20.000 lei; those stipulated at letter b. above, with fine between 50.000 lei and 100.000 lei and the nullity of the drawn audit report; those stipulated at letter c. with fine between 10.000 lei and 20.000 lei.

The contraventional penalties are to be applied to the persons empowered by the Chamber and by the Public Surveyance Body.

The Disciplinary penalties applied by the Chamber to the auditors and to the audit companies are, according to the case: admonishing, written warning, suspending the right of exercising their activity on a period between 3 months and a year, the withdrawal of the certification accompanied by losing the quality of a statutory auditor.

4. Conclusions

A mission of audit cannot perform its role if the audit team does not know the elements of the following stages: the main objectives of the audit; the responsibilities that the auditor takes during performing his task; the specific objectives that the audit is trying to reach.

Without an understanding of these three stages, the planning of the audit and the collecting of the evidence along the mission will have no relevance.

Abstract

Agriculture is an important sector in South-West Oltenia. In communism agriculture in the region have an important contribution to the GDP. Currently the overall character of the area is subsistence farming (traditional). To reduce the effect of droughts, irrigation systems were built, used during the communist era. Unfortunately, nobody takes care about them and now creates a visual discomfort. People should be educated to support sustainable agriculture, using the technologies and agro-technical systems that preserve and regenerate the land: crop rotation, careful use of fertilizers, agro-forestry, terracing and mixed cultures.

Key words: agriculture, the region, sustainable development.

J.E.L. classification: O13

1. Introduction

When our country decided to join the European Union, the organization of national economic space in units appropriate implementation of regional development policies and develop an appropriate statistical system have become key elements of Romania's development policy in the European context.

Today Almost everything takes place under the banner of sustainable development, the company develops through the application of sustainable development must become sustainable education, industry and develop sustainable agriculture, research

needs to support sustainable development, water resources are sustainably used, etc..

We started this research in mind definition of sustainable development, now classic "model of development that ensures the well-being of human society today without compromising future generations similar opportunities, which I think is generous, emotional, that can motivate both individuals and institutions, but is very general.

So I asked how to determine whether the industry, agriculture contributes to sustainable development of the region. One of mankind's global problems, now is the national and even regional food security and environmental protection.

They talk about global "hunger crisis", which involves discussions on the question of providing food for the population at national level, with implications for each region. The sustainable development of agriculture crops made to understand that performance without destroying the biological basis of agriculture, protect the environment and food security of the population.

2. Sustainable Development of the South-West Oltenia Region

From the theoretical point of view, to benefit the sustainable development of the region would be that renewable resources not to be used only in relation to their regeneration rate and sources of raw materials to be used by man rather than as long as they can be replaced, both materially and functionally, as a renewable resource, while generating higher productivity. Should remain a temporary equivalence between time and intervention during the ongoing

processes in nature. This is a strong view of the concept of ecological sustainability and was conditioned by the fact that the discussion around sustainability has been marked since the beginning of the aspects of ecological modernization and the establishment of a new innovative environmental policies.

This situation should make us believe that economic and social functions will be treated equally. These factors are bound by certain rules of the game in terms of fair distribution of inter-and intra-generational tangible and intangible resources. Economic component, may ultimately most important, having a crucial development, because economic interests should be managed and regulated in a very special way. Realised price today of sexual exploitation or environmental degradation can no longer be tolerated in an economic system that bows to sustainability.

From an economic perspective, sustainable agriculture is manifested through successful commercial activities, which are doing less subsidies from the state, making it competitive. Persons employed in agriculture will not only gain from the production of healthy food and mostly regional marketing and processing, but in the sense of a multifunctional agriculture, and gain from other sources of income from tourism, the cultivation of raw materials or renewable energy production from biomass. In all these will add other sources of earnings, by honoring the raw state of environmental protection and natural conservation.

Sustainable development of agriculture is characterized in terms of organic soil that handles natural resources, water and air so that they are protected against negative influences of time. Specifically, this means that fertilizers and substances that protect plants should be used sparingly and with great care so that the land and waters near surfaces grown to be unaffected. Crops must allow the preservation of an environment characterized by diversity of species, and will encourage and genetic potential of crop plants or breeds of pets older.

And from a social perspective, it must ensure jobs in rural areas. Rational management of land ensures that by combining agricultural activities with environmental services to ensure sustainable rural development. The measures are

intended to ensure sustainable improvement of agricultural land use, to conserve and protect the natural landscape.

In the South-West Oltenia agriculture has an important role, with 1 million hectares for cultivation of cereals (mainly maize and wheat), oilseeds (especially sunflower), vegetables (soy, peas, beans, tomatoes, cabbage, leeks, onions) and fruit (apple, watermelon, melon, grapes), potatoes, sugar beets, production of honey, milk and milk products . It also produces good quality wine.

The soil in this region is favorable for cereals and vegetables, but as can be seen from the table above the cultivated area in the operating profile is continuously decreasing. I believe that the more we, as inhabitants of this region should benefit from every area of land to cultivate and harvest the fruit. You should not use other countries' agricultural products, the region has favorable soil, a favorable climate and skilled labor. South-West Oltenia has a very good agricultural potential, but very poorly capitalized, especially after 1990, due to the deterioration and disappearance of technical and organizational support and division of land. In 2008 the average yield of major crops is as follows:

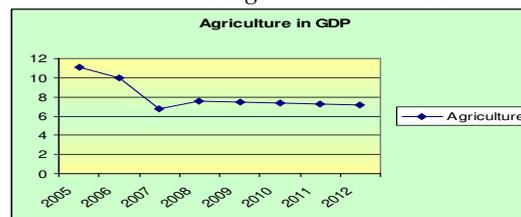

Table 1 - Average yield per hectare of major crops in 2008

- kg / ha -

South-West Oltenia	Total	Of which: private sector
Wheat andrye	3044	3043
Barley andbarley	2845	2844
Oats	1783	1776
Grain Corn	2843	2843
Shelling	1859	1870
Beans	1183	1183
Sunflower	1417	1421
Sugar beet	-	-
Soya bean	1.456	1.456
Potatoes	11.148	11.117
Autumn Potatoes	11.334	11.267
Tomatoes	14.192	14.197
Dry Onions	10.084	10.085
Cabbage	15.765	15.768
Melons green and yellow	16 953	16 953

Source: National Institute of Statistics, Regional Statistics Department Dolj.

Chart. 1 Agriculture in GDP

Source: Graph was made by the author based on data from the Department of Statistics

Overall character of the area is subsistence farming (traditional). To reduce the effect of droughts, irrigation systems were built, used in the communist period, especially in Olt county. Unfortunately, nobody takes care about them and now creates a visual discomfort. People should be educated to support sustainable agriculture, using the technologies and agro-technical systems that preserve and regenerate the land: crop rotation, careful use of fertilizers, agro-forestry, terracing and mixed cultures.

Distribution of the average total population in the region, highlights the prevalence of rural population with a number of 1,175,776 people (52.24%) than the urban population, which consists of 1,074,789 people (47.76%). Proportion of population in rural counties is as follows: Dolj - 46.15%, California - 59.52% Month - 54.57%, Mehedinti - and Gorj 51.35% - 52.78%. Note that Dolj and Mehedinti counties are below the regional average in terms of share of rural population.

Greater percentage of rural population and vast area of arable land, particularly in the southern region are predominantly agriculture sector in the regional economy.

So, the increasing number of people employed in agriculture and further fragmentation of land ownership reform, and the use of less advanced technologies, have led to a notable decline in labor productivity in this sector.

And in the South-West Oltenia Region, implementing the concept of Sustainable development is the basic premise of sustainable development of agriculture and territorial restructuring and socio-economic development of rural areas.

Even though the region has a substantial agricultural area, this area contributes to the region's GDP in a small way, somewhere around 7% and is in constant decline, as shown in the chart below:

In the region there are a number of farms analyzed with recognized nationally and internationally, who do not receive subsidies from the state and region who bring considerable income. Most important are wine farms in the area Drăgășani. Their development involves making labor as an important part of rural population to be trained in these fields. Always in the region have been using fertilizers and substances that protect plants economically and with great care so that the land and waters near surfaces not grown nor have they been affected.

Sustainable development of the region is to improve competitiveness agriculture and forestry. Restructuring the agricultural sector, which is absolutely necessary for the implementation of sustainable rural development, implies a constant for increasing the performance of agricultural holdings along with the introduction of environmental measures and rural social development. To achieve these objectives are necessary cost-cutting measures, the establishment or increase the size of farms, promote innovation, market orientation, investment in physical capital and human economic activities, production of quality products, environmentally friendly, using technologies cleaner. South-West Oltenia struggle for economic, social and environmental sustainable development hence effective.

Decisive role in the rapid and continuous acquisition and generalization of research results they have farms specialists (engineers, agronomists, horticulturists, veterinarians, engineers and economists) from all institutions at national and regional levels in the agriculture, the training of all workers in agriculture.

But we are fully convinced that the current conditions of the Romanian agriculture - South-West region ranking among countries European largest agricultural potential - with another technical and material specialists will find agriculture - will take the place of work and motivation that it is for the value of the land, the principles of sustainable agriculture, organic farming, a plentiful food healthy, eliminating the state of embarrassment that we all know, two-thirds of importers of food.

Let's hope for a wiser land policy promoted by the factors responsible for state-level and technical transformation of scientific achievements in a powerful force for progress and national dignity, the region will become net exporters of food products, taking a worthy place in the country and abroad.

Abstract

The objective of this study is to prove the existence of an inverse relationship between the unemployment rate and the vacancy rate, i.e. the Beveridge curve, in the case of Romania. Estimation of this curve allows the identification of friction and matching process between demand and supply in the labor market. This study is structured in three parts. The first concerns the analysis of theoretical background of the Beveridge curve. In the second part we made the graphic representation of this curve between 2004 and 2010 years. On this basis, we explained why Beveridge curve shifted to inward until 2008 year and to outward when Romanian economy entered into recession. In the third part of paper, we validated the existence of the Beveridge curve in Romania, using a VAR model with two lags.

Key words: Beveridge curve, VAR model, vacancy rate, labour market, hysteresis.

J.E.L. classification: E24, E27, J08

1. Introduction

In 1989 Olivier Blanchard considered that, until that moment, the importance of the Beveridge curve was underestimated by the macroeconomists, although the labour market evolution in the OECD countries could have been explained with this analysis tool. Other empirical studies have validated both the existence of the inverse relation between the rate of unemployment and the rate of vacancy for certain regions or countries (Coles and Smith, 1996; Petrongolo and Pissarides, 2001), and also its stability (Wall and Zoega,

2002; Valletta 2005). Three of the economists who have studied the effectiveness of the labour market based on the Beveridge Curve (Pissarides, Diamond, Mortensen) were rewarded with the Nobel Prize for Economics in 2010 year.

Romania's labour market was characterized in the past ten years, both by increasing jobs deficits at the beginning of economic recovery and by deepening of the vacancies in certain areas of activity, as a consequence of economic overheating between 2006-2008 years and of active population migration. The reduction of unemployment process started in the 2000 year has been stressed since 2005, which has reduced the NAIRU by about 7.5% at the end of 2004, to 5.5% in July 2008. The minimum effective rate of unemployment was registered in July 2008 - 3.7%, while the economic crisis has led to the rise of the unemployment rate up to about 7% at the end of 2009. Evolution of unemployment up in July 2008 was caused by increasing the flexibility of the workforce in context of favorable economic evolutions in Romania and in EU countries.

The mismatch process between the qualifications of the workforce and those required to fill a job on different segments of the labour market has increased the number of vacancies since 2006, up to a maximum of about 27.000 in July 2007. The entry in the recession of the Romanian economy caused a reduction in the number of vacancies up to a level of about 3500 in December of 2010 year.

The decrease of unemployment in Romania was determined increasing the number of job vacancies (the claims of those who were seeking a job were higher), while

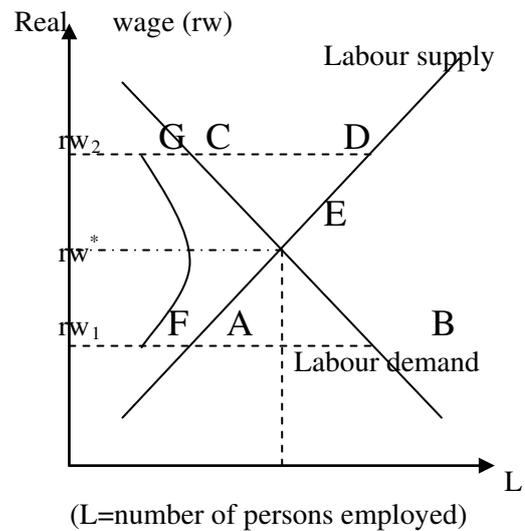

the economic crisis has depressed vacancies, in conditions of increase in the number of unemployed. Within this study, we used the Beveridge curve to explain both the matching process between supply and demand of labour in Romania, as well to estimate the degree of labour market flexibility. In light of changes in this curve, we estimated the direction in which changed the structural and cyclical unemployment.

2. Theoretical background of the Beveridge curve

One of the reasons for which deficits of the labour market are recorded consists of the lack of matching between the unemployed and the existing number of jobs vacancy in an economy. Thus, segments of the labour market (those which offer higher wages and better working conditions) can coexist with the segments in which there is a labour deficit, these ones being characterized by the constancy of a raised number of vacancy (those in which the wages are closer to the minimum wage, and the working conditions are difficult). However, the weak compensation of the surplus with the labour deficit can be caused both by the development differences of the regions, and also by disparities of the regional migration phenomenon.

The Beveridge curve can be derived from relationship between employment and real wage, and hence using the labour supply and demand curve. The equilibrium of the labour market is established at intersection between labour and demand curves. At point E are neither vacancies nor unemployed persons. If the real wage is below that level (rw_1), then the number of persons employed is lower than number of employment and distance between A and B measures the number of vacancies. If the real wage is above the equilibrium level (rw_2), then number of employment is lower than labour supply and distance between C and D represents unemployment.

Figure 1. The equilibrium of the labour market

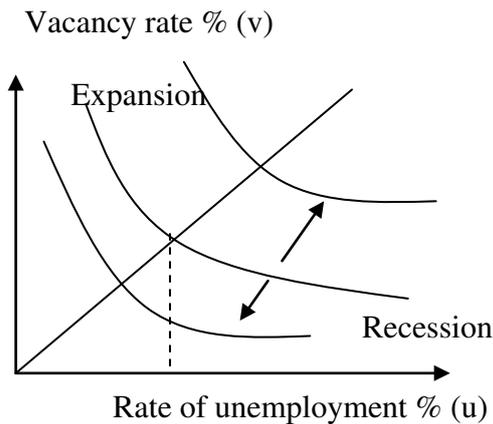

According to figure 1, each level of real wage different from equilibrium is characterized by one of labour deficit form – labour supply deficit (vacancies) or labour demand deficit (unemployment). But, in real economy, both labour market deficits coexist. In order to adapt the above graph to economic reality, we established the conditions existing at the same time of unemployment and of job vacancies. Thus, when the real wage is rw_2 , the employment will never be on the labor supply curve (point A), but at point F. The explanation is that some workers will not be able to find a job even though there are excess vacancies. This leads to unemployment measured by the distance between F and A, respectively to vacancies (AB). Also, when the real wage is rw_1 , employment will never be on the labor demand curve (at point C), but at point G. Under these conditions, some firms will not be able to find workers although there is excess supply of labour. This situation generates vacancies (distance between G and C), respectively unemployment (CD).

The curve GF highlights the correlation between unemployment and vacancies, in terms of both labour market deficits existence. The Beveridge curve can be derived starting from GF curve, but using unemployment and vacancies in terms of rates, dividing both variables by the labour force. Will results an inverse relationship between unemployment rate and vacancy rate, as in figure 2, where the 45 degree line

represents equilibrium in the labor market, which is point E in figure 1. Movements along the Beveridge curve indicate where the economy is in the business cycle. At times of a recessionary gap, there is low vacancy rate and high unemployment rate, and in an inflationary gap the economy experiences high vacancy rate and low unemployment rate.

Figure 2. The Beveridge curve

The changes of the Beveridge curve can be interpreted according to cyclical and structural factors that influence the real economy. Thus, the movements along the Beveridge curve are the result of cyclical changes of labour demand:

- The movement by flattened side of Beveridge curve signify the increase of the vacancies number and decrease of the unemployment, following the rising the economic activity or high demand. Thus, the probability of finding a job increases.
- The movement by inelastic side of Beveridge curve corresponds to decrease of vacancies and to increase of unemployment. If the economy is in recessionary gap, then aggregate demand is lower and the firms keep fewer jobs.

These movements explain the form of unemployment also. This is a cyclical one because reacts to changes of aggregate demand, so it will automatically decrease in expansion periods.

The shifts of the Beveridge curve are the result of structural changes in the real economy. Therefore, it results a higher or lower unemployment rate for a given vacancy rate, that have been interpreted as reflecting structural changes which affect the

matching between jobs and unemployed workers. There are four categories of factors could explain the outward and inward shift of the curve: composition of the unemployed population and the labor force, institutional factors affecting the matching efficiency between unemployed workers and job vacancies, business cycle, and other structural shocks such as productivity growth and reallocation of employment across sectors and regions.

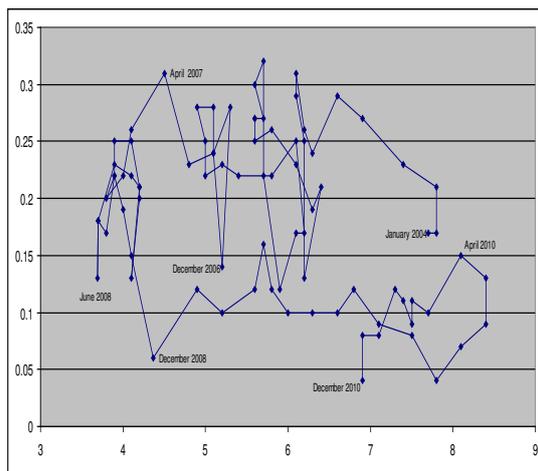

- If the Beveridge curve shifts inward, then will decrease the structural unemployment, the labour market frictions will be smaller and the matching process will be more efficient. Frictions can be due to information imperfections, skill mismatch, location mismatch or lack of workers' motivation. The mismatch could decrease due to changes in employment protection legislation, labour market policies and to increase of economic incentives for labour force.
- If the Beveridge curve shifts outward, then will appear a hysteresis effect of structural unemployment. The higher level of unemployment will be persistent and the vacancies will adjust rapidly. The unemployed must re-qualify to find a job, but number of vacancies is very limited.

3. The changes of Romanian Beveridge curve in the last seven years

Graphical representation of the Beveridge curve for Romania highlights increasing compatibility between vacancies and the unemployed in the context of economic expansion since 2004 year. According to figure 3, the curve inward shifted until the end of 2008 year, which corresponds to a significant decrease in structural unemployment (the unemployment rate is plotted on the horizontal axis and the rate of vacancies on the vertical axis, both sizes as percentage). This process has intensified since 2007 year, as a result of overheating the economy and labour migration. The minimum level of unemployment rate was achieved in July of 2008 year, at the level of 3.7%, the vacancy rate in that month being 0.18%.

The recession in that has entered the Romanian economy from the fourth quarter of 2008 year has generated in the first phase a rise of cyclical unemployment to a level of 5% (at the end of the year), after which a rise of the structural unemployment up to 8.4% in early 2010 year. Classification of unemployment in cyclical and structural can be based on the change curve Beveridge. Thus, in the first phase occurred a movement along the curve, then an outward shift of this. Therefore, increasing unemployment in Romania has a strong structural component, driven by job losses in sectors that have sustained economic growth (especially in real estate). Under these conditions, the unemployment rate decrease to levels lower than 5-6% can be achieved in terms of promoting sustainable economic growth and structural reforms (including labor market).

Figure 3. The Beveridge curve in Romania (2004 – 2010)

Source of data: Romanian National Institute of Statistics (2011)

4. Estimating the Beveridge curve with a VAR model

In order to estimate the inverse relation between the vacancy rate and the rate of unemployment in Romania, we estimated the Beveridge curve for the period between 2004 and 2010 years, by using monthly data series offered by the National Institute of Statistics (2011). The econometric model is described by following equation:

$$\log(u) = \alpha_0 + \alpha_1 \cdot \log(v) + \varepsilon \quad (1)$$

In the economic literature, the equation above was tested depending on the lagged values of the rate of unemployment, because lack of stationarity of these variables.

Using monthly data series, we observed the seasonality phenomenon in the case of unemployment and vacancy rates, so the increase in the rate of unemployment and by the decrease in the vacancy rate during the period between November and February of the consecutive years included within this paper. In order to eliminate the influence of the seasonal factors, we have used the de-seasonality of the data series by using the Census X12 procedure from Eviews 6 econometric package. During the period between 2004:1 and 2010:12, the rate of unemployment recorded an average value of 5.74%, a maximum value of 8.04% in March 2010 and a minimum value of 3.86% in May of 2010 year. The mean of the 84 observations for the rate of vacancy was of 0.18%, the maximum being 0.29% in January 2007, and the minimum value by 0.08% in October 2010.

In order to correctly identify the VAR model which describes the relation between the two variables, we have checked their stationarity hypothesis. The stationarity of a data series supposes that its stochastic features, respectively the average, the dispersion, the covariance are constant and they do not vary with time. Moreover, a stationary series tends to return to the average value and to fluctuate around it (it has a finite variance). On the contrary, a non-stationary series has an average which differs with various moments in time. If we analyze, based on the ADF test, the stationarity hypothesis for the two series expressed in logarithm, we can notice the acceptance of the initial H0 hypothesis, and this supposes the existence of a unit root (table 1). The two series used are those seasonally adjusted.

Table 1: Stationarity test of the variables included in Beveridge curve

Critical values of t statistics	$\log(u)$ ADF(0)	$\log(u)$ ADF(1)	$\log(v)$ ADF(0)	$\log(v)$ ADF(1)
	-2.3029	-3.2924	-2.3100	-12.935
1%	-3.5133	-2.5934	-4.0738	-2.5934
5%	-2.8976	-1.9448	-3.4655	-1.9448
10%	-2.5861	-1.6141	-3.1593	-1.6141

Source: our estimations in Eviews 6

According to the ADF test, the data series of the rate of unemployment and of the vacancy rates become stationary with the first difference, so the ADF(1) values are lower than those corresponding to the significance thresholds included in the table. In order to use stationary time series, we have calculated the first differences of the two variances:

$$\begin{aligned} d \log(u) &= \log(u) - \log(u - 1) \\ d \log(v) &= \log(v) - \log(v - 1) \end{aligned} \quad (2)$$

As the two variables of the model are stationary, we have created a VAR model in order to estimate the way in which the change of vacancy rate influences the unemployment rate. For the purpose of selecting the number of the model's lags, we have used the Akaike (AIC) and Schwarz (SIC) selection tests, according to which the optimum lag is selected depending on the minimum values of these information criteria. According to them and to the *lag exclusion test*, we have estimated the existence of two lags within the VAR model, which has the $d\log(u)$ and $d\log(v)$ as endogenous variables. Moreover, this VAR model of the 2nd order is also characterized by the highest value of the adjusted R² coefficient, namely 0.65. The VAR model is stable, all the four roots of the polynomial have values expressed in module which are lower than 0.87, thus meeting the condition to be inside the circle with the radius of 1. The residual VAR also meet all the necessary conditions for a good representation of the model: normal distribution, absence of heteroskedasticity and errors autocorrelation.

The VAR model with two lags has all coefficients statistically significant, as it results from the analysis of the t statistic criterion, which suggests a good representation of the relation between the rate of unemployment and the vacancy rate. According to the model, increase with 1 percentage point of the unemployment rate variation during the previous period leads to 0.54% increase of actual unemployment rate, what generates a persistent unemployment. The impact upon the current variation of rate of unemployment gets decreased in the case of variable lagged with two months. The relation between the first difference of the rate of unemployment (u) and the one and two months lagged differences of the vacancy rate (v) is negative and it is

statistically significant, and this fact confirms the inverse relation between the two variances. Thus, a 1% increase of the v variance, which is lagged with one lag, is reflected in the 0.05% decrease of the rate of unemployment variation (table 2).

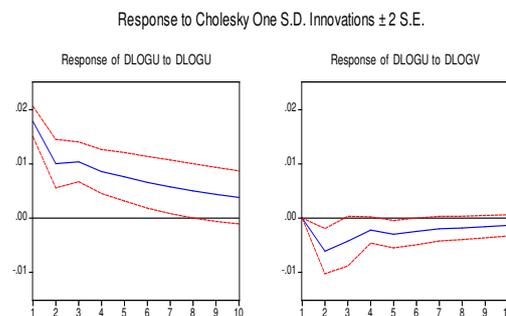

Table 3: The results of the VAR model estimation
- dependent variable: $d\log(u)$

Variab le	Coefficient	t statistics
$d\log(u)(-1)$	0.54	4.88
$d\log(u)(-2)$	0.25	2.27
$d\log(v)(-1)$	-0.06	-3.02
$d\log(v)(-2)$	-0.03	-1.79

Source: our calculations in Eviews 6

We have finalized VAR analysis using *impulse response function*. Figure 4 shows that the increase of the unemployment rate with 1% in t month leads to rise of unemployment rate with 0.2% during the month $t+1$, followed by a slight decrease during next months. The total impact of rising unemployment disappears after 30 months. The increase of vacancy rate with 1% leads to unemployment rate decrease with 0.06% after first month, the impact being neutralized after 20 months. The analysis of the response function suggests the occurrence of some consistent impulses upon the rate of unemployment during the period between 2004:1 and 2010:12, and this aspect may be explained by the existence of some different forms of the Beveridge curves during the period between 2004 and 2008 years and between 2008 and 2010 years. The decrease up to elimination of the impulses upon the variance $d\log u$ strengthens the stability feature of the used VAR model.

Figure 4. Responses of $d\log u$ to the $d\log u$ and $d\log v$ impulses

Source: our estimations in Eviews 6

5. Conclusions

Beveridge curve is a useful tool to identify both frictions and compatibilities on the labour market, but the nature of the unemployment (cyclical or structural) depending to economic activities evolutions. Based on the theoretical foundations of the Beveridge curve, we explained its change in period 2004-2008, respectively from 2008 to 2010 years. If in the first sub-period was recorded a decrease of both structural and cyclical unemployment, in second part it registered a significant increase of the structural unemployment. To assess the validity of the inverse relationship between unemployment and vacancy rates, we used a VAR model in which we included those two variables expressed as first difference. The results revealed the persistence of high unemployment in Romania and the existence of a coefficient of elasticity of the rate of unemployment at 0.06%.

Abstract

Infrastructure represents a national strategic objective and a high priority is given within the Romanian public policies. Financial assistance is received through the European Programmes to support country's efforts to develop and implement infrastructure projects. Despite the funds allocated for this area, the absorption level is low at national level.

Selection of the most appropriate and relevant infrastructure projects is an important task. The technical and financial evaluation of the applications submitted for financing is the most important stage of the evaluation and enables the selection of the projects that will be financed. Various criteria are assessed, like the opportunity of the project, the relevance for the public programme, the quality and sustainability of the project etc.

The present paper envisages to presenting the results of the study undertaken to identify the critical aspects that need to be taken into account in the evaluation of the infrastructure projects. The methodology applied in the study is based on in-depth analysis of existing documentation for elaboration of infrastructure projects, evaluation reports prepared by the individual evaluators and European Programmes progress. It also includes the extensive practical experience of the authors.

Key words: infrastructure projects, European Programmes, evaluation, public funds, Romania

J.E.L. classification: M 21.

1. Introduction

Selection of good infrastructure creates the premises for a successful implementation and development of existing infrastructure elements.

The aim of the present paper is to show the critical aspects that need to be addressed during the evaluation. The chapter 2 displays the main strategic documents and the available European funds in Romania through the Sectoral Operational Programmes. Then in chapter 3 is detailed the evaluation framework and the assessment stages of the applications submitted for financing. The chapter 4 emphasizes the critical points that require higher attention in the evaluation process. The last chapter presents the conclusions and several recommendations to be considered for a higher absorption of European funds.

The article is based on a desk research study based on in-depth analysis of public available documents and author practical experience in evaluation of projects financed through European Funds.

2. European Programmes that Finance Infrastructure Projects

The National Development Plan (NDP) for 2007-2013 represents the main strategic document defining the Romanian national policies. It sets out specific objectives in line with Lisbon Strategy and Göteborg objectives, which establish the national development priorities related to infrastructure: developing and modernizing transport infrastructure, protecting and improving the quality of the environment, diminishing development disparities between

country regions.

Further, these are detailed within the National Strategic Reference Framework (NSRF) for 2007-2013, which is the national strategic document that creates the links between the Romanian development priorities and the European Community ones. Thereby, development of infrastructure at European standards is one of the four thematic priorities. NSRF explains how the European Structural Instruments are implemented in Romania for the programming period 2007-2013, through the Sectoral Operational Programmes (SOPs).

The infrastructure investments are financed through the following SOPs:

- **Regional Operational Programme (ROP)**, financed through European Regional Development Fund (ERDF) – infrastructure projects for regional development, urban growth, local infrastructure, social infrastructure,
- **Sectoral Operational Programme Environment (SOP Environment)**, financed through European Regional Development Fund (ERDF) and Cohesion Fund (CF) – infrastructure projects for environmental infrastructure, water and wastewater systems, waste management systems, rehabilitation of historically contaminated sites, natural risk prevention,
- **Sectoral Operational Programme Transport (SOP Transport)**, financed through European Regional Development Fund (ERDF) and Cohesion Fund (CF) – modernization and development of transport systems,
- **Sectoral Operational Programme Increase of Economic Competitiveness (SOP EC)**, financed through European Regional Development Fund (ERDF) – energy related infrastructure, IT&C infrastructure, R&D infrastructure.

For each of the Sectoral Operational Programmes are launched Calls for proposals and the interested applicants have to submit their applications for financing based on the requirements set out in the Guidelines for Applicants. The financing applications consist of various documents, including a predefined Financing Application Form, detailed project description, property documents and rights if the case, applicant's

declarations and certificates, Master Plan and Feasibility Study, institutional analysis, curricula vitae of the team etc.

Using the official statistical data centralized at national level for each of the Sectoral Operational Programme, we have elaborated the following two tables that show for the four SOPs taken into account the low absorption of the European funds. Table 1 presents the amounts contracted by end of February from the total available funds and Table 2 presents the number of contracts signed compared with those submitted.

Table 1. Situation of funds contracted per SOP at 28 February 2011

Values in lei	Allocated amounts for 2007-2013*	Contracted amounts 28 Feb 2011		
		EU	National	Applicant
ROP	15,863,165,050	8,842,642,743	1,272,701,953	775,172,674
SOP Environment	19,211,390,366	9,357,212,300	1,893,235,535	247,059,198
SOP Transport	19,439,021,440	2,956,919,334	978,176,482	0
SOPEC	10,874,345,207	3,637,762,515	618,661,135	1,306,871,539

* infleuro exchange rate

Table 2. Situation of applications per SOP at 28 February 2011

No of applications	Submitted	Approved	Signed contracts
ROP	7616	1357	1131
SOP Environment	292	174	164
SOP Transport	71	42	38
SOP EC	7705	2334	1586

3. Evaluation Process of Infrastructure Projects

The European Commission defines "evaluation" as an independent analysis of an intervention taking into account the results achieved, the impact estimated and the needs addressed to be satisfied.

The evaluation is made by independent consultants with experience in the field, usually following a tender procedure for technical assistance and selection experts undertaken by the Managing Authority of each SOP. Confidentiality and Impartiality Statements are signed by each evaluator.

The evaluation criteria are compulsory and are presented within the Guidelines for Applicants for transparency, along with the detailed evaluation grids that will be used during the evaluation.

The applications are assessed from three points of view:

a) **administrative compliance** – administrative aspects are assessed, including: submission of application within the deadline, correctness filling out of the forms, provision of all the requested documents, certificates, studies etc.

b) **eligibility verification** is two-folded:

- *eligibility of the applicant* – the eligible applicants are defined in each Guidelines for Applicants and only those entities are entitled to receive funding and may include county councils, city/town halls, utility companies, intercommunity agencies, etc. On the other hand, an eligible entity should have the capacity to implement the project, to provide the co-financing part, to respect all the institutional, legal and financial criteria, etc.
- *eligibility of the project* – the proposed project for funding should have objectives in line with the call for proposals scope, to include activities that under financed under that specific call, to respect the legislation for environment, public procurement, energy efficiency, horizontal themes, the duration and requested required funds comply with the call for proposals criteria, etc. In the same time, the proposed activities should not benefit of other public financing.

These first two evaluation stages are usually conducted by the experienced staff of the Managing Authorities/ Intermediate Bodies. The administrative compliance and eligibility criteria are assessed with YES/NO and a “NO” for any of these criteria leads in rejection of the whole application.

c) **technical and financial evaluation** – this represents the actual evaluation of the application. During this stage, the project objectives, results, activities, resources involved are assessed, as well the importance, technical solutions and methodology proposed, in other words the:

- relevance and opportunity of the project,
- maturity, quality and sustainability of the project.

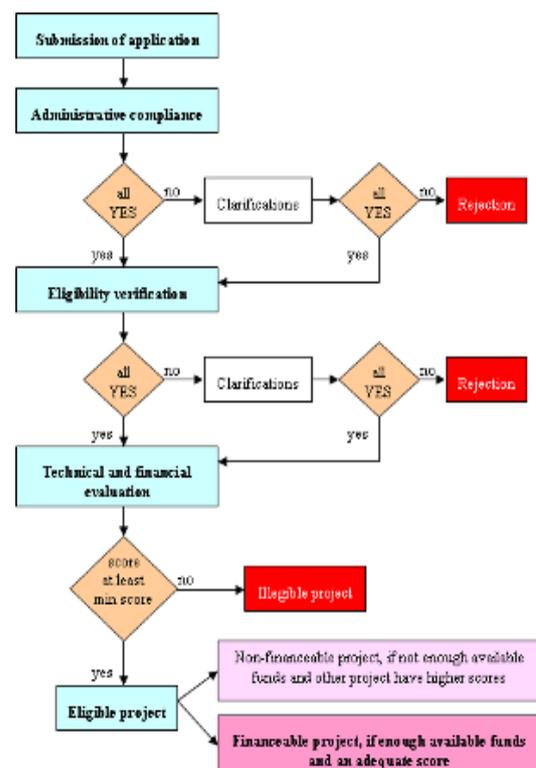

The technical and financial evaluation enables the selection of the projects that will be financed.

Independent evaluation of the applications is needed in order to ensure a better objectivity, as well as that specialized expertise is needed. Thus, the third evaluation stage is performed by independent evaluators. For projects with higher budgets, like those over 25 million euro under SOP Environment, beside the national evaluation European Commission’s approval is requested.

The evaluators assess the project from the technical and financial points of view and score each of the criteria as defined in the Guidelines for Applicants.

Figure 1 summarizes and presents the evaluation process in a logical flow from the submission of an application till it passes all the stages and is considered an eligible project that can be contracted.

Figure 1. Evaluation process

Source: Proceedings ICBE Brasov 2010, pp. 275-278

If a project is considered illegible because the application scores below the minimum threshold, it does not mean automatically that the project is not good, but that the project is not significantly in line with the SOP objectives, or that it is not enough elaborated,

or that has to be reviewed.

Once a project is considered eligible, a financing contract may be signed depending on funds available.

4. Critical Points in Evaluation of Infrastructure Projects

The Tables 1 and 2 presented above show that a high number of applications are rejected or receive low scores that determine the evaluated projects to be rejected or considered illegible. These reasons are various and in this section we present several points considered critical, that require attention and can contribute to increasing the number of eligible projects and creating premises for a higher absorption of European funds in Romania.

a) Evaluation has to be made based on responsibility for public money

Responsibility for public money requires paying special attention to assessing Government actions. Taking this into account, the evaluation of projects funded from public funds should focus on selection of projects relevant for the community, in line with the established priorities. As at programming level the evaluation is considered as a process that allows independent analysis of the benefits of a public funded intervention, the evaluation of the applications for financing should aim to select projects based on their impact, their efficiency and effectiveness, their continued relevance for the beneficiaries needs, their results sustainability etc.

b) Evaluation has to be objective

Projects need to be selected based on objective criteria. Assessment has to be performed by individuals/ entities outside the control or influence of those responsible for the development or implementation of actions. Objectivity and impartiality of the evaluators has to go beyond provision of a sworn statement and direct checking of the implication in the elaboration of the application that will be evaluated and interests in relation between the evaluator and evaluated project need to be conducted. Evaluation needs to take into account only the application and established criteria.

c) Evaluation has to be made by professionals

If in the case of the administrative compliance and eligibility verification the assessment can be made by persons who are acquainted with the Guidelines for Applicants and familiarized with documentation required for applications, the technical and financial evaluation has to be performed by specialized persons, who have extensive knowledge and expertise in the evaluated field. Understanding the procedures is not enough and extensive experience in the infrastructure field is needed, both in terms of technical and financial aspects.

d) Evaluation of technical documents

- evaluation of Master Plans

Master Plans provide an overview on the investments foreseen in an area as strategy and represent the base for the Feasibility Studies and other following documents of the project. Therefore, the evaluation of Master Plans is important and should focus on:

- checking the data provided to justify the proposed investment on three levels: horizontal, vertical and external,
- forecasts are made for the entire lifetime and are clearly correlated with the major assumptions,
- all existing deficiencies are explained in a precise and quantitative manner to justify the need for investments,
- sufficient strategic options are considered to identify the proposed technical solutions,
- all envisaged locations for the new infrastructure are suitable and available,
- all institutional aspects are taken into consideration,
- affordability to paying for public services is substantiated,
- a list of priority investments is clearly defined, and include a long-term investment plan,
- the applicant understands and accepts his obligations regarding the co-financing part for project implementation.

- evaluation of Feasibility Studies

As the Feasibility Studies are the base for the Technical Project/Detailed Design and getting construction approvals, their evaluation of should focus on the following aspects:

- detailed relevant analysis of the existing infrastructure in the target area and considered for funding,
- correlation of the project objectives with those at national/regional level,
- accurate quantification of established targets,
- provision of adequate estimations of demand for services/ operating standards, to justify the proposed measures,
- detailed relevant description of possible alternatives (size, location, investment, operation and maintenance costs etc.),
- criteria used to identify the optimum investment option (in terms of achieving targets and to compliance with regulations, with minimum costs, minimum environmental impact and minimum risk to public health),
- identification of the optimum alternative and explanations provided for selection,
- quantification of benefits and specification of performance indicators,
- description of the investment budget and the operation and maintenance costs,
- project implementation plan and procurement strategy.

Even that not always the Guidelines for Applicants clearly specify the provision of the approvals and agreements requested by the National Legislation (like those mentioned in the Urban Certificate – utilities, environment, health, emergency situations etc., Natura 2000, heritage agreement), the evaluation of the Feasibility Studies cannot be performed in their absence.

The percentage of the corresponding criteria in the technical and financial evaluation grid does not presently reflect the importance of the Feasibility Studies. A higher attention in elaboration of the Feasibility Study should be given as the technical specifications have direct financial implications, and may lead to the impossibility of implementing/ finalization of the project.

e) Evaluation of financial aspects **- evaluation of Project Budget**

The project budget included in the financing application should be detailed to a degree that allows a proper financial assessment. Presenting only the main chapters may hide illegible costs.

- evaluation of Cost-Benefit Analysis

The Cost-Benefit Analysis should be made in line with the cost-benefit analysis guidelines. Evaluation is focused on the options from the financial and economic point of view, the justification of the selected variant, the sensitivity and risk analysis, the calculation of financing needed and the financing sources taken into consideration or already available.

The budget presents as well a forecast based on the existing financial accounts and the financial indicators are different for public institutions than for private operators.

f) Consideration of other aspects

- institutional analysis

Institutional Analysis is frequently put aside. It takes into account the definition of the institutional structure (human resources, revised organization chart etc.), management capacity, financial capacity, methodology for project implementation, relationship with other institutions, financial and operational management, quality indicators of the project etc.

- internal factors

There are several internal factors within the organization that determine the success or failure of a project. These include the following:

- inadequate evaluation of the resources needed for the project,
- faulty planning of project activities that undermine the possibilities to successfully achieve the proposed results,
- logistics and backstopping issues,
- inadequate allocation of project resources (human, financial and material),
- organizational inefficiency.

- quality management plan

Quality assurance is the ultimate target without being a demagogical statement. A quality management plan and clearly defined procedures create the premises for achieving the desired objectives.

- risk management plan

A good project includes a risk management plan that can overcome the impact of unpredictable factors and provides a framework to tackle the various problems that a project can face during the implementation.

5. Conclusions and recommendations

The impact and importance of good and viable infrastructure projects for Romania's development is well recognized. The financial assistance provided by the European Union supports national efforts in this sector. As the absorption level is low compared to allocated funds, identifying and understanding the critical points in evaluation of the submitted applications can help.

Several solutions are considered to diminish critical aspects identified:

- provision of detailed, concise and clear training for the potential applicants on how to prepare financing applications, emphasizing the key points and presenting the common mistakes,
- elaboration of more structured Guidelines for Applicants, underlining the important issues, to facilitate preparation of applications and evaluation of the projects, like enclosure of a detailed checklist with the studies and technical expertise required if the case,
- promotion of the call for proposals well in advance and provision of enough time for project preparation,
- establishment of help-desks able to clarify various aspects and to screen and orientate potential applicants,
- evaluation of the whole application should better assess the coherence of the documents provided and the justification of the technical-economical solution proposed,
- observations and recommendations included in the evaluation report should be concise and clear, to provide the foundation for designing future financing schemes,
- establishment of a better evaluation framework that allows the selection of the most appropriate projects that respond to specific community needs, and which provide higher benefits compared to the related costs.

Once the critical points are identified, further analyses can be conducted to identify possibilities to improve the evaluation procedure of infrastructure projects.

Abstract

This article reviews recent developments in leadership that are to upgrade the pre-existent knowledge in this field. Also, it discusses the shift towards the language of performance outcomes used increasingly to describe leaders and leadership and the changing political and economic environments in which educational leaders act. As governments worldwide articulate the rhetoric of a 'knowledge economy', traditional cultures of education management and leadership are found to be wanting. At the same time, growing recognition that market and managerial reforms have not improved levels of educational performance, has increased government interest in the transformative powers of business and charismatic leadership. This paper considers this phenomenon with reference to the changing conditions of corporate leadership taking place in the education sector. In so doing the paper seeks to examine how principals and senior managers mediate changing education policy agendas in a sector recovering from an intense period of financial crisis, industrial action and low staff morale. The paper concludes with an example of visionary leadership in education.

Key words: educational leadership, adaptive change, knowledge

J.E.L. classification: M19

1. Introduction

In a world in perpetual motion, evolving from year to year, organizations keep their importance in the life of any individual. In organizations, man builds or loses his identity, his inner self is affected or shaped according to his own will. By their structures, mechanisms and purposes, organizations are producing a certain type of man and certain types of behaviours, called organizational man, respectively organizational behaviour. In turn, man and organizational behaviour are profoundly affecting and influencing the organizational life and effectiveness.

Making a natural analogy within the current education environment, we discover the academic ecosystem that produces people of a certain kind, so that then to "acclimatize" them for the ruthless jungle of the society where they will be able to enjoy the results of their and others' academic training, through the society's network system. It results from here the need to acknowledge a special kind of leadership, ethics and social responsibility which are applied in the first instance, to the academic function, in order to gain access to a generalized competitive organizational system.

2. The written and unwritten history of Leadership: from Charisma to Consensus

Nearly 100 years ago, the renowned political and social theorist of German descent, Max Weber, introduced the notion of "charismatic leadership" as an antidote to his grim prognosis for industrial society.

Without such leadership, the author has predicted that "not summer's bloom lies ahead of us, but rather a polar night of icy darkness and hardness." Since then, the notion of charisma has endured, alternatively attracting and repelling us as a function of events in the world at large. In the chaos that followed World War I, many scientists continued to see powerful leaders as a sort of Messiah. But in the aftermath of fascism, Nazism and the World War II, many scientists have turned against the notion that only character determines the effectiveness of leaders.

On the contrary, scientists began to favour "contingency models" which focus on the context in which leaders operate. For example, studies carried out in the '60s and '70s by the influential social psychologist Fred Fiedler at the University of Washington, suggested that the secret of good leadership lies in discovering "the perfect match" between the individual and the leadership challenge he or she confronts. For every would-be leader, there is an optimal leadership context; for every leadership challenge, there is a perfect candidate. This idea has proved to be a big money-maker; it underlies a multitude of best-selling business books and the tactics of corporate head-hunters who promote themselves as extraordinary individuals who manage to make mergers.

In fact, such models have delivered mixed results to humanity, contributing to a partial resurgence of charismatic models of leadership in recent decades. In particular, James MacGregor Burns and his work on transformational leadership in the late 1970s rekindled the view according to which only a figure with a specific and rare set of attributes is able to bring about necessary transformations in the structure of organizations and society.

How, then, do we get beyond this frustrating turnabout between those who argue that an effective leader can overcome circumstances and those who retort that circumstances define the leader? In our view, strong leadership arises out of a symbiotic relationship between leaders and followers within a given social group and hence requires an intimate understanding of group psychology.

In the 1970s Henri Tajfel and John C. Turner from the University of Bristol in England, performed seminal studies on how groups can restructure individual psychology. Tajfel introduced the term of "social identity" to refer to the part of a person's sense of self that is defined by a group. As Turner pointed out, social identity also allows people to identify and act together as group members - for example, as Catholics, Americans or Dodgers fans. Social identities thus make group behaviour possible: they enable us to reach consensus on what matters to us, to coordinate our actions with others and to strive for shared goals.

Tajfel and Turner's original social identity framework does not refer to leadership explicitly, but it helps to clarify why leadership requires a common "us" to represent. Leadership theorist Bernard Bass of Binghamton University has shown, for example, that leaders are most effective when they can induce followers to see themselves as group members and to see the group's interest as their own interest.

The emergence of social identity helps to explain the transformation in the strategies of rulers associated with the birth of modern nation states in the 19th century. According to historian Tim Blanning of the University of Cambridge, before national identities emerged, monarchs could only rule as autocrats, using power (rather than true leadership) to control people. But once people identified with nations, effective monarchs needed to rule as patriots who were able to lead the people because they embodied a shared national identity. Monarchs such as Louis XVI of France who misunderstood or ignored this shift, literally lost their heads.

In the context of the current situation, identifying with a structure meets the adaptive change - it starts from leaders who create and communicate their vision. Choosing the appropriate leadership style might be the best first step that a manager should make him towards sustainable development.

History attests many successful models of leadership, each with its own unique characteristics that are perfectly appropriate to certain situations. Leadership based on providing an example is perhaps the most powerful leadership style. Napoleon and

Patton led by giving an example to others and were widely admired by their troops because they led them into battle; but not all leadership situations occur in dramatic circumstances, such as those we encounter on the battlefield.

Leadership characterized by making difficult decisions in difficult times, the discernment and the ability to survive over a long period of time represents another powerful model.

In conclusion, leadership represents a phenomenon of influencing the subordinates' behaviour by using tools of psychosocial nature (motivation, involvement in achieving objectives, generating satisfaction). Ordway Tead defines leadership as "the art of influencing people to cooperate toward some goal which they come to find desirable" (The Art of Leadership). Also, The Collins English Dictionary gives several meanings for this term, including the ability to lead. Leadership can be viewed as a group dynamic process by which a person manages to determine by influencing other group members to voluntarily engage in group tasks or goals, over a certain period of time and in a particular organizational context. One can observe from most definitions of leadership that the leading process has a psychosocial nature because it is based on three fundamental elements: group, influence and purpose.

A very important aspect is that leadership is based on team spirit, which consists of the employee acceptance to think, act and behave harmonized, consistent with a well-defined and common purpose.

Among the major issues that organizations are facing today is one linked to adaptive change, which especially applies in the academic environment. Thus, changes occurring within society, on the market, at customer and technology level have forced organizations to develop new strategies and courses of action. Mobilizing people to adapt to new conditions represents one of the most difficult tasks of a leader.

Regarding the identification of adaptation challenge it is implicit that - when the organization cannot learn with proper speed to adapt to the new trends and challenges, it risks going irreversibly to decline. Heifetz and Laurie believe that to successfully overcome the adaptation obstacles, managers

must overcome prejudices according to which a leader commands and the employee performs. Solutions to achieve adaptation imply the collaboration of all members of an organization and to assume a collective responsibility to problematic situations they face.

A leader, regardless of his level and how he is invested, must support people in facing new challenges, in accommodating to new values, in changing perspectives and learning new rules.

3. The current model of educational leadership. Case Study: University of Bucharest, Faculty of Business and Administration

Theoretical elements presented in this paper find their application both in curricular and extracurricular activities of the Faculty of Business and Administration. Leadership functioned equally successful in developing the educational capacity of the Faculty of Business and Administration (Fig. 1) as in developing the attitudinal capacity of the Faculty of Business and Administration (Fig. 2). Reality has shown that an academic system is complete when the informational system is supported by practice. Here we can also consider volunteering. (Fig. 2)

Educational leadership is seen as a first class catalyst for adaptive change at the society level.

In our view, education is by far the number one public project of Romania in the next 20 years. The historical stake is the success or failure in terms of Romania obtaining on 1st of January 2007, the status of European Union member state.

The transformation of the School in Romania through a process of adaptive change starts at the vision of implementing an authentic educational system, which is cultivating values, which is useful and attractive.

Adaptive change generates discomfort, because, by its very nature, imposes significant losses for those facing this change: status, beliefs, attitudes, habits. To actually achieve in fact this adaptive process, Ronald A. Heifetz identifies the available resources of the leader and group within the educational context, resources that are

dealing with change (Heifetz emphasizes the importance of separation between technical problems and problems of adaptive nature, the first using the ingredient of the exerted authority and the last ones exploiting leadership processes for adaptive solutions.):

- *Gaining the group's attention.* This is a critical source of power and a resource that the leader can use to calibrate the focus on priority areas for action;
- *Accessing the information needed for change;*
- *Articulating problems and formulating questions,* ways in which the meaning of the actions is transmitted and the main directions of effort are being establish;
- *Orchestrating the conflict.* Managed intelligently, conflict is productive. Leaders can use dissonance and differences to determine to engage in the adaptive effort;
- *Choosing the team* (participants). To decide the participants in the crucial conversations and decision-making represents a powerful resource to influence the desirable results.

Educational leadership manifested in the circumstances of adaptive challenges must have the ability to manage long periods of anxiety and also to very accurate evaluate the group's ability to handle different levels of stress. There are several key factors that can help a group to perform tasks of adaptive nature:

- Internal cohesion;
- Confidence;
- Clear delineation of tasks;
- External structure of authority.

The adaptive challenges often emerge in the form of essential questions and the adaptive solutions are formed from the formulation of responses to essential questions:

- *What should I learn as a person and all of us, as a community of teachers?*
- *What should we keep and what should we give up?*
- *What values to cultivate in ourselves and in those we teach?*
- *I want to go enter this process of transforming School as a system*
- *Is it worthy to remain until the end?*

Here are, for instance, three illustrative examples of the projects axiomatic of transforming the School as a system in Romania, which means as many the most complex challenges for their immediate protagonists - pupils, students, teachers, education system - as for society in its whole:

- Achieving the strategic objective of generating sustainable highly competitive human resources, by allocating – starting from 2012 for at least 4 years - 8% of GDP under “Public expenditure for Education”;
- Placing the system of public universities on the principles of quality and competitiveness defined by the Bologna Process, with the goal that by 2020 at least one university in Romania to be included in the top 500 universities in the world, in accordance with any of the certified criteria systems and classifications;
- Implementing the project of teaching career, from the vision of a modern strategy for developing the human resource from education which confirms the dignity and the first class social status of the profession of being a teacher. The design parameters of the new model of teaching career are: the existence of career options and career transition with clear entry / exit points; the development of teaching skills and attitudes; continuous training; personal development; motivating financial offer provided on merit basis; conversion training.

To put on the public agenda projects such as those mentioned earlier out and to determine the responsibility of putting them into fact until the end means in terms of Dean Williams, managing a separate set of “real” leadership challenges, where the prevalent nature of orchestrating change is the adaptive one (“The crisis” challenges identified by Williams in his book, "Real Leadership" are consistently resorting as well to system solutions based on specific applications of crisis management).

Projects that adhere to the idea of adaptive change by implementing a highly topical educational leadership have already been done at the University of Bucharest, the Faculty of Business and Administration, with its specializations - Public Administration and Business Administration. This college is

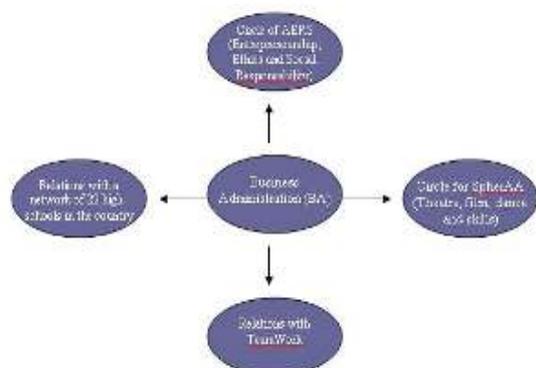

a modern and attractive new structure, awarded by the EDUNIVERSAL International Association of Paris with the "Excellent Business School" prize in 2008 and 2009.

We further present as a relevant example of educational leadership, the schemes of the faculty projects by the values of curricular and extracurricular activities, which, by correlation, help in refining a system fertile to performance toward which the Romanian society tends, such as:

Figure 1 - Curricular activities in chronological order

Figure 2 - Extracurricular activities

As you can see in Figures 1 and 2, curricular activities have the efficiency of a system of educational leadership which having been implemented in accordance with modern standards has generated a performance with *domino* effect, thus triggering the achievement of other successful projects, listed in the chronological steps.

While the first figure consists of a brief history of educational leadership as a catalyst for adaptive changes to the demand existent on the market, the second figure is

remarkable by refracting this leadership in a visionary schema which is profoundly original and it is for improvement and multilateral and creative completion of the bachelor and master programs through an extended and innovative view on the issue of the 21st Century student.

The projects implemented have generic roles to mould on the student's current profile, but also to achieve other objectives of European class, such as:

- Promoting among students a positive attitude towards volunteering and teamwork;
- Familiarizing students with different organizational environments by developing projects and internships;
- Discovering the multitude of creative resources and civic responsibility;
- Early social responsibility;
- The practical valuing of the students' theoretical knowledge;
- Developing partnership contracts with various companies.

All these objectives are fulfilled by the action of some synergistic, symbiotic forces, generated by a program of visionary leadership, applied to the educational environment, thus facilitating the achievement of immediate results.

4. Conclusions

Leadership is a form of knowledge and self-awareness. Through power (the ability to influence others) we can motivate people because we can offer something of expert power, resource owner power, and information owner power. The organizational mechanism is subtly linked to people's skills and the roles they can play.

Leadership gives people the opportunity to be creators of contexts and to visualize the hidden flaws of organizations of any kind, even universities. Visionaries see what is not seen and scanning the future, they make it visible to others.

As we have seen, it is more than obvious what renowned specialists say, that in this current turbulent world, leadership becomes more important than management techniques and methods.

One may say that leadership is a complex process by which guidance, direction and training of a group is accomplished without using coercive means, in a certain direction to achieve the long-term goals of the group itself, in agreement with the current changes.

At the same time leadership should also be regarded as a social process of exchange in which the leader "gives" something to those who follow him and "receives" something else of them in exchange. It appears that from this point of view, leadership implies three variables of involvement: the leader, those who are following him and the situation in which they act. Practice has proved that the existence of these three variables is absolutely necessary for carrying out the leadership process, especially the educational leadership, the lack of change at individual and managerial level could not support the adaptability to the turbulent factors of the environment.

Posttransition Word Associations of Bulgarian Students – a Comparison to the 1980s Norms

Marinov Georgi

University of Economics, Varna, Bulgaria

Abstract

Economic developments in South European countries raise questions about the sustainability of fiscal policy. We aim to study the attitudes of young people in Bulgaria towards prudent economic policy and we use the word-associations as a tool for this goal. To our knowledge, this is a pioneer attempt in this field, the present paper shows some results from our pilot study among Bulgarian students in economy.

Key words: word association norms, posttransition attitudes

J.E.L. classification: C92, D03, Z13

1. Introduction

Recent development in fiscal policies in Europe and around the globe, especially within the framework of the post-2008 financial and economic crisis raise many questions about the design of prospect fiscal policies. The PIIGS problem has particularly clearly showed, that maintenance of the Single Currency in EU continues to require conservative fiscal policies, from the one side, but from the other side also that attitudes towards prudent policies have to be cultivated among people – South European countries are seemingly more vulnerable to aberrant shifts in economic policies.

In this environment, an interesting question is what are the attitudes of young Bulgarian citizens towards economic policy, given that young people are the future "core" of the working force and of political parties electorate. Development of democracy will require political parties to act in accordance with these attitudes, thus future economic

policy will be strongly influenced by views of contemporary youth.

An often used tool for research of cognitive processes is the analysis of word associations. We believe it can be useful also for our goals of studying support to certain type of economic policy, thus such a research seems promising. Moreover, this is to our knowledge the first attempt in this area.

2. Word association norms and their research

Free association as a procedure for measuring the strength, number and direction of connections has a long history as a reliable technique. Although the idea that principles of association drive the thought processes might have earlier roots, the seminal study in word associations is Kent-Rosanoff (1910). Most of later studies, especially in languages other than English, base on the Kent-Rosanoff lexicon and principles of the experiment. Generating the associative response may involve numerous operations and is a fairly complex mental process, requiring time for initiating.

After attempts to use word associations as a psychodiagnostic tool (Jung 1918), in the mid-20th century studies shift towards collecting association norms through large-scale studies – the most influential and widely known paper in the field is Palermo and Jenkins (1964), but also others – Russell and Jenkins (1954) – the "1952 Minnesota norms", Kucera and Francis (1967), Postman and Keppel (1970) etc. Popular starting points for overview of literature are the Brown (1976) catalog, summarising 172 studies on scaled verbal materials and Bradshaw (1974) – a guide-index of 119 studies, also – Proctor and Vu (1999), who

provide an index of 142 norms published in the Psychonomic Society journals.

For Bulgaria the fundamental study of word associations is Gerganov (1984) – Bulgarian norms of word associations, influenced i.a. by several Soviet studies – a Russian dictionary of association norms – Leontiev (1977), a Kyrgyz and Russian dictionary – Titova (1975) et. al.

One common contemporary problem is that later research is based mainly on the influential studies, and examples exist that this is not always a good way to obtain plausible results – see e.g. Moss and Older (1996). This requires norms of word associations to be repeated and re-calibrated.

An often made assumption in association research is that concepts are represented as nodes, interconnected in a network (Collins and Loftus 1975). Activation of a concept leads to spreading along the links to the related concepts. Detailed analysis of data from word associations could reveal some qualitative aspects of the structure of semantic memory. Similarities in the representations of the words in the memory could infer similarity of the sets of responses to these words (Collins and Loftus 1975, Aitchison 1987).

As a measure for the strength of word associations traditionally the percentage of the subjects who produced each response is taken (see details in Moss and Older 1996).

Word association studies base upon the belief that they provide a direct window to the semantic memory, and even to the thought processes in general (for a discussion see Deese 1965).

Word association norms are considered to be an important factor in psycholinguistic research, especially in the area of lexical retrieval (see Church and Hanks 1989 for a discussion), who provide also an alternative informational measure for measuring word association norms, the association ratio. Robust estimates of word association norms for a large portion of the language can be obtained. For compiling of the word lists, often frequency of usage dictionaries are used. Anyway an arbitrary selection is to be preferred.

With the advance in information technologies, recent research widens towards speed recognition and optical character recognition (OCR), retrieving texts from

large-scale databases and enhancing the productivity of computational linguistics (see Church and Hanks 1991 for a discussion).

We limit our research to the basic properties of the results obtained from free word associations.

3. The experiment

Our lexicon – we compiled a list made of 50 Bulgarian words, half of which are from the Gerganov (1984) lexicon, and the other half are new. Here we present the results only for the 25 common words, and only for some of the statistical properties of response data, the full lexicon will be analysed in a further study.

Our subjects – we asked a group of 107 students in economy (75 female and 32 male; aged 20-24; 103 of them – Bulgarian native speakers, 4 – Turkish native speakers; all – Bulgarian citizens, living in a Bulgarian-speaking environment).

Our study is made among bachelor students in economy at the University of Economics – Varna, Bulgaria. As UE-Varna is a leading Bulgarian university in the field of economy, we consider the participating students as a part of the future top-level workers in companies in Bulgaria. Thus their views and attitudes are of certain importance for designing the fiscal policy in the future. Cued recall is strongly affected by the strength of the preexisting connection between the word-stimulus – test cue and the word-response – the target, the information to be recalled. The probability that the cue produced the target in free association is believed that it gives some information about the underlying attitudes of the subject on the matter.

We followed the traditional approach and asked the subjects to write down the first word they think of after hearing a sound signal. The respondents were asked to mark also the case when they have no associations. The stimulus words (cues) were given with a pause of 5 seconds between the words. Answers are written. After each 10 words-cues respondents were asked to match the number of the word-response. As in other similar studies, in the subsequent processing of data typographic and orthographic errors have been corrected, and illegible answers excluded from the sample.

In fulfilling the experiment, we underlined, that the subject are asked to (1) give the first response produced by the stimulus-word, (2) respond with only one word, and (3) speed of responding is important.

Traditionally most researchers follow the Palermo-Jenkins (1964) paper, so that studied are (1) response frequencies, (2) idiosyncratic responses, (3) response index – showing the response words in alphabetical order. Most investigators are unlikely to use multiple-words responses, these are of little interest.

In this paper we limit our results only to the response frequencies.

Our study should be regarded as allowing plausible comparisons to the Gerganov (1984) study, because the overwhelming majority of subjects in the 1984 study were high-school students in the last grade (usually 18-19 years old).

As for a common measure for the association strength the percentage of the particular word-response is taken, we present further the two most often responded words to the stimulus-words, with their percentage occurrences (in parentheses, after the respective word-response) – first in the Gerganov (1984), and then in our study (year 2011). Below we present the cues with their two most important targets, in parentheses we show the percentage people who gave that word-response.

Gerganov (1984):

justice - no(does not exist)(7.6), reality(7.6)
town - village(17.6), big(13.3)
health - sickness(13.5), strength(4.9)
party – BCP(12.1) (the ruling party), people(5.3)
want - desire(13.1), can(6.6)
grandmother - grandfather(35.5), old(21.1)
meeting - Komsomol(13.9), party(5.2)
take - give(37.5), money(9.5)
working - man(person)(17.4), worker(10.5)
student - pupil(7.8), student(female)(4.9)
market - big(4.9), commodity(4.7)
success - big(9.3), excellent(8.3)
money - many(17.5), wealth(5.4)
village - town(19.6), little(9.7)
truth - lie(22.2), reality(8.7)
citizen - peasant(16.5), man(person)(12.5)
week - month(11), Sunday(10.6)
alcohol - wine(8.7), spirit(6.4)

way - long(14.5), road(8.3)
thief - prison(6.9), of peaches(6.7)
promise - fulfil(10.9), promise(6)
car - light(personal car)(11.3), driver(7.9)
sickness - health(9.4), hospital(5.3)
give - take(30.1), money(12.8)
pay - money(28), bill(8.3)

The average association strength for the first word-response is 15.9 (8.8), with a maximum of 37.5 and a minimum of 4.9 and for the second word-response – 8.4 (3.7), with a maximum of 21.1 and a minimum of 4.7, in parentheses we give the standard deviations.

Our study (2011):

justice - court(19.6), law(9.4)
town - Varna(26.2), village(18.7)
health - hospital(21.5), sickness(10.3)
party - GERB(14) (the ruling party), politician(8.4)
want - can(17.8), money(14)
grandmother - grandfather(30.8), age(old age)(7.5)
meeting - peoples'(Parliament)(21.5), people(7.5)
take - give(29), money(21.5)
working - man(person)(15), wage(10.3)
student - university(15), learning(5.6)
market - trade(7.5), economy(5.6)
success - luck(8.4), excellent(6.5)
money - many(11.2), power(5.6)
village - town(25.2), tranquility(4.7)
truth - lie(45.8), justice(4.7)
citizen - peasant(16.8), man(person)(9.35)
week - month(18.7), day(15.9)
alcohol - cigarettes(15), party(feast)(6.5)
way - highway(13.1), car(12.2)
thief - prison(7.5), house(6.5)
promise - lie(18.7), fulfil(15)
car - way(13.1), gasoline(6.5)
sickness - health(15.9), hospital(9.4)
give - take(30.1), money(11.2)
pay - money(15.9), bills(13.1).

The average association strength for the first word-response is 18.9 (8.64), with a maximum of 45.8 and a minimum of 7.5 and for the second word-response – 9.8 (4.5), with a maximum of 21.5 and a minimum of 4.7, in parentheses we give the standard deviations.

Such differing results are not to surprising – as Jenkins and Palermo (1965) stress, adult word-association norms collected in the USA in 1910, 1925, 1927, 1933 and 1952 show

that systematic changes take place.

Apparently associative patterns have significantly changed for the 30 years period, given the substantial difference in association strengths for the first associated word-response.

Among our on-going research is a comparison to another sample of subjects – high-school students in the last two grades. We expect to obtain results for existence (or lack) of a trend in association patterns in analysing responses of different ages. The rest of the words in our lexicon are more closely linked to visions about fiscal policy and we expect to make plausible conclusions about the prospect visions for economic policy and economy as a whole.

Our intentions are to possibly expand the study to other countries and languages, besides the in-depth analysis of semantical links.

This study is to be considered as a pilot study, as we plan to expand it spatially and among people of different age.

Participation of both authors in this paper is to be considered as equal.

Glod Alina

CCFM Romanian Academy

globoalinbest@yahoo.com

Abstract

Financing through a bank loan, commercial or other type of financing can be quite costly for a micro-enterprise or an SME, therefore accessing funding through the Community initiative JEREMIE can prove its usefulness. Thus, in this article we will present modus operandi of the program JEREMIE which, by its revolving, leverage and multiplying nature, using a portfolio of financial instruments created specifically to enable an easier access to capital, will facilitate the increase of small enterprises competitiveness in Romania.

Key words: JEREMIE, financing policies, Structural Funds, entrepreneurship

J.E.L. classification: G32, H81, L26, M13

Insufficient access to finance is an issue especially for SME sector, in particular, for micro-enterprises and for innovative initiatives. In Romania, despite of the availability of support programmes, a few aspects could be considered regarding small firms: - business start-ups have a very high mortality of in the first year, - undercapitalisation is still a big problem for most SMEs, - limited entrepreneurial experience and knowledge of how to enter and stay on the markets, - shortage of finance and other problems of business support services.

Diverse financial demands of SMEs could be covered by a range of funding sources including micro loans considering the excellent repayment rates and the wide distribution across the country of SMEs

sector. The potential credit demand is estimated at 400 million euros, with a remaining gap to fill of 372.6 million euros besides banks and other international and national institution [4]. Thus, banking micro credit covers just a part of the gap mostly because: - banks do not provide sufficient business development support to their SME customers (though SME's exposure to risk is very low), - many micro-enterprises are discouraged to apply to bank's capital due to the banks rules and procedures, lack of creation of specific programmes for SMEs, high interest rates, fixed costs and banking fees and short term horizon for credit granting, -the guarantees required by commercial banks are often beyond the means of entrepreneurs. All this gives a reason for self-financing, thus more than a half of the SMEs use their own financial sources for business financing and not loans from banks.

In Romania, just a few SMEs use guarantees from the four credit guarantee institutions providing products for SMEs¹ end only less than 1% of SMEs entrepreneurs resort to the National Credit Guarantee Fund [4]. The reason why small enterprises resort less to the guarantee institutions is that these institution do not provide a wide range of cover for banking loans (ex. only for the principal and not for the interest too) and the guarantees are usually short-term and not for

¹ The Export-Import Bank of Romania (EXIMBANK) established in 1992, the Romanian Loan Guarantee Fund started in 1993, the Rural Credit Guarantee Fund founded in 1994 and the National Credit Guarantee Fund for SMEs established in 2001.

long or medium term, supporting insufficiently the SMEs which apply for investment loans.

The National Credit Guarantee Fund for SMEs, which provides guarantees for bank loans with one general credit guarantee programme for all SMEs without any discrimination (regarding the sector, the region, the stage of development), introduced in 2004 a special guarantee programme for micro-enterprises which improved over the last few years micro-enterprises' access to guarantees. Thus, new series of facilities for firms are provided by the National Guarantee Fund (NGF) such as: - a more flexible and simplified procedure for obtaining a letter of guarantee, letter which is issued as an advance guarantee by NGF, based on a general analysis, - from the beginning of the 2008, the classical guarantees have the commission decreased to 1%, regardless of the project and the limitation of the guarantee percentage up to 80% of the amount financed, and - coverage of the payment of the consultant from credit financing and guarantee up to a maximum 200,000 euros for a maximum 3 years (with a period of grace of up to one year for the instalments), and the overall financing of the investments, including consultancy, could be between 1,000,000 and 50,000,000 euros for R&D activities for a period that varies according to the type of investment (Anda Georgescu, *"Companies are obliged to provide additional guarantees for the access to the European funds form the competitiveness operational programme intended for investment. Besides co-financing, the beneficiaries of European funds will be required to deposit guarantees for both the correct implementation of the project and also for the maintenance of the investment destination for at least three years"*) [4].

Nevertheless, considering the high refusal rate of guarantee applications to this fund (NGF) it is clear that the guarantee risk policy of the fund is not clearly delivered to its beneficiary and banks and the fund's overall support of for SMEs in accessing loans from banks could be regarded as limited, especially for start-ups and innovative enterprises.

In this context, in order to have a better access to finance and to guarantee their investment, enterprises will be able to resort

not just to NGF, to commercial banks and to national and international authorities but also to the JEREMIE Community initiative to support SMEs, which is available for Romania from middle of 2008. JEREMIE (Joint European Resources for Micro to Medium Enterprises. According to Francis Carpenter, the EIF's Chief Executive: "JEREMIE is a 'tool-kit' to create financial products that are focused on redressing gaps in SME finance. I believe that it will provide an effective response to the range of demands made by the regional and local authorities. JEREMIE brings together the expertise of the different financial European institutions to use Community funding resourcefully to support SMEs.") is an important instrument promoting innovative financial engineering tools, proposed by the European Commission together with the EIB group, which gives SMEs access to funds for venture capital, micro-credit, guarantee schemes and counter-guarantee (In monetary terms, the gap between early stage venture capital in EU-12 and in Romania is estimated at approx. 70 million Euro for the period 2007-2013. Source: Government of Romania, *National Strategic Reference Framework 2007-2013*, Final Version 2007).

Considering that in the "Cohesion Policy in support of growth and jobs, Community strategic guidelines 2007-2013" it is stressed the importance of improving access to finance for the development of SMEs, especially for start-ups and micro-enterprises (through grants and non-grant instruments such as loans, equity, venture capital and guarantees and through technical assistance), in the summer of 2005 appeared a joint initiative between the Commission (through European Regional Development Fund or ERDF- a structural fund which supports the less developed European regions by financing investments in the productive sector, infrastructure, education, health, local development and by supporting small and medium enterprises. ERDF finances up to 85% of eligible expenditure relating to regional development in Romania, through the Regional Operational Programme [6]. In addition to this program, the ERDF in Romania co-finances the operational programmes: Transport, Environment, Competitiveness, Technical Assistance and territorial cooperation programmes in) and EIB

Group (**EIB Group** is composed from European Investment Bank and European Investment Fund.). In this regard, having this goal, together with other Commission services and with the help of the EIB Group, DG REGIO (European Commission's General Directorate for Regional Policy) has prepared a proposal, for the next programming period, presented under the JEREMIE acronym, the proposal which was agreed and accepted, at the Ministerial meeting of 11 October 2005 in Brussels, by the ministers responsible for the Structural Funds in the 25 member states and candidate countries.

Therefore, JEREMIE Programme represents a series of coherent actions designed to optimise the use of European funds to improve access to finance for SMEs, offering its financial products on market terms, increasing the competitiveness of enterprises, enhancing entrepreneurship, and creating new jobs. JEREMIE is managed through financial institutions such as the EIF (European Investment Fund) and is available through EU Cohesion Policy for all Member States (MS).

JEREMIE is implemented on the basis of two phases:

- the first phase or the preliminary phase functioning in the period 2006-2007, in which the European Commission has joined forces with EIF (European Investment Fund), benefiting of the support of national and regional authorities, in order to undertake the evaluation of the gaps between the demand and supply for financial engineering instruments in the regions - named "gap analysis" (Financial Engineering is a form of financial support, other than grants- e.g. subsidised lending, equity, venture capital, guarantees, interest rate rebates, public-private partnership funds for investments. The European Union has set up three types of financial engineering tools: JASPERS, JESSICA and JEREMIE)[6]. Thus, the 75% of the required resources came from the ERDF technical assistance budget, at the initiative of the Commission, and the rest of 25% represented the EIF contribution. The assessment aimed to identify gaps between the existing supply capacity of the local specialised financial

intermediaries in providing financial engineering products in support of SMEs and the demand of these products in the region.

- the second phase or the implementation phase covering the period 2007-2013, established on previous phase, used for the elaboration of the next generation of operational programmes to be financed by the Structural Funds in this period. The programmes set out the necessary resources for the accomplishment of the proposed objectives and the allocation of these resources is specifically for actions to improve access to finance, actions which are implemented by programme authorities. Two essential steps will have to be considered for an improved access to finance: - first, it is envisaged that the programme authorities would organise a tendering process to identify a suitable fund holder, to act as "fund of funds". In this situation, the necessary advice in organizing the call for a tender will be provided by the Commission and when a tendering procedure is launched, the EIF will guarantee to the programme authorities that it will participate, alone or in co-operation with other International Financial Institutions (IFIs) or specialised financial institutions; -secondly, a clear "Funding Agreement" setting out the arrangements for funding and deliverables will be concluded between the programme authority and the selected fund holder.

Provisions for the transfer of resources from the concerned operational programme to specific national and regional accounts managed by the fund-holder selected by the programme authority are included in the "Funding Agreement". The transfer from the programme to the accounts consists of a national public component (whose ratio depending on the ERDF co-financing rate, according to the relevant priority axis of a specific operational programme) and of an ERDF component. Usually, when the EIF is selected as fund-holder, the EIB can refinance through loans the national public component of these programme grants, if this is requested by the Member States or regions, also taking into account the nature of this financial product. The transfer of the operational programme to the selected fund-holder will be irreversible throughout the

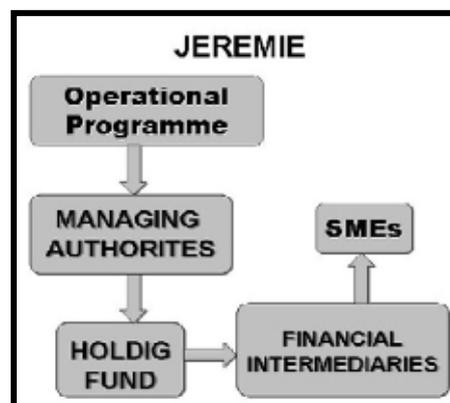

programming period 2007-2013 and will constitute an eligible interim payment of ERDF under the regulations of structural funds.

The selection of financial intermediaries will proceed like this: the programme authorities, assisted by the selected fund-holder, will make an open call for expressions of interest, which will remain open at least the first part of the programming period 2007-2013. For giving the opportunity to participate to the initiative, the open call for expressions of interest is addressed to all financial intermediaries (like venture capital, micro-credit funds, loans, guarantee funds providers). The fund-holder will analyze, evaluate, select and will formally accredit the financial intermediaries, accreditation which will be the subject of a periodical review. Selected financial intermediaries will be allowed to receive technical assistance, equity, loan capital and guarantees for on-lending to small – to medium businesses for the programming period 2007-2013.

In the specific national and regional accounts of the chosen fund-holder drawing on the resources will provide equity, guarantees or loans, to the accredited financial intermediaries and it may be decided by the programme authorities to make available technical assistance credits to accredited financial intermediaries from the relevant operational programme, in line with operational details established between the managing authority of the operational programme and chosen fund-holder. Also, the selected financial intermediaries will make these funds available, on competitive basis, on the principles agreed between the programme authority and the fund-holder, to SMEs and micro-enterprises.

Therefore, the modus operandi of JEREMIE initiative could be synthesized by the next figure:

Figure 1 The modus operandi Jeremie initiative

Source: Authors

It is recommended, when a "Funding Agreement" is signed by a Member State or a region with a fund-holder, that:

- Fund-holder to be concerned with ensuring a sufficient presence of in its local offices in regions for a more effective marketing and for providing information for financial intermediaries and the SMEs.
- Local offices of the fund-holder to include operational costs in management fees, for the amounts and under conditions specified by the "Funding Agreement". These management fees of the specific accounts will represent eligible expenditure to the ERDF for the concerned operational programme, on the conditions and for the amounts provided by the Funding Agreement;

The "Funding Agreements" between the fund-holder and programme authorities would be elaborate in a sufficiently flexible manner to allow additional ERDF contributions to be made from the relevant operational programme to the specific accounts of the fund-holder over the programming period.

To the extent that the ERDF component of the operational programme will finance equity-type products and loans for SMEs and micro-enterprises, reimbursements of these loans will be recycled to provide additional finance for these companies (revolving funding). Therefore, **JEREMIE Programme has a strong revolving or recycling character of resources and gives rise to a significant effect of leverage.**

JEREMIE sustainability and permanent financial support for social and economic structure of the Member State regions depend of this revolving character. Also, the leverage effect of the grant contribution is anticipated to bring in additional capital from the EIB Group, banks, and other IFIs, expecting a multiplier of disposed resources up to 10 times, depending on the financial products used in co-financing of SMEs.

After Greece, Romania is the second country which signed the "Funding Agreement" between government and EIF (European Investment Fund) in February 2008 (The first "JEREMIE funding agreement" was signed in June 2007 with the EIF by the Government of Greece. Other funding agreements are still in negotiations with Slovakia, Bulgaria, Cyprus and the Baltic countries. This "Funding Agreement" regulates the cooperation with the EIF concerning the implementation of JEREMIE in Romania, agreed under the Memorandum of Understanding signed on 23 January 2007 between the Romanian Government (through the Ministry of Public Finance) and the European Investment Fund, which was approved and published by Government Decision no. 776/2007). This "Funding agreement" provides that EIF is appointed the only manager of the JEREMIE in Romania and this institution will ensure the administration of 100 million euros from the amounts of pre-funding received from the European Commission from the Cohesion and Structural Funds contribution to the operational programmes. Following the transfer of approximately 100 million euros in the first year of the programme period 2007-2013, including ERDF resources and the Government co-financing through the Ministry of Economy and Finance (specifically, through the Certifying and

Paying Authority), JEREMIE fund may be increased, after the bilateral parties' approval.

In Romania, JEREMIE can support SMEs by:

- Developing and improving economic and financial environment at the local level, through flexible actions, specifically tailor-made for SMEs (reducing the loans' interest rates through the guarantees provided by programme JEREMIE, thus reducing the need for collateral).
- Increasing the supply of financing to SMEs at the local level, by finding appropriate expertise and investment schemes according to the assessment made for the SMEs development depending on the local needs;

JEREMIE initiative may attract contributions from a number of financial investors and donors and can raise the amount of capital available for the micro-credit providers, through the establishment of a micro-fund under this framework.

Trade Performance in CSG of ESCAPE Member Nations and some Regional Groups in the Region¹

Mathur Somesh Kumar

Indian Institute of Technology, Kanpur, India

skmathur@iitk.ac.in

Abstract

This paper deals with the mapping of trade performance of Climate Smart Goods (CSG) for ESCAP regional members and associate members including those for regional groups like ASEAN, SAARC and APTA for years 2002 through 2008¹.

Key words: trade performance, CSG, ESCAPE

J.E.L. classification: F14

1. Introduction

Trade performance is judged using some trade indices and indicators. Trade indices like Export and Import shares, Revealed Comparative Advantage index, Competitiveness index, Regional entation index and Michelaye index for trade of CSG and its sub categories of the ESCAP member nations and other regional groups are calculated to form a policy opinion on countries competitiveness, trade patterns, changing comparative advantage over time and regional bias.

CSG are defined as components, products and technologies which tend to have relatively less adverse impact on the

environment. For example, it consists of articles of iron and steel and aluminum, machinery and mechanical appliances, electrical machinery equipment, ships, boats and floating structures, glass and glass ware articles, among others.

The study finds that trade of such CSG has a regional bias for most of the countries in the region although almost all are net importers from Japan and Hong Kong and more recently from China.

Thereafter, gravity analysis done to explain determinants of imports of CGS and its sub categories of ESCAP countries with countries in the region and with US and countries in the EU. Gravity model is used to explain the role of tariff barriers, preferential trading arrangements, economic size and endowments, general policy environment and overall infrastructure, distance between trading partner, membership of multilateral agreement, foreign direct investments, common language and borders, among others on trade of such climate smart goods and sub categories.

In particular, the study will consider bilateral trading partners (83 permutation 2=6806) from 83 countries (57 ESCAP plus 25 EU and the US) for each of the CSG imports and its sub categories for years 2002 and 2008 for our gravity analysis. The study uses cross sectional analysis for 2008 and 2002 for import of CSG and its subcategories.

Please see Appendix Table I which lists the countries and regional groups considered in the study while Appendix II gives the entire list of the 64 CSG. The study has been able to define 64 such goods under 6 digit HS code (2002) by putting together various lists that have been defined by various international organizations recently. The list is arrived by defining concordance series from series of list given by the World Bank,

¹ ESCAP has 62 members including associated members. The study considers 57 of them by excluding the non regional members UK, France, the Netherlands, the US and Timor Leste for non availability of data from 2002 through 2008 (period of study). Trade statistics uses World Integrated Trade Solution (WITS) data base where in UN commodity trade data is culled out for estimating the various indices. For comparison purpose and saving space the study reflects figures for 2002 and 2008 mainly but the trade indices and indicators have been worked out for all the countries (for which data was available) in the ESCAP region from 2002 through 2008 and for some regional groups like APTA, SAARC and ASEAN. All countries of ASEAN, APTA and SAARC fall under ESCAP region. For comparison purpose the study has taken ESCAP as one region for our analysis.

ICTSD, WTO, APEC and the OECD². The study consider these 64 CGS as one category and calculates the above mentioned trade indicators for this category.

Further, following the World Bank (2008) we have been able to bifurcate such 64 goods further into clean coal technologies (HS code 840510,841181 and 841182), Wind Energy (HS code 848340, and 848360), Solar Photovoltaic systems (Hs code 850720, 853710 and 854140) and Energy Efficient Lighting (HS code 853931).

The study besides these four sub groups have also considered 'Other Codes' as the fifth group which consists of all HS codes not considered in the four categories above. The study also performs the trade analysis for such sub categories.

2. Some Background to Climate Goods Trade Analysis and Importance of Discussing Climate Smart Goods by the World Community

The CGS forms part of the broader group named 'environmental goods and services (EGS).

An Environmental good can be understood as equipment, material or technology used to address a particular environmental problem or as a product that is itself 'environmentally preferable' to other similar products because of its relatively benign impact on environment.

Environmental services are services provided by eco systems or human activities to address environmental problems.

EGS can be also classified as Environmental Goods comprising of pollution management products, cleaner technologies and products, resource management products and environmentally preferable products. EGS also has Environmental services comprising of sewage services, refuse services, sanitation and similar services and others.

The EGS were first discussed as part of the liberalizing agenda in the DOHA round

of the multilateral trading round in 2001. The countries had wanted the tariff and non tariff barriers to go down for trade of such EGS as this may lead to adoption of cleaner and cost effective technologies by firms and country at large and possibly mitigate climate change and improve energy efficiency.

Liberalization has followed three routes namely the list approach, project/integrated approach and request for offer approach. Environmental Goods were always part of trade agenda but were subsumed within industrial or agricultural negotiations.

Global EGS industry is worth 650 billion US dollars. Trade in EGS is estimated at roughly a tenth of that amount (Veena Jha, 2008). CGS exports to the world were worth 38 billion dollars out of total World Exports of 1488 billion US \$ in 2008 with World export share of CGS working out to be 2.5 % in the year 2008. This share has varied between 2.3 % in 2002 to 2.8 % in 2009. World imports of CSG were worth 38 billion US\$ out of total World Imports of 1557 billion US % in 2008 with World Import share of CGS working out to be 2.4 % and this share has varied from 2.2 % in 2002 to 2.68 % in 2009.

CGS (a subset of EGS) were discussed at the multilateral forums as countries wanted a smaller list to liberalize and where in negotiations could be easier done than concentrating on the entire list of environmental goods. CSG constitute low carbon growth technologies.

Also, it was felt that freer trade can make available such goods for countries that do not have access to these goods or where in domestic industry do not produce them in sufficient scale or at affordable prices. For exporters additional market access can provide incentives to develop new products or technologies with less green house emissions.

Most of the exporters of EGS are the developed nations, but some of the developing countries are also becoming important players in heat and energy management equipment, noise and vibration abatement and in environmental services like air pollution control and solid waste management (Veena Jha, 2008). Our preliminary findings do suggest that trade in CGS by countries belonging to ASEAN, SAARC and APTA have regional bias.

² This list builds on the 43-product list amalgamated by the World Bank, which was tabled as an initial starting point for discussions. The list at UNESCAP proposes an additional 21 products that appeared on one of the recent ICTSD lists (Renewables and Buildings) and also on either the APEC, OECD or WTO list. In total, the list comprises of 64 climate smart goods classified by H.S. 2002 codes at the 6-digit level

3. Analysis of CSG trade performance of members and associate members and some regional groups in ESCAP region

3.1. Export Share of CSG Trade in ESCAP Region

Only small percentage of total exports and imports of ESCAP economies goes on climate smart goods (CSG). Table I and II provide information on CSG exports and imports of ESCAP economies relative to their total export and imports, as well as ranking of these economies.

On export side (table I) Japan is ranked number 1 in the Asia-Pacific region with the share of CSG in its total exports increasing from 4 % in 2002 to 5.2% in 2008. Compared to the share of CSG at the world level as a whole, which is 2.5% in 2008, it appears that Japan has higher propensity to export CGS than the world on average.

Similarly, China and Hong Kong, China have exports shares above the world average depicting good trade performance of such countries for CSG goods. Noteworthy, is that

both APTA and ESCAP region record higher shares of CSG in their group's total exports than the world share.

This is in contrast to SAARC and ASEAN where the export share drops below the world average. In fact the export share for ASEAN as a group even falls slightly from 2002 to 2008, whereas for most countries in the region export share has risen. This growth is particularly notable for Japan and China whose share rises by more than 1%. In the context of very fast growth of total exports of China this is a good achievement.

It is also notable that Singapore and Malaysia have been replaced with Philippines and India for fifth and six positions in 2008. Republic of Korea and Thailand are ranked fourth and seventh respectively in 2002 and 2008.

ESCAP region again has export share figures above world average in 2002.

In summary, the finding that almost all economies record an increase in CSG export shares needs to be investigated to see if this is a result of applied policies or just a consequence of fast export growth for many of these countries.

Table I: Export Share of CSG in World Export for Countries and Regional Groups in 2002 and 2008

Countries	Export Share 2002(%)	Rank 2002	Gross CSG exports to World 2002(Million US\$)	Countries	Export Share 2008(%)	Rank 2008	Gross CSG exports to World 2008(Million US\$)

Source: Author's calculation from UN Commodity Trade Statistics in WITS. Please note that Gross Exports of all Products from each country and region is not shown in the table above. [Also, export shares of regional groupings are exports of CSG and its total exports to the Rest of the World\(not total World\)](#)

The figures below give the top 5 countries of ESCAP in terms of export share from 2002 through 2008. China, Hong Kong, Japan, South Korea and Malaysia figure in

the list. Except for Malaysia the export share has increased for CSG for countries in the list below.

Export share – Top 5 countries among ESCAP 57

Country/Year	2002	2003	2004	2005	2006	2007	2008
China	2.27103919	2.151644069	2.2485033	2.340182858	2.514077975	2.85745234	3.414800846
Hong Kong	2.558958195	2.53506104	2.57564027	2.668833748	2.67538287	2.78794448	2.640768254
Japan	4.009666273	4.394365537	5.10358165	4.884417135	4.722664748	5.21726227	5.203899355
Korea	2.057123392	1.591930971	1.75612102	1.870237984	1.989326288	2.35926845	2.405359329
Malaysia	1.630064997	1.635831182	1.71943274	1.615630549	1.868670015	1.67134067	1.590685657

With respect to import, as table II shows the import share of CSG in countries and regions total world imports in 2002 and 2008. The findings show that countries with ranks 1 to 10 in both 2002 and 2008 have import shares above the world averages.

The 10 countries above world import average of 2.4% in 2008 are Kazakhstan, South Korea, Azerbaijan, China, Vietnam,

Pakistan, Thailand, Russia, Australia and Hong Kong. The 10 countries above world import share of CSG goods of 2.2% in 2002 are Papua New Guinea, China, Thailand, Turkey, South Korea, Malaysia, Singapore, Russia, Australia and Hong Kong.

The above are indications that most of the countries in ESCAP region are basically importers of CSG products from countries within regions.

One confirms the above statement by looking at the regional groups performance

of ASEAN, APTA and ESCAP. All have import shares above world import share of CSG in 2002, while ESCAP import share is above world import share of CSG in 2008.

Table II: Import share of CSG in World Import For Countries and Regional Groups in 2002 and 2008

Countries	CSG Imports(Million US\$) 2002	Import Share 2002(%)	Rank 2002	Country	CSG Imports(million US\$) 2008	Import Share 2008(%)	Rank 2008

3.2. Competitiveness

Competitiveness indices are shown in table III together with the rankings of the countries. This index is broadly defined as the capacity of an industry to increase its share in international markets at the expenses of its rivals (ESCAP, 2009, p56). By its construction, the competitiveness index is an indirect measure of international market power, as it tracks country's share of the world market in a selected product or a group of products. The index takes a value between 0 and 100 percent, with higher values

indicating greater market power of the country in question.

From the information in table III, in 2008 China, Japan and Republic of Korea are the highest ranked among the ESCAP economies with shares of the world market in CSG of 12.6 %, 10.5% and 2.6% respectively. APTA as a group enjoys 14 % share of the world market in CSG – double from what the share was in 2002 (compared to its overall share in world exports). Among the high performers are India, China and Republic of Korea whose competitiveness has improved from 2002.

Table III: Competitiveness Index for Export of CSG by member states and Regional Groupings, in 2002 and 2008

Country	Competitiveness Index 2008(%)	Rank2008	Country	Competitiveness Index 2002(%)	Rank2002

The figures below give the top 5 member nations competitiveness from 2002 through 2008. China, Hong Kong, Japan, South Korea and Singapore figures in the list.

China's and South Korea's competitiveness has increased from what it was in 2002 to what it is in 2008.

Competitiveness – Top 5 among ESCAP 57

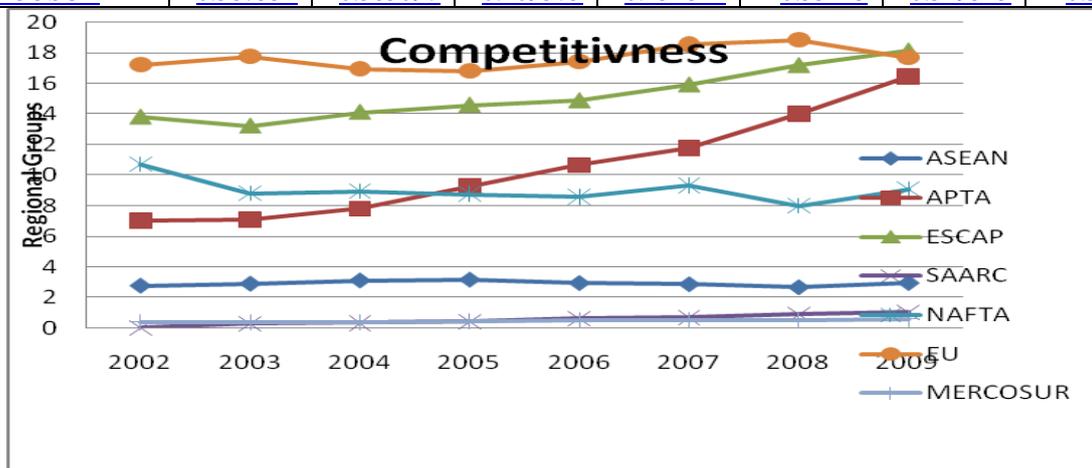

Country/Year	2002	2003	2004	2005	2006	2007	2008
China	5.522607464	6.021640244	6.676737772	8.027913597	9.40953099	10.48365622	12.62110139

MERCOSUR	0.387354	0.385097	0.409375	0.452821	0.53415	0.549345	0.51425

3.3. Michelaye Index and Revealed Comparative Advantage in CSG for member states of ESCAP and for selected Regional Groups

There are two indices that are frequently used to assess comparative advantage of countries in particular products. Comparative advantage which conceptually means that a country has an ability to produce the same product at lower relative cost (and price) than its trading partners (but prior trade has started) is approximated by a ratio of country's export share to the world's export share in a specific product. So, in absence of necessary information to measure comparative advantage (i.e. autarky relative prices) if a country demonstrates larger share of a certain product in its exports than the world on average, it is said to have a comparative advantage. Thus values below 1 are indicative of disadvantage.

The Michelaye index is defined as the difference of two shares: share in export and in import. The share of a country's total exports of the product of interest in its total exports and the share of the same country's imports of the same product in its total imports. The index takes a value between -1

and +1. A country is said to have a revealed comparative if the value exceeds zero.

The Revealed Comparative Advantage is defined as the ratio of two shares. The numerator is the share of a country's total exports of the commodity of interest in its total exports. The denominator is share of world exports of the same commodity in total world exports. The RCA takes a value between 0 and + infinity. A Country is said to have a revealed comparative advantage if the value exceeds unity.

Tables IV and V present the values of calculated Michelaye Index and RCA for selected countries from 2002 through 2008

Base on Michelaye index, not too many countries in the region indicate having a comparative advantage in CSG- see table IV. Nevertheless, several countries do show positive values meaning and it would be interesting to see if they are the source of export of these goods for the other countries in the region. However, they may be importing regionally from some good performers (Hong Kong, Japan, Philippines, Macao, and China) or in few cases from outside the ESCAP region like what Philippines and India are doing.

Table IV: Michelaye Index for Various Years for Some Selected Countries, 2002 through 2008

	JPN	HKG	Philippines	RUS	MAC	IND	China	AUS
YEAR	CSG	CSG	CSG	CSG	CSG	CSG	CSG	CGS
2002	0.022	0.002		-0.019	-0.018		-0.013	-0.0181
2003	0.024	0.001		-0.0201	-0.009	-0.006	-0.014	-0.017
2004	0.031	0.002		-0.021	-0.009	-0.005	-0.016	-0.020
2005	0.030	0.002		-0.0254	-0.004	-0.005	-0.012	-0.0198
2006	0.029	0.002		-0.025	-0.006	-0.0007	-0.009	-0.020
2007	0.032	0.003	0.01	-0.023	-0.0017	-0.002	-0.007	-0.020
2008	0.035	0.001	0.009	-0.023	0.006	0.0025	0.0007	-0.021

Source: Author's calculations

Table V shows that RCA figures for Japan, China and Hong Kong have figures greater than one and have a comparative advantage in the production of these CSG products in 2008. Japan and Hong Kong have figures greater than one in 2002. Again one sees a rise of China. China had figure of 0.98 in

2002 while the figure in 2008 works out to be 1.31. Any value of RCA greater than one indicates comparative advantage in the production of the good. APTA and ESCAP region as a whole has RCA figures greater than one in 2008 while none of the regional groups had RCA greater than one in 2002.

Table V: Revealed Comparative Analysis of CSG for Selected Members and Regional Groups in 2002 and 2008

Country	RCA2008	Country	RCA2002

3.4. Regional Orientation Index of CSG goods trade

Table VI presents the values for the Regional orientation index (ROI) for selected countries of the ESCAP region in context of them being member states of APTA, ASEAN and SAARC. The regional orientation index shows whether exports of a particular product from the country under study to a given destination (its own regional grouping) are greater than exports of the same product to other destinations (Rest of the World). The index is the ratio of two shares. The numerator is the share of a country's exports of a given product to the region of interest in total exports to the region. The denominator

is the share of exports of the product to other countries in total exports to other countries (Rest of the World). The ROI takes value between 0 and + infinity. A value greater than unity implies a regional bias in exports.

The study finds that for most of the countries in the ASEAN and APTA there is a regional bias for CSG goods based on values which are over 1. It seems that countries in the ASEAN and APTA may not have comparative advantage and may be net importers but most of them are importing from countries within the region. There are few exceptions though. These are Philippines and India which are exporting more (CSG) with the countries outside ESCAP in 2008

Table VI: Exports of CGS: Regional Orientation Index For Selected Countries and Regional Groups, 2002 and 2008

	ASEAN		APTA		SAARC		ESCAP	
	2002	2008	2002	2008	2002	2008	2002	2008

7. Conclusions

The study works out some trade indices like Export and Import Shares, Competitiveness index, RCA, Michelaye and Regional Orientation index for ESCAP member nations and some regional groups for trade of CSG for years 2002 through 2008. The objective is to map the trade performance of ESCAP region in trade of cleaner technologies.

Analysis of the Export shares of CSG (in terms of its total exports of all products to the World) indicates that only few of the countries in the region like Hong Kong, Japan and China (only recently as 2008) have shares above the world average. All are importers of such technologies from the ESCAP region and some of them are importing such technologies from regions outside ESCAP.

Import share of CSG (in terms of its total imports of all products from the World) indicate that as many as ten developing economies of the ESCAP have import shares above the world average. This indicates the realization of such countries in importing such technologies from the World.

The Comparative advantage analysis is worked out through two indices, namely, Michelaye and RCA. Both of them indicate that Hong Kong, Japan and China (only recently) have comparative advantage in the

production of CSG goods and are net exporters of such products. ESCAP as a group and APTA also have RCA greater than one in 2008. One of the stark fact which comes out of Michelaye index analysis is that except for except Japan, Hong Kong, Philippines and India, China, Macao and APTA (2009) all have negative figures in almost all years from 2002 through 2008. Most of the members in the region do not have comparative advantage in the production of CGS. However, they may be importing regionally from some good performers (Hong Kong, Japan, Philippines, Macao, China) or in few cases from outside the ESCAP region like what Philippines and India are doing.

The competitiveness figures (an index of countries performance in terms of World exports of the same product) and ranks in Table III show the most important economies in world export of CSG in 2008 and 2002. These are China, Hong Kong and Japan and ESCAP and APTA as regions. Among the performers India, China and South Korea's competitiveness has improved from 2002 position to what it was in 2008.

The study finds that for most of the countries (and regional groups) in the ASEAN and APTA and ESCAP there is a regional bias for CSG goods based on Regional Orientation index values which are over 1.

Appendix Table II: 64 Climate Smart Goods

SERIAL No.	HS CODES6 DIGIT(2002)	DEFINITION
1	380210	Activated carbon
2	392690	Articles of plastics & arts. of oth. mats. of 39.01-39.14, n.e.s. in Ch.39
3	392010	PVC or polyethylene plastic membrane systems to provide an impermeable base for landfill sites and protect soil under gas stations, oil refineries, etc. from infiltration by pollutants and for reinforcement of soil.
4	560314	Nonwovens, whether or not impregnated, coated, covered or laminated: of manmade filaments; weighing more than 150 g/m2 for filtering wastewater.
5	701931	Thin sheets (voiles), webs, mats, mattresses, boards, and similar nonwoven products.
6	730820	Towers and lattice masts for wind turbine.
7	730900	Containers of any material, of any form, for liquid or solid waste, including for municipal or dangerous waste.
8	732111	Solar driven stoves, ranges, grates, cookers (including those with subsidiary boilers for central heating), barbecues, braziers, gas-rings, plate warmers and similar non-electric domestic appliances, and parts thereof, of iron or steel.
9	732190	Stoves, ranges, grates, cookers (including those with subsidiary boilers for central heating), barbecues, braziers, gas-rings, plate warmers and similar non-electric domestic appliances, and parts thereof, of iron or steel.
10	732490	Water saving shower.
11	761100	Aluminum reservoirs, tanks, vats and similar containers for any material (specifically tanks or vats for anaerobic digesters for biomass gasification).
12	761290	Containers of any material, of any form, for liquid or solid waste, including for municipal or dangerous waste.
13	840219	Vapor generating boilers, not elsewhere specified or included hybrid.

14	840290	Super-heated water boilers and parts of steam generating boilers.
15	840410	Auxiliary plant for steam, water, and central boiler.
16	840490	Parts for auxiliary plant for boilers, condensers for steam, vapor power unit.
17	840510	Producer gas or water gas generators, with or without purifiers.
18	840681	Turbines, steam and other vapor, over 40 MW, not elsewhere specified or included.
19	841011	Hydraulic turbines and water wheels of a power not exceeding 1,000 kW.
20	841090	Hydraulic turbines and water wheels; parts, including regulators.
21	841181	Gas turbines of a power not exceeding 5,000 kW.
22	841182	Gas turbines of a power exceeding 5,000 kW.
23	841581	Compression type refrigerating, freezing equipment incorporating a valve for reversal of cooling/heating cycles (reverse heat pumps).
24	841861	Compression type refrigerating, freezing equipment incorporating a valve for reversal of cooling/heating cycles (reverse heat pumps).
25	841869	Compression type refrigerating, freezing equipment incorporating a valve for reversal of cooling/heating cycles (reverse heat pumps).
26	841919	Solar boiler (water heater).
27	841940	Distilling or rectifying plant.
28	841950	Solar collector and solar system controller, heat exchanger.
29	841989	Machinery, plant or laboratory equipment whether or not electrically heated (excluding furnaces, ovens etc.) for treatment of materials by a process involving a change of temperature.
30	841990	Medical, surgical or laboratory stabilizers.
31	848340	Gears and gearing and other speed changers (specifically for wind turbines).
32	848360	Clutches and universal joints (specifically for wind turbines).
33	850161	AC generators not exceeding 75 kVA (specifically for all electricity generating renewable energy plants).
34	850162	AC generators exceeding 75 kVA but not 375 kVA (specifically for all electricity generating renewable energy plants).
35	850163	AC generators not exceeding 375 kVA but not 750 kVA (specifically for all electricity generating renewable energy plants).
36	850164	AC generators exceeding 750 kVA (specifically for all electricity generating renewable energy plants).
37	850231	Electric generating sets and rotary converters; wind-powered.
38	850680	Fuel cells use hydrogen or hydrogen-containing fuels such as methane to produce an electric current, through an electrochemical process rather than combustion.
39	850720	Other lead acid accumulators.
40	853710	Photovoltaic system controller.
41	853931	Discharge lamps, (ex ultraviolet), fluorescent.
42	854140	Photosensitive semiconductor devices, including photovoltaic cells whether or not assembled in modules or made up into panels; light-emitting diodes.
43	900190	Mirrors of other than glass (specifically for solar concentrator systems).
44	900290	Mirrors of glass (specifically for solar concentrator systems).
45	903210	Thermostats.
46	903220	Manostats.
47	700800	Multiple-walled insulating units of glass
48	730431	Tubes, pipes & hollow profiles (excl. of 7304.10-7304.29), seamless, of circular cross-section, of cold-drawn/cold-rolled (cold-reduced) steel
49	730441	Tubes, pipes & hollow profiles (excl. of 7304.10-7304.39), seamless, of circular cross-section, of stainless steel, cold-drawn/cold-rolled (cold-reduced)

50	730451	Tubes, pipes & hollow profiles (excl. of 7304.10-7304.49), seamless, of circular cross-section, of alloy steel other than stainless steel, cold-drawn/cold-rolled (cold-reduced)
51	840682	Steam turbines & oth. vapour turbines (excl. for marine propulsion), of an output not >40MW
52	841012	Hydraulic turbines & water wheels, of a power >1000kW but not >10000kW
53	841013	Hydraulic turbines & water wheels, of a power >10000kW
54	850239	Electric generating sets n.e.s. in 85.02
55	850300	Parts suit. for use solely/princ. with the machines of 85.01/85.02
56	850440	Static converters
57	902830	Electricity meters, incl. calibrating meters therefor
58	903020	Cathode-ray oscilloscopes & cathode-ray oscillographs
59	903031	Multimeters
60	903039	Instruments & app. for meas./checking voltage/current/resistance/power (excl. of 9030.31), without a recording device
61	890790	Floating structures other than inflatable rafts (e.g., rafts (excl. inflatable), tanks, coffer-dams, landing-stages, buoys & beacons)
62	847989	Machines & mech. appls. having individual functions, n.e.s./incl. in Ch.84
63	842129	Filtering/purifying mach. & app. for liquids (excl. of 8421.21-8421.23)
64	842139	Filtering/purifying mach. & app. for gases, other than intake air filters for int. comb. engines

Trade Analysis of CSG subcategories for Regional Groups and Some Selected Member States of ESCAP¹ in 2002-2008

Mathur Somesh Kumar

Indian Institute of Technology, Kanpur, India

skmathur@iitk.ac.in

Abstract

This paper deals with the mapping of trade performance of Climate Smart Goods (CSG) for ESCAP regional members and associate members including those for regional groups like ASEAN, SAARC and APTA for years 2002 through 2008¹.

Key words: trade performance, CSG, ESCAPE

J.E.L. classification: F14

1. Introduction

CSG are defined as components, products and technologies which tend to have relatively less adverse impact on the environment. For example, it consists of articles of iron and steel and aluminum, machinery and mechanical appliances, electrical machinery equipment, ships, boats and loading structures, glass and glass ware articles, among others.

The study finds that trade of such CSG has a regional bias for most of the countries in the region although almost all are net importers from Japan and Hong Kong and more recently from China.

Thereafter, gravity analysis done to explain determinants of imports of CGS and its sub categories of ESCAP countries with countries in the region and with US and countries in the EU. Gravity model is used to explain the role of tariff barriers, preferential trading arrangements, economic size and endowments, general policy environment and overall infrastructure, distance between trading partner, membership of multilateral agreement, foreign direct investments, common language and borders, among others on trade of such climate smart goods and sub categories.

In particular, the study will consider bilateral trading partners (83 permutation $2=6806$) from 83 countries (57 ESCAP plus 25 EU and the US) for each of the CSG imports and its sub categories for years 2002 and 2008 for our gravity analysis. The study uses cross sectional analysis for 2008 and 2002 for import of CSG and its subcategories.

Further, following the World Bank (2008) we have been able to bifurcate such 64 goods further into clean coal technologies (HS code 840510,841181 and 841182), Wind Energy (HS code 848340, and 848360), Solar Photovoltaic systems (HS code 850720, 853710 and 854140) and Energy Efficient Lighting (HS code 853931).

The study besides these four sub groups have also considered 'Other Codes' as the fifth group which consists of all HS codes not considered in the four categories above. The study also performs the trade analysis for such sub categories.

¹ ESCAP has 62 members including associated members. The study considers 57 of them by excluding the non regional members UK, France, the Netherlands, the US and Timor Leste for non availability of data from 2002 through 2008 (period of study). Trade statistics uses World Integrated Trade Solution (WITS) data base where in UN commodity trade data is culled out for estimating the various indices. For comparison purpose and saving space the study reflects figures for 2002 and 2008 mainly but the trade indices and indicators have been worked out for all the countries (for which data was available) in the ESCAP region from 2002 through 2008 and for some regional groups like APTA, SAARC and ASEAN. All countries of ASEAN, APTA and SAARC fall under ESCAP region. For comparison purpose the study has taken ESCAP as one region for our analysis.

2. Trade Analysis of CSG subcategories for Regional Groups and Some Selected Member States of ESCAP in 2002-2008

This section will work out Michelaye index, Revealed Comparative Advantage, Competitiveness Index and Regional Orientation index for sub categories of CSG, namely clean coal technologies (HS code 840510, 841181 and 841182), Wind Energy(HS code 848340, and 848360), Solar Photovoltaic systems (HS code 850720, 853710 and 854140) and Energy Efficient Lighting (HS code 853931). The study besides these four sub groups have also considered 'Other Codes' as the fifth group which consists of all HS codes of CSG not considered in the four categories above. The indices have been worked out for regional groups and some selected member states from 2002 through 2008.

2.1. Michelaye Index of CSG subcategories for Regional Groups

Michelaye index identifies the sectors in which an economy or a group has a comparative advantage. A country is said to have a revealed comparative advantage if the value exceeds zero. The Michelaye index takes a value between -1 and +1.

Michelaye index is worked out for ESCAP, ASEAN, APTA and SAARC (see tables I-IV) for CSG and its sub categories. The positive figures for two codes out of other codes including CGS for ESCAP (Table I) indicate that Solar Photovoltaic Systems (SP) and Energy Efficient Lighting are two sub categories of CGS in which the region as a whole has comparative advantage. All figures for CSG broad category for ESCAP works out be negative. However, the above analysis and this one has shown that most of the member nations in the region do not have a comparative advantage in the production of CSG and are net importers of CSG.

Therefore, the study identifies and works out the Michelaye index for those countries and regional groups whose values for sub categories of CSG works out to be positive. The analysis for member states of ESCAP for the trade in subcategories will be done in the next section. The results indicate that China, Hong- Kong, India, Japan, Macao, Malaysia, Philippines, Thailand and Vietnam performs better for some sub categories in terms of export pattern to its own import pattern. For example China, India, Japan, Macao, Thailand and Vietnam have positive Michelaye index for Energy Efficient Lighting in some if not all from 2002 through 2008 while Japan, India, Macao and Malaysia perform better in Solar Photovoltaic systems

Table II works out the Michelaye index for ASEAN. The sub category Solar Photovoltaic systems in comparison with other sub categories including CSG have positive figures from 2002 through 2008 indicating of the comparative advantage in

such sub categories. All other categories have negative figures indicating that ASEAN as a group does better in terms of export pattern to its own import structure for the sub category Solar Photovoltaic systems only.

Michelaye index for SAARC is worked out and figures given below in Table III. CSG sub categories Clean Coal Technologies, Solar Voltaic Systems and Energy Efficient Lighting show some positive values for some years (2008) indicating that SAARC as

a region are net importers of CSG and sub category goods from the rest of the world. The positive values indicate the changing trade pattern of these countries in SAARC towards producing and exporting more cleaner technologies.

2.1.1. Michelaye Index of CSG subcategories for Selected Member States of the ESCAP

This section works out the Michelaye index for CSG subcategories for selected and identified countries of ESCAP. We have identified those member states which show positive values in some years for sub

categories. For convenience and comparison purpose CSG results are reproduced.

Table V shows that the index is positive for Energy Efficient Lighting for all years from 2002 through 2008 indicating that China may have a comparative advantage in production of energy efficient lighting. Michelaye index is positive for CSG and Solar photovoltaic systems in 2008 only.

Table V: Michelaye Index for China, 2002 -2008

Year	CSG	CCT	SP	WE	EEL	Other

2.2. Revealed Comparative Advantage (RCA) in CSG Categories for Member Nations and Regional Groups of ESCAP in 2008 and 2002

The Revealed Comparative Advantage is defined as the ratio of two shares. The numerator is the share of a country's total exports of the commodity of interest in its total exports. The denominator is share of world exports of the same commodity in total world exports. The RCA takes a value between 0 and + infinity. A Country is said to have a revealed comparative advantage if the value exceeds unity.

The Table XVIII indicates that the Revealed Comparative advantage index for Energy Efficient Lighting is greater than one

for China, Sri-Lanka and Macao in 2008 while it was greater than one for China and Thailand in 2002. This indicates that the share of EFL exports in the total exports of each of these countries is greater than the World share of EFL in Worlds total exports. The greater than one RCA figure for China in 2008 are also reflected in the alternative Michelaye index for China which is positive. This reconfirms that China is performing better than other is such technologies. The same happens with Macao in 2008 reconfirming that Macao has a revealed comparative advantage in 2008 and is reflected in its export pattern. Both APTA and ESCAP as a groups have values of RCA greater than one in 2008 and 2002 indicative of its strong performance.

Table XVIII: RCA in EFL for Member Nations and Regional Groups, in 2008 and 2002

Country/ Regional Groups	RCA in Energy Efficient Lighting 2008	Country Regional Groups	RCA in Energy Efficient Lighting 2002

The Table XIX shows RCA in Solar Photovoltaic systems in 2008 and 2002 for member nations and regional groupings in ESCAP region. Japan, China, Malaysia and Macao show greater than one values in 2008 while Malaysia, Japan, Thailand, New Zealand and Hong Kong had greater than one figures in 2002. The Figures show the rise of

China and Macao in 2008 to levels reached in 2002. All regional groups APTA and ASEAN and ESCAP regions show greater than one figure for SPS in 2008. In the year 2002 only ASEAN and ESCAP had values greater than one. This shows the rise of APTA in terms of SPS.

Table XIX: RCA in Solar Photovoltaic Systems for Member Nations and Regional Groups in 2008 and 2002

Table XX gives the figures for RCA for clean coal technologies. It is to be noted that Pakistan and Singapore are the only countries in 2008 who have secured more than one figure in RCA. India is close at third with value of 0.85. It seems that SAARC countries have developed expertise in the production of CCT. It is also notable that no country in the ESCAP region had a comparative advantage

in clean coal technologies in 2002. Also, no regional group have comparative advantage in the production of clean coal technologies. Maybe the world community at large need to rethink and review the policies related to clean coal technologies. ESCAP and ASEAN are already showing impressive export performance in relation to its import profile.

Table XX: RCA in Clean Coal Technologies for Member Nations and Regional Groupings in 2002 and 2008

3. Competitiveness Index for Trade in CSG Categories of Member Nations and Regional Groups in ESCAP Region in 2002 and 2008

Competitiveness index shows the share of exports of one product by a country in World Exports of the same product. The higher value indicates an improvement in its competitiveness in relation to other countries. The values vary from zero to 100 % indicating an ideal situation of hundred percent competitiveness. The ratio shows the countries international profile with respect to a product traded internationally.

Table XXIII gives the index for member nations and Regional Groupings in ESCAP region for EFL. China , Hong Kong and Thailand are ranked one, two and three for 2008 while China, Japan ad Thailand are ranked in the same serial in 2002. What is notable is the big gap between the figures of China and the second ranked nation in 2008 and in 2002. China got figure of 57.84% in 2008 while the second ranked nation got figure of 2.28 %. In 2002 China got the figure of 30.96 while it was only 4.25 for second ranked Japan. ESCAP and APTA as regions perform better than other regional groups as far as competitiveness is concerned.

Table XXIII: Competitiveness Index for Trade in EFL of Member Nations and Regional Groups, in 2002 and 2008

Table XXVI gives the Competitiveness Index in Trade in WE of Member Nations and Regional Groups in 2002 and 2008. Japan, China and South Korea are ranked one,

two and three respectively. The ranking are Japan, China and Singapore in 2002. ESCAP and APTA are ranked one and two in 2008 and 2002.

Table XXVI: Competitiveness Index for Trade in WE of Member Nations and Regional Groups in 2002 and 2008

4. Regional Orientation of CSG Subcategories

Table XXVIII give the Regional Orientation Index for selected member states of ESCAP and some regional groups for sub categories of EGS in 2002 and 2008. A value greater than unity implies a regional bias in exports. The results indicate that Malaysia has regional bias for export of CCT, WE and OC in ASEAN in 2002 and 2008. Philippines also has regional bias for export of WE and OC in 2007 and 2008 and in EFL in 2008. Singapore has regional bias (in ASEAN) for all codes in 2002 and 2008 except SPS in 2008. Thailand has regional bias (in ASEAN) for exports of CCT, WE and OC in 2002 and

2008. ASEAN as a group has regional bias towards its own region for all codes except SPS in 2002 and 2008.

India has regional bias for EFL in SAARC for both years and in CCT in 2008. Sri-Lanka has a regional bias for export of SPS and EFL in 2002 and 2008. SAARC as a group has regional bias for EFL in both years and CCT in 2008.

India has regional bias for clean coal technologies in APTA in 2008. South Korea has regional bias (in APTA) for OC and SPS in 2002 and 2008. APTA as a group has regional bias for OC and CCT in 2008. ESCAP as a group as regional bias for OC in both the years and CCT in 2008.

Table XXVIII: Regional Orientation Index of Export of Sub Categories of CGS for Selected Members and Regional Groups, 2002 and 2008

Country(in Regional Grouping)	CCT		WE		SPS		EFL		OC	
	2002	2008	2002	2008	2002	2008	2002	2008	2002	2008

5. Conclusions

The study works out some trade indices like Competitiveness index, RCA, Michelaye and Regional Orientation index for ESCAP member nations and some regional groups for trade of CSG subcategories for years 2002 through 2008. The objective is to map the trade performance of ESCAP region in trade of cleaner technologies.

Revealed Comparative advantage index for Energy Efficient Lighting is greater than one for China, Sri- Lanka and Macao in 2008 while it was greater than one for China and Thailand in 2002. This indicates that the share of EFL exports in the total exports of each of these countries is greater than the World share of EFL in Worlds total exports. The greater than one RCA figure for China in 2008 are also reflected in the alternative Michelaye index for China which is positive. This reconfirms that China is performing better than other in EFL. Japan, China, Malaysia and Macao show greater than one RCA values in 2008 for SPS while Malaysia, Japan, Thailand, New Zealand and Hong Kong had greater than one figures in 2002. Table XXVI above gives the figures for RCA for clean coal technologies. It is to be noted that Pakistan and Singapore are the only countries in 2008 who have secured more than one figure in RCA. India is close at third

6. References

[1] Jha, Veena (2008), "Environmental Priorities and Trade Policy for Environmental Goods: A reality Check", ICTSD Issue Paper No 7, September

with value of 0.85. It seems that SAARC countries have developed expertise in the production of CCT. Japan has a comparative advantage in the production of Wind technology both in 2002 and 2008. Japan, Philippines, China, Hong Kong and South Korea have a comparative advantage in production of 'other codes' in 2008 while Japan and Hong Kong got values greater than one in 2002. None of the groups have RCA advantage in 2008 and 2002.

ASEAN as a group has regional bias towards its own region for all codes except SPS in 2002 and 2008. SAARC as a group has regional bias for EFL in both years and CCT in 2008. APTA as a group has regional bias for OC and CCT in 2008. ESCAP as a group as regional bias for OC in both the years and CCT in 2008.

The above analysis based on trade indices indicates the factual position of each member nation with respect to trade of CSG and its sub categories. Gravity analysis will help us answer why do we see trends like the above? Do tariffs(both with and without preferential rates), economic size, endowments, policy, transparency, regulations or infrastructure matter, dummies for regional trade agreements, among others matter more for trade of such clean technologies for the ESCAP region.

Specific Features of the Current Economic Recession in Japan and Ways of Managing It

Maşcu Simona

Marcean Dana-Elena

mascu_simona@yahoo.com

dana_marcean@yahoo.com

Abstract

In almost every area of human activity there are concerns regarding malfunctions that may occur within it. Therefore, there are studies about the causes, the mode of occurrence, manifestations and consequences of these deviations which act as the economic crises.

The current crisis differs from other crises in its proportions, now affecting a large number of countries. If until now there were mainly affected countries in progress, in this crisis there have been involved most developed countries. In this category it is also included Japan.

The National Bank of Japan tries continuously to carefully examine the outlook for economic activity, and, if necessary, take policy actions in an appropriate manner.

Since the Tohoku Pacific Earthquake occurred, the Bank of Japan has been trying to manage its effects on financial markets and financial institutions' business operations. In addition, the Bank has been providing funds flexibly through appropriate money market operations.

Key words: crisis, Bank of Japan, policy measures, financial market, earthquake

J.E.L. classification: E52, E58, G01

1. Introduction

Economic crises have always invited to reflection and sometimes introspection, putting everyone in the position of wondering where it went wrong, who was wrong, what went wrong and last but not least, what should be done so that these mistakes do not

happen again. Today's financial crisis has its roots in corporate irresponsibility around the subprime mortgage market in the US. If "responsible lending" which presumes providing credit, based on background checks and professional judgment, to people who can accommodate regular repayments without getting into financial difficulty had been observed (or if tighter regulatory oversight had been imposed), we might not all be in this position right now. This crisis is a financial crisis of liquidity slump in global credit markets and banking systems, caused by the collapse of companies that have invested in high-risk mortgages. Its causes are foreseen since the end of last century, but the peak was reached in 2007 and 2008.

The baseline was when Japan and U.S. decided to reduce their interest rates in order to avoid recession. National Bank of Japan has tried by all available levers to limit the adverse effects of the recession through decisions on the reference interest rate, measures to ensure stability of financial markets and corporate support facilities to customers.

2. Monetary policy measures – evolution of the reference rate

The reference rate is the starting point of all monetary policies implemented by each central bank. A higher reference rate is attracting more money into bank accounts and limits the possibility of getting a credit contract, so a smaller amount of money on the market. In the opposite situation, a lower rate, is generating more loans and money saving - so a larger amount of money on the market. In terms of reference interest rate, Bank of Japan decided a dramatic reduction since December 2008.

Table 1: The development of loan interest rate and reference interest rate at the National Bank of Japan in 2007-2008

Date	Loan Interest Rate	Reference Interest Rate
February 2007	0,75	0,5
October 2008	0,5	0,1
December 2008	0,3	0,1
December 2010	0,3	0-0,1

* *Source:* Own processing of the information available at <http://www.boj.or.jp>.

Moreover, in October 2010, the Bank of Japan surprised the economic world by announcing a reference interest rate fluctuating between 0 and 0.1. Together with this decision, it adopted an expansion plan to combat unjustified strengthening Yen and stop persistent deflationary process. Japanese government tried to equilibrate economic problems of the economy through excessive public spending. [1]

Government loans took a great extent. Japan is a highly indebted country: the IMF said in 2010 that the net public debt amounted to the equivalent of 121.7% of GDP, double compared with 2000. Regarding the total public debt, it reached almost 200% of GDP. Most of this debt is not external, but internal, thus making the country less dependent on foreign creditors. Japan would have had inflation only if the growth of public debt had been so great as to require foreign loans. [2]

3. Measures to ensure the stability of financial markets

The Bank of Japan has taken several measures in order to balance the situation on financial markets.

A. The need to expand operations generating additional funds in U.S. dollars

In the third quarter of 2008, an important number of central banks decide to approach simultaneously the problem of increased

pressure on the dollar in international financial markets. Thus, the National Bank of Canada, Bank of England, European Central Bank, the Federal Reserve and Swiss National Bank take certain measures, together with other actions conducted by the individual central banks in order to improve liquidity conditions in global financial markets.

Bank of Japan joins the central banks taking such measures, through an agreement with the Federal Reserve providing funds meant to provide entering transactions in dollars, seeking to provide dollar-denominated funds for the Japanese market participants, in collaboration with the Federal Reserve. The Bank will provide funds in accordance with the market conditions.

In the first quarter of 2010, in coordination with the other central banks, Bank of Japan confirmed the expiration term of temporary swap lines with the Federal Reserve liquidity. These lines are not necessary, taking into account the functional improvements in the financial market.

Consequently, supply funds for operations in dollars run by the Bank of Japan will no longer be in operation. Similar announcements are made at the beginning of 2010 at the Bank of England, European Central Bank and Swiss National Bank. Central banks will continue to cooperate in order to sustain global economy.

However, in May 2010 the Bank's Monetary Policy Council of Japan has decided to temporarily restore the U.S. dollar swap agreement with the Federal Reserve, for the same purpose with which he did so in 2008: funds needed to restore market operations dollars. The Bank will continue their efforts in order to maintain financial market stability by implementing proper market operations.

B. Introduction additional storage facility

In the third quarter of 2008, Bank of Japan revised the bank's reserve system, in order to make another step to improve the functioning of open market operations to ensure stability on the financial markets. Global financial markets continued to be influenced by both internal and external pressures and their influences began to be felt in the Japanese financial markets. In these circumstances, the Bank has provided sufficient liquidity until the end of the calendar year, but also by the

end of the fiscal year in order to ensure financial stability in the markets.

Additional storage facility is a temporary measure, through which the bank pays interest on additional reserve balances - correspondent account balances held with the Bank in addition to the required reserves. Introducing this facility had the consequence of giving additional flexibility in managing money market operations by allowing sufficient liquidity, while maintaining the policy rate around the target level.

4. Supporting facilities provided for corporate customers

The Yen reached the highest levels in 13 years against the U.S. dollar after the decisions of FED in December 2008, which has reduced its reference rate to 0%, and the decision of the Bank of Japan, which lowered the interest of reference to 0,1%. Yen appreciation leads to a decrease in the earnings repatriated by Japanese companies and also undermines the competitiveness of Japanese exports.

Government forecasts show a slowdown in economic growth of 1.5% due to currency appreciation. Domestic producers, which include Panasonic Corporation, the largest plasma TV maker in the world, complain that the Yen appreciation affects competitiveness against foreign companies.

To support both the national economy and the corporate sector, Bank of Japan has invested in 2009, 11 billion dollars to buy shares of Japanese commercial banks in an attempt to undermine the economic crisis and credit crunch. Japan agreed in October 2010 a new package worthing 61.3 billion dollars to stimulate the Japanese economy, hard hit by deflation and strong appreciation of the currency. This massive package included programs for creating or saving 500.000 jobs, in addition to the measures taken in support for small and medium enterprises.

Figure 1: The evolution in the exchange rate Yen/Dollar during the period 2006-2011

*Source: Retrieving information available at <http://www.forexpros.com/currencies/jpy-usd-chart>.

Another program designed to reinvigorate the situation of Japanese enterprises, was the program to purchase treasury bills and bonds from firms. The program intended to provide an alternative financing option for companies unable to obtain loans from banks, while the credit market began to stagnate, affected by the bankruptcy of U.S. bank Lehman Brothers in September 2008. The success of this program has lately begun to fade after the operating conditions in financial markets began to show signs of recovery. Therefore, in December 2009 the bank's monetary policy committee decided to close the program.

5. Economic situation short after March 11, 2011

The events on March 11, 2011 have already had an apocalyptic dimension for Japan and will definitely have adverse economic effects worldwide. An earthquake measuring 8.9 on the Richter scale and tsunami waves devastated the Tohoku region in northeastern Japan, which has an 8% contribution to GDP.

What the Japanese government failed to make, was managed, unfortunately, by the earthquake: depreciation of the yen.

Depreciation discourages Japanese exports from other countries to Japan and favours exports for Japanese companies.

Table 2: External interchange situation Romania - Japan in the first three quarters of 2010

	Percent change	Absolut change	Share in total exports/ imports
Exports to Japan	+83%	102,6 mil euro	0,38%
Imports from Japan	+7,7%	161,4 mil euro	0,48%

*Source: Own processing of the information available at <http://www.imes.boj.or.jp/research>.

The major impact on the global economy is that this earthquake has brought a lot of nervousness. Moreover, the effects of the earthquake in Japan (rolling disaster, human losses, imminent nuclear issue), and the conflicts in the Middle East, bring into question the global recession, intensifying it.[3]

The Bank of Japan has acted very quickly and has doubled the maximum size of its current asset purchase program to 10 trillion yen (approx. 123 billion US dollars). It further has increased the liquidity supply for the economy. These steps are turning the already supportive monetary policy in Japan more expansive, which should support the ability to recover from the earthquake shock. Direct and immediate consequence of this natural disaster was that the Japanese financial market's main stock index Nikkei, was diminished with over 10%.

The earthquake damage was very extensive in terms of geography. Thus, for the moment, there is likely to decrease production and to increase the situation of concern that businesses and households will be affected by the feeling of uncertainty. [4]

6. Concluding remarks

The present financial crisis is much more than a financial one. It is a crisis of ethics and it was facilitated by the moral hazard. Banks no longer trust other lenders. Investors no longer trust banks. Lenders no longer trust borrowers.

National Bank of Japan tried to diminish the adverse effects of the current economic crises through decisions on both monetary issues, but also on financial markets. Bank of Japan also tried to mitigate the effects of the earthquake in Tohoku on the operations of the capital market and of the financial institutions.

Japanese economy has undergone a state of development during the deceleration phase once faced with the global economic crisis beginning. Consumption Index continued its downward trend. The Banks baseline scenario regards Japan's economy as expected to return to a state of moderate recovery. It is also expected that future growth rate of the consumer index to become slightly positive.

Regional Development in the Creative Age

Mazilu Sorin

Horodnic Adrian Vasile

mazilu.sorin@yahoo.com

adi_horodnic@yahoo.com

Abstract

This article brings into question the increasing importance of creativity as a factor for regional development. For this purpose, it is briefly discussed the fine connection between culture, creativity and regional development and how creativity can increase the development of a region and ensure sustainable competitive advantages.

In the final part, it is underlined the importance of the creative economy quantification and there are identified the main obstacles for such a step.

Key words: culture, creativity, cultural industries, creative economy index, regional development.

J.E.L. classification: F15, O31, L80, O34

1. From culture to creativity

The European Union is more than just a simply economic market: it represents a much broader project including political, social and cultural aspects. For this reason, the integration process is a multifaceted one, including not just economic, social and political aspects but cultural ones, too.

In order to underline the importance of culture in the European construction, J. B. Duroselle (1965: 25) sustained that "Europe is a construction of the human spirit" [1].

This paper presents a different face of culture, not only as a source of social inclusion, as a factor for fostering the sense of belonging to a certain social group, but as an important factor to competitiveness, by its use in the complex process of *creativity*.

From this perspective, culture becomes a powerful tool to transmit values and promote public interest objectives that transcend

wealth creation, continually redefining it. Adam Smith argued in his "Wealth of Nations" published in 1776, that the economy's only purpose is to ensure the attainment of wealth of nations [2]. However valences of this concept are in constant change, closely related to human society. History has proven that the nations' prosperity cannot depend any more just on the possession of certain natural resources or the endowment with production factors but on the use, development and share of knowledge, as a main attribute of the *Knowledge society*[3].

Though, more and more theorists say that because of the greater imitation capacities [4],[5], possession, use and share of knowledge is not enough. For ensuring the sustainability of competitive advantages, at microeconomic or macroeconomic level, it is required the networking of knowledge which may lead to technical innovation to a more complex one, drawn from the unique cultural and social context. This can be achieved through *creativity*, described as the ultimate economic resource "human creativity is the ultimate economic resource," (Florida 2002, p. xiii) that outlines a new era: *the creativity age* [7].

In his book, *The Free Market Innovation Machine: Analyzing the Growth Miracle of Capitalism*, William Baumol (2002) rejects the conventional view where competitiveness lies in the dimension of prices. Baumol argues that the importance of systematic innovation within companies is vital and can ensure the sustainability of competitive advantage as a continuous concern [8].

Introspection on this issue, by discussing intellectual property rights and the creative economy size, is continued by J. Howkins (Howkins, 2001: 288) which highlights the importance of income generated by intellectual rights in the composition of U.S.

earnings. Howkins argues that it is imperative to think at the crystallization of a new economy, with the pivotal "*creative industries*" - defined as sectors that are governed by copyright laws [9].

In *The Information Revolution* (A. Porter, R. William and Walter, 1998) the American economists capture the knowledge economy changes and its transfiguration into a new form: *the creative economy*. The authors underline the importance of redefining: work, management and strategic policies in the new context [10].

The militant approach to innovation and creativity is continued by R. Reich (R. Reich, 2001) who demonstrates that continuous innovation is required in competition. Moreover, innovators themselves must become broad and creative in an economy in which ideas are the fundamental standard [11].

A series of studies of Harvard University (R. Caves, 2000, T. Cowen, 1998) analyzes specific elements of the cultural products market, arguing that market entrepreneurship, producing wealth and culture are interdependent and their connection is amplifying [12, 13].

B. Frey brings into question the issue of institutionalization and characterization of the report state-creativity. He concludes [B. Frey, 2000] that one can speak of creativity economy but that this is profoundly shaped by institutions [14].

The dual nature of creative work is handled by the Russian author V. Inozemtsev in "*Work, Creativity and the Economy*." (1999). He argues that economies are directly dependent on the existence of creative employees, and therefore boost their priority [15]. A significant effort to integrate the concept of "creative industries" in the analysis of economics is S. Lash and J Urry's study: *Economics of Signs and Space*, 1994 [16]. The authors examine social inequality, dynamics and interrelationships between culture, economy, environment, entrepreneurship and globalization. They argue that present economies are increasingly economies of symbols and culture.

2. Measuring culture and creativity

Although European construction has not only an economic dimension, the EU has been built through market forces and market economy. Thus were laid the foundations for economic solidarity between European nations, the basis of EU economic development. From this point of view, the priority in order to reveal the culture and creativity's role in the regional development is to measure their influence in the European economy.

This demarche represents a considerable challenge due to the rarity of research studies in this field and the disparity between the different approaches.

The main obstacles that stand out are [17: 31]:

- From the statistical perspective, the only pan-European source - *Eurostat*, is based on the data and reports supplied by national states. Beyond the fact that many of them have developed specific mechanisms to monitor the relevant cultural sector and to collect comprehensive data and systems they use different statistical approaches, resulting in a lack of comparability of data in this area. As a result, it is much easier to determine the amount of EU spending on science and innovation, than the measuring of the economic value of culture and creativity;

- Cultural organizations are sometimes reluctant to participate in an exercise designed to give economic value to the world of art and culture. For these entities the invaluable investment in the arts do not need economic justification. A cultural activity should be disconnected from the reality of the market to avoid the economic pollution on the artistic minds;

- Some commercial companies avoid being considered as part of the cultural sector, preferring to give them the term "*industries*". This assumption is created by fear of not being taken seriously by policy makers and to be excluded from European programs unfocused on culture;

- So far, interest in the Lisbon strategy focused on developing Information and Communication Technologies (ICT), creation of networks and investing in technological research. Technology has been accorded primacy over the factors that stimulate economic growth and social development in

Europe. On the other hand, culture and creativity suffers from an image problem, their role in the economy needed to be more highlight in the front of decision makers;

- Culture has often been regarded by the authorities (national or local) sector as a generator of expenses rather than investment opportunity, located in a well-defined business plan.

3. Creative industries

Although there are many obstacles, is felt internationally a new vision of culture and creativity, their marginalized situation being change.

Thus, the contribution of culture to the economy was gradually realized, particularly by the development of *creative industries*.

The term refers to a wide range of economic activities which aim the generation and exploitation of knowledge. The concept is also known by the name of *cultural industries* in Europe (Hesmondhalgh 2002: 14) or the creative economy (Howkins 2001).

The Howkins' perspective on creative industries is the broader one, including advertising, architecture, art, crafts, design, fashion, film, music, performing arts, publishing, research and development, software, toys and games, TV and radio, and video-games.

Other definitions are provided by Hesmondhalgh, Howkins, Florida or International organizations like UNCTAD, UNESCO or WTO.

Even there are very different approaches in defining creativity; Lash and Urry [16] find a common denominator among them: each of the creative industries has an "irreducible core", which implies "the exchange of finance for rights in intellectual property".

The most accepted description of creative industries is the DCMS (Department for Culture, Media and Sport, UK) one. According to this, creative industries are "those industries which have their origins in individual creativity, skill and talent and which have a potential for wealth and job creation through the generation and exploitation of intellectual property" [19]

Considering these, *creativity*, by using the unique cultural resource as inputs, contributes directly to regional development,

providing products for consumption in the form of cultural goods and services (books, films, recorded music, cultural events, concerts, etc.) or in the form of technologic goods or other goods and services which have also a creative component (computer and software industry, car production, architecture, etc.). In other words, *creativity* helps the developed and developing regions to capitalize their distinct cultural characteristics and to develop new patterns of sustainable growth, which permit the preservation of cultural identity.

From this perspective, creativity is a complex process of innovation, shaped like a mix of several dimensions: science, management, culture and technology.

Responding to the question "What is more important: culture or science?" José Manuel Barroso, President of the European Commission said, "*Certainly both are important, and particularly since the Renaissance, Europe has excelled at both. Constant innovation in art and science has helped Europe to enjoy rapid development and unparalleled cultural wealth (...)*

For Europe it must never be a question of art or science, but (...) art and science are the legs on which Europe stands" [21].

5. Conclusions

Even there isn't a generally accepted perspective on creative economy, the awareness of its positive effects on the economic development is increasingly shared over the world. As Cunningham and other stated in the *Financing Creative Industries in developing Countries* [20], "*The harnessing of creativity brings with it the potential of new wealth creation, the cultivation of local talent and the generation of creative capital, the development of new exports market, significant multiplier effects throughout the broader economy the utilization of information communication technologies and enhanced competitiveness in an increasingly global economy*".

The main lesson that should be learned by developing countries is that creativity has its roots in the individual creativity, their abundant resource, through whose revaluation can be developed new types of economic entities, new markets and a

new way of wealth creation, which can provide sustainability.

Entrepreneurship - Requirement and Necessity of the Current Economic Context

Mărăcine Mihaela Simona

corina_ducu@yahoo.com

Abstract

At the beginning of the 21st century, entrepreneurial leadership is as necessary as water and air for survival. The knowledge of entrepreneurial practices and methods is useful for the companies facing a complex and changing environment, but also in society's interest, to ensure development and progress.

Key words: entrepreneur, entrepreneurship, innovation, business.

J.E.L. classification: M1, M13

1. Introduction

Entrepreneurship and entrepreneurial activities have been the subject of much writing in the field. Joseph Schumpeter, Max Weber, Howard Stevenson, Arnold Shapero are some of the classics cited in nearly all papers referring to entrepreneurs and entrepreneurial activities. Offering a contemporary perspective on entrepreneurship, Vesper (1982) states: "the general area of entrepreneurship is defined in a superficial way as new business creation by individuals or small groups of individuals." [1] As the term "contractor" began to be used more and more often in the context of the economic development, its meaning and its characteristics have received increasingly higher attention.

The concept of entrepreneurship, by its complex content and large number of meanings, did not allow the expression of a concise definition accepted by all economists. Throughout entrepreneurship history, researchers from different branches

of social sciences have brought multiple interpretations and definitions to conceptualize this idea [2].

Kent suggests that the word entrepreneur can be used interchangeably with the expression "successful entrepreneur." To Peter Drucker (1970) entrepreneurship is associated with risk taking.

The entrepreneur is the person willing to put his/her career at stake, his/her time and financial security, to take risks on behalf of an idea, the person who "seeks change, who is responsive to change and exploits it as an opportunity." [3]

2. Content and importance of entrepreneurship

Entrepreneurial activity is one that allows individuals to keep pace with the ongoing changes of the market conditions. Entrepreneurship is not an abstract concept. By entrepreneurship we mean a practical activity of creating a new organization or of rehabilitation, modernization, recovery and/or restructuring of an existing organization, especially in business. Entrepreneurial activities can take various forms, ranging from projects undertaken by individuals or legal entities, to the creation of large national and even international companies.

There is greater and greater demand and interest for placing "entrepreneurship" (creation of new businesses) as a key element in the process of development and revitalization of the less developed areas in Europe. As the globalization factor affects increasingly stronger world economy and technological progress, generating growing uncertainty in economy and society, the

dynamism of entrepreneurship is considered a factor able to increasingly contribute to strengthening the new economy based on knowledge, to address the environmental, economic and social challenges.

More and more experts believe that entrepreneurship and innovation represent the key to national economic competitiveness. Entrepreneurship policies are more closely related to the innovational ones, the common characteristics and features of both types of policies being focused on creating new assets, processes and services in terms of boosting the economy. [4]

3. Characteristics of the entrepreneurial activity nationally and internationally

The early-stage entrepreneurial activity rate in Romania is of 3.89%. In Romania 2.5% of the adult population aged between 18-64 years is an entrepreneur-to-be (meaning 2.5 in 100 adults are involved in running a business).

These rates are lower than those recorded in most countries of Central and Eastern Europe (e.g. Croatia, Latvia, Hungary, Serbia). Only 25.57% of the adult population perceives favourable conditions for starting a business in the next six months, this rate being higher than that measured in Hungary and Latvia, but lower than in Croatia and Serbia and one of the lowest of the participating countries GEM. (Global Entrepreneurship Monitor, 2008). [5]

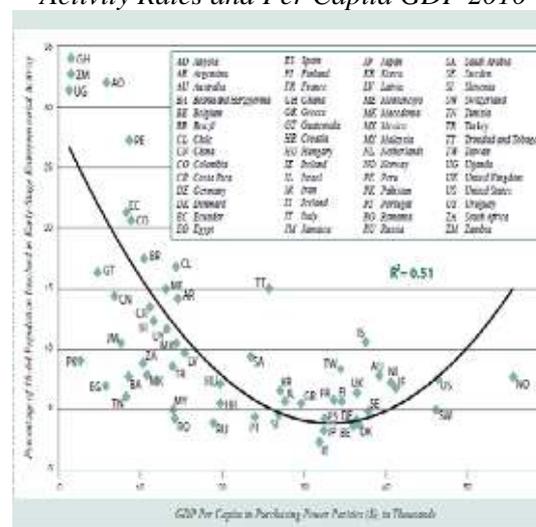

The rate of the early-stage entrepreneurial activity in Romania has decreased slightly from 4.02% in 2007 to 3,98% in 2008. The early-stage entrepreneurial activity rate for women fell from 3.1% to 2.1% and the rate of entrepreneurial activity motivated by the opportunity fell 2.7% to 2.12% in 2008 as compared to 2007.

These low rates of Romania can be explained by the lack of tradition, of the entrepreneurial activity and education before the '90s, by the unfavourable business environment during the transition period of the '90s, as well as by the acceptance of the population of jobs that involve a lower degree of risk than, offered by the big firms during the period of economic growth after 2000.

The most important change in entrepreneurial motivations is the increase of the rates of those who start a new business to maintain their current income or of those who are motivated by necessity from 17.2% in 2007 to 44.52% in 2008.

The contribution of entrepreneurship to economic development is a fact universally accepted in the specialized literature. Graph no. 1 illustrates the U-shaped relationship between GDP/per capita and the level of entrepreneurial activity in early stage internationally.

Figure 1: Total Early-stage Entrepreneurial Activity Rates and Per Capita GDP 2010

Source: Gem Adult Population Survey (APS) and IVF World Economic Outlook Database, 2010

As this figure shows, TEA rates are highest for the poorest countries, declining rapidly and then leveling out in the efficiency stage, with low levels continuing into the innovation stage until they turn upward at increasing levels of wealth.

Further inspection reveals that the dispersion of TEA estimates around the line of best fit in Figure 1 is not just a function of differences in economic development (or welfare) but also other factors. For example, Eastern European countries have been experiencing falling populations and a low stock of business owner-managers as a legacy of communism.

Their TEA point estimates are clustered below the trend line. In contrast, Latin American countries, with healthy population growth rates and a larger stock of business

owners, tend to appear above the trend line. [6]

4. The need for support and development of SMEs

The welfare of small and medium enterprises is essential for future employment and prosperity in the EU. For this reason, in June 2008, the European Commission has launched an ambitious new policy initiative called the "Small Business Act for Europe" (SBA), which situates SMEs at the forefront of the decision-making process in order to strengthen their capacity to create jobs in the EU and to boost their competitiveness both on the single market and on the global markets. As key element, SMEs aim at implementing the "Think Small First" principle in policy and in the decision making process at all levels in the EU.

The economic and financial crisis has highlighted even more the need to adopt comprehensive and complete policy measures in favour of SMEs. When adopting the SBA initiative, the "Competitiveness" Council has also approved, in December 2008, an action plan which regroups measures to be implemented with priority to better meet the needs of SMEs in the context of the global crisis, focused on improving the access to financing, the access to markets and the regulatory framework. [7]

Between 2008 and 2010, the Commission and the EU Member States have taken several measures to ease the administrative burden, facilitating the access of SME to financing and their access to new markets. [8]

The measures proposed by the European Commission refer to increasing the access of SME to local and international financing, use of the single market, but also strategies for doing business with non-EU countries.

- SMEs should have access to loan guarantees through enhanced mechanisms to guarantee them;
- Each Member State must have an action plan to improve the access of SME to financing, including the access to venture capital markets;

- "Single windows" in the Member States to facilitate administrative procedures;
- Reduction of "over-legislating," practice of national authorities through which the terms of the EU directives are exceeded while transposing them into the national legislation;
- Measures to facilitate the cross-border debt recovery;
- Proposal for supporting SMEs on the markets outside the EU.

Examples of supporting entrepreneurship in various countries:

- FRANCE: The status "Self-entrepreneur" (launched in 2009) allows any citizen (unemployed, clerk, employee, retiree) to easily open a business and enjoy some tax relief for the first three years. More than 500,000 self-entrepreneurs "have benefited from the French program in January 2009 - June 2010.
- ROMANIA: The "Start" program meant to encourage the entrepreneurial qualities of young people (18-35 years) and to support start-ups. (Budget: 21.2 million EUR in 2009, including 19 million euro for grants and 2.1 for funding the implementing agency).
- SWEDEN: The national program to promote female entrepreneurship (2007-2010) provides support for start-ups run by women.
- GERMANY: 23 bureaucratic procedures were simplified in 2009 as part of the third act to reduce the bureaucratic barriers for SMEs.
- HUNGARY: Single windows for simplified and electronic registration of companies (since 2008, electronic procedures are mandatory and the time required to set up a business was reduced to one hour).
- PORTUGAL: "Simplex," the program aims to simplify the administrative processes, procedures and practices. Since 2009, public consultations are also made via a public blog.

Both the Commission and the Member States have taken substantial measures to improve the access of SME to financing and

to facilitate their access to the EU and third-party countries markets, as well as to improve the framework conditions for SMEs, in particular by removing unnecessary administrative burdens.

5. Conclusions

Promoting small and medium enterprises, in terms of improvement of the decision-making process, of quality management and entrepreneurial skills, in order to rapidly adapt to the rising demands of the environment, is a necessity, but also a requirement of competitiveness.

How Globalized is Romania? New Challenges in Measuring Economic Globalization

Mărginean Silvia
"Lucian Blaga" University of Sibiu
silvia_marginean@yahoo.com

Abstract

Romania's transformation in the last 20 years raised a lot of questions about the causes and consequences of the good and bad things that happened in our economy. European integration and globalization were the two key words of our evolution. Romania became more opened and integrated in the world economy but we don't know the best way to measure the importance of globalization in our life.

This paper examines different measures of globalization, presenting the sets of indicators and indexes used to evaluate this complex process. The purpose is to find some answers to a difficult question: what is the best way to measure economic globalization of a country? The paper starts with an overview of the challenges related to the evaluation of globalization, continues with a synthetic presentation of the most used indicators and presents the scores and rankings of Romania in the recent years.

Key words: globalization indicators, international trade, foreign direct investment, Romania

J.E.L. classification: F01, O19, O52

1. Introduction

The literature on the causes and consequences of the recent recession is leading often to globalization. Given the rapid spreading of the crisis, there are a lot of questions about the role of globalization and is no doubt that the synchronization of downturns was possible because of the links between countries and firms.

Romania is hardly recovering from the crisis and the GDP forecasts for 2011 are about + 1,5% growth after a period of strong negative values. Romania was in the top 5

most affected developing countries by the crisis [1]. The main economic globalization drivers - trade flows, foreign direct investments and remittances - registered important negative growth rates, as effect of global crisis.

Is it Romania through most affected countries because of the high connection with global markets or the lent recovery is caused by a low degree of globalization? Is it too integrated or not integrated enough in European and world economy comparing other countries?

To answer this questions the first step is to find how globalized is Romania and how can we measure globalization in order to make the right policy choices and stimulate economic recovery.

2. Measuring globalization – challenges

Measuring globalization is a complex process requiring a relevant set of indicators, a consistent database and a lot of hard work.

Measuring globalization is a complex issue from two points of view: *there is not a single, general accepted definition of globalization*, therefore the wide range of indicators tries to reflect the complexity of the process - economic, social, political, technological, cultural dimensions of globalization are reflected separately or aggregated through indexes; *globalization impact scale* (individual, local, global) requires not only measures for the openness of countries but also for the individual and firm level international interaction.

Another challenge in measuring such a complex process is the *changing character of the globalization*. One of the crisis effects was a dramatic collapse of international trade and foreign direct investment, the two main drivers of globalization. While the magnitude of the current trade crisis can be comparable with previous drops of flows for individual

countries, the remarkable degree of synchronization explains the collapse in international trade and is directly related to globalization. As Araujo and Martins [2] shows, in OECD countries after more than six years of positive trade growth, trade dived in October 2008, reaching a record negative growth of -37% in April 2009.

Globalization is the explanation for the fact that trade flows during the global crisis have fallen much more sharply than they did during the Great Depression [3]. The new thing about globalization is the scale, the high level of integration and synchronization of national economies.

Another new aspect of globalization is *the complexity of the linkages* between the countries due to the global production networks, to the global value chains that have increased foreign direct investment flows and intra-firm trade, and have made them increasingly interdependent [4]

But globalization is much more than growing trade and foreign direct investments. The internationalization of technology and the growing flows of services are parts of the globalization changes. Globalization is also deeper and wider, with a growing number of countries actively participating at the process.

These changes are not regarding only economic globalization, but also cultural, social, political, components of the process. New facts and trends need appropriate indicators to measure the changes.

3. Measuring globalization – literature review

Globalization is not a new phenomenon. The first wave of globalization was between 1880 and 1913, the second wave was after the Second World War and there are voices talking about 3rd wave of globalization after this crisis. It is possible that such a deep crisis generates structural effects on the global system.

In this context seems appropriate to look at the current tools used to measure globalization and to find what is good enough to keep and what indicators are not relevant at this point. This analysis doesn't use statistical tools, being just a critical review, a state of art presentation for the

wide field of globalization measures literature.

Integration is the key word for the global economy. International economic integration indicators can be classified into two categories: price – based and quantity based indicators. The most commonly used integration measure based on quantities is the degree of openness defined as exports plus imports divided by GDP. [5]. This measure provides a synthetic approach from economic globalization point of view and one of the main advantages is data availability for long time series and a large number of countries. It disregards the architecture of trade flows and the geographic patterns of trade connections for every country.

In order to provide a synthesis of the existing literature on globalization indicators we classify them into two categories: (a) indicators measuring one particular aspect of globalization (b) indexes constructed on different variables, used to rank and compare globalization in different countries.

OECD, European Union, World Bank, International Monetary Fund, UNCTAD's databases and reports are important resources for the first type of indicators. Indexes are proposed by independent researcher, by universities research centers, by NGO's and are generally constructed on the available information provided by the actors from the first category.

Because of European Union's particularities we can't find a unique resource regarding globalization on EU site. There are several EU policies related to the different dimensions of globalization: External trade, Development and Aid, External relations, Environment, Information society, etc.

Moreover, European Union developed through Eurostat a list of Globalization Indicators that includes the main levels of globalization: **persons** (non-national among residents, non-nationals in the labor force, nights spent by non-EU residents inside EU, number of tourism nights spent abroad by residents, international air transport of passengers); **technology** (high tech exports, high tech imports, Gross Domestic expenditures on R&D); **goods and services** (export of goods, import of goods, export of services, import of services, intra EU trade in goods, energy dependency, growth of maritime transport, growth of air freight

transport; **global responsibility** (CO2 emissions per habitant in the EU and developing countries, official development assistance); **business and capital** (inward Foreign Direct Investment from the rest of the world, Outward Foreign Direct Investment, Market integration, Foreign controlled enterprises, Employment of foreign controlled enterprises, Outsources employment). The list is very comprehensive but in general Eurostat provides only information on member states and candidate countries.

The same kind of problem appears related to OECD databases and reports. OECD is a leading actor in issues of economic globalization indicators, but the countries covered are the 31 members of OECD.

In 2010, OECD second edition book on economic globalization indicators [4] provides a comprehensive selection of the main dimensions of economic globalization measures. The book covers indicators that can measure the magnitude and intensity of globalization:

- globalization of trade and investment: international trade of goods and services; foreign direct investment; portfolio investment;
- globalization of technology and knowledge;
- multinational enterprises;
- global value chains.

UNCTAD research and reports (*Trade and Development Report, World Investment Report*) offers a wider selection of countries.

Indexes are the expression of the globalization complexity, in terms of globalization dimensions covered, number of countries and number of years. We choose to present three relevant indexes: KOF Index of Globalization, Maastricht Globalization Index and AT Kearney Globalization Index.

KOF Index of Globalization is a composite index introduced in 2002 by Dreher as an instrument to measure the impact of globalization on economic growth [6]. Using panel data for 123 countries, for 30 years Dreher determined the values for this index and analyzed empirically whether the globalization affect economic growth. The conclusion of Dreher's study was that "contrary to the beliefs of its critics, globalization indeed promotes growth". But the most valuable outcome of the article was

the index of globalization, used as a base for future research.

Later, the index was updated and described in detail in Dreher, Gaston and Martens book *Measuring Globalization – Gauging Its Consequences* [7]. KOF Globalization Index covers the economic, social and political dimension of globalization. Looking at globalization as a "process that erodes national boundaries, integrates national economies, cultures, technologies and governance and produces complex relations of mutual interdependence" authors focus on the three most important dimensions of globalization.

Economic globalization is measured by two dimensions: actual economic flows (trade, FDI and portfolio investments as a percent of GDP) and restrictions on trade and capital.

The KOF Index is available for the period 2002 – 2010, and the update version of the original index for 2010 determines the Index values for 208 countries [8].

Maastricht Globalization Index (MGI) is proposed by Pim Martens from Maastricht University, "to be in position to evaluate the consequences of globalization in a rational and scientific manner" [9]. Thinking that economic globalization is not the only aspect that counts, the MGI is determined for five dimensions of globalization: political, economic, social & cultural, technological and ecological. Economic globalization is evaluated based on the following variables: trade (Imports + Exports of goods and services as a share of GDP); FDI (Gross foreign direct stocks as a share of GDP); capital (Gross private capital flows as a share of GDP).

ATK Globalization Index (ATK-GI) is another interesting index of globalization, last updated in 2007 by AT Kearney and Foreign Policy. ATK - GI covers four dimensions of globalization process [10]: political engagement, personal contacts, technological connectivity and economic integration. The indicators used for evaluating these four dimensions are:

- political engagement: foreign aid, treaties, organizations and peacekeeping;
- personal contact: telephone calls, travel and remittances;
- technological connectivity: number of internet users, hosts, secure servers;

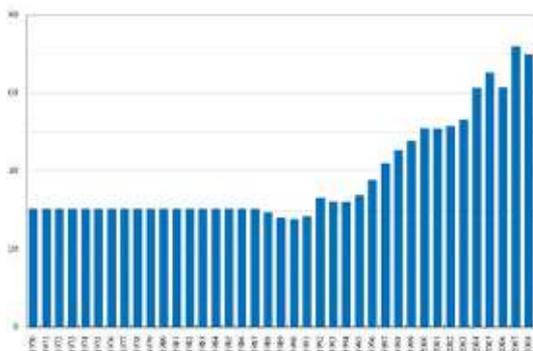

- economic integration: international trade and foreign direct investment.

4. Romania's globalization: values, scores and rankings

Romania's globalization level could be analyzed in a global or European context. Because of EU integration, we consider that our challenges should be judged first at European level, using the instruments mentioned above.

Since 1970 there has been a progressive upward trend in Romania's globalization measured by **KOF index**. In terms of economic globalization the take-off was at the beginning of 1990s, with an important improvement in 2004 (Figure 1).

Figure 1. KOF Economic Globalization Index in Romania

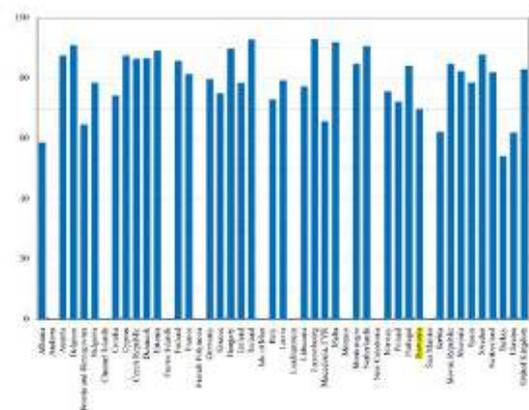

Source: <http://globalization.kof.ethz.ch/>

The last economic and financial crisis is visible in the results of KOF Economic Globalization Index for Romania, as for the world. Romania's position in *KOF Index of Globalization overall rankings for 2011* is 39 (the same as previous year), with a value of 71,25. It is important to emphasize that KOF Globalization Index 2011 is based on 2008 information, so there are the first results that include a year of crisis. Sub-indexes shows some differences, a 92,89 maximum score for political globalization (20th place), a 69,91 score for economic globalization (53rd place) and a minimum 57,83 score (69th place) for social globalization [11].

Using EU as a benchmark for the level of globalization (Figure 2) we find that Romania has the almost lowest score and position (39th) on overall index (26th place from 27 EU countries). Latvia finds itself on 41st place this year. In terms of economic

globalization Romania has moved down 9 places, mainly because of the 7,3% lost in actual flows sub-index comparing to the previous year. The top 10 positions in EU27 based on KOF Index are Belgium, Austria, Netherlands, Sweden, Denmark, France, Hungary, Portugal, Ireland, and Finland. These are holding 10 from 11 places on overall rankings, the only country outside of EU making the global top 10 is Switzerland (5th place). Political globalization sub-index is determined based on number of embassies (counting 25%), membership in international organizations (28%), participation in UN Security missions (22%) and international treaties. Romania's 20th place (13th place In EU 27) is a one place improvement (previous year: 21st place)

Figure 2. KOF Globalization Index in Europe

Source: <http://globalization.kof.ethz.ch/>

In **Maastricht Globalization Index** last rankings (2008) Romania is on 35th place from 117 countries. EU 27 countries are not all in MGI database (Cyprus, Luxembourg and Malta are missing). With a 33,4 score and a 7 places improvement since 2000, Romania is ahead of Lithuania and Latvia. There are not enough details about economic globalization, the scores and rankings based on this aspect of globalization.

Foreign Policy and **AT Kearney Globalization Index** places Romania on 36 position from 72 countries [10]. The index is determined based on 12 variables, included in four "baskets": economic, personal, political and technological. Economic globalization indicators include FDI and Trade expressed as percent of GDP. From this point of view Romania is placed on 29th

place, ahead two European Union countries: Poland and Greece.

From the 25 indicators used in European statistics on globalization we considered *Market integration* (average value of inward and outward FDI flows divided by GDP - %) the most relevant available indicator. From this point of view, Romania has a 1,5% score in 2009, under the average EU27 level which is 2,1%. Romania shares 11th place with Germany in 2009, behind countries like Bulgaria, Ireland, Estonia, etc. Data on trade are not available for Romania in Eurostat database.

Finally, we can show the scores and rankings of Romania in Table 1.

Table 1. Romania's rankings

Index	Year	Ranking	Relative position in UE 27
KOF Index of Globalization			
	2011	39/208	26/27
<i>Economic Globalization</i>		53	27/27
<i>Social Globalization</i>		69	27/27
<i>Political Globalization</i>		20	13/27
Maastricht Globalization Index

5. Conclusions

In this paper we presented five reliable sources for measuring globalization: UE and Eurostat set of globalization indicators, OECD view on best way to measure globalization and three indexes – KOF Index of Globalization, Maastricht Globalization Index and AT Kearney Globalization Index.

Any good set of globalization indicators or any index has to meet simultaneously the need for broad coverage and data availability. From this point of view we consider KOF Index of Globalization the best way to evaluate the level and dynamic of globalization in Romania. The number of countries covered and the number of years are wide enough to offer an image on key developments of globalization. KOF index offers a good evaluation for economic globalization and the data are comparable.

As a European Union member, Romania has to improve its position relative to other EU countries. The increasing complexity of globalization makes clear the necessity to choose the right policies for catching up, even in economic globalization.

Models of the 21st Century Learner

elena_mam2006@yahoo.com

Abstract

Millenials or Generation Y are terms referring to the generation born between 1977-1980 and 2001, that is the generation of youth and adolescents exposed to the new technologies of communication, a generation that starts to be in obvious but unexpected ways different from the previous generation. It is a very numerous and diverse generation including very well-prepared youngmen with a high education, education which has the continuous tendency of becoming an open education. It is built on the belief that each should have the freedom of using, improving and redistributing the educational resources without constraints. The teachers, the students and other people sharing the same convictions, gather together as part of the global effort of making education more accessible and efficient altogether.

Key words: second language, learning system, learner, learning technologies.

J.E.L classification: Z00

1. Introduction

Modern communication and information technologies are having an increasing impact on learning - how we learn, where we learn, when we learn, what we learn, what learning resources we have, and why we learn. It is important that our learning systems are guided by a vision of learners and of the communities to which the learners belong and which they are helping to create.

2. Characteristics of the SL Learners

- The process of learning a second language is lifelong. Experiences in childhood and youth lay the foundation for lifelong learning.
- People of all ages have a capacity to learn and this capacity is affected by various social, economic and physical conditions and situations.
- People have a variety of learning needs related to their personal interests, their families, their communities and their work. These needs include personal development, social and civic responsibility, cultural enjoyment, and continuing learning related to work and careers.
- People learn a language at different rates and in different styles, in different situations and at different times.

3. Characteristics of Second Language Learning Systems

- An effective learning system presents learners with a variety of patterns of (a) institutional affiliation, (b) service by teachers and resource persons, and (c) access to technologies. These patterns vary according to the context, the kind of learning and the needs and style of the learner.
- Teachers will have new roles and responsibilities as institutional patterns and learning technologies evolve.
- Communications and information technologies are transformational technologies with powerful impacts on society and profound implications for Second language learning and learning systems.

- The quality of the SL learning systems and processes is enriched and improved by using the knowledge and skills gained by experience, innovation and research.

4. Four Models of the 21st Century Learner

This era of radical and rapid change places demands on learners to increase their capacity for learning. This capacity is not necessarily about learning more, but, as Alberti has reminded us, about expanding and enhancing the ways in which learning takes place. There is the growing expectation that students will become more flexible, more self-reliant and autonomous, learners who can 'select personal pathways ... and who will develop the skills of life-long learning' [1]. What are the models of the learner for this brave new world? What are the approaches and processes by which our new-century learners will learn?

The Collaborator

The first model is that of 'The Collaborator'. For this learner networks of people, knowledge, skills and ideas are the sources of learning. For this learner new brain research which stresses the importance of social interaction [2] is a significant rationale.

The Collaborator-learner:

- seeks out and maintains links and networks
- negotiates and exchanges ideas
- uses new technology to support collaborative work
- contributes and adds value to cooperative learning processes
- also exploits and derives value from them
- is a team player, able to reach 'win-win' agreements.

What sort of learning environment does the Collaborator require? This learner needs access to knowledge and ideas, especially those of practitioners. This learner needs partnerships and networks from which to profit. This learner needs support for development of people skills and a sense of personal value within collaborative ventures with others.

The Free Agent

The second model is the 'Free Agent'. This learner makes full use of continuous, open-ended and life-long styles and systems of learning. This is a learner who is:

- flexible, able to keep pace with change, to take advantage of it
- able too to cope with changing requirements of an unstable job market and of employers who 'are by no means certain and often ambiguous about the necessary qualifications of graduates' [3]
- more concerned with personal transferable skills than with those relating to particular occupations - this learner is not bound to an occupation
- conversant with new technology and therefore not constrained by place and the accessibility of instructors
- independent, self-reliant, using new combined courses of study, rather than those which are profession-related
- able to take advantage of modularity, credit transfer, and arrangements for accumulated learning.

This Free-Agent learner requires opportunity to engage in practical work, to integrate performance and learning. This learner needs opportunity to plan flexibly, to seek out a wide range of sources and use these creatively and effectively.

The Wise Analyser

Model number three is the 'Wise Analyser'. This learner gathers evidence of effective activity, scrutinises it and applies its conclusions to new problems and new contexts.

The Wise Analyser is:

- reflective and critical
- skilled at the processes of research, testing of validity and the application of findings
- close to the world of work and opportunities for action research
- able to argue judgements securely
- able to apply and adapt arguments to new contexts and to use them in the management of change.

This learner requires opportunity to analyse and manage processes and to apply analysis to new situations. This learner seeks to pursue initiatives through circular processes of identification, analysis, result, impact and evaluation.

The Creative Synthesiser

The final model is the 'Creative Synthesiser'. This learner connects across themes and disciplines, cross-fertilises ideas, integrates separate concepts and creates new vision and new practice.

For this learner knowledge does not rest on particular ways of seeing the world. This learner:

- has 'new ways of seeing' [4]
- puts aside ideas that learning is linear and confirms to us that everything is inter-related and complex
- is able to create, investigate and to seize opportunities for development and change.

The Creative Synthesiser requires complex and stimulating learning environments, with access to disparate disciplines. This learner needs opportunities to negotiate across boundaries, together with the framework for creating radical visions and seeing them become real.

5. All Models

We can be sure that these four models are not separate. We are unlikely to see one learner uniquely adopting a single model. There will be considerable overlap, mixing, with elements present and elements missing, some well-developed, others less so. Our learners of the future are more likely to embody aspects of several, perhaps even all, models, in their approaches to learning.

Nevertheless the needs of these learners may have some common elements. In their higher education all of them need:

- keen perception of new social trends and change
- skills of self-reliance, the ability to take, survive and profit from risks
- ability to develop and maintain value of their 'portfolio', to adapt goals in the face of changing circumstances, and to seek out and manage ... and not to fear - career transitions
- underlying confidence and sense of self-worth
- support towards responsibility in learning, because as Ball points out: 'The key principle governing provision for and pursuit of learning in the future must be the primacy of personal responsibility for learning,

encouraged and enabled by the support of the whole community [5]'.

These models cannot claim either to be fully new or a complete surprise. They are an enhancement of many current ideas, such as those of Sinclair (1999): 'A sharper focus on being able to use knowledge, and to use communication skills, collaboration and teamwork skills, and thinking and decision-making skills in both creating and using that knowledge is needed in preparing graduates for professional lives in the decades ahead' [6].

These imaginations for the 21st Century learner suggest however rather more than lists of personal skills, core skills, transferable skills which have been advocated and analysed in many reports [7]. They are wider too than the personal qualities and attributes of learners which have also been considered [8]. They seem to be as much about choosing and using learning strategies as about taking on skills or developing qualities. They are about what actions learners can take when faced with the challenges of investigation and acquiring understanding.

In this outlook education becomes closely linked to what strategies learners bring to the learning process themselves, derived from social experience, from pressures and opportunities they see and feel, from challenges they already experience in everyday life. As time progresses we may, I suggest, focus less on the skills which a learner can be taught, and more on the strategies a person needs to nurture and possess in their learning armoury. The key skill will be learners' ability to develop and expand their own learning strategies, to be more imaginative in working them out and using them, to make them more useful and effective.

6. Higher Education

In the changing world many things are different for higher education itself. In the UK there is Government-engineered expansion, broadening of the student population, with responsibility for funding increasingly passed to learners themselves. There are more mature students, more women, more part-time students, modularisation, greater flexibility of choice.

There is renewed focus on higher education's contribution to society's skill-base [9]. Institutions themselves are subject to greater accountability, competition for funding and a consumerist view of learning. They need to respond to larger, more diverse learner groups, to learners who have new and different expectations, to a changing world and changing expectations.

How might higher education need to reflect the learning models of the future and support the learners who aspire to them? In a survey by The Association of Graduate Recruiters (1995) 160 unemployed graduates described how higher education had not provided them a range of experiences, skills, qualities and areas of knowledge which they needed for their work. It had not given them:

- self-confidence
- ability to uncover hidden opportunities
- decision-making abilities
- networking skills
- relevant experience
- knowledge of changes in the labour market.

The list relates well to some characteristics of our imagined 21st century learners. Currently learners may gain such skills and experiences more from their informal social activity travel, internet and mobile-phone communication than from their formal learning within higher education institutions. Higher education may have to respond to the opportunistic, flexible, pro-active approaches to learning which modern social activity and life-styles represent. It may need to do much more to:

- identify the individual styles and experiences which learners bring to the learning process and the learning strategies which are at their disposal
- design and develop responses to these styles and strategies - new materials, new delivery, new environments
- develop and respond to new concepts of competency and job-relatedness
- combine imagination and specificity in refinement of formative and summative assessment
- handle the huge tensions between such complex flexibility and the safeguarding of standards.

7. Conclusion

As we move from teaching to learning-centred provision, the learner is more central to the higher education process, indeed to education as a whole [10]. The emphasis is shifting 'from the activities of the teacher or trainer towards development of the student' [11]. This paper has looked at four models of that learner for the new century. There may of course be more.

Higher education must both respond to and lead learning trends and aspirations. The future is difficult to foresee, especially as development becomes ever more rapid. Our predictions of models of the learner, and our ability to adapt systems to meet needs for support, will determine how successful higher education can be in meeting 21st century challenges for learning.

The Development of Mixed Portfolios Using Risk Covering Strategies

Micu Angela Eliza

Iacob Doina

"Dunarea de Jos" University of Galati

angelaelizamicu@yahoo.com

Abstract

The transactions on the future markets represent a form of investment with a high degree of amplification of the effects, in which the movements of the prices can be fast and extensive. For these reasons the future markets represent an extremely attractive environment for the people who have a minimum capital and the required temper to make this kind of operations. The initial investments for the access on the futures markets represent a very small part from the total transacted value (usually a few percents), which means that sometimes we can obtain substantial profits.

Key words : strategy, risk, profit, trading

J.E.L. classification : G 11

1. Introduction

The assumed risk in such a transaction, of course, exists and cannot be ignored. The higher the risk, the greater the winning chances on the one hand, and the greater the losing chances on the other hand. But the true diversity of these derivative products (they are called like this because they are always based upon a support asset – shares, indices, interest rates, etc), and especially their flexibility allow the investors not only the substantial reduction of the risk that comes with transacting such a product, but also in some cases avoiding the risk, of course within some well -developed strategies in theory and correctly applied in practice (Codruța Maria Făt, *Futures Contracts and options*, Casa Cărții de Știință Ed., Cluj Napoca, 2005, page 16)

The main reason for which the economic agents use the futures contracts is the risk management (Teodor Ancuța, Darius

Cipariu, Ioan Aleman, Mirela Cozgară, *op. cit.*, page 18). The futures contracts help the economic agents to transfer the risk to which they are exposed upon the people who want to obtain profits by assuming risks. In other words, the futures contracts can be used to cover the risk (hedging) as well as an investment possibility. Using these instruments, the market participants have the possibility to cover their risk and to protect the value of the assets they have against the risk for price fluctuations to appear at a certain product (foreign currency, shares or interest rate) by taking up a position on the market opposite to the position they have on the actual market.

Using the futures contracts for a protection purpose the market participants practically block the price of the respective asset for a limited amount of time, and any profits or losses that appear from their futures position will compensate any profits and losses from the actual market.

The second reason for which the futures contracts are used is the one of the **speculation**, in which, unlike the hedging operations the physical goods or the financial companies are not owned and the operators do not seek to reduce their risk but they are transacting to obtain profits only from the fluctuation of the prices.

2. Risk covering strategies: hedging, arbitration, spread transactions

I am going to use in this paper an investor, MCAE, which can be an individual or a company, having an available amount of 100.000 RON, which he invests on the capital market in shares and share derivatives on Oltenia Financial Investments Company Co. (SIF5), due to the fact that the shares of this company have the most liquidity on the Sibex and BVB markets. The transaction

commissions are excluded for calculation simplification reasons. Generally on the spot market the commissions have the value of 1% from the value of the transaction, and on the futures market the commission is 1,5 lei/contract (0,6 lei/contract perceived by CNVM, BMFM SIBIU and CRC plus the commission of SSIF).

he Hedging (risk covering) means the compensation of a position by assuming an equal and opposite position on a different but parallel market. The effect of the compensating position is the reduction or the elimination of the effects of the value changes of both positions. The markets are parallel enough if the correlation coefficient is of 0.70 or higher (Teodor Ancuța, Darius Cipariu, Ioan Aleman, Mirela Cozgară, *op. cit.*, page).

According to the **asset** at the basis of the risk covering operation we can consider goods hedging, foreign currency hedging and portfolio hedging.

In this specific case, the portfolio hedging, the investor as a company has this sum of money of 100.000 RON, only until the date of 19 June 2010 when this amount must be used again to buy raw materials for the unfolding of the basic activity until the end of the year 2010. Thus, he decides to buy on the 24th of September 2009, 50.000 SIF5 Oltenia shares at the price of 1,3300lei/share. The intention of the investor is to maintain these shares in its portfolio until June 2010 (the goal is represented by the benefits afferent to the rights of the shareholder). In order to protect his shares portfolio, the investor decides to sell in the same day on the Sibex market, 50 futures contracts DESIF5 IUN10 (the equivalent of 50.000 SIF5 shares) at the price of 1,4100 lei/share (table 1). In order to make these two operations, the investor must have at his disposal the following financial resources:

➤ On the spot market he must pay the value of the 50.000 shares he bought:

$$50.000 \times 1,3300 = 66.500 \text{ lei}$$

➤ On the futures market he must deposit the necessary margin for the acquisition of the 50 futures contracts DESIF5 IUN10:

$$50 \times 0,1920 \times 1.000 = 9.600 \text{ lei}$$

Per total in order to make these two operations the investor must deposit the sum of 76.100 lei.

Table 1. Futures SIBEX/spot BVB SIF5 DEC10 quotations in the time interval 22 – 28 of September 2009

data	open	high	low	close	var (%)	pret spot	numar tranz.	contracte tranz.	profit/descluse
20.09.2009	1,4000	1,4000	1,3711	1,4300	9,33%*	1,2900	49	92	1,000
21.09.2009	1,4000	1,4147	1,3824	1,4345	9,39%*	1,2900	36	66	1,000
24.09.2009	1,4010	1,4300	1,3900	1,4100	5,72%*	1,3200	45	90	1,020
23.09.2009	1,4200	1,4500	1,4300	1,4209	9,77%*	1,3000	69	130	1,052
22.09.2009	1,2240	1,4100	1,3348	1,4500	6,16%*	1,3000	65	117	1,032

Source: www.ktd.ro

Table 2. The result of the operations on 19th of June 2010

Spot market	Futures market
24th of September 2009	
BVB SIF5 quotation: 1,3300 lei/share Buying 50.000 shares The required amount: 66.500 lei	Selling 50 futures contracts DESIF5 DEC10 at the price of 1,4100 lei/share The required amount: 9.600 lei
19th of June 2010	
The sale of shares: BVB closing quotations: 1,3200 lei/share Loss: 500	The closing price of the futures contracts DESIF5 DEC10 at the deadline is of 1,3200 lei/share. Profit: 4.500 Amounts in account: 14.100 lei

On the 19th of June when the investor sells the shares on the spot market and closes the positions he had on the futures market, the profit made of the futures market covers the loss on the spot market (table 2.).

We can notice that the sale made on the futures market of an equivalent quantity of shares held on the spot market preserved the profit of the investor.

In the case of the portfolio hedging we can conclude the following: after an accelerated growth of the price of a share, the investor on the spot market can anticipate a correction or even a comeback of the trend (figure 1.). In order to score a profit on the spot market he is not forced to liquidate his portfolio but he can sell the equivalent amount of shares from the futures market for a closer or farther maturity. By doing so, he keeps his shares and he makes some profit, all of these having more than reasonable costs.

Figure 1. The evolution of spot BVB/futures SIBEX SIF5 IUN10 in the time interval June 2009 – 2010

Source: www.ktd.ro

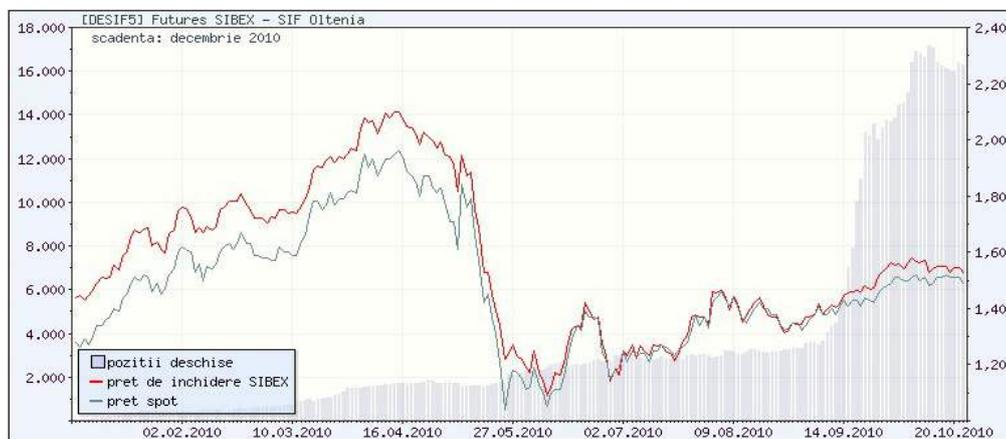

The **arbitration operations** rely upon the exploitation of the price “anomalies” for a certain financial instrument transacted simultaneous on two markets of the same type (either spot or futures) or of the differences in the spot and futures quotation for the respective instrument.

I will present, as an example, the MCAE investor making arbitration between the spot market (in the limelight) and the futures market.

On the 8th of March 2010 the investor buys from the spot market 45.000 SIF5 shares at the price of 1,6000 lei/share and simultaneously sells from the futures market

Sibiu 45 DESIF5 futures contracts (the equivalent of 45.000 SIF5 shares) at the price of 1,7500 lei/share. In order to make these operations it is necessary for the investor to have and to deposit on the limelight market the sum of 72.000 lei, and on the futures market he must deposit the margin of 270lei/contract. In total, in order to make these two operations the investor must have the sum of 84.150 lei (72.000lei + 12.150lei). The account of the investor on these two markets will record the maximum profit, meaning the difference between the two prices (figure 2.).

Figure 2. Basis spot BVB/futures SIBEX SIF5 DEC10 in the time interval December 2009 – October 2010

Source: www.ktd.ro

The situation of the account of the investor on the two markets during the unfolding of the arbitration is briefly presented in the following lines:

Step 1:

We can notice the difference between the prices from the two markets for the same asset.

➤ SIF5 – Regular BVB market – 1,6000 lei/share

➤ DESIF5 – the deadline December 2010, derivative market Sibiu – 1,7500 lei/share (the margin of a contract is of 270 lei/contract)

Step 2:

➤ He buys from the market at a smaller price (45.000 shares at 1,6000 lei = 72.000 lei)

➤ He sells on the futures market the equivalent quantity 45 contracts at the price of 1,7500 lei/share. One contract is the

equivalent of 1.000 shares. He deposits the margin for the 45 contracts, which is 12.150 lei.

The invested amount 84.150 lei.

Now the arbiter only waits for the market to balance itself.

During the time interval in which the opened positions are maintained, the arbiter can be put in the situation to bring more money, because the opened positions on the futures market are profit or losses generators by marking them at the market in accordance with the quotation price.

Thus I will exemplify the two situations:

a) **"appeal in margin"** on the date of 23rd of March 2010 when the spot price rose to the value of 1,8100 lei/share, and the futures price had a quotation of 1,9400 lei/share (table 3.), a loss of 0,1900 lei/share brought the arbiter a minus in his account of 8.550 lei.

Table 3. Futures SIBEX/spot BVB SIF5 DEC10 quotation in the time interval 19 – 25 March 2010

data	open	high	low	close	var (%)	pret spot	numar tranz.	contracte tranz.	pozitii deschise
25.03.2010	1,9111	1,9400	1,9107	1,9400	1,05% ↑	1,7900	39	47	1.192
24.03.2010	1,9500	1,9650	1,9022	1,9199	-1,04% ↓	1,7700	42	71	1.132
23.03.2010	1,9399	1,9415	1,9101	1,9400	0,66% ↑	1,8100	21	37	1.036
22.03.2010	1,8605	1,9275	1,8605	1,9273	1,44% ↑	1,7700	65	74	1.024
19.03.2010	1,9297	1,9400	1,9000	1,9000	-0,26% ↓	1,7500	68	201	1.012

Source: www.ktd.ro

b) **"profit"** on the date of 16th of July 2010, when the arbiter enjoys a decrease of the price from the futures market more than the price on the

spot market, meaning 1,2600lei/share, and the futures contract is of 1,2450 lei/share (table 4.).

Table 4. Futures SIBEX/spot BVB SIF5 DEC10 quotations in the time interval 14 – 20 of July 2010

data	open	high	low	close	var (%)	pret spot	numar tranz.	contracte tranz.	pozitii deschise
20.07.2010	1,2451	1,2451	1,2065	1,2160	-2,00% ↓	1,2300	108	329	2.930
19.07.2010	1,2301	1,2620	1,2200	1,2408	-0,34% ↓	1,2500	64	129	2.840
16.07.2010	1,2837	1,2900	1,2450	1,2450	-1,97% ↓	1,2600	105	161	2.822
15.07.2010	1,2510	1,2948	1,2510	1,2700	0,40% ↑	1,2700	106	194	2.906
14.07.2010	1,2750	1,2909	1,2550	1,2650	-0,30% ↓	1,2500	114	251	2.830

Source: www.ktd.ro

The arbiter liquidates both his positions:

- He sells on the spot market at the price of 1,2600 lei the 45.000 shares.
- He buys on the futures market at the price of 1,2450 lei the 45 contracts at the derivative DESIF5 DEC10.

The result of the operation is the following one:

The initial investment: 72.000 lei (spot) + 12.150 lei (futures) = 84.150 lei

The final amount: 56.700 lei (the sale of shares on the spot market) + 34.875 lei (futures market) = 91.575 lei

34.875 lei from the futures market represents: 16th of July 2010: (sale of 45 contracts at the price of 1,7500 lei) – (buying 45 contracts at the price of 1,2450) = 0,505 ×45× 1.000 = 22.725 lei profit

Margin: 12.150 lei

Profit: 7.425 lei

When closing the positions held on the two markets (spot and futures) the investor obtains the amount of 91.575 lei, which represents a return of 9% from the invested amount of 84.150 lei, a return obtain over a time interval of 4 months. The losses from the spot market are compensated by the profit made on the futures market.

The adequate use of these tools can effectively help an investor to control many of the risks he exposes himself to in a continuously developing business environment. This thing is especially valid in the cases of the futures contracts. The non-involvement in the futures market can have as a result the loss of the opportunities to close deals at the most convenient prices.

On the stock exchange market there are many types of investor profiles. The monotonous ones have remained on the classical transactions (the spot market), while others, willing for something new, for the last discoveries in the field of stock exchange and have successfully entered on the derivatives market. A small percentage from the persons that participate on both segments of the market making arbitration or spread transactions, the respective combinations bringing safety regarding the obtained profit,

at a smaller scale compared to the persons which favour speculations.

In the situation in which there is an attractively enough price difference between the spot market and the futures market the well known arbitration strategy will be applied, with an acquisition on the market where the goods have low quotations (spot) and in the same quantity, on the same goods a sale on the stock exchange where the product is more expensive (derivatives). The price difference between the two markets will be gained by the investor at the due date of the futures contract the latest.

Under the same scenario we can also initiate **spread transactions**. These types of transactions are preferred by all the customers also due to the fact that in order to accomplish such transactions the technical or fundamental analysis is not necessary (Teodor Ancuța, Darius Cipariu, Ioan Aleman, Mirela Cozgară, *op. cit.*, page 85).

With the help of the spread transactions:

➤ We can take advantage of the price differences of the same product with different deadlines (intra-market-spread), for example the DESIF5 – December 2010 / DESIF5 – march 2011 contracts;

➤ We can make spread between two different types of goods (inter-commodity spread), for example DESIF2/DESIF5 or SIBEX9/SIBEX18;

➤ We can make spread between goods that derive one from another (crush spread), for example soy and soy flour or soy oil or even dollar-gold.

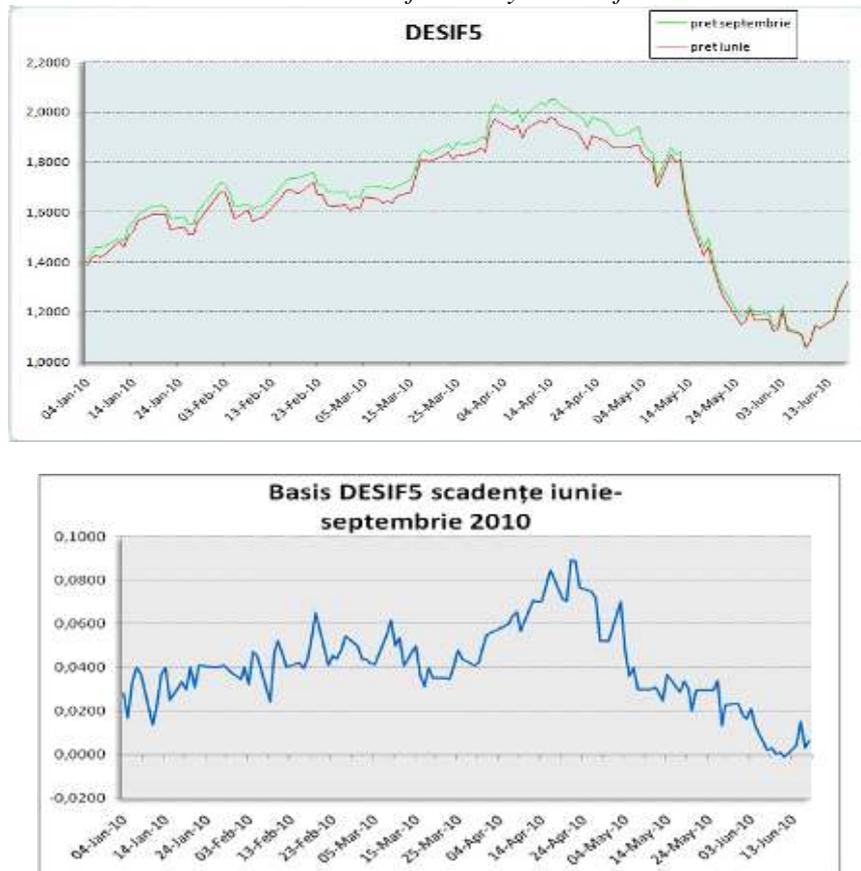

For instance, the MCAE investor, due to the increased spread on 16th of April 2010, buys 50 contracts with the due date in June 2010 at the price of 1,9471 lei/share and sells 50 contracts with the due date September 2010 at the price of 2,032 lei/share, the strategy involving a starting difference of 0,0849 lei/share (figure 3.3.). The necessary amount to make these two operations is of: 270 lei/contract (representing the margin) ×100 contracts = 27.000 lei.

As the time passes the difference between the two markets has tightened, on the date of 11th of June 2010 this registered a negative difference of - 0,0011 lei/share, the respective tendency offering the possibility for the closing of this strategy.

The liquidation prices were of 1,1336 lei/share for the June 2010 due date and of

1,1325 lei/share for the due date September 2010 (figure 4.).

Figure 3. The evolution of DESIF5 June 2010/September 2010 in the time interval 1st of January – 19th of June 2010

The gross profit recorded is of:

June 2010: $(1,1336 - 1,9471) \times 50 \times 1.000 = -40.675$ lei

September 2010: $(2,0320 - 1,1325) \times 50 \times 1.000 = 44.975$ lei

Gross profit = 4.300 lei

The efficiency of the immobilised amount is of 16%.

The fear of the unknown, including the one in the business field can only be controlled by education and by perfecting some behaviour mechanisms that would allow the investor to be able to take knowledgably and reasonable decisions, to anticipate and especially to assume his risk.

The Elaboration of the Mixed Portfolios by Using Complex Strategies of Options Trading

Micu Angela Eliza

"Dunărea de Jos" University of Galati

angelaelizamicu@yahoo.com

Abstract

In this research paper I am going to use some of the complex strategies of options trading, with the help of an MCAE investor, namely: Spread Invers Balanced Call, Spread Invers Balanced Put, Bull Spread, Bear Spread, Long Futures Synthetic, Short Futures Synthetic.

Key words : strategy, risk, profit, trading

J.E.L. classification : G 11

1. Introduction

The use of the options, due to their versatility, can bring enormous advantages to those who trade them, offering superior yield or efficiency to the investments in classical financial instruments. In the situation in which a participant has clear beliefs or convictions regarding the market evolution or the price volatility of the underlying asset can appeal to trading strategies.

2. Spread Invers Balanced Call

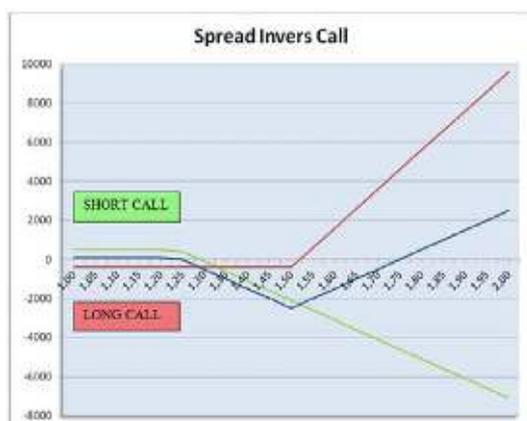

Figure 1. Spread Invers Balanced Call

The strategy premises: the investor anticipates that the market will register a high volatility, on an ascendant trend (figure 1.).

The strategy implementation: a Call option is sold with an exercise price **a**, and at the same time the two Call are purchased or bought with a higher exercise price, **b**.

The position is usually established by selling an option at money or nearby this level and by buying two Call options outside the money, thus obtaining an initial credit (although in a quite reduced value). Depending upon the selected exercise prices there is the possibility of registering an initial deficit.

The MCAE Investor, at the date of 09.07.2010, sells 10 Call DESIF5 options with the due date June 2011 at an exercise price of 1,2400 lei/ share with a premium of 0,0500 lei/ share and buys 20 Call options having the same underlying asset with a higher exercise price 1,5000 lei/ share, paying a premium in value of 0,0200 lei/ share.

The break-even point: is achieved in two points, the inferior one is given by the more reduced exercise price to which it is added the initial collected credit (if the position has an initial debit , then there is not going to be an inferior break-even point) and the other is obtained when the intrinsic value of the option with an exercise price **a**, is equal to the intrinsic value of the two options with a higher exercise price out of which it is subtracted (it is added) the initial credit (debit) .

The break-even point:

$$P_{M1} = 1,2400 + 0,0500 - 2 \times 0,0200 = 1,2500 \text{ lei/ share}$$

$$P_{M2} = 2 \times 1,5000 - 1,2400 - 0,0100 = 1,7500 \text{ lei/share}$$

The potential profit: is unlimited if the market registers a positive ample variation. If the futures price is situated at the level of the lower or smaller exercise price **a**, or below

this level the profit will be limited to the value of the net credit, in this case 0,0100 lei/ share.

Decrease risk: the maximum loss can be produced when the market price is at the same level with the higher exercise price, being equal to the difference between the two exercise prices, out of which it is subtracted (to which it is added) the initial credit (debit).

The maximum loss: $1,5000 - 1,2400 - 0,0100 = 0,2500$ lei/ share

Table 1. Scenarios for the evolution or development of the futures DESIF5 IUN11 price subsequent to the strategy application

Futures DESIF5 IUN11 price	Net result Long 2 CALL	Net result Short CALL	Net result *
1,1000 lei/share	-0,0400 lei/ share	0,0500 lei/ share	0,0100 lei/ share
1,2500 lei/ share	-0,0400 lei/ share	0,0400 lei/ share	0,0000 lei/ share
1,5000 lei/ share	-0,0400 lei/ share	-0,2100 lei/ share	-0,2500 lei/ share
1,7500 lei/ share	0,4600 lei/ share	-0,4600 lei/ share	0,0000 lei/ share
1,9000 lei/ share	0,7600 lei/ share	-0,6100 lei/ share	0,1500 lei/ share

* A futures DESIF5 contract represents the equivalent of 1.000 shares, so that the total result will be obtained by multiplying the net result expressed in lei/ share with 1.000 and with 10 representing the number of sold contracts.

3. Spread Invers Balanced Put

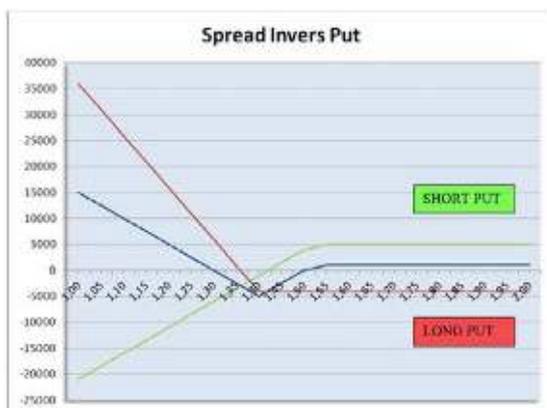

Figure 2. Spread Invers Balanced Put

The strategy premises: the investor anticipates that the market will register a descendant trend of the market, amid a high volatility (figure 2.).

The strategy implementation: an option Put is sold at an exercise price **b**, and there are purchased or bought two Put options, with an exercise price **a**, smaller or lower,

having the same underlying asset. Usually there is sold a Put option at money, and the two bought options are outside money, so that the position is established with an initial credit. Depending upon the selected exercise prices, the strategy can also be achieved with an initial debit.

At the date of 06.08.2010 the MCAE investor sells 50 Put DESIF5 IUN11 options at an exercise price of 1,5200 lei/ share for a premium of 0,1000 lei/share and buys 100 Put options at a lower or smaller exercise price, of 1,4000 lei/share with a premium of 0,0400 lei/ share, so that an initial credit is registered.

The break-even point: is achieved in two points, the inferior one is obtained when the value of the sold option is equal to the sum (difference) between the intrinsic value of the two bought or purchased options and the initial credit (debit). The superior one is reached when the intrinsic value of the sold option is equal to the initial credit. If the strategy is achieved with an initial debit, then there is no superior break-even point.

$P_{M1} = 2 \times (1,4000 - 0,0400) - (1,5200 - 0,1000) = 1,3000$ lei/share

$P_{M2} = 1,5200 - 0,1000 + 2 \times 0,0400 = 1,5000$ lei/share

The potential profit: unlimited, if the market decreases under the level of the inferior break-even point, and in the case in which it is situated above the exercise price **b**, it is limited to the net credit, in this case 0,0200 lei/ share.

Decrease risk: the maximum loss appears when the market price is identical to the exercise price **a** and is equal to the difference between the two exercise prices, **b - a**, out of which it is subtracted (to which it is added) the initial credit (debit).

The maximum loss: $1,5200 - 1,4000 - 0,0200 = 0,1000$ lei/ share

Table 2. Scenarios for the evolution or development of the futures DESIF5 IUN11 price subsequent to the strategy application

Futures DESIF5 IUN11 price	Net result Long 2 PUT	Net result Short PUT	Net result*
1,2000 lei/ share	0,3200 lei/ share	-0,2200 lei/ share	0,1000 lei/ share
1,3000 lei/ share	0,1200 lei/ share	-0,1200 lei/ share	0,0000 lei/ share
1,4000 lei/ share	-0,0800 lei/ share	-0,0200 lei/ share	-0,1000 lei/ share
1,5000 lei/ share	-0,0800 lei/ share	0,0800 lei/ share	0,0000 lei/ share
1,6000 lei/ share	-0,0800 lei/ share	0,1000 lei/ share	0,0200 lei/ share

* A futures DESIF5 contract represents the equivalent of 1.000 shares, so that the total result will be obtained by multiplying the net result expressed in lei/ share with 1.000 and with 50 representing the number of sold contracts.

4. Bull Spread

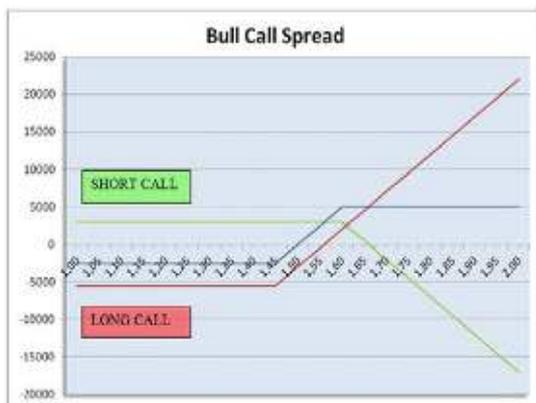

Figure 3. Bull Call Spread

The strategy premises: the investor has the belief that the market is not going to decrease but, however, he wants to prevent this risk. It might be considered a conservative strategy for those who anticipate that the market will register a moderate increase (figure 3.).

The strategy implementation: A CALL option is purchased or bought with an exercise price **a**, and it is sold simultaneously another CALL option with an exercise price **b**, higher, by registering an initial deficit (debit) equal to the difference between the premiums. In a similar way the strategy can also be built with the help of the PUT options, thus it is purchased or bought a PUT option at an exercise price **a** and another one is sold at an exercise price **b**, higher, having

an initial redundancy (credit) from the difference between the premiums.

At the date of 11.10.2010 the MCAE investor sells 50 CALL DESIF5 IUN11 options at an exercise price of 1, 6000 lei/share for which it receives a premium of 0,0600 lei/share and at the same time it buys 50 CALL options having the same underlying asset at a lower or smaller exercise price, of 1,4500 lei/share for which it pays a premium of 0,1100 lei/ share.

The potential profit: is limited in both cases:

- In the case of buying and selling CALL the net profit is given by the difference between the exercise prices out of which it is subtracted the initial net debit;
- In the case of buying and selling PUT the profit is equal to the net initial credit.

The maximum gain is achieved for both variants in the moment in which the futures price, at maturity it is higher or equal to the exercise price of the sold option.

The potential profit: $(1, 6000 - 1,4500 - (0,1100 - 0,0600)) \times 50 \times 1.000 = 5.000$ lei

The break-even point:

- For the CALL options: the exercise price of the purchased option to which it is added the initial debit;
- For the PUT options: the exercise price of the sold option out of which it is subtracted the initial credit.

The break-even point: $1,4500 + (0,1100 - 0,0600) = 1,5000$ lei

The potential loss: is limited in both cases:

- For CALL options it is equal to the initial paid debit;
- For PUT options the loss is equal to the difference between the exercise prices and the initial credit.

The maximum loss, in both cases is produced if the futures price, at maturity, is situated at, or under the exercise price of the purchased option.

The potential loss: $(0,1100 - 0,0600) \times 50 \times 1.000 = 2.500$ lei

Table 3. Scenarios for the evolution or development of the futures DESIF5 IUN11 price subsequent to the strategy application

Futures DESIF5 IUN11 price	Net result Long CALL	Net result Short CALL	Net result*
1,1500 lei/share	-0,1100 lei/share	0,0600 lei/share	-0,0500 lei/share
1,4000 lei/share	-0,1100 lei/share	0,0600 lei/share	-0,0500 lei/share
1,5000 lei/share	-0,0600 lei/share	0,0600 lei/share	0,0000 lei/share
1,5500 lei/share	-0,0100 lei/share	0,0600 lei/share	0,0500 lei/share
1,7500 lei/share	0,1900 lei/share	-0,0900 lei/share	0,1000 lei/share

* A futures DESIF5 contract represents the equivalent of 1.000 shares, so that the total result will be obtained by multiplying the net result expressed in lei/ share with 1.000 and with 50 representing the number of sold contracts.

5. Bear Spread

Figure 4. Bear Call Spread

The strategy premises: the investor has the belief that the market is not going to increase but, however, he wants to prevent against this risk. It is a conservative strategy for those who anticipate that the market will register a moderate decrease (figure 4.).

The strategy implementation: A CALL option is purchased or bought with an exercise price **a**, and it is purchased or bought a CALL option with an exercise price **b**, higher, thus obtaining an initial credit, or, in a similar way, it is sold a PUT option with an exercise price **a** and another one is purchased at an exercise price **b**, higher.

At the date of 05.11.2010 the MCAE investor sells 100 CALL DESIF5 IUN11 options at an exercise price of 1,4000 lei /share for which it receives a premium of 0,1400 lei /share and at the same time it buys 100 CALL options having the same underlying asset at a higher exercise price, of

1,5000 lei /share for which it pays a premium of 0,0900 lei / share.

The potential profit: is limited in both cases:

- In the case of buying and selling CALL options the net profit is given by the initial credit;

- In the case of buying and selling PUT options the gain is given by the difference between the exercise prices out of which the initial debit is subtracted.

The maximum gain is achieved if at maturity the futures price is under the exercise price of the sold option.

The potential profit: $(0,1400 - 0,0900) \times 1000 \times 1.000 = 5.000$ lei

The break-even point:

- For the CALL type options: the exercise price of the sold option to which it is added the net received credit;

- For the PUT type options: the exercise price of the purchased option out of which it is subtracted the initial debit.

The break-even point: $1,4000 + (0,1400 - 0,0900) = 1,4500$ lei

Risk of loss: is limited in both cases:

- In the case of CALL options the net loss is equal to the difference between the exercise prices and the initial credit;

- In the case of PUT options the loss is given by the initial debit.

The maximum loss is marked if the futures price, at maturity, is higher or equal to the exercise price of the purchased options.

The potential loss: $(1,5000 - 1,4000 - (0,1400 - 0,0900)) \times 100 \times 1.000 = 5.000$ lei

Table 4. Scenarios for the evolution or development of the futures DESIF5 IUN11 price subsequent to the strategy application

Futures DESIF5 IUN11 price	Net result Long CALL	Net result Short CALL	Net result*
1,2500 lei/share	-0,0900 lei/share	0,1400 lei/share	0,0500 lei/share
1,4000 lei/share	-0,0900 lei/share	0,1400 lei/share	0,0500 lei/share
1,4500 lei/share	-0,0900 lei/share	0,0900 lei/share	0,0000 lei/share
1,5000 lei/share	-0,0900 lei/share	0,0400 lei/share	-0,0500 lei/share
1,6500 lei/share	0,0600 lei/share	-0,0110 lei/share	-0,0500 lei/share

* A futures DESIF5 contract represents the equivalent of 1.000 shares, so that the total result will be obtained by multiplying the net result expressed in lei/ share with 1.000 and with 100 representing the number of sold contracts.

6. Long Futures Synthetic

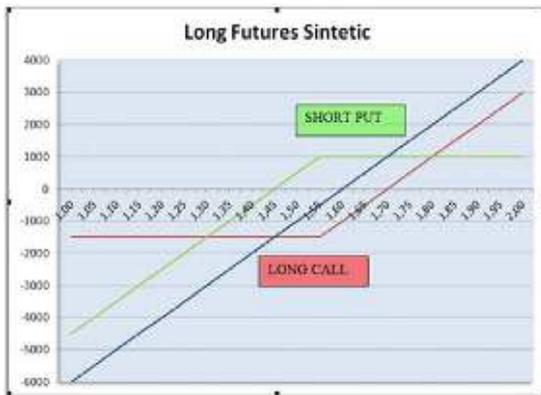

Figure 5. Long Futures Synthetic

The strategy premises: the investor has the belief that the market is going to be on an ascendant trend (figure 5.).

The strategy implementation: there are different ways in which there can be combined the futures contracts and/ or the options in order to generate profit. For example if it is noted that the Long Futures Synthetic position can be achieved at a lower price than the futures underlying position, the following strategy can be made: a CALL option is bought or purchased with an exercise price *a* and a PUT option is simultaneously sold with an identical exercise price (the strategy is often used for options with different exercise prices).

The MCAE investor, at the date of 08.10.2010, buys 10 Call DESIF5 IUN11 options at an exercise price of 1,5500 lei/ share, with a premium of 0,1500 lei/share and sells simultaneously 10 Put DESIF5 IUN11 options at an exercise price of 1,5500 lei/ share, with a premium of 0,1000 lei/ share.

The break-even point: if the position is established with an initial debit, then the break-even point is going to be reached in the moment in which the futures price of the underlying active will overcome the level of the exercise price of the options with a net value of the paid premiums. If the position registers an initial credit, the break-even point is going to be equal to the difference between the exercise price of the option and the value of the net cashed premium.

$P_M = 1,5500 + 0,1500 - 0,1000 = 1,6000$ lei/share

The potential profit: is unlimited and is increasing as the futures price increases, above the level of the break-even point.

Risk of loss: unlimited, if the futures price is situated under the level of the break-even point.

Table 5. Scenarios for the evolution or development of the futures DESIF5 IUN11 price subsequent to the strategy application

Futures Price DESIF5 IUN11	Net Result Long CALL	Net Result Short PUT	Net Result*
1,2500 lei/share	-0,1500 lei/ share	-0,2000 lei/ share	-0,3500 lei/ share
1,4500 lei/ share	-0,1500 lei/ share	0,0000 lei/ share	-0,1500 lei/ share
1,6000 lei/ share	-0,1000 lei/ share	0,1000 lei/ share	0,0000 lei/ share
1,7500 lei/ share	0,0500 lei/ share	0,1000 lei/ share	0,1500 lei/ share
1,9500 lei/ share	0,2500 lei/ share	0,1000 lei/ share	0,3500 lei/ share

* A futures DESIF5 contract represents the equivalent of 1.000 shares, so that the total result will be obtained by multiplying the net result expressed in lei/ share with 1.000 and with 10 representing the number of sold contracts.

Mentions: the initiation of a synthetic position, in this case, was more advantageous than the initiation of a simple position of buying futures, due to the fact that the obtained purchase price was lower (1,6000 lei/ share as compared to 1,6143 lei/ share as it was the minimum quotation price DESIF5 IUN11).

7. Short Futures Synthetic

The strategy premises: are generally initiated when a participant holds a short position (sale) with options and the market develops and evolves in its favour. He decides that the cashed premium is not enough, wanting a higher profit and will buy opposite options (figure 6.).

The strategy implementation: is sold with a Call option at an exercise price *a* and bought or purchased a Put option with an identical exercise price (the strategy is often used for options with different exercise prices, too).

At the date of 18.11.2010, the MCAE investor sells 50 Call DESIF5 IUN11 options at an exercise price of 1,4500 lei/share, with a premium of 0,2000 lei/share and it buys simultaneously 50 Put DESIF5 IUN11

options at an exercise price of 1,4500 lei/share, with a premium of 0,1500 lei/share.

Figure 6. Short Futures Synthetic

The break-even point: if the position is established with an initial debit, then the break-even point is going to be reached in the moment in which the futures price will decrease under the level of the exercise price of the options with a net value of the paid premiums. If the position is established with an initial credit, the break-even point is going to be equal to the exercise price to which it is added the value of the net cashed premium.

$P_M = 1,4500 + 0,2000 - 0,1500 = 1,5000$ lei/share

The potential profit: the potential gain is unlimited and increases as the futures price decreases under the level of the break-even point

The potential loss: is unlimited if the futures price increases above the level of the break-even point.

Table 6. Scenarios for the evolution or development of the futures DESIF5 IUN11 price subsequent to the strategy application

Futures price DESIF5 IUN11	Net result Short CALL	Net result Long PUT	Net result*
1,2500 lei/share	0,2000 lei/share	0,0500 lei/share	0,2500 lei/share
1,4000 lei/share	0,2000 lei/share	-0,1000 lei/share	0,1000 lei/share
1,5000 lei/share	0,1500 lei/share	-0,1500 lei/share	0,0000 lei/share
1,6500 lei/share	0,0000 lei/share	-0,1500 lei/share	-0,1500 lei/share
1,8500 lei/share	-0,2000 lei/share	-0,1500 lei/share	-0,3500 lei/share

* A futures DESIF5 contract represents the equivalent of 1.000 shares, so that the total result will be obtained by multiplying the net result expressed in lei/ share with 1.000 and with 50 representing the number of sold contracts.

All the transactions on derivative financial instruments imply a risk and there is no trading or transaction strategy that can

completely eliminate it. This is the reason for which the transaction of the derivative financial instruments implies the knowledge of the market derivatives as well as of the underlying or underlying market.

Innovation Typologies in the Financial Services Sector: Limits and Implications

Micuda Dan

Asandei Mihaela

"Constantin Brancoveanu" University of Pitesti

dan.micuda@gmail.com

mihaela.asandei@univcb.ro

Abstract

The management of innovation since the early 90s is more and more present in the business discourse, whatever the field of activity. However, the academic literature is often limited to technological innovations carried out in the industry and leaves the service sector which is a major source of innovative capacity. By nature, services are very heterogeneous and therefore they can't be study as a whole ensemble.

The present research focuses on the case of retail banking because, despite the growing appetite of banks for innovation, the academic literature in strategic management pays little attention to this sector [1]. This paper aims to review different typologies of innovation and their application to the retail banking sector, thus leading to a clarification of the concept and its implications for these companies. It also tries to capture the specificities of innovation in the banking sector and discuss future avenues of research

Key words: – Innovation Needs, Services Industry, Banking,

J.E.L. classification: G21, M31

1. Introduction

The Romanian banking sector has undergone profound changes in the last 20 years, in the post-revolution period and especially in the last two years in the context of the current economic and financial crisis that affected the local banks and also the Romanian banking market as a whole. After the accession in the European Union and the liberalization of the current account we have seen a significant enhancement of

competitive intensity. In this difficult environment, banks must find solutions to remain competitive; either by reducing their costs or by trying to differentiate themselves from their competitors and therefore innovation becomes a strategic necessity.

The innovation process makes it possible to launch new products on the market that can provide a bank with a competitive advantage relative to its competitors (even if it's only temporary). The often upstream integration of new technologies also permitted banks to reduce operating costs in the last years.

However, despite the growing number of innovations introduced in the banking sector, the literature rarely focuses on this sector. More generally, the services remain the "poor relative" of innovation management literature [2]. The majority of research in innovation management is more interested in technological innovations, particularly those developed in the biotechnology, semiconductor, etc fields [3],[4],[5]. However, the results of these investigations are difficult to transfer to the services setting [6]. For example, the main criteria for measuring technologic innovation, such as the number of patents or research and development budgets, do not appear to be valid measures in services. Similarly, innovation in services is often less tangible, more human-related than technological and relational [7]. Finally, within services, there may be specific forms of innovation (often called "tailored" that exist in many sectors of business to business services, but not necessarily apply to retail banking), which encourage researchers to focus on the study of a single sector: insurance[8], hospitals [9], consulting [10], etc. The few researchers who were interested in banking innovations have either focused solely on the

development of new products[11], either they concluded that banks could not innovate more besides the integration of new technologies [12].

The mechanisms of innovation are complex and extensive literature seeks to explore the subject. The services companies' management is also a complex topic and equally abundant literature was devoted to it. But the intersection of these two issues, innovation and services, forms a narrow niche where little research was done [13],[14]. Therefore a framework for identifying all the innovations in banking is lacking. Innovation is the creation of new value, customer-oriented but can also involve other stakeholders such as the organization itself [15]. Innovation can take various forms: the service concept, the process (computer system or work process), organization (hierarchy, structure, etc.) and type of external relationship (new interface types, implementation of a mediator, etc.) We can talk about innovation when it comes to actions having the deliberate aim of profiting from the changes made [16]. Based on this definition, this article aims to better understand what is meant by innovation in the banking sector, show that there are several categories of innovation in retail banking

2. Constant changes in the financial services sector and the need for innovation

After explaining why innovation is an issue which particularly concerns the banks over the past years, presenting an overview of the literature on innovation in the banking sector is a normal research approach. This reveals two limitations: (a) focusing research on development of new products (innovations visible to customers) and (b) technological progress as the only source of innovation.

Over the past twenty years, the Romanian banking sector has undergone profound changes which forced banks to evolve from both a structural and policy perspective, leading them to seek to develop their innovation practices.

At the regulatory level, global deregulation and the accession in the EU have put an end to a period during which Romanian banks

have been somewhat "protected". Especially the 2007 accession to the EU started a major change in the competitive landscape by changing the positions of traditional banks and facilitating the arrival of new entrants in the banking market. Competition has thus increased greatly, and especially since the market for banking services described as critical (checking accounts, credit cards ...) will reach saturation this competition will continue to increase. Along with this increased competition, banks are facing greater demand from their clients, including transparency of billing and investment returns. Better educated, they want to optimize their financial resources and do not hesitate to seize their consumer advantages in case of disputes.

Finally, technological advances in IT have revolutionized the operation of banks. They have to cope with new types of competitors (the "virtual" banks, which have very limited physical infrastructure), leading them to seek solutions to reduce operating costs, they also benefited from the Internet opportunities: to communicate differently with their customers and to offer new services. The costs of integrating these new technologies are particularly high and the banks had to make tradeoffs in allocating both financial and human resources.

All of these regulatory changes, sociological and technological resulted eventually in a renewed conception of the banking profession and changing management practices. The banks had to think about how to create a sustainable competitive advantage. Two generic strategies are now used in a complementary way: the cost leadership and differentiation. Cost reduction is primarily concerned with "production" of the service or what is called the "back office. Thanks to computers, banks seek more and more to reduce the costs of current operations. Differentiation addresses several aspects. Thus, despite numerous regulatory hurdles facing the banks (including supervision by regulators, which severely limits the possibilities of creating new products), they regularly try to launch new offerings.

Then, as they can not play on the price issue (there are few references to money in commercial messages, the impact of this factor being somewhat important), or rates

offered (very similar from one bank to another), they try to find other ways of differentiation, through the offering of a better quality of service, customization to suit the customer, implementation of new distribution channels (ex. Internet) that allow for greater customer intimacy or improved service availability and speed of transactions.

We can see here, implicitly, what are the challenges of innovation: whether to reduce their costs or to differentiate themselves, banks must innovate to remain competitive in the market [17], [18],[19]. Available statistics illustrate this need. Some authors [20] note that financial services (comprising banking) innovate strongly, with a rate of introduction of new products or processes higher than those found in industrial enterprises (nearly 62% against 42% for chemistry or 54% for the oil industry). Similarly, other surveys [21], finds that nearly 60% of banks claim to be engaged in innovative activities (36% permanently and 23% occasionally).

However, despite the challenge and the reality of these practices, little research has been made about the topic of banking innovation ([22],[23];[24];[25]). In addition, the latter, take a fragmented view of innovation and focus either on developing new services, either on the impact of technological change on business operations.

3. Limitations of current research regarding innovation in the services sector

Early research on innovation in banking has raised the question of whether or not such practices of innovation exist and their strategic impact. According to some authors [26], [27], banks do not always consider innovation as a mean of development. However, those who implement programs and encourage the development of new products are more successful than others and disregarding their size. Näslund [28], in his comparison between financial innovations and those from traditional industry shows that banks innovate but these innovations are easier to imitate than in the industry setting (because they are easier to implement). A bank that does innovative is able to make use of her lead position in the market for a very short time since its competitors will

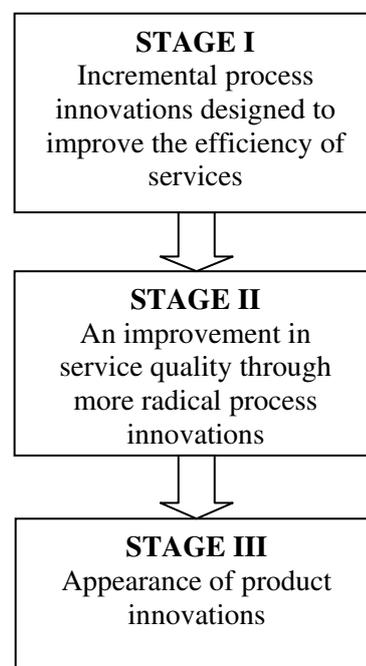

quickly copy the new product, which can not be patented.

Initial researches, are only interested in NSD (New Services Development), meaning the development of new services. The additional research also ignores other types of innovation, such as those that may affect the service delivery process. However, technological progress has affected many facets of the operation of the bank, especially the back office. For example, the automation of many administrative tasks has enabled officers to spend more time with customers and evolve toward a more commercial and consulting missions. The banking business is also often regarded as one of the most vulnerable to computer mutations [29]

It is on this influence of technological and computer that Barras [30],[31] has constructed a theory of diffusion of technological innovation in services.

The adoption by a bank of new computer equipment causes in fact a succession of innovations that takes place in three stages (Figure 1).

Figure 1. A possible diffusion process of technological innovation in a service firm (Barras)

Learning the new software causes first incremental process innovations, designed to improve the efficiency of services (in the

case of automating the back office of banks by the introduction of mainframe computers);

In a second stage, there is an improvement in service quality through more radical process innovations (automated teller machine which can cut costs and improve quality of service); Finally, at the third stage, product innovations may emerge (home banking). For Barras, innovation does not exist outside of technological possibilities. In line with its work, several authors have looked at the role of technology in the banking practices of innovation ([12], [14]. Ding et al. [14] focused on the development of self-service activities (consultation of account balances, account statements printing, etc.) and consider that technology is an essential skill to master for all banks. However, if the impact of technology on innovation practices in banking is undeniable, it seems that the banks can develop innovations beyond technology. The technology is, in fact, just one component of the supply system.

Other factors may be the cause of innovation: deregulation allowing the introduction of new services previously prohibited, changing in consumers behaviors producing new requirements, the increasing competitive intensity pushing banks to differentiate themselves and to develop the skills of their human resources). In addition, the banking innovations are not always very tangible.

The human dimension is often forgotten by the researchers. Finally, Barras model indicates implicitly that banks tend to have reactive behaviors in relation to innovation. They seem content to adopt innovations developed by the industry. This seems to be a simplistic view of reality [32]. In sum, neither approaches focused on IT nor those based on the impact of technology appear to consider the heterogeneous set of innovations in banking sector.

Few authors have attempted to draw a typology of innovations in banking. In addition, existing research rather belongs to the current NSD area already mentioned and is thus incomplete. Thus Karmarkar [12] focuses only on services associated with new information technology and communication (Internet, telephone, kiosks, etc..) and proposes a typology with two axes: the access mode service (centralized: the client

must move, or decentralized: the client access to the service without movement) and the cost of technology access (from weak to strong).

Most of the literature on innovation in services is unidimensionally constructed:

- The element affected by the innovation (product, process or organization)
- The degree of novelty of innovation, which can also be discussed along with the risk level of innovation
- The method of production of innovation (with the participation or not of the client)

These criteria, although relevant, are used too isolated and did not seem to be able to fully understand the variety of innovations in banking. The combined use of two criteria would probably refine existing typologies. There are a few classifications apparently built on several criteria, but they are not always really clarified [33]. Therefore, none of the existing typologies seems sufficiently effective to correctly identify different types of innovation that could appear in banking.

4. Conclusions

The analysis of innovation practice in banking services brings out three major issues.

First, banks do not innovate only incrementally. They tend to have leaps in innovation and bring out new products or improve processes on a whole basis.

Secondly, whereas the literature has often focused on technology as the only source of innovation, these sources can be quite numerous: reduced regulation, new customer needs and competitors' innovations.

Third, innovation in the banking sector often takes the form of process innovation which, unlike many product innovations (patenting is difficult in the banking sector and thus the innovations are easily copied), are indeed difficult (or no) visible to customers (and competitors), but helps instead the banks in obtaining a sustainable competitive advantage.

Finally, innovation actions must always take into account their impact on banking services quality and the specific cultural and social context in which the financial institution is operating [34].

E-Government Portal. Main Instrument for Electronic Services Delivery

Mihai Gabriel

mihai29gabriel@yahoo.com

Abstract

The introduction of e-Government services and applications leads to significant changes in the structure and organization of Public Administrations. In this paper we analyze a solution provided by a set of technological processes that can change the interaction between citizens and government

Key words: e-Government, electronic public services, electronic services delivery.

J.E.L. classification: H11, M15

1. Introduction

Over the last decade, the concepts related to how governments operate and perform the act of governance have changed dramatically. These changes were due in the first place to expectations in which the act of government is regulated so that it should reflect modern methods of efficiency and effectiveness (that governments should do more with less government spending), but meanwhile, governments should become more open to a democratic society where all citizens are involved in the act of governance. Many researchers argue that migration to an electronic governance allows to achieve both the efficiency of the governance act and a democracy with a much reduced effort and cost.

Using information and communication technologies in the government act begins to redefine the governmental environment through the modification of power and responsibility relations established between government and citizen, between private and public sectors or between service providers and industry. Thus new forms of governance are emerging, these reflecting, among others,

the organizational and economic structures change, with profound consequences in how we understand and exercise our citizenship. It is clear that eGovernance is not just about providing online government services or to improve their supply, but also it is a set of technological processes that can change the interaction between citizens and government.

2. The provision of electronic public services

Electronic Governance enables multiple services to be delivered 24 hours of 24 throughout the year, regardless of the location in space of the recipient. This favors those who are familiar with the use of information technology, and how today they are not few, the whole purpose, structure and modus operandi of electronic governance begins to reflect more than ever, the needs of an increasingly bigger part of citizens.

Many European administrations and agencies reorganize the access to services taking into account of the information and communication technologies. These new methods of access to services, placed face to face with the traditional methods of access, it is desirable to complement existing ones and not replace them entirely. Among the modern channels of access to these services we can mention the phone, fax, Internet, television, info kiosk, wireless access points etc. Relying on information and communication technologies contributes not only to the proliferation of services access channels but also to the organization change in the providing service itself. An example is given by Internet portals that, in this sense, offer services:

- for citizens (those services that relate to matters of everyday life) - births marriages, deaths, employment,

unemployment, education, sport and leisure, etc.

- for companies (services relating to business environment) – the start of a business, financing, regulatory, legal, legislative, business operations and trade, environmental tax, innovation, business development, reimbursement and other state obligations etc.

Such an approach, centered on events that may occur either in citizens life or in the life of companies, combined with the principles of one-stop shop concept, shows us how the government can be reorganized to reflect mainly the needs of citizens or companies rather than the concern about its internal structure. One of the fundamental perceptions of e-governance is the shift from the services that relate in particular the internal needs of public administration to those services that are more pro active in meeting the needs of citizens, regardless of their social status or their financial situation, quoting As. Wimmer "IT has played an important role in changing and migration of the bureaucratic and traditional government patterns towards the current electronic governance model, where services are provided according to the needs of citizens" [5]. The approach centered on the life events shapes the functioning of the government in terms of daily life. This approach is a metaphor used to highlight a specific situation or an event that occurs in the citizens' or a company life, event that involves the satisfaction of a public service [4]. The approach in itself should help users to identify more easily a set of public services that they need in a moment of their life and adapt these services under the circumstances or the needs of the moment.

3. World Wide Web and electronic public services

Electronic Services Delivery (ESD), which appeared originally in the private sector, has been characterized by focusing on the specific needs of a company [1]. Recent studies have shown that the use of new technology World Wide Web generation did not represent a guarantee of successful implementation of **electronic public services (EPS)**. Both B2B and B2C sectors revealed that apart from compliance with complex

web pages design rules, so they are as user-friendly, certain economic and market rules in using the web also should be applied, so that the providing services to be effective. According to these studies, unfriendly and inefficient web-based processes, including transactional processes, do not attract such a large number of users, as was optimistically predicted several years ago.

Organizations that had success in using web-based services had to learn from experience that the recorded success is due more to the specific of the services offered via the web. Services offered by these organizations refer more to disseminate information than the use of the Web as a means of providing personalized services. The following developments occurred in the provision of electronic services have focused on the reorientation of providing these services to meet the multiple needs of citizens, needs that are constantly changing [2].

This customer-oriented vision has been also adopted in the implementation initiatives of electronic governance, promoting the change in the form of governments' organization from the traditional functional structure of the administration to a flexible model that provides services focused on the needs of citizens [3].

"One Stop Government" is the most promising concept of public service delivery by the public administration. Specifically, "One Stop Government" means a physical location (for example one stop shop) in which users (for example citizens or business environment) can solve their administrative problems in one place and preferably through a single contact. In terms of electronic governance, this concept is represented by a virtual location (for example a web portal) that, through information and communication technologies, improves the possibilities and functionalities of the concept "one stop shop".

Whether the concept of "One Stop Government" is represented by a physical or virtual location, we can say that it characterizes, in terms of users, an integration of public services offer. The term "One Stop Government" refers to the interoperability and integration of public services in one single place, providing more opportunities of access at a time, whether it is

a contact "face to face" at the institution headquarters, or that this contact is made through ICT, such as telephone, fax, etc., although the typical communication channel used is the Internet. In the latter case, the concept of "One Stop Government" is done through a web portal that presents a technological and organizational infrastructure (for example a physical platform) that allows a single point of access for users of electronic public services, regardless of internal fragmentation or of accessed public administration responsibilities.

4. Types of web portals in the perspective of electronic governance

A web portal serves to the presentation and access to data, information and applications in a structured manner. In terms of physical architecture (front office and back office) we can differentiate portals for the final user and intermediary portals. Intermediary portals are those that promote electronic access (via Internet) for the public institution employees or facilitate access for the online intermediaries to resources through online extranet. These online intermediaries are usually private actors that are positioned as an interface between the public administration and citizens, these intermediaries providing administrative services to customers (for example firms of architects that submit applications for construction permits on behalf of the clients). Also, in exceptional circumstances, may be made extranet portals, for those customers who regularly come into contact with the public administrations. Making intermediary portals is a precondition for achieving a more efficient multi channel access.

In terms of final users we can differentiate the following types:

- Portals belonging to the regional authorities - their informational content refers either to the national administrations or to the regional or local administrations;

- Portals containing groups of portals - offers services that are provided by the public administration and also by the private agencies;
- Specialized Portals – these provide special services that are subject to a specific area (for example portals for payment of fees, portals for job offers, etc.).

5. Conclusion

In conclusion we can say that only a combination of the three concepts can grant the realization of true one-stop government as an effective way to deliver public services. Web services represent that technology that can be used in order to improve public sector activity, with the hope of obtaining the same results as in the private sector. Promoting widely public administration services via Web allows private companies to work easier and conveniently with government agencies.

E-Governance and New Communication Instruments

Mihai Gabriel

"Spiru Haret" University, Faculty of Financial Accounting Management
mihai29gabriel@yahoo.com

Abstract

The appearance in the 60s - 70s of information technologies has helped to automate the processing of large amounts of data in the productive companies having a positive impact on management. The appearance of the Internet in the 90s has eliminated from the companies' business model the restrictions of geographical order. E-business solutions include a variety of applications that allow these companies to operate more time online. Fierce competition and especially the implementation of new information technologies and communication have made these companies to reinvent systems and new processes.

Key words: e-governance, public administration, information technologies, communication

J.E.L. classification: H11, M15

1. Introduction

Ten years after the explosion of Internet, the information society is on a steady growth path. The benefits of providing online services are increasingly recognized by government worldwide at national, regional and local levels. A decade of investments in information and communication technology (ICT) is bearing fruits, fuelling innovation in ICT various areas and transforming the EU into a knowledge-based economy [2]. In this context, the public sector is not lagging behind. Online public services at European level are getting more mature and producing visible efficiency gains: more services have been put online, the available services have become more sophisticated and increasingly more people deal with the public sector online [3]. In this regard, public administration services are leading the way

and health and education are closing in.

In the context of modernizing public administration, information society is an essential component of the reform process, a way to contribute strongly to ensuring citizens' access to public information, increase transparency and efficiency in administration activities offered by the public services. As an essential feature, we can say that the information society is characterized by the democratization of information, communication, understanding and cooperation.

Governments' use of Internet, as the main tool to provide public services, has revolutionized the speed and efficiency of government services delivery. The benefits of an online presence of governments in providing administrative services are reflected in their faster delivery, more efficient in terms of cost, highly personalized, targeted to citizens and private business.

2. E-Governance and communication

Due to globalization, markets have developed in an accelerated pace without giving the possibility of political, social and economic institutions to develop at the same pace, to ensure sustainability of this growth [5]. In many cases, this has led to the rethinking of priorities and interactions between groups, urging the public sector to respond rapidly and effectively to the growing needs of society. The growing concern of the interest groups in society can be sustained only with information and communications technology, the only one capable to allow public access to knowledge and information that were previously inaccessible to most people. This new knowledge has led to greater demand from citizens to participate in political decisions, causing the civil servants and the decision factors to take urgent action to improve

service delivery.

Seeing the impact of using new information technologies at the level of economic units, one can certainly say that they are defined as engines of innovation. Through government-wide use of information technologies, they become instruments for transformation of governance models and thus improve the quality of life. Taking the e-business development model from the private companies which operate more time online and implementing it at government level, allows us to use the word **e-governance** in order to recognize that, within government, there is a continuous process of transformation of both its internal relations and its external relations by using new information and communication technologies.

The online presence of the public administration involves, as in the case of private companies, both remodelling the organizational structure and the processes that govern the daily activities, in line with the needs of citizens and businesses. Traditionally, government organizations are highly "compartmentalized" in terms of organization. This phenomenon occurs not only within the same institution (ministries which have a multitude of subordinate agencies), having rather a vertical organizational development, but according to the specifics of governance, public administration organizations have a territorial spread, across a country and beyond its borders by the presence of consulates and embassies in other countries.

The need for communication between people is the essence of human society. People have always used communication to inform, learn, define concepts, discuss and reach consensus in public and private life [4]. If we add to this timeless communication process the characteristics of modern information technology in the context of public administration it is supposed to have an impact in creating public value. Indeed, e-governance can be seen as a process of creating public value through the use of information technology and communications. By using information and communication technologies, government communication channels gain speed, accuracy, mobility and simplicity. All these can be converted into cost reductions and efficiency gains, the

aimed objectives in all government activities, especially in delivering public services. Achieving these characteristics requires on the one hand interconnect different local agencies, and secondly the integration of services offered by various government agencies in an effort to simplify the interaction both intra-government and extra-government, while reducing the overall structure costs and improve public service delivery.

3. Intra-governmental communication

Civil sector, private sector and public administration sector are considered to be the three constituents operating and interacting in different ways to build and sustain a nation.

The implementation of a good e-governance solution implies an interaction at all levels and between all actors involved in e-governance. Electronic Government defines interactions between the main actors: citizens, private organizations and public institutions, as follows:

- G2G – on-line relation system of Government – Government
- G2C – on-line relation system of Government – Citizen
- G2B – on-line relation system of Government – Business

Some of the theories in the field only focus on the technical aspect of intergovernmental cooperation, others instead seek to address a vision focused on solving problems such as organizational and cultural ones.

Communication between interconnected agencies generates intra-governmental information flows. Depending on the expression of these information flows, we can vertically integrate intra-governmental processes if information flows between different agencies located on different hierarchical levels or/and they can be integrated horizontally if there is an information exchange generated by cooperation between government agencies located on the same hierarchical level [3]. In reality, because of the scale and complexity of the state apparatus, this distinction between external and internal interactions can not be surely and clearly identified. Those relations occurring in the same government agency are defined as internal

government relations (G2I). Using the same logic, we can say that the relations arisen between public institutions and the employees working for government and public administrations are government-employee relations (G2E).

Public sector employees are essential for the successful implementation of e-governance policies. Taking into account two factors that characterize the state institution, bureaucracy and resistance to change, the question is whether these institutions are prepared for changes in the recruiting policy and to change the remuneration system in order to attract those employees who have the skills and competencies necessary to manage the entire process of implementing e-governance policies. Unfortunately, these skills and competencies are the same as those required by the private sector companies, companies that desire, implement or have already implemented e-business applications or e-commerce. These organizations manage to appeal "true professional" from the labour market by offering benefits far better than what government institutions can offer.

The selection, recruitment and retention skills needed within government involves the ability to stop certain subjective practices frequently used in the public sector and to innovate this process by means of competitive benefits that will put the government in an preferred position. Governments that have started this pathway have already felt the need to improve their internal conventional systems of public sector compensation and work practices.

The introducing of new information technologies in governance involves focusing also on employees' training and continuous learning system. G2E focuses on increasing the skills of public sector employees. By using information and communication technology, they gain new skills, improve their careers, being constrain to be always active and to keep the pace with developments in information technology.

4. E-Governance for citizens.

The relationship between government and citizens has constantly evolved as the society evolved. The public services provided by government have varied, depending on the needs and requests of citizens, hence the

government changed its role and purpose. Amid these evolutions, governments began to provide customer-oriented public services, with multiple options from which to choose and personalized services. Meanwhile, due to the access to education of and increased number of people and due to the influence that media has on these people, the capacity of citizens has developed and improved. Now, as citizens, people participate more actively in public life, having access to various methods to express their views to the government.

The initial purpose of e-governance was to bring efficiency in the governing process. With the development of information technologies and increasing citizens' participation in public life, the concept of e-governance focuses on efficiency and democracy. In fact, if we look at the countries that started the implementation of electronic governance, we see the emergence of democratic processes and civil society development, as new trends of political participation by using information and communication technologies.

In terms of e-governance, G2C relation system has made possible the transition from passive information of the people towards an active participation of citizens by informing the citizens, representing and consulting them, encouraging their participation and their active involvement in the voting process.

Electronic governance is strongly influenced by the expectations of citizens to see public services provided in the same way or at the same level as certain services are provided by many private sector entities. Of course, given the scale and complexity associated with the establishment of G2C relationships, the implementation of online public services can not be achieved at once. In most cases, governments begin by providing information about their on-line activity. Handling a large volume of information, the need for efficiency and the more and more increasing demand coming from the citizens lead to increasingly more complex services. These changes are gradually introduced, some services being offered on-line much sooner than others. In some cases, the demand coming from the citizens is the engine that contributes to the development and implementation of online

services, in other cases we see that the costs logic, related to reducing operating costs of the government, contribute to the introduction of these online services.

The existence of these online services provide their use by citizens of 24 hours a day, 7 days a week, fact that contributes to an increase in citizens responsibilities and to the insurance of a certain transparency of government. The benefits of providing these services is that the citizens can enjoy a safe and rapid service, and on the other hand, the government not only gets more integrated within communities, but also can focus its resources where they are more needed. Moreover, "self service" culture taken from the banks' e-business model, enables the citizens to "help themselves" whenever possible, hence saving time and money.

5. Communication between Government and businesses

In terms of relations between government and business, the traditional way of governance has focused mainly on regulations and interventions. Government's behaviour was intended more "to lead" rather than "to serve" the companies and businesses [1]. However, the development of private sector has become more important when referring to citizens' welfare. The relations between government and business have changed. Now, the government's role is to provide better public services to business in order to help companies to make businesses in a harmonious and comfortable way.

G2B relation system was the first to be developed. In this type of applications, the government seeks to meet the requests of the business community via Internet. By offering on-line services to business, government seeks to establish and regulate a wide variety of activities, such as electronic registration of companies, on-line purchase of goods and services (e-procurement) or on-line payment of taxes.

In terms of G2B, the main objective of good governance is the best use of limited resources (money and labour) to deliver maximum business advantage, according to its ever-changing needs. In a modern economy, the government has a double role in maximizing this benefit. The first role is to

facilitate and maintain active the private initiative. This role involves the provision and development of the relevant infrastructure, development of entrepreneurship, the provision with favourable policies (laws and regulations, taxes, etc.). Beyond this role, the government becomes an active contributor to private initiative. For example, government institutions are using on-line procurement system for purchasing goods and services.

6. Conclusions

The challenge of electronic governance is to develop a partnership between the main actors of public life, in order to control the changes that occur in the management of public sector, changes that are essential in introducing e-governance applications and services. The innovations in ICT, the proliferation of wireless networks and broadband "require" that the organizations, either public or private, offer new electronic services. The implementation of such services requires a change in the role of the government.

From this point of view, the government must move from the role of information and services controller to the role of a link, so that informations and services to respond to the citizens needs, for achieving social harmony. The development of social policies must necessarily involve people and communities' access to ICT, all for the population to participate actively in the economic and knowledge society

Abstract

Managerial decisions and decision making process stand for the key issues of each entity around which all activities of financial information collection, processing, review, construing, summarizing, and not only, gravitate within every organisation.

Moreover, costs (calculation, review and optimization of such) are important as the whole activity of an organisation reflects itself in costs, respectively based on information concerning costs based on which managers may decide on purchasing, producing or abandoning production of a given product. The whole decision making process may be directed on several stages such as: define objectives, determine and evaluate alternatives and making of decisions. The question arises: how is information offered by administration accounting used within each of these stages and which of the accounting information has got the most relevance in selecting the optimum solution.

Key words: cost, business administration accounting, decisions, public establishments, decision making process.

J. E. L. classification: M 41, M10

1. Introduction

The set of problems for business administration accounting and calculation of costs shall be a permanent concern for the public manager. Public services supplied by such establishments are closely related to utilisation of public resources namely public

money. Consequently a permanent and primordial concern within a modern economy is to identify the types of expenditure and calculation of cost related to supply of such types of services towards population, namely tax-payers.

The circle of budgetary system in Romania includes activities within the field of culture, education, health, art, justice, religion, national security. According to Law of Public Finances no. 500 / 2002 and Law of Accounting republished, the public accountancy includes also accounting designed to review costs of approved programmes.[1] If up to the present at the level of Romania public establishments the issue has not been raised of developing business administration accounting that should meet cumulatively the above listed functions, that shall no more be neglected in the future, especially given the necessity of elaborating budgets per programmes.

Budgets per programmes are to be prepared depending on objectives proposed under the circumstances of widening of the reference horizon to a larger number of years. From a budget of means having annual finality it will be passed to budget per programme, where expenditure is included related to achievement of some medium and long term objectives. The budget per programme reflects the assembly of expenses for an objective with breakdown of budget credits that are opened annually to the proposed purpose by making use of budgeting technique.

To estimate the opportunity of public expenditure one shall start from the comparison between costs and updated advantages of achieving an objective. This

basic criterion of budget-per-programme preparation is supplemented with the assumption of optimum breakdown of revenues. To such respect structuring is objectively necessary of expenditure pertaining to each public establishment per programmes specific to attributions of such, as well as lay down of denominate criteria of performance to be adapted to particularities of each line of business for assessment of efficiency and economics of budget financing programmes per the assembly of national budget.

Drafting of material criteria of performance in relation with the specific of each public line of activity is an extremely toilsome process, but which once stepped out, allows decision making factors both removal to the highest extend of subjectivism and random in allocating budget resources and genuine assessment of efficiency and economics in using public funds. For efficient follow-up of the level of achievement of each programme apart at the level of each establishment a system of follow-up and reporting shall be developed by the establishment management. To such purpose the business administration accounting becomes a useful instrument that can satisfy to an optimum the domestic users' need of information. [2]

2. Business administration accounting main instrument of management activity

Business Administration Accounting / Management Accounting responds the domestic users' needs concerning planning, control and assessment of programmes and services of the public establishment. Its purpose is to offer information that correspond to the specific needs of various hierarchy levels of management and decision makers, within their range of activity and assure an adequate and responsible utilisation of resources. Management accounting helps achieve both financial predictions concerning costs and performance of future programmes and further evaluation of such programmes.[3] Determining and estimate the costs associated to various programmes, services, activities or work units are essential within a management accounting system well organised. Costs of the kind may afterwards be compared to the ones in previous periods

and to similar programmes and services of other establishments.

In the literature in Romania, the topic of public establishment management accounting did not enjoy too much attention. Although a series of adepts occurred for the new techniques and methods of calculation used by management accounting, they are not used on a wide scale.

Public establishments are at the present into internal and external tensions that emphasize the necessity of an evolution versus other manners of management. Internal tensions put into light the discrepancies between modalities of functioning of public establishments and their necessities – there are some problems as for allotting of responsibilities, marketing, trading, allocation of revenues, budgetary framework. Moreover, external pressure get deepening the significance of redefining the management of public establishments; that is all about the necessity of reporting within a context of economic difficulty regarding utilisation of public funds.

3. Costs and cost significance for public establishments

Knowing the costs stands for a decisive factor in view of making decisions in planning future activities.

Data review and recording concerning costs of past activity is only one side of cost accounting. Managers are concerned also with costs to occur in the future, their level being at the basis of certain decisions on making available to consumers certain categories of products or services.

In the business administration accounting the cost category is used for various purposes. There is a multitude of types of costs, and such costs are grouped, classified depending on management necessities^[3]. Not all costs are at the basis of decision making but only the ones that are relevant. A cost is pertinent (relevant) if it has been elaborated at the right moment, for the right policy maker and with a satisfactory accuracy for such. [4]

Generically, the cost calculation occurred as natural necessity to determine costs of production per total and per unit of product. The cost calculation includes the assembly of mathematical operations used according to

given methodological provisions in order to determine unit costs for a product, a service, a performed work. The scope of calculation requires exact, relevant and operational calculations, while the method and procedures are the role of the cost calculation theory. Management of costs is an attitude, a set of techniques meant to generate more value at lower price. [5]

The manner cost accounting organized is let at the public establishments discretion depending on specific of activity and their own necessity.

The purpose of a calculation being to supply information within the field of costs it results that it should be so organised as to assure on the one hand quantity and quality measurement of the whole process and on the other hand a means of control, guidance by decisions to be proper to the value side of such based on information supplied at the level of the management.

As each organisational level of the structure of public entities needs certain information that are specific to such the cost calculation must supply in the foreground relevant information on costs, namely information referring to major aspects having decisive involvement in the cost field. Thus selective information can be assured on the only aspects involving urgent decision making thus relieving the management from less significant information.

Knowing the significance of the relevant cost results in that its correct setting out shows particular significance in decision making. Depending on the issue which it shall decide on, a cost calculation may supply information on actual costs, standardized costs and planned costs. In case we have to make short term decisions, then variable costs are relevant as capacities of production do not suffer from alterations and consequently neither would be altered fixed costs. Should we have to make long term decisions, then besides variable costs there are fixed costs being relevant as an alteration occur in the capacity of production.

It has been shown in practice that, generally speaking, the highest frequency of issues demanding decision making stand in the issue of the kind of short term decisions. Thus a series of current problems in optimum charge of machines and places of production, accept or reject extra orders, implementing or

removing out of production some product are within such short term decision. Decisions concerning increase or decrease of physical output of production are subtended on variable costs generating such an alteration.

From point of view of the duration how long to run decision making processes the review of costs shall be distinctly conducted. Therefore a review of long term costs assumes the study of cost evolution over some time horizon during which all production factors are variable while a review of short term costs involves studying of costs behaviour over a time horizon during which production factors are fixed. [6]

Against the multitude of problems requiring decision making utilisation is required of those methods in calculation that should assure supply to the shortest possible of the most accurate and relevant information on costs. Making decision becomes in as much complicated as the number of problems to solve and of criteria of treating such is more varied. That is why grouping of problems is recommended upon a certain sequence. Given that the whole activity is pictured in costs the cost calculation shall be regarded as basic informational system of the public establishment management, the role and significance of costs per each organisational level standing in the fact that: [7]

- Cost occurs in all ranges of economic-social life;
- Cost calculation is the only capable to account for the efficiency of activity;
- Information supplied by cost calculation are management information on all places generating costs;
- Liability for the cost level attracts all management hierarchy steps within the establishment;
- Costs are at the basis of adopting the managerial decision and assure transparency of using public money;
- Cost calculation having as main purpose supply of information on costs; in order to be useful information need to be exact, opportune, little costly.

Cost is the basic element of the marketing study and must be regarded in its complexity within both the stage of service rendering and further on. Information of costs is what helps us know and foresee the chronology of the

life for the product made by means of its cost.

Production cost being the synthetic most important cost that features a company's activity results in that by its control the level of the run activity can be followed-up.

Evaluation of this control is based on cost calculation as the single action to be taken for supply of the data necessary to know the level of costs, of deviations versus the planned costs and of the causes having generated such. The assembly of information on costs is gathered, processed and located systematically by means of cost accounting. What features the cost information flow is the emphasis put on concentrating information offering a synthesis insight on both the manner of conducting the production process and the general management of a public establishment.

At the present, in our country no due significance is paid to the business administration accounting. Although a series of adepts of the new techniques and calculation methods used by management accounting have occurred they are not used on a wide scale.

Further on, part of public entities decline putting into practice the business administration accounting for thinking there is extra work not producing anything but only consuming resources and they thus ignore the significance of information that can be made available to manager by its means. Even where business administration accounting is organised it is only briefed to the old method of post-calculation.

4. Conclusions

Many a time, the capacity of an organisation to manage costs depends on its organisational efficiency. It is often not establishing the ways and means of mitigating costs that stands for the solution but rather optimization of such starting ever since in the phase of design and development of products and finishing with the phase of their sale. For just such reasons, we think that the cost management shall have a "honour" place within each organisation and shall be an essential component that cannot miss from management accounting because it supplies the management information with high degree of detailing coming in support of

planning, control and grounding of decisions about products, activities or processes within organisations.

In order to select the best working alternatives, to make the most appropriate decisions at the most appropriate place and time managers can and must make use of decisional models by means of which a prompt and target addressed action can be achieved, creatively and rapidly approaching and settling problems of decisions which have not been scheduled or of those that are run under risk and incertitude circumstances.

The chief conclusion we have come to at the end of this article is that by means of an integrated system of cost management the managers have the possibility to integrate calculation and cost review within the strategic policy of an organisation in view of creating long-lasting competitive advantage, thus contributing to not only substantiation of decisions concerning the product portfolio but also to an assembly of micro-decisions progressively leading to a change in the organisation strategy.

The Audit of Accounting Information System Infrastructure

Mihalache D. Arsenie-Samoil

"Alexandru Ioan Cuza" University of Iași, Doctoral School of Economics
arsenie_samoil@yahoo.com

Abstract

The phenomena that mark the economic environment in recent decades are under the sign of globalization, interdependence and interaction. Whatever happens in any corner of the world, affects more or less extensively the local economic environments. In these circumstances, any organization, regardless of its activity profile, size and space in which it operates, must prove its viability, ability to communicate and adapt in order to achieve economic and financial performance to make it increasingly competitive.

This paper aims to address the issue of accounting information system infrastructure audit, in terms of globalization, an activity which involves evaluating all aspects of automated data processing systems, including related manual processing activities. Key concepts relative to what is the audit of accounting information system infrastructure, audit aim, audit methodology (7 steps), audit report, as well as steps to be followed in implementing post audit corrections, are highlighted.

Key words: infrastructure, accounting information system (AIS), audit.

J.E.L. classification: M4, C4, D8, L14, E42, G32, H83, L86, Q56.

1. Introduction

Accounting is the most important subsystem of an organization's information system. Also, accounting is the main source of information in an organization. Economic data provide about 80% of the total circulating information throughout an organization. Of these, about 46-50% are information provided by accounting [1].

This way of seeing the organization makes accounting information system the most important element of an organization's

information system for the following reasons: accounting information system is the only provider, to management and external users, of an overview of the entire organization, accounting information system interlinks other important information related subsystems such as marketing, personnel, research and development, production, etc., in such a way that information in all these subsystems is eventually expressed in financial terms, non-financial information in areas such as social responsibility and human resources are integrated with accounting information to enable decision making, accounting integration with other subsystems leads to higher speed and increased accuracy in providing information to users.

From the perspective of the development of information technology and communications (IT&C), accounting is subject to many challenges: the increasing number and importance of external events for any organization, changing the means of producing economic events, the latter become increasingly means of electronic nature, the existence of information technology capable of automating specific accounting operations: identification, measurement, recording and reporting; globalization and developing information technologies ensure that organizations are no longer monolithic structures, but they tend to become increasingly complex structures, interdependent and interoperable with other agencies and organizations; internal and external users request more and more information, more diverse, more complex and in increasingly shorter intervals of time.

From this perspective, an organisation's accounting information system infrastructure (AISI) includes: equipment (hardware resources) – the hardware of the system, network components – communication network infrastructure; classifications – databases – data infrastructure; software package (the program-products) the system

software infrastructure; processes – the logical infrastructure of the system; employees – the social infrastructure of the system; the implementation strategy.

A principle widely accepted by management says an activity can not be operated and managed if it can not be measured. The IT&C audit provides the measure of using the accounting information system infrastructure in an organization [3].

The audit of accounting information system infrastructure is a thorough analysis of the information system in an organization. It is a very important tool for the organization's management when evaluating the efficiency and effectiveness of using IT&C resources (hardware and software).

IT&C technologies are under steady development, so that both security systems and modes of attack are analyzed and perfected every day. The only way an organization can protect itself by implementing the best practices in the field is an audit of information system infrastructure.

IT&C audit should be conducted by a specialized, independent company and in no case can be made by its service provider in information system implementation.

The audit of information system infrastructure is a kind of "insurance" that things are on track and that any difference will be analyzed and eliminated as the company's accounting information system is in compliance with safety and quality standards stipulated by law and are consistent the direction in which the organization operates.

It is generally accepted that the audit of information system infrastructure is the only and best way for company management to ensure that security technologies and practices used are performing in accordance with specifications set [5].

The audit of accounting information system infrastructure is the collection and evaluation of evidence in order to determine if the computer system is secure, maintains the integrity of data processed and stored, enables the achievement of company's strategic goals and uses information resources effectively.

In an audit of accounting information system infrastructure, the most common procedures are checking, assessing and testing information resources, such as:

identifying and assessing risks in the system, evaluation and testing of system control, physical examination and assessment of information environment, checking and evaluation information system management, checking and evaluation of computer applications, checking and evaluation of computer network security, checking and evaluation of plans and procedures for recovery from hazardous situations and business continuity, and testing data integrity.

The audit of the accounting information system infrastructure AISI is an essential method by which an information system IS is checked as to whether it has achieved the goal for which it was designed. The standards clearly define the scope, tasks, milestones, content auditing and forms completion. The AISI audit of is an area that includes all auditing activities for the following: specification, design, software, databases, processes typical of a program life cycle, of a computer application, of a management information system and the maximum complexity of a portal associated with a virtual organization.

The AISI audit may relate to the risk assessment of physical security information, logic security, management of changes, assistance plan, etc. In general, the information audit refers to a set of computer processes in order to meet the specific customer requirements.

From another point of view, the AISI audit is the mechanism for examining the efficiency of organizations, systems, risk processes and controls. The audit enables management to: discover what actually happened at a given moment in time, detect potential problems before they are too late to remedy, assess the business situation objectively, accept reality and, knowingly, make decisions even if they are difficult, implement corrective actions, changes and improvements where necessary.

The AISI audit is not just about compliance. The audit may include an element of control on the compliance with policy/standards/internal company procedures or laws, rules and external terms of trade, but compliance is a daily activity of management. Experienced auditors control whether management processes to achieve and assess compliance are effective, which

rules are adequate and sufficient for the audited IS. More often, auditors will find out the absence of compliance and are less inclined to look for symptoms of problems in depth.

Accounting information system infrastructure audit is the process of collecting and evaluating evidence to determine if the accounting information system and resources involved are adequately protected, maintains data integrity, provides relevant information and contributes to achieving organizational objectives.

2. Purpose

The AISI audit, used by an economic body in its economic activities, aims: to ensure the precision, completeness and accuracy of data input, as it affects the results of processing performed; ensuring processing accuracy of data input the system, meaning that their results observe management rules specific to that economic organization and current legislation; ensuring accuracy and integrity of the system output, that it is exactly the one required by the managers and financial control bodies of that economic agent; ensuring fairness of control procedures (controls) used for auditing the respective information system

The accounting information system infrastructure audit within the organization requires, as a whole, a high level of analysis; in particular, the integration of applications, systems, infrastructure and how they affect the entire organization's information system will be analysed; identifying and eliminating weaknesses in information system; minimizing the risk to which the organization is exposed; raising awareness of potential risks involving the current computer system in project development and critical points where intervention is necessary to remove these risks; safe use of updated, developed technology by applying security policies that comply with the specific organization.

The AISI audit process helps companies cut costs by finding more efficient ways of protecting hardware and software and provides a better management relative to the application and use of security technologies and of processes.

As a result of this audit, a set of suggestions for changes to be made in the present computer system structure will be provided.

3. Methodology

In order to achieve the AISI audit, the definition of the overall audit plan and audit program is considered. The structure of the plan and program definition are standard, assuming completion of the mandatory steps. The specificity of the software, computer application or computer system and their complexity, entail some breakdowns that differ from one general plan to another, namely from one information audit program to another. The tasks to be included in the plan, the phasing in the program stages, involve elements of variability strictly related with the structure and diversity of software products analysed [5].

The information analyst has available a number of techniques and methods that can be adapted to the context. A statistical calculation or optimization computer program and an application using a database will be analysed in different ways. For a complex information system, there are adequate methods of auditing, while in auditing web applications emphasis is placed on target group satisfaction. The audit for mobile applications is based on ensuring continuity, compatibility, fast access to resources, and especially on the level achieved in securing the data flow in the whole system.

Therefore, in the AISI audit process, planning and defining the audit method is essential. Choosing an inadequate method leads to the use of inadequate tools and the audit results are speculative [9].

The choice of method relies on obtaining information on the context in which processes take place in relation with the software product, the computer system or computer application, as objects of auditing.

The audit report is based on questioning the IT&C staff in order to evaluate and monitor policies and current documents, perform risk analysis that relative to workstations, servers and the whole network and evaluate network services and configuration files. The assessment will highlight potential errors and/or security

holes present in the computer system.

STEP 1 includes the following stages: 1. Meetings, interviews and/or direct observation of staff in the company; 2. Collection, compilation and review of current documentation, checking licenses of installed software. Analysis of all IT policies underlying the whole system operation (policies on the terms of use of IT infrastructure, policy on Internet, e-mail use, backup policy, passwords, access to resources, etc.); 3. The analysis of electronic document flow within the company, as well as outside the network with external partners (customers and suppliers);

STEP 2 includes the following stages: 4. The analysis of IT&C requirements in the company;

5. Evaluation of the human factor in the IT department. Classification of IT staff according to qualifications and professional skills; 6. Evaluating performance in the IT department based on measuring the time in which it responds and resolves any incidents;

STEP 3 includes the following stages: 7. Evaluation and verification of hardware infrastructure (workstations); 8. Evaluation and verification of software infrastructure (installed applications, licenses); 9. Evaluation and verification of the servers in terms of hardware, software and traffic;

STEP 4 includes the following stages: 10. IT&C analysis in terms of security; 11. Analysis of connectivity between locations and with the outside (location, Internet connections, VPN channel, remote access); 12. Analysis of network topology in locations;

STEP 5 includes the following stages: 13. Assessment of IT&C staff based on know-how (knowledge of processes); the possibility of training some of the IT staff; 14. Verification of IT applications used widely within the company;

STEP 6 comprises the following stages: 15. Testing of the backup/restore procedure; 16. Analysis of disaster recovery plan;

STEP 7 comprises the following stages: 17. Analysis of acquisition services; 18. Analysis of IT&C technologies used in business activity;

4. Audit Report

The audit process is completed with a report containing proposals for measures to reduce and keep major AISI risk under control. Audit report is a work of synthesis which is based on a series of checks on interconditioning between modules, programs, i.e., between the subsystems of the information system.

The audit report is an essential element of auditing through which the situation of the audited system is shown as it was evaluated by auditors [3]. The audit report communicates the auditors' findings and conclusions to the audited party. The objectives of the audit report are: restore managers' confidence in the information system, immediately after the auditing has finished; to provide useful advice on improving inspection procedures and efficiency of operational activities; to provide an official record of the audit activity and managers' response.

The audit report is a structured text which includes: the presentation of context; the result of the audit process; final evaluations; records of each stage of the audit process.

The audit report will consist of two parts: the AISI evaluation results at present; the auditor's recommendations following the analysis made in the evaluation stage. Finally, the audit report will result in a set of documents presenting an objective evaluation of the IT system, which enables the implementation of all necessary measures to correct and remove potential errors.

5. Implementing corrections

The most important result of the process of accounting information system infrastructure audit is be the list of weaknesses discovered. Being aware of the specific weaknesses faced by the organization is a good step towards developing a comprehensive program to remove these shortcomings, thus avoiding the occurrence of malfunctions in the day to day activity [8].

The process of implementing corrections (post audit) involves the following stages:

- Establish priorities. Following the audit report, we receive a lot of information with variable degrees of importance. Each of these pieces of information will be assigned a risk level. The most critical points will relate to the most critical systems which can be caused by public access to the network or events that involve the transfer of critical data.
- Assign roles. It is very important to decide who will manage each task. At this stage, we must ensure the necessary resources, such as budget and/or time have been allocated for each employee to perform each project.
- Requesting reports. After roles have been assigned to each individual involved in the correction of weaknesses following the audit, we must ensure that the project will be completed as promised, within a certain deadline. A status report has to be presented regularly, so as to provide for any delays or problems that may arise.
- Individual evaluations. Once the correction of security "holes" or equipment reconfiguration have begun, we can start testing the corrections that were made. Before scheduling and requiring a second audit, we must ensure that the weaknesses detected in the first audit were corrected. This approach will help us develop a plan for continuous improvement in the organization. If status reports can be submitted to the management and with an ongoing dialogue on the status of projects, it can be shown that we are on "top" of any problems and it is justified to ask for continuous support to audit processes and correction making.
- Schedule next IT audit. It is a rare situation for an organization to return to conduct a new audit, the second, even if the first one has failed. However, companies should have regular assessments of the AISI audit. The scope and frequency "will depend on who we are and what we do." Ideally, it is recommended for an organization to conduct an AISI audit every 6 months.

Since the accounting information systems are constantly developing and upgrading, the AISI audit process can be seen as a regular process.

This is because once a problem has been fixed, another problem may occur, but as long as we perform regular audit assessments, we can continuously improve accounting information systems.

Therefore we believe that the analysis of information system should be a continuous one [11].

6. Conclusions

AISI audit represents a distinct branch of the audit. It includes techniques and methods of auditing software, computer applications, traditional information systems, modern computer systems, mobile applications, as well as all applications using Internet resources.

With globalization and integration, as complexity of processes in the information society increases – a society of knowledge, the requirements of information systems impose a very high level of credibility which only information audit is able to support.

The achievement of AISI audit contributes to: the improvement of information systems and process controls; prevention and detection of errors and fraud; reduction of risk and improvement of system security; planning for recovery in case of accidents and disasters; information management and system development; assessment of efficiency in the use of resources.

The information systems auditor must be able to assist the management team in determining the size of the accounting information system infrastructure and the necessary number of staff, the business areas where computer systems are used effectively, the nature of business, potential loss if the computer system crashes, the extension of manual controls and the degree of technical complexity.

In order to achieve an effective auditing process, it is necessary to go through the following steps: defining the object of accounting information system infrastructure audit; building the audit plan; assignment of tasks to each member of the team of auditors; taking the structures of tables for recording the results of auditing; performance, step by step, of the auditing process using established standards, techniques and methods; recording the results of and evaluating each step taken; re-grouping of documents from various

stages of the auditing process and building of the final report.

There are two results for a product subject to AISI audit.

The first case, the negative one, corresponds to the situation where the audit process leads to the conclusion that there are key differences between the actual accounting information system and the accounting information system expected by the user; the system does not perform the established accounting information processing functions fully; reports obtained are only a part of the established ones – the auditors recommend adding new modules to develop planned, but unrealized, processing; variances are caused by incomplete results within the report - we recommend adding modules that bring reports to the level of completeness required; the differences relate to the way indicators are calculated – we recommend changes in program sequences that either contain all the information for processing or change filtering criteria or modify assessment expressions; if cases are identified on the upper levels of the tree associated with accounting information system, the requirements for change stipulated in the audit report have a larger scope. After having made the changes in the hardware infrastructure, software infrastructure or databases, the audit process is resumed and the findings report turns into an audit report, followed by the issue of a certificate by the auditor, which recognizes the qualities of the computer system and users can rely on the computer system audited.

In the second case, the favorable one, the difference between what is expected by the user and what has been achieved is insignificant or is favorable to the increase in product quality.

Corresponding to the two cases above, the auditor's audit opinion will be one of three types: negative audit opinion when, at the end of the audit, there is one or more noncompliances; qualified audit opinion (with reservations) when there is one or more observations at the end of the audit; audit opinion – when, the end of the audit period, there is no persisting comment or noncompliance.

AISI auditing is meant to transfer confidence and trust in the information

system established through a positive result established by a team of auditors, belonging to a consulting firm whose authority has been provided by previous audits.

Security of the Accounting Information System Infrastructure

Mihalache D. Arsenie-Samoil

"Alexandru Ioan Cuza" University of Iași, Doctoral School of Economics
arsenie_samoil@yahoo.com

Abstract

The accounting information system infrastructure is crucial to the carry out successfully most of bookkeeping operations in a modern enterprise. Consequently, the security of the system should be an important issue on the enterprise agenda. A series of factories can be construed as having increased the risk of electronic attack at the accounting information system infrastructure such as unavoidable difficulties of securing such system; the increased globalization; insufficient awareness and training of the accounting systems users, and attitudes or practices that do not observe use procedures; availability of information with concern to unauthorised access to the accounting information system; unclear regulations and certain jurisdictional difficulties. The paper studies the security of the accounting information system infrastructure in modern corporations from the viewpoint of modernising accounting against the background of implementing new information technologies aimed at carrying out the objectives of integration and globalisation construed as phenomena specific to information society and knowledge.

Key words: infrastructure, accounting information system, security, risk analysis.

J.E.L. classification: M4, C4, C8, D8, L14, E42, G32, H83, L86, Q56.

1. Introduction

The phenomena marking the economic environment over the last decades have been under the sign of globalisation, interdependence, and interaction. Whatever happens in any part of the world may have a minor or major impact on the local economic environment. Under these circumstances, any company regardless of its operations, size,

and area of operation, has to prove its viability, capacity of communication, and adjustment with a view to achieving economic and financial performance that would make it increasingly competitive.

The development of the latest information and communication technology has led to building up company-integrated systems that make storage, access to, and transfer of information increasingly easier and more accessible. By implementing such systems, companies are enabled to build up flexible information infrastructures that are easily adaptable to changes in their operational environment, hence revolutionising their way of conducting operations [3].

Accounting is a formal language of business communication, which allows the company to be represented internally and externally. It should also be able to adjust quickly to the new global business environment undergoing continuous change and transformation. This adjustment would be impossible without the assistance of the new information technology and computer infrastructure revolving around the Internet. The use of communication networks and systems may be hazardous as it may encounter unexpected occurrences such as breakdown of communication systems, loss of information, or taking the wrong decisions.

If we consider a corporation from this perspective, the accounting system is regarded as the most important element of the corporate information system due to the following reasons [5]:

- the accounting information system is the only system that allows management and external users to have an overall picture of the company;
- the accounting information system connects other major information subsystems such as marketing, human resources, research and development, production, etc., to such an extent that all

the information provided by these subsystems may be expressed ultimately in financial terms;

- the non-financial information in areas such as social responsibility and human resources are integrated with the accounting information to allow the decision-making process;
- the integration of accounting with the other subsystems leads to offering more accurate information to users at a higher speed.

The phrase information infrastructure refers to information resources, including communication systems, entities and people with expertise in the field. Examples of infrastructures are the corporate information infrastructure, the defence information infrastructure, the national information infrastructure as well as global information infrastructure [1].

2. Attackers

The main sources of risk the accounting information systems may face are the people within a corporation and accidents or natural disasters. Moreover, people outside the company represent an important source of risk, in some cases, as they are more motivated and difficult to detect and investigate than the people inside the company.

The following 'agents' are likely to cause security-related problems to the accounting information system:

- Employees. They are invested with trust and they have access to the information system, which may enable them to develop a better knowledge of the system's weak points, they can conduct operations detrimental to the company, and they may delete digital records as well;
- Consultants / System servicing personnel. These people have frequent access to sensitive areas of the information system, which may enable them to conduct a wide range of operations;
- Suppliers / Customers. Their economic reasons are not always consistent with those of the customer / supplier and, sometimes, they may undertake actions that are likely to pose security-related

risks;

- Competitors. Other individuals or companies likely to gain from losses incurred by the company resulting from such attacks on the information system;
- Crackers/ IT mercenaries / Professional criminals. People that illegally penetrate information systems and intentionally cause damage, whose motivation is generally diverse;
- Espionage experts. They are professionals in obtaining information on behalf of other companies. These people have highly technical expertise; they are well trained and can most often pursue their interests without being detected;
- Accidents / Natural disasters can cause loss of important information or they can make them unavailable.

Attackers of information systems usually fall, according to their motivation, into four main categories such as:

- Social motivation. Attackers in this category try to gain a feeling of superiority or control, of acceptance of other attackers or of integration in a certain group.
- Technical motivation. Attackers in this category try to 'beat' the system, as a kind of intellectual challenge.
- Political motivation. Attackers in this category try to obtain political attention in order to promote a certain cause.
- Financial motivation. Attackers in this category try to gain personal benefit (i.e. spies, IT mercenaries, various companies, or even people that deal with confidential information, etc.).

Attacks on accounting information system infrastructure may have various forms. First, attacks can be classified according to the location where the attack is conducted. We can distinguish two kinds of attacks: on-site or remote. A second classification can be made according to the way the attacker interacts with the information following a successful attack. This leads to two categories of attacks, i.e. passive and active ones.

In most cases, one should be able to cope with the following types of attacks: computer viruses, Trojan horses and backdoors, password crackers, scanners, traffic sniffers, and social engineering attacks. Computer

virus is a general term that describes various types of attacks on the infrastructure. As the existence of a malicious code in the computing systems may act differently due to the very design of the code, one should consider the various classes of malicious "programmes" – e.g. viruses, worms, Trojan horses, bombs, trapdoors / backdoors, spoofers, hoaxes, etc. – whenever one refers to such programmes.

A password cracker is a programme that may crack passwords, by-pass or deactivate password protection. Among the techniques used to "guess" the password, attack by "brutal force" and attack by use of dictionaries are commonly used.

The scanner is a utility application used to detect automatically the weak points in the security of a system. By means of a scanner, a user will be able to check, on-site or remotely, the entry points to penetrate a system and, later, to cover such security gaps. If an ill-intended person who masters the required knowledge uses such an instrument, the security of the information system infrastructure will be seriously affected. Initially designed to enhance it, scanners reaching the other side of the barricade may cause severe problems in ensuring security.

A sniffer is a software or hardware component, designed to "eavesdrop on" and "grab" the information transferred via the network. In order to sniff the traffic, certain conditions are required: the network architecture or the configuration of the network board should allow this to happen promiscuously. Placing a sniffer inside a network is possible only if either the attacker finds a gap in the security system or she or he is an employee of the corporation that wishes to collect classified information.

Social engineering attacks use human nature to secure access to classified information. Such attacks most often target credulous people among the organisation personnel.

Attacks on databases display some particular features as compared to the other information in the corporation, namely databases represent the largest amount of information the corporation operates with; databases can reveal personal details by processing public information. The main types of attacks on databases are direct, indirect, and by monitoring.

Countermeasures can be applied to such attacks in order to block them or limit their effects such as antivirus software, firewalls, traffic analysers, patches, fixes, hotfixes, safe operating systems, safe applications, adequate passwords, and user's education.

3. Threats

Threats affecting the infrastructure of the accounting information system represent actions, possible or taken, that might attack the system.

Threats directed against security fall into three categories: natural/physical, accidental, and deliberate. The deliberate ones are the most frequent. They fall into two categories: internal and external. Internal threats come from inside the corporation where its employees can easily access information, because there are fewer barriers they need to overcome. In addition, they are familiar with the corporate security policy. External threats come from many categories such as foreign intelligence agencies, terrorists and terrorist organisations, criminals, raiders, hackers and crackers.

Threats at the infrastructure of the accounting information system can be classified as follows: fundamental threats, facilitating threats, and indirect threats. Fundamental threats represent what an attacker wants to do. Such threats are information leaks, tampering with information, rejection, denial of service, and illegitimate use. Facilitating threats represent those threats that allow access to fundamental threats. Facilitating threats can be classified as masquerade, malicious programmes, security by-pass, and authorisation breach. Indirect threats derive from the basic characteristics of the Internet and of the information infrastructure, e.g. interception, scavenging, indiscretion and administrative error.

4. Vulnerability

Vulnerability can be defined as weakness in terms of system procedures, system architecture, system implementation, internal check, and other causes that may be exploited to penetrate security systems and to have unauthorised access to information. The main

weak points of the infrastructure of the accounting information system are physical, natural, hardware, software, storing environment, radiations, communications, and human.

Universal vulnerability is defined as a state within an information system that:

- allows an attacker to execute commands as if she or he were an authorised user;
- allows an attacker to access information against the access protocols;
- allows an attacker to conduct a denial of service attack.

Exposure is the state of an information system that is not a universal vulnerability but which:

- allows an attacker to carry out activities to collect information about the system;
- allows an attacker to hide her or his illegitimate activities;
- includes a function that may be easily compromised;
- is a port of entry an attacker may use to access the system or the information therein;
- is construed as a problem from the point of view of the information system protocols.

5. Security

Ensuring security of information involves carrying out four objectives: confidentiality, integrity, availability, and non-repudiation. Security is not an aim in itself. Security as an objective may be construed as a state. Security is never perfect, irrespective of the measures taken to this effect. There will always be an unthought-of gate via which the accounting information system may be attacked [10].

Security technologies designed to remove risks and limit loss are access control, firewall, antivirus software, file encryption, digital identification, physical security, etc. They are designed to limit access to information. Besides restricting technologies, infrastructure system security needs to be administered, monitored, and serviced. To this effect, the following operations have to be performed: prevention, detection, and response to intrusions.

Within information systems, encrypting is apparent on several layers, namely hardware, application, data transmission, files and folders.

Antivirus software is a utility that detects the action of a malicious programme and annihilates it. The antivirus software will detect the presence of a malicious code (virus) in the computer by using the signature left behind by such malicious programme (virus). Once the presence of a virus has been detected, the antivirus software will launch a subroutine, the vaccine that will annihilate the action of the virus. When selecting antivirus software, we should consider several criteria such as: workstation, the number of viruses it can detect, the time required to respond to a virus, network scanning options, e-mail scanning options, protection from scripts, compressed files scanning, presence of technical support, the length of time free updating is provided, the name of the software producer, location of the software company and of the dealer, and the price. Corporations or enterprises may face problems when using antivirus software. Virus scan, for example, is difficult to perform from each workstation, updating is difficult from each workstation, monitoring the performance of antivirus software on every workstation is difficult. Therefore, it is necessary to use an antivirus programme that would allow protection and monitoring from a single console, with safe and constant updating and centralised management.

A firewall is a system used to implement policies designed to control access to a corporate system or among corporations. It will protect a computer or a network from unauthorised access. In choosing a firewall, one needs to consider the following criteria: the degree of security, the operation system, and the administration one.

An intrusion detector is a process that detects and responds to abusive use of the accounting information infrastructure components. The use of an intrusion detector will create benefits for the company with respect to detecting, blocking, response to attacks, support in assessing damages incurred as well as evidence admissible in court against people charged with abusive use of infrastructure components. According to the specificity and the size of the company, one can opt for a certain type of

intrusion detector. In small enterprises, such intrusion detectors are embedded in the firewall installed. Analysis of firewall logs or router will signal the intrusive attempts. Moreover, operating systems can facilitate detection of intrusions.

6. Risk analysis

Risk can be defined as a potential threat that may exploit weaknesses of the accounting information systems. Risk is an expected event. To prevent an event likely to affect the security of the information system from occurring, specific measures should be taken. Such measures are called security measures.

Risk analysis involves a process of identifying security risks, of determining the extent of such potential risks, and of identifying the high-risk areas that need to be secured. Risk analysis is part of a comprehensive body of measures called risk management. Risk assessment is a result of risk analysis. Risk management can be defined as the body of methods aiming at identifying, checking, removing or minimising events that may affect the resources of the system. This body includes risk analysis, cost analysis, selection of mechanisms, assessment of security measures implemented, as well as overall assessment of security.

Risk can be approached from many angles from among which some are presented below: quantitative analysis, qualitative analysis, and workstation analysis. These risk analyses are conducted mainly within large corporations and within some medium-sized enterprises. Small enterprises have neither specialised personnel nor the money to pay for such an assessment. Nevertheless, a minimum of security measures must be taken. It is a well-known fact that company managers are reluctant to invest in something that has no direct profit. When they are persuaded by the necessity of allocating the amounts required by ensuring security, such amounts are usually below the limit of the requirements. Under these circumstances, the entity needs to ensure such a security system whose expenses do not exceed the amount allocated. This can be labelled financially constrained security. There are two alternative solutions to this situation, i.e.

covering threats that are most likely to occur, while preserving the initial checking methods or covering all threats and reducing costs as to checking measures.

The former allows for a maximum degree of protection against some threats, but may leave partially or completely uncovered threats. The latter requires reduced expenditure needed to ensure checks for a specific threat so that all possible threats may be covered. This can be reflected by modifying and configuring checking measures. This measure is to be preferred over the former as it does not allow for vulnerabilities to be uncovered by checking measures [8].

Security is difficult to quantify but it can be appreciated as high, medium, low, or missing. Nevertheless, security level can be quantified at least from a financial point of view. Implementing or testing and upgrading a security system will always generate costs related to equipment and human resources.

Setting forth a security programme is the process via which the corporation or enterprise ensures its security. This programme involves five steps, namely appointing the personnel in charge with ensuring security, determining the main stages of implementing security, defining requirements of upgrading security, informing the personnel as to the required security measures, auditing, and monitoring security. There are cases where ensuring security involves hiring specialised organisations. They can conduct both the study and implementation, or only the study, while implementation is to be conducted with the company's own personnel. Specialised services are often hired by small-sized enterprises or when upgrading qualifications of the personnel in charge with ensuring security requires high costs. Outsourcing represents the company's option for security services ensured by a third party. If this is the case, we refer to a Security Service Management Supplier (SSMS). They provide both security services and the management thereof. Security Service Management (SSM) will be conducted not by the company but by the services supplier. Security is not a destination, it is an on-going process.

7. Conclusions

As corporations and enterprises become increasingly dependent on the reliable operation of the accounting information systems, the issue of system security becomes paramount. The infrastructure of the accounting information security in modern corporations relies on communication networks, which are generally open structures to which a large and varied number of components can be connected, hence a twofold potential vulnerability of the infrastructure can occur: tampering with information and unauthorised use thereof. In order to ensure the security of the accounting information system, the implementation of some specific mechanisms is of utmost importance. Such implementation start from the physical level (physical protection of transfer lines), the procedures blocking access to networks (firewall software), applying data encoding techniques (encryption), i.e. a specific method of protecting communication among applications running on various computers in the network. From among the causes of communication network vulnerability, we mention programming errors in the applications and their poor documentation, unsuitable configuration of the hardware and software elements, lack of support from the manufacturers, poor knowledge of or security issues or ignorance thereof.

The points presented in the paper enable us to consider the digitised environment as generator of new risks. In order to ensure efficient protection of data, it is necessary for any corporation to develop complex risk assessment and analysis.

The reality around us requires a three-fold approach of the risks the accounting information infrastructure faces, i.e. threats regarded as events or activities (generally from outside the system assessed), which may affect the vulnerabilities within any system, causing thus the impact, understood as a loss or a consequence the corporation or enterprise may suffer on a short, medium or long term. Risk within a corporation cannot be removed altogether, it will always be there. What corporation management can do is to reduce it to a manageable degree.

The Impact of Inflation Rate Upon Interest Rate in Romania

Mihut Ioana Sorina

*"Babes-Bolyai" University of Cluj-Napoca,
Faculty of Economics and Business Administration
ioana.mihut@econ.ublcluj.ro*

Abstract

The main objective considered by the monetary authorities in Romania after EU integration is to maintain the inflation target imposed. To achieve this goal, the slowdown in inflation can be maintained by reducing price volatility and minimizing the impact of inflation on new taxes imposed on alcohol and tobacco products. The persistence of inflationary risks associated with the current macroeconomic framework generated by the economic crisis, largely due to increase in some categories of indirect taxes as well as exposure to domestic demand urges monetary authorities to pursue policies that consider these issues. This context makes it necessary to elaborate a model for studying the impact of the inflation rate upon interest rate in Romania.

Key words: inflation, multiple linear model, inflation targeting.

J.E.L. classification: G17

1. Introduction

Inflation is an economic, social and monetary phenomenon originated in the discrepancies that occur in the context of the structural-qualitative mutations specific to an economic environment. These mutations are generated by a complex of connected factors with unbalanced action on monetary processes and being governed by the laws of monetary circulation.

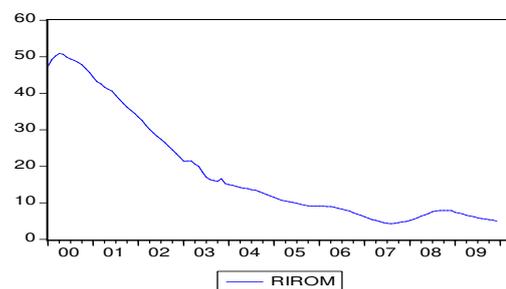

Although the inflationary process is a generalized phenomenon and a particular attention is paid to it by the economists, inflation still remains insufficiently defined as a concept, so that the indication of the exact nature of the inflation remains topical, complex and controversial.

As a macroeconomic process, inflation is generated by several factors which contribute to its appearance and maintenance, albeit with different intensities, or for shorter or longer periods of time. The inflationist mechanisms, stemming from a number of factors, influence in turn the evolution of all the indicators of the real economy. The factors that generate inflationist mechanism are general, individual or specific factors. They can be grouped into the following categories: internal factors (economic, socio-political, monetary, financial and valutory factors) and external factors.

2. Data used

In order to illustrate the relationship between interest rate and inflation rate for Romania we used monthly data. We used a representative sample for the period 2000 M₀₁- 2010 M₀₃, and the source of data for the interest rate and inflation rate evolution was Eurostat.

Figure 1: The interest rate evolution in Romania

Source: Author's calculations based on the statistic data obtained from the Eurostat

As what regards inflation, we have to mention that Romania registers a positive trend. After the disinflation process has registered a slight slowdown in 2005, the evolution of consumer prices in the first

months of the year 2006 certifies the further disinflationary trend.

Thus, consumer prices rose in September to 2,76% compared to December 2005 and the monthly average recorded during 1.01.-30.09.2006 fell 0.3 percentage points below the level of the same period of the previous year.

In the coming period the disinflation will continue in order to fulfill the medium-term objective, namely achieving in 2010 a comparable level of inflation with that of the European Union. Such a development is mainly supported by reducing inflationary expectations, especially by adopting an inflation targeting strategy of monetary policy, by a more moderate growth of the regulated prices compared to the previous periods and by the continued appreciation in real terms of the national currency against the euro, but also by the Government's commitment to a prudent wage policy.

The ADF test on the inflation rate

In order to achieve an econometric model of ADL type must be completed several steps such as: applying the ADF test in order to determine the stationary or nonstationary character of the time series; testing the validity of parameters; calculating the estimators of the model's parameters; testing the validity of parameters; testing normality; testing the hypothesis of the autocorrelation of errors; testing the heteroskedasticity of the residues (D. Lazăr, course notes).

Table 1: The ADF test on the inflation rate

Null Hypothesis: RIROM has a unit root			
Exogenous: Constant			
Lag Length: 6 (Automatic based on SIC, MAXLAG=12)			
		t-Statistic	Prob.*
Augmented Dickey-Fuller test statistic		-4.838092	0.0001
Test critical values:	1% level	-3.489117	
	5% level	-2.887190	
	10% level	-2.580525	
*MacKinnon (1996) one-sided p-values.			

Source: Author's calculations based on the statistic data obtained from the Eurostat

From the above figure we can see that the null hypothesis H_0 : the observed values of the inflation rate have a unit root (went random) are accepted. The probability is $0.0001 < 5\%$, which means that the null hypothesis is rejected. The observed values of the inflation rate are stationary. Further the ADF test will apply to the differential values of the inflation rate.

The ADF Test on the differential values of the inflation rate

Table 2: The ADF test on the differential values of the inflation rate

Null Hypothesis: D(RIROM) has a unit root			
Exogenous: Constant			
Lag Length: 5 (Automatic based on SIC, MAXLAG=12)			
		t-Statistic	Prob.*
Augmented Dickey-Fuller test statistic		-1.661771	0.4479
Test critical values:	1% level	-3.489117	
	5% level	-2.887190	
	10% level	-2.580525	
*MacKinnon (1996) one-sided p-values.			

Source: Author's calculations based on the statistic data obtained from the Eurostat

From the above figure we can observe that the null hypothesis H_0 : the differential values of the inflation rate having a unit root (went random) is rejected. The probability is $0.4479 < 5\%$, which means that the null hypothesis is accepted. The differential values of the inflation rate are non-stationary.

Upon the completion of the corelograme on the differential values of the inflation rates in Romania we can observe the fact that at a lag = 1 and a lag = 5 could be obtained a better correlation. In building the model we shall start with $p = 1$, so we shall include as explanatory variables DRI (-1) and DRI (-5) .

Also from the analysis of the corelograme of the differential values of the interest rates we can observe that at a lag = 1 and a lag = 10 appears a better correlation. In building the model we shall start with p = 1, so we included as explanatory variables DRI (-1) and DRI (-10)

Modelling results of the inflation rate impact on interest rate

3. Estimation of the model

Table 3: Estimation of econometric model for de case of Romania

Sample(adjusted): 2000:11 2009:12				
Included observations: 110 after adjusting endpoints				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
RDROM(-1)	0.070049	0.015057	4.650	0.0000
RDROM(-10)	0.031875	0.011315	2.817104	0.0058
RIROM(-1)	-0.108771	0.064922	-1.675403	0.0968
RIROM(-5)	0.030073	0.052427	0.573620	0.5674
Mean dependent var	1.000000	S.D. dependent var		0.000000
S.E. of regression	0.549332	Akaike info criterion		1.675459
Sum squared resid	31.98718	Schwarz criterion		1.773658
Log likelihood	-88.15025	Durbin-Watson stat		0.058330

Source: Author's calculations based on the statistic data obtained from the Eurostat

In order to obtain better results we will not take into consideration the unimportant variables.

Table 4: ADL model upgraded

Sample(adjusted): 2000:11 2009:12				
Included observations: 110 after adjusting endpoints				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
RDROM(-1)	0.070049	0.015057	4.650	0.0000
RDROM(-10)	0.031875	0.011315	2.817104	0.0058
RIROM(-1)	-0.108771	0.064922	-1.675403	0.0968
RIROM(-5)	0.030073	0.052427	0.573620	0.5674
Mean dependent var	1.000000	S.D. dependent var		0.000000
S.E. of regression	0.549332	Akaike info criterion		1.675459
Sum squared resid	31.98718	Schwarz criterion		1.773658
Log likelihood	-88.15025	Durbin-Watson stat		0.058330

Source: Author's calculations based on the statistic data obtained from the Eurostat

We will consider the second model because it has the Akaike value lower than the first model. The ADL model equation can be written as:

$$DRD_t = 0,07 DRD_{t-1} - 0,031 DRD_{t-2} - 0,108DRI_{t-1} + 0,030 DRI_{t-12} + \varepsilon_t$$

Test of coefficients

Further it will be analysed the relevance of the model coefficients.

$$H_0 : \beta_1 = 0$$

$$H_1 : \beta_1 \neq 0$$

The probability of accepting the null hypothesis is $P = 0,0000 < 5 \%$, which means that the null hypothesis is rejected, i.e. we have a significant coefficient. For $\alpha = 5 \%$ the acceptance interval for t_{calc} is $[-1,96; 1,96]$, $t_{calc} = 2,4 \notin [-1,96; 1,96]$, which means that

the null hypothesis is rejected, so the DRD (-1) variable is significant.

$$H_0 : \beta_2 = 0$$

$$H_1 : \beta_2 \neq 0$$

The probability of accepting the null hypothesis is $P = 0,058 > 5 \%$, which means that the null hypothesis is accepted, i.e. we have a nonsignificant coefficient for DRD_{t-2} .

$$H_0 : \alpha_1 = 0$$

$$H_1 : \alpha_1 \neq 0$$

The probability of accepting the null hypothesis is $P = 0,096 > 5 \%$, which means that the null hypothesis is accepted, i.e. we have a nonsignificant coefficient for DRI_{t-1} .

$$H_0 : \alpha_{12} = 0$$

$$H_1 : \alpha_{12} \neq 0$$

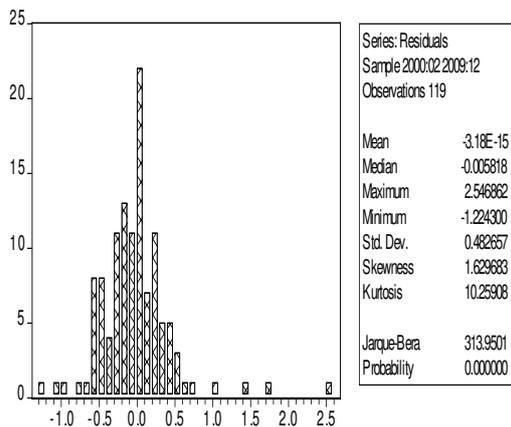

The probability of accepting the null hypothesis is $P = 0,056 > 5 \%$, which means that the null hypothesis is accepted, i.e. we have a nonsignificant coefficient for DRI_{t-12} .

Further, in order to validate the model we will make test on residues.

4. Normality of errors

After applying the Jarque Bera test we can observe that $JB > 0$, and the probability of the acceptance of the test is $P = 0,00000 < 5 \%$, which means that the residues do not follow the normal law.

Figure 2: Normality of errors

Source: Author's calculations based on the statistic data obtained from the Eurostat

Next we shall investigate the heteroscedasticity of the residues. We will apply the test type LM for the heteroscedasticity test ARCH.

Table 5 : ARCH test

ARCH Test			
F-statistic	277.6983	Probability	0.000000
Obs*R-squared	83.23226	Probability	0.000000

Source: Author's calculations based on the statistic data obtained from the Eurostat

The ARCH test is utilised to test the following hypothesis:

H_0 : the residues have the same variance

H_1 : the residues have not the same variance

$M = T * R^2 = 83.23$. The probability is $0.05902 > 5 \%$, which means that the null hypothesis is accepted. Errors have the same variance.

Next we shall present a simple econometric model, taking into account the interest rate as a dependent variable and the inflation rate as explanatory variable.

Table 6 : Econometric simple model

Dependent Variable: RDR0M				
Method: Least Squares				
Date: 04/25/10 Time: 08:50				
Sample(adjusted): 2000:01 2009:11				
Included observations: 119 after adjusting endpoints				
Variabl e	Coeffici ent	Std. Error	t- Statisti c	Prob.
C	1.914417	0.747922	2.559646	0.0118
RIROM	0.996839	0.031600	31.54533	0.0000
R-squared	0.894794	Mean dependent var	20.42378	
Adjusted R-squared	0.893895	S.D. dependent var	15.53220	
S.E. of regression	5.059419	Akaike info criterion	6.097044	
Sum squared resid	2994.934	Schwarz criterion	6.143752	
Log likelihood	-360.7741	F-statistic	995.1076	
Durbin-Watson stat	0.337684	Prob(F-statistic)	0.000000	

Source: Author's calculations based on the statistic data obtained from the Eurostat

The equation of the model can be written as: $RD_t = a_0 + a_1 RI_t + \varepsilon_t$

The equation of the model is the follows as: $RD_t = 1,9144 + 0,99RI + \varepsilon_t$

5. Concluding remarks

The reaction the National Bank of Romania has to the potential inflation shocks should be based on a credible monetary policy model. This model is intended to include previous experience with the decisive factors influencing the inflation rate. The accuracy of such a model is only possible if the economy is not affected by one of the following risks:

- Wage rates growth more than expected, uncorrelated with productivity growth;
- Deviation from the parameters set in the budget execution;
- Large discrepancy between savings and investment

The ascension of Romania in the European Union has brought about changes in the price of consumer goods through the adoption of policies specific to the European community as well as the influences resulting from integration into a common market.

The analysis carried out in this work has shown that inflation remains one of the most important macroeconomic indicators reflecting the performance of an economy and the living standards of the population. Because of the importance that inflation decrease and maintenance at a low level have, anti-inflationary measures should be a core objective of all governments, representing an ultimate an indicator of the government grade of efficiency in a given country.

Although recently there has been undeniable progress, Romania remains the country with the highest levels of inflation among countries in transition. Controlling this major macroeconomic imbalance over recent years proved to be a costly and painful treatment for all socio-economic categories,

who paid the price for a continuous erosion of the purchasing power and had to cope with uncertainty and a decline in living standards.

6. Acknowledgment

The authors wish to thank for the financial support provided from the program co-financed by THE SECTORAL OPERATIONAL PROGRAM FOR HUMAN RESOURCES DEVELOPMENT, Contract POSDRU/CPP107/DMI1.5/S/76841 – "Doctoral studies, a major factor in the development of socio-economic and humanistic studies".

The Implications of the Bologna Process on the Romanian Higher Education System

Militaru Cezar

Pavel Adina

caesarmil@yahoo.com

adyna_pavel@yahoo.com

Abstract

At its inception, the Bologna Process was meant to strengthen the competitiveness and attractiveness of the European higher education and to foster student mobility and employability through the introduction of a system based on undergraduate and postgraduate studies with easily readable programmes and degrees. Quality assurance has played an important role from the outset, too.

However, the various ministerial meetings since 1999 have broadened this agenda and have given greater precision to the tools that have been developed. The concept of social dimension of higher education has been introduced and recognition of qualifications is now clearly perceived as central to the European higher education policies. The Bologna Process in Romania is an opportunity for the higher education systems. In brief, the evolution of the main objectives of the Bologna Process can be seen hereby.

Key words: Bologna process, higher education, knowledge society,

J.E.L. classification: I21, F15

In the context of increased European cooperation in education, European dimension of education gain new valences with the achievement of a "knowledge society": „A Europe of Knowledge is now widely recognized as an irreplaceable factor for social and human growth and as an indispensable component to consolidate and enrich the European citizenship, capable of giving its citizens the necessary competences to face the challenges of the new millennium, together with an awareness of shared values

and belonging to a common social and cultural space" (Bologna Declaration, 19 June 1999).

Before the signing of the Bologna declaration, the Magna Charta Universitatum had been issued at a meeting of university rectors celebrating the 900th anniversary of the University of Bologna – and thus of (Western) European universities – in 1988. One year before the Bologna declaration, education ministers Claude Allegre (France), Jürgen Rüttgers (Germany), Luigi Berlinguer (Italy) and the Baroness Blackstone (UK) signed the Sorbonne declaration in Paris 1998, committing themselves to "harmonizing the architecture of the European Higher Education system".

The Bologna process is the product of a series of meetings of Ministers responsible for higher education at which policy decisions have been taken with the goal to establish a European Higher Education Area by 2010. The process also includes the European Commission as a full member. The Council of Europe and UNESCOEPES, along with a range of stakeholder organizations are also involved as consultative members. There is thus full and active partnership with higher education institutions, represented by the European University Association (EUA) and the European Association of Institutions in Higher Education (EURASHE), students represented by the European Students' Union (ESU), academics represented by Education International (EI) as well as the European Association for Quality Assurance in Higher Education (ENQA) and Business Europe representing employer organisations.

The basic precepts of the Bologna process date back to the Sorbonne Joint Declaration on Harmonisation of the Architecture of the

European Higher Education System, signed on 25 May 1998 by the education ministers of four countries: France, Germany, Italy and the United Kingdom.

The Sorbonne Declaration focused on:

- improving the international transparency of programs and the recognition of qualifications by means of gradual convergence towards a common framework of qualifications and cycles of study;
- facilitating the mobility of students and teachers in the European area and their integration into the European labour market;
- designing a common degree level system for undergraduates (bachelor degree) and graduates (master and doctoral degrees).

The Bologna Declaration on the European Higher Education Area, largely inspired by the Sorbonne Declaration, was signed in June 1999 by ministers responsible for higher education in 29 European countries. This Declaration became the primary document used by the signatory countries to establish the general framework for the modernisation and reform of European higher education. The process of reform came to be called the Bologna process.

The Bologna Declaration of 19 June 1999 has been signed by 30 European countries, including the 15 Member States of the EU (Austria, Belgium, Germany, Denmark, Greece, Spain, Finland, France, Ireland, Italy, Luxembourg, the Netherlands, Portugal, Sweden, the United Kingdom) as well as the 10 countries that joined the EU on 1 May 2004 (Cyprus, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Malta, Poland, Slovakia, Slovenia). Iceland, Norway and the Swiss Confederation are also signatories to the declaration, as are Bulgaria and Romania, who became members of the EU on 1 January 2007. Kazakhstan joined the Bologna process in March 2010. Today, 47 countries participate in the Bologna process after having fulfilled the accession conditions and procedures.

International institutions such as the European Commission, the Council of Europe and associations of universities, rectors and European students also participated in drafting the Declaration.

The Bologna Declaration also formulates the objective of increasing the international competitiveness of the European system of higher education and stresses the need to ensure that this system attracts significant attention from around the world.

In the Bologna Declaration, ministers affirmed their intention to:

- adopt a system of easily readable and comparable degrees;
- implement a system based essentially on two main cycles;
- establish a system of credits (such as ECTS);
- support the mobility of students, teachers, researchers and administrative staff;
- promote European cooperation in quality assurance;
- promote the European dimensions in higher education (in terms of curricular development and inter-institutional cooperation).

The Bologna process is in line with the objectives of *Education and Training 2020* and *Europe 2020*.

Since 1998, seven ministerial conferences devoted to mapping out the Bologna process have been held in different European cities, namely Paris (at the Sorbonne University), Bologna, Prague, Berlin, Bergen, London Leuven/Louvain-la-Neuve and Budapest-Vienna.

In **May 2001**, the meeting in **Prague** was convened to assess the progress accomplished to date (particularly as indicated in the respective national reports) and identify the main priorities that should drive the Bologna process in the years ahead. 33 countries participated, with Croatia, Cyprus and Turkey accepted as new members. Liechtenstein was also included, having committed to the process between the Bologna and Prague conferences, and the European Commission also became a member.

The education ministers also decided to establish a Bologna Follow-up Group (BFUG) responsible for the continuing development of the process. The BFUG is composed of representatives of all signatory countries and the European Commission and is chaired by the rotating EU Presidency. The Council of Europe, the European University Association (EUA), the European

Association of Institutions in Higher Education (EURASHE) and the National Unions of Students in Europe (ESIB), later renamed the European Students Union (ESU), take part as consultative members in the work of the BFUG.

The Prague Communiqué emphasised three elements of the Bologna process:

- development of lifelong learning;
- involvement of higher education institutions and students;
- promotion of the attractiveness of the European Higher Education Area.

Held in **September 2003**, the **Berlin Conference** was an important stage in the follow up to the Bologna process. With the inclusion of seven new signatory countries (Albania, Andorra, Bosnia and Herzegovina, the former Yugoslav Republic of Macedonia, the Holy See, Montenegro, Russia and Serbia), 40 countries were then involved.

In the Berlin Communiqué, ministers charged the BFUG with preparing detailed reports on the progress and implementation of the intermediate priorities and organising a stocktaking process before the following ministerial conference in 2005. The UNESCO European Centre for Higher Education (UNESCO-CEPES) joined the work of the BFUG as a consultative member.

With the Berlin Communiqué, the Bologna process gained additional momentum by setting certain priorities for the next two years:

- development of quality assurance at institutional, national and European levels;
- implementation of the two-cycle system;
- recognition of degrees and periods of studies, including the provision of the Diploma Supplement automatically and free of charge for all graduates as of 2005;
- elaboration of an overarching framework of qualifications for the European Higher Education Area;
- inclusion of the doctoral level as the third cycle in the process;
- promotion of closer links between the European Higher.

By May 2005, the Bologna process extended to 45 signatory countries with the inclusion of Armenia, Azerbaijan, Georgia, Moldova and Ukraine. The ministers responsible for higher education met in

Bergen to discuss the mid-term achievements of the Bologna process. The commissioned Stocktaking Report was submitted by the BFUG for the occasion. **The Bergen Conference** also marked the adoption of the Standards and Guidelines for Quality Assurance in the European Higher Education Area (ESG) and the Framework of Qualifications for the European Higher Education Area (FQ-EHEA).

The European Association for Quality Assurance in Higher Education (ENQA), the Education International Pan-European Structure and the Union of Industrial and Employers' Confederations of Europe (UNICE, later to become Business Europe) joined the BFUG as consultative members.

In the Bergen Communiqué, ministers enlarged their priorities for 2007, which also include:

- reinforcing the social dimension and removing obstacles to mobility;
- implementing the standards and guidelines for quality assurance as proposed in the ENQA report;
- developing national frameworks of qualifications in compatibility with the adopted Framework of Qualifications for the European Higher Education Area;
- creating opportunities for flexible learning paths in higher education, including procedures for recognition of prior learning.

The London Ministerial meeting, held on **17 and 18 May 2007**, provided a landmark in establishing the first legal body to be created through the Bologna process – the European Quality Assurance Register (EQAR). This is to become a register of quality assurance agencies that comply substantially with the standards and guidelines for quality assurance in the European Higher Education Area (ESG) on the basis of external evaluation.

London also saw developments in two key areas – the social dimension, where Ministers agreed to develop national strategy and action plans, and the global dimension, where Ministers agreed on a strategy to develop the global dimension of European higher education.

In the London Communiqué, ministers:

- welcomed the creation of the European Quality Assurance Register (EQAR);

- committed to completing national frameworks of qualifications in compatibility with the adopted Framework of qualifications for the European Higher Education Area by 2010;
- promised to report on national action to remove obstacles to the mobility of students and staff;
- pledged to implement and report on national strategies for the social dimension, including action plans and measures to evaluate their effectiveness;
- adopted a strategy for the European Higher Education Area in global setting.

The **Leuven/Louvain-la-Neuve** Ministerial meeting, held on **28 and 29 April 2009**, took stock of the achievements of the Bologna process and laid out the priorities for the European Higher Education Area for the next decade.

Looking back to ten years of European higher education reform, Ministers emphasized the achievements of the Bologna process, highlighting in particular the increased compatibility and comparability of European education systems through the implementation of structural changes and the use of ECTS and the Diploma Supplement. Acknowledging that the European Higher Education

Area is not yet a reality, the Leuven/Louvain-la-Neuve Communiqué also established the priorities for the decade until 2020.

The organisational structures of the Bologna process were endorsed as being fit for purpose, and ministers decided that in the future the Bologna process would be co-chaired by the country holding the EU presidency and a non-EU country.

In the Leuven/Louvain-la-Neuve Communiqué, ministers agreed that:

- each country should set measurable targets for widening overall participation and increasing the participation of under-represented social groups in higher education by the end of the next decade;
- by 2020 at least 20 % of those graduating in the EHEA should have had a study or training period abroad;
- lifelong learning and employability are important missions of higher education;

- student-centred learning should be the goal of ongoing curriculum reform.

The **Budapest-Vienna Declaration of 12 March 2010** on the European Higher education area marked the end of the first decade of the Bologna Process and officially launched the European Higher Education Area (EHEA), as envisaged in the Bologna Declaration of 1999. With this declaration, the ministers:

➤ underlined the specific nature of the Bologna Process, i.e. a unique partnership between public authorities, higher education institutions, students and staff, together with employers, quality assurance agencies, international organisations and European institutions;

- stressed that the Bologna Process and the resulting European Higher Education Area, being unprecedented examples of regional, cross-border cooperation in higher education, had raised considerable interest in other parts of the world and made European higher education more visible on the global map. The ministers also declared to look forward to intensifying their policy dialogue and cooperation with partners across the world;
- acknowledged the findings of various reports, which indicate that some of the Bologna action lines had been implemented to varying degrees and that recent protests in some countries showed the Bologna aims and reforms had not been properly implemented and explained. The ministers promised to listen to the critical voices raised among staff and students;
- reiterated their commitment to the full and proper implementation of the agreed objectives and the agenda for the next decade set by the Leuven/ Louvain-la-Neuve Communiqué.

The Bologna Declaration is a voluntary undertaking by each signatory country to reform its own education system; this reform is not imposed on the national governments or universities. As for Member States of the European Union (EU), Article 165 of the Treaty on the Functioning of the European Union states that the Union "*shall contribute to the development of quality education by encouraging cooperation between Member*

States and, if necessary, by supporting and supplementing their action".

Contrary to popular belief, the Bologna Process was not based on a European Union initiative. It constitutes an intergovernmental agreement, between both EU and non-EU countries. Therefore, it does not have the status of EU legislation. Also, as the Bologna Declaration is not a treaty or convention, there are no legal obligations for the signatory states. The (extent of) participation and cooperation is completely voluntary. This can be regarded both as a positive and as a negative thing. On the one hand, one could say that this "bottom-up" voluntary convergence does justice to the sovereignty of the states, which is especially important in the field of education. On the other hand, the avoidance of EU structures can be regretted for democratic reasons. The Bologna Declaration can be said to be a deal done behind closed doors by governmental officials without any participation of the European Parliament. Also the involvement of the national parliaments has been limited.

Most countries do not currently fit the framework – instead they have their own time-honoured systems. The Process will have many knock-on effects such as bilateral agreements between countries and institutions which recognise each others' degrees. However, the Process is now moving away from a strict convergence in terms of time spent on qualifications, towards a competency-based system. The system will have an undergraduate and postgraduate division, with the bachelor degree in the former and the master and doctoral in the latter.

Romania is an Eastern European country that, after ten years from the collapse of the communism, in spite of some difficulties, also noticeable in other countries from the region, in spite of the synopes and stagnation periods characterising the transitional process that it is passing through, it presents itself as a democracy with solid institutions and a market economy in an on-going process of consolidation.

Romania made major steps towards the European Higher Education Area by reorganizing the entire education system. The new structure was approved by the National Rectors Council in November 2003 releasing

on 5 November 2003 the Declaration of the National Higher Education Conference.

The new legislation of June 2004 (No. 288/2004) stipulates the reorganization of the university studies, in accordance with Bologna declaration and Prague 2001, Berlin 2003 ministerial meetings, in three main cycles: Bachelor, Master and Doctoral. The implementation began with the 2005-2006 generation of students and consists in a short-term higher education (180 ECTS) after which the student receives a diploma or a long-term higher education (240-360 ECTS) after which one can receive an engineer diploma (300 ECTS), architect diploma (360 ECTS) or bachelor in other fields (240-360 ECTS). The first stage of the higher education can be followed by an advanced studies program (60-90 ECTS) in the same field as the diploma obtained after a long-term higher education, giving the student a diploma for advanced studies. Master studies last for 2 to 4 semesters (60-120 ECTS). The 3rd cycle is the doctoral degree (no ECTS range given).

In most cases, these cycles (Bachelor, Master and Doctoral) will take 3, 2, and 3 years respectively to complete. The actual naming of the degrees may vary from country to country.

One academic year corresponds to 60 ECTS-credits that are equivalent to 1,500-1,800 hours of study. The new model comes closer to the North American and Japanese systems. It gives greater weight to practical training and to intensive research projects. The way credits are measured reflects how hard a student has worked. The new evaluation methods reflect not only a student's performance on exams, but also his or her lab experiments, presentations, hours spent on study, innovation capacities and so forth.

After 1990, Romania has started many projects supervised by countries from the European Union and also in collaboration with the US, obtaining some projects and bursaries. The main goal of the country has been to adapt to the European Higher Education System. Especially notable has been the effort for having their academic diplomas recognized by other European countries and for developing international programs such as: Tempus, CEEPUS, Socrates/Erasmus, Copernicus, Monet, and

eLearn. With the US, Fulbright programs have been developed.

One can appreciate that, in the last decade many progresses have been achieved in Romania in the field of reducing the adults' illiteracy. The recognition of illiteracy as a complex phenomenon was determined by multiple causes associated with the economical difficulties and social and cultural constraints that conducted to the initiation of specific forms of training and more comprehensive programs focused not only on the achievement of the basic competencies, but also on the solution of the problems related to the economic and local community problems.

With the Leuven/Louvain-la-Neuve Communiqué the Ministers decided that in the future, the Bologna Process would be co-chaired by the country holding the EU presidency and a non-EU country. The chairing arrangement up to the next Ministerial Meeting in 2012 is:

Table 1. BFUG chairs and Co-chair

Semester	EU-Presidency	Chair from non-EU country	Vice-chair
1 July – 31 December 2010	Belgium	Albania	R O M A N I A
1 January - 30 June 2011	Hungary	Andorra	
1 July – 31 December 2011	Poland	Armenia	
1 January - 30 June 2012	Denmark	Azerbaijan	

Source:www.ehea.info

Starting from July 1st, 2010, the Secretariat of the Bologna Follow-up Group is held by Romania, as organiser of the 2012 Ministerial Conference.

The team representing the Romanian Bologna Secretariat includes seven permanent members and three consultative experts (from the side of the Romanian Ministry for Education, Research, Youth and Sports), who are committed to the mission of ensuring professional and neutral support to further the consolidation of the European Higher Education Area (EHEA), under the exclusive authority of the Bologna Follow-Up Group (BFUG) and its Co-Chairs and Vice-Chair.

The next milestone of the European Higher Education Area will be marked with the upcoming Ministerial Conference, which will take place in **Bucharest**, Romania, on **26-27 April 2012**. The Third Bologna Policy Forum will be also connected to this ministerial meeting, thus enabling further debate on the progress of the European Higher Education Area on the global scale.

Various steps towards the implementation of the Bologna declaration have been taken by individual universities. However, only in 2004, once a specific legislation has passed, national-wide measures towards the implementation of Bologna were taken by all the Higher Education Institutions in Romania.

As a result of Romania's effort to adapt its national educational framework to the European Union, the educational system has attained many improvements; however, there is still a long way to go.

Economic Crisis - Implications and Perspective on the European Economy

Militaru Mădălina
„Spiru Haret” University
madalina.militaru@yahoo.com

Abstract

The current global economic crisis involves shocks felt far and wide in Europe, without precedent in post-war economic history. This crisis was preceded by long period of rapid growth, availability of liquidity. The acute liquidity shortage pushed system to collapse. The financial crisis has had a pervasive impact on the real economy of the EU, and this in turn led to adverse feedback effects on loan books, asset valuations and credit supply. Not only actual economic activity has been affected by the crisis, also potential output is likely to have been affected, and this has major implications for the longer-term growth outlook and the fiscal situation.

Key words: liquidity shortage, systemic collapse, structural unemployment, global crisis

J.E.L. classification: F02

1. Introduction

The financial crisis has had a pervasive impact on the real economy of the EU, and this in turn led to adverse feedback effects on loan books, asset valuations and credit supply. But some EU countries have been more vulnerable than others, reflecting inter alia differences in current account positions, exposure to real estate bubbles or the presence of a large financial centre.

2. Implication of the Economic Crisis on the European Economy

The current global economic crisis has important consequences in terms of relevance of economic theories. This crisis involves giving the paradigms of modernity, obsessed

with immediately return, the immediate financial gain and requires a review of economic theories and processes (Dinu, 2010, p. 267).

The European economy has been affected by the financial crisis in the US, with Germany and Iceland being the hardest hit. This economy produces almost \$13 trillion per year, which is about the size as the US economy. Per capita, gain is much smaller, as it is made up of 710 million people (in the 48 European states) versus almost exactly half of that in the US.

The main currency in Europe is Euro, although some smaller nations still use their own currencies, such as the UK, Denmark, Norway, Poland, and others. Therefore, any financial shocks that affect Euro will have immediate and identical effects on these countries' currencies, although most of them have their own stock exchanges.

The shocks have been felt far and wide in Europe. Germany was hit particularly hard when a proposed bailout there for Hype Real Estate fell through resulting in a colossal bankruptcy (400 billion Euro). This news led to Chancellor Angela Merkel putting a guarantee on all German savings, only one day after criticizing Ireland for enacting similar measures. Greece and Ireland have been forced to nationalize all of their banks, while the Dutch bank Fortis has been nationalized, as has Icelandic bank Landsbanki. In fact, Iceland's banking industry is on the verge of collapse.

Iceland's Prime Minister Geir Haarde, even went so far as to say that the country's citizens will experience a decline in their standard of living. He added that the small nation will have to know rely more on its traditional industry instead of relying too much on financial services.

Island nation of about 320,000 euro enjoys the 4th highest GDP per capita in the world. The US and UK are 11th and 12th.

The European Central bank actually raised rates in July 2008. This reduced demand for money, sucking it out of the system – exactly what Europe didn't need. The European Central Bank could have learned a thing or two from the US Fed's mistakes in the Great Depression. It did the same thing, thinking that would work, but the then-young Fed was inexperienced and had never faced such a crisis before. And so the Great Depression began.

At least the UK and Spain have taken proactive measures. \$87.8 billion of taxpayer money is expected to be injected into some of Britain's largest institutions such as Barclays, the Royal Bank of Scotland, and Lloyds TSB.

The Spanish housing market has recently tanked, affecting the banking industry – Spain has had its own subprime crisis over the past few years.

The financial crisis that hit the global economy since the summer of 2007 is without precedent in post-war economic history. Although its size and extent are exceptional, the crisis has many features in common with similar financial-stress driven recession episodes in the past. The crisis was preceded by long period of rapid credit growth, low risk premiums, abundant availability of liquidity, strong leveraging, soaring asset prices and the development of bubbles in the real estate sector. Overstretched leveraging positions rendered financial institutions extremely vulnerable to corrections in asset markets. Such episodes have happened before (e.g. Japan and the Nordic countries in the early 1990s, the Asian crisis in the late-1990s). However, this time is different, with the crisis being global akin to the events that triggered the Great Depression of the 1930s.

In its early stages, the crisis manifested itself as an acute liquidity shortage among financial institutions as they experienced ever stiffer market conditions for rolling over their (typically shortterm) debt. In this phase, concerns over the solvency of financial institutions were increasing, but a systemic collapse was deemed unlikely. This perception dramatically changed when a major US investment bank (Lehman Brothers) defaulted in September 2008. Confidence collapsed, investors massively liquidated their positions and stock markets went into a tailspin. From then onward, the

EU economy entered the steepest downturn on record since the 1930s. The transmission of financial distress to the real economy evolved at record speed, with credit restraint and sagging confidence hitting business investment and household demand, notably for consumer durables and housing. The cross-border transmission was also extremely rapid, due to the tight connections within the financial system itself and also the strongly integrated supply chains in global product markets. EU real GDP is projected to shrink by some 4% in 2009, the sharpest contraction in its history. And although signs of an incipient recovery abound, this is expected to be rather sluggish as demand will remain depressed due to deleveraging across the economy as well as painful adjustments in the industrial structure. Unless policies change considerably, potential output growth will suffer, as parts of the capital stock are obsolete and increased risk aversion will weigh on capital formation and R&D.

Despite of the prompt response given by the EU, the legacy of the crisis is far reaching. It has resulted in a large loss in economic activity, a substantial increase in unemployment, a steep fall in productivity, and badly weakened public finances. By the end of 2012, eleven Member States are expected still to remain at output levels below those preceding the crisis. In 2010, EU gross government debt rose, on aggregate, to around 85% of GDP in the euro area and to 80% EU-wide. The budgetary impact of the crisis will compound the effect of demographic change, which will add a fiscal burden of some 4.5% of GDP in the long term. Structural weaknesses that were not tackled before the crisis have become more apparent and urgent.

The crisis has taken a heavy toll on Europe's societies, despite the cushioning provided by welfare systems. The rise of unemployment is a central problem. On aggregate, 9.6% of the working population is unemployed. In some countries, youth unemployment can be as high as 40%. Around 80 million people are estimated to live below the poverty line in Europe.

The economic crisis was global, but its impact is very different across the world. While unemployment and public deficits increased more sharply in the US than in the EU, the crisis has aggravated the labour

productivity gap between the EU and the US. Price and cost competitiveness remain problematic. Emerging economies are returning to growth at a faster pace although some of them also face major economic challenges. Therefore, the EU needs to use this crisis to address decisively the issue of its global competitiveness.

The economic recovery in the EU, while still fragile and uneven across Member States, is proceeding at a somewhat faster pace than anticipated in the beginning of 2010. Real GDP has surprised on the upside so far this year and particularly in the second quarter, when it picked up by an exceptional 1% (quarter-on-quarter) in both the EU and the euro area. This strong performance stemmed in large part from the ongoing export-driven industrial rebound, in line with the continued strong dynamics of global growth and trade in the first half of the year, most notably in emerging markets.

Encouragingly, a revival in domestic demand, including private consumption and investment, also became evident, particularly in Germany. The spillover of some of this momentum into the second half of the year implies a significant upward revision to annual growth in 2010 compared to the spring forecast.

Looking ahead, the pace of GDP growth in the EU is set to moderate into mid-2011, as the global economy goes through a temporary soft patch, dampening EU export growth. The pace of economic activity eased already in the third quarter, reflecting also the fading of the temporary factors that kick-started the recovery, such as the exceptional stimulus measures and the positive impulse from inventory adjustments that were particularly important in shaping short-run dynamics in the EU and globally in recent quarters.

Another factor that is set to weigh on growth prospects in the short to medium term is the fiscal consolidation phase that many Member States are embarking on to put the fiscal situation onto a sustainable footing.

On the side of financial markets, conditions in several segments have recovered somewhat from the acute tensions experienced last May. In particular, following decisive policy action, including the creation of the European Financial Stabilisation Mechanism and the European Financial Stability Facility, and continued support provided by the monetary

policy authorities stress in sovereign-bond markets has generally eased, though some tensions have reappeared lately. For the banking sector, the publication of EU-wide stress tests showed that the system as a whole is resilient, despite some pockets of vulnerability. Moreover, lending activity to the private sector appears to have turned positive in line with past patterns. As the economic recovery gains firmer ground and concerns about fiscal sustainability are addressed, financial-market conditions should continue to gradually improve and provide support to the recovery.

Notwithstanding the strong performance earlier this year, the EU recovery so far is more muted than the average of previous upturns. This is in line with the pattern that has in the past characterised recoveries following financial crises. As argued since last autumn, the EU faces significant legacy headwinds that are set to restrain domestic demand while the economy transits to a new steady state in the coming years. These include the downsizing of construction sectors, which is still ongoing in a number of Member States; the increase in unemployment, which following financial crises tends to be accompanied by higher structural unemployment; the surge in government deficits and debt, which, as seen recently, can threaten overall financial stability; and the adverse impact of the financial crisis on potential output, which is estimated to remain well below pre-crisis levels over the forecast horizon. The two thematic chapters in this autumn forecast document provide a timely treatment of the latter two issues, with an assessment of the likely impact of fiscal consolidation on economic growth and an examination of how to restore the EU's growth potential. In keeping with the renewed emphasis on these two issues (e.g. via the Europe 2020 strategy), the chapters also consider how fiscal adjustment and structural reforms can be used to underpin the sustainability of public finances and spur a more dynamic EU economy beyond the forecast horizon.

In terms of demand components, a broadening out of the recovery appears to be taking hold somewhat earlier than envisaged in the spring. The ongoing strength of export growth has brought forward the rebound of equipment investment, which is set to return

to positive growth this year. The brighter prospects for equipment investment also reflect improved corporate profits and higher capacity utilisation rates. As for private consumption, the gradual strengthening has also been advanced, with a modest pick-up envisaged for this year. Further ahead, slowly improving labour markets, moderate income growth, subdued inflation and lower saving rates should underpin the gradual recovery of private consumption. However, the still ongoing deleveraging process in the corporate and household sectors, heightened risk aversion and the impact of fiscal consolidation are set to weigh on capital and consumer spending in the short term.

With private domestic demand gradually strengthening, the recovery is set to become increasingly self-sustaining over the forecast horizon. Overall, EU GDP growth is expected to remain rather subdued over the next three quarters, and to regain ground from the second half of 2011, when external demand growth also picks-up, to reach a pace of some ½% quarter-on-quarter in 2012. Taking into account the significant upward revision to this year's growth and the above mentioned developments, annual GDP growth should ease somewhat next year, from about 1¾% in 2010 in both the EU and the euro area to about 1½% in the euro area and more marginally in the EU, before recovering to some 2% in 2012. This implies that the EU economy starts this year to slowly close the sizeable output gap that opened up during the recession.

The aggregate picture masks marked differences in developments across Member States. Some countries, in particular Germany, but also some smaller export-oriented economies have registered a solid rebound in activity, while others, notably some peripheral countries are lagging behind. Factors explaining the divergences include trade orientation, the product mix of exportables, degree of openness, exposure to the financial-sector disturbances and the existence of sizeable internal and/or external imbalances. Looking forward, the expectation remains for a differentiated pace of recovery within the EU, reflecting the challenges individual economies face and the policies they pursue. Lingering concerns about fiscal sustainability, especially in some euro-area Member States that remain under

intense market scrutiny and differences in competitiveness positions appear among the most important challenges in this regard.

Among the largest economies, the upturn is set to be notably strong in Germany, where economic activity is expected to expand by 3.7% this year, more than double that of the euro area. Meanwhile France is just below the area average, Italy ½ pp. lower, and Spain is projected to remain in recession. By Poland, the only EU economy to have escaped a recession last year, while the recovery in the United Kingdom is expected to match only the moderate EU average. Among the smaller economies, the rebound is particularly pronounced for Slovakia (4.1%) and Sweden (4.8%), the latter two posting the highest growth rates in the EU. In contrast, GDP is projected to contract in Greece, Latvia, Romania, and mildly in Bulgaria and Ireland. By 2011, all EU countries, with the exception of Greece and Portugal, are expected to be out of recession. With the strong momentum in Germany pulling other countries, and a general gradual strengthening of domestic demand, GDP growth will tend to firm up in the course of 2011 and 2012 for most Member States.

Labour-market conditions have started to stabilise in recent months. The second quarter of 2010 saw job losses come to an end in the EU, while employment remained stable in the euro area (at 0% q-o-q). Similarly, the unemployment rate has more or less held steady since the spring, at 9.6% in the EU and at around 10% in the euro area. The situation is, however, highly differentiated across countries, with the rate of unemployment ranging from 4-5% in the Netherlands and Austria to some 17-20% in Spain and the Baltics.

Looking ahead and taking into account the usual lag between output and employment growth, the outlook is for a gradual improvement in labour markets over the forecast horizon. Employment is now projected to contract by around ½% in the EU and ¾% in the euro area in 2010, some ¼ pp. less than envisaged in the spring, with modest growth expected thereafter in both regions. The outlook for unemployment is brighter than in the spring, also owing to the resilience shown in some Member States, with declines of some ½ pp. expected over the forecast horizon in both regions. However, despite

brightening since the spring, the outlook remains for a rather jobless recovery and (potentially persistent) high unemployment ahead at the aggregate level.

Consumer-price inflation has been on a moderate upward path so far this year, on the back of upward food and energy base effects, increasing global commodity prices and firming core inflation. Sizeable slack in the economy is nevertheless expected to keep both wage growth and inflation in check, partly offsetting expected increases in energy and commodity prices. HICP inflation is projected to average 2% in the EU both this year and next, before easing to about 1¾% in 2012, and in the euro area to rise from 1½% this year to 1¾% in 2011-12.

After having been severely hit by the crisis, albeit to different degrees across countries, public finances are starting to adjust. About half of EU Member States are expected to post lower general government deficits this year than in 2009. On account of stronger growth, the end of the temporary stimulus measures and the additional consolidation efforts announced since the spring, the general government deficit in the EU (excluding Ireland where a one-off operation led to a deficit of some 32%) is expected to fall from about 6½% of

GDP this year to around 5% in 2011 and 4¼% in 2012, with a broadly similar pattern but at a somewhat lower level for the euro area. The adjustment seems to be mainly expenditure-based in both regions.

The debt ratio, in contrast, remains on an increasing path over the forecast horizon, reaching some 83% of GDP in the EU and 88% in the euro area by 2012. If not corrected in the years to come, the current trends in public debt may jeopardise long-term fiscal sustainability given the combination of sustained large deficits, low(er) potential growth than in the past and, in the not too distant future, unfavourable demographic developments.

Amid continued high uncertainty, the present outlook is faced with elevated risks, which go in both directions and appear to remain broadly balanced.

As regards economic activity, the rebalancing of EU GDP growth towards domestic demand could prove stronger than assumed in the forecast with, for instance, the labour market surprising positively.

Similarly, spillovers from the strong momentum in Germany to other Member States could materialise to a larger extent than currently expected. Moreover, policy measures to redress the fiscal situation could prove more effective than presently foreseen in dissipating market concerns (in both the EU and abroad) and thus further raising confidence among businesses and consumers. In contrast, a more pronounced slowdown in the global economy than included in the baseline is a risk to EU export growth. Related to this are risks from tensions in exchange rates and rekindled protectionist impulses. The fragility of financial markets, particularly of some sovereign-bond segments, remains a source of concern, with damaging negative feedback loops still possible. Finally, fiscal consolidation, given uncertainty on the timing of measures, may weigh more on domestic demand more than currently envisaged.

Turning to inflation, the recent rebound in oil and other commodity prices as well as increases in indirect taxes and administered prices constitute upside risks to the current projection. At the same time, the remaining slack in the economy, weak labour-market conditions and well-anchored inflation expectations are likely to contain inflationary pressures in the near term.

The crisis could have a lasting effect on potential growth. Medium term potential growth for Europe is projected to remain low and estimated at around 1.5% up to 2020 if no structural action is taken namely to resolve the labour productivity gap with our main competitors.

Given its cyclical nature, recovery alone cannot provide the impetus for leading Europe back to the pre-crisis economic situation and absorb the deficit accumulated.

To avoid stagnation, unsustainable debt trends, accumulated imbalances and ensure its competitiveness, Europe needs to accelerate the consolidation of its public finances, the reform of its financial sector and to frontload structural reforms now.

That is why the European Council adopted the Europe 2020 strategy with ambitious targets for a new growth path (raising the employment rate, raising the investment levels in R&D, meeting the climate change and energy objectives, improving tertiary or equivalent education levels and reducing

early-school leaving, promoting social inclusion through the reduction of poverty). The preliminary indications of Member States on their national targets in the five areas agreed under the Europe 2020 strategy clearly show the road that the EU has to travel to deliver its own ambitions.

If fully implemented, this strategy will help the EU come out stronger from the crisis and turn the EU into a smart, sustainable and inclusive economy delivering high levels of employment, productivity, competitiveness and social cohesion. This will deliver the competitive social market economy of the twenty first century, boosting confidence of market actors, companies and citizens alike.

In this context, the EU has also decided to change its economic governance. January 2011 launches the first European Semester of ex-ante policy co-ordination starting with this Annual Growth Survey which is anchored in the Europe 2020 strategy.

This Annual Growth Survey brings together the different actions which are essential to strengthen the recovery in the short-term, to keep pace with our main competitors and prepare the EU to move towards its Europe 2020 objectives. Given the urgency, the Commission has chosen to present 10 priority actions. The Commission will continue its work on a broad range of other policy areas, including trade and a host of internal policies. These are not developed here. In this Communication the Commission focuses on an integrated approach to recovery concentrating on key measures in the context of Europe 2020 and encompassing three main areas:

- The need for rigorous fiscal consolidation for enhancing macroeconomic stability;
- Labour market reforms for higher employment;
- And growth enhancing measures.

Fiscal consolidation, structural reforms and growth enhancing measures are necessary ingredients for the comprehensive response the euro area must give to the crisis.

But such a comprehensive response will have to include other elements, e.g. the review of the European Financial Stability Facility (EFSF). As regards the latter the Commission considers that the effective financing capacity of the EFSF must be reinforced and the scope of its activity widened. This Annual Growth Survey also

constitutes a contribution to the comprehensive response of the euro area to the sovereign debt crisis.

Moreover, progress in establishing a permanent mechanism for resolving sovereign crises is needed to provide certainty and stability in markets. The new European Stability Mechanism should complement in 2013 the new framework for reinforced economic governance, aiming at an effective and rigorous economic surveillance, including reviewing the effectiveness of current financial backstops.

3. Conclusions

This paper out how the crisis has demonstrated the inadequacies of the economics profession when it comes to predicting the future. In defence, one can say that this crisis was a once-in-a-lifetime global event, the effects of which were impossible to predict. It is hoped that an understanding of the channels through which events in one part of the world were transmitted elsewhere will help economists build more accurate and meaningful models. This is not a frivolous academic point; policy-makers need to make judgements about the future when deciding current policy. If the crisis leads to future forecasts that are less wildly inaccurate than those in the recent past, it will be a small but important step forward.

Abstract

The protected areas' issues are debated today at all levels, from the local to global. Taking into account the evolution of interest in protected areas, their expansion, came the necessity of implementing a performance management, both in terms of organization of protected areas, as well as regarding the protection and conservation. In the current period, management of protected areas is a complex activity that involves a significant number of people, development of specific legislation and cooperation with other economic sectors, including tourism. From this perspective, modern management requires a holistic vision, leading to an integrated tourism development, ensuring sustainable development activities taking place in the protected areas.

This work was supported by CNCIS – UEFISCDI, project number PNII – IDEI 1811/2008, "Implementation dynamic of the communitarian politics in valorisation through tourism of the Romanian protected areas and the projection of an integrate management architecture of these protected areas".

Key words: protected areas, integrate management, sustainable development, tourism.

J.E.L. classification: Q26, Q 57.

1. Introduction

The concept of integrated development started from the need for economic growth municipalities and regions by adding, over time, new dimensions. Observing the negative impact of environmental pollution has led to the integration of this factor in the development process. The discontent of local communities to the measures promoted by local businesses or local governments and/or central has been taken into consideration and planning their development programs.

In these circumstances it comes to integrated development period, the amount of all factors of influence, on the one hand, and the evolutionary process and customized according to the specific area on the other side.

2. Protected areas' management

Protected areas are the response of modern society for the growing process of deterioration, disappearance of species over-exploitation or the different categories of resources, especially non-renewable impact on quality of life and society perspectives.

Obviously they would not necessarily be needed in a world governed by environmental responsibility and respect for appropriate conduct embodied in the people and institutions in promoting sustainable development.

Protected areas are still represented for many people their conservationist purposes only and are considered true nature of wildlife oasis in a desert of economic development, to be created solely for the

conservation of species that inhabit them. Very little is acknowledged that areas under semi-natural and is in fact the implicit support of life and socio-economic development. Protected areas by the reduced value of their natural and human intervention on their territory are the best examples and models and semi-natural ecological systems.

Also to make the transition from the current development model to a model of sustainable development is necessary to research, knowledge and experience to implement the theories of sustainable development. Thus, both the assessment and monitoring the condition of natural capital and knowledge development can be achieved only in the pilot areas as protected areas.

Conservation of natural capital mainly involves maintaining an acceptable ratio between natural ecosystems and anthropogenic semi-natural, and diversity within each type of ecosystem and ensuring connectivity between these ecosystems. In this matrix spaces, good sized, must be distributed anropizate ecosystems, urban and rural ecosystems, industrial complexes and roads so as not to be exceeded the productive capacity of ecosystems and natural and semi-natural which is the main producer of resources and services necessities of life.

In a world responsible for all these considerations should be implemented and should be integrated into all sectoral policies and strategies (agriculture, transport, industry, tourism). In reality many mistakes occur which require solving these problems, beginning with small steps, within protected areas and that by creating systems and national and international networks of protected areas.

To these issues should be added that even within these oases of ecological balance - protected areas - gaps occur by failure of rules, intensive exploitation of resources, encouraging seemingly harmless activities such as tourism.

From these considerations, on the one hand and taking account of the evolution of interest in protected areas, by expanding the number and surfaces, as well as the number of countries that have established, there was need to develop their management, both terms of the organization, protection and conservation and in terms of techniques used.

The establishment of protected areas and their effective management is so a necessity because:

- they are exponents of the semi-natural ecosystems can be assessed and monitored, expressing their status at some point;
- these are areas where knowledge grows necessary to ensure the transition to a sustainable development model;
- are true outdoor classroom where people can be educated about the role of nature and necessity of sustainable development.

Although in a first phase, the management measures necessary for the conservation values of protected natural areas were limited, they resumed the protection of flora and fauna or geological features of representative, when they had to evolve in order to cope increasing pressures caused by higher development of certain economic sectors (agriculture, transport, industry, tourism). Thus, during the current management of protected areas is a complex activity involving a significant number of people, development of specific legislation and cooperation with other economic sectors.

With reference to the diversity within protected areas, their management is a complex content adapts to each category specificity. If, for example, category I, strict nature reserve, management may be quite simple, involving the prevention of any activity that may cause harm or damage to the other categories it has a more complex involving more than setting targets and methods of achieving them or reporting requirements. Therefore, management of protected areas requires great skill, combining the role of scientists, rangers, social workers (volunteers), teachers, politicians, administrators, economists and diplomats.

Process management of protected areas representing all shares of foresight, organization, coordination, training of staff, volunteers and local communities, as well as monitoring of ecosystem status and actions to achieve specific objectives of the site. This process can not be reduced to one or other of its functions, whereas none of them can define the complexity of management and can not ensure its effectiveness.

3. Integrated development of protected areas

As results from research on motivation in the establishment of protected areas and their objectives, with conservationist approach in their management must be taken into consideration other aspects: first, it is a complex character of valorizing nature reserve of resources exploitation, the many destinations possible and, secondly, that any protected area which is located in a wider area, allowed an environment that develops relationships with more or less intense and of a different nature - economic and socio-cultural, positive and negative.

In this context, management of protected areas should be linked diversity activities inside and outside, you need to address totdată unit and take into account the complexity of the environment which is integrated and the impact it generates. From this perspective, modern management of protected areas requires a holistic vision that takes into account the interdependencies with other components of the natural environment and ensuring social and economic benefits of potentiation of the effects of their operation.

In other words it is applying the principles of integrated development and protected areas. Integrated development in general, be understood as a new higher stage of economic planning, state that takes into account the actual growth and interdependence with the other components of economic and social environment, leading to a complex evolving entity, unit.

The concept of integrated development started from the need for economic growth municipalities and regions by adding, over time, new dimensions. Observing the negative impact of environmental pollution has led to the integration of this factor in the development process. The discontent of local communities to the measures promoted by local businesses or local governments and / or central has been taken into consideration and planning their development programs. In these circumstances it comes to integrated development period, the sum of all factors of influence, on the one hand, and the evolutionary process and customized according to the specific area on the other side.

Institute for Social and Economic Planning in Latin America and the Pacific [6], under the aegis of the United Nations considers the integrated development as a "comprehensive and multidimensional process involving all sectors of human activity, all factors affecting the quality of life and society - economic, environmental, physical / spatial and social ". Integrating all these aspects of development is a necessary element of a successful development strategy. It provides a balance between economic activities that tend to predominate, and relatively limited space and other natural factors, social and cultural factors that are fragile and difficult to fix.

Analyzing the development of integrated strategic perspective, it must contain a number of factors including:

- long-term planning issues;
- an interdisciplinary and multi-sectoral approach;
- involving open and strong political factor;
- strengthening administrative capacity and /or administrative reform;
- broad participation of stakeholders;
- to establish a practical mechanism of interaction between the continuous and relevant stakeholders.

Applying these requirements to the protected areas requires, above all, identifying the typology of activities inside and outside such areas.

No doubt about integrated development of protected areas can speak and global perspective, however, to date economic and socio-cultural activities have benefited from a wider application of this vision. Basically the integrated development of tourism as a specific dominant forms of protected areas is the approach most commonly encountered.

Integrated tourism development concept originally appeared in *"References on integrated tourism planning in the Pacific Islands"* published in 1996 under the United Nations [7]. This concept was resumed later in the paper "Integrated Planning Guide for Sustainable Tourism Development"[7] conducted by the Economic and Social Commission for Asia and the Pacific under the auspices of the United Nations in 1999. In this work, the term integration is closely linked to the concept of planning for sustainable development in Pacific islands. In

this context it is understandable that even benefit from a fully-fledged, integrated tourism is subject to sustainable development.

The European approach is significantly different in the sense that tourism is seen as a solution to rising living standards of local communities in terms of rural development without a direct connection with sustainability (*Project SPRITE - Supporting and Promoting Integrated Tourism in Europe's Lagging Rural region*). *SPRITE project* [8] authors provides a complete integrated definition of tourism is broadly understood as directly related to economic structures, social, cultural, natural and human resources of the region where the search is conducted and they use them at an optimal level. This definition is observed integrated factors with influence on tourism, namely: local resources, activities and local economy and local community participating. In these circumstances, the integrated tourism has the potential to provide consumers with a separate package of products, services and local experiences.

Another view on integrated tourism have had *Cabrel C. and M. Gordon* [9], in the paper "Measuring Integrated Rural Tourism" (2007) considers the integration, as seen in terms of tourism activity, as a holistic model of all the consequences that can occur over an area of interest: environmental, socio-cultural and economic.

Starting from the definition given in the *SPRITE* program, some authors (*Saxena and Ilbery, 2008*) considers tourism as an integrated and comprehensive way of critical thinking on the actors, resources and relationships involved in the tourist industry so fragmented [10].

Based on the approaches listed above and the "*Integrated Planning Guide*" published by the *Economic and Social Commission for Asia and the Pacific* can identify **the main features of integrated tourism development**, namely:

- is based on combining different sets of values and the need to achieve various targets. Integrated tourist development should be seen as a static model which, once established, can be applied in different areas. Due to the complexity of the environment, the success of an integrated development model of a certain

area does not automatically guarantee the same results in other regions. Each town has its unique character given by different combination of natural factors, economic and social. Under these conditions, each location will have other objectives which integrated development must first identify them and to find, then the optimal combination of solutions;

- must meet the needs of interconnectivity and pluralism. To talk of integration within a region that development of the components must be complementary. Different options for local development within the region should be harmonized to ensure a uniform development of the latter;
- the economic environment of increasingly complex, uncertain and ambiguous call is required to promote marketing techniques to create a distinct image in the minds of consumers and loyalty. Currently, negative information spreads through the mass media, throughout the world almost instantly. Terrorist attacks, the emergence of viruses, certain ecological disaster affecting the whole country which occurred in that particular area. The role of marketing-promotion in these situations is to segregate and isolate the area from other destinations in the country, thereby minimizing the negative impact.

In addition to the challenges of reconciling and combining of different interests and needs and their integration into a unified strategic plan which, in turn, can be integrated into economic and social realities of the region, **the concept of integrated tourism development must also meet a new series of challenges**, namely:

- be a solution to the problems of deterioration of the natural environment - in these circumstances, the integrated tourism development must be a partner in environmental protection, biodiversity conservation and restoration;
- to support sustainable development - these relate to the efficient use of environmental resources, respect for socio-cultural authenticity of local communities and the general increase in living standards;

- to avoid the appearance of a pronounced seasonality - a low level of seasonality is a balanced tourism movement to the whole year with favorable implications on employment and use of resources, the emphasis on seasonality is manifested in overcrowding in some periods, use a negative impact on natural resources and anthropogenic climate of life of local people (in peak season) and by reducing the number of employees and revenues (during the season);
 - be appropriate to the specific area and focus more on quality than quantity - suitability for specific area means finding the optimal form of tourism based on local resources, once identified, it is necessary to determine the operators in providing quality services high added value but to be consistent with the needs of tourists, providing quality services, in addition to income growth brought, means a high level of satisfaction to tourists and hence a step back and determine their future;
 - to encourage cooperation between the public and private - in the sense of integrated tourism development, cooperation is key to successful action to increase the competitiveness of destinations, based on the principle of "where are many power increases. Public-private partnership can be manifested in several ways within the local community: development of a slope, building a skating rink or amusement park, events, fairs, events and traditional folk art. This partnership is manifest in other areas, such as identifying land to be used in economic activity, laying down rules on the status of construction, local taxes;
 - create a unique identity of the destination - this is an important component of integrated tourism development activity. Any marketing activity promoting the long term has among its objectives to create a unique identity of the product or service, this unique identity is one aspect that distinguishes the other competing tourist destination and increase the tourist traffic, identification of a destination that is different the other is the first step in this process extremely important;
 - propensity to combine operators profit for other purposes beneficial to the local community - businesses need to understand the relationship between them and the local community first, workforce comes from the local community, secondly, the resources area, customs and traditions are what attract tourists to that destination, getting involved in social responsibility, which can take various forms (construction of a playground for children, funding the restoration of a tourist attraction, granting scholarships for further action remediation, etc..) is a long term investment by getting local community support, on the one hand, and resources conservation and protection as a factor of attraction for tourists, on the other hand;
 - to use their creativity and innovation in the integrated development - development of new Internet technologies and communications, construction, machinery, electricity, alternative sources. provides possible new approach to tourism phenomenon, the Internet, for example, has made possible 24 h/24 of tourism promotion through web-sites, and any person connected to the internet can get information about a tourist destination and a few minutes minimal effort, efficient use of the Internet involves techniques to optimize websites, online advertising through various methods, search of business partners and maintain links with them.
- The need for integrated development of tourist areas is mentioned by UNEP (United Nations Environment Programme) which defines **four characteristics of the integration of tourism in sustainable development general policy** [11]:
1. *national strategy* - ensuring that tourism is complemented by a series of objectives of other national economic sectors and local and national development strategies to create a tourist industry based on diversity of natural and human resources, integrated into national and local development plans;
 2. *complementarity and cooperation between the authorities* - to improve management of tourism and ensuring cooperation between the authorities at all levels and jurisdictions to ensure a clear, precise and complementary responsibilities of the latter;

3. *integrated management* - to coordinate the allocation of land and ensuring an adequate legal framework for environmental protection or to ensure an integrated development of the tourism sector;

4. *reconcile the conflict over resources* - involving stakeholders in decisions affecting the area and strengthening the capacity of organizations to implement these decisions.

4. Conclusions

Given those shown on the content, characteristics and meanings of the integrated development of tourism, its interference with sustainable development, on the one hand and, on the other hand, the fact that tourism is an activity strongly represented in the protected areas and / or that the prosperity of local communities embedded these areas or placed in their immediate vicinity can not be left in the background is understood that the integrated management solution for the future management of these areas. Integrated ensure resource protection, an optimal combination of all factors of influence within a territorial unit and a harmonization of stakeholder interests involved. Moreover, such an approach responds to the fundamental objective conservation / protection areas in a broader context of their sustainable development.

Abstract

Intensifying international tourist trips and the pressure that they exert on fragile areas, especially on protected areas, generate a range of issues related to achieving a balance between tourism resources on the one hand and tourism activities on the other, between benefits of tourism for local communities and the negative impact that it could have on the environment. Within this context, the identification of the methods and the indicators for assessing the impact of tourism and the implementation of protected areas management tools have an important role in ensuring sustainable development in these areas.

This work was supported by CNCSIS – UEFISCDI, project number PNII – IDEI 1811/2008, "Implementation dynamic of the communitary politics in valorization through tourism of the Romanian protected areas and the projection of an integrate management architecture of these protected areas".

Key words: tourism, impact, protected areas, indicators

J.E.L. classification: Q26

1. Introduction

Tourism in protected areas was considered for a long period of time „a clean industry”, without negative impacts, worth to be mentioned, on the environment. Presently, this image of tourism in protected areas is perceived differently, the majority of specialists being aware that it also has a negative impact and they act in order to reduce it. In the same time, tourism in

protected areas is capable to contribute in raising awareness regarding the value of nature, thus enhancing public support for environmental protection.

Under these conditions, lately, it was pursued a balanced development of tourism in protected areas, according to standards that ensure the maintenance of ecological balance and avoid overuse of resources, pollution and other negative environmental impact. In this context, it is particularly important to identify the types of impact and, especially, the procedures, the methods and even their assessment indicators.

2. Forms of impact

The approach regarding the impact involves the analysis of the relationship between tourism and tourism resources in protected areas, respectively between the natural and socio-cultural travel as an element of motivation on the one hand, and the tourism activity - synonymous with the transformation of this framework by developing a general and specific infrastructure, through the creation and consumption of tourism products, the presence of tourists in protected areas, on the other. These essential elements of tourism in protected areas determine more than one category of impact - *economic, on the natural environment, social and cultural, on local communities - which may take positive or negative forms*. Thus, the main positive **economic** impact of tourism in protected areas is linked to the creation of production growth, contributions to local budget and business opportunities. It also has the ability to promote social development through job creation, redistribution of income and

improvement of living standards[1]. Revenues from tourism in protected areas can be considered as direct and indirect contributions that are to be maximized [2]. Direct contributions are generated by taxes imposed on the revenues of workers and entrepreneurs in tourism industry and taxes on tourists, such as the airport ones, to enter in protected area etc. Indirect contributions are those resulting from taxes on goods and services provided to tourists. These revenues can be used to improve community facilities, services and general infrastructure of local communities in protected areas. Tourism in protected areas can determine local authorities to stimulate investments in general infrastructure - water supply and sanitation systems, roads, electricity, telephone and public transportation, all contributing to increase the quality of life of residents and the quality of tourism services [3]. Tourism in protected areas, through its content involves a set of *social relations* between tourists and host community population, mainly. These relationships take effect on both the tourists and the locals and may found in consumption, education and training, use of leisure time etc. This process has important social and cultural consequences, positive and negative. The social dimension of the tourists interaction with the host population in protected areas arise from the contact with other moral values and a different behavioral pattern, while the cultural dimension includes a wide variety of events resulting, directly or indirectly, from the tourist activities in protected areas such as: the preservation of traditions, respect and tolerance for other peoples' culture, imitating foreign cultural values, cultural values, national marketing, promotion of national identity, cultural erosion etc..

The socio-cultural impact is defined as the way in which tourism in protected areas contribute to changes in the value system of a community, of the behavior and the morality of individuals, family relations and collective lifestyle, in expressing creativity in traditional ceremonies and organization of the protected area community. It refers to the effects on the host community as a result of direct or indirect association with the tourists [4]. In essence, the social efficiency of

tourism in protected areas is the contribution to this field of activity: useful spending of free time, comfort and entertainment of people, the restoration of work capacity, raising the general level of knowledge and training, satisfaction of spiritual, mental motivation.

In general, the effects of tourism in protected areas are positive, favorable, but, given its complexity, the negative implications are not excluded. Thus, the growing demand of tourists for souvenirs, art, handicrafts and cultural events determined the craftsmen in many protected areas to adapt and develop products closer to the taste of buyers, changing the traditional design [5]. The special interest of tourists on local art can contribute to a sense of pride of artists and their work, such as the preservation of cultural traditions, but at the same time, the merchantability of cultural goods, causing its erosion. However, tourism in protected areas, seen from the perspective of modern man, may be the essential advantage of the globalization process, enabling people to know, to understand those to whom they live close, to discover others' life and culture novelty, to fight together in order to revitalize, to improve the natural and cultural heritage, hoping that it will be transmitted to future generations. Also, knowing and being aware of the possible adverse effects will lead to fair sizing of tourism in protected areas so that changes of any kind can be positive and favorable.

Regarding the impact of tourism in protected areas on the environment, it was demonstrated that the destructive effects are larger. They have different causes, from the large number of visitors and uncontrolled exploitation of resources to the organization of work and it manifests as air, water, soil, noise pollution, disappearance of natural habitats, destruction of local flora and fauna and increasing urban pressure. At the same time, there is the phenomenon of disappearance of biodiversity which has as effects: the threat of food supplies, of recreation and tourism opportunities and of wood resources, medicines and energy, interfering with essential ecological functions - balance of species, soil formation, greenhouse gas absorption, reducing the productivity of ecosystems which are a

constant source of food and services; ecosystem destabilization and weakening their ability to deal with natural disasters - floods, hurricanes, pollution, climate change, stress etc. caused by people. Tourism in protected areas is closely linked to biodiversity and attractions of a rich and varied environmental and may cause loss of biodiversity when the territory and the resources are used excessively and the impact on vegetation, wildlife, mountains, coastal and marine environments and on water resources exceed carrying capacity.

3. Methods and indicators for assessing the impact of tourism in protected areas

Taking into account the typological diversity of the impact and, in particular, his negative component, it is absolutely necessary to design a complex system of monitoring it. Also, the information obtained in the monitoring process must be converted into a set of indicators whose comparative analysis provides arguments and potential solutions for responsible exploitation of protected areas.

Developing and implementing such a plan / system for monitoring the impact of tourism on protected areas involves going through several stages:

- *Planning for monitoring* by setting up a coordinating committee and conduct a meeting with representatives of the host community;
- *Development of the monitoring program* by: identifying impacts and indicators to be monitored; selecting the methods of measurement; identifying the boundaries of acceptable change; developing an operational plan for monitoring;
- *Monitoring set up and its results application*, namely: training the involved personnel, managers and community representatives; performance of monitoring and examination of the resulting data, presentation of monitoring results;
- *Assessing and monitoring progress*, which means the evaluation of the monitoring program.

Regarding *the methods for measuring the impact*, currently exists in the literature and in practice over 50 methodologies that are based on numerous and varied methods and techniques, from scientific disciplines dealing with human impacts on environmental components - natural and social sciences -, or in other areas - management, planning and legislation.

The methods regards different components of the environment or followed issues (identification, description and comparison) using scaling levels, their weight and supports data collection and classification of environmental impact.

Monitoring methods in the programs are selected according to their characteristics, but also by the followed objectives. Also, time and existing logistical resources; financial systems; evaluation criteria; the evaluation team and its composition etc. are other restrictions on choosing working methods and techniques.

Among the most used methods to assess the human impact on the environment there are [6]:

- *Ad-hoc methods*. Are part of the category of simplest ones and are limited, in general, on identifying the event areas of potential impact; they have the disadvantage of the possibility of neglecting some areas or types of impact which methods are used to diminish the value. These methods are used in the early stages of the research field and provide a range of direct and indirect information on environmental issues;
- *Method of control lists*. Simple checklists are issued based on a-priori judgments and the achievement of a ranked list of factors to be considered in the evaluation (Barrow, Westman). They allow the identification of the types of impacts and the assessment of their nature and character (adverse/beneficial, significant/insignificant, short/long etc). The checklists are important because they allow ordering the ideas; they facilitate data collection and information and permit their visualization so that the impact can be traced better. There can be performed simple checklists that describe impacts and give a series of measurements and predictions and more

complex checklists that apply measurement and scaling techniques of impacts.

- *Methods of overlapping thematic maps* have appeared in the '60s and are derived from territorial planning and landscape architecture. Thematic maps allow – by overlapping and comparing - producing a composite image of the places and routes of production impacts. By using GIS and remote sensing techniques, aerial images, satellite data and field research, they provide more numerous, more detailed monitored aspects.
- *Geographic Information Systems (GIS)* regularly and real time update environmental data and help experts in assessing cumulative impacts. With their help it is possible to quantify the cumulative impacts, updating remote sensing data and supporting territorial planning decisions.
- *Matrix methods* (Arts, Barrow, Cooper, Canter, Wood) can be used to identify, to systematic study, to envision and to assess environmental impacts. A simple matrix is a combination of two checklists, one describes the potential of existing impacts on the natural and / or anthropogenic environments (distributed by columns) and the other includes environmental or socio-economic conditions that may be affected by these impacts (distributed lines).
- *Quantitative methods* are based on a series of measurements and standardization of the impacts. Among the commonly used methods can be mentioned the environmental value system (based on value judgments and a comprehensive checklist).
- *Modeling methods* are specific ways to complete the environmental models. There are various types of models (computerized, conceptual, of simulation) that have been applied in ecology, land use change, pollution assessment, socio-economic studies and regional planning.
- *Simulation models* may be useful for management of ongoing activities (e.g. air pollution dispersion models). Modeling is an attempt to simplify reality in order to understand and describe processes and phenomena or to predict. The advantage

of these methods is that there is a "skill" of the models reflecting the dynamic nature of the environment and human activity.

- *Environmental size impact analysis method* (Rojanschi method). This method, called also the method of trustworthiness, is the most common procedural practice in Romania, and is grounded on estimates of environmental quality indices based on a scale of their creditworthiness.

Impact assessment is based on the global quantitative expression of the state of environmental pollution on global pollution index (IPG). This index results from the relation between the surface that represents the ideal state S_i and the actual state S_r of the environment, i.e.:

$$I_{pg} = \frac{S_i}{S_r}, \text{ where:}$$

S_i = surface of ideal state of the environment;
 S_r = surface of actual state of the environment.

The information provided by the application of these methods combined with the experience gained in planning studies of tourism areas (7) enables the design of indicators whose determination and dynamic analysis ensure quantification, event incomplete of the impact dimensions.

The indicators that measure the impact of tourism in protected areas are a necessary tool in designing the sustainable development strategy.

Measuring the impact that tourism has on the environment is difficult due to its complexity (large number and variety of their effects), the quantitative and qualitative aspects involved and, last but not least, the lack of information (8).

However, in the specialized literature various indicators have been identified - from the perspective of sustainable tourism - that provides an opportunity to assess environmental impacts and to identify measures in order to reduce them.

The intensity of use involves the identification of the potential of resource overloading in a natural protected area. For this purpose, an indicator measuring the *tourist density in relation with the surface*

can be used with the following formula:

$$Dt_{\text{in relation with the surface}} = \frac{\text{inoming tourists}}{\text{surface}} = \text{tourists} / \text{km}^2$$

Tourism density (Dt) in relation to the population shows the number of tourists visiting the protected area and provides information on the respective strenuousness, the solutions to be applied so that no environmental conflict appears.

The social impact represents the number of tourists visiting an protected area relative to the population. In this way, we measure the social impact of the presence of tourists in a given area.

$$Dt_{\text{in relation with the pop.}} = \frac{\text{inoming tourists}}{\text{surface}} = \text{tourists} / \text{resident}$$

Determinating this indicator helps avoiding social conflicts and also the orientation of tourism management strategy so that the impact is minimized. When the report is 1 tourist / 1 resident there is an urgent need for reorientation of tourist flows to areas less solicited.

4. Carrying capacity to support - warranty to reduce the negative impact of tourism

Carrying / loading capacity is a tourism planning policy instrument that can provide the framework for the implementation of measures and actions for planning and developing tourism in a certain region, taking into account the particularities of each region. Thus, the setting of limits on space tourism planning or sizing flow of visitors should not be reduced to a single number, such as the visitors who can have access to an area at a time, but must be established for both of maximum and minimum levels, necessary to support the local business community. In terms of content loading capacity, specialized literature (9) identified three fundamental components or dimensions: *a physical and ecological component*, *a socio-demographic* and *a political and economic one*, whose importance varies depending on the particularities of their region of interest, tourism practiced forms and their impact on

the environment.

Regarding *the specifics of the region*, evidenced by the typology of resources, the fragility of ecosystems, the number and demographic structure of population, the development level of economy, we can say that they determine, to a certain extent, the carrying capacity of the pressure exercised by tourist activity. *The practiced forms of tourism*, both determined by the type of the resources and by tourists motivation to travel, both significantly influence the behavior of tourists and the relationships between them and local communities, the development of tourism and the environment. Regarding *the relationship with the environment*, it can be expressed in two ways, both by the constraints generated by the pressure of tourism activity on the environment and by the effects of environmental degradation on tourism, that can significantly influence tourism territory planning and management models, but also the life cycle of tourist destinations.

- *The physical and ecological component* includes fixed and flexible elements of the natural and built environment and also of the infrastructure. Fixed elements refers to the ability of natural ecological systems to withstand the pressures of tourism activity and over which we can not occur, but only to measure in order to establish limits of affordability, and flexible elements are those that involve general and specific tourism infrastructure. The indicators as the acceptable level of air, marine and noise pollution, the intensity of use of transport infrastructure and services, the maximum acceptable level of damage of natural resources, the excessive use of public services related to water supply networks, energy, waste management, the number of tourists per unit area, the number of parking spaces in fragile areas etc. can provide information in determining the load capacity, given the physical and ecological components.
- *The socio-demographic component* refers to important social issues for local communities, directly related to tourist activity (workforce, local cultural identity etc.). In this case, the load capacity is used both for determining the level of tolerance permitted by this population in terms of

tourists, but also to increase the level of visitor satisfaction. Thus, there can be analyzed indicators as the number of tourists who can have access to a tourist area without affecting the identity, the way of life, the local community activities, the types of tourism activities, that do not alter the nature of local culture and traditions, the number of tourists per unit area, number of accommodation to 100 people etc..

- *The political-economic component* refers to the impact of tourism on both the local economy and the competition of tourist activity with other sectors. In this case, the loading capacity evaluation includes aspects related to the level of specialization in tourism, migration of labor from other sectors of the tourism industry, the employment rate compared to other tourism activities etc..

With these requirements as a reference, in the specialized literature several ways of calculating the carrying capacity (C) were crystallized; one of the most known and used determines the maximum number of tourists who may visit a tourist area, at a certain time, so that they can enjoy optimum holiday and also that no conflict with the local population and environment appears.

$$C_o = \frac{Sxk}{N}, \text{ where:}$$

S = area surface

K= correction factor, determined according to the strain of the area, with values ranging between [0; 2]

N= standardized surface for a tourist

The need determinate such indicators occurred because they are the basic level of management information, essential for measures management to be taken in order to monitor the key elements of human-environment relationship, in the context of tourism development in protected areas. (8)

5. Conclusions

Tourism in protected areas can have both positive and negative effects on the natural environment and the local communities, which lead to increased concerns to identify the methods and impact quantifying indicators, as well finding solutions for mitigating / limiting the consequences from unbalancing the biodiversity and the social environment (people). In this context, assessing the impact of tourism in protected areas is extremely difficult, generated by the particularities of each tourist destinations. Nevertheless, using planning tools, the responsible authorities can help mitigate the negative impact that tourism could have. For this it is necessary to introduce studies on the carrying capacity in local and regional development plans and ensuring a favorable institutional framework for such action.

Abstract

The world's main accounting standards setters are currently working with an unprecedented agenda of standards development in an attempt not only to bring International Financial Reporting Standards (IFRS) and US Generally Accepted Accounting Principles (US GAAP) closer together, but also to achieve substantial improvement of these sets of standards. This agenda is likely to have a major impact on the companies that use these standards for their financial reports and the stakeholders that rely on those reports. The ongoing process of converging and reforming the world's accounting standards continues to challenge standards setters and worry stakeholders.

Key words: international standards, global convergence, standard-setting

J.E.L. classification: M41 Accounting

1. Introduction

Starting with 2005, when the European Union required European Listed Companies to use International Financial Reporting Standards (IFRS) for group financial reporting, the global trend has steadily moved towards adoption of IFRS. Today, more than 40 per cent of Global Fortune 500 companies use IFRS and by the end of 2011 a clear majority is likely do the same. The growing acceptance of IFRS brings the vision of a single set of high quality accounting standards closer to reality.

There are two major forces at work in driving towards the achievement of this objective[1]:

- Since 2001 more than 100 countries have moved to a position where they require or permit the use of IFRS, while the remaining major economies are also progressing towards convergence of their national standards with IFRS, or the adoption of IFRS
- The two main standard-setters - the International Accounting Standards Board (IASB) and the U.S. Financial Accounting Standards Board (FASB) - have committed to a joint undertaking to improve IFRS and U.S. GAAP and to bring about their convergence

2. IFRS adoption around the world

The IASB website presents a map [2] of the world indicating those regions which require or permit IFRS, those regions seeking convergence or pursuing adoption of IFRS, with the remaining regions being mainly on the African continent and in South-East Asia. Even with these African and Asian regions there are positive indications emerging that progress is being made towards IFRS.

Three of the countries that are currently seeking convergence with IFRS or pursuing adoption of IFRS are Japan, India and the United States.

In Japan, much work has been carried out on the elimination of major differences and will continue with the objective of eliminating the remaining differences by June 2011. The Japanese Business Accounting Council, a key advisory body to the Japanese Financial Services Agency (JFSA) approved interim proposals to allow certain listed companies early adoption of IFRS from fiscal years ending on or after 31 March 2010 followed by a final decision about the mandatory adoption of IFRSs about 2012.

In India, a plan has been adopted by the government for listed companies to commence implementation of 'notified Indian standards that have been converged with IFRS' on 1 April 2011 with a phased transition period up to 2014 depending on size. There are no adoption plans for non-listed companies and there is a separate 'road-map' for banking and insurance companies which is expected to be published shortly.

3. IASB and FASB efforts to converge

The two leading accounting standards-setting organizations in the world today are the IASB and the FASB. The IASB sets the accounting standards for over 100 countries that have adopted IFRS, while the FASB develops US GAAP, which serves the world's largest capital market. Working closely together, and spurred on by the G-20, these two organizations hope by the end of 2011 to finalize several revised standards that have been "converged" to be as comparable as possible.

Given its stature and significance to global markets the convergence of IFRS and U.S. GAAP is fundamental to achieving the ultimate objective of a single set of high quality accounting standards used globally.

Despite recent adjustments to the timeline for convergence, the FASB and the IASB still hope to finalize a number of important accounting standards by the end of 2011, including standards for financial instruments, revenue recognition, leases, the presentation of other comprehensive income, and fair value measurement. Though the dates by which companies will have to apply these standards are still to be determined, they will ultimately have a significant impact on stakeholders such as companies and investors.

If the standards setters succeed, it will be a major step toward the ultimate goal of creating a single, unified set of accounting standards, developed and managed by one global standards body. The US Securities and Exchange Commission (SEC) will consider the status of the convergence projects when it decides whether or not to adopt IFRS for US-based companies.

Members of the European and North American Audit Committee Leadership Networks have discussed the ongoing

convergence efforts at previous summit meetings, focusing on the progress being made, the emerging implications and the political dynamics that are both driving and impeding change.

With the planned deadline for the convergence projects now a year closer, leading audit chairs are seeking to understand not only the projects' impact and current status, but also the evolving challenges that are shaping these projects and the role that they and their companies can play to make the projects successful. Many audit chairs have been surprised by the magnitude of the efforts under way. 5

Both the FASB and the IASB are devoting considerable resources to the convergence projects, which were initially specified in the Norwalk Agreement of 2002. The intent is still to complete as many projects as possible by 2011, though the precise timetable is subject to change.

The IASB and the FASB have again recently reaffirmed their commitment to the project to converge and improve standards, with plans and targets for completing by June 2011 the major projects under their joint Memorandum of Understanding (MoU) which was originally signed in 2006 and updated in 2008.

In October 2009 the FASB and IASB reviewed the status of joint projects described in the MoU, assessed the timelines and developed strategies to ensure timely completion of projects, including

- Financial instruments
- Consolidation
- Derecognition
- Fair value measurement
- Revenue recognition
- Leases
- Financial instruments with the characteristics of equity
- Financial statement presentation
- Emissions trading schemes
- Insurance contracts
- Joint arrangements
- Financial statement presentation
- Emissions trading schemes

The joint intention is to complete new, converged standards on each of the above areas with the work to be completed by mid-2011. Work is also taking place on developing a new conceptual framework

which will underlie the continuing development of new and improved standards.

Recently, the FASB and the IASB announced that the target completion dates for some projects would be extended into the second half of 2011 and that the number of significant exposure drafts issued in any one quarter would be limited to four.[3]

These convergence projects will present major challenges for companies' information technology systems, internal controls and staff resources. They will also present communication challenges as companies attempt to educate investors and analysts so that they do not misinterpret the numbers produced by the revised standards.

In a letter to the chairmen of the FASB and the IASB, Financial Executives International (FEI) noted that because of these challenges, convergence would require a three-year implementation period.[4]

There are many practical difficulties in achieving the '2011 objective' and it is going to take some very focused attention and determined effort to reconcile and/or eliminate the many differences between the two bodies' standards. A major example of this is in relation to financial instruments with, for example, differences in approach between the two bodies in relation to such matters as measurement and asset impairment.

The advantages of successfully completing these projects on a timely basis are substantial in terms of significant improvements in the quality of financial statements and the calibre of financial reporting in jurisdictions that use IFRS.

To improve the quality and acceptance of the emerging standards, the FASB and IASB are seeking as much input as possible from constituents. Stakeholders have a variety of ways of making their voices heard, including comments on discussion drafts, participation in field studies and one-on-one meetings with members of the standards boards. [5]

The Securities and Exchange Commission (SEC) has solicited comments on a proposed road map to adopt IFRS in the U.S. for all filers. Surveys carried out by Deloitte and others show strong support for adopting a single set of standards but with emphasis that various pillars need to be put in place to achieve that goal.

At its meeting on 24 February 2010, the SEC reiterated its support for a single set of high quality global accounting standards commenting that IFRSs are the set of standards best positioned to be global standards.

The key areas of concern to be addressed by the SEC staff as part of the work plan include sufficient development and application of IFRSs globally - comprehensiveness of IFRSs, auditability and enforceability of IFRSs, and comparability across jurisdictions.

The Commission Statement directs the SEC staff to carry out a work plan prior to an SEC decision on whether to require US issuers to transition to IFRSs. According to the Commission Statement, that decision will be made in 2011 when the IASB/FASB programme for convergence and improvement of standards is due to be completed with potential transition dates likely to commence in 2015/2016.

The SEC's Division of Corporation Finance is responsible for reviewing all company filings, including those of foreign private issuers. A Deloitte publication summarises the comment letters issued to foreign private issuers in respect of their filings as reviewed by the SEC and provides an interesting insight into the issues identified.

By far the largest number of issues raised on a single area were those in relation to financial instruments with fair value disclosures, risk disclosures, hedge effectiveness and related disclosures being the issues of most concern. Other areas which invited more than five comments in letters included presentation of financial statements, share-based payment, revenue recognition and provisions.

It is also noteworthy that the main areas commented on by the SEC are in most cases those which are on the agenda for improvement and convergence by 2011 - this seems more than a coincidence.

As one would expect, many of the comments made are similar in nature to those made by Irish and U.K. equivalent authorities - IAASA and the FRRP. Nonetheless, the summary report is informative and, again, highlights issues which all IFRS-adopting entities may find useful to consider.

4. Involving of all constituents in standard setting

Interesting times will continue with the next two years expected to be almost unprecedented in terms of the volume of IFRS activity.

Despite the significant ramifications of accounting standards for a variety of stakeholders, some of these stakeholders are not always as forthcoming with their views as the standards setters would like. Both the FASB and the IASB are trying to increase the input that they receive from their constituents in the hopes of improving standards' quality and practicality.

In fact, the involvement of all constituents is critical for producing high-quality standards. [6]

The long-term viability of IFRS depends on the development of standards that will not provoke carve-outs or more dramatic defections. Some jurisdictions, including the EU, already use carve-outs – their own versions of certain standards.

Companies have a variety of ways for influencing standards setting. We may discuss several approaches:

- Comment on discussion paper drafts. In addition to commenting on exposure drafts, companies can weigh in earlier by providing feedback on the discussion papers that the boards often release during the process of developing an exposure draft. For example, on 1 July 2010, the FASB and IASB released a staff draft on financial statement presentation, seeking input before publishing a formal exposure draft. [7]
- Participate in field testing. The boards frequently field-test a proposed standard, both before and after an exposure draft is released. Taking part in these studies provides an opportunity to wield influence.
- Initiate one-on-one conversations with members of standards boards. Reaching out to individual board members can be very effective, especially during the comment period.
- Participate in roundtables. The boards hold public roundtable discussions about proposed standards, allowing constituents to debate proposals with board members

and each other. To facilitate participation, the IASB hosts these discussions in a variety of locations across the globe.

- Understand the political complexion of the standards-setting boards. The boards publish dissenting views when they issue a proposal. A divided board offers an opportunity to change a standard, possibly leading to a more protracted process, but a better standard. Exposure drafts contain tentative conclusions that are intended to provoke discussion.

Despite the measurable progress toward convergence, audit committee members in the networks are unhappy with many aspects of the convergence effort and with the state of accounting standards in general. They are frustrated by the pace of progress on convergence, and one US audit chair voiced doubts about the US ever adopting IFRS: "I don't even ask about IFRS anymore." They are also frustrated by the increasing complexity of accounting standards and by the content and quality of specific standards. Networks members elaborated on their expectations of accounting standards and their disappointment with the current situation:

- Transparency. Members highlighted the importance of having standards that allow companies to convey accurately to the investor community how they have performed. Audit chairs decried the fact that financial statements are becoming less and less useful. One member noted, "Most investors don't understand financial statements." Another remarked, "Chairmen's statements now comment on how accounting standards are distorting results."
- Practicality. Members want high-quality standards that are practical to implement and easy for investors to use. One European audit chair remarked, "Our annual report is 500 pages long, which is longer than a Harry Potter book and too heavy to be legally carried by the postal service [in my country]."
- Certainty and stability. Members expressed considerable frustration with the lack of certainty around the convergence process. If it is unclear when standards will actually be completed, or if standards are continually

changing, companies are less likely to take them seriously.

Despite extensive outreach and consultations with stakeholders, the two boards continue to struggle to reconcile differences in how fair value should be applied. At the time of the meeting in Amsterdam, they were still proposing different approaches, and both boards are internally divided on the issue as well. [8]

The resolution of difficult issues such as the more extensive use of fair value is further complicated by disagreement among individual board members. When an exposure draft is issued, there may be a sizeable dissenting vote, and this vote can be strengthened during the ensuring comment period, leading to significant changes in the standard.

Board members may differ on general approaches as well as specific technical points. Some board members, for example, may be particularly interested in the concerns of a certain set of stakeholders.

The long and laborious march toward convergence is testing the patience of stakeholders and the resistance of standards setters. Audit committee members are concerned about the quality of emerging standards and the uncertainty surrounding the convergence process.

Meanwhile, the FASB and the IASB are struggling to balance the interests of different constituents as they attempt to meet aggressive deadlines. In order to improve quality and acceptance of the new standards, both boards are seeking extensive input from stakeholders, and they are offering access to the process in a variety of ways.

As the endgame approaches for several important standards, audit committees should ensure that their companies gauge the potential impact of proposed standards and make their voices heard.

The benefits of global adoption of IFRS are significant for investors. Global adoption will create a common denominator from which regulators and supervisors can assess the operations of the entities and markets they oversee. It will permit investors to compare the financial position of companies across borders, potentially allowing investors to more efficiently allocate capital on a global basis.

5. Conclusions

The concept of a single set of global accounting standards, considering the global economy and the prevalence of cross-border transactions, makes great sense. However, the burden and cost of implementation during the current economy is a large hurdle for some companies. In the long term, I believe a single set of global accounting standards will be very positive.

I think that the political, cultural and governance challenges associated with getting global adoption of a uniform set of high-quality accounting and financial reporting standards accomplished are far more difficult to deal with than the technical accounting issues, and will likely prevent the achievement of that goal. Still the convergence goal should be pursued to the extent feasible, and any remaining differences should be identified so that financial statement users can better consider the impact of such differences

Intensification of Disparities between New Member State – Consequence of Capital Flow

Moise Elena

mihaela.darzan@yahoo.com

Abstract

The beginning of the 90's transitional period generated a significant increase of loans, in Eastern, South Eastern and Central Europe. The challenges that period brought were successfully overcome by the countries with flexible economies.

Lately, the uncontrolled evolution of the credits determined a rapid growth, but also a bigger recession, especially for the countries with less consolidated economy.

The opening of economies represented an opportunity for new investments, especially due to the governmental targets to increase the convergence with the Western Europe countries.

Key words: capital flow, FDI, economic growth, economic indicators.

J.E.L. classification: E20

1. The impact of the investment flow in the New Member States

The current crisis had a lower impact on the countries that redirected capital to foreign direct investment (FDI); but the countries that used capital flow for loans for banks and companies faced a harder situation, the consequences being severe decrease of GDP.

Part of the New Member States that joined the European Union in 2004 and 2007 (Bulgaria, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania and Slovakia) have independent central banks, and capital accounts. These have to respect the same convergence prerequisites, determining similar macroeconomic policies. Nevertheless, they felt differently the impact of credit. The Baltic countries are the ones

that have been threatened by an excessive amount of loans, because of a high level of capital inflow that was in 2007 approx. 15% of GDP, while Slovakia and the Czech Republic were the less affected ones.[1]

Capital flows were high in most of the New Member States, but the increase was slowed down starting with 2008, when the economic and financial crisis hit. (Figure. 1).

Figure 1.

Net Private Capital Flows (percent of GDP)						
	2004	2005	2006	2007	2008	2009
EU	-12	7,1	8,7	8,1	11,6	8,4
						1,5

*)Eurostat [3]

The flows were high before 2003 also, but the biggest increase was between 2003 and 2007, and intensified the disparities between states.

Considering the low volatility at global level and the low interest rate, capital investments were directed to the areas where the yield was expected to be the highest, especially on emerging markets.

The investments were formed by ISD but also bank loans, the latter being the factor that caused the intensification of the disparities between regions.

The Western mother banks expanded to Eastern Europe. By supplying for the local branch, they generated a loan "boom". Their entering the market was rather aggressive, because they targeted the increase of the market share in a development region, which would have led to the expected profits.

Loans were a success especially in the countries with poor population, poor living

conditions and extremely low internal product value, elements that determined the continuous growth of imports, leading to the deepening of the commercial deficit. Loaning was not directed to productive sectors, sectors for which investments should have been encouraged. Instead, loans were directed only towards household consumption.

As a consequence of consumer behavior, that requests constant capital inflows, not for productive activities but for internal consumption, countries became more and more vulnerable.

In 2008, the economic and financial crisis revealed that, in the areas where the percentage of loans in GDP had grown the most, a significantly increased inflation rate and commercial deficit appeared, and, of course, extremely low competitiveness.

The negative consequences of this excessive loaning reflected in low wages, but also in rapidly increased housing prices.

Towards the end of 2008, the capital flows from mother banks decreased. The direct foreign direct investment flows were also affected by global recession, going from 1,2 trillions EUR (2008) to less than 0,72 trillions (2010). The decrease of FDI, though being a general trend, analyzed from a geographic point of view, had different intensities. In South-Eastern Asia FDI decreased with 17%, while in the Western Asia, FDI continued to grow in 2009, for the sixth consecutive year. In South-Eastern Europe, the impact of the crisis in FDIs appeared later than in Western Europe, considering that the New Member States reacted better to crisis until mid-2008, and in some cases, until the first part of 2009. In the second half of 2009, as a result of the deepening of the economic crisis, the decrease of FDI affected the entire Europe, the profits decreased, businesses slowed down. In 2009, the capital outflows from the developed countries decreased severely, by 46%. Analyzing the FDI for the Global Triad for 2008-2009 leads to the following conclusions: Japan was the most affected (decreased 17 times) followed by the USA (decreased 3,1 times) and then by Europe (decreased 1,8 times).

Because of the pressure caused by the lack of liquidities, lending slowed down,

continuing only where the financing sources came from the residents' deposits.

Because of the policies they used, the banks that before 2008 supported the capital flows in the less developed countries in order to maximize profits were severely affected by the crisis, facing lack of liquidities and solvability on national market.

The internal demand severely decreased, especially in the Baltic countries, as a consequence of the decrease in consumption and investments; the Czech Republic and Poland were the exception.

The decrease in import demand in developed countries triggered, starting with the second half of 2008, the free fall of global commerce that, by the beginning of 2010 had already lost between 40 and 45%. The severe decline of aggregated demand was associated with the increase of the tensions on global financial markets, leading to reduced commercial loans and increased loan costs.

Figure 2.

Annual average inflation rate					
	2006	2007	2008	2009	2010
EU-27	2,2	2,3	3,7	1	2,1
Bulgaria	7,4	7,6	12	2,5	3
Germany	1,8	2,3	2,8	0,2	1,2
Greece	3,3	3	4,2	1,3	4,7
Spain	3,6	2,8	4,1	-0,2	2
France	1,9	1,6	3,2	0,1	1,7
Italy	2,2	2	3,5	0,8	1,6
Hungary	4	7,9	6	4	4,7
Poland	1,3	2,6	4,2	4	2,7
Portugal	3	2,4	2,7	-0,9	1,4
Romania	6,6	4,9	7,9	5,6	6,1
United Kingdom	2,3	2,3	3,6	2,2	3,3

*) Eurostat

The crisis had an overwhelming impact especially on the countries with a rapid GDP growth in the past years and in which reducing loans generated the largest current account deficit.

The current economic crisis impacted negatively on the main economic indicators: inflation, unemployment, economic growth,

volume of commerce, foreign direct investments.

2. The consequences of global decline on the evolution of economic indicators

On a global scale, starting with 2007, several difficulties appeared in keeping the inflation rate in a bearable margin that would not have a severe impact on consumption, therefore the economies of the countries going through crisis should recover.

The pressure of inflation impacted on the demand, by reducing it, and also on the labor force market.

The year when the decline was felt the most was 2008, when most of the countries recorded much higher price increases than in the previous years. The highest inflation rates were recorded in Bulgaria (12%), Romania (7,9%) Hungary (6%). The EU average was approx. 3,7%, compared to 2,3% in the previous year.

The stability of prices was affected in most of the countries. This was a consequence of changes in raw material costs, which have a medium to long term impact. The most affected countries were the ones with more fluctuant economic development. In March 2010, the reference value for inflation rate was calculated to be 1%, based on the values recorded in Portugal, Estonia and Belgium, the most performant EU countries in this respect. [2]

For this, specialists used a different calculation approach than the procedure adopted in the Convergence Report in 2004 – this time, one country was removed from the study, the only one that recorded, for 12 months, an inflation rate of in March 2010. The exclusion decision was taken in order to not reduce too much the reference value and to highlight the considerable divergences between member states, which would have shown the severe economic problems the EU is facing.

Figure 3.

Unemployment Rate					
	2006	2007	2008	2009	2010
EU-27	8,2	7,2	7	8,9	9,6
Bulgaria	9	6,9	5,6	6,8	9,9
Germany	9,8	8,4	7,3	7,5	6,8
Greece	8,9	8,3	7,7	9,5	12,3
Spain	8,5	8,3	11,3	18	20,1
France	9,2	8,4	7,8	9,5	9,7
Italy	6,8	6,1	6,7	7,8	8,5
Hungary	7,5	7,4	7,8	10	11,2
Poland	13,9	9,6	7,1	8,2	9,6
Portugal	7,8	8,1	7,7	9,6	11
Romania	7,3	6,4	5,8	6,9	7,2
United Kingdom	5,4	5,3	5,6	7,6	7,7

*) Eurostat

The price index is expected to vary between 1,2% and 2% in the near future, and inflationist pressure will become a medium term concern, after the recovery becomes more solid and stable.

Even if, from the price evolution point of view, Spain was not one of the most affected countries, the alarming unemployment growth, especially in the last 2 years (200 and 2010) proved that Spain also faced severe problems.

In 2010, along Spain (20,1% unemployment rate), other countries faced the same situation: Greece (12,3%), Poland (9,6%) and Romania (7,2%).

As a consequence of the decrease in global demand and investments, of more expensive loans, the GDP growth rate decreased severely between 2007 and 2009, most of the EU member states recording negative values.

In Romania, GDP recorded one of the most reduced values (-7,6%), followed by Hungary (-6%) and Bulgaria (-5,7%).

Figure 4.

Real GDP growth rate						
Growth rate of GDP volume – percentage change on previous year						
	2006	2007	2008	2009	2010	2011(f)

Romania	7,9	6,3	7,3	-7,1	-1,9	1,5
United Kingdom	2,8	2,7	-0,1	-4,9	1,3	2,2

*) Eurostat

3. Causes and effects of crisis in Romania

In Romania, the 2003-2008 economic growth focused on household consumption, which was growing with 10-15% annually and on the dynamic fixed capital accumulation (20-30% growth), which led to the increase of employment rate, income and demand growth, but also a price increase for a wide range of products. After a positive evolution during the previous years, characterized by an important inflation rate decrease, from 3-figures values to one figure –value in 2005, the inflation rose again to 7,9%. In 2009, the price growth was of only 5,6% but based on the deepening of the crisis and as a consequence of the layoff measures, the inflation rate rose again, to 6,1% in 2010.

The fiscal policy, budgetary expenses and banking system are the three mechanisms that fueled the decline. The adopted fiscal

measures were procyclic. The 16% income and profit tax flat rate, introduced in 2005, which stimulated demand is representative for this argument. 82% of the amount of extra money obtained through this measure went to consumption, and budgetary income became more and more dependent on consumer tax. (VAT, excises).[4]

The uncontrolled investment based budgetary expenses (oversized, compared to the needs of the real economy and the financing possibilities), and salary expenses (that between 2005 and 2008 recorded an increase of 86%) represented additional factors for consumption. As in the other New Member States, the banking system activity had a positive trend. The consumer loan grew from 10% to 39% of GDP.

In 2008, the company loans decrease, being over passed by population loans, which by the end of 2008 would reach 70% of total income.

Compared to the savings rate, which in Romania had one of the lowest values in Europe, the investment rate has high, which led to a significant current account deficit.[5]

Figure 5.

Savings and Investment Rate in Romania (2005-2009)

	% from GDP				
	2005	2006	2007	2008	2009
Savings Rate (Sr)	13,1	14,4	17,1	18,8	19,1
Investment Rate (Ir)	23,7	25,6	30,2	33,3	25,6
Sr-Ir	-10,6	-11,2	-13,1	-14,5	-6,5

*)INS, calculated by RNB

The personal needs loans grew unprecedentedly, focusing on the purchase of long term usage goods. Real estate was used as collateral, real estate with a value up to 50% value than the real one. The demand for loans grew, and the ability to pay installments diminished year after year.

The economic crisis in Romania must be analyzed from 2 perspectives:

- Internal- the responsibility lays with the internal policy, which favored wage increases at a higher rate than labor productivity growth, excessive

consumption, mostly based on debts. These measures also favored speculations on the real estate markets. One of the biggest errors was delaying the application of prevention measures that could have diminished the unavoidable impact of decline.

- External – the global circumstances amplified the existing unbalance and generated new ones.

4. Conclusions

The new member states presented a much too high degree of economic opening, and the process was fast; therefore, the capacity to absorb capital flows was low.

The economic policies the new member states applied targeted an unprecedented economic growth, in order to decrease the lag

between them and the other states. The current crisis had such a significant impact because many of those countries did not comply with fundamental long term sustainable growth objectives.

Consumer Behavior – A Consequence of Economic and Social Changes

Moise Elena
Dârzan Mihaela
Romanian American University
elena_e_moise@yahoo.com
mihaela.darzan@yahoo.com

Abstract

Consumer behavior is part of the economic behavior, being observed from a multidimensional and interdisciplinary perspective.

Being a consumer is a quality given, in the first place, by the parties involved in the economic activity; the behavior is analyzed from a micro and macroeconomic perspective – behavior oriented towards satisfying individual needs.

According to the current economic trends and also as a consequence of the globalization of the markets, the following question arises: a person consumes to live or lives to consume?

Key words: consumer behavior, income, economic crisis, globalization

J.E.L. classification: D10

1. Introduction

The first studies on consumer behavior date from the 1960s. Until then, the analysis was done only at psychological level.

In order to support the detailed research on consumer behavior, The Association for Consumption Research, which in 1989 had over 1100 members, organized annual worldwide acknowledged congresses.

Consumer behavior includes the totality of the individual or group decisions connected to purchasing goods or services for satisfying current and future needs. The analysis includes studying the actions and attitudes that precede and influence these actions.

The evolution of the society triggered, in time, consumer behavior changes.

The globalization led to the increase of the number of companies competing, in places rather distant from one another, crossing the traditional, geographic, cultural, religious, moral and ethic borders.

2. Modern society – different consumer

The new trends on the global market brought with them new life philosophies, from the consumer's perspective, which put him in three different situations: mass consumption, the abundant society and hyperconsumption.

The first phase, the mass consumption was mostly generated by the development of infrastructure, of new transportation networks, which, at local/regional level, led gradually to the transformation of small markets into big, national markets. The development of mass consumption was also caused, in great part, by product manufacturers and service suppliers, which also invested significantly in the technical modernization of the production machinery and equipment. Lately, the specialty literature, [1](Key,P,2006) has used more and more frequently the phrase "democratization of consumption", which may be seen as a new production strategy or as simple "commercial strategy", having as main goal to sell a large amount of products, for the beginning with rather low profit margin.

The modern 21st century consumer differs significantly from the consumer one or two centuries ago, because of the new, modern lifestyle, mostly associated to his ability to assimilate the culture, traditions, customs of the people he comes into contact with.

The second situation the modern consumer faces is the so called "abundance". The abundance society, unlike mass consumption, focused on productivity increase, consumer

purchasing power (especially for the ones with salary based incomes), addressing mainly to the household appliances market.[2]

Gradually, the market for long term usage products (household appliances) grew, mainly due to the personal loans the banks gave in the last years.

Marketing studies showed that the increase of productivity and market share alone - which insure a substantial profit for the supplier, for a short time - are not enough; a quality readjustment during the marketing of the goods, by using the economies of scale is also necessary.

The mass consumption society grew inside the European Union countries, based on the economic growth of various sectors and on the improvement of the standard of living in certain countries as well as on the recent years' unprecedented development of the self-service facilities, supermarkets, hypermarkets, and the transformation of some stations and airports into commercial networks for travelers from all around the world.

With the development of new markets, the consumer's personal motivation became, obviously, more and more complex, thus having the possibility of becoming more independent, more selective in choosing the goods and services.

The globalization impacted significantly on the labor and product and services market of the 20th and 21st centuries, because of the latest social, language, economic and religious challenges.

The most known behavior models in psychological and economic literature belong to Freud and Veblen.

The Freudian model explains the consumer's behavior reactions, taking into consideration a series of factors like the person's attitude towards consumption (which can be either positive or negative). The Veblen model analyzes the consumer's behavior by observing the reactions and the external factors. Considering the two models, we have the following types of consumer behavior: the competition, ostentatious consumption and the compensation consumption.[3]

The competition consumer is a person that focuses on purchasing goods that give him higher social status within the group; this

consumer wants to strengthen his social status by financial superiority. This consumer has an ostentatious attitude, targeting the display of a higher status than the current one. This behavior is common for all the countries, but differs in terms of display.

Ostentatious attitudes appear especially in the economic boom, in USA and UK, but, in Romania, this behavior is displayed shortly, mainly during the periods preceding the growth peak. In the other EU Member States, the actions are long-term oriented, the social status being transferred to the heirs.

Sometimes these ostentatious consumers target imitating other persons' behavior; the evaluation of the products they purchased isn't done on personal criteria, being addicted to the image having these goods reflects, focusing on taking advantage of the success and fame that comes with the social status. For these consumers, the goods don't represent a means to satisfy their own needs, but a way to strengthen the others' opinion regarding their financial wealth.

The compensation consumption means buying durable goods (house, car, furniture, household appliances) which would induce the idea of a successful life, in compensation for the rigid social status.

The compensation consumption decreased during the current economic crisis as a consequence of income cutbacks and the increase of consumer goods.

The modern consumer's behavior is mainly based on personal satisfaction, and consumption is seen more and more as a strictly subjective choice, being influenced by a series of factors: consumer's age, gender, profession, social status and entourage, income, standard of living, tastes and preferences, his ability to assimilate a new culture, new traditions or internal rules, but also the economic development of the area.

There weren't any changes of the household consumption in the last decade within the EU (Figure. 1, Figure 3). Nevertheless, the differences between the structure of consumption in Romania and the consumption in EU are significant, especially regarding the expenses for food (35% in Romania compared to 13% in UE, in 2000 and 29.1% in Romania compared to 13.1% in UE, in 2009).

The significant differences in consumption give an important message regarding the economic development (standard of living, income and purchase power).

During the last 10 years, in Romania, the household expenses on food decreased with approx. 20%, as a consequence of the improved living conditions, but also of the increase of the expenses on education (from 0.9% in 2000 to 2 in 2009) culture (from 4.6% in 2000 to 4,9 in 2009).[4](Eurostat Database)

Even if the consumers' preferences are alike, their abilities of satisfying their needs are different, which causes changes in the structure of consumption.

Starting from an analysis at microeconomic level, we bring up the pleasure or satisfaction that the consumer feels when taking "one unit" from a good or service.

In a society dominated by hyperconsumption, the consumers are especially interested in the quality of the product, which has to comply with the consumer's emotional status.

A series of transformation and structural changes of approach of new competitive strategies and of presentation of new offers on market appeared, based on the "technological progress" and new globalization trends.

The latest changes determined the appearance of a new type of consumer which has faster access to new products, images, services (communication) at any hour, especially through internet.

Hofstede's well-known studies on cultural dimensions often explained national differences in ethics. Hofstede's studies were analyzed especially from the perspective of national differences in ethics. We cannot claim that culture is the only cause for consumer behavior, but also circumstances and social aspirations.[5]

It hasn't been scientifically proved that a factor has the same impact in different cultures "inter-national differences may be generated by the different mentalities in different countries, or by the systematic polarization of the reply of people in different countries to the same factors". The ethical implications of consumer behavior involves series of cognitive, affective and behavior trends towards problems and activities connected to social standards.

Ethical decisional models show that moral judgment depends mostly on the deontological (inherent quality) and theological (consistent) approach of the situation, but also on the personal and circumstantial features of the evaluator.

Figure 1

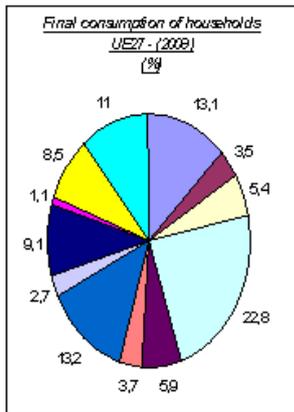

Figure 2

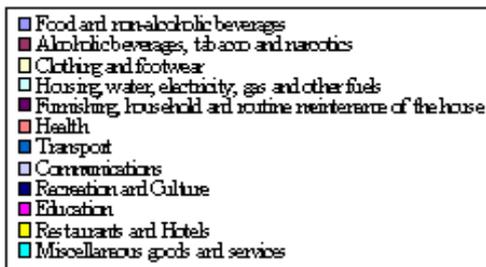

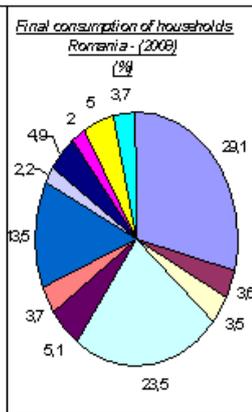

Figure 3

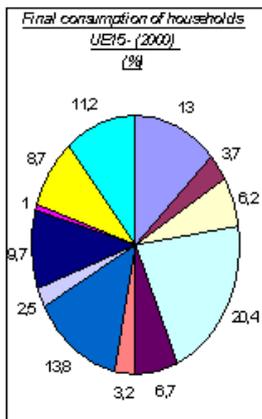

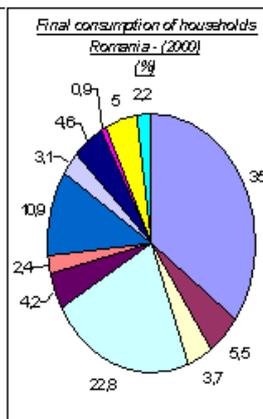

Figure 4

3. Conclusions

National and organizational culture, religious or personal beliefs, economic pressures and other factors will influence decisions, intentions, leading, in time, to different consumer behavior in different countries. Any perspective determines economic development, as an important factor in testing the effects of culture on consumer ethics. Research shows that the less developed countries do not always have the necessary resources to insure the legal means to balanced economic development of various sectors or markets.

Consumer ethics is defined by the moral rules, standards that guide individual (or group) behavior in taking the selection, using or selling decision. [6](Muncy & Vitell, 2005).

Abstract

Emerging market economies were significantly affected by the global financial crisis.

Nevertheless, compared with their experience in previous crises, emerging market economies displayed remarkable resilience, maintaining robust rates of growth even as the crisis unfolded in advanced economies starting around mid-2007, and containing disruptions to financial markets so as to avoid experiencing crises themselves.

Many countries experienced recession in 2008 and Romania went into recession in the third quarter of 2008.

In this article we present the impact of the present crisis on the Romania' balance of payments current account and external debt between the end of 2007 and the end of 2010.

Key words: financial crisis, balance of payments, current account, external debt

J.E.L. classification: G01; G20.

1. Introduction

A balance of payments sheet is an accounting record of all monetary transactions between a country and the rest of the world. These transactions include payments for the country's exports and imports of goods, services, and financial capital, as well as financial transfers. The balance of payments summarizes international transactions for a specific period, usually a year, and is prepared in a single currency, typically the domestic currency for the country concerned. Sources

of funds for a nation, such as exports or the receipts of loans and investments, are recorded as positive or surplus items. Uses of funds, such as for imports or to invest in foreign countries, are recorded as negative or deficit items.

Since 1974, the two principal divisions on the balance of payments have been the *current account* and the *capital account*.

The *current account* shows the net amount a country is earning if it is in surplus, or spending if it is in deficit. It is the sum of the balance of trade (net earnings on exports – payments for imports), factor income (earnings on foreign investments – payments made to foreign investors) and cash transfers.

The *capital account* records the net change in ownership of foreign assets. It includes the reserve account (the international operations of a nation's central bank), along with loans and investments between the country and the rest of world (but not the future regular repayments/dividends that the loans and investments yield; those are earnings and will be recorded in the current account).

The *current account* is the sum of the balance of trade (exports minus imports of goods and services), net factor income (such as interest and dividends) and net transfer payments (such as foreign aid).

The current account balance is one of two major measures of the nature of a country's foreign trade (the other being the net capital outflow). A current account surplus increases a country's net foreign assets by the corresponding amount, and a current account deficit does the reverse. Both government and private payments are included in the calculation. It is called the current account

because goods and services are generally consumed in the current period.

The balance of trade is the difference between a nation's exports of goods and services and its imports of goods and services, if all financial transfers, investments and other components are ignored. A nation is said to have a trade deficit if it is importing more than it exports.

The net factor income or income account, a sub-account of the current account, is usually presented under the headings income payments as outflows, and income receipts as inflows.

In the traditional accounting of balance of payments, the current account equals the change in net foreign assets. A current account deficit implies a paralleled reduction of the net foreign assets.

Action to reduce a substantial current account deficit usually involves increasing exports (goods going out of a country and entering abroad countries) or decreasing imports (goods coming from a foreign country into a country).

◆ Firstly, this is generally accomplished directly through import restrictions, quotas, or duties (though these may indirectly limit exports as well), or subsidizing exports. Influencing the exchange rate to make exports cheaper for foreign buyers will indirectly increase the balance of payments.

◆ Secondly, current account deficit are reduced by promoting investor friendly environment i.e. Foreign Direct Investment, Foreign Institutional Investors, the income from these foreign investments positively contributes to current account.

◆ Thirdly, adjusting government spending to favor domestic suppliers is also effective.

Less obvious methods to reduce a current account deficit include measures that increase domestic savings (or reduced domestic borrowing), including a reduction in borrowing by the national government. [15]

2. Romania' balance-of-payments current account evolution

Through the macroeconomics' analysis carried out by National Bank of Romania and

presented in Financial Stability Report/ 2010 result that:

"Due to the crises started in mid-2007, the world economy deteriorated significantly in 2009 (down 0.6 percent), its first contraction in 30 years, while the European Union economy saw a sharper fall (more than 4 percent), the important government stimulus packages notwithstanding.

The Romanian economy followed a similar trend as the other countries in Central and Eastern Europe, except Poland. The Romania' economic contraction was sharp (7.1 percent) and the fiscal deficit widened substantially (to 7.4 percent of gross domestic product). There was no need for public funds to support the banking sector, as the noticeable increase in capitalization of credit institutions in Romania was fully achieved through the efforts undertaken by shareholders, also in response to the National Bank of Romania's demands.

The current account deficit adjustment (from 11.6 percent of gross domestic product in 2008 to 4.5 percent of gross domestic product in 2009 and its maintenance close to this level in 2010) help to markedly reduce one of the vulnerabilities of the Romanian economy when the crisis broke out. At the same time, external deficit financing was achieved almost entirely via foreign direct investment, even though their volume decreased by about 45 percent against 2008.

A substantial part of external private debt was rolled over for increasing maturities, to larger-than-initially-forecasted levels, despite the decline in banking intermediation at global level, and the short-term external debt stock, along with its share in total external debt, narrowed considerably, thus contributing to the reduction of the Romanian economy's second vulnerability since the crisis broke out, respectively since mid 2007.

The largest contribution to the narrowing of the external deficit came from the systemically important companies in the real sector. As far as these companies were concerned, after their trade deficit exceeded EUR 6 billion in 2008, in 2009 their external transactions posted a slight surplus of EUR 0.1 billion." [4]

Between December 2007 and December 2010 the balance-of-payments current account posted deficits, those deficits were between EUR 5.520 Million, in December

2007 and EUR 966 million in December 2010.

This diminishing of the deficit of account current is due, in principal, to the climb-down of the trade deficit (this deficit was of EUR 5.653 million in December 2007, then it became EUR 4.221 million in December 2008, EUR 2.065 million in December 2009 and finally in December 2010 it was of EUR 1.623 million).

Also, the evolution of the incomes' deficit posted a significant influence over the decrease of the deficit of current account (the deficit of incomes fell from the value of EUR 954 million, in December 2007, to EUR 238 million in December 2008, then the incomes' deficit rose to EUR 479 million in December 2009 and, finally, registered a slowly decrease at EUR 444 million)

The current transfers registered surplus in all period. The value of this indicator grew from EUR 1.088 million in December 2007, to EUR 1.345 million in December 2008, then diminished at EUR 822 million in December 2009 and in December 2010 increased at EUR 1.102 million.

The evolution of balance of payments current account in studied period is presented in the Table 1. and in the Figure 1.

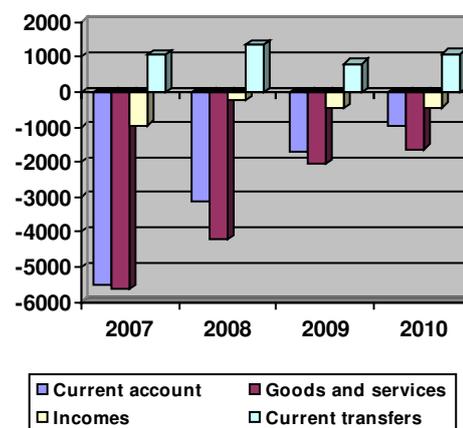

Table 1. The annual dynamics of balance of payments current account

- EUR million-

Period		Current account, Of which (A+B+C)	A) Goods and services	B) Incomes	C) Current transfers
Dec. 2007	Credit	12,130	9,736	560	1,835
	Debit	17,650	15,389	1,514	747
	Net	-5,520	-5,653	-954	1,088
Dec. 2008	Credit	12,817	10,117	590	2,110
	Debit	15,931	14,338	828	765
	Net	-3,114	-4,221	-238	1,345
Dec. 2009	Credit	11,364	9,588	266	1,510
	Debit	13,086	11,653	745	688
	Net	-1,722	-2,065	-479	822
Dec. 2010	Credit	13,828	12,073	266	1,489
	Debit	14,794	13,696	710	387
	Net	-966	-1,623	-444	1,102

Source: National Bank of Romania

Figure 1. The balance of payments current account evolution

In all period the current account deficit was covered by non-residents' direct investment in Romania. The evolution of Romanian external debt is presented in chapter 3 "The evolution of external debt".

3. The evolution of external debt

The brut total external debt of Romania registered a permanent increasing in period December 2007 – December 2010, in principal due to the global recession and financial crisis beginning in 2007 and its influence upon the Romanian economy.

An important share in brut total external debt is kept by brut external debt (with more that 80%), comparative with the share registered by direct investments inter-companies (below 20%).

Also, an importance share in brut external debt is kept by banks and monetary authority followed by the government debt.

Regarding at the components of the direct investments inter-companies the share of 90% is held by foreign direct investment.

This evolution is presented in the Table 2. "The annual dynamics of external debt", in the Table 3. "The evolution of brut external debt' components", in the Table 4 "The evolution of direct investments inter-companies' components" and in the Figure 2. „The external debt evolution”.

Table 2. The annual dynamics of external debt
-EUR million at the end of the month-

Data	Total brut external debt*, of which:	Brut external debt	Direct investments inter-companies
Dec. 2007	58.629	46.695	11.934
Dec. 2008	72.354	57.7534	14.600
Dec. 2009	81.163	66.015	15.148
Dec. 2010	90.765	74.881	15.884

*) The balance of external debt is cash-based (excluding unmatured accrued interest); the IMF's SDR allocations are not included:
a) external loans taken directly by the Ministry of Public Finance and local general government in compliance with the legislation on public debt, including Government Emergency Ordinance 99/2009 ratifying the Stand-by Arrangement between Romania and the IMF;
b) external loans guaranteed by the Ministry of Public Finance and local general government in compliance with the legislation on public debt;
c) under the Stand-by Arrangement concluded with the IMF, excluding the amount received by the Ministry of Public Finance from the IMF according to Government Emergency Ordinance 99/2009.

Figure 2. The external debt evolution

The companies that benefited from foreign direct investments weathered the crisis better than the rest of the economy. Their performance indicators deteriorated at a slower pace. These companies may contribute to a more sustainable convergence to the euro zone, as they proved their structure allows them to withstand shocks more efficiently, they play a key role in generating value added in the economy (almost 40 percent of value added of non-financial companies) and account for more than 75 percent of Romania's exports. Abstract

The financial crisis of 2007 to the present is a crisis triggered by a liquidity shortfall in the United States banking system. It has resulted in the collapse of large financial institutions, the bailout of banks by national governments, and downturns in stock markets around the world. In many areas, the housing market has also suffered, resulting in numerous evictions, foreclosures and prolonged vacancies. It is considered by many economists to be the worst financial crisis since the Great Depression of the 1930s. It contributed to the failure of key businesses, declines in consumer wealth estimated in the hundreds of trillions of U.S. dollars, substantial financial commitments incurred by governments, and a significant decline in economic activity.[15]

Many countries experienced recession in 2008 and Romania went into recession in the third quarter of 2008.

In this article we present the impact of the present crisis on the Romanian Banking System between the end of 2007 and the end of 2010.

Key words: financial crisis, credit institution, loans, deposits

J.E.L. classification: G01; G20.

1. Introduction

The Romanian banking sector has remained relatively unaffected by the direct impact of the global financial crisis, till the third quarter of 2008, due to its traditional banking activity model. Local banks were not engaged in investing in complex structured

financial instruments and, therefore, the size of financial institutions' exposure to US sub-prime market risks, either in the form of holding structured financial instruments or other instruments issued by the largest investment banks, was negligible.

Romanian banks were adversely impacted by its collapse (in the third quarter of 2008) as a result of a major increase in the risk aversion of global financial market participants, despite the lack of direct exposure to Lehman Brothers. As a significant number of Romanian banks are members of global or regional banking groups, the turbulence in the global market caused a major fall in mutual confidence between them, which may be denoted as an "imported" confidence crisis. As a result, liquidity in the local money and foreign exchange markets decreased significantly. Tensions in the money market were also caused by the increased risk aversion of global investors resulting in a "flight to quality" and the withdrawal of capital from emerging markets.

Stress tests conducted by the National Bank of Romania in 2009 and 2010 indicate that banks operating in Romania have sufficient capital buffers to absorb potential losses resulting from even very strong adverse economic developments.[4]

2. The effects of the financial crisis over the principal indicators for credit institution.

The Romanian banking sector entered the period of global financial turbulence and economic slowdown in a comfortable position in terms of profitability and capital adequacy. During the period December 2007

– December 2010 bank capitalization has increased to comfortable levels. These developments are the result of the efforts undertaken by credit institution, while the National Bank of Romania's demands in this field and the signing of the financing arrangement by the Romanian authorities with the European Union and the International Monetary Fund, along with the commitments assumed under the European Bank Co-ordination Initiatively the nine largest foreign banks operating in Romania, were the major catalysts of these efforts. [4]

Between 2007 and 2010, the structure of Romanian banking system posted no significant changes in terms of the number of credit institutions, total net assets, share holding and concentration degree. This situation is presented in Table 1.

Table 1. "Structural indicators of the Romanian banking System"
-at the end of the month-

No	Indicator	Dec 2007	Dec 2008	Dec 2009	Dec 2010
1	Number of credit institutions	42	43	42	42
2	Number of banks with majority private capital	40	41	40	40
3	Number of banks with majority foreign capital, of which	36	37	35	35
	- foreign bank branches	10	10	10	9
4	Total net assets (including foreign bank branches) (mil. RON)	251.426	314.442	330.184	341.846
5	Assets of banks with majority private capital/ Total assets (%)	94,7	94,6	92,5	93,2
6	Assets of banks with foreign capital including foreign bank branches/ Total assets (%)	88	88,2	85,3	86,1

Source: NBR

The deterioration of international economic situation due to the global crisis exerted negative influence on the Romanian banking sector. The economic slowdown adversely impacted the economic standing of borrowers and, consequently, the quality of banks' credit portfolios deteriorated.

The increase in credit risk and funding costs adversely impacted banks' profitability (see Table 2). Return on assets (ROA) and return on equity (ROE) decreased at the end of 2009 comparatively with the same period of 2008 and in 2010 the values of those indicators became negative.

The majority of Romanian banks followed the National Bank of Romania's recommendations and retained 2008 profits in order to increase their capital base. As a result, the average capital adequacy ratio in the banking sector increased to 14.67% at the end 2009 and at 14.66%, at the end of 2010 (compared to 13.76%, and 13.78% at the end of 2007 and respectively at the end of 2008) (sees Table 2).

The indicator "Total operating income/Total operating expenses" decreased from 179.56%, at the end of 2008, at 156.53%, at the end of 2009 end, respectively at 155.92%, in December 2010.

The indicators "Credit risk ratio" and "Non-performing Loans Ratio", debased sharply followed a rising trend, reaching 20.81%, and respectively 11.85% in 2010, comparative with 15.29% (Credit risk ratio) and 7.89% (Non-performing Loans Ratio) in December 2009 and with 6,52% (Credit risk ratio) and 2.8% (Non-performing Loans Ratio) in December 2008.

Also, the indicators "Past due and doubtful loans/ Total loans portfolio (net value)" and "Past due and doubtful claims (net value) / Total assets (net value)" followed the same path followed by indicators "Credit risk ratio" and "Non-performing Loans Ratio"

Table 2. Indicators for Credit Institutions
-percentages-

No	Indicator	Dec 2007	Dec 2008	Dec 2009	Dec 2010
1	ROA - Return on assets	...	1,56	0,25	-0,09
2	ROE - Return on equity	...	17,04	2,89	-1,02
3	Capital Adequacy Ratio* ($\geq 8\%$)	13,78	13,76	14,67	14,66
4	Total operating income/ Total operating expenses	...	179,56	156,53	155,92
5	Credit Risk Ratio*	4,00	6,52	15,29	20,81
6	Non-performing Loans Ratio*	...	2,8	7,89	11,85
7	Past due and doubtful loans/ Total loans portfolio (net value)	0,22	0,32	1,45	2,22
8	Past due and doubtful claims (net value) / Total assets (net value)	0,17	0,29	1,01	1,49

Source: NBR

*) Indicators for commercial banks and Creditcoop; foreign bank branches do not report Capital Adequacy, Own Funds and Loans Classification Statement

Calculations based on credit institutions prudential supervision reports

ROA = Annualized net profit/ Total average assets

ROE = Annualized net profit/ Average own capital

Credit Risk Ratio = Gross exposure of non-bank loans and interest classified as doubtful and loss/ Total classified non-bank loans and related interest, excluding off-balance sheet items

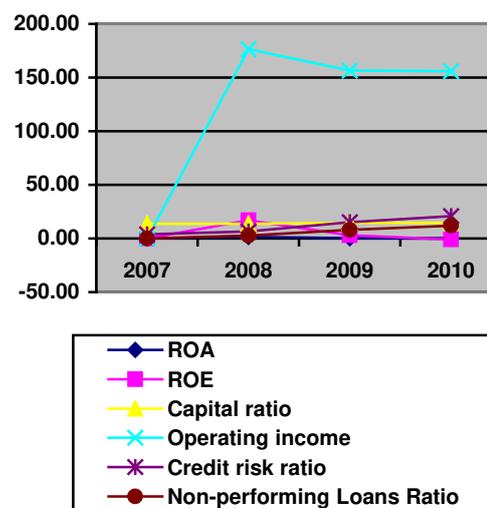

Non-performing Loans Ratio = Gross exposure of non-bank loans and interest classified as loss that is overdue more than 90 days and /or for which legal proceedings were initiated against the debtor or against the operation / Total classified non-bank loans and related interest, excluding off-balance sheet items

Note:

Indicators include all credit institutions (commercial banks, foreign banks branches and Creditcoop).

From January 1, 2008, based on FINREP and COREP reports
From January 1, 2008, Total assets and Own capital for indicators 2, 4 and 7 are calculated as averages.

Figure 1. Indicators for Credit Institutions

3. The evolution of loans and deposits of non-banks and non-government customers during the crisis period.

The evolution of loans and deposits of non-banks and non-government customers during the crisis period, respectively from December 2007 to December 2010 is presented in Table 3 and in Figure 2.

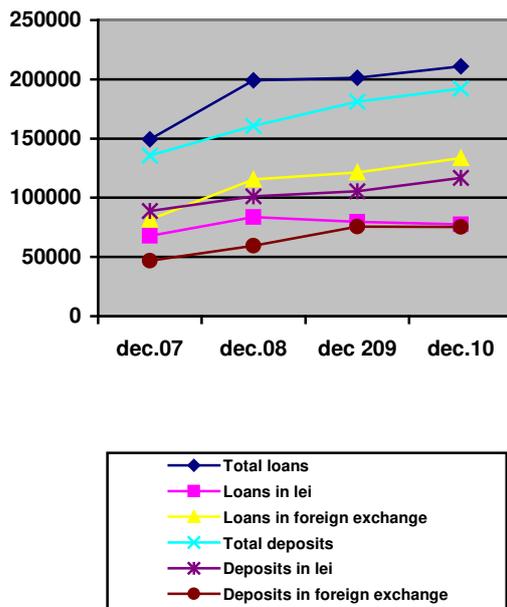

Table 3. The evolution of loans and deposits of non-banks and non-government customers
- mil RON, at the end of the month-

No	Indicator	Dec 2007	Dec 2008	Dec 2009	Dec 2010
1	Total loans (r.4+r.7), on which:	149.261	199.106	201.193	210.851

16	Deposits, time deposits, deposits redeemable at notice and repurchase operations in foreign exchange, on which:	46.742	59.588	75.538	75.367
17	- residents	41.407	52.633	65.075	63.957
18	- non-residents	5.335	6.955	10.462	11.410

Source: NBR

Figure 2. The evolution of loans and deposits, by currency

Both "total loans" and "total deposits" reported positive annual growth from December 2007 to December 2010.

By currency, the evolution of loans and deposits in lei knew an increase in December 2008, comparatively with December 2007, then the evolution reported a decrease in December 2009 and December 2010, comparable with the values from December 2008. The evolution of loans and deposits in foreign exchange registered a constantly upswing since December 2007 to December 2010.

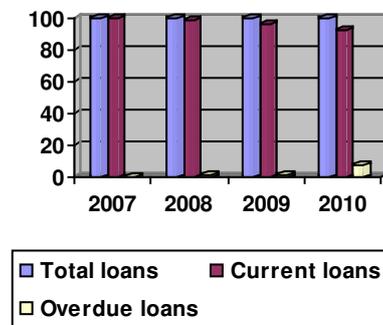

The evolution of current loans and overdue loans weight in total loans is presented in Table 4. and in Figure 3.

Table 4. The share of current loans and overdue loans in total loans

-percentages-					
No	Indicator	Dec 2007	Dec 2008	Dec 2009	Dec 2010
1	Total loans , on which:	100	100	100	100
2	- share of current loans	99,27	98,59	95,95	92,34
3	- share of overdue loans	0,73	1,41	4,05	7,66

Source: NBR

Figure 3. The share of current loans and overdue loans in total loans

The share of overdue loans in total loans followed an uptrend, rising from 0,73% in December 2007, to 1,41% in December 2008 then to 4,05% in December 2009 and, finally, growing at 7,66% in December 2010.

Economic Competitiveness: a Theoretical Overview

Moldovan Nicoleta–Claudia

West University of Timișoara, Faculty of Economics and Business Administration
nicoleta.moldovan@feaa.uvt.ro

Abstract

The complexity of the concept of competitiveness lies in the fact that the term is used in various levels of aggregation, allowing the generation of its different meanings at microeconomic, mezzoeconomic, and macroeconomic level.

Based on the evidence of interdependence and complementarities of economic competitiveness with other terms, such as to induce errors in understanding the phenomenon, this scientific approach aims: the development of conceptual limitations of the term competitiveness, what does competitiveness mean at the firm, industry and national level and accentuation the essential theories of trade, from classical theories such as Adam Smith's absolute advantage to new theories such as Helpman's or Krugman's model and to reveal their influence on international competitiveness.

Key words: competitiveness, trade theory, comparative advantage, imperfect markets.

J.E.L. classification: F11, F12, F23

1. Introduction

The scientific approach developed in this paper starts to address the concept of competitiveness, reviewing various definitions of literature and sparked controversy around the concept. Much of its opaqueness stems from the fact that the term is used at different levels of aggregation, leading to different meanings as well as different indicators. We will introduce separately the concepts of competitiveness at the level of firms (micro) level, at industry (mezzo) level and national (macro) level.

The second part of the paper performed a review of the main theories of trade that are relevant for economic competitiveness,

synthesizing the main findings of the classical theory and the neoclassical theories that trade theories can induce on competitiveness.

2. What are we talking about? Concept of competitiveness

The terms of competitiveness are often used in different contexts, meaning different things.

At company level, competitiveness is defined as the ability or capacity of companies to compete and sometimes as the ability to compete in international markets, with a satisfactory rate of return (OECD, 2001).

Companies may build competitive advantage over their rivals through products differentiation, through ability to learn and innovate, or by shaping the framework conditions under which they operate, including the market and regulatory frameworks.

There are authors (Belz and Hugenschmidt, 1995) that break down the concept of competitiveness to the individual business unit and product level, saying that for multiple-products companies it is very difficult to evaluate competitiveness at firm level. Rather, it makes more sense to evaluate a firm's competitiveness at the level of its business units or products categories.

Sometimes, the firm is often described as being the most obvious level to which the concept of competitiveness can be applied. It is firms which compete with one another in the market place. An economy cannot be competitive unless companies operating there are competitive, whether they are domestic firms or subsidiaries of foreign company (Porter, 2002).

Competitiveness at industry level is understood by economic literature as the ability to compete, particularly in international markets, with satisfactory rates

of return (OECD, 2001). Porter and Van der Linde specify that the proper definition of competitiveness at the aggregate level is the average productivity of industry or the value created per unit of labour and per dollar of capital invested (Porter and Van der Linde 1995). Concerning at the impact of public policies on competitiveness, it is often argued that it is more informative to explore industry than firm level competitiveness because a competitive advantage that an individual firm may gain as a result of the public policy is often realised at the expense of competitors. At industry level, impacts by public policies on competitiveness may be assessed in an aggregated way and in comparison to other industries either within the same country or the same industry in another country.

The competitiveness of a country is essential for the welfare of its citizens. It means output growth and high rates of employment in a sustainable environment. In a fast-moving world economy, one of the keys to competitiveness is adaptability. An economy is adaptable if it can accumulate and redeploy resources rapidly in pursuit of new opportunities, while, at the same time, fully exploiting existing competitive strengths. Adaptability is crucial not only for the growth prospects of a country but also for its resilience to economic shocks.

Most often, the competitiveness concept is discussed of the national level, frequently denominated as international, national or economic competitiveness. From this perspective, it is distinguished between: an understanding of competitiveness as a country's share of world markets for its products and a productivity oriented understanding of competitiveness (Porter, 2002).

The OECD describes a nation's competitiveness as the degree to which it can, under free and fair market conditions, produce goods and services which meet the test of the international markets, while simultaneously maintaining and expanding the incomes of its people over the longer term (OECD, 1990).

The 'market share' view, is held by economists representing traditional or strategic trade theory, frequently links competitiveness to trade flows. This view of competitiveness is based on an interpretation of national competitiveness as a zero-sum

game, with each country gaining at the expense of others. Many critics stress that competition of such a zero-sum kind does not exist between nations. Paul Krugman, for example, points out some crucial differences in the competition between economies and firms: above all, a country that loses its competitiveness does not go out of business. Also, nations are not able to externalise social and environmental costs to the same degree as companies in order to increase their efficiency. These discrepancies make competitiveness a somewhat elusive concept at national level (Krugman, 1994).

While the 'market share' view of national competitiveness stresses a country's performance on international markets, critics like Krugman or Porter are convinced that a country's standard of living depends almost entirely on its own domestic performance, and not how it performs relative to other countries.

Applying the concept of competitiveness to national level is highly contentious. In addition to the conceptual objections raised by Krugman, Porter and the like, there are methodological and political concerns. National competitiveness is a highly complex aggregate of the varying levels of competitiveness of individual firms and industries. The evaluations depend to a large extent on the set of indicators used to analyse national competitiveness and therefore judgement and rankings of the world's most competitive countries vary from one measurement to the next. When it comes to assessing the impacts that policies have on competitiveness, the OECD describes the national economy as the most preferred level of analysis. When evaluating a particular policy, the effects on the economy as a whole should be considered, not just the effects of individual sectors (OECD, 2004). It is likely to remain a big challenge to the research community to distinguish the effects of one policy from another policy on the aggregated level of the national economy.

Other researchers reject the debate on nation level competitiveness in particular on grounds of its expected political implications and effects on state governance. Fougner points out that the debate on international competitiveness has shifted from how governments can support national companies to export and invest abroad to how states can

attract investors. He underscores that the primary governmental problem on the part of state authorities is no longer to make firms more competitive, but to make the state itself more competitive (Fougner, 2006).

3. Implications of trade theories for competitiveness

Trade theory asserts that economic welfare is dependent on the production of goods and services that a country has comparative advantage in. Therefore, international competitiveness is secured when production is in line with a country's comparative advantage situation.

The survey starting from trade theory and embracing competitiveness theory will try to detect concepts and elements that would facilitate clarifying and understanding driving factors determining international trade competitiveness.

Each of the following major groups of economic theories provides frameworks of direct relevance to any discussion of international trade competitiveness:

- Traditional trade theory, which incorporates the principles of perfect competition, homogenous goods, and constant returns to scale in production. This includes the trade theories of Smith, Ricardo, Heckscher and Ohlin and the modifications or extensions of the Heckscher-Ohlin theory.
- The second group- new trade theory would include theories characterised by product differentials, imperfect competition and increasing returns to scale. These theories have been pioneered by Dixit and Stiglitz (1977), Krugman (1979, 1980, 1985) and Helpman (1981).

During XV–XVII centuries, when international business became important, evolved an economic theory named mercantilism, which viewed trade as a zero-sum game in which a trade surplus of one country is compensation by a trade deficit of another country.

In contrast, according to the theory of absolute advantage, Adam Smith viewed competitiveness of country as a positive-sum game in which all trading partners can benefit if countries specialize in the production of goods in which they have

absolute advantages (Cho and Moon 1998). The advantage comes from the division of labour. Smith extended this idea to that of international division of labour. From his point of view, competition was important because it assured that each person and nation would do what they were best fitted to do, mutually rewarding their services and maximally contributing to the common good.

David Ricardo extended absolute advantage theory to comparative advantage theory. He demonstrated that gains from trade could be made when two countries specialize in the production of goods for which they have a comparative advantage.

According to the ricardian model, differences in production function across sectors and across countries rise due to differences in comparative labour productivity.

Classical theories previously presented provide models to clarify the competitiveness of international trade based on differences in productivity levels between countries, but it does not explain why these differences exist. Certain degree of specialization is being foreseen, but in reality countries produce a variety of products, part of which is being traded.

Neo-classical economists Heckscher and Ohlin explained that comparative advantage arises from differences in factor endowments. According to their theory, there are two basic characteristics of countries and products. Countries differ from each other according to the factors of production they possess. Goods differ from each other according to the factors that are required in their production. A country will have comparative advantage in and therefore will export, that good whose production is relatively intensive in the factor with which that country is relatively well endowed. In other words, in two countries, the capital-abundant country will export the more capital-intensive good while the labour-abundant country will export the labour-intensive good.

Some neo classicalists have developed alternative theories, such as Leontief paradox, product cycle, country similarity and economies of scale (Cho, Moon 1994), which are still widely used for practical purposes in applied scientific researches.

To sum up, the ideas of the traditional theories of international trade are that the specialisation in products of comparative

advantage, accumulation of resources, innovation of productive processes and the intensity of entrepreneurial activity determine a country's international competitiveness. Furthermore, the conventional models advocate free trade as the main proponent of improved competitiveness.

Comparative advantage justifications for international trade imply a strong tendency for trade between countries with large differences in technology or factor endowments. It has been shown that in many cases trade flows are greatest between countries with similar technological capabilities or factor endowments.

The literature of the last decades have shifted the focus away from the traditional models based on the assumptions of perfect competition and returns in production to the implications of imperfect competition and economies of scale for international trade.

The new trade theories have challenged three underlying assumptions of the traditional trade models, as follow:

- the assumption of perfect competition, which is replaced by imperfect competition;
- constant returns to scale which is replaced by increasing returns to scale;
- the definition of an industry in terms of homogeneous goods which is replaced by product differentiation.

New trade theories are based on monopolistic and oligopolistic models rather than perfect competition models as in the case in traditional trade theory. The Dixit&Stiglitz(1977) model of product differentiation has formed the basis for models of monopolistic competition on trade.

On the other hand, perfect competition models can only accommodate pure technological external economies since internal economies of scale imply imperfect competition.

Helpman's view (1981) and Krugman's view (1985) classified economies of scale in the following ways: static intra-firm technological economies of scale; static external economies and dynamic economies of scale. Each of these types of economies has implications for international trade. Economies of scale or increasing returns means, that if inputs were doubled, output would be more than doubled. If there are economies of scale, countries would benefit

if they specialize in the production of a limited range of goods. Economies of scale and international trade make it possible for each country to produce goods more efficiently without sacrificing of variety of goods.

Not least, the new trade theories don't restrict the choice between comparative advantage or increasing returns as the underlying causes for trade. The models of intra-industry trade assumed that products could be grouped into industries where, at the aggregate level, factor proportions or comparative advantage explanations were responsible for inter-industry trade, while intra-industry trade was primarily driven by economies of scale in production. In this way, new trade theory offered a kind of synergy between comparative advantage and increasing returns.

4. Conclusions

The paper provides a comprehensive survey of the literature discussing competitiveness. The notion of competitiveness is specifically defined and explained.

The theoretical literature is synthesised to characterize the main driving factors, explanation how they relate to understanding of the relative competitiveness of international trade is being suggested.

Analysis of the trade theories, allowed us to highlight some specific elements of the new climate in which trade takes place, leading to the conclusion that it would be better for economic development strategy of a country, cover less comparative advantages and focus mainly on competitive advantages

Abstract

Sales management is particularly difficult, as one of the few areas in which management rarely meets with his staff. In an age where technology has increased dramatically the speed with which the goods and services can be produced, distributed and facilitate communication between organizations, the most valuable factor for the efficient functioning of a company in its relations with customers is still the human performance.

Key words: manager, leader, sales team

J.E.L. classification: M31, M54

1. Introduction

Sales operations is the link between the firm and its clients, a point of contact with them. Sales operations are carried out in the core business and generating incomes is a vital function.

Today, sales operations consist not only of personal sales, but also from a range of other forms of contact with customers, including sales by phone, internet and other forms of electronic communication, service activities or technical assistance available to customers who join the traditional form of selling through agents[1].

Fundamental nature of the sale in a market-oriented enterprise implies the existence of several vital functions - the provision of information, belief and creating, developing and maintaining relationships with customers.

2. Sales management within GMB Computers

GMB Computers is a limited liability company operating in the Constanta. The main activity is providing complete IT solutions. GMB Computers provides a range of products, starting from next-generation computers, servers, networking products, multimedia products, video cameras and digital audio-video products and other peripherals, to the latest portable devices such as mobile phones, PDAs, iPods, laptops or flash memory with high capacity.

GMB Computers was guided from the beginning by a set of values that over time have come to define the way society thinks about the business: customer orientation, trust and respect, responsibility and professionalism, honesty, innovation, excellence.

Structure of an organization is considered within its frame. This means that all persons and branches set up in such a way as to ensure achievement of the company's forecast[6]. In the company GMB Computers there is a specific organizational structure of the company, carrying the daily work, so it can be easier[2].

Goals in terms of management structure are: clarification of channel sections and tasks, clarifying the organizational hierarchy, to clarify the channels of communication and ability for managers to allocate resources to the objectives defined by the plan. The company's top management consists of General Manager, Technical Manager, Director of Sales, CFO and Project Accountant. According to the chart, the top four management positions form the Steering

Committee. The General Manager General and the Finance and Accounting Manager are the two shareholders of the company. All four departments aim to provide IT products and services in accordance with customer needs and international standards.

The role of sales manager in the GMB Computers is planned to achieve business development goals, by motivating the sales team towards obtaining the best results. This continuing support is provided by the sales manager of his team. There are certain standard tasks that are performed by sales managers, as happens in the GMB Computers: planning, organizing, controlling, recruitment, training and motivation.

Sales manager's role varies depending on the position and level located in an organization. In the case of GMB Computers the sales manager contributes to all three existing levels: the strategic, tactical and the operational one.

In the case of the strategic level, decisions involves: currently and the future underserved markets, the types of products that can satisfy customers in these markets, areas of activity which the company does not want to deal with[3].

Tactical level involves decisions about structuring the sales staff by size and organizational structure, development of sales staff, the policies and programs for recruitment, selection and training, motivating staff through supervision, coordination, compensation, evaluation and control.

Operational level refers to manager's focus to persuade the people to fulfill their assigned duties at the highest level of quality. They have to encourage salespeople to self-managed, as individuals[5].

Sales team within the company GMB Computers consists of 24 employees. The company has four subsidiaries: Constanta, Mangalia, Cernavoda and Eforie South. Workers within them, 18 as number, are available for customers to provide the best solutions and products. There are 6 salespeople, who carries out the sales to other companies. There are a number of steps in terms of sales team management: recruitment and selection, training, management and supervision, remuneration, motivation, evaluation and control. affect the business. The process of achieving

In the GMB Computers by *recruiting staff*, the company seeks not merely the filling of opening jobs, but also the process through which the new employee integrate psycho-socio-professional in the company, in the working group, how he is attached to the group, how he perform tasks and even respond to more duties.

Regarding *employing staff*, GMB Computers follows certain policies that govern the selection of potential employees: policy based on equality, youth orientation.

Training is important for improving productivity at the individual level sales agents. Thus, training the sales team is an continuous process within the GMB. It consists of the following activities: training, equipment sales, coaching.

The company tries to offer a challenging experience as a sales team based on different directions: *a personal* development, skills and ability, *a professional* developing on sales field that helped in achieving business goals and *constant motivation* of the team.

Payment is an important factor for workers and for the company. GMB Computers operates a system of combined pay. It contains a lot of variants, depending on various global corporate and commercial objectives, and the variety of situations and tasks associated with the sale of each case. This is understandable because the elements that determine the method of payment may include variables such as complexity of the process of buying or number of factors influence the decision process. For all sales staff there is a base wage.

One of the most important factors affecting business performance is the *motivation of staff*. The financial part is an important motivator in the GMB Computers materialized primarily through granting commissions which encourages agencies to focus on their activities and are offered in proportion to the complexity of activities.

Evaluation is difficult, costly and time consuming. For the success of the sales team were taken into account the processes and actions essential that begin through setting clear standards of performance and motivation[7].

The process of planning and control sales has an essential role in economic activity in that forecast future trends that may sales plan in the GMB Computers includes

the following phases: analysis (where the company was at that time), forecasting (where the company is leading to), goals (where the company wants to reach), sales planning (the plan to achieve the proposed sales), control (the goals will certainly be fulfilled).

Setting goals also play an important role. Computers GMB settled the following objectives for 2011: to increase turnover by 13%, to increase by 11% revenue growth, increased spending by up to 10%, increase by 35% the profit growth, increase market share by 2%, increase volume growth sales by 20%, reducing stocks by 2%, increasing customer satisfaction by 5% and reduced customer complaints by 10%.

Once a correctly and motivational planning system has been established, sales manager can control the daily business performance using productivity indices on which it was agreed, and set specific performance standards. GMB Computers has developed a guide that can be updated easily, were these standards are presented. What is very important to mention is the need to update these performance standards to keep pace with any changes in work roles.

This guide sales performance used by GMB Computers is divided into 3 business prospects that the company considers essential in achieving performance: financial sustainability, employees and customers and the quality and innovation of products and services.

3. Conclusions

Over time significant changes have occurred both in theory and in practice sales management. In light of the new reality of relational selling, sales managers should not be guided in their activity of recruiting sales agents established standards based on stereotype "vivid commercial mastery"[4].

This specific process can be concluded with several sales management staff in the GMB Computers and some recommendations for the proper functioning of the sales department.

In the employment of labor, they must try to detect the qualities necessary for establishing and maintaining long-term interpersonal relationships. Training salespeople should focus on improving communication and customer psychology knowledge. In terms of remuneration and evaluation, rewards plans that stimulates relations should not be questioned. In terms of motivation, some studies have shown that customer-oriented staff, who know how to work wisely, obtain from this activity also an intrinsic motivation.

Introduction in the Accounting Systems Convergence and Convergence as an Accounting Concept

Moraru Maria

West University of Timișoara , Faculty of Economics and Business Administration,
mariamoraru2002@yahoo.com

Abstract

The financial situations performing and presentation in accordance with the IFRS is practical and take into consideration a large number of problems with which these are confronted when applying the IAS-IFRS precautions. In its content the IAS-IFRS requests are presented on domain of interest, such as presenting the information in financial situations, group situations, elements evaluation and admission in the balance and in the profit and loses account.

In March 2001 the International Accounting Standards Board (IASB), which became a foundation organized after the American organization model of normalization (FASB). The foundation consists of four elements:

- *trustees meeting*
- *normalization organism, IASB, which takes the harmonization activities from the old international organism (International Accounting Standards Committee: IASC)*
- *an interpretation committee, the international interpretation committee concerning the financial reports (International Financial reporting Interpretations Committee: IFRIC)*
- *a normalization consultative council (International Accounting Standards Advisory Council: IASAC)*

Key words: harmonization, situations, committee, profit.

J.E.L. classification: M41, M49.

1. Introduction

National accounts and international accounting rules are going through a transitional period which is full of challenges and opportunities.

Geopolitical interests, economic, professional still prevent a solution and reach a consensus which would benefit all countries and entities components.

A solution and a consensus would have allowed the most international of all occupations, accounting to play what meets the new standard within the international trade known as globalization.

Task organizations coordinate and organize the international accounting profession (FASB, IASB, IOSCO and IFAC) is to accelerate steps to reach the much coveted accounting harmonization or convergence.

At the beginning of enforcement actions in the world of rules and procedures common terminology used was known as accounting harmonization, it is now increasingly replaced by more convergence accounting terminology.

2. Accounting Systems Convergence

The trustees meeting consist of nineteenth members. Five of these members are appointed by the expert accountants international federation (International Federation of Accountants: IFAC), after a consulting process of the various organizations which represent the accounts performers, accounts users and collegiate.

The other trustees are perceived as personalities, as a consequence of their professional competence in the field of accounting and normalization. The trustees most important missions are: the power to finance the new normalization machine and to vote the organization budget; the quality to appoint members of IASB, Normalization Consultative Committee and Interpretation Committee.

International Accountants Standards Boards, IASB, holds the responsibility concerning the international accounting standards elaboration and publication.

They are called Financial Reporting International Standards (IFRS).

The old mechanism standards, IASC, keep their symbol (IAS) and will remain legal until their replacing by an IASB standard, therefore by an IFRS.

The standard elaboration due process is reproduced after that of the American normalization organism and consists of two important phases: in the former phase, IASB publishes an exposure draft (ED); in the second phase, after all the possible comments have been received the council publishes conclusive standard or postpones its publishing.

The Interpretations Committee. [1] In connection with the IASB this committee (IFRIC) is charged with the omitted standard interpretation and possibly with handling proposals in order to solve problems which could be raised by the standards appliance. Once they are admitted by the IASB the interpretations have the same authority as the standards.

International Accounting Standards Advisory Council represents a forum of the persons and organizations aimed for the financial report and international accounting harmonization. As its own name indicates its role is that of conciliating, which is exerted for IASB help.

The council helps the international organism to establish its working program and its priorities, to admit certain rule programs. It must also be consulted by the managers, in the case they aim at IASB statutes changes. Nowadays, the general term of IFRS international accounting referential is accredited. This includes:

- financial report international standards (IFRS) elaborated by IASB;
- accounting international standards (IAS) which were and will be submitted a revision process through omission of alternatives, redundant and conflicts in their own content, as well as those which imposed such an amelioration or their omission is not necessarily;
- new interpretations: elaborated by IFRIC Committee or by its predecessor, "Standing Interpretation Committee",

they being submitted to omission and revisal when the reality requires it.

Taking into consideration the UE' s ambitions connected to adopting the international accounting referential, such a promulgation brought and will still bring fundamental changes in the perfectionists accountants from Europe reflection area. These challenges bring the amazement of those who keep their traditions. It is bigger a some European countries (actually the majority) carried out and still carry an accounting model remote from the Anglo-Saxon philosophy, model which was used for the inspiration of international normalization organism.

The main element of these evolutions is in accordance with the accounting objective, even through international conceptual frame: information providing the investors necessity concerning their decision related to the financial titles that they own bought, keeping or sell.

From such an objective results that the balance has priority reported to the other financial situations. In this forces report the appliance more and more important of the economic content prevalent principle is placed over juridical form and the use of an evaluation system based on the real value.

Concerning the balance, the speed loss of the patrimonial balance in favor of a structure that should better explain the financial and economic reality is obvious. As concerning the principle of first consider the economic then the juridical (English translation which is not in accordance with the Anglo-Saxon interest), it can lead us to the idea that we should consider a fact control instead of a right control. Moreover, its intervention requires the belief in the thoughts about a professional accounting.

The more used real value in the measurement domain does not mean the giving up of historical costs and prudency, but at least the diminishing of these principles in the accounting message, making place for a criteria closer to the correspondence between the information relevance and liability.

The real value represents, first of all, a market value, which means that the active and debts should be evaluated conforming to an efficient market. Very often, the real value is calculated on the basis of models using

actualizations, the present values of treasury fluxes waited by the respective company.

The use of international accounting standards, although relatively unexpected, is still necessary. Their learning must not infinitely repeat the efficiencies and credits rule, as we used to assimilate in the past the account functions and the immortal plan.

The necessary professional evolution in the assimilation of IFSR letter and spirit standards is absolutely necessary and will clarify the values. The accounts tutors, users and auditors must elaborate an adequate interpretation and judgment capacity, as much as these new normalization products, which we call IFRS standards, lead to using an important estimation quantity, namely approximation, which means subjectivity.

In the assimilation of international standards the necessity of a comparative interpretation between the international referential ant that produced by IASB may grow.

Our country accounting is nowadays in a gradual implementation process of financial reporting international standards, fact confirmed by the two regulations emitted by the Public Finance Minister: [2] OMFP no. 907/2005 referring to admission juridical persons categories, which apply accountant regulations in accordance with IFRS, respectively regulations in accordance with the European directives and [3] OMFP no. 1121/2006 referring to the IFRS appliance.

At worldwide level the general tendency in the accounting domain is that of convergence of referential accounting systems, as an answer to the globalization process of economy. In this way the international organizations International Accounting Standards Board and Financial Accounting Standards Board develop negotiations in order to omit the differences existing between the two accounting systems, in such a way that the financial situations users should benefit of homogenous situations, no matter where they are.

For facilitation [4] reasons of information approximation, the information is concentrated, theoretical details are concise, which thing will allow the fast understanding of the IAS-IFRS problematic referring to a certain domain, without the necessity to get through the whole standard. The first adoption of IFRS.

The new concept related to the harmonization or convergence represents a constant preoccupation for the professional organisms, as well as for the surveyors and financial- accounting users. The present accounting phenomenon has characteristics based on the need of uniformity in accounting, also forming general objectives of this domain, objectives which can be realized only by the action of its normalization. The main phenomenons which govern the process of contemporary accounting reform at worldwide level are: accounting normalization, harmonization, convergence, conformity and internationalization. These phenomena act not only individually, but also in a reciprocal inter-conditioning relation.

Accounting normalization represents the process through which is harmonized the financial situation presentation, the accounting methods and the terminology.

Accounting harmonization represents the process through which the accounting rules are improved in order to become comparable.

Accounting convergence represents the process through which the accounting rules are elaborated in a manner capable to direct it towards the same fact or aim, by prominence of the resemblance between national- local-international.

Accounting conformity represents the process through which the concord in action and content of the financial situations presentation and performing rules is appreciated, representing a harmonization of national regulations with the rules presented by accounting normalization local and international organisms.

Accounting internationalization originates in the preoccupations for international harmonization of the accountant practices and rules.

There is an opinion that the high level of expositions and interventions related to the central theme of the congress put a finger on better clarifying of certain aspects connected to the convergence in financial reported standards implementation.

A former aspect of convergence in accounting is represented by the convergence between the American Accounting Standards (USGAAP) and the international standards of accounting (IAS/ IFRS). In spite of all differences existing between the two

accounting referential (among which we mention the different optics, namely while the American standards are based on a system of rules very clearly defined and include information for the companies which are searching clients for the American markets, accounting international standards are based on fundamental principles and include information destined for the companies which search capital on international markets), through the agency of Norwalk agreement, IASB and FASB established that all the disagreement opinions should be identified in order to assure in a proper period of time the necessary convergence. In this context we should mention the EFRAG role, which brings an important contribution from the private section, introduced in order to underline the European point of view concerning the IFRS evolution. At European level the aspects related to the convergence in accounting take into consideration the identification of disagreement clauses between the European directives, especially the fourth and the seventh directives and the international accounting standards (IAS/ IFRS); these two directives were castigated by introducing the real value in 2002 and the evaluating options in 2003. In the conception of IFAC and FEE the IFRS adopting mechanism must represent a reason for deliberation, reflection and change of information between the main interested parts, especially the national normalizers, the accounting profession and supervisors from the domain of value titles, banks and assurances, the account users and those who prepare them.

In the latest years in UE countries great steps were made in order to improve the financial report system while FEE works in strong connection with all the partners in these aspects dispute; the capital markets need a high quality financial reporting indeed.

The European Parliament decided: accounting international standards (IAS/IFRS) will be compulsory from the beginning of 2005 for those companies which are marketable exchange; the same is established for those companies which improve things concerning the consolidated accounts. There is quite a large opposition for the extension of accounting international standards appliance for other companies than

those which have been mentioned and the reasons for this are various:

1) In the majority of the countries the most part of the companies is constituted by the small and middle companies category for which the standards appliance is difficult and expensive;

2) The main users of the information provided by the small companies are usually the state (budget) and banks: the budget uses the accounting for the establishment of the taxation result and some major changes in this domain would mean that the state should lose an important quantity of money; the banks do not necessarily look for performances obtained by this category of companies, but keeping the patrimony, which guarantee their relation with the companies;

3) The immense juridical implications: not to forget the juridical and right systems, whose changing implies a long period of time and social and economic environment deregulation risks, at least temporarily.

The particularizing aspect of the European model is connected not to the first phases of its evolution, but to the level that it reached and at which it evaluates, when its basic function directly aims at internal convergence and the economic, social and local cohesion. The alternative under which the European model developed followed the neo-classical theory logic referring to the international trading. The progressive enclosing of other countries in the European economic mechanism transposed the construction accents from those aiming at the communitarian market defining towards those having as finality their regulation. Therefore, these determinations became the processes of convergence and cohesion on the basis of mutual politics, whose finality is represented by accommodation to the performing nucleus standards of the model.

The European model has as finality the individuals' social guarantee and for this fact the market subordination was realized, exclusively of the communitarian market. This is a rope dancing game between economic and social, aiming at assuring construction's stability. The European integration process implies not only market integration, but also the appliance of social cohesion politics, producing in this way welfare earnings for everybody. Nowadays, the European economic model mechanisms

were improved, also from the perspective of theoretic attitude, from the spontaneous market to the market regulation. This step signified the market subordination to the communitarian function in order to consolidate the system social finality.

The convergence process aims at economic system structure adaptation to the economic global cycle, as well as the consisting economies at the European model structural characteristics. The latter represents the result of the cohesion communitarian politics, as well as that of national politics which influence the economic raising and modernizing. The integration European model has as finality the living standard rising for the UE citizens, in the condition of differences development reduction. This specific objective can be realized by harmonizing the convergence processes (internal, as well as external) and by the cohesion processes.

In the literature of specialty the cohesion and convergence notions can be considered as being the same, with the intention of reducing the development differences reduction. When we talk about the convergence internal sources we take into consideration those factors which stimulate the process of economic rising. In the case they generate an economic transformation they will influence in a positive manner the economic potential and as a consequence the whole process of economic convergence for a long period of time. The economic modernization implies not only the accommodation to the European model structure, but also to the structural characteristics of the global cycle of business.

Accounting principles or detailed accounting rules?

FEE, the promoter of sustaining the IFRS implementation in UE till 2005 encourages the departure on the basis of financial reporting standards principles; this thing means that the clearly formulated principles destined to the public interest service improves rules which show the way in which these principles should be applied in concrete situations. This way of encouraging facilitates the determination and transparency and help the companies to answer in a corresponding manner to complex situations towards the new evolution implied by the

business practice. This way of encouraging also notifies regulation concentration and the "technical omissions" which can appear in the places where detailed rules are developed in an attempt to cover all the happening that may appear in practice.

Taking into consideration the disadvantage of approaching on the basis of principles (namely the possibility of a too large "creativity" which can be used for suppression of accounting information), but also the disadvantage of approaching on the basis of detailed rules (such as oppressing the initiatives; the creation of the false and extremely harming impression that if you respect the rules everything function right or the creation of temptation and even of some mechanisms of rules omission) we consider that the exclusivist way of departure either on the basis of principle or on the basis of rules can prove not to be enough for the realization of certain qualitative works and correct report.

IFRS represents a challenge for the accounting profession in Romania. The most important consequence of the program elaborated by the Romanian normalizer consists of the opening way for the accounting profession to develop at its true value. The business environment, the users of the information provided by the financial situations become more and more conscious of the accounting professional in the company and generally in the economy.

3. Conclusions

Given the disadvantage of principles-based approach (ie the possibility of too much "creativity" that can be used for suppression of accounting information), but also the disadvantage of detailed rules-based approach (such as on initiatives, creating the false impression and very bad if all the rules function well or even create temptation and failure mechanisms rules) believe that exclusive mode of departure, either on principle or based on rules may prove to be not enough for the achievement of quality work and balanced.

IFRS is a challenge for the accountancy profession in Romania. The most important consequence of the program developed by Romanian Normalizer consist in the way of opening to accounting profession to develop

at its true value. Business environment, users of financial statements information provided become increasingly more aware of the accounting profession within the company, and generally, in the economy.

Current concerns for international accounting convergence will bring universal, of course, some changes and adjustments that will require the existence of a national accounting convergence.

In this regard, we believe that it is not possible to harmonize accounting or accounting convergence of our country intended to make two big accounting systems, namely the Fourth Directive of the European Economic Community and the International Accounting Standards.

Abstract

Public and consumers receive products' and services' information and migrate, in the current period, from the traditional media to online. An increasing number of people accessing news more and more desired by specialized websites and even on mobile devices anywhere and anytime. Rapid adoption of new technologies affect - and even transforming - production, distribution and consumption, but to optimize the online channel, should act objectively, not subjectively, and decisions must be based on key performance indicators. In the process of adapting to these changes in the market, marketers now have the opportunity to reach an entirely different audience via online tools and the mobile. This evidence-based approach, facilitated by web analysis helps organizations to focus their efforts and success with new versions of tenders.

Key words: marketing, Internet, digital, business, communication

J.E.L. classification: M31, L86

1. Introduction

On the Internet goes global marketing communications, no longer applies the motto "Think globally and act locally." It uses the term "potency" because this medium does not automatically guarantee any success, because the possibilities of communication are perceived globally. Potency lies in the original products, ideas and, in general, the

achievements will be shared globally. The local jurisdiction is more original and more easily transferred, the greater the likelihood of a successful world [1]. In this context, the marketing mix is gradually being transformed from a manufacturer's agent in one of the customer, who must actively and consistently including the interests of the buyer.

2. The transition from traditional to online marketing

Dynamic research and development in computer science is very pronounced in this period, appearing so many news that those who tried to define this time as "Web 2.0" are, already, overwhelmed by those who constantly innovating in the hope of making markets and revenue growth. The Internet offers many potential uses, depending on the objectives and user capacity. Thus, it can be considered as a source of information, an interactive communication tool, a distribution channel for products and services.

With web pages, a person or organization may present to the world. They show today as newspapers, is particularly complex as possibilities for displaying content. But unlike television, radio, newspapers and magazines, web, as media support, are under the control of individuals. These "producers" create content which individual information can be used for many other people. By e-mail, these creators and producers can be in close contact with each other. The result is market dynamic and interactive web information [2]. In these circumstances, the digital environment has some important features [3]:

- is quickly moving information efficiently;
- is constantly changing;
- allows for continuous development of hardware and software;
- provides new business development.

In particular the flow of information on Internet marketing is a challenge for all those who have the ability to create commercial websites to make them more attractive and useful. In addition to the great power of innovation, the web is characterized by the fact that it is developing with unprecedented speed, while quantitative and numerical expansion, having a quality place. Thus, in 1994 they launched the first advertising banners [4], and ongoing communication became more organized and professionalized. The sites, which until recently were only "a set of compiled data" [5], have become showcases real and virtual stores. But to be successful on the Internet, marketers need to know the fundamentals of the marketing process, including assessment of needs and wants of people, market research, product policies, pricing, distribution and promotion (marketing mix) etc. Although online marketing is rooted in traditional concepts of marketing - it is divided, however, through a new process - interactive. Sellers can now have interactive relationships with consumers in their own offices or homes at any time. Conversely, buyers can interact with vendors in a new way, realizing communication, so in two ways.

Online marketing has the advantage that it can present interactive sales materials that meet the needs of every type of buyer. Marketers can create brochures that allow consumers to choose the information they want to see them and even individual sales presentations to fit each client. On the Internet, the distinctions between different forms of marketing (advertising, public relations, sales promotion and direct sales) are unclear; the website of an organization is usually a combination of all of them. Internet presence brings a competitive advantage for organizations are particularly important as an alternative not only to promote products, but also an additional distribution channel.

For a better insight into online marketing is suggestive comparative approach on the traits afforded by mass marketing and electronic:

- Mass marketing needs to survive an extended market, reaching consumers through television and magazines, sending standard messages to large audiences and diffuse. It has the highest efficiency for food, cosmetics and pharmaceuticals, beer and cars. But also has many disadvantages, including: no real-time interactivity, feedback missing symmetrically reduced flexibility, lack of control over the message receiver, the receiver is more influenced by messages than offer information to his application.
- Direct marketing requires a well-defined market segment, reaching consumers in general, through the mail. It is effective for selling credit cards, travel, software, supplies catalog.
- Online marketing targets individuals through the Internet is effective for selling travel, stocks, computers and software, etc. It has the advantage that the company can establish warm relationships and potential future clients, through direct communication, using e-mail, personalized welcome messages in web pages, following their interests, previous orders etc. (eg. A florist can track birthdays, holidays and anniversaries you celebrate a person and can remember some time before ordering flowers).

Through the presence on the web, organizations can make known their fields, can broaden its market by attracting new customers and partners around the world, may have contact with their representatives and, not least, can sell their products. That is why companies web presence has become a necessity, no other existing advertising medium can not be more accessible, affordable, fast and economical.

On the other hand, information has become in recent years one of the most important products developed in industrialized countries. Modern marketing techniques put an increasing emphasis on the interactive side of trading, highlighting the importance of communication skills (relationship marketing, targeted marketing to individual consumers etc.). In fact, any transaction involving an intensive exchange of information, phased as follows:

- dissemination of information;
- contact information;
- exchange of information;

- deliberation;
- consensus;
- exchanging products or services traded.

As can be seen, five of the six stages of a transaction are made at the informational level. Depending on the nature of products / services delivered and the last stage may even be turned into an exchange of information (text, images, sounds, software, electronic money etc.).

Technology transforms the business, making business even in some cases, and the Internet is an electronic alternative to the real market, which is not only viable but also more efficient, eliminating geographic boundaries and time zones and the barriers to entry are very low.

Impact of Internet on marketing activity and overall the organization is limited by [6]:

- logistics: fast, cheap, close links with suppliers;
- connecting within organizations: linking web of subsidiaries, branches, located in different cities or countries, ensuring a prompt response to changing customer needs;
- sales: the largest value added in this area so far. The cost of advertising a product on the web is only a fraction of the cost of advertising in newspapers, television or radio;
- service: high impact, similar to that of marketing sales;
- human resources: the Internet is a vast training and recruitment tool of labor;
- technological development: faster and more comprehensive interaction with the world. By collaborating with other agents on the market, are exchanging information, software etc.;
- shopping: advantages related to marketing;
- high-speed information transfer;
- personalization information;
- interactivity: help the seller to understand fully the needs of consumers, which can easily be involved in designing products and services, changing its applications can be met quickly. For example, some automotive sites have a feature called "Design your own car", which is nothing other than a way to gather customer preferences;

- great feedback, companies can learn not only what customers buy, and what pages they are interested in pursuing which they operate;
- current information can be updated;
- flexibility;
- elimination of time and space limits;
- cover market niches by promoting products for straightening clearly defined target groups.

Expression domains of marketing on the Internet are almost as extensive as in the real economy, the most common being [3]

- web sites;
- Internet advertising;
- direct marketing by e-mail;
- permission-based marketing;
- online marketing research;
- online data exchange;
- public relations online;
- integrated marketing on the Internet.

American Marketing Association (AMA) has developed a Code of Ethics on Internet marketing, which demonstrates its growing importance to marketers' activities. The Code provides guiding principles and directions of ethical responsibility in this dynamic field of marketing [7].

General Responsibilities: marketers must evaluate the risks and be responsible for the consequences of their activities on the Internet. Their professional conduct should be guided by:

- supporting professional ethics to avoid harm by protecting privacy rights, property and access;
- compliance with all laws and regulations on non unlawfully marketing, when done by mail, phone, fax or other medium;
- ownership changes in regulations related to Internet marketing;
- effective communication of risks and policies on Internet marketing to member organizations;
- organizational commitment to ethical Internet practices communicated to employees, customers and shareholders.

Confidentiality: Information received from customers over the Internet should remain confidential and be used according to the expressed goals. All data, especially confidential customer must be protected from unauthorized access. Applications specifically

mentioned about receiving unsolicited email messages to be respected.

Ownership: common information sources on the Internet must be properly authorized and documented. Ownership information must be protected and respected. Furthermore, marketers must respect the integrity and ownership of computers and networks.

Access: marketers should treat access to accounts, passwords and other information as confidential and examine them or disclose them only with the responsible party. Integrity of information to third parties should be respected as regards the placement of information, advertisements and messages.

Internet meets all the advantages of media and direct marketing business.

3. Tendencias in the on-line marketing: from Web 1.0, through Web 2.0 to Web 3.0

Based on broadband, cheap hardware and open-source software, the Internet turns into a completely different environment from what had until now, leading to new types of companies, the creation of alternative business models to the emergence countless opportunities for development. We are in early stages of development which would be better defined as "Next Internet", which includes all digital devices, from PCs to mobile phones and TVs.

- *Web 1.0*

In the "property" terms included: sites, domains, addresses, locations, designers and architects; visitors. The sites are "built", but the areas are "developed". If there was anything wrong, the sites were declared "under construction". In the terms of "sailing" people could "surf" on the Internet and using "protocols", the information could be "transported", "imported" or "exported" from one location to another.

For example, blogs are considered sites in the Web 1.0 search engines, but their nature is fundamentally different from that of a site: blogs are "written", not "built" on them to write daily, even and several times a day, are places of debate and conversation (their authors "talk" with readers and other bloggers, and they "respond" by comments or notes on their blogs).

- *Web 1.5*

In the dotcom (.com) era sites have diversified their offered services, there were millions of news pages that were updated often, and people reading the press, came on the forums, sailing. Those who wrote the news and web pages were, in general, only journalists and information "traveled" to the reader. Anyone can create their own web page: either conceived or born of the open-source, with the possibility of free hosting.

- *Web 2.0*

It is associated with a new stage in the development of the Internet, published in early 2000 and involves combining and improving the existing technologies, applications and online content to create new services. It is defined as a true "architecture of participation" or as a "tool" that puts together the contributions of ordinary people everywhere and it gives meaning and value.

The most important principles are: the Internet has become a platform, and the information is the main driving force, the architecture of participation has a direct impact on social networks, creating an effect of aggregation of users in various virtual communities, innovation is the core principle, and "collective intelligence" is the sum of individual contributions of users worldwide, simplicity and accessibility are key elements that allow access to anyone, without having special technical knowledge.

However, Web 2.0 has a number of features means more than just a group of technologies is a new way of thinking, even a new business perspective, is an expression that captures the fundamental changes produced in the internet and the impact it has on how we think and live. Among the possibilities offered to users are: an experience much closer to desktop applications with intuitive graphical interface and, above all, transparent, has the ability to connect between them and the various applications or services to aggregate data from various sources - RSS, blogs supports collaborative tools like wikis, social networking platforms, collection of bookmarks (del.icio.us or digg), videos (YouTube) or images (flickr); democratize its content and distribution (content user created and distributed freely).

Thus, we can say that Web 2.0 is rather a new vision of the web than a technology or a technology group, more than an "attitude" than a technology, a cultural phenomenon, rather than technical, a marketing term, a new wave of technology, an internet within everyone's reach.

Following are still some of the "big players": Microsoft, Amazon, Yahoo (webmail application Yahoo Mail!, del.icio.us - social bookmarking application - bought in December 2005, flickr - photo sharing software - purchased in March 2005, my.yahoo.com - personalized portal, Yahoo Instant Search), Google (Gmail, Google Calendar, Google Docs & Spreadsheets, Google Reader, Google Scholar, Google Book Search, Blogger, YouTube - bought in October 2006, Google Maps).

Limits of Web 2.0 expansion:

- increased speed and volume of data traffic over the Internet bring to network security issues;
- Internet infrastructure needs substantial improvements to keep pace with growing demand;
- undertake a large number of financial transactions, which raises the level of network protection against "cyber-attacks";
- social pages are the most obvious example of the spread of private information on the Internet;
- although users freely share their information on such websites, engines collect and store information after each search;
- personal email content is stored on servers and in some cases, scanned for commercial and security;
- advertising to target audiences and improve the search facilities are the direct consequences of more detailed data collection and deeper.
- *Web 3.0*

From Internet bidirectional communication phase will evolve to what we call generic "Web 3.0". This website will continually learn what she likes and dislikes each user prefers and sites will be a permanent profile of each user and will display the information it wants, the preferred mode. Note that the online media industry trend keeps heading towards "predictive behavioral targeting".

Need to integrate online services in the marketing mix is important for companies that want to increase sales. Fortunately, the Internet provides powerful tools for marketers seeking to expand marketing program integrated electronic media. The online program must be integrated into traditional marketing program purposes, such as all marketing activities to support each other. Integrated marketing has three components:

- consistency of the message: the consumer finds the same message regardless of the used medium. The colors, logo, characters are identical, so their connotations and credibility creates a strong feeling of familiarity;
- interactivity: consumers lead a very useful dialogue with the company, obtaining information that respond to their questions quickly, accurately and staff;
- marketing mission: to define what an organization is and what is its purpose.

Interesting is the fact that the size of the organization is still an irrelevant detail on the Internet. In a shopping center, people can immediately see the size of competitors in that market, on the Internet, this is not possible. Small companies can compete with large ones, but this may change as increasingly more companies entering the web, bringing the power of their brand names famous. Now is the time since the new firms or smaller can establish a brand identity on the Internet. Moreover, the online business world, companies can quickly be surrounded by competitors who say they can offer the same products under similar conditions, which can even be done immediately [8].

For marketers, it is necessary a major shift in thinking on the value of a customer, too. Long or too long, companies have treated clients as "replaceable goods", instead of being concerned about their long-term value.

Successful companies must persuade existing customers to make their additional purchases from the same source. Online marketing offers this possibility through the creation of posts for each customer, by recording each person's preferences and nonpreferences, its purchasing patterns and choosing how power should be used if each conviction. It can be sent personalized letters describing new products, company sales statistics and information on manufacturing

technologies. It should be noted, however, that online marketing does not invent this process, but only made it easier and less expensive.

4. Conclusions

Finally, the first step in starting Internet marketing strategy is the careful evaluation of the characteristics of this communication and the correct identification of opportunities offered. Operations on the Internet should be treated as an independent strategic unit which has to be designed, implemented and coordinated in accordance with the specific organization.

Next will be fully interactive Internet, people around the world can work together on the same project, and the products and tools can be rapidly improved through collective thinking of an entire online civilization. It is also developing a territory indefinitely content: any user who has a browser can access vast areas of information, can process it and then can offer it in a new form for tens of millions of users.

But the most important thing is that it will create unlimited opportunities for prospective investors and those already existing. New companies now build on the success standards (Flickr, MySpace, Wikipedia, etc.), But these pioneers are more creative ways, fascinating. Few new companies make money at the moment and certainly many of them fail to make a hit. But among these companies may find the following Google or Microsoft, or at least one company that will pay a fortune, soon, to have these giants.

The Theory of Games and the Corresponding Applicability

Moşnianu Cristian

"Ovidius" University of Constanta

cristianmosnianu@gmail.com

Abstract

Game theory is the study of how optima strategies are formulated in conflict. Because of the mathematical complexity of game theory, this module was limited to two persons and zero sum games. Zero sum means that the sum of the losses of one player must equal the sum of the games of the other player.

In a pure strategy game, strategies for the players can be obtained without making any calculations. When there is not a pure strategy, also called a saddle point, for both players, it is necessary to use other techniques, such as the mixed strategy approach

Key words: theory, games, applicability, equilibrium, competition.

J.E.L. classification: C70

1. Introduction

The theory of games is a relatively new branch of microeconomy that evolved continuously in the last decades. In the analysis of the above-mentioned concept one might consider the work that is entitled "The Art of War" by Sun Tzu and, particularly, the motto of it: "Express your strengths regardless weaknesses you might have, yet fragile when being strong".

2. Corresponding applicability

The pioneer of this theory is considered Emile Borel, that in 1921, published the first study in respect of this theory in his book "Over Games", but failing to develop the basic theorem. Later, John von Neumann (mathematician) and Oscar Morgenstern (economist) by means of the work "Theory of Games and Economic Behaviour" (1944)

succeeded in developing the axiom. A game is referred to as being a contest where two or more opponents, identified as players, compete, the winning the final competition is pursued by each of them. The theory of game is the science of interactive decision making.

John von Neumann and Oscar Morgenstern defined the game as "any interaction among various agents, governed by a set of specific rules that determine possible moves of each participant and the earnings for each combination of moves." The impact of theory was an enormous one. Consequently, it has been concluded that the description can be applied to any social phenomenon. The content of analysis refers to the special cases of games with zero sum.

John Nash Jr., one of the most eminent mathematicians, continued research on the topic during his life, thus succeeding in the doctoral dissertation of over 30 pages in 1951 to demonstrate that any such game must function according to a combined strategy that shall eventually lead to an equilibrium.

Although affected by an aggravating paranoid schizophrenia, his contribution to the development of the analyzed theory (Nash equilibrium) was awarded in 1994 with the Nobel Prize in Economy. Nash Equilibrium is a set of strategies (one for each player) which determines that no player can earn additional gains by the unilateral changing strategy. Nash equilibrium introduced the concept of "the absence of regret". Thus, after the result is obtained and displayed, no player regrets the way of playing in agreement with the manner of action of the respective partners.

The American Thomas Schelling (The strategy of conflict, 1980) and Israeli-American Robert Aumann, Nobel Prize winners for Economics in 2005, have continued research of John Nash and succeeded in setting out a system that contributes to "the explanation of economic

conflicts, as is for example the prices war or trade wars. " The works of the two specialists have proved useful in the defining of the possible effects of cooperation and conflict.

The theory of games has applicability in many fields such as economics, sports, politics, human relationships. The only condition is that each participant in the scheme might have something to gain at the expense of others. In this theory each player depends on the decision of the other players. One must anticipate and take into account the possible decisions of the others.

The theory of games uses three basic hypotheses:

- all players know the rules;
- all players behave rationally;
- each player knows that others are rational.

This theory is based on the existing balance in any system economic: the sum of earnings is equal to the sum of losses. There are at least two players, losses, gains along with rules of the game. A zero sum game is any game in which the interests of players are diametrically opposed. By contrast, a nonzero sum game is the interactive situation in which participants have combined incentives (besides conflictual interests they might have in common specific interests). For example, two countries that experience a economical conflict have the target to ensure the optimum of the trading conditions. At the same time, there is the likelihood that both to be willing to avoid the costs of a trade war. Taking these circumstances into account, the interests the two countries are diametrically opposed.

The theory of games is based on the fact that participants take rational decisions. But the problem arises when irrational behavior of a player (eg. huge stock of nuclear outbreaks) is considered rational according to the standards corresponding to the theory of game. In the beginning of the Cold War the Eisenhower administration considered nuclear weapons as being just another weapon of the arsenal. However, T. Schelling was convinced that nuclear armament is quite efficient, thus contributing to the action of discouragement and consequently, USA proposed variety of tactical responses viable in any situation.

The balance had been created - no nation was in advantage (in case of nuclear attack the reprisals would have been catastrophic). The equilibrium situation requires knowledge of weaknesses and strengths of each state. As in the case of the prisoner's dilemma, both countries need to assume that the other is concerned only with the personal interest and must therefore adopt a dominant strategy and, in this way, trying to limit the risk. If a player alters the equilibrium (install shield missile) is the perspective of a nuclear conflict to be taken into account?

In an attempt to avoid such imbalances the theory of games was applied. When a nation built missile silos the other marked it as possible target. U.S.A and USSR continued the nuclear arms race to such a level that the nuclear arsenal had to be installed on airplanes and submarines which were non-stop patrolling to prevent the situation of the silos destruction. The atmosphere was extremely tense and even a defense motion (building a antiatomic bunker) of one of the players might lead to a nuclear cataclysm.

There was nothing rational in launching weapons if a player would have been launched nuclear arsenal. World destruction for the sake of revenge? If revenge doesn't discourage what can prevent a nation from launching a first attack? There have been used used various misinformation strategies among leaders of both states (such as the fact that they are overwhelmed by hate or just mentally unstable - just to force the opponent to keep guard above). Arms control and disarmament negotiations were only repeated games that allowed both parties to reward the communication and punish its absence. Finally, due to repeated meetings and increase of the degree of communication between the two countries, trust and cooperation have led to diffuse the atmosphere.

Fortunately, none of the two players were willing to play the final scenario in which the purpose was the victory that would have been celebrated by some underground survivors. The theory of game shows how to choose the optimal strategy in a conflict. Schelling showed that even the most radical and destructive strategic confrontations could create, simply by the

logic of confrontation, equilibrium points and the elements of consensus and cooperation between the two parties.

A minimum of cooperation would be necessary for the society to prosper. Another example where it can be applied the theory of game is the competition market. If a competitor lowers the price, one might obtain a significant profit as the market share is increased.

However, if another competitor respond in the same manner when the two market shares remain unchanged and both competitors shall eventually experience losses.

The theory of games and economic behavior nowadays opened an unexpected field of study that helps us better understand economic phenomena and why not, our daily life. In conclusion, I might say that in certain situations, the best thing to do is to behave in an unpredictable way. It essential that when a person is in the position of a player and chooses the corresponding strategy is important to consider the interests of the both parts. One must assume the premise according to which the opponent will choose the best option.

It is important to choose the strategy in such a way that the expected benefit to reach a maximum value, taking into account the fact that the opponent analyses the others options in a corresponding manner

Theories of Competition

Moşnianu Cristian
"Ovidius" University of Constanta
cristianmosnianu@gmail.com

Abstract

Competition is regarded as being one of the fundamental elements of a market economy, the concept of competition has emerged and developed since the inception of political economy as a science.

Starting with the 20s' of the twentieth century, the economists influenced by contradictory processes in the economy have returned to the central idea according to which the market should be conceived in terms of pure and perfect competition.

Key words: theory, competition, market, neoclassical, barriers

J.E.L. classification: B1

1. Introduction

Adam Smith in his 'Wealth of Nations, An Inquiry into the corresponding Nature and Causes' developed the concept of competition. The analysis was based on the work of David Hume's "Essay on the primitive contract" (1748) who had found that one new social duality was constructed around the social reality, being based on interests and needs where "the need is the user's interest."

One might identify in this very interval the first substitution of policy with economy, as the engine of the smooth functioning of society: "the needs and interests of society are the main connections that attach the individuals to government, thus being referred to as sacred bonds." In another work, "Treatise on the human nature", Hume considers that sympathy is the element that realizes the link between the individual selfishness (self-interest) with the interest of society as a whole.

Starting from Hume's concept of sympathy, A. Smith validates it by the apology of frugality (Theory of Moral

Sentiments), that, eventually, becomes a means of moderating the impulses and the social control theory which enables to impose his basic equalization theory of needs and interests.

2. Theories of competition

Adam Smith's economic theory is conceived at the confluence of philosophy (the moral one especially, that held the place of sociology at the respective time) and politics.

The economy is regarded, in his opinion, as a method of the social construction and not the purpose of the philosophical approach. For example, the market concept does not solve economic problems for Adam Smith but two huge social problems of the time:

1. the one related to the reason of the war and peace and
2. the foundation of the social obligation.

Market, in the point of view of Smith, is a natural mechanism that might offer a solution for two problems contrary to the theory of Hobbes. The market is seen by Adam Smith as the place where the products are exchanged.

This produces a natural process by which the supply demand balance, and vice versa, and this natural process is believed to be caused by an "invisible hand", the one of interest that is not subject either to the State or people's will.

The "Theory of invisible hand" expresses the fact according to which from the combination of selfish private interests of individuals results an overall balance of the market economy, which enables its effective and harmonious functioning, able to provide gain and prosperity not only to individual agents, but even general good / interest. In conclusion, for the market to produce wealth and balance, it must necessarily be left absolutely free.

No one, much less the state should not engage in the economic life, because the state is the worst administrator of the economy, "because it does not spend the money earned through its respective work but the capital from fees and taxes. "

Adam Smith's perspective was fundamental in the imposition of free market economy, especially since the other theory in point of natural division of labor has encouraged the industrial revolution. According to his theory, only free competition is a guarantee of progress by means of the two main corresponding functions: the optimal allocation of resources in the advance of production factors and extra-cancellation.

Thanks to the pioneering taken by A. Smith, and the future development, the theory of competition is referred as being one of the central concepts of economic orthodoxy. Absolute advantage theory that is developed by the same analyst considers specialization as beneficial in achieving those products in which the nation has an absolute advantage by operating on the premise of free trade under a perfectly competitive market.

He has proposed and realized the imposition of the free trade within the framework of trade process between the markets of the same state but also among the ones of various countries. By means of the economics the analyst was convinced that wars will be eliminated and will be imposed a permanent peace in the world which has as dominant features the commercial interest and the target of welfare.

These goals haven't been achieved, but, on the contrary, the significant development of capitalist industry and the start of capitalist competition among the states of the world (especially European ones) has led to a senseless and permanent war to occupy the new markets for their products and colonization of as many territories so as to obtain cheap labor force and raw materials for industrial process resumption.

Studies on competition are related to important names such as the neoclassical Leon Walras, Antoine Augustin Cournot, Bertrand, Vilfredo Pareto, Edgeworth, Alfred Marshall.

One of the most important merits of marginalists is the establishment of the

concept of pure and perfect competition. This concept was developed by the representative of the mathematical school of Lausanne, L. Walras. L. Walras's model allowed the analysis, "in pure stand "of the price formation mechanism in conditions of free competition.

According to the theory of the specialist the ideal market meets all five criteria:

- Participants atomistic (presence of a large number of sellers and purchasers);
- homogeneity of the products (products sold in these markets are identical by quality and appearance, so the consumer to be indifferent the seller from which to purchase the property);
- market fluidity (free market entry of new producers);
- perfect mobility of factors of production (their free passage from one branch to another);
- market transparency (requires free flow of information on market of all conditions of sale of products (information on quality, quantity, price).

Currently it appears that almost none of the above conditions is respected and a market that would be characterized by the all five principles is utopian. Still, the pure and perfect competition model should be taken as an axiom, the properties of which need not be proven no actually approved by the existing reality. This competition model could not be a representation of reality, but it might exist as a principle and can function as a theoretical basis for empirical explanations of the modern market structures.

French economist Antoine Augustin Cournot founded the basis of theory explaining the formation of quantities and prices in situations of monopoly and oligopoly market. Consequently, real market models were researched, that have proved to be very different from the model proposed later on by Leon Walras.

For this purpose the above mentioned economist has simulated different situations in which sellers, choosing the quantity they intended to sell, could influence their benefit, but also the one of the respective competitors. Neoclassical French Bertrand criticized A.A. Cournot's approach and proposed the study of competition on price basis and not quantity.

The English economist A. Marshall, with his model of economic equilibrium in part, began the study of the concrete competition cases by defining and introducing for the first time the concept of economy of scale.

Joe S. Bain has developed the theory of entry barriers "which explained the absence of entries of new firms on markets where prices are higher than average production costs (normally it should determine new business entries in the branch because of the obvious possibilities of gain). He has assumed that firms that expressed the intention to enter the market are disadvantaged in comparison to the ones that are already on market, because the latter have absolute cost advantages, economies of scale or benefits arising from the range of differentiation products.

These disadvantages, Bain's view, represent significant barriers to new entrants. He identifies four types of barriers as regards the market entry:

1. absolute advantages of firms already existing on the market;
2. product differentiation;
3. economy of scale;
4. statutory exclusions, which prevent enterprise mobility.

Thus, it appears that the market is not a simple informal meeting ground of anonymous individuals who have no power to influence exchange structures, specific to the market with ideal and pure competition.

There has been a continual emphasis on the importance of exercise the principle of freedom of competition, as a fundamental condition of a viable market economy. Thus, competition is achieved only through the market mechanism and the state intervention to correct certain deviations from the model of pure competition is likely to affect economical processes.

Competition involves between a rather reduced number of unequal sized firms. This trend is dictated by the new conditions in which the competitive struggle occurs.

Eco-tourism on the Black Sea Coast

Muhcină Silvia

Șerban Comănescu Adrian

"Ovidius" University of Constanta, Faculty of Economic Sciences

Gruescu Ramona

muhcina@gmail.com

Abstract

As a modern shape of tourism, the ecotourism follows to observe and admire the natural environmental elements, in such a manner that assures the conditions of protection and preservation of nature. On the Black Sea Coast, the marine ecotourism can involve activities like: watching animals and birds from marine environment, trips by boats or submarines, scuba-diving etc., activities that can be the answer to some needs of a market niche.

Key words: marine coasts environment, ecotourism, marketing

J.E.L. classification: M31

1. Introduction

On marketing point of view, the marine ecosystem is the corporal base for tourism product, the tourism attraction. By adding specifically tourism services (accommodation, food supply, transportation etc.) on these natural and/or cultural attractions, the tour-operators create ecotourism marine products, which are offered on the tourism market. Through an appropriate marketing mix, the tourism organizations suppliers fallows to create and offer sustainable products for these tourists which really appreciate them, on an adequate price level, and to distribute and promote them in such a way that underline and support there's sustainability character. A good marine ecotourism marketing must allow the tourists to get a satisfying experience (for a product that is bought on a relatively high level price), must assure prosperity for the local communities from tourism destinations, and must get economic or other advantages for the other

stakeholders, in such a way that the preservation of nature is assured.

2. The concept of ecotourism

Defined and understood in various ways, the ecotourism become a new modality for spending holydays in natural, wild or isolated areas, on our planet. Many nature's admirers understood that is necessary to practice a health tourism that allows and contribute the preservation of natural environment by using in touristic purpose the natural and cultural environmental elements, in such conditions that assure an equilibrate economic local development. The ecotourism is a tourism shape that „uses” in touristic purpose the various natural elements of the environment and the areas where these are located (Stănciulescu et al, 2000, p. 13). Without an appropriate management, the development of tourism in natural areas can become a threat for ecosystems and local communities' integrity. Usually, in regular conditions, when visitors number is increasing (contributing in such way to local economic development), the fragile equilibrium of ecosystems is deteriorating. The ecotourism has been developed going from the stream of biosphere's preservation and because became a consistent source of incomes for the natural areas that must be protected. In the seven and eight decades, the tourism in wild areas from Africa, tropical forests from South America or choral isles from Pacific became an interesting subject for the nature lovers and travelers, being considered as the first ecotourism ways.

Some specialists consider that the ecotourism is a distinctive type of tourism based on four criteria (Nistoreanu et al, 2003, p. 75):

- Is practiced in natural and cultural areas not adulterated
- Involves various actions of preservation
- Encourage the involvement of local community
- Sustains the local people well-fare.

Considering the same opinion, the ecotourism is a sustainable shape of tourism in natural areas, practiced for a better knowledge and appreciate of local nature and culture that involves preservation measures and actions and assures an active involvement of local community and generates considerable incomes for local people.

The international preoccupations for ecotourism development are various. United Nations declared the year of 2002 The International Year of Ecotourism, and the most important action was The World Summit for Ecotourism, in the Canadian town of Quebec. Through the most relevant goals of this Summit can be considered the following (The Declaration from Quebec, Nistoreanu et al, 2003, p. 97):

- Underlining the ecotourism role in sustainable development process
- Exchange of information considering the sustainable planning, development, management and marketing of ecotourism
- Evaluation and understanding of social, economic and natural environmental impact of ecotourism
- Establishing some mechanisms of monitoring and controlling the ecotourism impact
- Conviction governs, public and private organizations to use and promote the ecotourism as an appropriate measure in the process of sustainable development edification
- Identifying new international ways of cooperation, as to contribute on sustainable development and spreading the ecotourism management.

The presentations were structured in four major themes:

- Eco-touristic planning and production development
- Monitoring and standardizing in ecotourism
- Marketing and ecotourism promoting

- Costs and benefits in ecotourism: a sustainable distribution between stakeholders.

Approached, on one hand, as a business opportunity or, on the other hand, as a concept with principles, the ecotourism represents a market segment that continuously evolving.

3. The marine ecotourism on Romanian Black Sea Coast

Distinctive type of sustainable tourism, market niche for tourism in natural areas and specific modality of ecotourism, the marine ecotourism is a shape of tourism travel, responsible for maritime zones that preserve the natural environment and sustain the local people well-fare (Stănciulescu et al, 2000, p. 22). In the beginning, the marine ecotourism activities were unfolded as scientific activities (especially as observation of coral reefs, in the last decades of last century). Now, the number of marine ecosystems' visitors is more and more increasing, and the ecotourism specific activities are various.

The marine ecotourism was often considered as a responsive reaction to uncontrolled human activities from marine coasts areas (fishing, industry, mass tourism), activities that can conduct to significant destructions of marine ecosystems. The ecotourists are often involved in research activities such as marine life observation, inventorying marine species, acting for natural environment preservation or cleaning operations of marine water and beaches.

The most important resources that can be considered as tourism attractions on the Romanian Black Sea Coast are the Black Sea, with large beach and fine sand and the Danube Delta.

The Romanian Black Sea Coast (245 km long) is going down from the Midia Cape to Vama Veche (Bulgarian border point).

The wide beaches go smoothly down in the sea and allow safe sea and sun baths, heliotherapy and water skiing. The water by the sea shore reaching between 18-25 Celsius degrees.

The waves and aerosols influence generates a special cure – talasotherapy.

Other natural tourist attraction can be considered the presence of original fish fauna

(sturgeons and dolphins, a non dangerous species of sharks etc.), lakes for leisure and water sports, local forests (Comorova), parks and nature reserves.

But one of the most important attractions on this area is Danube Delta, one of the greatest wetlands of the Earth. Borne in a Black Sea Gulf, initially as a littoral string (between 11,000 BC and 7,500 BC), the Danube Delta has three branches (Sf. Gheorghe, Sulina and Chilia), more than 400 lakes of different sizes, the oak and ash tree forests, the sand dunes. The beaches on the delta marine seacoast provide a great diversity and spatial variety.

The Danube Delta Biosphere Reserve (DDBR) has a total area of some 580,000 ha, and almost 1/3 from the total number of plant species that grow in Romania can be founded in here.

There are also many important colonies of pelicans and cormorants, a large variety of other water birds, which reside in or visit the delta for breeding and wintering, and a large number of fish, with species of both high economic and ecological value.

The ecotourism is different from the classical tourism shapes that are characterized by massive tides of tourists in coastal areas. Its goal is to establish and to maintain a symbiotic relation between tourism and natural marine environment, to generate positive effects on the environment and a sustainable development for local communities.

4. Some considerations on the structure of marketing mix in ecotourism

The marine ecotourism concerns the nature appreciation and involves (Genuinely Sustainable Marine Ecotourism in the EU Atlantic Area, University of the West of England):

- Local participation in planning and management process
- Sustainable management, the environmental preservation being the key-objective
- Education for the participants concerning the environment understanding and preservation

- An appropriate mix of formal and voluntary measures
- Cooperation between all stakeholders
- Responsible marketing
- Monitoring and evaluation.

An appropriate marketing must allow for the eco-tourists to obtain a satisfying experience (for the price that is give), for local communities to thrive, for the other stakeholders (tourism services suppliers, tour-operators, travel agencies etc.) to get economic benefits, and for natural and cultural environment to be preserved in better conditions.

From marketing policies point of view, is necessary to consider the four basic elements of marketing mix: product, price, position, promotion.

The product

The marine ecotourism activities are based on two environmental elements: water and land. These elements assure the basic existence for various species of flora and fauna, and there's observation is the key for the process of tourism products' creation.

From marketing point of view, the tourism product represents an assembly of specific elements, structured on the following categories (Balaure et al, 2005, p. 268-270):

- Tangible elements, with material structure, that represent the „body” of tourism attraction, and includes the natural and anthropical patrimony, the general infrastructure of tourism destination and touristic equipments
- Intangible elements, representing the tourism services assembly, offered to the tourists by tourism products' suppliers
- Communications concerning the tourism products (information transmitted to the tourists using promotional tools, like advertising, sales promotion, fairs, public relations etc.)
- Image of the product, which means the perception for tourists of this product.

Going from this opinion, it can be considered that marine ecosystem (or its composing elements) is the tangible base that represents the tourism attraction. Adding the other standard-elements, mostly basic (accommodation, food supply, transportation etc.) and supplementary tourism services

(that allow to practice specific recreation or scientific activities, such as traveling with boats or ships to observe the life of marine animals, fish and birds, scuba-diving, submarine transportation etc.), the ecotourism product is created and offered on the market.

From marketing point of view, in ecotourism is important not only to assure an appropriate satisfaction of tourists' needs, but to realize an optimal assembly of the elements of tourism product, as to preserve the natural environmental integrity, to maintain and even to improve the quality of marine environment and to assure a sustainable development of local communities. For these communities is vital to encourage the development of some specific economic activities that can be realized in such a way that don't harm the environment, valorize the local habits (such as traditional fishing and hunting, handicrafts etc.), preserve the specific culture and the traditional way of people's life.

The price

The price for ecotourism products can be established in such a way as to indicate the high quality or the rarity of these products. A high level of prices allow to fructify the rarity of the tourism attractions that composed the eco-marine product, and, in the same time, is a modality to select the tourists segments and to indicates that these kind of products are designated not for mass-tourism, but for some specific tourists categories, which are disposed to pay a lot of money to get exclusive products.

For the local communities, forced to maintain a traditional way of live that not encourage a strong industrial or touristic development, the high level of prices assures benefits and resources to keep the sustainable development and for the local people, involved in traditional activities, supplying services or products on a high level of price assures the incomes for the family living.

The distribution

Considering the specificity of theirs elements, the marine ecotourism products are usually assembled by specialized tour-operators and can be distributed through a

relatively small number of travel agencies. To get a sustainable distribution, it must approach and apply the sustainable principles on the all links of distribution chain, from services suppliers, to tour-operators and travel agencies. By theirs' power and position on the distribution channel, the most important role to assure a sustainable marine tourism it's owned by tour-operators. Producers, and in the same time, wholesalers, the tour-operators can contribute to achieve sustainability of tourism marine products through different ways:

- Understanding themselves and helping suppliers to understand the principles of sustainability
- Choosing those services suppliers, which acts in sustainable spirit and encouraging suppliers to develop theirs' activities in sustainable conditions
- Designing sustainable products, going from a strong collaboration with those suppliers which are following sustainability in theirs' activities
- Cooperating with local community from tourism destinations and involves in environmental problems' solutions
- Market targeting, identifying those tourists segments preoccupied to by and to make a sustainable tourism
- Imaging and positioning the marine tourism destinations
- Promoting and distributing those products to travel agencies and informing the tourists about these sustainable products etc.

The promotional policy

The promotional policy is one of the most visible elements of tourism marketing mix. Important element of marketing-mix assembly, promotion and marketing communication has an important role to sustainable tourism achievement process because assures the tourists' information about products and brands, contribute to the creation process of tourism organization' image, influence and change the tourists' behavior.

All activities of tourism marketing organization are useless in absence of marketing communication, which is very important because of different reason, such

as: inform business partners, collaborators, medias, tourists etc., about services and products that are offered, about marine destinations, about the organization itself, or about its activity; inform local community, stakeholders and other important decisional factors about its current actions, which are putting in to practice its marketing and global policy; create, maintain or consolidate the tourism organization or its offer' image; influence consumers' perception, expectations or opinion as to choose and buy certain ecotourism products; underline the products or the organizations' brands; increase demand for certain tourism products etc.

The structure of the marketing communication activity in tourism includes certain specific techniques and tools, such as: advertising, sales promotion, public relations, marketing events, sales force, or direct marketing.

A considerable force in marketing communication is represented by brand, the distinctive sign of property and quality, which contribute to the services, products or organizational image creation process. The communicational tools are used in different measures in tourism, considering the nature of transmitters. For example, on distribution levels (tour-operators, travel agencies, Internet retailers), to Destination Marketing Organizations (DMOs), the most used tools are: guidebooks, brochures and catalogues, press conference, travel fairs and other events etc.

Host community, employees and visitors interacts at the tourism destinations, and by their behavior can influence the destinations' sustainability and the perception about these.

5. Conclusions

To become a business opportunity and, in the same time, a way to get profit in respectable conditions to people and environment, a responsible marketing policy must be elaborated considering some necessary aspects, such as the following:

- Practicing sustainable management and responsible cooperation between stakeholders
- Analyzing the market-target
- Studying the environment

- Elaborating the marketing strategy
- Assembling an adequate marketing mix, considering that the price, the distribution and the marketing communications must reflect the rarity and the quality of the elements of eco marine products
- Permanently monitoring and evaluating the results etc.

Financial and Economic Crisis during Current Economic Restructuring

Mungiu-Pupăzan Mariana Claudia

Chirtoc Irina Elena

Vasilescu Maria

"Constantin Brancusi" University of Targu Jiu

claudia.mungiu@gmail.com

Abstract

Cyclical evolution represents a reality of any contemporary economy. In the same time, each phase of a cycle is a characteristic of a particular state of economy, performs a specific function in its overall evolution, so that, by restructuring components, the whole economy is reformed. In the opinion of Romanian economists, the current economic and financial crisis appears to be unprecedented over the last century. A massive decline in confidence, both in the business sector and for consumers, both responding by restricting spending, is in full swing. Challenges triggered by the crisis are multiple.

Key words: economic restructuring, cyclical evolution, economic growth

J.E.L. classification: O11

1. Current approaches to economic and financial crisis

It is well known that, in the postwar period, cyclical fluctuations mitigated for several decades. This position gave rise to a new question: "Is economic cycle an obsolete concept?". In 1990 same question was asked again. Few years ago, Robert Lucas and Ben Bernanke have said publicly, that although the economy would continue to suffer occasional downturn and the age of severe recessions or of global economic depressions was already over, imbalances still remained and appeared in different forms, despite the business cycle phase. [1] This situation has enabled a school of thought according to which economic theory and practice must be restructured from the ground.

It is estimated that, when an economy faces imbalances, one of the next possible ways may be followed:

- to introduce conditions of stable equilibrium by a profound restructuring
- to maintain the status quo and implement Keynesian policies They represent attempts to neutralize harmful effects of the former imbalances without touching the original causes of disorder, that is breach of conditions of stable equilibrium and manifestation of fluctuations in the economy.

Cyclical evolution represents a reality of any contemporary economy. In the same time, each phase of a cycle is a characteristic of a particular state of economy, performs a specific function in its overall evolution, so that, by restructuring components, the whole economy is reformed.

In the opinion of Romanian economists, the current economic and financial crisis appears to be unprecedented over the last century. A massive decline in confidence, both in the business sector and for consumers, both responding by restricting spending, is in full swing. Trying to restore stability, U.S. government and some governments of European countries, have rationalized parts of their financial sectors to an extent that contradicts the very foundations of modern capitalism. The world seems to change course, heading towards a time when the state's role will be larger, while the role of the private sector will be lower. This will, probably, be the most important macroeconomic restructuring caused by the current crisis.

It is estimated that the current crisis is rooted in the real estate speculative bubble in the U.S. This vision is at least incomplete. The main causes are both macroeconomic

and microeconomic and they were interconnected.

From a macroeconomic point of view, abundant liquidity, created by major central banks around the world and by oil and gas exporting countries' desire to limit currency appreciation, was a profound cause of financial crisis. There was, also, a super-saturation with savings generated by the increasing integration into the global economy of countries with high rates of accumulation (China, South-east Asia), and by the global redistribution of wealth and income to exporters of goods such as: crude oil, natural gas, etc. . All these have created the resources available for investments, including sophisticated financial instruments.

Very low interest rates and low volatility have been the consequences of abundant liquidity, thereby leading to increased appetite for assets with large gains and a tendency to underestimate risk.

Against this background a series of microeconomic causes have operated: securitization, clefts in the business model of rating agencies, rational private outsourcing, but socially inefficient, and international competition for deregulation.

Finally, the demand for liquidity in combination with a loss of confidence between banks gave rise to a rush for cash and effective interest rate started to increase. In the U.S. and in some European countries, governments and central banks have responded by improving liquidity, providing government guarantees for loans, recapitalization of financial institutions, preventing a messy collapse of large, networked companies, buying shares in banks, or through a coordinated interest rate decrease.

According to Friedman, slower growth and lower productivity generate a series of doubts and controversy over the private capacity of innovation in continuing to prevent the stifling effects of government control, if we continue to grant even more rights to government. He, also, suggests, that a more intrusive administration could damage prosperity due to free market and human freedom.[3]

Friedman's critics acknowledge the beneficial effects of government involvement in the economy: deregulation, privatization, a

reduced public spending, reducing taxes, non-intervention in the currency market and , the most important, to allow people to make their own decisions even if some will lose.

Such a conception seems to have no currently counterpart in economic reality, when the very lack of control over markets and globalization are blamed for the disasters induced by the financial crisis started in 2008. The crisis has encouraged criticism of the ideas of Chicago School and return to Keynesian ideas about stimulating the economy by increasing public spending and state involvement in regulating imbalances in the economy.

Who is right? Such a question is simplistic and incorrect. On the one hand, there is no pure market economies, and Friedman does not take this idea into consideration, and no absolute rule in the economy. On the other hand, because no theoretical construct may not fully represent the complexity of a reality after the time it was made, what we call today "free market economy" or "neo-liberal orthodoxy" is still serving as a model, as the Keynesian solutions of the U.S. administration in their effort to cope with current economic and financial crisis.

The recent crisis has highlighted a growing problem known under the collocation "too big to fail". [4] Lehman's collapse and the subsequent cardiac arrest of the global financial system have revealed that many financial institutions had become so great, indebted and interconnected that their collapse could have catastrophic systemic effects.

In the U.S., when a bank goes bankrupt FBIC takes control through a process of forced administration. But among these institutions "too big to fail" there are too few traditional banks. Most of the companies are huge financial institutions like Morgan Stanley and Goldman Sachs, AIG and other insurance companies extended over all possible fields, companies sponsored by the government, like Fannie Mae and Freddie Mac, hedge funds like Long -Term Capital Management.

Challenges triggered by the crisis are multiple. In the short term, the main challenge is finding solutions that will restore confidence of investors and consumers. In the long term, the main challenge is to adjust

the principles that guide the international financial system reform, mainly relating to transparency, improvement of regulations on securities accounting, ensuring a proper regulation of financial markets, companies and products and a closer cooperation between the world's financial institutions including upgrading governance structures of IMF and World Bank.

The recovery process can be represented in different forms reflecting the relative degree of rigor and sustainability of the process. [4] A V-shaped recovery is intense and rigorous, a U-shaped recovery is slow and disappointing, and a W-shaped is double minimal recovery, the economy is going through a temporary downturn, only to dive to zero again. The most likely scenario is, currently, a U-shaped recovery in advanced economies with weak growth in the forefront of the trend curve for a number of years.

2. Cyclical developments, economic restructuring and macroeconomic environment in Romania

After 1989, during the transition to a market economy, gross domestic product (GDP) has had an oscillating evolution, as an expression of profound transformation and restructuring of the national economy.

Table 1. Variation of GDP Growth

Year	previous year =100%	Year 1989 =100%	Year	previous year =100%	Year 1989 =100%
1989	100,0	100,0	2000	102,1	76,8
1990	94,4	94,4	2001	105,7	81,2
1991	87,1	82,2	2002	105,1	85,3
1992	91,2	75,0	2003	105,2	89,7

Source: *Statistical Yearbook of Romania, in 2008, the INSS data, own calculations*

In 2005, we had a GDP equal to that of 1989, but with a substantial improvement and modernization of branches and sub-structures of the economy, marking the end of transition to a functioning market economy and creating the necessary conditions for a closer position to the average level of countries of the European Union. Over the period 2001-2008, we obtained a GDP growth of about 40%, which corresponds to an average annual rate of growth, close to the maximum level of economic potential of 5.8%. This is a macroeconomic indicator that can be achieved in terms of full capital and labor, whose value (level) is not very different from the actual nominal GDP if the activity takes place normally.

Table 2. Growth Rate of Potential GDP and Productive Inputs

Period	Potential GDP	Capital	Employed population (15-64 years)	Total factor productivity
1992-2000	0,8	0,0	-1,0	0,7
2001-2003	2,3	1,3	-2,3	1,5
2004-2007	7,4	3,7	-0,5	2,7

Source: *Government of Romania, Pre-Accession Economic Programme, 2005, www.cnp.ro / studies*

If nominal GDP dynamic exceeds potential GDP, inflationary pressures and external imbalances occur in the economy, that can become unsustainable. Leap potential GDP recorded since 2004 is partly explained by methodological changes: until 2003, we took into account the total employed population since 2004 only working age population employed and is envisaged. Also, statistical data were revised.

Although the progress recorded in modernizing the economy and improvement of its functional character underlines the internal factors of development, as an open and highly integrated economy of the European Union, Romania is sensitive to

changes in economic environment and especially to the evolution of the main countries of the EU, that is its commercial partners. Therefore, one must consider the cyclical evolution of economic growth in the European Union and globally, as a factor that strongly influences the Romanian economy.

The financial crisis triggered in the U.S. and Western Europe in 2008 began to be deeply felt in Romania. The first episode of recession, 1990-1992 was a period of transition from a command economy, the second recession was observed in the years 1997-1999, being regarded as a transformational recession. A period of recovery and then an overhanging growth, above potential, followed these episodes. This was the most prosperous period, but a chaotic growth based on unsustainable consumption and our lack of strategic vision of development in terms of a wrong mix of economic policies that has stimulated consumption at the wrong time and has emphasized imbalances determined a new recession. In the last quarter of 2008, the Romanian economy ceased growth and signs of crisis became apparent. In 2009 GDP fell by 7.7% over the previous year and assessments for 2010 are about - 2.5%.

From the perspective of heterodox theory, the main cause of the current economic crisis started in the U.S. and then expanded globally through the contagion effect, is an excess of investment associated with the structure of competition for market share gain, which leads to excess productive capacity. A pressure of financialization of non-financial companies was added, which led to an excess fictitious financial investment, based on money illusion. There are similarities between the crisis triggered in the U.S. and then expanded in the developed countries and the Romanian crisis: the process of deregulation, the phenomenon of corruption associated with bad management of funds, the polarization of income distribution, real estate speculative bubble. What happened in Romania is easier to present [5]:

- Romania's economic crisis is internal, it would have occurred without external impulse;
- the causes of economic crisis in Romania are different from those of the financial

crisis in developed countries, the latter factor was just Shutter;

- transmission mechanism is the current account deficit financing and banks' exposure to derivatives are not bad;
- the adjustment mechanisms are represented by pro-cyclical policies: reducing the budget deficit, reduce public expenditure and not counter-policy.

In summary, the crisis in the Romanian economy has been driven by wage growth than productivity, increasing consumption and private debt financing by the exponential growth of current account deficit. It is a crisis of overconsumption. In detail, there are more cases to be added, namely:

- opening the capital account too quickly;
- consumption-foot, based on short-term external financing;
- pro-cyclical fiscal and budgetary policy, based on flat and strong growth in public sector employees, while the economy is expanding;
- postponement of structural reforms;
- reduced absorption of structural funds;
- denying the crisis in late 2008 which delayed the implementation of preventive measures and increasing internal and external imbalances.

From all this, the excessive consumption fever debt is the main cause of the crisis in Romania. Funding was provided by increased consumption of short-term external debt. Total external debt rose from 18 billion in 2004 to 72 billion euro in 2008. At the end of third quarter 2008 (at the height of growth, the economic slowdown that began then) short-term external debt was 33 billion euro of which 99% was private debt. Non-government credit increased rapidly from 10% of GDP in 2001 to 39% of GDP in 2008. Credits given to population and is reached at the end of 2008 about 70% of disposable annual income population. Since the summer of 2007 loans to households has exceeded people's deposits in banks, low savings rate, as opposed to high investment rates lead to accumulation of large current account deficit. It has consumed more than they produced. A significant contribution has had a fever consumption and speculative real estate bubble but not the proportion or what happened in the U.S.: only 5% of the population accessed the mortgage is

borrowed, most loans were for personal needs, but, most often backed by a good real estate.

3. Possible solutions to overcome the crisis and resume growth

Postponing reforms mean a profound restructuring in several areas (the real economy, economic policy mix, the market system, etc.) is a cause of imbalances and extend the economic crisis deepening, the U shape that is emerging more, while expression contradictory phenomena. Such is the labor market situation where emigration is recorded representing 3.2 million people, mass unemployment in rural areas, employment in the informal economy, agriculture is dominated by subsistence households. The Romanian economy is energy-intensive: a consumption record seven times higher than the EU average to produce one euro of gross domestic product. Many goods and services markets dominated by monopolies and oligopolies are restricted, which leads to higher prices for customers. The postponement was due to reforms and the lack of strategic vision and its components. Spreading economy - industry, agriculture, tourism, services.

The stringent application of topical interest for Romania is a viable anti-crisis program. Romania has a loan agreement with IMF, which provides quantitative performance criteria and benchmarks for restructuring. If Crisis is more than deficit financing, agreed with the IMF program is helpful but not enough to restore growth on sustainable basis. It includes quantitative performance criteria and structural benchmarks for reform: ceilings on monetary aggregates, interest arrears, reduce inflation, reduce public expenditure, growth stocks, capping the budget deficit, the adoption of new legislation on wages in the budgetary, fiscal accountability, administrative reform.

In the economic literature other solutions anti-crisis arising from the monetary approach are presented too: resume lending and boost consumption (main source of the crisis in Romania was an excess of consumption. Not that the crisis can be made on the same channel that generated the crisis), increased public investment in

infrastructure, increased call the Structural Funds (To date, Romania has demonstrated a low capacity to absorb structural funds. They tend to be procyclical. Can help economic growth, the factor of whether they are well targeted and damping effect). To overcome the crisis and achieve sustainable growth - consistent with the macroeconomic performance - Romania should have as a priority, increasing the employment of labor. [5] Currently occupancy is below 60%, which means that 4 of 10 fit does not work. If it succeeds as one of the 4 to work it means a million jobs, which is in line with the Lisbon Agenda, which does not mean full employment, or an equilibrium level but there is more people who use and save Produce added value and pay taxes. Employment growth could be correlated with other specific objectives: increasing internal migration from rural to urban, which could offset the rural pockets of poverty and reduce external migration. Overcoming the economic crisis involving an industrial policy and agricultural policy to stimulate economic sectors create jobs, value added, goods and services with a sustainable demand on domestic and foreign market.

Increasing employment is the opposite of staff restructuring. and reduce spending on the employers. In restructuring the public sector must address inefficient persons, those whose positions are not justified economically and socially. In the private sector restructuring is focused on reducing personnel costs. Increasing tax revenues and reducing budget deficit may be based on other sources including the most obvious is to reduce tax evasion.

Another component of a sustainable breeding program is a tax reform based on the principle of solidarity, which means that everyone pays tax according to the availability of pay-and the automatic stabilizer function of prices and profits to be a have the tax system. A flat tax system based on who wants to say that it is built on the principle of neutrality is misleading in a world with many externalities, asymmetries and adverse shocks.

Tax reform should also be accompanied by a change in budget planning: The state budget should be based entirely on a multi-annual programming, many investment

projects are inherently multi-and structural funds are also provided for projects that are multi.

Sustainable exit from the current crisis is not just about GDP growth in the previous year. Welfare includes quantitative and qualitative dimensions other than income growth. To overcome the current crisis and resuming economic growth is important to avoid the resumption of over-the duty cycle and maintenance costs financed deficits in normal limits determined by the market.

Abstract

The paper aims to make a radiograph of the world economic situation, how to overcome global economic crisis, the impact of global crisis on the countries had developed on one side and emerging on the other hand, and how which attempts to overcome the effects of this unprecedented crisis by different countries in different regions of the world. The paper's objectives are related to the presentation of the current global economic situation, the rapidity with which covered the entire world financial crisis.

Key words: economic crisis, emerging economies, developed economies, recession, financial flows

J.E.L. classification: F50, F59

1. Introduction

The paper is structured into four main chapters, preceded by an introductory chapter and ending with a chapter of conclusions. Chapter one, Introduction, presents the structure and phenomena work covered each chapter. Chapter two sets out the global crisis that characterizes the turning point of the global economic order, making a review of the current situation. Next chapter three that examines the return of economic crisis, strong but uneven phenomenon for developed and developing, so-called emerging economies. Chapter four shows that economic recovery requires the adoption of

coherent policies for the next chapter, Chapter five, to provide regional and global prospects of the global economic crisis. The paper ends with the conclusions resulting from analysis of the current economic crisis.

2. World crisis, turning point of the global economic order

The world economy is currently experiencing the largest decline in the postwar era, dominated by a financial crisis that swept in a record time, all over the world. Many developed economies have entered a recession, the rest of the economy slowing down and substantial growth. International trade and global monetary and financial flows show a significant contraction, while the unemployment rate has increased considerably.

The nature of the current crisis events can be reported in a precedent - in particular, the current situation of financial crisis combines the most advanced economies in the world with a period of global economic contraction.

In 2010, countries across yet another shock wave, which invariably involve changing the current world order. The last twenty years have seen major changes in international economic context, the collapse of the Soviet Union and the centrally planned economies of Eastern Europe, reforms in China and India, export-based growth strategies in East Asia, all leading to the creation of a world economy market and also bringing 4 to 5 billion people.

On the one hand, these major changes have led to tremendous opportunities for

development, but on the other hand, have destabilized the international economic system built in the mid-twentieth century, subsequent recalls being only temporary.

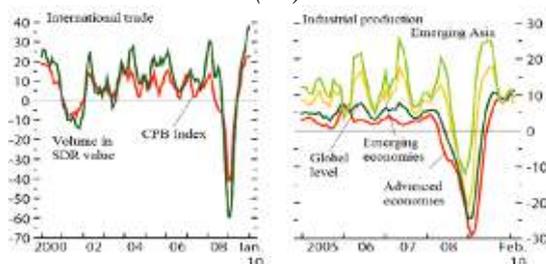

Recessions products simultaneously in several countries are considered to be deeper and more prolonged than unilateral ones. In this case, recovery is extremely difficult to produce, international trade plays a smaller role than in synchronized recessions. Recession now facing countries of the world can be characterized as being strongly associated with Synchronous and severe financial crisis, a rare combination at least for the postwar period.

Consequently, the crisis will be extremely difficult, thus justifying the historical parallels between now and the Great Depression of the 1930s, by far the most long and deep recession, known by most developed countries.

3. Recovery from crisis - robust, but irregular

Fortunately for the world economy, signs of recovery from the crisis appear, but can not even talk about a return to all parts of the world. Partial data show that in 2010, world production increased by 4.25%, which means a clear improvement compared to 1% in October of 2009, financial markets recovering much of the economic and consumer confidence both (Figure 1).

Figure 1. Global economic indicators (%)

Source: Netherlands Bureau for Economic Policy Analysis, IMF, February, 2011

Real GDP growth reached 3.25% in second quarter 2009, having to reach up to 4.5% last quarter. The world's key economies (both developed and emerging), improved domestic demand and the foreign debt was boosted by the return of international trade.

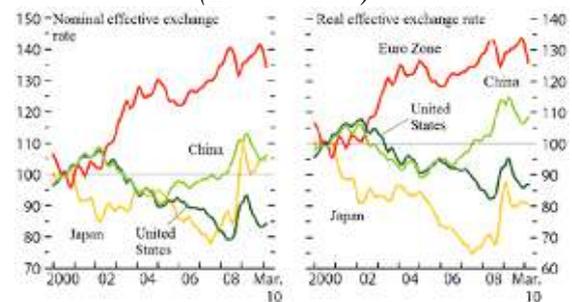

Restore of the U.S. economy compared with the European Union and Japan reflects a number of differences between the three power centers: the United States, fiscal stimulus has been achieved in considerably larger scale, non-financial corporate sector is less dependent on lending banking, recovering the securities markets and relatively quickly, and Federal Reserve System reacted promptly in implementing policies to counter the crisis.

In emerging economies of Asia already exceeds the production rates achieved before the crisis (Figure 1). In the third quarter of 2009 and some Latin American countries have started to show signs of recovery, although the production level in this area can not be compared with that of Asia, some Latin American economies are still facing crisis.

Emerging Europe and the CIS are other regions where economic recovery slow to appear, while benefiting from economies of Middle East oil demand growth and its rising price. The situation in sub-Saharan Africa is diverse. Most middle-income economies and oil exporters, subject to abrupt deceleration of output contraction in 2009 and begin to benefit from rebalancing of international trade and commodity prices.

Border financial flows seem to recover from the shock suffered in 2008. Key factors behind the recovery include increases in capital flows to emerging economies and their willingness to take financial risks again. State influenced financial flows exchange rates, leading to dollar depreciation and appreciation of their floating rates of other advanced and emerging economies, but if we consider the levels attained before the crisis, the bill changes are reduced (Figure 2).

Figure 2 Evolution of major currencies (2000 = 100)

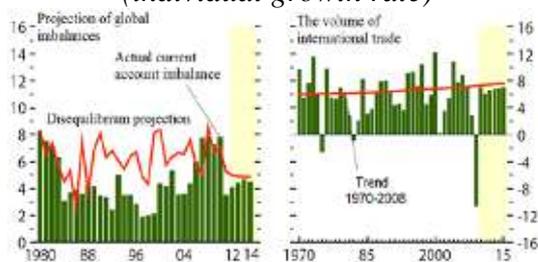

Source: International Financial Statistics, IMF

Regarding major economies, China's current account surplus fell from 9.5% of GDP in 2008 to 5.1% of GDP in 2009, reflecting the contraction of world output and international trade, and an increase accelerated public spending. During the same period, the current account deficit of the United States declined from 5% to 3% of GDP, increased state induced by the collapse of savings and investments households.

International Monetary Fund estimates, however, seem to suggest an increase in current account deficits throughout the period restabilizare international trade (Figure 3).

Regarding the global economic recovery, there are two factors that will continue to support the course of 2011, with financial incentives to decrease gradually in intensity. The first factor is the state of financial markets - it is hoped that the sources of financing (loans) become available again, and rebalance income households can retake consumption.

*Figure 3 Global imbalances
(individual growth rate)*

Source: *International Financial Statistics, IMF*

Overall, it appears that the global economy will enter a recovery phase, but not uniform (Figure 1). Global growth is estimated at 4.25% for 2010 and 2011 (estimates). Economic growth in advanced economies is set to 2% in 2010 and 2.25% in 2011 (estimates) after a 3% drop in production in 2009. In developed economies, their growth is expected to reach 6.25% during 2010-2011, after a modest rate of 2.5% in 2009. Therefore, the return of developed economies will be quite slow. Some European Union countries that have suffered major financial imbalances in the crisis will pass through a difficult period, not falling into forecasts of economic growth, while countries such as Australia or the newly industrialized Asia (which have experienced less impact global

crisis) will describe the most favorable development.

4. Economic recovery requires adoption of coherent policies

For an effective economic recovery can take place, it is necessary to take radical measures, no easy task, since requiring an international correlation. In most advanced economies, but also a handful of emerging economies, we need a relocation application, focused so far on ordinary consumers (public domain), relocation to the private sector, coupled with the consolidation of public

If economies must restore the level of private capital (United States), it requires a balancing and acceleration of financial reform, to help recreate the proper economic recovery. Such a framework would allow to remain lax monetary policy, inflation or coppices in domestic and international stability.

In addition to fiscal consolidation, financial sector reform progress should be considered a priority for both developed economies and the more advanced, whereas the current global crisis has been propagated only by financial market inefficiencies. Given the integrated nature of markets and financial institutions, reforming their synchronization needs worldwide.

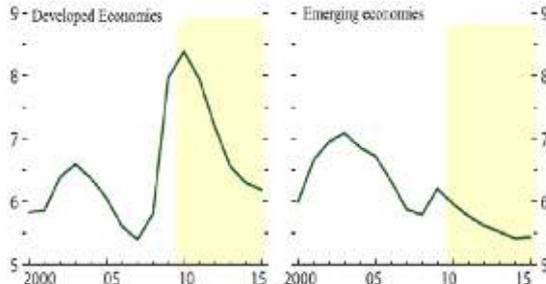

Briefly, efforts will be needed to fix damage from the crisis:

- recapitalization of banks: it needs an influx of cash to absorb the deterioration of credit quality and to support sustained growth in the light of tightening standards on financial markets;
- restructuring of banks: it will help stabilize the banking system and lead to avoid future turmoil from external bodies to support them when leaving the states;
- titrize claims revive markets: although still dependent on the state, have become an integral part of bank lending in most advanced economies.

Looking ahead, a considerable effort will be devoted to restoring order to the markets. This can be achieved only through actions on several fronts: higher capital needs, new financial instruments, reducing the size of financial institutions to be more easily operated and controlled.

Another problem that threatens the economic recovery the unemployment rate is up. In advanced economies, the unemployment rate will reach a value of 8.5% in 2011 and then to decline slightly.

Figure 4 Estimated unemployment rate 2010-2015 (%)

Source: International Financial Statistics, IMF

The problem is much broader than statistics can show. A large proportion of the employed population is engaged in temporary work or work part-time, part of the population and occupied, but able to work, gave up the idea of hiring, so there is included in the statistics. Influence on unemployment showed lower production varied among developed economies.

Retraining programs can help to reintegrate the unemployed into the labor market. Wage flexibility is important in terms of facilitating the reallocation of labor in economies that have suffered strong sectoral shocks. Also, wage adjustment is required to mitigate the effects of salary on the standard of living declines.

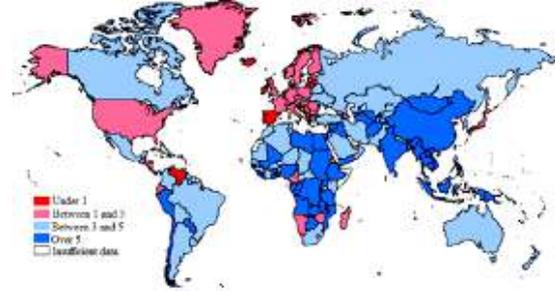

In most developing economies, unemployment was more weighted than in advanced economies. The need to reduce the adverse effects of soaring unemployment becomes an imperative in the entire world economy

5. Regional and global perspectives

While the world economy recovers from its biggest crisis since the Second World War until today, the economic recovery varies greatly by region (Figure 5). In some economies, the average increase expected for 2010-2011 will likely exceed 10%, while in others it will be negative. In addition to major disparities between growth rates, while the figure below shows the potential recovery

towards the optimal level of production for economies to function properly.

Figure 5 Estimated real GDP growth between 2010-2011 (%)

Source: International Financial Statistics, IMF

As regards the United States, is circulated into a recovery phase, but demand remains low. According to the IMF fiscal and monetary easing, and other policies to improve the financial and real estate sector have led to adding real GDP growth rate by 1% in 2009. Thus, real GDP grew at a rate of 2.2% in the third quarter of 2009 and by 5.6% in Q4, the domestic demand while maintaining a level still below that registered prior to the coming crisis.

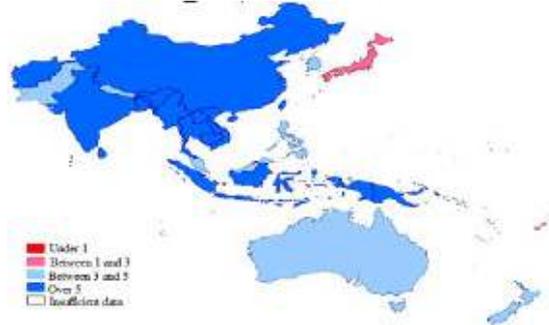

The labor market remains unusually weak. Since the crisis began, more than 7 million people have lost their jobs and 8.8 million working (unwillingly) to half-time. Although job losses decreased in intensity, the number of employment remains negative, the unemployment rate in 2009 decreased 10% and marginal in the first quarter of 2010.

Financial market tensions have diminished, but credit availability is still low. Liquidity spreads and the risk associated with investments have already reached pre-crisis levels. Securities markets recovered from early losses after 2009 and the issuance of shares and bonds have already exceeded pre-crisis levels.

Considering these circumstances it is fair to say that the of the United States economic recovery will take place gradually. Real GDP grew by 3% in 2010, 0.5% more than the estimates in January 2010 and 1.5% higher than the forecasts made in October 2009. But the return will still be weighted by restoring income households, but necessary, reforming the financial sector and the state that make the labor market.

And for Canada, the economic recovery will be slow, reflecting more moderate growth in demand than in the United States and a substantial appreciation of the currency.

Figure 6 Estimated real GDP growth in Asia between 2010-2011 (%)

Source: International Financial Statistics, IMF

Although the impact of financial crisis on many Asian countries was strongly felt at the end of 2008, surpassing expectations, their recovery from the crisis was the just as fast. The low level of public debt has enabled many Asian economies to implement strong anti-cyclical policies.

In China, GDP growth exceeded the government set for 2009, 8% and is expected to reach 10% both in 2010 and 2011. What has so far been sustained economic growth through public investment in infrastructure from 2010 will be translated to the private sector.

In India, economic growth will reach 8.75% in 2010 and 8.5% in 2011 (estimates). Consumption will increase as labor market conditions improve, while being expected investment boom induced a high level of profitability.

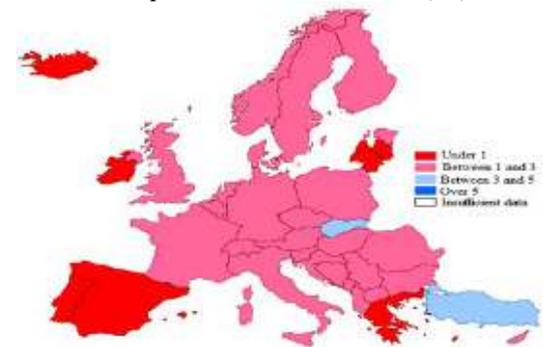

Estimates for the five member states of ASEAN (Indonesia, Malaysia, Philippines, Singapore and Thailand) on economic growth reached 5% for 2010, based mainly on increasing domestic demand. Among ASEAN economies, the most powerful has proven to be Indonesia's production increased by 4.5% in 2009 compared with 1.75% ASEAN media, thanks to low levels of domestic demand and trade dependence.

In Japan, improving the economic situation is supported by exports, but also hampered by the low level of domestic demand. Domestic demand will remain low

because of several factors, including a return to deflation and labor market unbalance.

Both in terms of emerging Europe and the advanced economies in crisis recalls estimates vary considerably. Many macroeconomic stimulus policies have helped the main European economies, although the application has not yet reached a level conducive to economic development.

Figure 7 Estimated real GDP growth in Europe between 2010-2011 (%)

Source: International Financial Statistics, IMF

There are certain forces which remove the economic recovery of Europe. Current account deficits constrain a number out of the recession in the Eurozone countries, producing externalities in the rest of Europe. Solvency and liquidity concerns for Greece continue to threaten financial market conditions normalize.

However, developments in Europe is estimated at more modest. GDP in advanced economies had a growth of 1% in 2010, reaching 1.75% in 2011 (estimates). Increase Europe's emerging real activity is expected to be 3% in 2010, having to grow a further 0.5% in 2011 (estimates). However, these aggregate estimates do not capture the pronounced discrepancies recorded over the region (Figure 7).

In developed Europe, the return is expected to be gradual and fluctuating. Average GDP growth throughout the euro area in 2010 reached 1% in 2010 and 1.5% in 2011 (estimates). The same moderate course will be followed by France and Germany, where export growth is limited by external demand, investment is hampered by credit constraints, and consumption is reduced because of high unemployment. A difficult recovery from recession and will be small

countries, where growth is reduced major fiscal imbalances or current account (Greece, Ireland, Portugal, Spain).

In emerging Europe, forecasts are also variables. The savings have been relatively well through the global crisis-induced shocks (Poland) and others where economic activity has recovered from external shocks (Turkey), will benefit from robust recovery, helped by capital flows and international trade rebalancing.

At the same time, the crisis economies caught with current account deficits excessive (Bulgaria, Lithuania and Latvia) and those with vulnerable fiscal situation (Hungary, Romania, the Baltic countries) are expected to recover harder, in a somewhat because of the prohibitive framework for the implementation of coherent policies.

6. Conclusions

Big financial shock waves that cause existing cracks deepen political, economic and social, and sometimes, a new order replaces the old. In 2010, countries across yet another shock wave, which invariably will lead to changing the current world order.

In the contemporary period, recessions have declined both in frequency and in intensity, while periods of economic expansion have been expanded. However, recessions associated with financial crises have become more severe and prolonged than those accompanied by other types of imbalances. Recovery from this type of recession is therefore much slower and are also associated with reduced domestic demand and acute shortage of liquidity.

Regarding the emerging economies of Europe, significant internal vulnerabilities, and in some cases relatively rigid exchange rates have hampered the application of complicated anti-crisis policies. A number of states marked by fragile banking systems, currency fluctuations and balance of payments deficit have used external financial support from the International Monetary Fund and other official sources.

Vices of advanced economies' financial systems have encouraged excessive lending and therefore inhibited savings, while some government programs and market irregularities in some emerging economies

have a strong impetus. Insufficient fiscal consolidation during periods of economic boom have boosted these effects, like the massive accumulation of official reserves by emerging Asia.

The lessons states of the world should learn from the current global crisis is producing as many as it is clear. The global crisis started in 2007 has demonstrated once again the fragility of the international financial system fragility enhanced by the high degree of globalization of financial markets.

Monetary Policy Aspects in Central and East European Countries

Munteanu Irena

„Ovidius” University of Constanta, Faculty of Economic Sciences
irena.munteanu@yahoo.com

Abstract

The monetary policy, as part of the economic policy, represents an absolute prerogative of the central bank. Although all monetary policy instruments are identical in most Central and Eastern European states, the manner and the frequency with which they are used differs from country to country.

At global level, the monetary policy objectives are either unique or multiple. In the past years, more and more states have given a special attention to the inflation objective.

Direct inflation targeting is a strategy adopted by many European countries, among which there is Romania.

The present paper brings to attention the particularities of applying the monetary policy in several countries from Central and East Europe, from the perspective of the inflation and the interest rate.

Key words: inflation targeting, interest rate, monetary policy.

J.E.L. classification: G21, G28.

1. Introduction

The world economy has recorded, over history, moments of economic growth, technological and social progress, but recession and collapse moments, as well. Therefore, states had become more and more preoccupied with providing the optimal economic activity development background, appropriate for promoting economic growth and a stable financial climate. In this context, the monetary authority of each country became an important pawn in reaching these goals.

All these aspects shape up the elements at the foundation of elaborating, developing and perfecting the countries' macroeconomic

policies. We can, therefore, consider macroeconomic policy to be “a deliberate state intervention with the purpose of reaching certain structural or conjectural goals” [1] based on sustainable and long-term constant development strategies.

2. Direct monetary policy strategies: Direct inflation targeting

Over the past years a new monetary strategy has been developing: direct inflation targeting. This theory is related to New Zealand which adopted such a strategy, for the first time, starting with 1988.

Direct inflation targeting represents a monetary policy strategy that requires setting a target for the inflation level over a certain period of time, which must be reached by applying monetary policy measure in order to ensure price stability. [2] Even if the origin of the concept is in practical life, its theoretical development was accelerated over the past period, on the background of this strategy being adopted by more and more central banks. Thus, Svensson [3] defines inflation targeting through its characteristics: (1) There is a numerical inflation target, in the form of either a point target (with or without a tolerance interval) or a target range. This numerical inflation target refers to a specific price index, the experience of the countries that have passed to inflation targeting is taken into consideration, showing that the most frequently used index is the consumer price index.

(2) The decision-making process at a central level is based on its strong independence regarding adopting monetary policy instruments that shall lead to achieving the inflation target.

(3) There is a high degree of transparency and accountability in order to reach the inflation target.

Monetary policy influences, through its instruments, the loan market and important areas of the financial markets [4].

3. Inflation rate evolution

Its evolution shall be analyzed taking into account the levels attained by this index over the past four years and, on this basis, we shall build a series of elements necessary to shape an accurate image of this evolution: charts, recorded average rates, evolution related to target and so on. In Table 1 there are presented the synthesized inflation rates with the levels recorded over the analyzed period.

Table 1- Inflation rate levels over 2006-2009

	2006	2007	2008	2009
ROMANIA	6 %	5 %	6.30 %	4.74 %
POLAND	1.38 %	4 %	3.30 %	3.50 %
CZECH REP.	2.50 %	5.40 %	3.60 %	1.00 %
AUSTRIA	1.70 %	2.20 %	3.20 %	1.00 %

Source: official data analysis: www.bnr.ro , www.nbp.pl , www.oenb.at , www.cnb.cz

The evolution of the inflation rates in Romania, Poland, the Czech Republic and Austria is presented in Chart 1. Based on it, the following analyses can be made:

The year 2006 was relatively good form the inflation viewpoint and Poland, the Czech Republic and Austria had the best inflation levels over the three years previous to the profound manifestation of the financial and economic crisis; the interval 2006-2008, taking into account that the powerful effects of the economic impasse were felt in these countries either at the beginning of 2009 or in the fourth trimester of 2008.

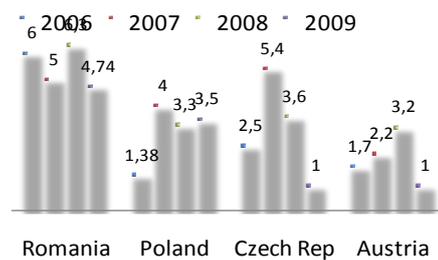

Unlike the other three states, Romania records a much higher inflation level at the beginning of the period but also presents a rather small variation over the analyzed period, therefore having a variation channel with relatively close limits.

For Poland and Austria, we can state that the inflationary process had a quite large leap in 2007 and then reduced in 2008, but the tendency created over 2006-2008 is one of growth of the inflation level in those

countries.

The situation of Austria is an atypical one as it presents the influences of the Euro Zone and if we take into account the inflation target, expressing it in a growth of maximum 2 pp per year, we may state that the monetary policies are efficient and maintain the inflation ration under the 2 pp growth limit, as it is an average of 1 pp over the analyzed period.

Chart 1. Inflation rates evolution

Source: official data personal analysis: www.bnr.ro , www.nbp.pl , www.oenb.at , www.cnb.cz

Over 2009, from the perspective of the inflation, there was a general tendency of decrease for three of the four analyzed countries: Romania, Austria and the Czech Republic, whereas for Poland the inflation index recorded a slight growth of 0.20 pp.

We may underline the average evolution of the inflation index, but based on the 2006-2008 period, in order to speak about a period with constant characteristics regarding economic growth, all countries recorded positive evolutions over the mentioned period.

Table 2- Inflation rate average

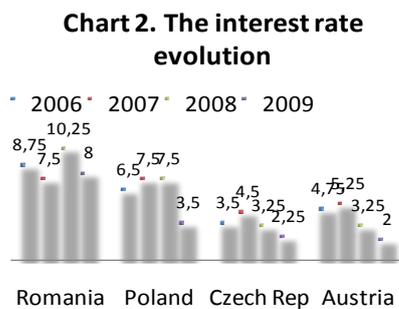

PER IOD	COUNTRY			
	ROMANIA	POLAND	CZECH REP.	AUS TRIA
2006 - 2008	5.76 %	2.89 %	3.83%	2.36 %

Source: official data personal analysis: www.bnr.ro , www.nbp.pl , www.oenb.at , www.cnb.cz

A relevant index may be the inflation rate evolution average. We may notice that the lowest average is 2.36% reached by Austria, and the highest value is 5.76% attained by Romania.

4. Interest rate evolution

An important monetary policy instrument is the reference interest rate. Its evolution over the analyzed period offers information and characteristics of the monetary policy for each individual state.

Source: official data personal analysis: www.bnr.ro,
www.nbp.pl, www.oenb.at, www.cnb.cz

By evaluating the interest rate based on Chart 2 above, we notice that, from this index perspective, we may divide the four analyzed states into two groups: Romania and the Austria - Czech Republic – Poland group; this is due to the large difference of value among the interest rates in these states.

We may also notice that Austria, the Czech Republic and Poland are approximately within the same interest rate index variation interval with the higher limit of 5.25% and the lower limit of 1.38%, compared with Romania, which has a separate interval, situated at a superior level, its interest rate varying between 7.50% and 10.25%.

5. Conclusions

The present research reveals the fact that inflation targeting is a hard-to-reach objective for Central and East European countries. Moreover, the world financial Crisis and the fiscal policies of some states did not facilitate reaching the proposed goal in the least. For Romania, raising the VAT to 24% made it impossible to respect the prevision interval for the inflation rate announced in the beginning of 2010.

The monetary policy interest rate has direct influence over the activity of the credit institutions. Thus, the adjustment process of the interest rates in the loans of the banking sector clients is slowly developing, as this is one of the characteristics of the monetary transmission mechanism that the majority of the field research papers have drawn attention to.

This phenomenon is influenced by both the characteristics of the loan contracts, and the variability of the loans' interest rate according to the reference interest rate that sets a certain rigidity to the adjustment mechanism of the new loans interest rates, by the dominant position of the banking sector within the financial system and the absence or the limited accessibility of non-banking financing alternatives, which has as an effect, the decrease of the loan demand elasticity of the non-banking clients regarding to the interest rate [6], to the possibility of replacing the national currency loan with an external currency, to the easy access to external financing and to the banks' expectations as to the reference interest rate evolution and the economy, in general.

The influence of the monetary policy over the companies' decisions regarding investment, consume or saving are determined by the usage degree of this transmission mechanism, especially under the conditions of financial intermediation increase, a process which characterized the Central and East European countries over the past few years.

The Philosophical and Economical Foundations of the Free Market

Munteanu Ligia

„Alexandru Ioan Cuza” University of Iasi, Doctoral School of Economics
ligia_mun@yahoo.com

Abstract

The free market represents the most efficient economic system, in resource allocation, trade growth and social development. A liberal economy is not based only on economic aspects, but includes all social phenomena of a nation. The free market depends on a proper framework, based on the rule of law, property rights, liberty of individual choice. This paper will analyze the philosophical and economical elements that offer the context for economic freedom.

Key words: free market, institutions, economic freedom, property rights.

J.E.L. classification.: K11, K12, B15, B53.

1. Introduction

If we look in the history, the nations have the experience of different ideologies. As old as the history of states is also the confrontation between liberalism and totalitarianism. From the point of view of an economist, the basic difference between all regimes is the degree of interventionism in the market.

As it has happened in history, a crisis tends to end a period of economic development. Maybe the great recession in '29 was much worse than the recent one and maybe the latest is more opened for media speculations. Whatever the difference, one effect is important, and that is the return to the call of the state. Governments are seen as a solution of leading the market in a right direction, assuring first that the present crisis will be passed and secondly, that in future a new depression will be prevented.

This paper gives an argumentation against interventionism. As Mises wrote, there is no way that a group of governors can know what is best for the market, simply because

they are not in the market [14].

The free market is not a perfect system of economy, but it is perfectible and until now, it represents the best way of achieving the *wealth of nations*, Adam Smith was writing about. The development of a society depends on economic growth. Prosperity can be obtained only if the nation is based on a strong economy, free, open and flexible to the permanent changes faced by the international trade.

An open society relies both on philosophical and economic fundamentals. The roots of a free market cannot be obtained from virgin soil, invented over night by a glorious mind. The framework was developed from old history, along with the development of human beings and societies.

The institution of free market cannot exist in an absolute vacuum, it will be a utopia. It needs a proper legal structure based on the security of property rights and freedom of contracting. The questions are how should this framework look like and by whom should it be implemented. Is there the need of government to come and give imperative laws or the market itself can form its own rules?

Trying to answer to these questions, the paper will analyze the institutional basis of a free market, dealing with the sense of liberty, the importance of economic freedom in gaining prosperity, security of property rights.

2. Liberty and free market

The first theories concerned with the concept of liberty appeared in nineteenth century, in England and France. But only the first state will get to know the true essence of the term [8]. Two traditions are concrete from these studies: an empirical and not strictly ordered one and a speculative, rationalistic one.

The first opinion underlines the principles of the spontaneous order, as the institutional evolution is based on real needs, appeared in the economic and social life, as a response to the concrete and unexpected situations. The traditions have an essential role, the informal institutions transform into formal laws, under general acceptance. This theory is found in the writings of David Hume, Adam Smith, Hayek and Mises. The Austrians stress the model of the Britannic *common-law*, as the proper legal structure of an open society. The institutions will complete one another and only the good ones will survive. If a rule is not following an efficient function, it will lose its purpose and appliance.

The second theory is based on Cartesian rationalism. Liberty is present, but in the margins of a plan. These view has quickly gained notoriety because, based on logical deduction, it offered specific answers. What is uncertain is not accepted. The French legal history is based on this conceptual view, and has many influences in the Romanian civil codes after Napoleon. Everything is based on a plan, things are predicted and imagined. All institutions are inventions of human for the good of society. Hayek described these authors: "*for them, liberty means chaos*" [8].

Adam Smith opened the road of combining economic theory with institutions. For him, liberty and free market are viable only in the state of law [16]. In his sense, economic freedom means the ability of agents to enter in any form of trade they consider proper, under a general system of law, defending private property. The individual acts on the market as he voluntary wants, without any interference of the authority, majority or other opinion [1].

The free market is more confident in the first scenario, as described by the Austrian economists. The principle of *laissez-faire* appeared in the XIXth century in England. The origins of the free market are, although, much older, going back into the middle ages.

It seems that one basic argument of the free economics lays in the private property. Even Aristotel wrote about this aspect. He observed that individuals tend to take better care about the things they own individually, in comparison with onther comun goods. He also underlines that if everyone would take responsibility for everything, the resoult will be a general confusion [1].

The essence of free markt is that individuals are able to act as they consider for personal benefit and an individual prosperity leads to national prosperity. When acting free on the market, without any disturbances of price ragulation or other boudaries, economic agents meet competition and this will make them improve their production, make more efficient the allocation of resources and dinamisize the transaction with lower costs. To sum up, free market is based on three general principles:

- Liberty of individual choice
- Liberty of contracting
- Security of property rights [6].

Under freedom of human action, complex institutions can evoluate, generating from social and economic needs [9]. But it is also true that human nature is unpredictable and individuals are subject of personal feelings. The general acceptance of rules originating in habits is not always a guarantee that one agent will respect the other. Here it will be the role of the state. Not in the market, but in assuring that property rights are guaranteed for every citizen.

A free market does not exclude a government, social mecanisms and organisation to fuction on behalth of the citisens and financed from public buget. The economy needs a proper governmental attitude in order to obtain groth.

When the state interfierces in the economic process, even if the intentions are goos, it cannot bring solution that on the long term will have assured consequences. Every action in short time will be unpredictable for the future. The fraze „*legislative inflation*” descriebes what happends in the market when leaders fix borders of trade. Entrepreneurs are suffocated, production failes, offer does not meet need and the resoult is not by any means prosperity, but economic regression [13].

3. Private Property

Even if the terminology of private property is knowened in practice from much older periods, a complete literature on the subject appears later in the XIXth century.

Mill distigueshes between production and distribution and includes property under distribution [13]. Schumpeter will argue that in a free society, there is not separation

between these two aspects of the same system. The impulse is primarily found in property of the land owner that will lead to production and on to the distribution process itself. If property is not assured, then neither the goods obtained in production are not under the voluntary will of the owner to change them in trade.

Mises argues that property of production goods is not a privilege but a social liability, as the production must be put at the disposal of the consumer, at a higher level assuring satisfaction [14]. Thinking in this way, Mises starts his arguments for capitalism, based on the supremacy of the consumers.

Private property is a fundamental right in a free market, including two aspects: to control and own the property and the privilege to transfer it to others, voluntarily. The liberty of contract is an extension of the property right [7].

The foundations of constitutions lay in the principles of property rights. Living in a society, it becomes natural the problem that individuals may do whatever they want with their own goods, but there are limits regarding trespassing another's property. American jurists of the XVIIIth century, like John Locke, James Harrington and the British Sir William Blackstone wrote about the limits of governmental power in private property. The state has „a police power” and it must be clear and definite borders. The answer to this issue was a supreme law, the constitution.

When property is assured, the uncertainty degree is lower and the investments grow, leading to economic growth. Huerta de Soto argued that the low condition of the undeveloped countries is the effect of the insecurity of the property rights. Economic liberty does not have any sense if the individuals have no power to dispose of personal goods and fruits of those goods. The states of the West, owe their development to the rule of law, which assures private property [8].

4. Conclusions

Liberty is one of the most precious gifts of life. The only impediment for reaching and maintaining it are people and their actions.

The free market is, until now, the best way of achieving economic prosperity and social

development. With all its imperfections, mistakes and negative aspects, the open society is the answer for wealth.

Even if the free market is a pure economic concept, it cannot be distinguished from the social context it is placed in. Itself represents a way of life, a specific conscience and attitude.

The rules of the economic game are structured around key elements like property rights, liberty of contracts, rule of law and individual liberty. The impulse for efficient allocation of resources comes from property and the will of the owner to realize production for future exchange. Trade will assure that everyone has what is needed.

Assuring property does not mean exclusive right for interventionism. Bilateral will shall be protected under the limit of general rules. The market is able of setting its own rules, coming from a behavior that is common to everyone. If one agent does not accomplish its contractual agreements, it will lose future liability. The market has its own ways of punishment and when competition is fierce, every individual will avoid this kind of mistakes.

The value of economic freedom comes from past experiences, from generations that know what unfreedom means. It is natural that the economic cycle has ups and downs, but to relay the failures on the free market is a fundamental mistake. These moments have their positive aspects also, and they should be seen as opportunity for reinvention and transformation.

The general conclusion is that a free society, based on a free market will be also a prosper one. Economic freedom is the engine for development. The confidence in the free market must be reaffirmed and only the states that will do so will assure a better future for their people.

Free Market and Prosperity- an Empirical Approach

Munteanu Ligia

„Alexandru Ioan Cuza” University of Iasi, Doctoral School of Economics
ligia_mun@yahoo.com

Abstract

This paper presents an empirical analysis of the relation between the free market and prosperity. Based on the 2011 report of the indicators Index of Economic Freedom and Economic Freedom of the World, the arguments for economic liberty gain empirical proof. The data presents a powerful source of measuring key aspects of economic life and development of the society, issues that will correlate in a general conclusion about the freedom of the world we live in.

Key words: Index of Economic Freedom, Economic Freedom of the World, free market, prosperity, economic growth.

J.E.L. classification.: O11, O12, O50, C43.

1. Introduction

The advocates of the free market have always been criticised about the empirical part of their science. As any social domain, economy has no definite borders. This field interacts strongly with others, with deep implications in social life, culture, religion, moral values and also real sciences. Because economists cannot have a strong delimitation between their subject and other domains, for them, the empirical analysis is a weak point.

For example, jurists have a very specific language, a way of understanding life, a certain method of judging things. In economy, doctrines are so diverse, and there cannot be found a middle point. Perhaps, the only thing that unites all economists is the final scope of their research. That is, finding the best way in which wealth and prosperity can be achieved.

In the austrian point of view, the free market is, until now, the most efficient economic system that leads in direct relation to economic growth. Also, the concept of

economic freedom deals with many intangible elements and measurement becomes difficult. Hayek and Mises did not reject calculation or statistics, but only believed that these models are, in their nature, limited. It is in the same way that any model is limited, because it means known causes leading to known effects.

However, in recent years, economic freedom found its empirical indicators. Researches founded the Index of Economic Freedom (IEF) and Economic Freedom of the World (EFW), measurements that will add to the argumentation for liberty.

EFW is developed in 1996, by Gwartney, Lawson and Block, researchers at the Fraser Institute. The indicator was used in the empirical analysis of year 2000, and its values proved to be right. EFW takes in consideration five fundamental areas: governmental spending, security of property rights, access to sound money, trade freedom, and credit, labor and business regulation.

IEF was implemented by the Heritage Institute and Wall Street Journal, starting the analysis from year 1995. IEF is based on ten components: business freedom, trade freedom, monetary freedom, government spending, fiscal freedom, property rights, investment freedom, financial freedom, freedom from corruption and labour freedom.

2. Economic freedom and prosperity

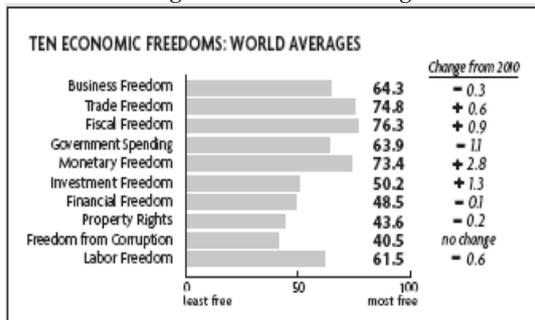

The final reports from 2011 come with great results. If the crisis was a general impediment for marching on the way of liberal economic, the indicators do not show regress. The degree of freedom is still growing, even if in a smaller percent. The world average of growth is 59,7, meaning with 0.3 percent more than last report.

Also, an interesting aspect is that America is not any more in the first five states. This has a major significance, thinking that the anglo-saxon space has always been

associated with liberty [6].

The data in *Figure 1* presents the research for 183 countries, starting from the second half of year 2009.

Figure 1-World Averages

Source: *Index of Economic Freedom, 2011*

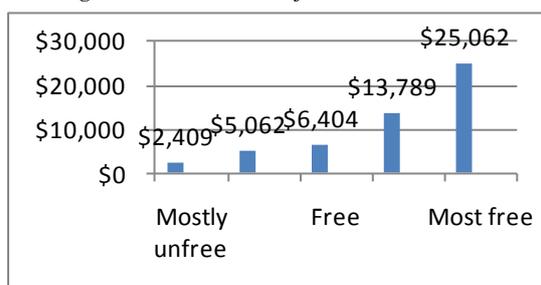

Based also on classical liberalism theories and institutionalism point of view, the indicators follow the fundamentals of economic freedom, most important areas that the free market interacts with.

The statistics contain both quantitative indicators, like GDP, unemployment, and measurements of human development, life standard, poverty, mortality degree, etc.

The indicators show a direct relation between the degree of economic freedom and prosperity of nations. The data correlates freedom with higher GDP values, greater life expectancy, lower mortality rate and lower competition [7].

The citizens from the first five states (Hong Kong, Singapore, Australia, New Zealand and Switzerland) have a GDP average of \$23,450 and a rate of economic growth of 2.56 percent per year. The last five states (Zimbabwe, North Korea, Cuba, Venezuela, Libya) measured only \$2,556 in GDP and a negative economic growth rate of -0.85 percent per year.

Figure 2- Economic freedom and GDP

Source: *Fraser Institute 2010*

The results are justified because economic freedom stimulates entrepreneurs and investment. A strong economy is the foundation of a developed society. The production is not in the hands of government and resource allocation becomes more efficient.

3. Economic freedom and life standards

In a prosper society, where the economy is flourishing, diverse and flexible to novelty, where the market is consistent in high quality goods and services, the life standard cannot be a poor one [2].

Every individual feels the signs of a slow economy, even if does not take part in actual economic activity. The standard of living becomes the reason for immigration, because it is in human nature to seek for a better way of life.

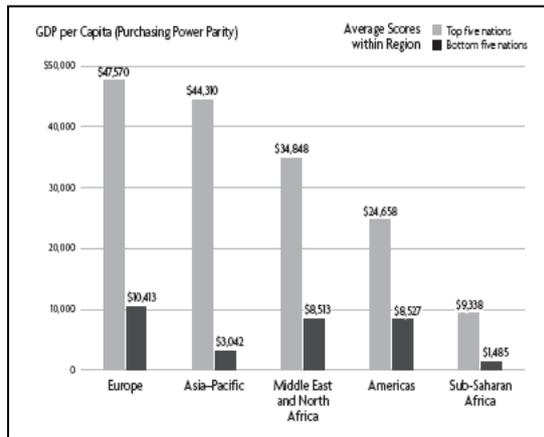

The wealth of a state is nothing when its citizens are living in poverty. The recent example of Arabic countries proof this is true. Not even when religion is very strong, people cannot accept forever unfairness and any form of slavery. The feeling of tolerance represents the meaning of the twenty one century [4].

The indicators IEF and EFW underline the relation between freedom and life quality. *Figure 3* sums up the data in a regional comparison between Europe, Asia-Pacific, Middle East and North Africa, the two Americas and Sub-Saharan Africa. Every region has countries both in the category of free ones and in the second category of less free. The differences are strong. It is clear that living standard is a measurement for a single country, at the level of region being impossible to expand the same characteristics [7].

The quality of life was the cause of blaming the strong differences between the rich west and the poor south. It is clear that in undeveloped countries, capital infusion under the form of help from the occident is not a solution. Where there is corruption, there is a high possibility that the money from foundations will go to specific and not wanted sources. The real help of the west countries is to make a cultural change in those states. The proposed plan from the

European Commission was to increase the imports from these countries, in order to help them make competitive products and do investments in production means [10].

Figure 3-Economic freedom and the living standard

Source: The Heritage Foundation, 2011

In the most free countries, also the life expectancy is higher and in the same way it is the degree of happiness [8].

4. Conclusions

Economic freedom is the way to achieve prosperity. The free market has the means to confer a better future for all nations, that will truly understand that the key is to avoid governmental spending and to let the economy follow its course.

The argumentation for economic liberty has empirical support. IEF and EFW are two indicators that contributed to a solid ground to the theoretical analysis.

The data shows undoubted links between free countries and development. It is not a surprise that also, the countries that faster exceeded the crisis are the most libertarian ones.

Well organized and with an enormous work behind, the two indicators are being taken into consideration in world economic analysis. The World Bank writes its reports on investment climates depending on the data from these indexes.

Maybe all states should take a look on the data and find their place in the ranking list. This would certainly conclude with a second thought in proposing new government policies.

Only the most free states will be able to offer a proper environment for individuals, assure a better future and transform themselves along with the new changes in the international trade.

As John Stuard Mill said, maybe it is the time to weak up, and restore the confidence in liberty, economic freedom and so find prosperity.

Derivatives Market in the Aftermath of the Lessons Learned from the Crises

Murcea Aurora

West University of Timisoara, Faculty of Economics and Business Administration
auroramurcea@gmail.com

Abstract

From individual investors to corporations and financial firms, derivatives have been used to hedge against, or speculation, changes in prices, rates, indexes, potential defaults on debts. Without any oversight, derivatives market and especially OTC derivatives rapidly became out of control growing to more than \$700 trillion in notional amount. The paper's goal is to analyze the influence derivative market played in this crisis and the main reforms taken to prevent this kind of event for the future.

Key words: financial crisis, derivative market, economic development, global risk
J.E.L. classification: G01, G15, G18, G28

1. Derivatives market and economic development

The potential positive influence of the capital markets on economic growth ([7],[13],[11]) and the question if financial development enhances growth or vice versa ([6],[14]) has been discussed by scholars for many years.

The volatility of interest rate, currency, stock and bond returns and commodity prices have led firms and financial institutions to implement hedging techniques to manage their financial risks. The development of sophisticated derivative instruments has helped improve the allocation of risk in the economy, increased the saving-investment process and enabled market participants to extend later depends on the rate of saving and investments. Derivatives provide a means to

control risk different from the techniques considered in the portfolio theory because allow investors to change the shape of the probability distribution of investment returns [10]. Also one could say that derivatives can enable price discovery because trading in derivatives markets helps market participants form expectations about underlying asset prices and to manage the risks associated with price changes.

Despite this, the recent theoretical and empirical work by Rousseau and Wachtel [17] shows a weakening link between financial sector and economic growth. The question raises, is: Tobin was right when he stated in 1984 that the advent of derivatives markets encourage speculation in the underlying asset markets?

Trying to answer to this question various scholars have extended previous approaches focusing on financial integration and growth ([18],[9],[15]) including the impact of the sensitivity of financial system toward risk ([19]) and stressing the complexities of the finance-growth linkage ([3],[12]). Also there are voices who state that the liquidity level of underlying spot market is a very important factor if we want an efficient derivative market. In a study conducted in 2007, A. Baluch and Mohamed Ariff[1] concluded that "negative relationship between the liquidity level of derivative markets and economic growth in the cases of developed countries indicates that the risk transfer function of the derivative markets is a contribution to economic growth. ...We find the liquidity level of underlying spot market is a crucial factor for the success of derivative markets".

2. Exchange-Traded derivatives versus OTC derivatives

The derivatives market could be divided in two parts: Exchange –Traded Derivatives (ETD) and OTC Derivatives (OTCD. Each of them is serving specific purposes for specific end users (the distinction between these two is very important because of their different contribution to the crisis)

ETDs operate for the benefit of a broad, diverse community of large and small participants from individual to institutional, from trader to hedger. ETD market is currently the best model for operational integrity because of its standards and serve almost all global risk transfer needs at a reasonable cost with speed, accuracy and reliability.

OTCDs operate like a wholesale market for the largest firms with specific exposure requirements addressing to the needs of the world's largest financial intermediaries and corporations. The unlimited flexibility of OTCD is in the same time the greatest source of product innovation for ETD but also a great source of risk.

Table.1.Main differences between OTCD and ETD

Attribute	OTC Derivatives	Exchange – Traded Derivatives
<i>Participants</i>	Limited (~ 30.000).	Expansive (~5.000.000)

3. Did derivatives cause the financial crisis?

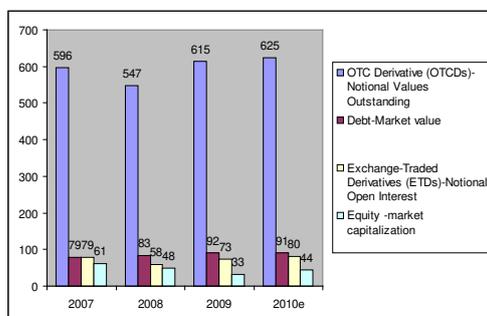

In 2002 in the annual rapport of Berkshire Hathaway the American billionaire Warren Buffet called derivatives clock bombs, mass destruction weapons due to the large losses they could cause if the underlying instrument has an opposite evolution compared to the forecasted one.

The emergence of derivative market, the associated structural move from regulated to more unregulated market determined a expansion of risk spreading abilities, the increase in risk bearing and the apparition of new intermediaries with rising risk appetite. All this determined a higher sensitivity of the

financial sector and finally of the economy to shocks and financial crisis. This could justify the Rajan statement from 2005 [19] "under some conditions economies may be more exposed to financial-sector-induced turmoil than in the past".

We described in the last paragraph the main differences between the ETD and OTCD markets. The increased risk associated with the OTCD market along with the growth in the last one (see the chart 1 below) represents one of the crises determinants. Due to the off-balance character of derivatives transactions (especially OTC traded derivatives), assessments of the creditworthiness of the counterparties become more difficult. Derivatives' trading facilitated financial integration but also allowed shocks to be transferred to other sectors. Oligopolistic structures in the derivatives segment encouraged the building of risk concentration along with possible domino effect if the most important market participants default. More than that liquidation of large derivatives positions overburdened the global liquidity of the markets.

Chart 1. Mainstream view of global financial markets in US\$ trillions

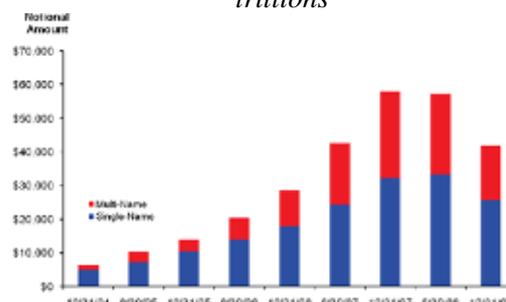

Source: Bank for International Settlements Quarterly Review, December 2010

Despite to the fact that credit risk is not much a problem for derivatives traded on organized exchanges because contracts are almost always honoured, this represented a real problem in OTC market where parties negotiate a derivative contract specific to their needs.

Credit default swap (CDS) contracts played a very important role as a crises determinant. Despite their social benefits the social cost are also huge as even Alan Greenspan concluded. He stated that whole intellectual edifice" which underlies the use of credit derivatives and complex financial instruments"collapsed in the summer of last year" because of risk management mistakes offers strong testimony that the costs associated with credit derivatives have to be taken as seriously as their benefits.

Why one could consider that credit default swaps contributed to the crises? In the first place one could notice that the credit default swap development allowed the credit boom which ended in a credit crises. The second argument is that the trillions of dollars in credit default swaps positions have created systemic risk. These massive exposures have necessitated the indirect bailout of Bear Stearns and the direct bailout of AIG which cost taxpayers billions of dollars. The Bank for International Settlements (BIS) reported that size of the credit default swap market at the end of 2008 was \$41 trillion. When the BIS started keeping track of CDS contracts, single-name contracts were 80% of the market; at the end of June 2008, these single-name contracts were only 58% of the market. Chart 2 shows the evolution of the size of the CDS market

Chart 2 Credit default swaps notional amount outstanding, 2004-2008, US\$ trillions

Source: BIS bi-annual derivatives survey

Not in the last place, all this generated an important imagine crises considered responsible for the fall of Bear Stearns and Lehman. In a non-transparent market, market participants lost confidence because they

have been left guessing how much banks might have to pay on credit default swaps. In this circumstances some financial institutions appeared to be more financially weaker than they actually were and threatening the soundness of the financial system.

4. The reformation of OTC derivatives market

The recent financial crisis demonstrated that the over –the-counter (OTC) derivatives market shows numerous weaknesses which contributed to the build-up of systemic risk. Nevertheless some of the OTC derivatives market continued to function well during the crises, a large contagion potential of the OTC markets was shown by the latest evolutions, due to the interconnectedness of OTC derivatives market participants and the limited transparency of counterparty relationships.

For this reason in September 2009, G-20 Leaders agreed in Pittsburgh that: *all standardised OTC derivative contracts should be traded on exchanges or electronic trading platforms, where appropriate, and cleared through central counterparties by end-2012 at the latest. OTC derivative contracts should be reported to trade repositories. None centrally cleared contracts should be subject to higher capital requirements.* [4].

Starting for these decisions, at the initiative of the Financial Stability Board (FSB), in April 2010, a working group led by representatives of the Committee on Payment and Settlement Systems (CPSS), the International Organization of Securities Commissions (IOSCO) and the European Commission was formed to make recommendations on the implementation of the G-20 objectives.

The 21 recommendations enclosed in it are concerning in synthesis the following points: standardisation, central clearing, exchange or electronic platform trading, and reporting of OTC derivatives transactions to trade repositories.

Standardisation: the proportion of the market that is standardised should be substantially increased in order to further the G-20's goals of increased central clearing and trading on organised platforms, and hence mitigate systemic risk and improve market transparency. The report sets out recommendations for authorities in order to increase the standardization through introducing incentives and, where appropriate, regulation.

Central clearing: the recommendations specify the factors that should be taken into account when determining whether a derivative contract is standardised and therefore suitable for clearing as well as address mandatory clearing requirements

Exchange or electronic platform trading: the recommendations suggest some possible actions needed to achieve the commitment that all standardised products be traded on exchanges or electronic trading platforms, where appropriate.

Reporting to trade repositories: in order to maintain the financial stability, the recommendations help achieve this objective, including that trade repository data must be comprehensive, uniform and reliable and, if from more than one source, provided in a form that facilitates aggregation on a global scale.

5. Concluding remarks

The recent trends in capital markets and in the all world's economies have showed that the libertarian strategy countries adopted to increase their development in the last decades did not generate the expected results. The increased financial innovation combined with deregulation and the lack of transparency in the OTC derivatives markets seems to be a very hard digestible cocktail for the globalised world economy where all the shocks are easily transmitted from one part of the world to another. The role of the derivatives market in increasing the systemic risk and in crises contagion was no doubt very important. A more regulated and transparent derivative global market could determine an increase in the social benefits

the derivatives markets bring and a change in the relation between its social benefits and social cost.

Abstract

In the context of the financial innovation of the last few decades, when we were faced with an important diversification of the financial instruments used on the capital markets, the ETFs are revolutionary financial products with a strong impact on the global investment environment. The unique creation and buyback process along with characteristics such as transparency, liquidity, flexibility, reduced costs and diversification have transformed ETFs into the financial products with the biggest growth rate, products preferred even during crises.

In the present paper, we try to analyze the world of ETFs (evolution, dynamics and special features that can respond to the complexity of needs portfolio investors have while deciding on the structure of their investment portfolios.

Key words: investment funds, financial innovation, benchmark, tracking error.

J.E.L. classification: G11, G 12, G 14, G 15, G 23;

1. Introduction

The amplitude of the innovation process as well as the continuous development of the financial markets has generated the evolution of the instruments available for investments. This can be explained through practical reasons such as higher efficiency, lower costs and better protection against risks.

Richard Ferri defines the ETFs as "baskets of titles" that are traded like individual shares through a broker's company on a certain stock exchange (Richard Ferri, 2009: p. xvii). As a hybrid form of the mutual funds, the ETFs invest in portfolio of shares or bonds that copy the structure of a certain index or

reference point with the purpose of reproducing the performance of that index or reference point.

The ETFs offer investors the possibility to diversify their portfolio by simply buying a unit of ETF and getting this way exposure on the whole market, but also allow focused investments on many markets, in different economic sectors or geographical areas, in both cases without the effort needed for an active supervising of the portfolio.

The knowledge over different investment sectors, the anticipations regarding asymmetrical evolutions of the market, the expected efficiency, the diverse objectives and investment strategies, the different preferences investors have for certain assets, have led to the foundation of a large number of ETFs' sorts: index ETFs, ETFs on commodities, ETFs on bonds, ETFs on currencies, sector ETFs, international ETFs, style ETFs, active managed ETFs.

Among the fundamental characteristics of the ETFs', we can enumerate: transparency, liquidity, flexibility, reduced costs and diversification.

The problem of transparency is one of large interest and highly debated because some authors consider that it is against the investors' interests since it offers speculators the possibility to practice *front-running* (Gary L.Gastineau, 2010: p. 9). Authors like Chen, Noronha and Singal (2006) have shown the costs involved in changing the components of an index and that important indexes as S&P 500 and Russell 2000 do not represent an efficient model of a portfolio for long-term investors. Portfolio managers of the ETFs that follow indexes with a transparent structure are confronted with problems in changing the components of their portfolio as these changes are known before they occur. When transparency brings a profit out of arbitration due to practices of

front-running of the fund's policies, transparency is undesirable. Therefore, Gastineau offers as a solution for increasing the performance of the ETFs, the use of *silent index*. They offer the confidentiality of the changes that were operated in the structure of the portfolio.

ETFs rely on a „basket of shares” that ensure a good **diversification**. According to Markowitz's portfolio theory, at a certain level of risk, a systematic diversified selection of financial instruments would lead to better efficiency. This way, instruments cannot be strongly correlated, and therefore they cannot generate massive losses in unfavorable cases.

2. Competitive advantages and risks

ETFs can be used in different models of assets' allocation (*Strategic Asset Allocation, Tactical Asset Allocation, Dynamic Asset Allocation, Integrated Asset Allocation, Constant-Weighting Asset Allocation, Insured Asset Allocation*), in sophisticated hedging strategies and cash-flow management strategies, being the optimal solution for making investments fluid in times of transition of the portfolio (*transition management*).

Among the strategies that are frequently associated to the ETFs, the core-satellite ones are very important. ETFs can be used as core of the portfolio. This way, they can offer a better diversification on different kinds of assets and an expected efficiency close to the market's average. At the same time, concentrated investments can be done (for example in a certain field or country) building this way an independent satellite portfolio that involves less capital allocations than the core portfolio and has a higher risk but also an expected efficiency above the market's efficiency.

The financial innovation process has allowed an unusual diversification of financial products and led to complex and attractive combinations such as the ETFs on futures or futures on ETFs, generating harmonization of the involved instruments' characteristics, even if the ETFs and futures are direct competitors. Another competitor is represented by the swaps on indexes that are attractive for the portfolio administrators and the institutional investors as it allows the

portfolio diversification. Still, swaps are not negotiated on a regulated stock exchange market and therefore they face a higher risk of counterparty.

Another instrument that offers exposure on the entire market or on specific segments through one transaction is the option contract on indexes. It has the advantage of investing an initial capital that is small and limited to the paid bonus, and the risk that it includes is known ex-ante. In this case, one buyer cannot lose more than the price of those options and of the paid bonus if the stock exchange index doesn't have the expected evolution.

One of the reasons of the accelerated increase of ETFs in comparison with that of other instruments refers to the fact that while futures, swap and options contracts are qualified as derivatives, ETFs are more secure instruments (*fully funded*). In times dominated by a more cautious attitude of the investors and an increased interest in the protection against risks, ETFs have been preferred especially by conservative or medium-size investors.

Still, investors in ETFs should take into account potential risks too. Beside the market risk, the counterparty risk and the liquidity risk that occur in the case of other investment funds too, ETFs present a specific risk (there are cases when their performance does not follow the performance of the index it goes after). In this case, the difference between the efficiency of the ETF and that of the index is known as **tracking error**. According to a study by Morgan Stanley, the tracking-error associated to the ETFs has registered a considerable increase in 2009 when factors like market's volatility, requests of diversification, optimization strategies and capital fluctuations in the companies with low capitalization have contributed in the failure of the ETFs in reaching the benchmark performance. While in 2008 it was 0.52%, in 2009 the associated tracking error of the listed ETFs on the American market reached 1.25%. The explanation of the tracking error could be the proliferation of the ETFs that trigger particular kinds of investments, in less liquid markets. Also, this can be generated by the way portfolios are created.

3. ETFs' market: Dynamics and structure

Even if ETFs are not risk free, the institutional investors, especially European ones, use these products more and more often. We consider this kind of products an excellent solution for the crisis we are going through.

In 2008, the administrated assets connected to the ETFs listed in Europe have increased with up to 11 % while in the USA, they have decreased with 14.39%. Of course one would wonder what has generated the different trend in the two markets. Besides the fact that USA was the first to be affected by the first signs of the crises, we can notice the market volatility reflected in the sinuous movement of the exchange market indexes, the S&P 500 index for example having daily fluctuations of over 5%, 18 times in 2008 (this has only happened 17 times in the last 53 years). The reduction of the assets held by the American ETFs becomes explainable, while the European markets, where the instability was felt later due to the contagion effect, continued to grow.

Another reason is that in the USA, ETFs are used more often by the individual investors that in turbulent times prefer to keep their money into bank accounts and to avoid the exposure of the ETFs. On the other hand, in Europe, on the ETFs market we find many institutional investors that have withdrawn the capital they had in certificates, swap contracts and other structured products and have used these resources in ETFs, considered more secure.

Even if the assets administrated by the European ETFs have increased, they represent less than a third of the actives administrated on the American market, that holds the first place according to this criteria (over 800 billions \$). The american market is much more homogenous and liquid than the European one, where we can find a certain degree of fragmentation, even if we have a unified legal frame (UCITS IV), and the hedging funds that are the main users of ETFs in USA have just started to look at ETFs in Europe, where they prefer the over-the-counter market.

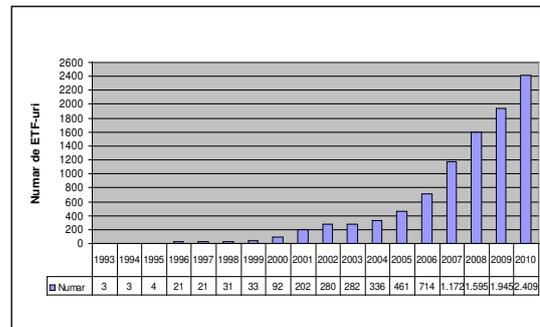

At global level, the assets administrated by the ETFs went down with 10,74% in 2008, followed by a spectacular increase in 2009,

from 711,1 billions \$ in 2008 to 1.036 billions \$ in 2009 and to 1.239 billions \$ in October 2010.

Regarding the number of ETFs, the ascending trend continued during the crisis both in Europe and in USA. In 2008, the number of existing funds on the market increased with 36,09% in comparison with 2007, in October 2010 the number of ETFs being of 2409.

Looking back, it is interesting to mention that the annual compound ratio of increase of the number of ETFs from 1993 (when they were introduced) to the end of 2007 was of about 53%, while the compound annual ratio of increase of the number of mutual funds was of only 4%.

Graph 1: The number of ETFs at global level

Source: data processed after BlackRock, Oct. 2010

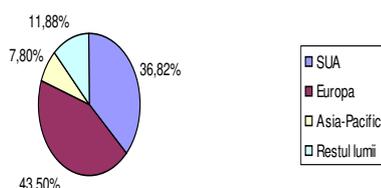

If we take into account the dynamics of the ETFs' market in the last year on regions, according to data at the end of October 2010, in Europe the rhythm of increase of the industry is higher than that of the American market. This can be due to a set of factors that influence the decision of the fund managers regarding the location of the ETFs: the existence of specialized personnel in the field, the favorable fiscal legislation, rules and formalities regarding new products. For example, due to the favorable fiscal legislation, Ireland has become an important player on the European market, with a market share of over 28% of the total European ETFs.

Also, we can notice the increase in the number of ETFs in Asia and Pacific where, even though the ETFs industry consists of only 188 such funds, the development potential is very high, about one third of the

Asian financial institutions using already the ETFs in the investment strategies.

These conclusions can be backed up by the next graph that presents the analyzed market shares. In the "rest of the world" category we have included Latin America with only 26 ETFs and Africa and the Middle East with 29 such funds.

Graph 2: Market share according to the number of ETFs

Source: processing of data after BlackRock, Oct. 2010

If we were to make comparisons regarding the volume of net capital invested in the ETFs industry, as seen from the statistic data for the first 10 months of 2010 in USA, this was of 85,9 billions \$, more than the double of the amount for Europe. Regarding the net capital invested in the Asian ETFs (except Japan) this is of 9,5 billions \$.

The ETFs market has seen a spectacular development, mainly in the last 10 years, still undergoing a process of financial innovating. If the financial engineering process is more selective and constructive and offers solutions that come to eliminate risks and weaknesses of the ETFs' structure, we agree that the ETFs can become the most important financial instrument at global level, indispensable in investment strategies of any kind.

Still, first, the ETFs industry (especially the European one) must respond to the new challenge of the funds that name themselves ETFs, but do not offer the transparency of the basis portfolio or the real time publicity of the intraday values. As Deborah Fuhr explains, there is the risk of getting away from the traditional virtues of the ETFs such as transparency and clarity which are absolutely necessary attributes that can help investors understand the structure, mechanisms and rules involved in the usage of ETFs.

Another challenge that the industry of ETFs is facing is that of the incertitude regarding the new rules in the financial field, the way they are going to be implemented and the associated effects. A first example is that of *UCITS IV*- the European Directive voted by the European Council on the 22nd of June 2009 and must be included in the national laws of the member states before July 2011. It brings changes in the rules that apply to the European investment funds.

The second example refers to the new rules proposed by the UK Financial Services Authority through the *Retail Distribution Review*, program that is going to be fully implemented in 2012. Its anticipated effect is the increase of the ETFs use at retail level – sector that represents only 10-15% from the European market, while in SUA is 40-50%. In Australia, where the ETFs industry has followed the global increase trend, the government has announced its intentions to adopt some reforms in the financial services sector. The most important change regards the commissions of the financial consultants and shall stimulate the request for ETFs.

In the USA, the new fiscal regulations imposed through the *Foreign Account Tax Compliance Act*, which is going to be fully applied by 2013, shall have a significant impact on the financial system. They include a 30% tax over the gains of the foreign financial institutions from a large list of American financial titles.

In the case of Asia, it is anticipated to have an important increase in the investors' interest in the ETFs, but this is hard to quantify at regional level as many investors from Asia-Pacific are still going to choose both products listed in Europe and USA and products listed on the local stock exchange. Unlike Europe, where we have a very clear procedure regarding the registration and *cross-listing* of ETFs organized according to UCITS IV, in Asia we do not have such regulations. Therefore, the fragmenting of markets and the absence of a regional standard regarding the ETFs makes the listing of European ETFs on the Asian stock exchanges raise less problems than the listing of ETFs that are located in Asian countries on other stock exchanges from Asia-Pacific. For example, on the stock exchange of Singapore and Hong Kong, the listing of

European and American funds is easier than the listing of Asian funds.

For 2011 we expect an increase in the number of private and institutional investors, of covered indexes, of strategies based on ETFs, of stock exchanges that plan to offer ETFs and of new suppliers of such funds. There are plans for new 1.038 ETFs at global level. In the center of attention we'll have Europe and Asia and we expect that by the end of 2012 the administrated actives of the ETFs in Europe are going to be over 500 billions \$. So, in 2011 we expect that ETFs are still going to be in the center of investors' preferences.

4. Conclusions

In order to conclude, according to the presented aspects, we could say that ETFs represent the most important financial innovation of the last decades given its spreading and the interest of investors in selecting ETFs as priority investment alternative. The simple way of diversifying the portfolio and of reducing the risks as well as the harmonizing of aspects regarding efficiency and risk add up to the main argument of investors preferring the ETFs: by their structure, the ETFs combine the advantages of a mutual fund with those of a traded share.

Transparent products, very simple, they are less risky than a derivative product over the index and offer access on the shares market, bonds market, foreign currencies market, merchandise market, in different sectors and industries, in international regions and countries, using different strategies and investment techniques. The ETFs industry is a dynamic one, undergoing continuous changes. Still the new ETFs bring along new risks and challenges making important the fact that the investment decision should be based on extremely good knowledge regarding the mechanism, the structure and risks related to each ETF.

Situation of Workforce in Albania and Moldova - Evolution and Trends

Neacșu Gabriela

"Spiru Haret" University of Constanța

gabrielle_neacsu@yahoo.com

Abstract

This study aims to attract attention to the phenomenon of employment in two countries, Albania and Moldova, which are not members of the European Union. We intend to study this phenomenon, because of the importance it has on individual countries and at European level. We know that all European countries should harmonize their regulatory framework for organizing and operating statistics to EUROSTAT requirements. The studied statistics indicators are the following:

- Working population
- Employment rate
- Unemployment rate.

In the study both countries have been analyzed; statistical yearbooks, surveys of employment and labor market performed in Albania in 2009.

Key words: working population, employment rate, unemployment rate, inactive population

J.E.L. classification J; J2; J2.1.

1. Introduction

The Republics of Albania and Moldova are European countries located in the south-east of Europe, but they are not included in the European Union.

There are many similarities between the two countries:

- Albania has a total area of 28,748 square kilometers and Moldova has a total area of 33,843 square kilometers;
- Moldova has a population of 3,567,512 and Albania one of 3,619,778;
- Both countries are members of the UN (Moldova was accepted as member of the UN on 27 August 1991, when it became independent) [1] and NATO

- Albania was a potential candidate for EU accession in January 2003 and formally applied for EU membership on April 28, 2009 [2]. The Republic of Moldova is also a potential candidate aspiring for membership in the European Union; the political structures of these two neighbors have established a cooperation agreement designed to improve and expand relations between them;

Figure 1. Map of Albania

Source: <http://www.nationsonline.org>

- Albania is divided into 12 provinces (counties) and in 36 rrethe (districts). Besides the capital city of Tirana, which has 800,000 inhabitants, the principal cities are Durrës, Korçë, Elbasan, Shkodër, Gjirokastër, Vlorë and Kukës- Moldova is divided into 32 districts, 3 municipalities (Chisinau, Balti and Comrat) and two regions

with special status - Gagauzia and Transnistria (with statute in dispute) [3].

Figure 2 Map of Moldova

Source: <http://ro.wikipedia.org>

2. Materials and methods

In the study we have documented on the on the economy and employment situation in both countries.

I have consulted for this:

- Statistical Yearbook of Albania elaborated by the Institute of Statistics (Instituti I Statistikës) and Labour Force Survey conducted in 2009;
- Statistical Yearbook 2006 and 2009 versions.

The information and data were translated (where the case) in order to be processed and to be brought to a common denominator (where the case). The methods used were those specific to statistical research: observation, grouping, processing, presentation and analysis of data.

3. Results and discussions

In this study the indicators were grouped as it follows:

I. *Distribution of employment by the participation in economic activity*
Economically active population, Population employed in economy, Unemployed, Number of employees; (Figures 3 and 4).

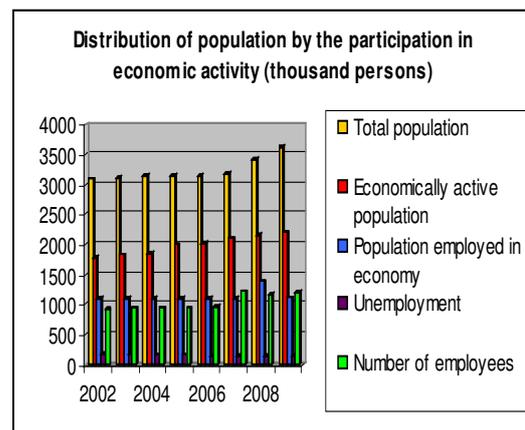

II. *Distribution of Employment by forms of ownership;*

III. *Activity rate, Employment rate and Unemployment rate.*

IV. *Distribution of employment by economic activities;*

V. *Registered unemployment at Employment Agencies, by gender, age and level of education;*

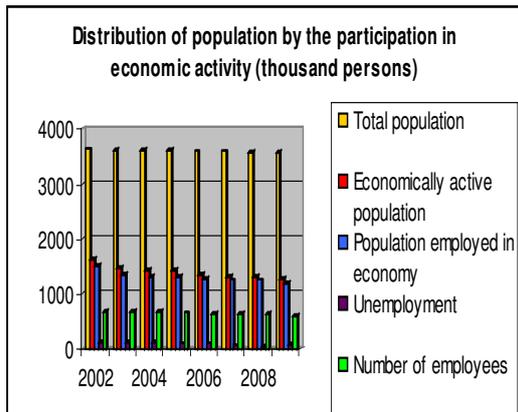

Figure 3. *Distribution of population by the participation in economic activity in Albania*

Economically active population comprises all persons aged 15 years and over, providing available labour force for the production of goods and services; it includes employed population and ILO unemployed.

Employment includes all persons aged 15 years and over, who carry out an economic activity producing goods or services of at least one hour during the reference period, in order to get income in the form of salaries, wages, or other benefits.

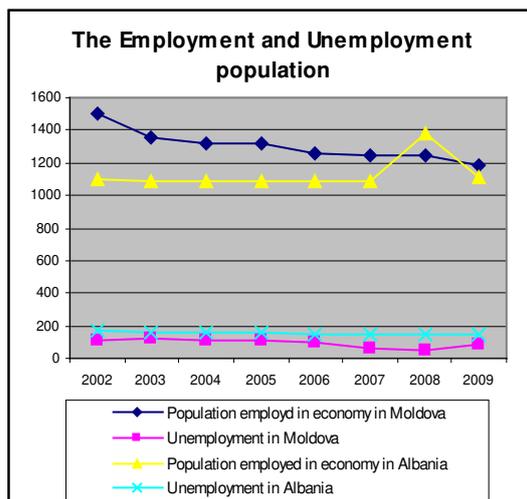

Figure 4. Distribution of population by the participation in economic activity in Moldova

Unemployed, according to the International Labour Office (ILO) criteria, are persons aged 15-74 years who, during the reference period, simultaneously meet the following conditions:

- have no job and do not carry out any kind of activity in order to get income;
- are looking for a job, using different active methods to find one;
- are available to start work within the next two weeks.

Figure 5 The Employment and Unemployment population in Albania and Moldova

- We can notice from the graphs:
- the evolution of the active population registered a decrease in Moldova and an increase in Albania;
 - the employment has the same trend, decreasing in both countries;

- unemployment tends to increase during the last two years, being higher in Albania;

Distribution of Employment by forms of ownership (figure 6) shows the high percentage of private sector both in Moldova and Albania.

Figure 6 Distribution of Employment by forms of ownership in Moldova

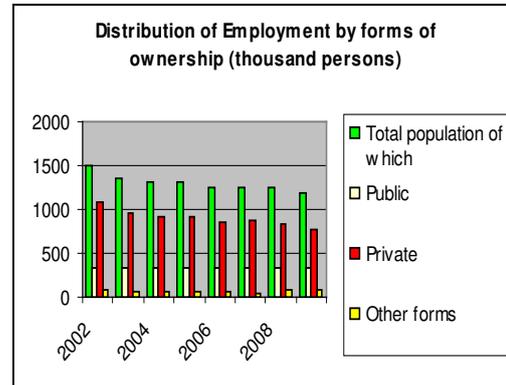

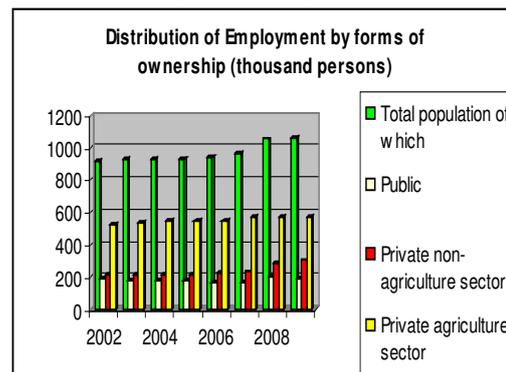

Figure 7 Distribution of Employment by forms of ownership in Moldova

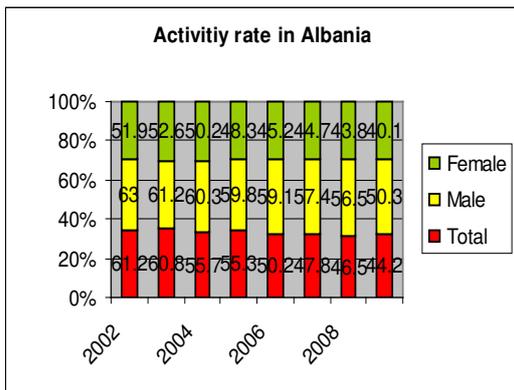

Albania has kept the same trend. Here the private sector is divided into two categories: private non-agriculture sector and private agriculture sector. The chart shows that private sector agricultural development is better than non-agricultural.

Activity rate represents the ratio between active population and total population aged 15-64 years expressed in percentages (Figure 8 and 9).

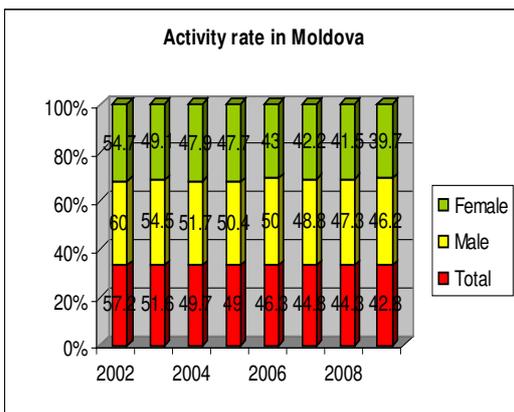

Employment rate represents the ratio between employed population and total population aged 15-64 years expressed in percentages (Figure 11 and 12).

Figure 8 Activity rate in Albania in period 2002- 2009

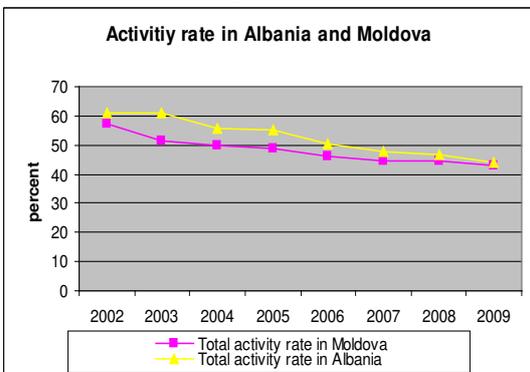

The activity rate for men is less well represented in Albania, but it follows a downward trend in both countries.

Figure 9 Activity rate in Albania in period 2002- 2009

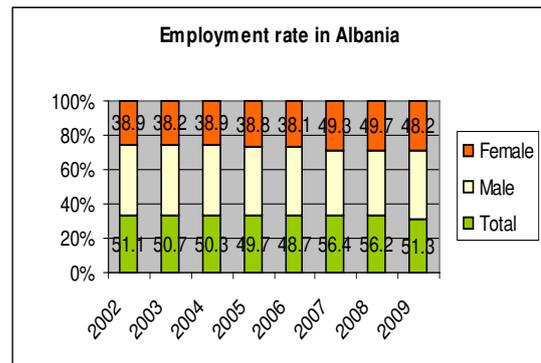

The activity rate for women is higher in Albania than in Moldova.

Figure 10 Total activity rate in Albania and Moldova in period 2002-2009

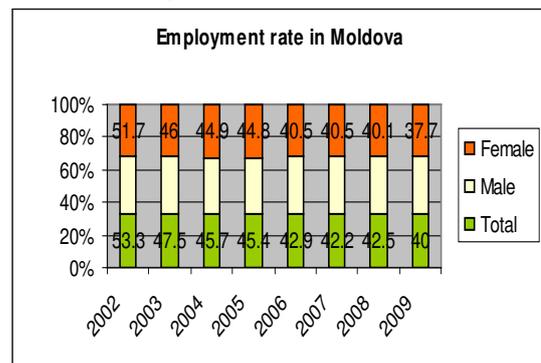

From the graph one can see that the rate of activity is better represented in Albania.

Figure 11 Employment rate in Albania in period 2002-2009

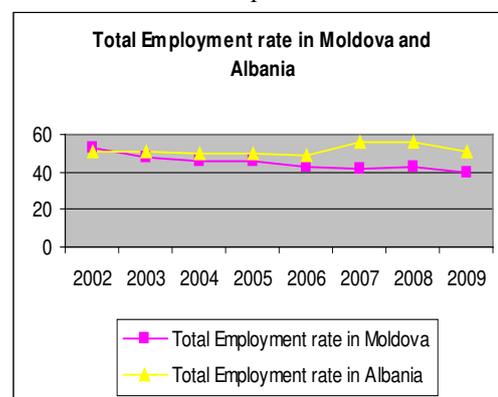

The employment rate for men increased more in Albania than in Moldova. It even registered an increase in the past four years.

Figure 12 Employment rate in Moldova in period 2002-2009

The employment rate for women decreased more in Albania than in Moldova.

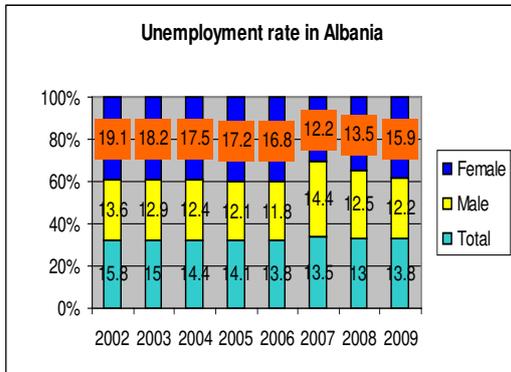

Figure 13 Total employment rate in Albania and Moldova in period 2002-2009

The graph shows that the employment rate in Albania is slightly higher than in Moldova. Unemployment rate represents the ratio between the number of ILO unemployed and

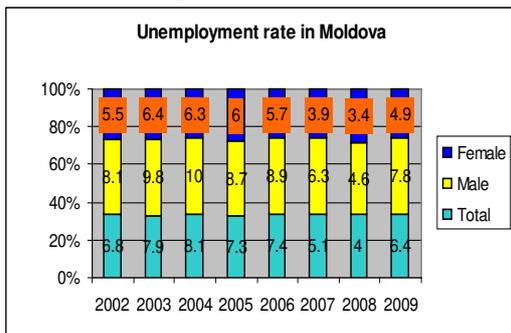

the active population expressed in percentages (figure 14 and 15).

Figure 14 Unemployment rate in Albania in period 2002-2009

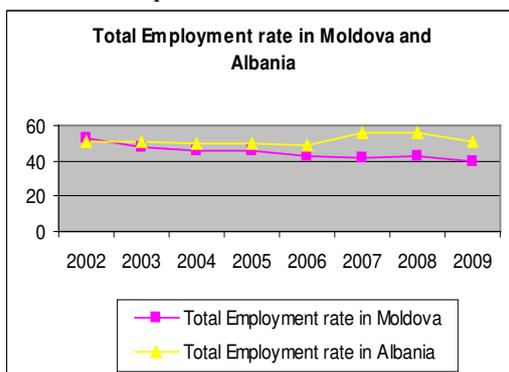

The unemployment rate for women is high in the two countries.

Figure 15 Unemployment rate in Moldova in period 2002-2009

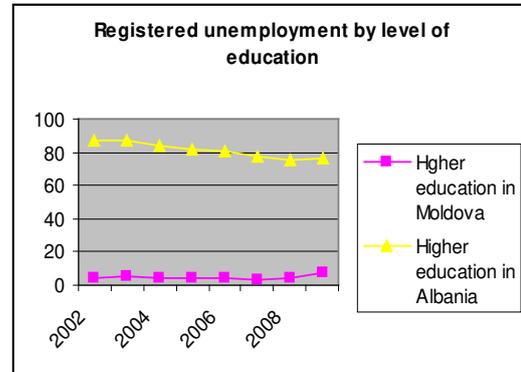

The unemployment rate for men has increased over the past year in both countries. Figure 16 shows that unemployment was higher in Albania (especially in the last four years) than in Moldova. Unemployment rate is almost double in Albania than in Moldova.

Figure 16 Total unemployment rate in period 2002-2009

The distribution of employment by economic activities has revealed the high share of agriculture in both countries.

Figure 17 Registered unemployment by level of education in Albania and Moldova

From the graph one can notice the higher percentage of unemployed persons with higher education in Albania than in Moldova. In both countries the most affected age segment is that of 21-49 years, and women are the most affected.

4. Conclusions

Albania and Moldova, are two countries with about the same area and population.

They are countries with a developing economy in which agriculture predominates. Agriculture attracts a large part of the workforce in both countries. Thus, employment in agriculture was 56% in Albania in 2002 and 47% in 2009, while in Moldova the employed population in 2002 was 49% and 28% in 2009.

The industry is underdeveloped in both countries, although Albania has some deposits of oil and natural gas [4] while Moldova is energy dependent on Ukraine and Romania. Employment in industry is low, it was 8% in Albania in 2002 and 10% in 2009, and in Moldova it was 11% in 2009 and 13% in 2009.

Albania and Moldova depend a great deal on foreign investors, fact that can determine their economic growth.

Services sector has experienced a large increase in Albania and Moldova, which has attracted the workforce here. Employment in this sector was 22% in Albania in 2002 and increased to 27% in 2009, and in Moldova it

was 32% in 2002 and increased to 45% in 2009.

Both countries face with population migration. Albanian population is considered to be relatively young by European standards [5], with a medium age of 28.9 years. Moldova is currently in the process of demographic aging.

Albania remains a poor country by Western European standards.[6] Its GDP per capita (expressed in PPS—Purchasing Power Standards) stood at 26 percent of the EU average in 2010.[7] Still, Albania has shown potential for economic growth, as more and more business firms relocated there.

Although it is blessed with a favorable climate and fertile land, Moldova is the poorest European country today, with an annual GDP per capita of only € 2,000 [8].

From Internal Marketing to Human Resource Marketing. A Conceptual Framework of the Human Resources Marketing

Neagu Olimpia

„Vasile Goldis” Western University of Arad, Romania

olimpian2005@yahoo.com

Abstract

The paper focuses on shaping a conceptual framework of the human resources marketing, having as starting points the interactions between internal marketing and human management resources at the organisation's level. The concept of internal customers, belonging to internal marketing and referring to the employees, can be taken in the human resources marketing as focus of the specific processes.

Key words: internal marketing, human resources management, human resources marketing

J.E.L. classification: M 12, M31, M 51

1. Introduction

We are already entered in such era in that the employees are choosing the companies, according to personal perceptions or rational analysis. The firms are in the position of marketers for finding the adequate skilled people for their business. The deficit of skilled workforce is a today's problems, companies being constrained to focus their human resource management to attract, motivate, satisfy and retain employees. In the practice of romanian companies is underestimated the fact that the potential of the employees attitude in their customers relations and the behavior of the sales work force have a great impact on the value offered to the customers.

2. Internal marketing theory: a summary

Due to the increasing importance of the recognition of the employees' in business performance, especially in services, the

internal marketing theory is developed in last years.

The employees are treated as customers, ensuring in this way higher satisfaction and a more customer-conscious, market-oriented and sales mind workforce(4)(5). Initially, the internal marketing was seen as a solution for delivering higher quality of service. Today, the concept is discussed as management tool for meeting and exceeding the customers expectations (8), (9), (10), (11), (12) In the definitions of internal marketing, the central idea is that the employees are treated as internal customers."The internal market of employees is best motivated for service-mindedness and customer-oriented behaviours by an active marketing-like approach, where marketing like activities are used internally"(2). Bekkers and Van Hasstrech (1) define internal marketing as "any form of marketing within an organisation which focuses staff attention on the internal activities that need to be changed in order to enhance external market place performance". Rafiq and Ahmed define internal marketing as "a planned effort using a marketing-like approach to overcome organisational resistance to change and to align, to motivate and inter-functionally coordinate and integrate employees towards the effective implementation of corporate and functional strategies in order to deliver customer satisfaction through the process of creating motivated and customer-oriented employees".

By satisfying the needs of the internal customers, the company it is in a better position to deliver satisfaction to the external customers. The logic of this approach is that the satisfaction of the employees needs enhances employees motivation and retention. Further more, a higher satisfaction of employees is related to a higher possibility to achieving a higher external satisfaction and retention.

Over the past several years "the internal customer" concept essentially revolved around the idea of "satisfying employees needs and "offering value". These notions are comparatively more tangible than intangible elements (salary, physical environment). The same stood for external customers, as "customers needs" and "value" were comparatively more related to the elements of quality, technical standards, etc, rather than abstract notion of value. Theoretical research shown that for external customers that has shifted and the contemporary marketing increasingly relies on Perception Management to create and sustain abstract notion of value. These are notions that find fertile ground in the minds of customers who seek to satisfy ever higher order needs. The correlation is natural as the higher those needs are, the more tangible they become and their satisfaction is achieved through intangible elements. A more nuanced contemporary perspective on the internal customer not only accepts the association between internal and external customers, but in fact states that they, for all practical purposes, are the same, and should be treated in the same way, within the management and marketing context. (13)

3. Objectives and processes in the internal marketing

As a conclusion of the above theoretical review, the aim of internal marketing is to promote the marketing as internal way of thinking, through an employee focusing, in order to achieve the market goals of the organisation. In the internal marketing the employees are the target audience or "internal customers". They are subject of marketing activities planned by the management of the organisation in order to achieve the marketing and the business goals of the organisation.

The main objectives of the internal marketing are:

- employees' customer orientation consciousness (norms, values, principles of customer-oriented thinking way);
- employees' motivation;
- employees' satisfaction;
- employees' engagement and loyalty;
- employees' know-how and competencies;

- employees' retention;
- acceptance and adherence to the organisations' goals;
- a friendly work climate.

In correspondance with these objectives, the main specific activities in the internal marketing are:

-human resources policies (personal and professional development, career development, job satisfaction, motivation, status symbols, job rotation, work conditions, social facilities etc)

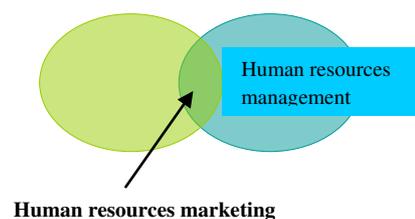

-marketing practices (employees attraction and retention, internal communications, relationships etc).

As a process, the internal marketing consists of the following components: attraction and recruitment; selection, integration; motivation; retention and loyalty.

These processes of internal marketing are belongs partly to marketing practices (attraction, retention and loyalty) and partly to human resources management (recruitment, selection, motivation, integration).

As we can see, internal marketing and human resources management has a common part, the human resources marketing. (Fig.1)

Figure 1 The human resources marketing between internal marketing and human resources management

Human resource marketing entails not only internal activities focused on existing employees but specific efforts to attract people skilled, as well. In this view, internal marketing resource marketing the target audience has two components: internal (existing staff) and external (possible to be hired). In this logic, the human resources marketing has two kinds of

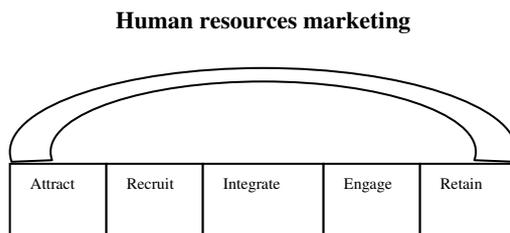

objectives: internal(integration, retention, loyalty) and external (attraction, recruitment).

In the relation employer-employee, the human resources marketing considers the staff(permanent, temporary or potential) as customers, in the noble sense of the word(Liger, 2007, pp.10).The employees, as internal customers, are acting in the internal organisation environment and are influenced by its structure(organisational culture, resources, capacities, organisational architecture, management and leadership, policies and strategies etc).

4. A conceptual framework of Human Resource Marketing

The components of human resources marketing are presented in the Figure 2.

Figure 2 The areas of human resources marketing

The processes corresponding to main actions specific for human resources marketing and the factors influencing them are presented in the Table 1.

Each action and the corresponding processes are influenced by various factors acting at the micro- and macroeconomic level.

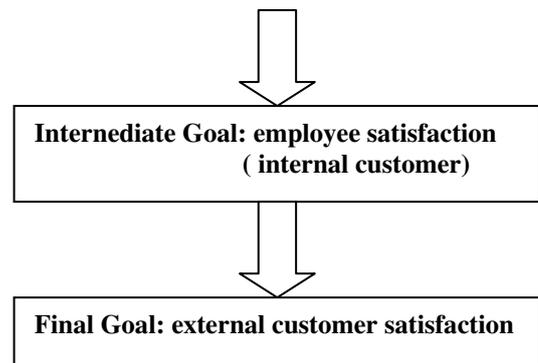

The attraction of candidates is influenced by: economic context, labour market trends, human resources strategy, marketing strategy, marketing environment, organisation's mission and goals.

The recruitment, selection and staff planning are carried out within the human resources policies of the organization.

A successful integration of the employees is depending on: leadership; human resources management; type and consolidation level of organisational culture; internal communications system.

Table 1 Actions and processes in the human resources marketing

Actions	Processes
Attract	communication and promotion dedicated to organisation external environment employer branding
Recruit	recruitment and selection staff planning
Integrate	socialization participation internalization of core values of the organisational culture adhesion to the organisation goals
Engage	engagement empowerment for a customer-oriented attitude and behavior of the employees
Motivate, retain and loyalty	work and tasks systems rewards(monetary, status, position in the hierarchy) work conditions work climate personal and career development, on the job training, upskilling assessment of human capital internal communications developing individual and long term relations with employees social benefits(life, health and unemployment insurance etc)

Engagement of employees, seen as the extent to which employees' commitment, both emotional and intellectual, exists relative to accomplishing the work, mission, and vision of the organization, is influenced by:

perception of job importance; clarity of job expectations; career advance opportunities, regular feedback and dialogue with superiors, quality of relations with peers, superiors and subordinates; perception of core values and norms of the organisation; rewards to engage

perception management; personal communication of managers, internal communication system, word of mouth communication.

The processes of motivation, retention and loyalty are depending on: human resources management; leadership; human resources policies; human resources strategy; internal communication system; social dialogue.

5. Conclusions and further research

The idea of the paper is that the companies are treating their employees as internal customers being possible to adopt the marketing techniques and tools to human resources.

It is needed to investigate the relation between internal marketing and employer branding and the role of latter in the effectiveness of the human resources marketing.

The paper aspires to lead researchers towards a new conceptual framework of the human resources marketing and stimulate further discussions and exchange of ideas on the subject.

The Impact of the European Employment Strategy on Romanian Employment Policy

Neagu Olimpia

„Vasile Goldiș” Western University of Arad

olimpian2005@yahoo.com

Abstract

The paper examines the mechanisms through which the European Employment Strategy influenced the Romanian employment policy. The influences may take the forms of: peer pressure, strategic use of EES and the europenisation mechanism. The impact of EES is present in the content of employment policy due to the compliance with the accession criteria and integration requirements. In the process of policy shaping the impact of EES is low.

Key words: European Employment Strategy, impact, employment policy, Joint Assessment of Employment Priorities

J.E.L. classification: J 08, J 21, J 68

1. Introduction

The European Employment Strategy (EES) was created in 1990, aiming to coordinate the various attempts of member states to address the more or less persistent high levels of unemployment and low employment rates. The main instruments used in the strategy are: Employment Guidelines for member states' National Action Plans of Employment (NAPs), the EU answer to these in the form of the Joint Employment Report, including country-specific recommendations. In 2003 and 2005 the EES was revised but the principles remain the same. These instruments working in a cycle have an impact on the employment policies of the member states. In general lines, in a evaluation conducted by European Commission in 2002, the conclusion was that EES had: strengthened national policy frameworks and focused attention on targets and deadlines; started a process of convergence between member states' employment policies

towards prevention of long-term unemployment; supported the process of convergence; ensured that policies had been maintained and reshaped in line with the strategy in member states where active labour market policies were already in place; inspired employment policy reforms in some nations; impacted policies other than active labour market policies; improved interministerial coordination and involvement of regional authorities, social partners and NGOs(5).

As states Mikkel Mailand(10), according to the experts, there are two kinds of impact of EES on national level employment policies: *as content* (the employment policy programmes and the economic resources spent on them) and *as processes* (the level coordinating governmental departments, consultations with social partners, NGOs, and regional governments, the use of evaluation and statistics).

2. Theoretical framework and methods

Mechanism through which EES might influence national policy

There exist several ways in which supranational institutions can influence national-level policies.

According to Mailand(10) the main mechanisms through which EES might influence national employment policy are: *peer pressure, strategic use of EES by national actors* and other indirect forms of impact (such as: learning, socialization, creation of discourses).

Peer pressure refers to the pressure that European institutions put upon member state to reach common targets. This works through written recommendations produced at EU level (Joint Employment Reports, meetings of European Commission or Council's Joint Employment Committee)

Strategic use of EES by national actors means the possibility to use EES by national governments for external legitimization of unpopular measures or reforms.

In the literature of europeanization, we can identify other forms of influencing the national employment policies by EU's institutions, named generally as *europenisation mechanisms*. In this paper europenisation means processes and mechanism through which EU institutions may cause changes at domestic level.

Regarding the impact of EU on the national policies, Christoph Knill and Dirk Lehmkuhl(8) state 3 mechanisms: *positive, negative and framing integration*.

In the *positive integration*, European policy-making may trigger domestic change by prescribing concrete institutional requirements with which member states must comply; that is, EU policy „positively” prescribes an institutional model to which domestic arrangements have to be adjusted. In the *negative integration* European legislation may affect domestic arrangements by altering the domestic rules of the game. European influence is confined to altering domestic opportunity structures, and hence the distribution of power and resources between domestic actors. In the third form, European policy neither prescribes concrete institutional requirements nor modifies the institutional context for strategic interaction, but affects domestic arrangements even more indirectly, namely by altering the beliefs and expectations of domestic actors.

According to Börzel and Risse(1), europeanization can cause three different degrees of domestic change:

-Absorption: member states are able to incorporate European policies or ideas and readjust their institutions, respectively, without substantially modifying existing processes, policies, and institutions. The degree of domestic change is low.

-Accommodation: member states accommodate Europeanization pressure by adapting existing processes, policies and institutions without changing their essential features and the underlying collective understandings attached to them. One way of doing this is by "patching up" new policies and institutions onto existing ones without changing the latter. The degree of domestic change is modest.

-Transformation: member states replace existing policies, processes, and institutions by new, substantially different ones, or alter existing ones to the extent that their essential features and/or the underlying collective understandings are fundamentally changes. The degree of domestic change is high.

In this paper I will investigate the presence of peer pressure, the strategic use of EES and the europenisation mechanism in the romanian employment policy.

Hypotheses on decisive factors for EES impact

According to Mailand(10) the literature on EES includes few hypotheses on explanations for its impact.

The most common hypothesis is "the compliance hypothesis" or "the level of fit hypothesis". This hypothesis predicts that the more a member state's employment policy, including its institutional set-up, was in line with the EES prior to its introduction, the less impact the strategy will have. The EES could be expected to have the strongest impact in cases where the level of compliance was low, simply because peer pressure in these cases would be probably the strongest(4).

Within the strategic use of EES at the national level, it can be used the "europenisation hypothesis". This hypothesis is referring to the impact that European policies in particular and European integration in general have on national policies.

Methods

The data sources for this article include: (a) reports and documents from EU institutions; (b) various government publications; (c) academic texts analysing the impact of the EES at the national level in terms of employment policies.

This article focuses on the period from 2002 to 2010.

3. The EES in Romania

Employment policy in Romania: a 20 years history

Employment policy has a short history in Romania, the concept of "unemployment" being introduced officially in 1991, by the law regarding the unemployment (Law no 1/1991 regarding the social protection on

unemployees and their professional reintegration).

The employment policy in Romania covers various areas such as: labour legislation, work conditions, gender equality, social protection, work protection, fight against discrimination, fight against exclusion, social dialogue at the company and national level.

During the period of preparation to be EU member (2003-2007), Romania has been involved in ongoing dialogues with European Commission to ensure the candidature is able to implement the employment element of Amsterdam Treaty and is ready for financial support from European Social Fund.

The Romanian government focused its efforts to harmonize the Romanian legislation and to ensure the compatibility with the community acquis.

It was agreed that Romania and the European Commission, as first step, should analyse the key challenges for employment policies in a Joint Assessment Paper (JAP). The employment was considered as priority number one for the implementation of EES in Romania. As a result, in 2001 was conceived the first National Action Plan for Employment (NAPE), transposing the 99/312/CE Resolution regarding the employment guidelines.

In March 2002, was approved a new law unemployment benefits, in a modern European vision (Law nr. 76/2002). The new law focuses on active labour market measures and proposes different measures to stimulate employment at level of companies and direct beneficiaries. The provisions of the law are related, as well, to the creation of statistical indicators for labour market at national and local level; modifications to the Classification of Occupations in Romania; diversifying the active employment measures etc

In 2002, the National Commission for Employment Promotion is established and the first Joint Assessment Paper is finalised. The Commission has a specific role in monitoring implementation of the National Employment Plan.

According to the JAP Romania's short-term employment and labour market policy priorities are determined by the following challenges: *restructuring still far from being*

finalised, will continue to have a negative impact to employment; some areas/regions will be more affected by high and increasing employment in agriculture; negative trends in labour market participation and employment in general and in industry especially; insignificant job creation in services; Insufficient development and contribution of the private sector to employment; unemployment located mainly in urban areas; high long term unemployment (half of total unemployment) and youth unemployment rates, especially for low qualified people. Other issues presented in the document are: low participation and high drop-outs in upper secondary and post-secondary level of education (especially for population living in rural areas and Roma), a wage policy which obstructs job creation and drive people into the informal labour market due to high social contributions and tax-wedge.

The recommendations of European Commission were referring to: efforts to ensure that all children can access and complete compulsory education and broaden access to upper secondary education; a strategy for continuing training in close co-operation with the social partners; a wage setting system that can be supportive of economic and labour market reforms; measures to reduce the income tax and examine further ways to reduce the tax-wedge; review the funding arrangements and the level of resources for active policies; better integration of ethnic minority groups, in particular Roma, on the labour market; implementation of the legislation and measures to ensure equal access to the labour market for all persons; progressively develop bipartite dialogue and ensure that tri-partite co-operation; efforts to strengthen capacity building in the administration and develop an appropriate institutional framework for regional employment policy and for the implementation of pre-accession and ESF support in co-ordination with the other structural funds.

For the alignment to the revised EES, the Romanian government conceived NAPE for 2002-2003 and 2004-2005.

In 2004, Ministry of Labour, Social Solidarity and Family was appointed Project Management Authority for Sectoral Operational Program Human Resources Development.

In 2006, Romania prepared the Strategic Operational Plan for the ESF funds. The main priorities of the SOP are: education and training in support for growth and development of knowledge based society, linking life long learning and labour market, increasing adaptability of labour force and companies, modernising the Public Employment Service, promoting active employment measures and social inclusion.

During the year 2007, in order to improve the administrative capacity and assure access to the labour market, there were envisaged: the increase in quality of services offered by the Public Employment Service, the strengthening of social partnership principles and assurance of quality in developing specific institutions in the fields of employment and vocational training (setting up of the National Observatory for Employment and Vocational Training of the Labour Force, development of the National Authority for Qualifications), the setting up of new institutions in the social sector (the National Agency for Social Benefits, the Social Inspection and Social Observatory).

To ensure development of policies promoting equal opportunities between women and men, through GEO no. 67/2007 regarding implementation of principle of equality of treatment between men and women within the framework of social security professional schemes, it was established the legal framework that stays at the basis of modifying all dispositions against the principle of equality of treatment.

During 2007 progress were made concerning: developing the inclusive labour market, flexibility and security on the labour market(modernization and updating of the Labour Code); the extension of active life(revision of the legal frame of the anticipated and invalidity pensions); employment in the rural areas(employment caravans);reform of early and inclusive early education; promoting lifelong learning.

In 2008, the recommendations of the European Commission concerning the employment policies in Romania were regarding the improvement of the quality and labour market relevance of the education and training systems, including lifelong learning, reduces early school leaving, and facilitates

the transition of young people into employment, including through work-based

training. One of the main problems identified during 2005-2008 was the high level of the youth unemployment rate(around 20 %, among the highest in the EU).

In 2008, the Action Plan in the framework of Lisbon strategy for growth and jobs has as general objective to *implement an integrated approach to increasing employment, activity rates and productivity levels, especially by accelerating reforms of the education systems to respond better to labour market needs, by reducing early school leaving, by significantly increasing adult participation in education and training, and by transforming subsistence/semi-subsistence farming into sustainable employment..*Subsequently, the Action Plan within the National Reform Programme was including the *strengthening the institutional capacity of Public Employment Services.*

The Community Employment Guidelines for 2008-2010 stated as priorities: *attract and retain more people in employment, increasing labour supply and modernising the social protection systems; improve adaptability of workers and enterprises; increase investment in human capital through better education and skills.* A new National Plan was conceived according to these Guidelines.

Institutions with tasks in employment policy

The Ministry of Labour and Social Solidarity has the overall responsibility for elaborating employment and labour market policies, programs and national plans and to prepare the draft budget for the Unemployment Insurance Fund on the basis of proposals from the National Agency for Employment, to control its execution and the implementation of employment policies, strategies, plans and programs done by the National Agency for Employment and by the National Training Board.

The National Agency for Employment is the main implementing body for labour market policies and programmes. The Agency established in 1998 as an independent public body, managed by a tripartite board started to function in January 1999 taking over an administrative department of the MoLSS as well as the existing network of county-level and local employment offices. The Agency is

responsible for job-brokerage as well as for managing active labour market programmes and organising adult vocational training programmes. It has also the responsibility of collecting the contributions to unemployment insurance to the Unemployment Fund and of administrating the Fund and to pay the unemployment benefits.

The National Adult Training Board, a tripartite, autonomous body set-up in 1999 (has a consultative role in promoting adult vocational training strategies and policies. It became operational in February 2000.

The National Commission for Employment Promotion is a new advisory, tripartite body set up by the new law on the unemployment insurance system and employment stimulation.

4. Main findings

The impact of EES in Romania took the form of the *peer pressure mechanism*. Some facts proving the presence of this mechanism are: creating the Agency for gender equality, the National Council Against Discrimination; elaboration of National Employment Strategy, Joint Assessment of Employment; transposing of several european directives in romanian legislation.

EES was used strategically by the romanian government as justification for the extension of the pension age limit.

The impact of the EES is expressed as well as a *content* of the employment policies and as a *process* as well. Concerning the *content*, the romanian authorities (ministry of labour and national agency for employment) elaborated national employment strategies and plans within the national reform programme, according to the Employment Integrated Guidelines and the Broad Economic Integrated Guidelines. Regarding the *process*, the impact is lower, due to the lack of transparency of the policy procedures. No consultations with social partners and public debates are absent prior the adoption of a new policy measure.

For accession as member state and to implement EES, Romania had to create new labour market institutions, according to the european legal frame and conceive programatic and strategic documents (National Reform Programme, National

Action Plan, National Employment Strategy National Employment Plan). In this case we refer to a *positive integration mechanism*. It is, as well, an *europenization through adaptation*, concerning the adaptations and completions of the romanian legislation in order to be in line with the european law.

The *negative integration* is present in the case of the romanian administration wich is responsible for specific priorities inserted in the Operational Programme for Human Resources Development. The romanian Governemnt decide the structure of authorities responsible for management of the European Social Fund. The romanian authorities are responsible for projects selection financed by ESF, generating a new distribution of power, opportunities and resources between national actors.

Concerning the effects of europenization, in my opinion, the positive integration creates the effect of *transformation*. Romania created several institutions that doesn't exist before its accession and elaborated programatic documents regarding the employment policy at the national level.

The first hypothesis, regarding the *compliance with european acquis* is confirmed because, prior its accession, Romania had to create an institutional frame, that doesn't exist before, able to implement EES. This were created during the accession time (2002-2007). The hypothesis is confirmed after the accession, as well, the ongoing process of european integration requires *compliance* of romanian employment policies with EU's regulations, directives and recommendations.

The second hypothesis, of *europenization*, is confirmed as well, the mechanisms of *positive integration* and its effects are expressions of europenization of institutions, procedures and actions operating on labour market.

5. Final conclusions

The main features of the impact of EES on the romanian employment policy are expressing the positive integration mechanism, under the pressure of accession to the EU and to comply with the european legislation and procedures. Generally speaking, the impact of EES in Romania is the sign of the europenization.

Further studies are required in order to investigate comparatively the impact in other eastern and central european countries new and old member state.

The Economic Role of Activities in the People Process of the City of Pitesti in the Post-Revolutionary Period

Nedelea Adelin

University of Bucharest, Faculty of Geography

adelindely@yahoo.com

Abstract

The post-revolutionary period is, in our country, the period after 1990, when there was a change of regime. This change has had remarkable consequences on the economy both at a national and local level.

As to the definition of this science – economy – it represents „ all human activities deployed in production, distribution, trade and consumption of material goods”[2]. Economic base consists of companies, businesses and firms that operate in the production of goods and services.

In the city of Pitesti, the economy has been an important factor with implications for the local development, generating the migration of population from surrounding towns or villages to the city of Pitesti, which influenced the growth of total population. After 1990, restructuring measures have been developed for certain industrial establishments. Production capacity and the default number of employees have been reduced, which has led to a reduction of the total population.

Key words: economy, production, restructuring, layoffs.

J.E.L. classification: O1, O18

1. Introduction

Many authors wrote in their papers about Pitesti city, the researches having various aspects of geography, history, economics, architecture, urbanism and others. Thus, in „History of Pitesti city”, the authors treat with the city’s history and issues of landscape, climate, hydrography, population and economy [3]. Emilia Greceanu discusses in her book „Urban ensemble medieval Pitesti” and some references on population and economic life of the urban settlement

Pitesti. Another scientific paper in which the author mentions in a subchapter, information on the city economy, both before and after year 1990, is „Water resources in the High plain of Pitesti and Pitesti city water supply” (Rozica Posirca, 2004). Also in this work are treated aspects about the city’s population. Important data on the population and economy’s Pitesti city’s, are outlined in various studies such as General Urban Plans from the years 1994 and 2009, Local Agenda 21 and Integrated Plan Urban Development.

2. Materials and methods used

The materials used from this study are represented by the statistic and economic data on economic activities and population trends in the analyzed period, these data were provided by the Direction County of Statistic Arges and Pitesti City Hall and various studies on urban economy. Like methods used in the current study may be mentioned: the method of collecting statistical data on economy and population, method of examination the information, questionnaire method and the explanation method.

3. Case study

Located in the county of Arges, at confluence Arges River with Doamnei River, Pitesti is the most developed urban center, both economically and numerically, compared with other cities in the county. The rhythm of development undertaken in a shorter time, compared with the other localities that belong to the county, was due to of certain causes, of which the most important are: city location at the crossroads old transit roads (trade routes) and its location at the contact between two different geographical and agricultural areas, plains and hills, reason why trade was practiced with products from different areas.

The first economic activities in the city were those of crafts and trade [6], those practiced at the intersection of trade routes, the place where merchants and craftsmen came from different places for the exchange of products from different geographical areas.

Over time the economy has evolved, economic sectors have diversified and at the beginning of the socialist period, the industry has represented main branch of economy. The political regime of the socialist period has put great emphasis on the industrialization of all localities in the county, including the city of Pitesti. Were set up the new industrial units with different profile, some factories have been equipped with new equipment and were created new departments within them for increasing production capacity, the reason for which were created new jobs, both for the population of Pitesti city and for those of neighboring cities, or other localities. The industrial development was an important factor for the numerical evolution of population. The growth in the number of inhabitants was recorded after 1950, when the population was about 30.000 inhabitants and until 1990, when the population reached value 174.790 inhabitants. In year 1990, the population was approximately six times higher compared with its value since 1950.

Post-revolutionary period or the period from 1990 until now, is different compared to the socialist period, or that was until year 1990. The process of industrialization ended, the units that existed until year 1990, it remained the same in first decade, due to privatization and „according to Law no. 15 of august 8, 1990, the production profile, number of employess and spaces previously built, must be maintained for a period of time” [4]. After being approved the low, had passed to a mass privatization and existing industrial units have been converted into joint stock companies. Following this measure, some industrial units have been renamed, thus „Aggregate Technical Rubber Products was called „*Rolast*”, Aggregate Wood Processing – „*Alprom*”, Textila Enterprise – „*Novatex*”, Factory Fabrics Argeşana – „*SC Argeşana SA*”, Shoes Factory – „*Argesin*”, Beer Factory – „*Pitber*”, Progresul Enterprise – „*Subansamble*”, Bread Factory – „*Spicul*”, Polygraphic Enterprise –

„*Tiparg*” [4] and not least Dacia Enterprise, located in the city of Mioveni, but belonging to the city of Pitesti it was incorporated by the French Company *Renault*.

The industry, until the beginning of the restructuring had a location in the three cardinal points of the city, differentiated to a certain extent, of the industrial profile, but also of their location, both inside and outside or the edge residential areas [5]:

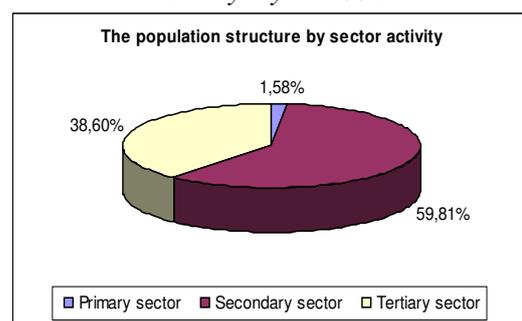

-Northern Industrial Platform Pitesti, grouped along a traffic artery, are included the textile, footwear, wood processing, chemical industry, food, rubber and plastics;

-Eastern Industrial Platform Pitesti, situated in Stefanesti locality, was formed of mechanical engineering industry and „Ana-Imep enterprise of micro-engines, a unit of electrical industry” [5] from Arges county;

-Southern Industrial Platform Pitesti, is located mostly in the locality Bradu, was specializes in processing crude oil, but, they within it was included and industrial establishments situated in the area station C.F.R. South Pitesti, it is the case the Enterprise Precast Concrete and Steel Bridges.

According to available data, both in the census conducted in year 1992 [10] and the General Urban Plan from year 1994 [9], the population structure of the economic sector is represented in Figure 1.

Figure 1. The population structure by sector activity – year 1992

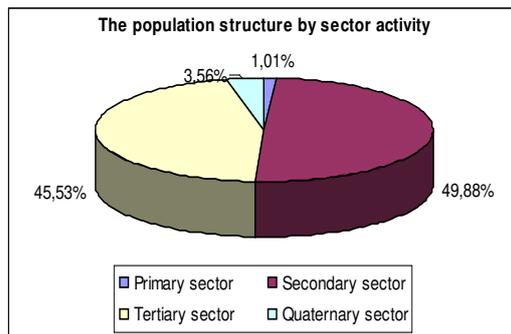

Source: Census of population, 1992

Analyzing figure 1, it can be observed that the largest share of the population is grouped in the secondary sector of activity where manufacturing industry owns the highest proportion of population, respectively 59,81 %.

The tertiary sector of activity occupies a second place with a share of 38,60 % and third place is occupied by the primary sector with a value of 1,58 %. It should be noted that the average total number of employees in 1992 was 88.045 people.

For year 2008, according to data from Department of Statistic from Arges County [7], share of employment in the sectors of national economy present the following situation (figure 2):

Figure 2. Population structure by sector activity – year 2008

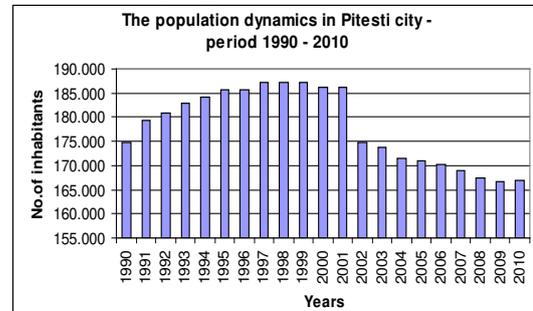

Source: Direction County of Statistic Arges

Figure 2 highlights the changes in population structure by sector between years 1992 and 2008. A new industry emerged is observed, the quaternary sector, in which included the scientific research activity, its share of being 3,56 %. Compared with the activities sectors of year 1992, in the year 2008 changes occurred in the three sectors. Thus, the primary sector decreased by 0,57 % compared with year 1992, reaching the value of 1,01 %, the secondary sector decreased by 9,93 % and for the year 2008 the value was of 49,88 %, and the tertiary sector grew by 6,93 %, the amount recorded in year 2008 being of 45,53 %. This increase of the tertiary sector is due to the trade which „represent the most important sub-sector of activity from the tertiary sector” [8], and now this sector „is the most important sector of the economy from Pitesti city” [11]. In year 2008, the average total number of employees was 70,020 persons, with 18,025 persons less as compared to the number of employees registered in year 1992.

The decreased of number of employees was due to the reduction of existing jobs at the municipality level, reason for which influenced reducing the number of people.

For the period under review, the dynamics of the number of people had an interesting trajectory, characterized by three periods of deployment (figure 3).

Figure 3. The population dynamics in Pitesti city – period 1990-2010

Source: Direction County of Statistic Arges

Analyzing the figure 3 we can delineate three periods of development of population, as follows:

- growth period, between years 1990 and 1997, the population grew by 12.391 residents, from 174.790 inhabitants registered in year 1990 to 187.181 inhabitants in the year 1997;

- period of stagnation, presents a short duration, between years 1997 – 2001, the population stands at around 187.000 inhabitants;

- period of population reduction, between years 2001 – 2010, stands out by reducing the population to 166.000 inhabitants in a nine year period.

The upward trend of population until the year 1997, was due to the Law No. 15 of August 8, year 1990, which prohibiting the termination of employment contracts of employees. The period of stagnation is due to imbalance of industrial units and curbing immigration, and the third period, the massive reduction in population, is based on massive industrial restructuring, the reducing of production, and thus, the number of employees, and in the final stage those units are closed. Following the closure of certain industrial units, the people who left without work, „ a large proportion of the population sought a job abroad, and some smaller part retreated to rural areas” [1].

The year in which the local industry was started downturn, it was in 1998, this period and currently remains. In some units have been registered difficulties, and finally

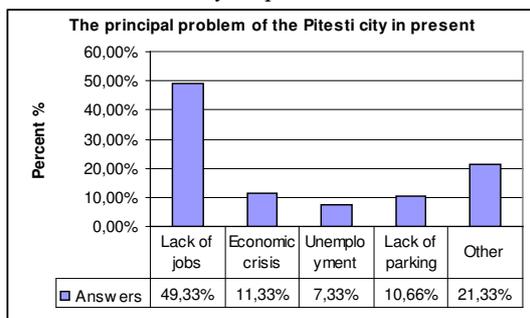

ceased the activity, and among them are:

- „Rolast”, ceased the activity in 2007,
- „Argesana” has changed the industrial profile, from at syntetic fibres to manufacture auto electrical wiring,
- „Novatex”, „Argesin”, „Pitber” have ceased the activity,
- „Alprom”, market due to competition, it was forced to close the work in certain units,
- „Textila”, changed the owner, and since 2008 belongs to a French firm.

These are just some of the industrial units which after 1998 have been faced with problems that could not be resolved, thus reaching at the stage of liquidation.

A widely used method in recent years by researchers, is the questionnaire method, which has been applied to the analyzed population, in this case. The questionnaire was applied to 150 people aged over 18 years, who working in different fields. For this study we selected only one question, what referring to the main issue of the Pitesti city in present (*Which do you think is the main problem facing the Pitesti city in present?*). After analysis results of the questionnaire, I made a chart (figure 4), highlighting the city's main problem from terms of its inhabitants.

Figure 4. The principal problem of the Pitesti city in present

The most people who were questioned, consider that the principal problem of the city is the lack of jobs (49,33%). Other problems noted by the city's residents are: the economic crisis (11,33 %), unemployment (7,33 %) and lack of parking (10,66 %). Some of the respondents (21,33 %), gave other answers to this questions.

In conclusion, for a locality, the economy is a very important aspect that should not to be out of control. According to the General Urban Plan of 2009, „business view is that

economic development is the development of the whole sector companies” [9].

4. Conclusions

The conclusions to those aforesaid, about the privatization of industrial companies from the city of Pitesti, is that, in ago to application of the privatisation law, after the grace period, several companies have implemented restructuring measures, the production level declined and a part of the productive force it was dismissed. Some companies have permanently ceased activity, because of the inability to compete nationally, cause that to influenced the growth unemployment and reducing local labor. The major reduction in population that occurred after year 2001, is mostly due to economic restructuring, cause that influenced the residents migration in abroad.

Some measures should be adopted in future for development of economic activities that to remedy problems, of economically, that occurred in the city.

Real Estate Market Situation in Romania in the Context of Economic Crisis

Negoescu Gheorghe
Botescu Ion

"Ovidius" University Constanta, Faculty of Economic Sciences

negoescugl@yahoo.com

ion_botescu@hotmail.com

Abstract

It is estimated that the real estate market of 2011 will enter into a so-called real estate crisis, their prices reaching those in 2005-2006 when in Bucharest you could buy a studio comfort I with prices between 15.000 and 20.000 euros, 2 bedroom apartment comfort I could have bought at that time with 20.000 to 25.000 euros and 3 bedroom apartment comfort I could reach 35.000-40.000 Euro. Considering that in Europe and the U.S.A. the price per square foot constructed does not exceed two average wages in the economy would have said above come true, one square meter built in old buildings should not exceed 500 euros.

Key words: real estate, crisis, mortgage

J.E.L. classification: M21

1. Introduction

During 2000 - 2008 were ended around 64.400 homes, according to INS, mostly 3-room apartments.

According to NBR, the chart analysis of housing loans at the end of 2008 shows that 42% of those who took a loan are in Bucharest and 58% of the rest of the country.

In April 2009, the central bank provides a credit report that housing debt of the Romanians circulation of almost 5 billion euros and that 92% of respondents have credit in foreign currency (euro or Swiss franc).

It seems that the market began to know a significant growth in real estate transactions in summer and autumn of 2007, a slight drop in August 2008 and a plunge in August to October 2009. In 2009 the State has earned

60% less money from the real estate taxes owed and taxes, over the same period last year, for example, in July 2008 the price of an apartment which was 100 000 in the same month in 2009 its price has fallen 80 000 and in the same apartment in April 2010 reached 65 000, are still declining, estimated somewhere between 15% and 20%.

The real estate market of 2010 comes with a pretty significant decrease in price per square meter for apartments both old and for new ones, leading to close some deals between the two types of apartments (old and new).

However, the desired market decreased to less than half last year due to economic crisis has led banks to not lend as easily as before and many private companies have failed in freeing functions many employees.

It is estimated that the real estate market of 2011 will enter into a so-called real estate crisis, reaching their prices in 2005 - 2006. [1]

2. The situation in Romania

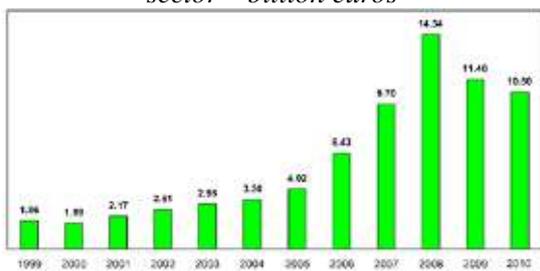

Romania was the champion on the increase - between 2000 and 2008 we went from a share of construction in GDP of 4.9%, a share of 10.7%.

During this period, the construction sector increased by 750% and 287% of GDP. For comparison, increases in second place among the ranks of Lithuania, the construction sector increased by 364% and 177% of GDP and Latvia came in third place with a percentage of 284%, 178% respectively. Estonia follows the rankings (280%, 155%) and Bulgaria (279%, 139%), while last place is Germany with a decrease of 9.7% of the sector, an increase of 18.3% GDP. Note that the share of construction in GDP

has declined in Poland, Hungary and Czech Republic respectively in countries with which we compare the most.

In 2000, the value added generated by construction activities was 1.7 billion euros, the amount increased to 14.3 billion in 2008, followed by a fairly steep decline, the achievements for 2010 is approximately 10.5 billion euros.

Fig. no. 1 - The value of construction sector – billion euros

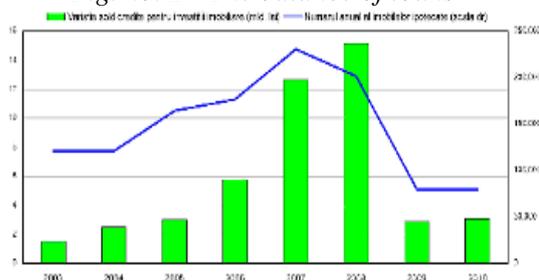

Source:

INS

If we strictly refer to residential buildings, the value of construction works increased from 363 million in 2000 to 4.2 billion in 2008 (1050%), of which 2.4 billion euros represents the value of individual buildings (houses) And 1.8 billion euros the amount of apartments built in blocks.

At the same time, banks have invested heavily in this sector, such as loans for real estate investment balance has grown to more than one billion lei in 2002 to 41 billion in December 2008 [2] and increased the number of mortgaged homes from 120,000 in 2003 to 200,000 in 2007 and 2008 [3]. At this point there are probably over a million homes mortgaged, banks having exposure to approximately 11 billion euros on the construction sector.

Fig. no. 2 - The balance of loans

Source: INS

The crisis has made grants in 2009 and 2010 are extremely rare, the growth of the balance of loans decreased dramatically - from an extra 15 billion lei in 2008, an addition of only 3 billion in 2009, but much of the growth recorded in 2009 was actually due to devaluation of the "leu" against the euro [4].

International economic and financial crisis has affected the Romanian industry, which took effect in November 2008 in a rapid and marked decline. However, if you do not take into account the seasonality, we can estimate that the first signs of international crisis occurred since the second quarter of 2008. The analysis of comparability in terms of seasonal shows at the same time the positive aspect of integration of the Romanian industry single European market. It seems that, at least for the industry, there is a big lag between changes in the Romanian and European industry, which may constitute an important prerequisite in the assessment of future recovery.

Even if the level of 2008 industrial production was located in a slight increase (+0.9%), have noted the contraction recorded in the last quarter, which exceeded 10 percentage points.

The tendency to reduce the workload has continued in the years 2009 and 2010. An analysis of gross index of industrial production series, the structure of 2005 [5] (a fixed base year 2005 = 100), according to NACE Rev2, published by the National Institute of Statistics, indicates reaching a maximum level in October 2008 Monthly Industrial production for 2000 - February 2011.

It is also the start of decline in industrial production, marking the largest month following the contraction of industrial activity. Decreased production in January 2009 was 37 percentage points compared to October 2008.

In 2009, the Romanian economy has recorded its first significant drop in nine years, ranging from 8% to -7.1%. Analysis of the data series published by the National Institute of Statistics go to some common conclusions:

- Change occurred in the evolution of the upward trend in industrial production, whether minimum point was in December 2008 or January 2009;

• The return of industrial production to a level comparable to that achieved in 2008 has a slow dynamics compared to the speed of contraction occurred in late 2008. In structure, the Rev2 CANE amid financial crisis reveals a different response of industries to determine factors influencing the demand contraction. And this time, they took into account trends from analysis of both unadjusted data and adjusted to the number of working days and seasonality. This has led grouping industries according to their evolution into three groups: industrial activities of any general difficulties which the production decrease can not be placed solely on account of the effects of the crisis, affected by the industrial activities and activities not were affected by the crisis.

Real estate market in Romania is in deadlock. The number of transactions dropped significantly but not drastically, and the supply and demand do not seem to want to meet.

3. Conclusions

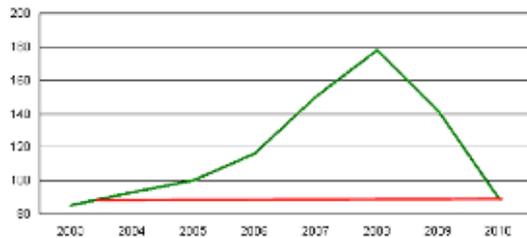

In an area so closely related to macroeconomics, such as in real estate, business plans are hard to do. Everyone is working with several backup plans and calculate their turnover by taking into account the worst case possible.

Real estate agencies believe that in 2011 will sell best with small apartments, so that lower price. Also, benefits would be owners who fail to understand that they must seek a fair price, market adjusted, if they want to sell their home.

Features Regarding the Proportion of Online and Traditional Business Environment

Negoi Eugen Remus

Academy of Economic Studies, Bucharest, Doctoral School

remus.negoi@yahoo.com

Abstract

If you look at the Internet strictly as a business, we can practically say that it is a place where you can bring your business into the homes of hundreds of millions of people who have an internet connection, but not just that. . On the Internet, everyone has an idea can put online and can receive feedback almost instantly. In traditional business is more difficult to get this feedback, because it is more difficult to transmit information to and from the people. Some businessmen, however, prefer to do business face to face.

Key words: online business, traditional business, internet, online costs.

J.E.L. classification: M10.

Romania, regarding investments made in online business environment in Romania, (<http://www.startups.ro/stiri/studiu>) shows that 68% of small and medium company representatives said that their company had made decisions to invest online.

The two parameters, number of customers on the Web and product information intensity, can be combined to provide a straightforward model (Table 1) for determining which companies should be using the Internet. Organizations falling in the top right quadrant are prime candidates because many of their customers have Internet access and their products have a high information content. Firms in the other quadrants, particularly the low-low quadrant, have less need to invest in a Web site.

Table 1. Internet presence grid[1]

		Information contents of products	
		Low	High
Number of customers with web access	High	Office supplies	Industrial products
	Low	Food and beverages	Consumer electronics

Source: Electronic commerce – the strategic perspective.

1. Introduction

Along with other environmental challenges, organizations face three critical strategic challenges: demand risk, innovation risk, and inefficiency risk. The Internet, and especially the Web, can be a device for reducing these risks.

The comparison between Internet and traditional businesses, where it refers to the start-up can be done in terms of cost. An Internet business can be done with fewer financial resources, requires less capital and will operate on some low cost, compared to a traditional business. Internet business can be very flexible, because the costs are actually variable, whereas in a traditional business problem appears very high fixed costs and very flat. In the economic recession is very difficult to apply and effectively restructured a traditional company, while an Internet company that can adapt, being more flexible in such a situation.

According to a study by E_Invest in

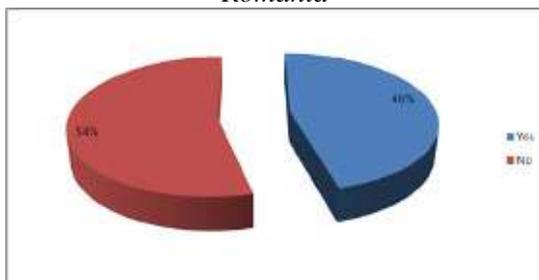

2. Movements from offline to online commerce

Over time, online commerce has progressed continuously. They appeared very strong new companies operating solely online, but traditional companies operating both in traditional media and in online business. And now and in future, some consumers will remain for certain kinds of products and in certain circumstances, which would prefer to buy only from traditional

trade. At the same time, it is clear that there is a significant move from traditional commerce to online trading. Almost all retailers, when they switched from traditional area to online area, or if they went directly online, they must understand and adapt to this new reality. From this point of view, traditional retailers and consumers who understand the market, consumer preferences have already or will have a representative presence on the Internet, even if they continue to develop in traditional retail networks.

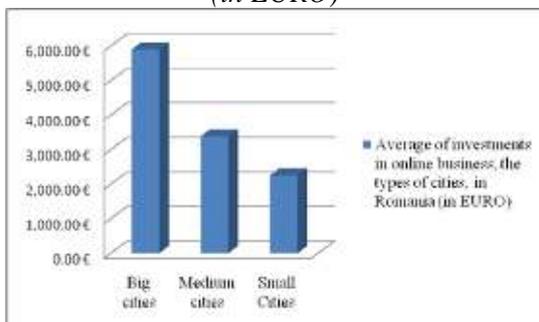

In the study organized by E_Invest (<http://www.startups.ro/stiri/studiu>), 46% of respondents said they had already invested in business activities on the Internet.

Figure 1 - Investments moved from traditional to online environment, in Romania

Grouping the cities situated on the first cities in the "investment company", with an average of 5898 Euro of investment which would be made, followed by medium cities, with an investment of Euro 3385 and small towns with an investment of Euro 2250.

Figure 2. Average of investments in online business, the types of cities, in Romania (in EURO)

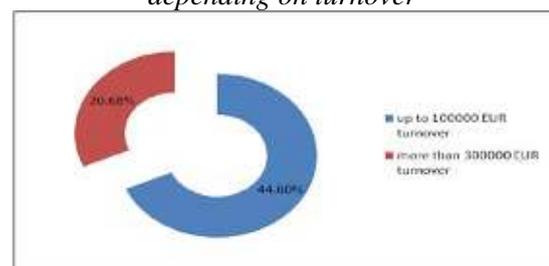

In terms of geographical distribution on, the amount of money invested in online business module, Moldova leads to an average of 8185 euro, followed by

Transylvania located averaging almost half of the amount spent by companies of Moldova (4422 euros) and Wallachia with Euro 3437, says the survey data cited. When asked "What would it take to address the online business environment", the respondents indicated as important financial resources (at a rate of 91%) and creating a site on the Internet (82%). The main institutions identified as those which should help companies to try to conduct business online, there are associations of employers (63%), EU (62%) and government and government agencies (59%).

Main ways in which government institutions could help companies trying to conduct business activities online are: providing funds and grants (27%), providing tax incentives, exemptions and tax reductions (19%), legal and regulatory policies market (11%). An online presence is considered important, 54% of SMEs representatives analyzed with a companion website. A percentage of 40% of firms interviewed representatives must, in large or very large extent, the business activity carried on may be carried out online, and 35% are still undecided in this respect. Zone Muntenia - Bucharest has supremacy in terms of percentage of business activity taking place online, with 48.3%, followed by Transylvania with 30.5% and Moldova with 25.4%.

According to group turnover, the share of the company that runs online activity is greater in companies with smaller turnover. Thus, companies with turnover below 100,000 euro a share the company owning 44.6% of the company's activities. And those with a turnover of 300,000 euro, it operates at a rate of 20.68% online.

Figure 3. Percentage of activity, held online, depending on turnover

According to the study cited, 31% of respondents believe that 50% of their company business activity will be held online, over the next five years. At the same time, most (49%) believe they will be held online between 11% and 50% of the activities of firms.

The main advantages of launching an online business activity have been identified as the gain of time, efficiency (23%), better and more efficient communication with customers (22%), lower costs (19%), coverage of this environment, great opportunities to attract new customers and partners (18%) and visibility offered by the company, it can become known (15%).

SMBs are considered less reliable in running an online business that could make accessibility (5%), increased sales and turnover (6%), development of e-commerce expansion market (6%), better organization of data (6%). The main disadvantages are considered to be the lack of direct contact with customers, with products (14%), difficulties in management (9%), low information security, data (8%), communication problems (6%).

The less important disadvantages are considered to be addressability (2%), lack of experience in IT staff (2%), reduced access to the Internet (2%). At the same time, 21% of respondents believe that running a business online would not bring any disadvantage. The main areas, in which the companies participating in educational research, are consulting, training, commerce and manufacturing. A 95% majority of the companies have Romanian private capital, and 5% - foreign private capital.

3. The consumer behavior in online commerce

Among various founded statistics, analysis and conclusions, one aspect particularly attracts attention: the fact that the average time which have the owners of websites to attract attention, is 8 seconds. In eight seconds, an online consumer will decide if the website is interesting or not, if he found what they are looking or not, you still deserve to browse or search for something better. In this very short time he has available, the owner of a website needs to

attract attention and arouse interest of people (perhaps future clients, partners, sponsors, etc.) who visit the website for the first time (<http://www.zooku.ro/blog/2010/01/comportamentul-consumatorului-online>).

Customers from online environment are more demanding, their requirements are higher than they expect to trade some superior performances of traditional trade online. They are better informed, more educated, more affluent, for the simple fact that they are very familiar with the Internet than other customers who buy only from traditional trade. Therefore, to live up to such expectations, it's not always easy.

From a certain point of view, there is a denial rate for items purchased online in Romania. This rate is the same level of denial in Romania compared to more developed countries, if we refer to the typical problems that customers have to say: the inadequacy of a particular product with a specific functionality or technical problems, even new products. From this point of view, Romania is on a par with Western Europe. But there is a higher return rate in the West, in more developed markets than in Romania, in terms of returns unjustified. Romanian consumers are more fair to those who sell their products, meaning they do not return, refuse or ask for money back for some products, unless they have a real problem with that product. Otherwise, the mature markets like the U.S., it often happens that a client seek to benefit from using a product for a certain number of days, then return it and try to take the money back. That is a really important issue, which is the law.

Taking into account the desires of consumers over time, one of the largest online electronics stores in Romania, Emag, opened in major cities also traditional shops. This is because, activating in electronic equipment operating area, customers want to have quickly access to warranty and post-warranty services. In other areas, such as delivery of gifts or flowers, for example, online stores have kept operating solely online.

4. Online promotion vs. classical promotion

The most important aspect of a traditional marketing strategy is understanding the consumer. In online marketing, the entire process of developing a keyword strategy is based on questions like: What do consumers? What consumers look for? What consumers want?

Before starting an online marketing campaign or traditional marketing must understand what the customer wants and what expectations may have from us. The client needs to understand what services the company offers but also what results you get if you use the services of the company (<http://optimizare-site-google.blogspot.com/2010/html>). Good ideas almost always formed the basis for a successful business. Whether creating a new product or market a product promotion strategy, original ideas are little secrets behind starting a successful business. Online Marketing great ideas often plays a key role in promoting more efficient online business. Take the example of the Facebook platform, first launched in 2004 as a university network to shut down and later extended to companies like Apple and Microsoft.

From the standpoint of channel promotion, many professionals are focused only on TV or magazines only, although there may be more effective than other platforms. Successful companies are those who figure out what channel and what channel combinations are best for their audience. In online marketing can opt for PPC (paid links), Social Media Optimization or Organic Optimization, etc. A PPC campaign can be effective for a client, but not for another.

Methods of measuring ROI (return on investment) are in the traditional marketing, varied depending on particular promotion channel (TV, print). In online marketing, it can demonstrate to the customer the effectiveness of a campaign by detailed charts the evolution of traffic on site and submitted sales during a certain period.

Many large companies turn to two, three or four different advertisers, so it is difficult to reach a common denominator in terms of promoting the product or company. In Online Marketing are cases when it is better to resort to the same agency for creating the site for

SEO. An SEO and Web Design agency will know best how to create a website that would be up to the expectations of customers and at the same time to be better indexed by search engines. Surely many business people are wondering how they can promote their business through online social platforms.

For example, social network Facebook is a dynamic environment that allows interaction with other members, keeping up to date with news and events contact group in particular, change of information and finding out their opinions about products or services.

Facebook is a simple, transparent and practical system, which allow to create in minutes their own networks of friends, share photos, documents, videos... From the start up has been created to share information. Initial access to the site was limited to students at Harvard, and now has over 500 million active users. Social networking platform Facebook can be a very useful tool in promoting a business. Thus, there are a few tips on promoting a business or start-up, traditional or online:

a. Create a Fan Page on Facebook. User page allows a maximum of 5000 friends. To successfully promote your business on Facebook, must have created a page for the Fans (Fan Page) customized according to the own website.

b. Launch of Buzz Marketing campaign, which would:

- competitions with prizes that launched a new product or a service fee to attract prospective customers;
- Information about a contact group organized by you or an event that will participate. By creating a group event, you will receive confirmation of this;
- Publish news or links to articles or products on your site. Moreover, interest is also published news on the "wall" (Wall) of its group members. This helps attract new contacts;
- Placing an icon on own website or blog to allow visitors to access the company profile and add up the list of contacts.

c. Analysis of profile members of their group.

Friends of friends are the friends of the company. Facebook allows members to find groups and their activity domain folds.

d.Launch of surveys or questionnaires. Social networking helps to obtain relevant opinions about products or services. Up help and to test various concepts before putting them into practice.

e.Recruitment of staff.

Information displayed on a member's profile is a mini CV which enables the company to know and to select personnel for a job.

f.Publication of sponsored ads.

Launch up advertising campaigns based on products or services ads are another component of online promotion. This is achieved according to targeted users' typology and budget.

5. Short conclusion

A manager can decide the proportion that will work in the online environment based on several criteria: core business, which targets to be met, business trends, market potential, budget. To achieve a mix of these criteria is a goal of every entrepreneur. Whether he worked long traditional business environment, be it a business start-ups, whether it decided to work only online, an entrepreneur will decide to conduct online activities. And this is happening and will happen for most entrepreneurs, even though they hold only a simple presentation website.

In Romania, there is a perceived tendency for smaller companies to move their online activities. Larger companies, or are more rigid in this regard, either already have such an important market share that online presence they need in a smaller proportion. Looking globally, it is observed that small companies "bite" of the market of the larger companies, because they are online present in a greater proportion. The decisions of entrepreneurs to move a part of business from the traditional environment to the online environment can make the difference between keeping a larger market share or lower.

The Credit Activity Impact of Small and Medium Enterprises on the Economic Recovery of Romania

Neguriță Octav
„Spiru Haret” University,
Faculty of Accounting and Financial Management Constanta
octavnegurita@yahoo.com

Abstract

The economic sector of small and medium enterprises is one of the most important areas in the Romanian economy. However, granting loans to these companies is not at the same level as the importance they have in the economic sector, the banks being more cautious to granting loans to this kind of enterprises as opposed to loans to big companies. The financial law and the banking excessive prudence are only some of the causes of this situation. In this way, reduced or no financing has seriously affected the activity of small and medium companies and their decline has significantly influenced the overall economic developments of the last period of time.

Key words: banks, credit, risk, influence, liquidity

J.E.L. classification: G21.

1. Introduction

The lending activity in the Romanian economic sector took place under the influence of macroeconomic shocks and distortions such as: inflation, the constant reduction of gross domestic product and of the production level, its balance of payments, the level of foreign exchange reserves, as well as the disturbances in the financial and banking system, respectively the budget deficit interest rate, the payment mechanism and also a lack of diversity in the loan portfolio. All these require a redefinition of the role of the banking system, whose vulnerability to the global financial crisis proved to be a decisive factor in the process of economic decline.

The banks' operating system should be done at a reasonable level of efficiency, based especially on the maximum financial prudence. In the current economic conditions, banks' functions should be adapted according to the market needs, being acknowledged the high vulnerability of money transfer in the banking sector. The role of banks in the economic system is given by one of their main functions, namely the allocation of cash by providing credit to the real sector of economy. Therefore, the nature of credit transactions, the size of credit resources and the risk assumed by banks, makes them become the most "informed" segment in the socio-economic field, with a huge potential in transferring information to their customers in order to minimize business costs and maintain a more effective ratio between the funds saved and the ones invested in the economy. From this point of view, we can estimate that the banking reform should be conducted in accordance with the reorganized activity of the economic agents.

2. The impact of risk on credit standards

During the fourth quarter of 2010, lending standards have undergone significant changes in accordance with previous expectations of the banks. For the beginning of 2011, credit institutions have tried a relative relaxation of standards for short-term loans and a tightening of standards for long-term loans for businesses in the SME category. Crediting terms have not experienced major changes, both in the sense of relaxation, by reducing the spread from 1M ROBOR, as well as getting a little worse by increasing the risk of premium and collateral claims. In the fourth quarter of 2010, the demand for granting loans by non-financial companies

has returned to a positive territory, being supported by the short-term loan demand. According to the banks, the demand for long-term loans will continue to decline during 2011, a trend already registered at the beginning of the year. In the opinion of the banks, the risks related to the companies are growing in all sectors except the energetic and the industrial ones. The risk perception towards the small and medium enterprises has been and it is still increasing.[1]

The main factors which led to an additional tightening of the credit terms have been the changing ratio of nonperforming loans in banks' portfolio and the weighted expectations regarding the overall economic situation. The risk associated with the industry where the company is operating, and the one associated with the collateral, have returned to the attention of some credit institutions (net percentage below 10 percent), although they had a neutral position in the last quarter of 2010.

According to banks, credit continued to diminish for companies operating into the energy sector, while for those in the industry, the situation does not change significantly. Constructions and real estate sectors remain, in the fourth quarter of 2010, in the category of the riskiest areas of activity, in terms of credit risk.

The credit risk associated with small and medium enterprises is still seen as an ascending trend, namely for the small companies and for the micro-business segment. For corporations, the situation remains unchanged for the last three quarters of 2010.[2]

According to financial data published by the National Bank of Romania for 2010, the crediting activity dedicated to economic agents registered a relative recovery with a plus, especially beginning with the second half of 2010. Regarding the small and medium enterprises, financial data is presented rather differently from the general trend.[3]

If, in the case of long-term loans granted to SMEs, such activity has stopped declining since the beginning of 2010, the short-term loans granted to small and medium-sized companies are still on a downward spiral. However, the tendency of these long term credits is to stop the decline, being expected

a rebound in this sector, starting with the middle of 2011.

The credit granted to the private sector, especially to the small and medium companies sector, has significantly diminished its growth rate, starting with the last quarter of 2008. The annual growth rate of these loans, in nominal terms, fell from 33.7% in December 2008 to 0.9% in December 2009, so that, from January 2010, for the first time in the last 10 years, being placed on a negative level (-3.5% in January, February and -3.7% - 1.6% in March 2010). The compression tendency of the growth rate of granted loans, characterized both components of small and medium enterprise sector, both in RON and in foreign currency transactions. In terms of value, most of the loans granted to the small and medium enterprise sector are long-term loans.

The financial sector continued to expand in 2009-2010, but the growth rate was significantly reduced due to financial international turmoil, that has contaminated the financial markets and the internal economy. The risks have remained high and infusions of capital were needed, as well as a restructuring of costs and a better management of liquidities so that the financial system stability not to be affected. The internal financial sector is strongly connected to the external sector and particularly to the European one, through relations of equity or of financing. In this way, its development and the risks' evolution depend, significantly, on the international financial system. The level of financial intermediation, as a share of our country's gross domestic product, increased in 2009 and remained at approximately the same level in 2010, changes being favored by the economic contraction, and the net assets of the financial sector have not registered significant increases. The internal financial system is dominated by credit institutions, but the insurance and investment sectors on the equity markets have a high potential for development, with the growing convergence of the domestic financial markets of the European ones.

The financial sector is characterized by a high sensitivity to adverse events, because it attracts short-term financial resources and carries out medium and long term investments. This principle of operation is

not homogenous in all credit institutions, but it is defining for the activity of financial intermediation, to a certain extent. The influences on the domestic financial system were both exogenous, induced by external financial markets and by real economy, and endogenous. Endogenous influences can be produced at the level of one or more participants and can be spread within the financial sector by pure contamination, or by balance and non balance sheet exposures, with the effect of the depreciation of assets, withdrawal of funds, payments or assuming losses from equities.[4]

The deepening economic decline in the 2009 activity, rising unemployment, tightening credit standards and terms, in the context of the rising volume of nonperforming loans, and the risk associated with guarantees, are inhibitory factors that impact on the demand and supply of loans into the small and medium business sector.

3. Problems of financing the small and medium enterprises

Small and medium-sized companies are a major player in the economic sector of Romania, they play the main employer role and they are the largest contributor to the country's gross domestic product. The financial crisis has fully affected these companies, and reducing the internal and external demand, reducing market liquidities and more demanding credit conditions have led in many cases to bankruptcy. In order to save themselves from bankruptcy, these companies have resorted to various cost reduction measures, such as layoffs, wage cuts or reducing the administrative costs. In addition to all these, there is also an acute need of financing from external sources, the vast majority of SMEs registering, in this period of time, a shortage of funding. These companies resort to this type of financing, through credit, and avoid financial blockade, but the possibility of conducting investment is extremely limited under these conditions.[5]

In spite of the flexibility of these companies, however, they do not provide the same degree of security for banks as large corporations. This is explained by their low financial power, and hence fewer

opportunities to guarantee loans. It should not be overlooked the fact that, small and medium enterprises are the engine of economic growth, they currently contribute with almost 70% to the GDP in Romania, being the major employer, providing approximately 60% of the total employment. Although the small and medium enterprises sector is of systemic importance, the present legislative framework creates a major problem for SMEs and the overcrowding, registered among the organisms which are precisely established to help and support these businesses, leads to a difficult implementation of the appropriate measures.

The alternative of investment funds of banks, within the retail banking, offers, in relation to granting loans to small and medium enterprises, the advantage of lower costs and risks. Regarding this last point, it is noted that the inadequacy of the mechanisms used by banks to analyze and monitor SME loans determined, on one hand, high operating costs, and on the other hand, high costs of provision. Therefore, the classification of a loan granted to a small or medium newly created company depends both on quantitative and qualitative factors. If banks do not have proper information systems and adequate decision assistance, they will qualify the customer, not just by virtue of a prudent approach, but also as a result of the impossibility to identify a more real risk category, the E category, thus generating a maximum cost, determined by provisioning.

At the other extreme is the situation when, unjustifiably, the client classified in the A category does not initially generate any regulatory cost, but later, through its financial inability, affects the bank's profitability. It results therefore, that the development, by the banks, of loans' granting to SMEs, requires, on their part, first of all, the assumption of initial operational costs, generated by the implementation of some informational systems, and of assistance with the performance decision, adapted to the specific sector of these companies. The covering of these costs is accompanied by the enlargement of customers' portfolio so that the profitability threshold is exceeded and it is able to generate more profit, in line with the risks assumed.

Another problem, located at the level of demand, is the fact that the largest share in the small and medium companies, is owned by the microenterprises, whose low volume of activity, which determines the demand for financing, both for the support of current business (treasury loans) and for investment loans, is directed mainly to small loans, below the threshold of profitability of banks. Therefore, the credit necessary for small and medium enterprises can be satisfied only partially by banks because they need to create a portfolio to ensure the overall profitability of lending in this area.

Banks are still facing a lack of information regarding the business conduct of their customers, a situation mainly caused by the absence of a history of the relations they had had with various creditors. In order to remove this obstacle, it should be considered, on one hand, the CIB modernization of the National Bank of Romania (extending the reporting requirements for financial institutions, including information related to groups of debtors that have economic connections with each other, providing consolidated information both for credit history and for the incidence of payments to borrowers and also providing information on credit card fraud) and, on the other hand, the development of the credit bureau activity so as to include in its database all the information on the history of the relations of small and medium sized with the banks.[6]

It is imperative for the state, together with the banking system, to find a solution for small and medium enterprises to access loans faster and at lower costs. Because the state borrows from the banks, they prefer to put money in value vouchers in loans to the state, so money do not get at all, or get in very small amounts to SME loans, that are hardly granted. SMEs also face the difficulty that the state hardly grants the state aid forms approved and even recommended by the European Union. Until the minimum level of state aid will not lower to at least 50,000 euro, the situation in which only a few companies in Romania will benefit from state aid will continue. The threshold decrease would result in the access of thousands of SMEs to the legal forms of state aid, in order to find the necessary financial forms. The simplification and generalization of loan procedure is especially necessary given that

the debts of companies (mainly small and medium enterprises) to banks reached a record level, and most probably will increase during this year. The share of overdue loans, in the total loans granted to SMEs, increased from 1% to 10% over the past two years, according to NBR reports.[7]

Although loans to small and medium enterprises were mostly those granted to microenterprises, however, the share of these loans is relatively low compared to the share of this category of companies in the total of SMEs (90%). Besides the general causes that restrict SME credit market (higher interest rates and required guarantees, the lack of training of applicants, etc.), in the case of microfinance there are specific breaking factors, such as information asymmetry. This refers to the inability of small enterprises to be perceived by creditors as potential creditworthy customers, both because of their small size, as well as the use of traditional techniques for assessing the credit records, by the banks.

Another shock, small and medium enterprises fully felt, in the context of the economic crisis, was the substantial increase of the length of time of the debt collection. In the first half of 2009, it increased with 30 percent for SMEs, while for the corporations, it only increased with 15 percent. However, it is worth mentioning that, in terms of access to financing for SMEs, there are also some positive developments. Thus, the National Credit Guarantee Fund for Small and Medium Enterprises (FNGCIMM) granted, in 2010, guarantees of 490 million euro, 26 percent higher than in 2009. The guarantees offered by FNGCIMM were designed for bank loans that amounted to EURO 950-980 million. It is also true, however, that just barely over 20 percent of these loans were for investment.[8]

There should not be omitted certain aspects of the granting loans process. So far, the volume of loans granted in Romania is 50% of the gross domestic product, which is a significantly low figure, compared to the European average, respectively 72%. Of all these, at the end of 2010, loans granted to economic agents were RON 40,060.5 million from a total of RON 77,030.3 million and foreign currency loans granted to economic agents were RON 65,606.2 million from a total of 132,340.4 million. There is an

approximately equal distribution between the volume of loans granted to individuals and those granted to businesses.[9]

The values provided by the National Guarantee Fund are still quite low compared to the total of credit granted to economic agents, especially to large companies. Thus, reporting the small volume of SME loans to the gross domestic product, this is in contradiction with the high share and the contribution that small and medium companies have to the GDP. We can say that the decrease of loans granted to this type of business since 2009, plus the relative stagnation in granting loans to this sector in 2010, is a key factor of the economic progress recorded in Romania over the past two years.

Therefore, Romania's gross domestic product declined with 7.1% in 2009, followed by a smaller decrease of 1.3% in 2010. Furthermore, during the second quarter of 2009, the credit demand of these companies is on a strong downward slope, respectively 50% - for short-term loans and 77% - for long-term loans.[10]

These decreases were determined, on one hand, by the strengthening of crediting conditions implemented by the National Bank, but also by the significant increase in the number of bankruptcies, which has seriously affected the small and medium enterprises sector. By making the access to bank financing more difficult, serious problems have been developed, these companies facing a shortage of necessary funds, primarily in their current activities. As the reports presented by the National Bank of Romania reveal, a small share of the funds intended for crediting small and medium enterprises, were directed for the finance of new investments or development operations.

4. Conclusions

Given the importance of SMEs to the economy, these issues were fully reflected in the evolution of the main macroeconomic indicators of Romania. This must necessarily be taken into account, especially since the importance of crediting to these firms is slightly reduced compared to that of large companies and as the lack of financing for small and medium companies had a significant contribution to the economic

decline of Romania, registered in the past two years.[11]

Loans granted to the population cannot advance at a very fast pace, but corporate financing is an area that has a high growth potential. Therefore, banks should be aware of this potential growth and understand that supporting the SME sector, ensure precisely the future development of their business.

All these situations offer a clear picture of the importance of granting loans to small and medium enterprises and of the influence this has on the domestic economic development.

The Refinancing Loan as a Compromise Factor Between Costs Widening and the Insuring of the Financial Stability of Individuals

Neguriță Octav

„Spiru Haret” University,

Faculty of Accounting and Financial Management Constanta

octavnegurita@yahoo.com

Abstract

The refinancing loan has represented until recently, for individuals, a complicated, expensive and risky way to finance current financial needs. Until the outbreak of the economic and financial crisis, banks were offering more credit alternatives, refinancing being relatively sidelined in the loan portfolio both for businesses and individuals. The deepening and the continuation of the crisis, plus a slight increase in the rate of overdue and doubtful loans, have determined the banking environment to look for other ways to slow down this phenomenon. Promoting refinancing loan, not only at the inter-banking level, but also in relations with non-bank customers, may be a way of recovery, in this context many persons being unable to pay outstanding rates.

Key words: refinancing, conditions, warranties, fees, rules.

J.E.L. classification: G21

1. Introduction

Currently, a loan refinancing may be an option for many of the banks' customers that hope to get more favorable conditions for an amount they have already borrowed. Refinancing can be obtained at the same credit institution or at a competitor, depending on the conditions. By 2010, this type of loan was not an advantageous method of financing in relation to regular loans, banks not being interested in the refinancing activity, but in attracting as many new customers or in concluding new crediting contracts with their actual clients.

In order to make their refinancing offer more attractive, at a lower cost, banks may

provide various facilities, like eliminating various fees. By favorable refinancing, thousands of euro savings can be obtained, which make it worthwhile. This should be treated, however, with the utmost attention by the customers, because an incorrect or careless calculation can bring a new long-term credit, more damaging than the first one. The essential criterion is the total cost, which is the client's responsibility following this procedure, comparing it after a rigorous calculation, the amount that has to be reimbursed to the former credit with the amount refunded by a new loan, plus all the taxes and fees involved in refinancing.

2. Steps

In general, refinancing a loan implies going through several stages both for the customer and for the crediting institution. As a first step, the bank where the original loan was contracted, assesses the client and establishes financial guarantee requirements. When refinancing a mortgage, this bank establishes a first rank mortgage on the property. In the next stage, the first bank grants an initial loan to the customer. Subsequently, the refinancing bank evaluates the customer that wants to refinance the loan, conducted by the initial crediting bank. This second bank also establishes specific conditions for the refinancing loan guarantee. In the case of a mortgage these specific conditions represent a second rank mortgage over the property. Furthermore, the refinancing bank transfers the credit in the loan account of the initial bank. In these circumstances, this bank will close the original loan and will remove the security established for the original amount. Finally, the refinancing bank will establish financial conditions specific to an initial credit.[1]

3. Establishing the value of the prepayment fee

One of the most important aspects that complicate the access of individuals to refinance a loan is represented by the value of the prepayment fee, which, depending on the bank and on the type of credit requested, could reach up to 5%. In fact, during 2009, the three largest banks in Romania registered the highest fees for early repayment of a consumer loan or a mortgage. The prepayment fee was, in fact, a primary condition of withdrawal, for the customer, to the original loan conducted in favor of the new refinancing loan. Thus, this criterion constituted, even before the refinancing credit contraction, a significant additional cost which reduced or even canceled the benefits of cost entailed by the new loan.

In the conditions when a loan interest is variable, the bank may increase it, according to the market fluctuations and does not take the risk of fixed interest. Prepayment fee, in the case of this type of loan, has no justification. Such a fee can be justified in the case of fixed-rate loans, because banks risk for a customer to refinance with another bank when the interest drops. However, the higher value of fixed interest and fees, charged by the credit institutions in Romania, in the case of these credits, significantly reduced the risk margin and also the possibility of potential losses in case of refinancing a loan in favor of another crediting company. At EU level, this financial situation was already covered, the early repayment fee being established only in the case of fixed-rate loans with a maximum of 1%.

Presently, what constituted an impulse for customers towards the refinancing segment was, essentially, the limitation of the fee payment in advance to a maximum of 1% for the loans with fixed interest and its removal for the loans with a floating rate. This was determined following the application of the Emergency Ordinance no. 50/2010[2], which standardized the loans' fees that have become more affordable. The income reduction, the decrease of interest rates starting with 2010 and the foreign currency appreciation are the real reasons for a client, who has especially contracted denominated loans in euros or Swiss francs, to refinance debt.

4. Refinancing traps

The most common requests for refinancing refer to the consolidation of all debts (loans, credit cards, leasing, overdraft), to personal credit card loans and to mortgages. For choosing the right refinancing formula, refinancing of one or more credits, it should be compared the amount to be paid to the value of the new loan, plus the refinancing costs.[3] Refinancing costs include, in general, the prepayment fee, the issue of a guarantee letter, the fee for handling the file and the fee for granting the credit, only in case of approval. Most individual customers, who want to reduce borrowing costs, ask for additional amounts, being very small the percentage of customers who want a refinancing only in order to move from one bank to another, for the same amount. But even if the customer qualifies for a loan, greater than the debt that has to be reimbursed, the additional amount is blocked until the redemption of the original loan. Anything additional is blocked in the customer's account at the refinancing bank until the issuing of the document confirming the liquidation of the loan.

The problems that might be encountered by a customer who wants a refinancing are the declining revenues over the past two years, the negative payment history, the collapse of property prices (for mortgage loans) and the customer classification according to more conservative norms, compared to the period previous to the recession in our country. In choosing a refinancing loan, customers must take into account the type of the loan refinanced, the amount of the guarantee, the number of refinanced loans and the personal situation. The financing opportunity is calculated based on the total amount of the maturities paid plus the loan granting costs and the total to be reimbursed, which should be smaller than the amount to be refunded. Otherwise, refinancing will not get the cost reductions for the client, but will significantly increase the final amount to be reimbursed.[4]

In general, a lower monthly rate does not automatically mean a lower cost. If you take a loan of 7,000 euro for a period of five years you will pay higher monthly rates, but overall loan costs would be significantly lower than if the same loan, of 7,000 euro, had been

taken for a period of seven years, paying lower monthly rates.

A credit category that may face refinancing problems is the loan in Swiss francs. The first one is, of course, the very large difference between the Swiss franc and the euro. This means that in order to refinance, now, a loan in Swiss francs, granted three years ago, it takes more euros than then, the rates associated with the new refinancing credit, being still high. The second major issue is that refinancing also requires the guarantee revaluation, which in most cases is a property. These customers no longer fit to actual interest rates in euro or RON which are higher than those in Swiss francs at the time they were contracted. We can add to these the unfortunate development of the Swiss franc - RON - Euro exchange rate, which makes today's equivalent of the credit balance in euro higher than the euro equivalent of the original loan, contracted according to Swiss franc - Euro exchange rate at the time.

Another possible disadvantage of the loans in Swiss francs is that this type of loan can be refinanced only in euro or in RON. In the case of loans in Swiss francs, it is preferable for the new refinancing loan rate to be at least one point percentage below the original rate. Even so, in converting from Swiss francs to euros, customers will have an unpleasant surprise due to the deeper appreciation of the Swiss currency. In this context, for a loan contracted in Swiss francs, for an amount equivalent to EUR 40,000 in 2008, the payment balance, presently reported at the current rate, would be greater than 50,000 euros.

Refinancing is recommended for the restructuring of several loans into one loan and the restructuring of a much higher interest than the one that can be obtained by refinancing. There can be gathered, in a single package, mortgages, consumer loans or even credit cards. It is true that for larger amounts, mortgage guarantees are required, including national assessment costs or home insurance. However, much lower interest and longer granting period, allow the achievement of a more diminished rate, which ensures the amortization of the refinancing cost within ten months. The current financial and banking conditions do not recommend the refinancing of loans that

have already passed half of loan repayment period, when, the main share of the monthly rates begins to match and even exceed the share of interest and fees. Also, the banking environment favors refinancing loans to RON and euro as interest rates that are at a minimum, at the moment, at a lower value than those prevailed before the outbreak of the global crisis.

If a loan refinancing is not possible for a particular type of loan, or refinancing costs are higher than those of the original loan, customers can choose the path of rescheduling the reimbursement, which would offer them lower monthly rates. National banking practice offers two ways of rescheduling a loan, by providing a grace period or by an extension of the repayment period. Rescheduling automatically assumes that total borrowing costs increase, but it has the advantage of protecting the customers from a too high monthly rate. Customers also receive a positive payment history (without delays), which gives them the possibility to contract new loans if necessary, depending on how much their income will allow them at the time.[5]

Presently, the refinancing offers on the market are not related to the banking regulations, but with the fact that different banks, in the context of the economic crisis, have smaller or larger difficulties to protect exposures. The real reason behind this opportunity offered to individuals, is that, it is difficult for banks to protect exposures, which determines them to be very reserved in crediting. In these circumstances, customers are looking for refinancing solutions in other commercial banks.

At this time, for a mortgage in euros, the best annual interest percentage fits around 6% - 7%. The effective annual interest rate depends primarily on the loan amount and on the reimbursement period, but many banks have eliminated the granting fee, have dropped other fees and added various bonuses (preferential interest in special conditions, free insurance for property, free life insurance for a limited period, notary fees incurred by the bank, free refinancing letter). If the insurance company reduces the costs included in the credit policy, then refinancing may lower the current rate with a few hundred euros.

Another significant problem of mortgage loans is that properties assessment may confuse all these calculations, because housing prices have significantly dropped from the level recorded in 2008. Thus, customers who have opted for a mortgage in euros for the acquisition of a property, assessed in 2008 to 90,000 euro, will face major difficulties if they want to refinance this loan at present. Therefore, a property subject to financing records a value, significantly lower in the evaluation than the one in 2008. This will result in significant differences between the rank 1 mortgage of the initial bank and the rank 2 mortgage of the refinancing bank. Everything depends on the refinancing bank's acceptance to take over the risks associated to the initial mortgage.

These refinancing loans will reduce monthly payments that customers have to pay, but at first they will have to bear additional costs. It should be noted that all property assessment and mortgage changing costs are borne by customers. Mortgage related notary fees are added to these (land book excerpt, proxy checking, notary office fee) and property assessment fees. The refinancing bank sets up a lower rank temporary mortgage, that will become a higher rank mortgage as soon as the bank from which the loan is canceled removed the mortgage entered to the refinancing bank's favor. Finally, the amount financed by the refinancing bank varies between 65% and 90% of the mortgage's total value.

Refinancing the loans in progress, by contracting consumer loans, might reduce the effective cost of the new financing, accessed by individuals. According to NBR reports the average effective annual percentage rate on these loans in euro dropped from 8.43% in December 2010 to 6.55% in January 2011. Personal loans in RON, used for refinancing, have met a reduction tendency in 2010. Therefore, the average effective annual interest rate, reported at the bank level in December 2010 reached a minimum of 10.79%, and in January 2011 slightly increased to respectively 10.89%. From June 2009, the average effective annual interest rate on new consumer loans in RON registered a downward trend from a maximum of 24.70% to 17.47% in January 2011. For the new mortgages in RON, the

average effective annual interest rate decreased with 2.4% in January 2011 versus January 2010. In this way it is explained the 6% share of mortgages, for the loans granted in RON, granted by banks for the purchase of a property.[6]

The sensitive difference between the actual annual interest rate of the refinanced loans compared to the new loans, particularly the loans in euro, represents one of the reasons for which refinancing has an increasingly important role in the bank's lending activity. This cost drop of the loans granted in euro can be explained by the significant impact of the consumer loans secured by property, loans often contracted in order to refinance old debt. According to the National Bank reports, consumer loans also include consumer loans with mortgages. The decreases, recorded by the average annual percentage rate in the banking segment, were registered because, the credit institutions were interested in refinancing and the consumer mortgage is one of the refinancing instruments.

The consumer mortgage loans costs are lower than the loans without property guarantees. This difference is explained by the fact that in the first case, the bank is confident of recovering a significant amount of credit from the sale of the mortgaged property. In addition, mortgage consumer loans allow refinancing of multiple loans both consumer and mortgage loans, by incorporating them into one new loan. There should not be neglected any additional costs that a customer pays for refinancing a consumer loan. So, if banks can no longer charge the early repayment fee of the original loan with variable interest rates, the customer will pay a file review fee for the new credit. Furthermore, in some cases, a monthly management fee for the credit or for the current account is charged. In addition to these, there are, the compensation for early reimbursement, the insurance costs, the interest penalties and the fee for services provided to consumer demand.[7]

According to banking regulations, the consumer loans have an upper limit that usually does not exceed 20,000 euros. So, in the case of this credit category with fixed interest, the prepayment fee paid by the client could reach 200 euros. Before the emergence of the Ordinance 50 of the Law 288/2010[8]

by which it has been approved, this fee goes up to over 1,000 euros in most banks. At the same time, the financial institution that has granted the initial loan can charge a fee of about 30-50 euros for the refinancing letter, price included in the single fee category required by law. The new financing bank may charge the applicant a fee for the analysis of the file that is typically a few tens of euros. Nevertheless, many banks have waived that fee in the battle to attract the competition's customers.

The loans in euro with variable interest are characterized by the fact that the enclosed interest is reported to EURIBOR at 3 months as well as at 6 months. The banking practice has shown that six months EURIBOR absorbs much more easily the economy shocks, while 3 months EURIBOR fluctuates more frequently.

The cost of the refinancing operations represents the cost for standard operations, to which are added only the financial costs determined by the international SWIFT transfer. The maximum indebtedness varies between 50% and 70% depending on the credit institution. There are accepted several types of income and certain banking companies accept up to 3 co-debtors.[9]

As a result of early repayment fee limit, and even its removal in the case of index able interest, the refinancing volume is expected to grow in the future. However, given the fact that, for refinancing operations, customers must on one hand, meet the requirements of solvency, the indebtedness degree, the guarantees and, on the other hand, to bear some additional costs (for assessment of guarantees, notary mortgage costs), this increase will remain within reasonable limits.

5. Conclusions

The refinancing operations initiatives have been prompted by two main causes, namely, the debt consolidation, on one hand, and the protection of liquidities and the optimization of costs, on the other hand. In the near future, this tendency will probably continue, given the flexible criteria to migrate from one institution to another.[10]

This flexibility is compulsory in the registration of a high degree of indebtedness of non-bank customers, and individuals in particular. The number of query requests, submitted to the Central Credit Register, which was placed in January 2011 at the minimum of the last six years, is an evidence of this. Thus, the financial crediting institutions will be required to limit certain fees and interests, or even to proceed to providing facilities for the notary or evaluation fees. In this context, banks will focus on an already existing market, which can be valued to the maximum, namely the market of the already indebted customers.

Abstract

In order to become competitive on the national and international tourism market, the entrepreneurs in the field of tourism from Cluj county should adopt within the product policy a series of new strategies that aim at diversifying and upgrading tourism products sold in this county. The main strategic directions for a superior exploitation of the existing touristic potential and for the development of new touristic products, aim at: establishing a network of centers for curative tourism based on the thermal and mineral waters in the region, the affirmation of rural tourism in some areas of the Apuseni Mountains, the development of tourism in the peri-urban areas, the development of the speleological tourism and hunting tourism and the development of specialized forms of tourism: wine tourism, mining tourism, fishing tourism, extreme tourism (paragliding, hang gliding, motocross).

Key words: strategy, product policy, entrepreneur, touristic products, services
J.E.L. classification: M 31 , L 83.

1. Introduction

The policy of the travel agency, in relation to the products offered on the market, is reflected in the product strategy which it applies. In adopting the best strategy, the tourism entrepreneurs from Cluj County should follow the size and structure of the range of touristic products and services they

want to sell, their degree of novelty as well as their quality.

Depending on their available resources (financial, human and material), the travel agencies from Cluj can apply product strategies with regard to the objectives which they proposed. These objectives may include [1]:

- the increase of the market share for certain touristic products which are sold by the agency;
- attracting new market segments for certain products;
- the differentiation as compared to the similar touristic products sold by the foreign competitors;
- a better positioning of the products within the global touristic offer.

2. The Elaboration of the Product Strategy

For the elaboration of the product strategy, the agencies operating in the Cluj tourism business must take into consideration a number of factors such as: the characteristics of the natural and human touristic resources specific to Cluj county, how to exploit such resources, the forms of tourism which are mainly practiced in the area in which the agency is selling its travel products, the features of the market segments to which the travel products and services are addressed, the characteristics of the markets on which the agency activates, etc.

Currently, one of the effective ways for reviving the tourism in the Cluj area is the creation of "attractive tourism products which can integrate and develop around them

a real network of rendering services units" [2]. The Cluj tourism entrepreneurs must take into consideration the marketing of competitive and qualitative tourism products, which can highlight the characteristics specific to hospitality so as to capture the interest of tourists and to address to multiple market segments.

3. Specific types of Tourism Product Strategy

The agencies operating in the Cluj tourism business which activate on well defined markets and aim to consolidate their position gained by continuously adapting their offer of touristic products and services in relation to the requirements of different segments of tourists, adopt a strategy of flexibility. This strategy involves the continuous research of the market and the monitoring of the progress of the touristic demands.

The flexibility of the touristic Cluj offer can be achieved by creating and promoting touristic products which can meet the increasingly higher requirements and demands of each segment of tourists.

The entrepreneurs can adapt their touristic packages, services, animation activities, etc., according to the wishes and expectations of tourists, also in the areas where the touristic offer is relatively rigid. A particularly important role in identifying consumers' requirements is held by the employees who are in direct contact with customers and who should adopt an open attitude towards them.

Currently, in the Cluj tourism, the training and the attitude of workers in the field of tourism is a real problem. Many entrepreneurs employ unqualified personnel and do not train them, therefore their performance cannot be exceptional in any way. It would be appropriate that, after the time of employment, the entrepreneur registers the worker for training courses, supporting the cost of schooling, and then concludes a contract with the latter, according to which the trained employee is employed for a specified period of time, to operate in the entrepreneur's agency.

The quality of the worker's performance also depends on financial motivation. Cluj tourism workers are poorly paid, an aspect which is reflected in their performance. It is

obvious that an employee who is dissatisfied may not have an open attitude to the customer. The agencies that apply this strategy of flexibility should permanently invest in different market researches, in improving human resources and in supporting an active promotional policy.

Many entrepreneurs operating in Cluj tourism choose to adopt a differentiation strategy as they have at their disposal more supporting elements: the touristic package, on the whole, the touristic services included in the product, the tourism workers involved in providing and marketing services, the image of the product, etc.

„The product differentiation is achieved by positioning it within the structure of the touristic offer, by the specific characteristics of the product, by its performance, by the degree in which the special nature of the product assigned to the product concept is met, by the style of the product and the emotional satisfaction that offers, which cannot be imitated by other products, conferred by the originality of the ambiance”[1].

In the process of creating touristic products, the entrepreneurs should start from the originality which is characteristic to the Cluj tourism. In this respect, a superior exploitation of the natural and human touristic resources available to the county of Cluj is necessary, in order to accomplish attractive touristic products, with spiritual values and national singularity, which can differentiate the offer of our agencies from the offer of the competing countries.

For example, rural tourism itineraries in Cluj County, unique for their richness of landscape and fauna, can combine different forms of tourism (recreational, itinerating, scientific, etc..) addressing to different market segments and being different from the offer of the foreign competitors in terms of their natural resources.

The characteristics specific to the touristic Cluj products (the natural picturesque landscape where many of the accommodation structures are located, Transylvanian cuisine, the possibilities of learning customs and traditions specific to Transylvania - pottery, folk, wood and stone carving, visiting historical remains, etc..) determine their positioning in the national and international touristic offer.

The product differentiation strategy, for the travel agencies from Cluj, is in close correlation with the existence, within the touristic offer of this county, „of the unique natural and historical attractions which, besides the fact that individualize a series of products, they also provide successful guarantees on the tourism market on which the competing offers for traditional products often represent restricting factors in attracting certain consumer segments”[1].

Given the particularities which clearly differentiate the market segments, the travel agencies in Cluj County can apply a strategy of adapting the quality of the touristic products according to the needs and expectations of each consumer segment. Strong agencies that have a good market position adopt a strategy of stability, in terms of quality, of the touristic products and services that they sell.

In order to have an advantage over competitors, the agencies operating in the Cluj tourism business can apply a differentiation made by means of the services that are included in the touristic products. For example, some hotel units can organize in their restaurants musical evenings (shows in which known performers attend or singing contests in which the hotel customers can participate, etc.) to which the accommodated tourists have free access, or, for example, the agencies organizing touristic itineraries can offer the tourists who bought that product the possibility to participate, during the itinerary, to some activities related to its topic (visiting historical sites, monasteries, protected reservations or areas, their effective participation to pottery, weaving, gastronomic, folk activities etc.).

The personnel differentiation for the personnel involved in the provision and marketing of tourism services is especially applied in Cluj by those travel agencies who understood the fundamental role of the employee for attracting and keeping the customers [3]. The number of such agencies is not large, but certainly, in order to face competition on the tourism market in the coming years, this strategy will have an increased applicability. Cluj tourism workers should have an adequate training in public relations in order to develop their capacity to communicate with customers, their credibility and helpfulness towards them as

well as their regularity and punctuality with which they provide the touristic services.

The image differentiation is a strategy used by many travel agencies in the County of Cluj. This strategy „involves identifying the possibilities and the opportunity of associating a product, an agency, a touristic destination with many symbols that can be assigned to them by the different segments of tourists, such as to encourage recognition of the agency which made the offer or of the brand under which it offer.”[1]

For example, Cluj mountain tourism entrepreneurs can use as symbols, which are aimed at sending an image that can represent that product or that touristic destination, photographs that capture special landscapes that best reflects the beauty of the area, various luxurious hotel units and restaurants, images that can present aspects related to the cuisine specific to the area, images captured at certain cultural and artistic events held in that area, at certain sporting events, etc.

The differentiation strategy aims at the superior, original exploitation of the natural and spiritual heritage of Cluj touristic areas and at introducing within the offer a multitude of services based on the traditions and customs that are found in each destination individually [5].

Another type of strategy applied by the Cluj tourism entrepreneurs, who wish to satisfy the requirements of as many segments of tourists as possible with their touristic services and products, is the diversification strategy. This means the changing, by the travel agency, of the components of certain touristic products so as to obtain a wide range of new products to meet the expectations of different segments of tourists.

In Cluj county, due to the complex and varied touristic potential, there can be developed and promoted as particular touristic products: mountain and cultural tours, spa tourism, rural tourism, ecotourism, spiritual tourism and pilgrimage, business, tourism, winter sports and other sports and recreational activities tourism, scientific tourism, etc.[2]

Applying this strategy by the hoteliers in Cluj county means to equip and modernize the touristic structures for accommodation and food services, to introduce certain computerized systems for on-line accommodation booking, to create within

their areas certain spaces that have various functions (children playgrounds, national or local restaurants, treatment and beauty centers) [4] etc.

In Cluj spa areas, tourism entrepreneurs should also direct to the creation and marketing of touristic products which can be addressed to other segments of tourists other than those who are suffering from various medical conditions. For instance, there can be arranged recreational areas (parks, sports areas, casinos, day and night clubs, swimming pools, discos, etc.), there can be arranged touristic routes for practicing itinerant tourism by tourists who like this form of tourism, there can be organized trips for tourists who practice scientific tourism (for students, teachers, researchers who want to study some natural phenomena, to study the flora and fauna, etc.).

In order to increase the number of tourists looking for these destinations for curative purposes, the travel agencies from the Cluj spa areas should take into consideration arranging and equipping the treatment centers with facilities and modern medical equipment, hiring qualified medical staff, providing natural healing factors, providing accommodation and food services of higher quality, etc.

The offer renewal strategy is applied by the agencies that appeal to replacing "obsolete" products with new, unique, qualitatively superior ones but which are addressed to the same consumer segments. This strategy is applied after carrying out some studies which aim at analyzing the performance of each product and in particular of those who are in a declining stage. This analysis should provide a series of information about the effects that may occur after the removal of a touristic product and the changes that may occur in the marketing mix that included that product.

After obtaining the information resulting from this analysis, the travel agency will adopt this strategy of product innovation.

The strategic options can take into account: the constant keeping of the range of products and services within its offer; the relative improvement of the offer by including new components within the same offer; increasing the innovation degree of the offer by including other products and services along with the existing ones.[1]

4. Conclusions

Currently, in terms of the conditions imposed by the existence of a competition held on the touristic market, the tourism entrepreneurs in Cluj should appeal to the continuous renewal of their offer, because this is the way they can adapt their products and services to the increasingly demanding requirements of tourists.

Adjustment of the Macedonian Monetary Policy with the European Union Monetary Policy

Nenovski Tome
Makrevska Elena

University American College Skopje

nenovski@uacs.edu.mk
makrevska@uacs.edu.mk

Abstract

Strategic goal of Republic of Macedonia (RM) is membership in EU. That road is apparently long. There are lots of reasons. Among them is the need for adjustment of particular instruments of the macroeconomic policy of RM.

The main instruments of macroeconomic policy in every country are fiscal and monetary policy. For the fiscal policy in RM can be said that in big portion is adjusted to Maastricht criteria. But we can't say the same for the monetary policy.

Sixteen years in row in RM is implementing monetary strategy of fixed exchange rate. That kind of strategy contributes for sustaining macroeconomic stability. From the other side, rates of economic growth were low or with negative values. External trade deficit have permanently upward trend. Unemployment rate is pretty high.

Those results impose the question about adequacy and sustainability of existing monetary strategy or it should be changed with targeting inflation.

Key words: strategies, exchange rate; synchronization; inflation; Euro

J.E.L. classification: E52

1. Introduction

By signing the Maastricht agreement in 1992 conditions for the common European market to grow into a European monetary Union (EMU) emerged. Formation of the EMU followed three phases.

The first phase (01/07/1990) started with removing the barriers for free flow of capital and use of ECU (European currency unit) as a common currency of the European Union (EU). The second phase started on 1 January, 1994, when the European monetary institute was formed, with the aim of setting the groundwork for the future European Central Bank (ECB). The third and the last phase (01/01/1999) encompassed fixation of currencies of all countries that have fulfilled the conditions for change of theirs with a one common currency (the euro), through the system of Exchange Rate Mechanism (ERM II).

Introduction of the Euro allowed the ECB to conduct a single monetary policy in the area of the countries that acceded to that currency (in the beginning it was 12 out of 15 member states). The main objective of the Euro area and the single monetary policy is the maintenance of price stability in that area by the Treaty of the European Community, Article 105 (1). That order of the single monetary policy needs to be addressed by all other countries - EU members and all other countries - aspiring for EU membership, whose monetary policy has ambitions to converge with that of the EMU.

Membership in the EU is clearly and unambiguously expressed strategic interest and goal of the Republic of Macedonia (RM). It imposes the need to harmonize its legislation with the EU, but also the individual instruments of macroeconomic policy of the Republic of Macedonia with those of macroeconomic policy of the EU. Therefore, we can not talk about equal membership and acceptance of economic rules of the game that govern the EU, if the various parts of macroeconomic activity are not aligned in order to follow the dynamics

and directions of development in the EU. In this framework, strategic alignment takes place on domestic monetary strategy with one that operates at EMU.

2. Monetary strategies

The main objective of monetary policy, and virtually to every central bank in the world, is to maintain price stability. It is believed that price stability is a condition for economic agents to act in adaptable and predictable environment as an essential condition for achieving their unfettered economic growth.

The realization of such a goal is possible by applying one of known monetary strategies: limiting the growth of money supply, targeting the exchange rate of the domestic currency, introduction of currency board or limiting the increase in the rate of inflation.

The choice of monetary strategy in each country is, before everything else, empirical rather than theoretical issue. The selected concept for monetary management should be seen as a dynamic category that is subject to change depending on the success of the strategy and existing possibilities of another concept in other economic conditions, to enable more effective achievement of macroeconomic objectives of the country. The most important criteria that determine the choice of a monetary strategy can be: 1) the stability of money demand, 2) openness of the economy, 3) defined goals of macroeconomic policy in the short and long term, 4) the price elasticity with respect to production, 5) the elasticity of wages, 6) length of time delay measures of monetary policy and the like. Moreover, maintenance of healthy macroeconomic fundamentals remain a fundamental prerequisite for achieving the ultimate objective of monetary policy in any chosen currency strategy.

3. Monetary strategy of European Central Bank

Starting from January 1, 1999 the European Central Bank is responsible for implementing the monetary policy in the Euro - zone - the largest economy in the world after that of the United States. The

European Central Bank is currently responsible for the monetary policy of 17 member countries of EMU. Each of these countries transfers the monetary policy control to the European Central Bank. The Bank, among other things, (which is the most important) decides on general interest rates.

Indeed, given the previously eliminated obstacles to international transfer of capital and highly developed and competitive financial market among the countries - members of the EMU, interest rates have not been very different from country to country. However, it is significant that these (somewhat) uniform European interest rates are determined by the major European countries. This implies that smaller member states have no opportunity and power to influence the reduction of interest rates in their periods of economic recession. In other words, Europe has already achieved financial agreement, which almost completely eliminates the possibility of smaller member states to lead an independent monetary policy in the future.

Member states wishing to become members of the EMU and adopt the Euro as currency, must meet the Maastricht criteria. They mainly consist of: a) establishing and maintaining price stability, with their average inflation rate not higher than 1.5 percentage point from the average inflation rate of the three EMU member states with the lowest rate of inflation; b) budgetary discipline, which implies a budget deficit of size less than 3% of GDP and public debt not exceeding 60% of the GDP of a particular country; c) stability of the currency: exchange rate fluctuation of their national currency within the frames +/- 15% within two years without devaluation, d) convergence of interest rates, with the average nominal long-term interest rate not exceeding 2% of the average of the lowest interest rates in the Union.

The primary objective of the monetary policy of the European Central Bank is to maintain price stability. That means an annual increase of the harmonized index of consumer prices in the Euro zone up to 2%.

The European Central Bank does not recommend a specific strategy for conducting monetary policy. The only recommendation is to maintain price stability. The strategies of the EU member states are consistent with this

principle. However, the dominant monetary strategy in those countries is targeting the inflation rate.

The monetary strategy of direct inflation targeting, which was recently applied in some countries, helped their central banks to build credibility and to "rein in" inflation. In the case of Hungary inflation targeting is combined with limited exchange rate flexibility in terms the Euro. Czech Republic and Poland also use the strategy of targeting inflation.

4. Monetary strategies in Republic of Macedonia

In RM, in the period of monetary independence (1992 until today) two monetary strategies have been applied: strategy of monetary targeting (until September 1995) and the strategy of targeting the foreign exchange rate (from October 1995 to date).

Switching from one to the other strategy is due to the importance of the exchange rate in a small and open economy, the unstable demand for money during the period of implementing major economic reforms and high degree of currency substitution, the suitability of the exchange rate as an intermediate target of the monetary policy due to its transparency and the possibility of daily monitoring by the economic entities.

Sixteen years in a row the fixed exchange rate strategy is applied in RM. Such a regime has become intermediate (secondary) goal of the monetary, and thus the overall macroeconomic policy of the country. The results were expected to manifest a permanent reduction in inflation, removal of uncertainty, boosting investment in the country and a significant reduction in banks' interest rates.

The implementation of the policy of fixed exchange rate had achieved only one of the expected goals: reducing inflation, which in time turned into a destructive deflation. General insecurity in the country has been present during the whole period of implementation of the system of fixed exchange rate, making investments (domestic and foreign) at the low level for the longest period of time. The absence of healthy competition among banks, the poor and

underdeveloped financial instruments, inadequate legal and economic systems, extended presence of a restrictive monetary policy (for maintaining fixed exchange rate) have obstructed any significant lowering of interest rates, especially if they are compared with the level the inflation rate in the country.

On the other hand, the opposite goal of the fixed exchange rate has been fully achieved. In a situation of partially reformed and weak economy with low mobility of production factors, defending the currency with low money supply and, consequently, high interest rates led to a low volume of supply of goods and services in the previous period. This results in further problems in the country's trade relations with foreign countries (permanently high trade deficit) and in the social sphere of the country (high unemployment rate, which makes a third of the population below or at the verge of the existential minimum).

5. Synchronization of the monetary policy of RM with the monetary policy of EMU

Such achievements make a part of the experts in the country suggest change of the country's monetary strategy in order to achieve better economic-social results. In favour of this are also the conclusions for inadequate monetary strategy and relevant suggestions for its change, which come from the most relevant international institutions.

Thus, in 2005 after a meeting with the Macedonian authorities, the International Monetary Fund Mission estimated that the monetary policy results of the Republic of Macedonia are unsatisfactory if the achievements of the real economy are taken into consideration. Therefore, the International Monetary Fund Mission has suggested to Macedonian authorities to change the monetary strategy. Instead of maintaining a fixed exchange rate of the denar, the International Monetary Fund has suggested that an intermediary goal of the monetary policy of the Republic of Macedonia should be targeting the inflation rate. But, as it was announced by the International Monetary Fund, this suggestion

had been rejected by the Macedonian authorities.

The European Commission has presented an even more explicit criticism of the monetary policy of the Republic of Macedonia. In its report on the economic situation in the Republic of Macedonia in 2006 it is stated (page 38) that "there is no progress in the monetary policy of the Republic of Macedonia". And further on, it is cited that "the National Bank of the Republic of Macedonia should set another secondary goal (read: a different monetary strategy) that will make the goals of the National Bank of the Republic of Macedonia be adapted to the general goals of the monetary policy which is being implemented in the European Union".

6. Suggested monetary strategy: inflation targeting

There is a rule that has been confirmed many times in most countries in the world: the fixed exchange rate of the domestic currency in short- or middle- term is going to be devastating, leaving behind itself consequences, which in order to be overcome will require a lot of further sacrifices of the economy to be made. Such was the case with the failure of the fixed currencies of the so-called Asian tigers in the middle of the 90s of the 20th century, problems which the economies of Brazil and Argentina had been facing with for a long time due to the fixation of their domestic currencies and so on. As opposed to them, the countries that had chosen a regime of a fluctuating exchange rate for their currency successfully resisted the turbulence of the world economy. The example with Australia and New Zealand best confirms that. Their economy is closely connected with the economy of the Asian tigers. However, the crisis there (in the year 1997-1998) did not affect these two countries that harshly because the exchange rates of their currencies fluctuate.

The inability of resistance to the external shocks while using a monetary strategy of a fixed exchange rate confirms the current experience of the Republic of Macedonia. The Macedonian economy could not oppose energetically to the severe pressure from the import inflation in the last several months of 2007 and the first months of 2008. That made

the domestic inflation rate in the first months of 2008 be substantially higher (10,2% annually) than the planned one (3% annually). The fixed exchange rate of the denar could not resist such a shock, which led to worsening the performance of the domestic economy, especially of the export companies.

The most illustrative indicator of that inability of resistance of the domestic economy to the external shocks is increasing trade deficit. The need for change of the monetary strategy is becoming obvious.

Which monetary strategy is the best for the Republic of Macedonia at the moment?

In such circumstances when the strategy of the fixed currency rate of the denar doesn't give positive results in long-term because of the insufficient mobility of the production factors, and the strategy for targeting the financial nucleus is not applicable due to the unstable demand of money, it appears that the choice for targeting inflation is the best possible solution. Lately this monetary strategy is used by an increasing number of countries: Hungary, the Czech Republic and Poland, which are countries-members of the EU, with an ultimate goal to enter the EMU. This kind of monetary strategy is also used in the USA, Canada, Great Britain and others.

It has been confirmed by the analyses that in the Republic of Macedonia a strategy of inflation targeting (for example, 3-4% annually) needs to be introduced. Provided successful implementation, this monetary strategy will have developing characteristics, will function as a support of the positive effects, which have been announced with the already started reforms in the fiscal policy and will not endanger the denar value stability.

Macedonian Denar (MKD) Depreciation, Introduction of the New Foreign Exchange Regime or Introduction of the Euro?

Nenovski Tome
Makrevska Elena

University American College Skopje

nenovski@uacs.edu.mk

makrevska@uacs.edu.mk

Abstract

Before the beginning of the world economic crisis, countries from Eastern and Central Europe (CEE) had tremendously high rates of economic growth. Their growth was stimulated mostly with foreign investments and huge amounts of loans that came from the Western countries.

However, as a result of the current economic crisis, global liquidity is sharply decreasing. Access to foreign capital gets more difficult. Inflow of foreign currencies from export of goods and services is being reduced. That caused an abrupt decrease of the inflow of foreign currencies and pressure on the exchange rates of the domestic currency. Countries with fluctuating exchange rate experienced depreciation of their currencies. Countries with fixed exchange rate faced the need of significant reduction in their foreign reserves in order to prevent the depreciation of their currencies.

The second scenario happened in Republic of Macedonia (RM). That raised the question whether the devaluation of the Macedonian denar is needed or new foreign exchange regime should be introduced?

Key words: liquidity, currency, rate; depreciation; Euro

J.E.L. classification: E

1. Introduction

Currencies in most of the countries from Central and Eastern Europe were under pressure from the world economic crisis. Some of them, such as the Polish zloty, Hungarian forint, and Serbian dinar and

others, were faced with high depreciation rate as a result of the insufficient foreign currency inflow in the country and the high trade deficit in their economies. On the other hand, countries (one of which Republic of Macedonia), where a currency's value depends on the value of another single currency ("strong" currencies such as the Euro and Dollar) spent high amounts of foreign currencies of their state reserves in order to maintain the stability of their domestic currencies. Both ways for sustaining the current exchange rate regime caused particular problems and costs in the national economies.

In order to stop further increasing of the costs, the IMF recommended to the EU member countries to become members of the Euro zone as fast as they can, or in other words to accept the Euro as their national currency. The often heard message that came from the EU was, "if you want to be safe it is better to be in the Euro zone". But it is not as simple as that. Within the borders of the European Monetary Union there are the Maastricht criteria that have to be fulfilled by any country that wants to introduce the Euro as its national currency.

That kind of message and opinion in the countries which are members of the EU automatically boosts the Macedonian public opinion for introduction of the Euro as the national currency in the Republic of Macedonia in order to protect the Macedonian economy from the negative effects of the global economic crisis. Is this possible and applicable?

2. Crash of the Eastern Europe currencies

Until the occurrence of the global economic crisis, countries from Central and Eastern Europe had high rates of economic growth. Implementation of a large number of reforms as well as membership for most of them in the EU caused high amounts of inflow of foreign investments (direct and indirect) in these countries. The growth was stimulated by a high amount of credits that came from the Western countries. At the end, easy access to fresh capital encourages these countries to finance their economic growth with high budget deficits.

Maybe the largest economic crisis in the history of the world has been happening during the last few years. Global liquidity is lowering. Access to foreign capital from the countries in Eastern and Central Europe is more difficult. Decrease of the GDP and the consumption, and the starting forms of protectionism in the countries from the Euro zone, caused a significant fall in the growth of the economies as well as in the export from the Eastern and Central European countries. Inflow of foreign currencies from export of goods and services has been constantly lowering.

Direct implication from these conditions in the foreign trade was the increasing deficit in the current account of these countries. In some of them (Romania, Bulgaria, Czech Republic, Serbia, Ukraine, and Macedonia) the deficit in the current account reached double digit amount relative to GDP.

On the other hand, the global economic crisis caused a dramatic lowering of the inflow of foreign remittances and foreign direct and portfolio investments, which in the previous years has financed the significant part of the deficit in the current account of the balance of payments. Decrease of the credit rating of these countries became a barrier for access to foreign credits.

All this caused a dramatic reduction of the foreign exchange inflows in these countries as well as a large pressure on the foreign exchange rate of their national currencies. Some of these countries allow free floating of their currencies which caused high currency depreciation in conditions of much higher demand for foreign currencies. Big depreciation (around 50 per cent) of the value

had the Polish zloty. The Hungarian forint depreciated by around 30 per cent, Czech crown by about 25 per cent, as well as the Serbian dinar. At the same time, countries where a currency's value is pegged to the value of another single currency (the Euro or another currency) faced the need of a significant reduction of their foreign exchange reserves in order to stop the depreciation of their currencies.

On the other hand, such reaction created new currency problem in these countries, which was evident in the high amount of credit debts towards foreign countries. In those countries, there was an increasing exposure to the exchange rate risk. What caused the exchange rate risk?

In the past, most people and numerous companies from the countries from Eastern and Central Europe took loans from the banks in the Euro zone or in Switzerland. The credits were usually approved in Euros, US dollars, Swiss francs or some other currencies with significantly lower interest rates than the interest rates of the credits in domestic currencies. People and companies from countries in Eastern and Central Europe who had received credit bought products that came from the countries of the lender banks. That was not a problem until the domestic currencies in these countries were stable and strong.

However, decreasing economies, followed by low export and high deficit in the current account, as well as payments of credit instalments, caused additional increase of the outflow of foreign currencies in the countries, apparently weakening the domestic currencies. The currencies (zloty, forint, crown, dinar....) started depreciating. Depreciation of the domestic currencies during times when the wages remained unchanged caused a unfavourable status for most of the credit users from the West concerning the returning of the credits. Credit obligations towards foreign countries for some of those countries (Poland, Croatia, Hungary, and Romania) increased by many times. In most of Eastern European and central European countries it caused a debt crisis or as some analysts say, "there was an existence of the largest currency crisis in the world that we have ever seen".¹

For most of the countries the rescue was in the International Monetary Fund. They asked for a record amount of credit. The IMF dispatched around 198 billion of US dollars. The credits are now approved through a new flexible credit line which often does not insist on strict accomplishment of certain criteria as it was the case before. With the introduction of the credit line, the IMF approved a high amount of credit to Ukraine, Hungary, Latvia, Belarus, and Serbia.

The question that arose was if that was the way to solve the greatest currency crisis in the history for those countries. The answer itself was very complex. Even IMF seemed not to believe in resolving the currency crisis in these particular countries in spite of the huge amount of money that were used as credit help. Apart from this scepticism, the IMF recommended the countries in Eastern and Central Europe which are already members of the European Union to give up their national currencies and introduce the Euro instead, without formally becoming members of the Euro zone and fulfil the necessary criteria for that purpose. The IMF considered that the act would solve the problem with the external debt, enforce the trust in the national currency and lead them out of the currency crisis.

Of course, it was not that simple. The European Monetary Union (EMU) supports the Maastricht criteria which every country is obliged to fulfil if the country wants to introduce the Euro as its own national currency. The European Commission pointed out to that fact, warning the countries against all negative consequences of the possible introduction of the Euro without fulfilment of the criteria.

3. Devaluation of the MKD: Yes or No?

The scenario of spending a large amount of one country's foreign reserves for the purpose of protection of the domestic currency was happening to the Republic of Macedonia in 2009. Lower export demand drastically decreased the inflow of foreign currency from foreign countries. In the country there were fewer foreign direct investments, compared to previous years. Access to credit on foreign markets was becoming more and more difficult quantity

wise and price wise. Inflow of foreign currencies as a result of foreign remittances from foreign countries that in previous years financed the deficit in the current account of payment was reducing. In such conditions supply was far beyond the demand of foreign currencies. That caused high pressure on the exchange rate of the MKD in the direction of devaluation of its value.

Negative movements in the Macedonian current account and particularly in the trade account are still in place. Such situation regularly enforces the inquiry of the public: Is there not a need for devaluation of the domestic currency? The result would be declination of the dynamics of import growth and rise of the dynamics of export growth, causing the trade deficit of the country to be at a significantly lower level than in previous years and protecting the foreign reserves of the country.

However, it appears that in this period of time devaluation of the MKD will be counterproductive with much more negative consequences than positive results.

The positive effects of the devaluation will be more expensive import and cheaper export (increasing its competitiveness). However in current terms of trading surrounded by great obscurity and challenges from the ongoing world economic crisis, it was not really likely that the positive changes would remain for a long time and would have significant effect on the current account of the country.

On the other hand, threats of the negative consequences from devaluation in current condition can be easily identified and confirmed.

So eventual devaluation of the MKD happens, the purchasing power of the MKD of the firms and households will be lower by the percentage of the devaluation while buying goods with prices determined in foreign currency (cars, houses and similar). This is an implication that their already significantly low consumption will continue to decrease and will motivate negative phenomena in the real sector (decrease in the scale of production, increase in the number of unemployed, etc.).

Eventual devaluation would cause problems for the households and firms that are in debt with credits in banks according to the contract with foreign currency clause. In

that case, everyone should have secured significantly large amount of MKD to return the credits, which will negatively influence the demand and the growth of the economy. Additional problem of the firms will be securing MKDs for buying foreign currencies for repayment of the borrowed credits from foreign countries, which in turn should be repaid in the course of the upcoming years.

The devaluation will jeopardize the balance of the budget of the Republic of Macedonia. For the purpose of repayment of the previously taken credits from foreign countries, the budget should secure additional MKD for buying the necessary foreign currencies for credit repayment. Such process will substantially jeopardize the realization of the planned activities of the RM government, especially the capital investments which are important for stimulating the economy.

The act of one way devaluation of the MKD will cause liquidity problems for the commercial banks. Eventually the increased demand of MKD for everyday transactions will cause proper exchange of the foreign deposits of the citizens in MKD. That, of course, will have negative influence of the bank MKD liquidity and also to the scope of credits for the economic sector. Banks previously indebted in foreign countries should reserve large amount of MKD for buying foreign currencies to repay those credits, the result of which will be worsening of their MKD liquidity. At the same time, for the scale of the eventual devaluation, the founders of some of the banks should provide additional amounts of MKD in order to reach the capital census of the capital adequacy. That, of course, will lower the liquidity of the founders and make the capital of the banks more expensive. That indeed will cause increase of the bank interest rates and will not ensure realization of development activities for the firms, and will lower consumption. That action at this moment is the worst scenario for the Macedonian economy!

Therefore, the act of devaluation should have happened many years ago with establishment and sustainability of flexible exchange rate. Eventual devaluation of the MKD today will obviously be very painful. Because of that the answer to the question whether devaluation of the MKD should be

done in the existing economic surrounding should be: NO!

4. Flexible against fixed exchange rate

The experiences from other countries (Argentina, Brazil, Asian tigers, etc.) confirm that it is not rational to defend something that on the long run cannot be defended! Fixed exchange rate of the domestic currency on a medium or long run will be violent, leaving consequences behind. For overcoming that kind of consequences much more additional sacrifices from the economy will be needed.

Although such rules have been regularly pointed out by some Macedonian experts in the past, they were not accepted by Macedonian authorities. If fluctuation of the MKD had been allowed a few years ago, Macedonia would have now been much more ready to oppose the current situation of the deficit in the current account. Therefore the question for devaluation of the MKD would not have been considered as necessary.

As a result of that, according to the previous solid analysis, in the near future a pegged exchange rate of the MKD should be consequently replaced by flexible exchange rate as a valve for protection and security, and at the same time as stimulation for the future development of the economy!

5. Replacing MKD with Euro?

Recommendation from IMF for introduction of the Euro by the Eastern and Central European countries members of the European Union caused the Macedonian public reviewing the possible one way introduction of the Euro in Republic of Macedonia.

The idea about introduction of the Euro as an official currency in Macedonia should be welcomed and goes in the direction of adjustment of the domestic economy with the EMU economies. On the other hand, the implementation of that idea is difficult and it is correlated with many restrictions and costs.

Legally Introducing the Euro by a state legislative is not possible, because the Euro is a foreign currency. The Euro though can be introduced by the means of specific acts that exist in EMU. The approval from the European Central Bank (ECB) is needed in

order for the Euro to be introduced in Macedonia as an official money. In order to get that approval, extensive analysis of the political and economic situation should be conducted, especially of the monetary (and payment) system of the country. ECB would not like the reputation of the Euro to be ruined as a result of an eventual disruption or inconsistencies of the domestic economy in RM. ECB does not influence the domestic monetary policy in Republic of Macedonia, nor does the National Bank of the Republic of Macedonia have an obligation (which is the case in member-states in EMU) to run monetary policy in accordance with ECB.

In case of one way introduction of the Euro as an official national currency, it will be necessary to insure adequate quantity of Euros in order to replace current money in circulation (around 15 billions MKD or 250 millions Euros). Another problem/cost would be menu costs, i.e. changing of the prices in all menus, values in ATMs, auto machines, fiscal machines, POS terminals, documents, laws and many other cases.

In conclusion, one way introduction of the Euro would be related to numerous restrictions as well as costs, meaning that before eventual acceptance of the idea, cost benefit analysis will be necessary.

In conditions of crisis such as the current one, the Euro will help the domestic economy by offering protection from fluctuations as a result of its flexibility. That will affect the international trade, save the deposits in banks (there will be no withdrawals or low withdrawals), which is an important positive assumption for the inflow of foreign investments. Trust by foreigners in the Macedonian economy will be increased to a certain level, even though that automatically will not mean protection of the domestic economy, because in the future the economy will still face negative influences of macroeconomic measures that will be individually introduced by domestic authorities.

One way introduction of the Euro cannot automatically protect domestic economy against inflation. Increase of the prices is determined by the quantity of money in circulation. If (primarily through the influence of the monetary policy) the quantity of money (Euros) in circulation is increased through financial channels, that will

affect the inflation growth, even though at the same time inflation in the other Euro-countries is low. That is the reason why ECB would be concerned.

On the other hand, use of the Euro might arise possibilities of its devaluation compared to other world currencies (dollar, frank, yuan, pound..). However, in that case devaluation does not depend on the domestic economy, but on other world factors (political conditions, economic conditions, changes in economies of the Euro zone, etc.), and on the decisions and measurements that are brought forth by ECB. The exchange rate of the Euro towards the rest of the world currencies is determined on the world exchange markets as a result of the mentioned factors. In any case, if the Euro is in use, the pressure for devaluation will not be present as it is now the situation with the MKD.

In conclusion, the Macedonian economy would most likely want to be in the Euro-zone, but it would obviously not be that simple.

Best Practices for Developing the Management of a Media Organisation in Romania

Niculescu Andrei

Academy of Economic Studies, Bucharest

andrei@niculescu.ro

Abstract

This article depicts a best practice guide for management in the media industry on the basis of the comparison between different markets and companies. Basically the empirical conclusions derived from the survey of the specialized literature are stated in a set of rules that managers in the Romanian media industry ought to obey. The paper also provides an extensive personal contribution to the topic of media management, associating managerial, commercial and strategic indications. First part of this chapter evokes the most important media groups on the local market and in the second part these indications are meant to prepare the management of a media organisation in Romania for an expansive development, following the "recipy" of the most important media groups.

Key words: best practices, media management, customer relationship management, online revolution

J.E.L. classification: M10, L82

1. Introduction

The media industry in Romania is mainly consolidated around four main trusts, active on major media channels, but mainly in television, radio, print media, online media and book editing.

Although the Romanian media market is still timid with respect to the great European media markets, it registers a continuous growth and it is characterised by a significant potential expansion and development of local media in South-East Europe, a consequence of the part Romania has played as an economic pole in the area and which it may have all the odds to get in the future.

2. Main media groups in Romania

The Romanian media market is dominated by the following trusts:

- Media Pro Group;
- INTACT Media Group;
- Realitatea-Cațavencu;
- Adevarul Holding.

There are also present subsidiaries of foreign media groups, but the current paper deals with these groups from a managerial perspective.

Analyzing the main media groups in Romania, one can reach certain conclusions regarding their affiliation to the main multinational trusts that dominate the European media market. Even if in most cases these share an impressive history, for many centuries, shedding influence and getting influenced by the great historical events, the various approaches of development of Romanian media trusts generally follow the international pattern.

The post-revolutionary era in media market development has registered an evolution quite similar to the larger markets. In other words, one cannot state that local national media groups are not capable of using the same instruments and obey the same rules in order to develop, such as any corresponding Western group, greater in dimensions and ramifications.

Indeed, for any industry it is true that each player must take into consideration the national specifications of his country, consumers' behaviour, evolution in their tastes and their sensitivity. It is crucial to find out to what degree the public's needs can be adjusted by means of offering new products or by transforming some media products already on the market.

3. Best commercial practices

One of the main goals for such recommendations is first of all the capacity to bring each title, be it books, magazines, newspapers or any print media product to its maximum selling capacity. Second, it is essential that these best practices contribute to the profitability of each and every title for every single publishing house.

Among the basic principles that form the best practices for publishers are:

- All existent information regarding clients must be used (bookstores, wholesalers, retail chains, kiosks etc.), by organizing marketing and promotion plans in order to determine the first print run as accurately as possible;

- The risk for each title must be reduced by publishing an as small as possible first print run, but that should answer to the clients' needs;

- The publishers must let the market decide the potential of their books;

- Each sale opportunity must be exploited, regardless of the client's value or the title's age, as long as there is even a small profit.

Here are some of the best practices for book publishers, from information extracted from professional associations of publishers worldwide [1]:

- On the long term, it is more important to sell to more customers than to sell more copies of the same title;

- The promotion should address to an audience as wide as possible, in order to exploit the full sales potential of the book;

- Good titles need to be kept at key clients for longer periods of time, through careful, detailed and constant analysis of sales performance;

- In general, titles need to be present on the market for the longest time possible, by using alternative sales channels (fairs, events, own initiatives) and thus reducing the costs associated with the returns;

- Every unrealistic hope, dream or expectancy regarding spectacular sales should be ignored, regardless of the initial sales potential of a new title (however, a positive attitude must be kept and nurtured);

- All available market information regarding sales should be used at all times,

never should a publisher take investment decisions based on emotional information alone;

- Most clients and sales representatives can make a rather accurate assumption regarding the number of copies that they will be able to sell, however no prediction is better than the direct response of the market;

- The first print run should be thought out very conservatively, so as to cover initial orders plus a relatively reduced quantity of returns, in order for the total expenses with this particular title to be covered by this first print run;

- Main clients should be encouraged and advised to take a reasonable quantity at first, in conformity with the book's sales potential, so as to avoid large returns;

- The sales representatives should be evaluated also on the number of customers they serve, and not only by the number of books they sell;

- It is better to try to save more on the second print run than on the first, in order not to endanger the reaching of the book's sales potential;

- The books from the back catalogue should be promoted equally intensively as the best-sellers. If in the case of the latter, the bookstores invest at their turn in advertising, promotions and marketing campaigns, it's the publisher's job to ensure that all titles in their offer have the same rotation;

- Assuring an optimal level of stock that can fulfill clients' orders prevents getting the new title on the returns list of all bookstores.

4. Customer relationship management

Specialized literature is more and more pervaded by the idea or the concept of „customer relationship management” in developing a media company. It appears to be necessary from the dynamic flow of new needs among the media consumers. For instance, in 2000, there has been a great deal of talking around unlimited real-time access to information, something that had never occurred in the past decades [2]. Therefore, the public's tendencies cannot possibly be ignored, mainly in an industry in which sometimes existence is conditioned by the

ability of real-time adaptation to market changes.

Some of the recent tendencies of the public are the instant accessibility of information, adaptation and individualization of more sophisticated products and services in accordance to personal needs, especially in terms of alternative media channels (online environment) [3]. Basically, media consumers raise questions and individual issues in order to get more and more sophisticated solutions from information suppliers.

5. The adaptation to the online revolution

According to a survey made by the research department of Deutsche Bank, many of the innovative technologies of the new millenium are changing the modus operandi of media industry. Offering more and more sophisticated products incorporating the latest technologies, such as exclusive online products, interactive media, personalized programme schedules is becoming increasingly spread.

Consequently, the contact between information suppliers and information consumers is getting more close, to the point in which consumers themselves become content creators. In the context of the Web 2.0 phenomenon or of the socialising networks which have led to a rise in the number of blogs from a few hundreds at the beginning of 2004 to over 40 million in mid 2006, according to the same survey, the entire media market reacts to this explosion of new media types, yet each particular player has an individual strategy [4].

6. Electronic editing – a challenge for the management of a media organisation

Media companies, irrespective of their domain of activity, need to stay anchored in this extremely fast changing world, whose jumps are pushed by the latest technologies. This millenium will bring about several changes in perceptions, even if such evolutions will also mean a different way of getting information, therefore the main source of information, the media company,

will be forced to adapt to consumer's increasing demands [5].

7. Conclusions

By observing the local national media market, one can draw the conclusion that all groups that form today's media market, be it incipient, under-developed, and still in its pioneering phase, did not have anything in common with book publishing, so that in the present moment, the mass-media market and the book market are two very different industry sectors in Romania.

Consequently, the affirmation can be made that the local media market has evolved in an atypical fashion, with the main media groups starting with television as the main media channel used, or with high-print run daily newspapers and developing horizontally to the other media.

Electronic Book – A Threat or an Opportunity to the Management of a Media Organization

Niculescu Andrei

Academy of Economic Studies, Bucharest

andrei@niculescu.ro

Abstract

Electronic books, or e-Books, are invading more and more any speech on editing, editors, books and the media. Even if most publishing houses are informed that e-Books (and e-Publishing, therefore editing an e-Book) are an inevitable fact in the future of any publishing house and they should precisely be given the attention they deserve from publishers who do not wish to disappear from the market, yet little is known at the present time

Key words: electronic book, traditional book, e-readers

J.E.L. classification: M10, L82

1. Introducing the concept of electronic book from the editor's perspective

E-Publishing, editing electronic books, is getting more and more adhesion among great editors, for various reasons. Here are some of the aspects an editor should take into account and might serve in deciding to publish electronic books: proliferation of reading devices (e-readers), low-cost Internet connections, multimedia assimilation and content creation, access to far-distance markets, permanent disponibility.

Some of the reasons why so far editors have been reluctant about e-Publishing are pirating, copyright issues, limited access to Internet and the price of an e-reader.

Electronic books expansion has allowed an important number of authors to become able to publish their own books. Similarly, several editors, most of The United States and Europe, have published lists of books exclusively in electronic form. These facts

are directly related to the fact that e-Book production gives up a whole series of processes traditionally associated with publishing a book.

The main concern for any editor in a discourse about e-Books refers mainly to pirating. Since electronic books are precisely electronic files distributed on the Internet, apparenatly there should not be any impediment for users to share this file with anyone else, the same way in which they share music and movies, which reads, at least in theory, a sales reductions for printing houses.

Such a major threat has been addressed through a mechanism of technical measures capable of protecting copyrights of the owner (the editor in this case) and are knowkn as Digital Rights Management or DRM.

2. E-Book form the perspective of the final consumer

Any review on the current state of electronic books would be incomplete without including in the analysis a perspective of the final consumer. Internet users experience has givern rise to an expectancy for instant access to information, anytime and anywhere it is necessary. Given that expectancy for digital information, editors, libraries, academical institutes and experts will constantly try to understand the way in which consumers see and interact with e-Books.

Despite the novelty of electronic books as an academical resource, most library users know about their existence and have used an e-Book at least once. In average, the number of users who gets e-Books via Internet is equal to that of users who frequent academic libraries. Thus, libraries now have the oportunity to rise in people's perception as a main source of information for the required

titles. In those institutions that had long adopted e-Books are using them just as frequently as newspapers and online magazines. Other surveys indicate that frequent library users have indicated lack of information on electronic books as the main impediment in e-Books use.

Usage frequency of e-Books varies from country to country, from market to market, but academic environments from institutions submit to analysis state that users read electronic books mainly for research and study, rather than for fun or data storage. Given the vast experience of people using computer every day in search for information on the Internet, research seems to be the most natural reason for using an e-Book.

Another encouraging result is the fact that most consumers consider e-Books useful and they would like to use them more in the future. Most users remember the difficulty of reading information on a digital screen and the emotional preference for traditional books. Given the low level of comfort and the long tradition that consacrated readers have for traditional books, the task of e-Reader producers to render this support easy to handle and user friendly proves to be rather difficult.

While most users consider adoption of e-Books in institutions and individual libraries is going to increase, no one yet states that printed versions will finally disappear. Consumers consider that the transition to electronic books will take place faster in research activities, rather than learning, teaching or fun activities. Moreover, they expect reference titles followed by monographies, textbooks and educational books to switch more rapidly to electronic variants. Such results come to support the conclusion that e-Books are most research-oriented and data oriented.

3. E-Readers: a complete research of the market

This chapter attempts to make a comparison between all important E-Reader devices available on the market in 2010, analysing their technical specifications and further the advantages and disadvantages of each E-Reader in comparison to the others. We have analyzed the following devices: Apple iPad, Amazon Kindle 2, Barnes and

Noble Nook, Sony Reader, Skiff Reader, Plastic Logic Que, EnTourage eDGe. As a conclusion, Apple iPad is a quality step forward, not only for e-Readers, but also for electronic editing in general. The device brings eReader technology to a totally new level and will surely captivate the public's imagination the same way iPod and iPhone did on dedicated markets.

4. Traditional book will not die

All along my research paper I have noticed that the most efferescent debates and most detailed studies related to users perception upon e-Books take place in academic environments, in places where the content is far from recreative aims. At this point, things become very distinct, in the sense that most users of both versions would prefer an e-Book in the case of a precise research. Still, nobody reads a complete book in electronic form, though it takes no risks for one's health. Therefore, it becomes more and more clear that e-Books and traditional books will reserve fundamentally different targets. Traditional books will continue to be read for pleasure, for insight, while electronic books will continue to be read for a precise purpose, to find specific information. Such a differentiation being produced, practically there will be no further argument for the extinction of traditional books, since they are two products which serve different purposes.

Therefore, instead of asking ourselves when and how digital forms will ever replace the print form, we should ask ourselves to what extent an e-Book can improve and enlarge the boundaries of a library in the physical sense of the word, offering readers a series of resources which had been inaccessible until now.

5. Conclusions

In conclusion, we should avoid putting this subject at the crossroads between books and e-Books, mails and e-mails, virtual libraries and historical buildings, or between paper and digital technology... Such concepts get into conflict only when we force ourselves to prove that only one is going to win.

Greek Economic Crisis

Niculescu Oana-Marilena
Academy of Economic Studies, Bucharest
[oananiculescu24@yahoo.com](mailto: oananiculescu24@yahoo.com)

Abstract

The purpose of this paper is to analyze the most severe crisis of a eurozone country.

After years of overspending, cheap loans and failure of financial reforms, the deficit increased in Greece to 12,7% of GDP and its rating was downgraded to the lowest in the eurozone. As an important part of the revenue increase proposed by the Greek Stability and Growth Programme proved to be impossible to materialize, the rescue plan approved by the European Union/International Monetary Fund was the only viable solution in order to avoid bankruptcy.

The results of the Greek crisis spread to other eurozone countries like Ireland, Portugal or Spain.

Greek economic crisis reflects the existence of a non-uniform Monetary Union, without a central fiscal authority able to correct internal disparities. The difference between north and south within the eurozone seems to be deeper than ever and might compromise even the survival of euro.

Key words: crisis, eurozone, rescue plan, PIIGS, Monetary Union

J.E.L. classification: F01, G01

1. Introduction

In the end of 2009 in many European countries recession seemed to be ended. The global economy started to increase slowly and anti-crisis programs began to work. In early 2010 analysts estimated that a second recession was not going to break but they admitted the existence of an economic uncertainty.

This phenomenon hit Greece whose financial situation has caused concern since the mid-October 2009. The bonds of Greek banks fell by 50% and their stock capacity

depreciated around 24 billion euro. The recession deepened, country's deficit decreased to 12,7% of the GDP, public debt increased to 113% of the GDP and its rating was downgraded to the lowest level in the eurozone. In this context, the Greek government was forced to adopt severe austerity measures that threw the country into chaos.

2. The causes of the crisis

In order to see how this situation became disastrous, we must identify the causes which led to the breaking of the crisis:

- huge economic policy and management errors

In none of the countries mystification at individual and governmental level went so far like in Greece. Money circulate mainly cash, justified documents or taxes are not collected. The figures reported by Athens to Brussels were embellished, reflecting the image of a country with a stable economy. The governors delayed the payment of some debts and turned to investment banks in order "to adjust" the Greek state budget. Goldman Sachs helped Greece to hide the real value of the debt through derivatives called CCS ("cross currency swaps"). CCS allowed governments to transfer the debt in the future and to fit "on paper" only in deficit targets;

- the destabilizing role of the financial markets

Periods of euphoria alternated with depression ones, amplifying movements in asset prices which has nothing to do with underlying fundamentals. In 2009 the sovereign bond markets entered into a bubble that led to record low levels of long-term interest rates in a moment when governments were adding high amounts of new bonds in the market. In a few weeks the situation changed dramatically and bond markets crashed in some countries.

Rating agencies have a central position in the destabilizing role of the financial markets which fail in the provision of crisis. And after the crisis erupt they violently overreact, in a systematic way, intensifying them;

- eurozone authorities - hesitation and uncertainty of the governments in the eurozone and of the European Central Bank. As Greek sovereign debt was lowered to BBB+, this represented a big problem for financial institutions which held Greek bonds and which were threatened by the fact that these bonds could become illiquid. No wonder that many participants on the market dumped Greek bonds precipitating the crisis. Similar uncertainties related to future bond ratings in the eurozone represent a real danger for the bond markets.[1]

3. Fiscal adjustment programmes proposed by the Greek government

Facing a severe economic crisis, the Greek government has proposed since the beginning of 2010 several rescue plans that focused on decreasing the deficit in the next 3 years. This attempt had not the desired effect and financial markets have sent increasingly signals that they have little faith in the capacity of the Greek government to implement the programme.

The analysis of the Hellenic Stability and Growth Programme seems to justify the financial markets' lack of confidence. The key weakness of the budget for 2010 stayed in the fact that it was not credible in such a short time. It contained measures that should have improved the deficit as follows: two thirds coming from revenue increases and one third from expenditure cuts. But the success of such programmes has usually an opposite distribution between revenue increases and expenditure cuts.

From the review of the programme it results that:

- revenue increases based on: unique personal income taxation scale (elimination of exemptions), higher property taxes, measures to fight tax and social contribution evasion, higher excise tax on cigarettes and on alcohol, higher tax on mobile telephony and petrol, fuel tax increase, excise tax in electricity and abolition of tax exemption,

introduction of excise taxes on luxury goods, special levy on high-value real estate, special levy on profitable firms, revenue from bank assistance scheme, revenues from EU structural funds;

- expenditure cuts were based on: public sector wage freeze, 12% reduction in public sector wage allowances, 60% reduction in the public sector 14th salary, 7% wage cut and 60% reduction in the 14th salary in public sector enterprises, 10% reduction in PPC and OTE pensions funds budget allocations, public and private sector pensions freeze, reduction in: short-term contracts, overtime costs, operating costs, hospital costs, the public investment programme, education expenditures in the ordinary budget, military expenditures.[2]

The detailed analysis of the above mentioned measures suggests that half of them are not convincing and are unlikely to have the planned effects, at least not as quickly as planned. The figures of the budget show that the projected revenue increase was impossible to materialize in such a short time while unavoidable cuts were postponed.

The rescue plan of the Hellenic government and its targets to improve the deficit to 8,7% of GDP in 2010 and under 3% in 2012 proved to be unlikely to fulfill. The reaction of Greek population to the adjustment programme of the Greek government was a violent one, ending with general strikes that paralysed the country several times.

4. Implications of the crisis for the Eurozone

Greek crisis gave birth to a crisis in the whole eurozone. It spread over other countries that passed through economic boom based on cheap credit so that their public finance deteriorated spectacularly.

Financial markets found a new term to sum up troubled eurozone countries: PIGS (Portugal, Ireland, Greece, Spain) which, after some opinions, includes also Italy (PIIGS). These countries have huge debt, budget deficit and small economic growth. Within this group of countries, positions are different. In 2010, Greece and Portugal held the weakest position, gross national savings rates of both countries being at the lowest

levels: Greece 7,2% of GDP, Portugal 10,2% of GDP. On contrast, Ireland and Spain with 17 and 19% were much closer to the eurozone average of about 20% that meant both countries could finance governmental deficits from their national savings.[3]

Portugal, with a budgetary deficit of 9,4% in the end of 2009 and a public debt of 85% of GDP, bought back bonds in value of 1 billion euro.

If in 2007 Spain was considered the country with the healthiest economy in Europe, the situation changed in the end of 2009 when the decrease of rating influenced the stock-exchange in Madrid which depreciated significantly. While GDP is 4 times bigger than in Greece and public debt implied any fears (58% of GDP), the working market has been strongly affected, the rate of unemployment being 19,5% of GDP (2 times the average of the eurozone, double than in Greece with 9,8%). While productivity has increased slowly (0,89% during 1999-2007) salaries have increased with 29,2% in the same period of time.

Ireland had a budgetary deficit of 14,3% of GDP and a public debt exceeding 90% of GDP so, it became obvious that an adjustment plan based on 2 pillars had to be adopted. The first regarded the banking system and the second massive cuts in the state budget.

Sometimes PIGS is written with double I, in this case it includes Italy. With a budgetary deficit of 5,3% of GDP, Italy is in a better position than countries previously mentioned.

In Great Britain, the last candidate to a possible bankruptcy, banks rating was decreased and public debt reached 68%.

5. Solutions to solve the crisis

As the recovery plans proposed by the Greek government were not viable, the only possible solution with a view to avoid the financial collapse of the country proved to be external aid. Although the Greek government tried till the last moment to avoid it, finally it had to accept the financial aid of the European Union/International Monetary Fund in value of 110 billion euro (EU 80 billion euro, IMF 30 billion euro). The interest rate of 5% that Greece will have to pay in the exchange of that amount to be

received within 3 years is above the standard interest rate of the IMF but below the interest rate Greece could finance on the external markets. In exchange, Greece accepted to adopt the austerity measures required by financial institutions, measures named as "big sacrifices" by the Greek prime minister.

The new austerity plan consisted in measures like: public sector wage freeze until 2014, cuts in the 13/14th salary for state employees earning more than 3000 euro/month and the freezing of these salaries to 1000 euro for those earning under this limit, increase of VAT already increased in march from 21 to 23%, adjustment of pensions according to the average income obtained by an employee along his career, the impossibility of anticipated retiring before 60 yrs, the gradually increase of the minimum contribution period from 37 to 40 yrs. till 2015, the increase of excises for fuels, cigarettes, alcohol with 10%, increase of the revenue to the state budget by adding new environment tax and tax on licence for games of change or those applied yearly to companies with a high profit.

In a Europe facing a very severe crisis, European Union was forced to announce, in the beginning of May 2010, a rescue plan for the member states in value of 750 billion euro. This amount shared between European Union (500 billion euro) and International Monetary Fund (250 billion euro) going to be granted as a loan; in exchange, the troubled countries will have to adopt a rescue plan consisting in high fiscal adjustments. The bail-out above mentioned consisted in: 440 billion euro from the eurozone governments, 60 billion euro from an EU emergency fund and 250 billion from IMF. In order to support the plan of the eurozone countries, the European Central Bank decided to buy bonds issued by governments in the eurozone as well as private bonds in order to ensure liquidity on financial markets. The troubled countries tried to sell the bonds, especially the Greek ones, low evaluated.

In December 2010, the Greek parliament approved, after several days of debates, the budget for 2011 which involves austerity measures like new expenditure cuts and tax increases, aiming to a budgetary deficit of 7,4% of GDP.

6. Uncertain future of the Monetary Union

Former European Commissioner Jacques Delors (one of the Monetary Union architects) considered the single currency unit a way towards a more powerful union. Those who wanted to speed up the enlargement from 12 to 27 members ignored the high level of corruption and tax evasion in some of the countries. Even the Greek Prime Minister Georgios Papandreou recognized that the explanation of the financial crisis in Greece is also the systemic corruption, so he had to admit that severe austerity measures have to be taken.

If Greece would have left the eurozone coming back to its national currency, the first step for its monetary policy could be the devaluation of drachma. In the opinion of analysts, this matter might be almost impossible as anyone would accept the return of a currency that aims to its devaluation.

Speculations regarding Greece exclusion from the eurozone would increase Germany's influence in the prejudice of the other countries, as the reconstruction of eurozone involves the increase of the German economy share.[4]

In this context of financial uncertainty, the problems Greece is facing are seen as European problems, even Euro's stability being threatened. Although markets were not against the Euro, the European Monetary Zone has been blocked in a certain way. Greek crisis reflects a non-uniform Monetary Union, without a central fiscal authority able to solve high internal gaps. Crisis proved that Germany (the most powerful economy in eurozone) and Greece can't go further together because realities in these countries are completely different. Gaps between north and south seem to be higher than ever and can compromise even the survival of the eurozone. More and more often we wonder if the refusal of a country to reimburse a debt might lead to the end of eurozone.[5] The real test of the eurozone stays in its capacity to protect member countries in front of the speculative attacks.

Crisis pointed out a structural problem of the eurozone coming from the fact that Monetary Union is not embedded into a political union. The imbalance leads to the

deepening of the disputes among the member states in absence of a mechanism able to correct them. These disputes are the starting point for budgetary disputes and crisis. Eurozone countries should go further into a closer political union but there are doubts it might happen in a certain way in the future. Small steps are however, possible. The first one would be an European Monetary Fund; the other consists in common eurobonds in order to minimize moral hazard. These steps should stimulate the eurozone member countries to intensify their efforts for a political union.[6]

Nouriel Roubini, professor at the New York University, one of the few economists that predicted the recession begun in 2008, thinks that "Greece might be the first country that will leave the eurozone and its "example" could be followed by other countries with weak economies. In order to become competitive, a "real devaluation" of the single currency is needed in the eurozone, especially for Spain, Portugal, Italy. Euro might remain a single currency for less countries with strong economies." Several countries with weak economies might be forced to leave the Monetary Union. Nouriel Roubini has doubts regarding Greece capacity to solve the crisis in the following years, measures that have to be taken being too severe. "Greek people won't be able to increase taxes and cut expenses so much."

Dominique Strauss Kahn, general director of the International Monetary Fund said, in an interview for Euronews that "Europe must take advantage of the actual crisis in order to remodel its own institutions and to strengthen its currency. Euro has not been finalized today. Whether European leaders wish that European Union and the eurozone make progress, they should finish the process begun once with passing to Euro." He also expressed his confidence that Greece will overcome all the problems which led to the break of the crisis. "The financial aid granted to Greece created a dangerous example, countries struggling with huge deficits and debt having the feeling that can continue their policies, devaluing their currency and increasing inflation", was the opinion of Joachim Fels, chief economist at Morgan Stanley. Whether it will happen, countries where prices are stable - like Germany -, might reach to the conclusion

that a smaller Monetary Union should be a better solution."

European officials fail to reach to an agreement regarding the future of the Monetary Union. Euro has been a stable, credible currency that has ensured the stability of the zone for over 10 years. French minister of Economy and Finance, Christine Lagarde and German chancellor Angela Merkel had different opinions regarding the future of euro. While Christine Lagarde stated that "euro is in danger to disappear", Angela Merkel said that "in order to save euro the whole Europe should follow the example of Germany." Europe is in danger and without protectionist measures the whole Europe will be in danger, consequences being impossible to be measured. German officials were afraid of a split in the eurozone and of the effects towards the Greek banks. That is why, they decided to ignore the will of German people who voted in a percentage of 57% against supporting Greece. [7]

However, there are common point of views considering that euro is a common good and therefore we must defend it. The French-German disputes came at a moment when Germany shocked the markets announcing that will forbid the speculative sales of financial products. The European Union's lack of trust, especially of the eurozone members to decrease their deficits proved to be the problem that troubled markets. Crisis in the eurozone started soon after the fear regarding a possible bankruptcy of Greece would be possible despite the bail-out of 110 billion euro. Speculation in the market have also put pressure towards the public debt in Spain or Portugal that led, in 2010, to the decrease of euro to its lowest level over last 4 years, involving critics regarding these kind of transactions. The forbidden of speculative transactions occurred because Germans believe that huge discrepancies between financial transactions and real economic activity might appear. Transparency for all market participants is needed; a market can't work if gains and risks are fully unbalanced. Measures proposed by Germany refer to high penalties for countries living over their financial possibilities, penalties that might include: obstruction of structural funds, withdrawal of voting within european institutions or even bankruptcy.

Even the amount of 750 billion euro was granted in order to save the single currency, the eurozone remains under the threatening of bankruptcy, being weakened by the huge debt, different competitive economies, and lack of a common fiscal policy.

Euroscptics think that eurozone problems are structural ones and have been obvious since its establishment. "Financial aid granted for Greece might work for a while but the eurozone has been facing with institutional problems and financial speculators will take advantage of it", said Joseph Stiglitz, Nobel laureate in Economics.

At the World Economic Forum held in Davos/Switzerland in January 2011, French president Nicolas Sarkozy tried to remove fears regarding the possible breaking of the eurozone and stated that, together with Angela Merkel, German chancellor, is decided to defend euro and will never allow its collapse. "This is not only an economic matter but it is also a matter of European identity. Failure of euro would have such disastrous results that we can't even think about it."

7. Conclusions

Greece recovery in the coming years lies in its capacity to assume the huge internal effort required in order to regain a sustainable fiscal position. This target involves the application of severe austerity measures consisting in substantial budgetary cuts and tax increases that the Greek government has committed to implement in exchange for external aid.

As long as there are doubts regarding this matter, the possible domino effect of the Greek crisis towards other countries in the eurozone (Ireland being the most recently example in this way) remains high, despite the conditions of the international rescue plan.

Therefore, we can state that the fate of Greece will be decided in Athens, not in Brussels or Washington.

Until recently, euro has passed only through prosperity. The real test is given now when recession showed the gap between north and south, between rich and poor countries, countries for which the single monetary policy meant cheap credit and

structural deficit that can be solved only through external loans.

Ever before, so many opinions regarding the danger that hang over the euro project have been heard, so the coming years will decide the future of the European Union and of euro as a single European currency.

Model of Acquisition, Transformation and Usage of Geographic Data Within an Informational System Adapted to Projecting Necessities

Nidelea Marinela

„Titu Maiorescu” University of Bucharest

matemaia@yahoo.com

Barbaresso Mariana

Military Equipment and Technologies Research Agency, Bucharest

alexei_adrian@hotmail.com

Abstract

The necessity to attach complex information to these graphic entities as well as the possibility to make descriptive and graphic operation analysis on these items caused the GIS systems to take another direction from the CAD system simplifying the graphic representation of these entities and developing graphic processing functions, the realization of topologies and links between graphic elements and the descriptive information stored in complex relational data bases, with client/server architecture.

Key words: GPS, Geographic Information, data base, transformation of coordinates in stereo 70,

J.E.L. classification L15

1. Projection and implementation of optimized acquisition, processing and analysis technological process for the analysis of geospatial data.

By the analysis and comparison of data collection methods that form a support for a GIS a prime objective can be established in the projection and realization of an informational system which is the choice of a method to collect information on the ground so that the ratio information quality / acquisition price to be as convenient as possible. To this end, the Dynascan project proposes the realization of an innovative technology for integrated underwater and terrestrial digital modeling of the relief. The technology is based on the research and development of a solution consisting in a

interconnection of systems used in modern methods for the investigation of the relief: LIDAR scanning (Light Detection and Ranging) scanning with high and low frequency , unifascicle and rotative, positioning on the basis of satellite global systems, the estimation of the attitude of targets in movement and synchronization.

At present there are key solutions for the digital aero-photogrametry, for the static terrestrial scanning and batimetry. However their integration is still in an incipient phase in technological advanced countries. The proposed solution is something new at the local plan.

Practically, the use of inertial platforms combining collection methods of the above mentioned data presents a series of advantages comparing to other scanning methods the greatest advantage being that the acquisition of the laser scanned scenes is no longer done in a static way but in a dynamic one and not involving aerial investigation methods which are expensive and relatively inaccurate. Simultaneously with mapping in the case of riverside arias underwater investigation is carried out both batimetrical and by the penetration in the geological profile.

In this way digital models of the ground are made in highly productive conditions and most secure for the operator.

The result of relief scanning with the proposed technology is a cluster of points within which to each point the coordinate pair (x, y, z) is associated. In the case of a static scanning, a color code could be automatically associated to these coordinates which are subject to some transforming algorithms in order to obtain the coordinates

referentiate in Stereo 70 system, the cartographic projection officially used in Romania.

From the cluster of points acquired by digitizing/scanning old projections and by georeferentiation or from surveyors (topographers, hydrographers) entities of the type node, arch, polygon must be created which gain IDs that can be linked to SGBD.

The second step of the preliminary stage of the projection of the informational system is to find algorithms to transform the coordinates of points acquired by the proposed scanning technology. These algorithms should replace the use of specialized GIS systems like Leica sau Transdat and to remove drawbacks coming either from the limitation of the dimensions of entrance folders from which data that are to be transformed are taken or by errors caused by the small numbers of points compared to the ones by which measurements are done.

2. Stereo 70 Stereographic Projection

The Stereo 70 or Stereographic 1970 Projection represents the official cartographic projection of Romania which replaced the Gauss-Kruger projection. This is a conform projection which does not contort angles permitting the geodesic measurements to be processed directly in the projection plan without calculations of geographic coordinates on condition that previous corrections for the reduction of measurements to the projection plan are applied. Projection contorts areas, function of their distance to the projection pole.

The GPS system uses for the referral of geographic coordinates: latitude, longitude ellipsoid WGS84, different from ellipsoid Krasovsky 1940 used in Romania.

3. Algorithms proposed for transformations

In order to transform the WGS84 coordinates obtained by measurements into Stereo 70 coordinates a succession of three transformations will be applied:

- Transformation of geocentric coordinates WGS84 into Krasovsky geocentric coordinates,

- Transformation of geographic coordinates into geocentric coordinates,
- Transformation of geographic coordinates into Stereografica 1970 projection.

The proposed transformations are done by formulas with constant coefficients in mathematic mapping and they have the advantage, compared to specialized informational systems used in transformations and used currently (Eg. Transdat) that they do not impose limitations to the number of lines in text folders where they are memorized and from where they are taken with a view to transformation. Images scanned with the proposed technology can be detailed, they can be taken in rooms, cities etc. That is why the number of points the coordinates of which are to be transformed is usually big enough which in the case of Transdat leads to a must in the distribution of points in many folders the content of which should not exceed a maximum value representing the number of lines that can be contained in the text folder on one loading.

4. Mathematical elements used for the realization of the algorithm

The mathematical principles for the graphic 3-D transformations used in coordinate transformation algorithms, from one system into another, into an algorithm for the manipulation of graphic objects, in CAD/GIS environment or into a graphical representation algorithm, posting, of geographic elements and of objects in 2-D/3-D spaces have as basis a few theoretic fundamental notions.

These are bound to:

- The general theory of cartographic projection,
- 3-D graphical transformations used to process cartographic objects,
- The equations of the cartographic projection,
- formulas for the calculation of rectangular coordinates,
- formulas for the calculation of geographic coordinates,
- The rotation ellipsoid. The terrestrial sphere.

- The representation of the surface of the rotation ellipsoid the plan,
- The representation of the surface of the sphere the plan.
- The elements of the terrestrial ellipsoid.
- The position of a point on the terrestrial ellipsoid
- Radii of curvature of the terrestrial ellipsoid
- The calculation of 1970 stereographic coordinates depending on the ellipsoid coordinates.
- The contortions of the representation of the rotation ellipsoid or of the sphere in plan. Contortions in the stereographic projection 1970.

5. The realization of algorithms for the transformation of coordinates in stereo 70

The cartographic projection is a mathematical method for the representation of the curve surface of the earth on a plane surface. By this projection, a correspondence is ensured between the geographic coordinates φ and λ on the points on the ellipsoid and the rectangular coordinates X and Y of the same points on the map. The correspondence is realized by the formulas:

$$X = f_1(\varphi, \lambda)$$

$$Y = f_2(\varphi, \lambda)$$

Coordinates of the central point of the Stereo 70 projection are:

-the geographical coordinates defined as follows: $\varphi = 25^{\circ}00'00''$ E Greenwich and $\lambda = 46^{\circ}00'00''$ Nord,

-the rectangular coordinates defined as follows $X = 500\ 000$ m and $Y = 500\ 000$ specifying that the X axe coincide with direction N-S. In the center of the projection we have maximum contortions of the lengths of $-0,250\text{m/km}$ and towards the margin the deformations are $+0.215\text{m}$.

For the realization of coordinate transformations taken from the cluster of points a u algorithm will be implemented that goes through the three steps mentioned above and which will use the following data types.

6. The projection and implementation of the informational system that meets the requirements of the described technological process

This has two distinct components:

- a data base with descriptive geographic information which memorizes the coordinates of the cluster of points the processing of which was presented above.

A program that administrates these data bases offering the instruments for the visualization, management and analysis of the geographical data.

The proposed informational system disposes the following functions:

- The management of complex data bases containing detailed planimetric and altimetric information,
- Visualization of tables associated to thematic strata,
- The filtering of elements,
- SQL interrogations,
- 2-D visualization, posting, increase, decrease integration, editing, creation of new folders in SHAPE,
- The import of data in VPF, DWG, acoperire Arc info, Grid Arc info,
- Posting information GPS receptor,
- Creation of thematic maps,
- 3-D visualization of the interest zone,
- Displacement, increase, decrease,
- Positioning in any point of the model 3-D

Within the application the altimetric digital model represents the basis for the extraction of attributes and characteristics of the ground,

- Topographic calculation,
- The possibility to add symbols and texts on digital maps,
- The interfacing with a GPS receptor,

That can be used as entrance data in SHP folders (from ESRI) containing the coordinates of points determined following the transformation algorithms or another type of folders.

The advantages of Geographical Informational System:

The reduction of routine operations and the automation of decision taking in problems implying geographical data.

The quantified identification of organizational problems and of technical operations with geographical data.

- The objective control of data and operations,
- Diversification of the presentation of products under the form of thematic maps.

Abstract

Since its inception the concept of globalization was seen well by some, others take the contrary highlighted the disadvantages.

They appeared even new concepts such as managed globalization, various approaches have emerged, offensive or defensive about globalization.

Extending the conceptual definition of globalization by comparing different approaches aimed at identifying problems applied the so-called building blocks that constitute a pattern applied against the existing realities in Europe and worldwide.

If so far we have seen from outer to inner globalization searching features and contextual factors determining, comparing the concept of globalization with terms like regionalization, globalization, Europeanization, Westernization did nothing but to complete the study of the phenomenon itself, revealing a complex general conclusion, is constantly seeking a self-definition as witnessed by the multitude of existing definitions and approaches in parallel with the complete absence of definitions, generally accepted.

Key words: managed globalization, comparative advantage, emerging economies

J.E.L. classification: F50, F59

1. Introduction

If until recently the globalization was presented more or less under precepts of the Washington consensus, a new concept has now become the key word on the lips of all politicians to say 'managed globalization. Trying to make the transition from

theoretical concept to define the practice, a pertinent question is: what managed globalization actually means? As Jacoby and Meunier said in their studies, the fact that politicians talk about managed globalization does not mean that they are trying to implement it.

Thus it is imperative for the present study an analysis of what managed globalization means in practice managed by comments on EU policies.

2. The concept of management of globalization. Offensive and defensive approach

One of the trends of recent years has been promoting both at European and transatlantic relations and not only the crucial role of Union in the active management of globalization. Specialists, doctrines, and promoters of this policy address two conflicting visions on successful implementation of it, an optimistic and a pessimistic approach.

Actors who support pessimism regarding globalization, hopes the Union becomes a barrier or a buffer or filter to slow down the negative effects of globalization. This type of management is known as a defensive approach.

Offensive approach is based on optimistic view of globalization, the EU is regarded as a platform to exploit opportunities not available from the individual Member States or their firms.

A type of offensive strategy of the Union for globalization is the exercise of regulatory, central approach for the EU to develop its regulatory power in such a way that can shape global governance.

In many sectors that have become liberalized, market competition is ensured through legal institutions. Jacoby and Meunier stated that the Union had become the largest legislative power in a wide range of sectors such as financial services, food, industrial chemicals, and telecommunications.

Another management tool of globalization is empowering international institutions. Using this tool, it seeks to develop an institutional architecture to monitor the "game rules" and to strengthen the capacity of these institutions to apply these rules itself. Like the paradox of this offensive approach, Meunier and Jacoby points out that the same international institutions that seek to strengthen them are promoters of an acceleration of globalization.

Increasing the territorial sphere of influence of the EU. Jacoby argues that part of the management of globalization was the management of Central and Eastern Europe by an approach such as offensive and defensive.

Union as manager of CEE (Central and Eastern Europe) is a tool used by the EU15 Member States, which Jacoby calls "old member states" to manage the new Member States, which Jacoby calls "new member states". It is noted that the Union technique applied is to extend by the concentric waves through remote management practices but not the immediate geographical periphery. In this context, Jacoby sees regionalization, a process by which the Union meets the challenges of globalization.

Redistribution costs of globalization. Managing globalization is not just about building the framework to facilitate trade rules, but also the redistribution of costs and benefits. Although it is a defensive approach to the management of globalization, it has an important role in supporting economic openness, these efforts actually representing the extension of social democracy globally.

Such redistribution involves the use of non-reciprocal trade benefits to improve economic growth in less developed countries; one relevant example is the European Globalization Adjustment Fund.

Legitimization of economic patriotism. This defensive strategy involves countering takeovers of national companies by foreign firms.

3. Management of globalization on the domestic market. Two perspectives

The European Union attempt to manage globalization on the domestic market requires an analysis from two perspectives.

One is the Union focus on the European continent and the former colonies of EU member states, which make Alberta M. Sbragia to consider in her work of EU trade policy, the Union could impose its own conditions.

A second perspective involves confrontation with the U.S. initiatives to shape globalization to their own interests. This second dimension can be seen as a global dimension to the management of globalization implies competition, and a symbiotic relationship with American business strategy.

This American trade strategy, said Sbragia, forced the EU to shift to Latin America by concluding bilateral treaties and interregional cooperation.

4. The impact of globalization on EU Member States

To check the implementation of globalization policies managed at European level will examine below in relation to the development of Member States both export and import trends and indicators at EU level exposure to globalization as they were identified by D. Rae, M. Solla.

As an indicator of exposure to globalization Solla Rae tries to find answers to questions like: Which country is facing its greatest competition from emerging countries? What State has the most profitable industry and the fastest growing industry? Which countries are specialized in the export of ICT? Which country won the most by outsourcing? What state has the highest labor force qualified? Which state is best suited?

4.1. European export trends

According to the paper "Globalization and the European Union" as opposed to the U.S. and Japan, the European Union has maintained more or less its share of global exports over recent years. According to international trade statistics yearbook 2009 of the UN at the European level of exports registered a value of 4.73556 trillion dollars.

Table 1. Developments Imports - Exports at European level

	Import	Export
2000	2535965	2516756
2001	2504616	2544025
2002	2611966	2713561
2003	3143741	3227891
2004	3786043	3846516
2005	4144083	4158314
2006	4768234	4712719
2007	5572670	5486882
2008	6223785	6099480
2009	4707811	4735560

Source: International Trade Statistics Yearbook, 2009, Comtrade, UN

In terms of market share, EU15 enjoyed some stability while the EU12 has increased its share in international trade of goods but has not progressed in terms of services.

In terms of destination of European exports, Rae and Solla observed relatively constant rate in terms of exports to the largest markets in Europe, U.S. and non-OECD countries, unlike China and export to neighboring countries of the Union, which accelerated.

Figure 1. Exports to the EU27 and the main partners in 2009

Source: Eurostat, 28/2010, EU-27 Extra tradefalls by 20per cent in 2009

4.2. Competition with new emerging economies

One of the solutions identified in the literature to determine the level of competition in trade relations was the measurement of comparative advantage. Rae and Solla argument that a claim is based on Balassa's findings about the comparative advantage which apparently can not be observed but can be found by current trading patterns when observed long enough to not be influenced by unbalanced behavior. Rae and Solla studies are based on calculating the index proposed by Balassa comparative advantage that actually observed is a measure of a country's export share of each product compared with the global export share of that product.

$$RCA^* = \frac{X_{k,j}}{\sum_j X_{k,j}} * \frac{\sum_j X_{w,j}}{X_{w,j}}, \text{ where } X_{k,j} \text{ is}$$

the export good and the country k, and w refers to the world (excluding the country k). By normalizing the relationship becomes:

$$RCA = \frac{RCA^*_{k,j} - 1}{RCA^*_{k,j} + 1}$$

Based on these relationships, Solla and Rae were calculated RCA for 1033 goods and 11 categories of services they record the results the following observations:

- At EU15 level are found strengths in engineering, pharmaceutical products and services and services, but the new Member States (U27-U15) focuses more on manufacturing with low and medium technology and forest products.

- RCA values can be used to analyze with country is a more direct competitor with emerging economies. Thus, in terms of export trade specialization most high-income OECD countries (including EU15) use globalization as an opportunity rather than a threat. Unlike the other new Member States (after the waves started with the 2004 accession) and poorest OECD countries have a similar mix of Asian exports (meaning China through Asia, India, Chinese Taipei, Hong K Ong, Indonesia, Malaysia, Philippines, Singapore and Thailand) found a direct competition. However, even Italy.

Greece and Portugal are found in direct competition with dynamic Asian textiles in the clothing industry. Trade between the 15 member countries is dominated by intermediate inputs and semi-finished products in Asia which is specialized and dynamic.

In the EU, trade could fall back as emerging economies increase their market share in terms of intermediate and semi-finished products.

EU15 countries are affected by a similar process of globalization and Europeanization as there is an internal direct competition between the new Member States and the EU15 in terms of manufacturing and jobs for average qualifications.

Table 2. RCA's for different categories of countries

	1	2	3	4	5
UE15	1,07	1,08	0,75	0,98	0,84
Brazil	0,11	1,31	0,55	1,03	5,72
China	0,81	0,70	2,73	0,99	0,13
India	0,27	0,42	4,14	1,09	1,00
Korea	1,51	0,51	1,96	0,76	0
Mexic	1,38	1,31	0,18	0,66	1,76
Rusia	0,24	0,26	0,01	2,17	0,94
Thailanda	0,94	0,78	1,86	0,92	1,22
Turkey	0,03	0,47	5,14	0,89	1,93
SUA	1,81	1,77	0,18	0,24	0,75
Canada	0,92	1,09	0,37	0,70	4,78
Indonezia	0,53	0,84	4,04	0,66	1,43
Japan	1,10	1,16	0,27	1,14	0

Source: Calculations made by Mika Widgren

According to studies conducted, Mika Widgren notes that the EU and the U.S. and Japan have a competitive advantage in the two categories (1 and 2) characterized by intensive use of highly skilled labor. Also both the U.S. and the EU do not enjoy the RCA in categories that require capital intensive.

4.3. Analysis of exposure to globalization based on specialization in fast-growing industry

Another way to analyze the degree of exposure to globalization is to determine the countries that have specialized in industries with the fastest growth.

From this perspective, Solla Rae notes that apart from Denmark, the Nordic economies are oriented towards fast-growing product type and telecom products. On the other hand Greece is more specialized in textiles, agriculture, fisheries, while Italy is exposed through clothing industry and the export of low intensity in the high-tech products.

The literature notes that, if we exclude intra-EU trade, EU exports of products with a focus on rapid growth.

Table 3. Export shares in manufacturing, where intensity

	High Tech	ICT	Medium High tech	Medium -low tech	Low tech
Worldwide	27,8	19,5	37,5	14,3	20,5
UE15	25,7	12,8	44,6	12,9	16,8
UE12	15,2	15,1	41,1	18,7	25,1
SU'A	36,1	20,2	40	10,1	13,8
Japan	27,1	21,9	55,7	12,8	4,4
China	36,2	33,2	20,7	12,8	30,3
Austria	14,1	8,7	43,7	17,4	24,8
Belgium	20,3	5,9	44,9	14,9	19,9
Bulgaria	5,4	4,6	23,2	27,4	43,9
Cyprus	49,2	32,3	21,9	4,3	24,6
Czech Republic	15,8	15,8	46,7	20,1	17,4
Denmark	23,2	10,8	29,8	11,7	35,3
Estonia	23,8	24,4	23,9	14,8	37,5
Finland	26,7	24	29,8	17	26,5
France	24,4	9,1	42,2	13,3	20,1
Germany	20,5	11,4	51,8	13,7	14
Greece	14,8	6	19,1	25,7	40,4
Hungary	32,8	31,6	43,6	9,4	14,2
Ireland	52,8	24,4	32,2	2,4	12,6
Italy	11,8	5	41,7	17,7	28,8
Latvia	7,7	4,6	17,4	13	61,9
Lithuania	11,3	10,6	29,5	15,5	43,7
Malta	57,3	50,3	15,7	6,3	20,8
Netherlands	34,7	24,6	31,7	10,2	23,4
Poland	6,8	7,4	40,4	24,3	28,6
Portugal	12,5	11,9	32,6	16,7	38,3
Romania	4,2	9,6	32,3	17,5	45,9
Slovakia	12,9	14,6	46,9	19,3	20,8
Slovenia	10,4	3,6	45	19,9	24,7
Spain	11,9	5,6	47,3	18,2	22,6
Sweden	24	15,3	38,9	15,3	21,8
United Kingdom	33,8	20	37,8	12,1	16,4

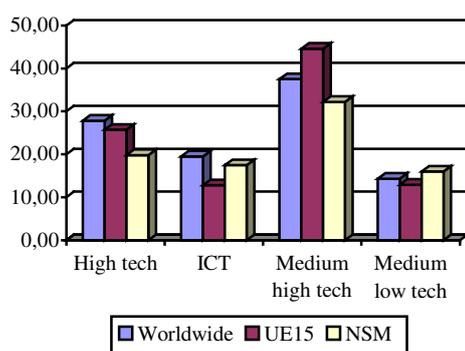

Source: Rae, Solla, 2007

It is noted that such high-tech goods represent a smaller percentage in the EU15 export share than Japan or the U.S., being more focused on EU15 exports of goods such as medium-high tech, while the new Member States have a higher share in export products such as medium-low and low technology.

Tabelul 4. Cotele de export în manufactură, după intensitate, raportare UE15, NSM, și nivelul mondial

	High Tech	ICT	Medium High tech	Medium -low tech	Low tech
Worldwide	27,8	19,5	37,5	14,3	20,5
UE15	25,7	12,8	44,6	12,9	16,8
Bulgaria	5,4	4,6	23,2	27,4	43,9
Cyprus	49,2	32,3	21,9	4,3	24,6
Czech Republic	15,8	15,8	46,7	20,1	17,4
Estonia	23,8	24,4	23,9	14,8	37,5
Latvia	7,7	4,6	17,4	13	61,9
Lithuania	11,3	10,6	29,5	15,5	43,7

Slovakia	12,9	14,6	46,9	19,3	20,8
Slovenia	10,4	3,6	45	19,9	24,7
Hungary	32,8	31,6	43,6	9,4	14,2
NSM	19,8	17,45	32,2	15,9	32

Figure 2. Reporting manufacturing export shares between the EU15 and the NMS world.

4.4. The ability of states to deal with globalization: a composite indicator

In terms of state capacity to deal with globalization interesting indicator is composed of following the analysis proposed by Rae and Solla consisting of:

- limiting aspect of the product markets
- Flexible employment
- The school (PISA)

- Level of Qualification
- Rates of participation in such programs LLP
- Public spending on programs for active labor market
- The rate of immigration as a percentage of the resident population
- The country-level innovative
- Structural changes in economy
- The degree of restriction on foreign direct investment

Specialized work examines only the first six indicators since the last 3 are of negligible value. Summarized the results obtained from the analysis Rea Solla composite indicator of the resistance to globalization.

Table 5. Analysis of the main components of globalization indicators

	1	2	3	4	5	6
Product market regulation	-0,39	0,26	0,24	-0,12	-0,11	-0,83
Labor market flexibility	0,40	-0,28	0,02	0,31	-0,45	-0,21
PISA scores	0,34	0,06	0,29	-0,81	-0,20	0,09
Level qualification	0,34	0,18	0,52	0,17	0,70	-0,06
LLP	0,43	0,20	0,01	0,35	-0,17	-0,21
Labor market policies	0,17	0,46	-0,72	-0,14	0,24	-0,14
Emigration rate	0,16	-0,73	-0,25	-0,21	0,37	-0,41
Index of innovation framework	0,47	0,18	-0,06	-0,11	-0,13	-0,16

Source: Rae, Solla. 2007

Rae and Solla's survey results revealed that the Nordic countries and North America have a greater capacity to deal with globalization as opposed to Eastern Europe and South which recorded below average values of indicators, human capital has a decisive influence their position.

5. Conclusions

We conclude the general analysis of this relatively new management policy outlined some basic characteristics of globalization. Thus, a first observation to be made is the dual nature of the management of globalization. The actors involved in this

process, be they policy makers, private stakeholders and Member States not only seeks to define the rules of globalization offensive. On the other hand, the same players would like to coordinate defensive exclusion of negative responses on some elements of this policy.

On these considerations, the overriding question becomes if possible a reconciliation of this dual identity, European, European Union without losing political legitimacy.

Analyzing the five offensive or defensive mechanisms for the management of the European vision of globalization, can highlight the following:

- The European Union uses relatively simple exercise regulatory influence on the EEC, somewhat inherent technical system integration, if taken into account the conditions imposed by the future members' accession.

- Union mandated sometimes other international institutions on the individual relations with Member States.

- Expanding the sphere of influence of the European Union as a management tool used both in terms of offensive and defensive perspective distinguishes between successive waves of European integration, the EU15 Member States enjoys a special status to the status of new member states of Union, which could be considered objects of management.

- Redistribution of costs and benefits of globalization was materialize by creating a fund to like Cohesion Fund structural regionalization used in the redistribution of costs.

Regarding the impact of globalization on EU Member States, which countries are most exposed to globalization and to make the best of this process we make the followings comments:

- For most Western European economies globalization is more an opportunity than a threat, because their exports do not compete directly on that of dynamic emerging economies of Asia. For example EU15 is strong in terms of engineering, pharmaceuticals and services, but yet there are exceptions such as Italy or Greece.

- The economies of South and West are more exposed because they are in direct competition with Asian economies being seconded to the large number of unskilled

workers

- EU internal trade is similar to that of developing countries, looking at the share of finished products, which will increase intra-European trade.

- Regardless of how they are exposed to globalization, countries face different phenomenon depending on factors such as flexibility of labor and product markets, the innovation, education, etc..

- If we look at the flexibility of the economy as a way to deal with globalization, this should not constitute abandonment of the European social model.

Abstract

Multinational companies are one of the most important factors of contemporary economic progress, representing the side "of globalization is most visible". The development of these companies have been driven by continuous liberalization of international trade and investment flows. These companies operate in both developed and developing countries. Multinationals now play an important role in the economies of all countries in international economic relations, a topic becoming increasingly important for governments. Foreign direct investment, firms can also bring substantial benefits to both countries of origin and host countries through contributions to the efficient use of capital, technology and human resources between countries and can thus play an important role in promoting economic and social welfare.

Key words: financial activity, multinational company, promotion policies, investment

J.E.L. classification: G1, G11

1. Introduction

Sony Ericsson Mobile Communications is a global company producing multimedia mobile phones, including the following products: phones and accessories, PC cards and M2M. Producers combine powerful technology with innovative applications for image, communication and mobile entertainment. Sony Ericsson is an enticing brand that creates compelling business

opportunities for operators offering furniture and fun products for users. Joint venture owned equally by Sony Corporation and Ericsson AB, was founded in October 2001. Their mission is to consecrate Sony Ericsson as the most attractive and innovative global brand in the mobile phone industry.

International Center's management company is in Hammersmith, London, and research and development teams have their headquarters in Sweden, China, Canada, Netherlands, United States, India and Britain. Sony Ericsson has approximately 8,000 employees worldwide. With an annual growth rate of 43%, became the fastest developing vendor in 2006, compared with Motorola, the growth rate of only 39%. Today, Sony Ericsson is the second largest mobile manufacturing company, after Nokia, and has claimed the title by raising the next generation mobile market.

2. Sony Ericsson: policies, competing objectives

a. Policy program

According to the website, portfolio of activities is wide. The company launched on the market products are the best in communication technology, as 2G and 3G, while stepping up its offer to give him the opportunity to enter the market level. Sony Ericsson products are liked and tangible differences in the areas of photography, design and applications.

In 2005, Sony Ericsson announced a number of new phones, networking products and accessories that have significantly

improved their portfolio and predicted the multinational will have a new growth phase. The company responds to all customers with new products, thanking him, as if covering all market segments.

b. *Promotion policy*

The company uses various promotional techniques, such as PR (through media articles as a special link to watch them), sponsorship (at various events such as MTV Europe Music Awards in Copenhagen, the emergence of different films, The DaVinci Code), sales stimulating, and most used is Internet advertising, web site. The site is professional and communicates directly with customers, providing much information about Sony Ericsson products. The company attaches great importance to its market image and direct communication with customers by providing product support, handset configuration, showing a good reputation and a positive corporate image, thus having an ongoing relationship with clients about the emergence of new products and their unique concepts, as and present range of products (phones, accessories, PC cards). The site features a section where you can join as a member, thus forming a close link between the company and customers.

All this leads to achieve the objectives of increasing customer confidence in both the short (helps attract a large number of potential customers) and long (old customer loyalty).

Other forms of marketing communication company are packaged products, special offers and other promotions, such as customizing mobile. This form of promotion creates a strong brand can be considered a form of sales and rapid growth of the power company, its image and positioning.

A global strategy is the agreement with Sony Music Entertainment. This is a way to bring the latest entertainment company and customers as thanks.

The company also worked with a major global sponsor of sports namely "Women's Tennis Association Tour, which was called" Sony Ericsson WTA Tour. The sixth year of partnership, is an unprecedented opportunities between the company to provide tennis fans with new ways to experience the game through mobile technology.

In 2004, Sony Ericsson took the lead with Java 3D without the phone handset in 2005 with daring 3D to a wider audience. These links can attract many customers in the long run if Sony Ericsson will continue to promote partnership.

c. *Competitors*

Like any company on a market with some competitors, of whom mention Nokia and Samsung.

Regarding competitor Nokia site shows a more advanced graphics. The content of the texts is a much more informative; more comprehensive and promotional techniques are used internet advertising, website, sponsorship, sales incentive.

The message is simple yet attractive, and that is "Connecting People ". Creation of advertising is more attractive to Nokia by color, graphics and messages used. It's a higher level in the market because our products with more advanced technology and the prices are much higher thanks to technology, but customers pay more dotoriță benefits.

Another competitor is Samsung Sony Ericsson. Competition is not too easy task. In their case after a new story emerged, the competition between the two is the first new product in market promotion. The graphics on the front page shows a resemblance with Sony Ericsson, text content is limited, have less data, have Maua about all the products including audio and video and contacts with their center, and promotional techniques that are focused Internet advertising, web, sales incentive.

Their message is "Pushing Limits Fürther image, thus providing an overview of product quality. What accessories do not have as it offers a database of customers and people with a solid financial status and her loyal to the specific tools and powerful marketing and communications professional to turn them into customers and key strategic.

d. *Objectives*

Sony Ericsson considers sustainable development and production that is one of the most important challenges of the future and requires immediate action from responsible manufacturers. Sony Ericsson is committed to continuously improving our environmental impact and society.

Multinational activity is expressed by a thinking that has three objectives: the economic aspect, at least not in the environmental and social aspects.

Sony Ericsson plans to exceed minimum standards and industry leadership over a number of chapters. Our decision to be first to remove unwanted substances, our efforts to get the focus on energy efficiency and recycling gives us a strong foundation to make the utmost desire to conquer the leadership in the mobile phone industry.

3. Financial activity at Sony Ericsson

Because the primary function of leadership is forecast in terms of organization's financial function in the first place must be the work embodied in the budget financial forecasting. Financial Forecasting serves the strategic goals of the organization and outlines the direction to be followed for the next period (next year). The main tool for financial planning is the budget.

Shares of financial preceding any other activity in an organization. First to get the money to serve the acquisition of raw materials and labor those employees will become finished products. In turn they have paid. As a result, the financial decision precedes any decision to turn the economic, technical or otherwise. Any effective work must be based on well founded and developed a budget.

If we were to define budgeting, it is the process of fixing and allocation of resources and responsibilities for each activity center.

Budget forecasting in this context is the damage expressed in money supply and taking responsibility for achieving organizational objectives in terms of efficiency.

Budgetary control is the process that monitors the actual costs and revenues generated by any kind of organization.

Budget process has some advantages: it has a role to guide the organization for a particular purpose, that is considered optimal level of liquidity and profitability, financial planning is to coordinate efforts of all departments in the budget preparation firm serving the establishment of budget an effective control system, which is done by comparing achievements with projections

and correct discrepancies as soon as they occurred

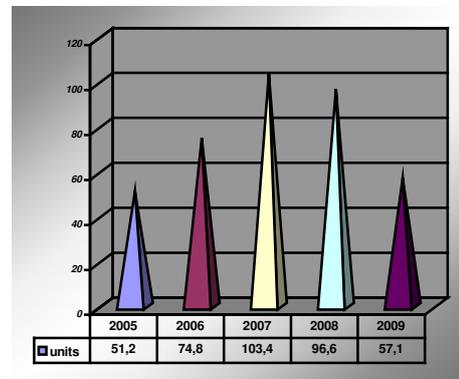

In this way budgets are benchmarks against which to appreciate the company's activity in a given period the previous period.

Budgeting with all its fundamental stages, the development and approval is an annual process, but there is the potential for detailed budgets for shorter periods of time (quarterly, yearly). However, in terms of reporting and control activity is a monthly process, but the reporting period may be longer than a month.

Sony Ericsson's first recorded profit in the second half of 2003. Since then, sales figures from all phones have increased peaking in 2007, when he received the sum of 103.4 million. Unfortunately, since that year, Sony Ericsson has managed to maintain their market position, sales have fallen increasingly more so at the end of 2009, have sold almost half the number of phones that sold in 2007.

In the chart below, I present the values of units sold during the last five years (figures in millions of units).

Chart No. 1.
Units sold in the period 2005 - 2009

Source: Sony Ericsson Data processing

I present below the analysis of financial activity in the Sony Ericsson during 2005 - 2010, following developments in particular the following indicators: number of units sold, the sales, gross margin, operating income, operating margin, net income The average selling price.

Year 2010:

For 2010 I will present work done in the first quarter compared with the same period last year.

The consolidated financial summary for Sony Ericsson Mobile Communications AB (Sony Ericsson) for the first quarter ended March 31, 2010 is as follows:

*Table 1.
Indicators used in the Sony Ericsson*

	Trim1 From 2010	Trim 1 From 2009
Number of units shipped (million)	10,5	14,5
Sales (EUR M.)	1405	1736
Gross Margin (%)	31 %	8 %
Operating income (Euro M)	20	-369
Operating Margin (%)	-1 %	-21 %
Net income (Euro M)	21	-293
The average selling price (Euro)	134	120

Source: Sony Ericsson Data processing

Examining data from the table we see that the units sold in the first quarter were 10.5 million, which represents a decrease of 28% compared to same period last year. The reduced number of units sold, sales achieved in the first quarter were also lower, ie reached a figure of 1405 million, representing a decrease of 19% compared to same period last year.

The average selling price increased by 12% but reached 134 Euros in the first quarter of 2010. This increase is due to the sale of existing models.

Gross margin increased both sequentially and year on year and reflects a more favorable product mix, benefit costs in the past year to improve sales and royalty problems during the quarter.

Transformation program, which began in mid 2008, aiming to reduce annual operating expenses of 880 million and expects to continue its result to be felt fully during the second half of 2010.

During the first quarter of 2010, Sony Ericsson has received additional external funding of 150 million euros. Funding has been secured by the parents in proportion 50/50.

Sony Ericsson supports a slight increase in unit forecast global market in 2010.

Net sales by market area for the first quarter of 2010 versus the same period of 2009 is as follows:

In Europe, the Middle East and Africa, Sony Ericsson has made an amount of 711 million, representing a decrease of 266 million or 37% over the same period last year, the company recorded sales of 977 million. Of this amount more than half is produced by the countries of Western Europe, reaching a figure of 525 million for 2010 and 721 million for 2009.

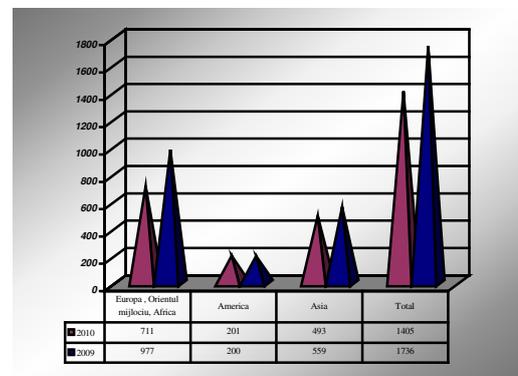

In America observă a small increase over the previous year, sales reached EUR 201 million and represents an increase of 0.5% compared to 2009 when Americans made 200 million sales companies.

Sony Ericsson has suffered losses in Asian countries, net sales in this area reached \$ 493 million, representing a decrease by 66 million in 2009 bringing 559 million multinational.

The company achieved total sales in the first quarter of 2010 were 1.405 billion euros, far less than your access period last year the multinational acquire a total of 1.736 billion euros.

The data presented above are shown in Chart nr.2. Figures are in millions of euros.

*Chart no.2.
Sales development in the areas of market*

Source: Sony Ericsson Data processing

Year 2009:

The consolidated financial summary for Sony Ericsson Mobile Communications AB (Sony Ericsson) for the fourth quarter and full year ended 31 December 2009 is as follows:

Table no. 2.
Indicators used in the Sony Ericsson

	Trim 4 from 2008	Trim 4 fom 2009	Final year 2008	Final year 2009
Number of units sold (millions)	24,2	14,6	96,6	57,1
Sales (EUR M.)	2914	1750	11244	6788
Gross Margin (%)	15 %	23 %	22 %	15 %
Income mining (M. Euro)	-262	-181	-113	-1018
Operating Margin (%)	-9 %	-10 %	-1 %	-15 %
Net income (Euro M)	-187	-167	-73	-836
Average Price sales (Euro)	121	120	116	119

Source: Sony Ericsson Data processing

In 2009, Sony Ericsson secures external funding of 455 million Euros to strengthen the balance sheet and improve liquidity. 350 million have been guaranteed by the parents in proportion 50/50. EUR 255 million, was developed by the end of 2009, but the remaining 200 million euros, an employee of two years of back-up facility was not used.

The program began in mid-2008 to reduce annual operating expenses of 880 million is to continue, with the full benefit expected in the second half of 2010. From the beginning Sony Ericsson program has reduced the global workforce by approximately 2,500 people from 9100 until the end of 2009. Total restructuring charges taken to date are 339 million Euros, and the fees for the entire program is estimated to be well within the previously announced 500 million Euros.

Units sold in the last quarter were 14.6 million, representing a sequential growth of 3% and a decrease from one year to 40%.

Sales for the fourth quarter were EUR 1,750 million, representing a sequential growth of 8% a year on year decrease of 40%.

The decrease from year to year, in both units and sales downturn was mainly due to the global market and the emergence of new

phones faster than expected, and transition to a new phone screen touch screen in the middle of market prices.

The average selling price for the fourth quarter 2009 increased 5% sequentially to 120 due to a more favorable product mix euro.

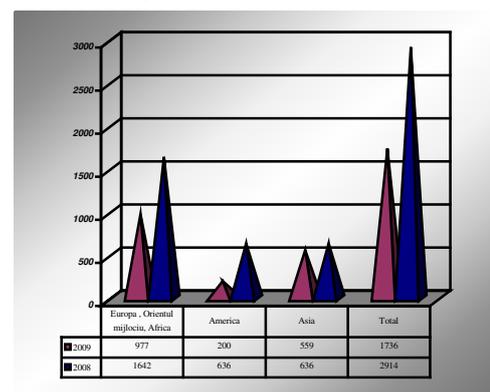

Net sales by market area for the last quarter of 2009 versus the same period of 2008 is as follows:

In Europe, the Middle East and Africa, Sony Ericsson has made in the last quarter of 2009 an amount of 977 million, which represents a decrease of 665 million or 68.4% decrease over the same period last year, the company recorded sales of 1.642 billion. Of this amount more than half is produced by the countries of Western Europe, reaching a figure of 678 million for 2009 and 1.117 billion for 2008.

In America, sales reached 200 million and represents a decrease of 436 million compared to 2008 when Americans made 636 million sales company. Sony Ericsson has suffered losses in Asian countries, net sales in this area reached \$ 559 million, representing a decrease of 77 million, or a 13.77% decrease in sales compared to 2008 in which Asians have multinational brought 636 million.

Chart no. 3.

Sales development in the areas of market

Source: Sony Ericsson Data processing

Thus, making a total sales achieved in the fourth quarter of 2009, the company achieved 1736 million; however multinational suffered losses of 67.85 compared to 2008.

The data mentioned in the previous paragraph are shown in the chart no.3. Sales development in the areas of marketing.

4. Conclusions

Sony Ericsson is an enticing brand that creates compelling business opportunities for operators offering furniture and fun products for users.

Sony Ericsson is the second largest mobile manufacturing company.

In 2009, Sony Ericsson has restated the goals of climate changing their dominant importance of the absolute. Therefore, the new Sony Ericsson absolute targets are:

- Reduce by 15% by 2015, total emissions of greenhouse gases resulting from the complete life cycle of Sony Ericsson products (based on levels in 2008);

- Reduce by 20% by 2015, total emissions of greenhouse gases from the internal activities of Sony Ericsson (based on levels in 2008).

Because all of the following characteristics Green Heart, overall CO₂ emissions from mobile are reduced by 15%:

- A manual, the phone, replacing the standard paper version and gives you instant access to convenient and user product support no matter where you are;

- Also, the electronic over 90% savings on paper and reduce the environmental impacts of transporting the final product more compact packaging;

- Made at least 50% recycled plastic;

- Light sensor optimized for the display, which uses less energy;

- The phone is water colored with dyes that reduce exposure to volatile organic compounds and can be transported as raw materials, using local water for reconstitution to the assembly plant, significantly reducing CO₂ emissions associated with transport.

The first organic product range is GreenHeart™ C901.

Sony Ericsson loaders deliver the most effective in terms of energy consumption in no-load.

In TakeBack comprehensive program, the Company's goal is to collect 1 million handsets per year in their system until the end of 2011.

The company uses various techniques Promotional sponsorships, sales incentives and advertising, the Internet is applied to the web site.

Sony Ericsson excels in these products give customers the opportunity to make a clear flawless pictures with cell phones that have built 12 MP cameras, listen to your favorite music sound faithfully.

Abstract

The financial situation of the national economy in a greater or lesser extent depend on attracting new sources to be placed in the economy, but already with a specific purpose. Increase or decrease the money supply in the area of banking system is influenced by bank deposits, deposits from individuals, legal and other financial institutions.. Develop products and services related to cash generated great interest from people and required more efforts and concerns of society, aimed at comfort, emotional stability and safety. Banks maintain deposits and means of payment in the economy. Thus collecting deposits, banks are responsible for their effective management, with maximum yield, for their own benefit and depositors.

Key words: household savings, bank deposits, banking system, efficiency, credit institutions, certainly.

J.E.L. classification: E 21, E5

1. Evolution of deposits in 2009-2010

In Romania there is now a modern and competitive banking system, which provides flow values in the domestic market economy and provides products and services in line with trends in European banking. The deposits from households and businesses, banks are valuable sources for creating a balanced banking business, long-term relationships with customers.

According to NBR, at the end of 2000, Romanians' savings held in banks, both in RON and in foreign currencies amounted to approximately EUR 1.8 billion, which means less than 80 euro per Romanian. Meanwhile, the Hungarians had the banks equivalent to 12 billion euro that 1200 per capita and the Poles had the equivalent of 52 billion euro respectively per capita 1375.

As you can see the difference between first Romanian, and Hungarian and Polish on the other hand, was downright huge, which shows how much we had lost due to lack of vision of those who governed country in the first 10 years of the Revolution in 1989.

But things have evolved quickly between 2000 and 2009, so this time, total public deposits with banks amounting to 22 billion, with more than 20 billion than in 2000. The percentage increase is 1100% (in ROL, the increase was \approx 2000%). Although neither Hungarians nor the Poles have remained in place, if their gains were more modest: 126% and 81%, annual progress from 2000 to 2009 are illustrated in Figure No. 1.

Figure. 1. Evolution of population deposits in Romania, Poland and Hungary between 2000 – 2009

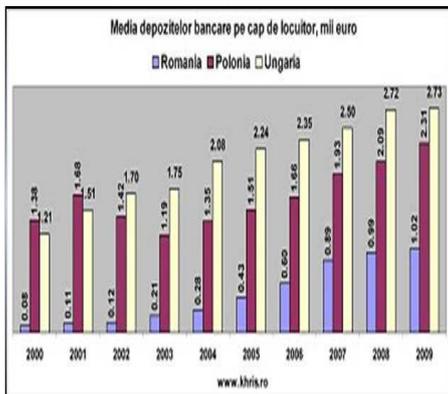

Source: www.khris.ro

Regarding per capita average, it now reached about 1,000 euro in Romania in Euro 2300 Euro 2700 in

Poland and Hungary, but is still very large differences. If we discuss only the period 2000-2009 (Figure No.2.) Romanian average amount deposited by banks was 940 euro per capita; one submitted by the Poles was 930 euro and issued by Hungarian was about 1500 euro.

Figure No. 2. Average deposits per capita (thousand euros) in Romania, Poland and Hungary in the period 2000-2009

Source: www.khris.ro

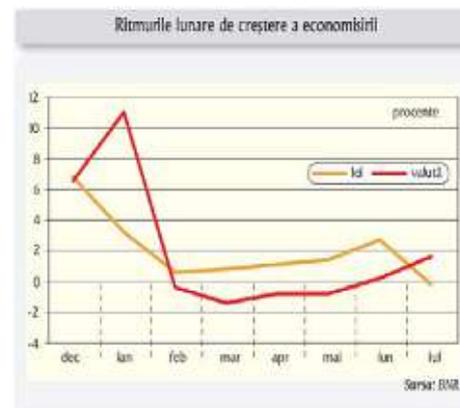

Although we are poorer than the Poles and Hungarians, the relatively small differences between the amounts deposited with banks in recent years, we explain by the investment opportunities. Poles and Hungarians have a more developed economy than ours, so that money went to stock exchange and investment by pension funds, etc., while the Romanians have continued to make most of the savings banks.

Evolution of the first half of 2009 shows very clearly changing financial behavior. Regionally, most deposits were recorded in Bucharest. Thus, the balance of deposits increased by approximately seven billion lei (1.68 billion euro) in the first half. Also, in Cluj, population investments increased by the equivalent of 685 million, and in Brasov the increase was about 668 million euro.

According to data announced by the National Bank, with the exception of June, the deposits in foreign currency advanced by 0.1% in February-May period, their growth rates were located in negative

territory. At the same time, savings in lei dropped 0.3% to 101.45 billion lei, amid more significant withdrawals from the companies that have decreased their deposits by 0.8% to compensate the drastic reduction bank financing and the high price of credit. From the beginning of the year, July also marks the first minus of the savings advance in national currency. After the peak recorded in December 2008, the 6.7% monthly growth rates were maintained continuously in positive territory (Figure no.3.).

Figure No.3. Savings monthly growth rhythms during December 2008 - July 2009

Source: own calculations NBR

It is noteworthy that there is a general legal framework for guaranteeing deposits, established by Government Ordinance 39/1996 on the establishment and operation of the Deposit Guarantee Fund in the banking system with subsequent amendments. The purpose of this institution is to guarantee repayment of deposits to banks by depositors, individuals and legal entities. Fund's financial resources come from contributions of all credit institutions authorized by the National Bank to receive deposits from the public, unless there is a state security for the deposits, and, since Romania's EU accession date, deposits banks in Member States. Coverage level increased each year from 1288 Euro in 1997 to 20,000 Euro in 2007, and 50,000 Euro from October 2008 until now.

Long-term deposits in Romania by non-residents, recorded in July 2009 a record value, of 6.48 billion euro, up by 18.57% - 1.015 billion euro - towards the end of 2008. These deposits are the main way that local banks are financed by the parent companies of the West.

According to data published by the National Bank in July 2008 their value was 5.8 billion euro, and by November the balance varied slightly to 5.87 billion euro (Figure No. 4.).

Figure No. 4. Long-term evolution of balance of deposits of non-residents in Romania

Source: own calculations NBR

As conclusion we can say that high interest rates on deposits and the risk of financial instability (due to loss of employment) were transformed in 2009 in savings.

2. Forecast deposits and savings accounts 2010

The new year started in the financial plan of the measures taken by the National Bank, the first monetary policy meeting this year bringing an interest rate reduction of 0.5 percentage points (from 8% to 7.5%), while rates on reserves applicable minimum liabilities were maintained (15% for RON and 25% for currency).

Deposit interest people have in the period January 2009 - January 2010 a small discount rate. Thus, if the average rate in January 2009 level of 16.06%, 12 months later this had fallen to 9.66%. Lowest interest rate reductions in the period under review saw it yields greater savings up periods of three months. Deposits with maturities between three and six months were paid with interest of 10.27% to 5.78% below January 2009. Those terms over six months until 12 months were 9.3% interest with 5.66% less than 12 months ago.

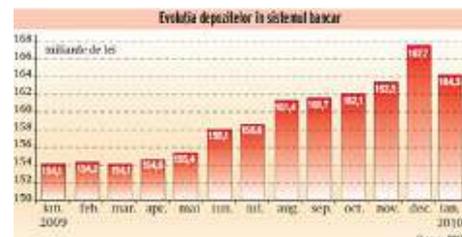

Data published by the National Bank show that the halving of interest was recorded in Euro deposits also. But unlike savings in lei, the effects for the population has recorded big reduction. Between

January 2009 - January 2010 average interest fell 3.57%. In January 2010, the highest yields have made deposits with maturities between 6 and 12 months, the average interest is 3.45%. A year ago, they were the most poorly remunerated savings, with interest of 5.77%. In early 2010, the lowest average interest bearing deposits in euro within a month, to 2.97%.

Corporate deposits decreased during the first month of this year with a record of over three billion RON. This resulted in a reduction of deposits in the banking system in Romania at 164.3 billion lei in December 2009 after saving reached a maximum level of 167.7 billion lei (Figure No. 6.). According to NBR, 31 January 2010, household savings were 97.5 billion lei and firms 54.8 billion lei.

Banking deposits fell during the first month of the year with a record of 3.4 billion lei, as a result of dwindling savings companies 3.27 billion lei. Meanwhile, population deposits increased by 160 million lei. In December 2009, residents' deposits reached a peak of 167.74 billion lei. According to data published by the National Bank in January 2010, up savings in national currency decreased by 2.15 billion lei, and the currency to 1.25 billion lei.

Figure No.5. Bank Deposit Evolution in Romania

Source: own NBR calculations

If bank deposits in lei last year was a profitable investment, interest on bank were over 12% twice and somewhat higher than inflation at this point in local currency bank deposit can not guarantee protection money than by depreciation caused by inflation. Transformation took place for two reasons: banks do not give high interest rates on deposits and Government decided to re-gains tax of 16% in bonuses.

At this time the interest offered by banks to one year deposits varies between 4% and over 8%.

In foreign currency deposits case, with or without 16% tax situation is about the same. If last year some banks offer up to 8% interest on deposits in euro, currently they vary between 2.5% and 4%. Thus, under a stable course, a one-year deposit at any bank will not only cover the best case, inflation, with no other practically gain. Last year the deposit in euro was not so much preferred by many Romanian to take advantage of good interest but as a measure of protection before a depreciation of the RON. Between April 2009 - April 2010 the balance of deposits in euro rose to an equivalent of 32.6 billion lei to 37.6 billion lei. During the same period, total deposits in lei belonging to households increased by 4.6 billion lei, up to a level of 63.18 billion lei, according to the National Bank of Romania (BNR).

Economists argue that although positive real interest rate is low, the Romanians will go further for the banks to keep their money, simply because there is little alternative. Financial behavior of population studies show that bank deposits remain in public preferences, but the pace of growth over the next two years will be moderation. This slowing is due primarily our attractiveness banking products compared to other alternatives because of the low level of interest. Another argument for reducing the rhythm of development of bank deposits is sorer Romanians appetite for funds and other alternative saving instruments.

3. Conclusions

The main source of funding of a bank deposit is represented by its customers. There are many types of classification of deposits (those individuals from those firms, the national currency against the currency, etc.).

In recent years began to grow increasingly bank deposits, with all their forms, through which we can obtain an additional gain.

The year 2009 marked a rapid and massive shift from consumption to savings. If in 2008 the population was the main objective of improving living standards in 2009 were quite different priorities due to the evolution of the economic crisis.

Romanians were concerned, on the one hand, job security, and secondly, the ability to pay debts. In this context, which overlapped with two-digit interest on term investments, banks have received from individuals' equivalent to about 4.3 billion euro in first six months of 2009.

Changing financial behavior has been helped by high levels of interest from deposits. Thus, some banks even gave a 16% interest per year for investment in lei, and nearly two thirds of the surplus savings in the first half was generated from deposits in domestic currency. In addition from January 1, 2009 the Government decided that individuals should not pay tax on 16% interest on deposits.

We can say that higher interest on deposits and the risk of financial instability (due to loss of employment) were transformed in 2009 in savings.

It is also noteworthy that there is a general legal framework for the establishment and operation of deposit Guarantee Fund Bank Deposit. The purpose of this institution is to guarantee repayment of deposits to banks by depositors, individuals and legal entities. Coverage level increased each year from 1288 in 1997 to Euro 20

In recent years, it is seen a shift towards smaller deposits with maturity less than one year, at the expense of deposits with maturity over one year. The maturity of deposits is becoming less likely to cause discomfort bankers provided that credit limits are required by the population becoming older.

Regarding currency savings, further savings Romanians interested in RON at the expense of foreign currency. Thus over 60% of depositors prefer savings in U.S. dollars.

Regarding 2010, the new year began in financial measures taken by the National Bank, the first monetary policy meeting this year bringing an interest rate reduction of 0.5 percentage points (from 8% to 7.5%).

In sections devoted to savings products months in January 2010 was no exception to the downward trend started last year, further fall in interest rate subsidies are operated by financial institutions. Emphasis was again placed on the products that interest RON two figures are now starting to be past. However, data published by the National Bank show that the halving of interest were recorded and Euro deposits.

If bank deposits in lei last year was a profitable investment: interest on bank were over 12% twice and somewhat higher than inflation at this point in local currency bank deposit can not guarantee protection money than by depreciation caused by inflation. Transformation took place for two reasons: banks do not give high interest rates on deposits and Government decided to re-gains tax of 16% in bonuses.

At this time the interest offered by banks to deposits in a year varies between 4% and over 8%, while deposits in foreign interest rates vary between 2.5% and 4%.

The Stability of the Romanian Banking System: an Overview during the International Crisis of 2007

Nucu Anca Elena

"Alexandru Ioan Cuza University" of Iași

nucu.anca@yahoo.com

Abstract

Financial stability is a primary objective of international decision-making process. The analysis and evaluation of the Romanian banking system is paramount, because this is the core of the financial market, which is in the process of European integration and shocks' propagation cross-border raises the level of systemic risk.

In this paper, we try to underline the spillover effects of the international crisis of 2007 on Romanian banking stability through a distinct analysis of the risks generated by households respectively, by companies. The study highlights the fact that major challenge to financial stability is credit risk.

Key words: financial stability, banking system, credit risk, non-performing loans, international crisis

J.E.L. classification: G21, G32, G01

1. Introduction

The effects of international financial and economic crisis show that financial integration does not provide a guarantee of financial stability, even in an almost ideal environment in which the European Union acts as a single market in all sizes and Member States are subject to a high degree of harmonization terms of financial regulation and supervision [2]. Institutional integration, as compared with integration via markets, facilitates crisis management system [8]. This article highlights the implications of current international crisis on banking system stability through an analysis of risks generated by households and by companies. Credit risk is a major challenge for the Romanian banking system stability.

Table 1. Key Prudential Indicators (%)

	Overdue and doubtful loans/Total credit portfolio (net value)	Total past-due and doubtful claims/Total assets (net value)	Credit risk ratio ¹
2007	0.22	0.17	4
2008	0.32	0.29	6.52
2009	1.45	1.01	15.29
2010	2.22	1.49	20.81

A growing vulnerability of the Romanian banking system is the decrease in loan portfolio quality. Although non-performing loans are at a manageable level, the pace of growth is a concern for financial stability. During the analysed period (2007-2010), credit risk ratio increased by 420.25%, reaching a value of 20,81 % at the end of 2010. The indicators that define the quality of banks' loan portfolios have reported a marked deterioration, the main reasons being: economic recession and rising of unemployment rate; currency depreciation and the high level of interest on loans, a development linked to increased risks [1].

These adverse developments have forced commercial banks to proceed to an increase of provisions in order to cover non-performing loans, and to adopt a caution position in granting new loans.

A positive aspect for Romanian banking system is the lack of toxic assets in the

¹ Gross exposure related to non-bank loans and interest under "doubtful" and "loss"/Total loans and interest classified related to non-bank loans, excluding off-balance-sheet items

balance sheets of credit institutions, and the fact that no bank was not in bankruptcy. Therefore, no government intervention was needed, on the contrary, the strong support of shareholders gave banks additional reserves to absorb losses from non-performing loans.

2. Spillover effects of the international crisis via households

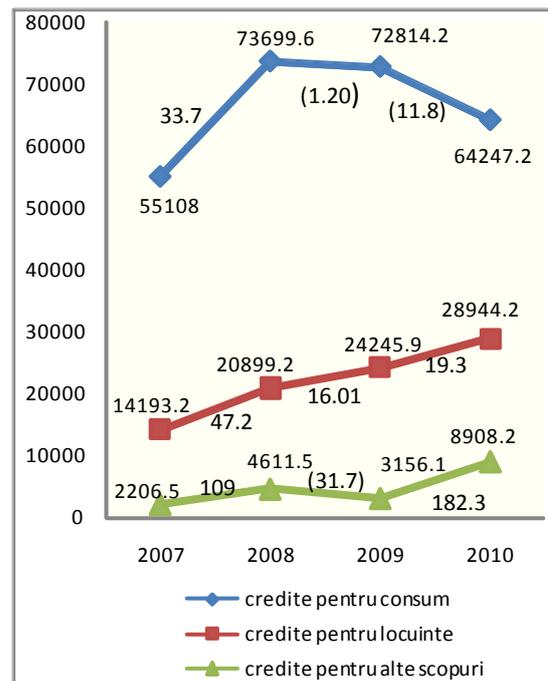

During the current international crisis, households have had a negative impact on Romanian banking stability due to evolutionary effects of two factors, in particular, the degree of indebtedness and disposable income volatility of the population [5].

The deterioration of the economic climate has reduced loans demand and also, the portfolios' quality held by credit institutions on households. Non-government credit slowdown in the latter part of 2008 and during 2009 was due to reduced credit supply, against the background of: existing liquidity problems on international markets, which have affected the international banks that have branches in Romania, reducing excess liquidity that previously characterized the Romanian banking system, increasing risk aversion of banks. Regarding loan demand, the most important negative factors were: increased cost of borrowing, currency depreciation and uncertainties about its evolution, negative outlook related to economic growth and unemployment.

Households have felt the crisis effects particularly from the following perspectives: net wealth deteriorated, disposable incomes have come under the adjustment pressure and confidence in the economy has declined [3]. Households have transferred part of the problems entailed by the crisis to the banking system stability. Non-performing rate loans has increased significantly in 2009 and the first half of 2010 (from 2.4% in December 2008 to 6.9%- June 2010). Also, the volume of bad loans in foreign currency registered a dynamic more pronounced than in the case of domestic funding (300% increase compared to 125%, December 2008-June 2010). After analyzing the structure of loans to

households' destination we can observe that substantial share is owned by consumer loans: 72.65% at the end of 2009, generating still more than 90% of debt service. Structural analysis shows that loans in foreign currency reported a higher non-performing ratio than loans in lei for all categories of retail loans.

Figure 1. The evolution of credit to households depending on destination during 2007-2010 (thousands RON)

Source: NBR Monthly Bulletins, <http://www.bnro.ro/Publicatii-periodice-204.aspx>

Challenges remain, on the short term, because [3]:

- there is a delay of several months in sending negative shocks from labor market to overdue payments;
- the expectations of population regarding their future financial standing remain negative;
- the risks accumulated during the years when lending conditions were looser will be maintained for long-term in banks' portfolio, as the maturity of loans saw an increase before the onset of the crisis.

Table 2. Past-due Debts for more than 30 Days Incurred by Individuals (2007-2010)

Year	Number of natural entities incurring past-due debts for more than 30 days	Total past-due debts	Currency		Type of delay		
			RON	EURO	Delay from 31 to 60 days	Delay from 61 to 90 days	Delay of more than 90 days
<i>Lei thousand</i>							
2007	352 394	573 266	489 225	81 825	25 109	24 357	378 234
2008	449 510	981 184	733 802	225 684	39 095	36 493	782 079
2009	683 308	2841822	1 827 273	869 537	65 506	74 962	2 194 995
2010	720 661	5 488231	2 673 604	1 971 239	79 485	89 128	3 925 097

Source: NBR Monthly Bulletins, <http://www.bnro.ro/Publicatii-periodice-204.aspx>

During the period analyzed (2007-2010), the number of natural entities incurring past-due debts for more than 30 days increased by 104.5%. The accelerated deterioration began in the second half of 2008. If the level is not alarming yet, the strong upward trend rears problems. Past-due debts volume increased about ten times in the same period, while retail credit has slowed significantly. Arrears on foreign currency loans reached 36.20% of the total past-due debts at the end of 2010 (from 31% at 31.12.2009), currency depreciation affecting debt servicing capacity. Expanding foreign, interest rate or income shocks, can cause a major effect on possibilities' loans repayment. The positive aspects are the provisions made by banks for the retail portfolio that would cover part of the past-due debts. Credit cards have reported the highest rate of arrears, but they have a small proportion in consumer loans, the opposite are mortgages which reported a reduced non-performing ratio, but ascending. Real estate loans reported a non-performing ratio that it was maintained at low values at the beginning of the crisis (3% in June 2010), one explanation being that first home buyers are more strongly motivated to service their debt.

Most loans (85%) are granted to persons who have a monthly income below 2000 lei, generating the significant share of the arrears. Because households with lower incomes may be affected by crisis, it can be concluded that the effect on banks' debts will be major. In volume, there are a relatively balanced distribution along the subcategories of income between 500 and 5000 lei. Small-value loans are the most numerous non-performing loans. By the non-performing

loan ratio, these loans range among moderate risk generating loans. Consequently, applying a high penalty rate to small- value loans would not be justified by the higher default rate [3].

Although the risks induced by households have increased in recent years, now, the situation does not create major problems for financial stability [5]. As an overview, the households, through its actions, do not lead to systemic risk on financial stability in Romania, but the adoption and permanent implementation of a proactive attitude is imperative [7].

3. Spillover effects of the international crisis via companies

The implications of international crisis of 2007 on companies' economic and financial performance in Romania are the following [3]:

- the deterioration of interest coverage ratio, due to adverse impact of both explanatory factors: profits declined markedly (by 64% in Jun 2008-June 2009), whereas interest costs continued to rise (by 31% during the same period).
- the increasing of total indebtedness, because of the faster growth in total debt than in equity.
- the reduction of companies' capacity to maintain their cash flow, the main drivers were the less readily available bank credit lines and the lower profitability. This issue has negative effects on: the overdue payment ratio (the debt servicing is affected), arrears and investment.

- Return on Equity (ROE) posted a strong downward trend (from 20% to 6% in June 2008-June 2009).
- gross foreign currency exposure of companies that took foreign currency-denominated loans is large and still increasing. By sector, companies in the real estate and manufacturing sectors have the highest exposure. The indebtedness for SMEs in foreign currency is significant and their degree of capitalisation is lower. Companies with large foreign currency exposure (more than 50% of own funds) have managed better, than the rest of the economy, on average, to service their debt with banks, because these companies enjoying a better financial standing than the rest of the economy, which allowed them to resort to external financing as well.
- the number of companies undergoing insolvency proceedings in 2009 was similar to that seen in 2008, but in 2010 Q1, the number of companies against which insolvency proceedings had been opened saw an increase of almost 38% compared to the same year-ago period.

Companies have transferred to the banking system stability part of the issues they experienced, because of the international crisis. The non-performing loan ratio increased from 0.9% to 8%, December 2008-June 2010. Companies in the construction seem to be the riskiest one with a non-performing loan ratio of 11% in June 2010. The real-estate sector has experienced the fastest deterioration, reporting an 8% overdue payment ratio in June 2010 after a 0.2% non-performing in January 2009. SMEs have generated the largest number of non-performing loans, their ratio exceeding 10% relative to the corporate sector (June 2010): the EBIT interest coverage ratio is lower (77% compared to 173%), the leverage ratio is more pronounced (3.1% compared to 1.4%), new cash flow deficit is double relative to the deficit of the corporate sector, albeit higher, ROE is attributable particularly to a lower capitalisation.

The probability of default in the case of companies has become more pronounced, from an average of 4.3% at the mid 2008 to 12.5% for 2010. Due to increasing number of non-performing loans, provisioning efforts must be further made, in spite of banks'

profitability being thus dampened in the short run. Banks have responded to the increase in the number of non-performing loans also by raising the risk premium.

Companies have mutually transferred the shocks induced by the crisis: arrears and payment incidents posted an increase. After following a strongly upward path in 2008, the number of payment incidents stabilised at the end of 2009. In terms of structure, almost 90% of total amounts are generated by SMEs. The main effects of international crisis on SMEs are: hinder financing, decreased exports, decrease in domestic demand, financial bottlenecks created on the one hand, by the state through the debt to private sector and, on the other hand, by other companies that have financial difficulties, reduction of investments and psychological effect.

Systemically important companies (SIC) had better capacity to cope with crisis than the rest of the economy: although their turnover shrank more than average, profitability has remained positive [4]. SIC have transferred in a position relatively lower liquidity problems to partners, because no incidents have been reported, with debts to banks and they contributed less directly, to increased unemployment. These companies resort to the relatively modest resources of domestic banks so that the return of demand for credit may not come from them.

4. Conclusions

The main conclusion of this paper is the fact that credit deterioration is the key risk to the banking sector in Romania. During 2007-2010, credit risk ratio increased by 420.25%, reaching a value of 20,81 % at the end of the period.

Both households and companies have transferred to the banking system stability part of the shock they experienced. Households have felt the crisis effects from the following perspectives: net wealth deteriorated, disposable incomes have come under the adjustment pressure and confidence in the economy has declined. Therefore, non-performing rate loans has increased from 2.4% in December 2008 to 6.9%- June 2010; the volume of bad loans in foreign currency registered a dynamic more pronounced than in the case of domestic funding (300%

increase compared to 125%, December 2008-June 2010) and the number of natural entities incurring past-due debts for more than 30 days increased by 104.5%. Although the risks induced by households have increased in recent years, now, the situation do not lead to systemic risk on financial stability in Romania.

Companies have felt the crisis effects from the following perspectives: the deterioration of interest coverage ratio, the increasing of total indebtedness, the reduction of companies' capacity to maintain their cash-flow, ROE indicator posted a strong downward trend, the number of companies against which insolvency proceedings had been opened saw, in 2010 Q1, an increase of almost 38% compared to the same year-ago period. Therefore, the non-performing business loan ratio increased from 0.9% to 8%, December 2008-June 2010. Companies have mutually transferred the shocks induced by the crisis: arrears and payment incidents posted an increase. While SMEs have generated the largest number of non-performing loans, systemically important companies have transferred in a position relatively lower liquidity problems to partners, because no incidents have been reported, with debts to banks and they contributed less directly, to increased unemployment.

The Romanian banking system entered the crisis well capitalized, but deteriorating macroeconomic and financial market conditions now pose significant risks to financial stability.

Ecological Consumer Behavior – Influential Factors -

Abstract

The study of the consumer behavior is a complex task because it is possible to analyze it from different points of view. So, if we investigate the ecological consumer behavior we realize that it is also difficult to establish the limits that clearly define the profile of a consumer who acts in an environmentally friendly manner. Consequently, the measurement, the conceptual delimitation of this behavior and the identification of the ecological segment in the market are essential aspects for the commercial strategies development of the companies.

Regarding the definition of this concept and its measurement, it seems reasonable to think that these consumers are those who are concerned about environmental problems.

Very often, their behavior is characterized by their attitudes and actions towards the environmental protection.

Key words: consumer behavior, bio products, consumers, ethic consumers.

J.E.L. classification: M39, I19, Q59

1. Introduction

Even if the organic products seem to be difficult to find and expensive, most of the consumers regard them in a positive way. All consumers associate organic products to their health at different levels of abstraction and they want good, tasty and nourishing products, because pleasure and well-being are their most important values.

Some of economic theories have shown some limits in explaining the complexity and multidimensionality of consumer behaviour. These are not only relating to the assumption of consumer rationality (i.e. utility

maximizing behaviour) and perfect information.

2. Ecological Consumers

In the literature, the ecological consumer behavior has been analyzed through conducts reflected not only in the purchase, recycling and/or elimination of a product (Guagnano et al., 1995; Ling-Yee, 1997; Chan, 2001) but also through aspects that reflect the consumer's ecological awareness level (Sanchez et al., 1996) and even through positive and active attitudes towards recycling and the willingness to pay more for environmental products (Kaiser, 1998; Kaiser and Wilson, 2000; Kotchen and Reiling, 2000; Laroche et al., 2001). Therefore, this behavior presents different manifestations which sometimes do not involve a final action but an environmental attitude and feeling.

In this regard, it is important to make a difference between an ecological attitude and an ecological behavior. The attitude involves a favorable or unfavorable intention to act and the behavior entails a final conduct pattern. Maloney et al. (1975) studied the environmental attitude from three dimensional perspective, which refers to the emotional, intentional and cognitive elements.

In addition, these authors included the behavioral component establishing a general ecological behavior measurement.

As for the identification of the ecological consumers segment, there are several studies which try to find the profile of this type of consumer. With this purpose, they introduce variables such as demographic, socio-economic, psychographic and environmental knowledge.

Early attempts to understand this consumers segment were based on single dimensions (such as socio-demographic variables) and did not proved to be very successful (Kassarjian, 1997; Kinnear, 1974). Recently, Diamantopoulos et al. (2003) found socio-demographic variables useful to define the consumer's profile in terms of environmental knowledge and attitudes but they argued that these variables were limited as far as environmental behavior is concerned.

3. Literature Background to Personality and Ecological Behavior

Over the past few decades, changes occurred in consumption models—and, more specifically, in food-related lifestyles (Reid et al. 2001)—have stimulated an increasing attention on the experiential and symbolic meanings of food consumption (Colacchio et al. 2008; Guido 2009). Once the utilitarian needs are fulfilled, consumers choose everyday food to build their own social and individual identities (Marshall 2005). The consumption of organic food products—made through biological methods devoid of synthetic fertilizers, toxic pesticides, and genetic engineering—can satisfy consumers' ethical needs to care for their relatives' health as well as for their own one, to protect the environment, and to preserve the well-being of animals (McEachern and McClean 2002). Most consumers perceive organic products as having also specific benefits—in terms of taste, nutrition, and sensory characteristics—which distinguish them from conventional food (Arvola et al. 2008 Magnusson et al. 2003, Zanolli and Naspetti 2002).

Although still a niche, the organic food market is considered a very promising sector (Hughner et al. 2007). According to the International Federation of Organic Agriculture Movements (IFOAM) organic agriculture is nowadays practiced in 141 world countries (IFOAM) 2007, and the organic-product market has grown rapidly during the last few years: in 2007, organic-product sales have reached \$ 46.1 billion worldwide, growing on an average of \$ 5 billion per year over the last decade. Even if 97% of the global sales are concentrated in North America and Europe, the organic

industry is experiencing a strong growth worldwide, and these products are now available in most retailing food stores (International Federation of Organic Agriculture Movements 2009). Because of this high potential, the organic food market has attracted a growing interest from many sides. On the one hand, organic food product companies look for new ways to increase their business, and, on the other, marketing researchers aim at a better understanding of organic food consumers' behavior. A number of studies have considered acceptance, primary motives, and major obstacles and rationales to their consumption (see, Hughner et al. 2007 for a review) but, to date, there is not yet a deep knowledge of the multifaceted mechanisms at the basis of the organic food consumers' behavior.

An conceptual model of consumer behavior was developed by following the so-called Prospect method (Caprara and Barbaranelli 2000), a conceptual framework which integrates the Theory of planned behavior (TPB, Ajzen 1991, and the Five-factor model of personality (FFM, cf. Digman 1990).

Deaton and Muellbauer (1980), for example, discuss consumer behavior in terms of preferences and opportunities for choice: "unlike preferences, the opportunities for choice are often directly observable so that, to the extent that variations in behaviour can be traced to variations in opportunities, we have a straightforward and objective explanation of observed phenomena". In their view, therefore, "much can be so explained, and (...) the part played by preferences in determining behavior tends to be overestimated."

In marketing, however, the analysis of consumer behavior is dealing primarily with preferences and how preferences are formed in the mind of the consumer. Marketing approaches to consumer behavior may be distinguished in cognitive versus behavioral.

Cognitive approaches emphasis constructs dealing with mental structures and thinking processes; behavioral approaches emphasize direct links between the characteristics of the environment and behavior. Both approaches are widely accepted and acknowledged way of analyzing behavior, with high degree of complementarity (Peter et al., 1999). In this study they will concentrate on the first

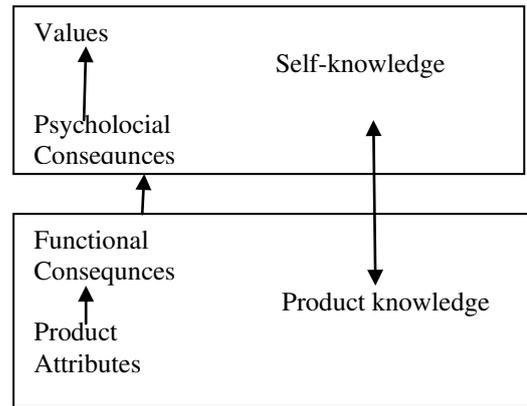

approach and focus on consumer product knowledge, involvement and motivation in the case of organic products.

From a cognitive perspective, it can define consumer behavior as the activities that people engage in when selecting, purchasing, and using products and services to satisfy needs and desires. Such activities involve mental and emotional processes, in addition to physical actions.

The cognitive approach is based on consumer knowledge, product's perception and the needs consumers want to satisfy. Cognition refers to the dynamic mental constructs and processes involved in thinking, understanding and interpreting stimuli and events from the environment. It includes the knowledge, meaning and beliefs that consumers have developed from their experience and stored in their memories (Peter et al., 1999). While many aspects of cognition are conscious thinking processes, other are essentially automatic. In other words, consumer behavior does not imply only reasoned action but it is essentially a consequence of his/her consumption-relevant cognitive structure (Grunert and Grunert, 1995).

When a stimulus or event regarding a product, including new products information, come in relation with consumer self-knowledge and his memory, a link between him and the product is built. A network of links between product attributes, personal consequences and values can be revealed to give a deeper insight in consumer motivation. These links build up those elements of the cognitive network that the consumer rises from his mind when presented product information in the form of product attributes: when this network is structured in a hierarchical form is known as a "means-end chain" (Gutman, 1982).

Figure 1 - Linking values to products: the Means-End Chain Model

Source: Gutman, 1982

A means-end chain (MEC) is a knowledge structure that links consumers' knowledge about product attributes with their personal knowledge about consequences and values (Figure 1).

The means-end approach suggests that consumers think about product characteristics or *attributes* in terms of personal *consequences*. These may be perceived as positive (*benefits*) or negative (*risks*). In other words, the means-end chain model gives the possibility to explicitly link consumers needs and products characteristics, and reveals his goals/motivations in purchasing a product. In means-end chain theory consumer decision making is considered like a problem-solving process. Consumers exert a behavior (as an example: acquire a credit card), as a *mean*, to reach an objective or an *end* (ex: not to pay cash) (Reynolds and Whitlark, 1995). Besides, consumer also see most product attributes as a mean to some end: at the conscious level this may be represented by some positive consequences, in a more abstract and subconscious level their end is to attain *values*, that is "*preferred end states of being and preferred modes of behavior*" (Peter et al., 1999).

4. Some Important Perspectives in Social Scientific Consumer Research

Understanding the consumption of food from social scientific perspectives implies taking account of the social and cultural

contexts in which people think about, buy, prepare, eat and dispose of food products. A social scientific perspective on food focuses on social relationships from social, cultural, institutional and political perspectives. This may concern questions of politics and economy, as related for example to the distribution of food - including kinds of shopping outlets. It may also concern questions of culture and tradition, in which food is seen as one form of symbolic communication, as a tasty source of pleasure or as a dimension of care in providing for the needs of families.

Food is a meeting point of numerous symbolic codes: personal, familial, cultural, biological, industrial and environmental, as well as ethical dimensions of social justice. It follows that organic food can also be understood in relation to such codes. Some studies are of an ethnographic character. A common feature of these approaches is a focus upon the *meanings* we connect with material products. This does not imply that the utilitarian values of products in use are overlooked, but rather an acknowledgement that there is something more than practical or instrumental values related to these products.

Sociological and anthropological studies of food and food choices have pointed out – among other issues – that consumers tend to conceive eating as a moral matter. Food purchase, cooking and eating are activities deeply embedded in the normative structures and routines of everyday life. Food is not only a form of meaningful communication; it is also a commodity that consumers pay for, as well as being a necessity of life. Buying food therefore is an everyday activity, which constitutes a connection between two different spheres: the market and family life, a duality, which should also be reflected in studies of food.

In recent years, the perspectives of social scientific studies of food have been broadened further and include, for example, important contributions from economic sociology and social geography as well as political economy. Moreover, food consumption as a form of political voice has received considerable attention, not the least with reference to organic food. The term 'political consumption' emerged first in marketing research, where it is still being applied, referring to a group with particular

values and lifestyle. In social scientific work, this is rather studied as a phenomenon associated with changing forms of political mobilization and voice, referring, among other things, to democratic theory, and to changing relations between consumers and suppliers.

These latter contributions direct attention towards the structures of systems of provision and the political and institutional contexts of distribution and consumption, as well as consumers' participation in these contexts as both buyers and citizens. Thus, the focus of much recent work has been redirected from a concern with the role of food in family life towards social, political and institutional conditions for the consumption of organic food.

What emerges from these very diverse social scientific approaches is that the consumption of organic food can be many-sided and complex. A common theme is that in order to understand the ways in which people experience organic food, how they evaluate such key concepts as 'safety' and 'quality', and the extent to which organic foods are chosen in preference to conventional variants, an approach is needed that takes account of the contexts of social action and the manner in which everyday activities are embedded in interpersonal relationships and institutional patterns.

Differences in the priority accorded to various quality attributes of food may reflect differences between the roles of social actors in the food system. In a Norwegian study of quality conceptions related to the purchase of vegetables, Lien and Døving found substantial differences between consumers, wholesalers, retailers and farmers with regard to their conceptions of "good quality". Consumers and farmers had a common focus on quality aspects that are not immediately apparent in the store. These included the nutritional value of products, their taste and the extent to which they were produced in an environmentally sound manner, whereas wholesalers and retailers focussed more on aspects of the products' appearance, such as their size, colour and form.

Several studies undertaken during the 90's and reviewed by O'Doherty Jensen have addressed the way in which consumers evaluate food. Many studies document a tendency to evaluate the quality of products

in terms of the extent to which they are perceived as being "natural" or "artificial". Results from a regional survey in Southern Norway, indicate the need to supplement this focus on product attributes. It was found that consumer considerations related to the choice of food include a range of issues related to the product itself as well as issues related to the food system as such. It is important to note how broad the range of consumer interests may be, which can be discussed as consumer conceptions of aspects of 'quality', just as it is important to keep in mind that different concerns may be relevant to consumers in specific contexts.

5. Some Social Scientific Points of Critique of Cognitive and Economic Approaches to Consumption

Within a marketing approach, whether or not consumers choose to purchase a particular commodity is taken to be the indicator of consumer demand, and often used as a basis for interpreting consumer interest. This approach, according to Warde and Martens, is inadequate in that purchases represent only some of the ways in which consumer choice and influence are exercised. They distinguish different levels of choice, as this term is defined in a common dictionary. These are: 1) to select; 2) to pick in preference; 3) to consider fit or suitable; and 4) to will or determine. They argue that these levels of choice tend to be mixed up without reflection in public debate about consumption, and sometimes in academic discourse.

The fourth level of 'choice' for instance implies the existence of freedom for an individual to determine his or her own fate, while the first two by contrast merely entail picking among a given set of items that are available. It is choice in the latter sense only, for which purchases made can serve as an indicator.

The seemingly great freedom of choice and influence of the consumer is often overestimated, and from Warde and Martens' argument it follows that the "truly sovereign consumer" is closer to fiction than to reality. They conclude that: "... the term "choice" inflates the importance of individual decisions and conflates qualitatively different

aspects and level of discretion." They further sum up some of the types of restrictions on personal choice, among them: the availability of resources, systematic inequalities of power in decision-making, shared cultural and aesthetic judgement, and "situational entailment".

They claim that a sociological approach should aim to describe those processes, which restrict freedom, understood as determination of will, and the components of the social logic of restricted choice.

Regina Birner also argues against the assumption that the failure to buy something indicates a lack of interest on the part of the consumer. One basic shortcoming of the tendency to interpret purchase as indicating interest in and support for a particular product is the lack of opportunity to communicate consumer dissatisfaction or desire for change. There is no way to receive qualitative information about what consumers actually want unless the exact incarnation of their wishes are to be found among the products offered on the market.

The inverse of this reasoning is to draw the conclusion that the only reason why consumers might not buy a certain product is a lack of interest in that product. Birner *et al.* list a number of other plausible reasons why consumers may not buy particular products, such as organic food. Factors connected with the product that might influence a decision not to purchase organic food include price distortions (due to external effects, differences in profit margins and know-how), problems of availability, advertising and labeling of products. Factors related to the decision-making of consumers include: trust, information costs and logistical problems, as well as social context and habits.

6. Conclusions

As theoretically expected, lower prices and better distribution, of course, would help to increase the demand of organic products. At the same time, potential organic consumers want good tasting products as well as easy-to-use products which aren't perishable. In terms of product development, better packaging and organoleptic quality standards should be a target for organic farmers and processors.

The consequence level can give information on organic products' positioning. Consumers ask for more information. They want to choose with more freedom and knowledge is an instrument, but they are also interested in more "natural" products: certification and labelling is a starting point, food safety is a desirable target, but most of all they desire to understand and to be aware about how organic production and processing is indeed different from the conventional one, and how organic products can be distinguished.

Organic consumers do not want to be driven by the market, they want to eat healthy and at the same time are not keen to renounce to the pleasures of life.

The value level may be useful to devise a better communication strategy (Peter et al., 1999). "Health" is clearly the key-word to this respect, but it should be coupled with implicit reference to value states such as hedonism, pleasure and achievement, which also act as driving forces.

Abstract

This paper illustrates an economic study conducted by the World Bank in line with the European Commission on the progress of the contemporary global economy in the nowadays crisis conditions. Based on this study it is showed that global GDP will increase by 3.3% in 2011 and 3.5% in 2012, and the private capital flows to the developing countries will increase by 3.2% in 2012.

The most affected industries by the global crisis are manufacturing, construction and sales of goods. In terms of social, the economic recession has increased inflation and unemployment and lowered the income of the household product. The global recession operates in an unbalanced economic environment. During 2005-2010, China has experienced the highest growth rate.

The inflation and unemployment rates are still high and vary widely among the main actors in the global economy.

Key words: global GDP, inflation, unemployment, growth rate, global recession

J.E.L. classification: F23

1. Introduction

The most recent comprehensive economic study realized by the World Bank is initiated on a different approach than that of the European Commission. This new approach considers that the new challenge for the world economy is the "nervous markets" related to the tax position adopted by some European economies with high incomes. [1]

2. The GDP Evolution in the Global Business Environment

Against this background, global GDP will increase by 3.3% in 2011 and 3.5% in 2012. The private capital flows to developing countries will increase from 2.7% of their GDP in 2009 to 3.2% in 2012.

As a result of the increased productivity growth, the GDP in the developing countries will increase by 6% between 2011 and 2012. This is more than double than the GDP growth rates in developed countries, which will reach 2.3% in 2011 and 2.7% in 2012 (see Table 1).

Moreover, many countries face economic depression. This caused a significant decrease in the industry's output, investment, trade and an unusual increase in the unemployment and inflation rates.

The global recession is operating in a unbalanced economic environment. Even if this crisis is called "The Great Recession", the same names have had other previous global crises.

Table 1: The Evolution of the global business environment (the annual growth rate of the GDP)

Country / Region	2008	2009	2010	2011	2012
World Economy	1,7	-2,1	3,3	3,3	3,5
Euro zone	0,4	-4,1	0,7	1,3	1,8
Japan	-1,2	-5,2	2,5	2,1	2,2
S.U.A.	0,4	-2,4	3,3	2,9	3,0
China	8,5	7,1	8,7	7,8	7,7
Russian Federation	5,6	-7,9	4,5	4,8	4,7

Table 2: The trend of global economy

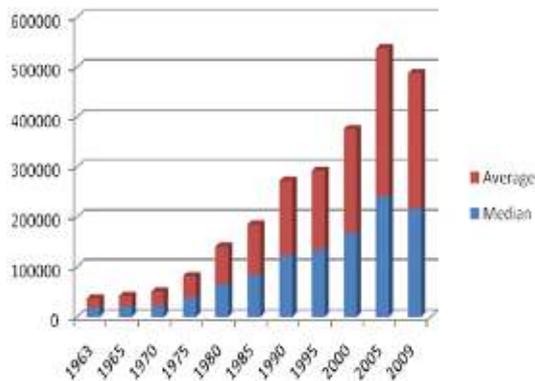

% annual real change	2005	2006	2007	2008	2009	2010
GDP real growth rate						
U.S.	2,9	2,8	2,0	1,1	-2,9	0,9
Japan	1,9	2,0	2,4	-0,7	-5,3	0,1
Asia (exclusively Japan)	8,3	9,1	9,7	6,9	3,3	5,6
China	10,4	11,7	13,0	9,0	6,1	7,8
ASEAN (Indonesia, Malaysia, Filipinas, Thailand) + South Korea	5,0	5,4	5,7	4,2	-0,3	3,3
Candidate Countries	8,0	6,7	4,8	1,3	-3,6	2,1
Russian Federation	6,4	7,7	8,1	5,6	-3,8	1,5
Latin America	4,6	5,4	5,6	4,2	-1,6	1,6
Sub-Saharan Africa	5,6	6,5	6,6	5,2	2,5	3,5
World Economy	4,5	5,1	5,1	3,1	-1,4	1,9
World trade in goods						
World import growth	8,5	9,5	6,7	2,6	-11,4	0,9
The increase in global exports (without UE27)	9,3	8,9	3,6	-10,7	2,1

On the other hand, the current global crisis is considered by many experts as the most difficult after the crisis of the '30s. It has caused the "destruction" of the main commercial and industrial activities, the fall of the costs and of the global economies.

The experts believe that the main cause of shrinkage in the U.S. construction sector constituted an interest rate cut by the FED, from 6.5% to 1% in just three years. It was practically an invitation for people who had higher risks of lending to contract new loans.

As a result, the housing was artificially increased, based on speculative resale conditions. [4] The victims of this process were the commercial banks (see Figure 1).

Figure 1: Median and average sales prices of new homes in U.S.

The crisis in the civil construction sector has expanded rapidly to credit cards, auto loans and the industry. The next step was to export the crisis in world economy. As a result, the economic situation of the most important global actors has changed, especially in 2009.

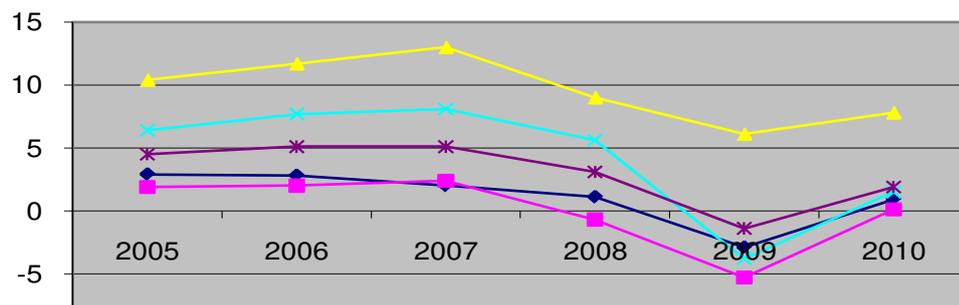

The highest rates of the GDP growth in 2009 were from China (6.1%), India (7.9%), Pakistan (2.6%) and Switzerland (1.5%). The Euro Zone has experienced negative growth rates (-4.0%), even if Germany (0.7%), France (0.3%), Italy (0.6%) and Spain (0.3%) had positive growth rates.

On the other hand, other major economic players have experienced economic contraction: U.S. (-2.9%), Japan (-5.3%), Russian Federation (-3.8%) and Canada (-3.2%). This trend had a negative impact on the global trade connections, as shown in Table 2.

According to Figure 2, China had the best economic development in 2010. During 2005-2010, China experienced the highest growth rate.

All the other major world economies have reached a growth peak in 2007 and a minimum in 2009. Even if their economic development was positive in 2010, these economies are not yet able to obtain the same economic performance as in 2008.

Figure 2: The GDP trend of the major global economic players

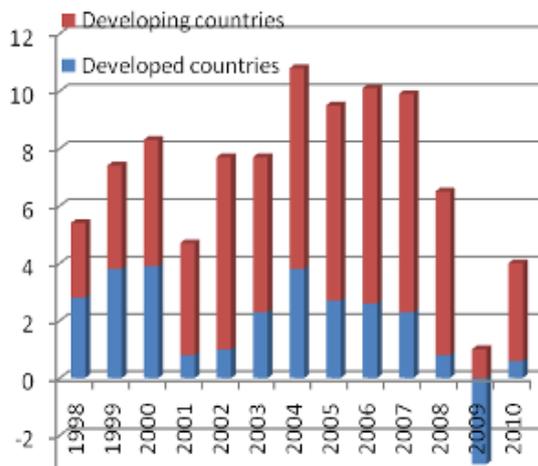

As a consequence, the trend of the world economy during 2008-2010 was similar to that of the largest national economy, except China.

Another interesting finding is that the developing countries experienced the GDP growth rates higher than those in the developed countries except the States of the EU27.

These developing countries, although the average growth reached a maximum in 2007, had continued to record strong growth rates in 2010 (see Figure 3). [2]

Figure 3: Growth rates in the economies of non-EU27 (%)

3. The evolution of inflation and unemployment worldwide

The inflation and the unemployment rates are still high and vary widely among the main actors in the global economy. In 2009, the inflation rate was 0.9% in the Euro area, 2.7% in the U.S., 1.9% in China, 1.3% in Canada and Australia and 2.8% in the Republic of Korea.

The highest inflation rates were registered in Brazil (4.31%), Russian Federation (8.8%), India (13.51%) and Venezuela (26.9%), while Japan has experienced with deflation (-1.9%).

The global economic contraction has affected the unemployment rate trend. In 2009, it has reached 3.5% in the Republic of Korea, China 4.3%, Japan 5.2%, 5.41% in Mexico, 5.5% in Australia, approximately 10% in the EU27 and U.S. and 23.2% in South Africa.

The financial crisis on the African continent is connected to the chaotic and unsustainable lending practice of the financial operators. As a result, there have been implemented a variety of schemes and financial instruments related to risky loans and security arrangements.

However, the African economies have experienced the decreasing demand and prices for crude oil, platinum and nickel (see Figure 4). [3]

Figure 4: The crude oil Futures transactions

South Africa was the first African economy that has been affected by the current global crisis. Morocco and Egypt have suffered contractions of their national economies, but they have managed to meet the challenges of the crisis.

A report by the OECD and African Development Bank has calculated the decrease of the rate of evolution of the African continent's GDP, from 5.7% in 2008 to 2.8% in 2009. This evolution has affected welfare, inflation and unemployment rates and has increased social and political conflicts in Africa.

On the other hand, the optimistic forecast of the GDP growth by 4.5% on the African continent in 2010 has not turned out.

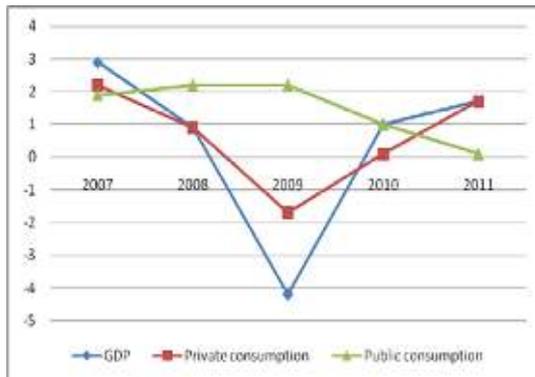

The mining sector, which is one of the most important economic activities in Africa, has suffered great losses due to the decreasing specific demand in Europe and America. The cumulative effect was the decreased African exports and commodity prices.

However, four African economies have suffered the greatest economic contraction in 2009. Angola, which is the largest exporter of crude oil from Africa, has reduced the annual growth rate of the GDP from 15.8% in 2008 to -0.4% in 2009. Seychelles recorded a growth rate of 0.4%, -0.7% for Chad, and The Democratic Republic of Congo -0.6%.

In 2010, the average growth rate was 0.2% in Central Africa and 3.5% in East Africa.

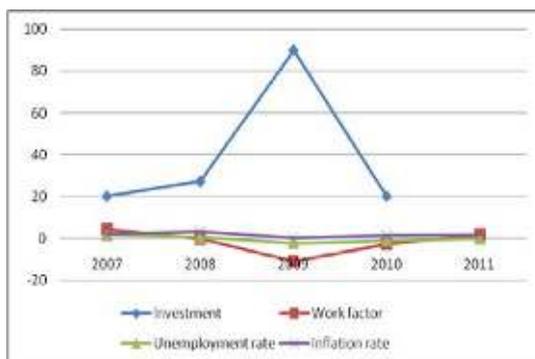

A similar evolution has had the private consumption, which has achieved a positive growth rate in 2010 (0.1%) and will increase by 1.3% in 2011. As a result, the public consumption will decrease on the period under review (see Figure 5).

Figure 5: Evolution of GDP and consumption in the EU27 (%)

Increasing investment and economic contraction have affected the employment factor and unemployment, even if the inflation rate was not so high (see Figure 6).

Figure 6: The evolution of the investment, employment and inflation factor in the Euro area (%)

Another economic giant, the Russian Federation, has reached an annual average growth of 6.8% over the past 10 years. In 2009, the Russian Federation has entered into recession and the real GDP has contracted to 3.8% and to 1.5% in 2010.

The Russian Federation must face the international liquidity decline and contraction in commodity prices.

The most affected sector of the Russian economy is investment, which has evolved from a double-digit growth in 2007, to a shrinkage of 17% in 2009. Against this background, the unemployment rate rose to 5.6% in 2007 and to 9.5% in 2009.

4. Conclusions

The Russian government has implemented several economic measures to help revive the national economy. These measures aimed at liquidity, direct support of the banking sector, firms and households and increased flexibility in exchange rates. The value of this stimulus package amounted to 14% of the Russian GDP.

The Multinational Corporations and the Global Economy

Orac Mădălina
Brăiloiu Liviu
Teliceanu Viorel Gabriel
„Dunărea de Jos” University of Galați
madalina.orac@gmail.com

Abstract

This paper illustrates the role that multinational corporations have and their trend in the global economy. Multinational corporations are operating at the intersection of production, international trade and foreign investment. These firms are at the heart of debates related to the economic globalization. In the past 20 years the role of the multinational corporations in the world economy has increased significantly. The multinational corporations' foreign direct investment has increased from 180 billion to 1000 billion USD in 2007.

Key words: multinational corporations, world output, foreign direct investment, productivity, profit

J.E.L. classification: F23

1. Introduction

The multinational corporation is a company that controls and organizes production through the production capacity located in at least two states. [1]

U.N.C.T.A.D. estimated the number of multinational corporations to 63.000, corporations that have 700.000 subsidiaries in third countries. The multinational corporations and their subsidiaries hold 25% of the global output and a number of 86 million employees.

In 2002, for example, the total stock of FDI was U.S. \$ 7100 billion, compared with 802 billion dollars in 1982. [2]

Based on the increase of the oil prices, oil groups have dominated the Forbes 500 ranking in 2009 due to lower manufacturing revenue and traditional banks.

The number of American companies in the Forbes 500 standings was reduced to 140, the lowest level since the start of writing tables, published by Forbes magazine in 1995.

The giant retailer Wal-Mart remained the world's largest employer, with 2.1 million employees, exceeding the Chinese National Petroleum group, with 1.61 million employees, and the State Grid companies, U.S. Postal Service and Chinopec.

Despite the additional revenue of \$ 30 billion, Wal-Mart has been relegated to third place of the Fortune 500.

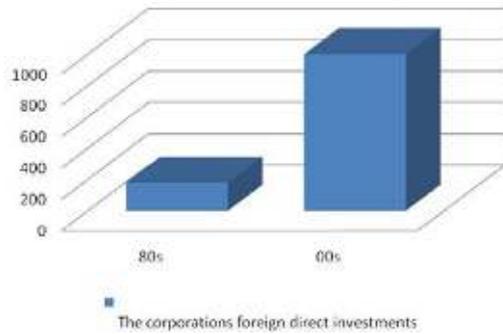

The new rising industrial empire of the world is China, which entered the top ten for the first time with the oil group Sinopec (China Petroleum & Chemical Corp.) ranked ninth, in front of the Toyota group.

In total, China has 37 companies in the Forbes rankings, compared to 68 in Japan. With the entry of nine new companies in 2008, China begins to challenge the positions of France (40 companies) and Germany (39 companies) in the ranking of the world economic giants.

Among the large American companies affected by the financial crisis it can be mentioned AIG, Freddie Mac and Lehman Brothers. AIG holds the sad record of being the company with the biggest losses in 2008 of 99 billion dollars, followed by the companies Fannie Mae, Freddie Mac, General Motors, Citigroup and Merrill Lynch.

Instead ExxonMobil still holds the world record of profitability, with a profit of 45.2 billion U.S. dollars obtained in 2008, followed by the Royal Dutch Shell and Gazprom.

Figure 1: Evolution of foreign direct investment of multinational corporations

2. The Evolution of the Multinational Corporations

Only in the U.S., the multinational corporations have a number of 21.3 million employees, representing one fifth of the labor factor in the American industry. The sales of the U.S. multinational corporations increased by 5.8% in 2004 compared to 2.3% in 2003.

In 2005-2006, the global multinational corporations' situation was as follows:

Table 1: The multinational corporations World Top

The position occupied in the year:		The corporation name	Turnover (U.S. \$ billions)
2005	2006		
1	3	Exxon Mobil	210,392
2	2	Wal-Mart	193,295
3	1	General Motors	184,632
4	4	Ford Motors	180,598
5	5	Daimler Chrysler	150,069
6	11	Royal Dutch-Shell	149,146
7	17	BP	148,062
8	9	General Electric	129,853
9	7	Mitsubishi	126,579
10	8	Toyota Motors	121,416

As shown in Table 1 it is noted that among the world's multinational corporations are headquartered U.S., Japanese and EU companies, i.e. the three major poles of global economic development. Among these

three major world economic powers takes place over 80% of the international trade volume value.

In 2009, the Fortune 500 multinational companies have fired a record number of 821,000 employees, while the total profits made by the largest 500 U.S. corporations grew more than four times to 391 billion dollars.

Thus, the profits of the first 500 companies from the U.S. economy virtually returned to normal after years of extremes - the speculative bubbles in 2006 and 2007, followed by a hard crash in 2008 - despite an infirm economic recovery, away from a return to normal.

The ranking for 2009, including the largest U.S. companies by revenue, is loaded with changes that mark the U.S. economy transformations. The house builders, occupying 14 positions in 2007, disappeared completely from the rankings, falling victims of the crisis, while the pharmaceutical sector has brought nine fresh new entries, reflecting the strength of this industry to recession.

The collapse of the commodity prices removed from the top six energy, oil and oil and gas pipelines giants and pushed the leader last year, Exxon Mobil, to the second position, far behind the new king, the Wal-Mart retailer.

The fall of the auto market has sent General Motors from the sixth place to the 15th place, marking the first year in the half a century history of the Fortune 500 when GM does not fall within the top ten.

The 2009 ranking is loaded by failures and successes, the story of the crisis, the dramas that companies some have gone through, the luck or vision of the others.

But for the 2009 top, the most important issue is clarifying a glaring inconsistency: how the 500 companies have managed to achieve such a strong growth in profits in the context of the steepest decline in revenue from the last 26 years?

The revenues of the Fortune 500 companies, normally the most important indicator for profits, fell last year by 8.7% to 9.800 billion dollars, the biggest percentage decline since 1983.

The answer is unusually simple: once they have seen the sharp fall in the sales volumes and prices in late 2008 and early 2009, the companies started to cut spending frenzy.

Basically, the corporations produced less cargo with fewer people.

Two thirds of the cost reductions came from the crucial area of labor costs. In 2009, the Fortune 500 companies have laid off 821,000 employees, the highest number in history, representing nearly 3.2% of all employees. Thus, by mid-year, the corporations produced fewer commodities with fewer people.

In the mid 2009 there was a burst of pace. The sales have passed the point of minimum and began to increase slightly, while companies continued to fire.

The result was a huge leap in productivity. Today, the major U.S. employers maintain austerity regimes imposed during the crisis, although the economy has finally started to grow.

The profits booming return come mainly from three sectors, namely financial services, consumer industries with cyclical developments and health.

Last year, the banks, securities firms and insurance companies reduced their total losses from 213 billion dollars to just 20 billion dollars. The best example is AIG, which went from a loss of \$ 99 billion in 2008 - the largest in the history of the Fortune 500 - to a loss of only 11 billion dollars last year.

The investment banks, including the giants JPMorgan Chase, Wells Fargo and Goldman Sachs had combined profits of 38 billion dollars last year, after losses of \$ 8.7 billion in 2008.

The retailers, led by Wal-Mart, were able to grow their business by attracting "the bargain hunters", more and more in the context of lower wages and rising unemployment, replacing the shelf quality products with cheap goods.

The star of the 2009 Fortune 500 is undoubtedly the health sector, which registered record profits of 92 billion dollars (up by 33%, or 23 billion dollars), surpassed only by the high tech industry, with 94 billion dollars.

On the European continent, the most important multinational corporations are:

Table 2: The multinational corporations European Top

The position occupied in the year:		The corporation name	Turnover (€ billions)
2005	2006		
1	1.	Daimler Chrysler	210,392
2	2.	BP	193,295
3	20.	Total Fina Elf	184,632
4	3.	Axa	180,598
5	7.	Royal Dutch-Shell	150,069
6	4.	Volkswagen	149,146
7	5.	Allianz	148,062
8	6.	Siemens AG	129,853
9	10.	Eon	126,579
10	8.	Deutsche Bank	121,416

In 2008, Nokia was the most important European corporation, with an estimated value of 38.2 billion Euros. [3]

The French LVMH brand ranked second, with a value of 34.9 billion Euros, followed at a difference of over ten billion by the UK brand Vodafone (24.1 billion).

In the fourth position was the Spanish telecommunications company Telefonica, with a value of 22.5 billion Euros. Unilever, the British-Dutch descent company, ranks fifth with a value of 21.6 billion Euros.

The German brands BMW and Mercedes-Benz occupied the sixth and seventh positions, with values of 21.3 and 20 billion.

The Royal Bank of Scotland was ranked eighth, with a value of 19.1 billion Euros, followed at a difference of only 10 million Euros by France Telecom. The tenth position was occupied by Deutsche Bank (18.1 billion Euros).

The study revealed a strong discrepancy between the brands in Western Europe and Eastern Europe. Thus, the aggregate value of the top ten brands in Germany, the United Kingdom and France represent 46% of the total value of brands from the 24 countries examined. Other 44 percent return from brands in Italy, Spain, Switzerland, Netherlands, Finland, Sweden and Austria.

The Eastern European countries were dominated by multinational corporations' brands, while local brands were poorly represented. Exceptions to this rule were OTP Bank, Beeline or Gorenje.

Germany was the center of the most powerful European brands, being the home for leaders of 7 from the 16 industries analyzed. Moreover, 15 of the top brands in the 50 European brands were from this country - especially the companies from the automotive industry.

The most valuable European brands affect positively the origin countries economy. For Finland, the most valuable European brands in October 2008 brought in a contribution of 37.3% to its GDP, while the percentage stood at 26.6% in Switzerland. The European average was 9.4%, exceeded by Austria (16.5%). On the last positions were located Romania (0.5%) and Bulgaria (0.48%).

3. Conclusions

By the extent of trade carried out and through special high volume of sales value, the transnational corporations have significantly imposed themselves as another pole of power in the global economy. Basically, two thirds of world exports of goods and services are conducted through the multinational corporations. [4]

An important part of this international trade is conducted between companies and between multinational corporations and their subsidiaries in other states. In the U.S., for example, 33% of exports and imports 40% of runs between this kind of firms.

Sovereign Debt Crisis in Europe – Romania' Vulnerabilities

Orăștean Ramona

"Lucian Blaga" University of Sibiu, Faculty of Economic Sciences
torasib@yahoo.com

Abstract

Romania is among the countries that are vulnerable to the sovereign debt crisis in Europe. As a result of the global crisis, public sector deficit and debt level increase from 2007 to 2009. Deficit remains high in 2010, with only a modest reduction, while debt level continues to rise. This paper analyzes Romania' vulnerabilities to sovereign debt crisis in the eurozone. Our findings highlight the necessity of major fiscal consolidation and fiscal discipline in Romania - a periphery country - to stay away from sovereign debt crisis.

Key words: sovereign debt crisis, Europe, Romania

J.E.L. classification: F34, G15, H63, O23

1. Introduction

2010 has brought up the issue of sovereign debt crisis in the eurozone that had to bail out Greece and Ireland after they racked up more debt than they could repay. Questions arise regarding Portugal and Spain. In 2011, concern about the situation extends to countries of emerging Europe.

2. Sovereign Debt Crisis – Theoretical Considerations

According to Manasse, Roubini and Schimmelpfening, a country is defined to be in a debt crisis if it is classified as being in default by Standard & Poor's, or if it has access to non-concessional IMF financing, exceeding 100% of quota [1]. They consider that not all debt crises episodes have to do with fiscal vulnerabilities of the sovereign. Developing an early-warning model of sovereign debt crises, their research demonstrates that high debt (more than

49.7% of GDP) and high inflation (larger than 10.5%) incur the largest default risk. However, low external debt levels (between 19% and 49.7% of GDP) can cause problems when combined with liquidity problems, political uncertainty and pegged exchange rate.

Reinhart, Rogoff and Savastano introduce the concept of "debt intolerance" [2]. They argue that a country's current level of debt intolerance can be approximated empirically as the ratio of the long-term average of its external debt to an index of default risk. Vulnerabilities to debt intolerance are affected by the level of external debt, degree of dollarization, indexation to inflation, short-term interest rates and debt maturity structure.

Manasse and Roubini find that crises differ depending on whether the government faces insolvency, illiquidity, or various macroeconomic risks [3].

Some authors [4] consider that the most important debt factors are the quality of national economy, of political and institutional bodies and of the government.

3. Sovereign Debt Crisis and Romania

Romania is among the countries that are vulnerable to the sovereign debt crisis in Europe because its financial sector is closely linked to highly indebted states on the continent (e.g. Greece), according to the World Bank Global Economic Prospects Report [5].

As a result of the global crisis, public sector deficit and debt level increase from 2007 to 2009. Deficit remains high in 2010, with only a modest reduction, while debt level continues to rise (Table 1).

Table 1. Evolution of Government overall balance and public debt in 2007-2011 (% of GDP)

	Government budget deficit (-) / surplus (+)					Public debt				
	'07	'08	'09	'10	'11	'07	'08	'09	'10	'11*

Source: Ministry of Public Finance, *Public Debt Bulletin*, October 2010; IMF, *Regional Economic Outlook – Europe, Building Confidence*, October 2010; EUROSTAT

According to Ministry of Public Finance data [6], the public debt at October 31, 2010 reached 182.4 billion lei, representing 35.5% of GDP. Although the public debt remains below the reference set by the Maastricht Treaty, 60% of GDP, the growth is sustained. In less than three years, public debt has doubled to 182.4 billion lei from 82.3 billion lei at the end of 2007. 93.7% of the total volume is government debt, direct or guaranteed.

To prevent worsening economic and financial situation in 2009, Romanian authorities have agreed a financing package for 2 years (May 2009-May 2011) of €19.95 billion with the International Monetary Fund - €12.95 billion, European Union - €5.0 billion, World Bank - €1.0 billion, European Bank for Reconstruction and Development and European Investment Bank - €1.0 billion.

The Government's austerity measures are stipulated by the Law on measures necessary to restore budget balance adopted in June 2010. The adjustment plan is to a significant degree expenditure-based, although it contains also some tax-based components.

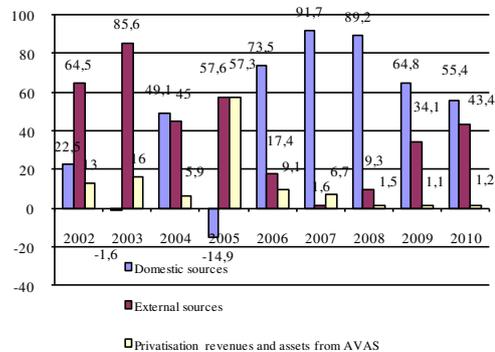

In Romania, expenditure measures for the fiscal deficit reduction were cuts in public sector wages (by 25% since June 2010), freezes in pensions, increases in the

flexibility of government expenditures and public employment cuts.

On the revenue side, the decision was to maintain a 16% tax rate on income and profit and to increase the standard VAT rate from 19% to 24% since 1 July 2010. Measures taken in the area of fiscal governance has been the adoption of the Law of fiscal responsibility, the Law on uniform pay in the public sector and the legislation on pension reform.

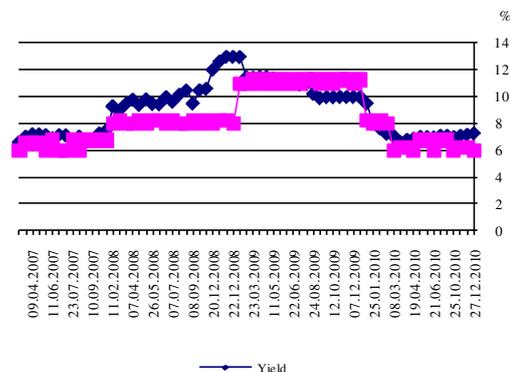

The budget deficit financing during the period 2007-2010 was focused mostly on internal sources, external funding increasing from 1.6% in 2007 to 43.4% in 2010.

Figure 1. Financing the budget deficit in 2002-2010 (% in total)

In 2010, Government made new loans of 44.1 billion lei, mostly by selling government securities on the domestic market. In the first half of the year, the authorities limited their regular market access to short maturity instruments (Treasury bills with maturity of one year). Since November 2010, they have begun to focus on extending the maturity of the domestic currency debt while accepting somewhat higher yields.

Figure 2. Yield and coupon rate of the Government bond in 2007-2010 (% pa.)

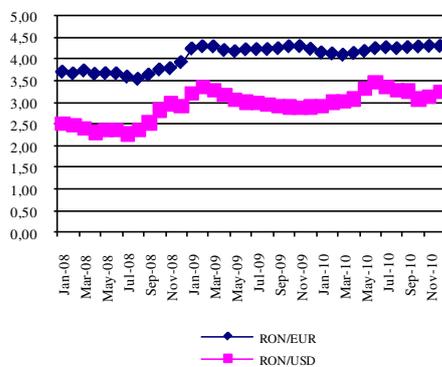

According to IMF Country Report January 2011, Romania plans to launch a "euro medium term notes" program in early 2011 that will maintain its presence in the external markets under more flexible issuance procedures [7].

Government fiscal strategy for 2011-2013 presents the reform program undertaken by the authorities to rationalize public expenditure, public sector restructuring, further actions against tax evasion, prioritizing investments, supporting economic activity and accelerated absorption of EU funds.

End-2010 inflation rate stood at 7.96%, outside the central bank's variation band of $\pm 1\%$ around the 3.5% target. December 2009 compared to December 2008 inflation rate reached 4.74% and 2009 annual average was 5.59%.

The exchange rate has added pressure on inflation, in early 2009 it recorded a nominal depreciation, followed by a relative stability. In early 2010 the exchange rate began a slight appreciation, but on short term, since April 2010 it continuing the depreciation process.

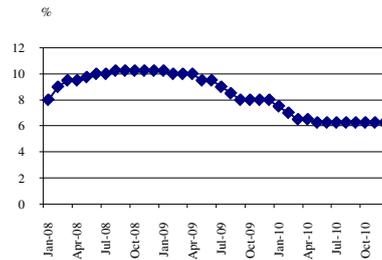

Figure 3. Exchange rate in 2008-2010 (monthly average)

Unemployment rate increased from 4.4% in 2008 to 7.8% in 2009 and in 2010 it registered a slightly downward trend, reaching 6.95% in November.

Compared with 2008 when the National Bank of Romania raised the monetary policy interest rate for six times, recording at the end of the year a level of 10.25%, in 2009 central bank reduced the monetary policy interest rate, reaching a level of 8% at the end of the year. In 2010, monetary policy interest rate continued to decline, reaching 6.25% in May 2010, which remained constant until the end of the year.

Figure 4. Monetary policy interest rate in 2008-2010 (%)

Monetary policy set as a priority for the period ahead the countering of the effects of the standard VAT rate increase starting 1 July 2010.

4. Conclusions

In a speech at the 2010 Leaders' Dialogue Reform Club in London, president of the EBRD Thomas Mirow stressed that sovereign debt is the most damaging direct legacy of the crisis. He considered that "sharp rise in sovereign debt will impose large liabilities on taxpayers in the West for a generation" [8].

Reinhart and Rogoff [9] estimate that debt will be the big issue in the next 10 years.

Kenneth Rogoff, the former chief economist at the IMF, considers that Europe is experiencing problems that will take years to play out. He said, speaking at a conference in Oslo in January 2011: "the periphery countries are obviously in deep fiscal trouble. I think we will see restructuring still in some of the periphery countries".

In January 2011, IMF [10] warned that in the euro area is needed a more comprehensive approach to crisis management that could break the fiscal-financial spiral and reduce the risk of cross-border contagion.

Greece, Italy and Belgium have the highest debt levels in Europe. In this context, Romania has the interest that eurozone to treat its weaknesses so that not to be directly affected.

Romania needs a major fiscal consolidation and fiscal discipline to stay away from sovereign debt crisis.

General Issues Concerning the Reconciliation of the Accounting Earnings with the Taxable Earnings

Abstract

Deferred taxes came from the need to reflect the deferred debts or claims in the financial statements, in an entity's relationship with the state budget. [4]

Given the complexity of the operations leading to temporary differences, in this article we will address general issues concerning the reconciliation of the accounting earnings with the taxable earnings in terms of accounting models.

In order to develop accounting models, we will first clarify the tax matters that affect the entry in the accounts of deferred taxes, after which we intend to briefly present the entry in the accounts of two types of deferred taxes.

Thus we can identify both the deductible temporary differences, which are indirectly involved in future net flows, by the fact that they reduce the tax due, as well as those directly involved in the net flows increase if the laws allow the recovery of tax losses from past profits.

Key words: accounting earnings, taxable earnings, deferred tax, reconciliation, profit

J.E.L. classification: H32, H87, M40, M41, M49, Q56

1. Introduction

Given that the financial statements are a structured representation of the financial position and performance of an entity, and their goal is to provide information about the financial position, financial performance and cash flows of an economic unit, useful for a wide range of users in making economic decision, special attention should be paid to

deferred tax through which is achieved reconciliation of the accounting earnings with the taxable earnings.

In the context of the trend on the European and international level to ensure a common agreed framework for the preparation and presentation of financial statements, we must accept a new formula of the accounting and taxation report, both in connection and disconnection relationships.

Thus, the accounting-taxation connection involves linking the two fields without having an interconditioning relationship; accounting is the main knowledge base of the taxation. Referring to the accounting-taxation disconnection we may say that it derives from the differences between the accounting rules and principles and the tax ones. Once these differences are found, proceed to the reintegration and deductions that are required between the accounting and tax values. [5]

Given these considerations, two sets of earnings are calculated for taxation of the profit: accounting earnings and taxable earnings. [2]

A large number of accounting professionals often complain that accounting principles are not observed by taxation and accounting is subject to taxation, some even argue that "total disconnection of taxation from accounting" is required. [1].

Thus, there is the question of their reconciliation, and most accounting standards currently used in the world provide certain methods in this regard.

Specifically, this reconciliation is achieved through the *deferred tax*.

The motivation to reflect the deferred debts and/or claims in the balance sheet, in an entity's relationship with the state budget,

due to temporary differences arising between the tax basis of assets or liabilities and their book value recorded in the balance sheet is the production of *immediate positive effects*, such as: reduction of a current liability with taxes to the state budget and prevention of false profit distribution to owners, both resulting in an outflow of resources. Given the complexity of the classes of balance sheet assets and liabilities that may result, in certain circumstances, in temporary differences, next we will deal with claims and debts regarding the deferred tax.

In order to reflect such operations in the accounts, first we must point out the defining and characteristic elements of the deferred tax, the advantages and disadvantages of its use, without forgetting the tax treatment.

2. Theoretical considerations on the deferred income tax

To clarify the theoretical matters regarding the deferred income tax, we consider it appropriate to refer to the tax base that generates it.

Thus, *the accounting profit* refers to the profit or loss from a certain period, before deducting the income tax expenses.

The taxable profit (tax loss) is the profit (loss) for a period, determined in accordance with the rules set forth by the tax authorities, based on which the income tax is payable (recoverable).[6]

The specific way to achieve reconciliation of the accounting earnings with the taxable earnings depends on the accounting and tax regulations applicable at a given time.

We can say that the accounting earnings and the taxable earnings are separated by two categories of differences: permanent differences (which are not subject to any accounting records) and temporary differences (subject to accounting records designed to reconcile the accounting earnings with the taxable earnings).

The permanent differences are represented by:

➤ *non-deductible expenses* that the tax authority definitively refuses to deduct due to their unjustified nature, due to their excessive size etc.; [7]

➤ *tax deductions*: these are revenues or other amounts that the tax authority permanently refuses to tax. [8]

The temporary differences are the gap between the book value of an asset or liability in the balance sheet and their tax bases. They are generated by the fact that the tax incidence of certain transactions or events takes place at a time different from that of recognition in the accounts. [2]

There are two types of temporary differences: taxable temporary differences and deductible temporary differences.

The taxable temporary differences will result in higher future payments regarding the income tax and give rise to deferred tax liabilities. They appear in the following cases: [6]

➤ for balance sheet assets, if the net book value of an asset is greater than the tax base of that asset;

➤ for balance sheet liabilities, if the book value of a liability is lower than the tax base of that liability;

The deductible temporary differences will result in lower future payments regarding the income tax and give rise to deferred tax assets. They appear in the following cases: [6]

➤ for balance sheet assets, if the net book value of an asset is lower than the tax base of that asset;

➤ for balance sheet liabilities, if the book value of a liability is higher than the tax base of that liability;

Given the above differences, we may say that the immediate *positive effect* of using deferred taxes is the reduction of a current liability with taxes to the state budget and prevention of false profit distribution to owners, both cases leading to an outflow of resources from that entity.

The deferred tax is, in effect, a tax credit, a credit granted by the state to taxpayers, without interest, over a certain period of time. If we take into account the tax deductions, unlike them, the deferred tax does not reduce the taxpayer's tax liabilities, but allows for deferred payment of certain tax liabilities.

The limits of using deferred taxes are represented by the fact that the entity must maintain a reasonable degree, not to overdo their use, unless in future years they accumulate very large payment obligations

for activities and profits for the current period.

Taking into account their tax effect it is required to describe the deferred tax assets and liabilities.

3. Accounting models concerning the deferred tax

The temporary differences generate taxable or deductible amounts when the book value of the asset or liability is recovered, that is extinguished.

Thus, we have deferred tax assets and liabilities that were generated by:

- assets, if tax depreciation differs from the accounting depreciation;
- stocks, if they are sold with installment payment and it is chosen to record the installments on taxable income, at the time specified in the contract for collecting such installments; the related costs are deductible on the same due dates;
- provisions, which sometimes may be recognized as deferred tax assets;
- interest, if there are differences between the time of performing and recognizing the interest costs from an accounting and tax perspective;
- tax losses carried forward;
- favorable and unfavorable foreign exchange differences recorded in the retained earnings account.

Due to the complexity of these operations we considered it appropriate to deal in this article with *the entry in the accounts of transactions relating to:*

- deferred tax liabilities arising from fixed assets;
- deferred tax assets arising from accrued expenses.

a) Accounting of operations regarding deferred tax liabilities arising from fixed assets

Assets are defined as resources controlled by the entity as a result of past events, which generate future economic benefits for the enterprise. [6]

The tax base of an asset is the amount deductible for tax purposes from any taxable economic profit to be made by an entity when it recovers the book value of the asset.

If these benefits are not taxable, then the tax basis of the asset is equal to its book value.

A deferred tax liability must be recognized for all taxable temporary differences, exceptions being made to the extent that the deferred tax liability is resulting from:

- initial recognition of the goodwill, or
- initial recognition of an asset or liability in a transaction that is not a business combination and at the time of the transaction it affects neither the accounting profit nor the taxable profit (tax loss). [6].

To understand how to reflect in the accounts the operations regarding deferred tax liabilities arising from fixed assets, we considered it necessary to start from an *application*.

In this respect we assume that a company SIMA has bought a piece of equipment at the cost of RON 500.000, and the estimated useful life is 5 years. From an accounting perspective, the equipment is depreciated linearly and from a tax perspective, the accelerated method is accepted. The tax rate is 16%. It is known that the income obtained from the equipment's operation or disposal will be taxed.

At the end of the first year of use, we will have the following situation:

- accounting depreciation = $500.000 * C_1 = 500.000 * 20\% = 100.000$ RON,
- tax depreciation = $500.000 * C_a = 500.000 * 50\% = 250.000$ RON,
- the tax payable is reduced by RON 24.000,
- *taxable temporary difference* $(250.000 - 100.000) * \text{tax rate } (16\%) = \text{deferred tax liability}$ (RON 24.000), where:

C_1 - straight-line depreciation rate,

C_a - accelerated depreciation rate = 50% of the original cost of the fixed asset in the first year of operation,

$C_1 = 100/5 = 20\%$.

Due to the difference between the depreciation rates, tax depreciation of company SIMA exceeds the accounting depreciation by RON 150.000 in the first year of operation, difference which is reduced from the second year.

This tax recognition of a higher depreciation expense caused a reduction in the tax due by RON 24.000 in the first year, which *is not actual tax savings* but *deferred tax liability* until the expiration of the normal use of the fixed asset.

This case generates the following *entry* in the accounts of the company SIMA:

6912	4412	
“Expenses with deferred income taxes”	“Deferred income tax”	24.000

b) Accounting of operations regarding deferred tax assets arising from accrued expenses

The tax base of a liability is its book value, excluding any amount that will be deductible for tax purposes in the future accounting periods regarding that liability. A deferred tax asset should be recognized for all deductible temporary differences to the extent that a taxable profit is likely to be available, for which may be used the deductible temporary difference, unless the deferred tax asset arises from initial recognition of an asset or liability in a transaction which:

- is not a business combination;
- at the time of the transaction affects neither the accounting profit nor the taxable profit (tax loss). [6]

In this respect, we consider that, in order to observe the principle of years' independence, at the end of year N, the company SIMA reflects in the accounts the interest expense (related to a long-term contracted loan), amounting to RON 2.000, in compliance with the credit agreement, interest which will be paid the next financial year.

In the accounting of the entity SIMA, this case involves the following *entry*:

666	1682	RON
“Interest expense”	“Accrued interest on long-term bank loans”	2.000

Two cases are considered:

a) if the interest expense is deductible for tax purposes, according to the cash accounting the book value of the interest liability is higher than the tax base of the interest liability. This results in a temporary deductible difference of RON 2,000, which gives rise to a *deferred tax asset* of RON 320 (2000 * 16%) which is registered in the accounts as follows:

4412	7912	
“Deferred income tax”	“Revenues from deferred tax income”	RON 320

In the year N +1, the interest expense will be deductible when determining the taxable profit and the company will pay a tax minus RON 320 than normal in an accounting perspective.

b) if the interest expense has been already deducted for tax purposes and the book value of the interest liability is equal to the tax base of the interest liability and therefore there are no temporary differences. That situation is related to the accounting practice in Romania.

4. Conclusions

The option to study deferred taxes is justified by the complexity and significance of this topic in delineating the objectives of a modern accounting from the fiscal imperatives.

We can say that in our country, the issue regarding an entity's development of accounting policies regarding the corporation tax is often placed in the background; the objective of a true and a fair view is abandoned to the detriment of tax provisions.

Thus, deductible temporary differences and the tax credit are indirectly involved in future net flows, because they reduce tax due, and if the laws allow recovery of tax losses from past profits, such resulting deductible temporary differences directly determine the increase in net flows.

If a company fails to recognize deferred tax assets or liabilities, this will lead to distortion of the financial position and performance.

Although these deferred taxes have some *advantages*, their *limitations* should not be neglected, namely a reasonable degree should be maintained and their use should not be overdone, unless in the following financial years very large payment obligations are accumulated.

The tax decision must fall organically within the entity's decisions, so that it may experience a risk and uncertainty reduction. [3]

Basic Problems Concerning Budgeting in Coal Extraction Units

Paliu-Popa Lucia
Dina Ionela-Claudia

"Constantin Brâncuși" University of Târgu Jiu
univers_cont@yahoo.com,
dina_claudia@yahoo.com

Abstract

Given that the purpose of any business, and therefore those working in the field of extraction of coal mineral resources, is aimed at maintaining the equilibrium relationship between revenue and expenditure, the management problem facing firms is to find those methods which allow sizing and controlling this type of relationship. For this purpose, a financial previsions document is elaborated, namely the „income and expenditures budget”, with the help of which mines forecast for a certain period of time, usually a year broken down in quarters, the financial revenues and expenditures, thus ensuring a relationship of financial equilibrium.

Key words: coal mining industry, objectives, planning, budget.

J.E.L. classification: D24, L71, M11, M41,

1. Introduction

Given that the purpose of any business, and therefore those working in the field of extraction of coal mineral resources, is aimed at maintaining the equilibrium relationship between revenue and expenditure, the management problem facing firms is to find those methods which allow sizing and controlling this type of relationship. For this purpose, a financial previsions document is elaborated, namely the „income and expenditures budget”, which appeared as an „instrument of harmonizing and streamlining the relationship between income and expenses"[1], with which the mines forecast for a certain period of time, usually one year broken down by quarters, income and

financial expenses, thereby ensuring a financial equilibrium relationship.

2. Planning – integral part of the management process

A budget is not something born „out of nothing” each year, it develops in the context of the activity, taking into account *the long term planning process* during which the following stages take place (Fig. 1):

❖ *Objectives’ identification* involve specifying the targets on which future actions should be targeted, their achievement must be measurable, usually expressed in financial terms, such as the expected profit or sales, return on capital employed.

❖ *Identifying potential strategies* that entail identifying possible alternatives of action for achieving objectives. To this end one must consider the following *steps*:

~ an analysis of the environment in which businesses operate;

~ an examination of the resources which require a determination having regard to the specific factors that may contribute to the success or failure of their operations;

~ determination of alternative directions in which the organization could develop.

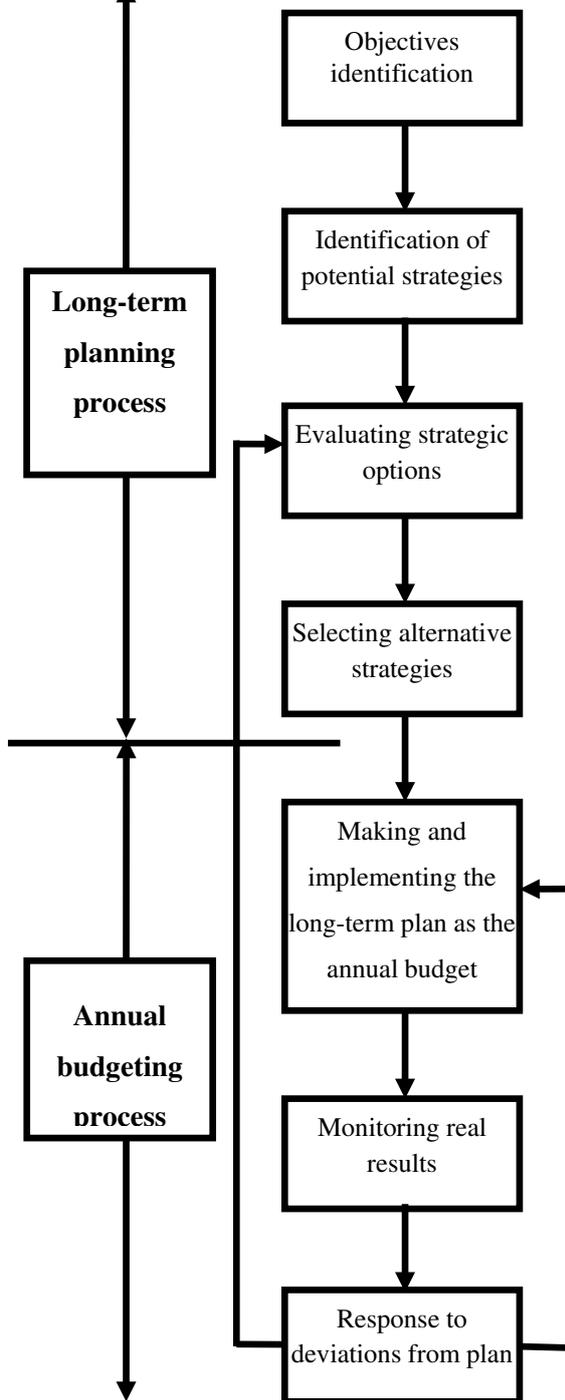

Starting from these steps three *generic strategies* have been identified for the coal mining companies:

✓ *cost-domination strategy* which seeks to achieve this goal by practicing the lowest cost in the range of activity;

✓ *differentiation strategy* involves conferring unique qualities of the product or service provided to the consumer to buy regardless of price;

✓ *concentration strategy* focuses the organization on a particular segment of the market.

Fig. 1 Stages of the planning process

❖ *Evaluation of strategic options* aims at analyzing each type of strategy, given an assessment of the advantages and disadvantages of each, using **differentiation criteria** such as:

➤ *adequacy* that seeks to identify the degree of overlap of the proposed strategies with the situation identified by strategic analysis.

➤ *feasibility* that focuses on checking the extent to which the strategy can be implemented within available resources;

➤ *acceptability* of a particular strategy.

❖ **Selecting a choice of alternative strategies** in boosting strategic objectives proposed by the establishment of long-term plans.

❖ **Making and implementing long term plans** as annual budgets are the first step in the budgeting process and they consider the long-term implementation strategy of the organization in financial terms.

❖ Final stages of the annual budget process: the actual **performance monitoring** and **recording deviations from the plan** have to compare results with those planned and not least the commitment of remedies for these deviations.

Given the **planning stages** discussed above we can say that the budget be considered as an integral part of long term planning, he was influenced by the decisions that were made in the past and implications for programs to be realized in subsequent periods .

3. Budgeting production costs

Most programs and projects are developed and controlled on a budget that can be defined as the quantitative expression of an action plan proposed by management to support a specified period and to coordinate the necessary actions to implement that plan. [2] In this sense, the budget is a forecast figure of objectives and / or the means to achieve them. Given the fact that the need for budgeting is the need to obtain the performance required in a competitive economy that has limited resources available, **the budget** may be defined as a voluntary action plan and an instrument of coordination among the various entities of economic organizations (divisions, departments, activities) to achieve strategic objectives. [3]

Thus, we can say that in any economic unit and implicitly in the coal mines budget is an organizational plan in terms of money short-term forecasts that make the entity on

the income and expenses to be recorded in concert with the strategic objectives pursued.

In the coal mining companies **budget** has the following **functions**:

- to assist in planning operations for the company's strategic objectives;
- to coordinate and ensure the harmony between the activities of different organizational subunits;
- to communicate plans of managers at higher levels to lower compartments' managers;
- to encourage managers to achieve proposed goals;
- to review the current activities;
- to evaluate managerial performances.

In detail, **the characteristics of the six functions of budgeting** are as follow:

Planning - we pointed out that fundamental decisions about planning are taken, usually under long-term planning and development process itself, the budget takes into account the implementation of these plans. Budgeting process ensures that on the one hand, mining managers plan future operations, and on the other hand, taking into account the specific conditions and potential changes, they have to find ways to counteract the adverse situations and to capitalize on the positive ones. Viewed from this perspective, budgeting has to encourage managers to anticipate problems before they arise, thus minimizing the risk of hasty decisions based on opportunity rather than a reasonable rationale.

Coordination – envisages bringing together and arranging a joint plan of action of various parts of the mine. In the absence of a centralized aggregate, individual managers can make decisions, potential divergence of general plans for the facility, and in this the budgeting process aims to precisely reconcile these differences appeared ,having as objective the good of the organization as a whole rather than the benefit each individual field.

Communication – involves all components of business information on mining plans, policies and constraints to which the organization must comply. Budgeting process ensures that senior management communicated its expectations to lower levels, in a way for all members of the organization to understand these expectations and to coordinate their activities

in order to achieve them.

Manager stimulation – is based on knowing precisely the objectives of all heads of mining of departments, through their active participation in preparing the budget. If the budget is required by management to a higher echelon and are more a threat than an opportunity to contest and resist its implementation this can cause negative effects on staff morale.

Control – entails identifying deviations from plan by comparing actual results with budgeted amounts, and by managers to identify the disturbing factors to trigger corrective actions to remedy the situation.

Evaluating management performances is often done by comparing the results obtained with the progress of the budget, the manager being able to evaluate its own performances.

A coherent budgetary system has at its basis some **elaboration and functioning principles**, namely [4]:

❖ **totality principle** which considers the coverage of the company's activities in coordination to ensure a balance between the various functional and operational services;

❖ **superposition principle** of the budgetary system with the authority system in the enterprise;

❖ **solidarity maintaining principle** between departments and of **concordance** with the general policy of the enterprise;

❖ **principle of suppleness** in an increasingly constrained socio-economic environment;

❖ **principle of coupling with the personnel policies** to find a motivation of staff in line with the aimed strategic objectives.

Business budgets in the specialized literature are **classified according to several criteria**:

1. Coverage criterion under which budgets are divided into:

~ *general budgets* that consider the fundamental objectives of an enterprise even if it is within the scope of coal extraction;

~ *Partial budgets* to provide for the development of sub-objectives arising from its fundamental objectives.

2. Budgetary responsibility criterion establishes:

- ~ budgets prepared by departments and management positions;
- ~ budgets elaborated on products, projects or activities.

3. Periodical elaboration of the budget criterion provides their division into:

- ~ periodic budgets which take into account a certain period of time: year, quarter, month;
- ~ *continuous budgets* which provide a continuous supplement of the regular budget before the expiry of fixed periods.

4. Criterion of adaptability to changes in exploitation activity divided into:

- ~ *static budgets* which include usually revenues and expenses at a single level of activity considered as unaltered;
- ~ *flexible budgets* which have in view calculating revenues and expenditures based on actual production levels achieved during the budgeted period.[5]

5. Criterion of budget importance according to which we have:

- ~ *Basic budgets* developed as a rule for the production which forms the basic object of production for the enterprise;
- ~ *Resulting budgets* whose elaboration starts from the basic budget and has in view the supply budget, treasury budget, investment budget, etc..;
- ~ *Master budget* which considers the coverage of a single budget for all budgets and industries developed in three parts: [6]
 - * regular budgets which include sales budgets and marketing activity, production budget, the budget for supply / consumption of raw materials, human resources budget, general consumption budget on production, general and administrative expenses budget and investment budget;
 - * provisioned account;
 - * provisioned balance.

Treasury budget is added to all this, he is a resultant himself of all other budgets.

For the beginning of the year, the procedures for drafting and approving the budget to be completed, making its operations usually start in August - September of the current year for the next year.

For enterprises operating in the coal mining area, the **budget formulation process** involves a cycle can be broken down into several stages and begins with the identification of overall business objectives and long-term projections.

As a step prior to actual preparation of the budget it is envisaged in anticipation of future events that must take into account the forecast of a large number of factors (sales volume - which is also the main forecast on which are based future projections, the size prices, wages and stock of raw materials, inflation, cost of services provided by third parties, overheads, etc.).

The personnel responsible for budgets should consider the following requirements [7]:

✓ To work in *harmony and adopt a practical vision* during development, which involves a realistic assessment of income and productive capacity utilization, the direct and indirect costs, liquidity, etc.

✓ Establish *achievable goals*, not provide indicators for a budget which are unfeasible as it may be rejected by staff involved in its execution.

✓ *Limited resources are distributed according to need*, production, investment, research, marketing, etc. - which requires discussion, negotiation and acceptance of compromises.

✓ To know that there is *a close link between continuous budgets*, they condition each other. If a budget is influenced by a single factor, the effect spreads its influence on other continuous budgets.

✓ *To participate in the discussion to establish goals and objectives* of the strategy formulation required by all interested persons.

✓ *The need to develop program budgets* that the early period in the overall budget can be implemented. Advance preparation of budgets is one of the essential conditions of an effective budgeting.

✓ To take into account the changes that may occur in which assumptions regarding the basis for drawing up budgets. This

requires the development of *flexible budgets* that can be revised according to changes in business environment.

✓ Establish staff *responsibilities* for implementation of each budget, known as technical control responsibilities. Persons responsible for implementation of the budget are required to keep expenditure within the budget, explaining the causes of their overcoming.

✓ *To track* periodically (monthly) the *execution* manner of budgets.

In specialized literature, a key condition for **budget preparation** is considered to be the human factor, is aimed mainly at the following *aspects*:

➤ **Compliance** of purposes aimed at agreeing individual and group interests with those of the mining company;

➤ **Participation** which supposes the involvement of directors in both the development budget as well as budget control;

➤ **Motivation** envisages encouraging initiative and responsibility and not exercising pressure on the control performance assessment;

➤ **Defining clear objectives** aimed at tracing tasks, so that the objectives of the operation should coincide with individual goals;

➤ **Communication** involves the transmission of accurate and timely information between all hierarchical levels of the enterprise. If the control system is accepted by those who need to realize it, they will impede the flow in information, so that programming decisions will be difficult to take control.

Another key factor in achieving workable and interconnected budgets in accordance with the objectives of the mining company is budget coordination and communication between functions. After testing several versions in the budget, will choose the most feasible and practical form, which corresponds most business objectives are drafted so that the overall budget will be submitted to the general manager. Following approval of the final form, the budget is required for each responsible in each program budget and will indicate the level of activity and expenditure.

With the approval of the master budget, **monitoring and control** becomes part of the job of the manager, and aims to compare the actual situation with the situation expected, and forecasts respectively the long-term objectives of the coal company. Thus, we can say that budgetary control is designed to identify and explain deviations from the budget. It is therefore responsible for the budget of each attribute, because every time when the level of achievement is known it must be seen by the budget allocated for this purpose, which allow for comparisons and decisions on actions to be undertaken in the future. Tracking the budget is made constantly and nonpunctual by comparing each chapter of the budget with the current achievements, following the development, in principle, of the methodology used in the development activity.

Actual results should allow all those who contribute to the preparation of the budget (not just the management company) to design their own future actions to achieve the budget extent developed in the previous period, given that the information provided consistently allow for advanced forecasts.

Some Considerations on the Liberalization of Maritime Cabotage within the Context of EU Integration

Pandele Adina Laura

„Ovidius” University of Constanta, Faculty of Law and Administrative Sciences

adinapandele@yahoo.com

Abstract

The maritime transport activity is extremely important to the European Union, taking into consideration its particular contribution to the development of international trade, employment, economic independence and its effects on industrial development (shipbuilding, port activities etc.).

Key words: maritime transport, liberalization, nationality

J.E.L.classification: K 10

The special role and importance of maritime transport activities for the European Union has been materialized in the development of several regulations aimed at ensuring the free access to the common market in this area. At Community level, maritime cabotage, respectively the transportation service between European ports, is seen as a natural consequence of the freedom to provide services in this area and as an optimal alternative to road and air transport.

Although "maritime transport is liberal by its nature and purpose, being based on an extensive and modern international coding"[1], liberalization has become certain after January 1st, 1993, when the transports made between Member States and those involving transit through a Member State have benefited of free services.

The issue of abolishing the restrictions related to the provision of transport services between Member States, so that the internal market comprises an area for the free movement of goods, persons, services and capital, has been raised at the Community level since 1992. Taking as its starting point the need to ensure the freedom of maritime transport services between Member States

and that the Community ship-owners operating vessels registered in a Member State will benefit from this liberalization, it has been decided to adopt, at Community level, several provisions in order to regulate this issue.

Thus, on December 7th, 1992, the EEC Regulation implementing the principle of free movement of maritime transport services within Member States [2] was adopted, and it entered into force on January 1st, 1993; starting from this date, it has been mandatorily implemented within the Member States of the European Union.

The adoption of this Regulation and the intervention of the European Commission in order to improve the maritime transport conditions is likely to ensure the safety, the maintenance of open markets and the increased competitiveness in this area, which is repeated in the three priorities in the development of maritime policies [3].

According to the provisions of this Regulation, shipping services within Member States, or, in other words, maritime cabotage services, represent the services normally provided for a remuneration which include the continental cabotage (the transport of passengers or goods by sea between two ports situated on the mainland or on the main territory of one and the same Member State without stopovers on islands); off-shore supply services (transportation of passengers or goods by sea between any port in a Member State and establishments or structures located on the continental shelf of a Member State); island cabotage (transportation of passengers or goods by sea between ports situated on the mainland and on one or more islands of the same Member State or between ports situated on the islands of the same Member State)[4].

In Romania, the issue of measures taken in order to ensure maritime cabotage liberalization was raised together with the

transposition of the community legal acts for the accession to the European Union.

Most problems have been identified in the existing legislation. The provisions governing the maritime transport since 1997 and the adoption of the Government Ordinance on civilian navigation nr.42/1997 [5] did not comply with the community rules in this area, although they have been often amended and supplemented.

It is therefore obvious that we need a law which would serve not only to cover the situations which are not regulated by the existing provisions, but which would also ensure the legal frame for a safe development of maritime transport activities.

The requirements imposed by the EU accession, the recommendations of the European experts and the entry into force upon the accession of Romania of the Regulation implementing the principle of free movement of maritime transport services within Member States, Regulation with a direct and mandatory application - all these led to a reconsideration of the existing legislation. This is because the homogenization of legislation seems to be the only solution in order to eliminate the drawbacks posed by the diversity of national legislations and thus to provide the necessary legal framework for maritime transport development. Only a uniform Community legislation can restore into the minds of the participants at the maritime transport activity the confidence that they will always be under the same laws everywhere and at anytime. For this purpose, the Government Emergency Ordinance no. 74/2006 [6] was adopted, and it modified the original title of the normative act in "Ordinance on maritime and inland waterways transport" and certain provisions considered inadequate to the accession process were also amended. This bill was approved with amendments by Law no. 290/2007 [7].

The main amendments concerned the liberalization of maritime cabotage, among other things, because once joining the European Union, the regulation become compulsory to Romania too. Therefore, all provisions of national laws that were contrary to the process of accession had to be abolished.

Thus, according to article 1, paragraph 1 of the Regulation, the freedom to provide maritime transport services within a Member State shall apply to Community shipowners operating vessels registered in a Member State and flying the flag of that Member State; these vessels shall fulfill all the conditions for carrying out the cabotage in that Member State.

The status of Community Shipowner may be reached by any citizen of a Member State established in a Member State or outside the community, and who is engaged in maritime transport activities, in a shipping company established in a Member State or outside the community, when the vessels are registered in a Member State and they are flying the flag of that State[8].

The legislative changes related to the granting of the Romanian nationality to vessels represent a first step in respecting the principle of freedom to provide maritime transport services.

The caselaw reveals that "the nationality of floating vessels is determined by the flag they are flying, and the headquarters or residence are determined in connection to the port they depend upon and they are registered into, a principle that is accepted in international law and undeniable by the positive legislations"[9].

Regarding the conditions under which a ship can obtain the Romanian nationality, we note that through the last legislative measures, they were extended in order to ensure the compliance with the principle of free movement of maritime transport services. If prior to the changes, the right to fly the Romanian flag could be granted only to vessels owned by Romanian natural or legal persons or even by foreign persons with their domicile or branch in Romania, now this right can be granted to vessels belonging to natural or legal persons who have the citizenship, respectively the headquarters located in a Member State of the European Union or belonging to the European Economic Area.

Thus, in accordance with article 44, paragraph 2 of the Government Ordinance nr. 42/1997, republished, vessels have the nationality of the State in which they were registered and whose flag they are entitled to fly. From the text of the law it results that, in order to be granted the Romanian nationality,

two conditions must be met: to be registered in Romania; to be granted the right to fly the Romanian flag.

Regarding the first condition, it is mandatory to register the ships in certain registers, depending on the category they belong to.

The second requirement is related to obtaining the right to fly the Romanian flag. This right is granted on behalf of the Government by the Ministry of Transport exercising the authority in the field of naval transport by the Romanian Naval Authority.

In all cases it must be proven that the vessels are compliant [10] with the domestic and international provisions on the compliance with the technical requirements established for the construction of ships. The fulfillment of this compliance condition is to be proved under the appropriate Act issued by the competent authority.

The regulation allows Member States to conclude public services agreements with the community owners for the provision of transport services characterized by continuity and regularity, practiced under previously established conditions and prices [11]. In cases of serious disruption [12] of the domestic transport market caused by the liberalization of cabotage activities, Member States will ask the Commission to adopt safeguard measures. Thus, at the request of a Member State, the European Commission may take measures which may involve the temporary exclusion of the respective area covered by the Regulation. The exclusion of the area under regulation can not exceed 12 months.

In emergency cases, Member States may unilaterally adopt the appropriate interim measures that can remain in force for no more than three months. The Commission will be notified immediately and it shall confirm or repeal the respective measures pending a final decision (Art. 5).

Also, we must emphasize the legislative changes made regarding the crew. Freedom to provide services defined as "the right to provide services to individuals or companies resident on the territory of other Member States" [13] authorizes any citizen to exercise their activities freely throughout the Community. In maritime transport, however, there are specific Community provisions governing this freedom. According to article

8 of the Regulation, a person who provides a maritime transport service may, for that purpose, temporarily exercise his or her activity in the Member States where the service is provided under the same conditions as those imposed by that State on its own citizens.

Initially, in its republished form, the Government Ordinance nr.42/1997 stated that "the Romanian sailing crew consists of all persons of Romanian citizenship who possess a licence or a capacity certificate obtained in accordance with the legal provisions which entitles them to meet shipboard functions". As a novelty, the Government Emergency Ordinance nr.74/2006 extended the sphere of the Romanian sailing crew, in the sense that it can be composed of persons of any citizenship, compared with the old regulations that provided that this option was granted only to Romanian citizens.

At the Community level, the liberalization of cabotage has also implied the adoption of measures related to policy regarding the competition in order to prevent unfair tax practices, the standardization of the traffic of dangerous goods and the improvement of working conditions.

Also, the re-launching of river and maritime transport on short distances by improving port services and the connections to other means of transport in trans-European networks, the adoption of new regulations on maritime security, of minimal social rules and of a European system of maritime traffic management is one of the objectives of the European Union.

Instead of conclusions

The issue of cabotage liberalization between European ports has not been as developed as land transport. For this reason, we believe that the maritime transport on short distances can be a competitive alternative, taking into account the existence of a European network of rivers able to decongest the terrestrial infrastructure [14].

Maritime Insurance. On Damage and Means of Coverage

Pandele Adina Laura

„Ovidius” University of Constanta, Faculty of Law and Administrative Sciences
adinapandele@yahoo.com

Abstract

Maritime transport can not be conceived outside the protection offered by insurers. Maritime insurance offers protection to maritime vessels and their cargoes, contributes to the development of maritime transport and, implicitly, to international trade development.

Key words: maritime transport, particular average, general average, insurance

J.E.L.classification: K 10

Despite the progress registered in shipbuilding, the damage of different types and magnitude, involved in water transport, cannot be ignored.

Starting from the idea of maritime solidarity and risk sharing between the participants to the maritime expedition, the problem of covering such damage can be analyzed in terms of their contribution to the costs incurred by losses.

In this respect, the insurance system against risks of losses and damage encountered within the maritime expedition is extremely important for the promotion and development of modern maritime transport.

The maritime insurance is optional. However, because of the risks present more than anywhere else and because of the great values involved (ship, cargo, freight), virtually there is no maritime expedition outside insurance. The aim of the insurance is to compensate the insured party (the shipowner, the cargo owner) for the losses incurred by the risks at sea.

The question is to know to what extent these losses are borne by the participants in the maritime expedition, and thus by their guarantors, the insurers.

The losses in the maritime transport of goods may be total or partial.

Total losses can be grouped into actual total loss, presumed total loss and total loss by interpretation [1].

"Actual total loss" equals to the total destruction of the insured asset (ship, freight).

"Presumed total loss" refers to the situation where there is no information on the ship for a certain period of time, and it is arisen the presumption that the ship has disappeared as a result of a risk of the sea.

"Total loss by interpretation" is characterized by the fact that the insured object exists and that it could be saved, but the damage is so great that it would require expenditures which would exceed the insured value or when the cost of repairs would exceed the value of the vessel repaired.

In accordance with the general principles of law, the losses are covered by the owner of goods. In the case of insured goods, the insurer will require the insured within the limits agreed within the contract.

Thus, in case of "actual total loss" and "total loss through interpretation", the rule stipulates that the insurant will receive the insurance indemnity from the insurer, leaving the missing vessel to its disposition.

In the event that the insurer has paid the compensation for "total loss by interpretation" and the insured goods (ship) has not disappeared, according to the principle of subrogation, it will follow the arrival of goods at their destination and the collection of the corresponding freight. This is merely a consequence of the fact that the respective loss was not due to a threat against which the freight has been insured. However, in order to avoid these situations, there are inserted appropriate clauses which exclude the right of insurers to make claims in connection to the freight no matter whether the ship is abandoned or not.

In the carriage of goods by sea, besides total losses, damages borne by the property owner and, implicitly, by his/her insurers,

there are also partial losses (damage) caused accidentally or intentionally. Damages are divided into particular average, caused accidentally and borne directly by the owner or by the party interested in keeping the affected goods, and general average, intentional losses, borne by the beneficiary parties, in proportion with the values at risk.

Typically, the term "damage" means a material damage or the degradation of something, regardless of its nature, consisting in its total or partial loss. In maritime law, the term "damage" has a broader meaning and includes not only the damage that may be suffered during transport by the ship and/or goods, but also the expenses which will be borne by the participants in the sacrifice made.

In common law, in the implementation of the *res perit domino* principle, loss or damage are and remain under the risk and responsibility of the owner or insurer. This is also the situation of particular average, where the losses caused independently of the human will are borne by the owner of the goods or, if the goods are insured, by the insurer.

In CASCO type ship insurances, particular average is covered by insurers if the insurance was concluded on condition of "total loss, damages and liability for collision", this being the most comprehensive and, at the same time, the most expensive insurance condition. In case of cargo damage, the cargo should have been insured under type A (all risk) or type B (with partial average) conditions, for the owner to receive compensation.

General average means a partial loss, consisting in the extraordinary sacrifice or expenses made intentionally and reasonably for the common rescue of the ship and cargo from a danger which threatens them in the maritime expedition. Unlike the particular average, where damage occurs without the possibility of prevention, in the case of general average, there is a deliberate sacrifice intended to avoid danger or to limit the damage. The distinction between particular and general average is important especially in terms of contribution to damage bearing. In case of general average, the incurred costs shall be paid proportionately by all those who have benefited from the sacrifice made. The classification of general and particular averages is not limitative and the

classification of facts in one of the categories depends upon the court [2]. The distinction between the two categories of average is important in what concerns the bearing of the costs and it seems unnecessarily to investigate the conditions to be fulfilled as long as the event would fall into one of the situations referred to by the legislature [3]. However, in general, it is considered [4] that a partial loss may be regarded as a general average where there is a great and volunteer sacrifice, with useful results. The extraordinary sacrifice, intentionally made in case of general average, is materialized in the emergency measure for the common interest. The general average results in a loss. The extraordinary nature of the act of sacrifice is assessed not in relation to the magnitude of the damage, but compared to its cause. The general average always answers to the idea of necessity reported to the common interest, namely to the intention of avoiding a greater danger.

In the Romanian Commercial Code, the general average is defined in article 655 as "expenses incurred and damages suffered voluntarily for the common good and deliverance of the vessel and burden". Also, there are listed the things, the expenses and the fact that may represent general averages, some of them being found in the modern regulation on general average.

The acknowledgement of the general average act is translated into sharing the loss. The general average basic principle, known by the trade since ancient times, is that a person whose property is sacrificed for the general benefit must recover the loss by the contribution of those who had benefited from the sacrifice made. The contribution to general damage follows therefore the sacrifice and the extraordinary expenditure incurred for the common rescue of the interests of those engaged within the maritime expedition and it is directly related to the compensation to which it gives birth [5].

Regarding the contribution to general average, article 659, paragraph 2 of the Commercial Code provides that it shall be divided proportionately between the load (cargo) and half of the ship and freight value. The load saved contributes to the general average with the value it has in the port of destination (article 667 of the Commercial

Code) and the ship – with the value it has in the port of destination or with the price to which it could be sold (article 666 paragraph 1 of the Commercial Code).

Regarding the freight due in case of general average, the Romanian Commercial Code provides in article 586 that the shipowner has the right to the freight even for the sacrificed goods, but he/she contributes to the general average. The right to the freight could be lost solely for the purposes of article 587 of the Commercial Code, i.e. for "things lost by shipwreck, kidnapped by pirates or taken by enemies", in the absence of a contrary agreement.

In order to avoid the loss of the freight, an exoneration clause is usually inserted within charter party, for instance: "the freight is earned even if the vessel and/or cargo are lost or not". The effect of this clause is that the shipowner will not contribute with the freight thus earned in case of general average, because the freight was earned before the act of sacrifice, it is not at risk; therefore, it can not be included in the community of interests [6]. In this sense, article 666, paragraph 2 of the Commercial Code provides that "the freight which, by the convention shown in article 587, is earned even in the case of the loss of the loaded goods is not subject to contribution". Also, the freight earned by these means is not included in the value of the goods for which the shipowner contributes with the ship (article 667 of the Commercial Code).

The provisions relating to the general average which are listed in the Romanian Commercial Code do not apply if the parties have expressly provided for the applicability of other rules. The solution results from article 654 paragraph 4 of the Commercial Code which states that "in the absence of a special agreement between the parties, damages are governed by the following provisions".

The general average was subject to various commercial codes, which led to the existence of differences, even if not essential, between the laws of various states. Regulatory differences have led to conflicts of laws largely solved by unifying the rules on the general average. Within the maritime transport, the *York-Anvers Rules* are usually applied (these rules have their origin in Glasgow Resolutions, in 1860, later modified

and brought together under the name of *York-Anvers Rules*, supplemented and amended thereafter) [7].

York-Anvers Rules, included most of the time in charter party and bills of lading, include a set of rules governing the conditions and principles of the general average and the costs incurred in case of general average.

Only the damages, losses or expenses that are a direct consequence of the general average act are admitted into the category of general averages, on the basis of *York-Anvers Rules*. In order to cover the damages resulting from general average, the party which has suffered the loss is entitled to a contribution from the other interested parties. Those interested parties which, within the general average, benefit from the contribution of other partners are: the shipowner, for the value of the saved vessel or freight set out in the charter party or in the bill of lading; the owner of the goods for the value of the goods saved; the charterer under the *time charter* contract, for the freight set out in the bill of lading. The interested parties will contribute to the general average proportionally with the amount of the interest saved (ship, cargo or freight).

Usually, the contribution to general average is determined in the unloading port by fulfilling several formalities known as General Average Regulations, established by a specialist in the field, on the basis of the eloquent documentation (bills of lading, manifests, invoices etc.), which will establish the amounts to be allowed within the general average, and the contribution of the parties in order to cover these expenses.

The York-Anvers Rules are applicable in the establishment and liquidation of the general average only if they are included in the charter party or in the bill of lading. Otherwise, the General Average Regulations will be drafted in accordance with the laws of the port of discharge or of the port where the maritime expedition ended. "In the absence of a special agreement between the parties, damages are governed by the following provisions (article 654 of the Commercial Code, paragraph 4).

If the Romanian law is applicable, the procedure will be conducted in accordance with the provisions of the Romanian

Commercial Code and the Government Ordinance no.42/1997 [8].

These regulations establish the obligation of the vessel commander to prepare a detailed written report on any important event happened on the ship's voyage. This report will be submitted to the competent port authority. Also, copies of this report will be sent to the interested persons (shipowners, insurers, experts in General Average Regulations).

Extraordinary expenditures made in connection to the general average are generally covered by insurers. Given the values involved in a maritime expedition (ship, cargo, freight), it is hard to imagine that it would take place without the protection offered by insurers. This is why, in practice, all procedures are perfected between the insurers.

In vessels insurance, the possibility of covering these expenses by insurers depends on the condition on which the insurance has been concluded. The expenses with general average are usually covered by policies concluded under "total loss, damages and liability for collisions" and "total loss, general average and liability for the collision".

In the insurance of goods, if the general average clause was inserted within the policy, this means that the damage to the goods included within the general average and the costs incurred by rescue shall be paid by insurers under the General Average Regulations, drew up in accordance with the legislation of the port of destination or in accordance the *York-Anvers Rules*. Also, in case of general average, the recipient of goods is required to sign a document called average bond drew up by the shipowner. For greater certainty, the shipowner may request a guarantee from a bank or insurer for the payment of the contribution. In this respect, a document is drawn up for the establishment of a *deposit receipt* in a bank, which will serve as a guarantee for the payments in the compensation account within the respective general average. After the establishment of the contribution to the general average by means of General Average Regulations, the insurer will reimburse the insured the general average deposit, according to the insured interest [9].

Abstract

The word "brand" is designated to be a name, term, symbol, or a combination of them all, in order to identify goods and services of a vendor or group of sellers and bring a difference in their their goods and services from the competitors. The present study is based on a laborious documentation, but of high interest, made at Orange Romania, the largest mobile operator in Romania, in order to identify all elements supporting this concepts' brand image, values and beliefs. We appreciate that supports the development of the company brand image, its good performance and customer relations.

Key words: brand, brand image, brand promotion, crisis.

J.E.L. classification: M37, M21.

1. Introduction

The *brand*, in essence, is an extremely complex, a distinctive sign used to distinguish a company to identify products and services identical or similar to those of other organizations.

The current status of this research highlights the various ways of expressing the significance of the brand. According to The American Marketing Association, the word "brand" is designated to be a name, term, symbol, or a combination of them all, in order to identify goods and services of a vendor or group of sellers and bring a difference in their their goods and services from the competitors. "

There are specialists [4] who consider the brand to be a symbol that gives customers a certain perception or positioning. The perception of the brand is suggested to the customers to enable a certain value or positioning of the intended product into their minds. A strong brand manages to present the best product value.

The brand is a name and / or a distinctive symbol that is intended to identify products or services as belonging to the producer or the producer group and to differential those goods or services from the competition's [1]. Other authors attribute to this word a very special meaning, which remains in the mind of the consumer [9].

One attribute of brand which ensures business success is simple: "*Brand Simple ideas lead to a strong branding and memorable, that people can relate with, immediately*" [2]. The most powerful generators of success in branding ideas are those that have common attribute simplicity [3].

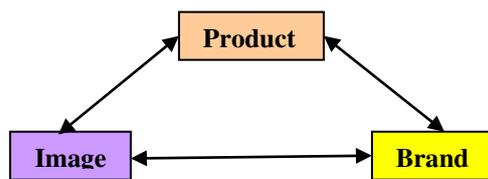

Other concepts designate *the brand* as "an interaction between mental processes about goods and forms and their images about goods that changes consumer's behavior" [6].

Brand have three primary functions: navigation (brands helps consumers choose from a bewildering array of choices) , reassurance (brands communicate the intrinsic quality of the product or service and reassure customers that they have made the right choice) and engagement (brands use distinctive imagery, language, and associations to encourage customers to identify with the brand) [11]

2. The relation between product/brand/company image

There is established between product, brand and image an inter-relationship and interdependence one. This relationship can be seen in figure below (Figure 1).

Figura 1: The relation between the brand/product/company image

Source: product by the authors

The image requires a mental representation of an object, which, given the businessmen area, may be a product, a service, an enterprise or other organization. It is the projection of attitudes, opinions or prejudices of any given person or group of persons towards an organization.

„A brand is not a corporate identity system. A brand is not a product. A brand is a person's gut feeling about a product, service, or company because in the end the brand is defined by individuals, not by companies, markets, or the so-called general public" [7].

The brand image is not only the representation of an object or an attitude, but is also a multitude of values and beliefs perceived inside this expression. The image representation, the brand image, the brand value of a product, service or business are the result of marketing policies related to the management style of the head of the organization, but also the combined effort of professionals and employees. Once the image was formed in the public mind, the product's brand name will automatically suggest the designated product image.

Modern business practice and performance of developed countries shows that good results in their market relations is due to a significant extent, formation of an image and a compelling brand image. Therefore, one of the most difficult tasks of

marketers is to create, launch, protect and maintain the brand image.

In order to find that creative solution, that unique combination of image and text to sum up and express the essence of the values and principles which underlie its existence, the organization can choose one of the following models of branding [5]: culture branding, mindshare branding, emotional branding and viral branding.

To formulate a clear picture of how the organization is perceived by the receptors of its unique speech, Olins [8] proposes the research of three aspects of the organizational life which he considered to be essential: the area or sector in which activates the organization, the organization and its characteristics and brands, businesses and divisions.

The Upshaw author [10] elaborates the main points of a strategy that focuses most on external identity:

- Evaluating the Brand Reality;
- The uniqueness of the Consumer;
- Prompting the Power Positioning;
- Humanizing the Identity;
- Managing Identity Contacts in the Real World;
- Analyzing those Brands that Succeeded and Failed at Building Strong Identities;
- Gauging what Lies Ahead in Interactive Marketing;
- Minding the Brand Identity.

There are the Romanian market two major categories of brands. There are *symbolic brands*, with strong personality and wide recognition, and *sign brands*, which enjoys a high reputation, but without much substance. In the second category, one can integrate high recognition brands, especially the generics, Adidas, Xerox - as well as national sign-brands - Dacia, Tarom, Mamaia. Everybody has heard of these last ones, but nobody could pinpoint exactly on their essence.

3. Orange brand worldwide

The present study is based on a laborious documentation, but of high interest, made at Orange Romania, the largest mobile operator in Romania, in order to identify all elements supporting this concepts' brand image, values and beliefs.

Orange history begins in 1992 when a new mobile operator, called Microtel Communications, appeared on the British market

[12]. Microtel wanted to create the most personal telecommunications brand in the world, honest and open in dealing with people. He has taken into account many brand names such as: Red, Amber, pecans, Yellow, Miro, and of course Orange.

"Orange" was the name that would fit best with his business ideas, as it had connotations for fun, optimism, and freedom, full of life. Market research showed that people believed this name distinctive and friendly, extrovert, modern and strong. The logo was a simple one, reducing the association with the fruit and supporting the brand purpose, to be direct and honest: a square orange, "orange" being written in small white letters. The company also launched the brand slogan: *"The future's bright, the future's Orange"*. The campaign deliberately avoided the pictures with mobile phones, in order to show that Orange is based on communication and supports consumer benefits. The advertise was focusing on the following promise: *"People will find it hard to believe in future, that voices have ever traveled through the wires. We will not change what you say, but how you say it."*

Orange has built from the very start a strong identity, fresh and clear, to differentiate itself from competition. He defied convention and was prepared to support what he believed in. Orange put customer needs first, introducing simple services, innovative and of high value. He was and still is a leader, not a follower.

When Orange entered the Romanian market, it reinvented an already on market company, namely Mobil Rom, together with its brands, Dialog and Alo, putting them all together. Orange brand was based on an already strong marketing company with a large number of customers.

Another thing that lightened the Dialog image is that it was perceived as a company close to people. Dialogue brought to market a new concept, the "customer oriented", which brings a new attitude and an extra benefit to customers. The line color - orange and blue – are intended to symbolize, on the one hand, sincerity, aspiration, technology, and on the other hand, creativity, human warmth, communication. The name had to have - in addition to any trade, the necessary attributes: simplicity and unique sounding - a strong connection with nature as the service,

in this case Dialog was the best synonym for "communication."

For five years after its launch in 1997 until the rebranding in April 2002, Dialog was almost always the market leader in Romania, trying to design in the consumer's mind a fresh image, a clear perspective on history that they wrote together.

Dialogue Image was supported by the following promotional campaigns:

- The Campaign Gift Dialogue (2000-2001) was an action designed to ensure as close to real people;
- Clock Dialog Campaign to introduce the method of charging per second. This campaign has been nominated Ad 'Or festival in the "Best Campaign for telecommunications services";
- Free Dialogue campaign. The slogan was *"By using Free Dialogue, one can become a night bird"*, and the campaign had a surprising personal touch. A rooster howling at the moon and then a wolf singing like a rooster became the symbol of Free Dialog subscription;
- Flight image campaign speaks primarily about the fact that Dialog means to learn.

All these campaigns have revealed the same thing: Dialogue communication was a more relaxed and free Company, in which everyone presented their views.

Many campaigns have defined the brand image through a clever approach, challenging and full of non-conformism. Such dialogue has won most of the GSM market in Romania and simultaneously launched the latest trends in style approach relationship with the consumer. All these have been the effect of a strategy whose main goal was to anticipate and respond promptly to customer requirements, the slogan being revealing: *"Dialogue makes it possible!"*

4. Orange brand promotion in Romania

Orange was launched in Romania with a performance which speaks of internationality of this brand, carrying a simple message: Orange respects differences between people and knows that people will always communicate to each other, and not with designated places.

Orange continuous challenge is to maintain a clear brand identity, according to the permanent renewal of how these attributes are transmitted. It always chooses association with important

events, "worthy" of brand reputation or establishes its own events. Orange has always involved itself in supporting people with disabilities in communication, education, social, in the environmental conservation by volunteering in disaster mitigation. It aims to support development sustainable society and the favorable trends of the mark in the minds of consumers.

The Orange image can be best defined by the company's statement: "Orange is what we are and what we do, every day." Its creativity, courage, dynamism, openness, attention to detail and consistency are what it defines the brand. Orange means a change in the development patterns and continues to provide quality service, innovation and transparency. The Orange Brand and Orange Romania will outline each clearer day which means this universe and the benefits it brings

5. Conclusions

The current research was based on all documents examined and the information collected within the organization Orange Romania, and was the subject of our study that supports the development of the company brand image, its good performance and customer relations. We appreciate the positive elements of corporate activity and the economic performance and impact on brand image are the following ones:

- Inside the company, all views are heard, however different they may be;
- on internal audit, the company always checks whether managed to meet its obligations;
Orange build business relationships based on trust, honesty and openness - relationships in which all parties benefit. It encouraged the application of ethical principles in all business relationships it establishes;
- Any employee or associate benefits of fairness and safety. There is a working environment where mutual respect is cultivated, involvement and trust. Employees are encouraged to continually develop, both professionally and personally;
the client is always first, taking advantage of quality and value;

- Orange supplier relationships are based on honesty, openness and transparency. Orange is a global brand that adapts to the specific part of each local community. By its actions, Orange is trying to contribute to the welfare of the community in which they operate;
- the company always tries to understand, control and minimize the negative impact that its work could have on the environment - globally, nationally or locally;
- it considers that the existence of the company depends on its ability to achieve financial targets and build long-term success;
- Orange image by outlining the promotion is a new opportunity to develop, strengthen its brand image and values. All campaigns and promotions focuses on communication and it has been continuously proved that the Orange brand is an open, surprisingly, simple, dynamic and honest one.

Orange, the European mobile company, is among the great brands that leads this movement to the point of leaving its telecommunication competition flatfooted in the last century. [13] Even though Orange delivers a tangible mobile service, its message has always wandered away from the product. Loaded with emotion, Orange's brand message is actually all about life. Unlike any other in its industry, Orange has become a brand with a beating heart, a brand that lives.

Impact of Economic Crisis on Business to the Franchise System in Romania

Parpandel Denisa Elena

Ganescu Cristina

Codreanu Diana Elena

"Constantin Brancoveanu" University of Pitesti

parpandeldenisa@yahoo.com

Abstract

Given the national context, but also international economic crisis, businesses are seeking the highest returns.

Why would a business franchise win a bet? Because franchising is the most dynamic and powerful method practiced for business development and economic opportunity and the franchisee has the opportunity to become its own franchise architect of the scheme and detailed plan of procedures.

Franchising remains a good recipe for business and crisis. What have changed because of economic difficulties are preferences Romanian entrepreneurs in this field. Thus, if two years before they were attracted to foreign brands, "business is now looking for not much money out of pocket and be easy to operate, that will not last too long before we can open a unit "believes Constantin Anton, president of the Romanian Franchise Association.

Key words: franchising, business, crisis, profit.

J.E.L. classification. M21, M16, E3.

1. Introduction

Romania XXI century, the economic and social point of view, is clearly distinguishable from pre-revolutionary period. Planned economy, centralized economy was replaced by a free market, in which each economic subject can pursue their own interests.

Economic freedom after 1989 was an opportunity for some, while others were disadvantaged by the new rules of market economy.

The range of franchises available on the Romanian market includes a very broad range of offers, both in price and as a field.

Franchise market in Romania has grown sharply, especially on the import franchises. This system broke quickly, and those who turned in time managed to create a safe and profitable business. Companies such as *Coca-Cola, McDonald's, Shell, Marriott, and Hilton* managed to build successful systems on the Romanian market. Failure rate of these companies is almost nil, and all partners enjoy the advantages of the beneficiaries. (2)

In parallel with the entry of international brands in Romania, local entrepreneurs have created successful brands. Some of them have already extended the franchise, and others have announced their intention to create a franchise network. *Angst, Ambassador Plus, Cris Tim, Cubics, Computer Warehouse, Elvila, donut angry, Tina R, Day, Rodipet, International Leasing, Parallel 45, Romstal Optinova, Vinexpert, Twister* Romanian brands that are expanding nationally through franchising. The big advantage is the price of local franchises, much lower compared to offers of international companies. (1)

The high demand on the Romanian market is now in the fast-food franchises. Are not neglected the real estate industry, advertising, fashion or cosmetics.

2. Impact of economic crisis on business to the franchise system in Romania

Romanian businessmen have been targeted mainly to business ideas that cost less than \$ 10.000. Most applications were registered among fast-food franchises, followed by

those in the services area, in third place topping retail franchises.

Among the most popular and developed over 2010 Romanian franchises are selling franchise **Romstal** equipment and facilities, the **Millennium Insurance** **Insurance Broker** in the center of recharging **Eco Refill** cartridges for printers and sports betting **GS BET**. To these are added two franchises Spanish beauty and **Cellulite Nomasvello Block**, according to the ARF.

Franchisors who wanted to expand the concept in this period had to draw the attention of anti-crisis measures, such as lower entry fees and concessions on the duration of the contract or terms of payment. They represent almost half the market share of franchises in Romania. (3)

Like any other business, a franchise depends on the sector in which it operates. Thus, the units have worked closed, mostly in areas affected by the crisis.

The adjustments to the strong expansion plans for the current period is cause for growing franchise segment affected by the new economic context, such as banking and financial services, real estate franchises and the construction of local franchises segment fashion retail, etc.. The franchise segment of the local real estate and financial fields has declined 90% from the previous period of economic crisis. At the same time, the fashion retail declined 60%, while the remaining areas had a decrease of 30%.

Given the market developments and requirements for the current period, domestic investors migrate from one area to another activity. A good example is the franchise candidates to financial and banking systems. With the new context of the market, they are turning to insurance brokerage franchises. **Safety Broker**, concept developing domestic franchise operations in the required type policy (non-life), has extended its network of franchisees in 2010.

During the crisis, continued extension of the franchise start-up investment of less than 10,000 euros and the breakeven point in a year. This includes franchises which do not involve a highly developed infrastructure and mature very quickly - the segment of cheap food franchises or franchise services. On the service, to invest in insurance, training, and afterschool programs for children, beauty salons, car washes, dry clothing, etc...

According to statistics, businesses in the franchise segment went better in 2010 than in 2009. Thus, in 2009, companies in this system showed a turnover of 900 million euros, according to statistics ARF, a high level in 2010 to over 1, 2 billion euros. (3)

Fig. no. 1
FRANCHISE MARKET IN ROMANIA

Source: Romanian Franchise Association

"He suffered more franchises this year in real estate, bank loans, very expensive franchises retail area, particularly on clothing and shoes from major brands, as well as luxury restaurants in the area" (Constantin Anton, president of the ARF, in an interview with the Wall Street journal, article "Cheap Franchises fashionable in times of crisis" by Ana Bâtca, November, 2010).

Although in our country, luxury franchises addresses a segment of the population more than 10% of the total, higher income, more than 10,000 euros per month, the business's financial crisis were felt.

"The crisis has hit both the purchasing power of customers and the owners of luxury franchises operating in our country by worsening market conditions." (Adrian Gheorghe, managing director ThinkBig International consulting company specializing in the franchise segment, the story "luxury franchises market crisis, the Wall Street journal)

Among luxury brands that have reduced the number of distribution units are, according to consultants ThinkBig CPC International and Managing Consultants, **Benneton, Escada, Mexx, Versace Jeans Couture, Frank Muller** and **Hugo Boss**. [1]

Increasing importance of private sector financial crisis has allowed the development investments Romanian franchise system; increasingly more investors discover the many opportunities in Romania. At present, we find our market more than 490 franchise networks, followed the next year to

witness resurgence in popularity, with this system, the leading brands in the fast-food, services or retail.

Fig. no. 2
MARKET SHARE OF FOREIGN
FRANCHISES

Source: Romanian Franchise Association

"In 2011, the market is expected to reliance the franchise, which will encourage the resumption of investment in more expensive franchises, such as retail or hospitality services sector," he told 3idei.ro during the event "Days of Biz" Adrian Gheorghe managing director ThinkBig International.

In essence, the franchise offers a business format which, if adhered to and adapted to the national level will be operational.

Specialists in the field believe that increasingly more people are looking for business concepts that will enable them to maintain at least the first years of business, the jobs they have. Start a business involves initial costs, plus an early period in which, until business begins to bring revenue, entrepreneur finds itself forced to support themselves in savings. Thus, business concepts that can be managed remotely, requiring no permanent presence of the owner will become increasingly in demand because people will want to maintain their source of income to shelter while launching their own business. For the same reason, the impact will be businesses that do not require large investments and the sale or advertising business shall be made directly by the firm, without appealing to other companies or not to contribute to advertising funds.

It will grow increasingly more business categories, such as home cleaning services, after-school services, company that organizes events for children and offer them to fitness centers and art centers.

Franchises activity related to object technology will register increases as well. If only a few years ago, having a website of the company seemed more like a fad, it is now imperative, regardless of their field of activity. Thus, web-advertising franchises, but also providing IT support and maintenance of systems and sites will be in high demand. In parallel, firms providing security and searching video surveillance will grow even more, because even the smallest shops, installing anti-theft systems.

Franchisors in America, Turkey, Italy and Bulgaria are beginning to discover the Romanian market, being attracted to areas such as services, tourism, retail and fast food. Currently, Romania is a target investment of more than 10 world famous brands; they join the existing franchise network, number about 490.

Extension of franchise will be as pronounced in the coming years. Our country is a potential magnet for international franchise network.

The Accounting Information: between Handling and Audit Quality

Pașcu Ana-Maria

„Alexandru Ioan Cuza” University of Iasi
pascuanamaria26@gmail.com

Abstract

The entire evolution of human society is based on the permanent amplification of the information ability. The transformation of knowledge into a “treasury” has become possible by the permanent transmission of the information, gathered from one generation to another, in an interrupted chain, for centuries and millenniums.

Accounting discipline guides the economic life to profitable alternatives and, through the financial statements it provides the most important source of information for both the management and for stakeholders. Audit helps to improve the quality of this particular information, verifying and certifying that the given information is consistent with reality, while auditors are true guarantors for the providing of quality accounting information. In the undertaken study, we have attempted to demonstrate the importance of accounting information in the contemporary world, by reading the through history, from its appearance until the need for certification.

Key words: accounting information, stakeholders, true and fair view.

J.E.L. classifications: M41, M42.

1. Introduction

The new potentials brought about by the “information age” lead to the considerable renewal of business development. Within the current context, business performance depends a lot on the only “distinctive resource” of companies, that is information.

According to the author Peter Drucker, the difference between a company and the others is “its ability to use all types of information – from the scientific and technical information to the social, economic and managerial

information” [1].

Clearly, the welfare of the people is conditioned by the environment they grow in. Undoubtedly, the economic environment has a major influence. A condition of development of the economic environment is to improve the business environment which depends on the acceleration of attracting capital. To achieve this goal, it is necessary to involve accounting, as a communication key for the information in relation to stakeholders, knowing that possession of information is essential to substantiate any decision or, in other words, modern management cannot be conceived without the offer of accounting information. In addition, the increasing of the economic efficiency is conditioned, among others, by the proper development of the accounting system, providing quality information and timely, so as to increase the investors confidence, creditors and other users of financial statements.

2. Accounting information, a permanence of history

The origin of the humanity is the information, recognized as the most important resource, only endless but also the hardest to acquire.

Information is a generic element for the process of knowledge and representation of reality, and of the design and communication in inherent for the human action, on the scale of society – in general – and organizations – in particular.

As for the information provided by accounts science, its evolution has seen some outstanding points. In this context, we venture to assert that a particular form of accounting information has occurred when people first learned to count and weigh their fortune. Known works of history, starting with Hammurabi's Code, which occurred four

centuries ago, include accounting notes, but also raise the question of morality and social attitude, problems which, we see further, propagated throughout history until now. Furthermore, Roman law, especially the commercial one, is also considered a milestone in the formation of accounting as a science in itself. According to the authors Lionel Collins and Gerard Valin, since the third century BC, the Romans designated a person to verify information on provincial heritage. By the early thirteenth century, kings, emperors, churches and state institutions demanded writers, to protect property, or punish the culprits for the wealth of information distortion. Going forward the thread of history, "the one who keeps records" become a major figure of the Middle Ages, being named responsible for the art of business and arithmetic [2].

At the end of the fifteenth century, along with Luca Paciolo and his famous work *Summa de arithmetica, geometria, proportioni et proportionalita*, it has become a conceptualized theory for the presentation of accounting information that has been perpetuated and developed until nowadays.

Paciolo was the one who noted, for the first time, the measurable accounting potential to represent, report, and why not, "inventory" business. Proof that he is and remains the "father of science of the accounts" is the fact that, more than half a century after his birth, accounting has come to be recognized as a social good, a resource full of potential for decision, given to his users in a regulated environment, recognized as the accounting information market.

Nineteenth century was marked by business development, leading thus to the development of accounting information. Therefore, it had come the moment when a validation of a reality check reports were necessary (we can assimilate the accounting information contained in financial statements present), in the purpose to avoid fraud and errors.

3. The accurate representation of the accounting information and the morality in business

Once in the twentieth century, accounting information has to be commensurate with

performance criteria. In the years 1940-1970, with the development of international trade and capital markets activity, the amplification of validation activity of the accounting information specific to banks, employers, financial institutions and credit occurs. In essence, it sought certification for the sincerity and regularity of the accounting information. These features have come to be recognized in the same period, under title of accurate picture.

This is the extent to which objective reality is depicted through a complete and relevant information on the facts and economic processes, expressed in monetary standard. It is widely accepted that, from its inception in 1948 in art. 149 of the Companies Act (Company Law in the practice of Anglo-Saxon) and until now, the faithful image remained a characteristic of accounting information, an accounting objective of reporting to users and a decision-making as a requirement for their quality. However, it has not been clearly defined, except that it is a normative concept of sustainability, which protects users from fraud syncope accounting rules and rulers.

In their paper *Droit comptable* from 1993, French professors Alain Viandier and Christian de Lauzainghein say: "For some people, fidelity is nothing but sincerity or even the prevalence of sincerity over rule observance, which makes them wonder about the real utility of assigning a particular name to a concept already belongs to the accounting law. For other people, fidelity is a concept that is characterized by an energy of its own, which allows the statement of rules., On the contrary, for some other people, fidelity is not a genuine concept, which merely has a guiding role. Finally, for there others, fidelity is the simple combination of regularity and sincerity".

The problem of "loyalty" of the provided information, has both concerned, economic entities and stakeholders. As proofs for the statement mentioned above stands, on the one hand, the international accounting referential, declaring, in 2010, a faithful representation as fundamental characteristic of accounting information of general interest, and, on the other hand, the European Directives, which require accurate picture as part of the accounting practices of each country in order to impose rules concerning

professional reasoning rather than accounting automatism [3].

Although controversial, the term of true and fair view on accounting information, has come to have the same meaning resonance worldwide, and it is an evolutionary process. The true and fair view imperative prevails over all the other legal obligations, therefore relying on the current tendency of harmonizing rules, principles and accounting concepts.

However, one should not forget that both history and especially the present have shown that it is not enough to impose the true and fair view from the accounting information and, implicitly, from the issuing economic entities. Constraint by the economic reality and the growingly emphasized presence of "unfair" accounting information, the economic environment has imposed an external and independent validation of the financial reports publicly provided by the accounting field, a validation achieved by audit. Ever since the occurrence of this activity, its goal has been the improved quality of information and the increased degree of its credibility. Therefore, public institutions together with stakeholders have required audit and consultancy professionals to provide an acknowledgement of the true and fair view on accounting information, as well as protection against international fraud by means of this procedure [5].

4. The quality of auditing - necessity of the present

Nowadays, when information is spreading so fast, all entities are linked in a dynamic network of interconnections and, as at any other level more or less, every action affects the actions of others and is itself influenced by them.

Starting from the previously mentioned aspects, the accounting information credibility is reflected in the true and fair view that it creates in relation to the activity of the issuing entity, and the implications of "altered" and "unfair" information are reflected in the quality of its users' decisions. Certainly, the role of the audit is to certify the fact that the information is affected by a small informational risk, which is actually a guarantee, as well as a validation of its quality [4].

Going forward the thread of history one reaches the twenty-first century and the global information society. With this title, the whole world recognized the potential of information and its role in today's world.

Regarding the accounting information, the same twenty-first century has exploited its highly developed manipulation potential. It is therefore no longer a secret to anyone that most scandals and the world economic crisis are based, to a great extent, on big-scale unauthorized maneuvers. Using numerous financial techniques, applied to accounting information, well-known companies have managed to distort reality in relation to their performance and financial position, providing uncertain information regarding the accounting information (non)quality, thus misleading users' outlook, which has raised issues on the deontology of the accounting profession, and especially of the auditor one. This has drawn attention on an outstanding truth: the observance of the law is more important than the law itself.

The current economic world must assume its own evolution. It must adapt to the lack of material resources and understand that the force currently comes from the permanent information flow.

The recognition that accounting information is a social good and that its use in an incorrect form spreads, altering decision making process and leading to adverse situations, if not disastrous, can help to restore „economic order of things", but also to relieve their rights of the accounting profession and auditing.

The answer has partially been found in the new attitude regarding the audit quality. Seen from a certain perspective, this new attitude may throw a negative image on the audit process, on the accounting professional and on the profession as a whole. But one should not forget that the exception invalidates the rule in any field. Therefore, if one needs self-correction, by securing the audit quality, then this is a small price to pay compared to the benefits that accurate and fair information may bring to users' decision-making process. We eventually subscribe to what the great Johan Wolfgang Goethe said centuries ago: accounting figures do not govern the world, but they express how it is governed.

"Constant" of human evolution, the concept of accounting and accounting

information has become vast and has come to be seen in absolutely all areas of human activity. The omnipresence of accounting information in all sectors of economic life of a nation and its defining feature, of commensuration of size and activity of economic entities, have turned it into a good value yet quantifiable. Although recognized as covering only civil law, accounting information dominates our lives and we cannot exclude it.

Appropriateness of accounting to economic reality image is, on the one hand, a consequence of normalization of accounting, and, on the other hand, the intervention of accredited professionals to verify and certify financial statements, namely auditors. It is important that auditors comply with quality requirements.

5. Conclusions

Within the multitude of information currently changing on various markets due to the free movement of capitals, assets, services and people (construed as the four fundamental principles of the "international construction"), the accounting information continues to occupy a privileged position.

The guarantee of this lies into the importance of accounting, which is considered the primary language of communication in the business world. Given that it quantifies, evaluates, processes and, more importantly, provides information about the activities of the economic entities, regardless of size and geographic location, the users' expectations move towards accounting information for supporting their business decisions.

Overall, the needs for accounting information of the users involve looking for new solutions to guarantee its quality, ranging from the harmonization of accounting practices and international procedures, to the certifying this information by the audit. In other words, these requirements and needs in the development of business impose accounting as a language of communication and accounting information, as a mean. They have public good character, whose role requires more than keeping track of transactions, being absolutely indispensable in representing relations between business and stakeholders.

Accounting has become quite a stake for the actors on the accounting information market – producers, standardizes, users – each following their own interests. Under these circumstances, the product that the accounting provides – the accounting information – may only be the result of a compromise between expectations and exigencies.

Human Development in Dobrogea Area – from Crisis to Crises

Patache Laura

“Spiru Haret” University

laura.patache@spiruharet.ro

Abstract

The aim of this paperwork is, on the one hand, to analyze the data represented by the Human Development Index and, on the other hand, to reveals some possible directions followed by human development under the impact of national and international trends. The position held by Romania and the two Dobrogea's counties in the rankings of HDI is highlighted in a comparative perspective for the period 1998–2009. Taking into consideration that Romania ranks among the last European Union members, the paperwork includes some warning signals on the future of human development in the area and some recommendations for improving the current situation.

Key words: human development, Dobrogea, crisis, health, education, standard of living.

J.E.L. classification: I00, R11

1. Introduction

According to Mahbub ul Haq, the pioneer on measuring human development since 1990, the defining difference between the economic growth and the human development schools is that the first focuses exclusively on the expansion of only one choice - income - while the second embraces the enlargement of all human choices - whether economic, social, cultural, or political. [1]

Through a plastic expression, the human development implies: providing those means by which people may enjoy a healthy life and participate actively in taking decisions affecting their lives; a process of enlarging people's choices.

Policies that take account of human development may allow individuals to acquire certain skills that make them feel less vulnerable to everyday life. This new

approach to development – by placing the individual in the spotlight - has emerged as economic development is no longer an end in itself but a means to serve people.

2. Current status of issue

According to Human Development Report 2006, entitled "Beyond scarcity: Power, poverty and the global water crisis" [2], Romania, though, ranked last in the hierarchy of EU countries in terms of human development has exceeded the threshold value of 0.800 at the Human Development Index (HDI) progresses through all three of its basic components: longevity (Life Expectation at Birth index), education (Enrolment in Education Rate, Literacy Rate) and standard of living (Gross Domestic Product - GDP).

In the historical area Dobrogea, composed from Constanta County and Tulcea County, the health of the population is the key issue of human development in the area, and in general, the premise of education and employment.

Thus, during 1996-2009, the mortality rate in the Constanta County, oscillated between 9.6 and 10.6 per 1,000 inhabitants (10.4 in 2009) and in Tulcea County, between 11.0 and 12.5 to 1,000 inhabitants (12.2 in 2009) - increasing in recent years of economic crisis, and the death rate by cause shows continuing growth of tumors and diseases of the circulatory system, as the main causes of death.

Regarding the delivery of health services, there is a worsening of the situation, both in terms of the number of doctors per 10,000 inhabitants and the population returns to a trained medical environment. All this accompanied by the decrease of the number of hospital beds in conjunction with the increasing number of patients requiring hospitalization reveals a picture of deteriorating health system, aggravated by a

slight increase in public expenditure on health as percentage of GDP, well below the EU-25 average.

Since last summer, the Romania Ministry of Health announced its intention to shut down and merge small and inefficient hospitals; they even talked of turning them in nurseries and homes for the elderly. The aim of such restructuring, as ministry officials have stressed repeatedly to streamline costs related to the personnel administration and health facilities (with bed per patient). The last minute events from Japan underlined the insufficient analysis of some government measures such as the proposal of changing the Cernavoda Town Hospital (the only one equipped with spaces for decontamination in the event of a nuclear accident) in the outer section of the Municipal Hospital Medgidia.

This state of fact will continue to deteriorate, with a direct impact on health and indirectly on the level of living standards, given that, on the one hand, Romania's EU accession has resulted in an exodus of qualified medical personnel and, on the other hand, health care facilities will not benefit from massive investments in modernization and refurbishment.

Finally, even if in health field had been made some progress (especially on the preventive side), the non-involvement and even the setbacks are numerous, requiring quick partnership solutions.

The second premise for human development, the education, focused on issues related not only to the education system, this is an ongoing process throughout life.

Extracurricular education is a process of reassessment of cultural values, both moral and spiritual ones, strongly affected by the current system of market economy. Also, the education system has undergone transformation (curricula, forms during the years on education, alternative textbooks, "step by step" education etc.), so, until now isn't a universally accepted framework. Family, entourage, teachers, and media, each of them, make their contribution to the individual's education.

In Dobrogea, as well as at national level, we may observe an increasing in the rate of enrollment in preschool education, and prospects for change caused by the legal framework, the final year of primary

education will become mandatory, according to new Law of Education [3].

This positive trend is accompanied by the phenomenon of overcrowding of schools as a result of the growing number of children assigned to these; the number of such institutions is falling.

The new legislative changes have been fed by the government desire to relieve the budget by a series of education's expenditure, the lyceum gradually is falling in the private sector charge, steps followed by this type of education are more difficult to make than in the university's case, the 15-16's year old teenager being unable to devote both to the educational process as well as the labour market.

In terms of pre-university population, the decreasing of its number was generated by the demographic reduction and the increase of school abandonment rate, too, especially in rural and disadvantaged areas. If concerning the Roma children's problems were written more articles; we easily forgotten the Romanian children who lost their inclination towards education, not only forced by poverty.

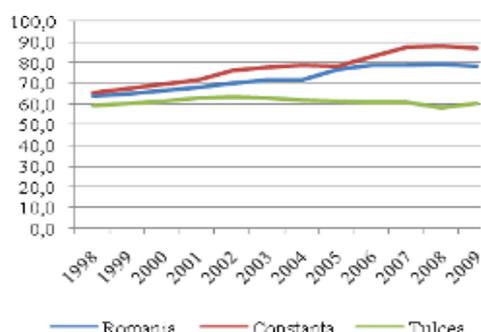

Despite the total number of illiterates has declined in Romania from 1992 until now, has tripled the number of young people aged between 15 and 24 who are illiterate persons. A similar pattern had the school abandonment rate between 2000 and 2009. These are the consequences not only of the financial problems, but also of the family model that has been offered to them.

The university population is concentrated in Constanta County, though, and in Tulcea County there are a number of centers for learning distance, this new form of education rapidly expanding beyond the barriers of space, in my opinion, the advantages of this system surpassing his quality.

During the 1998-2009 gross enrolment ratios by level of schooling in Dobrogea is growing over 22 percentage points in Constanta County, unlike Tulcea County, who it's the overall oscillating, and increased, with only 1 percentage points. (see Figure 1) It should be noted that the gross enrolment ratios by level of schooling is determined by reference to the population aged 5-24 years, although the school population includes people aged over 25 who are included in the compulsory education

(based on various national programs such as "Second Chance") or in higher education (as a result of changing employment requirements of some jobs).

Figure 1. Gross enrolment ratios by level of schooling in Dobrogea

Source: NIS, Romanian Statistical Yearbook 2000-2010 editions

As regarding the main investment in human capital of Dobrogea Area, the population of Constanta County is recorded a high interest for the extension of studying years and a superior qualification, which is not connected however with the local labour market demands, thing which generate either a lost of productivity as well as unemployment. As a difference of Constanta County, in Tulcea, the population has already re-directed to a lower to medium level of education in power to ensure quickly incomes through an earlier entry on labour market, here we had been confronted with a scarcity of high qualified personnel.

The two premises of human development: health and education have as a basis for sustaining economic growth, rising incomes and economic stability seen in terms of reducing inequality and poverty.

GDP per head at PPP, in Constanta County is above the national value, although the growth rate is lower than that recorded nationally. In the Tulcea County, the same indicator values are below the national average growth rate was also below the national level.

3. HDI in Dobrogea – evolution and reform

Among the indicators that composed the system of indicators that characterize human development (human development index,

index of gender disparity in human development, index of women's participation in economic and social profile of human development indicators, human poverty index, health indicators, education indicators etc.) I stopped at the synthetic indicator of human development (HDI).

Based on the data provided the United Nations Development Programme (UNDP) in global and national reports made by it [4]; where the Romania's HDI is calculated, and appealing to a range of data from the National Institute of Statistics (NIS) I have determined the human development indexes for the two Dobrogea's counties. In the figure below we may observe the fact that since 1998 till 2008 the HDI values are increasing, its evolution underlining the disparities between the two counties.

On both counties, we may observe a discrepancy of the human development level, Constanta County, presently, having a higher development, meanwhile Tulcea County is situated itself to an average level, the value of the indicator to 2005 reference year being close by that one recorded in Constanta county in 1999 reference year (the year with the most smaller values of the indicator for all analyzed period).

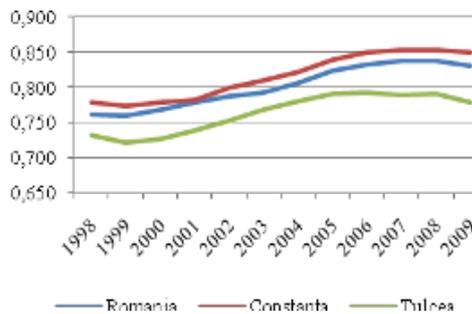

Thus, in Constanta County this indicator values, over the period 1998-2009, are above the national average, but nonlinear, positive gap is reduced in 1998-2001, after which resumes favorable development, since 2003 exceeding threshold of 0.800 which indicates the transition to the high level of human development. Unfavorable evolution, during 1998-2001, of the HDI is a consequence of economic problems summarized by the evolution of GDP, in real terms has declined amid the economic downturn accompanied by lower purchasing power and strong domestic currency depreciation against the U.S. dollar.

HDI values are in Tulcea County consistently below national average - but with a tendency to reduce the unfavorably gap - ranging from 0.731 in 1998 and 0.778 in 2009 as a result of a lower life expectancy than in Constanta County (71.9 in Tulcea and 72.2 in Constanta, 2009 values), a gross enrolment ratios by level of schooling (about 60.4% compared with 87.5% in 2009 in Constanta County) and values of GDP per capita at purchasing power parity below the

national average (in 2009 represents only around 62% of the GDP per head at national level and no more than 50% of Constanta' GDP per head).

The *global economical and financial crisis* that affected Romania beginning with the fourth quarter of 2008 is reflected in the HDI evolution, too. (see Figure 2)

Figure 2. HDI in Dobrogea

Source: UNDP, HDR-2009; NIS, Romanian Statistical Yearbook 2000-2010 editions, the author calculations

The Human Development anniversary Report for 2010 entitled: *The Real Wealth of Nations: Pathways to Human Development* analyzed by examining human development progress in health, education and income since 1970, as measured by the HDI for the 135 countries for which comparable data are available. On this Report Romania ranks 50. The top 10 countries in terms of HDI for 2010 are Norway, Australia, New Zealand, United States, Ireland, Liechtenstein, Netherlands, Canada, Sweden and Germany. Closer to Romania, countries which have entered the top category of human development or "very high degree of development" are Hungary (36) and Poland (41). Romania (50) and Bulgaria (58) are in the second quarter HDI of "high human development", together with Serbia (60) and Ukraine (69).

In 2010 the Romanian live on average four years longer than in 1990, up from 73.2 years and per capita gross national income rose from 8,929 USD per year to 12,844 USD (an increase of 44%).

In terms of education, in 1990, expectations for the years of schooling were 12.5 years, while actual years of study were only 9. In 2010, it expects an average 14.8

years of school, Romanian studying actually only 10.6.

Given these components of HDI, Romania has an index of 0.767 and ranks 50 from 169 countries. Evolution of the HDI over the past 20 years has been increasing with 12% or an annual increase of 0.5% from 0.688 in 1990 to 0.767 in 2010.

The HDR 2010 made some important changes both in composition and manner of calculating of HDI as well as in the inclusion in the HD analysis of new indicators such as: the Inequality-adjusted HDI, Gender Inequality Index and Multidimensional Poverty Index. [5]

In the former editions of HDR the HDI was calculated as an arithmetic average of three indices: life expectancy based on dimension of life expectancy at birth (with values between 25-85 years); education index like an average of literacy rate and gross enrolment ratios by level of schooling (both with values between 0-100%) and GDP per head in PPP as a standard of living index.

In the last edition of the Report, HDI is calculated as a geometric mean of normalized indices measuring achievements in each dimension. The data sources are: life expectancy at birth (values between 20 and 83.2); mean years of schooling (0-13.2) and expected years of schooling (0-20.6) to estimate the access to knowledge through combined education index (0-0.951); gross national income (GNI) per capita in PPP USD (minimum 163 USD – maximum 108,211 USD). This method reforms the traditional vision of HDI and makes impracticable the comparisons.

4. Future of human development

The policies and reforms compatible with progress vary widely across institutional settings and depend on structural and political constraints. [6] Starting from this idea, I would appeal to a quick review of some government's measures made in the last few years, such as: in health domain restricting the medical services package that state covers accompanied by an expansion of the contributors to health insurance budget, also, restricting the number of active units and polyclinics privatization, in education the exit of lyceum from compulsory education system, restricting the number of school

units, reducing budgetary revenues and increasing of the didactic norm, in the economic field, in a economy based on consumption sustained on borrowing, increasing of VAT with 5%, applying of minimum tax last year etc. – to the welfare state to minimal state tough measures given the fact that social spending in GDP are even lower than the EU average (17% of GDP), and public expenses are second lowest in Europe (about 36.3% of GDP) ahead of Ireland. [7]

At national level we are dealing with an increased unemployment, an expansion of informal market [8], leaving of the few foreign investors who have invested in production (such as Colgate-Palmolive or Kraft Foods), low absorption of EU funds, around 50% of national agricultural area is uncultivated and register a negative balance and growing export of agrifood products and the list could goes on.

All these problems are reflected in the onset at national/ regional of *food crisis* – Nomura study placed Romania on 12th place in the world in terms of vulnerability to food crisis, despite the fact that it ranks 25th in the world in terms of arable land area and, theoretically, could provide food for 130 million people [9] -, *energy crisis* - energy network in the former communist countries of Southeast Europe is overloaded and causes many problems, after economic growth recorded since 2000 has led to an energy consumption over the volume was recorded in socialism; the situation is worsening in terms of armed conflict on Arabic countries -, *social crisis* is the first consequence of the economical problems corroborated with the inefficiency of government's measures who was overwhelmed by the chronic budget deficit, it is generating an increase of inequalities and people's demoralization, and are all powered by *institutional and political crises*.

Our crisis comes not only from the socio-economic status, but, surprisingly, is exacerbated by the scarcity of understanding the nature of the problems we are dealing.[10]

The main directions to follow to overcome the crises could be:

- A policy directed to increase public income for balancing our budget who isn't too high, on both income and

expenditure components, but too low. At the end of 2008 many EU members take measures such as: stimulated the necessary supply of cash and trade credits for industry; reduced the tax burden and stabilization of social security costs; stimulated the family's investment - increasing aid and allowances for children; Romania made the opposite.

- To encourage groups of farmers to form cooperatives and invest in their appropriate education; not to punish the agricultural land owners for the inability to use them.
- To support domestic energy suppliers and expand the national use of alternative energy.
... and ... to restore the dignity of workers.

5. Conclusion

“Viewed from the right height, all crises look (more or less) the same, at least as regards their essential characteristics” (said Michael Feiner, Management Professor at Colombia Business School) ...: events start with a “displacement”, expansion of bank credit, demand pressure and prices increase, “euphoria” sets in, bubbles or manias develop, overtrading spreads from one country to another, interest rates, velocity of circulation and prices all continue to mount, financial distress, *crisis* ...till ... the panic feeds on itself until one of three things happens:

- i. Prices fall so low that people are tempted back into less liquid assets;
- ii. Trade is cut off by setting limits on declines, shutting down exchanges, or otherwise closing trading; or
- iii. A lender of last resort succeeds in convincing the market that money will be made available in sufficient volume to meet the demand for cash. [11]

Higher Education and the Labour Market – Romania Case of Study

Patache Laura

“Spiru Haret” University

laura.patache@spiruharet.ro

Abstract

In the present paperwork I tried to achieve a SWOT analysis of Romanian higher education through the perspective of national and international trends which outline it, highlighting the interconnections between the higher education supply and the labour market demand. Like any SWOT analysis is focused on an objective, so, I seek the answer to the question: The educational supply is able to respond and to anticipate the labor market demand? In the New Economy context, on labour market began to take shape some features of "creative worker": provider of work that incorporates a high degree of investment in human capital, with emotional intelligence, adaptable and flexible to the requirements of internal and external environment, dependent on HT, mobile and easy to fit in the firm. The educational offer must not only to be linked to the labor market needs but to anticipate them.

Key words: higher education, labour market, new economy, SWOT analysis.

J.E.L. classification: I21, I23, J23, J24

1. Introduction

The Romanian higher education system has undergone massive transformation in the recent years and the reform process is not finished yet.

Romania is participating in the Bologna Process since the time of its launch in June 19, 1999; its purpose is the creation of the European Higher Education Area. Since then and until now has been adopted as a comprehensive legislative framework for the education system to align with the requirements of the various European initiatives to increase student mobility, their

labour market opportunities, to reduce the number of university specializations and to increase participation in masters and doctoral programs.

Synthesizing, commitments so far in the Bologna Process can be highlighted the following requirements that are imposed to the European universities:

1. A common reference framework for qualifications and diplomas obtained in European higher education, based on a system of transferable credits;
2. A certification system of higher education comparable and understandable;
3. The organization of university studies in three cycles: Bachelor, Master, PhD - BMD;
4. Promoting mobility of students, teachers, researchers and administrative staff within the European Higher Education Area (EHEA);
5. Providing a European dimension to quality higher education;
6. Promoting the European dimension of higher education in terms of curricula development and inter-institutional cooperation;
7. Develop strategies for lifelong learning;
8. Enhancing the participation of student organizations to create EHEA;
9. Promoting the attractiveness of European higher education area by students from Europe and other parts of the world;
10. Promoting closer links between higher education and research. [1]

The contemporary economics and social exchanges, are offering to the labour market a triple function of the economy movement mechanism: transmitter, receiver and resonator of the transmutation.

Labor market signals are in the same time economic, social, and societal. The evolution of the employee towards the gradual accumulation of human capital has generated structural changes of the materials and / or financial supply, of the typology and the structure of services. Thus, an increasing

share of resource - knowledge is included in products, their labour evolved into a creative activity.

Labour market received signals from other markets, processes and integrates them in wage bargaining, which generates a reverse flow of information by broadcasters, as a resonance at the restrictions and the limitations imposed by syndicate-employers union rapport and/ or employee-employer.[2]

2. Constraints in the evolution of labour market

European Union (EU) economy, and Romania's, too, is struggling to adapt to the knowledge society that is viewed from different angles:

- some authors consider it as an equivalent or just an extension of The Informational Economy[3];
- others appreciate the Knowledge-Based Economy as a bridge between Informational Society and the so-called "society of conscience, truth, morality and spirit"[4], through knowledge understanding more than high technologies, informatics etc.; it is characterized "by transforming knowledge into raw material, capital, products, key factors of economy and the economic processes in which the creation, sale, purchase, learning, storing, developing, sharing and protecting of the knowledge become predominant and decisive conditions for profit and long-term sustainability of the economy"(author 's translation) [5].

The multitude of terms that attempts to define this phenomenon also indicates that what has not yet emerged, and sat in stable forms can't be labeled clearly and unequivocally [6]; therefore, I will use the generic term New Economy.

A series of specialists [7] believes that the New Economy indicators could be grouped into five broad categories:

1. *Occupations in information and knowledge*. Indicators measured the degree of occupied in the office and office occupations held by managers, specialists and technicians, on the one hand, and the acquisition of education for employment, on the other hand.

2. *Globalization*. Indicators measure the export orientation of production and foreign direct investment. Such as: share of total employment engaged in producing export goods and services, specific weight of the workforce employed in companies owned by foreign owners.

3. *Economic dynamism and competition*. Indicators measure the number of jobs in the most dynamic companies, so-called gazelle companies, the rate of economic „effervescence”, as a result of the emergence of new business thriving and bankruptcy of some traditional businesses, and public offering of stocks value of companies.

4. *Transition to a digital economy*. Indicators measure the percentage of adults connect to Internet networks, the number of domain named „.com” registered, existing communication technologies in schools and the degree to which the central government and local authorities are using information technology to deliver their services.

5. *Technological innovation capacity*. Indicators measure the number of jobs in advanced technology („high-tech jobs”), the number of scientists and engineers in the workforce, the number of patents in circulation, investment in research and development and the activity in capital risk domain (venture capital).

In the context of the new economy structural and operational changes in the labour market will occur:

- expansion of Internet and intranet is one of the fastest, most convenient and least expensive methods of tendering, respectively, demand for labor there are many sites with this profile, as well as communication and structural change in the relations and working conditions;
- explosive growth in the number of sites was accompanied by a significant improvement in the quality and timeliness of information presented;
- activities are increasingly dependent on various specialized computer programs, this makes the preparation of potential candidates to acquire knowledge of their use;
- provision of computers acquired by companies has increased substantially, as well as connecting to the Internet, there are limitations regarding the networking of computers within firms, individual

generalized Internet access (for employees), and there are no statistics to highlight the Member State level productivity gains through the extensive use of information and communication technology;

- company evolution is strongly correlated with the activity of research and development and innovation and knowledge absorption capacity.

Changes in the labor market and employment developments are directly linked with globalization, as changes in technology, changing age profile of the population (demographic aging generating major imbalances in the socio-economic balance: the pension system, social protection, social assistance, equipment with nurseries, kindergartens, etc. versus nursing home.) shrinking population combined with increasing employment, rising divorce, declining fertility and marriage and spreading of the nonconventional family-the single parent or homosexual families - are all factors of potentiating the poverty and the social exclusion.

Concerns caused by economic globalization tend to merge with larger concerns of global capital strength. „Social dumping” has emerged as a major issue throughout Europe, the accession of new Member States in 2004. According to Anthony Giddens [8], it is essential to delineate the well-founded anxieties by the false ones, social dumping being an emotional term with different meanings, the idea that the availability of cheap labor from Eastern Europe creates downward pressure on wages in rich countries at that low taxes in the new Member States, falsely offering them a competitive advantage over those with high levels of taxation. Fears and concerns as regarding the threat of the living standards in rich countries for the accession of the poor are not substantiated; studies on the economic impact of the accession of Portugal, Spain and Greece have shown positive rather than negative effects on EU member states already. In addition, the effect of EU enlargement on the whole is considered rather low GDP of the new Member States represents only 5% of total EU is in the interest of the whole Union that they can prosper.

On the other hand, China's rapid development as a world center for the production of goods, or India, as an own core for outsourcing resources, throws them in the midst of competition not through the low level of wages, but by the high level of quality and technology. A science park in Beijing includes 56 universities and 232 research institutes. High tech clusters appear not only in metropolitan areas around India, but around secondary ones too. There are two examples of countries that have shown adaptability to the context and market demands and labor market flexibility, which, combined with creative management, have generated success. Identifying innovative solutions is essential, mainly because, if until now the main victims of the transfer of production abroad were manual workers, new forms of transfer-dominated India and China affect different groups (doctors, high tech/HT programmers, accountants, journalists, etc.) from the broad branch of services, the most important segment in modern economies.

Social and technological changes associated with knowledge-based economy have led to the emergence of new occupational divisions: at least 50% of employment in knowledge-based economy is occupied by the so called „connected workers”, who use the computer most of the day without to be HT specialists.

Regional Economic Development Specialist, Richard Florida has assigned the term „creative class” which is compound by people from diverse backgrounds, all ages, different sexual orientations, different ethnic groups, which are mainly in the professional category highly skilled managers and professionals and HT specialists. The key for the economic growth is not only the ability to attract the „creative class”, but to translate that advantage into creative economic outcomes based on new ideas, new businesses in high technology manufacturing and Regional Growth. Florida state has add an index designed to measure the distribution of this new social class - the creativity index, based on four factors: the creative class percentage of the total workforce, the percentage of high-tech industry, innovation (measured by the number of patents per capita) and diversity as measured by the „Gay Index” (the percentage of homosexuals to openly declare their orientation). Thus

being said, it was noted that most local economies and vibrant cosmopolitan is characterized by „the three T's”: talent, technology and tolerance. [9]

Currently, most people's lives are affected by their essential job prospects. The relationship between working and non-working became increasingly complex. Labour market policies have to focus on increasing employability and minimizing the precarious employment. Under the given pressures that globalization carries, labour markets suffer discontinuous changes that lead to life situations with negative but also positive aspects, health problems or changing social relations, to better paying jobs and bringing new enjoyment. To manage these situations, the policy of the second chance plays a key role, providing opportunities to start again after the watershed moments of work, family or other fields. If the old welfare state benefits defined in terms of rights (right to employment, education, social benefits), Giddens believes that Europe is at the point where it must redefine wealth in terms of personal autonomy and self-respect. A good society can be defined by the balance between a competitive market, a robust civil society and a democratic state.

The staff appreciation or job performance evaluation is an activity that today is experiencing a very wide distribution area. If a few years ago there was a tendency to apply for employment tests of conventional intelligence (IQ) for hiring them, recently, a new type of intelligence is gaining ground in organizational structures, namely emotional intelligence (EQ). EQ is a relatively recent behavioral model, rising to prominence with Daniel Goleman's 1995 book called "Emotional Intelligence". The early Emotional Intelligence theory was originally developed during the 1970s and 80s by the work and writings of psychologists Howard Gardner (Harvard), Peter Salovey (Yale) and John 'Jack' Mayer (New Hampshire). Emotional Intelligence is increasingly relevant to organizational development and developing people, because the EQ principles provide a new way to understand and assess people's behaviors, management styles, attitudes, interpersonal skills, and potential. Emotional intelligence is the ability of personal identification and effective management of their emotions in relation to

personal goals. Its goal is to achieve our goals with minimal inter and intra-personal conflicts. Even if a person has sufficient knowledge and intelligent ideas, unless he knows and fails to manage their emotions and feelings, may face difficulties in trying to build relationships with others or a successful career. Emotional intelligence is a mixture of self-discipline, motivation, empathy, open mind, tact and diplomacy.

Without attempting an exhaustive description of the defining features of a person employed in the new economy I shall try to emphasize a few trends which are already emerging in the labour market:

- work provider who builds a high degree of investment in human capital;
- adaptable and flexible to the requirements of internal and external environment;
- H.T. dependent;
- especially endowed with emotional intelligence instead of native/conventional intelligence;
- mobile and easily integrated into business or ... more companies / New Economy companies are making efforts to „adjust” themselves so that to attract "the creative worker".

3. Institutions of higher education market

Among the factors that influence the Romanian demand for education, I would mention just a few such as: "the price" of education, income level, the means for promoting education, attractiveness, etc.

According to the study of National Alliance of Student Organizations in Romania (NASOR) [10], the main reason why a student drops out studies is above his low income. More specifically, financial problems are in 71% of Romanian universities the prime factor of dropping out of studies.

Although the number of foreign students coming to study in Romania has doubled in the past decade according to the estimates of the Institute of Education Sciences (around 40,000 persons), they represent only 4% of all students enrolled nationally in all core areas of bachelor. Most foreign students come from Moldova, Albania, Greece, Ukraine, Saudi Arabia, China and Israel.

The main reasons why foreigners come to study in Romania are "low cost and quality of education in Romania, higher than in their home countries, according to the research institute. Foreign students are particularly interested in the faculties of medicine, economics and technical skills.

In terms of educational offer, according to the Romanian Statistical Yearbook 2010 edition in 2009/2010 we had 26 institutions with 190 faculties and 775,319 students enrolled. (see Table 1)

Table 1. Higher education evolution in Romania

Year	2004/ 2005	2005/ 2006	2006/ 2007	2007/ 2008	2008/ 2009	2009/ 2010
Tertiary education institutions	26	24	21	23	23	26
Faculties	237	268	255	185	180	190
Students enrolled (total) - ths pers.	650.3	716.5	785.5	907.3	891.1	775.3
Technical	161.9	164.7	170.9	178.3	188.7	168.9

4. SWOT Analysis

SWOT analysis strategic concept comes from '60 research of Stanford Research Institute from U.S.A.

With respect to the higher education from our country I have identified the following aspects:

Strengths - quantify the positive effects caused by internal factors

Financial incentives - social grants, scholarships and merit scholarships granted to students, and private scholarships, provided through methodologies and the annexes to the former Law on Education; notwithstanding the fact that only 10% of universities students know of the existence of private sector grants and scholarships for rural students are practically nonexistent. Furthermore, although the state grants student scholarships, they have no consistency in solving existing problems in the sense that fail to cover meals and accommodation needs of students with low incomes, or to stimulate excellence due to the small value of them. Other facilities include student hostels and discounts to the railway.

The *mobility of teachers* rather high compared with the restricted mobility of students.

A *low level of study fee* compared with those of leading academic centers.

The equivalence possibility of diplomas provides a wider range of employment opportunities for graduates of Romanian universities.

Weaknesses - cumulate the negative effects of internal factors

The relatively low visibility of educational institutions at regional, local, national level - the top 500 Universities in the world as shown in a study from the Institute of Higher Education, Shanghai Jiao Tong University, China, in 2004, ranked only 15 are not from USA and for these only 10 are from European Union (EU), none from Romania (hardly in 2006's top was registered the University of Bucharest).[11]

The lack or insufficient development of Centers for Counseling and Career Guidance, which, are compulsory, according to the Ministerial Order 3235/2004.

The restricted mobility of students which is consequence both of the financial problems and recognition problem of skills obtained abroad when students return to the country; 38% of students encountering problems with the recognition and equivalence of credits obtained in the mobility program. [12]

Often students are taught only to reproduce the information, not to understand it.

Low level of staff remuneration system compared with those of leading academic centers.

Theory laboriously studied in universities is insufficiently correlated with the practice work; a possible solution for improving it might be the restriction of the theory hours and reallocation of time in favor of the performance of practical activities.

Opportunities - brings together positive effects caused by external factors

Assuming the idiomatic expression „opportunity knocks softly” but you have to be ready for it I make only a few possible improvements of the educational system, such as:

Implementing student-centered learning[13]

Extension of active learning techniques

A much closer collaboration with business and social environments to form students as potential employers desire.

Threats - includes the negative effects of external factors

"A pessimist is a person who sees a calamity in an opportunity, and an optimist is one who sees an opportunity in a calamity."

The evolution of education is the direct consequence of the demographical trends, therefore *the trend of school population is decreasing* and this fact will had as consequence to restrict the higher education's activity if we not find the way to increase visibility and attractiveness of Romanian educational system at the international level.

The increasing of the *financial problems* and the extension of it at an important part of people will limit young people's access to higher education.

Dotted items above are just a few, a thorough analysis is imperative for a better and realistic reform of Romanian higher education system.

5. Conclusions

Synthesizing the main trends in higher education are:

- massified of higher education;
- decline of public funding;
- the increase of demographic and socio-economic diversity;
- demand for long-life learning of adults;
- unprecedented development of information technologies;
- globalization of higher education market.

At the question: The educational supply is able to respond and to anticipate the labor market demand? I strongly believed that if weaknesses of the system will be removed and opportunities will be capitalized the graduates of higher education have a higher employability and a quick integration in the firm.

Learning in a Virtual University

Păcuraru Raluca

"Spiru Haret" University, Faculty of Accounting and Financial Management Constanta
raluca_pacuraru@yahoo.com

Abstract

The advance to knowledge society is considered, in the world, as a necessary evolution to ensure the durable development in the context of „new economy”, based mainly on intense-intellectual products and activities, as well as to realize an advanced socio-human civilization. In this context the competent institutions to take care the education of citizens are forced to rethink the development strategies by going so far as to change the forms of functioning, and the whole educational process suffers changes designed to make it more flexible and adaptable to the requirements of players in the labor market. This paper intends to argue in a new manner learning, an essential part of the educational process, an activity which takes place in a modern and effective educational environment, the virtual university.

Key words: learning, e-learning, virtual university

J.E.L. classification: A23, I23

1. Introduction

„The teaching process is a series of activities organized and directed that take place in phases, in specialized institutions under the guidance of persons trained for this purpose in order to achieve certain instructive and educative objectives”. [4]

The essence of the educational process is learning-teaching and evaluation.

Teaching is an activity specific for the teacher, through which he transmits to the students its expert knowledge in the field.

Learning is an activity specific for the student, through which he accumulates a smaller amount or more of the knowledge transmitted by the teacher. Learning is achieved both in the classroom, in the

traditional "face to face" system, as well as at home.

Evaluation is regarded as a "complex task of appreciation of the joint working way of the teacher and his students, in an effort to achieve educational goals designed to a higher level of performance." [4]

Beyond these definitions and the theoretical part of the entire process, is a reality that many of us have experienced it in the classroom, at least until high school graduation. In a traditional university, this situation perpetuates, it is true that at a higher level, but the essence remains the same. The teacher teaches – browse sequentially through the didactical material, students take notes, then learn (most of the times "word by word") what they have been taught without asking too many questions about the ideas presented.

The reason that traditional classrooms are prevalent in current educational system is the familiarity of this model, as well as lack of viable alternatives. But giant steps forward that have been made in ICT lead to an education paradigm shift towards a new model of training, a model that is now sustainable.

2. The virtual university

The concept of *teleeducation* – in the sense of distance education – is a term that describes the courses flexibility and the use of the information and communications technology in the educational process and it was projected to meet the individual requirements both of the student, and of the professors who are no longer dependent of a certain timetable. Distance learning takes place when the professor and the students are geographical separated, and the technology, supported most times by the traditional education, is used to cover some educational needs. There are several models of distance education which, depending on the goal had

in view, adapt the education requirement and the available resources:

- *the independent model* – is the model upon which is built the virtual university. The independent institutions oriented towards distance learning can be multidirectional (they insure training in several fields) or unidirectional (they insure training in only one field);
- *the model of the department specialized in distance learning inside an existing educational establishment* – is the model met at present in most universities in Romania.
- *the model of cooperative structures* – the establishments cooperate both in the education activity, and in accomplishing other functions (production and distribution of didactic materials, teaching-learning techniques, administrative actions etc). This establishments do not enroll students directly, but they offer services for the proper education institutions.
- *the model of hybrid structures* – resulted from combining in different forms of some parts of the models described above. Comparing it to the model of the department specialized in distance education from an existing educational establishment (model that has become vast in scope lately in Romania, as well), the advantages of a virtual university are the following:
 - the creation of an administrative structure proper for the development and management of a system based exclusively on distance education;
 - the orientation of the whole educational process towards distance education, and so towards the optimization of its results, the fact that in traditional establishment it is often considered that distance education has inadequate results, being well known;
 - the pedagogy of distance education is much different from the classical one, the flexibility and the orientation towards the student being two of its defining characteristics. In this context, the teaching staff can create their courses so that they may correspond to the new pedagogic criteria without being necessary to make any compromise that permits the adaptation of the didactic material for another type of education, too

(as it happens in the case of departments specialized in distance education from classic educational establishments);

- the distance students requirements can be best satisfied if the establishment is dedicated entirely to distance education;
- the segment of population which this type of establishment addresses to is much larger and more varied from the point of view of its characteristics, than the target population for the traditional establishments.

The new technologies make it possible for the educational organizations, and not just them, to take what is best in the model based on traditional class, but to use the power and flexibility of the ICT-based solutions. E-learning is now seen as a strategic solution, part of a global business strategy for the entire organization. Its primary function is to develop habits and skills of human resources and to make lifelong learning a low-cost labor.

E-learning advantages are easily seen [7]:

- cost reduction;
- personalization of education;
- more efficient scheduling;
- immediate dissemination of the vital information;
- staff motivation profitability;
- facilitation of assessment;
- increased collaboration and access to information.

New aspects of informatics pedagogy that interfere in the analysis and conception of the elements of online learning, are: [1]

- the interface student – informatic system;
- the structuring and organization of the teaching materials (of instruction);
- the surfing into the knowledge field;
- the visual presentation of the multimedia information;
- the using of the software components specific to the informatic system of instruction.

3. Organizing and conducting the learning process in a virtual university

Virtual University is organized around a field of study and an e-learning platform. Here are preparing students for various

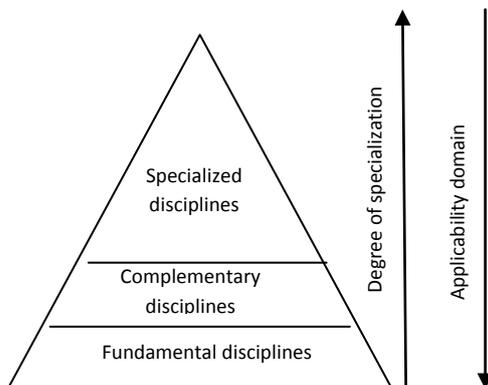

specializations of the domain. These specializations are in narrow areas, clearly defined, for each of them the student must go through three categories of disciplines:

- fundamental disciplines – containing basic knowledge about the studied domain;
- complementary disciplines – containing shared knowledge for several specialties, but not for all;
- specialized disciplines – contains specific knowledge of the area of specialization.

In figure 1. is observed variation in the degree of specialization, as well as the applicability domain for knowledge gained from the study. For a certain degree of specialization the student will have to go through a certain "tree" of disciplines, in a direction well established. Nodes of this tree are the disciplines which must be completed, unable to reach a parent-node if all of the children-nodes have not been completed. This means that the study of certain disciplines is conditioned by achieving the minimum grades (not necessarily 5) to others. Generally, the more the degree of specialization is increased, the stronger is the conditioning.

Depending on the specialization, these trees may be higher or lower horizontally or vertically. Some specializations may have more complementary disciplines, other more specialized disciplines. This is established in the beginning of each academic year by a specialized department within the University, in collaboration with the Ministry of Education and Ministry of Labour, in order to meet the existing requirements of human resources market.

Figure 1. The disciplines studied in the virtual university

It is also possible to go directly to an intermediate level of the tree if they have been successfully completed the tests from children nodes. This makes it easier to obtain more qualifications simultaneously, especially since some related specializations have common nodes in the tree of disciplines. Also because of this the period of time required for university graduation can be shorten if the student already has knowledge of the applicability domain or the specialization. Making an analogy for exemplification, a student who has graduated from a technical computers Faculty will make it easier to go through the specialized disciplines from the Faculty of Cybernetics, Statistics and Economic Informatics and an accountant will move quickly through the fundamental disciplines and even by some complementary disciplines. But both of them will graduate sooner (if there is the assumption of the same external disturbing factors) than a theoretical high school graduate.

The didactic materials that are used in a virtual university (of any type: courses, seminars, case studies etc) are in digital format, and they have the following advantages to the classical format:

- the integration of a variety of learning media: text, graphics, static and dynamic images, sound, films;
- access to materials from vary many sources, some by direct links from the original site;
- due to hyperlinks, there are pages which allow the coming back, the profound study through accessing other pages with similar subject, or the skip to other type on information;
- the integration of the relationships with the professors and with other students mates by Web;
- the reducing of the delivering costs;
- the delivering in time and where it is supposed to be delivered;
- the minimization of the storage spaces;
- the possibility of the student's choice of the part that is printed and of those that remain in electronic format.

The courses consist in several modules and are designed in such a manner that they can indicate an "optimal path" to be covered, depending on each student's individuality. At the beginning it will be a test of student

knowledge, with the sole purpose of determining whether he has knowledge in this field and which is this level of knowledge. Depending on the results of this test are determined the modules which must be completed. At the end of each module the learner will complete a test and depending on the results obtained he will proceed to the next module or will return for improved knowledge. This guidance through elements of course content will be done automatically, whenever the student believes he is ready, without requiring teacher intervention. The work of the latter will however be reflected precisely in the capacity of teaching material to conduct the learning process in the best manner consistent with the features of each student. To provide an education that is adapted to labor market needs, there is no fixed duration of studies. Duration depends on the availability of the trainee, his ability to learn and its previous knowledge.

Another feature consists in the possible existence of "superior qualifications" in which leaf-nodes are in fact other specializations – this characteristic can be used especially in postgraduate training.

4. Conclusions

In a virtual university educational process organization requires greater flexibility in the achieving of one or several qualifications, while also being more restrictive and more individualized regarding the way to move through the disciplines. This together with the distance development of learning process creates the assumption of a student-centered education and its results, but facilitates also the lifelong learning, which are two of the higher education priorities that are set by the European Union for the coming decade.

Evaluation in a Virtual University

Păcuraru Raluca

"Spiru Haret" University, Faculty of Accounting and Financial Management Constanta
raluca_pacuraru@yahoo.com

Abstract

In our days, the computer assisted instruction became a reality. The continuous perfecting of evaluation techniques and their adaptation to be used in training assisted by the computer is a recognized necessity. This paper work presents some theoretical and practical aspects of evaluation, an essential part of the educational process, an activity which takes place in a modern and effective educational environment, the virtual university.

Key words: computer assisted evaluation, virtual university, evaluation in education

J.E.L. classification: A23, I23

1. The concept of virtual university

The model of the virtual university proposed in this article is the independent model of distance education – an exclusively virtual establishment, that will insure the following functions:

- the developing of educational programmes, tutorials and guidance;
- the projecting, producing, stocking, and distributing of the didactic materials;
- the administration and accounting of the didactic process;
- the marketing;
- the evaluation and accreditation of the students.

For the teaching-learning-evaluation process, the virtual university is based entirely on computer assisted instruction – recognize by some as the most important technological innovation of the modern pedagogy.

From the student's point of view, the concept of computer assisted instructional process includes:

- "the teaching" of the courses is done in digital format, usually in asynchronous manner, without excluding the possibility of existence of some synchronous meeting (for example videoconferences) – communication of new knowledge;
- the application, consolidation systematization of the new knowledge;
- the automatic verification of the knowledge resulted from reading a lesson or a group of lessons (didactic evaluation assisted by computer).

From the methodological point of view, in a virtual university the teaching-learning-evaluation activity integrates the following didactic operations, capitalized by computer assistance:

- the information organization is digital, and it is done according to the requirements of the curriculum, but it is adapted to each student's capacities;
- the student's cognitive stimulation through didactic snapshots and questions that aim at discovering some problems;
- the solving of the above didactic tasks through the reactivation or obtaining the necessary information from the informative resources called upon through the computer;
- after having studied some study modules, synthetic reviews are done, which may be accompanied by partial evaluations that have the role to fix the information, but also to find out the possible gaps or problems;
- the insurance of some exercises of stimulation of the student's creativity;
- the didactic evaluation is exclusively computer assisted.

New aspects of informatics pedagogy that interfere in the analysis and conception of the elements of online learning, are: [1]

- the interface student – informatic system;
- the structuring and organization of the teaching materials (of instruction);
- the surfing into the knowledge field;

- the visual presentation of the multimedia information;
- the using of the software components specific to the informatic system of instruction.

In a virtual university, the roles of the tutor and that of the student are changed comparative to those assumed in a classical educational establishment. Thus, the professor's role is modified significantly, the distance between the two participants to the educational process is diminished in spite of the space distance, which is, obviously, greater:

- the professors participate actively to the projecting of the teaching media, doing more than just supplying knowledge;
- in projecting the didactic material, the teacher must pay more attention to the students' working styles;
- the professor is not only a supplier of didactic resources, but also a guide and a consultant in the learning process;
- the teacher becomes an expert in asking the right questions as well, not only in giving the correct answers;
- the teacher offers only the initial framework of the students' activity, encouraging then the personalized orientation;
- the professor presents more views on a certain taught subject, and he/she underlines the important directions of study;
- the teacher becomes, finally, a member of the study group.

The student's role who attends the courses of a virtual university is changed, as well:

- the student surpasses the stage of passive receiver, and contributes actively to creating his own knowledge;
- the student has multiple perspectives over a taught topic;
- the student formulates himself questions, to which he/she looks for the right answers;
- the student gets the capacity to solve complex problems, not only to memorize facts and problem-situations;
- the students work in groups for certain collaborative tasks, thus, the interaction among the study group increasing significantly;

- the student becomes his own learning process manager;
- the student learns to use the significantly increased access to the educational resources.

2. Theoretical aspects of computer assisted didactical evaluation

The didactic evaluation is a controversy enough subject, because through this process are realized classifications, selections, and finally there is decided the destiny of some people. There are more definitions for the didactic evaluation, all having some common points [6]:

- evaluation is a process, an activity in stages developed in time;
- evaluation do not summarize to give marks to students, but refers to some complex domains;
- evaluation involves some measures, comparisons, appreciations, based on which could be adopted some decisions with the purpose to optimize the activity in areas subject of the evaluation and, finally, the results obtained.

Evaluation in education is a compulsory process and could be used to:

- measure the quality and efficiency of the curriculum (at the group level by teachers);
- measure the quality and efficiency of presentation form of a course (at the individual level – a teacher);
- leading and motivating a student in the training process;
- hierarchy of results and knowledge accumulation realized by students.

The theory of the evaluation is developed, at present, as an autonomous domain of pedagogical science, and inside this the formative evaluation represents an efficient solution in the learning process, in the conditions the people trained belong to a diverse social and cultural area.

Formative evaluation (evaluation for learning) is the evaluation strategy who facilitates and motivates the learning process, emphasis the progress of a student, or who, on the contrary, diagnoses the gaps or the obstacles in learning. Its main purpose is to provide the necessary feedback to increase the learning performance, is permanent, and

it takes place in time of respective module or course. Following the feedback received, the teacher could correct the deficiencies and multiply the positive results before the end of the instruction sequence, and could also realize individualized instruction sequences, passing this way to an educational process centered to the individual. The formative evaluation is *critical*, so the results of teaching-learning process are compared with previously established criteria or standards (usually minimal).

Summative evaluation (learning evaluation) is an evaluation strategy with balance character with the purpose to give marks, and the feedback provided this way is used to appreciate the success of de instruction and the determination of curriculum efficiency. This type of evaluation is realized at the end of the module or instruction sequence. The summative evaluation is *normative*, so the results of the students are compared each others to realize a hierarchy.

3. Practical aspects of computer assisted didactical evaluation

The use in overwhelming proportion of objective items could lead to artificial growth of tests results numerical expressed in marks, mainly thanks to the possibility to guess some answers. This problem specific for the evaluation assisted by the computer could be treated in many ways, to decrease the negative effects.

At the level of the test, there are the following possibilities to discourage the tentative to "guess" the correct answer:

- establish a maximum time allocated to solving;
- create a test from many items subsets, built so that they cover as many subdomains of the respective discipline (for ex. a set of items for each chapter). Any subset could enter in the content of the test with a different number of items, depends on the importance of that subdomain;
- at each launching of the test, the items should be selected by chance from a items bank with big enough dimensions;

- attribution of negative values for wrong answers, the student preferring this way, in the situation he does not know the correct answer, to not fill in any answer and to pass to the next item;
- to be established a minimum admitted performance – minimum number of points to be realized to obtain the minimum admission mark (usually, 5 mark);
- reformulate the same question in more variants (items types) – for the same knowledge which should be tested will be formulated 2 or 3 different items types (for example true/false, multiple choice and completion), and if it is not given the right answer to all the three items, then will not be marked anyone;
- referring the same knowledge subset which should be assimilated will be realized a "basic item", and a "complex item"; the last one could not be solved without knowing the correct answer at the basic item. If the basic item is not solved correctly, will not be given score for the complex item, no matter the way of solving the last one ;
- the items are divided in subset, depends on the knowledge they need to solve them: basic knowledge, medium knowledge, advanced knowledge. If at the subset of items for the inferior level knowledge is not obtained a certain score, will not pass to the subset of immediately superior level, the score remaining the one established until the moment of interruption.

At the level of an item, could be taken the following "security measures":

- the position of correct answer inside an item to be rearranged according an algorithm established by chance;
- to not exist the obligation to fill in an answer;
- establishing the score in a differentiate way, depends on the difficulty of each item (items more difficult have a higher score, the easy one a smaller score).

Those methods could be combined so it will be obtained a higher accuracy of knowledge testing.

In the virtual university two processes of evaluation are conducted via computer: the formative and the summative evaluation.

Formative evaluation process occurs simultaneously with the learning process. After completing each module of the course, the student must take a test. The result will lead to a new chapter (or the final evaluation, if it was covered all the discipline content) or will send back to deepen the study.

The algorithm presented below contains the steps necessary to be followed to determine the optimal structure of a test used for summative evaluation of students.

1) The course must be divided into a sufficiently large number of subdomains (or chapters) to provide the basic knowledge testing. However, this number must not be too high because this will lead to heavy testing, of large dimensions. A number between 3 and 5 subdomains is realistic and serves well the purpose for which it is designed the test.

2) For each subdomain are identified important theoretical aspects, as well as the usual practical problems. For the theory will be created a set of items of different types. For the practice will be created another set of items, preferably with multiple choice and / or fill in the blanks (you can fill in words, numbers, mathematical expressions, logical etc.). The teacher should establish the importance of the theoretical aspects compared to the practical ones, giving each of them a share in the subdomain. (For example theory is 35% and 65% practice). Can be chapters for which there may be a single set of items (made with 100% share), this being determined according to the particularities of each discipline.

3) It determines the importance of each subdomain in the respective discipline. This translates into granting a weighting for each subdomain, regardless of the number of sets of items that have been created.

4) Together with a competent person who know the possibilities of e-learning platform, are set the time to complete a test and maximum number of questions that can form a test. The maximum score that can be obtained is 100%.

5) Depending on the weight that each subdomain has in the discipline, is established for each of those the maximal score that can be obtained. The sum of these partial scores should be 100.

6) For each subdomain separately, taking into account the weight given to theory and practice(step 2), the score is determined for each set of items. The sum of these partial scores must be equal to the subdomain score (set at the previous step). Check if the sum of scores of all sets of items is equal to 100.

7) For each set of items is established the number of questions and the score for each question, so as to respect what it was agreed to step 6.

8) Check again if the maximum score that can be obtained is 100 (for each set of items is multiplied by the number of questions with the score awarded, the sum of these numbers should be 100).

Following the steps described above it will provide a good coverage of the discipline material, and thus increase the content validity of the test.

4. Conclusions

Gaining the knowledge needed to develop the career in a labor market becoming increasingly competitive can not be achieved without promotion of diversity in educational systems. Online learning is a new way of looking at the educational process, in which the means of exchanging and acquiring knowledge changes, and student-teacher interaction is possible both synchronous and asynchronous.

The modern technologies provides opportunities for learning performance evaluation. There are many European projects aimed at using new technologies in higher education, and some of these concerns the improving or efficiency of student assessment practices. This paper work presents some theoretical and practical aspects of computer assisted didactical evaluation, as well as some methods to solve the problems incurred following the use of evaluation technique assisted by the computer, to help the specialists involved in the elaboration of instruction systems assisted by the computer.

Economic Culture and National Ethics

Pădurețu Elena

Academy of Economic Studies, Bucharest

elenapaduretu@yahoo.com

Cristian Elena Raluca

Romanian American University, Bucharest

cristianraluca@yahoo.com

Abstract

National ethics constitutes an important topic within the current globalization process, showing that intercultural relations affecting global issues don't limit only to economic reasons, but also cross the barriers set by the classic specialists, entering the era of understanding the power of behavior economy, based on impulsivity, spontaneity and flexibility. This paperwork studies the factors that influence the ethic attitude of a large number of countries, based on Hofstede's studies.

Key words: ethics, culture, globalization, migrationist ethics

J.E.L. classification: A13, F01, F22, Z1

1. Introduction

Globalization determined the increase of the number of competing companies, despite the distance between them, traditional, geographic and cultural. Franke and Nadler (2008) said that new markets and business relations offer countless rewards to the participants. Nevertheless, crossing the national borders often require clients, employees, suppliers, which may have different views on right or wrong [1].

The different perspectives on bribe, intellectual property, negotiation techniques human resources may lead to legal and managerial problems for the organizations with various cultures. Smka (2004) defines the global variations in ethic decision making as an imperative prerequisite for multinational business. The increasing number of multinational companies turned global business ethics into a priority for the economic activity. Also, because of the

economic, social and political circumstances, together with the changes in education and business environment, many countries developed migration generated international relations [2].

Paduretu and Cristian (2010) reached to the conclusion that populations are integrated together with the principles they have, thus diluting national ethics. These cultural changes transform behavior, attitudes, beliefs, moral and social values, aspirations [3].

The well-known Hofstede's research on cultural dimensions often explained the national differences of ethic perception. Inter-nations differences may be caused by the differences between countries, with different views, or by the systematic polarization of people's response to certain factors, people coming from different countries. [4]

Franke G. and Nadler S. researched on the ethic national attitudes based on the understanding of justifications of four types of behavior with moral implications. The researched ethic-related data for 44 countries come from the World Value Survey. Afterwards, the results are processed by a regression on Hofstede's cultural dimensions and on GDP per capita, as a measure of economic development.

Therefore, by this paperwork, we intended to analyze the way that Hofstede's dimensions apply on national ethics and on migrationist integration, starting from Franke's and Nadler's studies.

2. About culture and ethic attitudes

There are many definitions of culture. Hofstede's definition, the most known one, says that culture is the collective programming of the mind which

distinguishes the members of one group or category of people from another [5]. He explains, afterwards (p.10), that culture includes values, and the values systems are essential elements of culture.

Srnka considers that culture may be identified at multiple levels, from microcultures (family, organization) to supracultures (nations with similar economic systems, ethnies, religion, etc.) [6]. For inter-countries comparison, culture may be defined by values, beliefs, behavior standards and models of a national group.

Hundreds of studies are based on Hofstede's research, in order to create a conceptual framework for understanding differences in national culture. Based on questionnaires addressed to more than 116.000 IBM employees in 72 countries Hofstede classifies 50 countries and 5 regions on the cultural dimensions: individualism/collectivism, avoiding uncertainty, distance from the power and masculinity/femininity. Hofstede's initial data were collected in the late 1960s and early 1970s.

Nevertheless, Hofstede (2001) and Kirkman [7] summarize a large series of important correlations between the Hofstede's country scoring and other national variables, after 1990s. This is why Hofstede's dimensions continue to be useful in intercultural research prognosis.

Ethic attitudes involve people's cognitive, affective and behavioral willingness to respond to problems and activities that include social standards of morality and honesty. National culture, organizational culture, personal religious beliefs, economic pressures and other factors may influence judgments, intentions and behaviors.

3. The influence of culture on ethic attitudes

Franke and Nadler (2008) analyzed the cultural values that influence the perception of right or wrong, concluding that morals and ethics are central components of many definitions of culture. Fukuyama is more explicit when considering culture as the inheritance of ethic customs [8]. Franke and Nadler focus on the effects of the four cultural dimensions on ethic attitudes.

- **Individualism/collectivism**

Because the individualism is characterized by self containment, competitiveness and self orientation, the individualists may be willing to ignore, more than others, rules and principles standing in the way of their own interests. Vittel said in 2003 that most of the individualists may be selfish ethic egoists, showing little preoccupation towards the rights of other individuals [9].

But in collectivistic societies, the values standards that individuals have for the inner groups differ from the ones for the outer groups and morality is contextual. The collectivistic people respecting norms, regulations may lead to higher ethic standards and may reduce corruption, especially in those cases when breaking the ethic laws brings a certain amount of risk to the inner groups. Franke starts from the idea that, in various countries, the increase of individualism has a negative impact on the national ethic attitude.

- **Avoiding uncertainty**

People are more receptive to respecting norms and regulations, connected to the desire to avoid risks. Nevertheless, in 2007, Hofstede [10] notes that the importance of rules may paradoxically vary from culture to culture. But avoiding uncertainty does not relate to avoiding risk; unethical behavior may be seen as accepted risks, because it often brings the expected results.

In 2001, Hofstede notes the positive connection between avoiding intercultural uncertainty and the concept that it is acceptable to break unjust laws, and also the negative connection with the trust in the legal system and the police. These kinds of attitudes lead to skepticism regarding strict rules on right and wrong, according to the following hypothesis: in different countries, the intensification of the actions for avoiding uncertainty as a negative impact on the national ethic.

- **Distance from power**

In Cohen's study, 49% of the relations involve negative effects on the distance from power, while only 3% show a positive relation. The employees with a bigger distance from power are expected to follow orders and to sacrifice ethics for the good of the company [11].

Employees are more willing to accept the cover-up of corrupted business actions. Generally speaking, the differences between levels may encourage the one with little power to be corrupted. This is why we may say that in various countries, the increase of the distance from the power has a negative impact on the national ethic attitudes.

- Masculinity/femininity

Cohen's results (1996) on femininity are similar to the ones for avoiding uncertainty, 39% of the replies showing that femininity raises ethic standards, 24%-decreasing. The research at individual level show that women tend to be less self-contained and more hardworking than men, which leads to the idea that women pay more attention to the ethic standards.

Masculine culture prefers large and rapid accomplishments, often obtained through illegal and corrupted means. Masculinity emphasizes competitiveness and material success, based on a higher level of corruption and lower ethic sensitiveness. This is why Franke reaches the following conclusion: in different countries the increase of masculinity has a negative impact on national ethic attitudes.

- The effects of economic development

Hofstede recommends controlling the economic development by testing the effects of the cultural factors, because variables like economy, biology, technology form a better country variable [12].

Research has shown that less developed countries don't always have the legal means to facilitate economic development. Satisfying the basic needs, such as survival, may require sacrificing personal values such as morality. In various countries, higher economic growth has a positive impact on national ethic attitudes.

4. The analysis of cultural hypothesis based on national ethics

Franke analyzed the hypotheses on 44 countries, representing 48 % of the world's population, selected by the validity of the data for the four ethic elements in World Values Survey and Hofstede's four cultural dimensions. The USA GDP estimates are also valid for each country. The sample includes 64.769 respondents, 755 to 2989

from each country. The cultural indices cover almost every dimension and the average GDP varies between 230 USD and 44,471 USD. The ethic values are grouped almost inexplicable on a scale from 1 to 10, varying between 9,5 and 7,54.

Franke's results show that distancing from the power and avoiding uncertainty are cultural dimensions that have a negative influence on ethic attitudes. The expected results of avoiding uncertainty have been more than controverted. The observed negative impact suggests that potential consequences of activities may often involve acceptable risks.

The fake demand for governmental favors avoiding transportation taxes, and so on, involve immediate gain or avoiding losses. The benefits of these activities are known, and the risk of legal consequences may be easily overlooked. The willingness to break the rules and skepticism towards the legal system may also lead to ethic rationalizations as well as to considering governmental benefits to be a right of the people, or the transportation costs to be seen as extremely high.

In Srnka's opinion, distancing from power and voiding uncertainty may be added to ethic decision-making models. Acknowledging these dimensions, that suggests but don't guarantee consistent ethic models, is very important. For instance, Greece, Russia and The Philippines, have values higher than 93, for one or for both dimensions, and at the same time, they are thereof the four countries with the lowest ethical values. At the other end, Japan has a high value for avoiding uncertainty, 92.

Same as for avoiding uncertainty, the expected influence of individualism on ethic attitudes was a very controverted one. Results have shown a negative impact on individualism in analyzing the regressions within the first hypothesis, but the effect is not a significant one.

A possible explanation is that any effect of this dimension may depend on the behavior in question dealing with the benefits or the consequences of the inner groups vs. outer groups. When the benefits are for oneself and the consequences are for society, as avoiding taxes or costs of transportation, the collectivists and individualists may have similar attitudes.

Javidan indicates the fact that what is associated with the economic factors may in fact have cultural roots [13]. Therefore it is logic not to expect that individualism and economic development to have opposite effects on ethic attitudes within the first and the last hypothesis. In exchange, individualism and economic development may have together a negative impact on ethic attitudes, suggested by the results of the regression.

Contrary to the expectations, the results show no effect of masculinity on ethic attitudes. Masculine cultures capitalize on self containment and materialism, but this orientation does not correspond to the tolerance of intercultural behaviors.

Japan for instance, the country with the highest masculine score, has high ethic values, more than the one foreseen by the regression. The insignificant effect of masculinity is consistent to the results of the studies at individual level on gender differences. Although, on average, men are more assertive and women more cautious, their ethic views tend to be very similar.

The regression diagnostics show that ethic attitudes are lower in Brazil and the Philippines and higher in Japan, than the values indicated by the effects of culture and economic development. Brazil and Japan always came forward as countries with unique cultures. Brazil and the Philippines have a history of political turbulences and high income disparities. Tax evasion is wide spread phenomenon in Brazil, and civil riots, poverty and crime rate are part of the day to day life in the Philippines.

At the other end, Japan is a society prosperous and homogenous. The educational system promotes moral education and obeying, reflecting the Confucian inheritance. The Japanese tend to present in public the opinions and feelings society expects, though they may not express the truth. That is why the answers to the questionnaires may be exaggerated.

5. Integration in intercultural ethics

The standard approach of the interaction with the persons belonging to the host-culture suggest that individuals must either adjust to the standards of the host culture, or maintain

their own, at the same time respecting the others.

People with different ethic standards may reach a common ground by intercultural dialogue, in which existing standards are criticized and new standards are created [14].

The desire to learn from other cultures does not mean abandoning one's own traditions and cultural values, though, unavoidably, opening to various ethic approaches leads persons to reexamine their own values regarding uncertainty, distancing from power and the other dimensions analyzed above.

But this kind of approach will gain a larger perspective on the world, though not everybody can make a successful transition to the multicultural perspective. The emigrants must form a third culture, because, besides their own cultural background, they assimilate the culture of the host country and also the ethic norms they have to adapt to.

The emigrants may not to have a precedent in taking the customs and norms of the country they choose to live in. Since these norms that create the link between them and the inhabitants of the host country still don't exist, they must be created by dialogue. Also, it is possible that these norms do not apply to those that have to live by the, or they are not believable for them. These issues are not impossible to fix, but they always appear in situations like this.

The intercultural dialogue on ethics is possible because of the fact that ethic principles are created by man, and passed on by culture. Research have shown a large variety of values and norms that different cultures respect when it comes to friendship, marriage, education, business, politics, indicating the relativity of values and intercultural norms. The process of integration offers an alternative on the ethics based on adjustment or respect. The conflicts between the emigrants and the host country may be solved through a more efficient dialogue.

6. Conclusions

In a basic research on some cultures, the researcher controls the number and the type of the analyzed variables. Nevertheless, the variability between cultures may be limited and it may be impossible to examine the

effects of a cultural feature and keeping other characteristics unchanged. The results suggest that organizations may face ethic conflicts when operating in other areas than the origin countries, conflicts on avoiding uncertainty, distance to power, economic development or other cultural dimensions. Solving the conflicts may require sensitivity to competing goals and attitudes. Acknowledging the differences in ethic perception between the countries is a challenging fact, but necessary for the individuals on the global market.

Role of Share Based Compensations in Romanian Environment

Petre Mihaela Cosmina

„Constantin Brâncoveanu” University of Pitești
Faculty of Management Marketing in Economic Business
nita_mihaela_c@yahoo.com

Abstract

The article aims to identify the role of share-based compensations. The authors find many studies that consider a positive role of share-based compensation for alignment of agent and principal interests. Studying the determinants of share-based compensation, the article provides relevant information to, mainly, owners and management about the circumstances which use of share-based payment and brings efficiency to the firm.

The authors also presents the scope of IFRS 2 Share –Based Payment, and identifies share-based payment arrangements in a business combination between owners and managers.

The article provides the results of a quantitative approach, conducted with statistical correlation and regression analysis in order to understand the variables relation and finding out how companies' characteristics are related to a proper remuneration plan in Romania.

Key words : share-based payments, determinants, agency theory, firms' characteristics, opportunistic behaviour

J.E.L. classification: M41

1. Introduction

The role of share based compensations is more frequently discussed. Elaboration of the IFRS 2 „Share based payment” aims to specify in relation to the entity of the recognition request in financial statements of transactions with share based payments. Even if the IFRS 2 goal is to approach a number of more comprehensive problems, in this study we shall use the issues approached by this International Financial Reporting Standard through the use of schemes or share based plans in order to remunerate managers.

Although there are many studies that provide a positive role to share based compensations to reduce and align the conflict of interest between owner and agent, described by the theory of agency, a number of researchers notice that these share based compensations only represent an opportunity in addition to wages, under the circumstances of a pressure exerted on financial reporting.

Thus we notice an opening and development starting from the conventional plans of bonuses and profit sharing to other forms of remuneration and compensation, especially of managers. After 1990, the share based compensations have become quite common worldwide. The most recent studies provide a higher attention to this type of remuneration.

2. Role of share based compensations in settling the conflict of interest generated by contract relations between owners and managers

The role of share based compensations can be studied according to the governing factors of applying these plans. Studying these governing factors of share based compensations provides relevant information in the research of the contract relations between owners and managers about circumstances of assignment and application, that provides efficiency to the company.

Thus, some of the research carried out approached even more carefully the external governing factors in applying the share based compensation plans, that mainly relate to the influence developed at market level or when rising the price of shares.

We mention that all this research related to share based transactions develop under the circumstances of some collapses, foreign scandals and some shortages of financial solutions in settling these problems. All this problems occur under the circumstances of a

range of controversies concerning compensations and remuneration plans of the managers.

Therefore, the implementation of share based compensations is considered it provides a positive role in aligning the interests of owners and managers. These compensations are considered as an innovative instrument of motivating the managers in aligning the managers' behaviour and their influence over financial statements in favour of owners.

IFRS 2 describes the share based payment agreement as a contract between an entity and another party (including an employee) to conclude a share based transaction that gives the right to the other party to receive cash or other assets of the entity in an amount that is based on the entity's price of shares or on the other instruments of entity's equity capitals, or to receive instruments of entity's equity capitals, on condition to meet the requirements specified to come into their own, if there is.

From this definition we identify that, as is described in the agency relation, the owner can consider within remuneration according to performance and share based compensations.

Remuneration of best managers is a delicate and sensitive issue if considering the effect of financial crisis and public feedback to it under the circumstances of paying the managers according to their performance. This type of identified remuneration is important to keep and motivate the best managers and employees, especially under the circumstances of crisis and a lack of currency liquidity.

Many researchers considered that there is a connection between the long term compensation plans and ways of improving the companies' performance. This fact was mentioned in all studies wherein the share based transactions have been analysed. They wanted to align the interests of owners and goals of management. As a result, these surveyed issues can help the managers to obtain a better remuneration by increasing the company's performance and raising the value by the owners, through this having consequences over the remuneration of managers as well. Thus, motivation through which owners determine the managers to work for their goal and their companies help

companies improve the performance.

3. Presentation of transactions with share based payments in financial statements

In order to limit the opportunistic character of managers, IFRS 2 recommends in introduction, various ways of presenting information in order to enable the users of financial statements to understand:

- Nature and dimensions of share based payment agreements;
- Way wherein the fair value of services received or the fair value of equity capital instruments have been determined;
- Effect of share based payment transactions on the entity's profit and loss related to the period and, on its financial standing.

Shares, share warrants or the other equity capital instruments that owners provide, especially to the managers of the companies they administrate and manage, under the circumstances of a contract, as a way of alternative remuneration, seen as a bonus in relation to a currency benefit. In this case it is difficult to estimate the fair value of those additional benefits. Thus, IFRS 2 recommends that the entity should evaluate the fair value of services received from the managers by reporting to the fair value of equity capital instruments provided, but on the date of their assignment.

The IFRS2 standard approaches the share based payment transactions with settlement in equity capital instruments identifying the requirements of coming into their own of various equity capital instruments provided to managers. Thus, if the equity capital instruments come into their own immediately, the manager is not asked to complete a specific period of services before having the absolute right to those instruments.

The practice of providing equity capital instruments and the ways of writing contracts show that services supplied by the manager are stipulated by the compliance with some clauses. For instance, a manager receives shares or share warrants if he has a certain number of years of service. Another clause of providing equity capital instruments is if the manager meets some performance requirements or remain in the service of

entity until that performance requirement is met.

IFRS 2 makes a difference related to the performance required by concluding a contract between owners and managers, namely if there is or not a market requirement. In case when the performance requirement is a market requirement, the estimation as regards duration of anticipated period to satisfy the clauses of coming into his own will be consistent with assumptions used in estimating the fair value of options provided and will not be revised later. According to IFRS 2, a market requirement relates to that requirement on which depend the exertion price, coming into its own or exerting an equity capital instrument that is connected to the market price of an equity capital instrument, such as reaching the specific price per share or the amount specific to the intrinsic value of the share warrant, or achieving a specific goal that is based on the market price of equity capital instruments of the organization in relation to an index of market prices of equity capital instruments.

In case when the performance requirement is not a market requirement, the organization will revise its estimation concerning the duration of period for complying with clauses of coming into their own, if necessary, in case when a subsequent information shows that the duration of period for complying with the clauses of coming into their own is different than the previous estimation.

The IFRS 2 standard also approaches the share based transactions with settlement in cash, in case when the owner provides in the contract it signs with the manager, relations to a future cash payment (rather than an equity capital instrument), based on rising the price of entity's share to a specified level. It is thus provided that the manager can cash by providing a right over a number of shares (even if they are issued at the moment of exerting the share warrants) that are redeemable either compulsorily (for instance severance of the contract), or at the manager's option.

It is required that financial statements should present information that enables the users to understand the nature and dimension of share based payment agreements that exist during the surveyed period, explaining the

way wherein the fair value of services received or the fair value of equity capital instruments provided have been determined, and show the effect of these transactions both on entity's profit or loss, as well as the financial standing.

4. Characteristics of remuneration ways of managers and employees in Romania

In Romania, contract relations between owners and managers as regards the assumptions of agency theory start showing their usefulness in practice as well. At the beginning some clarifications are required over the notion of advantages provided to the remuneration of the members of the Managing Board and directors, the supervisory board and directorate, respectively, as they are presented by the Law no. 31/1990 concerning trading companies.

In the annotations we found information concerning the average number of people hired during the financial year, the breakdown on categories, and personnel costs related to the financial year. At the same time, we found the sum of allowances provided in the financial year to the members of bodies of administration, management and surveillance in virtue of their responsibilities, as well as any generated or assumed commitments concerning the pensions for the former members of these bodies, showing the total value of commitment for each category.

In annotations we also found published the sums of advance money and loans provided to the members of the administration, management and surveillance bodies, showing the interest rates, the main requirements and any returned amounts, as well as the commitments assumed on their behalf as warranties of any kind, mentioning the total on each category.

Related to the application of IFRS 2, the companies that have the category I of transaction at the Stock Exchange of Bucharest stated that in 2009 this standard had no impact over the financial statements (at level of financial standing or performance), the payment methods of the members of Managing Board and directors

being made according to the Law no.31/1990 concerning trading companies. Although the share based payment of managers is still avoided, we suggest to introduce the methods of payment based on shares and share warrants within the Romanian managers' remuneration plans.

Of course, these payment examples are relevant when the price of shares on market increases over the value of the price set previously, the Romanian managers' motivation being that to maximize the price of shares in future. Even if the rise of shares does not mean necessarily the rise of company's value, the income per share can be measured at the same time with, for instance, measuring the return on assets and the return on equity.

Therefore, improvement of performances showed by financial indicators, but also the capital market can be a cause that results in rising the price of shares and hence alignment of goals of both owners and managers, under the circumstances of a specific financial structure.

5. Conclusions

Bonuses based on share or share warrant based payments are a key issue for both executive managers, and owners or shareholders, they being those people remunerated according to their services supplied in line with the IFRS 2. A disadvantage faced in the IFRS 2 application (at least as regards the presentation of financial statements of the year 2009) is that there is not a described, common method, but the fact that it is not applied in any Romanian companies where the state is the major shareholder.

That is why, one of the required challenges is finding those methods and patterns to align the shareholders' interests and requirement of attracting and retaining the good executive directors in the company. It is a problem that should concern all Romanian companies, in order to meet the owners' interest.

Even if right now the capital market in Romania is not important yet in the measuring system of the managers' performance, a selection analysis of those specific performance indicators is required. We consider that tracking of activities segmentation according to maximization of efficiency concerning investments made is important, and in case of capitalizations to stock exchange, identification of indicators related to the capital market and development of earnings from shares is required.

For this analysis frame, at the same time with the positive development of the role played by the capital market, in Romania the requirement of using the IFRS 2 share based payment and development of financial reporting of these remuneration patterns will materialize. The members of the Romanian companies' management bodies will have shares at the companies they manage, thus creating the environment and application opportunities of their methods of payment according to the profitability of shares.

We consider it is required a more precise description related to the remuneration method of management bodies in the trading company, with presentation of information in dynamics, at least on two years, and correlated with the main accounting indicators concerning the company's performance, but with non-financial indicators, too.

Abstract

The way in which insurance companies protect individuals is reflected at the level of the whole society. The more developed a society, the better it is protected – through insurance – against the various dangers its members are exposed to. Ethical, socially responsible behavior is not only necessary, but mandatory both in the case of insurance companies and their clients, the insured. The State through its institutions has the role of cultivating responsible behavior. Within wider research on the Romanian insurance consumer behavior and the factors influencing it we analyzed important aspects regarding the social function of insurance, by using both qualitative market research techniques, as well as the market survey. The research showed that insurance is perceived as being necessary, and the subjects interviewed consider that the State plays a major role on the insurance market. In the insurance field, social responsibility is an element necessary for all the actors involved in the insurance mechanism: the insured, the insurers and the State.

Key words: social responsibility, insurance, marketing, consumer behavior, direct market research.

J.E.L. classification: M31, G22

1. Introduction

Social responsibility lead even from antiquity to the appearance of primitive forms of insurance, forms of mutual aid among people exposed to the same risk. By its very nature, the insurance activity not only has the role to protect the insured against a variety of risks, but also to produce benefic

effects for the whole society. Insurance, as a form of protection against a/some risk(s), is a service bought and sold on the insurance market, which is an important component of the financial services market. [1]

The insurance mechanism is based on risk transfer, as insurance transfers the risk from a person to a group which can pay for the loss easier, thus spreading the risk. The insurer organizes on the principle of mutuality a large number of insured persons, exposed to the occurrence of some risks, and indemnifies the ones that suffer a loss, from the fund constituted of the premiums collected from all the insured clients, as well as from the other incomes resulted following the activity of the insurance company [2]

The insurer must balance the premiums received with the indemnities owed, the incomes obtained with the commitments towards the insured. So that the insurance company can honor all the indemnity claims, it has to organize the mutuality of risks on strict mathematical rules.

The purpose of insurance is the mitigation of the financial consequences of the occurrence of a risk, as it is an instrument which offers financial compensation for unfortunate events, the payments being made from the contributions of several parties participating in this scheme. [3]

Insurance is a financial operation, following either from a contract, or a requirement in the law, through which the insurer is bound to take the risk of the occurrence of a certain event, and indemnify the insured for the losses he would suffer as a result of events independent of his will.

In the insurance field, social responsibility is a vital element, being the starting point for all the actors involved in the insurance mechanism: the insured, the insurers and the

State. Social responsibility is the link between the actors, the element which makes the insurance market function properly.

Ethical, socially responsible behavior is not only necessary, but mandatory both in the case of insurance companies and their clients, the insured. As far as the insured are concerned, the main purpose of insurance is their financial protection. The insured must have a socially responsible behavior, because if they did not have it and there were various illegal practices in their behavior – such as over insurance (this implies the insurance of a good at a value exceeding the real value of the good insured and it is not a legal practice) or the overvaluation of loss etc., this could affect the insurance mechanism.

The way in which insurance companies protect individuals is reflected at the level of the whole society. The more developed a society, the better it is protected – through insurance – against the various dangers its members are exposed to.

The countries where the insurance sectors is prosperous are developed countries like the US, France, Germany, the UK – countries where insurance is not perceived as a secondary product, an extension of basic needs (satisfied by material production), but have the status of a primary need. [4]

2. The functions of insurance and social protection

The functions of insurance are the more complex the more developed the insurance industry is in a country. The main functions of insurance are the following: the function of financial compensation for loss due to the occurrence of one or several risks, the function of prevention of risks and losses, the function of distribution, the financial function, the control function, the saving function, the function of reduction of costs to the state.

1) The function of financial compensation for loss due to the occurrence of one or several risks. Insurance has the role of contributing to the repairing/replacing of goods damaged or destroyed, of compensating for losses the insured are responsible for according to the law, and of granting amounts in the case of events concerning people's life and integrity. [5]

2) The function of prevention of risks and losses. This function is achieved through financing measures of loss prevention for natural calamities and accidents. Prevention can be made by building dams to protect against floods, through draining, reforestation, irrigations in areas affected by draughts, through consolidating buildings, through creating programs for information, educational programs for the insured, etc. Social responsibility in this case can be attributed to the state, but also to potential insured clients and insurance companies. For instance, so as to prevent floods with disastrous effects – like this year's floods – starting with October 2010, insurance companies together with the Commission for Insurance Supervision (CSA) have announced that they will initiate a reforestation program for areas where forests had been cut down or on the shores of waters in the afflicted areas. [6]

The mandatory home insurance [7] may be seen as a measure that can help in the prevention of risks and losses.

Moreover, prevention can be made through setting insurance terms that would force the insured to have a preventive behavior. For instance, through practicing the franchise – the insured participates in covering part of the loss and is thus forced to have a preventive behavior.

3) The function of distribution. This is manifested in the process of forming the insurance fund available to the insurance company, then in the process of directing the fund to its legal destinations. Likewise, taxes are directed towards the budget, and the due contributions to the state social insurance fund. [8]

4) The financial function. Revenues come from the fact that not all insurance policies have as a result the occurrence of the risk and from the gap between the moment of collection of the premiums and the moment when the loss occurs and the indemnity is paid, period when the amounts collected from premiums can be invested by insurance companies.

5) The control function. This is a complementary function of insurance [9] aimed at identifying the causes which produce loss, the way in which insurance premiums are set and collected, the way in which the payment of indemnities is made,

the management of the insurance fund and of the legally constituted reserves, the way in which the insurer meets its financial obligations, etc. The control is made by specialized bodies of the insurance companies. An important institution for control on the Romanian market is the Commission for Insurance Supervision.

6) The saving function. This is a function specific to life insurance, the insured having the possibility, in the case of certain policies to benefit of the amount insured and to participate to the profit obtained from the amounts invested when the insurance contract expires.

7) The function of reduction of costs to the State. Due to insurance social protection costs can be reduced. Thus insurance companies support the State in social and medical assistance, pensions, compensations for work related accidents and other domains. [10]

By their nature insurance services have an important role in society which makes social responsibility indispensable in the activity of insurance companies.

The economic role of insurance is extremely important, as they contribute to the development of national economy both by loss prevention and compensation, and through the fact that they represent an important means of saving and investment (for instance insurance can help you earn a supplementary income after retirement; get a loan for building a house etc.)

The role of insurance companies is to correctly assess the commitments towards the insured and to manage the funds collected from them. The insurance fund is used to cover the losses produced by the events insured, in the case of property insurance and third party liability insurance, and to pay the amounts insured in the case of life insurance, to finance activities related to loss prevention, to constitute reserve funds at the disposal of the insurance company and to cover the administrative expenses of the insurance company. The insurers must try to increase the amounts obtained from premiums by investing them, but at the same time they have the obligation to have the necessary liquidities to honor the payment obligations arising from the insurance contracts.

Insurance can be considered the easiest and most efficient social tool for protection against risks. Specialists consider that by pricing risk, insurance provides incentives for reducing risks [11]

There is a certain social role in the provision of insurance. Many technological and scientific ventures were possible because insurance helped spreading the risk. [12]

The relation between the insurer and insured is based on trust and good-will, on the social responsibility of the parties involved.

3. The methodology of the direct market research concerning the perception of the social function of insurance

Within wider research on the Romanian insurance consumer behavior and the factors influencing it we analyzed important aspects regarding perception of the social function of insurance, by using both qualitative market research techniques and quantitative methods.

The study of the way in which insurance services and insurance companies are perceived in Romania, the perception of the potential insured regarding mandatory home insurance in Romania, the influence of socio-cultural factors on the behavior of the consumer of insurance services, the attitude of the insured towards illegal practices in insurance can be studied by using direct market research.

Direct research is the main method used in market research to obtain the necessary information. [13] Function of the type of information to be obtained, market research can be divided into quantitative research and qualitative research. [14]

In the current market survey we used both methods of research, as we aimed at generating ideas related to the analyzed phenomenon through qualitative research – ideas related to the insured behavior, which we then tried to quantify with the help of quantitative research.

The qualitative research was conducted among Romanian people who are over 18, from an urban as well as a rural environment, by using semi guided interviews. We have actually conducted two series of interviews:

first a qualitative research took place in October-November 2009 (59 insured, aged over 18, from urban and rural environment), and the second qualitative research was made in April 2010 (59 insured, aged over 18, from urban and rural environments).

The survey was conducted on a sample of 1068 persons, with a probability of 95% and a margin of error of +/-3%.. The research was conducted based on a face to face interview with the subject with the help of a written questionnaire completed by the interview operator. The interviews took place between April - May 2010.

4. Main results of the direct research concerning the perception of the social function of insurance

From the analysis of the replies of respondents in the qualitative research we can conclude that for the vast majority of respondents, the concept of insurance is related to the idea of **protection** (see more about this subject in [15]). Only a small part of the subjects interviewed see in insurance an investment tool.

Overall, insurance products enjoy a positive perception. However, there is an important number of insurance consumers who do not have a favorable opinion on the insurance products present on the Romanian market, a small number of subjects interviewed with a neutral opinion ("they are all the same" etc.), and there is also a fairly large number of subjects who do not have an opinion due to insufficient knowledge of the supply.

The insurance products perceived as being attractive are RCA and CASCO insurance, followed by life insurance, home insurance, property insurance, health insurance. A small part of the subjects interviewed said they did not find any type of insurance attractive. Respondents consider insurance services necessary and they trust insurance companies. The majority stated that they had a good opinion about the company with which they closed an insurance contract.

Starting from these data, the quantitative research was designed and a questionnaire was created. The data was gathered based on the latter.

In Table 1 we can observe that the most feared risk for the interviewed subjects is earthquake risk (see more about this subject in [16]).

Table 1. The most feared risk

	Female	Male	Total
Financial risk	9.18%	14.98%	24.16%
Earthquake	16.39%	9.27%	25.66%
Floods	5.99%	3.18%	9.18%
Theft	3.37%	10.67%	14.04%
Other	9.74%	6.27%	16.01%
No Answer	2.34%	8.61%	10.96%
Total	47.00%	53.00%	100.00%

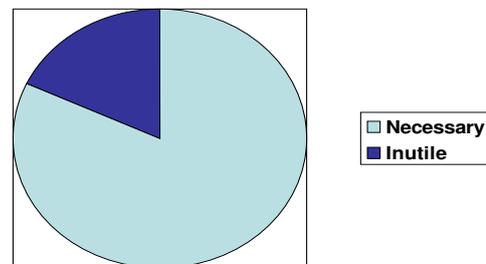

Source: data resulted from the survey

The general perception on the insurance industry was studied this time by using the Likert scale, the subjects investigated being asked to express agreement or disagreement with a series of statements regarding the insurance industry. By analyzing the responses, we can state that insurance in Romania is perceived as necessary, even though you have to make a financial effort, and the activity of insurance companies in Romania is benefic for the population.

In Romania insurance services are perceived as necessary, yet inaccessible. Moreover the crisis is perceived as severely affecting the insurance sector in Romania; however the subjects consider insurance necessary during the crisis (see more in [17]).

In the quantitative research we studied the opinion on mandatory home insurance and the answers have shown that mandatory home insurance is perceived as being a rather good measure: mandatory home insurance (MHI) in Romania is perceived as necessary by 81.9% of the subjects interviewed, the rest considering it useless (see Figure 1).

Figure 1. Perception of the utility of MHI

Source: data resulted from the survey

In the quantitative research we studied the attitude of the insured towards illegal practices using the semantic differential scale (with five levels). The answers to the question: "What is your attitude towards illegal practices in insurance? I condemn these practices 5 __ 1 I understand them) have revealed an ethical behavior, the subjects having an unfavorable view on these and condemning them (a 4.8 score).

To the question whether, in Romania, there is a mentality for or against insurance the majority of subjects consider that there is a pro insurance mentality: "Pro. The Romanians purchase insurance because they are afraid of possible accidents" etc. The interviewed subjects, who consider that there is a mentality against insurance, justified their answer by saying that the causes of a mentality against insurance are poverty and the lack of knowledge.

Regarding the role of society in the development of the insurance industry the opinions of the majority are positive, the subjects interviewed considering that the industry can develop because "There is a certain level of risk awareness among Romanians" etc. The subjects interviewed that consider that the role of Romanian society in the development of the insurance industry is not important justify their answer by the low level of incomes of Romanians.

Concerning the role of State institutions in the development of insurance, the opinion of the respondents is that the State should play a major role through legislation. However, a large part of the interviewed consider that the institution of the State encourages only to a low degree the development of the insurance industry.

The majority of subjects consider that there are cultural differences between us and other states which determine the way in which we purchase insurance.

5. Conclusions

The direct research has revealed that the subjects interviewed have a good perception regarding the role of insurance as a social instrument, as a protection tool against different risks. From the results we can deduce that there is a pro-insurance attitude and that, if the economic level allowed it, the

society, through its members, would support the insurance sector.

Another important aspect that should be noticed is that, in the opinion of the respondents, the State should play a major role in the development of the insurance sector and in the social protection of Romanian citizens through legislation and by assuring the economic security of citizens.

The Contribution of Accountancy Intelligence to the Development of the Economic Intelligence

Petroianu Grazia – Oana
„Constantin Brâncoveanu” University of Pitesti,
Faculty of Management Marketing in Economic Affairs Braila
oana_petroianu@yahoo.com

Abstract

Organizations of all sizes and kinds are challenged by the needs of information management. Given the increasing competition in the current business environment, organizations are paying more attention to the knowledge as a key element in obtaining competitive advantages. One way for the organizations to create a knowledge management is, according to the experts, through the economic intelligence.

The economic intelligence representing a way to manage and control the information, may be applied to all economic sectors and not only, since we may talk of cultural, social, legal, accounting and financial intelligence.

The economic intelligence mainly addresses users that want up to date information to make the best decisions in a framework of a defined strategy. It is also of interest to policy makers who create the context for other's strategies or, more generally, to suport creativity processes.

Key words: economic intelligence, accounting intelligence, financial intelligence, knowledge management.

J.E.L. classification: M4, M40, M41,

1. Introduction

In the present conditions, the use of quality resources and the achievement of a proper relation with the market are not sufficient so that the organization may attain competitiveness and performance, the manager facing permanently challenges generated by competition on the one hand, and by the business partners, technical and technological suppliers, clients or

„producers” of regulations, laws and institutional, administrative, fiscal mechanisms on the other hand. This complex medium, in which the only safe thing is a change, must be very well known by the management, so that it may be intelligently mastered and exploited. The ways, means and mechanisms necessary to cope with such challenges have already been made and improved in time, especially by the large companies, but also by state specific organisms or by private or mixed agencies and organisms. All this has started to be known what the specialists call „economic intelligence”.

The field of economic intelligence has not been yet delimited with enough precision, the sense given in speciality works being quite general, it is associated respectively with activities of identification, search, collection, treating, diffusion and exploitation of information necessary for the decision substantiation at the level of company, organization, corporation, etc. The economic intelligence is conceived in the spirit of ethics with authority structures, especially with those belonging to state (sovereignty) and to organizations.

Initially developed under the form of technological supervision, the economic intelligence has proposed actions from this domain: the anticipation of technical and technological innovation; the protection of technological advantages; the detection of technical and technological threatens; the protection of material and imaterial patrimony of an organization, etc. Once with the diversification of activities for meeting the informational needs of an organization, the economic intelligence appears as an assembly of activities, techniques and instruments by which the information is used to achieve actions or in other words, this becomes an action and the enterprise

involves faster and surer to competitiveness and performance.

2. The concept of economic intelligence

In speciality literature, the economic intelligence represents an assembly of actions coordinated by research, the processing and diffusion of information necessary for the economic actors. The useful information is the one needed for different decisional levels of organizations or collectivity to elaborate and function in a coherent way of tactics and strategies necessary to attain the organization objectives in order to ameliorate its position in the competitive environment.

Most specialists summarize the economic intelligence in the form of the following axes:

- economic supervision (getting pertinent information);
- protection of informational patrimony (non admittance of secrets);
- assistance in decision – making (analysis, decisional cartography etc);
- influence (diffusion of information or of a way of behaviour and interpretation which influence strategy).

The entire steps of economic intelligence are translated in starting some actions which integrate into organized measures in the following way:

- *Definition of informational needs* according to the strategy of economic entity, with the aim to identify priorities and consequently to fix the orientation regarding the collection of information;
- *Selection of information available in organization;*
- *Collection of open information* using adequate research instruments to allow the keeping of only pertinent information;
- *Taking into consideration the informal information* which often offers the higher extravalor for the organization alongside network and ground activities;
- *Selection and processing of gathered information* using information

processing instruments and consulting experts in the respective field, especially the chartered accountants (general accountancy is primarily a structure of the organization informational system.

- *Diffusion of information to the right persons in the right moment in the most adequate way*, commissioning a scheme of information circulation and implementing an exchange culture within the organization to enable the loss avoidance and insulation of information;
- *Environment influence by lobbying* actions, using information as action lever which enables the promotion of organizations interests in a legal framework;
- *Getting everybody adhesion* and commissioning of devices which enable the distribution of information within the organization according to a vertical hierarchical axis as well as a transversal one, the economic intelligence being, from this point of view, a vector of organizational culture.

As regards the functions of economic intelligence, in the speciality literature one can distinguish four functions of economic intelligence: management, memorization, network, analysis:

- *Management.* Economic intelligence is in the organization service. In this way it is led by the manager, who has to define his objectives and the main questions he has to answer. At the beginning the questions must remain open, in order not to exclude, if possible the eventual key-information which might come out of the context. Ethics and deontology are advised by this function.
- *Memorization.* This is the only one specific to economic intelligence. Memorization duty is to keep the explicit information and knowledge of the organization, maybe obtained owing to economic intelligence. It may be organized in a project of knowledge engineering. It is about a structured referential in which the main data are compatible with the structure of information system and

which answers to some coherent, internal or external norms.

- *Network.* Frequently we can distinguish: an external network – made of persons who do not belong to the organization (employees acquaintances, clients, suppliers, business partners etc) and an internal network – the organization employees may serve as experts for a question and supply information.
- *Analysis:* It is about the correspondants of economic intelligence network who supply pertinent questions and validate the answers offering various choices for the organization.

If on a theoretical level it follows the management and protection of strategic information that is useful to all decision - making factors, on a practical level the economic intelligence represents a state of mind, a way or an instrument to collect and process all data information that are necessary in the decision - making process.

3. The process of economic intelligence in a modern vision

Some advisors in economic intelligence state that its commissioning needs first of all an evaluation of organization strategic culture, beginning with:

- an audit stage of economic intelligence;
- a follow up of competitors methods, especially of methods used by the large groups;
- analysis of the best practices within the organization.

This conception on economic intelligence may encounter some difficulties:

- „The audit of economic intelligence” can give rise to some dangerous actions for the organization, as it entrusts to an outer intermediary the role to make the employees to talk about sensitive subjects.
- The scientific works about economic intelligence showed that a manager is not able to formulate the knowledge objectives without avoiding the great deviations of perception and interpretation.

- Such an audit, even one correctly done may met two errors: the client is told things which he has already known or he is told things which he does not like to hear.
- The follow up of competitors methods can lead to imitation, mimetism, but if this is donea correctly, it can bring a richness of ideas and eliminate inhibitions.

The difference between economic intelligence and business intelligence

Economic intelligence distinguishes from business intelligence, because the latter corresponds in reality to a particular category of applied information.

The phrase business intelligence is commonly used as a synonym of decisional informatics, a concept which covers a much too limited perimeter and whose usage is focused on the control and activities optimization rather than on the global knowledge of opportunities and strategic threatenings. Furthermore, business intelligence especially relies on operational prestructured, quantitative data, already available in the internal informational system, and very little on qualitative or external multiform data.

4. Accounting and financial intelligence – new territories of economic intelligence

Economic intelligence advises any person who manages any public or private organization, a director of an organization, organism or administration, no matter their size or activity. However, mention should be made that it is quite often met in the large groups. In this context the chartered accountants have to play a part in the development of economic intelligence.

In methodical terms, economic intelligence consists in a pluridisciplinary measure, to the extent in which the information analysis needs environ – mental, juridical, technical, economic, commercial, accounting and juridical competences. Knowing progressively the need of implication of all economic actors makes it easy the role of chartered accountants on this subject, especially in case of extension of economic intelligence at the level of new

territories such as accounting and financial intelligence.

The appearance of the concept of accounting and financial intelligence is justified by a public policy by which it is desirable to assure the keeping of a number of strategic organizations in the state patrimony.

The vulnerability of enterprises in actual conditions peculiar to an economy in crisis represents a problem all over the world. With this aim in view the public powers, especially the Ministry of Economy, Commerce and Affairs Environment and the Ministry of Public Finances intend to mobilize the chartered accountants to identify the organization weak points and to find solutions to solve them in a partnership with the advised public services.

The chartered accountants are specialists categories directly advised by economic intelligence. First of all, they need a better administration of their own information and the protection of those having a strategic character. They also have to correctly administrate and protect information about their clients. It is important to mention that the chartered accountants play a main role in the relationship with their partners, their clients respectively, in order to explain them the games connected to economic intelligence. The competences in the field of administration of organizations accounting and financial information offer the chartered accountants a total legitimacy for the development of a new field, that of accounting and financial intelligence.

Chartered accountants are the main actors of accounting and financial life, they being the ones to capture, interpret and spread information. They also develop indicators and graphics which enable the organizations the management of all the accounting and financial information available to them.

Accounting and financial intelligence is a strategy for the managers regarding the protection of their patrimony and for the development of their activities. They are assisted by the chartered accountants, who can present information to third parties as regards the organization financial stability, who can objectively make a lecture of the financial standing and who also can comment on the organization patrimony and financial standing.

The account users are finally in the position of understanding the organization vulnerability starting from the analysis of annual accounts and their evolution in time.

It may be about bankers, shareholders, credit suppliers and other suppliers who must be assured as regards the organizations financial solidity through the quality of financial information registered in the annual accounts. It can also be about the public powers who want to sustain the strategic activities and who have to understand the organizations vulnerable points so as they may offer the necessary support.

The chartered accountant represents the first ring in the chain of expert's report. He understands and he integrates very well in the field of systemic analysis, as the organization is more or less an economic microsystem put to uncertainty and risks which may appear in their operational environment.

5. Conclusions

The economic intelligence has become a subject of major importance for many enterprises and organizations or institutions owing to the important flow of information handled, world competition ever more intense and to the development of the regulation actions. The actions of economic intelligence are not unknown for the actual organization in the conditions in which we speak about modern, competitive and performant enterprises.

The success of the activities of economic intelligence is conditioned by the relations between the organization and its system of information, on the one hand and the local, regional and national administrations on the other hand. Most of the information necessary to enterprises comes from this area, either it is about policies and strategies, or that appears the need of information of regulations, laws and standards, or that it is useful the participation to the assurance of a good social medium.

Economic intelligence is not applicable only to the sectors of economic life but it also adjusts to the following fields: humanitarian, cultural, social, sportive, juridical and even accounting and financial. In this context, the most important role as regards the accounting and financial intelligence belongs to the chartered accountants, who have to be placed

within these measures so as they may join leaders of companies (creators of values and working places) but also of third parties who come into contact with the company (bankers, social organisms, public finances, employees, etc). If this placement is achieved from the manager's point of view, the objective of the chartered accountants will be that of reducing uncertainties about the risks the enterprise is subjected to.

Strictly referring to financial intelligence, this can be looked upon between the manager quality and enterprise financing, as an extension of the manager's horizon on the organization imaterial capital and the achievement of actions in the vision of a sustainable development or as a means through which new connections with partners are invented to contribute to the sustainable development.

All this is nothing else but the result of a synergy given by different sources of organization intelligent finance respectively: public, private and individual. Whwn the manager will succeed in achieving a good management of internal and external information and will resort less to bank finance in favour of intelligent finance sources, less expensive for the organization will surely succeed to regtister the company in the category of competitive, performant and intelligent ones.

Brand Loyalty- a Valuable Asset

Petrușcă Claudia-Ioana

Brunello Adrian

"Alexandru Ioan Cuza" University of Iași, Doctoral School of Economics

petrusca_claudia@yahoo.com

adrian_brunello@yahoo.com

Abstract

Brand loyalty represents a significant factor which leads to the development of business competitiveness and also it is one of the most frequently implemented marketing initiatives by the practitioners. The question of how loyalty develops has been subject to an abundance of research, leading to an expansive body of literature on loyalty determinants. This article focuses on brand loyalty as an important company asset. Defining the concept and typology of brand loyalty supports practitioners and researchers build successful relational marketing strategies.

Key words: brand, loyalty, brand loyalty, brand equity.

J.E.L. classification: M310

1. Introduction

Brands have become a major player in modern society. In fact they are everywhere. They penetrate all spheres of our life: economic, social, cultural, sporting, even religion. Because of this pervasiveness they have come under growing criticism [1]. As a major symbol of our economies and postmodern societies, they can and should be analysed through a number of perspectives: macro and micro-economics, sociology, psychology, anthropology, history, semiotics, philosophy and so on [2].

2. The brand and its significance

There is strong disagreement between experts concerning the definition of a brand. Each author comes up with his or her own definition, or nuance to the definition. The problem gets more acute when it comes to

measurement: how should one measure the strength of a brand? What limited numbers of indicators should one use to evaluate what is commonly called *brand equity*? In addition, there is a major schism between two paradigms.

The first one is the customer-based and focuses exclusively on the relationship customers have with the brand (from total indifference to attachment, loyalty, and willingness to buy and re-buy based on beliefs of superiority and evoked emotions).

The second paradigm aims at producing measures in dollars, euros or pounds.

The financial approach measures brand value by isolating the net additional cash flows created by the brand. These additional cash flows are the result of customers' willingness to buy one brand more than its competitors', even when another brand is cheaper. Why then do customers want to pay more? Because of the beliefs and bonds that are created over time in their minds through the marketing of the brand. In brief, customer equity is the preamble of financial equity. Brands have financial value *because* they have created assets in the minds and hearts of customers, distributors, prescribers, opinion leaders.

These assets are brand awareness, beliefs of exclusivity and superiority of some valued benefit, and emotional bonding. This is what is expressed in the now classic definition of a brand: 'a brand is a set of mental associations, held by the consumer, which add to the perceived value of a product or service [1]. These associations should be unique (exclusivity), strong (saliency) and positive (desirable).

This definition focuses on the gain in perceived value brought by the brand. How do consumers' evaluations of a car change when they know it is a Volkswagen, a Peugeot or a Toyota? Implicitly, in this

definition the product itself is left out of the scope of the brand: 'brand' is the set of added perceptions. As a result brand management is seen as mostly a communication task. This is incorrect. Modern brand management starts with the product and service as the prime vector of perceived value, while communication is there to structure, to orient tangible perceptions and to add intangible ones.

3. Brands-important company assets

There are very few strategic assets available to a company that can provide a long-lasting competitive advantage, and even then the time span of the advantage is getting shorter. Brands are one of them, along with R&D, a real consumer orientation, an efficiency culture (cost cutting), employee involvement, and the capacity to change and react rapidly. This is the mantra of Starbucks, Apple and Zara.

Successful brands are the most important assets of a company. Specifically, those assets represent the knowledge created in the minds of consumers as a result of all of the marketing programs executed for those brands. In one sense it can be viewed as the result of the total resource investment in marketing the brand. All the marketing activities including product development, market research, advertising, promotion, distribution, sampling, and others act to create a brand image in its target audience.

Firms may choose from among three main branding strategies which link products to the company [3]. One strategy employs individual brand names for different products without an explicit connection to the company or to each other. Procter & Gamble has employed this branding strategy with brands such as Tide, Bold, Cheer and many others. Each brand has its own brand identity and can develop its own brand equity. In the unlikely event of a Procter & Gamble product catastrophe, each brand would be rather insulated from adverse publicity. Indeed when toxic shock syndrome claimed users of one of Procter & Gamble's brands, there was virtually no link to the company's unrelated brands. One difficulty is that the company's identity is so removed from individual brands that a consumer looking for Procter & Gamble quality might wonder whether Fab (Colgate-Palmolive) or Dash (Procter & Gamble) is a Procter & Gamble brand.

4. The concept of loyalty

Loyalty is defined as repeated purchases of particular products or services during a certain period of time. For this reason brand loyalty is measured using the purchase frequency of a particular brand [4] or the possibility of acquiring it. Researchers measure five types of behavior during certain time intervals to operationalise loyalty in a competitive market: (1) the percentage of customers buying a brand, (2) the number of purchases per buyer, (3) the percentage of customers who continue to buy the brand, (4) the percentage of customers who are 100 percent loyal, and (5) the percentage of customers who also buy other brands-duplicate buyers [5]. However, this kind of behavioral definition has been criticized for its limitations in predicting future behavior; therefore it is difficult to distinguish between repeat purchase behavior attributable to convenience and commitment.

Another argument is that behavioral loyalty does not explain multi-brand loyalty in the context of consumers who buy two or more brands interchangeably [6].

Jacoby & Chestnut (1978) explored the psychological meaning of loyalty. A psychological approach implies attitudinal loyalty that includes cognitive, affective, and conative elements [7]. Oliver (1999) defined loyalty as „a deeply held commitment to re-buy or re-patronize a preferred product or service consistently in the future, despite situational influences and marketing efforts having the potential to cause switching behavior". Researchers have thus proposed a two-dimensional conceptualization of loyalty by adding the attitudinal dimension [8]. For example, Dick and Basu (1994) classified loyalty into four different categories based on repeated patronage and relative attitude. The categories are loyalty, spurious loyalty, latent loyalty, and no loyalty. Research findings support two-dimensional measurements as more accurate in determining a customer's future behavior [9].

Reviewing research, it becomes obvious that the notion of customer loyalty is blurred. At its core, customer loyalty deals with relationships between suppliers and their customers and can be distinguished from other loyalty aspects, such as brand loyalty,

which refer to a more abstract attachment, such as that towards a brand.

Within German customer loyalty literature, the notion of customer loyalty is even more faceted [10]. The German word for customer loyalty, 'Kundenbindung', encompasses both 'customer loyalty' and 'customer retention', wherefore [11] distinguishes an active, supplier-focused component and a passive, customer focused component of customer loyalty or 'Kundenbindung'.

In the supplier-focused perspective, customer loyalty is seen as a bundle of measures that aim at improving relationships with customers. The supplier is in the center of attention and the customer is only regarded as the factor at which success of customer loyalty becomes manifest. Here it becomes clear that this approach contains a conceptual deficit. It is the customer who eventually decides on whether customer loyalty management is successful or not, because all activities undertaken by a supplier can only be geared at influencing customers to be loyal. A customer-focused perspective therefore has to be added to evaluate the success of customer loyalty management.

Within the customer-focused perspective, customer loyalty is conceptualized taking into account customers' complex characteristics. These can either be approached as customers' directly observable actions and/or take into account their attitudes and intentions. Since customers' actions are directly influenced by their attitudes and intentions, it is obvious that these have to be scrutinized [12] to understand and manage loyalty.

A third perspective identified by Dorsch, Scott, & Scott (1998) is a synthesis of the former two approaches. The relationship-focused perspective directly examines the relationship between suppliers and customers. Accordingly, the objects of study in this perspective usually are buying behavior in retail contexts and long-term relationships marked by frequent interaction between suppliers and buyers in industrial contexts.

It is clear that the supplier-focused perspective with its instrumental approach is significantly different from the other two approaches. Distinguishing the customer- and

the relationship-focused perspective, however, is difficult, because both focus on the customer. Eventually, even within the relationship-based perspective, a customer decides on the initiation, continuation, and development of a relationship. Therefore, researchers like Henning-Thurau, Gwinner, and Gremler postulate to focus exclusively on the customer-based perspective. And in fact, the customer-focused perspective dominates current research on customer loyalty.

As this approach serves as the basis of this study, details of the customer focused perspective are given below [13].

Within the customer-focused perspective, two separate approaches have to be distinguished, the behavioristic and the neo-behavioristic approach.

While the behavioristic approach dominated research until the 1970s, Jacoby & Chestnut (1978) introduced the neo-behavioristic approach. Instead of exclusively considering observable behavior, as in behaviorism, neo-behaviorism accounts for customers' attitudes and intentions. The two approaches will be detailed in the following section.

5. Brand loyalty - behavioral and attitudinal perspective

Brand loyalty represents a favorable attitude toward a brand resulting in consistent purchase of the brand over time [14]. It is the result of consumers' learning that only the particular brand can satisfy their needs. Marketing literature presents two approaches of the study of brand loyalty. The behavioral perspective views consistent purchasing of a brand over time as an indication of brand loyalty. Behavioral measures have defined loyalty using indicators such as the sequence of purchases and/or the proportion of purchases [15].

Repeat purchasing behavior reflects reinforcement and a strong stimulus-to-response link. This perspective regarding loyalty may represent a lack of commitment to the brand and it can also reflect a repeated buying experience based on inertia.

The cognitive perspective to brand loyalty reflects and points out that behavior alone does not indicate brand loyalty [16]. Loyalty

implies a commitment to a brand that may not be shown just by measuring continuous behavior. For example, an individual or a household might purchase a particular brand because it displays the lowest price on the market. If the price increases, the buyers may shift to another brand. Therefore, this situation presents the case in which continuous purchasing does not reflect reinforcement or loyalty. The connection between the purchased good and the reward is not strong. One may state that some of the drawbacks of the behavioral perspective can be overcome when loyalty relates both to attitudes and behavior [17].

Brand loyalty ranges from the habitual buyer to the satisfied buyer, to those that like the brand and finally to those who are truly committed. Its role is to generate value mainly by reducing marketing costs: it is much easier for a company to retain its existing customers than to attract new ones [16]. Competitors have difficulties in communicating with satisfied brand users, because these people have very little motivation to learn about alternatives. The competitor brand encounters a lot of problems. A common and significant mistake is to neglect existing customers while trying to attract new ones [1].

Loyal customers may, in some cases, entice others by using the product or advising others to use it [20].

6. Types of brand loyalty

Brand loyalty is a complex phenomenon which displays at least seven alternatives.

In emotional loyalty, unique, memorable, reinforcing experiences create a strong emotional bond with a brand. Positive word-of-mouth is likely to be very high [8].

In identity loyalty, the brand is used as an expression of self, to boost self-esteem and manage impressions. Branding prospects into related product categories are good.

In differentiated loyalty, brand loyalty is supported by perceived superior features and attributes. Demonstrations and trials play a significant role here, becoming very important tools of marketing tactics. In contract loyalty, a consumer believes that continued loyalty earns him or her special treatment, but a competitor can question

whether the consumer's trust is being exploited [16].

In switching cost loyalty, a consumer is loyal because the effort involved in considering alternatives and adapting to a new alternative is not worth the expected return. Sometimes, the consumer may even be dissatisfied but will remain loyal because a competitor is perceived to be same. Competitors can undermine loyalty by making it easy to switch through, for example, product design, training and terms [18].

In familiarity loyalty, brand loyalty is the result of top-of-mind brand awareness. This kind of loyalty is defended and attacked by constant, attention arising advertising that builds top-of-mind brand awareness.

Finally, in convenience loyalty, brand loyalty is based on buying convenience. This type of loyalty may be attacked by the expansion of a competitor into convenience channels.

It can be concluded that some types of loyalties are relatively easy to change because the habit is only superficial, sustained by buying convenience or the fact that the brand is the first to occur to mind [19].

Brand loyalty plays a significant role in customer-based brand equity. It reflects how likely a customer will be ready to switch to another brand, especially when that brand makes a change, either in price or in product features. As brand loyalty increases, the vulnerability of the customer base to competitive action is reduced. There are at least five potential levels of loyalty [14]. These levels do not always appear in the pure form.

However, the five levels provide a feeling for the variety of forms that loyalty can take and how it influences brand equity [1].

The first loyalty level is the non-loyal buyer who is completely indifferent to the brand. Each brand is perceived to be adequate, and the brand name plays only a small role in the purchase decision. This buyer can be named a switcher.

The second level includes buyers who are satisfied with the product or at least do not show signs of dissatisfaction. These buyers are considered to be habitual buyers.

The third level consists of those who are also satisfied and, in addition, have switching costs, such as the costs in time or money associated with switching to another brand. This group represents switching-cost loyal consumers.

On the fourth level we find those that truly like the brand. Their preference may be based upon a symbol, a set of use experiences or a perceived high quality. Segments at this fourth level might be termed friends of the brand, because there is an emotional attachment. Committed customers are the most valuable clients of a company and they form the top level clients in the hierarchy. They feel pride in being users of a brand. The brand is very important to them either functionally or as an expression of who they are. Their confidence in the brand is so strong that they will recommend it to others.

The brand loyalty of existing customers represents a strategic asset that, if properly managed and exploited, has the potential to provide value in several ways. A loyal set of customers can reduce marketing costs, since it is much less costly to keep a customer than to gain and regain, and it provides trade leverage over others in the distribution channel. Customers can create brand awareness and generate reassurance to new customers. Loyal customers will also give the company time to respond to competitive threats [1].

7. Conclusions

In order to fully understand the concept of brand loyalty, this article presents both the client and the company perspective.

The above analysis of the marketing literature concludes that brand loyalty, from the consumer perspective, is considered to be the commitment to re-purchase a preferred product or service consistently in the future, regardless of situational context or competitor's marketing efforts. Loyalty is viewed as a component of brand equity, because loyal consumers tend to exhibit more favorable responses to a branded product than the clients who do not have loyal intentions or switching consumers. The perceived quality of a brand is considered to be the subjective judgment of consumers with respect to a brand's overall excellence and superiority, which leads a customer to

purchase a brand over another competitor brand. The concept of perceived value attributable to a brand is a function of aligning the price of purchase and costs associated with the ownership of a brand's product and the expectations of consumers.

Brands are intangible assets, assets that produce added benefits for the business.

This article also includes the firm's perspective related to the best way of managing brands in order to obtain profit. Due to the fact that brands are now recognised as part of a company's capital (hence the concept of brand equity), this article argues that they should be more exploited.

Financial Innovations

gabriela_piciu@yahoo.com

georgiana_chitiga@yahoo.com

Abstract

The article presents that financial innovation have played a vital role in some bank failures; as the markets undergone significant changes over recent decades, this in consequence has brought some new instruments and techniques into practice in both national and international financial markets. This has resulted in international banks operating in a more risky environment. These financial innovations have facilitated the management of risks in a better way in both dealings and operations.

Financial innovation as derivatives are a kind of insurance policy, they can be used as a hedge against the unfavorable movements in currencies, interstates or commodity prices derivatives are just a shift in risk, also they can be used to limit, manage and manipulate risk in different manners.

Key words: financial markets, derivatives, management of risks

J.E.L. classification: G12, G13, G14, G20

1. Introduction

International financial markets have changed dramatically in the past decade and are likely to continue changing at an even higher pace with the help of information technology. The Euro bond market has proven fertile for the introduction of many experimental techniques that are designed to meet the requirements of investors and issuers in the market. In today's world, investors and issuers are confronted with dual currency bonds and reverse-dual currency bonds, futures options and swaps. In the recent past, with the rapidly increasing popularity of the internet, many issuers are using the internet for issuing bonds. All these

innovations are the result of the combination or modification of basic contracts, and if the pricing of bonds and forward contracts and the like is understood, in many cases the price of complex sounding instruments can be estimated. [1]

In 1983 Sibley argued that product innovation arises because of constraints—namely—regulation—competition and risk—placed on a bank. One of these constraints can act as a catalyst for financial innovation that allows bankers to bypass the rules. Eurocurrency markets were developed in such a way where bankers wanted to bypass the regulatory framework. Financial innovations are designed to benefit one of the parties involved in the contract. The benefits can range from lower cost of capital for the issuer to higher returns for the investors. Also, they help in reducing risk, tax cuts and in foreign currency exposure. These financial innovations have also been introduced following some market imperfections. When the product offered in the market are a result of market imperfections then, the product life cycle is shorter as once the policy makers take some action, the popularity of the product declines and hence with time the product vanishes, but on the other hand there are some products that have a rising product life cycle and once confidence is gained with the technique it lowers the cost and increases the volume; currency swaps in the 1980's followed the same life cycle.

Financial innovations go hand in hand with information technology. The remarks made by the Vice Chairman Roger W. Ferguson, Jr. at the financial services conference 2000, "...my colleagues at the Federal Reserve Board have often noted, technological innovations affects not just banking, financial services and regulatory policy, but also the direction of the economy and its capacity for continued growth..."

From these remarks it is obvious that innovations are chained together and change in one line will affect the other line of business.

Recently it has been seen that even the most conservative organizations have tried to adopt new technology. As a result of the Internet revolution many banks have been observed offering online services to their customers and many brokerage houses offering trading business online. Also, with the invention of mobile phones, the prices of many instruments and currencies are available in a short time period to our handsets. Many banks have realized the importance of information technology and therefore they are now making huge investments in technology. Apart from investing in IT they are also trying to upgrade their infrastructure; these investments are being made not only to provide electronic-based services but also to manage their risk positions and pricing. As mentioned above, the Internet has made it possible for small financial institutions to reach their customers at reasonable costs through offering online retail banking; this has not only increased the customer base but also reduced costs.

Financial and technological innovations bring many benefits but they also carry some risks. If banks fail to recognize these risks or lack knowledge of the products and services they offer then these innovations can turn out to be disastrous. The financial innovations will be examined and then technological advancement will be considered.

2. Understanding new instruments

In the recent past many firms have revealed financial losses as a result of new innovations being offered in the market. Many people consider them to be financial instruments of the devil. These disasters in the past have raised questions among the managers about what precisely these derivatives are and why are they being used?

We would like to mention two quotes by people involved in the business of dealing with derivatives:

a) Based on recent press reports, the current media definition sometimes seems to be: "A derivatives transaction is any financial transaction in which a large amount of money is lost";

b) Top management, whether corporate or otherwise, failed to understand the nature of the products being used in their treasuries or trading operations.

On the other hand, many investment bankers, accountants and financial economists argue that miss-selling is rare and believe that fraud and misusing or misunderstanding of derivatives have caused all the disasters in the past. Therefore, they believe that derivatives did the job what they were supposed to do. Secondly if one looks at the history, all the derivatives related disasters were as a result of human error and not the result of derivatives, though the disaster vehicle was a derivative instrument.

Derivatives may be taken as an example of financial innovation since many banks have recorded losses resulting from trading in derivatives. To examine them it is important to know their mechanics. Derivatives provide a low-cost and precise method of transferring risk from those that are exposed to it, but would rather not be to those that are not but would like to be. Derivatives can also be defined as a contingent instrument, since they consist of financial instruments or commodities. Both parties involved in a derivative transaction have more flexibility than the underlying asset themselves. This flexibility is result of the buying and selling of derivatives in well established markets. [3]

The difference between the traditional risk management by banks and derivatives is that before these financial innovations banks were concerned mainly with credit risk. With the invention of derivatives, banks can now generate business by transferring risks between different parties. Therefore, now banks rather than having the traditional function of intermediation between depositors and borrowers can now intermediate in risk management with the help of derivatives. Another reason for the popularity of derivatives among the banks is that they are off-balance sheet, meaning that they do not appear on the bank's balance sheet, since the capital required for financing these derivatives costs less than if bank were to finance these derivatives themselves. Derivatives are also popular among banks because they broaden the type of intermediation they undertake. [4]

In addition to the above mentioned derivatives, the new financial innovations

within derivatives are hybrid derivatives. These are the hybrids of the derivatives such as futures, options and swaps. Floating rate notes, note issuance facilities and swaptions fall into this category. All these instruments normally come with a form of credit risk. The risk associated with these instruments is usually counterparty risk, that is one party will fail to meet the obligations. For this reason, before entering into such type of contracts the bank should carry out a careful analysis. Since derivatives are traded on established exchanges they are also subject to market risk. For example, in the case of options, banks normally try to match out option market risks; this is done by keeping option "delta neutral". This delta indicates the absolute amount by which the option will increase or decrease if the price of the underlying asset moves by one point. In addition to market risk, derivatives also expose banks to liquidity risk, operational risk and legal risk.

3. Approaches for managing financial risks

Risk management in banking over the period of time has shifted from the traditional management of liquidity and credit risk to management of off-balance sheet operations. In modern banking, risk management is focused on both what is on a bank's banking book which is on balance sheet assets and liabilities and also trading books which mainly consist of off-balance sheet financial instruments. Different approaches are used in order to curb the financial risks that banks can be exposed to. These approaches are briefly explained one by one.

Credit risk analysis

Credit risk can be minimized by banks in four ways:

1. Loan pricing: depending on the credit worthiness of the borrower, loan pricing should include the administration costs, market risk and the risk premium. The risk premium depends how risky the borrower is. Loan pricing itself has a self-deceiving factor in it. If the loan is highly priced then the borrower will find it hard to pay back and eventually he will default. Therefore careful consideration is needed when pricing the loan. It should be noted here that the loan

price should exceed the risk-adjusted rate and includes any loan administration costs.

2. Credit limits: this is another approach to safeguard against credit risk. During the Asian financial crisis of 1997-1998, many banks undertook this approach. In this method credits are made to certain class of borrowers.

3. Collateral: banks require collateral to reduce the credit risk. Again in such an approach banks have to value the security regularly as it might have fallen below the value of the borrowed amount. This is what banks in Japan experienced as the loans taken were collateral against the property and once the property prices fall banks found it hard to recover loans.

4. Diversification: diversification can also be useful to reduce the credit risk of the bank. Too much investment in one particular sector can result in a bubble which can burst any time and become disastrous for banks. Therefore it is important for banks that they should diversify their lending to different sectors in order to reduce credit risk.

Interest rate risk

Banks manage their asset liability management (ALM) by two techniques which are gap analysis and duration analysis. From both of these techniques the most widely used is gap analysis as it can also be used to manage liquidity risk.

1. Gap analysis: Gap analysis is the most widely used ALM technique, where "gap" is the difference between interest-sensitive assets and liabilities for the given time interval. When the bank uses gap analysis it values and classifies its assets and liabilities according to the date these assets and liabilities are reprised. When the gap is negative, it means that sensitive liabilities are greater than sensitive assets; similarly when the gap is positive, it means that sensitive assets are greater than sensitive liabilities. When the ratio between sensitive assets and liabilities is one, this means that both assets and liabilities match. The ratio is obtained by dividing sensitive assets by sensitive liabilities. Therefore it can be said Gap analysis provides an overall picture of balance sheet mismatches. Gap analysis, these days, is not used in isolation now, yet it is an important technique for managing interest rate risk (Figure 1.).

Figure 1. Interest rate GAP

Sensitive Assets		Sensitive Liabilities
	GAP	

Source: Chew, L., *Managing Derivates Risk*, John Wiley and Sons, New York, 1996

2. Duration analysis: Duration analysis is a risk management technique, which measures the impact on shareholders' equity if a risk free rate for all maturities falls or rises. Duration analysis helps by allowing the possibility that the average life of an asset differs from its respective maturities. Since it is an additive it can be applied to a portfolio or to a firm's assets and liabilities. This is done by calculating the duration of all assets and liabilities and then taking the weighted average of all assets and liabilities. Subtracting the latter from the former shows the duration of the entire portfolio. This duration analysis shows the interest rate sensitivity of the firm's balance sheet. A question arises here: what about those assets these are insensitive to interest rates? If that is the case then one takes duration equal to zero.

It is useful for a firm to calculate the duration of the equity as it serves two purposes. First, it identifies and quantifies the exposure of equity to interest rates and second, it suggests appropriate actions to eliminate such exposures or to bring sensitivity to an acceptable level.

Several reports have been published about what are the best practices in risk management especially for derivatives. The Basle Committee for banking supervision and the International Organization of Securities Commissions (IOSCO) has also published risk management guidelines, recommended specially for those banks and securities houses that deal in derivatives.

Those banks and financial institutions that have incurred losses as a result of trading in derivatives have mostly failed to institute a proper managerial, financial and operational control system into place. For banks to deal

with innovative products they have to look at their foundations to establish whether they are strong enough to bear any damage occurred because of the failure in dealing with such instruments. [2]

4. Conclusions

Financial innovations bring some fruits in the form of huge profits but they can also turn out to be beasts if not managed properly. It is therefore important to keep the basic finance rule of "high risk high return" in mind as when banks trade in derivatives they can get high returns and enjoy the profits earned by trading in such derivatives. But at the same time they should also bear this finance rule in mind, as high return cannot be earned without taking high risks. Therefore it is important for the management to understand the risks and the mechanism of products that they are doing to use in future. [5]

Following bank collapses in the past, it has now been realized that it is important to hire people who have some background of mathematics and statistics, so most of the fund management houses are more interested in employing people who have degrees in actuarial mathematics. These are the people who are going to manage the business in future and most important understand the instruments.

The Role of Information Technology on the Banking Industry

Piciu Gabriela Cornelia

Chițiga Georgiana

„Victor Slăvescu” Financial and Monetary Research Center of Bucharest

gabriela_piciu@yahoo.com

georgiana_chitiga@yahoo.com

Abstract

The article presents a study which aims to analyze the role of information technology (IT) in the banking industry. Technological innovations have enabled the industry to open up efficient delivery channels. IT has helped the banking industry to deal with the challenges the new economy poses.

Technology is also changing the supervisory and regulatory landscape. It is creating new tools for supervisors and new supervisory challenges. Technology-driven issues such as privacy and the nature of electronic communications have reached the forefront of the policy agenda. And the line between electronic banking and electronic commerce is becoming more difficult to define clearly.

More than most other industries, financial institutions rely on gathering, processing, analyzing, and providing information in order to meet the needs of customers. Given the importance of information in banking, it is not surprising that banks were among the earliest adopters of automated information processing technology.

Key words: *information technology, banking industry, risk management, electronic banking*

J.E.L. classification: G12, G21

1. Introduction

Information technology has changed the way people bank, the way they invest and the way they earn profits. In other words, IT has changed the face of banking and banking supervision.

More than most other industries, financial institutions rely on gathering, processing, analyzing, and providing information in order to meet the needs of customers. Given the importance of information in banking, it is not surprising that banks were among the earliest adopters of automated information processing technology.

2. The impact of information technology

Financial institutions, as compared with other industries, rely more on gathering, processing, analyzing and providing information in order to meet their customers' needs. This is the reason why banks were the first to start automated information processing technology. According to Roger W. Ferguson, Vice Chairman, the Federal Reserve Board, there are three reasons why financial institutions have been and still are heavily investing in technology. First, financial institutions anticipate a reduction in operating costs through such efficiencies such as streamlining back-office processing and the elimination of error-prone manual input of data. Second, institutions find ways to serve their current customers and attract new customers by offering new products and services and at the same time enhancing the convenience and value of existing products and services. Third, with new technology, institutions have been able to implement sophisticated risk – and information-management system and techniques.

Another reason for innovation is change, many banks and financial institutions had to contend with change, which is not only rapid but also more complex. Even the established financial institutions and companies are not sure who exactly their competitors are? Behind all this lies the Internet. The Internet performs many functions cheaply and

flexibly. Gary Reiner, chief information officer of GE, one of the pioneers of the Internet, describes how the company set out to build its own electronic-auction site. "It was less expensive than we thought", he says. This change has brought a dramatic fall in the cost of handling and transmitting information and also in the way banks and other companies reach their customers and the products and services that they offer. Organizations therefore have to be run properly and employees have to be well trained in order to keep up with the pace of this new information technology era. The introduction of the Internet has brought people closer to each other but on the other hand in the financial services sector it has brought disintermediation. For years old banks in particular enjoyed intermediation between the lenders and the borrowers. With the passage of time and with the invention of new technologies and systems, intermediation has decreased. Disintermediation can be clearly seen in the market with the lenders directly going to the borrowers without appearing on a bank's balance sheets. [1]

It is therefore important for the financial institutions to invest in what it is called "Internet strategy". Bill Gates said that banking is necessary, but banks are not. This is one of the signs of threat for banks, as many companies can reach their customers through online services easily and at less cost.

3. Risk management and electronic banking

Advancement in information technology has made it possible for retail and wholesale customers of banks and other financial institutions to access and have delivered a range of products and services at the click of their mouse button. This type of banking is mainly referred to as e-banking. Development of e-banking carries benefits as well as costs. In other words electronic banking has modified the traditional risks and benefits associated with banking. Risks in general can be characterized as strategic, operational, legal and reputational, so it is to be said that it has increased the overall risk profile of banks. This increase in risk profile

can be associated with the speed of change, technological advancement and global nature of open electronic networks, integration of electronic banking with computer system and dependence of banks on the third parties for providing information technology, whereas benefits can be characterized as greater customer base, lower costs and high profits. [2]

With the increase in risk profile of banks, The Basle Committee on Banking Supervision's Electronic Banking Group (EGB) has issued risk management principles on e-banking. Banks will have to follow the existing risk management principles, but in addition they will have to address specific risks created by banks electronic activities. The committee therefore believes that it is the responsibility of management and the board of directors to make sure they have taken necessary steps to review and modify their existing risk management policies.

Since banks have integrated their electronic banking activities with the computer systems, consolidated risk management should therefore be given importance for all banking activities.

Taking all of the above points into consideration, the committee has identified fourteen Risk Management Principles for electronic banking institution. These principles are not an absolute requirement, as with the pace of change they will soon become outdated. Still, they provide a guideline for risk management of e-business. These risk management principles fall into three main categories: Board and Management Oversight; Security Controls; Legal and Reputational risk management.

As mentioned above, senior management and the board of directors have more responsibility of making sure that the bank has updated its strategies and risk management policies, since they are responsible for developing the institution's business strategy. It is therefore their responsibility to make sure the decisions take by them are explicit, informed and strategic as to how the bank is going to conduct its e-banking services. Therefore, they are responsible for making the initial decisions over policies and controls to address risks. Also, it is the management's responsibility to approve such controls that are related to maintenance and development of security.

With the proper security infrastructure in place banks can easily cope with internal and external threats related to e-banking systems and data. [3]

The second category of principles is security controls; security controls means that appropriate authorization and authentication measures, logical and physical access controls, adequate infrastructure security to maintain appropriate boundaries and restrictions on both external and internal user activities and data integrity of transactions, records and information are all in place. It is also important for banks to have a proper audit system for all the transactions that take place through e-banking.

The third category of these principles is related to legal and reputational risk: consistency and timeliness is essential for successful e-banking. It also protects against business, legal and reputational risk. It is therefore the bank's responsibility to provide e-banking to all end users under any circumstances. To minimize operational, legal and reputational risks it is important for a bank to have effective incident response mechanisms in place. To meet customer's expectations banks should have a business continuity and contingency plan. These measures will help banks to reduce legal, reputational and operational risk. [4]

Since rules and regulations vary from place to place these principles can therefore be taken as a guideline to enhance a bank's performance and reduce risks.

4. Conclusions

Banks and financial institutions will continue to experiment with financial innovations and technological innovations and electronic, information-based services. Particularly with the invention of the internet, there is a great potential for growth and experimenting different innovations. At this stage it is therefore unknown as to what payoffs will these financial institutions will get once they have heavily invested in these new technologies. As every innovation has some drawbacks, banks should therefore be prepared for worse scenarios, as it has been experienced that many computers and sometime systems go down bringing the entire office world to an untimely end. For this reason it is management's responsibility to keep abreast with the new systems and technologies and make sure it is sure updated with the flow of information technology.

Abstract

Sustainable development is the macroeconomic concept of global performance. The three pillars of sustainable development, namely economic, environmental and social can be found at the level of a company through its overall performance. So, nowadays we can't speak only of financial performance without mentioning the social and environmental performance. A company reaches its goal of performance not only if achieves its financial (economic) goals but also if is simultaneously responsible regarding its employees, customers and the community in which it operates.

Sustainable development is a way in which we perform the everyday activity, a way to act to ensure a balance between the limits imposed by the environment, the needs of present and the future needs. Referring mainly to economic entities we define sustainable development as a new philosophy of development, to assure business sustainability in a turbulent and constantly evolving environment.

Key words: sustainable development, global performance, social responsibility, environmental performance.

J.E.L. classification: G39

1. Introduction

Currently the main objective of an organization is not simply to obtain profit. To achieve sustainable development at the level of organizations they must collect performance at three dimensions: environmental, economic and social. In the current macroeconomic context ignoring

social and environmental issues can lead to loss of international market shares of large corporations, more than this, they are forced to bear costs of greening the area of activity and spend considerable sums for loss control to regain consumer confidence.

If in the last century the fore was on financial performance, companies have now realized that this is only the outcome of the race, but the race itself and the vector is the success of today's racing, in the context of sustainable development of society, is what we call overall performance. Bachet since 1998 found that performance should not be reduced to the sum of partial performances, considering that performance is "an emergent property that shouldn't be reduced to the amount of partial performances, but to an overall performance which is based on a virtuous link between the economic and social and on a long-term concern for success." [2]

Each company should consider a "fair evaluation" of performance: the economic dimension, the environmental dimension and the social one. Overall performance of the company is defined as aggregating economic performance, social performance and environmental performance. So always, the overall performance of a company will be valued by the exchange with the environment. The three dimensions mentioned are embedded in what is called Triple Bottom Line (TBL), a concept introduced in literature by Elkington in 1980. The concept of Triple Bottom Line (TBL) focuses entities not only on the economic value added, but also on social and environmental values that they create or, conversely, destroy.

2. Sustainable development – Literature review

What is sustainable development? The best known definition of this concept is mentioned in Our Common Future or "Brundtland Report" prepared by the World Council on Environment and Development in 1987, which gives the following definition of the concept: sustainable development is the development that fulfills the present's needs without compromising the ability of future generations to fulfill their own needs (WCED, 1987). It seeks to not compromise the environment's ability to produce for future generations and this feature is captured very well in what we call sustainability and its weaknesses are as follows: population, climate change and energy consumption. In 1992 the World Summit in Rio de Janeiro has developed and adopted Agenda 21 as a tool to promote the concept of sustainable development. It argues that sustainable development is that development that will not damage and does not compromise the environmental, economic and social development, which depends on the continuous development[9].

"Sustainable development is loyalty against future" [16]. We believe that sustainable development is the concept that best describes the present and future. According to Tietenberg [23] if a project maximizes the value of the present benefits but with loss of future generations it should have a share in present earnings to be set aside, whereas an "inter generations" compensation fund.

Analyzing the literature we found that there isn't a generally accepted definition of this concept from both practitioners and academics [14] although in this moment there are over 100 definitions in circulation [9].

Development is represented by highlighting the following objectives[21]:

- Economic (creating wealth for all on the base of sustainable production and consumption);
- Environmental (conservation and management of the resources)
- Social (social equity and participation of all groups).

How can we define sustainable development taking into account these three objectives? Sustainable development is the

one that is based on the principle that the three dimensions must be balanced to avoid prioritization of an objective on the expense of the other two.

At the level of organizations operationalization of the concept of sustainable development is achieved through the concept of either overall performance of the organization or societal responsibility. And for this we need the concept introduced by Elkington, Triple Bottom Line that involves economic prosperity, environmental compliance and improve social cohesion [17] So TBL or Triple balance can be defined as an approach for measuring organization's overall performance according to its triple contribution to the three aspects mentioned above. It is an approach that takes into account the financial result, the social and environmental balance of organizations [22].

There are others voices that do not entirely agree with this approach, saying it was incomplete. Various authors like Neculai Tabără, Emil Horomnea, Marcel Nuță and Roxana Dicu believe that sustainable development should not be reduced to measuring the three dimensions, it must be added also the interaction between them. They believe that "the true value added of sustainable development regards the management of interactions between the three dimensions" [21]. Thus, it is proposed a new concept, namely the integrated performance.

Considering the term "sustainable" from the expression we are discussing, sustainable development can be defined as a "development within the carrying capacity [18,5,9]. So what is sustainability? According to Dragomir [6] sustainability is a concept that implies a fair allocation of resources regarding processes run on a global scale. In this context, equity assumes responsibility for the rational use of resources for opportunities of present generation, so as not to impede the opportunities of future generations. Brundtland United Nations Committee in 1989 gives the definition of sustainability which in 1987 was awarded to sustainable development. So according to him these two terms are synonymous.

But there are a number of authors who claim that the organization must make a distinction between those two terms, namely

sustainability and sustainable development [20]. So, according to them sustainable development is the process that ensures the sustainability of an organization, it is the ultimate goal of the organization. Here we remind of Bouquin's words that we can extrapolate defining sustainability as the outcome of the race and sustainable development as the race for sustainability, the vector of future successes. Sustainability is an objective that aims to be achieved at the entity's level and sustainable development is the macroeconomic principle.

Another concept of great development that is considered the foundation of sustainable development is social responsibility, as defined by the European Commission as a concept that means the voluntary integration, by enterprises, of social and environmental concerns into their business and their relationships with stakeholders.

3. Overall performance - microeconomic concept of sustainable development

In the current globalization of world economy, a company that registers performance is a "company that creates added value for its shareholders, satisfies customers demand, takes into account the opinion of employees and protects the environment. Thus, ownership is pleased that the company has achieved the desired return, customers have confidence in the future of the company and in the quality of its products and services, company's employees are proud of where they work, and society benefits through policy adopted by the enterprise, of environmental protection"[10].

In a world of competition that has gained increased impetus as a result of environmental change and increased risk with increased financial and economic turmoil and with the internationalization of trade in goods and capital, achieving "excellence" in business is the path of survival and development of businesses in a competitive economy. Peter and R.W. T.J Waterman in 1995 likened the concept of performance with excellence, today a fundamental criterion for any organization that is founded on four essential factors: the efficiency of the organization, social identity,

achievement and reputation of the organization.

One way to achieve excellence is performance, now it is talked more about the overall performance. This new approach to performance is known as sustainable development, which has three objectives: increasing economic and financial performance of the company, effective development of environment and encouraging social development. Thus we can say that overall performance is the sum of economic and financial performance, environmental and social performance. According to some Romanian authors the concept of global performance is used to evaluate sustainable development strategies and to report on the societal responsibilities of different partners [21].

In Romania, there were also concerns towards the approach performance from a global perspective, especially in the context of national economic approaches on the line of integration into European Union. We recall in this regard concerns of authors such as [28,25, 21].

As Bouquin [3] says in his paper "Controle de Gestion" if financial performance is just the "outcome of the race", overall performance is the race itself or "the vector of future racing success" [1]. For long time overall performance was reduced to the financial dimension. This is to achieve the desired return on shareholders by turnover and market shares that would lead to continuity of business [21]. In the present financial performance is no longer sufficient to be able to assess a company's business. So the performance concept has expanded to take into account social responsibility (a term used by the European Commission) or societal responsibility of the organization to all stakeholders. It should be noted that this also includes environmental issues.

Overall performance concept is present in the literature to assess the implementation of business strategies in the context of sustainable development. The concept is the reflection in the management system of the macroeconomic concept of sustainable development [4]. Marc Lepetit (Financial Consultant, a member of a working group of the General Commissariat of Plan, on the overall performance issues) defined the overall performance as "a multidimensional

concept, economic, social and societal, financial and environmental, which covers both the company and human society, the employees and the citizens." For Reynaud overall performance is the aggregation of economic, social and environmental performance [19].

In the context of sustainable development global performance can be defined as a multidimensional effect, economic, social and societal, financial and environmental that concerns both organizations and employees, human communities and citizens [21].

For sustainable development of a company, the strategy and value creation can't be dealt with strictly financial terms. Corporations must apply the principle of balanced development, based on various aspects. A well-known example is the concept of multidimensional performance evaluation focused on the theory of Triple Bottom Line. It is a concept that aims to enhance the non-financial and non-accounting dimensions of performance and responsibility of a company. The concept of Triple Bottom Line focuses companies not only on the economic value added, but in particular, on social and environmental values that they create or, conversely, destroy [7].

TBL performance also requires involvement in all three areas of reporting: economic performance, social performance and environmental performance [12]. So, in general terms, economic performance relates to all aspects of the company's economic interactions. Traditionally, financial indicators refer to an entity's profitability and aim to provide useful information for both management and company's shareholders. The environmental dimension of a company's performance regards the impact on natural systems, including ecosystems, land, air and water. Environmental performance include information that characterizes the quantity of energy consumed and its origin, treatments resources, management of exhaust emissions, spills, waste, residues, etc., how to exploit the land and environmental management.

Social performance can be measured by analyzing impacts of the company on stakeholder locally, nationally and globally. This can be seen as the company's impact on employees and the local economy, impact that can be quantified by information on

employees (number, wages, holiday bonuses, etc.) or by information about payments to suppliers (local economy) Social performance focuses on the interactions of the company, engaged human resource and any other individuals with whom contacts are established. Social performance indicators include: relations between employees, work safety and health and human resources, the report salary / cost of living, elimination of discrimination of any kind, local community rights, community development impact, customer satisfaction etc.

Lebas illustrated in 1995 these two new dimensions of performance, the social and environmental performance through the performance tree [11]:

Figure 1. Performance tree

Source: Lebas, 1995: 25

In the broadest sense, TBL is a philosophy that drives corporate performance. In a narrow sense, the concept refers to the tactics of measurement, management and reporting of business performance beyond financial dimension and in terms of an integrated vision of the entity, with clear evidence of the economic, social and environmental impact. To highlight the social impact (social performance) organizations should refer to its reoccupation concerning health insurance of population, activities consistent with sustainable development requirements, etc., while the environmental performance requires actions of the organization in order to protect environment, to give a certain quality of manufactured a products.

In the present context, both in Romania and in any economy in the world performance involves "ensuring the viability of the firm in terms of domestic and international competition, within the

restrictions imposed by sustainable development" [8].

4. Conclusions

Sustainable development and globalization set new standards of performance that exceeds the economic field, both for domestic companies as well as international ones. So, these standards should be integrated into corporate strategy development to ensure sustainability of activities undertaken by harmonizing the economic, social and environmental objectives.

Sustainable development is a concept based on three pillars: economic development, social development and environmental protection, even if over time it has been brought into question a fourth, namely cultural diversity. To this macroeconomic concept it can be associate different concepts at microeconomic level among which we remind overall performance and sustainability.

Why overall performance evaluation is needed? Because as we have seen exclusive financial performance reporting limits the information provided that is why it has emerged the need to report information on overall performance thus distinguished also non-financial aspects. In this context, TBL reporting has become an invaluable tool because it captures the three dimensions of performance: social, environmental and economic.

Population, a Decisive Component of Creation and Size of Labor Resources. From Theory to Reality

Pivodă Roxana Mihaela
„Spiru Haret” University
roxana_pivoda@yahoo.com

Abstract

There is no doubt that the population seen in its various sides is actually a crucial component, active and dynamic long-term, closely linked to motor factors of society and economic activity, demographic potential of a country, influencing state and the social and economic development of the country.

Population is the human community that is identified by a specific set of features and links their development, while also being an issue analysis for the various sciences, including the economic one, due to the fact that demographic change can influence some mechanisms of functioning of the economy, including the labor market.

Key words: demographic potential, lively resource, demographic explosion, demographic inplasion

J.E.L. classification: R23

1. Introduction

Population is both a factor and a basic resource, the creation of human resources, only resource of all things living there until today. Man, as a constituent part of the population, labor force to adapt and transform objects continuously work to achieve its goals. Population, viewed and analyzed in its twofold aspect, but at the same time consumer and the producer is an element of prime importance in economic and social development of any country. From the consumer point of view is identified with the total population of the country has human potential, ie the total population of that state, and in terms of the manufacturer, the population generates employment resources, however different in terms of numbers, experience and their preparedness. For

developed countries and the decline of labor may be offset by capital resources or by replacing it with the importation of labor from less developed countries. For less developed countries, developed or even lacking sufficient capital resources, low population and labor force may affect attempts to revive the national economic growth can block any trend of accelerating growth and reducing economic disparities and social. The purpose of subsequent analysis is to decipher changes in the structure of the population in Romania, as the main determinant of the level of labor resources and the effects of demographic phenomena generated by the labor market.

2. Human resources, a source of wealth of a nation

Human resources component of national wealth is a strong determining influence on the level and pace of development of economy as expressed in the principle of education, research ability, scientific, cultural and artistic values that have a people, this is an argument for shall be deemed that no wealth, except human resources, as would be consistent from the point of view, is only transitory and misleading.

If the elements that compose the accumulated wealth and natural resources attracted the economic cycle, makes direct economic activity, rates and proportions of economic development, human resources influences the economic development process. Thus, level of education, research capacity, experience gained over time, are factors that influence the dynamics of labor productivity and thus economic development level and dynamics. As a result of difficulties in quantifying these factors, human resources viewed from this perspective are not taken directly in the calculation of national wealth, which is obvious only indirectly.

Human resources can be examined from another angle, namely as part of the national wealth of a state, the people expressed through his stock. In general, the notion of the stock of real property may be sold, ie those that can be put on the market. When the economy was slaves, they could be considered part of the wealth of that state. In the current system of market economy, people are not real property belonging to someone say they can not sell itself, but what they can sell on the market and more specifically the labor market is their workforce, as expressed by the various specialized activities or not, that people carry. As the value of the stock, it is expressed by the value of production measured by revenues made it work without factor. In fact, the stock of people, people in general can be expressed by all physical and intellectual endowments of a nation, contributing to a portion of national wealth. Even when talking about the national wealth, our thoughts go to all buildings, productive equipment and consumer durables, monetary gold and foreign investment, all of which are based on certain human labor, physical or intellectual and consumed today, yesterday or one hundred years ago.

3. Quantitative and qualitative aspects of population

Developing economic and social development policies in general, but especially those in the labor market, among other things requires knowledge and analysis of quantitative and qualitative aspects regarding population of a country.

The population of a country is defined mention Trebici must „as an aggregate, an amount, a community of people living on the land and properly defined.”[1]

The quantitative approach is performed using volume indicators and human resource structure that relates to livestock population and its structure after several variables, the most characteristic being the age group and sex. Number of population, the fundamental feature analysis, are all people exist in a country at a time.

The analysis of the light of its herd to a structured whole time. In this case the entire population is represented by a well-defined

and can be any intersection when the tangent to the axis of time, so people can say that number is an indicator of time. The best known and used for determining moments of a herd populations are 1 January and 1 July.

This population number set at January 1, namely 1 July according to the definition of the National Institute of Statistics, „The population consists of people living in that locality, having the residence in the village at that time. It is calculated using the last census, corrected for the natural population growth, external migration balance, the balance of migratory movement by changing their residence, and migratory movements to balance the change of residence between the census and recorded phenomena moment.”[2]

The fundamental equation for determining a stock

$$S_F = S_I + I - E, \text{ where (1)}$$

S_F - closing stock; S_I - original stock; I - input; E - output; and in line with the definition given above, the stock population on 1 January and 1 July, can write the relationship:

$$P_C = P_R + (N + I_E + I_D + I_R) - (D + E_E + E_D + E_R),$$

(2), when we consider that:

$P_C = S_F$ - the current population, the total population registered on 1 January, namely 1 July; $P_R = S_I$ - the last census the total population registered; $I =$ [births (N) + immigration external (I_E) + immigration due to changes of residence, (I_D) + immigration due to change of residence (I_R)]; $E =$ [deaths (D) + external migration (E_E) + emigration due to changes of residence, (E_D) + emigration due to change of residence (E_R)], and knowing that:

$N - D = S_N$ - natural increase; $I_E - E_E = S_E$ - external migration gain; $I_D - E_D = S_D$ - balance migratory movement with change of address; $I_R - E_R = S_R$ - balance migratory movement with change of residence then equation (2) can be written as:

$$P_C = P_R + S_N + S_E + S_D + S_R \text{ (3)}$$

Analysis taking into account population age structure of population shows the effect of demographic factors. The economic analysis of population structure using large age groups, as follows:

Young population P_T	0-14 years	0-19 years	0-14 years	0-19 years
Adult population P_A	15 - 59 years	20 - 64 years	15 - 64 years	20 - 59 years
The aging population P_V	> 60 years	> 65 years	> 65 years	> 60 years

Differences in terms of the age groups is mainly due to different visions of the concept of labor resources used by various statistical analysis, group wants to highlight the fact this population, namely the working age. Analysis of the adult population who actually identifies with the working age population, just highlights the economic dependency ratio, ie the number of inactive persons per 100 active population, according to the relationship:

$$R_D = \frac{P_T + P_V}{P_A} \times 100, \text{ where (4)}$$

R_D - economic dependency ratio; P_T – young people; P_V – the elderly population; P_A – adult population

Analysis of the category vârstnice population age structure, highlights the demographic aging of the population. Where[3]:

The share of elderly in total population	Demographic considerations in terms
< 7%	Young population in terms of demographic
7% - 12%	Population aging demographic that is going to
> 12%	Population aging population

Population analysis taking into account gender, viewed as an important variable, leads to a simple classification of male and female populations, thereby, the degree of masculinity, femininity that can characterize a population.

Therefore, for further analysis using the combination of this variable with age, highlighting both the potential limits of a population and reproductive changes in the structure of a population. For example, Trebici be noted that the “so-called feminization of a specific population - the rural population, the working population in an industry - has significant differences depending on age”. [4]

Also the analysis of population by age and gender can shape the same time both a past picture, providing an explanation and a picture of the future, due to the influence that this combination of variables has on the natural growth and population growth rate.

The qualitative approach of the population has a number of issues related to the average nominal and real income per capita, the education level of population groups such as reflecting population with higher education, elementary middle and in the general population, the state health of the population overall and by various socio-professional categories, the overall level of human development, reflected in the human development indicator.

Over time, the qualitative analysis of human development has undergone several stages. In nineteenth-century, classical economic thought from the perspective of people just appreciate the factor of production, so they were considered real car which provides a certain amount of productive labor, which in turn are necessary for some maintenance costs for to function in a regular and continuous. Subsequently this concept has been treated and discussed by other sciences such as philosophy, which sees human development from the perspective of an individual's personal development, sociology, emphasizing the possibility of a consumer to choose freely on the market, goods and services required; psychology, which believes that human development is based on a specific motivation when individuals perform a particular task.

Several decades ago, the concept of human development was used to highlight the investment in human capital, but about two decades ago, this analysis becomes more comprehensive human development, the concept acquires new cotonații. Science now calls for a new approach to human development, which arises from the need for each nation should re-orient reconcepă and policies in order to reflect and decide how they can be involved for the aspirations of people to be made for the most part.

More broadly, human development reflects the development and use of human and material potential of the national economy, the extent to which the nation uses the factors of production, it combines and

structures to achieve maximum efficiency. As a result of the quantitative expression of such a complex phenomenon is quite the hard, in 1990, Human Development Report issued by the United Nations, introduces a unique method to quantify the global extent of human development by combining several indicators into a single indicator, internationally known as the human development index and Romania as the human development indicator.

The global dimension of human development indicators integrate the significant determinants longevity measured by life expectancy, educational attainment measured by adult literacy rate and average duration of education, standard of living, measured by gross domestic product per capita.

The significance of human development indicator allows characterization of both human development and development experience comparing different countries or regions in economic and social progress, and highlighting social and economic policy priorities, where these areas require intervention from the state.

4. Developments in the population of Romania

In recent decades, Romania has experienced significant changes in population structure. Some of these changes was due to both the communist political decisions that have influenced the evolution of demographic phenomena, in particular birth and demographic transition period.

During the twentieth century, except for periods of two world wars and the 1990s, the population was growing, given the natural growth before 1967 and maintained artificially, through an aggressive pronatalist policy between 1967 and 1989. The sharp decline in birth rate since 1990, confirms that high levels of Romania's population, recorded in previous years were maintained by the constraints of the communist regime.

Negative demographic trend of the volume registered in Romania, after 1990, and the rise of the phenomenon is due to external migration. First departures occurred in the first years of freedom of representatives of ethnic groups, such as those of German,

Hebrew and Hungarian, on the other hand, a significant number of people leaving the country for the opportunities opened immediately after the change political regime, as manifested in this situation for labor migration.

Determining factor for defining and structuring a viable strategy for sustainable development of the country, people should remain the central element on which to focus the full attention of both policy makers and the entire Romanian society. In this regard, we need a vigorous intervention as the only alternative that can be taken into account but not to stop the decline, a goal difficult if not impossible to achieve in the short and medium term, but to reduce the degradation of its future structure.

In support of these considerations, the following lines are some statistics on population trends in Romania.

5. Overview of the population of Romania between 1930-1989

A brief picture of the population of Romania between 1930-1989, reveals an upward trend and may even say uniform, as the figures in Table no 1. Population census held in Romania in 1930, there were 14,280,729 people registered a number, for nearly six decades later Romanian population to increase by 8,870,835 persons, representing a 62.11% increase.

The permanent population annual growth between 0.31% and 2.26%, due primarily to increasing birth rates as a result pronatalist policies promoted by Romania in this period. Referring in particular birth and birth in general, the great Romanian Vladimir Trebici demographer, said that although "apparently an elementary biological event, birth, is set under a large number of social, economic, cultural and frequency of births in reflecting the national population in the final analysis, cultural models involving complex social institutions, attitudes and values in society as a whole." [5]

Pronatalist policy measures aimed at our country, the first prohibition of abortion and on the other hand, financial support to mothers and families with children. Abortion was considered an offense and enrolled in the Criminal Code in 1948 and was then approved by Decree 456/1955, but only if it

was done by a doctor and for certain categories of pregnancy risk. In 1956, he was introduced as first aid for families with children called the state child allowance.

In 1957, Decree 463 regulating what is called abortion on demand. In accordance with the provisions of this decree, the normal course of pregnancy termination was made possible only at the request of the pregnant woman and the measure by which to achieve this medical act to take place only in medical institutions or public health centers. The results recorded in the period 1957-1966, points out that legalizing abortion, has increased their number and therefore have produced negative demographic effects, which have resulted in lower and lower annual rates of growth between birth 0,88% and 0,59%.

Table no. 1 - Evolution of number of population in Romania during 1930-1989

Year	Total population	Difference from the previous year in %
1930	14280729

Source: <http://www.insse.ro>, *Statistical Yearbook 2007* and own contribution

Following the situation in 1966 has issued Decree 770, and with it took place and changes to the provisions of the Criminal Code on abortion. Thus, art. 482 is that defined the crime of abortion is termination of pregnancy by any means done with the consent of the pregnant woman. In 1985, abortion was permitted under certain conditions on December 26, 1989 to defend a new decree repealing the decrees 770/1966 and 441/1985 and Articles on abortion.

Some of the effects of these legislative measures have influenced the evolution of birth in Romania, as statistical evidence presented in table no. 2. If during the years 1930-1938, the birth rate exceeded 30 per 1,000 live births during the period of the Second World War, due to a psychological climate of fear and uncertainty, the reproductive rate of the population began to decline or due to lower marriage or following the breakup of many families due to moves of population concentrations and mobilization.

Even after the war, following a period of declining birth rate value, reproducing population is steadily declining, reaching a minimum in 1966 to 14,3 births per 1,000 inhabitants, as a result of free practice surgical rate cuts pregnancy that occurred in the period between 1957-1966. As a result of this effect since 1966 prohibiting surgical abortion, the consequences of this measure is reflected in the fact that at the end of 1967, recorded a sharp increase in the birth rate, reaching a value of 27,4‰, compared to 14,3‰, as indicated in the previous year.

Table no. 2 - Birth rate in Romania during
1930-1989

Year	Birth rate	Year	Birth rate
1930	34,1	1973	18,2
1938	29,5	1974	20,3
1940	26,0	1975	19,7
1950	26,2	1976	19,5
1955	25,6	1977	19,6

1969	23,3	1987	16,7
1970	21,1	1988	16,5
1971	19,5	1989	16
1972	18,8		

Source: <http://www.insse.ro> Statistical Yearbook 2007

In the coming years due to pronatalist demographic policy and the existence of legislative measures listed above, there was an ongoing phenomenon identical to that shown in the 1957-1966 period, ie a trend of steady decline, but at a somewhat slower pace, reaching is in 1983, the value of the years 1966. Following the introduction of new coercive measures, the birth rate in Romania in 1983 after a slight upward trend, reaching values exceeding 16 births per thousand inhabitants in 1986, because between the years 1986 to 1989 to maintain the values relatively constant.

6. Conclusion

The man regarded as the most important competitive factor in any economy, is a common resource and also a key resource, vital to conduct any economic activity and therefore potential demographic changes in the structure of a country influences the level of employment resources employment, a fundamental dimension of the labor market.

There is no doubt that the population seen in its various sides is actually a crucial component, active and dynamic long-term, closely linked to motor factors of society and economic activity, demographic potential of a country, influencing state and the social and economic development of the country.

Population is the human community that is identified by a specific set of features and links their development, while also being an issue analysis for the various sciences, including the economic one, due to the fact that demographic change can influence some mechanisms of functioning of the economy, including the labor market.

In quantitative terms, until 1990, over six decades the population of Romania has experienced a consistent upward trend, registering a growth of 62.11% compared to 1930, because after this year so far to show a continuous and uninterrupted decline, so that the end of 2009 Romania's population is in decline with 1,736,761 people, compared to 1990.

roxana_pivoda@yahoo.com

Abstract

This paper is meant to emphasize the importance of the demographic factor, which is a crucial component in the long term, the creation and sizing of labor resources. The offer of work which has the general background population, ie the number of people of working age and their ability to provide services needed in society, is essentially a variable that depends on demographic phenomena and processes. Based on these considerations, the analysis in this chapter is to decipher changes in the structure of the population in Romania, as the main determinant of the level of labor resources and the effects of demographic phenomena generated by the labor market.

Key words: population, labor market, population declin, demographic explosion, demographic inplasion

J.E.L. classification: R23

1. Introduction

Multiple valences of human resources, crucial component of long-term, the creation and sizing of labor resources, to enhance their role in effective utilization of the country's economic potential, there is simultaneously combined, pooled and propagated in the long term and more plans. From these considerations, we started to analyze the demographic potential of the Romanian products to decipher changes in population structure over time as the main determinant of the level of labor resources and the effects of demographic phenomena and processes that generate them on the level of employment of labor resources, a fundamental dimension of the labor market.

Population is both a factor and a basic resource, the creation of human resources, only resource of all things living there until today.

2. Overview of the population of Romania between 1930-1989

A brief picture of the population of Romania between 1930-1989, reveals an upward trend and may even say uniform, as the figures in table no. 1. Population census held in Romania in 1930, there were 14,280,729 people registered a number, for nearly six decades later Romanian population to increase by 8,870,835 persons, representing a 62.11% increase.

3. Population dynamics in Romania after 1990

The dynamics of any population can be analyzed taking into account the number of people, but only in close correlation with the development of natural growth.

As can be seen from the statistical data recorded both in the table. And in table no. 2 and 3, 1990 was characterized by the increased value in terms of number of population who are currently registered to our country, that 23,206,720 people.

In the last two decades, Romania was marked by continued and significant decrease in the population, the difference in effective population during 2009-1990 being -

1,736,761 people.

The largest annual decrease recorded in 2002 and 1992, when Romania's population decreased by 613,600, ie 396,115 persons.

Table no. 3 - Evolution of number of population in Romania during 1990-2009

The continuous reduction of the population was mainly due to the manifestation of both a negative natural increase and external migration has also a negative balance, the main factors which directly influence the number of people in any country.

Natural increase, the difference between the number of live births and deaths, is a biological and social phenomenon, generated by the manifestation of pure demographic events such as birth and death, while expressing the refreshment of a population, in terms natural movement of the components which are not subject to migration flows. As can be easily seen from chart no. 1, only 1990 and 1991, is also recorded positive values of natural increase as a result of demographic policies were imposed until 1990 in Romania.

As regards Romania's demographic policy after 1990, it is characterized by removing constraints imposed by the previous regime and the liberalization option in terms of birth, with the result, even in 1992, recording negative values are still far.

Registration negative natural growth shown in chart no. 1, after 1992, is due to the decline in births and maintaining a relatively constant number of deaths.

Chart no.1 - Evolution of natural increase in Romania during 1990-2008

Source: <http://www.insse.ro>, POP 201A and 206A

Thus, the loss in the last two decades a number of 1,736,761 people as well as continuous and uninterrupted decline of population in Romania is not only due to negative natural growth outlined above, but also a negative balance of external migration, which characterized the population of Romania by 1990, issue revealed by statistical data expressed in table no. 4.

Since 1990, large negative values are observed to decrease at a rate more or less until 2001, when the first recorded positive growth, a very small amount and only for one year.

Situation by 2001 can be explained both by the large number of people who have migrated and they as can be seen from the in table înregistrate no.4, a general downward trend, recording over the light oscillation period and the small number of immigrants registered at the beginning of the analysis, which over time begins to increase, but at a much lower rate than of emigration, reliefându is clear that during this period Romania has lost an important part of the population.

From 2002 until 2007, known migratory growth again negative, but a much lower intensity than the previous period. In the last two years recorded positive growth of migration, much higher than in 2002, but covers only a small part of the loss of population registered in the past. This is due to the small number of registered emigration in 2007 and 2008 and the growing number of

immigrants, coming especially from Moldova, as shown by official statistics.

Table no. 4 - The balance of migration in Romania between 1990-2008

An	Immigrants	Emigrated	Migration balance
1990	0	96929	-96929

Source: <http://www.insse.ro>, POP 309A, 310A and own contribution

The balance of migration, the difference between number of emigration and immigration, shows not only quantitative aspects but also qualitative. Thus, a positive migratory balance, means that the recipient country populations attraction exercises in other areas, but as this balance is greater, the higher the force of attraction, in which case the number of immigrants is larger than the migrants. A negative migration balance, highlights the attractiveness of a country, the more pronounced, as the negative migration balance is greater, in which case the number of emigrants outnumber immigrants.

Throughout the period of analysis in Romania as a total negative migration balance of 298,569 persons as a result of the emigration of a number of immigration of 404,396 people and 105,831 people, which took place during this period. This figure means that Romania has been a source of attraction, on the contrary there were a range of other receivers of the population in Romania, due to numerous reasons. The above figures are part of official statistics, but must take into account that in addition, its product and forward and illegal migration, whose number may not even be estimated.

It should be noted that after 1990, in

Romania migrations occurred mainly in two major causes of migration that is aimed at family reunification and labor migration. The first of these took place following the fall of the communist regime and the opportunity to open borders, free movement of people, leaving in 1990 favoring a massive number of Romanian, that 96,929 people, mostly ethnic Hungarian and German. The phenomenon continues in the coming years, but occurs at a somewhat reduced intensity. The second issue is the European labor market opportunities and perhaps even international, who has absorbed a significant proportion of the population in Romania.

After I noticed that in terms of livestock, the population of Romania is characterized by a pronounced decline demographic analysis of population dynamics, its structure continues to age.

To analyze population trends in Romania in terms of age structure, are used to divide the population by large age groups, choosing the third option mentioned in subsection classification, as a result that is closest to its limits than legislation in Romania.

Table no. 5 - Structure of population by age group in Romania during 1990-2009

Year	1990		1999	
Age group (years)	Total population	%	Total population	%
	23206720	100	22458022	100
0 - 14	5468676	23,56	5214951	23,22
15 - 64	15324421	66,03	15315279	68,19
> 65	2413623	10,41	2927792	8,59
Year	2002		2009	
Age group (years)	Total population	%	Total population	%
	21794793	100	21469959	100
0 - 14	3779298	17,34	3245775	15,11
15 - 64	14954474	68,61	15019959	69,95
> 65	3061021	14,05	3204225	14,94

Source: <http://www.insse.ro>, POP 102A and own contribution

It is recalled that the third classification includes population between 0 and 14, 15 and 64 years and more than 64 years, the ranges are bounded to reliefării and analyzing the working age population, the labor force in Romania employment laws in force[2] is represented by the working age population between 16 and 57 years for women and 16-62 years for men, that the status of unemployed person has any attached certain conditions must have under the laws of

Romania a minimum age of 16 years and under EU law at least 15 years of age.

Following these arguments in the table no. 5 presents the structure of the large age groups and calculated the percentage of each age group in total population over the past two decades.

Population numbers presented in this table represent the number registered on July 1, for the situation to be as current. It should be remembered that the number of population is calculated by the National Institute of Statistics, the two times of the year ie 1 January and 1 July.

The figures in the table above shows that the biggest differences are recorded in the age group 0-14 years. Thus, in 2009 this group recorded a 6.01 percent decrease compared to 1990 due to continued decline in birth rates, demographic characteristic process of Romania after 1990, it has been amply highlighted in the assessment of the number of people.

Compared to 1990, the age group 15-65 years, recorded at period end analysis an increasing share of the total population, the right of a lower intensity of only 2.77 percentage points. This is due to the shift premium natural population age groups in the second, the transformation over time of the young population of the early analysis, the working age population, where birth rates have a standard higher thereafter decreasing gradually and evenly.

Third age group, recorded in the last twenty years, an increasing trend with 3.24%. In 1990, the population over 65 years owned a share of 10.41%, was part of Romania among the countries with an aging population. Subsequently, over time there is a tendency to increase that percentage, so that after 1994 the aging demographic change, and so far its mark on our country. The emergence of this process is primarily due to demographic decline birth rate in a more sustained than the reduction of mortality, ie the negative natural increase was registered in Romania, after 1992, also highlighted in the analysis part of the herd population.

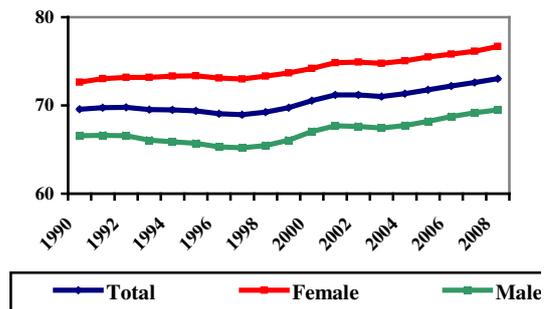

4. Qualitative features of population dynamics

After the quantitative aspects of what occurred in population trends in Romania, is necessary to continue and an overview of the quality.

In this regard, some qualitative aspects of a population refers to life expectancy at birth, educational level, per capita gross domestic product, in fact constituent elements of human development level. As a result of the methodology for calculating the human development indicator is fairly complex and not the main subject of this thesis, we will stop only an overview of the evolution of these qualitative elements of Romania's population since 1990.

Life expectancy at birth, or as is also known as the average life expectancy in the period 1990-2008, is shown by chart suggestive no. 2.

Chart no.2 - Life expectancy at birth for the population of Romania between 1990-2008

Source: <http://www.insse.ro>, POP 217A

Overall, life expectancy at birth of people in Romania increased from 69.56 years in 1990 to 73.03 years at the end of 2008. This increase, however, and some have both positive and negative swings. Thus by 1992 life expectancy at birth increased by 0.22 years, because after this year and by 1997, this indicator to have a descent trend. After 1997, there is an increase in life expectancy by the year 2001, life expectancy being 71.19 years. In 2004, there is again a decrease, because after this year and so far, life expectancy is increasing.

We find that life expectancy among women is higher than among men, due to the fact that mortality in the second half of life is higher among males, as we saw in the

previous analysis. Thus in 1990, there is a difference in the average duration of 6.09 years for female persons, because at the end of 2008 this difference to be 7.19 years. Also, during the 19 years life expectancy for males increased by 2.9 years and 4.15 years among women. Overall, in Romania the average life expectancy increases, both among women and among men, those with different values as quite significant.

Evolution of education of the population, is another indicator that influences the development of human resources.

The population of Romania, contained in different stages of education, where presents an important qualitative leap.

Although the analysis in terms of education level of a population, or the degree of coverage of population at various stages of education is generally intended for long periods of time, usually one hundred years, in order to obtain an analysis able to render a general trend and not a temporary, even analysis of past 14 years, positive developments can be observed in the level of training of the population in Romania.

Compared to 1997 [3], at the end of 2008, noted significant changes in terms of population covered by primary and secondary education, as well as that contained in higher education. If the first category there is a loss of 3.06 percent, the second is an increase of 2.66 percent, those contained in formal higher education was in 2008, 2.8 times more numerous than in 1997. During this period, it also notes a slight increase of persons enrolled in secondary education, but a decrease of time and a 0.38 percent decrease of persons following a vocational school, secondary education while maintaining relatively the same level.

Qualitative assessment of the development of population dynamics and requires evidence of the third significant determinant of human development indicators, namely gross domestic product, reflecting the gross amount of the final output of goods and services produced over a period of time by economic to operate within national boundaries.

Increasing amount of human development indicators, as is apparent from the data recorded in the table no. has made Romania a pass from the category of countries with

medium level of development in the category of countries with high human development. Location of Romania in this category took place in 2004 [4], when the human development indicator was 0.805. It resulted from the index of life expectancy at birth of 0.78%, level of education of 0.9% and GDP per capita index of 0.74%, life expectancy is 71.5 years and GDP per capita is \$ 8.480. If in 1990 the worldwide number of 160 countries, Romania is ranked 60, with a value of 0.786 human development indicators, in 2007, Romania ranks 63 out of 182 numbers states, the same indicator registering a value of 0.837. From information provided by the 2009 Human Development Report, which contains data relating to 2007, Romania is surpassed by the OECD member states, the countries of Central and Eastern Europe and the Commonwealth of Independent States, is above the level reached by the countries of America Latin, South and East Asia, the Arab States.[5]

5. Conclusion

In quantitative terms, until 1990, over six decades the population of Romania has experienced a consistent upward trend, registering a growth of 62.11% compared to 1930, because after this year so far to show a continuous and uninterrupted decline, so that the end of 2009 Romania's population is in decline with 1,736,761 people, compared to 1990. Continuous reduction of the population in Romania after 1990 was mainly due to the manifestation of both a negative natural increase and external migration has also a negative balance, the main factors which directly influence the number of people in any country.

Abstract

This study addresses the role of European institutions in their efforts to combat the effects of global financial crisis. Emphasis is placed on the European Union's contribution in the initiation of measures to limit the global financial crisis. This study seeks to explain the causes of the financial crisis while stressing the decisions taken thereon, to prevent such a phenomenon in the future.

Key words: Lisbon Treaty, economic and monetary policy, global financial crisis, crisis unit, European economic recovery plan.

J.E.L. classification: K33

1. Introduction. First reactions of the European institutions to the global financial crisis

The occurrence of the global financial crisis makes the object of certain diplomatic negotiations both at regional and global levels, while searching for the most appropriate measures in order to limit its negative consequences, but mostly to eliminate the causes that could possibly trigger it. In such sense, obviously the most sustained diplomatic activity in view of combating the consequences of the global financial crisis has been developed by the European Union, on one side, and by certain groups of states, on the other side. [1]

At the European level, the institutional perspective of the European Union's economical and monetary policy, the way it is defined by the treaties in force and it is implemented, strongly outlines the distinction between the supranational and intergovernmental components which are

typical for the European institutional system. In such sense, such a perspective, settled at Maastricht and completed at Amsterdam in what concerns "The Stability Pact", acts in such manner that the monetary policy is clearly defined in what concerns the instruments and objectives, while the economical policy is left in the responsibility of the Member State, establishing nothing more than its parameters and mechanisms of coordination. Consequently, there is an enormous disproportion between the objective of a common economical policy and the existing instruments at the European level.

In what concerns the competence of enactment and action regarding the supranational and intergovernmental components of the economical policy, the Structure of the European Union implies three pylons in the light of the Maastricht Treaty : the first pylon - exclusive competences of the European Community, the second pylon - competences in matter of security and external affairs and the third pylon - comprising domains of action under the exclusive competence of the member states, regarding the cooperation in matters of justice and internal affairs.[2]

2. The institutional perspective in force and the Lisbon Treaty

The Lisbon Treaty leaves unaltered the forming phase of the "general requirements" of the national economical policies established in the European areas yet, in the same time, it brings certain improvements in what concerns the surveillance phase of their application, thus strengthening the role of the Commission and changing the classic framework of legislative competence established by the previous treaties.

The measures considered by the

Maastricht Treaty on the European Union regarding the surveillance phase of the "general requirements" application and the protection of the European Union's financial interests, haven't reached any result. The harmonization and assimilation techniques have encountered the striking differences between the Member States' legal systems and the impossibility of cooperation has proved to be difficult to achieve, hence the multiple projects of international conventions which have never been ratified by the Member States.[3]

In such conditions, the Lisbon Treaty interferes in order to concile the radical distinctions of competences and legal techniques existing in the area of fiscal law and of criminal law at the European Union's level.

Thus, the Lisbon Treaty substitutes the traditional mechanism of the three pylons with a bipartite classification of the communitary and national competences into exclusive and shared competences. In matters of exclusive competences, the latter refer to the domains in which the European Union may act, while the Member States have the possibility to interfere only with the Union's consent or to implement the European policies. In matters of shared competences, the Member States may interfere as long as the Union's hasn't act yet, thus on grounds of reverse subsidiarity.[4]

In this new classification of the competences between the Union and the Member States, the policy of freedom, security and justice, the hard kernel of the third pylon, is being assimilated in the area of shared competences. Such fact allows the direct interference of the Union in the national legislation of the Member States, strenghtening in the same time the legal instruments of action of the Union at the financial interests' protection level.

The specific enactment approach introduced by the Lisbon Treaty is represented by the technique of unification, guaranteed by the provisions of articles 69A-69E in the Treaty, which has turned out to be much more dynamic than the assimilation, cooperation or harmonization technique, introduced once with the Maastricht Treaty.

In this new framework, the Commission may address autonomously "an advertismment" to the Member State which economical

policy proves incoherent, regarding the general requirements, and becomes owner of a power of "proposal" and not only of "recommandation" of the act by means of which the Council decides the existence of the excessive deficite, with the consequence of making necessary the unanimity of votes in the Council in order to counter the respective proposal.

Yet, such significant improvements cover the surveillance phase only regarding the application of the "general requirements, not also that of their formulation, fact confirmed textually by art. 2 TFEU, which, after itemizing the Union's "exclusive" and "concurrent with that of the Member States" competences, depending on the sections, adds the following distinct expression : "The Member States coordinate their economical and occupational policies with the forms provisioned by the present treaty, while their definition rests in the responsibility of the Union" (par. 3) as well as art. 5, par. 1, TFEU, according to which "Member States coordinate their economical policies inside the Union. In other terms, the Council adopts measures, specially the general requirements for these policies".

The Lisbon Treaty, as we mentioned earlier, does not add anything new from this point of view. Consequently, the affirmation is wrong when stating that for the time being the coordination of its concurrent competences exteriorizes by means of regulations, as for example "The Stability and Growth Pact" or by means of directives, as in the case of services.

Letting aside the difficulties encountered during the process of ratification of the Lisbon Treaty, one asks himself whether such institutional framework is at the same level as the problems that the Union must face, once the global financial crisis has blown. We stopped at the discrepancy between the objectives and instruments and the rigidity of the automatisms, but we shouldn't ommit the low transparency and the democracy of the decisional processes, denounced by an ample specialized literature.[5]

3. The perspective and the proposals of the European Council

The global financial crisis is being considered thus, exceptional, being able to occur one single time in a generation and one can ask himself, firstly from the point of view of the economical science, how much can it to alter the presuppositions on which the European economical government lies. For the moment, the scholars from the European institutions are called to research, more modestly, what kind of requirements may come out from the first Union's reactions on the crisis, for a reorganization of the government.

Initially, the procedures provisioned by the European treaties substituted the majoritarian Member States interference and only after the European institution regained ground, among which, the most successful is the European Council, which has adopted a series of decisions extremely important for the future of the government.

First of all, there has been settled the implementation of an informal mechanism of alert and change of information and evaluation of the state of things. Practically, we speak about the creation of a new cell of crisis, to which all Member States in difficulty must address, by giving information on the difficulties in the financial system the president of the Central European Bank, the president of the European Commission, the president of exercise of the Council, but also the other Member States. In such sense, the national authorities of surveillance, that is the heads of the central banks, are invited to meet monthly in order to exchange information.

Second of all, being obvious the necessity of consolidation of the European financial section, especially that of transnational groups and of urgent application of the measures proposed by the Ecofin Council, in order to improve the coordination of the surveillance, the European Council has developed a "high level group", by inviting firstly the national surveillance authorities to reunite at least once a month in order to exchange information. "The high level group", presided by Jacques de Larosiere, former governor of the National Bank of France has been charged with the task of guaranteing, among others, major European

cooperation, for the surveillance of the financial stability.

This last measure has been imposed also for the considerent that the European directives can be translated in different rules in the Member States, the plurinational bank groups are unable to act with homogenous rules, let alone the fact that information about these banks is not put at the service of the national authorities. Additionally, the European banks, analogue to the American ones in terms of dimension and debit, are submitted to the regulations of certain states smaller than the USA, hence the information that they are too important banks for a single state to save them. For these reasons it has been proposed the constitution of a new surveillance authority beside the European Central Bank (CEB), which delimits the action lines, at least for the banks in the Euro zone, as well as the common requirements of capitalisation and surveillance.

At its turn, the Commission declared that a surveillance of the banks organized on a national basis limits the capacity of an effective supranational surveillance and it interfered also in the activation, together with the Member States, of a part of the private banking system, in such manner that to guarantee once again the competition and the acces to the private loan in the framework of a stable and effective private system.

In a report to the European Council from the 26th of November 2008 [6], the European Commission proposed an „European economic recovery plan” concentrated on a financial loan of the European Union for the stimulation of the economy in the Member States in the framework of the "Stability and Growth Pact", which after its revision in 2005 guarantees the necessary flexibility regarding the observance of the deficit report/GNP. Furthermore, the plan consists of immediate budgetary measures of a total amount of 200 milliards of €, consisting, on one side, of measures adopted at the communitarian level of a total amount of 30 milliards of € and, on the other side, of measures adopted at the national level of the total amount of 170 milliards of €. Beside these measures, the plan comprises a series of priority actions that the European Unions should undertake in the context of the Lisbon Strategy, conceived in order to adapt the European Union's economy for the

challengings on long term, to develop the potential growth and to continue the implementation of the structural reforms.

The same way it treated the financial backups of the banks, and implicitly of the real economy, the Commission seems to assume the fact that the crisis can be faced with emissions of idle money, which would impose several significant modifications to the European government. All these are available also for the institutional perspective. In such sense, the Commission, insists, several times, on the necessity of coordination between the Member States, yet without indicating instruments, headquarters or inovative procedures.

A more ambitious proposal regarding the stopping of the negative effects of the global financial crisis has been handed in by the political man, Guy Verhofstadt, president of the Alliance of Liberals and Democrats for Europe (ALDE) inside the European Parliament, which stipulates :

- creating an European agency of financial reglementation in the framework of a global net of analogue agencies, all being governed by the same regulations and standards.
- an insitution, possibly inside the CEB, with the task of fixing *clearances* for the requirements of the interbanking loan, considered a better alternative to fixing statal guarantees or to instituing an European intervention fund, equivalent to the Europeanization/cost collectivization of the nationalizations.
- creating a governing authority claimed to follow a social-economical policy of convergence, which, despite the harmonization, implies the fixation of certain parameters in which the Member States in the Union or inside the euro zone should develop in order to achieve, together, the purpose of a more integrated and competitive European economy.

Finally, Guy Verhofstadt brings into discussion the fact that the global financial crisis has constituted a lesson for the Member States outside the Euro area, which suffered pressions on their currencies, much more higher than those of the states inside the euro area. If opening once again the debate over the necessity of adopting euro in certain states is a sort of prelude for an expansion of the euro zone, the actual asymetry between

the monetary union and economical union would dilute. In the same time, the financial crisis implies a general deceleration of the economical growth in the following years and the final growth of certain countries like China, India and Brasil.

4. Final conclusions

The ideas mentionned in the paragraphs above demonstrate the fact that the problems of reform of the European government do not consist of the difficulty of identifying an alternative institutional perspective for the one in force, but of matters of context, or in the presence of a series of variables which condition the feasibility and of unpredictable interactions between them.

Instituing an authority of governing the economy in a less fragmented Europe that that of our days and concentrated mainly on the Member States ministers of economy, is not justified only by the internal requirement of the European Union to identify a political interlocutor for the CEB, but also for the uncertainty of the global financial perspectives.

In such context, the Lisbon Treaty, which adoptation overlaps temporarily with the highest moment of the global economical crisis, interferes on the purpose of protecting the European Union's financial interests by measures constituting the premice of a new institutional and legal organisation at the communitarian level.

The Crisis – Basic and Repeatable Economic Phenomenon

Ploae Catalin

„Ovidius” University of Constanta, Faculty of Economic Sciences
catalinploae@gmail.com

Abstract

Beginning in 1825, the global economy has had a cyclical development. Growth and progress have not been determined by linear chaining but by circuitous development, by ups and downs, by phenomena such as crisis, depression, revival and prosperity. Piles of books were written, several Nobel prizes have been won on these issues, which are at the heart of economic theory. The economic policy inspired by this theory has achieved something notable and laudable at the same time, it has managed to reduce and prevent the conversion of sine wave peak in a crisis. The business cycle has thus been reduced to two significant stages: economic growth and recession. Crises have been avoided or have been changed into something bearable. However, in two famous cases, economic policies have failed to avoid serious crises: 1929-1933 and the present. These are unprecedented cases, of a scale and bearing consequences unparalleled by any other phenomena. On these two phenomena and especially on the second we will focus when we try to find the meaning of this lesson on crisis.

Key words: economic crisis, public policies, recovery.

J.E.L. classification: E20

1. Introduction

We have learned from the lessons of others and our own experience that the moment called crisis is the event of implosion-explosion of maximum intensity, which includes a great variety of economic phenomena and processes, and which has the highest temporal concentration and spatial coverage. It's in its nature not to pass unnoticed. It's annoying, it determines reference points, it changes government

matrices, it revises and renews discourses, in a word, it is worthy of study and this is exactly what it gets. The generation that lives the crisis writes down the lesson through its leading scientists. It should be told and taught in order for it to be learned and taken into account. But what actually happens is that the lesson is given an historical character, packed and sent to the past with the label: "to those interested in the subject". Once it got there, the information ages, it becomes relative, or is simply lost. If this phenomenon would happen more often, these notions would maintain their actuality. Unfortunately this is not the case, since the next big crisis is experienced by another generation, third and fourth, and it is interpreted in a different language and is depending on another paradigm.

And another thing: crises do not teach us the same thing: Although the crisis is a series of negative phenomena, it leaves an empty space behind. During a crisis and after it, most people have lost something. They learn their lesson from their mistakes and the lesson takes the form of a set of statements designed to teach their offspring, a century later, what you should not do to avoid danger. Others, however, learn and pass on a different lesson, a lesson that teaches one not only to survive, but also to gain a profit from a crisis. Passing on this lesson (irrespective of its nature) in time will probably be either considered a distant alternative or will simply be lost.

2. The Economic Crisis as a Basic and Repeatable Phenomenon

The world is not considered to be literally in a crisis until the moment the streets are flooded with unemployed people. Remaining in virtual form and preventing wave breaking through resorption, is a proof of wise policy; but the ultimate proof would be to prevent the formation of the wave itself. The hardest

lesson the crisis teaches us refers to these particular moments. Social riots are actually the last outbursts with sparks and tragedies of latent economic conflicts, present in all stages of the cycle but only manifesting by explosions in the crisis phase, when mass unemployment reaches a peak. We are talking about conflicts of facts and ideas, insurmountable contradictions between production and consumption, between real and nominal economy, between views of micro, macro and global, between current events and theoretical orthodoxy, one that provides no explanations and no solutions for what happens in the real world. This is a time when economists are blamed for all ills, including of deception and the occult, and when economics are viewed with suspicion. In front of the battlefield now occupied by people without jobs, politicians are forced to admit what have not admitted previously, namely that the economic balance is nothing without social peace. And they are forced to admit that because, as noted J.M. Keynes's speech on 'outcome' crisis of the '30s: "... Men will not always die quietly. For starvation, which brings to some lethargy and a helpless despair, drives other temperaments to the nervous instability of hysteria and to a mad despair. And these in their distress may overturn the remnants of organization, and submerge civilization itself in their attempts to satisfy desperately the overwhelming needs of the individual. This is the danger against which all our resources and courage and idealism must now co-operate" (Keynes, 1919, p. 213). Keynes was an interventionist with a liberal soul. He wrote these lines not out of a great attachment towards the cause of the proletariat, but because the facts and events required such a conclusion. A good model of economic policy is only effective if it is based on the human factor, if its main focus aims at engaging the entire workforce.

We insist on stating that such moments should be avoided because they generally involve 'crazy' solutions that elude not only the status quo of economic logic, but logic in general. Consider two examples, which belong to the same areas that have prompted Keynes to also write less brilliant texts. First, being preoccupied and even obsessed with finding solutions for labor market development, he advocates to discourage saving and encourage investment. With the

specter of unemployment under his eyes, he found the sources of investment and especially their less important destination. He accepts any source of investment, including the budget deficit. And more than that, if an investment has a multiplier effect and generates jobs, the investment may even be counterproductive. According to his 'logic', Keynes said that "...If the Treasury were to fill old bottles with banknotes, bury them at suitable depths in disused coalmines which are then filled up to the surface with town rubbish, and leave it to private enterprise on well-tryed principles of laissez-faire to dig the notes up again [...] there need be no more unemployment [...] and its capital wealth also, would probably become a good deal greater than it actually is." (Keynes, 1970, p.147). In other words, what Keynes tries to say is that people filled streets are so dangerous for the future of social peace that even meaningless work is an alternative "better than nothing. Taken out of context, Keynes' words are simply absurd. We can understand him only if we refer to the time and the context in which his statements were made, to what made possible in a country with healthy traditions that gave Europe prices, faced with an explosive rate of unemployment of up to 60 % in industrialized areas of the Ruhr basin, and we refer here to Germany, where a person like Hitler became the 'democrat' leader of the country only because he promised them jobs. The time of such statements should be viewed from this perspective, when such a crisis synthesizer context can be 'exploited' fully for the future of a nation. Secondly, Keynes is known as the author of an infantile way of thinking: what does the economy have and what does it not during the crisis? It has excess labor and idle capital. It has no money, real money, because the crisis is one of credited money. And, forcing his way to the following conclusion, he suggests loud and clear that the gold standard is a 'barbaric relic'. The economy should be given what it lacks and the money printing press seems to be a perfect solution. Such reasoning is still seen today, encouraged by the current crisis (see Krugman 2008). Those who afford it would make such a statement. The choice between a visible 'no pain' inflation and unemployment, which can only be an explosive tragedy, also requires 'crazy'

solutions.

The crisis is a moment of truth to the extent that it puts things into place; mainly it places nominal economy, enlarged by volatilization, on the foundation provided by the real economy. It's a time when the institution of bankruptcy is required to purge and cleanse the territory, to do its duty to bowl over those who have excluded or gave up formal and informal healthy practices, those who by selling illusions, not only compromised the game, but in addition, turned the GDP in a huge and disappointing wheel of Swiss cheese. For this to happen, the market should be allowed to do its duty. But this did not happen either in 1923-1933, nor today. In other words, the cleaning mechanism is transformed and perverted.

The crisis is a moment of compromise because this is the moment the fundamental institution entrusted with the arrangement and rearrangement of competitors based on their results is questioned. From this point of view, the ideas from studies published after 1929-1933 do not differ fundamentally from those published today. Like today, we learn that we have developed on the right side but park on the left to find solutions and to get out of the blind spot. And once we get here, we request the state as the ultimate authority able to reconcile what has proved to be irreconcilable.

This is the moment when the state shows what it knows best: to privatize profits and socialize losses. Now is its chance to appear as an abstract entity beyond and above the people, the vast category of losers, and close to the few winners without the risk of being anathematized. This occurs because in these circumstances, there appears to be an objective necessity for the support and regulation required from the state, that the tragic reality requires. The "arguments" that support its help are many and perverse. Market-regulating mechanisms are disturbed. And this is because, in times of a crisis more than in an uneventful period, the state is courted in order to guarantee contracts and in order to become corrupted, in order to provide employment under conditions of safety for those who have failed in private enterprises, ending in bureaucracy and paralysis. Using its mechanisms of redistribution, the state takes from those who played by the market rules in order to make

gifts to those who should be punished. The principle of equivalence is rejected in favor of manipulation practices: money does not return to those from whom they have been taken, but to those who have created holes, to companies that do not comply with rules of the game, to companies artificially created that in the future shall come in competition with those that can cope with the crisis without state aid.

There is information that gives hope, this being that, in general, the attacks are transient, they come, creating serious problems or disorders, and go. A new cycle begins when they leave the scene. Regardless of its nature and duration (if annual, decennial or centennial), a cycle always reaches a peak of crisis. What is happening today, comparable only to what was witnessed in history from 1929-1933, is part of the long Kondratieff centenary cycle. If we are tempted, which is only natural, to compare the current crisis with that which took place in early 20th century, we have every reason to believe, at least out of inertia, that this crisis has also a beginning and an end. When it comes to establishing temporal benchmarks, only the big players in the world have a say in this matter. It is no accident, and we intend to prove that the U.S. was the triggering factor of this phenomenon in both cases. The same country will undoubtedly dictate the end. Naturally, the contagion spreads quickly in a globalized world. For exactly these reasons, this crisis requires global and adequate responses. Despite its various amplitudes and higher velocities of spreading the primary impulse of response is still present: "the center" seeks refuge and solutions at the expense of the "periphery".

Regardless of the level of indebtedness, (states to states, companies to companies and vice-versa, and all of the above to IMF, WB or ERBD) to end the crisis, despite cooperation and various requests for joint efforts, does not consist in detachment from the world's way to act, a world of domination, asymmetric and irreversible effects, just as Francois Perroux inspiringly described it, that is, from large to small and never vice versa, regardless of the level of indebtedness (states to states, companies to companies, companies to state, and vice versa and all these to the IMF, World Bank and EBRD) and the nature of indebtedness.

"The accuracy" of this phenomenon, able to cover any discriminatory practices and abuse of power, transforms outrage into futility. The world has become so accustomed to this way of being of the world (so mundane) that the states at the "periphery" expect "quite rightly" and with delight to be notified when their ordeal will end. It is undoubtedly true that this comparison reveals many other differences and similarities between now and then. There is hope that lies hidden somewhere in the background: the current crisis should be shorter. Existing technical and material resources, means of intervention and specific skills entitle us to think so. Besides, beyond a certain limit, which is difficult to trace the econometric parties involved to overcome this are becoming more numerous and larger. Leaving aside for the moment the technical and economic reasons, political and financial crisis maintain this phenomenon called, we will focus on another cause, which explains, from a different point of view, the emergence of the crisis and its repeatability. In other words, we try to answer a perfectly legitimate question: What happened between 1929 and 1933 and what happens today will happen in the near or distant future? Will this phenomenon occur again at the end of the century in support of Kondratieff's (1984) theories and of the assumptions of other theoreticians of the cycle?

We dare to give an affirmative answer, and at the same time not support our beliefs on technical reasons. Rather, we believe that what really counts is human nature responsible for the repeatability of these phenomena, which because of their ugliness and their devastating consequences should remain "unique" / "single. "

We do not pretend that we develop a pioneering work when we say that human nature may be responsible to a great extent of what is called economic cyclicity. Keynes's psychological reasons that urge individuals to refrain from spending or on the contrary, to increase their appetite to consume, prove that the great economist was a great connoisseur of human nature. People's interest in investment or consumption, their preference for cash, the evolution of "average belief", credit conditions, "fundamental psychological law" that explains the behavior of individual consumption as depending on

the evolution of income, caution, transactional and speculative reasons, etc. Here are just some of Keynes's concepts that have as their central point the human nature.

A fairly large number of economists still base their studies on the economic crisis on behavioral patterns (such as adaptive responses to the euphoric mood, panic, excess, debt, appetite, etc.) invoking greed as the all-encompassing cause of the chaos generated by the crisis.

What we are trying to further emphasize is that the proper environment may trigger a potential crisis. It is a result of the action and reaction of two categories of players: one the makes offers and another that stimulates demand. An assumption is necessary for a clear understanding of the phenomenon: today, just like during 1929-1933, the crisis actually began in the context of loaning money. Although the events in 1929-1933 suggested an overproduction and a consumption crisis and in the present, the real estate market crisis and the panic on Wall Street, they actually mean the same in both cases: the collapse of confidence in loans. Built step by step, the type "bubble" permissive environment of overly packaged and excessively secured products has been created by common "contribution", suppliers and customers joined in a dance of madness, enslaved in a game built from trust and "human frailty".

Post factum, after the frenzy has dropped and the game proved to be a sand castle, the guilty are instinctively sought and the blame is thrown: on the stock exchange market that has made possible to sell illusion in tempting installments, on the banking system, which made possible the stock market's casino-type transactions and have poisoned the market with no coverage products, on the insurance companies that have played their clients' money on the stock market, on the shadowy world of intermediaries, which have facilitated the systematic emergence of synthetic products, on the rating agencies who have staged the show giving high marks for dubious initiatives, etc.. If we are open to a minimum of objectivity, we should admit that the stock markets, banks, insurance companies, etc. are not entities that feed themselves. Their inputs and outputs bring in play a greater or lower number of participants.

Current crisis manifestations entitle us to say that we passed the limit. In 2005, two years before the start of the crisis, America had the highest rate of indebtedness. Meanwhile, in 1993, the savings rate was negative. In spite of this and despite all the warnings, loans reached dizzying levels. The offer was so generous that loans with rates of 2-4% profit and which exceed government bonds were successful. Failure or delay in repayment of the loan, the banks' inability to make payments, the stock market collapse, etc. announced an impending crisis and the destruction of a system.

However, the show continued until the giants began to crumble. Individual life plans tailored after the concept of "permanent income" of Nobel Laureate Friedman were not taken into account. Keynes' "beastly spirits" had prevailed. Secondly, indebtedness, regardless of who is in debt, has the same meaning: you loan in order to spend more than you earn. The assumption that the debt capacity is limited is well known. As well as the statement claiming that indebtedness is not a positive thing. Chances are you feel worse as borrower than as lender. Also, the concept of deficit has an ancestral validity when it defines the difference between inputs and outputs. Minor differences consist of units of measurement, solving methods and the consequences resulting from debt. We do not claim to say anything not already known.

We should take into account that consumption and investment loans based on future income have increased and are accompanied by greater exposure of all economic players. The way in which innate aversion to risk affects financial flexibility, acceptance of risk during periods of economic growth, unquestioning trust in future income, temporary financial imbalance in conjunction with stages of economic tension, "the aid" offered by the banking and financial system through its own examples (massive cuts of their rates of capital), says much about the trend described above. We believe that the consequences of indebtedness deserve special attention. In a medium sized entity (family, business), indebtedness and debt return is one and the same problem.

The one who assumes the loan risk is the one that after the onset of the crisis is punished for the audacity of overcoming his/her limitations. His "grief" is an effect of miscalculating. This does not apply to large companies or the state. These mistakes are not always paid by those who commit them. State intervention, regardless of the manner in which it occurs, is a "socialization" of losses. Neither the large companies nor the State can be in bankruptcy without causing serious imbalances. In these cases, there is usually "someone" who pays for the mistakes of "someone else" who took the risk. The fact that not only large corporations or euphoric promoters of prosperity, but the entire population is involved in paying for the mistakes of others, turns the crisis not only in a psychological certainty of the fact that underestimating risk comes into conflict with the aversion to risk of each of us, but also in a time of maximum social tension when the basic elements of human cooperation are shattered.

International Trade Crisis

Abstract

This article captures a brief history of the negotiations of the Doha Development Agenda (DDA), analyzes its deadlock and offers some suggestions for a successful Doha deal. First, this study shows that the nearly decade-long negotiation stalemate is caused by the opposite perceptions between industrialized countries and developing ones on agriculture, as well as by the influences of economic crisis on the world trade. Subsequently, some proposals are presented to solve the current crisis from the international trade, starting especially with the goodwill of the WTO members, as well as the countries with observer status within the institution.

The main conclusion is that the US must exercise a leadership position in completing the Doha Round and the developing countries must embrace the open trade with a positive attitude beyond DDA.

Key words: Doha Round, failure, commercial crisis, farm protectionism, North-South clash.

J.E.L. classification: F13, F51, F53, G01

1. Introduction

Accelerated globalization and strong competition between the world states make the attempts to regulate emerging global issues more difficult. Perhaps, the most significant example in this regard is the endeavour to liberalize international trade in goods, services, intellectual property rights, mainly, but not generally, in order to improve what is known in the literature as the Doha Round failure, pointing out "*the institutional crisis and reform*" [14] within the World Trade Organization, for almost a decade.

What exactly is the Doha Round, why does it stain the plausible image of the global institution, obtained with difficulty from 1995, and how it came to the current collapse of world trade, are the questions that will represent the starting point in this study. Noticing what ordinary people do not know about this continuous cycle of multilateral trade negotiations which has its origins in the capital of Qatar, from 9-14 November 2001 and what were the key factors that have contributed to the impasse of this round are the main steps of the paper.

2. Literature review

Regarding the international trade crisis caused by the non-conclusion to the Doha negotiations started in 2001, followed by the blockage that led to further delays in these negotiations, and the economic recession that has entered later, in every corner of the Earth, were published many works of foreign authors.

Thus, a detailed history of the fourth WTO Ministerial Conference and the hazy future of the next negotiations, were approached by J. François and H. Meijl, S. Kinnman and M. Lodefalk, F. Ackerman, C. F. Bergsten, Aaditya Mattoo and Arvind Subramanian, A. Bouët and others. According to them, the Doha Round – known to specialists as the "*Doha Development Agenda*" – faced a long series of launch-delays [12, p.351], an issue that led to still ambiguous negotiations in a number of the key areas. Moreover, Aaditya Mattoo and Arvind Subramanian stressed the fact that after the Geneva Conference in July 2009, it proposed the revival of the Doha process, collapsed since 2005. This effort is needed to resolve the differences between the traditional powers of the world (USA, EU) and the new emerging countries (China, India, Brazil), such as on the peace of liberalization [17, p. 25]. Also, from the

scenarios made by Bouët and Laborde, Kinnman and Lodefal in their researchs, we can extract the idea that the economic cost of a failed Doha Round would lead the world trade to a decrease of 7.7% and if the tariffs, applied by the strong economies, continued to increase, the world welfare would be reduced to 353 billion dollars [15; 9, p.1]. This issue displeases not only the developing countries, but also Pascal Lamy himself (the Director-General of the WTO), who states that if the country had slipped into the kind of protectionism, as in the 30s, the contraction of international trade would have been catastrophic [23, p. 10].

In terms of research defining aspects of the most controversial area of the negotiations, also found on the Doha Development Agenda, an essential contribution had Kym Anderson, Will Martin, Giovannia Anania, J.-Ch. Bureau and Patrick A. Messerlin. According to them, the high agricultural protectionism, illustrated by defending the national farmers and their production through favourable agricultural policies, is embraced, with predilection by the two "elephants" or a better term should be the two "dinosaurs" – the United States and the European Community [18, p.6]. The desire to benefit from broader agricultural policies, allowing a large amount of tariff reductions in this area and its derivatives, results in the European area from French practice.

Before and after the Doha, the agricultural sector was granted in the WTO negotiations, a special place and that because, it is as important as vast and complicated. Moreover, the existence of "several agricultures" according to Messerlin, with different levels of the protection have made the liberalization of "hard core" farm products such as sugar, rice, milk, and beef [18, p.7] to be broached in the Ministerial Conferences that followed the 2001. But unfortunately, the policy of an "uniform agricultural tariff" (the same tariff for all agricultural products) is expected for almost a decade, a matter which shows that agriculture contributed assuredly, and hasn't ceased to do so, to the current collapse of the commercial nature [2, p. 541].

Emphasizing the same point, Anderson and Martin reported that it is ironic how the agricultural policy is so controversial, given its low importance and declining in the global economy [3, p.4] and also relying on the fact

that the DDA negotiations on agriculture have been affected, much more than some others may have believed, by the outcome of the dispute settlement mechanism of WTO [2, p. 548].

Outlining this topic, it is appropriate to recall the relevant research effectuated by Hoekman et al., Esty, Levchenko et al., Baldwin and Evenett, Wilkinson, according to which, the deadlock, within the international trade and specially within the World Trade Organization, has its origins in the failure of the ministerial meeting in Seattle (1999), continuing with Cancun (2003) and Geneva (2009). During the last conference there was no significant progress made, as DDA negotiations were indefinitely suspended and the period for completing the Doha Round was extended [6; 11; 21]. Moreover, the crisis of legitimacy facing the WTO at the beginning of XXI century, concretized in the protests presented at the major international economic meetings and also the role of organization, in terms of globalization, are questioned by many researchers [11, p.7]. But there is a solution for it; in the first place, it should aim to restore credibility through a freer trade around the world, serving the interests of the global community, raising the awareness among the important goals and values, such as poverty reduction, environmental protection, public health promotion [11]. And how all this were not enough, in the 2008 year, a significant "contribution" to the recent commercial collapse acquires the current recession (less than commercial loans) [16, p.1] with reference to which, Baldwin and Evenett stressed the idea that trade is not the cause of economic crisis, but is likely to be one of its most significant casualties [6, p. 1]. This matter was understood in the 2009 G20 Summit, showing that the rejection of the protectionism, being critical in times of financial uncertainty, and also the lack of new tariff barriers in trade or investments represent the most successful solution in mitigating the trade effects of the crisis, in general, and in completing the Doha Round, particularly.

Concerning the fall of international trade, Levchenko et al. stated that this collapse is global in nature, and dramatic in magnitude [16, p. 1] because the most trading partners

are affected, and trade with virtually all parts of the world fell by double digits.

Although there are differing views vis-à-vis the current crisis in the international trade, a sum of the relevant remarks of the researchers in the global transactions lead to the idea that rebuilding the reputation of efficiency, lost by the WTO, depends on the long-term installation of a trade regime in a broader global governance structures, enhancing thus the legitimacy of international trade policy [16; 11].

3. The beginning of the Doha Round

In the last three decades, the global trade agenda has expanded considerably to include just the agricultural products and the trade in services during the Uruguay Round (1986-1994), the intellectual property rights (1994), the environmental issues (1995), followed by the investment, the competition policy, the government procurement and the trade facilitation (1996), and finally, the development-related goals during the Doha Round (2001-present).

Launched in the hope that it would inject a new life into the global economy which entered into decline following the attacks of 11 September 2001, and that it would strengthen the multilateral trading system to enable it to meet the challenges of XXI century, the fourth WTO Ministerial Conference gave birth to a new round of negotiations, known as the "*Doha Development Round*". Its task was to improve the trading system which had become more open, with national markets more interconnected, with goods, services and capital that moved more freely from a large number of participants [4], compared to the setting up WTO. In a narrower sense, its primary purpose was limited to reducing the trade barriers and the development gap between countries, with an emphasis on poorer countries marginalized by that date, in terms of the world trade.

4. The gradual deepening of commercial collapse

Although, initially, members agreed to reach a common point on the completion of the round by 1 January 2005, because of the

difficult and intractable problems that have been on the negotiating table (it is appropriate to mention agriculture – considered the most controversial area, as well as access to markets for industrial products), the deadline could not be reached.

However, the hope wasn't lost and two years later, during the Hong Kong Conference, the negotiations were resumed, but the difficulties mentioned above remained present at that time. Nevertheless, members agreed to the full completion of the Doha Work Programme and for the successful conclusion of negotiations by 2006 [10, p. 580], but it wasn't to be so. Nonetheless, during the meeting of China, member states agreed on arrangements which included several significant figures, such as deadlines for getting rid of agricultural export subsidies (2013), cotton export subsidies (2006), and also included a commitment to development, under which exports from less developed countries should enjoy free access, at least up to 97% after 2008 [10, p. 582]. From this moment, the emerging countries have gained a more positive attitude vis-à-vis a possible successful conclusion of Doha Round in the following meetings.

Therefore, the Ministerial Conference in Geneva (2008) agreed on a "saving package of elements", known as "*Lamy draft*" [5], composed of different ways of solving problems related to agriculture and market access of industrial products. In accordance with this draft, US and EU should reduce their agricultural subsidies by 30%, respectively, 80% [6]; also, developing countries have been given certain privileges, resulting in tariff reductions on "sensitive products", the use of the Special Safeguard Mechanism when there is an import surge of more than 40% by volum, a customs tariffs protection for strategic products etc.

The invitation to international trade of less developed states, manifested by Lamy in this Conference and during the negotiations that followed, bothered industrialized countries, which, according to Bhagwati, refused significantly to reduce their agricultural subsidies that are considered to distort trade and to be "*universally recognized as intolerable*" [5]. This aspect led to intensive negotiations that collided with major differences between the rich and poor, so now, at the beginning of 2011, we are in a

collapse of the Doha Round, meaning a loss of credibility in the international institution that issued it. Because of this aspect, the specialized press is crossed more frequently by articles whose titles are some more sarcastic than others, like: "*The Doha blues: institutional crisis and reform in the WTO*" [14] or "*Doha Round is dead or just in trouble?!*" [19] or "*Doha Round: Do not breathe, but still lives*" [6] and the list goes on, dividing into two camps, supporters and critics of this cycle of multilateral trade negotiations and implicitly, the World Trade Organization as a whole.

5. The commercial crisis causes

Any major event is based on a few causes more or less important and those that led to what we call today the crisis in international trade are memorable. These causes are as numerous as the domains found in the Doha Development Agenda. Thus, we can announce, without restraint, that the multiplicity and complexity of the issues negotiated in 2001 and continued in the Ministerial Conferences that followed (Cancun - 2003, Hong Kong - 2005, Geneva - 2009) have been more characterized by their lack of progress than their success. This is due, on the one hand, to the incompatibility between the purpose of the DDA and the "mercantilism" [10, p. 583] of states, and on the other hand, to the less favorable environment for trade negotiations.

To understand those mentioned above, we use concrete examples, while arguing the option for the title of this paper.

Thus, in the first case, we already know that the Doha Round was meant to be a development round focused on liberalization and open markets both among developing and poor countries. The Ministerial Declaration emphasizes this detail: "International trade can play a major role in promoting economic development and poverty reduction. We recognize the need for all our peoples to benefit from increased opportunities and welfare gains that the multilateral trading system generates them. Most WTO members are developing countries and we are looking to place their needs and interests at the heart of the Work Programme adopted in this Declaration" [22].

However, the initial emphasis placed on development has transformed rapidly into a blurred and faded one, so that, the main actors on the world commercial market, like USA, EU and not only, have pursued their own merchant interests, being concerned only with the accumulation of as many privileges from the main commercial partners, such as reduction or elimination of tariff subsidies. But developing countries refused to grant favors before industrialized countries provided substantial commitments in the domain of agriculture which led the policy at the edge of the abyss, often blocking the negotiation process. Also, in the 2008 year, a delegation of U.S. interest groups went to Geneva, in order to monitor and even to instruct U.S. negotiators to achieve substantial compromises that can lead to billion state budget revenues resulting from trade. There are just, some of the so-called mercantilist positions of developed countries that have bothered developing countries and their reaction was quite strong. The idea that major international players watched, just, their own "commercial prosperity" [10, p. 585] could not be refuted neither then nor now, no matter how much we want it, moreover, the generous agricultural protection of EU and U.S. has accelerated the international trade crisis. Even today, the problem of excessive protectionism has not been resolved and is still "*the biggest threat to world economy recovery*" [7], according to German Chancellor, Angela Merkel. In conclusion, due to different expectations, as a result of a possible completion of the Doha Round, the enormous tensions between North and South trade negotiations have an unmistakable echo and are difficult to control.

The second reason, that led to the current impasse of the cycle of multilateral trade negotiations begun in Qatar, relates to the international shaken environment by the end of 2007 on American continent and with the beginning of 2008, on other continents. As a result of financial crisis, born on Wall Street, global trade was frozen, generating new protectionist sentiments. On the other hand, this recession has had some negative effects, including slowing global economic development, which led in 2009, to a decline in the international trade with up to 2%, considered the most drastic reduction in the

volume of transaction from the crisis in socialist economies since the '80s.

Due to the fact that the most affected by this decline were poor countries, because the investment flows decreased and also they could not sell consumer products to industrialized countries, their hope in the economic recovery and an aid in the development of remaining not competitive sectors was limited to successful completion of Doha Round in the near future.

If we were to answer to the second question surprised at the beginning of the paper, referring to the destroying by the Doha Round of the plausible World Trade Organization image, we can highlight only one and concrete aspect, taken from a totally different context but adapted to the problems mentioned above, the fact that "Nothing is perfect, but everything is perfectible". By introducing this quote, we suggest that the WTO has stopped to be an ideal institutional framework for trade a long time ago, despite its positive image had been an important purpose after the end of the Second World War. This is due to the large number of member states (currently 153), whose goals and interests are branched out more than are intertwined, as would be expected. Also, the Qatar Round is not unique in the history of trade negotiations whose results are less successful; we should mention the Geneva Ministerial Conference of 1998, the failure of launching the Millennium Round of the meeting in Seattle, and the post-Doha meetings. Making a parenthesis, referring to real deadlock of the Conference in Seattle, due to the divergence of interests between U.S. and EU, Japan and U.S., and between rich and poor countries, WTO disputes that it could not master them, neither then nor today. In this context, WTO was criticized as "*undemocratic, unfair, opaque and unbalanced organization*" [20, p. 389] since a decade ago. It would, therefore, be wrong to say that because the Doha Round, both the member states (particularly developing ones) and other international organizations have reduced the confidence in the organizational pillars of the institution, in the capabilities of commercial settlement of the occurring problems with the current financial crisis and the overall functioning of the WTO.

Without criticizing the institution previously mentioned, the current crisis of international trade, reflected in the failure of the Doha Round, will not go down very soon, although many consequences of this issue are known and are not encouraging. A prolonged DDA impasse would more shake the WTO system and would provide ample ammunition to members with protectionism ideas [10, p. 590]. Also, in the case of DDA settlement, the biggest losers would be the developing countries, which hope to improve market access for especially but not only agricultural and industrial products, but also the weak states, which may not escape soon from poverty.

On the other side of the barricade, there are several prerequisites for a successful round, which, unfortunately, were not quite taken into account. Thus, to have a finality round of multilateral trade negotiations, the first and most promising option for developing countries is to act collectively to refresh the WTO and the Doha Round negotiations. But for this, they must declare their willingness to open their markets to developed countries in exchange liberalization, by the simple fact that they can become the main beneficiaries of the advantages arising from a successful round. Moreover, many studies such as annual reports of the WTO, the World Bank, EU, UNCTAD statistics indicate that a successful Round would boost the world trade and would increase the global welfare with several billion dollars. This thing would achieve the dreams of many Third World countries, but also those of developing countries which can't boast with a trade surplus. Formulated in another way, we can say that there is no doubt that a successful conclusion of the Doha Round would bring, in addition to the benefits mentioned above, the confidence among investors and it would give a vital boost to the global economy.

6. Conclusions and proposals

Looking at the various options that we discussed, it is clear that the most desirable alternative in terms of developing countries would certainly be the Doha Round to be resumed and completed with a successful conclusion. This would lead international trade crisis melting like an iceberg. But no

progress will happen as long as developing countries don't offer anything in exchange for policy changes that they seek in the developed world. They have to accept that trade liberalization is in their interests, if not for the gains from the trade that economists are speculating, but for the sake of political transformations that are looking outside national borders.

Finally, an optimistic spirit makes its presence: with or without the Doha Round, World Trade Organization along with other international institutions will have to encourage very small countries to open their domestic markets and to determine countries with higher rates to reduce or eliminate their subsidies and other commercial barriers, unilaterally.

As a final conclusion, it can be stated that the promotion of trade liberalization hasn't yet become an easy task. In some measure, this reflects how far the global trading system has moved compared to the new theory of free trade, broached by Bhagwati, Johnson, Keynes and not only.

Cluster as an Element for Regional Competitiveness Strengthening

Popa Florina
National Institute of Economics
florinacarina@yahoo.com

Abstract

The concept of regional competitiveness is associated with certain economic circumstances leading to the development of clusters in a limited number of places. Michael Porter has had an important contribution to the development of the concept of geographical clusters, at both European and overseas level; he combines the basic Marshallian model with elements of company competitive strategy, while also taking into account the factor related to the level of resource endowment. This paper highlights the conceptual elements of the cluster, its essential characteristics as well as its impact on regional competitiveness, owing to the relationships developing within clusters and to the facilities they create.

Key words: clusters, regional competitiveness, development.

J.E.L. classification: R-R1-R10-R11-R12

1. Introduction

The dependence of companies' competitive advantages of their local environment, in the context of global competition, has led to the concept of regional competitiveness and to an increased interest in analyzing this concept.

Increasing the competitiveness of regional economies is an important step in achieving sustainable development, the existing disparities being, in the opinion of the European Union, one of the main reasons for the regional gaps.

At regional level, competitiveness is the ability to cope with market competition, ensure environmental, social and cultural sustainability, based on a two-fold approach of network and inter-territorial relationships.

According to the definition given by I. Lengyel (2002)^[1], competitiveness is "... the capacity of the companies, industries, regions, nations and supra-national regions to generate, while being exposed to international competition, relatively high income and employment levels".

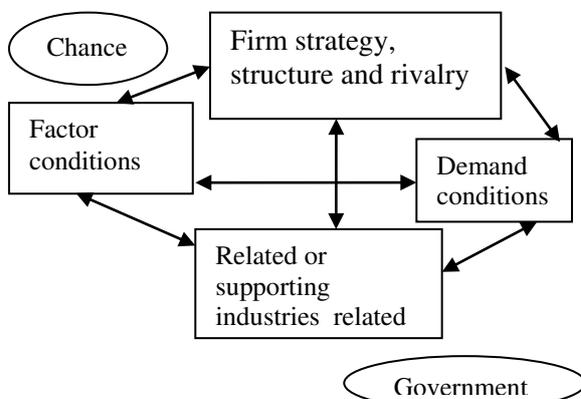

2. Concept, cluster formation methods

The concept of regional competitiveness is often associated with specific circumstances of the economic activities that lead to cluster formation in a limited number of places and within clearly defined borders. Michael Porter has had an important contribution to the development of the concept of geographical clusters, his influence being manifest both at European and overseas levels. The concept combines the basic Marshallian model with elements of company competitive strategy, while also taking into account the resource endowment. Based on empirical evidence from a large number of countries, he argues that the globally competitive industries of a nation invariably tend to manifest themselves in the form of geographical clusters in particular regions. According to the definition given by Michael Porter (1998)^[2], clusters are "geographic concentrations of interconnected companies and institutions in a particular field, of suppliers specialized inputs, [...] and providers of specialised infrastructure, such as universities, standards-setting agencies, [...], trade associations"^[2], which promote both competition and cooperation. The definition highlights a representation of different forms of agglomeration economies: economic activities concentrated spatially, the critical mass of economic actors, specialised economic actors, multiple actors addressing a group of markets, competition and cooperation strategies involving participants, interconnections (formal and

informal) among different actors, achieved through the cluster.

The theory is based also on a particular view on competition, namely the "dynamic strategic positioning of firms." The so-called "Porter's diamond" regarding the competitive advantage of nations offers a model that can help to understand a nation's competitive position in a competitive environment, at global level, a model that can be replicated to large geographic regions, too. Porter introduced the concept of "cluster" or groups of interconnected companies (service providers, suppliers, related industries and institutions), which develop in locations where there are sufficient resources and skills, thereby achieving a key position in an economic branch, with a sustainable competitive advantage, or even with world supremacy in that particular field. Competitive advantage is the result of four interconnected influences in and across companies within a cluster, graphically represented in Porter's model, also known as "Porter's diamond." (Figure 1.)

Figure 1. "Porter's diamond" graphically representation.

Source: „Diamond Model and Clusters (Michael Porter)” www.12manage.com.

► **Factor conditions** have been recognized as an important factor influencing company productivity. The key production factors - skilled labor, capital and infrastructure - are not inherited, but are obtained through sustainable investment, which gives them value, thereby creating a competitive advantage:

→ *quantity and quality of training and university education* help increase the qualifications of the workforce in both

advanced and in developing economies, having a positive impact on prosperity levels;

→ *efficient access to capital* is important for companies making long term investments that increase productivity;

→ *physical infrastructure* - globalization and growth generated by trade flows have increased the demand for transport and communications infrastructure for countries found under different levels of development;

→ *infrastructure in science and technology* is important for boosting productivity: in advanced economies, it becomes a source of new ideas that drive the knowledge frontier outward, while in developing countries it enhances the capacity to absorb the knowledge other countries have already generated, allowing the less developed economies to catch up.

► In terms of **firm strategy, structure and rivalry**, the key factor is opening of the countries to foreign trade and foreign investment, allowing them to exploit their comparative advantages and gain access to advanced ideas and technologies from abroad, exposing local companies to higher levels of competitive pressure.

► **Demand conditions** are a positive influence item to the extent that a higher consumer demand exerts a higher pressure on firms, thereby pushing them to improve their competitiveness through innovation and higher quality products. Environmental and consumer protection regulations, although considered expensive items by the firms, are essential, given the costs and prices of ecological products.

► **Related or supporting industries related**. Spatial proximity of the upstream and downstream industries associated within the clusters facilitates the exchange of information and promotes a continuous flow of ideas and innovations, which would otherwise be difficult to achieve by dispersed companies.

● **Government** serves as a catalyst, encouraging companies to aim high in their competitive performance, to stimulate the demand for advanced products, to concentrate on creating specialized inputs and boosting local competition by limiting direct cooperation and by enforcing anti-trust regulations;

The relative competitiveness of a region depends on the interaction among these four key subsystems. The weakening of any of the components of these subsystems will decrease the competitiveness of the region, and the absence of clusters in a region would be a sign not only of poor development of the subsystems as such, but of a standstill in the interactions among them, which may lead to the weakening of the entire regional productivity.

Valentin Cojanu, Laurian Lungu^[6] show that the size of regional advantage has determined the development of certain clusters patterns in the European countries:

•**Traditional versus science-based clusters**, where competitive success is linked to technologies (Finland, Germany, Spain, UK).

•**Global versus local clusters** - regional clusters developed through cross-border cooperation: Glass-Cluster - Austria, Bavaria, Bohemia; Textiles Cluster - Austria, Bohemia; Technical Cluster - Syria and Slovenia.

By the way it is created and by the relationships it develops across its companies, a cluster shows the following **characteristics**:

a) it represents an intermediate unit of productivity factors between the quality of business environment and the experience at firm level;

b) it is a form of manifestation of the role of specialized knowledge, skills, infrastructure and industries, aimed at enhancing productivity;

c) plays an increasingly important role in the global economy, where most competitive companies can serve larger markets unprotected by national borders. Being exposed to global competition, companies have more freedom in choosing the localization of their activities based on economic efficiency, in addition to access to market, which has increased the role of clusters, their productivity advantages becoming ever more important. National economies tend to specialize in a subset of clusters, where a particularly favorable business environment will emerge, which explains the disproportionate share of the marketed output of a nation. The level of prosperity in a region is interdependent with the degree of regional specialization.

d) the nature and the depth of a cluster vary with the degree of economic development. In developing or emerging economies, clusters are less developed, lacking a wide range of industries and supporting institutions, and firms are engaged in relatively less advanced activities within the cluster. They compete based primarily on their cheap labor or local natural resources and depend to a large extent of imported components, machinery and technologies. Specialized local infrastructure and institutions such as educational programs and industry associations are absent or ineffective. In advanced economies, clusters are enhancing the need to encompass suppliers of specialised inputs, components, machinery, technologies and services. Specialised infrastructure is financed from public and private investments and increases the number of institutions providing specialized training, education, information, research and technical assistance;

e) clusters lead to increased attractiveness of a region. The presence of companies concentrated in clusters in a region is for a long-term, which turns clusters into a magnet for other companies which want to relocate in that area;

f) the abundance of various companies provides flexible responses to changes in the business environment and organizes lobbying groups for different types of skills and funds.

3. Impact of clusters on regional competitiveness

There are three ways in which clusters impact on regional competitiveness:

► **Increasing productivity of companies in a field.** Being part of a cluster allows companies to have a quick access to inputs, information, technology and needed institutions, coordinating relations with related companies and motivating performance, in many different ways:

a) *facilitates the access to employees and suppliers.* Companies in well-developed clusters can have a good access to specialised and experienced employees, even those in other regions, thereby lowering their transaction costs in recruiting and, because of the cluster opportunity, it reduces the risk of relocation for employees. Also, a well-

developed cluster provides for companies, efficient means of obtaining important inputs and eliminate import costs by sourcing locally instead of from distant suppliers.

b) *access to specialized information.* Extensive markets, technical and competitive information which accumulates within a cluster, allow its members, a quick access to these items. Community ties generate trust and facilitate the flow of informations.

c) *complementarities* increase cluster attractiveness to customers and come in many forms:

- products complement one another in meeting customers' needs. For example, in a tourism cluster, for a visitor, is essential not only the attractiveness, but also the quality and efficiency of complementarity activities, such as hotels, restaurants, shopping and transport facilities. Because cluster members are interdependent, a good performance for one can boost the others success;

- there is a coordination of activities across companies to optimize their collective productivity – for example, in wood products, the efficiency of sawmill depends on a reliable supply of raw and on the efficiency to use it, aiming to obtain products of different quality;

- in marketing, a cluster enhances the reputation of a location in a particular field, and cluster members profit from a variety of joint marketing mechanisms, such as company referrals, trade fairs, trade shop etc.

d) *access to public goods.* Investment made by government or other public institutions, such as public spending for specialized infrastructure or educational programs, can enhance a company's productivity, while the ability to recruit employees trained at local programs, lowers the cost of internal training. Other quasi-public goods, such as cluster's information and technology, as well as its reputation, are products of competition. Private companies, too, invest in increasing productivity (in training programs, quality centers, testing laboratories, infrastructure), but they prefer to make such investments collectively, because of the potential collective benefits, which they can obtain as being cluster participants.

e) *better motivation and measurement.* Local rivalry amplifies competitive pressure within a cluster, even among noncompeting

or indirectly competing companies. Clusters often make it easier to compare performances because local rivals share the same circumstances, as for example, labor costs and market access, and they perform similar activities. Companies within clusters have knowledge of their supplier's costs; thus, managers are able to compare their company's performance with other local companies.

► **Drive the direction and pace of innovation.** Clusters' important role in a company's ability to innovate is not only in opportunities of innovation but in his capacity to act rapidly in the following directions:

- a company within a cluster can easily access what it needs to implement innovation;

- local suppliers and partners can also, get involved in the innovation process, thus ensuring a better match with customers' requirements;

- companies within a cluster can experiment at lower cost and can delay large commitments until they are more assured that a given innovation will be implemented.

In contrast, a company relying on distant suppliers faces greater challenges in every activity it coordinates with other organizations (contracting, securing delivery or obtaining associated technical and service support).

Reinforcing the other advantages for innovation, that occurs in a cluster – competitive peer pressure, constant comparison – it may say that clusters can remain centers of innovations for a long period of time.

► **Clusters stimulate new business environment formation.** Clusters offer a number of advantages to companies within: very low barriers to entry and a significant local market, in which the entrepreneur can benefit from already established relationship; easy access to needed assets, skilled staff and inputs which are often available at the cluster location, to be used into a new enterprise. Individuals working within a cluster can more easily perceive gaps in products and services used in their businesses, while local financial institutions and investors, already familiarized with the cluster, may require lower risk premium on capital. All these factors reduce the perceived risks of entry

and of exit, which should generate the enterprise fail.

The formation of new businesses within a cluster is part of a positive recurrent feedback. An expanded cluster amplifies all the benefits described above, increasing the common competitive resources, which benefits the cluster's members. The result is that companies in this cluster advance relative to rivals at other locations.

To **conclude**, we may say that clusters or, as M. Porter calls them, the "critical masses of competitive success in particular business fields" are an important feature of every national, regional, state and even metropolitan economy, especially in more developed nations. They gather together coordination across companies in the areas of research&development, production, inputs, marketing&sales and government relations.

Through the three actions developed – increasing company's productivity, facilitating access to innovation and formation of new businesses environment - clusters play a substantial role in increasing the competitiveness of a region, by developing new relationships among enterprises, enabling access to human, material and financial resources and to innovation, increasing the competitiveness of the enterprises within them, relative to that of rivals from other locations.

The trend set by the European Union is to link the concept of regional competitiveness to economic activities that lead to development of clusters within well-defined boundaries and in a limited number of places, mainly because clusters are associated with better economic performance.

Strategic Management of Regional Development in the Context of Contemporary Economy

Popa Gabriela

gabriela_valahia@yahoo.com

Abstract

Globalization includes the entire system of international economic relations and refers to actions with impact on the entire humanity and each human being. These actions resolving means the involvement of some important resources of the majority or even of all countries in the world. Likewise, the global concurrency is seen as international concurrency. From economic and political point of view small states total the common parameters which determine the susceptibility for certain risks. A good part of small states are excessively responsive to external events; they are crossing a transition process to market economy, a process of establishing their economic system or of preserving some situations of economic crisis which exceed the governments capacity to manage them.

Key words: globalization, economic integration, competitive advantage, cluster, regional development.

J.E.L. classification: M29, L89

1. Introduction

The increase of productivity and competitiveness especially in residential areas was possible following the endorsement of some flexible models of entrepreneurial structure (setting up networks, subcontracting, and externalization of production system), introducing innovation in the methods of producing and disseminating knowledge within manufacturing systems. At the same time, the activities of producing systems suffered from drastic changes – from introducing the

unique standardization to establishing the production quota in case of elements and sub-branches necessary to produce the internationalized final good.

Globalization is in fact a challenge for the European entrepreneurial system and the ascension of the concurrency imposes a further reform of the productive processes thus, significantly affecting the activity of firms and the employment rate and so increasing the uncertainty and the threats in case of those firms that did not succeed in adjusting their structure in accordance with the new realities. In this connection, economic development assumes the efficient use of local potential and foreign resources drawing up with the view to increase productivity...The "postulates" of regionalization impose integration of inter-community interests and activities based on local interests' adjustment to regional ones with the view to consolidate the efforts to increase employability and collective resistance in case of increasing concurrency. Although independence and self-management of each economic agent stay undeniable, the increase of enterprise viability, conditioned by region population welfare, needs coordination of social politics with regard to employability, living standards and income per capita increase.

The topicality of the present paper is supported by the evolution of European potential development within international processes which makes the concurrency be the worldwide economic power. The crystallization of the four world powers – USA, European Union, Japan and China – determines the EU countries to draw up interstates strategies to increase the collective competitive potential.

During research it was noticed that because of a lack of economic aggregate evidences at regional level in national statistics, the models of competitive advantage determining at mezzo-economic level are limited to sociological research and surveys with no clear methodology to process the existent statistic data which involves the determining of some contended development solutions and models of the given regions.

The applicative value of the present paper consists in adding a plus to the special knowledge regarding regional development. The investigation looks for seeking solutions to draw up the politics strategies in the given field based on relevant pointing, proposed by authors. The proposed economical - mathematical models can be applied both in systemic analyze of regional potential and in related industrial fields from value chains which are competitively advantageous.

2. General principles of strategic management of regional development

Harmonious development of national economy is in tight correlation with the economic success's ensuring based on creating a stimulating environment for change and innovation. Promoting those premises that stimulate investments of firms in development and knowledge involves the establishing of cooperation and collaboration relations between private traders and public institutions. This desideratum is conditioned by the individual interests' interdependency and the collective ones in the process of competitive capacities development within an economic-geographical area with common characteristics.

1. Common characteristics of manufacturing factors (such as qualified working force or infrastructure) needed to compete in a certain industry/branch of industry.

2. Common nature of internal request (from a given area) with regard to products or services of the respective industry/branch of industry, exigency degree of internal customers.

3. Presence or absence in this area of some related industries able to successfully compete internationally.

4. Common conditions of governing, organizing and management of enterprises, common management practices and common nature of rivalry between the firms on the same area.

Given the fact that contemporary organization is an open system, influenced and oriented in its activity by external environment, it is considered that a firm is in competitive advantage when the environment supports the fastest accumulation of means of production and specialized professional abilities and provides a better information and a higher decisional capacity regarding the necessities connected to manufacturing processes and products.

The particularity of productive forces and human capacities grouping from a certain area is in tight connection with the specific character conception of the trader activity who aims at maximizing his profits on one hand, and the public administration profits on the other hand.

Just like in case of corporations, the character of relations within a region and the particularities of relations with other regions determine three management models: administrative, situational and strategic.

Based on the appreciation of value and contribution of each of the four approaches in the development of strategic management science, we can conclude that:

- planning – establishes the necessity of determining the strategic targets of the firm and the obtained results appreciation;

- emergent approach – imposes the plans to be mobile in order to allow the organization to learn and adjust itself to the external environment changes;

- concurrential positioning – emphasizes the importance and role of external environment and offers the necessary tools to use in analyzing the firm position in the context of the industry/branch of industry;

- competence axis – emphasizes the company role in determining the specific resources meant for a specific firm.

3. Uncertainty and the concept of regional economy under globalization

Controversies with regard to globalization significance, its importance, its dynamism

and impact cause optimistic scenarios in accelerating the human development on one hand, and the pessimism ones in emphasizing the differences between the few rich economies and the poor ones which are dependent on the first category on the other hand thus, highlighting the importance and implications of the given process [2] which can be accepted as an increasing process of economic interdependence that strengthens economic, political and institutional relations between countries and leads to a diverse global system formation [6].

In many cases [8], the global notion is assimilated to that of international. For instance, speaking about global business or global company, the authors speak about that firm that achieve production on global market. Likewise, global concurrency is interpreted as international concurrency. More often these notions are used in reference with Trans-National Corporations (TNC).

From economic point of view, globalization comprises the entire system of international economic relations and, more concrete, it is Mondo-economy. In this context, the term "globalization" is differently interpreted by the specialists. Thus, the researchers in the field of international finances consider that globalized relations are best reflected in the field of finance by the huge reaction of rates, prices and transactions oscillations.

From economic and political point of view the small countries meet the common parameters which determine the susceptibility for certain risks. A great part of small states are extremely sensible to external events, are in transition to market economy, or are in process of setting up an own economic system or a system to preserve some economic crises situations which exceed the governments capacity to manage them. Very many of these countries totally depend on external sources of energy, food, raw materials etc. Also, a phenomena specific to small underdeveloped countries is high level corruption.

The parameters determining increased risks for the economic security of a small country such as Romania are:

- A very small domestic market for most of domestic manufacturers, thus, overproduction situations being very

frequent. The access to European Union is blocked by European protectionist politics and the Eastern markets are extremely unstable and insolvent. Beside the insufficient level of Moldavian products quality, these determine the reduced competitiveness of domestic products.

- The shocks of opening to worldwide economy. Integration into worldwide economy by commerce liberalization, granting increased facilities to foreign investors and introducing a free financial and currency politics involves both considerable benefits and risks that cannot be neglected. Thus, the working force which is cheap enough compared to European market creates the opportunities for large corporation to settle in Romania, these corporations might have a great importance in completing the public budget and unemployment reducing.

- Increased homogeneity of agricultural production and insufficient diversification of exports and industrial production. Because of reduced dimensions and resources, small countries cannot substitute an activity affected by a force-major phenomenon with another one.

- Generalized poverty. Sufficient statistical data can be provided to demonstrate that poverty is much more spread in small countries rather than in the large ones, Romania being an example in this respect. Both the limited economic resources and general poverty (of the state and most part of population) query the state capacity to react promptly to the globalization risks and challenges.

- Limited natural and financial resources. Although the insufficient development of private sector is a phenomena specific to all developing countries, in Romania there is a very striking one. At the same time, the public sector faces difficulties in public services provide and in private sector protection. Being more exposed to the negative effects of globalization, small countries do not possess institutional capacities and resources to reduce the risks; they promote reactive politics compared to the pro-active politics promoted by large countries. The lack of inner resources determines the small countries to access the international financial loans, which increase the small countries dependency on the generating forces of globalization.

The Post-Kensyan paradigm of uncertainty argued by historical dimensioning of economical phenomena and their research in time establishes that:

- economy acts in historical time;
- historical past remains unchanged;
- future is unknown, uncertain.

Thus, "only in a world of rational expectations the future is the statistic image of the past while in a world of uncertainty the current result cannot provide an exact information about future; consequently, the free market is not efficient enough" [1, p.72] due to its variable character, dependent on the momentary circumstances of the socio-economic factors.

Once the uncertainty is recognized as a tangible attribute of real economy, the traditional concept on economic equilibrium is breached [5], and the lasser-faire hypothesis are no longer relevant [3,p.367], which causes the subsequent economic crisis and instability [4, p.129].

In order to reach this desideratum, the simultaneous elaboration of two complementary models – regional and local – is desirable, where [7, p.120-121]:

The regional model's task is to create and consolidate the most competitive economy centers and axis. This model has to be treated as a special policy of concentration, under the coordination of the superior managerial level of economy and local public administration.

The model of regional integration prevails the drawing up and promoting the strategies of endogen supporting and development through territorial grouping. The objective of these strategies aims to emphasize and promote economic growth options in connection with local resources which are to become the main element in the balanced development of the regions.

4. Regional advantages within national competitiveness: identification methodology

The desideratum of a high competitiveness cannot be considered realistic without an adjustment of the political, social and economic balance components.

In order to confirm the logic of the regional competitive advantages' identification based on the national index of the net competitiveness (I_{kn}), it is necessary to

establish the contribution of each region in the respective production.

Because the net competitiveness index expresses the net profit of the international commercial transactions from a certain period, we can define the commercial weight of a region in the branch with $I_{kn} > 0$ by establishing the average weight of the region „r” in the total of production/branch „i” from the national economy, following the indexes dynamics.

$$\alpha_{ir} = \left(\frac{\sum_{t=1}^m q_{ir}}{\sum_{t=1}^m Q_i} \right) : t$$

where α_{ir} - average weight „r” in the total of production/branch „i” from the national economy (commercial ratio);

q_{ir} – volume of branch production „i” from region „r”;

Q_i - global volume of production „i” from national economy;

t_m – reference period (years).

If we assume that there is a perfect balanced market and, respectively, and an equality between requirement and offer at all levels and territorial subdivisions, then, in this situation (impossible in reality) the competitive advantage comes out as an index superior to the average level of the branch weight „i” (α_{ir}) for the administrative-territorial units with activities in the „i” branch.

The given assumption can be checked by the realtion:

$$\bar{\alpha}_{ir} = \frac{\sum \alpha_{ir}}{nr_i}$$

where α_{ir} - n average level of commercial weight

$\sum \alpha_{ir}$ - sum of commercial weights

nr_i –number of administrative-territorial units with activities in branch „i”.

In the context of concurential capacities, based on the competitive advantages, the research conducted allows to find out that in case of industrial activities in the field of agriculture and animals breeding, there are specialized industrial centers while, in case of the national agricultural sector, the

agricultural groups where the respective unit is to be specialized have not been yet defined. Following the logic of Porter value chain forming, it is possible to confirm the approached assumption by establishing the conditions of productive forces concentration through regional/territorial agglomerations.

5. Conclusions

Based on the scientific research conducted with reference to strategic management of regional development, the following conclusions arise:

1. The globalization paradigm promotes the interdependency of commercial and productive system at worldwide level, offering priority to multinational corporations – TNC. The problems of integrated economic processes and conducted by TNC bring into view the aspect of development particularities of small countries considered small economies. The market requirement from a small country is by far much smaller than the productive potential of the respective country.

2. Economic integration and globalization represent a challenge for the entrepreneurial system from Europe and the competition increase imposes a continuous improve of productive processes thus affective at a great extent the activity of firms and employability, and increasing the uncertainty and threats for those firms that have not succeeded in adjusting their structures to the new realities. The contemporary scenario of the potential development of EU approaches the central question with regard to dynamic and structural changes of local and regional economies. So, the economic development assumes the efficient use of local potential and the external resources attracting with the view to increase productivity.

The Direct Foreign Investments Effects on Workforce

Popa Lucia-Ramona

"Constantin Brancoveanu" University of Pitesti
lucia_ramona10@yahoo.com

Abstract

The sustainability and growth of employment provided by foreign affiliates vary considerably among host developing countries, depending upon whether foreign affiliate activities are upgraded as labour market conditions and the structure of domestic and foreign demand change over time. The prospects for such upgrading are high if the domestic educational and skills building systems and TNCs' own contributions to training and human resource development continuously improve the skills and capacities of workers so that they are able to adapt to higher technology intensities and changes in tasks assigned to them in production.

Key words: foreign direct investments, Romanian workforce, correlation.

J.E.L. classification: F 21

1. Introduction

TNC's, like other enterprises, combine labour and other factors of production to generate goods and services. The quantity and quality of employment generated within a firm regardless of whether it is a TNC or not depend mainly upon the industry group to which it belongs, the production activities in which it is engaged, and its size.

The activity in which a firm is engaged, and the technological parameters of that activity determine the capital, labour and knowledge intensities of its production, although there is usually a range of technological options and hence combinations of labour with capital that are available to producers to choose from, depending upon, among others, relative factor costs.

2. The determinants of employment

The size of a firm, on the other hand, determines whether a large or small amount of labour is employed, given the combination of labour, capital and knowledge that are required to produce one unit of output. It also determines the extent to which a firm can invest in training and the building up of skills.

While these determinants of the volume and nature of employment are the same for all firms, there are some factors that suggest that the behaviour, practices and role of TNCs with respect to employment and skills upgrading may differ in some respects from those of other firms. These include the larger size and greater technological sophistication of many TNCs, the competitive pressures under which they operate, and their ability to deliver, by means of FDI, non-tradable goods and (especially) services. Among other things, because of their size, many TNCs are employers of larger total numbers of workers than national firms in the same industries. At the same time, because of their technology-intensity and competitive behaviour, they are likely to generate smaller numbers of jobs than other firms of equal output size.

The principal difference between TNCs and other firms is that TNCs distribute their production activities and, hence, employment, between their internationally dispersed facilities. The distribution of employment by size and quality among different locations depends upon several factors. It depends upon the TNC's motivations for and strategies with respect to international production and on the locational advantages of different countries. It also depends upon labour market conditions in host and home countries, including the availability and cost of labour of various skills and capabilities. While FDI of all types involves employment in host countries, some FDI is motivated specifically by

considerations directly related to the employment of skilled or unskilled labour. Resource-seeking and efficiency-seeking FDI in manufacturing and services is often made with the specific objective of accessing low-cost labour for labour-intensive production or taking advantage of relatively abundant supplies of educated and skilled workers. For market-seeking FDI, on the other hand, the availability and cost of labour or skilled human resources is not the main consideration in the choice of location, although it is likely to be one of several secondary factors that determine the investment location decision.

Given the broad motivations that underly TNCs' decisions regarding FDI, their strategies and the resulting organizational structures of their international production activity affect in a number of ways the intra-firm distribution of employment among home and host countries.

Under a "stand-alone" strategy, in which a TNC replicates in its foreign affiliates much of the value-chain of the parent firm with the exception, typically, of technology development and finance that are retained at headquarter operations, affiliates in host countries perform the tasks necessary for production to service the host-country and/or neighbouring markets. Accordingly, most of the employment of labour necessary for host country production occurs in the foreign affiliates. If foreign affiliate sales replace exports from the home country, that may be accompanied by a reduction of employment in the home country facilities within the TNC systems. Replacement of actual or potential employment in parent firms by that in foreign affiliates does not occur if the foreign investment is motivated by high tariffs or other restrictions on the home country's exports.

Under a "simple integration" strategy, in which a TNC locates one or a few elements of its value chain in its foreign affiliates, the latter undertake typically with technology obtained from the parent firm a limited range of activities to supply their parent firms with specific inputs or products that they are in a more competitive position to produce. Employment quantity and quality in a host country depend upon the nature of the locational advantages that attract FDI. If, as is the case in labour intensive manufacturing

for export, a TNC invests to take advantage of low-cost labour, low-skilled jobs are located in foreign affiliates, and the more skilled and highly paid jobs remain in the parent firm or in affiliates in countries with higher wages.

Under "complex integration" strategies, each TNC affiliate specializes in a product, process or function integrated with those of other units within the TNC's regional or global network of integrated international production. Deeper integration of this kind provides efficiency gains for a TNC and could result in a smaller system-wide workforce for a given output size than the other two strategies mentioned: specialization and consolidation of business functions in various locations have a rationalizing effect on total firm employment when compared, for example, to the replication of value-adding activities in all host locations as in a stand-alone strategy, or limited specialization among locations as under simple integration strategies. With respect to employment quality, deeper integration can imply a convergence in certain elements of the employment package in order to maximize the efficient performance of a firm's overall production system, this may imply higher employment quality and greater skill formation in foreign affiliates.

3. The impact of DFI on the Romanian workforce

The analysis of the impact of direct foreign investments on the local workforce is very important if we have in view the decisive and active role which work has in the economic development. In this way we shall analyze a series of representative indicators, rate of unemployment respectively and the monthly nominal medium net gain per employee. There should be mentioned the fact that in the last 10 years the active population has lowered with about 16 percentage, on the basis of the decrease of the total population in the same time with the significant increase of the number of pensioners

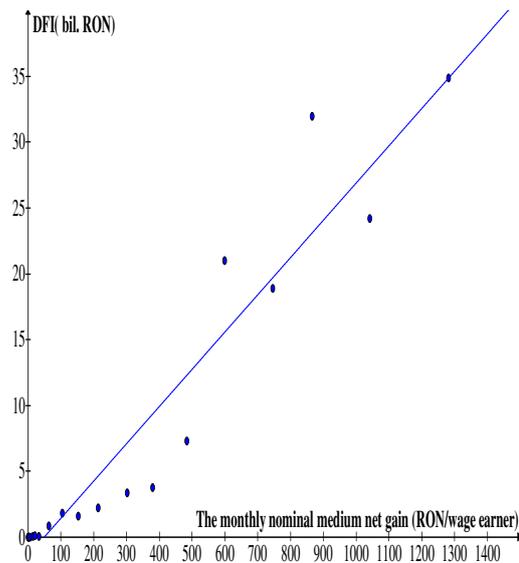

As regards the relationship between the DFI flows (mil. RON) and the rate of unemployment in the period 1990-2009, although did not show strong relations between the two variables, it allows the identification of two periods characterized through divergent evolutions.

Until 1999, the input of foreign capital did not influenced significantly the rate of unemployment, nevertheless in the period of time 1991-1994 the two variables registered in the same time a positive dynamics and in the period 1996-1999 when the rate of unemployment constantly and sensibly increased from 6.6% to 11.8%, although the DFI flows knew an ascending trend, I appreciate that the direct foreign investments, through the participation in the restructuring of private companies, contributed, as a secondary factor, to the rise of unemployment rate in the period 1990-1999.

In the period 2000-2009, we can notice an inverse ratio between the DFI flows, which evolved on a rising trend, and the rate of unemployment which registered a tendency of constant decrease from 10.5% in 2000 reaching a value of 4.4% in 2008, which demonstrates that the direct foreign investments influenced directly and profitably the work market.

First the restructured and modernized companies in the former period developed their activity contributing both directly and indirectly to the appearance of new working places. On the other hand, the input of foreign capital partly channeled to the development of some business on "empty place" positively influenced the work market, by making new working places with direct and profitable impact on the rate of unemployment.

Figure no 1. Correlation wages - DFI in the period 1990-2009

Source: National Statistics Institution, Romanian National Bank

From the qualitative point of view, the correlation analysis between the DFI flows and the monthly nominal medium net gain per employee (RON/ employee) in the period 1990-2009 pointed out the existence of some direct links between the two variables, more intensely beginning with 1997, when the DFI rising rate was 90.8% in comparison with 1996, and for the same period the rising rhythm of wages was 49.1%.

Taking into consideration that some of the foreign investors were motivated by the work force which is cheap and skilled in certain industrial sectors (textile industry, food industry, wood industry, chemical industry, etc.) the profitable impact is largely due to foreign investments achieved in technology in the intensive fields (computing equipment, electronic and communication devices, means of transport etc.) and in those sectors which strongly developed in comparison with the previous periods (financial intermediaries, communication, services to enterprises).

In this field of activity the foreign companies invested important financial resources to prepare the inland staff, thus contributing to the improvement of the quality of human resources, whose experience and skill was later remunerated on a higher level.

However the FDI qualitative impact on the workforce also has some considerations which are hard to quantify such as the real report between the time for work and for rest, the observance of the frequency and time for holidays, etc. The economic cost stands in the decrease of the employees performances and implicitly of productivity at the working place with direct effect on the evolution of business and on a long term on the economy as a whole.

4. Conclusions

The impact of DFI on the inland workforce stands both in positive contributions got from salaries and the improvement of training level of the employees, and also in the unfavorable influences on a long term, due to the dramatic rise of professional illnesses.

The motivations and strategies of individual TNCs each with its firm specific advantages, including, among others, those arising out of its international production networks interact with the locational advantages of particular host countries to determine how much FDI the latter attract, in what industries, and of what kind. Simultaneously, they determine the size and quality of employment and the potential for skills upgrading directly in foreign affiliates. Different organizational forms and structures have different implications and potentials in these respects. In addition to these direct effects, there are indirect effects on employment and related skills building that occur through competition, production linkages and multiplier and accelerator effects of income generated by FDI. TNC strategies and behaviour with respect to investment and, hence, employment, human resource management, and investment in skills formation change in response to changes in global, regional or country-specific conditions affecting their competitive positions and profit opportunities. Globalization and increased global competition are leading TNCs to shift towards more complex corporate strategies and integrated international production structures. These involve a greater geographical dispersion of TNC activities, increasing coordination and specialization of the activities of individual affiliates and greater importance being attached to created assets in making locational decisions.

The Impact of Direct Foreign Investments on the Balance of Trade and on the Budget Income and Expenditures

Popa Lucia-Ramona
"Constantin Brancoveanu" University of Pitesti
lucia_ramona10@yahoo.com

Abstract

Romania's economy was affected by the drastic decrease of production in all sectors, making a dramatic effort to adapt the productive capacity and workforce peculiar to requirements of a market economy. These tendencies are influenced by a multitude of factors, some of them very aggressive: increase of the import penetrating rate on the Romanian market, in an inevitable competence with the inland products; the continuous aggravation of budget deficit; the proliferation of financial lock-up and the decapitalization of economic agents, the low quality of the Romanian products which lost or have lost important export commodity markets. The role of direct foreign investments is to make a sustainable development in the economy of the host country by the contributions brought to the increase of workforce employment, of the living standard and of the GDP.

Key words: foreign direct investments, budget income and expenditures, balance of trade, correlation.

J.E.L. classification: F 21

1. Introduction

The effects of direct foreign investments on balance of trade implies both quantitative aspects as the TNC have greater export capacity than the inland companies due to a higher productivity, lower costs, high quality of goods, a rigorous marketing strategy based on a better knowledge of external markets and on the consumers requirements, the existence of some transport facilities, a more facile access to external markets and qualitative technological aspects, characterized by a higher processing level.

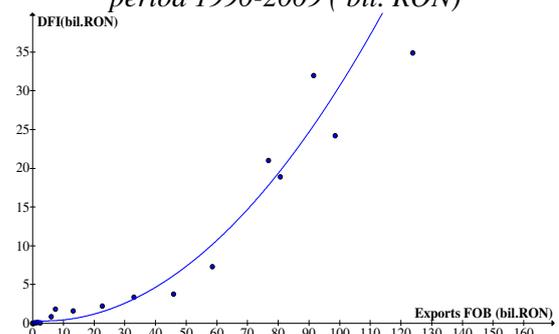

The effects of foreign investments become manifested on the budget having both negative contributions which appear in the investment implementation stage through: restructuring of state firms as a result of privatization, redundancy and also due to fiscal facilities given to foreign investors; and also positive effects which are mainly noticed in the investment maturity stage through the development of new activities and the increase of the number of the working places and implicitly of taxes and fees collected by the state.

2. The impact of DFI on exports

The strong relationship begins with 1997 when both exports and DFI register high rising rates which demonstrates that the foreign investments in Romania were determined by the size of the inland market and also by the efficiency caused by the increase of sales abroad.

Following the rise of goods export competition through cost reduction, transnational companies opened production units in those traditional fields of activity, characterized by large quantities of raw materials and qualified work force at relatively low costs.

Figure No 1. Correlation exports - DFI in the period 1990-2009 (bil. RON)

Source: National Statistics Institution, Romanian National Bank

As regards the level of exports, some of the DFI flows were directed to metallurgical industry (over 8%), food, drink and tobacco industry (over 6%), cement, glass and ceramics industry (about 4%) and textile, ready- made and leather industry (over 3%).

The export structure was characterized by a low processing level such as: metal, crude wood, textile, ready – made (made by Lohn system), glass, cement, furniture, etc.

Unlike other Central and East European countries, which registered an improvement of export structures to the benefit of high added-value products, such as Czech Republic, Poland, Hungary, in Romania still continues the products having low added-value because of the lack of capabilities

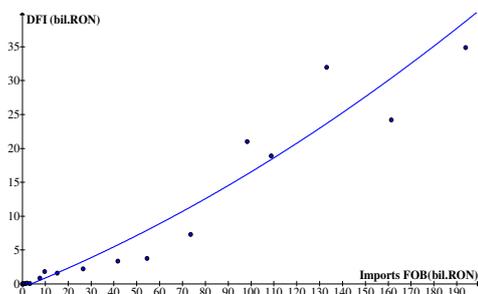

necessary to achieve some intensive goods in technology.

If around these intensive work activities and human resources will developed “economic clusters”, by massive penetration of foreign capital it is expected that in Romania, too similarly to the evolution of other countries in the region, to be registered an increase of export products with high added- value.

3. The impact of DFI on imports

The effects of direct foreign investments on imports are generally significant, as the foreign branches prove an intense tendency to imports, in comparison with local companies, beginning with 1997.

Figure No 2. Correlation imports- DFI in the period of years 1990- 2009 (bil. RON)

Source: National Statistics Institution, Romanian National Bank

After 1996 the foreign investors show a greater interest to the modernization of the acquired units and to the development of some “greenfield” projects, causing the

increase of imports necessary for the investment implementation.

Therefore in the years in which the DFI registered high flows, the rising rate of imports were representative in comparison with the other years of 56.4% in 1997 compared with 1996, 18% in 2006 compared with 2005 and 16.8% in 2008 compared with 2007.

The effects of direct foreign investments are reflected on the structure of Romanian imports, in the way of rising import technology rate necessary for the investment implementation, and also of components and accessories rate for industries having to make goods as the Romanian market is showing a deficit.

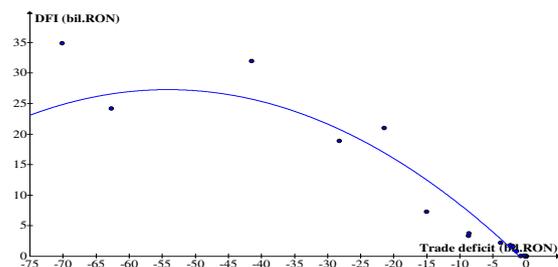

In the structure of DFI drawn in the Romanian economy, trade holds a high rate (13%), which proves the foreign investors interest for the inland market, the second in size of EEC, after Poland. In this context a large number of foreign investors substituted the exports previously made by parent company, having in view the satisfaction of inland requirements, with a negative impact on imports both on a short and on a long term.

4. The impact of DFI on the trade balance

In order to determine the net impact on the trade balance, we shall analyze the correlation between DFI flows and the balance of trade in the period of years 1990-2009.

According to the graphic below, there is a direct relation between the two variables in the period 1997-2007 as both of them registered high growth rate.

Figure No 3. Correlation trade deficit - DFI in the period of years 1990-2009 (bil. RON)

Source: National Statistics Institution, Romanian National Bank

This fact demonstrates that DFI had a net negative impact on the balance of trade, fuelling the trade deficit, which had growth rate of 46.6% in 1997 in comparison with 1996, of 30% in 2004 in comparison with 2003 and of 32% in 2006 in comparison with 2005, years in which the DFI flows had spectacular growth rate.

This evolution is due to the import dynamics of foreign companies in comparison with exports but also to the structure of trade flows engendered by foreign companies, especially to the fact that there are mostly imported equipments, machines, tools, components and accessories for industry, whose value is higher than of export goods, largely represented by products having a low processing level (metal, crude wood, glass, furniture, textile, ready-made etc.)

While ever higher DFI flows will penetrate the economy, their impact on balance of trade will depend both on the direction of foreign investors, to the inner or outer market, but especially on export competition of goods made by foreign branches. A special importance will have the export structure of foreign companies, as the growth rate of high added- value products, which incorporates a high content of local resources (work force, knowledge, technology) will positively reflect on the trade deficit, accelerating in the same time the comparative advantages of the Romanian economy.

The effects of direct foreign investments on the balance of payment are numerous, and sometimes contradictory, being determined by a series of factors, among which the most important are: type of investment, economic efficiency, field of activity, access to resources, host country costs for transactions and interventions.

An aspect of analysis of DFI impact on balance of payment has in view to follow in time the generated effects, so: in the first stage (investment made), the capital input is registered in the financial account, constituting a means of balance of balance payment by financing the current account deficit; in the second stage (investment implementation) due to massive imports made by foreign companies (equipments, tools, raw materials, etc.) is registered a

negative effect on the trade- balance; in the third stage (investment maturity) the effects on the balance of payment, on the balance of trade are diversified.

The favorable effects on the balance of trade are registered when the transnational companies have in view the development of productions achieved on the external market or if the production achieved is substituted to imports. The positive effects on the current account may appear when the profits got are reinvested in the host country, and the capital output in the form of interests, royalty and those generated by the system of administrative transfer prices are not significant.

The analysis of DFI impact on balance of payment must have in view both trade flows- balance of trade, and the possible significant capital output or the embezzlement of some potential flows from other investors. These higher profits got by anti- competition techniques can be changed into capital output, under the form of excessive wages of the expatriates, and of the high royalty taxes, negatively influencing the balance of payment.

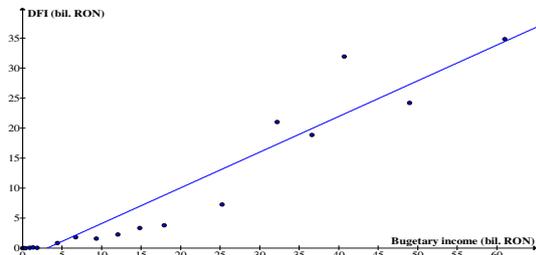

The negative effects on the balance of payment appear in the case of foreign companies which make loans abroad and concentrate on the rapid recovery of investment by using techniques of fiscal eludation – transfer prices or high royalties.

5. The impact of direct foreign investments on the budget income and expenditures

The correlation analysis between the budgetary income and the DFI flows for the period of years 1990- 2009 pointed out a direct relation between the two variables beginning with 1997, when both budgetary income and DFI register increases, the positive impact being more intense beginning with 2003. So, between 1990-2003 the input of foreign capital was relatively low and mainly directed to the privatization process, the positive impact consisting in keeping the tax payer quality of some of the natural persons and legal persons as a result of restructuring of activities of the acquired companies. In this way, during this period, the additional income generated by the

development of certain activities especially in the service sector, and the creation of new working places were largely counter - balanced by the fiscal facilities given to foreign investors, so that the DFI contribution to the increase of budgetary income was relatively low.

Figure No.4 Correlation budgetary income – DFI in the period of years 1990-2009

Source: National Statistics Institution, Romanian National Bank

Beginning with the year 2004 the Romanian economy benefited from high DFI flows with growth rate of 65.25% in 2004 in comparison with 2003, 40.84% in 2006 in comparison with 2005 and of 30.4% in 2008 in comparison with 2007, largely directed to the development of greenfield activities.

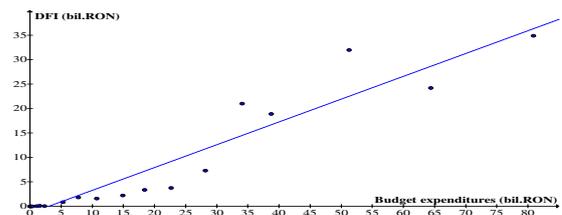

In the same time through training effects, the foreign investments got to maturity, contributed to the development of activities which were either rising or decreasing as to the foreign branches, influencing indirectly, positively and significantly the budgetary income which registered growth rate of 21.6% in 2005 in comparison with 2004 and of 19,7% in 2008 in comparison with 2007.

The more high flows of direct foreign investments penetrated in economy, it was registered a growth of income to the state budget largely due to the taxes and additional duties paid by the new contributors, economic agents and wage earners.

The correlation analysis between the budget expenditures and DFI flows for the period 1990-2008, pointed out the direct relation between the two variables beginning with the year 1996, when the budget expenditure registered ever greater growth rate. Therefore the DFI growth rate was of 65.25% and of budgetary expenditures of 17% in 2004 in comparison with 2003 and in the year 2008 compared with 2007, the FDI rate was of 30.4% and those of expenditures of 30.4%.

Within the privatization process, the foreign capital was especially directed to the acquisition of the state companies, in this way being registered an increase of the budgetary expenditures due to additional expenses of social nature generated by the rise of the unemployed as a result of these enterprises restructuring: unemployment benefits, social assistance, expenses for professional reconvention, etc. If in the Romanian economy had penetrated a greater volume of greenfield DFI, these expenses would have been diminished.

Figure No.5 Correlation budget expenditures - DFI in the period of years 1990- 2009 (bil. RON)

Source: National Statistics Institution, Romanian National Bank

If we consider that some of these enterprises were acquired for the value of the land or of the building or to remove the competition made to some companies which had the same activities practiced in the neighboring countries, and not with the aim of developing some productive activities which implied important investments in modernizing production, the effect being ever stronger.

Beginning with the year 2003, by developing some greenfield activities and due to the maturity stage in case of most investments implemented in the previous period, DFI had a benefic influence on the budget deficit materialized in the growth of income from duties and taxes and in the decrease of expenses of social nature.

6. Conclusions

The lack of capabilities necessary for the substitution of technology imports and of accessories necessary for industry, as well as the foreign investors direction to inland market have negatively influenced the Romanian balance of trade.

A greater contribution to the Romanian economic growth can be attained by drawing a greater amount of DFI to be directed not only to the speculative sectors such as retails or estates but to sectors to produce a sustainable development such as innovation and high technology capable to generate export competitiveness. In the same time, once the direct foreign investments will be accumulated in significant stocks, the business companies which will become the engine of the economy, positively influencing the country gross domestic product and the budget.

Romania needs a significant volume of foreign investments in order to solve the social and economic problems emphasized by the world crisis and to reduce the difference from the other EU member states.

Trends in Strategic Management of Romanian Banking Institutions

Popescu Dan

Academy of Economic Studies, Bucharest

Dinculescu Elena –Silvia

"Constantin Brancoveanu" University of Pitesti

nataliadinculescu@yahoo.com

Abstract

Romania's integration into European Union caused serious implications for national economy and banking system, which came in a position to deal with the pressures of a competitive market and increasing requirements of customers seeking more complex products and banking services. It can be argued that the banking management and strategy involve each other. The action of implementing a strategic program in a bank actually represents the concrete manifestation of banking management since the strategic plan materializes by putting into practice the major decisions concerning the key areas of the banking activity.

Key words: banking strategy, performance, motivation

J.E.L. classification: G21, E43, F33.

The banking sector is involved in a targeted approach to researching customer needs and establishing a portfolio of services that credit institutions intend to offer[1]. This is mainly due to specific features of banking products and services such as:

- banking products and services that are long term investments - these, because of their immaterial state, are not subject to obsolescence or physical wear;
- the demand for banking products and services is heterogeneous, the credit institution must take into account the requirements and needs of each customer segment in order to attract consumers and make them loyal customers;
- conducting banking transactions requires the customers' involvement;

- atomicity, another feature of the demand in banking services, impedes the development of operations with customers, which requires more personalized services;
- banking products and services can only be offered to customers directly, with no possibility of a redistribution or resale. This implies that the existence of dispersed branches in different geographic areas results in the enlargement of the banking process in that area. Branch banks are the places where customers are won or lost.

In contemporary times, the banking strategy included a broad area and recorded an increased complexity, adaptation represents a continuous struggle and involves considering the transformation of the population's attitudes concerning the banking activity in general[2].

The banking strategy consists in ordering some objective values, of some banking policy elements, which require a constant concern for their application in various fields of credit institutions' activity. According to recent developments in the structure of the Romanian banking sector, that form the primary components of the financial institutions of our country, included in 2010 a total of 42 credit institutions, in which 31 were Romanian banks, 10 were branches of foreign banks or authorized networks of credit unions (CREDITCOOP).

Regarding the countries that hold shares in the capital of national banks and foreign branches, top positions were occupied by Greece (22.4%), followed by Austria (18.4%) and Netherlands (9.2%). The most significant gains were reported by Greece who climbed into a position that placed itself near the top in the top five countries (Table 1).

Table 1. Sources of foreign capital in the Romanian banking system

Country	2009		2010	
	mil.lei	%	mil.lei	%
Austria	2419,8	22	2448,3	18,4
Greece	2391,9	21,7	2980	22,4
Netherlands	846,4	7,7	1229	9,2
France	551,9	5	562,1	4,2
Hungary	535,8	4,9	573,8	4,3

Source: NBR - Annual Report 2010

At the end of 2010, the national banking market was dominated by five credit institutions that together accounted for 54% of the total assets and deposits. BCR, retained its leading position, followed by BRD at (15%), Volksbank remained in forth, Raiffeisen with 6.2% and BT climbed two positions (Table 2).

Table 2. Market quotations of the first 10 credit institutions

2009		2010	
Bank	%	Bank	%
BCR	20,3	BCR	20,4
BRD	15,7	BRD	15,0
Volksbank	6,8	Volksbank	6,7
Raiffeisen	6,0	Raiffeisen	6,1
Total 5	54,3		54
Alpha Bank	5,5	Banca Transilvaniana	5,8
UniCredit Tiriatic	5,5	UniCredit Tiriatic	5,6
Banca Transilvania	5,4	CEC Bank	5,5
BancPost	4,8	BancPost	4,8
CEC Bank	4,3	Alpha Bank	3,7

ING Bank	3,5	ING Bank	3,5
Total 10	77,8		77,1

Source: Author's calculations after data published by NBR

Even though the degree of localization of the top five credit institutions is declining compared to 2008, it appears to follow the indicated trends of other European countries such as Austria (44%), France (54%), Germany (22%) Italy (26%), Netherlands (85%) and Spain (40%).

Table 3. The degree of concentration of the top five credit institutions

Country	Degree of concentration of the top five credit institutions (%)
Netherlands	85
France	54
Austria	44
Spain	40
Italy	22

Source: www.ghiseulbancar.ro

Reducing the degrees of centralization in the Romanian banking industry indicates an increase in competition[3]. Credit institutions in our country can be grouped into three larger strategic groups. They have criteria for classifying their strategic advantages, competences, and vulnerabilities:

- the group of state-owned banks made up of CEC Bank and Eximbank, which have the following competitive advantages: good knowledge of Romanian economic environment, high capital value, extensive territorial network, and a large number of employees serving customers. All these trumps, if not properly managed, can become negative points in time. In addition, state-owned banks also have vulnerabilities consisting of a reduced degree of flexibility on operating investments and reticence regarding investments largely due to controls made by government bodies. The marketing of banking products and

services is limited by the skill of their managers. This can make it impossible to focus on strategies for attracting specific customers.

- the group of private banks have the following competitive advantages: the highly skilled staff and managers driven by processes of selection and motivation, the high degree of flexibility in the mode of operation, investment policies, a good knowledge of economic and social environment, the importance given to new banking technologies of information. Furthermore, private credit institutions are vulnerable in terms of capital, which is sometimes insufficient to serve the big companies and in terms of reduced number of branches in geographic areas. Commercial banks that are affiliated with this group will seek to expand their strategic domain's area in diversification of prospective customers and also in terms of technology and offered services;
- the groups of foreign branch banks that have the opportunity to benefit from the banking experience the 'parent' banks acquired their experience from the countries where they originate. Experience such as an international banking know-how, a strong reputation among customers, and relationships with large numbers of foreign correspondent banks. Another advantage that they have is the stability of their capital (currency) exchange rates. Fluctuations result from the natural occurrence of inflation.
- These groups do have disadvantages: they have a limited network in the territory, it may be impossible to benefit from significant gains that the parent bank may be experiencing at home, a limited knowledge of the economic environment and how customer segments react.

Competition between the three groups manifested by applying differentiation strategies takes into account issues such as: interest rate, geographic location to the services (territorial network), the fees and

charges levied for such services, and the speed and safety of services.

In regards to the interest rates for deposits and loans received, a competition was conducted between banks that are part of the first two groups (Table 4).

Table 4. Differing elements of banking products and services

Differing elements of banking products and services	The group of state-owned banks	The group of private banks	The group of branches of foreign banks
Interest rates	X	X	-
Geographical proximity to the clients	X	X	-
Fees and charges	X	X	-
The speed and safety of products and services	X	X	X

Source: author's data

Superior management representatives of several credit institutions believe that the future of national banking market can be influenced by the following success factors[4]:

- rapid and effective resolution of customers' needs;
- offer a wide variety of personalized quality banking products and services;
- reduce time to resolve problems reported by customers.

Given recent developments in the banking environment, for any credit institution, factors such as: diversification, innovation and customization of products and banking services should be a priority.

In a consumer society where time has become a "commodity" more and more expensive - time is money, and urban traffic congestion is already a daily reality, the best solution seems to be frequent use of

electronic distribution systems of banking products (cards), the computerized machines (ATMs and terminals for electronic funds transfer at point of sale) and electronic banking system that virtually places customers in the banking institution (services such as Internet banking, mobile banking, home- banking).

According to the international standards in order to be considered truly modern banks, the Romanian banking institutions are required to submit a strategic program, and therefore within the major commercial banks there were set up departments of strategy that deal with the elaboration and implementation of strategic programs.

Abstract

Despite the complexity, the ambiguities and even the contradictions of the concepts of "personal development" and "types of training for personal development" that are shown in our early researches, we continued to study the relationship between the two concepts and attempt to identify the issues that could form the basis for debates on the legitimacy of "personal development". In other words, we believe that if the terms refer to different concepts and practices, confusing, even contradictory, however they are not meaningless.

Key words: management, public institution, personal development, training, professional development

J.E.L. classification: H10.

1. Introduction

In an organization, the concept of "training for personal development" seems unfair and seems to concern especially leaders and managers. There would be differences between what could legitimately be expected from such actions if we refer to their theoretical references, and what is actually done.

In general, personal development training includes training focused on the individual, that means a type of training focused on a better understanding of self, of the relationship with others, that suggests a better understanding of the interactions between individuals.

2. Fundamental aspects of personal development

2.1. The concept of personal development

For practitioners, and researchers 'personal development', although strongly present in the speeches and writings, seems to "slip through their fingers" as soon as they try to understand it more precisely. It is so difficult to find a clear definition. The trend is rather to take into consideration as many experiences and as many definitions as there were analyzed, in what concerns the experience of "personal development". However we found two definitions for this stage of our research - the subject of our paper itself is to clarify them or make them evolve:
