If a forecasted transaction currency risk within the group does not affect the consolidated profit and loss account, the intra-group transaction can not qualify as a hedged item.

Unlike IAS 39, U.S. GAAP does not permit hedging currency risks unless the hedged item is an investment held until maturity. However, American accounting rules accept applying accounting operations for hedging of changes in the fair value of prepayments operations incorporated in such a placement.

Another difference between the two standards refers to the use of accounting for hedging forecasted transactions to be reviewed and whose value changes are recognized in the profit or loss account. While international standards do not deal with this issue, the U.S. ones prohibit considering such a forecast transaction as the hedged item.

Hedging operations are of three kinds:

- fair value hedging- for the hedging of changes in the fair value of a recognized asset or liability or of an identified segment of such asset or liability that may be assigned to a particular risk and which will affect the reported net income. Hedging an unrecognized firm commitment to buy or sell an asset at a fixed price established in the company's reporting currency is accounted for as cash flow hedging, even if it is exposed to the fair value risk;
- cash flow hedging- hedging for the flow related to the cash flow variability which can be attributed to a particular risk associated with a recognized asset or liability or a forecasted transaction affects net profit and net loss reported;
- hedging a net investment in a foreign entity, as defined by IAS 21 "Effects of Changes in Foreign Exchange Rates".

When a company has accounted for a financial instrument with an instrument to hedge risks associated with anticipated future transactions, then the company will present:

- Description of anticipated transactions, including the time until the risks are estimated to occur;

- Description of the hedging instruments;
- The amount of any deferred or unrecognized gains and losses and when their recognition as income or expense is expected to occur.

An enterprise should present all gains or losses incurred in the financial instruments for hedging anticipated future transactions, whether those gains or losses have been featured or not in the financial statements.

If the hedged item is a financial asset or financial liability, it can be a hedged item in respect of the risks associated with only a portion of cash flows or fair value, provided that its effectiveness can be evaluated. Thus, a portion which is identifiable and can be assessed independently from the interest rate exposure for an asset that produces interest can be classified as being hedged.

If part of the cash flows of a financial asset or financial liability is designated as a hedged item, that part must be less than the total cash flows of the asset or liability. In the case of a liability whose effective interest rate is below LIBOR, an entity may not designate:

- Part of the debt equal to the capital plus LIBOR interest;
- Some negative residual.

However, the entity may designate all cash flows of the entire financial asset as hedged item and only hedge them in case of a certain risk. The entity may also choose a hedging index, other than one to one, in order to improve the effectiveness of the hedge.

When hedging the fair value of a portfolio of financial assets or financial liabilities designated the hedged portion can be defined rather as an amount in a given currency than as a sum of individual assets. Although the portfolio may, for risk management, include assets and liabilities, the amount designated is a value of assets or a value of debt. The entity may cover a portion of the interest rate risk associated with this designated amount. In the case of hedging of a portfolio containing assets that can be paid in advance, the entity can hedge changes in fair value attributable to changes in the hedged interest rates based on the expected reassessment data rather than on the basis of the contractual values.

From all of the above it follows that if a portfolio that contains elements which can be paid in advance is hedged with a derivative instrument that cannot be paid in advance,

there is ineffectiveness bound to occur if the dates when the items hedged in the portfolio are expected to generate advance payment are changed or if the real dates of prepayment differ from those expected.

Representative derivatives are futures and forward contracts, swaps contracts and options contracts. A derivative usually has a standardized value on financial markets, called notional value, which is the value of a currency, a number of actions, a number of units of weight or volume or other units specified in the contract. However, in case of a derivative, it is not requested that the seller should invest or receive the notional value at the beginning of the contract. On the other hand, in case of a derivative, it could require a fixed payment as a result of a future event that does not depend on a notional amount. It is the practical application of comparative advantage.

The basic and defining element of a derivative is that it requires a smaller initial net investment compared with other contracts that respond similarly to market conditions. An option contract meets the conditions of this definition because the premium is significantly lower than the investment that would be necessary to obtain the basic financial instrument that this option is correlated with.

Derivatives, following the criteria of differentiation of financial assets and financial liabilities that are generated by the accounting of the holder, namely:

- debts held for trading are derivative debts which are not hedging instruments and are, for example, the obligation to deliver securities borrowed by a non-hedged seller. The fact that a debt is used for financing commercial activities does not mean that debt is held for trading.
- loans and receivables generated by the company are of the nature of a loan obtained by an enterprise as part of a loan from another lender. This is considered to be issued by the enterprise after the loan was made by the other lender.
- loans and receivables obtained by an enterprise (not issued by it) are properly classified as held to maturity, available for sale or held for trading, as appropriate.

- available for sale financial assets are classified as available for sale if not part of one of the other three categories of financial assets - held for trading, held to maturity and loans or receivable created by the company.
- embedded derivatives - a derivative may be a component of a hybrid derivative instrument that includes both a derivative and a basic contract having as effect the change in how the cash flows generated by the derivative is similar to that of a stand-alone instrument.

If, according to the rules required by IAS 39 Financial Instruments: Recognition and Measurement, a company must separate an embedded derivative from its basic contract, but is not able to evaluate the embedded derivative separately either at the time of purchase or at a subsequent financial reporting date, it must care for the entire combined contract with a financial instrument held for trading.

The general initial recognition rule imposed by IAS 32 and IAS 39 is that an enterprise should recognize a financial asset or financial liability in the balance sheet when it becomes a party to the contractual provisions of the instrument. After initial recognition, an enterprise should assess the financial assets, including derivatives that are assets, at fair value without any deduction for transaction costs that may arise from sales or other outputs, except for the following categories of financial assets which should be evaluated differently.

These financial acts which are excluded from the assessment based on fair value and which have a maturity must be evaluated for the amortized cost using the effective interest rate method. All financial activities should be tested for appreciation. There is a presumption that fair value can be determined reliably for most financial assets classified as available for sale or keeping for trading. However, this assumption may be mistaken for an investment in the case of a placement in an own capital instrument which does not have a quoted price in an active market and for which other methods of estimating fair value are clearly inappropriate or inoperable. If a financial asset must be measured at fair value and its fair value is negative, it is accounted for as a financial liability.

Hedge accounting recognizes the offsetting effects on profit or loss related to changes in the fair value of the hedging instrument and of the hedged item.

3. Conclusions

As a general rule, derivative instruments are not covered (except for options purchased which are compensated by the options issued). The key requirement is that the hedged item must expose the entity of a risk which is identifiable separately and which can be assessed during the hedging operation. Such risks are: the interest rate risk, the currency risk, the goods price risk and the credit risk.

Investments held to maturity cannot be designated as hedged items in the case of interest rate risk because they do not imply recognition of its change. The interdiction covers both the change in fair value hedge of a fixed rate instrument and the risk of variation of cash flows from interest on a floating rate instrument. However, investments held to maturity may be protected against credit risk or currency risk. Expected buying of an asset to be held to maturity and reinvesting cash flows generated by such a placement can be hedged.

The hedged item can be an individual or may be part of a group that has similar risk characteristics. This means that changes in fair value attributable to the hedged risk for each individual element must be approximately proportional to the total change in fair value attributable to the hedged risk in the group.

The Impact of Leadership on the Business Performance in Romania

Horga Maria-Gabriela

“Ovidius” University of Constanta, Faculty of Economic Sciences
gabihorga@gmail.com

Abstract

Throughout this research, I revealed several organizational factors on which leader must intervene in order to multiply the performance of his employees.

These factors are the eight leadership variables, studied throughout the paper, and included in a model..

By using these variables I was able to identify how the Romanian organizations were managed, how were the Romanian leaders perceived by their employees, how did Romanian leaders work on these eight variables critical to the effective leadership of organizations and the extent to which these variables were acting on the Romanian business' performance.

Key words: leadership, economic organization, economic performance, leadership factors, performance indicators

J.E.L. classification: M10, M12

1. Introduction

The research addresses the issue of effective leadership within the economic organizations, at a national level, based on the concepts, theories and national and international researches in this large field.

The scientific research paper is structured in two sections: the scientific background of leadership and the exploratory research that seeks to determine the impact of leadership on the organizational performance within economic organizations in Romania.

The scientific background of leadership consists of: establishing the research area - the economic organization and presenting the stage of knowledge in the field of research, that is - leadership and performance, by approaching classical theories, but also current ones, as presented by the national and international literature in the field.

The exploratory research aims to demonstrate a strong connection between leadership and organizational performance by studying Romanian leaders. The research is based on the current state of national and international knowledge in this field. Thus, this study determines the impact that Romanian leaders generate on the performance of their organizations, also by taking into account that the performance can be influenced by many factors, some of which cannot be controlled entirely by the management of these organizations.

The study explains the need for leadership in achieving business performance and it identifies the areas where the leader can lead the organization towards change and performance. Through the scientific research of the field concerned, I made a trustworthy and validated diagnosis of the Romanian leadership and of the performance of the organizations studied, thus offering the management community in our country a big picture of the Romanian leader and his effectiveness.

The objectives of the research study consisted in:

- creating a knowledge base for the advanced leadership training, research and practice in Romania;
- developing a model of excellence in leadership, that would be effective in motivating the organizations' human resources;
- proposing an instrument to easily diagnose leaders and their performance in their organizations.

Both the instrument and the model that were validated throughout the study are developed to be used by leaders. Both provide essential information to Romanian leaders interested in improving the performance of their organizations.

2. Defining the studied concepts

The universe of research is the economic organization.

Throughout the research paper, I intend to cover a number of issues related to the leadership manifested in economic organizations, because most of the world's activity is conducted within or through organizations. Regardless the manner of classifying the organization, is widely recognized that it is a group of people who are realizing common activities in order to achieve one or more objectives.

The studied concepts are both leadership and the organizational performance and especially the relationship between leadership and performance as established by the current literature in the field.

Leaders and the ability to lead are organizational behavior topics that have been extensively investigated.

Thinking about leadership, researchers in the field responses to the question „*What is leadership?*” vary from that of Emeritus Professor Warren Bennis, a political scientist, researcher and writer, who says that "*the concept of leadership is like beauty, difficult to define but easy to recognize*", to that of Ken Blanchard, researcher and writer, who states that "*leadership relates rather to a directed way than to a meaningless walk.*" [10]

Why is it so important the ability to lead? Because those who lead organizations make things happen. And if leadership is so important it is normal to ask ourselves: *What do leaders do differently? What does it mean to be a leader? Can this level be reached?*

People were interested in the ability to lead from the moment they started to come together in groups, in order to achieve goals. Investigations on the ability to lead, that is the deliberate influence on others to achieve a goal through collective action, showed that over time, leadership proved to be vital, not only for economic organizations, but for the entire world. Thus, leadership is present every day, everywhere in society and along the history.

Under this perspective, the manager is the one who coordinates and monitors the work of subordinates and the organization's resources so that organizational goals are met. [11]

Thus, by studying the economic management theme within the organization, I will focus on the leading of the human factor. To work, the organization needs people, the right people. The activity of the employees depends on the effectiveness of the employees and especially of the leader. People in order to fulfill their duties within the organization, are waiting for the leader to establish the route, the purpose, to guide them. The leader has now become a vital element of a successful business. The organization may have all the advantages: financial resources, market position, cutting-edge technology but if it fails to leading chapter, they are simply lost and the organization goes down. [12]

The ability to lead can be defined based on multiple and different approaches of the researchers in the field. Thus, one can identify the following common operational elements of leadership, regardless the approach:

- it is a process;
- it involves influence;
- it manifests within a group;
- it involves common objectives;
- management authority may exist, but it is not required.

Concerning the importance of leadership, organizations have experienced the intense need to develop a new generation of leaders capable to prime the mechanisms of development, learning, change and performance.

Business performance can be defined by using a series of concepts, theories and definitions. The approaches range from the performance in terms of profitability, from Goldratt's definition, which stresses that "the purpose of any business organization is to make money", to those of other TOC theorists or to that proposed by total quality management up to that of Ken Blanchard and Marc Muchnick, who analyzes the success of a business by evaluating three basic parameters, such as: the favorite supplier; the favorite employer; the favorite investment. [3]

Numerous research papers, theories and articles in the field state the value and the importance of leadership and also the existence of genuine association between leadership and performance.

3. Leadership’s knowledge in national and international literature

Some of the most valuable writings about leadership can be found in ancient texts, especially in the texts of the Chinese philosopher, Confucius. The importance of this ancient doctrine contribution is to reveal that the individuals are able to express what is best in them through leadership, encourage and influence others to do the same. However, the interest in understanding leadership has begun to grow in the 20th Century. At the beginning of the century, it was believed that leaders are born, and studies focused on the characteristics identified by psychologists. But after many years of study, there were not identified any differences between leaders and the others.

The study is based on both classical and current theories, on researches in organizational management and human resources management, such as: Theory X - Theory Y developed by Douglas McGregor; the social relations at work developed by Elton Mayo; the need for achievement and affiliation, developed by David McClelland; Maslow's needs pyramid; Likert's leadership styles; Warren Bennis studies that have attempted to transform leadership into practice; a research study on human motivation conducted for more 10 years by the U.S. Sirota Group; J. Pfeffer's research; Romanian researches and many other. All these developed a particular and important influence on the assumptions, concepts and interpretations of this research study.

In Romanian articles and study papers there have been only few research studies in the field, some of which inconsistent in analyzing the performance of companies, others inconsistent in analyzing the leadership – performance connection. Worth mentioning researches such as: Project LIDEROM, developed by professor Năftănăilă and some other researches of the Bucharest Academy of Economic Studies; Nicolescu and Verboncu, who defined the “symbiotic leadership”; professor Vagu’s, D. Popescu’s; Lefter’s researches in the field; the Human Synergics research on leadership, which defined several types of leaders and validated the results by statistical analysis.

4. The Exploratory Research

The exploratory research aims to demonstrate a strong link between leadership and organizational performance, based on the current state of knowledge in this field, by studying leadership within Romanian economic organization.

The exploratory research’s objectives are as follows:

- Identifying the current working model of Romanian leaders, by analyzing the responses of employees to the key management policies and practices;
- The diagnosis of the current business performance as reviewed by the subjects of the study;
- The demonstration of a strong causal relationship between leadership and business performance;
- The correlation of the leadership variables with the impact that the leader has on the organization' in terms of efficiency, in order to report actual and meaningful data on the impact of each studied variable on the business performance;
- Presenting the validated model of effective leadership;
- Creating a diagnosis tool of leadership as an opportunity questionnaire;
- Providing the management community in Romania a trustworthy image of the Romanian leader and his current performance;
- Making recommendations to Romanian leaders in order to reshape perceptions of the interviewed subjects on their leaders, by applying the validated model of effective leadership.

In order to study the leadership – performance relationship, I approached key management policies and practices and elements used in measuring and analyzing performance, by considering eight key factors or variables on which the leader intervenes, namely: *vision, organization flexibility, follower’s confidence in leader, communication, teamwork, the learning process within in organization, motivation through equity, motivation through fulfillment* of the employee at the workplace. These factors are the eight leadership variables, that have been studied throughout

the paper, and have been included in the leadership model, whose relevance is demonstrated by statistical data. These are the organizational factors on which a leader must intervene in order to multiply the performance of his employees.

Based on the proposed leadership model and using the eight variables of leadership, I formulated nine research hypotheses, relevant to the objectives, as follows:

H1: There is a positive correlation between leadership and business performance within the Romanian economic organizations;

H2: There is a positive correlation between the formulation and communication of organizational vision and values and business performance in Romanian organizations;

H3: There is a positive correlation between organization's flexibility and business performance in Romanian organizations;

H4: There is a positive correlation between employees' confidence in their leader and business performance in Romanian organizations;

H5: There is a positive correlation between business communication and business performance in Romanian organizations;

H6: There is a positive correlation between teamwork and business performance in Romanian organizations;

H7: There is a positive correlation between the learning process within the organization and business performance in Romanian organizations;

H8: There is a positive correlation between equity and business performance in Romanian organizations;

H9: There is a positive correlation between employees' fulfillment at their workplace and business performance in Romanian organizations.

Another key issue was the establishment of indicators used to measure performance. To measure performance, I used both financial indicators - profitability, as well as non-financial – the employee's commitment and satisfaction and the customer's satisfaction.

Using these variables I envisaged a model of excellence in leadership, which was tested in more than 50 organizations in Romania.

The applied research was conducted on a sample of 183 respondents, engaged in economic organizations active in multiple industries, from several counties (Dambovită, Constanta, Valcea, Brasov, Prahova, Braila and Bucharest). The chosen sample is representative.

The research was carried out based on a questionnaire used to question employees and leaders within Romanian organizations. The questionnaire measured two dimensions - leadership and performance - having regard to assessing the following aspects: identifying the leadership factors manifested in the organization (the first section of the questionnaire, questions 1-53), assessing organizational performance, as measured by subjects' perspective respondents (a second section of the questionnaire, questions 54 - 64), general information relating to persons under investigation, thus allowing the sample structure and differentiation of respondents.

The obtained quantitative data was assessed by using statistical analysis of data. To correct any error occurred and as well to confirm the findings obtained, the quantitative research was supplemented by a qualitative research based on data obtained from interviews.

Each leadership variable, defined in the studied hypotheses, was found, without exception, to be a significant variable in relation to performance in all surveyed companies. Therefore the formulated research hypotheses have been validated through quantitative analysis.

The strong causal relationship between leadership and performance shows that leadership is a crucial factor in achieving high business performance.

5. Conclusions

Thus, by using the mentioned variables I identified how the Romanian organizations are managed, how are the Romanian leaders perceived by their employees, how do Romanian leaders work on these eight variables critical to the effective leadership of organizations and the extent to which these variables are acting on the Romanian business' performance.

To conclude, the scientific research carried out, was finalized through the development of an effective leadership model and a diagnosis tool of Romanian leadership.

The Importance of Leadership to the Success of Total Quality Management

Horga Maria-Gabriela

"Ovidius" University of Constanta, Faculty of Economic Sciences
gabihorga@gmail.com

Abstract

At a first sight, there is a very powerful relationship between quality management and leadership. While leadership make us think at a soft instrument of influencing and guiding a group of people to act in a certain way, the quality of processes management is seen as a technical instrument that shapes the activities, re-projects and continuously improves them as that the final result satisfies the client.

Essentially, a careful analysis of the two concepts points to the fact that the leadership is a major premise for all the steps associated to implementing the quality management within an organization: planning, organizing, coordinating, controlling, and improving.

Key words: leadership, total quality management, process, human resources, quality

J.E.L. classification: M10

1. Introduction

By writing this work I want to highlight the importance of leadership to the success of the Total Quality Management. In this respect I studied the role of the human resources management, in general, and of the leadership, in particular, in the implementation process of the quality management in an organization.

As to highlight as well as possible the influence of leadership in the quality assurance inside an organization I have taken into account aspects as: the responsibility of the management in quality assurance; managing and orienting the human resources for quality and the Awards for Quality.

2. Conceptual borders regarding the process oriented Total Quality Management

The total quality management is represented by the totality of methods used to obtain total quality. The total quality represents a target, an objective that has to involve all the elements of the organization in order to create products or services that are satisfying the needs of the clients. Therefore, the efforts should be focused on all the activities through which the client satisfaction is gained.

The activities of an organization can be understood as being part of a certain process. **The process** can be defined as a linked ensemble of activities, that, starting from one or more inputs, transforms them generating an **output**. The one that receives the output of the process is the client and he can be either external or internal (the employee).

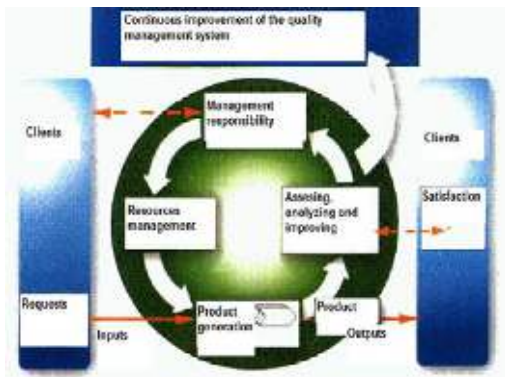

The ISO 9001:2011 Standard promotes the integration of a process oriented approach in the development, implementation and improvement of the effectiveness of the quality management system, as to increase the client's satisfaction by fulfilling its requests. [12]

As for an organization to work effective, it has to identify and manage numerous correlated activities. An activity that uses resources and it is managed as to permit the transformation of the inputs in outputs is considered to be a process. Often, the outputs resulted from a process represent the inputs for the following process.

The application of a process system in an organization, together with the identification of these processes interactions, as well as their management, may be considered a process oriented approach.

The design of a process oriented total quality management is represented in Figure 1 and shows the links between the processes of an organization. This figure shows the significant role of the clients in the requests determination, as inputs. The monitoring of the client satisfaction needs the evaluation of the information regarding the client’s perception of the fact that the organization fulfilled its requests.

Figure 1. The architecture of a process-based total quality management system according to ISO 9001:2000

The importance of the process approach of the total quality management results also from the principles of the quality management extracted from ISO 9004:2000, Guide for performance improvement. This standard contains 8 principles conceived as to assist the organizations in focusing on the most important aspects of quality:

- ✓ Client (internal and external) orientation;
- ✓ Leadership;
- ✓ Personnel involvement;
- ✓ Process approach;
- ✓ The system tackling by the management;
- ✓ Continuous improvement;
- ✓ The correct approach in taking decisions;
- ✓ Mutually beneficial relations with the suppliers.

The first three principles are eloquent for the purpose of the present work and are described in Figure 2. The managers are the ones that determine the objective and direction of the organization. They have to create and maintain, through leaders, an internal climate favorable for the involvement of the employees in fulfilling the organization’s objectives.

Figure 2. Consumer-oriented organization

Source: I. Năftănăilă, *Abordări moderne în managementul și economia organizației*, 2003

3. The responsibility of the management for quality assurance

The functionality and performances of the organization depend on the managers and leaders. These are the ones who draw up the strategies, the managerial system and the organizational culture and that operate them, generating effectiveness, sustainability, competitiveness and efficiency.

On the other side, the manager is the one who coordinates and stands over the resources of the organization and over the activity of the subordinates as to fulfill the organizational objectives.

The leader is the one who can influence others to fulfill the goal. The efficient leaders are people of vision, that communicate effective with the subordinates, are good deciders, respects the persons and their dignity and engage in tasks completion.[7]

The leadership is the process through which a person settles a task or a directive for one ore more persons and determine them to act together with competence and full dedication in order to complete them.

The activity of the organization depends on the effectiveness of the employees and especially of the leader. People in order to fulfill their duties within the organization, are waiting for the leader to establish the route, the purpose, to guide them. The leader has now become a vital element of a successful business. [1]

When the objective of an organization refers to the achievement of quality, the continuous improvement and satisfaction of all the interested parts’ expectations, it is necessary the direct involvement of the top level management. Therefore, hence from the principles of the quality management, the managers and the leaders should determine specific actions through which:

- To assess and maintain the policy and objectives of the organization regarding quality;
- To promote the policy and objectives as to assure awareness, involvement, and motivation;
- To assure that the adequate processes for the completion of the requests of the interested parts are working;
- To assure that a quality management system is implemented and is working effectively and efficient;
- To periodically analyze this system and decide improvement actions;
- To provide the necessary resources. [12]

4. Leading human resources towards quality

For an organization, the human resources represent a pro-active factor in achieving quality, having a great influence upon the total quality, which is constantly affirmed by the Japanese and American management, which emphasize the human factor.

Only having some quality human resources is not enough for gaining the desired results. They are needed certain material conditions and a certain social and management climate which to determine not the “utilization” but the “participation” of these resources in achieving the goals. The person, as a resource, is not to be seen only by what he is doing, but also by his attitude upon his activity and organization.[3]

Inside a process of implementation of the quality management, the human resource plays the role of a changing agent. This change has to be planned, communicated, accepted and realized by the employees. Otherwise, the implementation of such a system, hierarchically imposed by the top management, will be only a change in shape that will not lead to the desired results. The philosophy of the quality management implies a major change, based on the changing of the old system of values, behaviors, habits, attitudes towards the concept of quality.

Usually humans are resistant to change, that is why the leaders intervene, becoming veritable agents of change, capable to determine the involvement of the employees and to motivate them as to act in the desired way. Total quality refers to an effort of

collaboration, which has to be based on the participation and agreement of all stakeholders.

In the exercitation of the activity of leading the human resources as to achieve quality, the managers have a series of certain responsibilities:

- Elaborating and communicating the objectives and the policies regarding quality to all the organization’s employees;
- The involvement and training of the personnel as to have a proper attitude towards quality and to be sure that the prevention is preferable to the correction of quality;
- Organizing actions of sensitization of the employees regarding quality issues, as to let them know how can they contribute with their work at the achievement of quality;
- Motivating and stimulating the employees depending on their results in the quality matters.[10]

A particularity of the process of the quality management implementation in an organization is connected to the necessity and opportunity of a change in the role of the managers, which have to become, in the same time, leaders. From the sources of power at the disposition of the manager responsible with the assurance of quality, the most influent are the power of expert and personal example.

Another particularity of the process of the management quality implementation refers to the type of leadership appropriate to the context. The field literature sketches the visionary leadership model, an inspiration and a motor of substantial changes for his followers. The visionary leadership model includes: charisma, inspiration and intelligence, intellectual impulse, individual consideration, anticipation of new tendencies, alignment of own values and opinions with those of the followers as well as with those of the market he is a player in, firm actions toward the planned direction.

Through his charisma, this type of leader creates an emotional connection with his followers. The results consequently consist in: loyalty, respect, emulation and trust into the leader, these being openings towards the understanding of a major change.

The leader intellectually challenges his followers, opening the way to new knowledge, doubting the existent solutions and searching for new solutions and answers. By encouraging the employees to see the problems in another way, the leader urges them to reach a performance beyond their known possibilities. The leader treats each of his followers in a different way, everyone being treated with the same attention, but individually. The individual consideration allows the leader to correlate the skills and abilities of the employees with the organization's needs.

And finally, a visionary leader is the one that sets the employees' goals. He defines a target for them, the transformation of the organization in an knowledge organization and lead them to it. The only thing that this type of leader doesn't do is to define the way the employees should reach their target. He has the vision and he shares it with others, but, usually he leaves them to find a specific way to achieve their goal.

5. Motivating the human resources in order to assure quality

An organization may excel in the quality field only if the entire potential of each person inside it is fructified, encouraging their creativity, making them proud and aware of their own value. Therefore, the human resource management must focus not only on providing high quality personnel to the organization (adequate professional training, innovative spirit, diligence), but on their motivation towards voluntary usage of the characteristics in order to achieve the goals in the quality field.[3]

Leaders should facilitate the human resources' embroilment and development through:

- Continuous training and career plans;
- Defining the responsibilities and authority;
- Facilitating the involvement in setting the objectives and taking the decisions;
- Acknowledging and rewarding;
- Facilitating a two-way fair communication;
- Continuous revising in personnel necessities;

- Assuring proper conditions as to encourage innovation;
- Assuring team work;
- Assuring open communication regarding suggestions and opinions;
- Measuring the level of personnel' satisfaction;
- Searching for sources of fluctuation.[3]

For any organization dealing with the quality management, assuring motivation for the employees has two main features. On one hand, a motivated employee fulfills his duties completely and on his own, adapting himself easier to change and even eliminating resistance to change. On the other hand, the same motivated employee is a performance-oriented one. His motivation must be based on the belief that the quality management leads to the development and profitability of the organization, reflecting directly on the wages of the human resources, being a win-win situation.

The motivation for quality might be achieved by adopting a participative management, meaning the involvement of the employees in the technical, commercial or financial performance, through the exploitation of the creative potential of the personnel. [11]

The proposals regarding the improvement of quality may come from each and any employee as well as from interested external parts. The management of an entity must not wait for these proposals, but to act in such manner as to obtain them [11]. Here is where the role of the leaders is essential because they may stimulate the employees though specific motivation techniques, the so called "quality circles". These are made of a relative small number of employees who, along with their supervisors, get together periodically and voluntarily and discuss problems related to the activity in order to find the best solutions. The quality circles are made to make aware the employees of the importance of their participation in the enhancement of the organization's performance.

6. Quality Awards

The sharpening of the competition between organizations determined the need of assessment of the performances achieved by implementing the total quality

management. Therefore, there have been created different Awards, the so called “quality Awards”, that are awarded on different categories of organizations, on multi-criteria basis, and that describe the image of “excellence” in an organization.

At an international level, the most important Awards are: *The Deming Award*, *The Malcolm Baldrige Award* and *The European Award for Quality*.

6.1 The Japanese W. E. Deming Quality Award

It is the first Award for quality in the world, awarded for the first time in Japan in 1951. It is awarded for two sections: to the organizations and to the people that had a major contribution to the development and implementation of TQM. There are 63 evaluation criteria grouped in 10 categories: Organization politics and objectives, Structure and function, Education and training towards quality, Collecting, transmitting and using information about quality, Process analysis (using statistics instruments), Standardization, Process control system, Quality assurance, Business results, Organization’s perspectives.

6.2 The American Malcolm Baldrige Quality Award

Firstly awarded in 1987, this Award has three sections: factories, services and small firms (maximum 500 employees). The evaluation criteria of the nominee firms are grouped in 7 categories and 28 sub-categories, totalizing 1000 points: Leadership (110 points), Informing and analyzing (80 points), Strategic planning of quality (80 points), Development of human resource management (100 points), Quality processes management (100 points), Quality and business results (450 points), Client satisfaction (80 points).

It can be easily seen that the “Leadership” criterion is the second in importance regarding the associated points, underlying the importance of leadership in the implementation of total quality management in an organization. More precisely, the Malcolm Baldrige Award examines the involvement and personal implication of management personnel in creating and

sustaining a client oriented organization, as a indubitable and transparent support of the quality values. It is evaluated:

- The leadership aptitudes of the personnel from the management;
- Quality assurance;
- The integration of the public responsibilities in the quality policies and the degree of client commitments fulfillment.

6.3 The European Quality Award

The European Quality Award (EQA) is awarded since 1991 by the European Foundation for Quality Management (EFQM) for the organizations that gain remarkable results in business by using the TQM. This model consists of 10 criteria by which the organization’s performances are rated [8]: Leadership (100 points), Policy and Strategy (80 points), Human resources management (90 points), Resources (90 points), Processes (140 points), Clients’ satisfaction (200 points), Employees’ satisfaction (90 points), Social impact (60 points), Business results (100 points).

Analyzing the three awards ante-mentioned by the point of view of leadership, it can be observed that the Deming Award has no criterion which to directly refer to leadership, thing that reveilles the Japanese conception about quality, according to which, “quality is everyone matter”, meaning that every person from an organization must be preoccupied of and act towards quality. Therefore, quality is a vertical scale philosophy. Contrarily, the American Malcolm Baldrige Award and the European Quality Award have a less decentralized approach, of the top-down type, underlining the role of the leaders as disseminators of the TQM model.

7. Conclusions

The impact of leadership on quality started to be appreciated at its true value along with the evolution of the quality concept from the “standards conformity” to the “client satisfaction”. Moreover, the role of leadership was underlined by two particularities of the “total quality” concept: the extension of the client notion, according to which quality means fulfilling the needs of

the internal clients and overtaking the classical view based on the idea that the department for quality control takes full responsibility for the quality. Quality is not checked but fulfilled by all the organization’s personnel. Therefore leadership is needed in order to implement a quality oriented human resources management, based on quality motivation and participation.

As nothing can be perfect, every system presents a number of limitations. Thus, success depends on skills and employment experience, including training on how to use the correct system, redesigning business processes that can lead to a loss of competitiveness, and the fact that systems are sometimes seen as too rigid and too expensive. [2]

Warren Bennis reckoned that the basis of management lays in the capacity of leader to change other peoples’ thinking and behavior. The quality management embraces the same philosophy, but adds a new idea, based on a new way of thinking, considering that the client is the only owner of the business. From this perspective, total quality management is the purpose while leadership is the mean to achieve it.

The Necessity of Auditing Information Systems

Horga Mihaela

"Valahia" University of Targoviste

m.horga@yahoo.com

Abstract

With the development of new information technologies a number of threats and risks of the information system have emerged, reaching alarming levels, which requires the introduction of an internal control of the information system within the organizations.

Key words: information security, audit, standard, risk.

J.E.L. classification: M42

1. Introduction

In the initial development of an information system a series of basic activities are executed. These activities consist in: definition of requirements; analysis; design; implementation; testing.

These stages are followed by the operation of the information system that includes: the input of information; processing and storage of information; the output to the various users.

However, in recent years there has been an explosion in the development of networking systems, which inevitably led to a convergence of networks, but also resulted in drawing information system risks.

In this context, the most valuable item is information that is the core of any organization.

By integrating information technology, the role of information system increases in processing data and in obtaining the information within an organization's information system. Naturally, there is a need to ensure the accuracy and security of information and of computer system operations, the reliability of the processed data and of the obtained results. Certification of data integrity and control procedures is a necessity arising from the need of trust.

Since 1968, The American Institute of Certified Public Accountants initiated the development of the concept called "Electronic Data Processing Audit – EDP Audit".

Information System Audit and Control Association (ISACA) is the only professional organization that groups and certifies information systems audit specialists since 1994.

Information security provided by an information process is an accumulation of measures that ensure confidentiality, integrity and availability of data.

- *Confidentiality* is a feature of information, which provides protection, meaning that it can be accessed by the owner or other authorized person that is granted access.
- *Integrity* is a feature referring to the protection of information against unauthorized intentional or accidental changes. Only authorized personnel has the right to modify information and programs in a specific manner in order to prevent the change or the deletion of present data in transit.
- *Availability* is a feature referring to the fact that information systems are used only for legitimate purposes by authorized persons at the necessary time and form.

IT Management requires an optimum flow of electronic documents and associated specific treatment procedures. Thus audit work becomes an urgent necessity, seeking to increase the security of information system's resources, data integrity, efficiency and quality of the internal control within the organization.

Etymology of "audit" stands for "Audire" in Latin, that in translation, is "listening". Semantically, "audit", in English, means test, book review.

Shortly, auditing can be defined as an activity that compares the actual situation with an ideal situation.

Broadly, the audit is an approach or a methodology prepared by professionals, using a set of information and evaluation techniques to achieve a motivated and independent assessment, referring to the valuation rules, assessing the reliability and effectiveness of systems and procedures used within an organization.

Auditing is a process by which a competent and independent person accumulates and evaluates evidence relating to an economic entity, seeking to determine their correspondence with various well-established criteria.[1]

2. International and Romanian framework of the audit of information systems

Information and communication technologies (ICT) are and will continue to be a major factor in the evolution of the economy and of the society. In 2010, the business sector in the EU allocated more than 20% of the investments to the ICT field and more than 60% of basic public services are currently available online, while more than half of EU citizens are constantly using the Internet.

The European strategic framework, respectively, the initiative i2010 [10], had three major objectives:

- Establishing an European area of information, namely a real single market for the digital economy, enabling the full exploitation of the potential of distinct economies, with uneven scale factors specific to the European consumer market of almost 500 million consumers;
- Increasing innovation and investments in ICT research, required by the fact that ICT is the main engine of the economy;
- Promoting the European values of social inclusion and increased quality of life towards an information society.

According to assessments in the cited report [10], Europe is among the world leaders in the development of digital economy.

Since 1993, the European Union has developed a series of strategic decisions and specific programs in order to create the favorable prerequisites for the transition to the Information Society. A representative strategic document is e-Europe - An Information Society for All, adopted in 1999, which proposes to speed up implementation of the digital technologies in Europe and to provide the skills needed for its widespread use.

The following documents and actions marked the development in the field, including in Romania:

1. The Community Program Interchange of Data between Administrations (IDA), that includes Romania also. Its lines of action focus on:

- implementing e-government systems;
- defining the European policy on digital information;
- creating an European portal for information and services;
- drawing guidelines for the organization and search of public information on legislative and regulatory framework in the EU;
- conducting market research for SME-s regarding the use of e-services;
- promoting the international exchange of knowledge on best practices of electronic services.

2. The e-TEN Program, that was developed in parallel with the IDA Program and was completed in late 2006. Its main objective was the development of electronic services to a trans-European dimension: e-Government, e-Health, e-Inclusion, e-Learning, services for SME-s, services for assuring security and trustworthiness of networks and information systems.

3. The IDABC Program (Interoperable Delivery of European e-Government Services to Public Administration, Business and Citizens), established by Decision nr.2004/387/CE of the European Parliament and European Council of 21 April 2004. It was initiated to develop the benefits of ICT regarding the delivery of cross-border public services for citizens and business across Europe and to increase efficiency and collaboration between European public services. Solutions and shared services were developed based on the most advanced information and communication technologies

and it was created a platform for exchanging best practices between European administrations regarding the European public service modernization.

4. European Commission's strategic policy framework for the Information Society by 2010 was traced through the i2010. The e-Government Conference "Transforming Public Services", held in Manchester in November 2005 approved a declaration setting benchmarks and targets for electronic public services.

5. The European Commission launched in March 2010, the European Strategy 2020 in order to overcome the crisis and to prepare the EU economy for the challenges of the new decade. One of the seven initiatives included in this strategy, namely, The Digital Agenda for Europe, sets out the key role that ICT will play at European level in order to achieve the proposed objectives by 2020. ICT sector is directly responsible for providing 5% of the European GDP, with a market value of 660 billion Euro annually. Also its contribution to productivity growth (20% directly from the ICT sector and 30% from ICT investments) is major and it offers a great development potential.

In practical terms, International Standards for Auditing Information Systems were developed and it allowed the international harmonization of the audit practices. The objective of these standards is, on the one hand, to provide the auditor a set of rules and principles to which he can relate to during his evaluation, and on the other hand, to inform the leadership of the organization and those interested on the activities and practices conducted during the audit.

To support the successful implementation of the audit standards, ISACA has published a number of methodological guidelines represented by a collection of examples of procedures that a auditor must follow in an audit of information system, which provide to the auditor the practical elements for implementing the auditing standards and procedures.

International standards for auditing information systems are as follows [[3]:

- Audit Charter;
- Independence;
- Professional Ethics and Standards;
- Professional Competence;
- Planning;

- Performance of Audit Work;
- Reporting;
- Follow-up Activities;
- Irregularities and Illegal Acts;
- IT Governance;
- Use of Risk Assessment in Audit Planning;
- Audit Materiality;
- Using the Work of Other Experts;
- Audit Evidence.

Nationally, there is a need for regulatory and legal framework in field of information systems auditing. In recent years, there are increasingly more legislative regulations on the protection and security of information, such as [3]:

- Law 365/2002 on electronic commerce;
- Law. 455/2001 on electronic signature;
- Law. 506/2004 on processing of personal data and privacy in electronic communications sector;
- Law. 102/2005 on the establishment, organization and functioning of the National Supervisory Authority for Personal Data Processing;
- Law. 64/2004 for ratifying the Council of Europe Convention on cyber crime.

Both the integration of plans and programs associated with ITC in Romania with the action plans adopted at European level (i2010, e-TEN, IDA), as well as the programs carried out to its sequel are important steps in accelerating the implementation of the basic structures of the information society in Romania.

3. Guidelines for auditing information systems

A definition based on IT governance practices as part of the management of an organization can be formulated as follows: IT governance is the responsibility of the management and of the steering committees and it is the act of assuming the leadership and the coordination of the organizational processes and structures to ensure that the IT function supports and expands the entity's strategies and objectives.[11]

In particular, this definition presents IT governance as a full component of business governance and not as an isolated discipline.

In practical terms, IT governance has two categories of results: delivering business value and attenuating (annihilating) IT risks. In this sense, IT governance focuses on five main areas:

1. *Strategic alignment*: following the objectives and implementing the strategies of the entity, by assuming coherent activities and responsibilities of different management structures or levels within the organization.
2. *Delivering value*: creating new value for the entity by maintaining and expanding the current value; eliminating initiatives and assets that do not create sufficient value.
3. *Risk Management*: approaching the specific IT risks and using IT to manage the risks of doing business.
4. *Resource management*: ensuring adequate capability to execute the strategic plans and providing sufficient, adequate and effective resources.
5. *Performance measurement*: following the objectives of the entity and complying with the external specific requirements.

IT governance functions as a continuous process, as an integral part of the organization's management and focuses on the strategic objectives. As a policy meant to ensure the integrity and security of public electronic communications networks, it follows three main objectives: to prevent actions against computer systems and communications networks; to reduce vulnerability to such attacks; to minimize damage and recovery time following the attacks.

The approach of the security issue is comprehensive, including policies, training, physical protection, security procedures manuals and software.

Strategies, standards, procedures and rules were developed in order to implement the security policies and measures undertaken to combat cyber crime.

The international standards for the audit of information systems are:

1. INTOSAI (ISSAI 3000 Implementation Guidelines for Performance Auditing, INTOSAI GOV 9100 – Guidelines for Internal Control Standards for the Public Sector, INTOSAI GOV 9130 - Guidelines for Internal Control Standards for the Public Sector – Further

Information on Entity Risk Management).

2. ISA – International Standards for Audit.
3. ISACA – Information Systems Audit and Control Association Standards.
4. COBIT – Control Objectives for Information and Related Technology (frame of work, good practice guidelines and audit of information system guidelines issued by ITGI systems – ISACA).

These standards are based on the assessment of risks and results.

The audit may be performed for the entire life cycle of programs, projects, systems and computer applications or only for certain stages specified by the objectives.

Risks play a critical role for the success of a business because a decision-making process involves effectively managing risks on a continuing basis. Quite often, IT risks (risks related to the implementation and use of IT systems) are neglected, unlike other types of risks (market risk, credit risk and operational risk), which are incorporated into the decision-making process. IT risks should be transferred to specialists and should be included among the risks that impact on the strategic objectives.

4. Conclusions

Both managers and auditors should properly evaluate the risks of the organization's information system.

To ideally identify and assess risks, managers and auditors should cover some phases such as: identifying risk factors; ranking risks by their importance for the audited system; determining the frequency and the duration of occurrence of each risk factor; assessing the risk level; planning the audit by allocating the adequate audit resources.

Risk and risk factors monitoring should be revised to meet the changing environment requirements. Also, processes and activities must be updated. It is necessary for managers to constantly have a business overview in order for them to be aware of business risks.

The Determination of Companies' Fiscal Profit and Profit Tax

Horga Vasile

“Valahia” University of Targoviste

horga.vasile@gmail.com

Abstract

The profit of a financial period is the result of the cost-price mechanism within a company and it is an essential instrument in analysing and evaluating the economic efficiency of a company as well as the quality of the company's activity.

By taking into account these aspects I developed throughout this paper a model for determining the profit before taxation and also for calculating the income tax.

Key words: financial period, revenues, expenses, fiscal base, fiscal profit.

J.E.L. classification: M41

1. Introduction

The profit and the rentability of the company are two complementar indicators and which in terms of efficiency determine the evaluation forms of risk and of opportunities of economic growth within the market economy.

Throughout the paper I used and analysed data such as the expenses composing the cost and the revenues generated by the price in order to establish exactly the income tax that every company is obliged to pay to the state authorities.

2. The determination of the result for the financial period

The result of the period is determined by the deduction at the end of the reference period from the total of the obtained revenues of the total of the registered expenses, according to the model:

$$V_T - C_T = R_C$$

where:

V_T = total registered revenues;

C_T = total registered expenses;

R_C = financial result of the period.

The financial result of the period can cover the profit form, the loss form or the null result.

The financial profit is obtained when the difference between the total revenues and the total expenses is bigger than zero, while the financial loss appears in the inverted situation.

In the situation where there is a perfect balance between the revenues and the expenses, and the difference between them is zero, we are talking about a null financial result of the period.

$$V_T - C_T > 0 = P_c$$

$$V_T - C_T < 0 = P_{ec}$$

$$V_T - C_T = 0 = R_n$$

where:

P_c = the financial profit of the period;

P_{ec} = financial loss of the period;

R_n = null result of the period.

The result of the period from the reasons of economic analysis of the activity is structured in:

- result from the exploitation activity
- result from the financial operations
- result from the extraordinary operations

The result from the exploitation activity together with the result from the financial operations gives birth to the current result of the activity. The current result of the activity together with the result from the extraordinary operations forms the financial result of the total activity.

The result from the exploitation activity is determined as difference between the revenues obtained from the exploitation activity and the expenses afferent to the revenues of the exploitation activity, according to the model:

$$R_e = V_e - C_e,$$

where:

R_e = result from the exploitation;

V_e = revenues from the exploitation;

C_e = expenses from the exploitation.

The result from the financial operations is determined as difference between the

revenues obtained from the financial operations and the expenses effectuated with such operations, according to the model:

$$R_f = V_f - C_f,$$

where:

R_f = result afferent to the financial operations;

V_f = revenues obtained from the financial operations;

C_f = expenses effectuated with financial operations.

The current result of the period is determined as difference between the revenues from exploitation and the revenues from the financial operations taken together and the exploitation expenses and the expenses effectuated with the financial operations taken together, according to the model:

$$R_c = V_e + V_f) - (C_e + C_f)$$

where:

R_c = the current result

The extraordinary result of the period is determined as difference between the extraordinary revenues and the extraordinary expenses, according to the model:

$$R_{ex} = V_{ex} - C_{ex},$$

where:

R_{ex} = extraordinary result;

V_{ex} = extraordinary revenues;

C_{ex} = extraordinary expenses.

The financial result of the activity of the period is determined as sum of the current result of the activity and the extraordinary result of the same activity, according to the model:

$$R_{co} = R_c + R_{ex},$$

where:

R_{co} = financial result of the activity of the period;

R_c = the current result of the activity of the period;

R_{ex} = extraordinary result of the activity of the period.

The result of the financial period has two components:

- an financial component illustrated by the financial result of the financial period;
- a fiscal component illustrated by the final (fiscal) result of the financial period.

In order to determine the third component of the result of the financial period, respectively the **profit tax** it is necessary to determine accurately the **fiscal base**.

3. The fiscal result

The fiscal base represents the value which will be deducted for fiscal purposes from any taxable economic benefit, which will be generated by an entity when it recovers the economic value of its assets.

The financial result of the period represents a global sum of the profit or loss registered by an economic entity, before the taxation of the profit or the recovery of the fiscal loss.

The fiscal result represents the taxable profit or the fiscal loss of the financial period, which is obtained by the application of the fiscal rules on the obtained revenues or the expenses effectuated by an entity which pays the profit tax and is calculated according to the model:

$$P_I = V_T - C_T - V_N + C_N - P_F, \text{ or}$$

$$P_I = (V_T - V_N) - (C_T - C_N) - P_F,$$

where:

P_I = taxable profit of the financial period;

V_T = total revenues of the financial period;

C_T = total expenses of the financial period;

V_N = tax-free revenues of the financial period;

C_N = nondeductible expenses of the financial period;

P_F = anterior fiscal loss, to be recovered.

The taxable profit in case of liquidation, is calculated as the difference between the revenues and the expenses effectuated for the obtained revenues, cumulated from the beginning of the fiscal year, taking into account the profit from the liquidation of the patrimony, the sums from the annulment of the provisions, the sums registered in the accounts of proper capitals constituted from the financial (gross) profit and which were not taxed at the date of their constitution, other similar elements to revenues and expenses. In the case where in the profit tax declaration afferent to the year precedent to the liquidation, the entity has registered a fiscal loss, it will be recovered from the taxable profit, calculated with the occasion of the liquidation.

At the calculus of the profit tax due by the entities that cease their existence following the liquidation operations, it is taken into account the taxable profit and the reserves constituted from the net profit, some reductions afferent to the taxation quota distributed as proper financing sources

during the functioning period, including the reserves constituted from the exchange rate differences favorable to the social capital in currencies, or those resulted from the evaluation of the availabilities in currencies.

The **profit tax** represents for a tax paying entity, a fiscal nature expense, which is determined quarterly, cumulated from the beginning of the year, through the application of a percent established by law, on the taxable profit, according to the model:

$$I_p = \frac{P_1 \times C_{ip}}{100}$$

where:

I_p = profit tax;

P_1 = taxable profit of the financial period;

C_{ip} = legal quota of profit taxation (percent).

The net or to be distributed profit represents the part from the financial profit which remains at the disposal of the paying entity, after the deduction of the profit tax due to the state.

The net profit is determined as the difference between the financial profit and the calculated profit tax, according to the model:

$$P_N = P_c - I_p,$$

where:

P_N = net profit of the financial period;

P_c = financial profit of the financial period;

I_p = tax on the due profit.

The determination of the profit tax to be paid at the state budget or to be recovered from the state budget is done as the difference between the calculated profit tax, cumulated from the beginning of the financial period, and until the calculus period established by law and the profit tax paid for the previous periods, according to the model:

$$I_{pp(r)} = I_{pd} - I_{pa},$$

where:

$I_{pp(r)}$ = profit tax to be paid or to be recovered;

I_{pd} = due profit tax;

I_{pa} = paid profit tax;

From this calculus can result three situations:

a) Profit tax to be paid, if: $I_{pp} - I_{pa} > 0 \rightarrow I_{pd}$

b) Profit tax to be recovered, if: $I_{pp} - I_{pa} < 0 \rightarrow I_{pr}$

c) Profit tax paid integrally, if: $I_{pp} - I_{pa} = 0$

The profit tax is calculated as if follows:

- in the case of the Romanian juridical persons on the taxable profit obtained from any source, Romanian or foreign;

- in the case of foreign juridical persons who have a permanent headquarters in Romania on the taxable profit, attributable to the permanent headquarters;
- in the case of foreign juridical persons and of the resident physical persons who develop activities in a association without juridical personality, on the part from the taxable profit of the association, attributable to each person;
- in the case of foreign juridical persons who realize revenues from the real estate properties situated in Romania, or from the sale of the participation titles owned to a Romanian juridical person, on the taxable profit afferent to these revenues;
- in the case of the resident physical persons associated with Romanian juridical persons who realize revenues in Romania and abroad from associations without juridical personality, on the part from the taxable profit of the association, attributable to the resident physical person.

It can be accentuated the fact that the results of the financial period, determined through the comparison of the revenues and expense, influences the patrimony of the economic agent with the purpose of increasing or reducing it, as it follows:

- the profit reflects an increase of the asset, at the present moment as compared to a passed moment;
- the loss reflects an increase of the liability, at the present moment as compared to the passed moment;
- the null result does not influence the patrimony of the economic agent.

The fact that the result of the period is integrated at the end in the patrimonial economy, leading to the increase or the diminution of the patrimony, the determination of the result of the period can be done and according to he model:

$$R = C_{p1} - C_{po},$$

where:

R = result of the period;

C_{p1} = proper capitals at the present moment;

C_{po} = proper capitals at the passed moment;

If:

$C_{p1} > C_{po} \rightarrow$ profit, and $C_{p1} < C_{po} \rightarrow$ loss.

The result of the period, irregardless if it is profit or loss it is found in the financial

balance registered in the liability in the category of the proper capitals, with a plus if it is profit and with a minus if it is loss.

The current tax and the delayed one must be recognized as a revenue or as an expense in the profit or the loss of the period, except the case where that tax appears from a transaction or an event that are recognized directly in the proper capitals, during the same period or in a different period or from combinations of enterprises.

Most of the debts regarding the delayed tax and the book debts regarding the delayed tax, appear where the revenues or the expense are included in the financial profit of a period, but is included in the respective taxable profit the financial loss afferent to another different period.

Such situations can appear when the revenue from interests, the royalties or the dividends, is cashed in late and is included in the financial profit allotted in time, but is included in the taxable profit, respectively the fiscal loss from another period or when the cost of the non-corporal immobilizations were capitalized according to IAS 38 “Non-corporal immobilizations”, are amortized in the profit and loss account, but were deducted for fiscal purposes when they were supported.

The book value of the debts and the debts regarding the delayed tax, can be modified even if there is no modification in the value of the afferent temporary differences, as result of the modification of the taxation rates or the fiscal rules, as result of the reevaluation of the manner of recovery of the debts regarding the delayed tax, or as result of the modification of the forecasting manner of recovery of an asset.

The resulted delayed tax is recognized in the profit and loss account, except the situation when it is afferent to the elements previously debited or credited, directly in the proper capitals.

The current tax and the delayed tax must be debited or credited directly in the proper capitals if these taxes are afferent to the elements which were debited or credited directly in the proper capitals during the same period or in a different period.

The International Standards of Financial Reference (IFRS) impose or authorize certain elements to be credited or registered directly in the proper capitals, as it follows:

- a modification in the book value appeared from the reevaluation of the corporal immobilizations;
- an adjustment of the initial balance of the reported result, coming either from a modification done upon the financial policy which is applied retrospectively, either from the correction of the fundamental errors;
- the differences of exchange rate appeared with the conversion of the financial situations, of a foreign operation;
- the sums appeared together with the initial recognition of the component of proper capitals, of the composed financial instruments.

There are situations where there is difficult to determine the value of the current tax and of the delayed one, which refer to the elements credited or debited in the proper capitals, when:

- the profit tax is determined using progressive rates and is impossible to determine the rate at which a specific component of the taxable profit was taxed;
- a modification intervened on the taxation rate, or on another taxation rule, affects a book debt or a debt regarding the delayed profit tax afferent to an element, which was previously debited or credited in the proper capitals;
- when an entity establishes that a book debt regarding the delayed tax must be recognized and the book debt concerning the delayed tax is afferent to an element which was previously debited or credited in the proper capitals.

The current and the delayed tax, afferent to some elements which were debited or credited in the proper capitals, are based on a just proportional distribution of the current tax and of the delayed one of the entity being under the incidence of the fiscal jurisdiction, or on another method which validated a more suitable distribution.

The current tax of the current period and of the previous one must be acknowledged as debt, within the limits of the unpaid sum.

If the already paid sum regarding the current period and the previous one exceeds the due sum for those periods, the surplus must be acknowledged as asset.

The annual loss established through the profit tax declaration is recovered from the taxable profits obtained in the following five consecutive years.

The recovery of the annual fiscal losses will be done in the order of their registration, at each payment term of the profit tax, according to the fiscal rules in force at the moment of their registration. The fiscal loss represents the sum registered in the imposition declaration of the precedent year. When the recovery of the financial loss is done from the legal reserves, constituted from the profit before the taxation, the ulterior recovery of the legal reserve will not be a deductible sum, at the calculus of the taxable profit.

The fiscal loss registered by the entities which cease their existence by division or fusion, it is not recovered by the newly established contributors or by those who take over the patrimony of the absorbed company.

The entity from whose patrimony is detached a part after a division operation, and which continues its existence as a juridical person, recovers the part from the fiscal loss registered before the moment when the fiscal operation produces effects, proportionally with the rights and obligations maintained by the respective juridical person.

In the case of the fusion by absorption, the fiscal loss resulted from the declaration of imposition of the absorbing juridical person, declared until the date of registration of the mention in the commerce registry regarding the increase of the social capital is recovered according to the fiscal rules.

The foreign juridical person can recover only the loss afferent to the revenues and expenses attributed to a permanent headquarters in Romania.

Any loss reallocated through a permanent headquarters from abroad, is deductible only from the revenues obtained from abroad.

The losses realized through a permanent headquarters from abroad are deducted only from these revenues, separately on each revenue source. The uncovered losses are reported and will be recovered in the following five consecutive fiscal years.

When the fiscal loss is used for the recovery of the current tax of a previous period, an entity acknowledges the benefit as asset in that period where the fiscal loss appears, because there is the possibility for

the benefit to be generated by the entity and to be credibly evaluated.

The revenues obtained by a Romanian juridical person in a foreign state, with the permanent headquarters in that state or the revenues taxed with retention to the source in that state, which are taxed in Romania, as well as in the foreign state, then, the tax paid to the foreign state, on those revenues, directly or indirectly by the retention and the bank transfer of the tax by another person, is deducted from the profit tax due to the Romanian state.

The deduction for the taxes paid towards a foreign state in a fiscal year, cannot exceed the profit tax calculated by the application of the legal quota of profit tax at the taxable profit obtained in the foreign state, determined in accordance with the Romanian fiscal rules, or at the revenue obtained from the foreign state.

The tax paid to the foreign state is deducted only if the Romanian juridical person proves with documents that the tax was paid to the foreign state.

At the end of the fiscal year, the operations effectuated through some permanent headquarters from abroad of the Romanian juridical persons, registered during the period in currencies, respectively the revenues, expenses, other taxable or deductible sums, as well as the paid tax are converted in lei, using an average of the currency exchange rates, communicated by the central bank.

The entity which develops activities through a permanent headquarters in a foreign state, calculates the taxable profit at the level of the entire company, according to the fiscal rules.

For the granting of the fiscal credit afferent to a permanent headquarters, an entity calculates the taxable profit and the profit tax afferent to that permanent headquarters, according to the fiscal rules in Romania.

The document based on which it is calculated the deduction from the profit tax due in Romania, it is the one attesting the payment, confirmed by the foreign fiscal authority.

If the document based on which it is calculated the deduction from the due profit tax is presented after the deposition with the fiscal authorities of the declaration regarding

the profit tax, the fiscal credit is granted for the year at which it refers, by the deposition of a corrective declaration.

The limitation of the deduction at the level of the profit tax paid in the foreign state is done regarding each revenue source in the foreign state, taken separately.

In this sense, all the revenues of the Romanian juridical person whose revenue source is in the same country will be considered as having the same source.

The foreign juridical persons who obtain revenues from real estate properties in Romania have the obligation to pay profit tax for the taxable profit afferent to these revenues.

The taxable profit in this case is determined as the difference between the value realized from the sales of these real estate properties and the purchase, constitution or modernization cost of the property, reduced with the afferent fiscal amortization. The value realized from the sale of these real estate properties is reduced with the commissions, taxes or with other paid sums, afferent to the sale.

The taxable profit resulted from the termination or the cession of the commonage of the real estate property situated in Romania, is calculated as the difference between the obtained revenues and the expenses effectuated with the purpose of their realization, except the revenues with retention at the source.

The revenues from the real estate properties include also the gains from the sale – cession of the participation titles owned at a juridical person, if the majority of the fixed means of that juridical person are directly or through more juridical persons, real estate properties situated in Romania.

In this sense, the fixed means of a juridical person are directly considered real estate property situated in Romania, when the respective juridical person owns social parts or other participation titles in a company, where the condition of owning the majority of the real estate properties, the value of the fixed means, including the terrains, taken into account at the establishment of the majority of the holding of the real estate properties, is the value of their registration in the accountancy, on the date of the sale-cession of the participation titles. Within the real estate properties are included also the current

investments, like buildings and other constructions. The gains from the sale, cession of the participation titles is determined as differences between the revenues realized from the sale-cession of the participation titles and their purchase cost, including any commissions, taxes or other paid sums, afferent to the purchase of such participation titles.

4. Conclusions

We can conclude by saying that there is a permanent connection between the two entities, meaning on one side the company that generates income and the state that is collecting a part of this income in the form of income tax. This is why the presented model takes into account the conciliation of the two parts in such a manner that both their economic interests to be satisfied.

The Need of Activities Integration as Effect of Global Economic Crisis

Hotăran Ilinca

The Bucharest Academy of Economic Studies, Faculty of Management
ilincahotaran@yahoo.com

Abstract

Even though the need for trust-based relationships existed in the prior period, following the global economic crisis event, it becomes a necessity and not just a growth opportunity. Research analyzes types of relationships and strategic alliances, focusing on long term partnerships. This article sees as a business essential element, relationships that are not based on cost advantage or high production volume at a certain moment. Knowledge management is also an essential element, giving us the possibility to outline the image of future managers. Essential characteristics of relationships that should have managed within a supply chain and between different chains have been known since ancient times, but the lack of importance associated with them has led to serious economic effects, as we are able to identify now in the environment.

Key words: integration, partnership, knowledge management.

J.E.L. classification: L20, M20, M53, O15

1. Introduction

What is the final purpose of any business organization? The central element of concern is customer satisfaction and loyalty. In this turbulent environment it is essential that the entire mechanism of the business to be directed to the client, in the meaning of a much profitable satisfaction of the clients' demands and wishes, to whom there are offered products and services [4].

In any sector, organization or department, we must always be sensitive to a group of customers. This is because customers are not only members of the public, as shoppers from a store, but they are also those members of staff from other departments with whom we

work. Indeed, a way to boost customer orientation within an organization is to encourage employees to see all their colleagues as internal customers. Everybody whom we work with, rely on us to carry out properly their own job. It can be the problem of supplying goods or services for further processing or simply giving information in order for them to be able to fulfill their tasks. Building effective and productive relationships with customers is crucial for proper functioning of any organization.

2. The role of activities integration

As effect of the global economic crisis, a number of factors threaten business at extended level, affecting the entire supply chain associated. Thus, companies must assess how to solve problems of visibility and control within the chain, without having to tear down the entire infrastructure. They should seek ways to expand partnerships without adding costs for start-up, training and maintenance of those partnerships.

Supply chain globalization, increased complexity, rising costs and the need to quickly respond to customer demands and to interruptions that can occur in the chain, force companies to rethink the former approach of the supply chain. Evolution of multi-integrated chain and demand-led networks is essential, but the need to reduce costs and to hold long-term competitive advantage is striking.

High costs, compliance with customer demand and increased global operations, as well as increased number of supply chain partners had led to an increase in its complexity. For organizations, this turned into lower level of visibility and the loss of control over operations and also of the possibility to carry out performance measurements. The reason why business should be focused on collaboration with business partners more than on other

domestic issues, is that today, companies can not survive without integration and without cooperation at a "business to business" level. [7]

Key issues that companies have experienced when they implemented integration and collaboration were:

- Technological solutions to implement collaboration are too expensive;
- Lack of infrastructure and resources to support electronic integration;
- Staff resistance to change;
- Lack of information management at organizational level to support the supply chain;

Also, the necessary investments have prevented many companies to implement needed skills for supply chain integration and connection. Tasks that are most time consuming fall into the category of activities for process mapping, human and technological support, handling end-customer requirements or activities devoted to partnerships connection.

3. Relationships inside the supply chain

To avoid problems, organizations must develop a better understanding of their processes and a better understanding of the term of quality and delivery performance of their suppliers in order to find better ways to serve customers. To ensure this actions, communications links between customers and suppliers should be well established and used regularly. Supply chain relationships are probably the most important management interface of the whole supply chain.

Many organizations continue to see their suppliers and sometimes even their customers as opponents in which they can not have trust and must avoid possible long-term partnerships. These departments have not implemented strategic roles and are often seen as simple functions of "buying" and "delivering". There are many cases where materials management is considered an individual activity, under the influence of the silo effect and staff did not communicate at all with other suppliers or customers. These departments and in fact these companies are very concerned to keep their own market position and their own competitive advantage state, instead of developing long term

relationships with all supply chain participants. It is the typically case of short term success, long-term failure.

A key element in improving relations within the chain is the presence of a performance measurement system used to ensure that both parties operate in line with expectations and reach objectives.

I further illustrated a reference model to study the development stages of alliances.

Figure no. 1: General model for the development of alliances
(Source: Hill 2000)

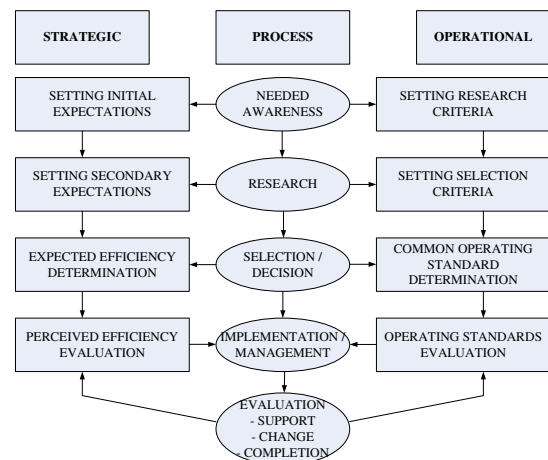

Figure 1 illustrates a model that shows how organizations establish and develop supply chain alliances. The model has several horizontal and vertical components. Vertical components are detailed below:

- The strategic component examines how expectations and strategic assessments evolve in the context of alliances and in the context of their own progress in several stages;
- The process component highlights development stages of alliances which bring into relief the essential steps required for training, implementation and maintenance of the alliance;
- The operational component sets the level of research development, selection criteria and operating standards in order to lead an alliance.

In each vertical stage, it must be considered each of the following horizontal stages:

- Level one - the conceptualization of the alliance - begins when the company determines the existence of a collaborative arrangement and it may

provide better alternatives to this arrangement. It involves planning strategies at common level to determine which would be the "ideal strategic alliance" in the "ideal state", and then designs and something more rooted in reality;

- Level two – the follow of the alliance - the decision to form an alliance is concluded and the company sets strategic operations to be performed in order to select a partner;
- Level three – the confirmation of the alliance - focuses on selecting partners and on confirmation. Managers determine expectations at strategic and operational level in terms of the arrangement during joint meetings with partners. The partnership is complete and well defined;
- Level four – the implementation/ the continuity of the alliance - creates a feedback mechanism to manage and assess performance in order to determine whether the alliance should be maintained, amended or terminated.

It is necessary to develop a relationship of trust with supply chain partners. As we have discussed, trust is not something that just "happens". Confidence is not something that can be clearly measured or determined. If we want to understand how some organizations can be confident in the other, we must understand first how people trust their partners.

Can we consider the lack of trust as one of the starting points for the difficult economic situation in which we stand?

- **Safety**

The feeling of confidence is based on previous experiences of the parts involved. If one partner forces the supplier to work within the chain, then the partnership is probably not safe. Appropriate are the situations where a supplier disappoints his client several times in a row. To contribute at extended level, it is necessary that each shareholder to respect their commitments and to behave in a predictable manner.

- **Competence**

It represents one person's concept about other's ability to fulfill commitments made. It is different from the feeling of safety. Competence-based trust can explore three key points. [5] The first area is the specific competence of a person. For example the

customer trusts the supplier to answer any question regarding its raw materials distribution strategy. The second area is represented by interpersonal tasks. This often refers to own skills like the ability to listen, to negotiate, to make a presentation. The third area involves business sense and refers to a person's common sense, experience and wisdom.

A solution to cope with negative effects exerted on the organization is to choose a partner who has registered experience in a particular technology. Make sure that your partner also designate people with skills and experienced in maintaining the relationship.

- **Trust based on „good will”**

This represents the transition from a business relationship level to a psychological relationship level. This manifests in two areas. First we talk about openness to the other. A supplier who will share information about internal structure, costs and strategies, will gain confidence more quickly. The second part relates to goodwill, which represents the confidence that the other party will do its best to meet his partner demands.

- **Vulnerability**

Vulnerability suggests that there is a risk when we choose a partner in the supply chain, a risk which goes beyond elements of incompetence. There are differences between actions prone to risk and actions prone to vulnerability. For example, if someone leaves to work without their umbrella, someone else can assume that this person has assumed the risk that it will rain. But if someone goes to work and requires a partner to bring an umbrella so he can use it, then he depends on that individual and he is vulnerable that his partner may forget the umbrella.

Perception of vulnerability must be carefully managed by supply chain members through information sharing. This assures partners that their interests will be protected.

- **Loyalty**

This feature can be revealed after a period of time in the partnership. If someone receives an order for which it has no stock of raw materials, he may require to his supplier for an overnight delivery. To do this, the supplier must allocate additional shifts. In such a situation, the supplier demonstrates loyalty to your company in a difficult situation.

To show an increased sensitivity to the needs of your partner and ask the same thing from him if necessary can be considered a basic rule for development and improvement.

Trust is a value good in a company because:

- Reduces transaction costs (research costs, contracting costs, monitoring costs, building cost)
- Leads to a higher level of knowledge sharing (discussing information, requesting assistance)
- Facilitates investment in specialized assets (building a factory in an area without trusting local suppliers and partners)

4. Trends in partnerships within the supply chain

There are several features whose importance was increased, both regarded as an effect of global economic crisis as well as organizational effort to survive and to develop in this ever changing environment. Few of the most important features are:

- Advanced informatics technologies;
- Increased level of awareness and analysis of products complexity within the organization. The accelerated pace of knowledge development suggests that supply chains must be increasingly less specialized on one company and more focused on companies that have the ability to invest in research and development.
- Increased demand specialization.

The trends illustrated above also points out that vertical integration and short-term alliances are no longer sufficient and are no longer able to sustain competitive advantage.

4.1 Types of relationships

In dyadic relationship between two companies, three types of relationships could be identified. In order to increase competitiveness and avoid work in excess, an appropriate level of interaction regarding specific marketing conditions must be selected.

Transaction is known as an exchange or transfer of goods, services or monetary resources. A relationship based on

transaction involves a value exchange process having price as the main objective.

Collaboration is often defined as the

Figure no. 2: Levels of interaction and specific associated classes
(Source: Bäckstrand Jenny, 2007)

activity to work with a person or organization with which you are not directly connected. It supposes to work or to act beside others and both parties to benefit.

Integration is often defined as a merger of two units into one. [2]

How can we use the frame illustrated to highlight types of interactions? Once the company has defined the framework and interaction levels, it must select the most appropriate level for its concerns. Each category must be separately analyzed, since many variations may arise, depending on different products, different markets and dyadic relationships that occur, you should look at each category separately. Analysis procedure consists of: selection of factors, selection of degrees or direction for certain factors depending of the policy established by the company, by its profile and analysis.

The cases where all elements suggest using the same type of relationship are very rare. Therefore, the financial decision belongs to top management.

This framework is an analysis tool that supports managers in the selection of an appropriate level of interaction for each product. Also, it identifies discrepancies that may arise between certain types of interactions and specific requirements for each factor analyzed. [3]

5. Knowledge management

Perhaps today the only chance to win competitive advantage is by learning faster than your competitors. All big companies, even Toyota and Microsoft are based on worldwide sellers to locate products and to develop market analysis in distant countries in terms of culture. Knowledge management within firms can be spread through associations of providers, consulting teams, voluntary groups, study teams formed to solve problems, transfer of employees between companies, or performance feedback and ongoing monitoring processes.

We considered essential the behavioral approach regarding different types of top managers:

- Supply chain thinker - a manager who is focused on the supply chain. Manager's attention is focused on traditional issues of management, including financial objectives, relationships with their investors, promotion and marketing topics;
- The frame setter - a manager with strategic objectives and specific frameworks for business. Manager defines frameworks for implementing the proposed strategy, for example he sets financial goals that help others to build the next level of strategy.
- Process designer - a designer oriented to organization's processes. He is the manager who sets the organization so that the physical flow of goods can be facilitated. Interdepartmental interface is build so that coordination activities and functions can be continuously improved.
- Relationship manager - a manager of supply chain relationships. He analyzes what kinds of relationships are suitable for supply chain so that they are congruent and able to support organizational position.
- Inspector - a manager oriented to IT systems ability. The manager attaches great importance to IT functions, as they facilitate the transfer of information essential for the proper functioning of the organization.

In this approach, the best fitted is the manager seen as the organizer of the future, a successful future planning manager. The

manager has an active role in the development of new capabilities needed by the organization, through meetings of top management, IT systems or by ensuring optimal organizational structure. It provides a degree of freedom of staff to facilitate learning and support investment, providing also the necessary support to implement future plans. [6]

6. Conclusions

Why a successful organization is defined as being "customer oriented"? We can give an answer if we look at who are "other stakeholders" of the organization. They allow the organization to exist to the extent that they are satisfied by it. Thus, for example, for a profit organization (company), the other stakeholders are satisfied in terms of income received as a result of the distribution of turnover.

Results due to customer satisfaction are different according to each organization. For example, for a company, the result is the turnover obtained after a certain period of time. For an association, the result is given by the associated benefits, while for the city hall, the result occurs to the extent that political actors are re-elected.

The need for collaboration and partnership is vital in this period. They are built on organizational capacity to share information, activity currently focused on information technologies. Production of goods is not the only area in which companies use supply chain software to reduce costs. Production of goods in developing countries may be cheaper, but can also bring a number of challenges and uncertainties. It is not as easy to synchronize data in real time with a factory from another country. In addition, the distance that products must pass through and many other factors, increase the likelihood of delays. Thus, production of goods in another country may induce elements of uncertainty that supply chain's software were designed to eliminate. [1]

The good news is that technologies capable of monitoring shipments wherever they are, become more efficient every day. The downside is that they are very expensive. In addition, some locations do not have the necessary infrastructure to support such systems being possible that investments in IT

automation are higher than the gain in productivity. Therefore, in some cases, the introduction of these technologies does not justify.

Activities integration, supported by the development of reliable partnership leads us to the approach that considers that best solution to overcome difficult moments is the use of any systems able to obtain maximum visibility on the extended supply chain. Sometimes the implementation of the model that equalizes production with demand is not possible, but choosing business partners who are willing to share information, the company can get many benefits and, therefore, payment and low wages.

Uncertainties arise from all types of areas. Some can be controlled, others not. The events we consider are not isolated events, but are fundamental changes in key elements that can cause a business to change. As a solution, we should create supply chains capable of adapting to these changes.

Opportunities to Develop the Extended Supply Chain under a Turbulent Environment

Hotăran Ilinca

The Bucharest Academy of Economic Studies, Faculty of Management

ilincahotaran@yahoo.com

Abstract

Following the global economic crisis, some organizations have managed to find new opportunities for development. The research aims to explore these opportunities in the extended supply chain by analyzing key features that until now were left behind to care for the cost and sales volume. A journey among the challenges that managers encounter in this period is necessary, because in order to be able to solve problems and to improve, we need first to know with what we are facing. The article proposes a development method at the conclusion level, regarding the fact that the approach of this research was conducted mainly in the internal management of the supply chain.

Key words: supply chain management, logistics, optimization, bullwhip effect.

J.E.L. classification: F15, L23, M11

1. Introduction

As John Kasarda affirms since 1999, in an interview for the Forbes magazine, the “competition between manufacturers decreases in terms of effective production and quality - comparable items - and increases fierce in terms of problems related to inventory and distribution speed on the market”. This quote reinforces the belief that supply chain management will be the main determinant of the ability of manufacturers to compete.

A comprehensive definition of the term of supply chain management says that this is what happens in a company beginning with the extraction of ores and going through many transformation and distribution processes until the product is delivered to the final customer. It ends with the last phase of

recycling for every product that has completed its life cycle.

The supply chain is under the impact of rapid changes, its inability to cope with change entailing many dangers. To emphasize the importance of supply chain management I have reviewed the situation in the IT industry. This is an industry that shows impressive growth, is in fact a very profitable business, whose sales are made in bulk from retail stores. Product development was spectacular and today only a few people notice the differences between companies. Their efforts focus on creating cheaper products. Consumers have realized that for their daily needs they do not require such advanced devices, and thus the sale of low cost products increased.

This has created for the supply chain the need to focus on “extended” product. Following the global economic crisis, activities that are part of extended supply chain, are those that bring competitive advantage. Among these we mention customer support, the ability to make different types of configurations and rapid response.

2. Supply chain logistics re-engineering

Logistics is defined by the Council of Logistics Management as “the process of planning, implementation and control of efficient and effective flow and storage of goods, services and related information from point of origin to point of consumption aimed at compliance with customer requirements “. The main elements met by the most successful logistics companies are:

- Positioning in accordance with structural approaches and strategies to guide logistics operations;

- Integration of internal discoveries related to successful logistics processes and development of long term relationships within the supply chain above its own boundaries;
- Increased business skills in terms of relevance and flexibility;
- Internal and external performance measurement. [8]

In turbulent times, we see that the integrated supply chain management increases the importance of logistics activities. It gives members the opportunity to optimize logistic performance at multi organizational level. This translates into integrated management from primary suppliers of raw materials to final customer. Logistics professionals are still challenged by materials movement inside the supply chain, in a less time consuming and more efficient method in terms of costs. The final target remains to meet customer requirements. To overcome these obstacles it requires a broad strategy for the extended supply chain. This necessity is enhanced by the fact that international supply chains bring together considerable geographical distance and time difference, several national markets, several locations for various operations and multiple opportunities due to diversity of supply and demand conditions. [5]

Changes throughout the world have led to the need for changes at higher supply chains level, in order to eliminate still existing barriers. With the implementation of change, an important element to take into account is the cultural differences between countries involved in the business process. Performance standards may vary from one region to another or within the same organization. It is therefore necessary to understand foreign partners, regional performance standards and regional infrastructure. Extended supply chain managers must be sensitive to specific local conditions and adapt their strategies accordingly.

As a result of the global crisis, companies should carefully consider a number of challenges and opportunities. Thus, I mention several facts:

1. Customers must be helped to understand the logistics system;
2. If the activity does not add value, it should be removed;

3. Barriers between supply chain members must be eliminated to improve their ability to focus on customers, to make better decisions in less time, to increase supply chain efficiency and to achieve desired degree of sustainability;
4. Third grade partnerships must be carefully managed.

This re-engineering approach is not only used to align business activities to customers in terms of timely delivery of goods, but in many cases, it refers to a significant increase in profitability. One study estimated that re-engineering of the supply chain can move the profit from 150 percent to 250 percent and reduce cycle time with 70 percent. [7]

3. Supply chain management features

When we want to analyze the features of supply chain management in an organization, and we want to do this analysis from a fresh perspective with a vision for the future, I think it is important to consider the following elements: spatial perspective, flexibility and outsourcing.

3.1. Spatial perspective

Spatial extension of production networks is a challenge for managers used to reduce implementation times by contracting suppliers from the geographical proximity of the supply chain. [3]

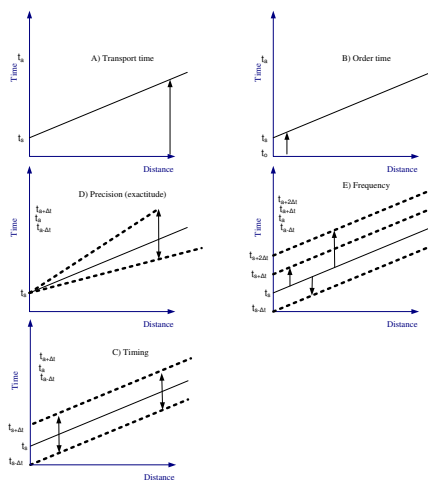

Theory of time, as a parameter in the transport system is described in terms of the following factors: order time, transport time, timing, precision and frequency. Theory related to transport time must be first treated at holistic level and then decomposed in three stages: adjacent suppliers, nearby suppliers and far positioned suppliers.

Time is often the most important element, especially for those working on the quality of transport and behavioral modeling application as a decision support for specific transport policy. I think that speed and low price never ceases to represent the simplest test of efficiency in a complex transport system. In Figure 1 are illustrated the main elements of time that require special attention.

For a detailed analysis, an explanation of given terms from the following figure, of reference is required:

1. Transport time: scheduled time for transport
2. Order time: time before the starting point of the shipment. The order must guarantee a certain capacity, price or level of service.
3. Timing: time points established for departure and arrival.
4. Precision: the ability to meet the program.
5. Frequency: The number of departures in a given period of time.

Figure no. 1: Main time features.

(Legend: t_o =order time; t_s =start time; t_a =arrival time)

Source: Woxenius, 2006

3.2. Dynamic flexibility – structural flexibility

Structural flexibility refers to the ability of the supply chain to adapt to certain changes in the business environment. We should move away from mental settings related to “control”, mental settings that seek to eliminate all variability, to a structure able to adapt at environmental turbulence and able to embrace volatility as an opportunity. Even if it sounds a paradox, the current crisis can be seen as an opportunity. It allows managers to seek for understanding regarding fundamental decisions inside the company. Rules accepted in the past, such as “advantage of low-cost countries” exceeding cost importance inside the extended supply chains, no longer works. We are not allowed to suppose that there is stability in our financial planning. We are also not allowed to build supply chain on the premise of a

single price for raw materials. [1], [2]

3.3 Outsourcing

Outsourcing in production offers two options for the supply network structure: either the product or the process is completely outsourced, or the outsourcing is combined with internal production. It is important to analyze the performance effect of combining different regarding outsourced production and internal production. [6]

4. Challenges for supply chain managers

Integrated information and materials management throughout the supply chain provides added value benefits from members of the chain, reduces waste, reduces costs and improves customer satisfaction. This strategy is still a difficult task. Implementation of an extended supply chain indicates many difficulties. “The data, information, means of information analysis, as well as information circuits and flows are influenced by the relations existing between the members of the chain”. [9] Thus, in some cases problems arise because information is not available to those who need them, or is not available to all members of the chain due to the mistrust that manifests one another. A second obstacle is the inventory management. Even if improvements are ongoing, in delivery many delays arise due to multiple causes: low speed due to product’s customs, problems related to weather, poor communication or simpler, human error. Establishing partnerships based on trust is still the most difficult problem faced. A third category addressed in the research is the material flow management, a key challenge due to the large quantities that are transported long distances between the various shareholders of the chain. Finally, we must take into account the time. The greatest challenge is the time-sensitive environment, a challenge that impels people to work within the supply chain.

What is the bullwhip effect?

Even if the need to share information is essential, it is very important to ensure that this information is accurate. In fact “distorted information from one end to another inside

the supply chain can cause tremendous inefficiencies: excessive inventory investment, poor customer services, lost revenue, poorly targeted production capacity plans, inefficient transport and failure of the delivery program”. [11]

If every company creates orders and decisions related to stocks being attentive to their own intentions, stocks may occur and can multiply across seven or eight levels. In this case companies will have stocks enough for 100 days that expect only because they “might be needed.”

How does inventory management can affect the organization?

The second trend worth mentioning is the increasing demand for higher levels of sensitivity and shorter time cycles necessary to deliver high quality goods and services. Personnel reduction forces the managers to take care of a greater number of channels with fewer people, while cost pressure forces them to do this with lower levels of stocks. Because competition is constantly increasing, errors related to supply chain management that lead to loss of orders can not be easy overlooked. Furthermore, customers as well as suppliers are becoming more experienced in measuring performance, so any mistake is very easy to detect. Everyone requires “perfect orders” that must be developed inside a fast supply chain, accurately and with a high quality associated to every product.

Despite these requirements difficult to achieve, some organizations succeed. They have adapted changes and adopted time-based technologies. Reducing lead time is seen both in stocks and in reducing the need to re-process, meaning higher quality products. These capabilities become even more important when we look at global level. To survive, organizations must increase globally their own market share to support its growth objectives and to be at the level of global economic expansion.

How does material flow management can affect the organization?

Most organizations are members of several supply chains. An organization offers a wide range of products and services buys materials from many suppliers and also sells to many customers. From the perspective of an organization, any supply chain has both internal links and external links. However it

is unlikely that all organizations to participate in initiatives to improve the chain. An organization must therefore focus their efforts on the supply chain critical to its success. By critical we mean those suppliers, customers or manufacturers who are more likely to provide competitive advantage.

In current conditions for a proper functioning of material flow in the extended supply chain, it is necessary to consider both internal and external level of an organization.

The internal supply chain is part of a chain that occurs inside a clear defined organization. A very effective technique for gaining competitive advantage can be the process of value stream mapping. In its developed it is needed to obtain an internal agreement, and further more to expand the research across borders. When an organization tries to select external members, it may experience different challenges. First it needs to consider competitive situations that arise between members of the chain. Second, all companies must have the same final target. In the third place, worth considering that a supply chain will be effective if all its members feel that they participate equally and that all parties benefit.

How does time management can affect the organization?

Cycle time is the total elapsed time required to complete a business process. It happens too often that the percentage of time that has to do with real work to be much too small, between 3 and 5%. The rest is consumed by unproductive activities. The challenge lies in removing these activities and this is one of the areas developed through supply chain management implementation.

5. Conclusions

Due to the crisis, supply chain acquired two tasks: it is faster and it has a lower intensity. Chain speed is given by the need to create supply without storage and interruption, without having activities that are without value. Low intensity is due to the obvious decline in demand. [10]

Under these conditions, an opportunity to talk about supply chain optimization is to talk about the advantage of cooperation in the extended enterprise. Through extended enterprise we understand an extended supply chain where all key players have created a

series of collaborative processes to enable them to achieve virtual integration and work together as an integrated team. Toyota and Chrysler have achieved a competitive advantage over their competitors because they have created a more efficient extended enterprise. The next period winners will be those who will know how to create profitable collaboration. They will understand the key trends and will continue to force companies to focus on a narrower set of skills and to develop ever more closely partnerships inside the chain. They will recognize exactly when and where to make improvements to optimize the supply chain, will develop a routine of sharing knowledge with partners, increasing in this way the level of all members.

There are three alternatives of supply chain relationships:

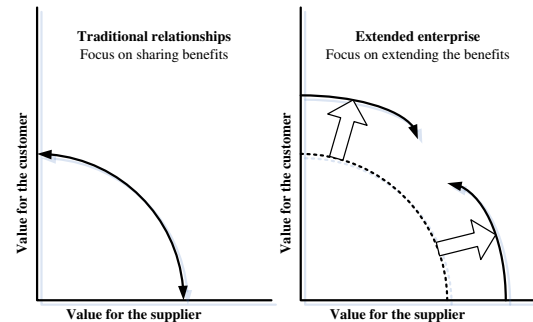

- Vertical integration or hierarchy: means that a company produces all the goods inside and can maintain control over the supply area and the customer area.
- Small length relations or markets: the company buys raw materials from a small number of suppliers, under a short term contract and makes purchases whenever the company needs input.
- Partnerships or alliances: the company buys from a small number of suppliers and builds long term cooperation relationship with them.

When trying to make these decisions, managers face a fundamental dilemma: productivity increases with the division of labor and thus with the increasing number of opportunities to purchase goods from specialized companies. However, specialization increases the communication and coordination cost. It is therefore necessary to bring activities to internal coordination in order for them to be conducted by a common hierarchical structure.

The steps in building an extended enterprise are:

1. Carefully selecting the members of the chain and approaches to be applied.
2. Creating an identity for the extended enterprise.
3. Developing close links with suppliers.
4. Developing partnerships and sharing information between other suppliers inside the chain. [4]

Abstract

The present paper aims to highlight the role of sustainable solutions for increasing the competitiveness of the reinsurance companies in the current economic and social context. The paper is structured into five parts: an introduction about present role of CSR as a factor promoting the competitiveness of the responsible companies; a brief presentation of CSR in the insurance sector; an empirical evaluation of the CSR of Munich Re and Swiss Re, the reinsurance leaders; an analysis of the products – mainly, insurance-linked securities – of reinsurance companies for increasing their sustainability involvement, followed by a presentation of the customized products of Munich Re and Swiss for complying with the most recent economic and social needs; conclusions and recommendations. The main conclusion of the study is that incorporating sustainability solutions and CSR practices into day-to-day insurance products could lead to an essential increase in competitiveness for the insurance and reinsurance companies.

Key words: Corporate Social Responsibility (CSR), Reinsurance Companies, Socially Responsible Investments (SRI), Insurance-Linked Securities (ILS), Catastrophe (CAT) Bonds

J.E.L. classification: M14, G22

1. Introduction

In the latest communication of the European Commission regarding CSR, “A Renewed EU strategy 2011-2014 for Corporate Social Responsibility” (25 October

2011), a new definition of CSR is proposed: “the responsibility of enterprises for their impacts on society” [1]. The new definition of the European Forum emphasizes one more time the increasing role of the companies in nowadays societies, especially in turbulent times, and the necessity of companies to achieve at least two prominent objectives: on one hand, to support in economic and social terms the communities they are acting in and, on the other hand, to regain the public trust in the business environment, so hardly shaken because of the current crisis.

In the same document of the European Commission, the competitive strengthening role of responsible practices is emphasized by considering that addressing corporate social responsibility is in the interest of enterprises and in the interest of society as a whole [2]. Considering that CSR brings competitive advantages for the responsible companies, no matter their size, a thorough analysis of the links between CSR and competitiveness is presented also in the European Competitiveness Report 2008 [3], demonstrating the deep interest of the European forums in analyzing the above mentioned link.

The links between corporate social responsibility and competitiveness, or the CSR-induced benefits for the responsible companies, are deeply presented in the specialized literature, but, in brief, they could be summarized in six main categories: maximizing corporate opportunities at global level; improving relations with stakeholders; increasing brand value; fostering business on the medium and long term; minimizing operational associated risks; competitive differentiation [4].

The present research paper is going to present the link between the competitiveness of the reinsurance companies and their CSR practices.

2. CSR and competitiveness in the insurance sector

As it is often emphasized in theoretical papers and practical evidence, the financial and insurance sector is subject to tougher societal scrutiny [5], especially after the boom of the economic crisis. In this sense, proving responsibility for the society and the environment could become a good strategy for the companies in the sector to gain comparative advantages in terms of image and competitive differentiation. The direct connection between the CSR and the increased competitiveness of the insurance or reinsurance companies is made through a more efficient and effective risk management [6], both in economic and social terms.

Taking into account their important role as institutional investors, the companies in the financial and insurance sector feel the pressure of international or governmental organizations to engage in CSR practices because of two main reasons: on one hand, the shareholders' expectations to obtain good return for their investments; on the other hand, the high financial power of these companies that helps them to have a special position on the market and, as such, a greater responsibility for the community as a whole.

In this sense, the socially responsible investments (SRI) are specific instruments of CSR that institutional investors could appeal at, in order to prove their concern for social, environmental and ethical criteria. In the specialized literature, there is a large debate about the reasons or the actual implication of the companies in the sector in SRI [7].

Considering the CSR integration in their business operations, the insurance and reinsurance companies made important progresses in the last years, as the practical evidence in the next section is going to emphasize. A few years ago (more exactly, in 2005), these companies were considered “the CSR sleepers” in the financial industry [8], but the current economic and social context has made them to react more quickly to the integration of responsible practices in their day-to-day operations.

In what concerns the insurance sector, a set of factors were emphasized for leading the evolutionary trend in the direction of CSR implementation through government and sectoral collaboration (co-responsibility): gradual integration of sustainability concerns within the existing products and services; climate change and natural catastrophes; economic and social alterations [9].

3. Practical evidence on the CSR of the top reinsurance companies

The two companies presented in the following lines are leaders in the reinsurance sector by their net written premiums (for 2010) and, at the same time, they are ranked at the top of the most relevant sustainability indexes, their shares being considered by the specialized rating agencies as good and solid sustainable investments.

Munich Re: CSR is an integral part of the Group strategy and permeates all business areas and processes. The global problems that the company is trying to ameliorate through its CSR practices – by way of new coverage concepts or through innovative partnerships with different social actors – are: climate change, global geopolitical and economic interactions, demographic change and social inequalities. In this sense, taking into consideration the challenges of the communities it is acting on, Munich Re has systematically pursued a risk and investment strategy to favor sustainable development. The company reports using the GRI Principles and the Financial Services Sector Supplement and it joined United Nations Global Compact; more than that, Munich Re also became the first German company to sign the United Nations Principles for Responsible Investments (PRI). In 2010, recently published updates of the Dow Jones Sustainability Indexes and FTSE4Good Index confirm Munich Re as one of the top global groups in the area of CSR. As it is stated on its official site, the company assumes social responsibility and brings economic, ecological and social requirements into harmony, while at the same time creating value for clients and investors [10].

Swiss Re: The long-standing commitment to CSR and the accountability to all its stakeholders represent the two main areas that define the responsible conduct of the

company. Swiss Re has been a pioneer in mitigating climate change and it supports local volunteering and charity programs, sponsoring of arts and culture and global humanitarian and development programs. The company puts its CSR policy into practice in seven main directions: creating sustainability solutions; extending the risk intelligence; exploring and shaping the risk landscape; reducing the environmental footprint; being a good corporate citizen; being an employer of choice; ensuring good governance. The Swiss company also reports referring to the GRI indicators and the ten principles of the United Nations Global Compact. Swiss Re is the 2010 Dow Jones Sustainability Indexes insurance sector leader. The CSR report of the company for the year 2010 reaffirms the corporate commitment to sustainable value creation as the main engagement that it takes to its shareholders [11].

4. Products of reinsurance companies for increasing sustainability and competitiveness

4.1. The Insurance-Linked Securities as Sustainable Solutions

As part of the alternative risk transfer instruments (ART), along with the insurance derivatives and the equity-like instruments, the insurance-linked securities – ILS can be defined as a new asset class, being characterized as a pooling of insurance related cash flows which are transformed into tradable securities, in general by utilization of securitization techniques, while the underlying assets and associated income streams serve as collateral [12].

One can differentiate between the life and non-life insurance risk transfer products. While through the life insurance-linked products mortality or longevity risks are securitized and transferred, through the non-life segment the catastrophe or frequency risks stand for the underlying risks (with low probabilities of the events, but high losses in case of the event is triggered) [13].

Therefore, among the main types of insurance-linked securities one can distinct among the catastrophe (CAT) bonds, life bonds and other structures.

CAT bonds, whose main function is the risk transfer, are bonds whose coupons and principal payments rely on the performance of a pool or index of natural catastrophe risks, or on the presence of specified trigger conditions. They protect sponsor companies from financial losses caused by great natural catastrophes and offer an alternative to traditional reinsurance. Basically, the transaction involves four parties: the sponsor or ceding company (government agencies, insurers, and reinsurers), the special purpose vehicle – SPV (or issuer), the collateral and the investors (institutional investors, insurers, reinsurers, and hedge funds) [14].

Within practice, one can identify several triggering mechanisms for the CAT bonds:

- *The indemnity trigger*, when the cat bond is triggered by the actual losses of the sponsor company;
- *The industry index trigger*, when the transaction is based on an index of industry-wide losses;
- *The pure parametric trigger*, that are grounded on the measurable features of the underlying catastrophe;
- *The parametric index*, that employs more refined techniques and mathematical methods with respect to the pure parametric trigger;
- *The modelled loss trigger*, that is determined through a model that includes several physical measures of natural events and estimates losses of the sponsor's portfolio [15].

As far as the life bonds transactions are concerned, their main function is the financing function. Extreme risks of increasing mortality rates can be transferred to capital markets having as trigger a local mortality rate index, along with longevity risks. Longevity bonds often provide variable yields which depend on a predefined survival rate of a certain population. This type transaction is generally designed as a coupon-at-risk bond, also called principal-protected bond [16].

Among the other structures of insurance-linked securities one can mention the risk of cancellation of the 2006 FIFA World Cup in Germany that was transferred as a terrorism risk bond to capital markets, or the securitization of motor insurance risks in 2005 and 2007 by AXA [17].

As far as the market of these instruments is concerned, accordingly to Peter Zaffino, CEO of Guy Carpenter, ILS (catastrophe bonds, in particular) have become increasingly important to carriers seeking to remove persistent perils from their portfolios, diversify sources of capital, or pursue carefully shaped risk management plans. The acceptance of these vehicles is evidenced by the growth of the catastrophe bond market from 1997 to 2007 [18].

Regarding the economic crisis, the before mentioned specialist stated that the catastrophe bond market has resisted the broad financial market turmoil and though there were some moments of anxiety, in retrospect, these vehicles have demonstrated their usefulness, even in a difficult financial climate [19].

4.2. Relevant Examples of Insurance-Linked Securities at Swiss Re

- *Catastrophe bonds for European Perils:*

Acting as sole structuring agent and joint-book-runner for a transaction whose sponsor was AXA Global P&C, a subsidiary of the French insurance group AXA, Swiss Re Capital Markets has successfully structured and placed EUR 180 million of notes issued by Calypso Capital Ltd – “Calypso” covering European windstorm events [20].

The notes issued by Calypso Capital in the 2011-1 series are exposed to windstorms in Belgium, Denmark, France (excluding French overseas territories), Germany, Ireland, Luxemburg, the Netherlands, Norway, Sweden, Switzerland, and the UK. Therefore, this transaction will provide AXA with broader cover than the last year Calypso Capital 2010-1 series catastrophe notes, taking into account that the ones in 2010 did not include windstorm risks in Norway and Sweden. Collateralization will be achieved through the use of a collateral account and purchase and investment of European Bank for Reconstruction and Development (EBRD) floating-rate notes with the proceeds from the sale of the Class A notes that Calypso Capital will issue. Standard & Poor’s have given the single tranche of Series 2011-1 Class A notes to be issued by Calypso Capital Ltd. a rating of ‘BB-’ [21].

- *Life bonds at Swiss Re:*

Part of its Vita Capital program aimed at transferring extreme mortality risk (including pandemics, epidemics, disasters, terrorist attacks etc.) to the capital markets through securitization, the 2011 Vita Capital IV transaction was structured into two series of notes. While the first one provides cover against catastrophic mortality in Canada and Germany, the second one provides cover against catastrophic mortality events in Canada, Germany, the UK, and the USA (including the District of Columbia, but excluding Puerto Rico and overseas territories). The investors will be at risk of an increase in age and gender-weighted mortality rates that exceeds a specified percentage of a predefined index (the mortality index value – MIV) in the covered areas, from the 1st of January 2011 to the 31st of December 2015 [22].

4.3. Relevant Examples of Insurance-Linked Securities at Munich Re

- *Catastrophe bonds for European and US Perils:*

Part of a catastrophe shelf program, the 2011 Queen Street IV deal provides protection on a per-occurrence basis over the risk period of nearly 3.5 years to Munich Reinsurance Co. The Queen Street IV Capital notes cover U.S. hurricane risks within the District of Columbia and several other US states, while the European windstorm is covered in Belgium, Denmark, France, Germany, Ireland, Luxembourg, the Netherlands, and the UK. Losses will be triggered on an industry loss basis using indices provided by Property Claims Services (PCS) for US hurricane risk, and PERILS AG for European windstorm risk. The index value for US hurricanes will be based on industry losses reported by PCS and predetermined payout factors by state. The index value for European windstorms will be based on industry losses reported by PERILS AG and predetermined payout factors by country, including constant exchange rates for both Denmark and the UK [23].

- *Life bonds at Munich Re:*

In 2008, in order to transfer extreme mortality risk to the capital markets, Munich Re has established its first mortality bond program amounting to US\$ 1.5bn. The first five-year series of US\$ 100m were principal-at-risk variable rate notes. The bonds were issued by Nathan Ltd. – “Nathan”, Cayman Islands-based special purpose company, and have been priced at LIBOR plus a 135 basis points spread. The program was designed to protect Munich Re against large losses deriving from an exceptional rise in mortality rates after major pandemics or similar events in the following countries: USA, Canada, England and Wales and Germany [24]. The transaction was placed with investors across the Americas, Europe and the Asia-Pacific region. Munich Re said it structured the program so that Nathan can issue future series of notes at short notice if there is increased capacity demand from Munich Re’s reinsurance clients [25].

5. Recommendations and conclusions

The examples provided in the above lines emphasize the increasing role of sustainable solutions in all areas of business and economics, but especially in the insurance sector, taking into account the occurrence of catastrophes lately and the changes in the economic and social climate that affected most of the countries.

The focus was put on two of the most important reinsurance companies of the world – Munich Re and Swiss Re – for identifying and explaining the basic mechanisms of a complex range of insurance-linked securities that incorporate sustainability and CSR challenges. The products presented reflect the societal changes – in social terms, and the new societal needs – in economic terms.

The increasing use of these products by Munich Re and Swiss Re is one of the triggering factors of their competitiveness on the market. This should be a good example to be followed by other companies in the insurance or reinsurance sector, aiming at increasing their competitive advantages and adapting more easily to the sustainability and CSR prerequisites of the market in the current economic and social context.

Keep It Formative, Stupid! Brand-Related Model

Ichim Cosmin

Dumea Andrei-Cosmin

“Alexandru Ioan Cuza” University of Iasi, Doctoral School of Economics

ichim_cosmin@yahoo.com

dumea.andrei@gmail.com

Abstract

This article deals with measurement scales in marketing research, focusing on the existing types of scales (formative versus reflective) and on the assessment modalities of the reliability and validity level of both scale types. As concerns formative and reflective scales, the decision in choosing the right model depends not only on theory and empirical studies, but also on the researcher’s imagination and inspiration.

Key words: formative and reflective scales, validity and reliability, brand strategies, crisis

J.E.L. classification: M31, M37

1. Introduction

The measurement scales in marketing research are a subject of interest for specialists in the field. Current orientations attempt to warn us not to fall in the trap of the misspecification of the measurement model [1] [9] [11], by succinctly presenting the theoretical and historical differences between the models – approach embraced by most researchers in the field – and by referring to other works in this area of interest, which presented case studies on models of scales, be they formative or reflective [1].

Given the fact that social sciences are the source for studying latent variables, most researchers in this subject field assume that indicators are effect indicators. Cause indicators are often neglected, despite their appropriateness [9]. Diamantopoulos (1999), as well as other specialists in marketing research, does not recommend us to become fond of a particular model, but rather to consider both measurement approaches in order to reach an informed choice as to the

most appropriate measurement model for their needs [7]. The correct definition of the concept and the wording, along the same lines, of the questionnaire, are the summarizing solutions proposed by Baxter (2009) so as not to fall in the trap of one of the two accepted models [1]. In line with the above, the article written by Coltman et al. (2008) supports the idea of making a decision by referring to theory and to empirical corroboration [5]. Current marketing research, based on questionnaires, tends to resort to formative scales although there are a number of controversial and not fully resolved issues concerning the conceptualization, estimation and validation of formative measures, among which the treatment of indicator multicollinearity, the assessment of indicator validity and the interpretation of formatively-measured constructs.

This article shortly presents the theories of the measurement models belonging to Structure Equation Modeling (SEM), namely the reflective and formative models, as well as some assessment modalities concerning their degree of reliability and validity.

2. What one should know about reflective and formative scales

Two types of measurement models, more specifically the reflective and the formative one, can apply for the assessment of the latent construct. These two models differ with regard to the nature of the construct, the causality direction between the indicators and the latent construct, as well as with regard to the characteristics of the indicators used for the measurement of the construct [5].

The reflective model is the product of research in the field of social sciences and relies on the traditional testing theory of Lord and Novick (1968) and primarily on the

domain-sampling model (e.g. Nunnally and Bernstein, 1994) [7]. The reflective model is the most widely used approach in marketing research, although some researchers consider that this may not be the most appropriate choice (e.g. Baxter, 2009). In the reflective model, the latent variable (η) is positioned as the main cause of the behavior of items or indicators. As one may notice in figure number 1, the causal action manifests its latent variable influence on the indicators. Change in the construct implies change in the indicators. *Change in the latent variable results in variation in the indicators* [2]. Thus, all indicators share a common theme and are interchangeable. This interchangeability enables researchers to measure the construct by sampling a few relevant indicators underlying the domain of the construct. Inclusion or exclusion of one or more indicators from the domain does not materially alter the content validity of the construct [5]. Thus, reflective measurement is consistent with the confirmatory factor analysis (CFA) model for the variance in each indicator is shown as a (linear) function of the underlying latent variable plus error [7].

Unlike in the reflective model, in the *formative model* the causal direction starts from the indicators (independent variables) and moves towards the latent variable. High correlations between formative indicators might occur, but they are not generally expected. Researchers must be aware that factor analysis and Cronbachs Alpha are inappropriate methods of evaluating a formative measure [14]. The latent variable is the dependent variable and the indicators are the explanatory variables. Diamantopoulos (2008) points out several characteristics of this model, which make it distinguishable from the reflective model [9]. For example, the indicators characterize a set of distinct causes which are not interchangeable, as each indicator captures a specific aspect of the construct's domain (see also [11] and [14]); indeed, the omission of an indicator potentially alters the nature of the construct [2].

In addition, there are no specific expectations about patterns of intercorrelations between the indicators; formative indicators might correlate positively or negatively or they might lack

any correlation. Some researchers point out that formative indicators have no individual measurement error terms, that is, they are assumed to be error-free in a conventional sense. The error term (ζ) is specified at the construct level and does not constitute a measurement error. The formative model is also characterized by the fact that, in insolation, it is underidentified and, therefore, it cannot be estimated.

Figure 1. Reflective and formative models

REFLECTIVE MODEL

FORMATIVE MODEL

η : latent variable; λ : loading; x : reflective indicator; ϵ : measurement error on level of indicators; r : correlation between indicators	η : latent variable; γ : weight; y : formative indicator; ζ : measurement error on level of the latent variable; r : correlation between indicators
---	---

The new interpretations given of reflective and formative scales shown that each researcher can choose a particular measurement model, depending on his own field of interest and on the methods or instruments that are to be employed (the use of the questionnaire cannot be compared with the use of experiment or observation, for these latter methods involve the use of reflective scales).

3. Rethinking brand strategy – a formative model

Whoever thinks that it is easy to configure this kind of model could not be more mistaken. It involves consulting specialized literature in the attempt of finding the best solution for one's research with regard to brand strategies. The formative model involves certain criteria that must be fulfilled in order to create the reliability and validity of the built model. Starting from the study of specialized literature and of the cases studies

presented by various specialists in the field, one can choose and build one’s own model, by relying on the applicative studies of [6], [4], [3]. For these purposes, one can use, just like Bruhn et al. (2008) the generic guide for formative constructions, formulated by Diamantopoulos and Winklhofer (2001), which comprises four stages: specifying the content, specifying the indicators assessing the collinearity of the indicators and last but not least, the assessing of external validity.

4. Specifying the content

The changes that have occurred at the level of consumer behavior during this period of economic crisis have determined managers to rethink their brand strategies. Research starts from the following hypothesis: *If the periods of economic recession create new consumption habits, then we can speak about the necessity of some brand strategies for the New Consumer.* Research will be conducted at the level of companies and is aimed at making the organizations aware of the fact that they must adjust their brand strategies to the New Consumer. The concepts used in this research are strategy, brand, brand strategy and brand value.

Nowadays, strategy is seen as *a plan or method for achieving something, especially over a long period of time, as the skill of planning how to achieve something, especially in war or business* (MacMillan Dictionary), or as *an integrated and coordinated set of commitments and actions designed to exploit core competencies and gain a competitive advantage* [10]. These strategies are applied by using the resources of the company.

The American Marketing Association defines the brand as a name, term, design, symbol, or any other feature that identifies one seller’s good or service as distinct from those of other sellers [12].

By combining the two concepts, companies can conceive brand strategies. The rethinking of the used strategies is imperatively necessary in order to adjust to the current context. Managers or marketers can generally choose between the following types of strategies: *line extension* (an already existing brand which is extended, within the same category, to new dimensions, colors, shapes or flavors of the product), *brand*

extension (the name of the brand extended to new product categories), *multibrands* (new verbal identities introduced in the same product category), *a new brand* (a new brand introduced for a new product category) or *cobrands* (the combination of the names of two or more brands) [12].

The primary role of the brand, in order to create value, is to generate trust, affection and loyalty. As cattle owners used to brand their cattle in order to know which ones were belonged to them, the companies will try, through the brand, to transfer to the consumer’s mind, apart from the visual identity of the brand, values, attitudes and behaviors.

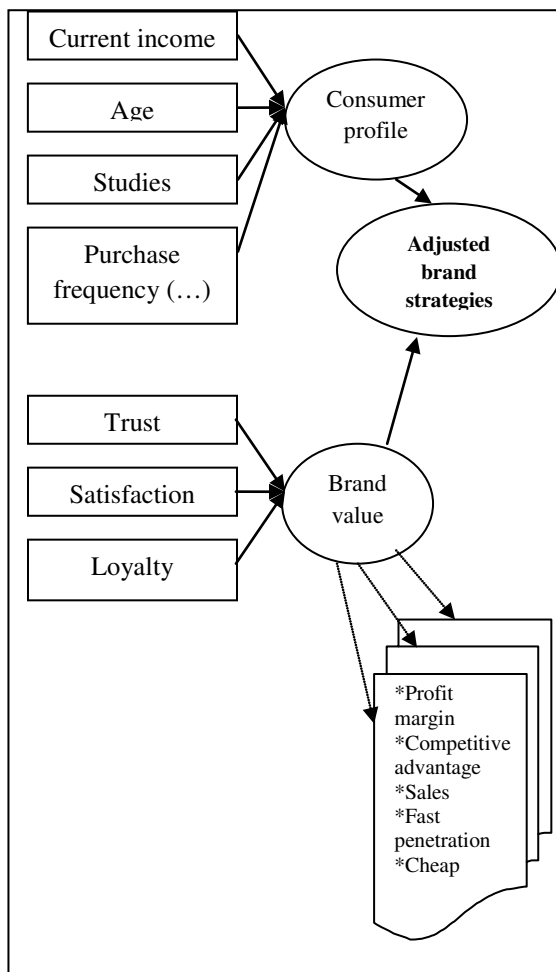

5. Specifying the indicators

As one may notice in figure number 3, the model is a formative structural one [9] made up of three latent variables, namely: target consumer profile, brand value and adjusted brand strategies. Each of the three latent variables is the effect of the presented causality indicators. Trust, affection and loyalty are measured with the help of the scale developed by Chaudhuri and Holbrook [13]. Trust was measured with the help of statements such as: *I trust this brand, I rely on this brand*, and affection through statements such as *This brand makes me happy* or *This brand gives me pleasure*. Two aspects of loyalty were taken into consideration: purchased loyalty (*I will buy this brand the next time I will purchase this type of product, I intend to continue to buy this product*) and attitude-loyalty (*I am addicted to this product; I am willing to pay more for this product*). Numerous studies analyze the relation between customer satisfaction and loyalty, starting from the premise that satisfaction plays a key role in explaining brand loyalty. Brand reputation, the influence of the group to which it belongs and recommendations are some other elements that contribute to obtaining loyalty. By winning the consumers’ trust, affection and loyalty, companies can obtain significant advantages, such as: competitive advantage, increased profit margins, increased sales, fast market penetration, inexpensive extension of the product range.

6. Assessing the collinearity of the indicators

According to [6], the formative model will rely on four main hypotheses: -the causal direction is from the items towards the construct; -some indicators are independent; -covariance between indicators is possible, but not also necessary (change in an indicator does not involve change in another indicator) and, -indicators may have different antecedents and consequences [3].

Figure 2. Rethinking the brand strategy – a model (Brand Strategy Model - BSM)

In terms of dimensionality, if one takes into consideration the reflective model as well, BSM represents a multidimensional construct with two dimensions, each of them including various facets of BSM that might indicate separate constructs but that also represent integral parts of BSM at a more abstract level.

7. Conclusions

Baxter’s (2009) conclusion, according to which construct conceptualization determines the formative or reflective nature of the model [1], is also shared by [8]. Choosing the right model depends not only on theory and empirical studies, but also on the researcher’s imagination and inspiration. Due to the importance given, in the current context, to the brand, one of the main problems that managers must solve refers to the structuring and management of the entire brand portfolio. The presented model is synonymous with the creation of value through brand, value communication to customers and strategy.

Abstract

The strategies for economic growth on a medium and long term meet the future economic crises to the extent in which they are built on an economic reality that is more than evident in the current period. Despite the problems facing the European Union, Europe 2020 is meant to cause a large change in the economy due to its targets. The analysis of the figures recorded in the previous period as well as the economic perspectives may show whether the targets established for our country are realistic.

Key words: the strategy, employment, innovation, environment, education

J.E.L. classification: E 24, F 00

1. Introduction

The economic evolutions in the last period of time have led to the elaboration of different strategies at the level of the states and at the level of the European Union.

These strategies did not represent objectives set as a result of the current crisis, and they existed before it, but we should underline the overview of the new strategy.

For the next 10 years the EU has adopted Europe 2020, a strategy that emphasizes the importance of changes at present and in the future, a strategy of economic growth (a poor aspect for most states). This strategy is intended to make the transition to a smart, sustainable social inclusion and to support it. These three directions of action are interdependent determining the employment

level, the growth of productivity and the increase of social cohesion.

Europe 2020 has five major objectives:

- employment
- innovation
- environment / energy
- education
- social inclusion

In this strategy they have established different specific major indicators and levels for each objective to be achieved in 2020, but the member states have adopted their own national objectives in these five areas.

2. Content

This paper will highlight the comparative levels established for the five major objectives in Romania and in the European Union and will argue if our country can meet these objectives by 2020 starting from the current situation that we face, but anticipating the potential adverse effects determined by the current situation in Europe.

Employment

The first major objective of Europe 2020 aims at achieving 75% employment rate of people aged between 20 and 64. Romania aims to reach an employment rate of 70% in the same period.

The current situation in the European Union and in Romania is shown in Table 1.

The EU average should grow by 6.4% and our country average by 6.7% so that in 2020 the objective could be achieved. If we look at the figures in the last 10 years in Romania we can see that this indicator decreased by 5.8%.

During 2000-2008, in our country, the real GDP rate was positive and it showed high values compared to the period 1990-1999, but it failed to increase the employment rate. What our country intends to achieve in 2020 is a difficult level to achieve, especially that the difficult economic crisis has not peaked yet. The recent years have been defined by an increase of the businesses that went bankrupt and a reduction of foreign investments (from 9,496 million euros in 2008 to 2,696 million euros in 2010). These assumptions can not support a future growth of the employment rate.

Table no. 1 Employment rate of persons aged 20-64 in 2010

	Total	Men	Women
EU (27)	68.6	75.1	62.1
Romania	63.3	70.8	55.9

Source: <http://epp.eurostat.ec.europa.eu>

The structure by gender shows that men's employment rate reached the established level since 2010, but the employment rate of women is poor, particularly in Romania. The first necessary step is to increase employment of females.

Innovation

In the current economy it is necessary to emphasize the importance of innovation, so that the Strategy established that 3% of the GDP must be spent on research and development. Romania has set for this major objective 2% of the GDP.

The data known for the gross domestic expenditures on research and development are quite old (since 2000) and demonstrate that in the respective year the European Union used 1.86% of the GDP for research and development, while in our country the percentage was 0.37. The National Institute of Statistics provided recent data on the costs of research and development and the figures are 0.47% of the GDP in 2010 (about 2.413 billion lei) and 0.48% of the GDP in 2009. Starting from these figures, we cannot say that we will succeed in using 2% of the GDP for research and development even in 10 years' time.

The winner will be that state that understands that to be competitive on the market it needs to preserve the gray matter and to increase investments in this area.

Environment/energy

There are three objectives that must be achieved in the field of environment and energy:

- 20% reduction in the emissions of greenhouse gases compared to 1990 (1)
- increase of the share of renewable in gross final energy consumption by 20% (2)
- 20% increase in energy efficiency - indicator: the energy intensity of the economy (3)

Romania has set the achievable targets: 20% reduction in greenhouse emissions compared to 1990, increasing the share of renewable in final energy consumption by 24% (indicator which exceeded the EU target) final primary energy saving of about 10 Mtep.[3]

Table no. 2 Indicators specific to environment and energy

	1 (2009) 1990=100	2 (2008) %	3 (2009) Mtep
EU (27)	83	10.3	165..2
Romania	52	24	576.9

Source: <http://epp.eurostat.ec.europa.eu>

The analysis of the energy potential of renewable energy sources shows that, to achieve the target set for 2020, Romania will have to build 63.5% of the total of the available renewable energy sources.

Education

Education in the European Union wants the rate of young people leaving early education and training to be lower than 10% and at least 40% of people aged between 30 and 34 to have completed their higher education or equivalent.

In the European Union the rate of young people who have left education prematurely has been decreasing in the last 10 years, from 17.6% in 2000 to 14.1% in 2010.

Romania has set the benchmark for this indicator the value of 11.3%. From 2002 until 2008 the rate of young people who left

early education was in decline, from 23% to 15.9%. the increase of this percentage has occurred amid rising unemployment and reducing the evolution of the GDP, so that in 2009 the rate recorded the value of 16.6%, and in 2010 it was 18.4%.

Table no. 3 Rate of young people who dropped early education in 2010 (%)

	Total	Men	Women
EU (27)	14.1	16	12.2
Romania	18.4	18.6	18.2

Source: <http://epp.eurostat.ec.europa.eu>

The figures in Table 3 show that the tendency of early abandonment of education is higher for males, which may slightly explain a reduced increase in the rate of employment of males aged between 15 and 64 in the last two years in Romania. The premature abandonment of education is closely linked to reduced material possibilities available to families of those who fall into this category.

Table no. 4 Proportion of population aged 30-34 years with tertiary education level in 2010 (%)

	Total	Men	Women
EU (27)	33.6	30	37.2
Romania	18.1	16.7	19.6

Source: <http://epp.eurostat.ec.europa.eu>

With regard to this indicator, our country has established a much lower level than that the one proposed by Europe 2020, but in the current conditions it seems to be quite realistic i.e. 26.7%. It should be noted that the share of females who have higher education in the group age 30-34 years is higher than the share of males.

The increase of the percentage of people who have completed their higher education is conditioned by the high school preparation, while the results obtained in the last years at the baccalaureate exam are not a real base to support this indicator. The graduation level of the baccalaureate exam in recent years is in a continuous decrease: 81.47% in 2009, 69.3% in 2010 and 44.47% in 2011 to resolve disputes.

Social inclusion

In this area, it is required to reduce poverty, because at least 20 million people are at risk of poverty and exclusion. There are four indicators that identify the problems of social inclusion:

- people at risk of poverty or social exclusion (1)
- people living in households with low labor intensity (2)
- people at risk of poverty after social transfers (3)
- people with severe material deprivation (4)

Table no. 5 Indicators specific to the social inclusion in 2009 (%)

	1	2	3	4
EU (27)	23.1	9	16.3	8.1
Romania	43.1	7.7	22.4	32.2

Source: <http://epp.eurostat.ec.europa.eu>

Romania tries to reduce the number of people at risk of poverty or social exclusion with 580,000 persons compared to 2008, representing a 15% reduction in the number of persons in poverty.

The reduction of these indicators in our country is for now only a pure statistical presentation as the last measures taken have affected those groups of people with a low income.

3. Conclusions

The employment rate of the population in the age group 20-64 years is an indicator that is not far from the target set for 2020, but the previous figures and the current evolution of the economy do not support the achievement of this indicator within the range set.

Investments in research and development were in all years after 1989 a domain that was not funded too much and the attempts to increase the amounts utilized will not be able to reach 2% of the GDP.

The rate of the youth who have dropped out early education in Romania has been increasing in the last two years, and the values recorded before 2008 were neither close to the target of our country, so a value of 11.3% is difficult to achieve.

The proportion of population aged 30-34 years with tertiary education level is one of the indicators that are likely to reach the target, because in recent years we face an increase of the percentage of those that can be found in this category, but it must be supported by increasing the graduation degree of the baccalaureate exam.

People at risk of poverty and social exclusion calculated as a percentage of the population is an indicator of decline, but with extremely low values in the last three years (45.9% in 2007, 44.2% in 2008 and 43.1 % in 2009).

The percentage of the people living in households with low labor intensity is decreasing in Romania, as well as in the European Union, but it should be noted that the value recorded in our country is lower than the European one.

The percentage of the persons at risk of poverty after social transfers in Romania has been 24.8% in 2007 to 23.4% in 2008 and 22.4% in 2009.

The percentage of the persons with severe material shortages in Romania was 36.5% in 2007 to 32.9% in 2008 and 32.2% in 2009.

Of all the indicators specific to Europe 2020, with regard to the share of renewable sources in the final energy consumption in Romania, it has been established a level higher than the EU average. The probability to record the 2020 levels set by our country is low, even though the National Reform Program (2011-2013) shows the necessary steps to achieve them. Yet we must distinguish between the beautiful presentation of figures in various documents and the existing economic reality both in Romania and worldwide.

The economic crisis has shown its effects in Romania later than in other states, but these still leave expected decrease, and the world situation is not reassuring to anyone. It is certain that our country has not been and will not be directly influenced by these disturbances, but indirectly and unfortunately we feel the decrease of some important macroeconomic indicators.

Abstract

The financial crisis represented the moment when the economists triggered the statements which predicted the change of the current type of economy. The crisis showed the failure of the current economy and it created the premises either for the fundamental change of the current model or for the emergence of another model. An analysis of the main macroeconomic indicators in the world's powerful states, but also in the states that acutely experienced the effects of the crisis will reveal the big picture of the current economic model.

Key words: the economic crisis, inflation, unemployment, the economic model

J.E.L. classification: E 00, E 24, E 31

1. Introduction

Currently, the up-to-the-minute term used in economy is its re-spiritualization. It is crystal-clear that today we have to talk about a different type of economy and that changing the production, distribution and consumption method is required. These issues, theoretically presented, seem innovative, a new stage towards the future type of economy, which is impetuously required by the mutations in the real economy.

The present-day economists, many supported by different marketing strategies, already proclaim the downturn of the current type of economy, but strangely none of them

presents a model that the current economy could implement, a model to replace the current type of economy.

The return to the past and the search of ideas by analyzing what is known is an example given by these economists out of a desire to present this new type of economy.

Capitalism is a system which has undergone a series of crises, harsher or less harsh, but which has always managed to recover. Capitalism recovered after the crisis in the '30s, considered the hardest crisis up to the current one, but will capitalism be able to save itself now?

George Soros stated “we are able to know some aspects of reality, but the more we understand, the more it remains to be understood.”

2. Content

The economist Mohamed El-Erian called the current period the “new normality,” so that people should become aware of the changes occurred in economy and learn to evolve in these conditions. The high economic growth that characterized the pre-crisis period will no longer be recorded in the following period; on the contrary, an economic growth of 3% represents the guarantee of a developed economy. The new normality involves causing crises in various fields, such as the sovereign debts crisis, a crisis currently affecting the world's largest economies.

The new normality of the world's economy is highlighted by some macroeconomic indicators specific to the world's powerful

states, but also to the states facing difficulties.

Figure 1. The real GDP in the major world economies

Source: <http://epp.eurostat.ec.europa.eu>

The economic reality tends to confirm this economist’s statements if we analyze the values recorded by the real rate of growth of the GDP in the world’s major economies, but also in the states which are currently facing the real problems caused either by the economic-financial crisis or by the sovereign debt crisis.

Figure 2. The real GDP in EU states

Source: <http://epp.eurostat.ec.europa.eu>

Before the economic-financial crisis between the states presented in the first two Figures, Romania recorded the highest growth rate in the GDP of 6.3%, followed by

Spain with 3.5% and by Germany with 3.3%. These values were recorded in the year predicting the crisis, the end of 2007 triggering the real crisis in the USA. In 2008 the crisis was felt globally leading to a reduction in the rate of growth of the GDP, in many countries even reaching negative rates. Our country was not yet affected in 2008, registering a record rate of 7.3% for that period.

In 2009 the decrease of the GDP rate continued with values higher to the previous year and Romania recorded a rate of -6.6%, one of the highest rates of all the states analyzed (only Ireland exceeded this value with -7%). The enormous difference characteristic to the Romanian economy shows that in the period previous the economic growth was not of a sustainable type, it was not a sustainable growth.

The year 2010 represented for most economies a period of recovery, of recording positive values for the GDP rate. Our country was not among these states, but the percentage is closer to zero than in 2009, while Greece faces a sharper fall in the GDP.

The forecasts for 2011 are positive for the states analyzed, except for Greece which is flush with the year 2010. Clearly the situation in this country is difficult and the economic results confirm this.

Even if the USA was the state that triggered the crisis, it did not significantly influence the real rate of the GDP which recorded negative values in 2008 (-0.3%) and in 2009 (-3.5%). In 2010 it reached 3% which according to the economist Mohamed El-Erian shows that the economy is performing and the forecasts for the current year present the value of 2.6%.

Japan recorded in 2009 a decrease by 6.3% compared to the previous year, but it managed to reach a value of 4% in 2010. However, the Japanese economy has not recovered completely, recording fluctuations in this indicator since for 2011 a value of 0.5% is estimated.

The values recorded by the GDP are clearly determined by a number of macroeconomic indicators, but we consider that the employment rate is the most important, as it achieves the gross value added during a year. The employment rate percentages vary in the analyzed countries, the trend being one of reduction.

Figure 3. Employment rate in the major world economies

Source: <http://epp.eurostat.ec.europa.eu>

Figure 4. Employment rate in the EU states

Source: <http://epp.eurostat.ec.europa.eu>

The EU the employment rate showed a decrease in the last two years, but this is not significant. The employment rate at EU level was of 64.1% in 2010, but the Europe 2020 Strategy established the achievement of the 75% target.

Germany is the only state of those analyzed which in the four years obtained growth of the employment rate, even though in 2009 the real GDP growth rate decreased by 5.1%. Germany, the USA and Japan have obtained values of the employment rate of around 70%.

In the U.S. this indicator has decreased progressively since 2007, the biggest difference was recorded between 2008 and 2009, when the employment rate reached 67.6% from 70.9%.

Japan retains a high employment rate, over 70%, even if it recorded a 0.7% decrease between 2008 and 2009.

Greece has obtained values of the employment rate of around 61%, the differences between the years being insignificant, but recording a decrease. Spain has experienced a sharper decrease of the indicator since from 64.3% in 2008 it reached 59.8% in 2009, and in 2010 it reached 58.6%.

Romania maintains the employment rate around 58%, with reduced changes in the four years analyzed.

Italy is the country with the lowest employment rates of the countries listed, falling within the general trend of reducing the indicator, obtaining a value of 56.9% in 2010.

The share of the public debt in the GDP reveals the states' degree of indebtedness. The sovereign debt crisis is looming for several states that record significant values of this indicator. Among the analyzed states, Japan faces the highest percentage (197.5%), but the Japanese economy provides enough reliable proof, so that no one has talked about the impossibility to pay. Greece has reached a share of the public debt in the GDP of 142.8%. Among the other European states, Ireland and Italy record values close to 100%. Romania has a debt level of 30.8% of GDP, representing the country with the lowest percentage.

Table 1. Public debt in 2010 (% of GDP)

Ireland	96.7
Italy	119.1
Japan	197.5
Germany	83.2
Greece	142.8
Portugal	93
Romania	30.8
Spain	60.1
USA	62.3

Source: <https://www.cia.gov/library/publications/the-world-factbook>

The unemployment rate has different values in these states, the most affected state being Spain with a value of 20.1%. Ireland records the next level of the unemployment rate with 13.6%, and Greece occupies the

next position with 12.5%. Romania reached in 2010 an unemployment rate of 6.9%.

Table 2. Unemployment rate in 2010
(%)

Ireland	13.6
Italy	8.4
Japan	5
Germany	7.1
Greece	12.5
Portugal	10.8
Romania	6.9
Spain	20.1
USA	9.6

Source:

<https://www.cia.gov/library/publications/the-world-factbook>

The measures adopted by these states to overcome the crisis, as a rule, have not increased the annual inflation rate, so that Germany, U.S. and Japan are characterized by deflation. Greece has recorded a fluctuating inflation rate by reductions or increases of 3% from one year to another. Romania has recorded higher values of the inflation rate as compared to the other states analyzed because in 2008 the inflation rate was 7.9%, 5.6% in 2009, and in 2010 it reached 6.1%.

The states analyzed were those which have undergone the effects of the economic-financial crisis, being either powerful states or states with real problems today. This paper has not presented data on the second economy in the world and the state that appears to not have been touched by the crisis because the arguments concerned the capitalist system. The indicators specific to the Chinese economy are surprising for this period, in the sense that the real GDP growth rate was 10.3% in 2010 and the public debt reached 18.9%.

All these indicators show how unpredictable the effects of the economic-financial crisis have been for different states. Clearly, the indicators presented are not the only ones showing how strong or weak an economy is, but they also provide an overview of what is happening in each economy.

3. Conclusions

The situation described above involves only a few indicators, but it is enough to show the state of the economy both in the world's developed countries and in the European countries facing the crisis.

Could this current normality lead to a new type of economy? Among the prophets announcing the end of capitalism or at least of its current form, George Soros is the most obvious in his statements to the public. He believes that this financial crisis shows that the markets fail to fulfil their role in economy, requiring government intervention. The failure of the markets is much too obvious to be hidden, and Soros believes that he can reorganize the whole economic system. This reorganization though out by Soros no longer includes the U.S. as central state around which the entire economy revolves.

Soros strongly attacked Greece and the euro area being convinced that this country can no longer be saved from bankruptcy, which will trigger a snowball effect for the other countries in the euro area which have significant debts. But still, half of Greece's debt was cleared in order that this country's possible bankruptcy does not deteriorate more than it has already done the euro area and that it does not attract a vicious circle Spain, Portugal, Ireland or even Italy.

Could it be that this debt reduction for Greece does nothing else but confirm that the new type of economy must be changed? Time alone will demonstrate the occurrence of another type of economy.

States’ role in Stimulating the Investment Process. Romania’s Case

Ionescu Alexandra

„Ovidius” University of Constanta, Faculty of Economic Sciences

al3xandra_ionescu@yahoo.com

Abstract

The economic environment, constantly evolving and developing, requires companies a great flexibility. One of the biggest challenges of a firm is to adapt its activity to the changing requirements of the business environment. Given the fact that technological progress is accelerated, Replacing obsolete equipment, launching new products, increase production capacity of the enterprise, creating subsidiaries or the acquisition of financial holdings are just some of the objectives of an organization. To achieve these objectives financial resources are needed, obviously,. Thus, investments appear as a necessity in the life of a company.

Key words: project investments, regional state aid.

J.E.L. classification: H30.

1. Introduction

The investment process is the material support for economic development, on which the growth and diversification of all production factors is based. Moreover, investments made in most disadvantaged regions is a key factor of progress. Therefore, in order to support the economic development, national regional state aid is granted within the European Union.

State aid Community acquires grants regional state aid allowances for companies in compliance with EU Guidelines on National Regional Aid for 2007-2013, respectively European Commission Regulation no. 800/2008 declaring certain categories of aid compatible with the common market.

According to EU Guidelines on National Regional Aid for 2007-2013, the form of the aid is variable. Aid may be awarded as

grants, low-interest loans or interest rebates. Further more, aid may consist of state guarantees, purchases of a share-holding or an alternative provision of capital on favourable terms, but also several tax, social security and other compulsory charges exemptions or reductions, or the supply of land, goods or services at favourable prices[1].

The investment aid granted for large companies in the EU refers to investments made in the most disadvantaged regions within the specified area, promoting investments and job creation. It addresses to the growth of the economic activity of the companies located in certain regions (qualified as disadvantaged regions). Mainly, the scope of the aid is to facilitate the set-up of new establishments in the specified regions.

Given Romania’s accession to the European Union, an increasing number of companies have become interested in investing in Romania. States’ involvement in the investment process, although not determinant, plays an important role. Based on Community legislation, three regional state aid schemes were developed, established by Government Decision:

- Government Decision no.1165/2007 to stimulate economic growth by supporting investments;
- Government Decision no.1680/2008 establishing a state aid scheme for ensuring sustainable economic development;
- Government Decision no.753/2008 establishing a regional state aid scheme by stimulating investments.

I will further focus my attention on the last of the three presented here, respectively Government Decision no.753/2008 which is in terms with EU Guidelines on National Regional Aid for 2007-2013 regarding large investment projects. I will detail the conditions that need to be met by a company in order to obtain regional state aid when investing in large projects.

2. State aid established by Romania’s Government Decision no.753/2008

Government Decision no.753/2008 establishes a state aid scheme. State aid scheme provisions apply to large companies (hereinafter referred to as companies) registered under the Act no. 31/1990, which invest in Romania and meet the following conditions:

- make an initial investment with a value exceeding euro 100 million, equivalent in lei, and the amount of eligible costs exceeds euro 50 million, equivalent in lei;
- create at least 500 new jobs as a result of completion of the initial investment.

There are several exemptions to this state aid scheme, respectively aid granted in the following sectors: production of agricultural products listed in Annex 1 to the Treaty establishing the European Communities, fishing, coal industry, steel, transport, construction of ships, synthetic fibers.

Duration of aid scheme is 5 years, respectively the period between 2008 and 2012. Extension of the initial period is possible by one year and can only be made after notifying the European Commission and obtaining its approval before 2012.

The total aid scheme maximum budget is euro 575 million equivalent in lei and the annual average budget that of euro 115 million equivalent in lei, limited by the ceiling set for the 5 years period.

In order to ensure a viable and efficient level of aided investment, the initial contribution of the beneficiary for financing the specified investment must be that of at least 50% of eligible costs, in a form not to subject to any other public aid.

State aid is awarded to those enterprises that make initial investments in large investment projects. An initial investment is an investment in fixed assets, tangible or intangible, referring to: creating a new unit, extension of an existing unit, diversifying the production of a unit by developing new products, or changing the production process of an existing unit. Also, initial investment is an investment in fixed capital consisting of the purchase of a closed unit, except the case of a unit belonging to a company in difficulty.

In addition to making large investments and creating new jobs, companies seeking state aid must meet a number of general conditions:

- Must not record state budget debts;
- Must not be in the enforcement procedure, bankruptcy, reorganization, dissolution or other similar situations;
- Must not be considered as firms in difficulty;
- Must submit a plan on how the investment will be used for state aid;
- Must not have activities in fields such as fisheries, aquaculture, industria coal, steel, transport, primary production of agricultural products, etc.

State aid is awarded to selected enterprises, within the maximum allowable intensity calculated according to the above formula, and consists of granting the state budget, the grant amounts.

State aid exceeding euro 30 million equivalent in lei, which is intended to be given in the Bucharest – Ilfov region, and respectively, 37.5 million in other regions must be individually notified to the European Commission.

3. Calculation of the state aid

Regional investment aid is calculated by reference either to the investment costs of tangible and intangible assets resulted from the initial investment project or the estimated wage costs for jobs directly created by the investment project, whichever is the greater.

If state aid is calculated considering the investment costs, eligible costs are the costs of tangible and intangible assets. These are obtained “by centralizing the expenses elements taken from financial accounting” [5].

Costs of tangible assets include those expenses related to acquisition of land, buildings and equipment. In case the acquisition of a tangible asset, other than land or buildings, is made throughout leasing operations, only financial leasing is considered eligible. Moreover, the lease contract must specify the beneficiary’s obligation to purchase the assets at the end of the lease. Lease purchases of land or buildings must be valid at least 5 years after finalizing the investment.

Costs of intangible assets include those expenses related to technology transfer through acquisition of patents, licenses or know-how and unpatented technical knowledge. These expenses must not exceed 50% of the total eligible costs of the investment project.

If state aid is calculated considering costs incurred by creating jobs, eligible costs are wage costs of the new-employed, calculated over a period of two years. Wage costs include gross wages and mandatory monthly contributions.

Job creation refers to a net increase in the number of employees directly employed by the aid-beneficiary unit, given the average number of employees for previous 12 months. Jobs lost during this period of 12 months shall be deducted from the apparent number of jobs created during that period.

It is considered that a job is directly created by an investment project if it refers to any activity that is related to the investment and is created within 3 years after completion of the investment. Jobs created as a result of an increase in the level of capacity incurred by the investment are included in the same category.

Raw intensity of state aid is calculated by adjusting the regional ceiling depending on the amount of eligible costs. Government Decision no.946/2006 establishes the regional ceilings (R) to 40% for Bucharest – Ilfov region, respectively 50% for all other regions, except the above mentioned Bucharest – Ilfov region.

Eligible costs are costs related to the initial investment, i.e. costs tangible and intangible assets or wage costs for jobs created by the investment project.

Depending on the amount of eligible costs of the investment project, aid ceiling may suffer some adjustments (Table no.1).

Table no.1. Assessment of large investment projects

Eligible expenditure	Adjusted aid ceiling
Up to EUR 50 million	100 % of regional ceiling
For the part between EUR 50 million and EUR 100 million	50 % of regional ceiling
For the part exceeding EUR 100 million	34 % of regional ceiling

*Source: EU Guidelines on National Regional Aid for 2007-2013

Therefore, eligible costs of the investment projects are adjusted by an adjustment coefficient which varies as follows:

- 0.5 for eligible costs between euro 50 million and euro 100 million, equivalent in lei (B);
- 0.34 for eligible costs exceeding euro 100 million, equivalent in lei (C).

Thus, the maximum amount allowable (A) as state aid for an investment project is calculated using the formula:

$$A = R \times (50 + 0.50B + 0.34C).$$

To illustrate how the maximum amount allowable is calculated, I will take the example of S.C. Complex Energetic Turceni S.A., a company awarded with state aid in 2010. The company, whose activity is entirely focused on producing electricity and heat, received a state aid for the investment made in order to improve the efficiency of energy block no.6. The company's investment was aided as it proved to create a number of 500 new jobs and the total amount of the investment was that of euro 296.5 million, equivalent in lei. Considering the mentioned provision regarding the initial contribution of the beneficiary, the investment taken into consideration when calculating state aid is that of euro 148.5 million, equivalent in lei.

The company is located in Turceni, Gorj County, therefore the regional ceiling applied (R) was that of 50%.

When calculating the state aid using the formula mentioned above, the maximum amount awarded as state aid is that of:

$$A = 0,5 \times (50 + 0.5 \times 100 + 0.34 \times 48.5)$$

$$A = 58.245 \text{ million euro}$$

Therefore, the company could have received a maximum amount of euro 58.245 million as regional investment aid.

After studying the full documentation submitted by the company and comparing the amounts required with the maximum aid amount, a euro 36 million investment aid has been granted. (Table no.2).

Table no.2. List of beneficiaries of the principle agreements in 2010

Company name	Number of jobs created	Total investment (euro, million)	Total state aid (euro, million)
S.C. Complex Energetic Turceni S.A.	500	296.5	36

*Source: Finances Ministry of Romania

4. Conclusions

The present study is based on the provisions of Government Decision No.753/2008 and details the methodology used in evaluating and awarding national state aid.

Summarizing the analysis conducted, state aid can be considered an essential lever for governments. Thus, the support measures taken by member states of the European Union aim to remedy market failures, promote investments, create new jobs and protect the environment or, more recently, prevent the collapse of the banking system.

In particular, Romania aims to stimulate the investment process in certain economic regions by establishing a regional state aid scheme, according to the European legislation. Although serious amounts have been allocated in this sense, few companies were awarded with regional state aid during the five-years period of the mentioned scheme. For example, in 2011 only one company was granted with a euro 36-million state aid.

In conclusion, additional measures should be taken by Romania's government in order to sustain and stimulate the investment process, as companies cannot apply for such schemes because they do not meet the imposed conditions.

Firm Decisions: Determinants of Investments

Ionescu Alexandra

„Ovidius” University of Constanta, Faculty of Economic Sciences

al3xandra_ionescu@yahoo.com

Abstract

The investment decision is part of a companies' investment strategy. Defined as a logical set of technical and economic information, the investment strategy determines the main objectives of the firm regarding its investments, based on studies, analysis and simulations. It also establishes the actions to be undertaken in order to achieve the objectives, methods of achieving them, sources of funding and resource allocation methods. Still, all these are influenced by several factors. The investment decision must be therefore attentively and strongly substantiated.

The present paper addresses the issue of investment policies within companies, and in particular the investment decisions. Through this study I intend to analyze the main determinants of companies' investment decisions. The analysis conducted refers to stock market influences on firm's investment decisions.

Key words: investment decisions, stock market

J.E.L. classification: G11, G12, G13

1. Introduction

Stock market, as a reflection of the economic activity, signals changes in the prices in real time. Definitely, even the slightest change in prices can have a strong impact on the market, as it can influence other prices' fluctuations. Information is therefore crucial, as it can affect major decisions. But how do the stock market fluctuations influence the investment policy of a company? Which are the main variables of the stock market that have a great impact on the investment decisions of the companies? The purpose of this paper is to answer these questions, and to further detail

the influences of stock market mispricing and price informativeness on firm's investments.

In general, the term investment is discussed as financial investment and capital investment. Referring to the first concept, financial investments are represented by any capital investment, such as purchase of shares or other securities, bank deposits, fund allocations for business development, with the stated purpose of obtaining a benefit (profit).

The second concept, that of capital investment, refers to companies' acquisitions of new assets and modernization of the existing ones. Arnold [1] considers that investment involves resources being laid aside now to produce a return in the future. He further shows that the objective of an investment within the firm is to create value for its owners, the shareholder. According to Stancu [16] investments consist of changing a present and certain amount of money hoping for a higher future income.

Economic thought has developed over the years numerous theories of investment. Classic theories of investment include Keynes' view on investment behavior [9], Fisher's [6] separation theorem, Modigliani and Millers' theory of investment [12]. Modern theories of investment include the q-theory of investment, the portfolio theory, the capital asset pricing model, arbitrage pricing theory, efficient market hypothesis theory.

Tobin's q-theory of investment [18] identifies investment opportunities as marginal q, which is the manager's expectation of the future marginal product of capital. Given the q-theory, the optimal investment rate is a function of risk-adjusted discount rates and of future marginal profitability.

In time, many economists founded their research on Tobin's q-theory and developed several theories correlating stock market and investments.

2. Determinants of investments: Literature review

Recent literature on corporate investment indicate stock prices and private investor information as determinants of investment decision. In support of this, Baker and Wurgler [3], show that stock market mispricing can affect companies' investments through an equity issuance channel. Stein [17], following Bosworth [4] and Merton and Fischer [11], argued that a manager can issue overvalued stock or buy back undervalued equity if a company is mispriced. Polk and Sapienza [13] agree that short-horizon managers temporarily distort the firm's investment decision and therefore misallocate resources. They show that firms' investment decisions are influenced by stock market mispricing by using a catering theory.

In contrast to the developed the idea that investments can be influenced by market mispricing, Bakke and Whited [2] argued that mispricing is irrelevant for investment of firms with high levels of mispricing and large firms. They developed an econometric model using an econometric errors-in-variables that eliminates irrelevant variations from the calculus. I conduct my research on the analysis of companies' investment policies, aiming to identify which determinants have a significant influence on investment decisions.

Referring to price informativeness, Bakke and Whited confirmed that investment decisions are guided by private information embedded in the stock price, following the results obtained by Luo [10], who argued that information from the stock market is extracted by the merging companies. Likewise, Chen, Goldstein, and Jiang [5] reported that price informativeness and investment sensitivity to stock market are positively correlated, showing that prices that incorporate private information can guide managers in making investment decisions.

On the basis of a sample of 794 cross-listing firms, Foucault and Frésard [7] conducted a study which highlights the influence of cross-listing on investment-to-price-sensitivity. Their conclusion is that cross-listing significantly increases the sensitivity of firms' investment to their stock price, showing that this is the effect of the additional information the managers obtain by monitoring actions of U.S. investors.

Shefrin analyzed the behavior of corporate financial executives when making investment decisions. He concluded that “financial executives engage in trend following”[15], showing that their investment decision is based on the expectations for the stock market.

3. How does market mispricing influence firms' investment decisions?

Mispricing means to price incorrectly. Hence, mispricing refers to both situations of overpricing and underpricing a company on the stock market. We further assess the following question: how does market mispricing influence a firm's investment decision? Assuming short horizons for the shareholders, we will detail the effects of stock prices deviations from fundamental value of a company on the respective company's investment policy.

Firstly, we will consider the situation of overpricing a company on the stock market. Taking into account an investment opportunity of a company, a capital input (K) is needed in order to generate a certain output. According to Polk and Sapienza's model, the value of a firm at a certain time t is a linear function of capital, noted $V(K)$. Considering a mispricing of the company (α_t), the model shows how mispricing can influence the market value of the company:

$$V^{mkt}(K) = (1 + \alpha_t)V(K)$$

Evidently, when if stock market correctly prices shares, respectively there is no mispricing, the stock market will reflect the true value of the firm.

In case the stock market misprices a company's stocks, managers will make their investment decisions in response to the prices' evolution.

Firstly, in case of overpricing stocks, the shareholder will consider investing a larger amount than the initial capital input, K . His motivation to do so is based on the fact that although the investment cost will exceed the investment marginal return, the market will compensate for the investment costs by overvaluing the investment project. This can be summarized as following: as long as a firm is overpriced, investors will have a raising appetite to overinvest.

The tendency to overinvest will persist on the duration of market's overvaluation of the

firm. Consequently, managers can benefit of this overvaluation by increasing firm's investments. Moreover, as overpricing lasts, investors will increase their investments, leading to an additional advantage for the firm, and influencing it to consider further investment projects. As a result, overpricing stimulates the investment decision of a firm.

Conversely, in the case of underpricing the company on the market, the managers will invest a lesser amount than initial K. Therefore, underpricing leads to underinvestment. The manager will further lower the company's investments as long as underpricing is expected to maintain for a longer period. In this latter sense, underpricing has an adverse effect on a firm's investments, as the investment decision will not be taken under these circumstances.

4. The influence of price informativeness on investment decision

Price informativeness assesses the issue of asymmetrical information available on the market. Privately generated information is subject to traders' knowledge and is incorporated in prices at a certain level, considering their "ability to disseminate and exchange information".[8]

Price informativeness is closely related to market mispricing, as it generates the production of additional information on the market, leading to a reduction of the mispricing.

Still, price informativeness is a subjective variable of investment. Subjectiveness derives from the fact that there is no generally accepted model to measure price informativeness.

Stock market reflects prices at a certain moment, given the respective circumstances of the market. Hence, stock market reflects a certain value of a firm, which differs in most cases from the firm's fundamental value. In other words, stock market prices can have a bigger or smaller deviation from firms' fundamental values. As there is a smaller deviation from firm's fundamentals, it is assumed that stock prices are more informative than the ones that have a bigger deviation on the market.

Based on the fact that stock market prices are substantiated by information gleaned from numerous and diverse sources, such prices reflect information that managers do not have access to. Mainly, this happens because traders incorporate some private information in stock prices, apart from public information, that is generally available. Still, managers could benefit by such information when making an investment decision. They can observe the movements in stock prices and, consequently, improve their investment decisions.

5. Conclusions

The present paper asserts the importance of the stock market in substantiating firm's investment decision. It considers the case of asymmetrical information and market mispricing.

I report a positive correlation between stock market and investments, mainly by relating the latter to firms' misvaluation and stock market price informativeness. Both mispricing and market price informativeness greatly affects firm's investment decision.

When taking an investment decision, managers must always take into consideration the fluctuations in the prices of their stocks on the market. They must always adjust their investments, in response to the market signals. For example, companies may benefit in case of overvaluation of their stocks by deciding to allocate resources for additional investment projects. In this case, the overvaluation of the stocks may compensate for the additional costs of considering new investments. In contrast, undervaluation is correctly assessed by limitation of the investments.

Unfortunately, managers do not always found their investment decisions on the evolution of the stock market, although connections between the two have been strongly evidenced.

Business Portfolio Strategic Planning Process – A Pertinent Marketing Solution for the Worldwide Companies Facing the Global Economic Crisis

Ionescu Florin Tudor
Bucharest Academy of Economic Studies, Marketing Faculty
florinionescu@mk.ase.ro

Abstract

Top level managers currently operate in a business environment characterized by dynamism and complexity. Thus, the best way to cope with an uncertain future requires managers to prepare for this now by anticipating those influencing factors that can cause changes in the internal and external environment of the company. Therefore, taking into account the uncertain economic conditions, the market dynamics, the fundamental changes in the attitudes and aspirations of the consumers along with the strong growth of the political role and interventions in the economy, currently characterizing both Romania and other countries of the world, it can be said that the need for market-oriented strategic planning was never so acute as now. Therefore, this paper aims to discuss in detail the market-oriented strategic planning process of the companies' business portfolio as a relevant marketing solution to the effects of the current global economic crisis.

Keywords: business portfolio, strategic planning, strategic business units

J.E.L. classification: M31

1. Introduction

Nowadays, all companies operate in a marketing environment, facing a large number of uncertainties. Thus, in order to be successful in a market place, a company should be subjected to a process of continuously adapting to changes that occur in the process, even though some marketing environments show higher levels of predictability, in comparison with others.

Over time, companies have tried each time to identify various ways in order to cope with uncertainties more easily, which were their most feared enemy. After many attempts, which were aimed at weakening or even annihilating this enemy, companies have managed, finally, to identify the most powerful weapon, by which the battle can be won definitively. This weapon of war is known in the literature of management and marketing as the strategic planning.

At the foundation of strategic planning lays a maxim, which says that in order to lead a company you must look in the future. This maxim reveals the degree of importance which is attached to the strategic planning process, which takes place in the vibrant world of today businesses.

Even if in the marketing and management literature, there have been written many pages about strategic planning, it should be noted that this discipline associated with its specific concepts did not totally emphasize until the early '70s.

On the basis of this work there are a number of reasons and the most important is related to the fact that during the '50s and '60s, companies faced a period of prosperity generated by the unprecedented development of economies in Western markets

Turmoil of the early '70s, which generated strong emergence of crises, of which we can remember: the oil crisis, energy crisis, high inflation, economic stagnation, strikes, unemployment growth followed eventually by the recession, have forced managers to identify a completely different approach, from the original, in order to be able to manage the company [8].

This new approach known as strategic planning had the advantage of providing companies with a general framework through which opportunities in the markets could be

spotted more easily, and the threats could be defeated much more quickly and efficiently.

2. Market oriented strategic planning

This new way of strategic thinking, represented by market-oriented strategic planning is based on three main elements [8]

- The businesses of a company should be seen as an investment portfolio, which must be constantly monitored and in which decisions aim to develop, maintain or eliminate the businesses run by it;
- The company must focus on identifying the potential profit of all business, that it holds;
- The management of the company must adopt a strategic perspective, in which every aspect of the business should be submitted to a planning process, in order to achieve the objectives set in advance.

Given what was said, it must be recognized that a manager in order to be able to adopt such an approach, first he must know in detail the complexity of relations that exist between different parts, that compose the organizational structure.

According to the management and marketing literature, most companies are structured in three levels of decision-making, known as: the corporate level, the strategic business unit level and the functional level.

Furthermore, the three level of decision making define the strategic planning process hierarchy, consisting of: market-oriented strategic planning, strategic business unit strategic planning and functional strategic planning.

Furthermore, the planning of the three levels should be subject to a process of implementation, the generated results should be monitored and evaluated and where necessary should be taken corrective actions.

In order to correctly understand the cycle of planning, implementation and strategic control, first is required to know its cornerstone. As such, below are outlined the basic principles of market oriented strategic planning process.

First I will try to outline a definition of the market-oriented strategic planning concept. Thus, market-oriented strategic planning is a management process for establishing and maintaining a viable relationship between objectives, training staff and resources of a

company, on the one hand and market conditions, on the other. Strategic planning objective is to continuously adapt the company's business and products in order to achieve its development and proposed profits [11].

3. Market oriented strategic planning process

The strategic planning approach consists of considering the elements of strategic management and marketing as a process of interdependence successive stages.

The action undertaken in cascade implies to run step by step each phase and to use specific instruments, in strict compliance with requirements arising from the position of these stages during the general process [13].

Thus, it can be said that the market-oriented strategic planning process, consists of the following steps: defining the mission of the company, internal and external environment analysis of the company, defining business objectives, establishing the overall strategy of the company, defining strategic business units, classification and allocation of resources for strategic business units, implementation and evaluation of the strategy and last but not least the strategic control.

4. Defining the mission of the company

The marketing environment provides a company, regardless of its nature, with a number of resources, which uses them in order to conduct its businesses properly. In exchange for these resources, the company offers a range of products and services at acceptable levels of price and quality. In other words, a company exists on the market for a particular purpose.

As time goes by, the company is subject to a development process in conjunction with a change in the marketing environment. As such, the initial purpose may become irrelevant, as the company launches new products, penetrate new markets and/or add new businesses to its portfolio [4].

Moreover, the changes of the marketing environment can also affect the initial purpose of the company, making it irrelevant.

Thus, the results of these essential changes occurred in the economic life of the company can turn into threats that can lead ultimately to failure. In conclusion, the company needs to formulate a mission that clearly expresses its purpose, based on the environmental context in which it acts [15].

5. Internal and external environment analysis of the company

After the company was able to go through the first stage of the strategic planning process, now it can establish a general framework that will allow identifying those aspects of its internal and external environment that can positively or negatively influence the managers to achieve the corporate objectives.

The internal environment includes all the endogenous elements of the company, over which it has influence and control. The study of the internal environment must answer the questions about the existence of resources and their management [6]

The external environment includes a combination of factors consisting of exogenous variables, which the company tries to face them by its own resources [6].

The internal environment analysis aims to review and evaluate the company's resources (human, material, financial and information resources) and its own potential in order to discover and appreciate the strengths and weaknesses of the company [15]

The external environment analysis aims to review and assess the business relationships with the external environmental factors, in order to highlight the existing opportunities and threats [15].

After the company completed the analysis of its internal and external environment, it has the possibility to identify if there are matches or discrepancies between its opportunities and threats on one hand and strengths and weaknesses, on the other hand.

This process of interpenetration of the two types of analysis (internal and external) allows managers to define precisely the general strategies that the company should adopt in such a way that corporate objectives, established in the previous step, can be achieved.

6. Defining the company's objectives

Setting the company's goals represent the third stage of the market oriented strategic planning process and also an attempt to materialize the mission of the company. In other words, the objectives of the company make its mission to become tangible and quantifiable.

Also, the objectives should be regarded as more than just a company's intentions, because they may influence its long-term performance.

More specifically, if the objectives are properly formulated they should: be easily converted into specific actions, provide direction or a starting point for further detailed objectives specific to lower management levels, establish long-term priorities for the company and facilitate the control process, because they serve as standards for assessing the overall performance of the company [14].

Consequently, their role, on the one hand, is to print a direction for the company mission, established in the previous step, and secondly to help managers, on the stage of formulating overall strategies of the company.

7. Defining the general strategy of the company

Once a company has established its mission, has undertaken a thorough analysis of its external and internal environment and has set its objectives, it can be said that it knows where it wants to go in future. Thus, the next step that a company must complete is the one that involves defining the overall strategy.

The role of the general strategy is to identify the general path of action through which the company will be able to achieve the objectives set in advance. Thus, at the top management level there are six general types of strategies that a company may take into account, in order to sustain the strategic decisions. These general strategies are the following: maintenance strategy, growth strategy, expanding the portfolio strategy, liquidation strategy, fructification strategy [2].

8. Defining the strategic business units

Each strategic business unit is subject to a process of defining the specific arena in which they will compete [5].

A definition of the strategic business unit in terms of product orientation focuses only on the company's products/services and also on the markets concerned by this. This approach obstructs the objective function of any company, which aims to meet the consumer needs [9].

In the light of product orientation, a product is nothing but a physical manifestation of the application of a particular technology in order to meet a particular need for a particular target audience. In practice, there are often several ways (technologies) to meet a particular need of a particular target audience. By identifying these pathways, based on a customer orientation in defining strategic business units, a company shall not be taken by surprise when major changes occur in consumer demand.

As such, the business of a company should be seen as a process of customer satisfaction and not as a process of producing goods. Products are transient, while basic needs and customer groups endure forever. Thus the companies must define their business not in terms of products but in terms of needs [12]. Based on this plea a company must consider during the process of defining the strategic business units, three elements or dimensions. These three dimensions are [1]:

- The group of consumers who will be served – how many market segments will meet the strategic business unit?
- The consumer needs that will be met – what consumer needs will meet the strategic business unit?
- The technology will be used to meet these needs - what technologies the strategic business unit will seek to master?

By plotting the strategic business units, using these three dimensions, managers can determine whether the basic skills of a strategic business unit link strongly with the technology used by the company, the needs of consumers or groups of customers they serve. Also, managers can identify the weaknesses in defining the strategic business

units and the best ways of their future development [5].

9. Strategic business unit classification and resource allocation

Regarding the prioritization and resources allocation process for the strategic business units within the business portfolio, many companies face big difficulties.

The company's business portfolio is submitted by the corporate level managers to a sorting process, through which the resources are allocated to each strategic business units, depending on the place occupied by them in the list of priorities. In other words, the managers must find an exact answer to the following question: Which strategic business unit is better to invest first?

Since a company's business portfolio may consist of one or more strategic business units, it should be noted that they differ in terms of potential but also in terms of cash flow, which they generate. As such, some strategic business units will provide more opportunities for growth and profit than others. For example, some strategic business units that have new products or pursue new market opportunities are more likely to receive net financial resources. Others who have significant market share in mature markets are likely to generate significant financial resources [5].

In general, the objectives and financial resource allocation decisions depend on two factors: market attractiveness and relative competitive position held by the strategic business unit [5].

The market attractiveness is based on a set of factors such as: market size, market growth rate, level of competition, profit levels, sensitivity to economic fluctuations, etc. The relative competitive position of strategic business units depends on market share, brand positioning, competitive costs, technical skills, marketing skills, organizational flexibility, etc.

In conclusion, the corporate level managers must ensure that financial resources are allocated wisely to each strategic business unit.

10. Strategy implementation

After establishing the general strategies by which the company believes that it can achieve the objectives set in advance, followed by the definition of strategic business units and allocation of resources for them, the next step is strategy implementation [16].

The successful implementation of the overall strategy involves the management of the company's employees, the allocation of resources required to implement the strategy, monitoring its degree of implementation and solving the problems, which may appear over time [3].

The most important considerations, aimed at this stage of the strategic planning process are the degree of compatibility of corporate strategy with the structure and content of organizational culture, the level of skills and knowledge of employees and also with the commitment of the corporate level managers [10].

In terms of organizational culture, it is known that it varies from case to case. For example, some businesses are open in terms of risk-taking while others show an aversion to them. There are also some companies that adopt a strong innovation-oriented behavior, unlike others who have a passive attitude, through which everybody is waiting to see what innovations appear in the market. As such, depending on what type of culture is adopted in the company, further, this will inevitably be found in corporate strategy.

Regarding the second aspect, the managers in charge of corporate strategy implementation should consider the skills and the training level of the company's employees. Thus, managers who are in charge with this stage are bound to find answers to the following set of questions:

- Does the current workforce have the necessary skills to implement the strategy?
- Do we need an additional workforce to undertake this?
- Do we need to run a training program for the employees before the strategy can be implemented?

Regarding the last aspect, corporate level managers must agree that the strategy chosen is the best way through which the company will achieve its desired objectives. As such,

they must fully understand all facets of the selected strategy and the resources that are required for its implementation.

11. Strategic evaluation and control

Strategic evaluation and control is the last stage, which a company must go through, consisting of monitoring and evaluating all strategic planning process to ensure the corporate managers that all goes according to plan [3].

During the strategy evaluation and control of the general strategy it should be considered the following set of criteria: internal consistency, external consistency, competitive advantage, the acceptable level of risk and social contribution [7].

- Internal consistency – is the strategy in line with the company mission, objectives and its internal resources?
- External consistency – is the strategy in line with the external marketing environment?
- Competitive advantage – does the strategy leads to the development or maintenance of competitive advantage in a business field or in a particular market?
- Acceptable level of risk – is the strategy in line with the level of risk accepted by the company?
- Social contribution – is the strategy in line with those social contributions that the company considers desirable?

Further, after identifying the answers to these questions managers can determine the nature of changes that must be undertaken during the implementation of the strategic plan.

Minor changes in the strategic plan do not affect dramatically the initial direction of the company, they are not doing anything other than to refine the plan. In fact, the changes that anticipate changes, in general prove to be helpful for an enterprise [10].

In conclusion, all the adjustments highlighted during the strategic evaluation and control stage are relevant and possible only if managers regularly collect new information and continually evaluate new opportunities that are emerging on the market.

12. Conclusions and managerial implications

In the beginning, the planning system used by most companies was a rudimentary one, because it was limited to setting annual budgets and to make extrapolation of current sales and marketing environment trends over a period of several years. Further, based on these forecasts, managers took a series of decisions, which concern the allocation of organizational resources. However, in many cases, the predictions made by companies turned out to have a high degree of accuracy. This was possible because many components of the marketing environment had a stable character. More specifically, the markets were developing, the demand exceeded the supply and the external changes were at a minimum level.

Nowadays corporate level managers operate in a business environment characterized by dynamism and complexity. Thus, the best way to cope with an uncertain future requires managers to prepare for this now by anticipating those influencing factors that can cause changes in the internal and external environment of the company. Therefore, taking into account the uncertain economic conditions, the market dynamics, the fundamental changes in the attitudes and aspirations of the consumers along with the strong growth of the political role and interventions in the economy, currently characterizing both Romania and other countries of the world, it can be said that the need for market-oriented strategic planning was never so acute as now.

Business Strategy in Banking Economy, in References with Marketing

Ionescu Gr. Ion

“Dimitrie Cantemir” Christian University

iionescu_levant@yahoo.ca

Abstract

The objectives of a strategic performance, are based into a certain hierachy, starting from an organised direction and crossing the firm, from up to down. Also, there is a resoning of elaborating a strategic plan of business, at every level of management, to obtain the objectives that are secured at that level.

Thus, the objectives that are at a high level in the firm, generate the making of a strategy of the firm, objectives that are at a subunit level, of economic activity (or business unit) are standing at the origin of making a business strategy (subunit of strategy), objectives that are stabled at a level of function (production, marketing, finance), generate the strategy formula, support of a functional domain, partition objectives or a link of execution that generate the formula of a strategy at a level for operation.

Key words: strategy, clients, firms, competition, marketing segmentation

J.E.L. classification: M10, M31

1. Strategies based on clients

“Into a free economy there’s no marketing that can be uniform, because every group of clients want a product or a different service then other groups. In these terms, a firm cannot satisfy in same amount all the clients, they have to make a difference between the groups of clients“.[1]

This difference can be made by the possibility of accesing the clients, but it must be taken in calculation of the abilities of competition of accesing some groups of clients.

For benefiting of a strategic advantage in concern with competition, a firm must segment the market (in sense that it must identify one or more groups of clients and focus the efforts for satisfaction of their needs):

- clients
- competition
- firm
- the key fuctions to a firm:
production, commercial,
personal

Other key aspects:

- price
- distribution channel
- quality

The segmentation of marketing can be made in two different ways:

- a) regarding of needs, client objectives;
- b) regarding taking over the market from firm;

• The segmentation regarding the needs of clients.

This segmentation starts from the theory that in a community can be and must be identified groups or client segments after numerous critiries : age, number of members in a family, rase, geographic area, sex, customs, profession, traditions (they represent statistic and conventional groups and less strategic segments) and their aspectings differ. These differences make the elements that consist segmentation.

As a result every group that appears in making the decisions of buying a product has the value that is seen by a group.

The value that a client from a certain group that accords for a product / service offered by a firm is based on tangible and intangible elements.

The tangible elements consist in: performance, durability, cost of use, retail value, buying conditions, the disponibility of

pieces for changing, access at a acquisition unity, of service.

The intangible element consist in the beauty of product, the satisfaction for the buyer, luxury, the image of the firm.

The value that is seen by every client consists on their needs and desires , but can be correlated with price- quality and the level or their incomings. The anlysis of all these elements can move to an efficient segment of a market from the client perspective.

- **The segmentation regarding the level of taking over marketing from firm**

"And the segmentation regarding the level of taking over marketing from firm is necessary because in terms of the existence of a huge segment of clients with needs and similar desires can create a problem regarding the abilities of satisfying their needs".[2]

The possibilities of action in firm of satisfying of these needs can be limited of resources, of necessary costs for serving this side of marketing, of the competitors and the possibility of promoting a price (in case the price gets higher can quit a product or can choose an alternative: a radio instead of a tv, a pen instead of a pencil, an autobus instead of a taxi.

This kind of of strategic segmentation has a studio that analize, in comparison, the marketing costs and taking over the market.

The grade of coverage of marketing depends of the marketing costs. These costs consist of: the cost of promoting the product, costs regarding the activity of sales, costs consisting in the service link, stoking the products destined to be sold, generated by distributors, dealers and commissions.

The essencial task of marketing segment is to bring the products and services in the favorable position in regarding of the competitors for every chosen segment. From this reason the competitos have a clear view of making a segment of clients, from the point of view of the objectives of clients and the perspective to cover the marke

2. Strategies based on firms

Unlike client-based strategy, strategy-based company is a functional, in that it seeks to maximize the strengths of the company, as compared with

competitors in key functional areas to achieve success.

Business functions differ in level of development from one firm to another - and more so, from a sector to another.

The only way a business can survive a close competition is to be stronger in one or more key functions, from competitors.

"Functional performance optimization firms can not bypas the cost effectiveness issues.

This is because the company generates fixed costs functions but may become partially variable.

Eg design function generates a fixed cost that has a certain weight in the total costs of the company, because it works as a feature. So the sales function generates a fixed cost, but the cost tends to turn into onevariable independent distributor".[3]

To reduce costs of business functions have three distinct ways:

Operational cost saving; more efficiently than competitor; Reducing operational costs fasterue:

- Operational costs assessed against the amount of work and not report value not in relation to sales;
- Reducing operational costs through the joint certain key functions than many of the company or organizational departemens even more companies.
- In applying these measures should be considered functional for the firm to not fall into some "traps" that competition exploit them. To avoid these pit falls company must have very good responsibilities for functional analysis and competitiveness.

3. Strategies based on competitors

From the foregoing it follows that for a company to remain competitive need to be to reduce the cost functional, but to business strategies. In fact, you made a compromise between cost and performance of operational functions in relation to competitors.

Competition-based strategies can be developed by analyzing potential sources of differentiation of functions: supply, sales and service.

The most important thing to remember is that any distinction between a company and the competitors will share in one of the tree elements that jointless determine the profit (sale price, volume and production costs).

To distinguish between a company and its competitors leak analysis method is used, which allows a systematic analysis of the areas that lead to this differentiation.

In the category drop corporate clients include:

A. Customers who do not have offered the product / model expected of them (range of products offered by the company).

B. Customers that have not considered selling agents, customers are not within range of the company

C. Customers whose products company image not say anything.

Market share is given by D and E. The company's clients.

To increase the market share of the company have identified ways to eliminate these flaws.

$$\text{The success rate} = \frac{D}{C + D}.$$

$$\text{Market Coverage} = C + D + E.$$

$$\text{Product range} = B + C + D + E.$$

Factor on whether the company has managed to gain the best position is:
 $F_p = 1/(C/D + 1)$

Table 1 Differentiation potential sources of competitive banking market

The cause of loss	Areas of possible differentiation	Possible ways of action
A	Product range	Tehnological flexibility
		Production tehcnology
B	Client initiatives	Image / reputation
	distributions	Link density
	Power of sales	Discipline
C; D	product	Performance / price/disponobility
	Power of payment	Preparing
	service	Image / cost / performance
	finance	Conditions of payment
E	relations	Assistance arrangements

4. Market - based strategies in the banking business and marketing mix

Market strategy is one of the most important development strategy of the company. This report is established between the firm and the environment, and position to be within a secure environment to meet goals under maximum efficiency.

A marketing strategy can be developed to the level of activity portfolio range of product, categories of customers of a product or band.

Strategy is determined following a rigorous justification of knowledge based on the likely environmental studies of endogenous and exogenous factors of marketing and their development.

A marketing strategy consists of three basic elements:

a) strategy sets out what action the company manufactures products at the prices on the markets in which geographical areas and the distribution channels will open.

b) the strategy that motivates the company's shares results such as more complete use of labor and production capacity, social usefulness, etc.

c) employment strategy which sets out who, where and when to perform the tasks set.

About the strategy and define the notions of political and tactical marketing.

„Marketing policy is defined by the ways in which a company begins its evolution, future guidelines and concrete actions. It should be understood as a style of approaching the market” [5]

Tactics that work be understood as applying step strategy through concrete actions which states that parts date, facilities, costs, etc.

5. Alternative marketing strategy

Complexity of the market generates a diversity of approach it according to several criteria: [6]

a) position criterion refers to the place they occupy in the market that the company is present with its products or services. This position is given to activities they may conduct business through their own potential

and pressure environment of marketing opportunities.

By positioning the company selects their industry and target market segments. In relation to the competition the company will choose the most advantageous position relative to which corresponds a certain type of strategy. The company can address a strategy or another position with the characteristics of demand, namely:

- Undifferentiated strategy when global demand can be satisfied by a single product with the same features that the company produces and offers to market it.

- Differentiated strategy is used when the firm produces and provides products and services relatively more differentiated between them, each gathering is a specific category of consumers.

- The strategy is to focus attention focused company on a limited number of regions of the market for offering a narrow range of products and services.

b) behavioral criterion refers to the ways of action to the side of environmental factors. In this vision, the company may adopt the following categories of strategies:

- Active strategy, innovative, energetic intervention by the company and influence market developments. This strategy can be applied by co-leader or leader.

- Passive strategy, adaptive, by the company based on the study of market evolution adapts.

- Anticipatory strategy seeks to determine future market developments and take appropriate strategic decisions.

c) criteria based on state development and evolution of the marketing potential of business and development trends of the sector which includes company. In these situations the company may adopt the following types of strategies:

- Diversified development strategy by the company expands into new products and penetreză sectors.

- Non-diversified development strategy by the company seeking to place their existence in a greater extent on traditional market and place them in other new markets, increasing turnover.

- Profitable strategy for a product as soon as possible by adopting high prices and reduced marketing expenses.

- Penetration strategy by the company on a beach trying to get more of its product market, falling profitability in the background.

In terms of relative positive posture its market competitors include: [7].

- a. the leader or co-leader;
- b. the position of follower;
- c. challenger position;
- d. specialist position.

Depending on the position he has company, it will adopt specific strategies as follows: marke

1) leader can adopt:

- a) total market expansion strategies by attracting new customers and new markets penetration action, by providing some new uses for products and increased demand led to increase preventive consumer products thereof;
- b) expansion strategies of improving market share position relative to competitors;
- c) strategies to preserve market share, defensive strategies designed to defend the position it has on the market but can be offensive by launching new products.

2) Challenger may adopt the following strategies:

- a) frontal assault;
- b) flank attack;
- c) encircling attack, bypass, harassment.

3) trackback adopt the following strategies:

- a) follow closely;
- b) remote tracking;
- c) selective prosecution.

4) specialist may adopt the following strategies:

- a) the number of market niches.

The Best Anti-crisis Solutions. The Polish Lesson

Ionescu Romeo
“Danubius” University of Galati
ionescu_v.romeo@yahoo.com

Abstract

The paper realises a comparative analysis between the Polish and the Romanian economies in order to find out the main elements which supported Poland to face successfully to the crisis. The analysis is based on the neutral statistical bases and covers the main economic indicators. A distinct part of the paper deals with the recovery governmental packages in the Polish and the Romanian economies and their viability. Important is the part connected to the relation of these two economies with the international financial institutes.

The main lessons from Poland to Romania about the crisis management are: policy matters, macroeconomic disequilibrium at a minimal level and an optimal privatisation policy.

The main conclusion of the paper is that the human society will be divided only into very rich or very poor people and both above economies are not able to stop this process.

Key words: macroeconomic imbalances, deficits, growth rate, privatization.

J.E.L. classification: O57, R11, R59.

1. Introduction

The present global crisis is far away to finish. As a result all world economic actors face to its challenges. EU27 is not able to find optimal solutions for its Member States.

On the other hand a Member State (Poland) was able to face the crisis. It was called the Polish miracle. The problem is that the Polish economy is not a miracle, but the Polish macroeconomic policy was and is realistic.

2. General approach

Poland adhered to the EU in 2004 but its economy was quite weak. But the same Poland succeeded in achieving positive GDP growth rates during 2007-2009. Moreover, Poland started a recovery economic process in 2010.

The maintaining stability in Poland was explained by some foreign analysts mainly by the low level of the companies and the citizens' indebtedness and due to relatively healthy banking system, which recorded profits totalling nearly 9 billion zlotys in 2009, for example.

The National Bank of Poland imposed strict regulations for the banking system, especially regarding security for private loans and credit to finance the rigorous criteria of commercial companies.

One advantage is that Poland has strong state institutions, a viable democracy. Accountability and transparency have the same important role as a state economic development as the economic policies. They provide reliable to the citizens. They were deprived of Hungary and Romania during the peak of the crisis and this has not gone unnoticed.

The ability to maintain the macroeconomic imbalances at relatively low level gave to Poland the opportunity to take advantage from the preferential loans mechanisms and the financial aid. As a result, Poland signed a preferential agreement with the IMF and it received a flexible credit line of 20.5 billion USD (14.4 billion Euros)

This feature is provided by IMF to those countries which achieve strong economic fundamentals and is intended to protect their economy and the currency of the credit crunch.

Under this credit, Poland was able to avoid any economic shocks, but he also provided a wider range of options and greater flexibility on policy choices that contribute to the

economic recovery.

3. Macroeconomic analysis

Unlike Poland, the unsustainable deficits and the large debts forced Hungary (15.7 billion USD) and Romania (17.1 billion USD) to seek financial aid from the IMF and the World Bank. Their loan applications were followed by the implementation of the strict austerity economic measures.

Figure 1. General government gross debt (% of GDP)

Source: personal contribution using European Commission, 2011.

According to Figure 1, Poland has a worst situation than Romania and a better one than Hungary. The problem is that Poland and Hungary will achieve a descending trend during 2011-2012, but Romania will face to a general gross debt growth during the same period.

The agreements with the IMF and World Bank will have long-term repercussions on Hungary and Romania, including the success of the economic recovery, the speed with which they will adopt the euro and the efforts to align to the EU principles.

Romania and Hungary, burdened by debt and strict austerity programs, will have to go the long way and will have minimal flexibility in the pace and extent of reform programs.

An important asset in the case of Poland is that the Constitution stipulates that the public debt may not exceed 55% of GDP (in exceptional cases may reach 60%). Basically the Polish government cannot enter into financial slippage due to the Constitution.

The construction sector and the real estate development are victims of the economic crisis all over Europe and especially in the East. Less in Poland, where buildings are rising and the land and the housing's prices fell slightly.

In 2009, the construction sector activity in Romania decreased by 29% compared to 2008, the largest decline in the EU, while the bloc as a whole decreased by only 11.1% in same period (Eurostat, 2010).

The following positions were ranked by Spain and Slovenia, where the construction sector reported declines of 21.1% and 19.6% over 2008.

On the other hand, the highest growth rates were achieved by Poland (9.9%), Sweden (9.5%) and Germany (1.9%).

The construction activity decreased in the euro area by 11.3%.

Poland succeeded to maintain high positive growth rates in construction because the demand for housing increases after its own rhythm, which means that it is not backed by mortgage loans that are still very difficult to obtain.

Figure 2. The evolution of the building permits

Source: personal contribution using data from www.businessday.ro

State regulations imposed tough market have prevented an explosion of mortgage loans, which in turn blocked a housing boom like those experienced by other Eastern European countries, including Romania.

In addition, the Polish central bank restrictions prevented most commercial banks to invest in real estate developers by providing unlimited credit. The first important result was seen in July 2009, when the real estate prices in Poland had declined

only by 0.4% compared to July 2008.

In Romania, the number of building permits issued for residential buildings was 13.4% lower in 2010 than in 2009 (INS, 2011).

Meanwhile, in Hungary, were issued with 37% fewer building permits than in 2009 and in Poland with only 1.9% fewer than in 2009. When talking about the number of dwellings completed in Romania and Hungary, they were 16% and 34% fewer than in 2009.

In Poland, have been put into use by 16.1% fewer homes in 2010 compared to 2009, and 10.8% fewer than in 2008. According to the European Federation of mortgage loan, the largest annual decrease in 2010 was registered in Ireland, a country where prices were lower by 16.6%. Greece followed a decrease of 10.9% and Hungary a decrease of 10.5%.

Figure 3. Nominal house prices growth rates

Source: European Mortgage Federation, 2011, p.5.

By contrast the UK achieved an increase of 10.1% of the housing price in 2010, followed by Sweden with an increase of 8.9%. Sweden is the champion of the prices increases in these years of crisis. In 2010, the housing prices were about 25% higher than in 2006, and 35% higher than at the end of 2005.

While the housing prices in Poland did not decreased during the crisis, most Member States faced to the cost of housing growth between 100% and 110% of the price recorded at the end of 2005.

The governmental investment programs had a strong influence in Poland. 20 billion Euros were allocated for the infrastructure works to organize the 2012 World Cup. Moreover, other 13.3 billion Euros have been budgeted by the National Highways for the road infrastructure investments between 2009 and 2010. An important support for the local and regional development in Poland is the allocation of the EU funds which will achieve a total of 68 billion Euros by 2015-2016.

Most of the European money are focused on the infrastructure development, and due to government vision, the absorption process is not a problem.

Poland participates to the EU budget by 22 billion Euros, being the eighth largest contributor, and receives back 87 billion Euros. The rapid absorption of the EU funds supports the consumption and the investment.

Inward investment rebounded in Europe in 2010 with a record number of projects (Ernst & Young, 2011).

Across Europe there was a 14% increase in projects from 3,303 in 2009 to 3,757 in 2010. The majority of the 43 countries in Europe whose inward investment is measured by the survey showed an improvement. The number of new jobs created across Europe as a result of these investments was also up by 10% to 137,000 although this still remains well below the peak of five years ago.

Investment from the United States was the primary reason for the turnaround in FDI across Europe with an increase of 24% in project numbers on 2009. The US remains the critical investor for the European market with over a quarter of all projects.

Although the UK and France remained the most attractive countries for investors with 728 and 562 FDI projects a growth of 7% and 6% respectively, the real success story for 2010 among the major European economies was Germany whose project numbers rose by 34% to 560 in 2010 challenging France for second place.

Countries in Central and Eastern Europe saw strong growth in 2010 with Russia, Poland, Hungary and the Baltics all recording double digit growth in the numbers of projects reflecting the strong economic recovery in the region and its growing attractiveness to business.

Portugal, Greece and Spain all saw a decline in project numbers and the latter was overtaken by Russia as the fourth largest recipient for FDI in Europe. By contrast, Ireland saw a 36% growth in projects in 2010 underlining its long term competitiveness in terms of tax rates and a highly skilled workforce.

Table 1. The most attractive countries for the FDI

Country	Rank in 2010	Rank in 2007	Evolution
China	1	1	0
USA	2	3	+1
India	3	2	-1
Brazil	4	6	+2
Germany	5	10	+5
Poland	6	22	+16
Australia	7	11	+4
Mexico	8	19	+11
Canada	9	14	+5
UK	10	4	-6

Source: personal contribution using Kearney A.T. 2011 database.

According to Table 1, Poland realised the highest progress (+16) connected to the FDI evolution. During 2009-2010, the FDI in Poland totalled 7.4 billion Euros (-26% compared to the period 2008-2009). During the same period, the FDI were about 3.4 billion Euros in Romania and 1.6 billion Euros in Hungary.

Moreover, the FDI financed 75% of Poland's current account deficit in 2010. A successful domain for Poland is the FDI. Poland became one of the most attractively countries in the world for the FDI (Ernst&Young, 2010).

An improved investment outlook is already emerging as confidence across Europe picks up. Research from the 800 global executives interviewed for the European Attractiveness Survey in Spring 2011 highlights a 5% increase this year in the number of companies looking to invest in Europe and a 6% fall in the number of investors with no plans to do the same in Europe. Poland is an important destination for the FDI.

In the first quarter of 2010, for example, Poland attracted direct investments of about 160 million Euros. This money covered 14

projects which generated 2651 new jobs in the following areas: R&D (4 projects), machinery and equipment (4) auto industry (2), electronics, plastics and metal (each 1 project). Among the major projects included R & D Center in Wroclaw Nokia (400 jobs) and Lampre Group metallurgical project (100 jobs).

Nowadays, Germany lost its leadership in investing in Poland, while Japan and South Korea have a strong interest. Moreover, Poland will try to attract Chinese investments in comparison with other Member States.

In 2010, the number of permits for new investments in the economic zones from Poland was almost double compared to 2009. The amount invested was doubled, as well.

Heavily criticized for slow privatization, Poland has now provided a major source of income, a part of the local economy being controlled by the state.

The government launched a privatization plan until the end of 2010, in order to collect 8.9 billion Euros to finance the public debt. This privatization plan was not complete implemented, but it generated about 5 billion Euros still the end of 2010.

Under a rough estimate of the proceeds from privatizations done in the past 18 years, Romania collected about 4 billion euros, an amount comparable with the privatizations carried out by Poland in the last three years.

In 2010, Poland privatized only 28 companies. But the Polish state obtained more than 6 billion Euros only from its companies' listings, while the Romanian state listed only Transgaz and Transelectrica, and obtained only 100 million Euros.

Only on the New Connect market, the Polish stock market makes turnover of 3 million Euros a day, a figure close to the average daily turnover on the Romanian capital market. The stock privatization and the government support were very important to develop the stock institution in Poland.

Each privatization brings on the market thousands of new investors who are satisfied with the returns made in the tender and falls with more money in the market.

Another reason for the Polish economy positive evolution is the maintaining and the growth of the exports and the consumption. It should be noted that the positive development of the foreign trade was not necessarily due to the exports but especially

to the strong restrictions on the imports.

During 2007-2010, the Polish exports had a positive evolution excepting 2009. The positive trend is forecasted for 2011-2012, as well. The same trend had the imports (European Commission, 2011).

Figure 4. Foreign trade evolution (%)

Source: European Commission, 2011.

According to figure 4, Poland had the lowest fluctuations connected to the foreign trade, comparing to Romania and Hungary.

On the other hand, Poland has a huge domestic market with 38 million inhabitants. This market is less open than its neighbours, and less dependent on exports. Part of Poland's success lies with the internal market for consumer. More specifically, when the zloty depreciated (and the euro rose), Poles spent in the country.

The fact that this country is not part of the euro area is seen as an advantage. Since 2000, the authorities allowed the national currency, the zloty, to have a variable course, making exports more competitive during the crisis, notably Fiat and Ford cars that are manufactured in Poland. In addition, Poland benefited greatly from the scrapping premium in Germany and France. In other words, Poland is not dependent on exports compared to most new member countries in the EU (a share of exports in GDP of about 40% against 70% in the Czech Republic), which limited the extent of the contraction in the domestic demand, linked to the dramatic decrease of the exports (12% in the first half of 2008).

According to the IMF, Poland entered the crisis with relatively healthy economic fundamentals, which allowed the government to implement countercyclical policies which

were able to mitigate the fall. It is, first, a countercyclical monetary policy. In the past decade, the National Bank of Poland earned a solid reputation for anti-inflation fight, and this limited the fears of an escape out of the inflation control. The National Bank of Poland credibility, both international markets and the public, allowed it to reduce gradually the interest rates shortly after the impact of the global crisis. Since November 2008, the National Bank reduced the benchmark rate from 6% to 3.5%.

Finally, the consumption growth in Poland was not based on credit. The banking system in Poland is dominated by foreign banks, which face difficulties, but the structural health of the Polish economy led parent banks to maintain exposure on the Polish market and to provide funds to their subsidiaries in this country. Moreover, the authorities did not expect the banking system to block and reacted very early, encouraging banks to retain profits. In addition, the National Bank tested the banking system resistance to stress by on-site inspections to identify potential vulnerabilities and bottlenecks.

A key factor in the Polish economy's performance was appropriate political, fiscal and monetary mix. Since two years ago, the Polish Liberal government introduced a series of tax reforms consisting of reductions in taxes and eliminate red tape for business. These tax reforms led to a reduction in the revenues and increased the fiscal deficit above the 3% of GDP assumed by the Maastricht Treaty, but even the IMF has admitted that "drastic corrective actions to reduce the deficit taken now would risk worsening the current downturn in a recession."

In order to return to the Maastricht limits, the IMF recommended Warsaw to restructure fiscal architecture and to include binding multi-annual spending limits, but it is already a luxury compared to other European countries such as Romania, which had appealed to drastic cuts to limit deficit spending.

From the social point of view, Poland is one of the few European countries that achieved a broad pension reform to increase the retirement age and to introduce the private pension funds.

On the other hand, Poland, the only European country which avoids recession, is the country with the highest share of employees with particular contract (27.1% of the total employees). The more flexible labour market in Poland led to an increase in the activity rate, from 44% in 2004, to 50% in 2009, for example. In Romania, the activity rate declined continuously in recent years, ranging from 62.4% in 1997 to 50.7% in 2009.

4. Conclusions

Romania had a positive economic evolution during 2000-2008. Unfortunately, the positive evolution from 2008 was only a good fortune and it wasn't followed by real economic development.

Many specialists consider that the present crisis could be a chance for Romania's modernisation and development, but it was loosed.

The realistic forecasts talk about a real economic recovery in 2016. This is why, the Romanian president consider that the welfare from 2007-2008 will be achieve again in 2014-2015.

On the other hand, Romania had not competent governments in the latest three years, the money didn't manage wisely and the public budget looks like a sieve.

The problem is that Romania has no tradition in technocrat governments as Leszek Balcerowicz's government in Poland.

Moreover, the specialists' ideas are eliminated and the neighbours' good practices are forgotten.

After 6 years of continuous decline, the 2009 crisis in Poland resulted in only a moderate rise in the unemployment rate, amid increasing labour supply benefiting inter alia from recent structural reforms.

The sharper-than-anticipated downward adjustment of real wages mitigated the effects of the downturn on employment. Thus, employment kept growing during the crisis (by 0.5% between the first quarter of 2008 and the first quarter of 2010), especially in the services sector (except transportation),

while manufacturing and agriculture experienced substantial falls in employment.

Overall, employment growth is expected to remain in positive territory (0.7%) in 2010. Hiring is muted due to the effect of labour hoarding during the crisis. Increasing labour market participation resulted in unemployment peaking at 9.5% in 2010.

Going forward, employment growth is projected to accelerate gradually, leading to a moderate decrease in the unemployment rate to 8.5% in 2012. Against this improved outlook and mounting demographic pressures, further reforms favouring dynamic employment creation and higher labour market participation focusing on the extreme ends of the age distribution would help sustain a permanent recovery of domestic demand without undermining the competitiveness of the economy (European Commission, 2010, p.126).

On the other hand, the present crisis is the result of the global tendency of promoting the unsustainable growth, without goods and services. This growth is based on papers, which are not in the taxpayers' pockets.

Maybe the most important negative effect of this crisis is the disappearance of middle class society. Step by step, the men with a decent welfare will disappear and the human society will be divided only into very rich or very poor people.

Comparative Study Between the Romanian Seaside Tourism and Bulgarian Seaside Tourism

Ioniță Roxana
Pîndiche Elena

„Dimitrie Cantemir” Christian University of Bucharest
ionita_roxana2000@yahoo.com
pindichielena@yahoo.com

Abstract

Romanian Black Sea coast is characterized by the existence of a high tourist potential, which facilitates the practice of various forms of tourism. Currently, high prices and low quality of services, offer poor, lack of investments, are just a few factors that have made Bulgaria to win in recent years, a rather large part of the tourists who traditionally whereas Romania and visited it often Romanian Black Sea coast.

Key words: tourism, seaside, tourist services, quality

J.E.L. classification : L83

From the tourist point of view, Romania has a good potential, and is considered the tourism destination of the future. In this regard, the development of tourism in our country should take the form of an objective and a means of social and economic development of the whole, in the context of national policy development and integration into European structures. This will be achieved only in conditions in which will bring substantial improvements on the quality of tourist products and services. Diversity of tourism offer of spa resorts of seaside is regarded as one of the points of departure in the development of tourism spas in the area, since this offer has a pretty big competition on the market of the European balneoclimatică. While our country balneary and climatic offer is rigid, inefficient and inadequate to modern requirements and the changing tourism market, offering European-oriented profile and belt adapted to support health, thus meeting customers modern

luxury facilities and very attractive packages to structure and price.

Romanian Black Sea coast is a place for spending holidays for many tourists, but is also a destination for those who want to treat various diseases of spa resorts in the polyclinics as Eforie Nord, Eforie Sud, Mangalia, Saturn and Neptun. The tourist season in this area is extended programme of spa treatments, as the first foreign tourists arrive on the Romanian Black Sea coast since April and the last leaves at the end of September. Spa resorts in polyclinics in the mentioned will be recovered in particular therapeutic qualities of sludge from the Lake, located about 15 kilometres south from Constanta. In addition to the sludge of Techirghiol, basics of spa treatment on the Romanian Black Sea shore, uses the natural and other factors in the area of treatment, such as sea water, sulphur water mezothermal and peat mud, extracted from the nearby town of Mangalia. In seaside resorts polyclinics, appearing in the catalogues of major tour operators abroad, can be treated, and outside the summer season, degenerative, inflammatory disorders, respiratory and dermatological, gynecological diseases.

With all the benefits that offer the Romanian Black Sea coast, there are, however, and some negative aspects related to the practice of tourism in this area, that make foreign tourists and the Romanians to prefer other comparable tourist destinations such as Bulgaria. Some of these negative aspects characterizing the Romanian tourism in the coastal zone of the Black Sea, are the following:

- the Romanian Black Sea coast has a bid far too low compared to the recreational potential of the natural and anthropic available;

- reduced number of facilities which are outdated in terms of equipment and installations;

- the coastline is characterised by a high degree of pollution of the environment and through a process of increased degradation of the beach and the waterfront;

- high season departures, basically keep on season 2-3 months;

- the absence of direct air flights to the airport in Constanta, graduating from Mihail Kogalniceanu;

- access to the shoreline, notably difficult by road: by motorway exit, the road to Constanta is practically on one side, with a very crowded during the summer season;

- low quality of tourist services in relation to prices which by default leads to decrease in the number of Romanian and foreign tourists, for example, representatives of the company World of TUI gave the Romanian Black Sea coast as a result of the fact that the degree of satisfaction of foreign tourists is below the average accepted and they wanted to avoid the risk of complaints from meeting

- adverse image of Romania abroad as a potential tourist destination and its insufficient promotion of the foreign tourists are increasingly fewer on the Romanian Black Sea coast;

- the existence of neîntreținute beaches, which offer guests comfort. For example, last year the Mamaia was faced with an invasion of seaweed, which, with all due care by the authorities to eradicate them, all drove the tourists from the shoreline during the period;

- price packages to see the Romanian seaside is significantly higher compared with that offered by other tourist destinations in neighbouring countries. For example a stay six nights in peak season at a resort less expensive seaside can reach to cost around 250 euros, while in Bulgaria with 266 euros per week can you rent a villa in Albena for four people;

- price packages to see the Romanian seaside is significantly higher compared with that offered by other tourist destinations in neighbouring countries. For example a stay six nights in peak season at a resort less

expensive seaside can reach to cost around 250 euros, while in Bulgaria with 266 euros per week can you rent a villa in Albena for four people;

- no tourist packages to all-inclusive service of Romanian tourist offer, marketed successfully by Bulgaria, Turkey and Greece. Foreign tourists will in addition to comfort, as the tourist package that you purchase is completely, so that the additional costs are much lower. A case of impossibility of these packages, package all-inclusive system in coastal area, is given by the fact that in very many cases it is property of a person, and the restaurant it holds another investor

- low level of training of qualified personnel, which is in line with the work they provide and insufficient, particularly through labour migration

- lack of collaboration at the level of the factors involved in the management of tourism and the public authorities and local and central public authorities, with a direct effect on the allocation of funds necessary for the development and modernization of the littoral zone

- although tourism on the Black Sea lasts only 3 months, or levies are paid to resort for a whole fiscal year;

- public services are paid twice because local governments offer doubtful, and the taxpayer are obliged to manage infrastructure on their own;

- excessive taxation requires operators of tourism to pay 14 Central and 3 local taxes (taxes represent 35% of the prices of hotels and restaurants). In Turkey, Greece, Bulgaria and the charges are for 4-5 times smaller than in Romania because the authorities have understood that in addition to the tourism sector can develop and other related fields.

As a tourist destination, Bulgaria has gained in recent years, a rather large part of the tourists who traditionally whereas Romania and visited it often Romanian Black Sea coast. In the years 2006-2008 in Bulgaria tourism achieve more than 5% of GDP, whereas in Romania there was no 4%. From the tourist point of view, Bulgaria closely resembles the seaside of the Black Sea, Romania being sprinkled to resorts that have received numerous German investment, for example the resort Sunny Beach. Thus, Bulgaria experienced a more rapid development on tourism than Romania.

Bulgarian seaside resort is 30 (this number includes the so-called resorts 3-4 hotels), of which only ten are declared to be of national importance. Before the year 2000, many of the beaches of Bulgaria received the distinction "blue flag". This distinction is a label of recognition internationally of certain beaches which meet certain conditions related to the clean and flawless services. Currently, Bulgaria has ten beaches that hold this distinction.

At European level, Spain has over 450 Blue Flag beaches, Turkey 140, 10, Bulgaria and Romania, by the year 2005 had no beach with this distinction. In the year 2010, as a result of sustained efforts, resorts Mamaia, Eforie Nord, Neptune, Saturn and the tourist port of Eforie Nord obtained from the Foundation for Environmental Education Award "blue flag" (Blue Flag). Among the strengths of the Bulgarian tourism offer, which attracts a fairly large number of foreign tourists, and include:

- Bulgarian coastline runs for a length of 378 km. and is varied: beaches open, followed by deep lagoons and bays, steep cliffs and dunes, miniature mountains covered by forests and Peninsulas covered with vines and orchards, fishery villages, private cottages, campsites, modern resorts and intimate golfclubs;

- most Bulgarian stations are located quite far from the stress of the great cities, but at the same time, quite close to many tourist sites. Relax on the shores of the sea shall be added the multiple possibilities of excursions to the medieval towns and monasteries, folklore and dance evenings, etc;

- more gentle climate, the low level of salinity of the water, made Bulgaria one of the most desired holiday destinations. Albena, Golden Sands, Sunny Beach rises to the level of the quality of the stations on the shore of the Mediterranean Sea

- privatization of hotels and buying by investors Bulgarian seaside facilities;

- privatisation began in Bulgaria in 1993, compared to Romania when the process of privatisation of tourist structures started after the year 2000. Moreover, renowned investors – such as for example those Germans, TUI or Neckerman offered not only consulting but also money for new investments in hotels, on the basis of their

projects. Subsequently, the "credit" paid through the provision of tourism services by tourists

- creation of a favorable image among tour operators foreigners whom they convinced to invest important sums of money in upgrading to international standards: one example is the TUI which brings each year many foreign tourists: Germans are seen increasingly more often on Bulgarian lands and the increasingly rare on the Romania

- quality of tourist services is high and not related to tariffs;

- Bulgarian Black Sea coast is one of the most welcoming and cheap destination for families with children. Beach kids clubs are organized with specialised personnel, and in some resorts such as Albena, kindergartens for children, where tourists can leave their children when they participate in various recreational activities or excursions. These services may not be offered on the Romanian Black Sea coast, where families with small children cannot participate in various activities since there is a space specially dedicated to the care of children

- most hotels are building new or fully refurbished, with adequate facilities at the international level;

- qualified workforce;

- maintained beaches which offer all the comforts tourists;

- bathing water quality is better on the Bulgarian Black Sea coast. According to a report from the European Commission in Romania was at the level of 2007, one place where the water quality requirements of the European Union respects all compared to Bulgaria, which had 70 such places. A number of bathing water 48 monitored European Agency in 2008, only one of Romania has fulfilled the requirements of the European Union, while in Bulgaria, of the 89 assessed waters of the Black Sea shore, 70 respecting Community rules.

Conclusions

Both by its geographical location and the kind of accommodation, catering and leisure on the shore of the Black Sea, Bulgaria offers are engaged in an activity supported by tourism. Albena and Balchik area, Golden Sands have a potential tourist and leisure very diversified, being completed and an

optimal price-quality ratio of benefits to see so many foreign tourists choose as destination for their Bulgarian seaside holidays.

Distrust. The Enemy of Economic Recovery

Istrate Alina - Mariana
„Alexandru Ioan Cuza” University of Iasi
alina_mariana2004@yahoo.com

Abstract

In the context of current economic crisis, in finding necessary measures to redress the global economy, this study makes a connection between the psychological factor, distrust, and the recovery process. The problem of major interest in this conditions is what are the effects of distrust on economic processes, but also on the recovery of local and global economy. To this end, the author aims to analyze and carry out a study on the effects and psychological implications of this phenomenon, distrust, on businesses, organizations, on people and their way of action. The conclusion logically reached, through a qualitative and quantitative analysis, is that, both at microeconomic and macroeconomic level, distrust, caused by economic crisis, by uninspired measures of the leaders but also by negative predictions about the recovery, affects and hinders the prosperity and economic development. Restoring confidence can be the engine of the investment process and of economic growth.

Key words: economic distrust, economic crisis, economic recovery.

J.E.L. classification: O44, F43.

1. Introduction

By randomly browsing through journals and articles in economics, or by a simple Google search on the words „economic situation”, we obtain the following information:

- „World economic situation has worsened in recent years” (Christine Lagarde, FMI).

- „In 2011, no improvement in the economy has been noted” (Guy Poupet, President and General manager of BRD).

- „Things in the world, rather than improving, worsened and we have no sign of improvement in the near future. On the contrary. In Europe and worldwide, there is no good, sunny time predicted” (Emil Boc, Prime minister of Romania).

There are numerous examples and almost all may continue in the same pessimistic way. From this fact, I began to wonder how can the global economy influence the feeling of distrust. *May distrust be considered a threat to the economy, perhaps the biggest threat?* This study will provide an answer to this question and will highlight some conclusions that can be helpful when talking about the economic crisis and recovery.

Closely related to the question above, the question that also appears is: *Isn't the vision of the global economy, however, a too negative one?* The current economic situation is, indeed, not at all encouraging. But is it better to overly promote pessimistic economic forecasts? Can not this cause more damage? These actions have as a result the increase of distrust and skepticism about economic growth and recovery.

2. Confidence crisis and the implications on economic environment

Distrust has taken on global proportions, became a phenomenon and confidence crisis overcame economy. Financial markets are dominated by an unprecedented lack of confidence. Trusting business partners, honesty of economic actors, an investment profit, is a challenge and a proof of courage in the actual conditions. The Managing Director of the International Monetary Fund, Christine Lagarde, says that *„The global economy faces a crisis of distrust, exacerbated by policy incoherence and by political class dysfunction”*.

It is well known that the global economy slowed down until the credit flow and exchange transactions were frozen, due to the

high level of uncertainty in financial markets and because of lack of confidence. The current crisis is a mixture of economics and psychology, being fueled by the reluctance to invest, by the fear to take risks and to spend the available funds, by the fear of not earning enough to satisfy your needs.

As previously stated, **distrust is a phenomenon**. To justify this assertion, we take into consideration the scale and scope that it has acquired. It starts from the common man, who is dominated by fear and insecurity in the workplace, in the ability to cover expenses, in governing the country, it extends to small businesses, distrustful in the chances of survival on a harsh market, plus the conditions of economic crisis, and it covers the entire business community, spreading at the global economy level. Distrust and fear permeated everyone: employees, managers, entrepreneurs, customers, banker, politicians/legislators, the state, the European community.

Citizen's distrust in the possibility to satisfy the needs of food, health and housing, and in government of the country. *Distrust of the employee* about job retention and about receiving the salary, according to the schedule established by the work contract. *Distrust of the manager* in the team that he leads, in the power and the ability of employees to make appropriate decisions. *Distrust of the contractor* in obtaining profitability or even in survival chances in the system of taxes, and in the business partners. *Distrust of the customer* concerning the quality of products and services and the correct pricing calculation process. *Distrust of the banker* in customers solvency. *Distrust of the politician* in his own actions and in government colleagues. *Distrust of the state* in the honesty of economic actors, in the good evolution of society, without rigorous controls and standardization. *Distrust of the European Community* in the ability of the member states to achieve the indicators and also in their policy. Thus, we see that distrust starts from the most basic structures and extends to the highest level. The result...nothing beneficial. Only a persistent fear that acts as a barrier to initiatives, actions, business, investment, and to economic processes and slows economic recovery and development.

With the results that can no longer be predicted, because the times are more and more unpredictable, this fear and distrust is justified, only that it should be cautiously managed, controlled and publicized. Focusing on the harm made and spreading fear is not a solution, what we should do is to try to find the necessary solutions for economic growth and recovery.

Specialists say that the ineffectiveness of the measures taken by governments, experts hesitations and the lack of perspective made the distrust to become general, and on this background, the economic system is being blocked for a long period of time.

Expert David Wyss, from Standard&Poors says that, with the financial crisis, the first reaction of bank managers was to suspend all funding lines, for fear of new losses. Thus, we see that the banking system withdrew under the cloak of fear because of the distrust caused by the collapse of the housing market and the losses caused by mortgage loans. Hence, the crisis of confidence has spread very fast throughout all economy. Partnerships and business relationships built in years were broken overnight, because of the fear that the partner company is affected by the crisis and will not be able to honor contractual duties. The best example is real estate. Here, after a fast rising and an exaggerated enthusiasm shown in recent years, panic was set, but also insecurity, distrust, fear and even despair. Real estate companies have reduced their activity and ended up in bankruptcy, real estate developers found daily increasing losses, and builders refused new contracts for fear that they will not be paid. For what concerns buyers, who had money, they were expecting cheaper and larger buildings, and those who did not have cash, they were not given credit by banks, which were also distrustful in the value of the property assessment and in the possibility of loan repayment. Construction field, with an important contribution to GDP growth, is struggling for survival. The number of unemployed persons increases and state costs also increase.

We can see how distrust is becoming a general one, with serious implications, and we conclude that *a hidden fee is being paid*, a tax created by distrust. Trust affects two results: **speed and costs** [1]. When trust

decreases, the speed of the action and the speed of economic transactions also decrease and the costs increase. Customers perceive the distrust expressed by businesses and they give it up. Thus, sales are reduced, there are layoffs and the costs faced by both the entrepreneur and the state grow. The mechanism also works in reverse. Trust is like a key that starts the economic engine, sustains the processes and transactions and reduces costs and losses.

To see how participants behave in economic, master of fear and mistrust, and what consequences their actions on other actors, as well as the global economy, I made an analysis whose results are summarized below:

- **Economic actor: CITIZEN.**
Source of distrust: improving the overall situation.
Mode of action: consumer caution.
Consequences: decrease consumption of products and services and, at the same time, production.
Source of distrust: the system of government.
Mode of action: immigration, protests, strikes.
Consequences: disturbing activities, blocking economic processes.
- **Economic actor: EMPLOYEES.**
Source of distrust: job security, adequate financial remuneration and without delay.
Mode of action: fear, reduce consumption, saving and keeping money at home.
Consequences: decreasing efficiency and effectiveness at work, reducing the consumption, removal of economic circuit of money and blocking them.
Source of distrust: efficient use by the state of contributions from salary, public services in exchange for these contributions.
Mode of action: work on the black market.
Consequences: decrease in state funds.
- **Economic actor: MANAGER.**
Source of distrust: he leads the team and how the tasks are performed by it.
Mode of action: authoritarian, not delegate responsibilities, verification and control excessive, take one decisions.

Consequences: delayed decisions and may not be the best, losing valuable time by performing controls and checks repeated, his distraction from its important responsibilities (developing strategies for recovery and growth, etc.), task load unnecessary that can be delegated to employees, creating an environment tense and a mutual distrust, low labor productivity.

• **Economic actor: ENTREPRENEUR / INVESTOR.**

Source of distrust: business success and its profitability.

Mode of action: keeping funds available, reducing costs to a minimum.

Consequences: stagnant economy, the unemployment rate increase, the economic situation deteriorates.

Source of distrust: state support, the system of taxes and fees.

Mode of action: illicit activities and creative accounting to avoid the payment of contributions, making investments in other countries that offer incentives and benefits.

Consequences: reducing the funds available to the state.

• **Economic actor: CUSTOMER.**

Source of distrust: quality products and services, continuity of an enterprise activity, pricing accuracy, the company adopted a social and environmental policies as appropriate.

Mode of action: giving up the products a company and calls for competition.

Consequences: decreased sales, reduced revenues, reduced activity and layoffs of staff, stagnation or even bankruptcy.

• **Economic actor: BANKER.**

Source of distrust: customer solvency, economic recovery.

Mode of action: restricting credit and even freezing.

Consequences: lack of liquidity necessary consumption, development or even investment, slowing economy, the collapse of business.

Source of distrust: evaluate reports of experts, real estate market fluctuations.

Mode of action: request for review, disruption of real estate lending process, credit refusal.

Consequences: blocking real estate transactions.

- **Economic actor: STATE.**

Source of distrust: honesty and good faith of economic actors.

Mode of action: imposition of various taxes, tributes, repeated controls, excessive bureaucracy.

Consequences: discouraging entrepreneurship and foreign investment, disruption of activity of firms.

- **Economic actor: EUROPEAN UNION.**

Source of distrust: performance criteria for a country to become an EU member state and compliance responsibilities by Member States.

Mode of action: imposing stringent criteria and complex plans must be met by the States wishing to accession, careful monitoring and verification.

Consequences: long process of accession.

3. Economic sentiment indicator (ESI)

The Economic Sentiment Indicator (ESI) is an indicator that measures public confidence in the economy. It takes into account five sectors, each with different weights: industry, services, consumer, construction and retail trade.

For each sector is establishes an index of confidence, periodically, based on a balance of answers to a series of questions strictly related to the field analyzed. ESI is calculated as an index as an index with mean value of 100 and standard deviation of 10 over a fixed standardised sample period.

Table 1. The index of economic confidence during June-October 2011

time/ geo	June	July	Aug.	Sept.	Oct.
EA17	105.4	103.0	98.4	95.0	94.8
EU27	104.6	102.3	97.4	93.9	93.8
RO	93.7	93.6	92.3	91.6	90.8
UK	99.9	98.5	92.9	89.5	89.5
DE	114.5	112.7	107.0	104.9	104.1
ES	95.7	93.0	92.7	90.9	90.8
FR	107.4	105.9	99.7	96.0	97.2
IT	99.3	94.8	94.1	89.0	89.3
PL	97.5	97.9	94.3	93.2	92.6
GR	70.0	70.9	73.7	70.6	67.5

Source: <http://epp.eurostat.ec.europa.eu/tgm/table.do?tab=table&init=1&plugin=0&language=en&code=teibs010>

As we can see, confidence in the economy declined, both in the euro area (EA17), which includes 17 states and the European Union (EU27), consists of 27 Member States, in a similar rhythm, in the five months analyzed.

Except for France (FR), which is recorded in October, compared to September, an increase in confidence by 1.2 points, Italy (IT) that a slight increase of 0.3 points and the United Kingdom (UK) that a stagnation at 89.5 percent during the same period, the evolution of the index of confidence in the economy follows a trend descendent monthly, as can be seen from the table. The perception population of the economy continues to suffer, the worst situation is in Greece (GR), which record the lowest ESI, in the month october reaching the level of 67.5 points. This is due, no doubt, serious economic problems that Greece has to face today.

In Romania (RO), analyzed index fluctuations are not drastic in between June-October 2011. Falling at the same trend descendent, but decreased to 93.7 index points in June to 90.8 points in the month of October (a decrease of 2.9 percent in five months), indicating a slight decrease in terms of distrust and panic in our economy. Countries like United Kingdom, Germany (DE), France (FR) and Italy (IT) recorded a decrease of 10 points, or even more, changed in comparison period.

4. Restoring confidence

In current conditions of political instability and unpredictability for the economic environment, the economic crisis can be both partner and adversary. With a positive mind and approach, and meeting the necessary conditions for **A-DAP-TA-TION**, the smart entrepreneurs are able to increase their business by treating the crisis as a partnership. The secret of success is about your position to the new conditions, if you have enough confidence to give your business another chance, or if you let yourself subdued by distrust in everything that surrounds you.

For an economic recovery, we should start to regain confidence, and to regain confidence, we need high levels of character, competence, not only at the employee, leaders, government level but also at the European Union level.

Restoring confidence involves quality communication, that should present the real situation, but also a recovery plan, maintaining morale, training and proper motivation of employees to work more efficiently, recognizing achievements, and appropriate remuneration.

Distrust and panic, created by the crisis, determine an organization to reduce costs to minimum, while it should invest in new strategies, in technology, in employees, in distribution channels, in image. So you can enjoy trust, you must offer it first. You have to respect commitments, to give confidence to the team and to your partners, and to create transparency.

The solution to escape the recession is to sell. You should sell, being careful to customers requirements and respecting the business environment which you belong to. To sell means initiative and action, basic burdens of entrepreneurs and managers. As long as a businessman focuses on quality of his products and services and, importantly, keeps them in time, he gains the trust and customer loyalty. He will sell more and get more cash. Having money and paying at maturity, suppliers will want to conclude business with him, and they will also give him discounts. Thus, the beneficial effects are multiple, and costs are reduced considerably. As a businessman, if you do not present credibility and reliability for your partners, they will refuse to collaborate. Profitable business can be made in minutes, by shaking hands with a partner you trust, this gesture being actually the unwritten contract, underlying the transaction.

The resumption of investment flows plays a very important role in the economic recovery. For this, the state is required to restore positive feelings in the economy. „*In times of crisis, the business needs **landmark stability** more than ever*”, said Bernard Baumohl, executive director of Economic Outlook. „*Therefore, attention in business environment is strongly moving to the state, and its help becomes fundamental. From investments in the economy, to lending areas*

considered to be strategic, such as infrastructure, to ensure funding lines and to develop a fiscal framework adapted to the crisis, businessmen look with hope towards authorities”.

5. Conclusions

Proliferation of distrust in the economic and social environment, on individuals and entities, has negative effects on the economy. It hinders business processes, decisions, investments, developing transactions, involving a series of direct and indirect costs. Distrust in the economy may keep, and kept, minus stock exchanges.

I could notice that fear and distrust is a great enemy for economic recovery. To regain confidence in the economy, ethics, transparency, respect for commitments and providing reliable voting to partners, are required. A moral basis can be profitable for a company that respects its customers and the environment.

The state has an important role in the process of restoring trust and of economic recovery. It has the task of creating an investment environment of trust and security, fiscally stabil, and a moderate tax on investments, able to attract foreign and individual investors within the boundaries.

Economic collapse is not just a chain of collapses of some business, of economic events, but also relates to the psychological factor, distrust. Therefore, to overcome the crisis, it is necessary to restore confidence in all structures with implications on the economic environment. Only so, transactions and economic circuits, currently blocked by fear caused by the economic crisis, will be brought to life.

6. Acknowledgement

Financing of Investments – A Starting Point for the Economy Development Practical Application of EOP Biodiesel

Istrate Luminita Gabriela
The Bucharest Academy of Economic Studies
istrate_luminita@yahoo.com

Abstract

Liquidation is one of the most important indicators of the companies. The fact, that the financial resources, as well as the valutory or the material ones are limited, and the destinations are competitive, claims their usage under extremelly efficient conditions. On expenses commitment for accomplishment of an objective or of an action, there must be carefully analized all the susceptible solutions worthing to be taken into consideration for choosing the optimum variant that presents the most advantageous report between the required effort and the obtained effort as its result. The financial policy must follow the systematic growth of all expenses efficiency.

Key words : own financing sources, profitability, capital, biodiesel industry, investment project.

J.E.L. classification : D24; M21.

1. Introduction

Without a capital adequacy, any small or middle business has less chances to be successfully marketed and to be developed. But attraction of the necessary financial funds raises several problems to the enterpriser, both under the discovering and access aspect to the financing sources, and under the aspect of advantages and disadvantages implied in each source separately. The main disadvantage that results in case of using funds, other than the own ones, is the decreasing of the rights of control and property of the enterpriser upon the business.

The own funds represent the most frequent starting point in case of small and new business. The financial institutions are less opened – especially during periods of economic instability – to the firms that are at the beginning than to those with a “history” already known.

Size decrease of the assets balance-sheet items or increase of the liabilities balance-sheet items value is equivalent to ready money release for the enterprise, and as a result, it can be considered a ready money source.

Thus, in the category of ready money source, it is included: the sale of fixed assets from the enterprise ownership, the clearance of the stocks of raw materials and/or finished goods, the decrease of receivables volume, the increase of the contracting credits from the third parties or of the capitals attracted from the shareholodres, the increase of payment gaps towards providers, employees, associates.

In the category of ready money use, it is included: the investments, the acquisitions of new assets and/or equipments, the stock increase of raw materials and/or finished goods, the increase of receivables volume, the reimbursement of contracting credits, the decrease of exploitation debts, the loss accumulation, the share repurchase from the enterprise associates.

2. The historical evolution of EOP Biodiesel and delimitation of its object

EOP Biodiesel, a German producer of biofuel, anticipated a high potential of development in the baltic countries, like Romania and Bulgaria, countries that do not have sufficient capacities of production in order to comply with the objectives of the European Union concerning the use of the

alternative fuels. The Beteiligungs EOP Division operates in Romania by EOP Farms și EOP Siloz that work with rapeseeds.

After 1973, when the first important world oil crisis took place, the scientists and specialists turned their attention, searches and researches towards finding any inexpensive and promising alternatives for the limited crude oil reserves of the Earth. Lately, these efforts have been added to the ones for the environmental protection whose pollution reached life-threatening levels in some parts of the world.

And thus, as a result of these sustained researches of the specialists all over the world, it appeared one of the saving solutions: Biodiesel! This is an alternative, non-polluting fuel which is obtained from regenerable resources (crops of rape, corn, etc.) and can successfully be used in diesel engines, being combined in different proportions with diesel fuel in order to create, thus, a mixture of fuel for the vehicles.

More foreign companies showed their intention to produce biodiesel in Romania. Likewise, the businessmen from Romania can see an opportunity in biodiesel production for their own companies as well as for Romania, that, according to the European Directives, they must take measures for replacing the gasoline and diesel fuel used in transportation with biofuel, from 2% in 2006 to 20 % in 2020.

A company listed at the Stock Exchange since 14.09.2005, EOP Biodiesel AG has been producing more than 400000 liters per day of quality biodiesel based on rape oil. This corresponds to the highest quality standards.

3. Description of the investment project

The main working hypothesis include both estimations at the macroeconomical level for the general evolution of national economy, and estimations specific to the biodiesel industry from Romania.

3.1. The main working hypothesis

1) Hypothesis at the macroeconomical level

Basic macroeconomical data used in construction and evaluation of the investment pattern, are:

a) Evolution of inflation rate in Romania during planification. Estimations of this indicator are made by international forecasting institutions and are based on a short-medium term horizon reflected through the prism of the current market situation (corresponding to the situation at the moment of evaluation).

b) The medium exchange rate RON-EUR during planification period is based on the current futures quotes, for different maturities, and it is provided by the Bloomberg financial information network. The necessity of selecting a medium rate exchange derives from the complete calculation of the investment rentability

proposed in EURO currency, fact that corresponds to a normal calculation option from the perspective of an EU investor in the Romanian economical environment and to the emission of initial capital in the European currency. Choosing a specific temporary rate exchange, instead of a fixed rate exchange for all period, is convenient due to inclusion of a considerable time horizon (in comparison with the present value, affected by the current market situation).

2) Hypothesis at the level of biodiesel market from Romania

The working hypothesis specific to biodiesel refer to the sustainable volume of biodiesel production in Romania and to the share evolution held by the EOP investment on the local market of biodiesel.

By sustainable production, it is referred to the accomplishment of a lasting development of biodiesel industry, without any negative impact on other economical branches. The main raw material for obtaining biodiesel is vegetable oil, a good but with a wide use also in the alimentary field, respectively in securing the human food necessity.

The main steps followed in estimation of the working hypothesis specific to the biodiesel market from Romania, are:

Step 1: Forecastings regarding the national production of biodiesel during the analysis period – are based on the national production of oleaginous seeds, estimations regarding the level of exports of these goods and the conversion rates for seeds – vegetable oil and respectively vegetable oil – biodiesel.

A basic influence factor in the positive evolution of biodiesel production is the agricultural yield of the oleaginous seeds, expressed in accordance with the quantity obtained per a hectare cultivated with these seeds. In comparison with an EU average, the actual level of this yield is over 2, lowered, fact that reflects not only the low efficiency of the agricultural branch, but also an opportunity of getting more efficiency and obtaining a higher production of seeds, without having a negative impact on the alimentary branch (in the working hypothesis, the cultivated surface is not modified, thus, the increase of the obtained quantity being only by means of a superior agricultural efficiency).

The main factors with a direct influence on the sustainable biodiesel production from the internal resources of raw material are not only the efficiency of oleaginous seeds but also the level of these seeds export (being high at present, due to the requests from other EU members for covering the own biodiesel need)

Step 2 : Forecastings regarding the market ratio held by the investment project of EOP in Romania - are based on estimations made in the previous step for the national biodiesel production, and on the production capacity taken into consideration by the EOP investment from Romania.

The market ratio held by EOP Romania has a positive evolution till 2011, when it reaches approximately 27%, corresponding to the capacity of maximum production of investment (45 thousand tones).

After 2011, the market ratio decreases and reaches the level of 18,5% in 2015. The negative evolution of the ratio is due to a constant level of EOP production, limited at the maximum capacity of investment, while the market is recording a continuous increase of the national production.

Step 3: Estimation of the investment project earnings and of the main variable cost positions.

The main earnings of the investment project come from the sale of biodiesel as a base product, and of glycerine as an alternative product.

The produced and traded quantities of biodiesel by EOP Romania correspond to the level estimated in the previous step. The trade price for 2009 corresponds to the current market price, and for the following planned years, the price was adjusted by the annual inflation previously estimated.

The final price forecasting of biodiesel used in the financial planification is based on the Euro currency and transformation of the national price in an Euro equivalent price, by means of the futures quotes.

The glycerine price is directly expressed in Euro currency due to the European outlet and it has been yearly adjusted by a constant annual inflation of 1%, as the glycerine price reports to the entire European market, and only limitedly to the Romanian one.

The glycerine quantity resulted from the biodiesel manufacturing process is forecasted to approximately 10% from the quantity of used vegetable oil.

The main variable expenses of biodiesel production are connected to the vegetable oil acquisition, with the highest contribution to the cost structure, and to those for methanol.

Calculation of vegetable oil price is similar to that for biodiesel trade price (National price - > Adaptation to the inflation level - > Conversion of national price in Euro currency).

The necessary volume of methanol for securing the biodiesel production is estimated to 10,4% from the necessary quantity of vegetable oil.

3.2 Structure of the project financing

For the achievement of the EOP investment project, there are taken into consideration 3 financing sources:

- **Equity capital:** it is constituted from the initial capital inflow and the distribution of the annual net profit / loss (working hypothesis: no other capital accretion)

- **Initial bank loan:** it is performed for covering - the financial gap, due to an insufficient capital inflow, - the initial investment in acquisition and development of the investment placement infrastructure and the necessary production equipments. The initial bank loan has a redemption period of 6 years, with rate payment at the end of each calendar year. The interest taken for this loan is 10%.

- **Bank credit line:** it is made for covering the current necessity of ready money for a normal functioning of biodiesel production (securing the working capital), and the the loan redemption is flexible, according to the EOP needs. The interest taken for this loan is 11%.

The equity capital inflow has an unfavourable evolution due to the loss reported during the first years of the financial planning and of the working hypothesis regarding the dividends distribution (100% of the net profit distribution is starting in 2011).

The bank loan should be totally repaid till the end of 2013, while the volume of the credit line increases considerably, due to the covering of the ready money need for the project.

3.3. Planning of the investment performance

The main earning sources (biodiesel and glycerin) and the sources generating variable expenses (vegetable oil and methanol) were presented in the previous sections.

Project evolution during the first years was negatively affected by a low level of production, mainly caused by the installation and operation process at normal parameters of production (in these calculations there were also included the initial production loss as a result of some technical problems, specific to a starting investment or to a local level of an insufficiently developed know-how). Other direct expenses are forecasted at a constant annual level, depending on the obtained earnings and they correspond, in percentage, to the research results in the field of biodiesel (feasibility and research study at a scientific level).

EBITDA margin was negative in 2009 as a result of a low production level corroborated with a high level of the fixed expenses, corresponding to a production of maximum capacity or close to it.

A normalized EBITDA margin is to be recorded in 2011, when the market is penetrated by EOP products and the equipment of production operates at high parameters. EBIT margin records a similar evolution, but it is additionally affected by the fixed expenses for amortization.

As a result of the loss recorded in 2009 and 2010, and of the opportunity to use the accumulated loss from the calculation of the profit tax in 2011 (hypothesis of deductibility of loss from the profit of the following 5 years), the planning forecasts tax expenses only starting from 2012. The complete tax ratio of 16%, proper to the fiscal field from Romania, is applied to the profit before tax (EBT) from 2012.

3.4. Capital Cost

The capital cost was estimated by means of the weighted average cost of capital on the basis of the initial capital structure, mentioned here as WACC (57% - loan capital, 43% - equity capital)

The cost of the equity capital for investment in biodiesel market from Romania was estimated by CAPM. Their basic elements are:

- **The risk free-rate** - corresponds to the yield offered by the Austrian government bonds, the main outlet market for biodiesel production from the source company, with a long-life maturity (the life period of investment project in biodiesel is considerable).

- **The country risk premium** - corresponds to the spread between the financial instruments issued in a developed country and a country of investment placement, in this instance, Romania.

- **The Unlevered Beta** – was estimated on the basis of the linear regression of 60 samplings of monthly observations, by means of of a company group listed at the Stock Exchange, having the same field of activity as EOP biodiesel. The final value of this indicator corresponds to an arithmetic average of beta values obtained for each company from the group, and the ulterior

elimination of the effect upon beta, due to the particular financing structure. Thus, the resulted value reflects only the operational risk.

- **The relevering process** – is based on reintroduction in the beta indicator of the risk caused by the structure specific to the financing of investment in the local production of biodiesel (D/E 1.33 due to an initial superior level of the loan capital for financing the equipments and the placement of location).

- **The market risk premium** – is forecasted to 5,5% and corresponds to the recommendations of The Auditors Chamber from Austria for a long period of time, for a mature capital market (a standard reached by Romania on a medium-long term).

4. Conclusions

Maintenance of the investment activity in Romania, as well as valorization of the oportunities specific to the present situation, can constitute important measures for reducing the impact of the economical and financial crisis.

In the present international situation, it has been highly emphasised the strategic orientation of investments which implies that, the managers must know not only the present social-economical environment, but also the future one, and identify the causes of changes. There shall be accomplished only those projects that have successful chances, that means, the ones which will generate useful effects during their entire economical life, in a social-economical environment that is in a continuous change and that is sometimes hostile.

This approach is of greater importance in the public working field, where each project must fit in the strategic axis of the social-economical development on a local and/or national plan.

In grounding of the investments decisions, the emphasis is put on the quantitative techniques of modification and quantification. The analysis on the basis of the cash flow generated by the project becomes a classical in the field from now on.

Whether the time limit of the project is longer, (the case of the research development projects of the territorial placement ones) the traditional techniques of decisions grounding are difficult to apply and do not give the best results.

A Brief Regard on the Cohesion Policy

Jaliu Dragoş

National School of Political Studies and Public Administration,
Faculty of Public Administration
jaliudragos@gmail.com

Abstract

More than five years have passed since the moment when the first European financial period that concerned 27 Member States officially commenced. The European authorities analysed its weak and strong points so far, and on this basis, they issued proposals for the next 7 financial years. This paper is intended to present a short overview of the main differences and similarities between the current financial period and the future one, in terms of budget, objectives, European co-financing and its architecture in general.

Key words: European cohesion policy, financial period

J.E.L. classification: O022

1. Introduction

EU acts to promote "harmonious development" and aims, in particular, "to reduce the gap between different regions"[1].

Since the mid 80's, the importance of the European development policies has grown, in both legal and budgetary terms. In **legal terms**, the problem of achieving "Economic and Social Cohesion" in Europe has gone from being just a mention in the Preamble of the Treaty of Rome, to become Title XIV (current Title XVII) after the adoption of the Single European Act. In **budgetary terms**, the policy development stage has increased from representing almost 10% of the European Communities budget and 0.09% of EU-15 GDP in 1980, to more than one third of the budget and about 0.37 of EU GDP, as an average for the 1998-2001 period[2]. The development policy has become, after the Common Agricultural Policy, the second largest European policy regarding the size of its implementation area[3].

The 1989 Structural Funds reform involved not only the coordination of the three then - existing Structural Funds (European Social Fund - ESF, the European Agricultural Guidance and Guarantee Fund – EAGGF and the European Regional Development Fund - ERDF), but also doubling the money allocated to regional development from 15.1% of the EU budget in 1988 to 30.2% in 1992. Secondly, the decision taken through the Maastricht Treaty to create a single European currency was closely related to the decision of establishing the Cohesion Fund.

The concentration of the regional policy was further increased by reducing the number of objectives from 7 (in the programming period 1994-1999) to 3 (in the programming period 2000-2006)[4]. For the 2007 – 2014 period there are 3 objectives, but for the next financial period, cohesion policy objectives will turn into 2 "Goals".

Since November 1993 when the Maastricht Treaty entered into force, economic and social cohesion became, officially, one of the objectives of the EU. As the EU expanded, consolidating the economic and social cohesion became more difficult because Member States became more heterogeneous[5]. Structural policies were developed based on three general assumptions: there were disparities between EU regions, structural policies were able to reduce these disparities and regional growth and convergence lead to cohesion[3].

The Cohesion policy was reformed in 2006. Bureaucratic simplification was attempted, by even reducing the number of documents that each Member State had to convey at the beginning of the financial period for EC's approval. Cohesion policy objectives were closely linked to the Lisbon Strategy. How will the cohesion policy look in 2014-2020? We try to present a short overview of the main differences and

similarities between what is happening in the current financial period and what it's expected to happen - according to the legislative package in debate - in the future financial period.

2. A brief history of structural and cohesion funds

Since the establishment of the European Coal and Steel Community, the Structural Funds have contributed to the realization of EU's economic and social policies.

1957. Since the drafting of the Treaty of Rome, the document that laid the foundation for future European Communities, there have been made specific references about the need to eliminate the economic disparities between regions.

1958. The European Social Fund and the European Agricultural Guidance and Guarantee Fund were created.

1975. After the accession of Denmark, Ireland and Great Britain, the European Regional Development Fund was created. It was the first time when the concept of redistribution between rich and poor areas of the Community was used.

1986-1987. The concept of social and economic cohesion was introduced in the Treaty; this concept aimed to help the last Member States (Spain and Portugal) to meet the challenges of the single market.

1988. At the initiative of the European Commission's President, Jacques Delors, the financial resources for Structural Funds were doubled over the next years. Thus, poor countries received about 154 billion ECU in nine years.

1989. The system of granting structural funds was revolutionized by introducing the principle of multi-annual programming, setting the priority objectives and developing partnerships between Member States.

1992. The Heads of State decided to double the budgets of disadvantaged regions.

1993. „Cohesion" became a priority objective for the Union.

1995. Due to the accession of Sweden and Finland, less populated regions began to receive funds.

1999. The Heads of State and Government decided at Berlin the next reform of the structural funds, focusing on helping disadvantaged social groups and regions.

2006. A new reform of the cohesion policy aimed at reducing the number of objectives and instruments. EAGGF and IFP were no longer instruments of the cohesion policy.

3. The actions of the cohesion policy. Objectives.

2007 - 2013

In order to achieve the objectives stipulated in the Treaty of Maastricht, the EU budget finances cohesion policy actions that contribute to promoting sustainable growth[6], competitiveness and employment[7].

The cohesion policy has a strong instrumental character and it contributes through its solidarity funds to the accomplishment of the objectives of other EU sectoral policies - such as the common agricultural policy, social policy, and environmental policy. In addition, the regional development policy is related to the enlargement policy through the creation of pre-accession funds - PHARE, ISPA and SAPARD. These are funds to which the candidate countries have access and that support their transition to EU standards.

2014 - 2020

The European Commission decided that the cohesion policy must remain an essential element of the financial package 2014 - 2020 and it also highlighted its important role in the implementation of Europe 2020 Strategy. The economic crisis caused a shock to millions of citizens and revealed some fundamental weaknesses of the European Union's economy. Consequently, three priorities, which are mutually reinforcing, were proposed by Europe 2020 Strategy[8]:

- **Smart growth:** developing an economy based on knowledge and innovation;
- **Sustainable growth:** promoting a more efficient economy in terms of using greener and more competitive resources;
- **Inclusive growth:** promoting an economy with a high rate of employment to ensure social and territorial cohesion

The three priorities of the strategy are interdependent and mutually reinforcing because progress in the educational field helps job prospects improvement and poverty reduction. More investments in research and innovation and more efficient use of

resources help us become more competitive and provide favourable conditions to create new jobs. Also, investment in green technologies contributes to combating climate change and creates new business opportunities and jobs.

For the 2014 – 2020 period, the European Commission proposed several important changes to the way in which cohesion policy is designed and implemented. These are:

- focusing on Europe 2020 Strategy`s priorities of smart, sustainable and inclusive growth;
- rewarding performance;
- supporting integrated programming;
- emphasis on results - monitoring progress towards the agreed objectives;
- strengthening territorial cohesion; and
- simplifying the application.

In what follows, we try to present a number of similarities and differences between the two cohesion policy financial periods.

What stays the same:

There will be the same cohesion policy financial instruments.

The cohesion policy is financed from the EU budget through three structural instruments: the European Regional Development Fund (ERDF), the European Social Fund (ESF) and the Cohesion Fund (CF).

The European Regional Development Fund (ERDF)

The ERDF finances the European intervention aimed at strengthening economic and social cohesion by redressing the main regional imbalances offering support for the development and structural adjustment of regional economies, including the conversion of declining industrial regions and less developed regions and supporting cross-border, transnational and interregional cooperation.

European Social Fund (ESF)

ESF contributes to the Community's priorities regarding the intensification of economic and social cohesion by improving employment opportunities, a quantitative and qualitative employment and by encouraging a high level of employment.

Cohesion Fund (CF)

The Cohesion Fund is the financial instrument that supports investment in transport infrastructure, energy and environment.

Unlike the Structural Funds, the Cohesion Fund does not co-finance programmes, but it provides direct funding for individual projects, which are clearly identified from the beginning. The decision to finance a project is taken by the Commission in agreement with the beneficiary Member State, while national projects are managed and supervised by a Monitoring Committee.

The budget will not change significantly.

The financial allocation is relatively the same, compared with the large sums allocated. The difference is no more than 8% for the years 2014-2020 in comparison with the current financial period. Thus, the budget for 2007 - 2013 was 347.4 billion euros and the total budget proposed for 2014-2020 is EUR 376 billion, including funds for the new "Connecting Europe" facility. This facility is designed to increase the number of cross-border projects in domains such as energy, transport and information technology. The budget for 2014-2020 will be distributed according to the graph and table below:

Graph 1. The budget proposed for 2014-2020

Source:

http://ec.europa.eu/regional_policy/what/future/proposals_2014_2020_en.cfm

Table 1. The budget proposed for 2014-2020

The budget proposed for 2014-2020	Billion euros
Less developed regions (<i>Romania</i>)	162,6
Transition regions	38,9
More developed regions	53,1
Territorial cooperation	11,7
Cohesion Fund	68,7
<i>Outermost regions</i>	0,926
The "Connecting Europe" facility for transport, energy and information technology systems	40

Source: Proposal for a Regulation of the European Parliament and of the Council, No. 2011/0276

What changes:

European co-financing

For 2014 – 2020, the Commission proposes capping co-financing rates at the level of each priority axis within the operational programmes at 75 - 85% in less developed regions and outermost regions, 60% in transition regions and 50% in more developed regions.

Geographical spread of European funds contributions

From six members in 1950 to twenty five in 2004 and twenty seven in 2007, the European Union can introduce itself today, and on good grounds, as a continent. Spanning between the Atlantic Ocean and the Black Sea, it reunites Western Europe and Eastern Europe for the first time from their separation determined by the Cold War, over 60 years ago. To ensure the concentration of funds according to the level of the national gross domestic product (GDP), a clear distinction between less developed and more developed regions is to be made in the 2014-2020 financial period.

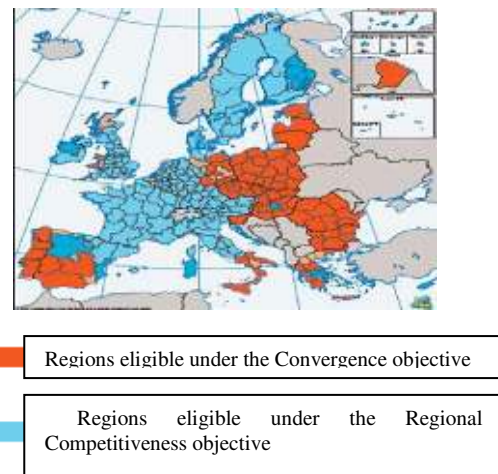

Less developed regions: Supporting less developed regions represents and will remain a high priority of the cohesion policy. Surmounting the social and economic

disparities between regions will require long term endeavours. This category includes those regions with a GDP/capita less than 75% of the average GDP of EU-27.

More developed regions: While interventions in less developed regions will remain a cohesion policy priority, there are still important challenges that concern all member states, such as the global competition in the knowledge-based economy and the shift towards the low carbon emissions economy. This category includes those regions with a GDP/capita above 90% of the average GDP of EU-27.

The programming of the 2014 – 2020 financial period introduces a new type of region, the transition region. This type of region was introduced to substitute the present system of progressive elimination and introduction of European support. This category includes all regions with a GDP/capita between 75% and 90% of the UE-27 average.

http://ec.europa.eu/regional_policy/atlas2007/index_ro.htm

Figure 2: 2014 – 2020 eligible regions – cohesion policy

Source:

http://ec.europa.eu/regional_policy/what/future/proposals_2014_2020_en.cfm

Cohesion policy objectives and European funds allocation amongst regions

For the 2007 – 2013 financial period, the policy framework is based on accomplishing the objectives of both Lisbon and Göteborg Agendas. The 3 objectives are:

Objective 1: The Convergence objective aims at speeding the economic development in less developed regions through investments in infrastructure, human capital, innovation, development of the knowledge-based society and environmental protection.

Objective 2: The Regional Competitiveness and Employment Objective aims at developing competitive regions, better employment by anticipating economic and social change by increasing and improving investment in human capital, innovation and promoting the information society.

Objective 3: The Territorial Cooperation Objective aims at boosting the cooperation between regions on three levels: interregional cooperation – the encouragement of experience exchanges between EU areas, cross-border cooperation – joint programs run in border regions and transnational cooperation.

The 2014 – 2020 financial period brings new changes: The European Commission proposed to merge the first two objectives, convergence and regional competitiveness, into a single goal: **Investment for growth and jobs**. The Territorial Cooperation Objective evolves into the Territorial Cooperation Goal.

Table 2: 2007 – 2013 Cohesion Policy architecture

Structural and Cohesion Funds	Eligible areas	Financial allocations
„Convergence” Objective		81,54%
251,16 Mld. Euro		
ERDF	Regions with GDP per capita <75% of the GDP per capita EU25	57,04%
ESF		189,6 Mld Euro
CF	Member States with GNI <90% of GNI / capita EU25	24,5% 61,55 Mld Euro
„Competitiveness and Employment” Objective		15,95%
49,13 Mld. Euro		
ERDF	Member States propose a list of NUTS I or NUTS II regions	15,95%
ESF		49,13 Mld. Euro
„European territorial cooperation” Objective		2,52 %
7,75 Mld Euro		
ERDF	Border regions and regions for transnational cooperation	2,52 % 7,75 Mld Euro

Source: http://ec.europa.eu/regional_policy/

Table 3: 2014 – 2020 Cohesion Policy architecture

Goals	Types of regions	Structural and Cohesion Funds
Investment for growth and jobs	Less developed regions Regions with GDP per capita <75% of the GDP per capita EU 27	FEDR FSE FC
	Transition regions Regions with GDP per capita 75% < 90% of the GDP per capita EU 27	
	Developed regions Regions with GDP > 90% of GDP / EU 27	FEDR FSE
European territorial cooperation		FEDR

Source: Proposal for a Regulation of the European Parliament and of the Council, No. 2011/0276

Multi-fund Operational Programmes

Up until 2013, if an operational programme financed from the ERDF targets operations eligible for financing through another Community support instrument, the member states decide, for each operational programme, the criteria that can allow the demarcation between operations supported

by the ERDF and operations supported by other instruments[9].

With the new financial period 2014-2020, the possibility to finance priority axes within the same Operational Programme was introduced for the three structural instruments – ERDF, ESF and CF.

A modified programming framework

To maximize the policy impact in what the accomplishment of European priorities are concerned, the Commission proposed the strengthening of strategic programming. This implies the introduction of a Common Strategic Framework, Partnership Contracts and a list of thematic objectives in line with the Europe 2020 Strategy and its integrated orientations[10].

The Common Strategic Framework is to be adopted by the Commission and it will establish key actions to achieve EU priorities, it will provide guidance regarding the programming applicable to all funds, including EAFRD and EMFF, and it will promote a better coordination of all structural instruments of the EU.

The Partnership Contracts, agreed at the beginning by the Commission and the member states, are intended to establish the general contribution at the national level, in relation to the thematic objectives and to the commitments concerning tangible actions aimed at pursuing Europe's 2020 objectives. The clear and measurable objectives will be defined in a performance framework.

A common legal basis

For the 2014 – 2020 financial period, the European Commission proposes a simplification of the legal basis of the European policy for regional development, through the establishment of common rules for the funds covered by the Common Strategic Framework.

Thus, on the 6th of October 2011, the European Commission adopted a project for a legislative package that will represent a framework for the EU cohesion policy for the 2014 – 2020 financial period. One of the differences from the current period is the fact that for the next financial period the Commission proposed a common regulation that will include rules for the European Fund

for Regional Development, the European Social Fund, the Cohesion Fund, the European Agriculture and Rural Development Fund and the European Maritime and Fisheries Fund.

Flexibility and simplified management

For the 2014 – 2020 financial period, the European Commission designed some measures for ensuring a simplified management of funds and a high absorption rate. The existence of ex-ante and ex-post conditions, the implementation of an electronic system that will allow beneficiaries to send documents, the establishment of annual meetings between the Commission and the member states so as to follow individual progress and to offer recommendations and the creation of a flexible institutional system - these could be some of the requirements of the Commission in its relation with the member states.

Abstract

About once each decade, the technology paradigm shifts in fundamental ways and forces us to rethink how we support business processes. Many people have commented on the shifts from mainframes and mini-computers to client-server to Software as a Service (SaaS). The new wrinkle is cloud computing, and it is notable for two reasons. First, cloud computing is bringing many new companies into the business application space, and many of these companies are not startups. Second, the old paradigm of differentiation to the point of incompatibility among products is being reversed. In the process, many vendors are working hard to support de facto standards so that all of their products work together. These attributes will help to ensure that the cloud computing era is nothing like those that preceded it. While there are many new entrants into the cloud computing business, it is remarkable how many companies had another life before cloud computing. What's interesting here is that so many of these companies had, at best, a tenuous hold on the SaaS market to begin with.

Key words: CRM, Cloud Computing, SaaS

J.E.L. classification: D80

1. Types of CRM Cloud Computing-Based Systems

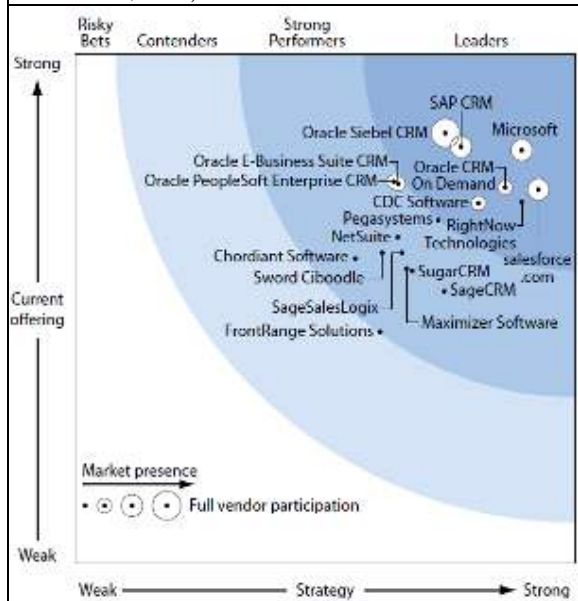

There are three types of CRM Cloud Computing-based systems to consider: *enterprise, midmarket, and specialty.*

❑ **Enterprise CRM systems.** These solutions are targeted toward organizations with revenues of more than \$1 billion per year and/or 1,000 employees or more. They offer a full range of functionalities, can scale to serve large user populations, and have support for multiple languages and countries. Examples of enterprise CRM systems are: *SAP CRM, Oracle Siebel CRM, Oracle CRM On Demand, Oracle E-Business Suite CRM, Oracle PeopleSoft Enterprise CRM, Microsoft Dynamics CRM, Pegasystems Customer Process Manager, RightNow CX, salesforce, Chordiant Software CX Suite, Sword Ciboodle.*

❑ **Midmarket CRM systems.** These solutions are targeted toward the midmarket organizations with revenues of less than \$1 billion per year and/or fewer than 1,000 employees. They offer limited and simpler CRM functionalities and capabilities than solutions built for the enterprise market. These solutions are less suitable for large-scale global deployments. Examples of midmarket CRM systems are: *SAP Business All-in-One CRM, CDC Software Pivotal, Oracle CRM On Demand, Microsoft Dynamics CRM, FrontRange Solutions' GoldMine Enterprise Edition, Maximizer CRM, NetSuite, RightNow CX, SageCRM, Sage SalesLogix, salesforce, Sugar Enterprise.*

❑ **CRM specialty tools.** This solutions offer narrow functional breadth but deep specialty capabilities for both large and midmarket organizations. Specialty CRM tools are available for marketing automation, customer service, customer analytics, and customer data management for specific

Figure 1. Evaluation of CRM Cloud Computing-Based Systems (source: Forrester Research, Inc.)

industries like life sciences and telecommunications. There are 5 categories of CRM specialty tools: *analytics tools*, *customer data management tools*, *customer service tools*, *marketing automation tools*, *industry specialist tools*. Examples of CRM specialty tools are presented by category as follows:

- a) Analytics tools: *SPSS Predictive Analytics*;
- b) Customer Data Management tools: *SAP NetWeaver MDM*, *Oracle Customer Hub*, *SAS DataFlux CDI Solution*, *IBM Initiate Master Data Service*, *IBM InfoSphere MDM Server*, *D&B Purisma's Purisma Data Hub*, *Siperian MDM Hub*, *Sun Master Data Management Suite*;
- c) Customer Service tools: *Consona CRM*, *eGain Service*, *Genesys Telecommunications Labs' CIM Platform*, *InQuira Customer Experience Platform*, *KANA Suite*, *LivePerson's Enterprise Platform*, *nGen Customer Interaction Mgmt. Suite*, *Numara FootPrints for eService*, *Parature Customer Service*;
- d) Marketing Automation tools: *Alerian Marketing Suite*, *Aprimo Enterprise*, *Infor CRM Epiphany*, *SAS Customer Intelligence Platform*, *Teradata Customer Management*, *Unica's Affinium Marketing Management*;
- e) Industry Specialist tools: *Amdocs CES Customer Management (telecommunications)*, *Veeva*

VBioPharma (life sciences), *StayinFront CRM (life sciences)*, *Cegedim Dendrite (life sciences)*;

The evaluation of the main CRM Cloud Computing-based systems reveals the comparison of their different characteristics like strategy and market presence (see Figure 1).

2. Features and benefits of Cloud Computing-based CRM systems

Sales processes benefits

CRM systems using Cloud Computing architecture increase sales productivity and business results by providing companies with a comprehensive set of tools to optimize the entire sales processes, from initial lead qualification to opportunity management, through forecasting and deal closure. Cloud Computing-based CRM systems also deliver critical information to everyone involved in the sales process, including inside sales, field sales, sales management, and partners. Embedded real-time reporting and powerful historical analytics provide insight to help managers make better decisions. Relevant sales and prospecting information can be accessed quickly and conveniently through Outlook, a Web browser, on a smart phone, or on a tablet device. By automating sales processes, and providing a comprehensive view of your customers, Cloud Computing-based CRM systems helps sales teams focus on selling rather than searching for information, resulting in increased productivity and higher revenues. The main CC-based CRM systems features that generate sales processes benefits can be summarized as follows:

- Automate sales processes, enabling salespeople to be more efficient and to focus on customers and finally to close more deals
- Provide salespeople with a choice of easy-to-use interfaces and the flexibility to work the way they do with complete access to customer and product data, anytime and anywhere
- Improve interaction with customers, by giving everyone in the organization access to one single source of real information via a customer repository

- ❑ Enable salespeople and managers to access advanced analytics to improve pipeline visibility and forecast business evolution more accurately

Marketing processes benefits

Cloud Computing-based CRM systems provide organizations and marketing professionals with a smart, simple, and integrated solution for managing marketing campaigns and activities. CC-based CRM systems provide a full suite of capabilities to automate the complete marketing process, from designing inbound and outbound campaigns through lead management and lead development to measuring marketing ROI (Return On Investment). Using built-in e-mail and Web marketing, easy-to-use automation, and built-in analytics, they provide the best of enterprise marketing automation with the advantage of complete integration with CRM. The main CC-based CRM systems features that generate marketing processes benefits are:

- ❑ Increase campaign effectiveness by delivering the right message to the right prospect at the right time with adaptive 1:1 campaigns
- ❑ Deliver higher-quality leads to sales by gathering more complete and valuable information through progressive profiling at each interaction
- ❑ Increase lead volume and conversions with automated lead promotion campaigns
- ❑ Build a comprehensive prospect database with a robust response management system
- ❑ Maximize marketing ROI ((Return On Investment) by analyzing the unified revenue funnel across marketing and sales.

Service management benefits

Customer expectations for superior service have never been higher, in contemporary competitive market. CC-based CRM systems solution enables organizations to provide quick, accurate, and consistent service to their customers, driving both increased customer satisfaction and organizational profitability. They brings together all of the critical elements of a comprehensive service

management solution that are needed to handle simple questions or manage a complex issue. Using on demand systems service, agents have clear visibility into the information that is required to ensure customer issues are resolved to satisfaction. The main CC-based CRM systems features that provide high quality service management are:

- ❑ Allow customers to interact with organization service department using any channel they wish including voice, e-mail, and IVR-Interactive Voice Response (i.e. telecommunication technology which allows customers to interact with a company’s database via a telephone keypad or by speech recognition, after which they can service their own inquiries by following the system dialogue)
- ❑ Enable agents to quickly and accurately find the right answer the first time
- ❑ Monitor customer satisfaction and provide valuable feedback for agent performance management
- ❑ Monitor organizational efficiency and maintain continual process improvement

Call Center communication benefits

The main requirements of any call center are to improve service agents' productivity, to provide superior customer service, and to keep IT costs as low as possible. CC-based CRM systems have hosted multichannel support application that can be deployed without up-front capital expenditures or integration costs. This application provides company’s agents a proper environment to work efficiently from all over the world with complete and comprehensive views into customer interactions and real-time business intelligence. Thus, customers gain from rapid and personalized sales and service, while organizations can dramatically reduce costs and increase revenues. The most important CC-based CRM system features to provide Call Center communication benefits are:

- ❑ Generate a interactive communication channel between customers and organization service department (using voice, e-mail, and IVR-Interactive Voice Response)

- ❑ Enable agents to quickly and accurately find the right answer to customers’ demands.
- ❑ Support full solution lifecycle management. Create and maintain a relevant solution library.
- ❑ Acquire customer satisfaction to provide valuable feedback for agent performance management.
- ❑ Maximize system analytics to monitor organizational efficiency and maintain improvement process.

CRM functionalities analytics

Making informed, intelligent, and real-time business decisions is critical in understanding what’s happening across any organization. The CC-based CRM systems must have fully interactive analytic capabilities to let managers to gain deep insight into their business. This solution is able to deliver actionable insight at the speed of business by combining real-time and historical pre-built and ad hoc reports as well as customizable dashboards. With these systems managers get the critical insight that is required to quickly and intelligently identify and respond to changing market conditions. The real-time, actionable business intelligence available through the interactive dashboards, custom reports, and historical trending enables CEO’s to uncover new opportunities and identify issues before they impact companies’ business. The CC-based CRM systems analytics help organizations to get the most out of ROI (Return On Investment) by providing managers the ability to take the proper decisions to improve companies’ effectiveness and increase revenue. The main CC-based CRM systems analytic capabilities are:

- ❑ Access real-time business intelligence
- ❑ Create historical and trend analysis via high-powered data warehouse functionality
- ❑ Create powerful ad hoc analysis
- ❑ Cover a comprehensive set of subject areas and easily cover all CRM functionalities.

CRM Mobile Sales Assistant

Mobile devices always allow customers and sales agents to keep in touch with the latest information. CRM Mobile Sales Assistant and Mobile Sales Forecast service must connect sales users with the people and information they need to be more productive and efficient.

CRM Integration

Strategic integrations yield cross-functional visibility, coordination, streamlined tasks, and increased productivity. All the silos of enterprise information must be integrated in order to operate more efficiently. Data integration is the only way to create an end-to-end, adaptable business process that overcomes the complexities of application environment and create all the necessary capabilities to make business change more quickly. The CC-based CRM systems must provide Web services support as well as built-in enterprise integration to business applications. The main issues of CC-based CRM systems integration are:

- ❑ *Integrate existing developer environments.* The CC-based CRM systems, must leverage the existing users development environments (e.g. *Oracle JDeveloper, IBM WebSphere, Microsoft .NET, or BEA WebLogic*). A comprehensive set of XML/SOAP APIs may be used for accessing business logic and data services to retrieve, modify, create, delete, and synchronize information.
- ❑ *Expand integration capabilities.* The CC-based CRM systems must provide on demand Web Service API’s that solves the multi-system problem by creating seamless, real-time integrations between those multiple systems and CRM. Thus, end users can obtain holistic, secure views of customers by using standard, configurable integration technology such as Web links, custom tabs, mashups, JavaScript, or RSS feeds.
- ❑ *Leverage single sign-on.* The CC-based CRM systems must provide a single identity management system for all applications. Thus, users can choose to be authenticated into system automatically, once authenticated within corporate network or portal, without having to enter their log-on credentials a second time.

□ *Access robust enterprise-grade security.* To ensure data is protected, the CC-based CRM systems must provide multiple security features such as including configurable authentication options such as *sSingle sSign-oOn*, *configurable sign-in*, *various session handling options*, *IP address filtering*, *user authentication and validation*, *session authentication*, *Cross-Site Request Forgery protection (CSRF)*, *Virtual Private Network (VPN) support* access, and the most secure data facility in the world.

□ *Single vendor solution.* Leverage prebuilt solutions to connect mission-critical enterprise applications at the data, business process, and user interface levels and provide out-of-the-box support for key business flows such as opportunity-to-quote and lead-to-order—all with a consistent user interface experience. Sales organizations’ performance, adoption, and information access can be increased with prebuilt integrations between same vendor products (e.g. *Oracle CRM On Demand* and *Oracle’s Siebel CRM*, *JD Edwards EnterpriseOne*, and *Oracle E-Business Suite*).

Figure 2. Typical architecture of a Customer Relationship Management system based on a Public Cloud

Figure 3. The Advanced Private Cloud architecture for CRM systems

In the end, we can emphasize the architecture of a typical Customer Relationship Management system based on a Public Cloud (see Figure 2) and on Private Cloud (see Figure 3)

3. Conclusions

CRM cloud computing has a strong future ahead, for both enterprise and small businesses. It might take a while to really implement these cloud solutions because there are minor obstacles that take time and effort. There are so many benefits of CRM cloud computing if adopted correctly.

Effective Customer Relationship Management Using Cloud Computing

Jeflea Victor

Zaharescu Eugen

”Ovidius” University of Constanta, Faculty of Economic Sciences

jefleavf@yahoo.com

ezaharescu@univ-ovidius.ro

Abstract

Cloud Computing provides a variable platform for organizations to build their infrastructures upon and to make resources available online. These resources can range from effective CRM (Customer Relationship Management) to extensive ERP (Enterprise Resource Planning). Cloud computing, as a distributed architecture that centralizes server resources on a scalable platform, allows these companies to benefit from accessing an online environment providing on demand computing resources and services. The most appealing advantage of this modern solution is that the cloud computing service provider takes care of the required hardware, software and networking including the associated costs. Cloud computing scalability and elasticity are the first two important characteristics.

Key words: CRM, Cloud Computing, SaaS

J.E.L. classification: D80

1. Cloud Computing Paradigm Definition

Cloud Computing refers to a suite of modern service oriented technologies and IT&C architectures globally named “*X as a service (XaaS)*”, where X includes *Infrastructure, Platform, and Software*. From the customers’ point of view, there are three new aspects in Cloud Computing:

1. The illusion of infinite computing resources available on demand, thereby eliminating the need for Cloud Computing customers to plan far ahead for provisioning;
2. The elimination of an up-front commitment by Cloud customers, thereby

allowing companies to start small and increase hardware resources only when there is an increase in their needs; and

3. The ability to pay for use of computing resources on a short-term basis as needed (e.g., processors by the hour and storage by the day) and release them as needed, thereby rewarding conservation by letting machines and storage go when they are no longer useful.

Therefore, there are many Cloud Computing definitions and one of them could be:

“Cloud Computing is a large-scale distributed computing paradigm, driven by economies of scale, in which a pool of abstracted, virtualized, dynamically-scalable and managed computing power, storage capabilities, software platforms and services are delivered on demand to external customers over the Internet” (Armbrust et al. 2009).

The main characteristics of Cloud Computing as a specialized distributed computing paradigm were emphasized by (Brunette and Mogull 2009):

scalability and elasticity, economies of scale, abstract entity, accessibility to software, device and location independence, high reliability, improved security, efficiency and utilization, constant performance monitoring.

- *Scalability and elasticity.* Cloud resources can be dynamically (“on-demand”) delivered in real-time on a fine-grained and self-service basis. Users are able to re-provision with technological infrastructure resources.

Elasticity is a valuable characteristic for established companies as well as for business startups. For example, *Target*, second largest retailer, uses *AWS (Amazon Web Services)*

for the *Target.com* website. While other retailers had severe performance problems and intermittent unavailability on “Black Friday” (November 28), Target’s and Amazon’s sites were just slower by about 50%. Similarly, Salesforce.com hosts customers ranging from 2 seats to 40,000+ seat customers.

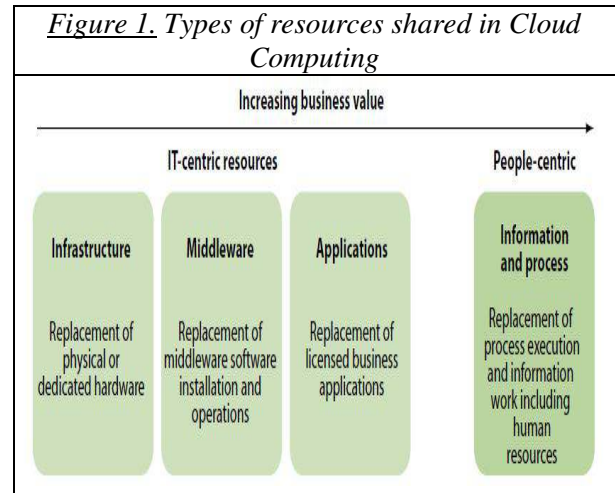

□ *Economies of scale.* Cloud Computing services are claimed to be free of charge or low cost even for hardware upgrades. Capital expenditure is converted to operational expenditure in a public cloud delivery model. The cost of licensing different software packages is moved to the data center level and there is no need to upgrade the local system when new service packs or patches are released. Also the infrastructure is centralized in low cost locations (such as real estate, electricity, etc.). The economy of scale in the Cloud Computing depends on the levels of sharing of the virtual and physical resources as shown in (Table 1).

Table 1. Levels of sharing describes the economy of scale in the Cloud Computing

Level of Sharing	Public Cloud Cloud service market	Public clouds. Services are offered via the Internet in a standardized, self-service, and pay-per-use way (e.g. <i>Amazon.com</i> is a consolidated large-scale public cloud service providers that handles huge volumes of identical services without individual customer interactions).
	Hybrid Cloud (Virtual Private) Cloud and integration service market	Hybrid Cloud (Virtual Private). IT capabilities are provided by service providers, similar to traditional hosting or outsourcing models but with far more flexibility regarding consumption-based pricing, standardization, and usage flexibility.
	Private Cloud Tool market	Private clouds. Services share computing capabilities within a single company. IT organizations go beyond the virtualization of infrastructure and use flexible self-service provisioning tools. The governance model used by the

	CIO (the engagement with the business side of the enterprise) is characterized by high standardization of infrastructure and the risk of fluctuating utilization on the IT side.
--	--

The types virtual and physical resources shared in Cloud Computing depends on the value of the company business (see Figure 1).

The Cloud Computing providers employs usage-based pricing, in which customers pay proportionally to the amount of time and the amount of resources they use. The customer’s revenue is directly proportional to the total number of user-hours:

$$UserHours_{cloud} \times (revenue - Cost_{cloud}) \geq \quad [1]$$

$$\geq UserHours_{datacenter} \times (revenue - \frac{Cost_{datacenter}}{Utilization})$$

The left-hand side of the equation [1] multiplies the net *revenue per user-hour* (revenue realized per user-hour minus cost of paying Cloud Computing per user-hour) by the *number of user-hours*, giving the expected profit from using *Cloud Computing*. The right-hand side of the equation [1] performs the same calculation for a fixed-capacity *datacenter* by factoring in the average utilization, including nonpeak workloads. The opportunity for higher profit is represented by the greatest side of the above equation.

Apparently, if *Utilization* = 1.0 (the datacenter equipment is 100% utilized), the two sides of the equation [1] look the same. However, basic queueing theory tells us that

as utilization approaches 1.0, system response time approaches infinity. In practice, the usable capacity of a datacenter (without compromising service) is typically 0.6 to 0.8.

Whereas a datacenter must necessarily overprovision to account for this “overhead,” the cloud vendor can simply factor it into $Cost_{cloud}$. While rent or lease for utility computing includes unusable overhead, the “pay-as-you-go” model does not. Hence, even if a company leases a 100 Mbits/second Internet link, it can likely use only 60 to 80 Mbits/second in practice.

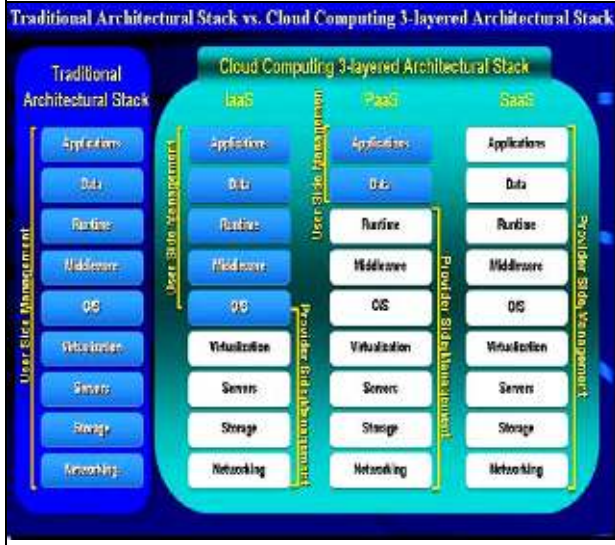

- ❑ *Abstract entity.* Cloud Computing providers can encapsulate and deliver different levels of services to customers outside the Cloud. The services can be dynamically configured (via virtualization or other approaches) and delivered on demand.
- ❑ *Accessibility to software* enables machines to interact with cloud software in the same way the user interface facilitates interaction between humans and computers. Users can reach the same result by using any Internet connected device having minimum software requirements. Cloud computing systems typically use REST-based API (Application Programming Interface).
- ❑ *Device and location independence* enables users to access systems using a web browser regardless of their location or what device they are using (e.g., PC, mobile phone). Devices with minimal hardware requirements could be successfully used as cloud clients. As infrastructure is off-site (typically provided by a third-party) and accessed via the Internet, there is no need to download or install a specific software, only the Internet connection is required, in order to become part of the Cloud;
- ❑ *High reliability* is achieved because multiple redundant sites are used. In case of client computer crashes, almost no data are lost due to centralized storage into the multiple cloud resources. Thus well-designed cloud computing are suitable for business continuity and disaster recovery.
- ❑ *Improved security* is achieved due to centralization of data, increased security-focused resources, etc. In comparison with the traditional systems, cloud security is

better, because providers are able to devote more resources to solving security issues that many customers cannot afford. However, the complexity of security is greatly increased when data is distributed over a wider area or greater number of devices and in multi-tenant systems that are being shared by unrelated users. Private cloud installations are in part motivated by users' desire to retain control over the infrastructure and to avoid losing control of certain sensitive data or lack of security for stored kernels.

- ❑ *Improved efficiency and utilization* for under-used systems (only 10–20% often utilized). Increased *peak-load capacity* is achieved with no need to engineer for highest possible load-levels on the client side;
- ❑ *Constant performance monitoring.* Most of the consistent and loosely coupled architectures are implemented using web services as the system interface.
- ❑ *Maintenance* of cloud computing applications is easier, because they do not need to be installed on each user's computer. They are easier to support and to improve, as the changes reach the clients instantly.

In the Cloud Computing architectural stack Provider Side Management complexity is increasing to maximum while User Side Management complexity is decreasing to zero for Software as a Service (SaaS) layer (see Figure 2).

Figure 2. Traditional IT Architectural Stack vs. Cloud Computing 3-layered Architectural Stack

The next section will analyze and compare 3 main Cloud Computing providers (*Amazon Web Services, Microsoft Azure, and Google AppEngine*) from the point of view of scalability and high availability of the virtualized resources (i.e. *computation, storage, and networking*):

1. Computation model or VM (Virtual Machine):

Amazon Web Services	<ul style="list-style-type: none"> • x86 Instruction Set Architecture (ISA) via Xen VM • Computation elasticity allows scalability, but developer must build the machinery, or third party VAR such as RightScale must provide it
Microsoft Azure	<ul style="list-style-type: none"> • Microsoft Common Language Runtime (CLR) VM; common intermediate form executed in managed environment • Machines are provisioned based on declarative descriptions (e.g. which “roles” can be replicated); automatic load balancing
Google AppEngine	<ul style="list-style-type: none"> • Predefined application structure and framework; programmer-provided “handlers” written in Python, all persistent state stored in MegaStore (outside Python code) • Automatic scaling up and down of computation and storage;

2. Storage model:

Amazon Web Services	<ul style="list-style-type: none"> • Range of models from block store(EBS) to augmented key/blob store (SimpleDB) • Automatic scaling varies from no scaling or sharing (EBS) to fully automatic (SimpleDB, S3), depending on which model used • Consistency guarantees vary widely depending on which model used
Microsoft Azure	<ul style="list-style-type: none"> • SQL Data Services (restricted view of SQL Server) • Azure storage service
Google AppEngine	<ul style="list-style-type: none"> • MegaStore/BigTable

3. Networking model:

Amazon Web Services	<ul style="list-style-type: none"> • Declarative specification of IP level topology; internal placement details concealed • Security Groups enable restricting which nodes may communicate • Availability zones provide abstraction of independent network failure • Elastic IP addresses provide persistently routable network name
Microsoft Azure	<ul style="list-style-type: none"> • Automatic based on programmer’s declarative descriptions of application components (roles)
Google AppEngine	<ul style="list-style-type: none"> • Fixed topology to accommodate 3-tier Web app structure • Scaling up and down is automatic and programmer invisible

In order to effectively respond to CRM systems demands, the emerging Private Cloud should feature important attributes like reliability of services, scalability, elasticity and metered-by-use self-service. The main technologies used to build the Private Cloud are shown in (Table 2) and (Figure 3).

Table 2. The main Microsoft technologies used in Private Cloud-based CRM systems

VIRTUALIZATION	➤	Windows Server Hyper-V

	Operations Manager
	Service Manager
	Data Protection Manager
	Opalis

2. Organizations Increased their Investment in CRM Cloud Computing Solutions

Although, the world economy plunged into a severe recession from which it is now slowly recovering, the fundamental business requirements for effective and efficient customer interaction management are increased.

The CRM system goals remain unchanged: acquiring new customers, building tighter bonds of loyalty, and reducing the costs of marketing, selling, and servicing (see Figure 4).

Both B2B and B2C enterprises are interested in the improvement of customer loyalty as their top goal. On contrary, while B2B companies intent on capturing new customers, the B2C companies try to improve the customer experience.

To support achievement of these important priorities, CRM Cloud Computing solutions are widely used by organizations of all sizes. Over 50% of the large and mid-sized organizations in North America and Europe have already implemented this solution and are investing more to upgrade their CRM systems.

Figure 4. CRM Cloud Computing System Goals

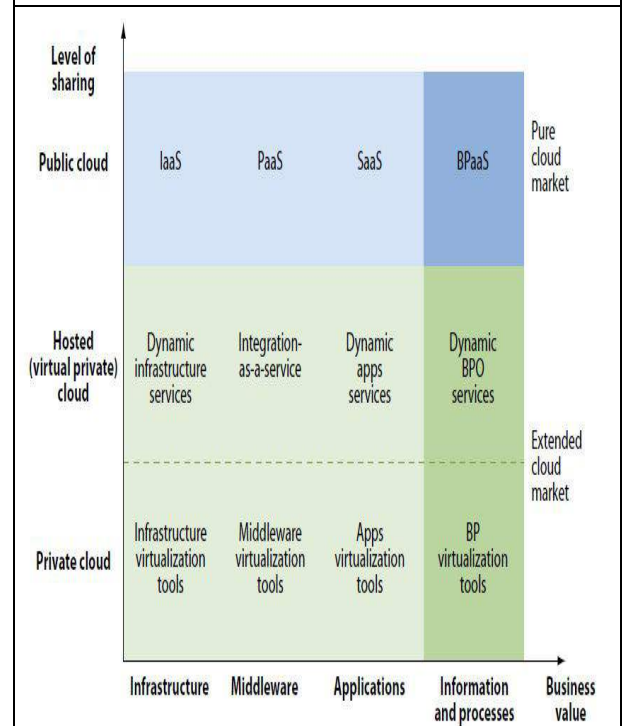

3. Cloud Computing Taxonomy within CRM Software Systems Market

Business-Process-as-a-Service (BPaaS) in the public cloud (see Figure 5). The outsourcing of people-centric services has taken place for many years under the label of business process outsourcing (BPO), a multibillion-dollar business annually. The event marketing and management services are such a business process in a highly shared mode. One example could be a company called *Meeting Expectations* which provides everything from the CRM system for online registration to the payment process to the staff who manages the on-site facility at an event. No customer has any contract beyond a single event, and the provider offers its business service to everybody publicly. This provides higher business value with human involvement than just a business process management (BPM) software system running in a public cloud environment.

Figure 5. Full Cloud Computing Taxonomy within CRM Software Systems Market

Acronyms: IaaS (Infrastructure as a Service), PaaS (Platform as a Service), SaaS (Software as a Service), BPaaS (Business Process as a Service), and BPO (Business Process Outsourcing).

Cloud Computing provider diversity replaces single-vendor sourcing for users. When a company is considering a CRM application as a subscription out of the cloud, it will follow no more a single vendor sourcing strategy or consolidation approach. Instead, it will embrace cloud orchestration, combining logic from internal systems with CRM or business intelligence (BI) application in the public cloud, for instance.

Cloud Computing providers focus on standardization of applications and platforms, not customization. Cloud computing significantly disrupts vendors' practices as they convince even the most influential customers to live with standardized CRM application logic. For example, *salesforce.com* basically rejects extensions to its packaged application; instead, it has established a standardized platform where customers or independent software vendors (ISVs) can develop extensions. This keeps the core CRM

application on a high-growth, mainstream path.

4. Conclusions

The idea behind Cloud Computing is to deliver *Infrastructure as a Service (IaaS)*, *Platform as a Service (PaaS)*, and *Software as a Service (SaaS)* over the Internet on a scalable level, using an easy pay-per-use business model. The Cloud Computing technologies can be exploited to build the next generation of platform-independent tools and scalable data storage for CRM systems. This set of technologies can distribute applications across a wider set of devices and can make great reduction in the overall cost of computing.

The proposed Public and Private Cloud-based CRM system can improve business success and has a service oriented architecture that simplifies the management and increases the effective utilization of the cloud resources.

Community Trade Mark – Strategic Marketing Instrument

Juganaru Mariana

Juganaru Ion Danut

“Ovidius” University of Constanta, Faculty of Economic Sciences

mjuganaru@univ-ovidius.ro

juganaru@ccina.ro

Abstract

A trade mark stands for a marketing tool through which products/services can be known by consumers. If we look around us everywhere and in all dimensions of our lives, we see that those trade marks that exert tremendous power over the “submissive” consumer are the ones which “reign”. However, in order to maintain their power conferred by the trade mark, companies have understood the importance of defending and protecting the trade mark. Registering a trade mark is seen as a powerful legal “weapon” in the “war” led against its unauthorized use, which could lead to negative consequences for its holder such as: damage to business, reduced market share and reputation damage. [6]

There is also the chance that nothing happens if the trade mark is not registered, but the risks are enormous. Therefore, leading companies (and not only) can not afford such a thing.

Key words: trade mark, registration, protection, communication, success.

J.E.L. classification: M31

1. The significance of trade mark

The trade mark history is much older than the practice history or the marketing theory. Nevertheless, marketing specialists have noticed the importance of the trade mark for the success of the company even since the beginning of the 20th century. This way we can explain companies’ intense efforts to create, maintain and improve the trade marks of products or services that they were producing or commercializing.

A trade mark can stand for a name, a term, a symbol, a design, or a combination of those

elements by means of which the producer or the marketer of a product/service is identified. [1] A trade mark also represents a marketing element of companies around the world which is used to customize the offer, to promote products and/or services on the national and international market, to differentiate from competitors’ offer and to develop consumer behaviour towards brand. It is interesting to analyze the significance of trade mark to the consumer and the consequences/effects on the company’s financial results as well as on the image or perception of the company.

A trade mark has an orientation effect on consumers, helping them to identify products they need and to certify a certain quality level. [2] It is considered that a product satisfies a need, while a brand offers something extra: quality guarantee and psychological satisfaction. The brand strength lies on influencing buyer decision due to the fact that it creates value for customers.

Lots of products have ensured their success by quality and performance. Beside these characteristics, companies have also created a certain ‘image’ of its product by using the trade mark. Quality, performance and trade mark are elements of international advantage which must be used carefully and distinctly on each and every foreign market.

The competitive advantage of trade mark is based on a characteristic, an attribute, or on a combination of characteristics of the product/service that the consumer appreciates to a greater extent by comparing the competitive offers. [2] Through an ongoing effort, companies aim to differentiate their trade marks from those of competitors by offering a product of higher quality at an acceptable price and value. At the same time, the company tries to identify other trade mark values that will be communicated to

their customers. Long-term success of the brands/companies in the world market depends largely on the popularity of the brand.

The popularity of the brand lies in the company's ability to recruit and retain customers, as well as to achieve a certain brand use. In other words, the popularity of the brand reflects the temporarily accumulation of acceptance by the market and the favourable attitude towards the brand. [2]

2. Community trade mark

Community trade mark stands for a sign which identifies and differentiates products and services of natural and legal persons from those of other persons and on which the holder has an exclusive right: it is valid throughout the European Union and it is registered at OHIM – Office for Harmonization in the Internal Market- (or Oficiul de Armonizare a Pietei Interne (OAPI), with its head office in Alicante – Spain), in accordance with regulations in the field. The community trade mark system stands for a system that is independent of the national systems of brand protection, the natural and legal persons being able to apply for national brand, community trade mark, or for both. [5]

Community trade mark has emerged as a consequence of achieving the objective of the European Economic Community (EEC), established by the Treaty of Rome in 1957 - to promote a harmonious development of economic activities among the member countries, removing economic barriers (tariff and non-tariff). Taking into consideration that the territoriality principle of protection represents an obstacle to free movement of goods within the European Community, and the fact that the national legislation of member countries of EEC had different legal aspects, a harmonization of member states' national laws on trade marks has been initiated.

In order to achieve a free market, the industrial property rights had to be harmonized at a communitarian level, and this has been accomplished for brands and design; the protection of these industrial properties' objectives being realized by using

a unique procedure which is valid on the entire European Union territory.

Since 1st April 1996, natural persons and corporate bodies have at their disposal a unique system to protect their businesses or ideas, which is implemented by the E.U. and governed by the Office of Harmonization in the Internal Market in Alicante. By registering the community trade mark, it is provided a unique title which ensures unitary protection across E.U. and which produces the same effects as a whole. [5]

3. Legal instruments that have created the community trade mark

Diplomatic conferences and intergovernmental meetings started even since 1960 aimed precisely to harmonize the national laws. Discussions and negotiations held for creating a community trade mark system was completed by two legal working instruments:

- 1) “Council Directive No. 89/104, to approximate the laws of the Member States relating to trade marks” introduced on 21st December 1988, provides the coexistence at European level of two trade marks protection systems as follow: (a) the national system governed by harmonized national legislations which are not identical; and (b) the community trade mark system. [5] To note that Directive 89/104 does not realize full harmonization of national legislation, but it limits to measures that are necessary for the proper function of the internal market. [6]
- 2) European Union Council Regulation no. 40/94 of 20th December 1993 on community trade mark, enforced on 15th March 1994. Thus, through a single procedure, trade marks become valid in all European Union Member States. The regulation must be understood as a supranational instrument by means of which one office records marks that produce effects across the E.U. (*6) It has been created an independent and autonomous organism – OHIM in Alicante, Spain – as an office for registering community trade marks of communitarian designs and patterns.

4. The relationship between community trade mark and national trade marks

A community trade mark stands for a tenure that can be exploited commercially by means of license, franchise, concession etc. all across the E.U., taking into consideration the requests along with all aspects of the internal market. [5]

Through the registration of the community trade mark, it is obtained a unique title which ensures unitary protection across E.U., producing the same effects. Therefore, the registration, the transfer or the abandonment of the trade mark will automatically affect all E.U. Member States, while decisions regarding the validity and the community trade mark rights will have a unitary effect.

It is necessary for companies to know that the community trade mark is neither mandatory, nor exclusive. Companies that are not asked about trade marks protection on the E.U. territory have the possibility to protect their marks nationally or internationally. Community trade mark does not replace the national brand or the international one, being an independent protection system. [6]

It should be also specified that community trade marks have effects on the new member states as well (including Romania), thus may occur conflicts with trade marks that have already been nationally registered, even before that particular state joined E.U. Trademark territoriality principle does not prevent the case in which a trade mark that is identical or similar both in terms of designation and protected products/services from being registered by different owners in different states. [5]

In case trade marks can not coexist for different reasons, the prohibition of use of the community trade mark may be established within the national territory or the court may request cancellation of the national trade mark; the solution to this conflict being based on trade marks' "seniority" principle.

The holder of a community trade mark who has an identical trade mark obtained nationally or internationally (through the Madrid System – a system administered by OMPI/OHIM) will be able to claim the seniority of that particular trade mark. We should note that both Paris Convention and

Madrid Convention allow simultaneous registration of trade marks in many countries. A trade mark seniority claim is affecting that when the national registration whose seniority has been requested and accepted is lapsing, it will not need to be renewed for maintaining the rights deriving from its registration. [5]

Another important aspect to mention is that any community trade mark that could not be registered just in some of the E.U. member states will be transformed into a national trade mark. The conversion procedure involves the need for the same application to be filed at national offices where there is no obstacle to registration, thus the application benefits from the deposit date of the community trade mark or of the national registration whose seniority has been claimed. [5] A possible obstacle that may arise in the registration of a community trade mark could be the existence of a prior right in one or more E.U. countries, or the aspect that in the respective country's language, a trade mark has a plus in the fact that it makes it be more descriptive about the products/services for which registration is required.

The national trade mark application resulting from the conversion of a community trade mark retains the same date of deposit and the same date of priority of the community trade mark. [6]

5. Aspects of the community trade mark registration and submission procedure

Both companies and interested persons should know that a community trade mark application can be registered in many ways:

- 1) using E-filing, sending request online by visiting www.oami.europa.eu;
- 2) directly at OHIM by post or fax;
- 3) at the national industrial property offices of E.U. member states (in the case of Romania, at the State Office for Inventions and Trademarks – SOIT(OSIM).OSIM deposition forwarded to OHIM involves payment of a specific shipping fee;
- 4) at the BOIP (Benelux Office for Intellectual Property). [5]

Any natural or legal person may file a community trade mark application if it meets one of the following conditions:

- 1) the applicant should have the nationality of a E.U. member state, of another state which is member of the Paris Convention or of the World Trade Organization;
- 2) the applicant should have his/her residence, head office or an effective and serious commercial and industrial enterprise on the E.U. territory, on the territory of a Paris Convention member state or O.M.C.

Even if the applicant does not meet any of these conditions, there is a possibility of obtaining a community trade mark registration if there is a reciprocal agreement between the applicant country and E.U. (for instance Taiwan). [5]

Any mark capable of graphical representation and that it can distinguish the products and/or services of a company from those of other companies can be registered as a community trade mark. [6]

Community trade marks may stand for signs such as: words, names and surnames, signatures, drawings, portraits, photos, letters, figures, colors or combinations of colors, the shape of the product or its package. Forms such as sounds and smells (when subject to a possible graphical representation) can also be registered trade mark. [6]

One should know that marks can be protected by means of the community trade mark as follows:

- 1) a mark which has been the subject of an application for registration to a national office in a country party to the Paris Convention or the WTO, if the two applications have the same applicant;
- 2) a mark that has been the subject of an international registration, regardless of the registration date, if the two applications have the same applicant;
- 3) a mark that has previously been the subject of an application for registration, if applications are submitted by applicants who reside in E.U. countries. [6]

The procedure for registration of a community trade mark application includes several stages: examination of application, publication of application, solution of possible oppositions and observations. [5]

The community trade mark application may be filed in one of the official E.U. languages, indicating a second language used in the “post-examination” procedures,

including for oppositions. The second language must be one of the five official EU languages (English, French, Italian, Spanish and German); languages in which all OHIM procedures are carried out. If the first language is not one of these, the applicant may authorize OHIM to use the second language on all correspondence regarding the application for registration. [5]

One should note that after the formal examination of submission for a community trade mark and the absolute grounds for refusal, OHIM carries out in its own community trade mark register and in some of the member states (those which showed their availability to do these researches) an anteriority research of a trade mark and prepares a research report in which it indicates to the applicant earlier trade marks that may be opposable. Anteriority research in the member states’ registers has become optional since March 2008. [5]

Within one month of receiving the anteriority reports, the Office publishes the community trade mark application in the Community Trade Marks Bulletin, thus informing holders of trade marks or community requests applicants about a possible conflict between the published application and their trade mark. [5]

The Community Trade Marks Bulletin stands for an OHIM official publication and it is published in all official EU languages, only in electronic form; it can be found free on the internet at http://oami.eu.int/bulletin/ctm/ctm_bulletin_en.htm.

Any natural or legal person, as well as groups representing manufacturers, producers, service providers, traders or consumers, may within 3 months of the publication of the community trade mark application submit written observations to OHIM, stating the reasons why the trade mark should be refused when registering at the office (absolute grounds only). Third parties can enforce their prior rights in opposition proceedings within 3 months of the publication of the community trade mark application. [5]

The opposition can be based on a trade mark application or on an earlier registered trade mark. It can be national trade marks of EU member states, international trade marks, Benelux Office trade marks or notorious

ones. Any other earlier right of intellectual property protected in the EU allows the holder to make an opposition to an earlier trademark filed for registration. [6]

If the trade mark application meets the Community Trade Mark Regulation 40/94 and if no opposition was made within the legal term, or the opposition was not accepted, then the mark is registered and published as a community trade mark, involving the payment of registration fee within 2 months of communication. [5]

After receiving the registration fee the submitted trade mark is entered in the community trade mark register; afterwards the registered trade mark is published in the Community Trade Marks Bulletin and the applicant receives a certificate of registration.

The validity of a community trade mark is 10 years and it can be unlimitedly renewed for another 10 years if agreeing to the terms and paying the renewal fee. It is important to mention that modification of the trade mark within the registration or renewal procedure term can not be accomplished unless it does not substantially affect the trade mark. [5]

6. Conclusions

Nowadays it is more and more important for natural and legal persons to be aware not only of the advantages given by the community trade mark, but also of the legal aspects regarding both the stages in obtaining a community trade mark and its conditions of use.

One can get trade mark protection throughout the EU by means of a unique procedure which is easier and has a lower price as compared to the case when submitting the application in each member state. [5]

Any company which has a current or perspective interest to impose on the EU market should seriously set the problem of registration and protection of its own trade

mark, the more so as the businesses environment nowadays is very competitive and protecting its own interests is essential. Even if it seems at first that the financial efforts are useless and irrecoverable, the advantages of registering a trade mark are certain and one can benefit in the course of time.

Through the registration of a trade mark holders may prohibit third parties to use the trade mark without their approval. This way, the holders avoid that others would take advantage of investments that they made in promoting and increasing product quality; protecting their profits gained from the use of the mark; ensuring a reduced risk of trade mark “degeneration”; discouraging trade mark counterfeiting; creating the possibility of “accounting” its value and increasing trade mark value in case of concession licensing or sale of business.

By registering trade marks companies hold for certain that they have efficiently invested in the development of their business and have the legal possibility to defend their earlier gained rights.

Conceptual Approach to Economic Efficiency Assessment of Finance Management System of Joint Stock Companies

Juscu Nicolae Cristian
Free International University of Moldova
alexcri74@yahoo.com

Abstract

The analysis of the concept of “economic efficiency assessment of finance management system of joint stock companies”, as well as the analysis of the known assessment methods on the characteristic of financial activity have shown that the versatility of the issue being analyzed do not allow scientists to propose an optimal procedure for resolving it.

Key words: finance management efficiency, financial analysis, assessment methods, management system.

J.E.L. classification: G15

1. Introduction

On the one hand, the existence of a wide range of assessment methods regarding the economic efficiency of finance management system of joint stock companies denotes the fact that each of these methods provide a certain degree of implementation efficiency, and on the other hand, the high number of methods shows the fact that it lacks a systematic non-contradictory unique analysis. Although the basis of company financial analysis at present is represented by a set of standard vertical and horizontal coefficients and it is obvious that the methods for the assessment of the economic efficiency of finance management system of joint stock companies do not lack technical and systematic drawbacks, they also have a limited practical use.

Besides that, we want to emphasize the fact that the above mentioned methods do not offer an analysis of the sources of efficiency of finance management of joint stock companies. In order to eliminate this significant drawback, we propose an

improvement of the approach regarding the assessment of the efficiency of company finance management.

Many experts noticed the duality of the sources of the efficiency of joint stock company finance management. Reasoning upon the management efficiency at a theoretical level it was demonstrated that the particularity of company management consists of the fact that the achievement of management objectives is done both within the management system (the management subject) and within the managed object. This complex interaction of objectives within the management-production system requires examining the outcome of the activities of the two sub-systems – the ruler and the ruled. Each of these sub-systems has its own resources and one should take into account their efficient usage.

Speaking about the domain of finance, Stancu I. asserts that “The financial statement of an organization depends on the available resources, the financial structure, solvency, cash and the management’s ability to adjust to the changes of the internal and external environment” [2]. Poloz A. [1] agrees with him: “The financial statement is provided both by objective characteristics of the field of activity and by the efficient organization of production, management and other components”.

P. Cumz and M. Watson mention an obvious correlation between the management system of the company and its assessment by the participants on the securities market. “Therefore, in the US and Britain investors are willing to pay 18% more for the shares of companies that offer an efficient corporative management than for the shares of companies whose financial indices are similar, but the company management practice is less perfect. In Italy, a similar amount was 22%, in Indonesia – 27%”.

In our opinion, regarding the assessment of the economic efficiency of finance management system of joint stock companies, there are two basic elements to be emphasized:

- 1) the assessment of the company’s financial potential, seen as an opportunity to reach a certain level of the company’s financial status;
- 2) the assessment of financial management efficiency.

2. Analysis of data

The traditional methods for complex assessment of efficiency of financial management of joint stock companies analyzed in the previous subchapter – ignore the existence of these two assessments as separate components. Therefore, they cannot determine if the change in the overall efficiency of the company financial management is conditioned by the efficiency increase in its financial service functionality. At the same time, in similar circumstances, such as the knowledge and abilities of financial managers, as well as their constituting the usage system of company financial management instruments and techniques, they determine the level of efficiency in the financial management system of joint stock companies.

Let us analyze the following function:

$$O^{(\phi)} = \mu_F + \mu_{FM} - \mu(\mu_F, \mu_{FM}) \quad (2.1)$$

Source: developed by the author

The financial potential in a certain sector of economy, from the perspective of a company in this sector, can be assessed according to the formula:

$$\mu_F = \mu(x_1, x_2, \dots, x_N) \quad (2.2)$$

Source: developed by the author

where x_1, x_2, \dots, x_N – values of the financial statement of other companies in the analyzed sector, calculated by the same method as parameter $I^{(\phi)}$, and $\mu(x_1, x_2, \dots, x_N)$ — the function that allows these calculations (for example, the weighted average function).

Parameter μ_F , calculated by this formula, may have both positive and negative values, depending on the significance of the assessment of the financial statement of the company in the analyzed sector.

The deviation of the actual assessment of the company financial statement from the financial potential depends on the efficiency of the corporate financial management and on the scale effect.

Parameter $u(\mu_F, \mu_{FM})$ within the formula (2.1) represents the value of the efficiency of corporate financial management of the company being examined. Recognizing the zero value as the state of absolute inefficiency, we will consider that $u(\mu_F, \mu_{FM})$ has only positive values.

The $u(\mu_F, \mu_{FM})$ function represents a correction component, that reflects in formula (2.1) the scale effect of the relations between the parameters of the financial potential of the company and of the efficiency of financial management, and is determined using the formula:

$$u(\mu_F, \mu_{FM}) = \sqrt{\frac{|\mu_F|}{\mu_{FM}}} \quad (2.3)$$

Source: developed by the author

If the economic sector is profitable enough or unprofitable (meaning that the value of the financial potential is high and corresponds to the absolute value), then the contribution of efficient management in modifying the financial statement of the company will not be essential. The same is also applicable for the case when, irrespective of the extent of the financial potential of the company, the weight of financial management efficiency is extremely low. And, on the contrary, the high efficiency of financial management allows a relatively easy management of the changes that occur in the financial system of the company.

The fulfillment of the conditions necessary for (2.3) formula is not difficult to verify, by analyzing the limits of the function $u(\mu_F, \mu_{FM})$.

Thus, if the efficiency of financial management is not high enough to overcome the scale effect, the actual financial statement of the company is more serious than its financial potential.

The function (2.1) has a number of specific properties. Thus, a extremely high or extremely low value of the financial statement of the company corresponds to some extremely high or extremely low value of the efficiency of financial potential and financial management of the company. In

this case, any increase of the financial management efficiency, in similar conditions, leads to the increase of the assessment of financial statement of the company. At the same time, the addition of the financial statement of the company towards the financial management efficiency, is subordinate to “returned value law”, meaning to keep the financial potential of the company to a certain level, increasing the efficiency of financial management in the same extent, every time will lead to a slower increase of the financial status value.

The execution of these particularities is not difficult to verify at the limits analysis of the function $I^{(\phi)}$ and by analyzing the first and second derivates.

Thus, the function (2.1) represents a mathematical expression of the main relations between the financial status of the company, the efficiency of financial management and financial potential of the company in a sector of the economy.

Calculation regarding the financial statement of the company and its financial potency are more widespread in the practice of finance management, then efficiency calculations of financial management. Thus we will transform formula (2.1), by expressing μ_{FM} through $I^{(\phi)}$ and μ_F :

$$(\sqrt{\mu_{FM}}) + (\mu_F - I^{(\phi)}) \cdot \sqrt{\mu_F} - \sqrt{|\mu_F|} = 0. \tag{2.4}$$

Source: developed by the author

According to the Cardano decision, the actual radical of this cubic equation will be type:

$$\sqrt{\mu_{FM}} = \sqrt[3]{\frac{\sqrt{|\mu_F|}}{2} + \sqrt{\frac{(\mu_F - I^{(\phi)})^3}{27} + \frac{|\mu_F|}{4}}} + \sqrt[3]{\frac{\sqrt{|\mu_F|}}{2} - \sqrt{\frac{(\mu_F - I^{(\phi)})^3}{27} + \frac{|\mu_F|}{4}}},$$

$$\mu_{FM} = \left[\sqrt[3]{\frac{\sqrt{|\mu_F|}}{2} + \sqrt{\frac{(\mu_F - I^{(\phi)})^3}{27} + \frac{|\mu_F|}{4}}} + \sqrt[3]{\frac{\sqrt{|\mu_F|}}{2} - \sqrt{\frac{(\mu_F - I^{(\phi)})^3}{27} + \frac{|\mu_F|}{4}}} \right]^2$$

(2.5)

Source: developed based on the Cardano decision

However, if the value μ_F is below 0, then:

$$\frac{(\mu_F - I^{(F)})^3}{27} + \frac{|\mu_F|}{4} < 0 \tag{2.6}$$

Source: developed by the author

and μ_{FM} will be expressed by a complex number. By correspondence, we will determine the final formula for the calculation of μ_{FM} as follows:

$$\mu_{FM} = \begin{cases} +\infty, \text{ pentru } Q \text{ complex} \\ \left[\sqrt[3]{\frac{\sqrt{|\mu_F|}}{2} + Q} + \sqrt[3]{\frac{\sqrt{|\mu_F|}}{2} - Q} \right]^2 \end{cases}$$

$$\text{unde } Q = \sqrt{\frac{(\mu_F - I^{(\phi)})^3}{27} + \frac{|\mu_F|}{4}} \tag{2.7}$$

Source: developed by the author

Here, parameter Q represents the excess indicator of the actual financial statement of the company in comparison to its financial potential. If this excess is high then the marker is of + sign and it means that “the efficiency of financial management is fairly high”.

The assessment of the efficiency of finance management system of joint stock companies proposed by (2.1) and the assessment of the efficiency of financial management (2.7), represents a common position towards the assessment of the efficiency of financial management of joint stock companies.

The assessment of efficiency by (2.1) formula excludes the identification of the efficiency of financial management system of joint stock companies as a whole and of the efficiency of financial management of organizations, which represents a key moment, determining the practical importance of this approach. This approach to the assessment of the economic efficiency of the financial management system of joint stock companies offers the possibility to identify the negative tendencies in financial management in advance. When the traditional assessment methods indicate an

increase of the management efficiency as a whole, this approach shows a possible negative dynamic of financial management.

3. Conclusions

In Romanian and international practice, the interest in assessing the efficiency of financial management of joint stock companies is manifested mainly by the contracting companies and financial managers who promote anti-crisis management. This is due to the fact that today, worldwide, bankruptcy cases, bankruptcy scandals as well as damages resulted because of bankruptcy reached an unprecedented level. Thus, the study undergone by specialists of World Bank indicated that in developed countries, officially during the first decade of the 21st century, an average of 1% out of the total companies reached bankruptcy, annually.

The need for an adequate assessment of corporate financial management is present in Romanian practice as well, because the financial statement of Romanian companies in the economic environment today, continues to be characterized as undergoing a crisis. According to official statistics, more than 56% of the autochthonous enterprises tend towards insolvency.

The complex analysis of the assessment basis of economic efficiency of financial management of joint stock companies should be conducted following two directions. The first direction is the analysis of approaches which will allow us to understand the essence of one of the most assessed characteristics of financial management of joint stock companies – management efficiency. The second direction is the analysis of the assessment of efficiency as a specific type of activity, after the quantitative assessment of this characteristic.

In many cases, the integral coefficient is proposed as main indicator for the assessment of the economic efficiency of corporate structures and which is made of individual components of the chosen indicator system. However, in our opinion, this eliminates the main difference of the narrow interpretations of efficiency.

The process of assessment methods regarding the economic efficiency of finance management system of joint stock companies

as a particular activity implies both technical difficulty and fundamental problems. The fundamental problems, which determine the development of approaches to the assessment of this characteristic of financial activity, refer to the following:

- 1) principle measurability of efficiency;
- 2) degradation of performance indicators;
- 3) extrapolation argument.

The issue of principle measurability or non-measurability of such characteristics as efficiency, is closely related to the capacities of human reason, the ability to formalize and measure different categories. The category apparatus allows the formation of structures included in the efficiency of company management, for example social and psychological costs, as well as of the performance of comparison and choice while lacking some clear criteria. But the evaluation of efficiency in such a broad interpretation, as well as the attempts to formalize the human reasoning process is extremely difficult.

Any assessment indicator regarding the efficiency is convenient to be applied only in the case when it allows the comparison of two objects from the point of view of their efficiency. Verifying any efficiency indicator is made by determining its capacity to destroy the efficiency levels (high level, low level).

For this it is necessary to observe a certain variation of this indicator, premeditated for a certain group of the researched objects. If the value of the selected indicator does not vary sufficiently from an object to the category of another object, then this indicator is not useful to undergo an assessment.

Nevertheless, the appropriate assessment of economic efficiency of financial management of joint stock companies does not seem to be unachievable. It can be achieved with a relative precision. Because the negative action of the fundamental factors, that influence the assessment of efficiency, cannot be eliminated, this influence has to be reduced to minimum, by developing some concrete methods for the assessment of the efficiency of financial management of joint stock companies.

Our interpretation, which considers the efficiency of financial management of joint stock companies as being the capacity of a company to reach and maintain a certain financial level by using the resources available for a certain period of time, allows us to equate the efficiency assessment

methods with assessment methods regarding the financial statement of a company. At the same time, various categories of methods, normally defined as “company bankruptcy forecast methods” should also be analyzed, because, in our opinion, these methods can also be included in the category of corporate financial statement assessment methods.

There were chosen as the objects of analysis both well known methods and new studies proposed by specialists for the assessment of the financial status of the company. A condition for constituting the methods for assessment of the economic efficiency of financial management of joint stock companies is represented by its complexity. Therefore, the category of methods analyzed can be reduced to the complex methods used for the assessment of the financial statement of a company, meaning those methods which characterize at least two of the four fundamental aspects of the financial statement of a company (profitability, turnover, cash, stability). Most of the methods of the complex analysis regarding the assessment of the financial statement represent formal methods, based on certain numeric algorithms. Then, all the formal methods used for the assessment of financial management efficiency of joint stock companies are made up according to one of these two aspects. According to the first aspect, the elements of the indicator system which forms the basis of assessment methods, contribute to the formation of an integral coefficient, and its values are used to perform the necessary assessments. Such methods (defined as integral methods) are the most widespread in practice.

In order to obtain an optimal variant of the comparative data analysis of the methods, we believe that calculations should be performed based on the data encompassing a group of companies; this group should comprise both companies on the verge of bankruptcy and companies that operate normally. Thus, if we consider the bankruptcy situation as a maximum inefficiency situation of financial management of joint stock companies, then

these calculations may indicate the applicability of these methods in assessing the efficiency of corporate financial efficiency. Nevertheless, the absence of statistic data regarding companies in Romania already under bankruptcy does not allow us to put this method in the autochthonous practice.

Methods based on assessment by rating may generally be considered satisfactory, while statistic, expert and cluster methods present unsatisfactory results in assessing financial management of joint stock companies.

Many experts note the duality of sources of financial management efficiency of joint stock companies. Reflecting upon the management efficiency at a theoretical level it was demonstrated that the particularities of company management consist of the fact that the achievement of the management objectives is done both within the management system (the management subject) as well as within the managed object.

This complex interaction of objectives within the management-production system requires examining the outcome of the activities of the two sub-systems – the ruler and the ruled. Each of these sub-systems has its own resources and one should take into account their efficient usage.

The assessment of the efficiency of finance management system of joint stock companies proposed by (2.1) and the assessment of the efficiency of financial management (2.7), represents a common position towards the assessment of the efficiency of financial management of joint stock companies.

Abstract

Content analysis of the concept of “effective” management of joint stock companies' finance” and examination of major issues related to the process evaluation of that characteristic of the company's financial activity, allows us to formulate requirements (conditions) for specific methods of assessing the economic efficiency finance management of joint stock companies.

Key words: economic efficiency, economic indicators, methods of assessment, management system.

J.E.L. classification: G15

1. Foreword

Principled conditions to any method of assessing the economic efficiency of financial management of joint stock company are related to its complexity (coverage of various aspects of finance companies) and minimize the negative influence of fundamental factors influencing the assessment of efficiency.

Elaboration methods usually reduces to the conditions of selecting items efficiency indicator system and identify relationships between them.

Generally, experts believe that the systems of indicators necessary for evaluation of their efficiency and integral coefficients must be designed based on these systems and meet the following conditions:

- optimal number of indicators;
- content;
- stability.

Provided the optimal number of indicators include requirements for volume and their sufficiency. On the one hand, the system chosen by indicators should fully characterize the subject choose by evaluation - economic efficiency of financial management of joint stock company. On the other hand, the number of indicators organized in the system should not be too large because otherwise natural boundaries of assimilation of information will be depleted and so the information will be lost.

2. Analysis of data

The possibility of extrapolation is characteristic for most integration methods which are based on statistical methods. Conclusions based on the results of the financial statement made by these methods, often refers to a certain future horizon. For example, according to the methods no. 2, 4, 5, depending on calculations of entirely coefficient towards value criteria to determine whether the probability of bankruptcy of the company will be high or low in the next few years.

The main object of criticism integral methods based on statistical methods is their instability. Management science specialists stated that established methods using multiple discriminant analysis are unstable in time and space. Comparison of the data received from several countries shows that the share link Z and threshold interval $[Z_b Z_2]$ are very different not only from country to country but from year to year within a country.

Integral methods based on statistical methods are not protected from possible manipulation of indicators that are used in

these methods. If the situation remains relatively stable (i.e. criteria values do not vary greatly from one period to another), degradation indicators in these models, it is very probable. On the other hand, as already indicated, destabilizing the situation in the economy leads to degradation method.

Moreover, some scholars have questioned the methodological arguments of the method of E. Altman, and other analog methods: regression methods of E. Altman cannot make a reliable estimate of the financial position of various companies, firms because of the restricted of their application.

These methods are appropriate and applicable only to those companies whose financial indicators were included in all statistical methods for calculating the coefficients.

The second group of methods is the methods based on full type rating.

In the classical approach, benchmarking rating is a distance between the financial situation of analysis companies and the reference financial situation. So, the lower the appreciation by rating, the more effective is the company's financial management. But in some ways based on ratings, established norms of indicators and integrated indicator calculated based on them, is the basis of a simple comparisons without making an analogy with the calculation interval.

Making analogies with intervals, shows that conditions on the content are made within these methods.

Since the methods based on assessment ratings operates with benchmarking, which takes values from a standard interval (0.1), then stability of methods is preserved in time.

Even significant changes in the external economic environment (for example, a situation of economic crisis in the country) appear, does not distort financial management effectiveness evaluations of joint stock company within the selected group of companies. Both evaluations until and after the crisis based on the rating assessment methods, characterize the comparative position of companies on a sample of companies (for example, branch or region) in terms of efficiency of financial management of joint stock companies.

Accordingly, the issue of stability in the space industry or stability for this type of methods does not arise at all. Evaluation of

the efficiency of this method is always done in a particular sample of companies and comparing the results received under this sample, with the sample results received from other companies, is only possible if a unification of these two samples is done.

Assessment methods based on the ratings are less prone to degradation indicators. It is not possible to determine exactly how much needs to be distorted indicators of a company as evaluating the effectiveness of its financial management to meet the conditions provided, taking into account the fact that this evaluation is determined based on the multiple values of the indicators of other companies included in the analysis.

Solving the optimal number of indicators using methods of evaluation by rating is not performed by applying the algorithm, as in methods based on statistical methods. Therefore, some methods contain a greater number of indicators (20 indicators each). However this problem can be easily solved by using special methods in the screening stage of indicators. For example, a variant of solving this problem would be the analysis of coefficients components using a statistical method.

This method allows you to select from a full set of indicators those whose correlation is relatively low. As a result, their number is reduced without losing significant information about the studied phenomenon.

If as evaluation indicators are chosen static characteristics of a company's financial situation, then inside the group of analysis methods there are not sufficient foundation for extrapolation the assessing efficiency, because these predictions also requires making assumptions about changes in financial position of other companies in the sample. However, if instead of static characteristics will use the dynamic ones (e.g. growth rate indicators) in this case will be also analyzed the key indicators trends of other companies in the sample evaluated, and the extrapolation will be more motivated.

This assessment is an effective tool for measuring the company competitiveness growth in its field of activity.

However, the algorithm itself to develop the methods based on the evaluation rating has many methodological shortcomings.

The main objection is that not all the indicators used to assess various aspects of the financial situation of the company satisfy the conditions "the more the better" or "the less the better."

Thus, for example, a high value of the coefficient of liquidity may indicate the inefficiency of financial management of the company because of the excessive amount of financial resources that are not involved in creating added value. But, according to the rating assessment method, maximum liquidity coefficient is chosen as the standard.

In addition, it is theoretically possible a situation when, after the results of the election standard values will be obtained a standard conventional company whose existence is essentially impossible. In other words, will not be able to develop such a balance sheet and profit and loss report, that all indicators of method to receive the standard values.

This specific approach to comparative analysis of financial indicators will be unreasonable in terms of economics.

Expert methods of evaluating the effectiveness of financial management of joint stock companies are used to determine the weighting coefficients, whose calculation indicators are part of the integral coefficients. Expert evaluation methods can be also used to identify criteria for the indicators values often used in cluster methods.

In our opinion, using the expert methods of integral type, methodological is without perspective, which results from the specific of groups of experts.

As mentioned in the literature, "experts can usually compare objects or projects in general, but cannot identify the contribution of different factors" [1]. Thus, the reliability and validity of information on the effectiveness of financial management limited liability companies is questionable.

Integral coefficient of expert methods can not be interpreted otherwise than only by qualitative indicators of the financial situation of the company, but shown from the broad definition of "economic interpretation" the conditions about the content are fulfilled. The condition on the optimal number of indicators can be done using statistical methods mentioned above.

Expert evaluation method stability is not ensured. Building expert methods of evaluating the effectiveness involves the establishing of specific tasks for an expert group (for example, setting the parameters of time, region, sector affiliation). We cannot take into account the results received from using this method for the formulation of other tasks. If formulated tasks are generally, then the argument for applying this method is questioned because of the narrow qualifications of the experts, since the evaluated field is very vast.

Similar arguments can be presented as a critical reasoning to argument the extrapolation within expert evaluation methods.

The most acute problem in expert evaluation methods is the degradation of indicators. You can already make mistakes at the stage of training the weights in the formula of full coefficient.

The last two groups of integral type methods is a new current in financial analysis and are the base of non-trivial mathematical theories.

Application of fuzzy sets methods in financial management results from statistical methods and expert criticism. For the scientific establishment of efficiency assessment methods based on statistical methods is necessary to have a statistical homogeneity in the studied group of companies. Application of expert methods is not possible because of the human thought specificity: experts find it difficult to make numerical estimates, while the distribution of the assessed objects can be measured relatively easily.

These two problems in fuzzy sets methods are eliminated by introducing the concepts of "quasi-homogeneous" and "quasi-statistics" and transition to operations with fuzzy classifiers. This allows the formulation of expert assessments, by expressing their qualitative rather than quantitative ("good", "less significant", etc.).

Establishment method based on fuzzy sets method is the following algorithm:

- 1) it forms a system of indicators, to form a hierarchy of indicators-factors of the company's financial situation;
- 2) it is developing the histograms of indicators values selected for the companies part of analyzed group;

- 3) it is determines the linguistic classification parameters of the indicators values. The optimum would be split into five classes of stock level indicators - 'very low', 'low', 'medium', 'high' and 'very high';
- 4) moving up from the histogram of indicators values to fuzzy classifiers indicated by the linguistic classification;
- 5) in accordance with the rules determined by the operations with fuzzy sets, is recognized the quality level of the values of some indicators and the assessment of the financial condition of the company as a whole.

Histogram analysis, as the hierarchy of indicators used, ensures the necessary condition on the optimal number of indicators. Developing the factorial model of the financial situation of the company, and the obtaining the qualitative characteristics, ensure the necessary conditions on the content integrated indicator. Methods based on fuzzy sets methods are prone to degradation indicators due to a complicated mathematical tool, which underlies their.

The possibility of extrapolation inside this method cannot be considered fully substantiated. However, in choosing forecasts interval while the main basic parameters of macroeconomic environment are considered relatively stable, the analyzed companies retain their quasi-homogeneity.

The fact that full evaluation of the effectiveness of financial management of joint stock companies inside this method is not based on quantitative characteristics, but of quality, ensuring the stability of these methods over time. The situation regarding the spatial and inter-sectoral stability is similar to the rating assessment methods: each of these methods applies only to companies from a single branch and / or region included in the quasi-statistical.

Integrated assessment method was developed to perform a comprehensive assessment of quality based on the selection of optimal alternatives as Pareto principle, the proposed system of axioms. The basis of this method is the concept of assessing the difficulty of achieving that goal, if is known the quality and quality conditions of necessary resources to achieve this objective. Characteristic of this method to evaluate the effectiveness of financial management of

joint stock companies as an objective serves the absolute financial stability of the company and quality of resources and conditions that are treated as normal quality and affordable financial statements comply with the indices.

It can be said that this method, to some extent, resembles the rating valuation methods - especially in terms of standardization of indicators based on data values companies included in the analysis - proceeding from this that all the advantages of the rating assessment methods are inherent on this method. Meanwhile, in this method, the term "company-standard" is not present, which leads to removal of shortcomings in evaluation methods by rating the above mentioned.

The second type of formal methods is cluster method (method no. 1). These methods meet two conditions - the content indicators (clusters are used to the quality) and the existence of an optimal number of indicators (to be done by using statistical methods). The other conditions are not met or complied smaller. Here, the main factor is the method by which it determines the criteria by which a company is assigned to a cluster or another.

If the ranges of values of indicators were determined based on statistical surveys of selecting the company, then cluster methods are assigned the same critical objections as for statistical methods[2]. If criterial values were determined by means of experts, than such cluster methods fall under the critical expert evaluation methods. Finally, the next group of methods determined by us is informal methods. In our opinion, they practically do not provide reliable information on the economic efficiency of financial management of the analyzed company.

They are similar to expert evaluation methods, with one difference - they do not operate with financial indicators. In this method does not consider by experts weighting coefficients or criterial values of indicators, but the financial situation of the company as a whole. In the absence of objective data from company reports, informal methods do not allow us to judge about the stability or validity of extrapolating results. Lack of information can lead to

distortions in reporting results in the interest of evaluating the effectiveness of company.

Thus, informal methods are heuristic procedures. They can simplify and / or narrow your search alternatives of finance management decisions. Their use is possible at different stages of financial analysis, but cannot substitute the formal methods based on accounting information.

3. Conclusions

In conclusion, the analysis of whole type of formal methods is presented in Table 1.1.

Table 1.1. Evaluation of formal methods for determining the economic efficiency of financial management of joint stock company

	Methods for assessing the efficiency					
	Integrals					Cluster
	Statistics data	of Rating	Expert	fuzzy type	Assessment of difficulties	
Minimizing the influence of degradation indicators	■	±±	—	+	+	-
Extrapolation argument	+	±	—	±	±	—
Optimal number of indicators	+	±	±	±	±	±
Content indicators	+	+	+	+	+	+
Stability method	—	+	—	+	+	—

Source: prepared by author

„+” – conditions are fully realized,
 „±” – conditions is achieved with some limits,
 „-” conditions is not achieved.

The conditions relating to minimize the influence of degradation indicators, efficiency arguments extrapolation parameters, the optimal number of indicators, their content and methods for assessing the stability of financial management efficiency of the company stock, are best observed by fuzzy methods. These conditions are also reflected in the methods based on assessment difficulties. Methods based on the evaluation by ratings, can be considered generally satisfactory and statistical methods, expert and cluster shows unsatisfactory results in the evaluation of financial management of company stock.

The Knowledge Stage of Economy based on Knowledge

Lazăr Cristina

“Ovidius” University of Constanta, Faculty of Economic Sciences
lazarcristinam@yahoo.com

Abstract

In this paper were approached the references and the evolution in time of knowledge based economy. Changes occurred in the second half of the twentieth century led the economic analysts to put the continuous growth rates of savings on the account of new factor of production, the knowledge. The ability to taking advantage of the knowledge acquired is decisive and will be defining in the economic success.

The knowledge shapes are various: a new manufacturing technology, a superior organization of whole activity (development of management knowledge), improvements in psychological field, new applications of the border studies, and what is essential, the rarity is not a feature of knowledge.

Key words: economy, knowledge, information
J.E.L. classification: D8

1. Introduction

Knowledge based economy describes a change in economic structures and operates in all sectors. The ability to generate process and store information large flows represents the condition of development the new economy.

The meeting of Heads of State and Government at Lisbon in 2000 established a European strategy to transform the EU into acknowledge-based economic area, the most dynamic and competitive in the world capable of sustainable economic growth with more and better employment jobs.

A study published in 2002 inference: “the weakness or even complete absence of definition is actually pervasive in the literature... this is one of the many imprecisions that make the notion of the knowledge economy so rhetorical rather than

useful” (Smith, Kevin, What is the Knowledge Economy? Knowledge Intensity and Distributed Knowledge Bases, Institute for New technologies Discussion Paper 2002/6, the UN University, June 2002.

2. Evolution of knowledge based economy concept

The changes in recent decades occurred in the new economy leaves a place increasingly lower to the old economy. These changes occurred in the late twentieth century led to the transition from industrial age to the post industrial, to knowledge based economy. This was the moment when economic analysts have noticed that economic continuous growth rates of western economies could not be explained anymore in terms of traditional economic factors such as land, labor and capital. The role played by knowledge in economic growth has no novelty.

Schumpeter was the first to recognize the importance of knowledge in the economy by sending it to “new combinations of knowledge” in the centre of innovation and entrepreneurship (Schumpeter, 1911, p. 57). Schumpeter also considers economic dynamic requires constant innovation and volatility, the idea being followed by other scholars such as Galbraith, Goodwin and Hirschman. Knowledge-based economy has gradually replaced industrial society, which is far from disappearing of the “industry”. In the new economy, “industry” will dress other shapes, is about an automated and robotic industry, a cyber industry, a computerized industry.

Changing the rules of business and competitiveness are the result of vectors development such as: insuring access to information and knowledge,

developing human capacity through education, training and formation, creation of a favorable environment for development, including the legal framework and improving security information to a global level and to communication networks.

The concept of knowledge-based economy is the result of pioneering work of Fritz Machlup. He was the first to measure knowledge, his work being published in 1962 and the calculations lead a whole literature on knowledge-based economy.

Machlup was classifying knowledge production in six major areas: education, research and development, creative arts, media communications, information services and information technology. He took into account the greatest importance in the GDP sectors and employment in the economy, and predicted that this percentage was intended to grow both absolutely and relatively over time.

Creating the OECD in 1961 was providing a framework within governments could compare their political experience, to seek answers to common problems, identify good practice and coordinate domestic and international policies. This led in 1963 to the birth of the Frascati Manual parameters

which were monitored statistical of science and technology on a comparable basis. Until developing Frascati's Manual, the methodology used in statistics was not a unanimous and so did not allowed

comparisons between countries. The manual has provided internationally accepted definitions for classification of

activities and components of development and research. These are updated periodically by Eurostat and Eurobarometer and placed at the reach of researchers, evaluators

and statisticians.

As a result of initiatives OECD, UNESCO, European Union and various regional organizations, Frascati's Manual became a standard for statistical surveys on research and development activity of the world.

OECD defines knowledge-based economy as: “The knowledge based economy is expression coined year trend s in Advanced Economies to DESCRIBE

Towards Greater dependence on knowledge, information and high skill levels, a nd the Increasing Need for ready access to all of tissue by the business and public Sectors”.

Drucker theorizes the concept of knowledge-based economy, describing the difference between manual (line) workers and the knowledge worker: a manual worker uses his hands to produce “things”, and a knowledge worker uses his intelligence to produce ideas, knowledge and information.

Knowledge economy or knowledge economy is a concept that refers to the use of knowledge to produce benefits (The Age of Discontinuity, 1969). He believes that education and knowledge are productive assets of a business, as they can be the most valuable primary elements in making a product or service.

Knowledge has been defined for a long period of time by limiting the skills of the workforce. Today we know that the knowledge society is a broader concept than research and development, covering all aspects of modern economy in which knowledge is essentially the creation of added value.

“The idea of the knowledge driven economy is not just a description of high tech industries. It describes a set of new sources of competitive advantage which can apply to all sectors, all companies and all regions, from agriculture and retailing to software and biotechnology” (New measures for the New Economy, report by Charles Leadbeater, June 1999).

To understand the profound changes that led to the knowledge-based economy, it is necessary to analyse the evolution of technological and economic systems.

On the history of human society, we find that there are certain thresholds of development that led the society thresholds higher planes of existence. These thresholds have been named by the specialists, revolutions. Switching from manual labor to mechanized work gave birth to the first scientific and technical revolution, called the “first industrial revolution”. This was another huge leap in the development of productive forces and the final victory meant the capitalist

production relations. Automation and computer technology have led to the second scientific and technical revolution.

Computer and information technologies have become true symbols of the “second industrial revolution”. They have become catalysts of other “new technologies” - microbiology, energy, materials, communications, etc.

Identifying knowledge and information as development resources have led to familiarity with the phenomena underlying the knowledge economy. The result is the knowledge revolution on knowledge-based economy. This last stage was marked by struggles in technological innovations and the need for globally competitive innovation with new products and processes that develop from the research community (eg, R & D factors, universities, laboratories, educational institutions).

3. Features of knowledge based economy

Called “digital or computerized economy”, “information economy”, “electronic economy”, “global economy”, “economy of networks or communications”, the new economy has several specific features:

- 1) Dominance of theoretical knowledge as a result of social space computerization;
- 2) The foundation of economic activities on intangible values;
- 3) Human resources will effectively dominate, unlimited, for a pragmatic development of centers of stimulation and motivation of individual and collective intelligence;
- 4) Creative work takes the place of routine work;
- 5) Firms ensure their development through continue innovation and assimilation of the newness.
- 6) Decisional decentralization, destandardization of work procedures, informalization the organizational relations, increasing the share of informal communication will represent the organizational frame, being able to provide creativity, responsiveness and flexibility of business organizations;

7) Expanded information systems on a global scale.

Specialists' opinions concerning the definition of knowledge-based economy still vary between very wide limits, from one specialist to another. Specialist Thomas Stewart approaches the knowledge based economy, naming itself and without using the new economy term. Therefore, he says (Stewart, 1998, pp. 12-14) that “knowledge-based economy takes into consideration the money, in the context of purchasing, production, and sales knowledge”. Carl Dahlman, the manager of Knowledge for Development Program of the World Bank Institute believes that specific strategies are necessary to meet the four pillars of knowledge-based economy:

- An institutional framework that promotes economic and efficient use of knowledge
- A population educated and equipped to create and use knowledge;
- A dynamic information infrastructure;
- An effective innovation system within firms and research centers that can satisfy new needs of the people.

Paul David and Dominique Foray (2003) identify a series of factors that in their opinion led to the knowledge based society:

- Acceleration of knowledge production;
- Increasing the share of intangible capital to micro and macro level;
- Innovation has become a dominant activity and its sources, increasingly diverse;
- The revolution of knowledge use tools.

4. Acknowledgment

This work was supported by the project "Post-Doctoral Studies in Economics: training program for elite researchers - SPODE" co-funded from the European Social Fund through the Development of Human Resources Operational Programme 2007-2013, contract no. POSDRU/89/1.5/S/61755

5. Conclusions

“A Knowledge Economy is the economy in which production and use of knowledge has a dominant place in creating the wealth of the members of society” (Department of Industry and Commerce of Great Britain since 1998). The evolution from the economy based predominantly on physical resources to the economy where knowledge has the most important place represents the knowledge-based economy. This change led to major changes such as industrial revolutions.

In the future the economic successes will be based on production, access and use knowledge. “New economy requires a rethinking of the theory of production factors. Knowing becomes the essential component of the economic and social contemporary development system. Dissemination of innovation and leading technology convergence will play a key role in accelerating the importance of knowledge in the context of globalization”. (Drucker).

Reflections and Suggestions on Science and Technology Park “TehnopolIS” from Iasi. Solutions for Economic Development

Lazăr Roxana-Elena

„Alexandru Ioan Cuza” University of Iași, Doctoral School of Economics

rxn_ele@yahoo.com

Abstract

The importance of scientific and/or technological parks, as well as their anchoring in solving regional problems, comes from the emphasis on their regional dimension, on the practical application of the research, development, innovation policy. Although scientific and technological parks are a convenient solution for Romania's economic growth, however, their potential to induce economic growth is neglected by the authorities. We stop on one of the materializations out of European research, development, innovation policy in Iasi, namely on the Science and Technology Park Iasi - TehnopolIS. Science and Technology Park "TehnopolIS" is a true regional, urban portrait of Iasi, capturing the development of Iasi, divided between the research and development side, represented by the academic environment from Iasi and developed accordingly, and technological and industrial innovation, hardly representative and represented.

Key words: scientific, technological, park, development, TehnopolIS

J.E.L. classification: K20, O10, O30, O32, O38

1. Motivation

To the economic growth and degree of modernization of a country, generally, of Romania, in particular, contributes the existence and operation of research parks, scientific and/or technological. The importance of these parks, as well as their anchoring in solving regional problems comes from the emphasis on their regional dimension, on the practical application of the research, development, innovation policy and

on European cohesion policy. The involvement of local factors, of prestigious institutions of higher education, the emphasis on public-private partnership emphasizes the role of these structures that are designed to promote economic growth by innovative development, therefore, in the European official documents they are assigned the name of "poles of innovation" [1].

Scientific and technological parks are part of the latest innovative policy ideas. We know that the innovative, research and development policy in Romania implies the existence of certain companies and of a competitive environment, of an effective educational system, of research universities focused on research, of a strong legal system, focused on the property rights in general, on intellectual property rights in particular. A special place in all this mechanism is occupied by scientific and technological parks. The legislative concern in Romania, to develop the legal framework for this type of parks, is grafted on the existing legislation on industrial parks.

Although scientific and technological parks are a convenient solution for Romania's economic growth, however, their potential to induce economic growth is neglected by the authorities. We currently have only four scientific and technological parks allowed to operate in Romania, namely: Science and Technology Park – Software Park Galati, Science and Technology Park for Micro and Nanotechnologies - MINATECH-Ro in Bucharest, Scientific and Technological Park - Tim Science Park Timisoara and Science and Technology Park "TehnopolIS" of Iasi.

Their location highlights the practical concern for their development within cities - important county residences in the country - where they held various important cultural and economic activities, and which there are also, in addition, acknowledged universities.

We think that the science and technology park is a type of institution shaped to allow the development of research and technology and know-how transfer, thus inducing regional economic growth and, subsequently, national, based on an economic strategy based on the right property in general. Once established, the science and technology park is an important infrastructure element and also indispensable for the development of innovative, research and development policies focused on results, thus able to induce economic growth. Such a park is, in fact, a way of balancing the balance between innovation and market, starting from the need to convert new knowledge into new products.

2. The applicable legislative framework applicable

We note the concern at European level to strengthen the legislative framework for technology, industrial and scientific parks motivated by the Notification of the Economic and Social Committee on European technology, industrial and research parks in the context of crisis management, of preparation of the post-crisis period and of post-Lisbon Strategy (2011 / C 44/22), similar to the one in 2005.

Laws applicable to science and technology parks in Romania are limited to the following regulations: Government Ordinance no. 14/2002 regarding the creation and establishment of scientific and technological parks and Law no. 50/2003 for approval of Government Ordinance no. 14/2002, plus the Order of the Ministry of Education, Research and Youth no. 5442/2003, which approved the certification, suspension and cancellation methodology of the operating permit of science and technology park, and the procedure for admission to the park of economic operators.

Admission to park is made in compliance with Annex 2 of the Order of the Ministry of Education and Research no. 3589 of 2002 on the approval of the periodic authorization and reconfirmation methodology of science and technology parks and of the procedure for admission in the science and technology parks of operators.

We note that the legislation in the field of science and technology parks is not exhaustive, leaving room for further

regulation, but also to multiple interpretations. Moreover, the absence of legal provisions to encourage the creation of such parks, by various tax facilities makes their establishment to be, just as in case of the industrial parks, "ineffective and practically useless." [2]

3. Science and Technology Park – Tehnopolis-Iasi. Case study

We stop on one of the materializations out of European research, development, innovation policy in Romania, in general, in Iasi, in particular, namely on the Science and Technology Park Iasi - Tehnopolis.

Achieved on the basis of a project co-financed by Phare 2000 program, up to 6,353,220 Euro, Science and Technology Park Iasi - Tehnopolis, involved a number of ineligible costs (consisting of land price, the cost of feasibility studies) in the amount of 1,277,295 , 36 euro, supported by the City Council Iasi and the County Council Iasi, namely by the main associates of the Park. The other associates of the Park contributed with smaller amounts, but also with know-how, given their quality: the Agronomy University "Ion Ionescu de la Brad" Iasi, "Al. I. Cuza" University; Technical University "Gh Asachi" from Iasi, University of Medicine "Gr T. Popa" Iasi.

The activity of Tehnopolis focuses on areas such as: research and development; business incubator; attracting investments; European Enterprise Network-information center; organization of symposia, conferences, seminars, work-shops; general and special services.

The park macro-structure is focused on four major segments / groups: business incubator, the group of SMEs, large enterprises group and the services group.

Using the data collected from the documents studied and interviews taken, we synthesize the state of facts and the one proposed as follows:

Table 1. Proposed indicators for TehnopolIS

No	Proposed indicators	Until 2012	Results
1.	Land area occupied	12 ha	5 ha
2.	Occupied build area	15.000 m.p.	8.000 m.p.
3.	Number of tenant firms	200	22
4.	Involvement in research activities by establishing research laboratories	7	3
5.	Organization of training modules on project management or specialized areas	Yes	No
6.	Giving expert advice on specific areas of the park	Yes	No
7.	Establishment of a liaison office with industry	Yes	No
8.	Organizing workshops on activities developed by the park	Yes	No
9.	Macro-structure of the park is focused on four major segments / groups: business incubator, the group of SMEs, the group of large enterprises and the services group	Business incubator the group of SMEs, the group of large enterprises and the services group	Partial: Business incubator, the group of SMEs, and the services group
10.	Number of companies in the business incubator	18	7
11.	Start-up companies	18	7
12.	SMEs group	15	14
13.	Group of large enterprises	10	0
14.	Group of services	100%	20%
15.	Model of the knowledge-based society	Model of the service-based society	Model of the service-based society

Source: Feasibility plan for TEhnopolIS

4. Recommendations

Based on the data collected and presented above, we present, below, a few recommendations:

4.1. The idea of a science and technology park was folded on the characteristics of Iasi area, in terms of its development. The original plan was largely respected. However, there are a number of problems identified, consisting of small degree of local economic

benefits, but also of political interference in the management of the park which have to be corrected.

4.2. The advantages of Iasi have been exploited, respectively the proximity to universities well-known not only in Moldova region, but throughout Romania, likely to stimulate regional economic growth, generally, Iasi, in particular. The concentration of universities and research centers in Iasi is considerable. Three of the ten best universities in Romania are in Iasi and are partners of the Tehnopolis Park: University of "Alexandru Ioan Cuza" from Iasi, Technical University Gheorghe Asachi from Iasi, University of Medicine and Pharmacy "Gr.T. Popa" from Iasi.

4.3. The role of Science and Technology Park "Tehnopolis" Iasi is that of a business incubator designed to nurture the very creation and development of start-up companies, of small and medium companies, facilitating the knowledge transfer of know-how from universities to Park residents, stimulating practically the development of new products and services. Focused on applied research, Tehnopolis also focuses on production capabilities in the Park or in the immediate vicinity.

Although it has the necessary potential to induce economic regional growth through innovation, Science and Technology Park Tehnopolis from Iasi meets this objective only partially. Although the park's role is to maintain its residents and to develop, moving from the initial stage of business incubation of a company in its incubator, to an intermediate phase, the hatching of incubated business in a SMEs and then, in a last phase of a business that would fit the group of large enterprises, the results are modest. Only one company had been in the park incubator for three years, after which they turned into SMEs, and another functioned as start-up business in the incubator, after three years turning into a SMEs, when they relocated the business. So, Tehnopolis Park lacks attractiveness needed to develop and maintain its residents.

Another drawback of the park comes from the fact that it fails to monitor tenant companies of the park once out of it, in the sense to find out whether they continue to operate, weather they remain within the scope

of the activity they had at the time of their inclusion in the park.

4.4. Undoubtedly we have to observe the shortcomings that the Science and Technology Park has while performing its activity, namely: the location of Iasi in Romania, Romania's EU position, Romania's image abroad very little improved. All these are likely to reduce the chances of Iasi Park of attracting investment capital.

On the other hand, the Science and Technology Park Tehnopolis in Iasi does not value existing strengths: cheap labor, good professional and cultural training of young professionals trained at the Universities of Iasi. In addition, the lack of promotion of the Science and Technology Park "Tehnopolis" makes its existence almost unknown in Iasi.

4.5. It is obvious that the cosmopolitan appearance of the Park Tehnopolis, the rooms for rent, the beautiful sites, the park facilities are important. But all this is not an end in itself, but are just ways to achieve the purpose for which the scientific and technological park was built - to induce regional growth through innovation. In addition, the park has to offer those essential facilities, that the company would not be able to provide by operating elsewhere. Otherwise, the park's role becomes superfluous.

4.6. It is imperative to improve Park Tehnopolis management, putting up a better strategy to attract innovative companies that could take over one of the marketplace segments. Attracting innovative firms is needed to reduce unemployment in Iasi. From this new perspective, we consider that the replacement of the Science and Technology Park "Tehnopolis" manager is a solution that must be considered to improve the performance that the Park has the capacity to develop.

At this time the management duties of the Park belong to the company with limited liability Tehnopolis. From the data provided by the National Trade Register Office it results that that the associates of S.C. Tehnopolis S.R.L. are Iasi County Council, the Local Municipal Council from Iasi, specifically two of the park associates. Overlapping the two qualities of the Local Municipal Council from Iasi and of the County Council from Iasi City regarding their quality of associates of the Park, but at the

same time, of associates of the company that manages the park, we think that this is not an advantageous situation for Tehnopolis. Political differences between counselors are reflected in the Park management, which produces losses, as well as in the way of understanding of the issues raised by the park. For example, we will remind you that three new cases, covering various legal proceedings to annul decisions taken in the Park, put pressure on the instances from Iasi, especially on Iasi Court. It is inexplicable how it is possible for one of the associates of the Park and of SC Tehnopolis SRL, namely Iasi County Council to sue the company manager - SC Tehnopolis SRL of which this authority is part!

4.7. The way of thinking of Romanian legislator, evident in the G.O. 14/2002 provisions on the establishment and operation of science and technology parks, is defective and therefore we think that it should be improved.

Relating the establishment of the park to a joint venture contract is at least questionable. Also, the possibility of including in the consortium of the park the local government makes room, in a masked way, but legally, to political interference in the delicate, but apolitical issue of the scientific and technological parks. This takes place because from the interpretation of legal texts applicable (Articles 1949-1954 of the new Civil Code), joint venture represents "an inappropriate form of society in which a person participates in the commercial businesses of another to increase their profitability and to share with it the gains and losses, definition that captures two key issues: the commercial business belongs to a person and the other person contributes to the implementation of the idea, to the achievement of business and (...) it does not matter if people are traders, but only the nature of business for which they associate"[3]. It follows that some public legal persons (such as Iasi City Hall or Iasi County Council) are allowed, in addition to the public interest for which they should always work to serve private interests as well.

Although these two local authorities administer public funds, they can initiate an association, removing thus public money from public attention.

In addition, joint venture agreement requires the partners to participate equally in profits and losses. So, the following legitimate question arises: to what extent has the local administration the right to participate in the conclusion of a joint venture contract assuming the risk of loss from local community patrimony? The problem is real, not imaginary, since the return to joint venture operations for year 2010 highlights Tehnopolis' negative financial results, reporting a loss of 359,400.08 lei, and for 2011 a loss of 183.000 lei is projected [4].

4.8. Traditionally, the operation of scientific and technological parks is based on their own efforts: "on their own choice of business partners, on self-financing, on their own management and on risk taking policy"[5]. Or, in case of Tehnopolis Park we only find the own choice of business partners and, to the limit, the existence of an own management. The above shows, abundantly, the absence of self-financing and, especially, of risk-taking.

4.9. One element that could lead to the development of the park is its integration into an association with an international character, such as, for example, the International Association of Science Parks, which currently includes 190 science parks. The role of such integration is given even by the size of this structure, which enables connection to a real communication channel, and to an important flow of information for approximately 30,000 innovative companies that are residents of various parks.

However, currently, the Science and Technology Park from Iasi is not part of any association of the same nature, national or international. In the future, we considered auspicious the association with at least three other existing scientific and technological parks nationwide.

4.10. We consider it appropriate that the results of research carried out in the park to be disseminated through a quarterly magazine or of a higher frequency. Only in this way, Tehnopolis Park would demonstrate its usefulness, disseminating all the results obtained in the business incubator or in laboratories opened here, to all those interested. The current lack of transparency is likely to raise questions about its real, scientific and practical importance.

It should also be taken into account the possibility to organize thematic conferences or other events open to the public, related to the park activities. In addition, the park location in Iasi, a city with a rich historical tradition, close to the universities from Iasi requires the conduct of cultural activities inside the park, which attract a larger audience.

It is also important to create centers of transfer of the results of the research carried out in the park, by finding a solution to pass from patents to products and services.

4.11. If the area of land granted to the Science and Technology Park from Iasi is currently of approximately 10 hectares, built and unbuilt land, the disadvantage is that unbuilt plots of land destined for rent remain the property of the Park, their alienation being prohibited. Hence the difficulty of attracting investors. Investors are forced to raise buildings exclusively with a provisional and not definitive character on park parcels. Investors' reluctance is thus translated into the non-use of the park, bound for construction. Our suggestion is to relax the regulations in this regard, in order to attract investors by the opportunity to purchase plots in the park. Fortus unused land area, the presence of numerous halls of the former company, currently unused, support our proposal.

4.12. The establishment of the Advocacy Center was originally included in the Park draft, but its implementation was postponed *sine die*. The establishment of the center inside the park would have been a premiere in the Romanian economy. The role of such a center is to prepare a team of specialists able to offer their expertise in their specialized area to residents of the Park to support their legislative initiatives, in order to improve the Romanian business environment.

The fact that even to this moment the Park does not have such a center shows a lack of confidence in the Romanian business people, in those who have the quality of tenants of the park. Only the local business competition can improve the legislative framework so as to transform the Romanian economy into a functioning market economy, at European level, respecting the characteristics and traditions of Iasi area.

5. Conclusions

At the national level, the following issues are imperative: the design and implementation of a research – development oriented policy, the change of existing legislation regarding scientific and technological parks, by diminishing the influence of local authorities, and also the establishment of more parks of this kind, since the establishment of a national and local innovation system is imperative. The reconstruction of the Romanian space through science, this time, is a requirement.

Everywhere in the world, public authorities’ attempt to establish a new Silicon Valley or a new Cambridge Park is obvious. Science and Technology Park "Tehnopolis" is a true regional, urban portrait of Iasi, capturing the development of Iasi, divided between the research and development side, represented by the academic environment from Iasi and developed accordingly, and technological and industrial innovation, hardly representative and represented.

The Role and Importance of Leverage Rates in the Financial Management of the Company

Lăpăduși Mihaela Loredana
Căruntu Constantin
„Constantin Brâncuși” University of Târgu-Jiu
caruntu_ctin@yahoo.com
loredana@utgjiu.ro

Abstract

The aim of this article is to present an own vision regarding the role and importance of the analysis of the leverage rates seen as one of the key aspects of the financial management of the company. Our concerns have in view a theoretical and methodological approach of the debt ratios that can influence the financial activity of the company.

Establishing the level of indebtedness is one of the most important financial policy decisions of the company. The analysis of the company indebtedness is a matter of internal management of the company through which it must ensure the effective use of loan contracts and the conditions necessary for the repayment terms and interest on outstanding rates.

The rates are sizes that are expressed by number, points or term and are analysis tools used for knowing certain economic and financial historical or forecast phenomena, and also of the elements and factors causing them.

Key words: debt, debt ratios, financial leverage, financial independence, repayment capacity

J.E.L. classification: B26

1. Introduction

A good knowledge of the financial management requires knowledge of the state of the company and timely discovery of various causes, effects, problems generating expected or unwanted changes in the economic and financial activity of the company. In this respect, the financial analyst

must study the profit and loss account, balance sheet items or groups of items to determine the relationship between them and the financial diagnosis.

The analyst will make a selection from the mass of information in order to calculate some rates, highlighting the economic characteristics of the market and is a means of analyzing and determining the financial diagnosis, these procedures are known as the method of rates.

The rate method is a traditional and widely used tool in financial analysis. Comparisons of rates in time and space are used to obtain useful conclusions in the decision making process. The interpretation of rates must be done, however, with caution, taking into account each term of the report.

It should also be noted that many factors can influence the conclusions: ownership, organization, nature of business, accounting procedures for recording and processing data. In financial literature and in practice, are used over one hundred financial ratios. One of the reasons for their proliferation is that they not only serve the purpose of the external financial analysis, but are also used as a tool for analysis and internal evaluation of the company.[5]

The leverage rate analysis has as object to characterize the company's debt position relative to its resources and sources of finance resulting from the activity itself of the society. These sources are in fact the company's financial results, of which it can repay its debts.

The share of debt in the funding structure of the company depends on its development strategy, the situation at one time on the financial market and its development prospects in the future.

The main forms of debt are:[7]

a) loans through direct call: bonds, participatory investor certificates, medium term notes, bonds, Treasury bills, certificates of deposit;

b) loans by financial intermediaries:

▪ long term and medium: medium and long term loans through the mobilization of debt, medium and long term loans without receivable mobilization, credit (rental or lease agreement);

▪ short term: loans for mobilization (discounting, factoring), treasury loans (home facilities, credits of campaign).

This classification must be done by taking into account the three types of credits or loans as they follow: [7]

➤ Specific credits refer to certain operations such as exports, creation of the enterprise, decentralization. These loans are generally provided by financial intermediaries and should therefore be included in this category.

➤ Between companies loans appear when a company gives its clients payment terms, not making a call to public debt or intermediaries;

➤ Credits on the international capital markets or international banks, accounting for large sums through complex financial techniques. These apply only to a limited number of large **enterprises**, public or private.

2. The role and importance of leverage rates

Using currently and significantly bank loans raises the question of a high level of dependence of the company to the banking system, determined by dividing the total bank debt resources or capital to total debt. In the financial diagnosis of the company, the level of indebtedness is a relevant element of management. The study of the level of indebtedness and its stability over the medium to long term is done in a static manner by evaluating the importance of debt relative to some appropriate references (debt rates), dynamic analysis of financial structure is accomplished by the array of financing. [6]

Companies use for performing their activity not only own capital but also borrowed capital. The debt represents two

major characteristic for the company: on one side the obligation to pay regularly certain interests, which means financial expenses which will diminish the results, and on the other side using credits can decrease a surplus of profitability, even if it is superior to the cost of capital borrowed, the company is in advantage.[2]

The role and importance of debt ratios is reflected mainly in the following aspects:

▪ permit assessment of the state of indebtedness of the company, being a synthetic information for the management of the company and for shareholders, bankers, financial analysts, experts, accountants, etc.

▪ allow determining and analyzing trends in debt for a certain period of time determined by the financial analyst;

▪ provide information on the company autonomy to its creditors;

▪ appreciate the importance and impact of borrowing on the financial management of the enterprise ;

▪ help to establish the causes, effects and problems that generate expected or unwanted changes in the economic and financial activity of the company.

Of course, the aspects showing the role and importance of the debt rates can continue, we are just presenting some of these aspects.

The debt ratios sized in the view of the liquidity - eligibility analysis show the importance of debt over the financial management of the company. Comparing external debt financing with equity, debt rates reveal the composition of the passive and permanent allocation between equity capital and those borrowed on medium and long term. [7]

3. The theoretical and methodological analysis of the leverage ratios

3.1. The leverage ratio

Also known as the “financial leverage ratio” it expresses total debt (on short, medium and long term) of the company in comparison with equity or otherwise said it reflects the degree in which own capital assures the financing of the company activity. It can be interpreted also as a ratio of the financial autonomy of the company

indicating the degree of its commitments on short and long term are guaranteed by the own capital of the company.

The leverage ratio is determined by using the relationship:

$$LR = \frac{\text{Total debts}}{\text{Equity}} \cdot 100$$

(1)

The result of this rate should be below par, as a value higher than one means a high degree of indebtedness. The literature indicates that a value of this rate exceeding 2,33% expresses a high degree of leverage, the company may be quite at the stage of imminent bankruptcy even if the result exceeds several times the threshold of 2,33%.

If the leverage is greater than 1% than the enterprise will depend more on its creditors, and if is less, the bank will continue to guarantee loans under certain guaranty. Creditors prefer low debt rates, because the smaller the report, the risk of possible losses in case of bankruptcy is lower. Business owners usually follow a higher rate because they want to develop the business and for that they need to borrow.

3.2. The financial leverage rate

In terms of accounting, liabilities are external funding sources available to a company, either bonds and credit institutions (financial liabilities) or suppliers (generally operating debt) or other third parties (fiscal or social liabilities) .[10]

The passive balance sheet of Romanian companies regroups liabilities in four positions: [10]

- loans and related liabilities (financial debts);
- suppliers and related accounts 9 generally ,operating liabilities)
- advances received from customers (customer-lenders) and other liabilities (debts salary, social liabilities, tax liabilities, debts to associates and shareholders, Accounts Payable, etc..).

Complementary to the balance sheet, the annex classifies debts, after maturity, in: [10]

- debt incurred up to a year;
- debts incurred between 1 and 5 years and debts incurred for more than 5 years.

The financial debt ratio reflects the company's indebtedness on long-term and is determined by the relationship:

$$FDR = \frac{\text{Financial liabilities and long-term average}}{\text{Permanent capital}} \cdot 100$$

(2)

If the rate will have a value lower than 0,50% (<0,50%) then the company will continue to benefit from medium and long term bank loans.

3.3. The rate of the financial independency

It is complementary with the financial leverage rate and measures the weight of equity in the permanent financial resources. This is determined by the relationship:

$$RFI = \frac{\text{Equity}}{\text{Permanent capital}} \cdot 100 \quad (3)$$

This rate must be greater than or equal to 0,50% ($\geq 0,50$) imposed by banking rules in credit relations with the enterprise. The value of this rate approaches 100%, the degree of financial independence is higher.

3.4. The rate of the loan capacity

The borrowing capacity of an enterprise is the possibility to be able to call in loans, taking into account its financial structure. It is determined by the debt rate and ability to repay and guarantee.

The lending capacity rate compares its financial resources with long term loans. If the financial resources are less than their debts on time, that $RCI < 100\%$, the theoretical capacity of lending of the company is saturated. Therefore banking rules recommend a ratio higher than one: [4]

The calculus relationship is:

$$RLC = \frac{\text{Equity}}{\text{Term debt}} \cdot 100 \quad (4)$$

3.5. The rate of the capacity of repayment (the rate of credits coverage)

It expresses in number of years the company's ability to repay the full long-term loans. This rate allows us to determine how long the company would be able to repay its financial debts, if they use the full capacity of self-financing for this purpose. In other words, this indicator shows the proportion of company profit (after deduction of dividends) that will be (was) available for the payment of interest on their credit, to repay long-term loans next year.

The relationship calculus is:

$$RCR = \frac{\text{Total loans}}{\text{Self-financing capacity}} \cdot 100 \quad (5)$$

The lower the value of this rate the higher its capacity of repayment. Generally, loans on term are paid in maximum 3 years and total debts in 4 years.

Such an indicator has importance, firstly in the phase of contracting the loan, as banking rules may impose a number of years for theoretical repayment of the financial liabilities. In practice, the repayment period is provided in the loan agreement, and how its provisions have been complied with result from the accounting of the company.[9]

3.6. Sampling rate of the financial expenses

It shows the payment capacity of the long term debt cost and is determined using the relationship:

$$RFE = \frac{\text{Financial expenses}}{\text{Gross operating surplus}} \cdot 100 \quad (6)$$

If the ratio is smaller than 0,60% (<0,60%) the company has financial management difficulties risking to go into bankruptcy.

3.7. Borrowing cost

The borrowing cost includes interests and other costs incurred by a company in undertaking loan funds.

It is also called the average interest rate and is determined after the relationship:

$$BC = \frac{\text{Financial expenses}}{\text{Total loans}} \cdot 100 \quad (7)$$

If the average interest rate is lower than the analyzed company's economic profitability, debt favors financing through loans, so the leverage is the use of influence on equity profitability.

3.8. The weight of current loans in total debt

It expresses the choice made by the company between medium and long term debt and current banking credits (short term credits). The relationship calculus is:

$$CLD = \frac{\text{Current bank loans}}{\text{Global debt}} \cdot 100 \quad (8)$$

A large proportion of current bank loans in business debt can mean a situation of vulnerability which takes into account the type of these resources and their high cost.[8]

4. Conclusions

In the financial management through rates there must be meet the following conditions:

- to use the most representative rate and perform complex and not unnecessary calculations;
- rates calculated on several successive periods are comparable to each other;
- to avoid comparing rates between firms with different total activity object.

The interpretation of the rates should be characterized by caution, because only one of them, taken alone, is not satisfactory to describe the business activity, but only a particular combination of rates gives this possibility.

Debt ratios allow the examination of the distribution or structure of equity disposed by the company, meaning of own capital and those borrowed.

The analysis of the leverage degree highlights its evolution in a certain period, with the view to adopt financial policies to ensure the necessary independence. The analysis of the indebtedness degree of the company is also a problem in which there are interested different subjects, among which, even financing banks play an important role. [9]

Leverage can increase a firm's value, but a company indebted has a greater risk, the company not indebted has only an economic risk, while the indebted company recorded an increase in equity risk vis-à-vis the indebtedness degree.

Study on Accounting for Assets use Change

Lenghel Radu Dorin

“Dimitrie Cantemir” Christian University, Faculty of Economics Science, Cluj-Napoca
radulenghel@yahoo.com

Abstract

The purpose of this research theme is to disentangle the manner of highlighting and accounting of the operations on the assets use change. Also the article wants to underline the complexity of the accounting problems connected to this subject.

Key words: : assets with long manufacturing cycle, tangible, stocks, housing complexes or ensembles, changes in the use of tangible, transfer of assets.

J.E.L. classification: M40, M41

1. General aspects on assets use change

The accounting on fixed assets is kept on categories and on each object of bookkeeping [3].

In the category of stock there are also comprised the assets with a long cycle of manufacturing, made for sale (for example housing complexes and ensembles, etc. made by entities that have as a main object of activity obtaining and selling houses) [1]. If the buildings are accomplished with the purpose of long term exploitation, they represent tangibles. Also when a site is bought for the purpose of building on it constructions for sale, this is registered in stocks [1].

When there is a modification of the use of the tangible, in the way that this will be improved in the respect of selling, at the moment of the decision on modifying the destination, in accountancy there is registered the transfer of the asset from the category of tangibles to the one of stocks; transfer that can be done at the unamortized value of the tangible[1].

According to point 92 from the accountancy regulations related to the European statutory approved by the Minister of Finance Order no 3.055/2009, an asset is

framed under the category of tangibles if it meets two conditions[1]:

- it is owned by an entity in order to be used in the goods production or services provision, to be rented to third parties or to be used in administrative purposes;

- it is used on a period longer than one year.

According to point 152 paragraph (1) from the same accountancy regulations, stocks represent elements of asset nature, that must be recognised as so and have to fulfil three conditions:

- to be owned in order to be sold in the period of the normal unfold of activity;

- to be on the track of production in the perspective of sale in the process of the natural unfold of the activity

- to be known as raw materials, materials and other supplies, that are to be used in the production process or for services provision.

2. Case study on asset use change

Example no.1:

Student Ltd. has in its portfolio buildings under the classification of both tangibles and stocks (for sale – 371). The company buys at 31st January 2008, for its own needs, a downtown building (building A) with the value of 30.000.000 lei (the building is used 75% for renting and the rest for its own needs). The building is paid entirely on a period of 50 years (monthly payment 30.000.000/600 months= 50.000 lei). In the first semester of the year 2011, the company restricts its activity due to the financial crisis, and at the beginning of July 2011, the board decides to modify the usage of the building A, this being improved in the perspective of selling, the personnel being transferred in another premises (B), which was initially framed in the category of stocks at a acquisition cost of 20.000.000 lei, being initially a space designed for sale.

The management has made this decision because the income from rents has decreased very much, and the renting activity is in deficit. In order to sell it in the period between July 2011-March 2012, several improvement measures are taken in a value of 12.000.000 lei, in the following way:

1. 1.500.000 lei (July 2011 – December 2011);
2. 1.000.000 lei (January 2012 – March 2012).

On the 1st of April 2012 the completion and reception of the modernization works takes place at building A.

As a consequence of the management policies, at the beginning of July 2011, the company restores the two assets:

- building A is transferred from fixed assets to stocks;
- building B, from stocks to fixed assets.

In April, the building is sold at a selling price of 45.000.000 lei, plus VAT.

Solution:

1. Accounting records regarding building A:

- building acquisition at 30.000.000 lei + VAT, on 31.01.2008:

%	= 401		<u>37.200.000</u>
	212/ A		30.000.000
	4426		7.200.000

- liquidation of building 11 months 2008, 12 months 2009, 12 months 2010, 6 months 2011: 41 months * 50.000 = 2.050.000

6811 = 2812		2.050.000
-------------	--	-----------

- transfer at the 1st of July 2011 of the building stocks at the value necessary for liquidation, 27.950.000 lei:

%	= 212/A		<u>30.000.000</u>
	331		27.950.000
	2812		2.050.000

- for the months July – December 2011, there is registered monthly on expenses the sum of 1.500.000 lei:

Cls.6 = %		1.500.000
	Cls.3	
	Cls.4	

- for the months July – December 2011, there is registered monthly the current production, the sum of 1.500.000 lei:

331 = 711		1.500.000
-----------	--	-----------

- for the months January 2012 – March 2012, there is registered monthly on expenses the sum of 1.000.000 lei:

Cls.6 = %		1.000.000
	Cls.3	
	Cls.4	

- for the months January 2012 – March 2012, there is registered monthly the current production, the sum of 1.000.000 lei:

331 = 711		1.000.000
-----------	--	-----------

- resumption and discharge of the current total production, representing the improvement works to the production expenses:

711 = 331		12.000.000
-----------	--	------------

- The building is recorded in accountancy at stocks of finite products at the level of improved asset.

- reception on the 1st of April 2012 of the improvement works at a total production cost of 12.000.000 lei:

345 = %		<u>39.950.000</u>
	711	12.000.000
	331	27.950.000

- the transfer of the finite products to merchandise in the perspective of selling:

371/A = 345		39.950.000
-------------	--	------------

- sale as merchandise, sale price + VAT:

4111 = %		<u>55.800.000</u>
	707	45.000.000
	4427	10.800.000

release of duty:

607 = 371/A		39.950.000
-------------	--	------------

2.Accounting records regarding building B:

- changing the destination of building B at the beginning of July 2011, and classifying it to constructions:

212/ B = 371/ B		20.00.000 lei
-----------------	--	---------------

Example no.2

The company Student has the object of activity the sale of houses. This one buys on 01.04.2010, the entity X, legal Romanian entity, a block of flats for the function of offices, at a negotiated value of the contract being of 20.000.000 lei, VAT 24%. Through the policy of the entity it is established that the bought block of flats is to be paid for over a period of 60 years.

Starting with the following months of acquisition, the entity calculates the payment of the block of flats by using the straight line method of depreciation.

On 31.12.2010 it makes the re-evaluation of the tangibles, and in the evaluation report there is established the fair value for the block of flats at 19.000.000 lei.

At the beginning of January 2011, more exactly 1st of January 2011, the management of the entity decides changing the destination of the tangible in order to sell it, the sale value of the block of flats being of 25.000.000 lei, VAT 24%.

In order to sell the block of flats, the entity decides the exterior thermal rehabilitation of the block of flats; the works done in this respect have the value of 1.500.000 lei. The building is sold at 31.01.2011.

Solution:

Accounting records:

- registration in accountancy on 01.04.2010 of the block of flats bought by the entity: :

%	=	404	<u>24.800.000 lei</u>
212			20.000.000
4426			4.800.000

- recording of the monthly depreciation, a total sum of 27.778 lei (20.000.000/60 years/12 months) starting from May 2010:

$$6811 = 2812 \quad 27.778 \text{ lei}$$

Depreciation for the period May 2010 – December 2010 = 27.778 lei x 8 months = 222.224 lei

Net book value of 31.12.2010 = 20.000.000 – 222.224 = 19.777.776 lei

Value (just) from re-evaluation= 19.000.000 lei

Results a depreciation value (a minus from re-evaluation) of 777.776 lei.

- recording in the accountancy of the depreciation value resulted from the re-evaluation:

Because after the calculus made we observe that the just value of the re-evaluated tangible is inferior to the net book value of it, the difference from the re-evaluation is seen as an expense with the total value of depreciation:

$$6813 = 212 \quad 777.776 \text{ lei}$$

- the change of the building destination on 1st January 2011, according to the decision of the management of the Student entity:

$$331 = 212 \quad 19.000.000 \text{ lei}$$

- all along the carrying out of the work representing thermal rehabilitation of the block of flats, the entity makes their recording in the accountancy books in this way:

- it is recorded as expenses the sum of 1.500.000 lei:

$$\begin{array}{r} \text{Cls.6} = \% \quad 1.500.000 \text{ lei} \\ \text{Cls.3} \\ \text{Cls.4} \end{array}$$

-the current production is recorded having the sum of 1.500.000 lei:

$$331 = 711 \quad 1.500.000 \text{ lei}$$

- resumption and discharge of the current production representing the improvement works:

$$711 = 331 \quad 1.500.000 \text{ lei}$$

The building is recorded in accountancy at the stocks of finished products at the level of improved asset.

- reception of the piece of work and of the building for sale at a total value of 20.500.000 lei (1.500.000 + 19.000.000):

$$\begin{array}{r} 345 = \% \quad \underline{20.500.000} \\ 711 \quad 1.500.000 \\ 331 \quad 19.000.000 \end{array}$$

- the transfer to merchandise of the improved block of flats:

$$371 = 345 \quad 20.500.000 \text{ lei}$$

- the sale of the block of flats:

Sale price = 25.000.000 lei

$$\begin{array}{r} 4111 = \% \quad \underline{31.000.000 \text{ lei}} \\ 707 \quad 25.000.000 \\ 4427 \quad 6.000.000 \end{array}$$

- release of duty of the block of flats at the carrying value (20.500.000 lei):

$$607 = 371 \quad 20.500.000 \text{ lei}$$

3. Conclusions

The objective of this article is to present the opinion of the author backed by case studies, regarding the modifications imposed by the introduction in the accountancy legislation of some theoretical aspects on the assets use change.

The tackled theme has also been studied in other major materials, presented in the bibliography, referring to which we can draw the following conclusions: concerning the developed material in the practical guide issued by MFP, in the year 2010, it is noticed a wrong accountancy of the manner of the release of duty in the stocks of the sold finished products, because the production is released at its entire value (production cost plus the value left for liquidation, through the registry:711=345) [2], considering in this respect that the alternative of product transfer to merchandise in more adequate (371=345).

This work represents a special problem that is less discussed in the professional environment of bookkeeping. We notice that the problem of accounting of the assets use change was less detailed in the accountancy regulations and in the major literature.

In the practical guide of the MFP, in the accounting regulations, in the case of stocks of the type of housing complexes or ensembles, which year 2010, there is noticed that accounting wrongly the way of subtracting from accounting management of the stocks of sold finite products, because the production is discharged at its entire value (production cost + value remaining for liquidation, by registering: 711=345), taking into account that the alternative of transferring these products to merchandise is more adequate (371=345).

According to the accountancy policies of an entity, an element of an asset nature can be recognised in the category of tangibles or of stocks, according to the purpose of its destination, but also of the period expected in which it will be used by the entity (on the long run, or on the short term).

The accountancy regulations allow framing in the category of stocks of the assets with a long cycle of manufacturing and which are meant for sale (for example: housing complexes or ensembles made by entities that have as a main activity obtaining and selling of houses).

On the other hand if these buildings are made with the purpose of being exploited on the long run by the entity which made them, they are recognised as tangibles. Also, when a piece of land is bought for building on it buildings for sale, this is registered at stocks.

Regarding to the alteration of the usage of one tangible, in the way that it will be improved for sale, at point 153 paragraph (1) from the Minister of Finance Order no. 3.055/2009, it is stated that at the moment of taking the decision regarding the alteration of usage, in accountancy there is recorded the transfer of the asset from the category of tangibles to the one of stocks.

The transfer is registered at the depreciated value of the tangible. If the tangible has been re-evaluated while the reclassification of the asset was made, there will be proceeded to the closure of the backup account from the re-evaluation reserved to it. According to point 153 paragraph (3) from the same initially were meant for sale and that afterwards change their destination, as to be used by the entity during a longer period of type or being leased to third parties, in bookkeeping there is a register of the transfer from stocks to tangibles. The transfer is made at the date of the destination swift, at the value that the assets were registered in accountancy (represented by cost).

Also, according to article 24, paragraph (17) from the Law no 571/2003 concerning the Tax Code with the subsequent modifications and additions, in the case of a tangible, which at the date of the entrance in the patrimony has a tax value lower than the limit established by the Government decision, the taxpayer may choose between the deduction of the afferent expenses of the tangible or for the recovery of these expenses through depreciation deductions.

We hope that this article will prove to be a useful tool of information for the people involved in the area of accountancy.

The Economic Recession, the Everlasting Bridge to the Informal Economy

Libardea Vlăducă Laura

Țâmpu Diana Larisa

The Bucharest University of Economics, The Doctoral Studies Institute

lauralibardea@yahoo.com

diana.tampu@yahoo.com

Abstract

These days, words as recession and crisis are on most peoples' lips, in Romania and elsewhere. The worries, mostly connected to unemployment rate increase, have also deep roots in the decrease of productivity. The official figures have sustained a potential exit from crisis since the August 2011. Beyond figures things are more clearly when consider the awareness for more work, responsibility turn into real performance and better results. Population cannot heat their home with figures that are far from reflecting the reality as it is. To survive the recession, Romanian employers prefer work informally, if not illegally, to avoid excessive bureaucracy and overburden taxes.

Although officially Romania got a top position among the countries with a low unemployment rate- 4.8% (August 2011), the official measures adopted by the government are not at all connected to economic development. In this respect, potential causes and future legal actions to follow are delivered in this script.

Key words: Crisis; Unemployment, Gende; Underground/Informal Economy.

J.E.L. classification: A13, A14, E24, H12, K42, E26

1. The economic and the social context of Romania

Specialists from all contries got the idea that what began as a subprime mortgage debacle in the United States has by now transformed into a worse global financial crisis. It's not the first financial crises and the history teaches us, that it won't be the last

one. We still wonder why these events are so quickly forgotten, and why all the time, we have to make new analyses, to give new lessons from which the population as well as governors and entrepreneurs have something to learn.

The main problems which gravitate around the world in this moment are: the containment of the immense financial sector crisis and the meltdown of production and the increase of the unemployment.

This paper aims to analyze the second problem: the unemployment. In Romania the official figures present a lower unemployment rate than before the crises has begun.

In Romania the unemployment rate recorded at the end of August 2011, a value of 4.8%, being one of the countries with the lowest unemployment rates in the EU. In order to cover the debt caused by the crises the Government decided to fire over 100.000 employees from the public sector. Nither the private sector doesn't taste good this bitter efect of the crises, and almost 150.000 workers were fired since the crises has begun. The adoption by the Romanian Government of certain unsustainable fiscal policies in order to reduce the unemployment in the current economic crisis, led to lower productivity, which limit the creation of new jobs.

Although the statistical data provided by NIS, look like the unemployment rate in Romania between Aug.2010 – Aug.2011, is in continuously decreasing, the total number of unemployment dropping from 675.800 in August 2010 to 435.200 in August 2011, the employees number in economy is continuously decreasing too, with more than 250.000 people less than the number recorded by the end of 2010 as in shown in the next graph.

Graph. 1. Unemployment rate during August 2010 – August 2011

Source: INS Yearbook 2010

At global level in time of crises the groups of people that are most affected are men and the young ones. This is not an absolute rule for our country too, and the particularities for Romania will be presented in the following lines.

2. Gender differences in terms of unemployment

In the labor market, the current crisis has affected men and women also. The reason why men are affected it's quite simple, because of the sectors that were most severely affected by the crises (egg. the construction, financial services and automotive sectors etc.), traditionally employ more men. From 2002 to 2007, the leadership for these ones has been in women hands. But, since the crisis has begun, most markedly since the first quarter of 2008, the rate has converged. In the first quarter of 2009, the male unemployment rate has moved to only 0.3 percentage points below the female rate. This rule is valid for all the European countries, but in Romania things is different. The female unemployment rate increased more than the male unemployment rate. In Romania, the crises made his presence felt in construction like in all the European country – but not only. Also the textile industries, the agricultural exports and tourism were affected by the fall into this economic recession. The sectors mentioned above are female intensive industries. In addition to this is all the great number of dismissal from the budget system that mainly has affected the women, because more woman than men works in the public sector.

3. What measures should Romania take to stop the gender differences in terms of unemployment?

The great danger that any country can fall is the recovery reform. These efforts and funds, have not to favor the strength position from the economy, because in this case, the existing inequalities will be strengthened. Not only that it will be an accentuation of the existing disparities and a hardening of social exclusion, but also the effects will be critical economically, socially and politically speaking. Here is the great opportunity, to see the crises like a great medicine- a new lifestyle - in order to reduce all the inequalities between genders lines, ages and experience.

Firstly, there have to be more re-skilling trainings for the entire population and more unemployment benefits. This re-training program of unemployed people to new jobs has to break gender stereotypes, especially those with family responsibilities. In women cases there have to be a strong initiative to return to work after the maternity leave. The initiative could come from men too, through encouragements for these ones to take paternity leave. A general measure can target the incentives. In this way it can be make work pay measures, which can increase incentives for low-paid workers to participate in labor market, by providing income tax credit. Another problem is in the public system, because most of the jobs from this sector are blocked. The government should do in order to reduce this anomaly of the system more public employment programs. For people to be stimulated there has to be an increase of the minimum wage – especially because women are lower paid than men due to the gender wage gap.

4. Youth unemployment

Another category of people that is affected by the global economic crisis are young people. In general, youth have been hit much harder than prime-age men in terms of increasing unemployment rates. Overall, youth unemployment rates are far more sensitive to the business cycle than witnessed for the adult population (OECD 2008). Youth unemployment has increased since the first

quarter of 2008 with 1.8% . The unemployment rate is expressed as a percentage of the labor force (employed plus unemployed), not of the whole population. The young people are the main victims of the crisis, this mainly because when the crisis began, the creation of new jobs was stopped as a reverse. Because the young people were the main group of people which was targeted by the creation of new jobs, they have suffered a disproportionate increase in unemployment.

5. What measures should Romania take to stop the growth of youth unemployment?

The first measure is to ensure a microeconomic environment for job creation. In this way, all labor force and in particular the young one would not be affected by the effects of the economic crisis. Youth tend to be disproportionately affected in the context of stagnant economy and declining overall employment. In order to maintain a microeconomic stability the fiscal austerity that is taken by the government has to be done carefully, for not to kill the job creation. But this cannot be possible, by increasing the VAT with 5%, or lowering the budgetary wages with 25%.

Moreover, young people have higher needs than the adult population, and the most important one is that they need a home.

The second measure is to adopt different ways in which is promoted the transition of the youngest from school to work. Good examples are the internships. In this way the training of young people or the training for those ones who are unemployed is encouraged. Another idea focus on the same problem is developing a fund to support the job creation for young people, or to have well targeted social programs for the young ones. In order to complete this measure, we mention the lack of vocational schools which can professionalize the youngest in certain occupations, especially the technical ones, and the inefficiency of the education system.

The last measure is about the duality that must be avoided in the labor market. Now on the market are two layers of jobs. The first one is made from good jobs, quality ones, the stable jobs. The second layer is made from

the temporary, precarious and informal jobs. In Romania, in almost all big companies, the second layer of jobs is addressed to young people, because they miss professional skills, and/or work experience, job search and abilities, and last but not least the financial resources to find the right vacant positions. In this way it is not use the whole human or career potential of the young people. This case is also available during the good economic times not only in time of a recession period like this one.

In some cases other qualities are those who lift you to a better function, even if you are young and inexperienced. And we can speak a lot about nepotism.

6. The extent of the underground / informal economy on the labor market

While the unemployment rate calculated by the NEA is based on the declarations of people which are registered as unemployed at the Employment Agency Labor, the ILO unemployment rate published quarterly by NIS is based on surveys made in households. The difference between the NEA rate and the ILO rate is the hidden unemployment, namely the people who do not work, but do not pass on the NEA to be taken in evidence.

The dramatic drop of the unemployment rate does not reflect the real economic situation from Romania. Although the unemployment rate is continuously decreasing, the number of jobs in the economy paradoxically is situated in the same trend.

In addition to the retiring employees and some of the massive departure of the Romanians to work abroad, lately Romania is experiencing with phenomenon, which can be found in two forms: *illegal* employment and *informal* employment, phenomena both widely dissipated and difficult to eliminate.

In contrast to "illegal employment" which involves hiring undocumented persons excluding entirely the contributions to the state and the existing legislation, the "gray economy" simulates a situation of legality. Thus, employers prefer to register usually in the individual contracts of employment the minimum wage, and pay to the employees, on another side – a dark one - a larger amount of money in order to escape from

excessive taxes. From the necessity of survive in this economic recession by avoiding the excessive bureaucracy and the extremely burdensome taxes the employers from Romania had to recourse to "illegal employment" and "gray economy". In most of the cases this is a real condition for employment. For the same reasons, many entrepreneurs from Romania prefer to send their employees into unemployment and then hire them illegally.

The current economic environment caused by the financial crisis, the concern of losing their jobs, the personal needs, the training level, the lack of information about the consequences of his actions, the salary offered, "illegal" , the distrust of the retirement system, determine the employee to show flexibility at employment and accept to work illegally, being in this way expelled from the payment of some bonuses, from the compensation for vacation, for child allowances, health insurance, pension and others benefits.

Until now has not been developed a viable method of calculating the number of the employed population in the underground economy, which can certainly estimate the number of employees who work on the black economy in Romania, but, according to a study conducted by Albu L. and L. Voinea, published by the National Trade Union Bloc later this year, entitled "The Informal Economy and her impact on the labor market " was estimated that no more than 3.4 million people are involved in the informal sector of the economy, either as partially or entirely works in illegality , while in the formal economy activates 4.1 million Romanians.

The same study reports that most of them are young people with ages between 15 and 24 years old, but also those aged over 55 years old, with a low education level attracted by the mirage of "illegal remuneration ".

According to data published by NBS, if all the employees from the informal economy would migrate into the formal one, the employment rate would increase by 45%, which would provide Romania the achievement of occupancy rate set by the EU Strategy, Europe 2020 – meaning 75%.

Making public the informal sector is almost impossible considering that the entirely excessive taxation of the economy

who not increased by productivity but on revaluation of assets, cannot be prevent the exposure to the risk that the activity which is the subject to taxation should not be performed.

Besides the lack of legal forms at employment and pay "in hand" the wages, mainly in services sectors, construction and agriculture sectors, the employers, in their struggle for survival, more and more often adopt illegal forms of remuneration. This situation fits those who are employed illegally on a minimum wage with a higher salary "in hand", those who belong to the freelancer's system, and to the tax structures recorded in European countries. These practices which damage the state budget with significant amounts of money tend to create an incorrect environment for those ones who are competitive in the relation to the formal market.

During all this taxation authorities assist helpless in front of the legislative inconsistency and slow and inflexible system that they have to deal with.

As long as, on the one hand, the population from Romania, from the desire to secure an income that satisfy the minimum standard of living, is willing to agree to perform work in any conditions, accepting the adverse effects on social security and developing economy, and on the other hand, the policy makers do not adopt sustainable measures designed to reduce employers' contributions and to increase the minimum wage, informal and underground economy is likely to grow in the following.

7. Conclusions

Almost all crises start and end up the same, and it seems that the nation heal so quickly that forget the past. Milk and honey will no longer flows through the Carpathian Danubian-Pontic area. Reducing the budget wages by 25% and increasing the VAT with 5% are not the best methods that government can take for relaunching the economy. In addition to this the dismissal of public sector with almost 100,000 employers, has done nothing more than encourage illegal economy, migration and fiscal evasion.

The measures that can lead to real economic growth are the expansionary ones. They must be accompanied by effective exit

strategies supporting on the one hand the sustainable growth, and avoiding on the other hand macroeconomic imbalances. But the measures adopted so far by the government were not designed to pull the economy out of crisis, but on the contrary, they led to the amplification of the informal system.

To restore law and order in the labor market the authorized organization should adopt the following measures:

- Increase the minimum wage to a decent level constitutes the safest way to avoid the illegal economy;
- Reduce the contributions to the state as is practiced in all EU countries;
- Removal of bureaucracy in terms of bushy documentation required in the case registration the legal forms;
- Creation of an electronic register required for recording coherent and stable legal forms that would not be changed permanently as it is currently done;
- Increasing the number of Labor Inspectorate centers in the country that facilitate the employer's performance of procedures required in the workforce quickly. (Now in most places in the country were abolished the Labor Inspectorate centers of cities, being founded only one in county residence);
- Introduction of compulsoriness to employees of holding identity documents on them during the execution of works, mainly in the economic branches the most affected one by illegal employment in order to identify faster the person checked. Currently the law is indulgent, enabling employers to provide legal forms of employment and other documents related to competent authorities, only after 48 hours from the request control;
- Initiating correctly and firmly punishment the people who try to evade from the payment of contributions and taxes through the practice of illegal work. According to the provisions of article. 264 of the Labor Code / 2003, republished, the state is quite permissive in the sense that does not punish severely the person who agrees to work in the underground / informal sector than in the situation when it commits acts

"repeatedly" or if it gets to work without legal forms "more than 5 people." The current legal provisions of minimum sanctions and the support for employers, undoubtedly lead to encouraging the exclusion of legal provisions by finding legal wickets, or opportunities alternatives that allow them to continue their illegal work;

- Drastic punishment of acts of corruption on the people involved, whether they are part of inspection bodies or private sector;
- Encourage sources of information both outside and inside companies and public institutions on illegal acts committed by the employers;
- Informing and educating citizens about their rights and their facilities offered by the state for the legal forms of employment through developing practical guidelines, in collaboration with other institutions from the same field, with employers and unions, through the mass – media;
- Continuous information of employers by the authorized organizations by various methods, on the obligations incumbent on them in the field of work relations;
- Creation of a retirement system at the European level to stimulate citizen not to agree to perform illegally work;
- Adoption of a consistent stable legislative system designed to protect labor rights both the employee and the employer.

In order to all these measure to be viable they must integrated and targeted applied so that all measures of the government institutions to converge to the same point and to increase the percentage of employment. This definitely can be done, once a social partnership between Romania and other developed countries is adopted. This may ensure the modernization and diversifications of all the activities and sectors currently ineffective in our country.

A Keynesian Versus a Monetarist Perspective of Money and Monetary Policies

Lipară Daniel

danl_02@yahoo.com

Abstract

This paper aims to show the different approaches of monetary policies from a Keynesian and a Monetarist perspective. We will present a critical view about money and monetary theories by comparing two of the most important and influential schools of economic thinking: Keynesian paradigm and Monetarism.

The later appeared as a reaction of the former, in a moment in which the existing solutions could not solve the negative phenomena the economy was confronted with.

A change was necessary. But for how long Monetarism succeeded to be a solution for the economy? And what school considered money as having an active role for economic growth?

Key words: monetary policy, money, Monetarism, Keynesism, economic growth.

J.E.L. classification: E52, E41, E12, O47.

1. Introduction

The period between the two World Wars is dominated by a very serious problem that needed urgent solving: unemployment. Not only did the number of unemployed people grow, but neither the thinkers of that times didn't give enough importance to the phenomenon, considering it solved even before knowing its disastrous effects.

These were the conditions that anticipated a changed paradigm: Keynesian school of thinking.

2. Being a Keynesian

Keynesianism has its name from the english economist John Maynard Keynes,

who, seeing the problems that the world economies had to face after World War I, will create in the early 1930s a new paradigm of economic thinking, different from the classical and neoclassical thinking. The market economy was the center of this thinking. It was guided by several fundamental psychological laws or inclinations and in the absence of market rules or a well-defined framework, it will likely to generate unemployment, crisis, other negative phenomena and even economic instability.

The classical laissez-faire attitude is no longer current. So Keynes considered that the state should have an active role in the economy, but without hindering entrepreneurship. A free left market is a magnet for crisis and unemployment. And this can't be tolerated anymore!

The paradigm, that will dominate the world economic scene until the 1960s, admitted the existence of a long term impact of monetary policy on the economy. In other word, this was the central thesis that the two major schools of economic thinking had regarding the monetary policies: what is the long term impact of the monetary policies?

Keynes appreciated in *A Treatise on Money* (1930), that there is not always an equilibrium between savings and investments. For him, the interest rate is a key factor in the evolution of investments. When the steady state between savings and investments is obtained, the prices are stable. When the monetary interest rate isn't equal with the rate of profit, there is a fluctuation in prices, just as Wicksell stated too.

So, Keynes believed that in order to reduce unemployment, a government should reduce the interest rate, increase the purchasing power of money and increase public expenses. So, he identified what determines employment. And, in doing so, he stated that the condition for macroeconomic

equilibrium is the equality: Savings (S) = Investments (I).

The level of production has an impact over employment, but is influenced by the effective global demand. So, the global demand will become the main element of the keynesian's employment theory. The investment demand – a part of global demand – is influenced by two factors: the marginal efficiency of capital and the interest rate.

And we have two situations. Firstly, if the profit rate is higher than the interest rate, the investments will increase, so will the level of production and employment. Otherwise, a decrease of the two indicators will be obtained.

If money supply or the amount of money in circulation depend on the central bank, or the government, the money demand is – after Keynes – influenced by three motives that define the preference for liquidity: transactions, precautionary and speculation. Manolescu (2007) identify a fourth motive, of the revenues.

The interest is determined by both the money supply from the central bank and the demand of money. If the demand of money remains unchanged, then an increase of the money supply will lead to lower interest rates and vice versa, emphasizing the inverse relationship between these two, under constant demand.

The Keynesian thinking was best expressed by the famous IS-LM model, created by the British Sir John Richard Hicks and the American Alvin Harvey Hansen. The model assumes a double equilibrium on two markets: goods and services market, where $S=I$ expresses the equilibrium of income and the money market, where $L=M$ represents the equilibrium of the interest rate. The equilibrium on the goods and services market shows an inverse relation between income and the interest rate. The supply of money, M , equal with the demand for money, L , means that there is a direct relation between income and the interest rate.

Keynes's followers believed in the famous Philips curve, admitting there is an inverse relationship between unemployment and inflation. On the other hand, monetarists denied the existence of this relation on long term. They even rejected it, because it could lead to high inflation and high

unemployment. And that's exactly what happened in the 70s.

Stressing that indirect relationship, Keynesians agreed that in an economy faced with high unemployment and low inflation, a relaxed monetary policy and an increase in the demand, can lead to economic growth and to the fall of unemployment. This, certainly will increase short term inflation, but on long term, unemployment will drop. Based on a study conducted on the American economy, monetarists were convinced that on long term, both inflation and unemployment will increase. The phenomenon of stagflation from the the 70s is a testimony of the monetarist paradigm. Inflation increased, but contrary to what Keynes sustained, so did unemployment.

The new Keynesian paradigm brings a macroeconomic approach, perfectly combining the theory of value – which meant price stability and full employment – with the monetary theory – which emphasized price and money fluctuations. Keynes studied the demand of money, which is the base of its theory of income, consumption and investment.

Referring to monetary policy, Keynes regarded investments as a catalyst for the economy. Investments can increase if the interest rate is reduced, so the cost of bank loans is smaller and lending is stimulated. The decrease in the interest rate could be the result of a raise in the money supply, through an expansionary monetary policy. The interest rate will decrease until the savings are equal with the investments, or in other words, until full employment is achieved. This relation is the condition for macroeconomic equilibrium in Keynes's view.

The Keynesian currency has a secondary role in economic growth. However, the increase of money supply is the main way to stimulate investments, leading obviously to the development of the society. Increasing money supply through nominal wages was in Keynes's view a necessary condition to maintain interest rates below the rate of profit, keeping the investments attractive.

The monetary theory of Keynes analyzed prices fluctuations and the purchasing power of money. According to Keynes, money supply is a function of the degree of liquidity in relation to interest rates, emphasizing

again the connection between the two indicators.

Keynes correlates the amount of money with the level of employment and prices. He considers that an increase in the money supply has a direct influence over employment, prices remaining unmodified.

Inflation occurs when prices rise even after full employment is reached. This means that not every increase of prices leads to inflation, but certainly any increase in the amount of money leads to a raise of prices.

The keynesian vision was a model for a long time. State interventionism adjusted the equilibrium. Regarding the monetary policy, the state acts through money supply, interest rate and credit.

In expansion, the state reduces the money supply to counteract inflation and increases the interest rates to limit lending, consumption and encouraging savings. In recession, the state increases the money supply to raise the demand and diminishes the interest rates to stimulate lending, consumption, discouraging savings.

3. Paradigm shift: Becoming Monetarist

Monetarism appeared as a critical response to keynesianism. Motivated by achieving economic balance and feeling that the solutions against unemployment, inflation and crisis are no longer effective, economists looked for new answers. One by one, unemployment and inflation began sicking the body called state. A shift of the paradigm was the best antidote. The laissez-faire of the classical school was obsolete. The keynesian interventionism was too extreme. The solution for macroeconomic balance was a mix between state intervention and the the competitiveness of the free market. So neoliberalism was born.

Jacob Viner and Frank H. Knight started in 1930 an academic movement, better known as the Chicago School. Real empiricists, the representatives of this school have paid special attention to the free market, but also to the importance it has in economic development, in the resource allocation and income distribution. They disagreed state interventionism. For them, the velocity of money was not stable. They even blamed the monetary and fiscal policies for the Great

Depression from 1929. However, monetary expansion and negative budgets were their objectives.

This first generation of monetarism was criticized by Patinkin (1969), who considered this movement as being amorphous and vague. Under no circumstances that could be called a school of economic thinking. On the other side, George Tavlas and Milton Friedman encouraged the theory, mentioning that this was more like an „oral theory”.

When we say monetarism, we refer to the Chicago School, although there are no less than three generations of monetarism.

The second generation (1940-1960) was dominated by the analysis of monetary phenomena. This was the type of monetarism that influenced the american policy under president Reagan and also, the british policy under the Iron Lady, Margaret Theacher, from the 80s. The leading figure of the twentieth century in terms of monetarism was Milton Friedman.

The last generation studied human capital and the property rights movements.

The keynesian movement wasn't anymore the recipe for success in economy and to ensure stability was needed more than a simple short term relation between economic growth and money supply.

Monetarism – a concept invented by Karl Brunner – considers money the center of any economic activity, the engine of development. For monetarists, the amount of money and their velocity have an active role in economy and in price stability.

Monetarism is a neoliberal current of economic thinking which states that the equilibrium is obtained only through fluctuation of the amount of money. So, money demand and monetary liquidity remain the two fundamental issues that will build the monetarsit theory.

Todd G. Bucholtz captured very well the common points and especially the original ideas of Keynesism and Monetarism in his writing *Idei noi de la economiști morți* (2004).

Although inside the school, there were different opinions (for instance, Friedman claimed floating exchange rates, Hayek claimed flat rates), one thing is clear: inflation is a monetary phenomenon, and on long term, the Philips curve is not justified. Thus, monetarists believed that we can not

increase employment through expansionary monetary policy.

Monetarists considered that the money supply is not influenced by production, it is determined by the monetary authorities. Moreover, inflation is caused by monetary phenomena. For them, monetary policy is a necessary condition for stability. Stable monetary rules are needed. The monetary authorities can only control the amount of money, allowing the free market to ensure the smooth running of the economy.

In *The Quantity Theory of Money—A Restatement* (1956), Friedman said that monetarism looked like a „rigid and atrophied caricature” of the economic theory and this must be changed.

Unlike Keynesists, monetarists disagree the idea that an increase of the public expenses can lead to growth and development.

There are different types of monetarism, the most important being the standard monetarism, represented by Milton Friedman.

The economist criticized the Keynesian ideas, mainly the use of fiscal policies, emphasizing permanent income, monetary stability, free market economy with less state control. For him, economic growth can't be obtained through an increase of the money supply or through interest rate. He actually invented the concept of permanent income and the consumers, in order to achieve it, decided to limit their spendings. Here, he opposed the Keynesian view of the state intervention on incomes and investments. Defender of the free market that can smoothly adjust economic activity and considering prices the instruments through which the resources can be allocated optimally, Friedman accused the state for excessive control of resources and for high taxes.

Friedman believed that floating exchange rates are the best option for inflationary countries, because it causes a reduction of the exchange rate, stimulating the imports from countries with depreciated currency. Doing so, the balance of payments will then be rebalanced.

The function of the money is more stable than of the function of Keynesian consumption. Money can be treated like a commodity. Friedman agreed Walras when

stated that money is neutral, meaning that, on long term, a change in the amount of money doesn't have any impact on prices or production. Friedman argues for setting monetary policy rules, saying that decisions should not be taken as a result of cyclical situations. On short term, an increase of the money supply will lead to inflation and also to a reduction of unemployment. This doesn't mean that Friedman appreciates the Philips relation! The situation is called money illusion and is not permanent as people are always looking for adaptations solutions.

Jaques Rueff, the representant of French or metalist monetarism thought that returning to the gold standard is the perfect solution for combating inflation. Just as Friedman stated, fiscal policies are not effective.

Brunner and Meltzer believed that money has an impact on employment and prices. Just as Keynes said, the followers of this so called budgetary monetarism, believed that monetary policy should be combined with fiscal and budgetary policies in order to obtain economic growth. They emphasized the budget deficit. According to Brunner, the control of both money and credit markets is needed.

Austrian monetarism studied the effects of an increase in the money supply at micro level. Friedrich von Hayek blamed Keynesists for the emergence of economic crisis. They also consider that the central bank should be disbanded and the currency should be stable - as the solely chance of its existence. As mentioned before, Hayek is for fixed exchange rates.

Nobel Prize winner, Robert Lucas Jr., is the follower of the rational expectations monetarism. The decisions are based on taking into consideration all the elements. He agreed with the existence of the rules for monetary policy.

Monetarism didn't disappear with Friedman. His ideas were continued by James Tobin, Don Patinkin or John G. Gurley. James Tobin, who won the Nobel Prize for Economics in 1981 is a meritorious Professor of Economics at Yale University and he worked as an economic adviser under the Kennedy administration. He stated that both Keynesism and Monetarism had the same aims: increase of production, a low inflation rate, raise of productivity and employment and price stability. For him, the

demand of money is influenced by the return on capital. If the profit rate equals the return on capital, or the demand of money equals the money supply, then monetary equilibrium is achieved.

The adoption of an expansionary monetary policy means an increase of consumption according to Tobin. And an increase of the reference interest rate will impact the economy in a negative way. Banks will make credits expensive, so, the number of the borrowers will fall. As a consequence of this, the consumption will decrease and all the sectors of the economy will be suffering.

Without a reduction in money supply, an aggressive fiscal policy will have no impact on inflation. A reduction of money when inflation is high, or an increase of money when the unemployment is high, has the same consequences – stagflation.

If the keynesists were not convinced about the coexistence of unemployment and inflation, saying that high inflation (as a result of an expansionary monetary policy) leads to a reduction of unemployment, monetarists would not deny the simultaneous existence of these two phenomena.

An increase in money supply will reduce unemployment, but will increase inflation, as a decrease in money supply will increase unemployment and reduce inflation.

The monetary authorities will influence the money supply. The demand of money is established by the free market mechanisms. Free market is the solution for economic equilibrium, so, the monetarists will support it against keynesian state interventionism.

If money had an important role in the economy for monetarists, keynesists believed it had a secondary role, because the expenses impacted on real revenues without the influence of money, the economic activity being a result of global demand.

Ronald Reagan applied the ideas stated by monetarists to ensure macroeconomic stability of USA in 1980s. He firstly reduced public expenses, then reduced taxes by 25% over a period of three years, he liberalized businesses, increased defence expenses and stimulated bank credits for investments.

The level of prices is influenced by the money supply. In *Studies in the quantity of theory of money* (1956), Friedman specified that, on long term, a change in the amount of money is likely to lead to a change in the

same sense of prices, without affecting the level of production in any way. On short term, however, a raise of the amount of money leads to a double increase: of production and of employment. Friedman updated through this writing the famous quantity theory of money dating back to David Hume. He predicted that an increase – made by the American Central Bank, Fed – of the money supply with the same rate as GDP growth rate will solve the inflation problem.

From the monetarists point of view, money influence on short term both the prices and the economic activity as a whole. On long term, the impact is only on prices.

Money is one of the most important instruments of monetary policy and Fed is the most important institution that apply monetary policy, according to Paul Samuelson in *Economics* (1985).

Friedman said that the monetary authorities can control the amount of money on short term, through the interest rate. And in doing so, he doesn't understand why the actual Chairman of Fed, Ben Bernanke or the former one, Alan Greenspan, didn't use the opportunity to control the amount of money through other instruments, such as open market operations, not only through the interest rate! They didn't look at the entire system!

4. Conclusions

Throughout this paper we compared the results of two of the most important schools of economic thinking in terms of money and monetary policies.

Monetary policies are demand-oriented policies. They are responsible for the fluctuations in the consumption of goods and services.

Monetarism was a critical reaction of Keynesism. It appeared when the existing solutions couldn't solve the negative phenomena: inflation, crisis, unemployment.

The differences between these two schools emphasize the richness of economic thinking. They both influenced the economy and some of their ideas are still used in order to achieve macroeconomic stability and, not finally, price and monetary stability.

Keynes argued that the interest rate can decrease until full employment is achieved. For him, investments are the catalyst for the economy. He considered money has a secondary role in the economy, while the monetarists stated that money is the engine of economy.

Macroeconomic equilibrium could be obtained through global income fluctuations. Keynesists also believed that between the demand of money and incomes is a direct relationship, while between the demand of money and the interest rate is an inverse relation.

For monetarists, inflation is a monetary phenomenon, which appears as a result of an increase of the amount of money in the economy. The money supply is independent of production. It is an exclusive instrument of the monetary authorities. In other words, the state can influence the money supply.

In *Capitalism and Freedom* (1962), Friedman limited the role of the government in the monetary policy, allowing the individual to have maximum freedom and responsibility.

The state was responsible for controlling the money supply in circulation, but also, for achieving economic stability. On the other hand, the monetarists considered that the free market just be responsible for production, employment, consumption and price stability.

Monetarists tend to pay greater importance to the monetary policies than to the fiscal ones, in contrast with the Keynesian view, that believed that a two policies mix is ideal for production and incomes. There were economists, however, that criticized the policies mix. Lionel Robbins in *The Great Depression* and Joseph Schumpeter in *Depressions* argued that in times of economic depressions, the cumulative impact of the two policies is very low.

All in all, the benefit of coexistence and collaboration of the two types of policy is obvious and the macroeconomic indicators of the world economies are an evidence of that success.

A Wicksellian Approach Over an Active Monetary Policy

Lipară Daniel

„Alexandru Ioan Cuza” University of Iași, Doctoral School of Economics
danl_02@yahoo.com

Abstract

Out of the two types of monetary policy interventions – along with passive ones – active interventions are better used in order to increase the performances of a real economy. This was the main field of focus for the Swedish economist Knut Wicksell.

The aim of this paper is to present a critical point of view regarding the quantity theory of money and the rate of interest – as the most important monetary policy instrument – and their implications in macroeconomic stability.

Wicksell contributed to the development of monetary policy by updating the old style fashion quantity theory of money, emphasising its strong points and especially its limits.

Key words: monetary policy, money, price stability, interest rate, economic growth.

J.E.L. classification: E52, E40, E31, O40.

1. Early times. The beginning and the „shift”

The period between the end of the nineteenth century and the beginning of the twentieth century is dominated by the economic thinking of the Swedish School of Macroeconomics. Among its leading supporters we mention: Knut Wicksell, Erik Lindahl, Karl Gunnar Myrdal, Bertil Gotthard Ohlin, Erik Filip Lundberg and others.

The Swedish School brought a new vision regarding the role of money in the real economy. The classics believed that money had a neutral role in economy, showing that no influence in the amount of money in circulation can't modify the economic environment.

This classical quantity theory of money will later receive a critical response from the contemporary quantity theory. According to this theory, money is an active part of the economy and, moreover, any change in money supply will affect the macroeconomic equilibrium.

This is the „shift” from a passive function of the money, where there is no influence in the economy, to the active function, where money is the engine of the economy. And this „shift” is the starting point for the development of the quantity theory of money by the Swedish School of Macroeconomics, whose work will be continued by Fisher, Keynes, newkeynesism and monetarism.

2. New challenges for Johann Gustav Knut Wicksell

The predominant thinking in the new vision belongs to Swedish Knut Wicksell, that will give in his writings an important role of the money in macroeconomic development.

Knut Wicksell began studying the famous classical quantity theory of money. Influenced by the ideas of neoclassics Gossen, Menger, Walras or Böhm-Bawerk, Wicksell, focused on explaining the monetary phenomena and especially, the relationship between the level of prices and the interest rate, as the main instrument of monetary policy.

The Swedish is in contradiction with the classical vision. If the classical school was seeing a reverse relation between prices and interest rate, Wicksell could not explain the situation that characterized the late nineteenth century economy: low interest rate and price levels, without that indirect relationship that classics thought.

Smith and Ricardo said that an increase of the interest rates means a rise in the cost of credits and therefore a reduction in the purchasing power of money and prices,

which, ultimately translates into economic recession. Conversely, a decrease of the interest rates would stimulate prices increase, a favorable situation for a period of economic expansion.

How could be solved this mystery? Wicksell considered this situation as an interesting challenge, so he focused on three main issues of his thinking: finding a solution for updating the classical view, the concept of natural rate of interest and the importance of the cumulative processes.

If the classics believed that the level of production had a direct influence over the level of prices or the purchasing power of money, Wicksell thought that monetary phenomena are responsible for this evolution.

That is the reason that, in 1898, the Swedish economist published *Interest and prices*, where he analyzed the changes in price levels, that will be considered by Torsten Gardlund in *The life of Knut Wicksell* (1996), the „obscure element in monetary theory” [8].

The fluctuations of the bank loans are the „guilty” ones for these changes. If the interest rate of loans is higher than the rate of profit, we are witnessing the beginning of an economic recession, that will automatically lead to a decrease of prices. Prices increase and, therefore, macroeconomic expansion occurs when the interest rate of loans is lower than the rate of profit. Wicksell agreed that an interest rate equal to the rate of profit will not encourage any savings or investments, so people will not pay too much attention to where they place their money. In this case, the demand for loans equals the supply of savings, and therefore, we have equilibrium.

Arnon (2011) considers that Knut Wicksell is the best supporter of active intervention in monetary policy. He agrees saying that *Geldzins und Guterpreise* – or *Interest and prices* – is the first treatise on monetary policy wrote by the Swedish. His work is a real masterpiece in a period when the monetary theory was developing really slow [2].

Wicksell analyzed the classical quantity theory of money, emphasizing the reasons to support it or not.

The Swedish announced the results that he will build his theory on since the preface of his work. „The Quantity Theory is correct in so far as it is true that an increase or relative

diminution in the stock of money must always *tend* to raise or lower prices—by its opposite effect in the first place on rates of interest” [9].

Wicksell’s theory is based on Tooke’s ideas that didn’t combine into one theory, considering the famous quantity theory of money as being exposed to critics. It’s more like an alternative to the quantity theory.

It meant that the focus had changed: from the relationship between money and prices to the relationship between interest rates and prices. The main discovery of Wicksell’s theory is that the quantity theory of money doesn’t establish the level of prices! This is possible when there is no produced by money between sales and purchases. But, in reality, this gap exists, so money will influence prices!

Wicksell disagreed with the classical view when he said that the quantity theory of money contradicts reality. He later presents four assumptions in order to support his ideas [1].

Firstly, the theory seems to be just a simple theory, without having any relation with real economy, with practice, and with a system that holds individually the cash balances.

Secondly, the theory assumes that the velocity of money is stable.

Thirdly, the theory says that money, „in the sense of coin or notes” are at the base of all transactions, excluding the „true instruments of credit (ordinary bank credit, bills, cheques, etc.)”, which replace the use of money during recessions [2], [9].

And fourthly, there is a difference between money in circulation and money held in form of hoards or ornaments and jewellery.

Ahiakpor (1999) asserts that none of these assumptions is valid [1].

The natural rate of interest appeared as a consequence of production and depends on the rate of profit [2].

Unlike classics – that considered that an increase in the amount of money by the Central Bank, could lead to increased prices – Wicksell believed that banks reduce interest rates without cash injection. Everything is done in the absence of money, and only cheques and bank transfers are allowed [1].

According to Humphrey (1997), Wicksell's theory consists of three elements: “(1) a real shock explanation of monetary and price movements, (2) the complete absence of money (currency) in the hypothetical extreme case of a pure credit economy, and (3) the identity between deposit supply and demand at all price levels in the same pure credit case rendering prices indeterminate” [6].

And so, in a virtual economy, where there are no banks, a “pure cash economy”, gold is the only standard. As a result, the existence of a constant quantity of gold will cause a proportional change in prices on long term.

Wicksell's theory is build on a credit based economy model. Before lending stimulation, the swedish emphasized the perfect equilibrium between the monetary interest rate and the natural rate. The credit expansion will diminsh the monetary interest rate and will rise the prices. This cumulative process will end when the two rates will be equal [2].

The interdependence between prices and the interest rate is perfectly illustrated by Wicksell: *„So long as prices remain unaltered the banks' rate of interest is to remain unaltered. If prices rise, the rate of interest is to be raised; and if prices fall, the rate of interest is to be lowered; and the rate of interest is henceforth to be maintained at its new level until a further movement of prices calls for a further change in one direction or the other.”* [9].

But what does it mean a reduction of prices for a bank? According to Wicksell's rule, as mentioned above, the banks should decrease the interest rate. So, in this case, their profits will fall. A rise of prices will determine an increase of the interest rate. This will make bank clients unhappy. So, in both cases, the use of the rule means great losses of profits and customers.

3. The wicksellian two types of interest rate and the cumulative process

If the interest rate is lower than the rate of profit, investments will be stimulated against savings. This kind of focus will increase the demand for goods and services, which will lead to economic expansion and to an increase in prices. It is the so called

„inclination” or „incentive” to investment that Keynes would later analysis.

An interest rate higher that the rate of profit will encourage saving, will reduce the demand for goods and services, so will lower investements because they are not profitable anymore. An economic recession and a reduction of prices are imminent.

Wicksell showed this inverse relationship between interest rates and prices, in full agreement with the classical thought, detaching it from Marshall's view, who saw a positive link between money and prices. Wicksell's analysis based on interest rate pointed out the importance that monetary policy has in reducing inflation.

On the other hand, in *History of prices*, Thomas Tooke explained the direct relationship between interest rate and prices. Who was right?

Keynes later connected Tooke's thought with the Gibson's paradox that supported the direct relationship between those two.

The swedish believed that any increase of the money supply in circulation is a consequence of an increase of prices. In his view, there is a monetary interest rate, which is the rate of loans that borrowers pay to lenders for the funds they receive, and there is another rate – a „natural” interest rate – which is the rate of return that the investor obtains by placing the cash held (the rate of profit).

Wicksell's conclusion is that, in monetary equilibrium, the savings S are equal with the investments I. And when this is happening, the prices remain stable. Otherwise, when there is no equilibrium, the prices will decrease or increase, depending on the evolution of the rate of profit; Keynes will dedicate an entire chapter to studying this situation.

So, when the monetary interest rate is higher that the natural rate, savings are stimulated because the investments bring a low profit and prices are falling. When the monetary interest rate is higher than the natural rate, investments will flourish, and so, there is an increase of prices. That is how the swedish explained the fall of prices at the end of the nineteenth century!

Wicksell agreed that once started, the monetary imbalances deepen as a cumulative and continuous process.

The economist said that banks can diminish this impact. How can this happen? Wicksell believed that the impact can be reduced through monetary policy instruments.

So, if the monetary interest rate is lower than the rate of profit, the investments are stimulated, and so is the purchasing power of money. As a result, prices increase and investments continue to develop. This is an cumulative process of expansion that will expand over and over.

On the other side, when the monetary interest rate is higher than the rate of profit (natural rate), both investments and purchasing power of money fell. Of course, the level of prices will decrease and because of small levels of productivity, the investments are no longer useful. A cumulative process of recession begins.

Knut Wicksell took into consideration two factors that can end one cumulative process and even change it into another: the real factors – which are the real incomes that can rise or fall when prices changes – and the monetary factors, that are the most important ones in order to end the cumulative processes.

First of all, when we have an expansionary monetary policy, then the monetary interest rate is lower than the natural rate (the rate of profit); that increases the demand for loans and investments. Facing this, the banks will be tempted to increase the interest rate, that will further reduce investments and cumulative process of expansion will be transformed into a cumulative process of recession.

Second of all, during a period of saving, when the interest rate is higher than the natural rate, the demand for loans decreases, and the temptation of the banks will be to reduce the interest rate; this will amplify the volume of investments and a rise of a cumulative process of expansion [8].

Wicksell said that banks has an active and decisive role in achieving macroeconomic balance. The reversibility of the cumulative process is the solely attribute of Central Bank through the manipulation of the interest rate. This assumes that any decrease of the Central Bank reserves, will rise the interest rate and vice versa.

We conclude that if savings aren't equal with investments and the interest rate isn't equal with the rate of profit, the monetary equilibrium could not be restored, except through bank policy actions. So, the equality between these two interest rates is a compulsory condition for stopping the cumulative process [2].

4. Wicksell's theory opponents

Wicksell's theory did not remain unnoticed for too long. Many thinkers have tried to combat it.

David Davidson believed that monetary equilibrium does not always lead to price stability, as Wicksell stated.

Karl Gunnar Myrdal found out that equality between the interest rate and the rate of profit can not be a condition for achieving monetary equilibrium, because in this case there will be no profit at all, and besides this, the investments would fall and so, the second condition – savings equals investments – would be impossible to obtain. That is why, Myrdal considered that in order to achieve economic equilibrium, only the equality between savings and investments is needed. Like Davidson appreciated, Myrdal's monetary equilibrium is not equivalent to price stability.

Bertil Gotthard Ohlin said that the monetary interest rate depends on the price changes and on the bank policies, without being an independent variable, as Keynes will see it over fifty years [8]. The monetary interest rate is a *sine qua non* condition for reducing the cumulative processes' effects of expansion or recession.

5. Conclusions

Knut Wicksell considered the active intervention of monetary policy as the most important tool for obtaining the best performances in real economy. That is why all his work was focused on explaining how can an updated, new version of the old quantity theory of money can influence the macroeconomic stability.

The quantity theory of money shows the indirect relationship between money and the purchasing power of money or in other words the positive relation between money and prices [10]. So, the interest rate has a decisive

role in explaining the relationship between money and prices in Wicksell’s theory.

Although the direct relationship between the quantity of money and prices represents the particularity of the quantity theory of money, Wicksell couldn’t be hundred per cent sure if this theory of money is „in actual fact true” [9], [10].

Money is considered by Wicksell as being a medium of exchange, as well as a symbol of value or a „store of value” [2].

Price fluctuations appear as a result of a cumulative process when there is a gap between the monetary interest rate and the natural rate. When the monetary rate is higher than the natural rate, prices increase. In the other case, prices fall. The banks are responsible for price increases because they fix a rate for loans lower than the natural rate [1].

The Swedish believed that banks have an active role in the economic process. They can provide the cumulative process reversibility.

On one hand, a reduction in bank reserves will lead to higher interest rates, stopping and even changing the cumulative process of expansion.

On the other hand, a better financial situation of banks will determine a decrease of the monetary interest rate, transforming the cumulative process of recession into an expansion one.

Knut Wicksell also pointed out the difference between the monetary interest rate and the natural rate. Beenstock and Ilek (2010) studied this phenomenon and showed – on the case of Israel – that Wicksell’s Dichotomy is true. So, the monetary interest rate is dependent on the natural rate, the reverse statement being false [4].

He appreciated that the equality between savings and investments is not automatically established and, that in case of discrepancy between those two, so called cumulative processes occur, and so, the only way we can restore the equilibrium and stability is through bank policy actions.

Wicksell enriched the old quantity theory of money, emphasizing the impact of the interest rate in achieving the balance of global demand, as a result of money supply evolution. For him, monetary policy has an active role in the fight against inflation, stressing the influences of savings and

investments in obtaining macroeconomic stability [7].

Abstract

Like many other modern information technologies, intelligent agents and multiagent systems are used successfully in many economic areas as electronic commerce, marketing or company management. But, technology intelligent agents, multiagent systems by default, can be successfully applied in finance and accounting, benefits being important. Thus far it appears that there is scope for application of this technology, with the aim of improving the accounting activities. In addition, based on fundamental characteristics of agents and multiagent systems, it should be described cases in which agent technology paradigm can be used to bring more competitive field. In other words, the agent technology has to offer in addition to other information technologies work and how an organization can be improved by adopting in practice. Thus, this paper aims to achieve insight into the specific field of intelligent systems research and present the main opportunities and benefits that they can create their adoption in practice.

Key words: intelligent financial-accounting systems, multiagent systems, agents, agent methodologies, workflow.

J.E.L. classification: G11, G17, M15, M21, M41, M51, O16, O33

1. Introduction

Today, there is recognition in the business community about the importance of knowledge as a critical resource for any organizations. The main purpose of knowledge management is to help organizations create, share and use knowledge effectively to achieve better decisions and to increase of competitiveness. In order to run business effectively an organizations needs more information about competitors, partners, customers, and also employees as well as information about market conditions, future trends and much more. There are several products and technologies available on the market that support advanced Business Process Management and advanced decision support. Any organizations expect intelligent applications to support wide range of functionalities: analyzing all partners, building and analyzing business strategies, developing customer-specific products, carrying out targeted marketing and predicting sales trends.

Amount of documents in the web, enterprise data repositories, and public document management systems with documents are growing. Also, the virtual world presents many challenges and opportunities for accounting firms. The Internet has proved exponentially in scope and speed, representing an important source of information for a growing range of users. Many beneficiaries are employees of accounting firms interested to serve as solid bases.

Knowing the properties and characteristics of agents and multiagent systems, it is important to present situations in which agent technology paradigm can be successfully applied and is likely to lead to increased business competitiveness. A first perspective is the fact that the use of agent-oriented programming in designing and developing information systems specifically dedicated to financial accounting. Practical agent-oriented programming is a dynamic extension of the programming object. Another perspective is that the vision of the enterprise as a multiagent system, multiagent vision in which the system of accounts is a concern of the field's leading researchers. Using technology for teaching, training and self, in accounting, is also subject to current concerns of professionals, because of the opportunities it may bring.

2. An overview of agent-oriented methodologies

Jennings and Wooldridge researchers say the benefits of using agent technology should be judged by two directions [9]:

- the ability to solve new types of problems;
- the ability to improve the efficiency of information technology solutions.

Currently, due to evolution, but also the benefits created, it is considered that agent-oriented technology is the highest level of abstraction in shaping their organizational and information systems. Agent-based modeling is a powerful simulation technique in which a system is modeled as a collection of autonomous decision-making entities called agents. Many of the actions performed by users can be submitted for resolution by different software agents. Using agent technology in information systems requires that we have different types of collaborative agents, endowed with the objectives of each activity, applying standard procedures and a set of information and knowledge to be automatically executed tasks.

The main characteristics of agents, which can be differentiated from other software entities, are autonomy, the ability to perceive, the ability to understand and ability to act in their environment, namely the possibility to

cooperate with other agents for solving complex tasks.

Intelligence agent is given the amount of knowledge that is provided, plus the capacity for learning and reasoning agent that can flourish in order to achieve behavior-oriented goals to be achieved. Possible uses of agents in an information system are related to searching the collection, analysis, integration and archiving information, inform users about the availability of information about areas of interest, negotiation for the acquisition of information, services and supplies, explaining the relevance and quality of information, learning and adapting to changing environmental conditions in which it monitors.

The literature has presented several methodologies for developing multiagent systems, with emphasis on formal or semantic representations [10]: Gaia, PASSI, MASSIVE, MaSE or AUML. Methodologies for agent-based systems development offer some analysis and design stages. The objective of the analysis phase is to understand the system and structure under which the organization is treated as a collection system of roles, which have certain relationships. For example, the Gaia methodology using two models: the model roles and interactions. Roles model identifies key roles in the system, while that of interactions and dependencies express relationships between different roles. Later, during design, analysis turns models into three models: agent model, which identifies the agent types that will be implemented in the courts system and agent for each type, services model, which identifies the main services called the execution of roles by agents and knowledge model, which documents the communication links between different actors.

Taking into account the above we can say that all methodologies have two well defined purposes, which ends with getting two models: an external model that captures the identification of types of agents, their goals, responsibilities, interactions between them and the definition of coordination protocols for each type of interaction and an internal model which aims at defining the architecture for each individual agent, that the definition of actions and data structures identified.

The internal model consists of an agent system and relations between them. Complex modeling can incorporate even artificial neural networks, genetic algorithms or other learning techniques to allow the representation of the real world. Each multi-agent system that aims to shape the activities and processes of an economic entity must simulate its structure, to be able to adapt to structural dynamics, interactions and new targets. Company structure determined implicitly, certain activities must be modeled by agents. Consequently, behavioral model of an agent must be understood and described in relation to the social structure of the company and its general objectives. Thus, the agents are individual entities located in a structure that reacts to the environment and cooperate with other agents in the environment, to achieve common objectives.

Workflow technology is one of those technologies that can provide a method of modeling and controlling complex business processes within an enterprise or between organizations. Although it is a recent paradigm, management of workflows technology has become in recent years very popular in commercial and research world. Workflow management technology advantages include an explicit definition of processes, rapid response to environmental changes and easy tracking operations.

Currently, some researchers believe that a combination of multiagent systems technology with workflow technology will be able to offer complete solutions for a wide range of specific financial accounting because, unlike the workflow technology, the technology can offer flexible solutions, distributed and intelligent for business process management.

The application of agent technology in the management of a business process can lead to precise definition of it, so that all coordination responsibilities and relationships to be as clear. In addition, workflow management system allows easy integration of applications on different platforms, in well-defined business processes.

3. The benefits and implications of information agents in web reporting financial accounting

With the development of artificial intelligence technology, management and informatics researchers have increasingly shown interest towards the use and adaptation of new technologies in the economic field, especially in finance and accounting. A good example is development of XBRL standard for financial accounting reporting, intelligent reactive agents that use technology that can be made based on financial and accounting expert systems.

As is well known, intelligent agents technology uses three basic pillars of software agents, which add the ability to make plans and set goals, to reason about the effects of actions, to gain knowledge and enhance their performance through learning. The architecture of intelligent agents present is, in essence, object-oriented and the staff is basically an extension of an object. Objects encapsulate data (attributes) and procedures (methods). Supplementing his intelligence with the help of technologies such as expert systems, fuzzy systems, neural networks and evolutionary computation, an object becomes an intelligent agent. Intelligent agents can act autonomously in the background of the main application, and to perceive the environment through sensors and act upon it, to perform tasks and optimize information retrieval, monitoring and notification, information filtering, data mining, training, configuration, etc., the whole range of tasks in a robust e-commerce environment.

Therefore, an intelligent agent operates as part of a cooperative problem solver community, including human users. An agent has its own roles and responsibilities. Multiagent systems are essential for entering the digital market; taking into account the dynamic and simultaneous roles a single organization should play in a given market (an organization must be a broker, a supplier and retailers simultaneously). Behavior of intelligent agents (pa tasks they perform and how they do it) can be changed dynamically, thanks to the influence of learning or other agents; a salesman who has just lost several opportunities would, of course, to change

their behavior the next time, by resorting to other agents able to help him.

Thus, E&Y CART (Center for International Business Education and Research) has developed a web site address <http://www.eycart.ukans.edu>, designed as a resource center for professionals in accounting and auditing. Their specialists have created an intelligent agent called FRAANK (Financial Reporting and Auditing Agent with Net Knowledge) which obtain financial and non-financial information of 10 million reports of public companies brand [2]. In order to maintain compatibility with the latest technological advances, FRAANK incorporate XBRL language. Thus, the Software used by millions converts named XBRL FRAANK reports in text format version of bookmarks, based on the U.S. XBRL taxonomy. XBRL allows the publication, exchange and analysis of complex financial reports and dynamic business world of the Internet's interactive. In addition, the standard provides a common platform for accounting and reporting processes sphere facilitates communication of financial data among users internal and external information. It also marks all financial and accounting information required by all categories of users, both internal and external decisions.

The accounting field has changed over last years. Accounting organizations have increasingly been using technology to obtain important benefits. In this context, they are developing accounting data management services to all support their activities. Input for such services comes from data sources that are available today on the Internet. In our opinion, the most important is the Securities and Exchange Commission's EDGAR (Electronic Data Gathering, Analysis, and Retrieval) Internet repository including corporate filings with the SEC. Many Internet official sites provide public access to financial data, analysts' forecasts, news of business relevance and more.

Organizations need give all know, in real time, what chances are in competition. Investors and their management require information and knowledge they offer much more than the traditional annual financial audit. Accounting firms can not respond in real time their customers are automatically at a disadvantage compared to competitors. As

a result, the phenomena of virtual global economic environment is the emerging new model of financial accounting audit

Such phenomena have been studied intensively and led to the adaptation of financial accounting, management and auditing, education and research, accounting, business accounting firms to new challenges. The entire accounting profession is involved in developing strategic plans to identify and implement solutions to ensure the introduction of new information technologies in the new accounting services performed on existing key skills that will develop. Audit services revolve around the need for confidentiality, authentication and accounting data integrity, accepting the demands of customers trust the profession, conducting transactions in the virtual environment conditions.

Under these conditions, many of the accounting activities, including auditing, requires involved in the virtual environment, operators can realize intelligent agents. In the case of audit, intelligent agents can provide a range of qualifying activities that add value. The most interesting example is Edgar database used agent commission Edgar Security and Exchange Commission (SEC) in U.S., reports to the current listing of companies.

Intelligent agents are competent and give customers confidence. Auditors and intelligent agents can extend the quality dimension to include verification of the confidentiality, integrity, completeness and timeliness of information in the virtual environment. Such services, focused on security, competition is an extension of the basic financial verification is already practiced in the profession of auditor. Offering auditing services and virtual accounting firms will increase their prestige and their clients will have greater confidence in them. It services such as mediation, automatic search of information, automatic reporting, translating from one language to another, collecting information required audit, review the default implementation of various different procedures for different analyses.

Edgar Agent is a first step toward permanent financial audit and financial audit to ensure success in the virtual world. It is an intelligent agent able to assist access to

financial and accounting information and its management. He seeks the SEC EDGAR database carrying information about a particular corporation and automatically lists the necessary audit reports.

Intelligent agents can provide information not only financial, but also the results of various calculations or analysis about a company can even arrange reconciliation between companies and customers to add value to the services for accounting firms. They can provide valuable information to base decisions on investment, privatization, nationalization, merger or bankruptcy trigger. In turn, accounting firms may allow their customers to gather information and to participate in the virtual environment, even to make profit from providing privacy and authenticity of transactions as their conduct under the control of intelligent agents. XBRL FRAANK agent, described above, is also the result of research using multiagent technology in accounting.

FRAANK agent can be seen as a tool for collecting financial data records of economic entities that are available on the Internet. The agent uses this data to provide more relevant user groups interested. Once you extract the information agent, the data can be processed and combined with other artificial intelligence systems to transform them into knowledge. In this way, real-time decision-making process becomes more efficient, thus facilitating more competitive organization. In terms of interaction, agent FRAANK communicates with users through a graphical interface. As the design agent, it should be noted that it consists of several sub-agents corresponding information sources available on the Internet that agent uses in real-time. FRAANK agent architecture allows agents to separate clearly from the end-user interface. The same architecture allows them to be separated and the sources of accounting knowledge stored in relational databases, too. In present, the sources of accounting knowledge database containing synonyms for specific terms sheet.

Users of this agent will be interested in getting and other relevant information that are not currently available through the agent. This information can be found on many web portals. Related future researchs aimed to incorporating new FRAANK agent and sub-

agents intelligent mechanisms to facilitate attainment of these objectives.

4. Concluding remarks and future researches

In recent years we witnessed a real revolution in computer science and especially intelligent technologies. One of the main reasons behind this expansion is due to the huge amount of information that the Internet offers today and can be harder analyzed and processed only by traditional means. Thus, modern information technologies have been gradually carried out and today they are an indispensable tool for decision players of an organization's, because all their work is based on an analysis of all information specific to their business and adopting the most appropriate decisions based on them. Thus, advanced technology, intelligent systems, is today able to propose solutions to cover more and more fields as the financial and accounting. In addition, this technology may be required and recommended for adoption as a solution of complex problems to support user tasks and to facilitate subsequent decisions that make the most efficient activity of economic entities.

Also, in this paper was briefly described an intelligent agent (FRAANK) developed and currently used to enable better decision making by collecting and analyzing financial information are available online accounting firms specialized sites. It is an intelligent system that allows players the decision to use it from anywhere where there is Internet access; accounting and financial information will always be as current as the data sources that are available online. Thus, it provides opportunities for more effective analysis of financial accounting information.

FRAANK agent practically opens new perspectives for research in financial reporting and on-line auditing company. Research directions provided by the studies undertaken to date will be extended and refined, so that systems are able to extract and analyze financial data and key non Edgar databases or other information sources.

In this context, this paper tried to highlight the importance and benefits of smart technology can provide finance and accounting. In addition, we believe that their

use is able to guarantee to obtain conclusive information, correct, so that decisions leading to improved activity of each company. We believe it is important that specific research to continue and be supported more intensively by the scientific community in the finance and accounting because only in this way a company will be able to cope with increasing competitiveness and increased competitive environment.

Also, combining with the agent-based systems that enable web reporting accounting financial information (XBRL-based products) will bring significant benefits and will open new opportunities for information analysis.

Post-december Developments in Public Expenditure for Education

Lupu Dan

Petrișor Bogdan

“Alexandru Ioan Cuza” University of Iași

danlupu20052000@yahoo.com

bogdan_mp@yahoo.com

Abstract

Public expenditure with education presents contradictory developments, in the post-revolutionary period. This article shows the changes in budgetary allocations for education and teacher wages.

Key words: education, wage, public spending

J.E.L. classification: H41, H52, I28

1. Introduction

The results of Bacalaureate examination from this year have highlighted a reality that should give many people thought: the pass rate fell to its lowest level after the Revolution; students achieved significantly lower grades than in previous years; the number of students removed was higher than in 2009 and 2010 combined, and the list could go on. Although these results are due and how the examination was held (security measures was extremely hard) it is evident that the level where it is now the educational system is quite low, many believing that the main problem is money. In other words, since the system is underfunded and teachers de motivated, we cannot have too many claims. Meanwhile, according to a study by IRES, the past education system is idealized by the Romanians: 86% of respondents believed that current students are less prepared than the past, the present examination system is actually considered ineffective.

2. Evolution of education budget

Therefore, the general impression is that the level of graduates decreases continuous, but this happens even though the budget for education is much higher than before 1989.

Figure 1 Evolution of Education budget as percentage of total public expenditure (%) 1970-2010

Source: National Institution of Statistics

According to World Bank data, in 1970, the Education budget represented 7.96% of total spending, and then dropping below 7% rate in coming years. In 1991, it reached at 10.36%, in 2006 and 2007 exceeded 13%, for 2009 to reach 10.33%. Media in all these years was approximately 10%. Further, the Education budget as a share of GDP ranged between 2.2% and 2.4% in the period 1985-1989; the percentage increasing to over 3% after the Revolution, and reaching a peak in 2007 4%. Note that, in reality, education has never 6% of GDP!

Figure 2 Evolution of Education budget nominal USD period 1970-2010

Blue The Education budget
Red -% share of GDP
Source: National Institution of Statistics

In absolute numbers, the last 5 years of communism, the Education budget was 0.9 to 1.1 billion dollars (1.8 to 2.3 billion dollar in 2010); in 2007 reached \$ 6.8 billion, and in 2009-5.8 billion.

What follows from here? It follows that Romania spent more money, while the general impression is that the educational act continuously decreased.

Figure 3 Funding per pupil / student 1985-2010

Source: National Institution of Statistics

In 1989, the school population includes 5.6 million people, and Education budget was \$ 1 billion, average annual funding per pupil / student amounting to about \$ 185 so (325 U.S. dollars in 2010). In 2009, the school population has dropped to 4.2 million people, and the Education budget increased to \$ 5.8

billion; the average funding of \$ 1,400, a level of over 7 times higher than in 1989.

3. The distribution of public sector wages

In October 2010, the total number of full-time employees who worked in Administration, Education and Health was 888,165, down 61,653 people from October 2009, and 20,890 people from October 2007. From these, 20.3% made a gross earning less than 701 lei, 43.8% recorded a gross earning less than 1,000 lei, while 85.6% earned less than 2,000 lei gross. For comparison, in October 2009, before 25% reduction in wages, the share of those earning less than 1,000 lei was only 25%. Distribution of employees by installments to win the last 3 years has been joined in the graphic 4.

Figure 4 Employees' distribution of income installment 2008-2010 and by public sectors

Source: National Institution of Statistics

Source: National Institution of Statistics

By public sectors, the figures look like this:

Public Administration

In this sector, in October 2010, 282.991 people were working, compared to 325.909 in October 2009 and 286.256 in October 2007. The distribution portions of the employees gross salary shows that one-third of them earned less than 701 lei gross and 57.3%, 1.000 lei less gross. In other words, nearly 6 in 10 full-time employees charged after a working month less than 741 lei net (180 Euros respectively). Moreover, do not forget that the average pension is 730 lei, which means that most employees from Administration earn less than an average retiree. In October 2009, the percentage of those earning less than 1,000 lei was 40%. At the other extreme are those who earn more than 7,000 lei gross, increasing their number from 4967 to October 2009, at 5158 in October 2010.

Education

The number of full-time employees in October 2010 was 350.526, down 9112 from October 2009, and 23.781 from October 2007. From these, one third has lower gross wages of 1,000 lei, while 72.6% had salaries of less than 1,500 lei. In 2009, before the pay cut, the share of those earning less than 1,500 lei was only 37.5%, which means cutting wages by 25% in this area has a total payroll of over 80.000 people.

Health

The number of full-time employees was 254.848, down 9623 from October 2009 but in 6156 compared with October 2007. In employees' share of income installment, 43.9% of the employees earn less than 1,000 lei, while 72.6% less than 1,500 lei gross; at the opposite side being located just 345 employees who gains more than 7,000 lei gross.

The above figures show that in public sector, the wages do not generate large costs to pay staff, but the number of employees is doing that. The expenditure on staff salaries budget is 8-9% of GDP, compared to 5-6% in Western countries and that wage growth does not lead to a further unbalancing the budget can only be done while reducing the number of employees.

But what the things looked like under communism, when egalitarianism was state policy? In 1986, average net salary per

economy was 2855 lei, and the Bureau International Labor Organization (ILO) data shows that, except for those who occupy senior the highest net wage income were obtained from university professors - 5620 lei per month, or twice the average wage.

Tabel 1 The wages in communist era

Net Salary 1986 lei / month	
The average net wage in the economy	2855
Administration	
Executive at the central government	4230
Local government executive	3200
Computer programmer	3680
Stenographer	2100
Counter clerk	2450
Education	
Professor	5620
High school and middle school teacher	3060
Teacher	2290
Educator	2255
Health	
General Practitioner	3520
Dentist	2690
Technician	2225
Medical	2150
Ambulance Driver	2040

A high school teacher earns less than 3,000 lei net a little over 3,500 lei general practitioner, an ambulance driver about 2,000 lei, a developer had a net salary of 3680 lei, 2100 lei and a stenographer.

4. Conclusions

In public sector, before wage reform law there were huge differences between the extreme highest salaries was 72 times higher than the lowest salary. Now, the ratio between minimum and ranking coefficient ranking coefficient used for calculating the maximum base salaries is 1 to 15, still above the level before 1989. As for the overall economy, on the Communist time, the differences between salaries were not very high, but this is because no private environment existed and wages were not freely determined market. In Romania of today, the problem is not the top, where

hundreds of thousands of people collected over 1,000 Euros net per month, but the base, where millions of employees work for less than 1,000 lei a month.

The above figures show that the main problem is not money but how they are spent. Also, frequent changes in legislation and lack of coherent educational policies are still two of the reasons why the system has reached the low situation. But we have an indicator showing that money is not the problem - in 2000, the PISA tests, in the "reading" Romanian students achieved an average score of 428 points. In 2006, the score dropped to 396 points, although between 2000 and 2006, the Education budget increased from \$ 1 billion to \$ 4.6 billion (or 2.8% of GDP to 3.77% of GDP). In PISA 2009, the average score was 424 points below that of 2000, although the budget was almost six times higher.

Of course, when talking about education, the increasing funding results do not occur overnight, but in a long time; and in our case, the significant increase in funding since 2000 not only led to no positive result, but we are probably at the point of minimum of 20 years. This minimum can be a starting point.

People Management Efficiency. New Challenges in the Current Economic Context

Luț Dina Maria

Miculescu Marius

Abstract

The most important resource that managers have available in the company is people. Managers know that people make the critical difference between success and failure. The effectiveness with which organisations manage, develop, motivate, involve and engage the willing contribution of the people who work in them is a key determinant of how well those organisations perform.

In 2008, when we started talking about the economic crisis we realized that the approach of business as usual could not work. We all need a new approach to business: out-of-the-box, based on creativity, innovation, flexibility and adaptability to market needs and clients - what differentiates leading companies from the rest.

*There are many companies who understand that business performance and efficiency are the result of human transformation and development. Therefore, these companies have adopted a new style of management: **management coaching style**.*

Key words: economic crisis, people management, management coaching style.

J.E.L. classification: M54; J24; O15

1. Introduction

It is widely accepted that today more than ever, managers, through their art and science to lead others, are called to solve the problems facing the economy at the beginning of the third millennium, and on this basis, to solve many social problems of

humanity.

Decisive force influencing management in the current period is international competition, globalization. Globalization has determined that the trade be made in complex interconnected systems, increased standards regarding quality, cost, productivity and response times. Globalization has led to a growing need for innovation and service consumers.

The business world moves today in a very rapid pace and less ordered. This has a direct implication: in any business, managers need to become extremely efficient. Even in Romania, gone the days when businesses grow with the market, without a very clear intervention of management, in terms of business performance and market exploitation. It seems that these days will not return anytime soon.

In terms of managerial efficiency, the circumstances compel managers to become as effective as possible. A truly efficient and effective management, professional managers exercised, is the main "supplier" of performance in areas managed. If efficiency requires the existence of effects in relation causally efforts to achieve their objectives is to achieve efficiency and exercise managerial tasks under temporal and qualitative pre-conditions. Efficacy is focused on achieving specific performance and general management.

Efficiency implies the existence of effects in relation to efforts to obtain it. Effectiveness is to achieve objectives and also to exercise of managerial tasks, in the temporal and qualitative pre-conditions. Effectiveness is focused on achieving performance management.

What factors most influence company performance and what can managers do to ensure the effectiveness of their companies? The answers to these questions are, in reality, complex because of the vast number of factors that may influence company performance. These include external factors such as market share and market environment, as well as internal company factors including organizational culture, management styles and human resource management practices. Recently, the increasing level of competition worldwide has led managers and researchers to focus even more sharply on these questions. Reducing labour costs in some countries, particularly in the newly industrialising countries, has raised the level of competitive threat for countries which have been industrialised for some time. There is an increased capacity for diversity and customisation inherent in microprocessor-based technologies, eliminating the cost advantage of mass production. Companies must now compete on the basis of cost, quality and customisation. The pressures on managers to manage the complex and varied influences on company performance are greater than ever before.

In 2008, when we started talking about the economic crisis we realized that the approach of business as usual could not work. We all need a new approach to business: out-of-the-box, based on creativity, innovation, flexibility and adaptability to market needs and clients - what differentiates leading companies from the rest.

The most important resource that managers have available in the company is people. Managers know that people make the critical difference between success and failure. The effectiveness with which organisations manage, develop, motivate, involve and engage the willing contribution of the people who work in them is a key determinant of how well those organisations perform.

This need for increased efficiency in the field named by major business schools, "people management" can meet in a very direct way: practicing a new style of management, a style that is generating options and solutions.

There are many companies who understand that business performance and efficiency are the result of human transformation and development. Therefore, these companies have adopted a new style of management: **the management coaching style**.

2. Why management coaching style?

Good economic results alone are no longer adequate. In addition to generating results, organizations have become a values workshop, helping employees develop a meaningful life.

Feedback is an essential component of any team. No matter what level – peer to peer, manager to employee, or business owner to contractor – the ability to both give and receive feedback defines the ability to work effectively as a collective and determines the long-term direction of the team.

Work responsibilities continue to crossover into multiple departments, as projects require knowledge and support across a range of disciplines and experiences. As a consequence, our work environments are becoming more team based and less individualistic.

Adopting a new way of thinking about the feedback process is important. Sports offer useful parallels to management; the one constant of any athletic team is the coach. The coach is on the sidelines, watching all the moving players while staying focused on the bigger picture. As needed, the coach pulls players aside to offer specific feedback that is necessary in the moment, including precise actions or questions to help the player unlock new levels of performance. Sometimes the advice is for the player's own development; other times it's for the team's benefit.

Managing people in a work environment is more complex. Managers' role isn't exclusively to oversee the team member's responsibilities, but to also carry out their own. The manager must achieve specific objectives, maintain his responsibilities, and coach his team.

But many neglect their supervisory responsibilities, like offering continual feedback, guidance, and assessments, and instead focus solely on their own work. These managers and business owners secretly

wish their team and employees would manage themselves. This wouldn't work for a sports franchise and it doesn't work for business management either.

The profile of the “new” manager is distinguished by thinking and acting like a **coach**. [5]

Already there are many organizations that have added the concept of “coaching” in their management development plans. Managers can have a significant impact on teams and organizations when adopting coaching as a management style. Management by Coaching is much different than traditional command and control-based management, and distinctions are easy to follow: collaboration replaces control; to delegate responsibilities not delegated tasks; talk less and listen more; fewer orders, more questions; give specific feedback rather than judgments. [6], [7]

In the 1980s, John Whitmore and his colleagues developed coaching as a management concept from sports psychology. [5] Sports psychology is a successful performance technique used in the athletic world to enhance mental and physical performance. The coaching management style is based on sports psychology techniques.

Using the coaching style also provides benefits to the manager and organization. It helps improve performance, improves manager's relationship with employees, increases the ability to meet organization goals, increases staff retention, and over the long term makes the organization more effective because the knowledge and skills required to operate an organization effectively in today's volatile environment are constantly being updated.

One misconception about coaching is that the manager's responsibilities as a supervisor no longer exist. [5] Coaching requires developing skills to increase the employee's level of performance vs. checking and monitoring the work consistently. Employees may think they no longer need to listen to their supervisor; however, coaching means they are held accountable to a mutually agreeable performance plan.

3. How to develop a management coaching style

Specialists found seven practical tools to assist managers develop a coaching style. [1]

Training through Role Playing

Coaching managers readily take their entire extended management group on two-day training workshops. Participants work in small project groups of 6-9 members throughout the workshop.

The object is to get to know each other, build networks, and generate team spirit. Much of the time is used on role playing, based on real challenges and opportunities facing the managers.

The problem can be a difficult colleague, a lack of personal efficiency, an imbalance between working life and home life, and, not the least, being able to give feedback without putting the recipient on the defensive.

Managers work together in groups of three during the role playing itself: One owns the problem to be solved. The second manager is the coach, asking good questions and suggesting various courses of action. The third plays a constructive “Devil's Advocate”. The participants learn from each other, solve concrete problems, and build a culture.

Focus and Energy

The coaching manager maintains a solid grip on the entire workshop. She presents the results achieved by the business unit, visions of the future, and what the managers should improve on.

Top managers are very clear on their expectations; for example, that managers should become even better at valuing their colleagues and inspiring them to be creative.

Nevertheless, participants are encouraged to find their own way, to get better acquainted with themselves, and to be themselves. They need to take control of their own lives. These signals are the basis of the training itself.

A coaching manager exudes a strong belief and confidence in the ability to achieve bold goals if everyone helps each other. This generates optimism, enthusiasm, and self-fulfilling prophecies.

Values and Meaning

It is important to work on concrete skills and, even more importantly, the core values that govern actions. Central values include: altruistic egoism, will power, belief in the future, self-discipline, and emotional intelligence.

Individuals are challenged to be aware of their core values and how these values affect how they think and act. When fundamental optimism, enthusiasm, and joy are lacking, it doesn't help to be good at praising, delegating, and giving feedback. Your body language will give you away.

We like what the manager says, but not the way she says it. This does not generate trust and credibility. It is not enough to have high ambitions for creating value in the organization. Employees must also experience their workplace as a workshop where they can develop themselves and learn to live a full and meaningful life.

Employees must experience success and personal rewards at work. Rewards can include experiencing good team camaraderie or having more time to think about development.

Super Management and Mastering - Managers shouldn't try to control what cannot be controlled. Ultimately, it is up to the individual to decide what to think and how to act. Employees must be directed to manage themselves. They must be competent in their own self-management.

Individuals often have resources and “hidden” talents, but many ruin their chances with negative thoughts and negative comments about themselves.

“I am not really that competent, the others have just not realized it yet.” Good self-management entails asking the following question: “Am I telling myself the truth or have I just convinced myself it is the truth?”

To achieve good self-management, individuals need good helpers who can support and challenge through central questions. The object is to become competent in cognitive leadership, in other words, direct our thoughts. If we don't take control of our thoughts, our thoughts will take control of us.

A coaching manager provides their employees with positive experiences of mastering, so they can develop a belief in

their ability to master.

Manager as a Role Model - A test of good leadership consists of two questions. First: Is the manager credible? Does the manager back up her talk with action? Secondly: Does my boss wish me well? Does my boss want me to succeed?

The Manager must be a good role model. She participates in the role playing, just like everyone else. The manager “forgets” her position and is one of the most enthusiastic to discuss. She considers her strengths and how she can be even better.

Talking openly about her weaknesses may be used against her in the future. Nevertheless, it is so important to demonstrate trust that it is worth the risk. The manager is not afraid of feedback, even if it is not positive. This enables learning and development.

Tackling Paradoxes

Leadership is about balancing scant resources and differing interests with wise decisions. When dividing up a cake, everyone should feel that they got a slightly bigger piece than everyone else. One thing that sets competent managers apart from less competent managers is how they relate to incompatibilities, dilemmas, and paradoxes.

Unpopular decisions must be made, while still maintaining a good relationship with the employees.

Leadership is situational. Managers must understand when coaching can work and when it will not.

Simplicity and Story Telling

Managers convey a message that employees can easily understand. Often, this can mean quoting others: “If the only tool you have is a hammer, you tend to see every problem as a nail.” (Abraham Maslow) “It takes two to know one.” (Gregory Bateson)

Often, a message can be a metaphor like: dark clouds on the horizon, but we are well prepared. Often it can be personal stories of success or failure, but learning constantly.

4. Conclusions

Coaching may not always be suitable to every business situation. For example, if it is using the authoritarian style and have a time-bound project, coaching may not be appropriate because it takes time to

implement and produce significant results. The style of management used in any given situation depends on the business environment, staff and the expected results. The manager's flexibility in applying coaching techniques will determine whether or not he is successful at influencing positive performance, increasing morale and motivating the staff to meet or exceed expected results. Therefore, it should carefully consider what style is best for each situation. [2]

Global multinational companies such as Wrigley, P&G, Danone, Glaxo, have adopted this type of thinking in the last decade, with impressive results.

Clearly, coaching sessions were a real transformational effect, both in life and at work. [3], [4] As soon as progress is visible, the confidence level increases. It all starts with your own knowledge and transformation, and later, all these positive changes to be reflected outside. Creating organizational culture that encourages people to try new things rather than punish them, will cause them to find new approaches to business, to become more creative and excellent drivers ready to perform. The future may be very different from the past.

Coaching is a tool that helps us grow and develop, both personally and professionally. Experts consider it by far the most useful tool when it comes to "transmit", in particular to transmit, forward mentality. The role of a very good coach is to know to ask you questions. And, perhaps equally surprisingly, questions are usually simple. The answers are what change you and makes you, usually, a better man, both in life and at work. [5]

In times of economic crisis, as is the one we just cross, training and coaching market should increase for two reasons. First, some people are laid off or they are in danger of being expelled. In these circumstances they suddenly remember that, the certainly they believed that they have, no longer exist. At that point they begin to invest (directly or indirectly) in education. The more you know, the more opportunities and choices you have. On the other hand, managers realize that fewer people professionally well prepared costs less than many people professionally poorly prepared. Theoretically, this is a known thing, practically, this stands out only

in troubled times such as the economic crisis. In Romania, coaching has not yet begun to be understood, much less to be used, except for a few fields.

We believe that there is now the opportunity to apply this management style and be ahead of the competition.

5. Acknowledgement

This paper is the result of research in the frame of the R&D project (nr. 667/06.09.2010) with the theme: "Study on the analysis of effectiveness and impact of the Mind Lab educational program usage, for managerial skills development, in order to promote the program on the management training market." The project is running under contract between "Dimitrie Cantemir" Christian University from Bucharest and a private economic operator from Timisoara – SC BIZEQ SRL.

The Current Situation regarding the Use of Labor in Romania

Manea Ludmila Daniela

“Dunărea de Jos” University of Galati, Faculty of Economic and Business Administration
manea_danielaludmila@yahoo.com

Abstract

It is known that the demographic impact effects on the economy are felt after many years from the production date of the phenomenon demo-economic. Latest research accredits more than ever the idea that economic growth and development are based on human capital, creativity and innovation.

This paper studies how the labor market in Romania has suffered erosion process with multiple consequences on the volume, quality and structure.

Key words: labor supply, human capital, occupational structures

J.E.L. classification: J21

1. Demographic factor – determinant factor of labor supply

Double position of population in the relations system demo-economic, as the main production factor and as a recipient of the products, is a strong argument in favor of assessing the demographic factor as endogenous variable of economic growth and development.

It is known that the demographic impact effects on the economy are felt after many years from the production date of the phenomenon demo-economic. Latest research accredits more than ever the idea that economic growth and development are based on **human capital, creativity and innovation.**

Negative demographic trends in recent years and those projected for the coming decades will affect the overall performance of the EU economy in a very complex manner.

Thus, in the study *The economic impact of ageing populations in the EU25 Member States* (Carone Costello), the authors identified two types of effects and more channels through which they can propagate in the economy: direct effects (demographic aging affects the quality of labor supply, the ratio capital/labor and the technical progress) and indirect effects (effects on budgets and, thereby, the whole economy).

Another effect of demographic aging can affect the overall long-term development of a country is changing of the consumption structure and could cause the development of sectors with low productivity.

Areas expected to decline in importance in the consumption structure are: education, transport, recreation and durable assets, housing services, respectively, while the food sector, most services, notably the medical services, will increase (Hagemann, Nicoletti, 1989).

The labor market in Romania has suffered erosion process with multiple consequences on the volume, quality and structure.

The dimension, structure and direction of movement of components of the labor market are influenced by the joint action of demographic factors, economic, psychosocial, and not ultimately, political factor. Consequently, the dimension and structure of supply, pressure and absorption intensity will depend on the many factors dynamics. Deciphering the complex and dynamic nature of labor demand and supply, requires analysis medium and short term trends of the factors that influence them in their interacting.

2. Transforming human capital in labor resources

Participation in the workforce population of the country and its use results from the connection: total population - the working age population – active population – employment – unemployed.

Since 1992, the working age population was considered the population, by both sexes, aged 16-64 years, now comprise population with age 15-65 years. Between 2005-2010, the working age population remained almost unchanged in absolute size with value between 69.66% and 69.99% of the population.

By gender, male working age population was in the analyzed period, 2005-2010, an upward trend, so that if in 2005 the percentage of total working age population was 51.78%, in 2010, the same indicator had a value of 54.77%. Evolution of female working age in the same period, showed a downward trend, and as a percentage of the total female population was between 40.26% (in 2005) and 38.87% (in 2010).

1. Available active population (employed population with the number of unemployed) experienced slight growth in the period 2005-2010, both as absolute size and as a percentage value, compared to the total population and working age population. Thus, in 2005, representing 43.44% of the population and 62.4% population of working age population. By gender, in 2010, available active population was 9.565 million people, of which 51.08% men and 48.91% women.

Public participation in economic activity is an aspect of human potential contribution to employment creation in our country.

Labor force participation of the population of Romania, 2005-2010

Table 1

Year	2005	2006	2007
Total population (thousands persons)	21610	21570	21565
Working age population (thousands persons)	15053	15057	15046
Percentage of total population (%)	69.66	69.81	69.77
Active population (thousands persons)	9387	9588	9483
Percentage of working age population (%)	62.4	63.7	63

The structure of total population (%)			
A. Active population (%)	43.44	44.45	43.97
Employed people (%)	40.19	41.08	41.00
Unemployed people (%)	3.25	3.37	2.97
Inactive population (%)	56.56	55.55	56.03
The participation rate in employment of working age population (15-64 years) (%)	62.4	63.7	63.0

On total population of Romania, in 2010, 55.43% are inactive people, and active people have a percentage, on total national economy, of 44.57%.

Also, at national level, are 3.39% unemployed people and 41.18% are employed. This means that Romania's labor resources are represented by values less than half of the population.

By professional status, active population at the end of 2010, was composed of employees (65.6% of the workforce), employers (1.1%), self-employed (21.8%), family workers (17, 6%), etc.

Sex structure of population participation in economic activity, indicates discrepancies between them. Thus, in 2010, those active men had a percentage of 50.443% of the total male population, while active women had a percentage of 38.874 % of the total female population.

Gender gap phenomenon occurs more strongly in terms of people employed, the difference being more than 11.5% at the expense of women, compared with men in the year 2010. In contrast, we observe a reverse trend in the BIM unemployment rate, where the spread between this indicator for men (7.9%), respectively, for women (6.5%) was approximately 1.4% in 2010.

In the first quarter of 2011, Romania's active population was 9.81 million people, of which 9.069 million people were employed and 741 000 people were BIM unemployed.

In present, **economic dependency ratio** (the number of inactive and unemployed per 1000 occupied persons) is **1361 ‰**, higher for female persons (1697 ‰) and for those in rural areas (1432 ‰).

Conclusions about the conversion of part of the potential working population and available resources, may be stated as follows:

a. Romanian population decrease has affected employment potential resources, active population and employment, these

decreasing in absolute value. In contrast, in the period 2005-2010, is maintain approximately constant, with small fluctuations, both the active population and employed population, expressed relative to the total population. If this condition continues, the population will affect for a long time productive capacity and social-economical progress;

b. The ratio between the active and inactive population has continued to slightly deteriorate, although decreased, numeric and percentage, inactive people compared with active people - this ratio is higher than one. This means that over half of the population is economically inactive, or to an active person come a 1.25 inactive person and to an employed person come a 1.35 inactive persons. If we add to the inactive persons and unemployed, this means a employed person come 1.43 people without any income. Resolve the situation would result in increased of natality, in context of recovery economic growth and maintaining it a long time (sustainable economic growth and development), enhancing the attraction of potential labor resources and economic and social activities, in particular, productivity growth of employment, which creates the assets and services necessary for human development.

c. Underspensing phenomenon manifests itself in full employment of resources, therefore the most important element of any economic and social activities. Even if the population of working age who are included and can not bring effective income (students who have reached age 16, students, domestic workers, dependents, persons with disability, etc.), they holding a few percent of the total working age population, also results in a high degree of neutralization of the country labor potential. The phenomenon of under-utilization of labor resources is claimed by other statistical arguments, such as the rate of labor force participation of working age population and employment rate of labor resources; first fluctuated around 63%, the maximum peaks were recorded in 2006, respectively, in 2010 (63.7%) and minimum was recorded in 2005 (62.4%), and the second, fluctuated around 41%, with a peak in 2008 (41.27%).

d. Distortion is manifested in the rate of labor force participation of the population, the participation rate of youth (15-24 years) remained almost constant, between 22.7% (2007) and 24.3% (2010) below the average rate the country and the participation rate of older people (from 41.1% in 2010). This rate is regarded by experts as the potential workforce.

3. The analysis of occupational structures in Romania

Currently, each country's economy is marked by fundamental changes, such as the rapid development of services, especially those that rely on processing, generation and distribution of information, specific demographic dynamics, economic crisis, financial, globalization.

Scramble competition in developed countries imposed the maximum use of financial resources, technology, moving then to new resources - human, information, knowledge - resources that provide competitive advantage in this context.

Romania is a country with high employment potential. The transition to market economy and integration in the EU have and had multiple and convergent impact on the labor market and the pressure of economic problems - pushed into the background issue of human, leaving the truth that success in any context and speed economic and social reforms are considerably dependent on their understanding of the people, adherence and participation in their implementation.

As we can see in Figure 1, in 2010, total employment comprised approximately 8.839 million people, of which 46.8% were female population and 54.5% were employed in urban population. Evolution of employment in Romania following the downward trend of the total population, due to the rise of population aging and the declining of natality.

In the period 2005-2010 employment increased from 8.684 million to about 8839 thousand people, which means an increase of 1.35%. The causes of this development is the decrease of population and the effects of current crisis, by reducing activities.

Regarding the components of the active population in the period 2005-2010 a strong decrease in the employment population, which records to decrease the number of unemployed. This can happen because those who leave the unemployed are not necessarily re-hired. It is possible that they will not declare that the unemployed and either give up looking for work or to illegal engage. The extent of the underground economy and illegal employment in Romania has taken worrying proportions, threatening macroeconomic and macro balances. Employees choose illegal labor in Romania, especially due to high taxes and contributions that are required to pay and there is no viable mechanism for punishing those situations. Workers fail to see the link between social security contributions and benefits, and often are dissatisfied with low quality of public services, so choose informal employment.

Figure 1. The structure of total population 2005-2010

If we analyze the structure of employment in sectors (agriculture, industry and services) we observe a high percentage of employment in agriculture, in condition of a very low contribution of this sector to GDP. In recent years the farming population decreased, but its percentage remains high in comparison with results obtained, with efficiency recorded.

In 2009, employment in agriculture increases (from 2008) to 28.7%, in context of the economic crisis which agriculture to become an occupational buffer, absorbing surplus labor force in other sectors, so that in

2010 the population employed in agriculture reach approx. 30.1%.

The added value of industrial sector to GDP is widening slightly in 2010 compared to 2009, however in 2000-2008 decreased mainly due to ineffective implementation of reforms in the industry. Indeed there is an employment increase in the services sector with the largest contribution to GDP (compared to other sectors). But the development of the sector has not made the same increasing manifested in developed countries. According to global trends, economic development orientation involves higher education services, but in recent years Romania has developed services sector that uses low-skilled labor. Service sector contribution to GDP growth is based on the development of financial services, commercial and without higher qualifications.

The construction sector in the period 2005-2008 was one of the most dynamic in the country, as there have been increases employment in activities such as trade, hotels and restaurants, real estate and other services, financial intermediation, etc.

But the economic crisis first hit this sector, such as added value (% of GDP) decreased by 13.3% in 2009, respectively, with 10.7% in 2010.

Structure of employed population by age group in 2010 suggests a rather high percentage of employed population aged over 45 years (22.35% for employed population aged 45-54 years, combined with the weight of 11, 96% employed population aged 55-65 years) due to demographic aging population. In the age group 55-65 years, and that of 65 years and over, the largest percentage of employment is recorded in agriculture, followed by education and health. Reduced percentage of the employed population aged 15-24 years (8.5%) is the result of reducing the birth rate, but also of youth involvement in educational activities, in recent years extending periods of study.

Distribution of occupation groups shows that farmers and skilled workers in agriculture, forestry and fishing accounted for 24.3% of total employment people. A significant proportion (15.2%) had a category of craftsmen and skilled workers in trades. In non-agricultural activities were employed 6.46 million people, among them significant

proportions being held by those operating in *manufacturing* (25.5%), *trade* (17.6%) and *construction* (10.9%). Compared with 2009, in 2010 significantly increased the number of people operating in private households (46.5%). Other significant increases were recorded in real estate (23.9%), other services (12.0%), water supply, sanitation, waste management, decontamination activities (10.8%). A low number of people employed in *manufacturing* (-6.0%), *mining* (-4.7%) and *public administration* (-3.9%).

Conclusions to be drawn from this brief analysis of the employed population are:

Negative demographic trends in recent years and those projected for the coming decades, will affect the overall performance of the EU economy, in a very complex manner.

Romania had and has now a population structure more favorable long-term economic development compared to other EU countries, however, soon in Romania by age distribution of the population will change in the negative, the proportion of elderly will reach equal to that of young people.

An important issue in the labor market is the low employment rate. At every person working there someone who could work, but for various reasons this does not happen. It is true that in Romania the percentage of people working is higher than statistics show, but many people work in the underground economy.

The process of transforming the economic structure carry to significant changes in professional structure of the population. Have occurred massive job losses in industry, which were only partially offset by new jobs emerged - in services and industries that were regenerated.

Decrease in employment is accompanied by an important activity in the underground economy, with hybrid forms of formal and informal activity, making it hard concrete labor market analysis.

Abstract

The present paper has as debut point the presentation of the moment and also, of the normative act that introduced the classification of the public expenditures and how the expenses are systematised in its frame. After a brief overview of what signifies the functional and economic classification of public sector spending in emerging economies belonging to Romania, had in view the temporal evolution of total expenditures, current, personal and capital expenditures at a series of authorizing officers of the state budget (the ministries leaders of: Public Finance; Economy, Trade and Business; National Defence; Transports and Infrastructure; Education, Research, Youth and Sports; Labour, Family and Social Protection; Agriculture and Rural Development; Health; Regional Development and Tourism.

Key words: public sector, budgetary classification, expenditures.

J.E.L. classification: H10, H61, H72.

1. Introduction

Approved by OMFP no. 1025/2005, the classification of the public finance indicators is a scheme of grouping, numbering and legal naming of the budgetary incomes and expenditures which is specifying the name of each budgetary income and, respectively, the destination and the nature of the budgetary expenditures. It should be noted in the same time that, due to the aforementioned characteristics, this classification can be no juridical basis both for revenues collection, or for expenditures payment but only as a tool for systematization and unitary correlation of

the budgetary indicators. Regarding the expenditures, their grouping regulated through the classification of the indicators regarding the public finance and the criteria had in view inside the classification are presented in Table no. 1.

Table. 1. The grouping of the expenses settled through the classification of the indicators regarding the public finance

Classification of the public expenditure		
Functional classification		
Criterion	Group	Expenditures
<i>Destination</i>	<i>Parts</i> (name which specify the destination of the categories of the public expenditure)	General public services (I); Defense, public order and national security (II); Social-cultural expenses (III); Services and public development, housing, environment and water (IV); Economic action (V); Reserves, surplus / deficit (VII).
	<i>Chapters</i> (the differentiated division of the categories of public expenditures inside the expenditure parts); these are subdivided into subchapters according to the destination of the public expenditure;

2. The authorizing officers of the state's budget

Made during the reporting period in order to assure the public institutions functioning, the current expenditure appear under the form of staff costs, goods and services, interest regarding the public debt and other interest, grants, reserve funds, transfers between units of public administration, other transfers, social assistance and other expenses. If some current expenses are common to all public institutions, indifferent of the activity developed by these (basis salaries, benefits management, the contribution for the state social security, the contribution to unemployment insurance, goods and services, etc.), others are specific to some of these - social and economic entities. *Capital expenditures* includes the expenditures with the unredeemed fixed assets, the ones regarding the state and mobilization reserve, etc. In the category of *loans* are taken into account: the ones for objectives agreed by the bilateral and inter-governmental agreements; loans for people with refugee status; the ones for the public services and institutions or for activities fully financed from its own funds; loans from the unemployment insurance; the one accorded for the building, purchasing, rehabilitating, strengthening and expansion of housing; loans for the protection of historical monuments etc. Regarding the *loans reimbursements*, these can have external character (the ones contracted by the authorising officers, the ones reimbursed from the guarantee fund, the loans reimbursements which correspond to the local public debt and the course differences which correspond to the public external debt) or internal (reimbursements of internal guaranteed loans, course differences which correspond to the public internal debt and loans reimbursements which correspond to

the internal local public debt). Representing sums aproved through the state budget, of the state social assurance, of the unemployment fund, of the unique national fund of social health assurance, through the local budgets, of the autonomous public institutions, through the budget of the state's treasury, through the one of the external grants, of the institutions financed entirely/partially from the state budget, of the institutions financed entirely/partially from own incomes and through the budget of the funds obtained from loans contrac-ted/guaranteed by the state or by the administrative and teritorial units, the *budgetary expenditures* can be effectuated only in the limit of *the budgetary loans aproved* through the budget. Their opening is realising by the main authorising officers financed from the budget, on the basis of the demand of budgetary loans opening which must be made for each chapter of expenditures aproved through the respective budget, with breakdown on current and, respective, capital expenditures. Known under the name of authorising officers, the leaders of the public institutions with juridical personality who has the right to engage and use budgetary loans are classified according to a serie of criteria (Table no. 2).

Table 2. Classification of the authorizing officers

Criterion	Authorizing officers
<i>according to the budget that funded them</i>	<i>financed from:</i> state budget, social insurance, state unemployment fund, the single national fund of health insurance, local budgets, etc.
<i>according to their rights and obligations in the budget's execution</i>	<i>main</i>
	<i>secondary</i>
	<i>tertiary</i>

Source: Table realised using the informations from source [1]

3. The phases of the expenditures budget execution

Regardless of the budget from that are financed, and of the degree of subordination, public institutions must follow the procedures regarding the completion of the phases related to the budget execution of the expenditure, as they are presented in Table no. 3.

Table. 3. The phases of the budgetary expenditures execution

Phase	Characterization
<i>The engaging</i>	any legal act which results or could result in a payment obligation on public funds;
<i>The liquidation</i>	checks the existence of the budgetary and legal commitments, determine or control the reality of the amount due and the chargeability conditions of the legal commitment, based on documents;
<i>The authorisation</i>	confirms that the goods were delivered, the works executed or services provided, that other claims have been verified and that the payment to the supplier, entrepreneur or creditor may be made;
<i>The payment</i>	public institution is released from any obligation face to the third creditors.

Source: Table realised using the informations from source [1]

4. The evolution of the expenditures of the main authorizing officers from the public sector of the emerging Romania

As specialized bodies of central public administration, the ministries exercise the public administration in activity domains that respond, are organized and are functioning subordinated to the government and may set up specialized agencies in their subordination, with the Court of Auditors approval. Some develops economic activities, others activities with social - cultural type, political or administrative, etc.. and their leaders have the quality of main authorising officers. As a result, the main authorising officers of loans financed from the state budget will had the responsibility to open budgetary credits for their own expenses and then, their allocation to the public institutions hierarchical inferior. In the following we consider personal expenses, current, capital and total expenditures made by some of the main authorising officers of the state budget during the 2008-2010 period of time. Were analyzed, for this purpose, the income and expenditure budgets belongs to: Ministry of Public Finance (MPF); Ministry of Economy, Trade and Business Environment (METBE); Ministry of National Defense (MND);

Ministry of Transport and Infrastructure (MTI); Education, Research, Youth and Sports (MERYYS); Labour, Family and Social Protection (MLFSP); Ministry of Agriculture and Rural Development (MARD); Ministry of Health (MH); Ministry of Regional Development and Tourism (MRDT).

5. Conclusions

As a general valid conclusion, the highest value of the expenditures of the main authorising officers of the state budget which was analyzed was the one of the current expenditure, followed by capital expenditures and, on the last position, by the personal expenditures. Exception to this trend did the Ministry of Public Finance, Ministry of National Defence and Ministry of Agriculture and Rural Development. For each authorising officer in part, the expenditure evolution can be explained as follows: in 2008, the maximum amount of personal expenses was recorded for the case of Ministry of National Defence and the minimum value belongs to the Ministry of Economy, Trade and

Business. For the 2009 year, for the same type of expenditure of the state sector, the maximum level was registered in case of Ministry of National Defence and the minimum one at the Ministry of Transport and Infrastructure. The 2010 year bring into the ranking of the personal expenditures, on the first place, the Ministry of National Defence and on the last, the Ministry of Transport and Infrastructure. Regarding the current expenditures, the maximum level of these was registered at the Ministry of Labour, Family and Social Protection in 2010 and the minimum one, at the Ministry of Economy, Trade and Business, in 2008. The evolution of the capital expenditures was placed between the maximum and minimum points registered at the Ministry of National Defence în 2008 and, respective, at the Ministry of Public Finance in 2009.

Abstract

During this period marked by the effects of the current economic crisis, the structural funds play most important role in regional development. Each country of the Union, especially those in development they wish to reach the level of the developed world, so you must access the funds in order to reduce economic disparities between them.

Key words: European Union, regional policy, cohesion policy, structural funds, convergence
J.E.L. classification: F, F1, F15

1. Introduction

Regional and cohesion policy was designed as a "counterbalance to the European economic social project to create free market"(6). However, with time, European cohesion policy began to be developed at European level, and the major economic and social disparities that existed within the Union could be reduced only by the application of specific instruments, called redistributive structural and cohesion funds. So, the economic and social cohesion of the EU is achieved in particular through the regional development policy supported by a set of financial instruments, of which the most important are the structural funds and the Cohesion Fund.

Through the structural funds, the financial instruments of regional and cohesion policy, the EU works for "the Elimination of economic and social disparities between Member States" (8), in order to achieve economic and social cohesion. Thus,

subsequent reforms of cohesion policy were closely linked to the efficient management of the structural funds, concentrating much of its expenditure in less-favored regions of the Union, "solidarity more developed States arguing in favor of LDCs" (4).

The idea of creating a policy to reduce and eliminate the disparities between regions, has its origins in the Treaty of Rome (1957), where it is explicitly transposed that one of the objectives of the community is to reduce social and economic differences between regions (11). However, the structural funds have appeared for the first time in the 1970s, after the first expansion and had suffered an economic crisis. At first, these funds were provided to Member States for infrastructure development and the achievement of economic growth to be close to that of European standards, but, since 1985, these funds were justified in terms of "economic and social cohesion", which was the Elimination of regional disparities (1).

In 1988, the Brussels European Council, following the initiative of Jacques Delors, then President of the European Commission, has adopted the doubling of financial resources for the structural funds over the next few years (12). This first great reform, which coincides with the signing of the single European Act, practically revolutionized the procedures concerning allocation and implementation of the structural funds, just to make it easier target for economic and social cohesion of the Member States (3). A new reform of the structural funds was negotiated with the signing of the Treaty of Maastricht (1993). An important moment is the adoption in 1997 of Agenda 2000, whose strategic directions were reiterated during the European

Council in Berlin in 1999. The main objective of Agenda 2000 was to increase the effectiveness of the structural funds, increasing the budget allocated to this expenditure. According to author Steven McGiffen, another result of Agenda 2000 was the merge of the objectives of the structural funds, from seven to three. The first goal, on convergence, promoting the development of disadvantaged regions, through the granting of financial resources for investment in infrastructure and business.

The second objective, the regional competitiveness and employment, focusing on areas such as, employment, modernizing policies and systems of education, training and employment of labor. With the final objective, the European territorial cooperation, supporting the economic and social conversion of areas experiencing difficulties in border areas at EU level (7). These objectives are reflected in the programming period 2007-2013.

2. The structural funds in Romania

At first there are the following structures of the structural funds. The first fund created is the European Social Fund (ESF) – established by the Treaty of Rome, whose mission was "to promote throughout the community employment facilities and the geographical and occupational mobility of workers" (13). Currently, this Fund is intended for social policy, including measures concerning employment and unemployment (14). In 1962 it was decided the creation of the common agricultural policy, which led to the establishment of the Fund, the European agricultural guidance and guarantee section (EAGGF) in 1962, being divided into two sections, the guarantee and guidance. The main objective of the instrument for structural is to finance the common agricultural policy, by supporting rural development and modernization of agriculture (15). The third structural type Fund is the European Regional Development Fund (ERDF) founded in 1975. This is the substance that interests me most, as the research in question. Among its objectives include investments in various areas such as infrastructure, health, small and medium-sized enterprises, local development, health, social conversion (5).

The last structural fund created is the financial instrument for fisheries guidance (FIFG), in 1993, aimed at increasing the competitiveness of the fisheries sector (16).

A date with the latest reform of the structural funds, since 2006, has been adopting a new regulation for the operation of the structural instruments (17), which resulted in the simplification of the financial instruments of regional policy and cohesion.

Thus, under the umbrella of the structural instruments, the structural funds are made up of the ERDF, renamed after the take-over of agriculture policy, the European Fund for agriculture and rural development (EAFRD) and the ESF and the Cohesion Fund. EAGGF and FIFG have been removed from the structural funds, being subordinated to the common agricultural policy. This merging of the structural funds was mentioned as early as 2003 in Sapir Report, which, inter alia, stated that a national approach is preferable to one regional structural funding, is used to determine eligibility (9).

As a result, the cohesion policy reforms have imposed geographical and economic criteria relating to the management of the structural funds. The largest financial allocation was made in the regions and the least developed countries and financial and human resources shortage, arguing, more developed States, solidarity in favor of LDCs, with the aim of creating a Union uniform of socially and economically.

Over the years, the arrangements for implementing the structural funds have become increasingly more integrated and sophisticated, but also decentralized. Author David Allen recorded the existence of four principles upon which the system of implementation of those funds. A first principle refers to the concentration of measures around priority objectives. The second principle concerning the programming highlights the fact that the objectives will be pursued within the framework of a multiannual programming system and multiregional. Partnership, representing the third principle, implies a close cooperation between the Commission and the competent authorities at national, regional or local level in each Member State.

And the last principle, additionally, where contributions granted through these funds must not replace other public expenditure but

may be supplemented through co-financing from the national budget.

Analyzing these principles, we can deduce that these funds are not manageable, referencing and intersection operations on many levels. On the one hand this is emphasized by the institutional framework at Community level, where the European Commission, the Council and the Committee of the regions are those which control management/implementation of the structural funds (2). On the other hand the Community legislative framework and plays an important role in this respect, because it is a pretty vast, if it is to keep in mind the number of regulations and guidance documents that govern the policy of the structural funds.

Apart from a part of the Community regulations and documents, which are unchanged when applied at national level, and the rest of the system of implementation of the structural funds that conforms to the legal and institutional features of each Member State. For these reasons, there are numerous differences of approach to the mode of implementation of the structural instruments at Member State level; hence the uptake rates vary significantly from country to country.

Regional Operational Program 2007-2013 is a program that implements important elements of the national strategy for regional development of the NDP, contributing, alongside the other sectorial programs, to achieve the general objective of the strategy of National-Regional disparities reduction, i.e. between the regions of Romania.

As I said the main objective of the Regional Operational Program is to support the regions lagging behind in terms of development, and within the regions somewhat more prosperous, more underdeveloped areas through harnessing their specific resources, underused so far, in order to speed up economic growth of these areas.

Main route identified to achieve this aim is the differentiated allocation of funds by region, depending on the degree of development of the region in general, inversely proportional to the size of GDP/per capita, so that the less developed Regions to benefit proportionally, and the largest financial allocation. These funds will be used to finance projects with significant impact on regional development and local rehabilitation

and modernization of transport infrastructure, educational, social, health and public safety, improving the business environment through the development of business support structures (industrial parks, technology, logistics, business, etc.) and supporting the initiatives of private entrepreneurs, potential tourist and cultural tourism infrastructure by supporting the development and entrepreneurial initiatives in this area supporting the development of urban centers, with the potential for economic growth, to create conditions to act as motors of regional development and local.

Calls for proposals will be launched on a regular basis, in each of the key areas of intervention. When a call for proposals was launched, receive funding only projects in that key area of intervention.

The economy of a country, region or group of countries, and that of the whole world, develops cyclically. This means that in certain periods of time, a country, (a group of countries, etc.) is characterized by a growing economy, followed by a limitation of the extension, then a decrease and a halt to it (10). Period that characterized much of the European countries at the present time.

The main areas that may be affected by regional policies are enterprise development, labor market, attracting investment, transfer of technology, the development of SMEs, improving infrastructure, the quality of the environment, rural development, health, education, education, culture.

Rural development occupies a distinct place within the framework of regional policies and shall cover the following aspects: the removal or reduction of poverty in rural areas, balancing opportunities of economic and social conditions of the urban and rural local initiatives, stimulation, preservation of cultural heritage and spiritual.

It should be stressed as particularly important the accessing of these structural funds in achieving economic convergence necessary for the transition to monetary Union, consisting of mixing of the main characteristics of the economies of participating countries: inflation rate (a high degree of price stability levels), the nominal long-term interest rates, changes in exchange rates, budget deficit, government debt level, but also the level of wages, unemployment, income per capita.

In literature, on the basis of the Treaty of Maastricht were refined three separate but complementary convergences: convergence of nominal; legal convergence; real convergence. The nominal convergence criteria laid down in the Maastricht Treaty (article 104, 109j), as in Protocol No 6 on the convergence criteria annexed to the Treaty are as follows:

- price stability, which will fully respect from a rate of inflation observed over a period of one year before the examination for the transition to stage three, the inflation rate not exceeding by more than 1.5% average of the three Member States with the lowest inflation;

- interest rates in the long term, which shall not exceed by more than 2% average nominal long-term interest of the three Member States with the lowest interest rate;

- the ability to sustain public finances: the government deficit must not exceed 3% of gross domestic product (GDP) at market prices; public debt must not exceed 60% of GDP, "less where this ratio is reduced sufficiently and approaching the reference value at a pace appropriate";

- stability of exchange rates, i.e. the observance of the normal fluctuation margins provided for by the exchange mechanism of the European monetary system for at least two years preceding the examination, on its own initiative, without devaluation of the currency exchange rate in relation to their own currency of another Member State.

By legal convergence means the harmonization of national legislation and regulations of the central banks of member countries of the EU, so as to make it compatible with the European system of central banks (ESCB). In a general sense, this convergence includes aspects such as the independence of national central banks and the integration of these banks into the ESCB.

Real convergence refers to a level standard of living, equalization of standards of living in member countries, and the pursuit of so-called “economic and social cohesion ‘at Union level. Variables that measure real convergence are income per capita, the level of wages, unemployment, government expenditure, etc. In order to achieve an equalizer in these areas it takes more time than the minimum for the variables, but these have been finally beneficial affects real variables.

3. Conclusion

As a result, regional development policy includes all the measures planned and promoted by the local and central public administration in partnership with various actors (private, public, volunteers), in order to ensure a dynamic and sustainable economic growth, by maximizing the potential of regional and local levels, in order to improve living conditions.

Process Communication – a Model For Communicating in a Challenging World

Măruntelu Liliana

„Ovidius” University of Constanta, Faculty of Letters

liliana_maruntelu@yahoo.com

Măruntelu Vladimir

Abstract

In the world of work, relevant skills and solid experience are prerequisites.

The way we communicate with others can define the level of success we achieve, and it is also often the single most important factor in our business dealings. Whether one’s role involves managing staff, clinching sales deals, delivering training, working with or building a project team, or any other area of business, he/she could achieve his/her full potential by raising his/her game in the art of effective communication.

The Process Communication Model® (PCM) is a key business tool that no serious professional can afford to be without. Developed by Dr Taibi Kahler Ph.D, an award winning clinical psychologist, PCM uses personality assessment and communication management tools to help one understand the different personality types so that one can deliver his/her messages more effectively, and develop positive communication skills.

Key words: communication, process, model
J.E.L. classification : Z00

1.Introduction

Communication is the transmission of information from someone who sends the information to a channel which goes to a receiver of the information. Communication consists of the sender, the channel and the receiver. Humans have a need to communicate. The need to communicate is what propelled the development of language and the mind. The need to communicate what is felt or perceived within. In order to communicate, humans created channels. The

way to create the channel is by hooking the attention of the receiver. With the transference of information we transfer many other things not just information in the mental point of view. We transfer many different kinds of energies also. We can transfer love, and we can also transfer emotional poison.

Communication always has an intention. Intention and intent are completely different. Intent creates the channels, opens the channels and creates the communication. Intention is the purpose for the communication from the point of view of the reason. Creating all these channels also creates emotional hooks. Channeling has an emotional component. The same way an individual has an emotional component within there is an emotional component outside as well. In this way the inside net and the outside net have an agreement.

While the field of communication has changed considerably over the last thirty years, the models used in the introductory chapters of communication textbooks (see Adler, 1991; Adler, Rosenfeld, and Towne, 1996; Barker and Barker, 1993; Becker and Roberts, 1992; Bittner, 1996; Burgoon, Hunsaker, and Dawson, 1994; DeFleur, Kearney, and Plax, 1993; DeVito, 1994; Gibson and Hanna, 1992; Wood, 2002) are the same models that were used forty years ago. This is, in some sense, a testament to their enduring value. Shannon's (1948) model of the communication process provides, in its breakdown of the flow of a message from source to destination, an excellent breakdown of the elements of the communication process that can be very helpful to students who are thinking about how they communicate with others. It remains, however, that these texts generally treat these models as little more than a baseline. They rapidly segue into other subjects that seem

more directly relevant to our everyday experience of communication.

In interpersonal communication texts, these subjects typically include the social construction of the self, perception of self and other, language, nonverbal communication, listening, conflict management, intercultural communication, relational communication, and various communication contexts, including work and family. In mass communication texts these subjects typically include media literacy, media and culture, new media, media industries, media audiences, advertising, public relations, media effects, regulation, and media ethics.

2. Work in a Conflictual World: New Challenges, New Abilities

In these times of crisis, technological progress has changed the face of organisations by providing immediate access to information. New forms of communication now fill our TV and computer screens. Though, the corporate world still consists of very real people, who, through their talents, training, experience and especially their personalities, truly enhance the capabilities of their companies. Today people are indeed the most valuable asset for any corporation.

Both individuals and groups demand mobilization in the context of current technological and economic challenges. Hierarchy plays only a minor role while new leaders seem to conceive strategic projects within matrix style organizational structures and task force teams. To meet the challenges of the new commercial markets work groups are formed and dissolved at a rapidly increasing rate. Time in which to establish contact and become familiar with people has become very short.

Inspiring others, giving meaning, uniting a team to capitalise on the strengths of its members and managing tensions in the workplace are all necessary abilities required of the modern manager. There is stress both for the managers and for employees who are also ready to learn how to better resist pressure. Self-knowledge, self-management, understanding others and better relationship management will inevitably release much of this pressure; especially if everyone, whether a manager or not, were capable of helping

and contributing by having their skills improved in these important and vital areas. Being able to effectively approach an interpersonal relationship challenge and to ask for or offer help if needed is an indicator of strength, though sadly many managers and employees do not see things this way. Employees and managers in the twenty-first century need to know how to bring their performance to a peak, both as individual and team players.

There have been considerable changes in how work is organised in recent years. It is no longer a matter of whether people will be able to work together as a team or not, because teamwork has become mandatory. Many companies are matrix systems in which each department's action is connected to the entire system. Departments no longer call themselves divisions since the reality is quite the opposite: now it is about uniting people from different disciplines to work on projects with shared ownership.

Steering projects of this type require new skills; like knowing how to assume leadership roles without necessarily having any hierarchical relationship. This change has been so rapid that the employees need to be supported in the acquisition and application of this type of skill. An operation like this requires both relational and situational intelligence. Employees who feel good about themselves and comfortable with each other are priceless assets to a business.

3. A Communication Model

In 1971, Dr. Taibi Kahler saw a PROCESS, a sequence by which people interacted with one another both in positive and negative ways. The uniqueness of this discovery was that human behavior could be identified objectively literally second by second as being either productive (COMMUNICATIION) or non-productive (MISCOM-MUNICATION). Both patterns were sequential, measurable and *predictable*.

For this discovery, Dr. Kahler was awarded the 1977 Eric Berne Memorial Scientific Award and honored by more than 10,000 of his clinical peers from 52 countries as having provided the *most significant scientific discovery in his field of psychology*. His miniscript afforded people the means of diagnosing someone within minutes and

accurately predicting their pattern of negative behavior under stress.

With many invitations to speak at national and international business and organizational conferences, Dr. Kahler translated his concept into a non-clinical model of communication for business and individuals. PROCESS COMMUNICATION was developed to offer business people a firm behavioral, management and interaction foundation.

Process Communications identifies personality types, assesses character strengths, reflects preferred management styles and favorite "channel" or means of communication, determines individual psychological and motivational needs, predicts potential management/interaction success or failure patterns under stress, provides intervention points for failure patterns and Offers ways of reinforcing positive, productive behaviors.

The model does not categorise people, but rather shows how all the possible personality types are in each of us, organised in our own unique order. It offers valuable methods for enhancing communication across the different personality types. Personality is composed of a unique, mixture of six personality types and we can observe multiple aspects of personality, including behavioural traits, perceptual preferences, individualised motivators, unique ways of communicating, & predictable, observable behaviour under stress.

Knowing and understanding these behaviours we can improve the quality of our business and private relationships by simplifying our style of communication and leadership including our method of conflict management. Knowing how PCM works, it is possible to monitor communication interaction by interaction, to ease avoidance of miscommunication with unmistakably defined strategies to reestablish communication, where it has been broken. This relevant and efficient model has rapidly grown in Europe to become an essential business tool.

The predictability of distress behaviour is one of the most valuable tools in the Process Communication Model arsenal. As a result of Dr. Kahler's observations, we know that behaviour under normal and severe stress is highly predictable. The model then provides

precise methods to enhance better self-management and better management of our interpersonal relationships even under stress. Because distress behaviours are very predictable, observation of these patterns is another valuable tool for assessing personality. Each personality type has its own way of behaving depending upon the nature and intensity of the stress to which they are subject. These six predictable, observable, and reversible behavioural sequences provide insight into understanding and managing interpersonal relationship difficulties and therefore, enhancing our efficiency both at work and outside of it. People who use the Process Communication Model® benefit from a whole range of practical tools specifically designed for successful everyday management of communication. Whether with employees, clients, partners, or colleagues; our business relationships become smoother, teams more motivated; team members accept ownership of projects and cooperate together contributing to team synergy and increased productivity with reduced stress levels.

4. The origins of Process Communication

Dr. Kahler began his award-winning research on interpersonal communication and behaviour in the late 1960s and, in the 1970s, developed it into what became known as the 'process model.' In 1978, Dr. Terry McGuire, NASA's Lead Psychiatrist for Manned Spaceflight, invited Dr. Kahler to demonstrate the efficacy of his model in connection with astronaut selection. After comparing notes on several candidates, Dr. McGuire hired Dr. Kahler, commenting that 10 minutes of using his approach revealed as much or more about a candidate than a standard psychological interview of several hours. This began an extended relationship with NASA (1978-96), during which Dr. Kahler worked with Dr. McGuire to incorporate the model into the astronaut selection, evaluation, training and management processes and during which time Dr. Kahler also translated the concepts underlying his model into behavioural terms. The predictability of PCM was essential to Dr McGuire because using it he was able to

accurately predict astronaut distress in space, important in crew selection for men working under such extreme conditions. In 1982 Dr Kahler brought the Process Communication Model® to the business world to enable organisations to offer their people tools and an approach to communication, motivation, management, and stress management in the workplace. Since then the PCM approach has successfully benefitted well over a million people around the world.

5. The Process Communication Model

People who wish to use the Process Communication Model will first complete a questionnaire which, once processed, will enable them to discover their personality structure. The teaching metaphor of a condominium (in the USA a name for an apartment building) helps in us to visualise the composition of each unique personality structure. One of the six personality types is located on each floor; the size of the floors indicating the level of energy available when the person wants to use the corresponding personality type. The metaphor of an ‘elevator’ illustrates the person’s ability to reach all of the floors and use all of their resources.

Individual personality structure is comprised of six, separate and mutually exclusive behaviour types, called Thinker, Harmoniser, Persister, Rebel, Imaginer, and Promoter. Likened to a six-floored condominium, personality structure is ordered, indicating the relative amount of time a person experiences and demonstrates the behaviours of a given type floor. These second-by-second behaviours – categorized by words, tones, gestures, postures and facial expressions – can be observed objectively with significantly high interjudge reliability. Additionally, test-retest reliability research indicates that once a person's condominium order is set, that order seldom changes.

The Personality Pattern Inventory, also measures the amount of energy available to the individual to experience each personality floor. Correlations for each personality type include: character strengths, management styles, channels of communication, perceptual preferences, environmental choices, and personality traits. No one type is better or worse, more or less intelligent, or

more or less OK. Each has strengths and weaknesses.

Each of us has the need to appreciate values like the Persister; has some of the spontaneity of the Rebel; has the compassion and warmth of a Harmoniser; has the ability to be logical as does a Thinker; can enjoy the experience of taking a risk as can a Promoter and has some of the calm that the Imaginer shows. In PCM we do not therefore, speak of types of people, but types in people. However we each have one or sometimes two personality types more obvious in us than others.

The Process Communication Model offers a wealth of wide ranging tools to develop a variety of competencies within an organisation. The strength of this approach lies in the originality of the model’s components, which enable to adjust the training investment to match corporate strategy and employees’ needs.

Coordinates of Romanian Natural Gas Market

Micu Adrian

Micu Angela Eliza

“Dunărea de Jos” University of Galați

Abstract

This work paper analyses Romania’s natural gas market. We have analyzed the demand, supply and price elements, taking into consideration also the import price of the natural gas. Trying to identify the concentration level of the market, we have used the Herfindahl-Hirschman Index (HHI). Calculating HHI for the Romanian gas market, we have found a high market concentration. Analyzing statistic data we have also found that Romania has the lowest gas price in the European Union.

Key words: natural gas, Herfindahl-Hirschman index, market, price.

J.E.L. classification: O16, P42

1. Introduction

Marked by a strong geographical imbalance between the production and consumption place and segmented in spite of a certain correlation with the oil market, the natural gas market operates by virtue of its own forces’ connections, which strongly vary, depending on regions. Generally, we speak about three distinct markets: Europe, North America, and Asia. Prices are fixed on multiple platforms, and the reference index is found in New York and London. This lack of unit comes from the fact that, unlike oil, the gas is not easily transportable, not permitting the elimination of local imbalances between offer and demand.

2. Coordinates of Romania’s natural gas market

Romania has the largest natural gas market of the Central Europe and has been the first country to use natural gas for industrial

purposes. The natural gas market has reached peak dimensions at the beginning of the 80’s, after applying a few governmental policies oriented towards the elimination of import dependence.

Offer’s bearers on the Romanian gas market are represented by:

- domestic consumers;
- industrial consumers.

Consumers’ categories, connected to the system of natural gas distribution, are the following:

- B.1. – consuming up to 23.25 MWh;
- B.2. – with an annual consumption between 23.26 MWh and 116.28 MWh
- B.3. - with an annual consumption between 116.29 MWh and 1,162.78 MWh
- B.4. - with an annual consumption between 1,162.79 MWh and 11,627.78 MWh
- B.5. - with an annual consumption between 11,627.79 MWh and 116,277.79 MWh
- B.6. - with an annual consumption over 116,277.79 MWh

Taking into consideration domestic consumers’ consumption profile, most of them consume annually up to 23.26 MWh, which places them in the B1 category.

Fig.1 Gas allocation in final consumers’ categories

Source: www.anre.ro

At the end of 2010, there were 2.7 million consumers recorded, out of which 2.45 million domestic consumers. The structure of natural gas quantities delivered to final consumers in 2010 shows according to figure 1. The highest consumption of gas is recorded at the level of industrial consumers, approximately 80% of the total gas quantity necessary to Romania, in a year.

Dividing consumers into consumption categories is realized by suppliers from the natural gas sector in accordance with the legislation’s provisions issued by the National Regulatory Authority in the Energy Field (Autoritatea Națională de Reglementare în Domeniul Energiei (ANRE)).

The offer is given by the quantity to sell, in a period of time, at a certain price.

Within the offer’s creation on the Romanian gas market, we can identify at present:

- an operator of the National Transportation System (Sistemul Național de Transport – SNTGN Transgaz SA Mediaș)
- 6 producers: Petrom, Romgaz, Amromco, Toreador, Wintershall Mediaș, Aurelian Oil&Gas;
- 3 operators for underground warehouses: Romgaz, Amgaz, Depomureș;
- 35 companies of natural gas distribution and supply towards captive consumers – the largest of them Distrigaz Sud and E.ON Gaz România;
- 75 suppliers on the wholesale market.
- The natural gas market in Romania is made up by the competitive segment and the regulated segment.

Fig.1 Romania’s natural gas market structure

Source: Romgaz

The competitive segment includes the natural gas trading between suppliers and eligible consumers. Inside this segment, prices are freely formed, on the basis of offer and demand. The volume of this market was 8.5 billion m³ in 2008, sold by 32 companies. The main players are Romgaz, Interagro, OMV Petrom, and GDF Suez.

The regulated segment covers activities with a character of natural monopoly and the supply at a regulated price, on the basis of framework contracts. Inside the market’s regulated system, prices and tariff systems are fixed by the National Regulatory Authority in the Energy Field (Autoritatea Națională de Reglementare în domeniul Energiei (ANRE)), in terms of their own methodologies.

Activities afferent to the regulated segment comprise: supply of natural gas at a regulated price and in terms of framework contracts towards consumers, management of commercial contracts and a contractual balance of internal market, natural gas transportation, natural gas underground storage, natural gas distribution and transit – except for the transit carried on through dedicated main gas pipe lines (transit under the control of regulations established by international agreements that have founded these main pipe lines).

In 2008, the total volume of this market was 4.8 billion m³, sold by 38 companies towards captive consumers. In this segment there are two main players, GDF Suez Energy România and E.ON Gaz România. Each controls approximately 45% of the market.

Starting from data regarding acquisitions-deliveries of natural gas transmitted towards ANRE by licensed operators in this sector, one can analyze the natural gas market from Romania. Thus, in 2010, the internal production of natural gas that has actually been consumed represented 82.84% of sources’ total, the first two producers (Romgaz and Petrom) covering 97.40% of this source. The import that went to consumption the current month, current import and extracted from warehouses, has represented the difference of 17.16%.

As for the natural gas distribution, the analysis on the basis of market share indicates the existence of a structure of oligopoly type, under the conditions where

two companies (Romgaz and Petrom) possess an average of 80% of the market share (see annex 1).

Fig.2 Evolution of suppliers' number on wholesale market, 2005- 2010

Source: www.anre.ro

Romania has substantial reserves of natural gas, estimated by Cedigaz to about 630 billion m³. Thus, the country produces internally more than 70% of the total gas consumption. Due to the internal available, the gas has played an important part in Romania's energetic mix, supplying almost 35% of the total energy consumption. As local deposits have been exploited, the local production has lessened from 35 billion m³ in 1988 to only 11 billion m³ in 2009. This decline has made Romania more and more dependent on Russian imports, in order to cover the consumption. Between 2003 and 2008, Romania has imported in average 30% of their gas need from the Russian Federation. This situation contrasts to that of the early 1990's, when our country imported only 18% of their consumption necessities. The year 2009 was a special one, where Romania has dramatically reduced Russian import to approximately 2 billion m³ / year (15% of the total consumption), since the local consumption has been reduced due to the global financial crisis.

The Herfindahl-Hirschman Index is used as a possible indicator of market power or of competition among companies. It measures the degree of market concentration, by adding the market shares' squares of all the enterprises from this sector [6].

To analyze the degree of concentration on the natural gas market, we use the method of market shares in order to determine a synthetic indicator- Herfindahl-Hirschman Index (HHI), by taking into account the total number of competitors and the (production) market share of each, by using the formula:

$$HHI = \sum_{i=1}^n s_i^2 \quad (1)$$

where:

s_i = the (production) market share of each of the „n” competing companies.

The Herfindahl-Hirschman Index is determined as a sum of market shares' squares of all competitors from the relevant market.

The more competitive a market is, the less HHI's value is (each company has a small capacity to influence it by price, quantity, trading method).

Theoretically, competitiveness is naught under the conditions of pure monopoly and maximum when none of the companies has the power to influence the market, HHI having the value zero (or almost zero). Under the conditions of absolute (pure) monopoly, HHI = 1.

From the perspective of the concentration degree, markets can be:

- atomized: HHI tends to 0;
- medium concentrated with HHI below 0.15;
- concentrated (between 0.15 and 0.8);
- very concentrated (between 0.8 and 1).

Calculating indicators for 2005-2010, we have obtained the following values:

- $HHI_{2005} = 0.4911^2 + 0.4133^2 + 0.0274^2 + 0.0213^2 + 0.0177^2 + 0.0136^2 + 0.0061^2 + 0.0055^2 + 0.0039^2 = 0.413$
- $HHI_{2006} = 0.394$
- $HHI_{2007} = 0.305$
- $HHI_{2008} = 0.283$
- $HHI_{2009} = 0.361$
- $HHI_{2010} = 0.224$

Fig.3 The evolution of HHI between 2005-2010

The value of Herfindahl – Hirschman Index shows a high degree of concentration of the natural gas market in Romania, in 2005, from the viewpoint of production and distribution. Starting from 2006 till 2009, one can see a high concentration, but due to the natural gas market liberalization, we notice a tendency of HHI decrease. We also notice that in 2009, HHI exceeds the value reached in 2007, and in 2010 it reaches the value of 0.224, being near to an average concentration of the market.

The mechanism of the natural gas market functioning in Romania. The Romanian gas market functions as follows: a part of the gas produced by local producers is delivered directly to end consumers (10% direct deliveries), and the rest of the gas reaches distributors. From distributors, the gas goes to final consumers. From producers to distributors, a transportation system is used, a system without which the transfer could not be possible. 18% of the gas produced reaches underground warehouses. When, in the market, there is an excess of demand, the gas stored is reintroduced in the transportation system, and it reaches distributors.

Fig.4 The mechanism of natural gas market functioning in Romania

Source: Romgaz

Physical distribution. The natural gas is extracted by producers and goes to a collection and gas treatment center. From this center, a part of the gas is stored in underground warehouses, and the rest is distributed to final consumers (electric power stations, industrial consumers, domestic consumers, etc.).

Fig.5 Physical distribution on the gas market in Romania

Source: Romgaz

The natural gas price structure. The final price is regulated and calculated by the National Regulatory Authority of Natural Gas, on the basis of an acquisition cost of natural gas, formed as weighted average between the prices of natural gas from internal production and that from import. Prices and regulated tariffs' determination is based on costs recognition justified by natural gas distribution operators. Thus, final regulated prices of natural gas supply cover all the costs with the natural gas ensuring of the final consumer.

In Romania, there are two main suppliers (GDF SUEZ Energy România and E.ON Gaz România) and two main distributors of natural gas (Distrigaz Sud Rețele and E.ON Gaz Distribuție). According to ANRE, at GDF SUEZ Energy România, the final price

paid by the population (for B1 category, meaning an annual consumption smaller than 23.25 MWh) is of 96.48 lei/MWh, the price structure being as follows: 40.08 lei/ MWh for natural gas from internal production (provided by Petrom and Romgaz), 14.92 lei/MWh – for import gases, 8.47 lei/MWh – transportation tariff, 25.03 lei/MWh – distribution tariff and 7.98 lei/MWh – supplier’s margin. At E.ON Gaz România, the regulated price for B1 category is of 96.20 lei/MWh, where the internal gas price is 40.08 lei/MWh, from import – 14.92 lei/MWh, transportation tariff – 8.47 lei/MWh, distribution tariff- 26.24 lei/MWh, and supplier’s margin – 6.49 lei/MWh.

Fig.6 Regulated price structure for B1 category at 1st of October 2009, in lei/MWh

Source: www.anre.ro

Within the European Union, Romania has the cheapest gas for final consumers.

The gigajoule average price (1,000 m³ = 38.5 Gigajoules) of the natural gas consumed in Romania’s houses was of 7.45 Euro, in the second semester of 2009, according to the last data presented by the European Statistics Office of Eurostat. With this value, Romania has the lowest price of gas in the EU, with a price two times lower than the average of the community block, of 14.67 euro.

Prices closer to Romanian’s can be found in Bulgaria (9.67 Euro), in Estonia (10.07 Euro) and Latvia (10.52 Euro). The highest prices are in Sweden (26.86 Euro), Denmark (26.77 Euro), and the Netherlands (18.70 Euro).

However, calculated in terms of the purchasing power parity, the gas price is, in Romania, higher than the average of the community block. The lowest prices are in Luxembourg, Belgium, and Great Britain.

Fig.7 Gas prices in the 2nd semester of 2009, taxes included (€/gigajoule)

Source: EUROSTAT

Import gas price versus oil price. Even if there is apparently not a direct connection between the two products (gas and oil), we observe that in the chart below, gas price on international markets varies proportionally with that of oil’s, with a delay of six-nine months. If in the second semester of 2008, the import gas price tended to rise, reaching at the beginning of the fourth semester a maximum quota of 540 USD/1,000 m³, in the same period, the oil price on international markets was diminishing, reaching a minimum of 51 USD/barrel. Starting with the fourth semester, the import gas price has decreased till 270 USD/m³, at the beginning of the first semester of 2009. The same period, the oil’s international quota has had an oscillating evolution, recording a value of 41 USD/barrel at the beginning of the first semester of 2009. At that time, the price of oil barrel was following an ascendant trend.

Fig. 8 Evolution of oil price and natural gas import price during the 1st semester of 2008- 4th semester of 2009

3. Conclusions

In a more and more globalized economy, the energetic strategy of a country is realized in the context of evolutions and changes that take place in the world.

For the creation of competition on the gas market, producers should be active on the mercantile exchange. Nowadays, in the Romanian commodity exchange, the ring of natural gases does not function. The local producers of natural gas sell the merchandise by contracting end consumers or wholesale suppliers. Each producer presents an offer to potential customers.

Since there is a commodity exchange that provides an organized environment for trading, a contracting authority can choose the initiation of public acquisition through the intermediate of the available shares market, if the solicited product makes the object of a ring managed by the respective commodity exchange.

The development of the gas market for the next years takes into consideration the following:

- Development of the competition at the level of gas suppliers;
- Stimulation of foundation and/ or rehabilitation of natural gas deposits, in order to increase the quantity of natural gas from the internal production and the limitation of import dependence;

- Qualification of new suppliers that unfold transactions in the wholesale market, diversifying the import sources;

- Realization of new interconnections between the transportation systems from Romania and Ukraine;

- According to the Energetic Strategy of Romania, for the period 2007 – 2020, the estimations for natural gas resources indicate the availability of this resource for another 64 years, and till 2025, gas resources will be diminished with 1/3, in comparison to the present.

Bukovina - A Romanian Brand Taking Shape

Micu Angela Eliza

Susanu Irina

Cristache Nicoleta

“Dunărea de Jos” University of Galați

Abstract

Tourism brand is an important part in promoting a destination, which aims for a central area distinguished from other destinations with similar profile. The distinction is often performed through the concept of singularity, creating the perception in the mind of the tourist, a market perception that often that a better product does not exist. In the present context, most brands facilitate "pre-sell" of a product / service. The brand name becomes a guarantor of this quality without the need for further guidance.

The region of Bukovina is tourist destination renowned both nationally and internationally, but has poor visibility on the international market. This is largely due to the lack of a rigorous regional brand.

Key words: Bukovina, regional brand, tourist destination, SWOT, marketing strategies.

J.E.L.classification: M31

1. Introduction

Every day, people from all over the world take decisions about the next destinations of their investments, about spending their spare time, studies, cultural knowledge or spiritual recollection. Consciously or not, the perception about these destinations influences people's decisions.

The reputation acquired in time by a city, region or even country creates the premises of attracting large masses, and in essence it supports tourism. An important part is played by the „tourist image” – the first impression, other people's references, travel guides etc.- which sell more than any other form of promotion. Tourists are extremely exigent

and careful with details, but most of the time, sensitive and influenceable if persuasion is artfully used by stakeholders. Under these circumstances, a strategical approach of the destination from marketing viewpoint should be directed towards the strengthening of a positive image, the achievement or re-affirmation of the tourist brand.

Brand means quality, safety, consistence, status, belonging - that is everything that tourist destinations need in order to define themselves. Generically speaking, a region's touristic brand means a set of opinions that tourists possess about a certain touristic product, which mostly is considered as the identity of that destination [1]

A brand is the essence of any marketing activity, of any trial to introduce a new product on the market. From marketing point of view, the brand represents that element of image that identifies products and tourist services of an area; it generates the feeling of local pride, recognition and satisfaction for consumers [1].

2. Bukovina – a tourist destination with European aspirations

As a tourist destination, Bukovina is the place where art, religion and natural background co-exist in time and space; it is the place where animals of traction share the same route with the most sophisticated cars.

From a tourist point of view, Bukovina offers sights of a rare beauty, where the “1000 monasteries” built by former Moldavian rulers (Alexander the Good, Steven the Great, Petru Rareș, etc.) reflect. Each of the monasteries has a specific chromatics, that crowns the good companionship of people from these areas: Voroneț (blue), Humor (red), Sucevița (green), Moldovița (yellow), and Arbore (a combination of colours), etc.

The promotion of Bukovina’s tourist brand has become a strategic priority of officials in the county of Suceava, especially after 2007, at the same time with Romania’s integration into the EU. Suceava county’s former prefect, Orest Onofrei, has proposed that the region under his administration to be

called “the county of Bukovina” [1], as a proof of the fact that this brand is well known abroad, and, consequently, more easily to promote in order to attract tourists and investors in the area.

Table no 1 Comparative analysis of the marketing mix

The 4 Ps	Bukovina	Maramureş	Braşov
Product policy	Cultural-religious tourism Religious tourism and pilgrimage Balneary tourism Rural tourism and agritourism active and mountain tourism Business tourism.	Rural tourism and agritourism Cultural-religious tourism Business tourism and team-building Sports tourism Mountain tourism	business tourism cultural tourism rural tourism and agriturism active tourism mountain tourism Ecotourism.
Price policy (medium tariffs)	- double room without breakfast: 70-100 lei/ night; - double room with breakfast included: 100-130 lei/ night; -half-board double room: 130-160 lei/ night.(www.turismBukovina.ro)	- double room without breakfast: 60-90 lei/night; - double room with breakfast included: 90-140 lei/night; - half-board double room: 120-180 lei/ night.(www.infoturism.ro/cazare-hoteluri-pensiuni/cazare-maramures/)	- double room without breakfast: 65-80 lei/night; - double room with breakfast included: 80-120 lei/ night; - half-board double room: 145-250 lei/night(http://www.infoturism.ro/cazare-hoteluri-pensiuni/cazare-brasov/)
Distribution Policy	Forms of tourism: - Travel on your own has a significant weight (www.turismBukovina.ro) - (semi) organized tourism mainly during important religious holidays. Local tourism agencies with incoming activity: Monny Travel, Instant Travel&Tours. Collaboration with large tour-operators is scarce.	Forms of tourism: - (semi) organized tourism is well represented; - Travel on your own is important but knows a slight decline; Local tourism agencies with incoming activity: Expert Travel, Ovesig SRL Sighetu Marmatiei, Etnic Tours 2007 SRL;	Forms of tourism: - (semi) organized tourism is well represented; - Travel on your own knows a slight decline. Local tourism agency with incoming activity: Expert Travel, Ovesig SRL Sighetu Marmatiei, Etnic Tours 2007 SRL; Local tourism agencies with incoming activity are very well represented.
Promotion Policy	- The National Programme of Marketing and Promotion of Bukovina; - Association for Tourism Bukovina (APT); - Bukovina’s Tourism Fair; - County Council of Suceava; - Actions of the University “Ştefan cel Mare” of Suceava.	- www.infoMM.ro; - Association of Tourism Promotion and Development Maramures (Asociația de Promovare și Dezvoltarea Turismului Maramureş – APDTM); - the Association Ecology, Turism Nordica - County Council of Maramureş.	- Association of Tourism Promotion and Development (Asociația pentru Promovarea și Dezvoltarea Turismului Braşov)- APDT; - County Center for the Preservation and Promotion of Traditional Culture Brasov(Centrul Judeţean pentru Conservarea și Promovarea Culturii Tradiţionale Braşov (CJCPCTB); - County Council of Braşov. - Actions of the University “Transilvania” from Braşov.

There is a differentiation of the product policy among the three tourist destinations (see Table 1). Thus, Bukovina focuses mainly on cultural and religious tourism, while Maramures is focused on rural tourism and Brasov on business and cultural tourism.

From the viewpoint of tariffs practiced in these three regions, there are not major differences, which suggest a somehow uniform price policy. The biggest differences appear however in the case of distribution policy. As a tourist destination, Bukovina does not benefit from the powerful support of local tour-operators.

Referring to this analysis, we can conclude that, in order to gain reputation, a brand of international rank such as Bukovina presupposes the re-thinking of the distribution policy and, implicitly, a more efficient collaboration with large European tour-operators.

3. Polling about Bukovina as tourist destination

In order to identify the future action directions regarding the development of Suceava's tourist sector and the strengthening of a powerful local brand, we have considered as opportune, the polling of public opinion, represented by two large segments that have played a primary role in the metamorphosis of Bukovina's tourist region, into an European destination, respectively: *tourists* – as consumers of tourist services and *stakeholders* – a segment which covers all categories of local actors that may influence the quality of the regional tourist act.

Collectivity represents the ensemble of economical units and of people that help creating a favourable image of the tourist destination[2]. The investigation is based on the questioning of 117 tourists visiting Bukovina, and 52 tourism stakeholders. The field research has taken place from the 14th of March to the 2nd of April 2011 and aimed at interviewing tourists found in tourist accommodation units from Suceava, Sucevița, and Gura Humorului and representatives of those units.

The researches' goals and hypotheses have been:

- O1: Identification of tourists' receptiveness towards the usual names of Suceava county.
- H1: Most tourists prefer the name of Bukovina.
- O2: The determination of the most representative tourist attractions from Bukovina.
- H2: Tourists consider that the most worth visiting tourist attractions are the churches and monasteries of whom Bukovina is so proud.
- O3: Representative elements' delimitation that may lead to the setting of Bukovina's logo.
- H3: Tourists, as well as stakeholders, have considered as characteristics of the area: the blue of Voroneț, historical Bukovina's coat of arms and painted eggs with local motifs, considered traditional elements specific to the area.
- O4: Highlighting tourism forms that may be successfully practiced.
- H4: The main forms of tourism that could be practiced are: religious and pilgrimage tourism, balneary tourism, mountain tourism.
- O5: Setting the elements that could lead to the creation of a tourist brand.
- H5: The elements that could constitute a brand are mainly linked to the promotion of religious tourism.

Presentation of studies' results

Referring to the name that this destination should carry, 63.46% of tourists have recommended the use of Bukovina, while a smaller percent (17.31%) prefers the syntagm “The Land of 1000 Monasteries”. Less agreed are the variants: Suceava (11.54%) and the North of Moldavia (7.69%), since the first confounds itself with the homonym administrative center or even with Moldavia's old capital, while the second is considered much too general (see Fig. 1).

Fig. 1 – The name of the region to be promoted

Fig. 2– Defining forms of tourism for the area of Bukovina, according to stakeholders

People interviewed have considered that the Bukovina tourist destination's characteristic elements should be centered upon cultural and spiritual values (50%), knowing that the area is a bastion of Christianity from the age of Ottoman invasions. In order to strengthen this great advantage that local tourism may benefit from, there is a possibility to alternate some specific forms of ecumenical tourism with travels amid nature and rural tourism, forms of tourism advantaged by the beauty of the natural background (19.2%) and the high

level of preservation of folk habits and traditions (11.5%).

In agreement with the situation in the territory, stakeholders recommend the practice of the following forms of tourism (see Fig. 2): cultural-religious (44.23%) – due to the great number of religious places, some of them included in UNESCO World Heritage Site, spa tourism (19.23%) – as a form of tourism characteristic to the area of Dorna, and exceptionally, to the village of Cacica, active and mountain tourism (23.07%) – forms of recreation trying to attract the young amid nature and to a smaller extent, rural tourism and ecotourism – variants that are practiced on the territory of Suceava county, but that should not have an intensive character.

Among the elements that should be taken into consideration by local authorities in collaboration with the representatives of the Ministry of Regional Development and Tourism, we distinguish the development of tourist material basis through the initiation of projects with European funds, homologation of new tourist routes, especially the urban ones (36.54%), a much better international promotion of cultural events and local habits (15.38%), the preservation of existing tourist fond (11.54%) and the protection of old buildings and historical zones from the urban environment (7.69%).

Tourists that have visited Bukovina consider that the accent of the future tourism strategies should be put on the anthropic patrimony dominated by churches and monasteries (44.45%), as stakeholders from tourism have well emphasized. However, we must say that many of the interviewed tourists have not been able to make a clear distinction between religious buildings with external fresco painting, included in UNESCO World Heritage Site, preferred by 20% of the interviewees, and the other representative monasteries such as: Putna, Râșca, Dragomirna, Slatina or Sfântul Ioan cel Nou from Suceava, agreed by almost a quarter of the interviewees (see Fig. 3).

Fig. 3 – The most representative tourist objectives from Bukovina

Also the future regional brand should broaden its tourist horizon by offering of spiritual alternatives (visiting the Roman-Catholic Basilica from Cacica, The Jewish Temple from Rădăuți etc.) or of different type: Suceava’s Cetatea de Scaun or Princely Citadel (14.53%), the salt mine of Cacica or spa tourism at Vatra Dornei.

For the elaboration of Bukovina’s regional brand, interviewed stakeholders have highlighted the following distinctive elements (see Fig.4), that can be totally or partially integrated in the destination’s image or in logo’s component: the blue of Voroneț (34.62%) – a pastel colour met only in mural paintings from the Sixtine Chapel of the Orient, a painted egg with traditional motifs from the areas of Ciocănești or Moldovița (15.38%), the aurochs head from Bukovina’s old coat of arms (13.46%), a miniature church that is found on the ritual table in the altar of Orthodox churches (11.45%) or even the Squirrel “Mariana” (9.,62%), the tourist attraction of the central park in Vatra Dornei resort.

Fig. 4 – Elements that identify themselves with the tourist destination of Bukovina, according to stakeholders

In comparison with questioned stakeholders, tourists have a different vision over the elements that identify with Bukovina (see Fig. 5). The last consider being more representative a miniature church than the aurochs head (3.42% in comparison with 13.46% suggested by stakeholders) or the blue of Voroneț (21.37% in comparison with 34.62% recommended by tourism experts). Tourists have also considered that Bukovina may easily be identified with the image of Stephen the Great (10.26% in comparison with 3.85%).

Fig. 5 – Elements that identify themselves with the tourist destination of Bukovina, according to tourists

To complete the questionnaire-based research, the A’WOT approach of Bukovina tourist area represents a more analytical method of SWOT analysis, which, in addition, introduces the granting of numerical rates to the factors identified within the four classic frames (strengths, weaknesses, opportunities, threats).

Table 2. The A’WOT Analysis of Bukovina tourist destination

Rate	Strengths	Rate	Weaknesses
0.30	The existence of religious edifices included in UNESCO World Heritage Site	0.20	Lack of a famous regional brand;
0.15	The possibility of practicing balneary tourism	0.15	Obsolete material basis or in disagreement with area’s specific;
0.10	High road accessibility, good condition of main access points;	0.15	Superficial and heterogenous promotion of tourist objectives;
0.10	Remarkable natural tourist potential;	0.10	Insufficiently trained personnel in the industry of hospitality;
0.10	Possibility of practicing sports and active tourism;	0.07	Lack of important tourist events that should emphasize local habits and traditions;
0.07	Traditional hospitality of owners and staff from tourism industry	0.07	Insufficient measures for the preservation and maintenance of tourist resources.
0.05	Well preserved habits and traditions.		
Rate	Opportunities	Rate	Threats
0.35	Including the tourist destination of Bukovina in the catalogues of the important European tour-operators;	0.20	Degradation of art and architectural monuments (especially of mural painting) due to acid rains;
0.15	Creation of partnerships with organisms or foreign investors in tourism;	0.10	Deepening of the world economical crisis;
0.10	European financing for the development of the tourist sector;	0.10	A variable macroeconomical policy;
0.10	Promotion in the virtual environment of Bukovina as a component of a wider tourist region: “the Carpathian Mountains”.	0.10	Unfavorable weather conditions that could discourage tourism or other risks and natural -anthropical chances;
		0.10	Migration of tourism qualified labor force;
		0.05	Terrorism

Source: adaptation after Năstase Carmen, Kajanus Miika – Universities’Role in a Regional Innovation System – a Comparative A’WOT – Analysis, Amfiteatru Economic Journal, Bucharest, Romania, vol. 10(23), pp.219-224

The tourist potential’s inadequate capitalization, the material basis obsolescence, loss of traditions and habits could be, at least, partially converted in strengths, by implicating local authorities in the arranging and maintenance of tourist attractions or by manifesting a greater receptiveness towards the natural and anthropical tourist potential.

Through the collaboration of tourist services’ direct performers with units of higher education or with the formation centers and reversion of the personnel, the improvement of tourism personnel could be achieved, thus compensating for the lack of qualified personnel in the industry of hospitality.

However, the most problematic seems to be the fact that there is only a declarative interest for the brand of Bukovina, when any tourist zone aspiring to become an international tourist destination allocates substantial funds for the identification and

efficient capitalization of defining tourist elements.

4. Conclusions and proposals

Bukovina does not have a very well structured brand character. Most of the time, tourists associate Bukovina to an ensemble of churches and monasteries. Unfortunately, as it also happens nationally, the local tourist offer has not known substantial retouches in the last decades, so it has favoured the weariness of tourist image in comparison with other destinations, such as Maramureş or Braşov.

To conclude, one may appreciate that Bukovina remains one of Romania’s symbolic tourist destinations, which is reiterated by tourists and also by stakeholders. In order that Bukovina should keep the status of a representative tourist region for Romania, it is necessary to take a series of strategic marketing actions:

- the directing of Suceava public authorities' interest towards a more efficient administration of real problems that Bukovina tourist destination faces (general infrastructure inadequate to European standards, obsolete material basis, low international visibility, architectural kitsch);

- performing quality tourist services by tourist units, as well as by local entrepreneurs, with a fair quality-price ratio;

- although cultural-religious tourism has a dominant character, it is necessary to alternate more forms of tourism- balneary, rural and agritourism, active, mountain, ecotourism- meant to attract a more diversified range of tourists;

- in the future, local authorities should canalize to carrying out measures for the acquiring of the European tourist destination's status and for the constitution of a regional brand to promote the tourist product of Bukovina.

The main directing lines that define the brand of Bukovina are in our opinion the following:

- the name of the brand could be Bukovina, but from tourists' viewpoint, a higher rate of representativeness has also the syntagms: The Country of Beech (Țara Fagilor) or “The Land of 1000 Churches” (“Țara celor 1000 de biserici”);

- Although it is not explicit, Bukovina's logo consists in the national chromatic (blue), multiseular history (aurochs head, the image of Stephen the Great, etc.) or the spiritual particularities deeply rooted in the area (the Orthodox religion). The strengthening and promotion of a unanimously accepted logo could help Bukovina acquire a suggestive and unitary image in tourists' minds, especially foreign ones';

- The slogan of Bukovina's brand has varied from “Come as a tourist, leave as a friend!” to the syntagm “Come to Bukovina!” promoted by the County Council of Suceava, starting from August last year, and at present, it has reached the highest point with “Come to Bukovina! You shall not regret!” promoted by local authorities in annual actions such as Christmas in Bukovina, Easter in Bukovina, and Pilgrim in Bukovina.

Brand personality should deserve to be improved if not by deep development of

services to be performed in Bukovina, than by a territorial diversification of tourist circuits or, why not, by collaborations and extrapolation of interest area to adjacent areas: Maramureș, Neamț, the region of Cernăuți.

The Income Statement: The Image of Financial Performance of a Public Health Entity

Miculescu Marius-Nicolae
Miculescu Corina

„Dimitrie Cantemir” Christian University,
Faculty of Management in Tourism and Commerce, Timișoara
marius.miculescu@yahoo.com
gmccorina@gmail.com

Abstract

The paper presents the *Income Statement* which has been introduced as a new element for the Romanian public health institutions since 2006 in order to provide information regarding financial performance. Deep restructuring was the result of acknowledging income when establishing rights and expenses at the moment of recording liabilities. This modality of acknowledging income and expenses has led to a reconsideration of the concepts of public accounting, thus leading to the income statement (the performance statement of the public health entity). The information extracted from it helps the managers of the entity to make decisions, to formulate development plans for the assets, to draw up budget plans for the income and expenses of the public health entities.

Key words: income statement, financial performance

J.E.L classification :M40.

1. Introduction

The income statement has been introduced as a new element for the Romanian public health institutions since 2006 in order to provide information regarding financial performance. The information about the entities' performance (the income statement) is employed by users:

- to assess the possible modifications of the entities' financial resources which can be controlled in the future. Their evolution in time is also highly significant in making decisions.

- to anticipate the entities' ability to generate cash flow using existing resources.
- to formulate interpretations on the entity's efficiency to use new resources.

2. Income statement and its use in decision making

The **patrimonial income statement** presents the situation of income (financing) and expenses during the current financial year. Income and financing are presented according to their nature and source, regardless of the fact that they were paid or not. Expenses are presented according to the category to which they belong, according to their nature or destination, regardless of the fact that they were paid or not. The patrimonial income statement also presents the calculated revenues (for example, revenues from commissions and value adjustments) which imply care their collection, as well as calculated expenses (for example, amortization, commission and value adjustment expenses) which does not imply their payment.

The patrimonial result is an economic result that expresses the financial performance of public health entities, surplus or deficit. This result is determined for each financial source and as a totality, as a difference between the produced revenues and the expenses incurred during the current financial year.

According to national standards, the structure of the income statement of a certain financial year also comprises categories of income as intermediate capital accumulations, this category including: operating result, financial result and extraordinary result.

The components that enter the calculus relation for each result category and the modality to determine the result are the following:

- **operating result** – determined as difference between operating revenues and operating expenses, it comprises the following elements, according to Table 1.

Table 1. Model for the determination of operating result

OPERATING REVENUES	OPERATING EXPENSES
a) operating revenues: - financing and revenues from economic activities, - revenues from subsidies and budget allocations with a special destination, revenues from properties and other activities, - special funds revenues and budget revenues, - revenues from commissions from operating activities.	b) operating expenses: - personnel expenses , - stock expenses - expenses on work and services executed by a third party, expenses on other services executed by a third party, - other operating expenses, - other budget-financed expenses, - capital expenses and budget expenses, - operating expenses with amortization and commission.
<u>Operating revenues – operating expenses = Operating result</u> <u>SURPLUS/DEFICIT</u>	

- **financial result** – in turn, it is determined as the difference between financial revenues and financial expenses, its structure comprises the following elements, as it can be seen in Table 2.

Table 2. Model for the determination of financial result

FINANCIAL REVENUES	FINANCIAL EXPENSES
a) financial revenues: - revenues from sales of financial	b) financial expenses: - Losses from claims related to

assets - revenues from financial properties, - revenues from debt assets, - revenues from foreign exchange, - interest revenues, - other financial revenues.	participation, - expenses on financial investments, - expenses from foreign exchange, - interest expenses, - other financial expenses,
<u>Financial revenues – Financial expenses =</u> <u>Financial result</u> <u>SURPLUS/DEFICIT</u>	

After determining the financial result, we can determine the current result using the following formula:

$$\text{Current result} = \text{Operating result} + \text{financial result}$$

- **extraordinary result** - formed on the basis of those elements which are not related with current activity or investment activity of institutions, as their difference, as can be seen in Table 3.:

- for extraordinary revenues: revenues from extraordinary appreciation
- for extraordinary expenses: expenses on losses and depreciation.

Table 3. Model for the determination of extraordinary result.

EXTRAORDINARY REVENUES	EXTRAORDINARY EXPENSES
a) extraordinary revenues: - revenues from extraordinary appreciation	b) extraordinary expenses: - expenses on losses and depreciation.
<u>Extraordinary revenues – Extraordinary expenses = Extraordinary result</u> <u>SURPLUS/DEFICIT</u>	

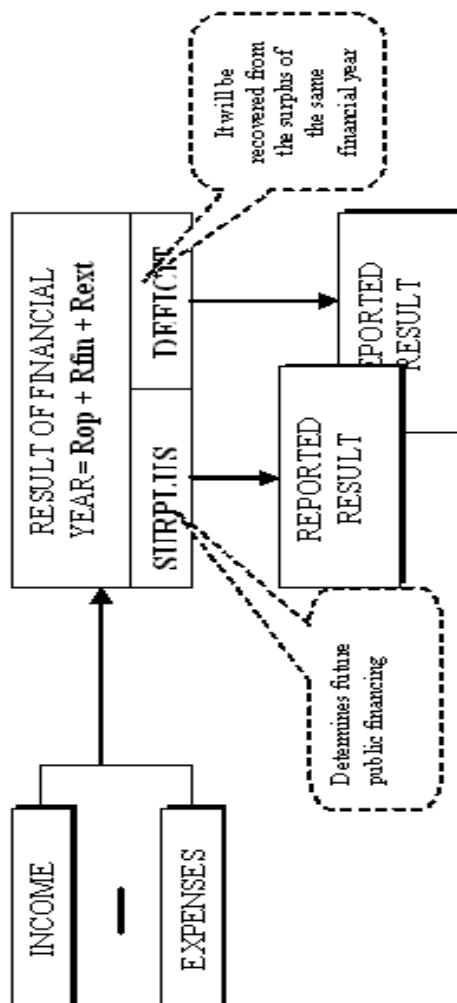

The result of the financial year – formed from the sum of the three types of results is determined as such:

$$R_{\text{year}} = R_{\text{op}} + R_{\text{fin}} + R_{\text{ext}}$$

The forms taken by the result of the financial year lead to indicators such as the **ordinary result**, formed by the sum of operating result and the financial result which are the base for the determination of intermediate balance as balances of potential public capital

The result of the financial year may take two forms, Surplus or Deficit, which is transferred on the reported result to cover the surplus or to report the deficit as it results from Figure 1.

Figure 1. The performance of the public health institution – Income statement

According to IPSAS 1, revenues and expenses, as elements of the financial performance of the public health entity, are structured within ordinary activity as:

- operating revenues and expenses, with corresponding results;
- non-operating revenues and expenses, with corresponding results.

It is worth mentioning the fact that the model proposed by accrual accounting presupposes that each type of result (operating, financial, extraordinary) should determine the surplus and/ or the deficit, so that the global result is to register a surplus or a deficit.

From the information sources analyzed on the level of a public health entity we may observe that they record *operating revenues* after financing, subsidies, transfers and budget allocations with special destination, and also after some operating revenues resulting from a series of individual activities specific to health institutions (different medical services – lab analysis). As far as operating expenses are concerned, they are recorded in connection with wages and social contributions offered to employees, subsidies and transfers, stocks, supplies, capital expenses (amortization and commissions) and other operating costs necessary for a good activity in progress.

As far as *financial revenues and expenses* are concerned, the majority of entities do not benefit from them due to the fact that they do not have an account or a deposit in commercial banks, and credits are contracted only by central units.

Extraordinary revenues and expenses appear only in special cases, for example in case of natural catastrophes or in case some fixed assets are to be sold.

National regulations include in the set of financial situations of public health entities the *Budgetary execution account* which comprises all the operations from the collected income and the payments made, thus checking the modality used to arrive at a certain income and expense in the income statement.

Drawing up an execution account for the entities financed from the FNUASS budget supposes overtaking of the collected income from the debtor turnover of account 5711 „Available from FNUASS”, on the structure of budgetary classification and their

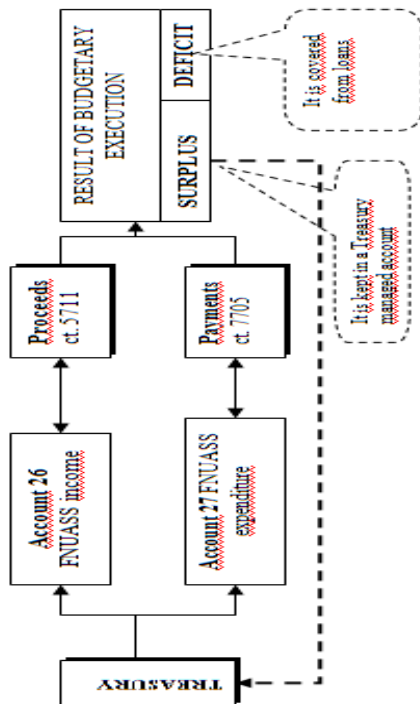

comparison with the information included in the deposit account 26 „Income of budget FNUASS”, and as regards the expenses, their comparison takes place between creditor turnover of account 7705 „Financing from budget FNUASS”- representing net cash payments, on the structure of budgetary classification – and Treasury account 27 „Expenses in budget FNUASS”

The structure of the execution account approved in the budget of the public health entity must include:

For revenues: budgetary provisions, recorded income, proceeds, income receivable.

For expenses: information regarding budget appropriations, legal appropriations, payments, payment commitments and actual expenditure.

Figure 2. Checking of budgetary execution account by Treasury managed accounts

3. Conclusion

In conclusion, we can state that the **result of the financial year** is the indicator that appreciates the activity as a whole for a public health institution, indicating, when the result is positive, the existence of a potential accumulation source which can finance a future financial year, or, when its values are negative, a covered deficit. It is extremely

important that managers should depend on the evolution of this indicator when making future decisions, but they should not neglect an optimal ratio between the result of the financial year and the budgetary execution result which should, in turn, enable the development of the financial activity, without any disequilibrium. Moreover, they should observe the modality of resource allocation, so that the level of assets generated and their use may be optimal, so that the level of total debt to their own capital should be guaranteed.

Cloud Accounting

Mihalache D. Arsenie-Samoil

"Alexandru Ioan Cuza" University of Iași, Doctoral School of Economics
arsenie_samoil@yahoo.com

Abstract

In the present day context of globalisation as well as the effect of crisis on the economy, the evolution of companies, regardless of the specific area where they activate, should abound in keywords such as optimisation, added value, cost cutting, efficiency increase, and profitability. In this respect, cloud accounting represents a new organisational model where the IT&C supporting companies' accounting services, are provided as online services, with users accessing software applications over the internet, without specific infrastructure or platforms and without holding the relative licences, in exchange for a monthly fee. This paper aims to present today's issues facing the increase in the efficiency of IT&C services that support companies' accounts. Aspects related to the concepts of Cloud Computing, Infrastructure as a Service, Platform as a Service, and Software as a Service will be analysed. In addition, the advantages, disadvantages and risks of cloud computing as well as the implementation of this new technology in the acquisition of IT&C services supporting companies' accounting.

Key words: Cloud computing, IaaS, PaaS, SaaS, Cloud accounting

J.E.L. classification: M4, F3, H8, Q56, D8, G1, L8, C6, C8, D5, L6,

1. Introduction

At a time when global economy is announced to be heading rapidly towards a new recession, financial difficulty makes the businessperson's daily agenda. In order to achieve the company's strategic objectives and create a healthy organizational culture, it is always important to take into account two key factors: development strategy and human

resources strategy. Thus, current economic conditions set the stage for new trends in technology, focusing now on the concepts of efficiency in terms of cost and environmental protection.

In order to survive the current economic climate companies need more flexibility and malleability of IT&C equipment and services to help them keep costs under control. Given that companies plan investment in IT&C infrastructure much more carefully and are increasingly aware of the maintenance costs related to these infrastructures, more and more providers of IT&C services redirect towards offering their own solutions in the form of SaaS (Software as a Service).

As the amount of information keeps growing, companies are looking for solutions to provide fast and easy access to data and software applications in an efficient manner in terms of cost and maximum availability. These solutions have been developed due to the unprecedented progress in IT&C technology and the extension of the Internet so that, nowadays, almost all the IT&C resources are available and can be placed on the Internet and can be shared by users: both software (applications) and data / information is made available via the Internet on the user's computer upon request (on demand), just like ordinary public utilities such as water or electricity.

As the market totally changed, companies were forced to further streamline operating processes, reduce costs and to impose themselves more aggressively on the competitive market. In this context, the largest IT&C companies started creating more and more virtualization and cloud computing technologies, which would play an increasingly important part not only in the activities of various companies but also in the end-users'.

Virtualization has emerged from the need to develop more and more computing resources running on the same physical

machine, eliminating the use of inconsistent and expensive servers dedicated to the same operations. A physical server can host multiple absolutely transparent virtual servers, which do not require additional costs and can be managed very easily. Virtual servers have the advantage they can be easily moved from one host machine to another without affecting the continuity of processing. Virtualization is a component of physical infrastructure and can be used as foundation for cloud computing infrastructure whose main role is to provide IT&C support.

Cloud computing is one solution using IT resources outside the company that can be configured according to requirements: servers, storage space, applications and services. Using the cloud is made on request (on demand) and in varying amounts (elastic). It is an online delivery model of services and applications and does not require its own infrastructure or software licenses as these resources can be accessed on the Internet through a simple terminal or mobile device and a browser.

An application (software) like cloud computing (cloud application) uses the web as a single, unique component within its architecture, eliminating the need to be installed on a computer. The requirements that cloud computing applications must meet are: general access (from anywhere via the web), self-service (the capacity to have your own available resources), elasticity (the ability to increase or reduce the resources allocated in terms of minutes/hours), scalability (the access to quasi-unlimited resources when the work load demands it), usage metering (the ability to measure resources consumed at any time and pay accordingly).

2. The concept of cloud computing

The concept underlying the development of cloud computing dates from the '60s, when John McCarthy said, "computer systems could someday be organized as a public utility." Later on, we had the '70s when mainframe computers occupied an entire floor of a building. Then came the early '80s when personal computers, operating systems and personal applications appeared. After this period, we proceeded to small servers and the

client-server concept (by the mid-'80s). Then came the Internet, multimedia applications and collaborative and integrative applications with the possibility of their hosting on the network and when specialized companies create servers infrastructures to be rented for hosting applications, web pages and processing power (in the mid-'90s). The situation changed by the mid-2000s, when the emergence of new concepts such as social networking, software and service and cloud computing.

The first people who implemented this idea were the engineers from Amazon in 2002. It all started from the observation that computing centres serving the enormous virtual library were in actual fact using only 10% of their capacity, while the rest was kept as a reserve to cope with potential overload. While trying to upgrade the infrastructure, the specialists were counting on virtualization and centralization, so that the necessary processing power could be dynamically sized and simplifying maintenance and/or the addition of new facilities. This new infrastructure also enabled the company to provide processing power to external customers, so that in 2006 they launched the Amazon Web Service (AWZ), the first practical manifestation of the concept of computing power as public utility [05].

Cloud computing is a modern concept in IT, consisting in a set of distributed processing services, applications, access to information and data storage, without the user's need to be familiar with the physical location and configuration of the systems providing these services [04]. The term "cloud computing" is derived from a symbolic graphical representation of the Internet cloud-shaped image ("the cloud"), used when the technical details of the Internet can be ignored.

The definition of AppNor "A solution to use external IT resources, configurable according to client's needs: servers, storage space, applications and services. Using the cloud is made on request (on demand) and in varying amounts (elastic). It is a model of online delivery of services and applications and does not require own infrastructure or software licenses, since Internet resources are accessed through a simple terminal or mobile devices"[03].

The definition given by the National Institute of Standards and Technology (NIST) in the United States is widely accepted and seems to gain popularity in the United States and in Europe: "Cloud computing is a computing architecture model whose aim is to facilitate easy access and upon request, through a network, to a shared collection of configurable computing resources (e.g., networks, servers, storage, applications and services) that can be planned and distributed quickly with minimal effort or interaction management service on the part of the provider." The key phrase is "on-demand access to a collection of shared computing resources." [02].

Cloud computing represents a significant evolution of the way information technology and services are supplied. By the ability to access a collection of computing resources on-demand in a self-assisted, dynamically scaled and metered, cloud computing provides attractive advantages in terms of speed, agility and efficiency. Cloud computing is based on a foundation of technologies such as grid computing, including clustering, server virtualization and dynamic planning, as well as shared services SOA-type and automated large-scale infrastructure management. Cloud computing relies on it and adds new features, such as self-service, dynamic scaling, and pay per use.

The types of cloud computing based on resource availability and use are presented below:

- private cloud – the existing infrastructure is operated solely by one company and can be managed by the respective company or by a third party. This model is similar to grid computing and database machines;
- community cloud – the existing infrastructure is shared among several companies who have common interests or joint objectives and can be managed by that community or by a third party;
- public cloud – the existing infrastructure can be accessed by any user with access privileges. The infrastructure is owned by a company providing services;
- hybrid cloud – the existing infrastructure is made up of two or more of the above types of organization, that

remain unique entities but are linked by standardized or customized technology that allows portability of data, applications and services.

The features of cloud computing are the following:

- service-based - developed to meet a specific need, the user cloud computing does not need to invest in hardware or software, except those he or she uses to access services (e.g., web browser), focusing on the benefits offered by the service and not on how it is implemented;
- scalable and flexible - this attribute refers to the system's ability to re-allocate resources dynamically, up or down, in a granular manner. The dynamic allocation and re-allocation of resources and on demand underlies elasticity;
- metered by use - services are quantified by means of usage metrics that allows for various payment methods. Payment will be made according to usage;
- shared - shared services using various resources in common to enable scale savings, IT&C resources are used with maximum efficiency;
- uses Internet technologies - services are provided through the use of credentials, formats and protocols;
- broad network access - geographically unlimited access. Remote network access: technology can be accessed via public network and from any location;
- on-demand self-service - use on-demand. On-demand self-service for consumers: the technology is available to end users without requiring internal IT department intervention;
- pooled resources - resources organized into groups.

Cloud computing services are classified into three broad categories:

- IaaS (Infrastructure as a Service): specialized cloud computing companies buy hardware and Internet bandwidth running various operating systems. For a certain period of time, users rent memory and computing power from them;
- PaaS (Platform as a Service): it is a complete platform for developers enabling them to access servers through a private network, in order to build and test applications;

- SaaS (Software as a Service): i.e., applications, used on a daily basis, for ordinary users who are hosted in the cloud.

3. Cloud computing: advantages and disadvantages

Cloud computing (CC) comes with some very important advantages, especially for companies that do not have the adequate IT&C infrastructure and/or do not have a local technical expertise:

- **Reduced costs:** CC leads to the reduction of IT&C infrastructure costs; costs of equipment storage areas, equipment, licenses, utilities and operating personnel. Optimization of operating costs;
- **Scalability and flexibility:** CC provides services as much computing power as needed. The scalability and flexibility associated with infrastructure as service allows the allocation and de-allocation of resources according to needs. Dynamic expansion or contraction based on requirements;
- **Increased agility and reactivity:** having a flexible infrastructure and software architecture, the company can respond quickly to punctual performance, storage or overload requirements;
- **Flexibility:** CC offers the greatest flexibility and is the perfect choice for beginners who do not wish to invest their time in learning the logistics of web site hosting;
- **Controlled use of resources:** the ability to control the use of resources, as billing is based on what the company has actually used. The possibility to predict and make adjustable monthly plans;
- **Licenses and updates:** no need for the company's IT&C department to be concerned with licensing and future updates relative to hard drives and software, as this activity enters the scope of service providers;
- **Remote access (Remote Access):** employees, business partners and clients can access and update information wherever they are;
- **Improved collaboration:** the software provided by means of CC can be used at any time, with almost any type of device

that has internet connection, which is an advantage that ensures better cooperation, especially for companies with employees in several locations;

- **Protection from disaster:** the company is able to store data securely in a data-center, allowing data to be restored as long as there is an internet connection without affecting their safety and integrity (redundancy and secure data backup);
- **Easy to implement as and manage:** CC service implementation is easy and requires no specialist training. It is much easier to manage;
- **Experienced suppliers:** the company benefits from high professional CC services;
- **Availability and response time:** in most cases, the CC providers ensure a very good response time. Qualified personnel ensure uninterrupted operation of the platform;
- **Economic advantage:** significant reduction in the time for market launching, high yield investments, capital costs (investment) conversion into operating costs;
- **14. Technological benefits:** the company benefits from virtualization and automation.

There are some concerns preventing companies to make the step towards cloud computing:

- **Security:** many companies are not comfortable with entrusting sensitive data to some public cloud sites, where they do not have total visibility and control;
- **Service quality:** as some CC services may not fully guarantee their levels in terms of operating performance and availability:
 - a) **Performance:** the solution may not achieve financial goals, the solution may not work in the context of organization culture; the solution might be hard to develop due to the difficulty of integrating services included in CC; sacrificing SLAs (Service Level Agreements) in favor of flexibility;
 - b) **Availability:** another important problem is when, for some reason or accidentally, the CC provider is forced to

stop their activity. It may be the case of delays or service interruption;

- **Compatibility:** the ability to integrate with the company's internal systems and adapt software-applications-as-a-service (SaaS) to company's business processes;
- **Confidentiality:** once companies place their data and applications in the cloud, they should be aware they are at risk that CC service providers can access these data and monitor any operation very easily;
- **Legality:** most times, it is impossible for companies to know exactly where the stored data are located and they are at risk of unintentional 'export/import'. What may be legal in one country may be illegal in another country where corporate data is located;
- **Loss of independence:** as in the case of outsourcing other services, some economic benefit is gained but a certain degree of freedom is lost since the control of computer resources is lost and the company becomes dependent on the service provider;
- **Computer identity:** the CC service provider must ensure absolute control of the company over its elements of identity - authentication and authorization of access;
- **The possibility of malicious attacks is intensified.**

4. Company accounting and cloud computing

Cloud accounting is a modern concept in computer processing of accounting data based on the concept of Cloud Computing [04], which represents a set of distributed computing services, applications, access to information and data storage without the user having to know the physical location and configuration of systems providing these services.

Traditional applications for financial accounting require many specific conditions, which makes them too difficult to manage and too expensive for small businesses. In order to work, they need servers, storage, networking, Internet bandwidth, storage capacity, etc. In addition to these requirements, it is also necessary to have a

team of experts to install and configure all these and then another couple of experts to maintain them.

Another problem common to many companies is related to data and business processes fragmentation, which leads to difficulties in their optimal activity. Due to fragmentation, IT&C systems require integration, i.e., an extra effort to get a centralized system for the analysis, reporting and monitoring of processes. Consequently, due to fragmentation and significant extra effort required, operational costs are also increased.

Most of the times, small and medium sized companies are unable to benefit from a performing ERP (Enterprise Resource Planning) due to high costs and keep using traditional software with insufficient functionality. A powerful software would be too expensive and too large an investment for this category of companies. However, the flexibility and low cost of cloud computing technology enables companies of all sizes to use the ERP technology much easier as a service utility.

With Cloud Computing technology, a company's accounting becomes much easier in that they can benefit from all advantages presented above: one can use a data centre where these applications are stored, there is no need to purchase infrastructure or software, everything is reduced to the existence of an Internet connection, the existence of a browser and payment of a monthly subscription, there are no hidden costs, and they are more scalable and elastic, benefiting from an increase in agility and reactivity, they are more flexible, more reliable, receive automatic upgrade, can get the latest technology with minimal costs and enjoy new features without any effort, can be accessed from anywhere as this runs entirely through the Internet, are easily implemented, managed, and customised, are integrated and can take advantage of their expertise.

With these technologies, accounting software is ready to meet more complex requirements and activities, greatly facilitating the activity of companies' financial-accounting departments. They can provide: the customised accounting monograph used by means of pre-defined formulas for different types of accounting

transactions and documents, the possibility to create conditional accounting rules useful in a variety of cases; the automatic generation of accounting notes for all types of operations and primary documents within accounting modules; the possibility to report costs and revenues on cost and profit centers; the automatic check up of the correlation between management and financial accounting on stock balances, clients, suppliers, stock circulation; the preparation of various periodical statements and synthetic reports as necessary; the preparation of accounting reports in equivalent accounting systems by defining alternative accounting plans with reference to various standards (IAS, IFRS, GAAP); the generation of the balance sheet and profit and loss account report as well as the possibility of defining various other indicators; the automatic check-up of the correlation between debit and credit cash flow and account balances in the balance sheet as well as stock circulation and primary documents in the other modules of the financial and accounting application.

As the cloud computing innovations focus on fast-paced and effective delivery of services to the business environment (and especially the financial accounting field), companies and service providers of management solutions (MSP) face radical changes in terms of information technology. Thus, most companies are moving towards a virtually private data centre (private cloud) in order to maximize application efficiency and reduce server downtime (the downtime). The main challenge faced by companies in this respect is the complexity of online applications, whose implementation demands a drastic simplification in order to maintain flexibility of IT&C.

The first step is the development of "private cloud" cores in the controlled framework of companies. These cores will then merge into a "private cloud", real-built and controlled by the company in question. Thus, data management is much easier to achieve, based on the flows already known and learned both managers and employees.

5. Conclusions

Companies' access to cloud computing applications is, first, lower costs, and second, a more efficient use of resources and their strict adaptation to current needs, with on-demand self-service access to a public pool of computing resources, in a measured and dynamically scaled manner. Cloud computing has generated a technological revolution for small businesses, offering access to a range of capabilities that only large companies can afford. By using Internet connections and browsers, small- and medium-sized companies can have access to high-level IT&C services. Given the current crisis, the Cloud Accounting option enables companies to cut costs dramatically and reduce acquisition costs relative to the infrastructure necessary to the use of an integrated system and make use of software as a service utility, minimizing the initial investment effort. Considering the potential of financial savings, this solution is ideal.

Outsourcing Company Accounting

Mihalache D. Arsenie-Samoil

"Alexandru Ioan Cuza" University of Iași, Doctoral School of Economics
arsenie_samoil@yahoo.com

Abstract

Taking into account both the development of information and communication technology and the effects of the current recession on global economy, outsourcing company services has been booming all over the world as it is regarded as a way to meet the strategic goals of cutting costs, improving the satisfaction of the clients' expectations, and of increasing company efficiency and effectiveness.

The paper aims at presenting the current issues of outsourcing accounting professional services and IT support of the company accounting. We have analysed aspects referring to the concept of outsourcing, outsourcing management, and BPO (i.e., Business Process Outsourcing). The advantages, disadvantages, and risks of outsourcing have been pointed out. In addition, the process of outsourcing financial – accounting as well as IT&C services in support of company accounting have analysed.

Key words: Outsourcing, BPO, Cloud Computing, IT & C Infrastructure

J.E.L. classification: M4, F3, H8, Q56, D8, G1, L8, C6, C8, D5, L6,

1. Introduction

Within the current economic context where the leitmotif of the companies surviving on the market has become cutting / optimising costs, an important solution, available to any company is outsourcing certain services connected to the company operations such as the IT&C, logistics, financial – accounting, legal, and human resources.

In their attempt to minimize costs and maximize profit, the companies' interest in outsourcing some of their services and even

functions has increased. Outsourcing means delegating some managerial tasks to third parties based on contracts. Although this approach has a series of potential advantages, it raises a series of specific problems detailed in this paper.

We are going to highlight some of the main arguments that answer the question why outsourcing services connected to the company operations an important solution in cutting / optimizing costs. The answer to this question would be as follows: because it helps to cutting personnel costs; it reduces administrative costs; it offers to the managers the opportunity to concentrate on their company's basic operations; it reduces risks connected to the correct application of all legal amendments, by receiving consultancy from the supplier who has more expertise in the field. Moreover, investments in software programmes (e.g. accounting, wages calculations, legislation, etc.) and their upgrading, as the supplier of such services is responsible for such investments and shares the costs thereof with other beneficiaries; a constant flexibility according to the client company requirements by compiling reports in the format agreed by the parties.

Large companies prefer to transfer these activities to some specialised companies because they have understood they can do such things for them more efficiently. In addition, by guaranteeing a high standard service under the SLA (Service Level Agreement), they are sure that things are going to happen according to their wish, as they only need to ask and wait for results according to the contract terms.

The expansion of the Internet network, the globalization of the economic environment, and the increases technical performance of the equipment have led to a progressive growth of the phenomenon of companies' outsourcing services.

As the new business model characteristic to global economy expands, more and more companies all over the world are compelled to seek outside their own company for highly qualified human resources. This is why most of the Western companies focused on companies specialised in providing services, in search for an ideal balance between high standard professional services and cost-efficient solutions.

Within the context of a crisis, this seems to be the solution for most companies, which want to provide the same quality services, but to reduce significantly their budget allotted to certain activity areas.

2. Outsourcing as a concept

Outsourcing is the delegation of some tasks or objectives to some organisational segments that belong to other entities, which offer a better quality price ratio or have expertise in specialized areas [15]. To outsource services means to delegate one or more activities within a business to an outside service supplier, who conducts and manages such activities based on some well-defined and measurable performance standards. In other words, outsourcing means to transfer an activity from within the company outside it. Such activity is to be conducted by another company specialised in such activity.

The IT & C literature [07] defines outsourcing as representing such practice by means of which companies contract centres that specialise in supplying IT services, within communication networks or software developers with a view to transfer a part / function of their own informational system. Another definition says that outsourcing is a strategy by means of which an organisation assigns major functions to outside suppliers, who specialise in certain fields and who thus become “valued business partners”.

However, outsourcing, whether it is off-shoring, near-shoring, or multi-sourcing, or crowd-sourcing etc., does not mean merely loan in the IT & C industry, but IT service outsourcing as well [16].

“Offshore” is another term used in the field and means to delegate an activity to a service supplier, who, from a geographical viewpoint, is located at a great distance from the company clients [16].

“Crowd-sourcing” is a more recent type of outsourcing, which promises further reduction of costs as well as of global economic changes over the last few decades due to outsourcing. Crowd-sourcing means carrying out a temporary collaboration between the company offering the problem and any agent offering a solution [16].

3. Outsourcing financial - accounting services

In Romania, Law no 82/1991 of 24 December 1991, the law of accounting – republished and updated [14], provides under item 10 (3) as follows: “Accounting can be organised and conducted based on accounting services contracts concluded between natural persons or legal entities, duly authorised, members of the Accounting Expertise and Authorised Accountants Corps in Romania. Furthermore, under item 10 (3¹) the text reads as follows: “In case of the persons under item 5 paragraph (1¹), accounting can be organised and conducted in compliance with the provisions of paragraphs (2) and (3) or based on contracts as per Civil Code with physical persons with high economic education, who will also be responsible the accounting services they conduct.” Considering the above, we can conclude that in Romania any company is allowed to outsource their financial – accounting function or certain accounting services to a third party.

Outsourcing the accounting function main mean to delegate the following activities: bookkeeping, financial reports to the fiscal authorities, managing payments (personnel, suppliers, etc); Cash management / treasury; Financial Management.

From among the major aspects that need to be taken into account when selecting an accounting services supplier, we mention the following: experience in bookkeeping of similar companies; the software such companies uses; flexibility; the contract with the supplier should provides clear terms with respect liability for possible errors or delays; if the supplier makes full payments of wages and contributions to the Budget, it should be registered with the National Authority for Surveillance of Personal Data Operators as an operator of such data.

Irrespective of their field of operations, all entrepreneurs asks themselves, which is the best way to control the activity in their company. A variant adopted more and more frequently is internal auditing. Partial or total outsourcing the internal auditing can be conducted with a view to obtaining a qualified opinion on the compliance with internal auditing international standards, as objectively and independently as possible.

One of the laws regulating auditing in Romania is Law No 672/2002, concerning internal public auditing, amended by OG No 37/2004 [13]. Pursuant to article 2 paragraph. (a) of this law, “internal public auditing is the functionally independent and objective activity that ensures and advises management as to a good administration of the public revenues and expenditures, improving the activities of the public entity. Moreover, it helps the public entity to meet its objectives by way of as systematic and methodical approach, which evaluates and improves the efficiency and effectiveness of the management system based on risk management, control and managerial processes.”

The audit standard “SAS 70” [10] presents the specific problems of outsourcing company auditing. It also represents a warranty for the fact that audit was conducted as to the objectives and activities of internal checking of the companies to which services are outsourced.

The outsourcing of the debts recovery service, the creditor will not be forced to invest in a collecting specialised department. Resorting to a specialised company, it will benefit from the collection services against a set cost most often representing a commission of the amount collected.

We can therefore conclude that outsourcing financial - accounting professional services is an increasingly adopted solution especially due to reasons of reducing financial costs.

4. Outsourcing IT & C services

Outsourcing IT & C services consists mainly in three types of activities [15]:

- IT Management services such as operationalisation of infrastructure services (operating systems, system administration and security, surveillance

of cost efficiency, configuration management, technology management, etc), software management and help-desk-type services management;

- Applied Management Services, AMS: they concern outsourcing development and implementation support services for hardware, applications, CRM (Custom Relationship Management), and business infrastructure (some for the development of applications and middleware, software for data management, data storing, for systems and networks);
- Business Process Outsourcing. These services imply full outsourcing of a process of the company involved.

The main forms of IT outsourcing are[9]:

- ASP (Application Service Providers) – suppliers of IT services: represent renting applied software services. Besides ASP, other variants of this IT outsourcing have emerged, such as: ISV (Independent Software Vendors) – individual software developers, HSP (Hosting Service Providers) – suppliers of hosting services, FSP - Full-Service Providers – full-service suppliers, BSP – Business Service Providers – business services suppliers, IAHP (Internet Application Hosting Providers) – suppliers that host Internet applications;
- HelpDesk: technical support services offered to users in solving the problems encountered in the exploitation of software applications or desk equipment.
- CRM (Custom Relationship Management) aims at finding technological solutions that allow to consolidate communication between the company and its clients with a view to improving the company relationships with its clientele by offering various automated components of such relationships;
- SCM (Supply Chain Management) – refers to a series of instruments and methods that aim at improving and automating supply by cutting costs and delivery terms;
- WEB Hosting: the IT departments of organisations cannot deal by themselves with the operations necessary to an

efficient administration of the website content;

- Network security: under the circumstances of the development of new applications such as Internet, extranet, and electronic commerce, a special attention needs to be paid to network security;
- Software technical support: whenever organisations face problems with using software, they can resort to a professional support service from the software developer companies or from those specialised in various IT & C segments;
- WEB Services: a web service means the logical module of an application that can be posted, located, or accessed on the web, irrespective of the operation system or type of hardware used, a simpler and cheaper one that it has been possible so far. By using this kind of IT outsourcing, the older applications in a company can interact by means of standard protocols.

Everything related to collecting, processing and storing accounting data implies, on one hand, the existence of an IT & C infrastructure, of some platforms that allow the development of the appropriate software. On the other hand, it also implies their security. This is why this field becomes the outstanding candidate for outsourcing IT & C services. The development of the Internet and cloud-computing enabled the accounting practices to externalize their IT & C and software services.

e-Outsourcing defines renting some IT & C products and services – from the source or a wide range of sources on the Internet – which can be adapted to the needs of the company. For instance, a company can resort to a web-hosting provider services to build and maintain its website, to a software supplier for its front office (CRM) and back office (ERP) applications, or to a security company to install and administer a firewall or a virtual private network (VPN).

Cloud computing [11] in a modern concept of computing and IT, representing an body of computing services, applications, access to data and data storing, without the necessity that the user knows the location and physical configuration of the systems providing such services. Cloud computing solutions allow cost reduction as the

applications,, technologies, and data are available on a virtual server, removing thus investments in the purchase of hardware and its maintenance. Moreover, payment is made based on subscription depending on the level of usage of the purchased software. As a rule, costs decrease by 30-40% as compared to the usual variant, where software is purchased for a long term. Complementary, cloud computing provides three categories of services: IaaS (Infrastructure as a Service), the primary level of cloud-type services, where the user accesses a series of virtualised hardware resources; PaaS (Platform as a Service), the intermediate level, where the user accesses a series of hardware and software resources automatically administered and on which the business's own solutions are developed; and SaaS (Software as a Service), the higher level, where the user only consumes the resources (applications), having no relationships with the administration thereof.

To conclude, companies increasingly focus on IT & C outsourcing solutions in order to cope with some tasks they could not carry out on their own or they could carry out at much higher costs. The difference between merely "contracting" some resources and outsourcing relies in the fact that the latter implies a more efficient restructuring of some fields related to the company's operations, by using external partnerships with suppliers who have the required competences.

5. Advantages, disadvantages and risks of outsourcing

Some of the aspects that make adopting outsourcing an attractive business strategy are highlighted below [08], [05]:

- Reducing associated costs by certain accounting or IT & C services (supplier versus employee). The savings to the company budget comes from the lower need for employees (i.e. savings in terms of money, time, and infrastructure). The company does no longer carry the burden of responsibilities and problems related to their own human resources (e.g. fewer wages, less infrastructure, less administrative effort). These responsibilities are transferred to the supplier and consequently budget funds

are freed and the contracting company has the opportunity to expand without having to use physical resources and related costs therewith;

- Professional accounting and IT & C solutions via access to expert services and skills. Most often, the personnel of “outsourcing” companies is made up of accountant professionally dedicated to a specialised field where the contracting company has no expertise. Moreover, the outsourcing companies have advanced technologies or software kits that they own exclusively and that can bring along immediate improvements to outdated accounting software;
- The lever effect (quality / price ratio) is very good. Suppliers have the position to carry out the so-called “stair economy” (as they have large volumes of customers, they reduce costs per customer unit by distributing fixed costs to a large quantity). This advantage derives from the fact that such companies have built their business model around a base service that can be applied to interested companies at reduced costs and more efficiently than such companies would try to introduce these services on their own;
- Companies focusing on functions that represent the core of a business competences (e.g., functions specific to the operations) Another advantage of third party contracts that can lead to an increased efficiency and productivity, is freeing workforce from certain accounting routines (for instance, primary bookkeeping, calculating and transferring wage-related tax) or IT & C services, repetitive procedures that do not represent the best use of qualified personnel and the companies’ focusing on more valuable and profitable functions, which will have a sizeable contribution to in their success (e.g., production, marketing, budget planning);
- Temporary assistance. Whenever accounting activities are intensive, outsourcing companies may respond with appropriate solutions to the temporary demand of personnel. This strategy avoids training costs for new employees and the risk of overloading the

company’s own employees thus increasing the risk for them to leave the company at some point in the future;

- Security, by accessing a higher risk management. It has been established that whenever an external supplier is addressed companies become much more flexible and thus able to cope with the transformations imposed by the market economy. There are two reasons that lower the risk that an investment is unlikely to be profitable: the outsourcer’s expertise and the fact that one can easily give up the project.

Herein below, we outline some of the factors determining a company to be more reluctant to accepting to outsource its financial – accounting and IT & C services [08], [05]:

- Data confidentiality. The supplier should offer warranty with respect to the security of the client’s data and prevention of unauthorised data transfer. The supplier should demonstrate that its own internal control mechanisms are functional and that clients’ data are kept safe from potential intruders’ “curiosity”;
- Conflict of interests (Sarbanes-Oxley Law). In the United States, the “Chinese wall” refers to the internal procedure adopted by the external auditing companies whereby information from a client by a member is prevented from being known by another member who works on a project for a competitive company;
- Dependence on the external supplier (fear of losing control over the processes, insecurity of service quality, hidden costs, doubtful performance, inadequate planning). Dilution of the control over the outsourced functions and sometimes the delayed or poor-quality answers.
- Loss of important competence representing the know-how or expertise to do something. This risk manifests when an outsourced activity which is really strategic is deemed peripheral;
- The risk of losing the competitive advantages. The access of a third party to data on clients, investing policies, marketing policies, etc., can lead to loss of competitive advantages;

The transfer most often implies making redundant trained personnel for whom the company has invested important resources.

6. Conclusions

Internet network expansion, the globalisation of the economic environment, and increasingly high performance of technical equipment have led to a progressive growth of outsourcing services related to the companies' operations. In order to be able to survive on the market, companies should adapt to the on-going development of IT technology and to regard the information system as a support to the business, which could ensure uninterrupted operations.

Moreover, outsourcing services related to the company operations can be an extremely safe way of reducing costs and improving efficiency, owing mainly to the access to specialised workforce and to resources that could not be used by means of the company's own management. In addition, the decision to outsource should be very well planned, as the supplier who would conduct these outsourced services should thoroughly understand the process and the procedures to be applied to the client's company. The legal and personnel related issues are of major importance as well. The managerial team should continue to be in control and outsourcing should not be used as an excuse for the company's failure to meet the objectives set.

Strategies relying on competence and outsourcing may allow for the increase of the revenue, lowering risk, a greater flexibility and a wider capacity to respond to the requirements of the environment. Hence, applying the outsourcing strategy means cutting costs and increasing performance by focusing on the activity conducted and enhancing the company's flexibility.

Consideration Concerning Country Rating in Romania

Mihalcea Lucean

"Dunarea de Jos" University of Galati,
Faculty of Economics and Business Administration
lucean.mihalcea@ugal.ro

Abstract

Country risk approach, although not new, is in the foreground investor's concerns whenever a crisis affecting the solvency of a country or a group of countries and endangers the claims directly owned on that state, national company or other entity.

The rating agencies are the main, but the most objective source of information for investors and governments. The major rating agencies are Standard & Poor's, Fitch-IBCA and Moody's.

In this paper we propose to do an analysis of Romania's country rating presenting the current situation in the country, compared with the international one and of the proposed solutions to improve the rating in Romania.

Key words: country risk, crisis, solvency, rating

J.E.L. classification: M10

1. Introduction

Credit rating agencies have first appeared in the U.S. The first company that was launched in the ratings business was The Mercantile Agency, appeared in 1841 in New York. The first office outside North America was opened in 1857, in London. In 1859, The Mercantile Agency was transferred to the ownership of Robert Graham Dun, and also changing the name of the RG Dun & Company.

Since 1849 began to emerge and competing companies; in that year was launched The John M. Bradstreet Company in Cincinnati, the first textbook published in 1857 called The Bradstreet Rating Book.

In 1933, under the pressure of economic circumstances, the two companies merged, the new agency called the Dun & Bradstreet.

Also in 1900, John Moody founded the company Moody's Investors Service, Moody's has also produced the Manual of Industrial and Miscellaneous Securities.

In 1909 Moody issued for the first time securities ratings in Moody's Analysis Of The Railroad Investments. In this paper, the author first used the classification of Aaa to C to assess about 1.500 individual securities issued by over 200 companies.

Rating is a word whose literal translation means "evaluation", referring to both a process (risk analysis) and its final result (note).

Features that characterize credit ratings:

- supervision of foreign financial interests of companies and national states, providing information relevant and value of international understanding;
- alternative to traditional services offered by financial evaluation and analysis of commercial banks and specialized financial institutions (especially banks and bank trade business).

Country risk approach [1], although not new, is in the foreground investor's concerns whenever a crisis affecting the solvency of a country or a group of countries and endangers the claims directly owned on that state, national company or other entity.

In recent years, concerns have focused mostly South America (especially Mexico), and after the 1997 Southeast Asian countries and Central and Eastern Europe, and in 2001 Argentina knew the worst crisis in its history.

Country rating has taken an unprecedented scale: in 1981, Standard & Poor's does not note than fourteen countries, and in 1999 marking referred to about eighty. Thomson

Financial Bankwatch noted in 1999 of 94 sovereign issuers.

Most of the notes in the 80s reflected high credit quality (AAA and AA) today, the range is very wide: from AAA to CCC.

In 1999, speculative grades (BB category) constitute about one third of the sovereign notes given, while in 1990 only speculative note was assigned to Venezuela.

Credit rating agencies have returned to the forefront of the global economy amid recent announcements of decisions and their role being challenged again by many economists.

The topical issue is the rating of the country of Greece, which was reduced in July this year in the CCC by Fitch, which involves a substantial risk of default entry, while all agencies have threatened U.S. to decrease AAA rating (highest possible) because of bickering between Congress and the Presidency on raising debt ceiling.

2. Country rating in Romania

Country risk assessment and analysis are useful in substantiating of the decisions which transnational corporations and other generators of foreign investment are taking in investment.

Each agency has its own country risk quantification. The evaluation shall take into account economic, political and social factors. Country risk analysis requires an assessment of the premises underlying the changes in internal or external environment. Without full knowledge of economic and political situation from the host country it can not be predicted what will be the reacting of this country to sudden changes in the economy have occurred worldwide.

In Romania, access to international financial markets has opened new opportunities for financing: either by issuing Eurobonds, either by syndicated loans.

National Bank of Romania intervened in the international capital markets in order to:

- strength the foreign reserves of Romania;
- to meet the conditions in agreements with the IMF on a certain level of international reserves of the country.

National Bank of Romania asked the international rating agencies assess credit risk in order to obtain loans from international markets.

In 1996, the National Bank for the first rating the assessment of the cost of foreign loans that were to be employed. Sovereign rated rating by Fitch in 1996 was BB-.

Table no. 1: Ratings for Romania established by Fitch

Data	Rating/ valute			Rating/currency	
	Long term	Short term	Perspective	Long term	Perspective
2 Feb 2010	BB+	B	Stable	BB-	Stable

3. Romania's situation

Romania, for that matter, all countries in the world can not overcome the financial crisis without business development. [2]

In 2011 growth is expected to shy in Romania, of 1,5% and better growth from 2012 to 2013.

Only in 2013-2014 will return to 2008 levels.

Romania is not in a desperate situation, but is dependent on external aid.

According to estimates, inflation will be 5,2% in 2011, over NBR target, as a consequence of increasing the VAT rate.

Unemployment will increase, due to continued reform of the state apparatus and budget staff redundancies.

Have increased both imports and exports and trade balance increased in 2010 and 2011 compared to 2009.

External debt has doubled in the last three years, from 44% to 80,8%.

Currency reserves remain at a sustainable level.

Current account deficit exceeds 5 billion euros, up 25% from 2009.

He reached the bottom of the crisis, but there is not a very powerful engine for growth resumption.

Table no. 2 Situation of the country's recent international rating

Last modification of country rating		
Country	Previous evaluation 2010	New evaluation 2011
Bahrein	A3	A4
Cipru	A2	A3
Egipt	B	B
Japonia	A1	A1
Libia	C	D
Portugalia	A3	A4
Marea Britanie	A3	A3
Siria	C	C
Tunisia	A4	A4
Vietnam	B	C

4. Solutions to improve rating

Standard & Poor's recommends to Romania to maintain reforms and the budget deficit under control in order to increase ratings.

Chance to improve credit rating is good news for Romania in an international context [3] in which debts and deficits have become a sensitive issue, since the sovereign debt crisis broke out in Europe.

If the Government maintains the pace of structural reforms which he initiated and if it will strengthen a history of prudent fiscal policy and maintain financial sector stability, it could increase the rating.

Romania's rating is currently BB + with stable outlook. Last change was to improve the rating outlook from "negative" to "stable" in March 2010.

Following the financial crisis, has fallen sharply in October 27, 2008, Romania's rating from BBB to BB + with negative outlook, thus turning the territory of Romania in the so-called speculative investments.

Everything below BBB- are speculative investments.

Any change in rating would mean two steps together, because usually before the improving of the rating it changes the perspective, in this case from stable to positive.

Standard & Poor's expects growth of 1,5% this year.

Recently, S & P made a historic step in the history of the agency for 70 years, and decided to review the rating in down U.S. perspective, to negative, the decision stood being too high deficit and debt and the inability of politicians to solve this problem. This is the first alteration of the agency's establishment in 1941, the United States during this period with maximum grade "AAA" with stable outlook.

U.S. public debt almost as large as GDP and a deficit of 10% and the change of the rating outlook means that the U.S. could be reduced over the next two years.

Some countries in Central and Eastern Europe are, in debt and deficits, in better shape than some eurozone members, so that ratings are not aligned with the economic situation and progress. Erste Group analysts predicted that Romania's ratings might be higher in 2012 if reforms continue and fiscal targets are met.

In the spring of 2010 S & P decision to improve long-term perspective of Romania's ratings from "negative" from "stable", saying the decision made by budgetary reforms and

the prospect of continuing the agreement with IMF.

Stable outlook reflects S & P's view that the Government will continue to consolidate public finances in line with specific targets, new preventive agreement with the IMF fiscal slippage minimizing risk before 2012.

In addition, S & P believes that structural reforms undertaken so far should help to rebalance the economy to allow a relatively solid growth medium. Analysts warn, however, that the credit rating agency ratings could come under pressure if the government will continue structural reforms and fiscal consolidation.

The authorities have made steady progress in reducing the budget deficit, which rose to 8,5% of GDP in 2009. It is estimated that the deficit fell to 6,6% of GDP in 2010 due to increased VAT and drastic reductions in public sector and social spending. However, the political system remains fragile. There may be policy reversals or slippage due to political tensions or decrease the government's commitment to reform before elections in 2012.

Moody's believes that Romania needs structural reforms and more efficient state-owned companies.

Romania's main problems are the inability to access European funds for investment projects, inefficient energy sector, transport and labor market and pressures on public finances, due mainly to a narrow tax base, the rising costs of health and poor performance of state companies.

Although some exceptional circumstances (such as strong growth of the internal market of credit because of international conditions easy) that led to a boom of growth in the last decade will not come back, Moody's expects that trade integration, investment and institutional Romania Europe to support growth and to allow income to continue their convergence with the richer countries. However, to fully take advantage of the opportunity of commercial and industrial ties with the EU, the government will have to implement structural reforms and improve the performance of state companies, while maintaining fiscal prudence adopted following the global crisis.

Although Romania's public debt is low compared with levels in other countries [4] in the region and promote agreements with the

IMF and the EU economic policy in a positive direction for growth and credit rating, internal political events on stage may limit the speed and depth reforms.

The government has faced in the first half of 2011 with the opposition of Parliament to reform the labor market. The burden of austerity and already divided political system could slow the introduction of new tax changes such as widening of tax base, reducing health costs and increase efficiency of state companies.

Romania's rating would be improved as a result of recent budgetary measures signals that lead to a significant reduction in fiscal deficit, and fiscal prudence can be maintained over the medium term. Rationalization measures in health costs, improve business performance and strengthen of state capacity to absorb European funds would also be good for ratings.

Ratings may be changed in a negative way if the program would suffer a reversal of fiscal consolidation, structural reforms combined with stagnation.

Moody's assigns credit rating Romania "Baa3" with stable outlook.

5. Conclusions

Country risk analysis requires an assessment of the premises underlying the changes in internal or external environment. Without full knowledge of economic and political situation from the host country it can not be predicted which will be the reacting of the economy of this country to sudden changes which have occurred worldwide.

Country risk assessment and analysis are useful in substantiating the decisions the transnational corporations and other generators of foreign investment are taking in investment sphere.

Country risk analysis is important and necessary on the grounds that for a rating agency to rate a public or private institution should be the country in which they operate are, in turn, note. Therefore, it is never attributed to national entities a note higher than the country of origin.

Each agency has its own country risk quantification. The evaluation shall take into account economic, political and social.

Country rating B indicates a weak financial situation, with potential for improvement, but with a risk of default (failure to pay debts) above average.

Romania's rating could be raised in fiscal 2012 if reforms continue, Erste analysts expected, pointing out that for some countries in Central and Eastern Europe, marks are not aligned with the economic situation and developments in the financial situation.

The result of country risk assessment is the main indicator that decides whether the country is favorable for implementing a business.

Turkey and the Lessons of 2001 and 2009 Crisis

Mihăilescu Mariana

Abstract

The current economic crisis proved to be a real test of maturity for emerging countries. While most developed countries facing debt crisis, review their position on economic liberalism, emerging countries are becoming more concerned to accelerate the development process ment to reduce the gap separating them from the developed world.

Turkey successfully fall into this category of countries.

This paper aims at highlighting the main elements that contributed to Turkey's current affirmation and guidelines to the future of this country, considered today an economic model to follow.

Key words: global crisis, emerging countries, Turkey's EU accession

J.E.L classification: O 52

1. Introduction

Although the current economic crisis is global in nature, a number of countries have coped with the shock much better than others, contributing substantially to the dynamics of global economy. It is emerging countries that have succeeded through effective economic policies to achieve high growth rates. So the key element that contributed to distancing and highlighting emerging group of countries among developing countries is the sustained economic growth recorded during the global financial and economic crisis.

Some analysts include in the group of eight emerging countries (India, China, Russian Federation, Brazil, South Africa, Indonesia, Mexico and Turkey), others refer to nine (including South Korea in that group),

others only five (BRICS group). Differences are in the indicators they consider.

The fact is that these countries have experienced during the crisis prudence to foreign aid, relying on their own policies and the exploitation of potential domestic crisis. Confirmation of their efforts is reflected in analysis and statistics compiled by international and regional organizations (UN, WTO, IMF, OECD, European Commission) in which you can see the differences in terms of economic growth rates recorded by the developed countries and developing and emerging ones. For example, the report prepared by the IMF World Economic Outlook published in September 2011 and provided estimates an overall increase of 4.0% in 2011 (down by 0.3 percentage points from its projections in July 2011, because of the risks surrounding Today's world economy), to which developed countries will contribute only with 1.6% and developing countries and emerging group by 6.4%. Also, forecasts for 2012 remain the same trend (4.0% global growth, for developed countries only 1.9%, while developing and emerging countries 6.1%).

2. Turkey's economic success

One group of countries included in the European emerging countries is Turkey. Because of important geostrategic position, Turkey is a historical crossroads, the homeland and battlefield of many civilizations and a large shopping mall. Eurasian country with a position that is of particular importance, Turkey has some advantages and very high surface 780,580 square kilometers, and the human potential available, about 72 million inhabitants. Turkey is a democratic republic, secular, constitutional, with old cultural and historical

heritage. Considered a regional economic power and a bridge between Europe, Asia and the Middle East, she is a member of several organizations such as the Council of Europe, NATO, OECD, OSCE, G20. Preparing for decades for entry into the European Union, the country has registered a remarkable growth since 1990 (4.4% being the average rate of growth in the period 1992-2006), with a number of gaps (in 1991, 1999, 2001 and most recently in 2009), generated mainly by the banking system weakness, severe deficit of trade balance, the recent turmoil on the world market, or sharp decline in external demand. Each time however, economic growth was resumed.

Generally, Turkey has forged a competitive economy based on soil and subsoil resources, on foreign investment, a policy to stimulate domestic private investment. Using the country's geopolitical and geostrategic position in contact with the Middle East and Europe ex-Soviet countries, Turkey has established links with many countries.

Over time the economy experienced significant structural changes: the share of industry increased from 25.2% to 29% of GDP, services 45% to 58.5% of GDP and the share of agriculture declined from 29, 1% of GDP to 11.7 [1].

In 2001, Turkey faced a deep crisis that has brought many banks go bankrupt and unemployment is still high. This has forced their government to take drastic measures and reform the country's banking system. There were reduced public spendings, banks were put under control and the entire banking system. Also the, loan worth U.S. \$ 10.4 billion made available by the IMF country has allowed Turkey to get out of severe economic crisis caused by banking difficulties.

Experienced with the 2001 crisis, Turkish economy has proven far more resilient to external shocks, so that after a severe contraction in GDP in 2009, with 4.8% economy recovered in 2010 the European Commission indicating an advance of 8.9%. The fact that in the last decade, the government strengthened their banking system helped Turkey to face the new crisis better than other European countries. In other words, Turkey has turned to a more severe state control over the economy, which is now

the largest creditor country. For 2011 and 2012, the European Commission forecast economic growth of 6.1% and 5.5% (table no. 1). Optimistic forecast of the European Commission based on the fact that several EU countries have revived the economy, members of this group is the main commercial partner of the country. Yet dangers remain on the economy of this country: the persistence of high public debt, a high level of inflation and unemployment, with negative effects on attracting foreign investment. Also, strong earthquake in October 2011 will have negative economic consequences on economic activity in this country.

According to statistical data of UNCTAD [5], foreign direct investment flows to Turkey have experienced a downward trend. Thus, in 2007 their value was 22.047 billion dollars, in 2008 they amounted to \$ 19.504 billion, while in 2009 only to be \$ 8,411,000,000. In 2010, these flows picked up slightly, their value amounting to the 9071 billion dollars, much below levels in previous years of the crisis. To attract foreign investors, since 2009 the government abolished the minimum capital requirements for starting a business. Also, the share of foreign capital participation is permitted up to 100%, except in areas where the share of foreign equity participation limited to: 20% for television, 49% for aviation, telecommunications and shipping.

The main areas where foreign companies have invested in Turkey: the service sector (banking and insurance) - 54.8%, manufacturing (energy, automotive, pharmaceutical industry) - 40.9%, agriculture - 2.4%, mining and quarrying - 1.8%. An average gross salary of about \$ 750, but the possibility of repatriation of profits have been one of the most attractive elements for many transnational companies located in this country: Cisco, Microsoft, Vodafone, Motorola, Exxon Mobile, General Electric, Ford Motor Co., Daimler Chrysler, Novartis, Pfizer and others. a.

In 2011, domestic consumption and investment in the economy is mainly responsible for economic growth this year, according to European Commission experts. Granting tax incentives for consumers to increase their purchasing power is the main measure taken by the crisis.

Investment in technology is a priority of the government of this country. In addition, the percentage of 1% of GDP R & D will increase from 2% in 2012. If in 2002 the most significant budget allocations returned by tradition, to the army, now it has reached the fourth and most important money goes to education.

Growth of this country is largely due to the fact that many young people live in Turkey. Approximately 70 million inhabitants of the country are under 30 years, which gives confidence in the continued growth of the country.

Negotiations for Turkey's European Union began as early as 2005 [5], but the process slowed down due to opposition from some Member States, lack of reforms and the problems it has with Cyprus.

Turkey has long been associated with European integration. European Economic Community signed in 1963 an Association Agreement (Ankara Agreement) which provided for the gradual establishment of a customs union. This agreement has added an additional protocol, signed in 1970. Since Turkey has not implemented this protocol in relations with the Republic of Cyprus, which it does not recognize, the EU Council decided in 2006 not to open eight chapters of negotiations relevant and not temporarily close any other chapter, as long as Turkey will not meet their commitment. The eight chapters are: free movement of goods, right of establishment and freedom to provide services, financial services, agriculture and rural development, fisheries, transport policy, customs union and external relations. Accession negotiations were reopened in 2007 for another four chapters (Enterprise and Industry, financial control and statistics; trans-European networks, consumer and health protection), and in 2008 the EU Council adopted a new Accession Partnership and opened negotiations for other two chapters (intellectual property and company law). On 30 June 2010 there opened negotiations for a new chapter - Food safety, veterinary and phytosanitary policy.

So far, Turkey has implemented significant reforms on human rights, abolished death punishment, gave the Kurdish minority cultural rights, has advanced in resolving any disputes with Cyprus. However, due to religious and

cultural differences in relations with Europe, Turkey faces a strong opposition from the governments of France, Germany, Austria, Greece, Cyprus and Slovenia.

A step forward in the country's accession to the European Union is the successful referendum in autumn 2010, in which Turkish voters were in favor of revising the Constitution, limiting the prerogatives of the judiciary and the army. According to officials of that country, the new Constitution will be very close to Turkey by European countries in many respects, from the collection of fees and taxes to justice, rights of employees, up to the military role in society.

EU is the most important trade partner of Turkey. In 2010 it exported to EU products worth 42.0 billion euro from the EU and imported products worth 61.1 billion euro [7]. However, 88% of foreign direct investment made in Turkey are from EU countries. And for this group, Turkey is an important trading partner (5th export, accounting for 4.5% of EU exports to third place in 2010 and 7 to import, accounting for 2.8% of EU imports to third parties). However, the 2010 European Parliament report on trade and economic relations with Turkey, stated that the customs union created between the two parties is not completely uniform, Turkey not observing customs union provisions.

Turkey has demonstrated skill, so far, it has greater role in the international arena. Political, economic and cultural reference in the current international system, the country has a well defined identity, which can not be ignored.

3. Conclusions

The collapse of the financial system in the United States in 2008 led to a recession that has hit both the developed and developing economies, significantly reducing overall economic growth. However, emerging markets were more skillful in fighting the economic crisis, some of them continuing to grow almost at the same pace. The current economic crisis proved to be a true test of maturity for these countries. While most developed countries facing debt crisis, review their position on economic liberalism, emerging countries are becoming more concerned to accelerate the development

process intended to reduce the gap separating them from the developed world.

Turkey successfully fall into this category of countries, and whether it will continue to apply the same economic policies as effective in recent years, it will be able to achieve its objectives and will be an economic model to be followed by other nations.

Good Practices for Quality Assurance in Romanian Higher Education

Militaru Cezar

"Dimitrie Cantemir" Christian University of Bucharest
caesarmil@yahoo.com

Pavel Adina

Bucharest Academy of Economic Studies,
Institute for Doctoral Studies - Business Administration
adyna_pavel@yahoo.com

Abstract

Quality in higher education is a multi-dimensional, multilevel and dynamic concept that relates to the contextual settings of an educational model, to the institutional mission and objectives, as well as to specific standards within a given system, institution, program or discipline.

Quality education is given by an innovative transformation, always seeking to diversify school functions in order to develop it as a resource center for students, parents, organizations and for other members of the community. The pace and dynamism of development can arise from education which has the means and the strength to train and educate mobile and active generations, well intellectually endowed, able to overcome the inertia of social and economic environment, strongly influenced by the contemporary world trends.

Key words: quality assurance, higher education, accreditation, improvement

J.E.L classification: I 21,I 23,I 25, A 23

1. Introduction

The existence of a quality management system in Romanian higher education is based on a model (standard) which plays the role of a reference system or a system of criteria for external evaluation (quality assurance function) and a guide for the internal organization (quality management function).

Like many former socialist countries, post-communist Romania has experienced a period of strong expansion of university education offers. The number of higher

education organizations has been growing. The demand for higher education programs was very high in the first decade after the revolution, causing entrepreneurs to provide diversified services to an expanding market (alternative forms of education have emerged, such as distance learning).

2. Paper content

In the current period, Romanian higher education institutions relate to several types of existing models in the academic environment. These patterns can be grouped into "loose" models, unstructured, and models with and specific and structured requirements:

- "Loose" models, based on college visits (groups of teachers from other Universities) followed by recommendations for improvement. There are many ways to disseminate "good practices" rather than quality assurance standards. These visits may or may not be preceded by a report of self evaluation. It aims to improve the quality of services offered by the university on the basis of benchmarking techniques.
- Structured models that imply a higher degree of rigor in the approach of quality issue and therefore, despite being required by the authorities and widely applied in the socio-economic environment are not fully accepted by universities.

The most common and widespread of such models are:

- models based on internal evaluation;
- models developed for specific areas of education (e.g. EQUIS* system and
- EQUAL model for management schools);

- models for excellence awards (e.g. EFQM European excellence model);
- models based on the application of TQM principles;
- standard models with minimum mandatory requirements (e.g. ARACIS standards for the authorization and accreditation of universities, domains and study programs, models based on the criteria of ISO 9000 series standards).

Excepting compulsory authorization and accreditation criteria specified by the legislation in the education field and ARACIS standards and methodology, the decision for a particular reference model is a decision that belongs to the institution. It is based on the objectives which have been established by the institution, from the national regulations and the experience available in this area. A gradual approach, on the degrees of maturity, is a decent option in this situation.

Universal models applied in education for quality assurance are based on the assessment method (shown in PHARE Multicountry project in the field of quality assurance in higher education). This is a very simple principle, consisting on systematic evaluation cycles, followed by corrective actions.

In higher education the situation is slightly different from the pre-university education due to the level of studies and the qualification of teachers which are or tend to the maximum. Therefore it is considered that one can not objectively identify a court more qualified to perform the evaluation than the University itself. For this reason, the assessment is "*peer to peer*" type (the term is used also for computer networks without servers, to express the horizontal relationship of the parties involved). Therefore, the evaluation model is based on an internal evaluation process (self-evaluation) conducted by a team from the evaluated institution. This process includes massive consultations of the academic community (including students), through a system of surveys and statistical processing and ends with a self-assessment report.

Its purpose is to analyze all aspects affecting the quality of the institution. The issues which must be mandatory analyzed are contained in a "checklist" of chapters promoted by national or international organizations, various excellence awards

promoted by international associations, etc. A documented analysis ("based on facts") is made for each aspect, highlighting the strengths and weaknesses (SWOT analysis) and concrete solutions for improvement are proposed where possible (but mandatory for negative issues)

The self-evaluation report is checked by an independent external panel (Peer Review Group - PRG). Peer review includes:

- the study of self-evaluation report;
- on-the-spot visit and verification of the report accuracy;
- the preparation of final evaluation report.

The evaluation reports are official documents and represent highly efficient tools for the improvement process in the institution, but at the same time ministry official tools to know the reality on the territory, taking any measures to support or even to constraint.

Quality assurance is a concept introduced in Romanian higher education by GEO no. 75/2005 and then enacted by Law no. 87/2006.

The existing legislative framework refers to two major objectives of quality assurance: control and quality improvement. On the other hand, the law refers both to the freedom of the educational institution to select and apply the relevant measures and standards and to the need for each organization to comply with a predefined set of minimum relevant standards for a particular set of criteria.

In this sense we have two opposite philosophies of quality assurance: one in which quality is related to their institutional objectives (fitness for purpose) and another in which quality is related to a predetermined and universal set of standards (standardization). On the other hand, the first philosophy is oriented rather to external assessment/audit, based on the development of recommendations for quality improvement, while the second one is oriented rather towards external control and accreditation. The second philosophy is more prescriptive, thus more coercive. Although in the law preamble both orientations are mentioned, Romanian system of quality assurance fits with the second philosophy. Moreover, in case of comprehensive universities the standards are universal,

practically operating with a single reference class for all universities. The differentiation is only vertically, by the extent to which universities achieve benchmarks on various criteria set out in national legislation.

The problem identified since the early '93 was the safeguarding of consumer interests. The State must assume the role of consumer protection, so the National Council for Academic Evaluation and Accreditation was founded. Its role was the accreditation of universities and to impose a minimum quality control. Quality Assurance Law no. 87 of 2006 introduced a series of legislative changes through which the concept of quality has become endogenous, undertaken by higher education organizations and not imposed from outside. The law speaks of quality culture, of responsibility of educational institutions in ensuring quality, etc. The introduction of internal quality assurance, reflected in the creation of the commissions for assessment and quality assurance was a fundamental initiative. Also, another important step towards quality assurance was the creation of a register of experts for external evaluation based on peer-review.

Quantitative data collected this year seem to suggest that these innovations of Law no. 87/2006 have been internalized and assumed by teachers. Thus, their majority opinion (52%) is the university or college should be the main decision maker in quality assurance (the assumption of quality responsibility at the organizational level), while a rate of 48% indicates that the ministry and central agencies are responsible for this process.

At the same time, the teachers think the most efficient way to assess the quality of the study programs is "based on national performance indicators" (41%), but also on "the opinions of those involved in university life"(26%). These figures suggest the internalization of the unitary system of indicators and standards, and also the peer-review principle. On the other hand, the majority of the responses on what are the most important criteria for quality assessment are grouped by input indicators: human resources, content of courses, material resources.

We can say that in the representations of the teachers, new concepts of quality assurance begin to take shape and the changing process is evolving. However, the potential for social change of the current legal framework (law and methodology for evaluation) seems to be exhausted. Although the institutionalization of this model certainly has beneficial effects outlined above, in the current stage of higher education development it begins to produce unintended effects, some of them dysfunctional in relation to the objectives of quality assurance. Therefore one of the major problems nowadays is to set up a design of quality assurance institutions to prevent the occurrence of such effects.

In addition to quality assurance model imposed by the relevant legislation in Romania, by the Ministry of Education and by the Romanian Agency for Quality Assurance in Higher Education (ARACIS), Romanian universities can implement successful models for educational services improvement, either using its own forces or by European programs.

One of these models is the EQUIS system (European Quality Improvement System). EQUIS is the European Foundation for Management Development's (EFMD) international system of quality assessment, improvement, and accreditation of higher education institutions in management and business administration. EQUIS was created in 1997 by a mandate of the EFMD's member business schools with the active support of a number of the top schools in Europe.

Some of the major objectives of EQUIS are:

- the system ensures the stakeholders that higher education institution provides a clearly defined set of quality standards;
- it supports higher education institutions to improve their activity through a process of self-assessment to highlight both strengths and weaknesses of the institution;
- building a benchmarking system to enable the comparison of different institutions.

EQUIS is a system of evaluation / accreditation for the entire institution, pursuing continuous improvement as the main dimension. EQUIS has never attempted to adopt the role of national accreditation

systems that are already able to detect quality at the domestic level. From its inception, EQUIS wanted to target top-quality international business schools. This target choice justifies the main features of the EQUIS model. One of these features is the emphasis of the EQUIS Quality Framework on internationalization as a key dimension. EQUIS-accredited schools must demonstrate that they are actively trying to make an impact beyond their domestic frontiers.

EQUIS also highly values the well-balanced development of students and participants as future managers and entrepreneurs. Therefore, the ways in which managerial skills and personal values are developed by a school are specifically assessed when dealing with the students and program quality dimensions.

For accreditation by EQUIS, higher education institutions (schools of higher management) must be able to demonstrate that they meet quality criteria on three dimensions:

- high quality standards at international level in all areas defined by EQUIS model;
- a significant level of internationalization as defined in the EQUIS model;
- the needs and expectations of socio-economic environment to be well integrated into curriculum, activities and processes.

A distinctive feature of EQUIS is closely related to its European origin: appreciation for diversity. One might presume that the EQUIS model would be based on the typical European business school. However, there is no such a thing. In fact, many of those that have analyzed Europe looking for commonalities reach the conclusion that the basic common feature of Europeans is the ability to live with the idea that diversity is a source of richness and that, while there maybe value in certain convergence, diversity should be preserved. This idea is embedded in EQUIS and it has practical implications in the way EQUIS assesses schools.

For example, in any initial accreditation the Peer Review Team visiting the school includes a member who is familiar with the national higher education environment, which includes the regulatory framework and the competitive situation. Only after EQUIS

understands the environment can the school strategy be fully assessed, and only then can the school be assessed in all its dimensions evaluating its fitness for achieving its strategic objectives.

The study programs incorporate opportunities for students to gain firsthand experience from external socio-economic environment through a strong practical activity (internship).

The teaching staff has practical experience related to their field of competence and teaching and they are aware of the best practice in the domain. It also has the opportunity to be engaged in consulting activities.

The accreditation is a voluntary option. EQUIS schools receive the value added of being challenged not just to fulfill basic expectations on EQUIS quality dimensions but that of being assessed against the standards of quality that prevail in the best international institutions all over the world.

Another model of quality assurance and improvement is proposed by the European Foundation for Quality Management (EFQM).

The European model of total quality management for the European Quality Prize includes nine criteria on which organizations progress is evaluated, through TQM. The criteria are divided into two categories, which have equal weight in the assessment: enablers and results. The 9 Criteria are: 1. Leadership; 2. Strategy; 3. People; 4. Partnerships & Resources; 5. Processes, Products and Services; 6. Customer Results; 7. People Results; 8. Society Results; 9. Key Results.

Each of the 9 criteria has a definition, which explains the high level meaning of that criterion. To develop the high level meaning further, each criterion is supported by a number of criterion parts: the criteria of 'enablers' in 25, while those from "results" in 8 partial criteria.

Evaluating the performance of each criterion is achieved with a five-level rating scale (0%, 25%, 50%, 75%, 100%), according to the methodology established by EFQM. The RADAR logic helps to assess and score the level of each sub-criterion (required **R**esults, plan and develop **A**pproaches, **D**eploy approaches, **A**sses and **R**efine approaches).

The assessment procedure for quality award comprises three steps:

- analysis of self-evaluation report presented by the organization;
- conducting a new assessment, at the organization and completion of a final report;
- the decision of the jury.

Attempts to introduce quality concepts like TQM from industry to higher education have existed since the early 1980s. A delighted customer is the main message of total quality approach. It has become a widespread social trend that of a realistic definition of quality based on customer satisfaction. If in the industrial and service sector clients are well defined, defining customers of higher education services is much broader. If students are accepted as the main customers, other potential customers are employers, parents, government and society. The problem gets complicated also because of the dynamic and interactive nature of higher education. If students are the main clients for universities, they are also working material, suppliers, co-processors and products.

What exactly is "quality" in the context of higher education? Some universities define quality as “a philosophy by which we can achieve our vision and mission in a manner according with our values”.

TQM is a holistic approach to achieve quality, as states that everyone must participate in quality assurance, insists on continuous improvement, cultural development and teamwork. This approach is in accordance with the academic environment and its philosophy is widespread among teachers, although some of them practices TQM without being aware of this fact.

Quality in higher education can not be made based on a two-day inspection or observation of laboratories and amphitheaters. There is no direct measurement between inputs and outputs of the system.

The purpose of higher education is to change the student, and, in particular, to help him to be able to learn alone. An attempt to measure the level of a year of study after the number of top marks means to be deprived of any methodological knowledge, as the intellectual maturity of a student with the

highest mark at his first examination is fundamentally different from that of a student who, two-three years later, reads for the completion of studies. The manner in which the student is assessed is a critical part of the learning process. Good assessment is accomplished if, upon completion of a study program or module, the student can demonstrate the extent to which s/he has acquired the expected knowledge and learning outcomes. Higher education institutions should allow student feedback on assessment, in order to find the best assessment solutions and allow for continuing improvement, over time, of the assessment procedures.

The institution is responsible for ensuring the quality of the research process, a complex process which in addition to the quality of "research itself" includes procedures on the management of funds allocated for research, funds from the public budget or from private or external sources. Contract funding can be obtained from the budget resources of the Ministry of Education and Research, from internal resources or from research grant awards from national and international donors.

A review of TQM in the university experience indicates that what was done is more related to administrative services, a problem that is significantly less complex than the academic one. In fact, the administrative body is acting as a general service organization within universities. However, the success achieved regarding customer satisfaction, teamwork, increased power of employees and the change of culture can be seen as first steps in introducing quality principles throughout the university.

3. Conclusions

The main objectives for quality assurance and continuous improvement in Romanian higher education are:

- improving the internal and external evaluation methodology, in full compliance with the European Standards and Guidelines for Quality Assurance in Higher Education (ESG);

➤ increasing the role of students and employers, as final beneficiaries, within the process of evaluation and assurance of education quality;

➤ accelerating the transition from the evaluation of input data to the predominant evaluation of learning outcomes, of graduates' insertion in the economic and social environment as a measure of education quality assurance's results;

➤ establishing a permanent partnership with all institutions in the national higher education system (MECTS, CNCSIS, CNFIS, ACPART) as well as with the economic-social environment, in order to correlate higher education with the labour market;

➤ creating a quality culture in the Romanian higher education.

The Analysis and Assessment of the Credit Risk

Mirea Marioara

Aivaz Kamer Ainur

“Ovidius” University of Constanta, Faculty of Economical Sciences

mm_mirea@yahoo.com

kamer_aivaz@yahoo.com

Abstract

The commercial banks main operation is the granting of credits that occupies the first place among the total investments. Any bank assumes risks to a certain extent when granting credits and certainly all the banks generally incur losses when some debtors fail to comply with their obligations. The level of the assumed risks, the losses can be minimized if the credit operations are organized and managed in a professional manner. The paper grasps the moment of the analysis process preceding the granting of the credit that mainly includes the financial analysis of the client, the internal analysis respectively to which non-financial aspects are added.

Key words: bank, credit risk, financial risk, the points method

J.E.L. classification: G20, G21

1. Introduction

In the bank current activity, all the bank products and services, therefore the credit too, contains risk elements. The credit risk is mainly generated by the fact that during the credit agreement period difficulties may appear as regards payment of the clients' contractual obligations in due time, that could not be noticed during the analysis, assessment and approval of the credit.

The non-financial and financial analysis may give the necessary elements for an assessment of the client's risk rate.

An assessment of the credit risk can also be made by means of the points method, that groups the clients into various risk categories depending on the points awarded at the analyses of various risk types that may affect

a firm (financial and non-financial).

Due to the importance of the credit risk management, the Romanian National Bank issues rules regarding the limitation of the banks credit risk, the credits and investments classification as well as for the creation, regularization and usage of the credit risks specific provisions. In our country the Romanian National Bank regulates the credit risk by means of: -rules regarding the limitation of the banks credit risk; -regulation regarding classification of credits and investments as well as the creation, regularization and usage of credit risk specific provisions.

2. The Methodology of Analysing and Assessing the Crediting Risk with the Points Method

The crediting risk analysis and assessment is a distinct activity of any bank that uses various analysis methods in order to take the necessary measures to diminish such risk.

The credit risk analysis mainly contains two stages: the risk assessment and risk management. The Credit risk assessment and analysis with the points method have in view the following risk categories.

Figure no 1. The risk categories

The *financial risk (FR)* reflects the difficulties that may appear in the firm financial activity related especially to the possibility to repay the obligations to the bank in due time. The documents containing the data necessary to carry on such an analysis are: the firm financial statements, official statistic data, the bank records. The reference dates when such analysis will be carried on will be the end of the latest year as well as the month prior to the credit application. For the business companies that have been carrying on an activity for less than a year the reference dates are the end of the last semester and the month prior to the credit application.

The analysis of the financial risk is carried on by means of the points method (*Z*) based on the J.Conan and M. Holder pattern that allows the evaluation of the bankruptcy risk and is based on the following formula:

$$Z=0,24X1+0,22X2+0,16X3-0,87X4-0,10X5$$

Where:-the variables $X1...X5$ are economic and financial indicators and the constants they are amplified with are indicators of a static nature expressing the weight of the variables in assessing the bankruptcy risk.

$X1$ = the gross operation surplus/total debts

$X2$ = long-term capital/total assets

$X3$ = (current assets – stocks)/total assets

$X4$ = financial expenses/turnover

$X5$ = personnel expenses/added value

The bankruptcy risk shall be construed as follows:

a. $Z > 0,16$ -the firm financial situation is very good, the bankruptcy risk is less than 10%;

b. $0,10 < Z < 0,16$ -the firm financial situation is good, the bankruptcy risk being between 10% and 30%;

c. $0,04 < Z < 0,10$ -the firm financial situation is under observation, the bankruptcy risk being between 30% and 65%;

d. $Z < 0,04$ -the bankruptcy risk is more than 65%.

The *Commercial Risk (CR)* represents the uncertainty that may appear regarding the collection of receivables and/or payment to suppliers and will be evaluated based on the following indicators:

a) *The average period for collection of receivables ($P_m IC$)* representing the average number of days within which the receivables are collected in relation to the turnover of the relevant period is calculated based on the following formula:

$$P_m IC = \text{Receivables (debtors)/Turnover} \times \text{no.of days}$$

b) *The average period for payment to suppliers ($P_m PF$)* representing the number of days within which the suppliers are paid in relation to the turnover of the relevant period is calculated based on the following formula:

$$P_m PF = \text{Unpaid suppliers/Turnover} \times \text{no.of days}$$

The assessment of the risk on the basis of calculated indicators is made as follows:

$$P_m IC > P_m PF \rightarrow \text{great risk}$$

$$P_m IC = P_m PF \rightarrow \text{medium risk}$$

$$P_m IC < P_m PF \rightarrow \text{low risk}$$

The guarantee risk (GR) is represented by the fact that some difficulties may appear when turning the securities to account in case the credit and the relevant interest fail to be paid as per the credit agreement. The assessment of the guarantee risk is made taking into account their value level and the possibility to sell them as soon as possible:

a) *maximum reliability*: irrevocable and unconditional securities issued by the Ministry of Finances based on the mandate of the Romanian Government awarded on the basis of normative deeds, unconditional letters of guarantee issued by banks, promissory notes guaranteed by the banks, pledge with dispossession, bank deposits in foreign currency or lei, as the case may be, as well as securities issued by the Credit Securing Romanian Fund;

b) *medium reliability*: mortgages over buildings that are appropriate for industrial spaces, factories, workshops, firms, commercial spaces (shops and places of business) as well as over inside building area lands in big cities and resorts, movables procured from credits, assignment of debts from exports with payment by irrevocable letters of credit issued by agreed banks;

c) *unsure reliability*: buildings appropriate for homes, stocks of industrial, semi-finished, agricultural and food products, raw materials, mortgages over buildings in the rural area and over the outside building area lands, other securities.

The managerial risk (MR) is determined by the quality of the firm management team and will be analysed based on the direct contact of the credit officer with them. The assessment of the managerial risk shall be made taking into account the following characteristics of the management team:

a) they are (not) qualified and have (do not have) a long experience in the field of the firm's activity;

b) depending on the evolution in time of the economic and financial indicators, they showed (did not show) the necessary capacity to efficiently run the company;

c) the quality of the relation with the owners (partners), employees, the organisational and team spirit, ability to cope with the changes;

d) they had (not have) proper relations with the bank: they made (did not make) operations through the opened account, opened (did not open) accounts with other banks, repaid (did not repay) the loans in due time, paid (did not pay) the interests in due time etc. and with the business partners: they are (not) permanent partners, paid (did not pay) the suppliers in due time, collected (did not collect) the debts in due time, had (did not have) litigious with the partners, whether they were involved in tax evasions etc.

The sensitivity risk (SR)- for the long term and medium term investments (at economic agents and natural persons) when analysing and assessing the credit risk a sensitivity analysis is carried on too. The sensitivity analysis is a technique of analysing the individual risk of an investment project that indicates how much VNA (the net capitalised value) or RIR (the profitability internal rate) will change as a reaction to the alteration of an entry variable with the other elements remaining constant. Any decision of the economic agents as regards the development and restructuring of production, upgrading or modernisation of the capital assets that may be put into application by means of the long term and medium term credits involves a risk in obtaining the initially estimated results due to the influence of continuous changes in the technical, financial, economic social, internal and external environment. Hence, the necessity to analyse the sensitivity of the studied alternatives in relation to the probable changes as well as the risk coefficient under the influence of the factors that could not be explicitly taken into consideration. Such changes may be: the raw materials price increase; the increase of the equipment cost (between the moment the project was elaborated and the moment it was purchased) wages increase; the increase of the investment value during the performance

thereof; the increase of the production costs; failure to achieve the projected production capacity (it is maintained at a certain percentage of the total); the unjustified extension of the manufacturing period as against the project provisions; the risk of the external competition; the risk of the occurrence of calamities etc.

Two indicators are used to analyse the sensitivity:

RIR_b = the financial profitability rate calculated based on the cash flow availability for the basic alternative;

RIR_f = the financial profitability rate calculated based on the same cash flow plus a 1% increase of the production costs in relation to the incomes as a result of the cumulated action of the above mentioned factors.

The risk coefficient in relation to the basic alternative (*r*) is calculated based on the following formula:

$$r = (RIR_b - RIR_f) / RIR_b \times 100\%$$

The conditions to be fulfilled are:

-RIR_f to be higher than the relevant interest rate of the credit submitted to be approved;

$$-r < 75\%.$$

RIR (the internal profitability rate) offer the global image of the efficiency of the investment project at any moment and it is the capitalise rate for which VNA is null, that is the capitalised income flow equals the capitalised expenses flow.

The total risk (TR) of credit will be established on the basis of the points awarded as per the risk class.

$$RT = RF + RC + RG + RM + RS$$

The risk classes:

class I - 100-80 points

class II - 79-65 points

class III - < 65 points

The significance of the risk classes:

Risk class I: the business companies of this class have very good financial performances, which allows payment of their obligations to the bank at the due date. It is supposed that the financial performances shall be maintained in the future and the securities offered by these clients ensure maximum reliability. The credit risk is minimal.

Risk class II: the financial performances of the business companies are good but the present level cannot be maintained for the

future. The securities offered by the client ensure a medium reliability. The credit risk is medium, and the approval is given provided that additional conditions are fulfilled regarding the financial indicators, guarantees.

Risk class III: the financial performances are low or indicate losses, the debts to the bank cannot be paid and the securities provided do not ensure the possibility for a quick transformation into liquidities. The credit risk is very high.

3.The management of the credit risk

Having in view the importance of limiting the credit risk, the Romanian National Bank issue rules and regulations about how to manage such risk that refer to:

- the banks own capital and funds;
- gross and net exposure;
- exposure to a single debtor;
- great exposure;
- supervising the solvency indicators;
- supervising great exposures;
- supervising the loans granted to persons that are in special relations with the bank, to the own employees and their families;
- classification of the credits granted to the non banking sector clients;
- classification of credits granted to other banks and the investments made to them;
- the formation, regularisation and usage of the credit risk specific provisions.

According to this regulation the credits and investments are classified under the following categories: -standard; -under observation (only for credits granted to non banking sector clients); -substandard (only for credits granted to non banking sector clients); -doubtful (only for credits granted to non banking sector clients); -loss.

The classification of credits and investments is made by simultaneously applying the following criteria:

the debt service —>the capacity of the debtor to pay its debt on due date, expressed as the no of payment delay days from the due date;

the financial performance —>reflects the economic potential and the financial solidity of the economic entity obtained as a result of the analysis of a group of qualitative and quantitative factors (economic and financial indicators calculated on the basis of the data obtained from the annual and periodical

financial statements);

instituting legal proceedings—>at least one of the measures taken in order to recover the debts: the court passes the judgement to open the bankruptcy procedure;the commencement of the enforcement procedure against natural persons or corporate bodies.

As regards the banking sector clients as well as the natural persons, the financial performance will be considered of the A category.

The assessment of the financial performance of a non-banking sector economic agent will place it in one of the five financial performance categories. Their Board of Trustees based on the points attributed to some quantitative and qualitative factors shall make such assessment according to the banks internal regulations approved. The points will be established taking into consideration quantitative factors mainly referring to liquidity, solvability, risk and profitability indicators and the qualitative factors mainly referring to aspects related to the way of managing the firm, the shareholding and management quality, the securities obtained and the market conditions under which it carries on its activity.

In case the banks are unable to assess a non-banking client financial performance, this client shall be placed in the E category.

The good standing represents the financial performance of the economic agent attesting that the bank is confident at the moment of the credit request that the client will repay the contracted credits on the due date together with the relevant interest.

The financial good standing is established by calculating some financial indicators on the basis of the data from the accounting forms depending on the period for which it is established.

“The financial profitability rate” indicator shall be taken into consideration for the calculation of the good standing at the value obtained on the basis of the data from the annual financial statements irrespective of the date when the analysis is made.

4. The analysis and assessment of the credit risk by means of the points method

We have the hypothetical situation when a short term credit is required for the current activity by a firm whose object of activity is the selling of industrial products and performance of services regarding the technical and material supply to private agricultural producers and other economic agents in the agricultural and food industry field as well as to other economic agents.

From its beginning the firm has an account current opened with the bank, it is a constant client and annually has benefited from financing for the performance of its activity.

According to the bank’s regulations the analysis and assessment of the credit risk are made having in view the following risk categories:

- 1.the financial risk
- 2.the commercial risk
- 3.the guarantee risk
- 4.the managerial risk

1.The financial risk. Its analysis was made by means of the points method (Z) based on J. Conan and M. Holder pattern for the assessment of the bankruptcy risk:

$$Z=0,24X1+0,22X2+0,16X3-0,87X4-0,10X5 = 0,23$$

Where:

$$X1=\text{the gross operation surplus/total debts} = 0,508$$

$$X2=\text{Long-term capital/total assets} = 0,503$$

$$X3=(\text{current assets-stocks})/\text{total assets} = 0,4717$$

$$X4=\text{financial expenses/turnover} = 0,02658$$

$$X5=\text{personnel expenses/added value} = 0,473$$

The used data to determine such indicators are form the “Patrimony situation” and the “Financial Results”.

The necessary information exclusively for obtaining the above values is taken from the accounting forms.

Table no 1. The financial results of the analysed firm thousand RON

Value indicators	Financial year n
Operating incomes	14728,3
Operating expenses	13865,4
Gross operating surplus	862,9
Financial expenses	391,5
Personnel expenses	835,9
Added value	1766
Turnover	14728,2
Gross profit	511,4
Net profit	337,8

Source: Data processed from the firm financial and accounting reports

Table no 2. The firm patrimony situation thousand RON

Value indicators	Financial year n
Total/current debts	1697,4
Own /long term capital	1722,1
Long term debts	0
Current assets	3048,3
Stocks	1435,1
Total assets/liabilities	3419,6
Receivables	330 days
Payables	420 days

Source: Data processed from the firm financial and accounting reports

The Z score is at the value of 0,23 and in this case the firm’s financial situation is construed to be very good with a bankruptcy risk lower than 10%

2.The commercial risk. It is analysed taking two indicators into consideration: the average period for collection of receivables and the average period for payment of suppliers and represents the uncertainty that may appear as regards the collection of receivables or payment to suppliers.

a)the average period for collection of receivables (P_mIC)

$$P_mIC = \text{Receivables (debtors)/turn over} \times \text{no.of day}$$

$$= (330 \times 330)/14728,2 = 7,4 \text{ about 8 days}$$

b)the average period for payment to suppliers (P_mPF)

$$P_mPF = \text{unpaid suppliers/turnover} \times \text{no.of day}$$

$$= (420 \times 330)/14728,2 = 9,4 \text{ about 10 days}$$

The data used to calculate these indicators are from the “Annual Financial Statements”
The assessment of the risk on the basis of these indicators drew the conclusion of a reduced risk because: $P_mIC < P_mPF$.

3. *The guarantee risk.* Taking into consideration that two mortgages are the securities granted by the firm, it was considered that they represent a medium reliability as regards the recovering of the credit granted.

4. *The managerial risk.* The credit officer who analysed the firm’s application for credit was under continuous and stable relations with the firm and its legal representatives. His credit analysis report contains a characterisation of his relation with the firms and its managers as follows:

- the management team is qualified and has a long experience in the field in which the firm carries on its activity;
- considering the future evolution of the financial and economic indicators we can conclude that they efficiently manage the business;
- the company management did not have major problems regarding their relation with the shareholders or employees; they proved ability and adaptability to the economic changes;
- as regards the relation with the bank, the firm repaid the capital and interest in due time and did not and does not have any accounts opened with other banks.

5. Conclusions

Following these appreciations the assessment of the credit total risk is as follows:

1.the financial risk (FR) $Z=0,23$
50 points

2.the commercial risk (CR) $P_mIC < P_mPF$
10 points

3.the guarantee risk (GR)- medium reliability guarantee
10 points

4.the managerial risk (MR) - the management team is qualified and experienced in the field;- the firm is in very good relation with the bank and third parties
5 points

5 points

THE TOTAL CREDITING RISK (TR) =
 $FR + CR + SR + MR = 80$ points

The firm was placed in Risk Class I, which underlines once again that the financial performances of the firm are very good as well as that the granted securities give a maximum reliability and the crediting risk is minimal

Considering the above, the risk committee gave their credit approval, which together with the conclusions of the risk analysis were comprised in the “Analysis and Assessment of the Credit Risk Report” that completed the credit file. This file was then remitted to the credit officer responsible for the further development of the crediting process.

Regulations regarding the Organisation and the Governance of the Accounting by the Legal Persons without Patrimonial Purposes

Mititelu Cătălina

„Ovidius” University of Constanta, Faculty of Theology

ovidiustomis@yahoo.co.uk

Abstract

In our country, the religious cults which, according to the fiscal regulations in force have the status of legal persons without a patrimonial purpose, also carry on economic activities and, consequently, they have the obligation to organise and to govern the accounting, analytically and distinctly, for the activities without a lucrative purpose.

According to the provisions of the Order of the Ministry of Finances no. 1969 / 2007 regarding the approval of the accounting regulations for the legal persons without a patrimonial purpose, the religious units of the Romanian Orthodox Church, too, that carry on activities without a patrimonial purpose are under the obligation, according to the law, to administer the double-entry accounting and to draw up financial accounting statements. In this context, the religious units of the Orthodox Church, - except for the Parishes - that is deaneries, the monasteries, the eparchies, the metropolitanites and the Patriarchate, as they belong to the category of legal persons without a patrimonial purpose, according to the law must keep the double-entry accounting.

Key words: patrimonial purpose, financial accounting, the religious cults, legal persons

J.E.L. classification: M41

1. Introduction

The Order of the Ministry of Public Finances no. 1969 / 2007 regarding the approval of the accounting regulations for the legal persons without patrimonial purpose was focused on the establishment of the basic accounting principles and rules for the activities without a patrimonial purpose.

According to the provisions of these Regulations, the units of the religious cults are under the obligation to apply the double-entry accounting and to draft yearly financial statements for these units. Also, in accordance with the fiscal regulations in force, the units of the religious cults which carry on economic activities are under the obligation to organise and govern the accounting, analytically-distinctly, for the activities with a patrimonial purpose, including the activities with a special purpose[1].

The Ministry of Economy and Finances chose to develop an accounting system of its own in line with the international legislation in this field. Thus, through the Order of the Ministry of Economy and Finances no. 1969 of 2007, the accounting Regulations[2] for the legal persons without a patrimonial purpose were approved, that is for Associations, Foundations or other Organisations of this kind, political Parties, Patronates, trade-union Organisations, religious Cults and other legal persons established on the basis of some special laws. In order to carry on activities without a patrimonial purpose, they are under the obligation to govern the double-entry accounting and to draft yearly financial statements.

2. The accounting regulations

The Order of the Ministry of Economy and Finances no. 1969/2007 also provided that "for the economical activities carried on, in accordance with the law, by the legal persons without a patrimonial purpose, these regulations will be completed, according to the case, by the accounting Regulations in accordance with the IV-th Directive of the European Economic Community, provided in the Appendix to the Order of the Ministry of Public Finances no. 1752/2005, with its

further modifications and completions" (Art. 1, par. 3).

In the Order no. 1969/2007 they also approved the "Accounting regulations regarding the organisation and governance of single-entry accounting by the legal persons without patrimonial purpose" (Art. 3).

The text of these Regulations[3] – provided in Appendix 2 to the Order – explicitly provides that among the first categories of legal persons without a patrimonial purpose are "the units of the cults", which "are under the obligation to organise and govern the single-entry accounting", if their normative act "of establishment contains explicit provisions in this respect" (chap. 1, par. 1 and 2).

The same text provides that "the single-entry accounting system, in the sense of the present regulations represents the ensemble of legally regulated account books and accounting documents which serve to keeping the accounts, in a compulsory chronological and systematic manner, of the economic operations mentioned in the covering vouchers." (chap. 2, A, 1).

The "Regulations" also specify that the legal persons can use the account books and accounting forms "in accordance with the elements of the activity carried on" (chap. 2, A, 2), but, "depending on the necessities, ..., also the other account books and forms which are common in their national economic system, regarding the financial and accounting activity, developed by the Ministry of Economy and Finances" (Chap. 2, A, 3). However, the patterns of these account books and accounting forms, can be adapted according to the nature and the necessities of the legal persons without a patrimonial purpose – among which the religious Cults – "under the condition to meet the minimal information content and to observe the methodological norms regarding their elaboration and use" (Chap. 2, A, 4).

Given that the juridical persons without patrimonial purpose which govern the single-entry accounting "do not draft financial statements" (Chap. 2, A, 7), the respective "Accounting regulations" specify that these ones "... can use all the forms provided in the Appendix to the present Regulations or only a part of these, ..." (Chap. 2, A, 2). In the Appendix they present the following two books, namely: a) the Journal – Account

Book, and b) the Inventory Account Book. Actually, these "accounting Regulations" specify that, in the case of the legal persons without a patrimonial purpose, the single-entry accounting "is kept with the help of the following compulsory account books: the Journal-Account Book and the Inventory-Account Book (Chap. C, 1).

With the purpose of verifying the correct bookkeeping of the operations made on a monthly basis, they provide it is compulsory that the "Statement of the elements of credit balance and debit, ..., on the basis of the data recorded and totalised in files and in ledgers" (Chap. 2, A, 8) be made.

3. The quality of legal persons of public utility

According to the legislation in force, the units of the religious cults have the quality of "legal persons of public utility" (Art. 8 par. 1 of the Law no. 489/2006, or, more explicitly – as the Status of organisation and functioning of the Romanian Orthodox Church provides – of "legal persons of private law and of public utility" (Art. 41, par. 1).

However, we must specify the fact that the units of cults have the status of legal persons without a patrimonial purpose and not of legal persons of public law, as provided by the Decree no. 177/1948, art. 28 and the Statutes of the Romanian Orthodox Church of 1949, art. 186. In this sense, their status of legal persons, without a lucrative purpose, should have obliged the administrative-territorial units of the recognised religious Cults "to keep the double-entry accounting according to Appendix no. 1 to the Order of the Ministry of Finances no. 1969/2007 at all organisational levels"[4]. But, based on Article 18 of the Accounting Regulations of 1993, completed through the Norms of the Ministry of Public Finances no. 460051/2001, the units of cults were entitled to keep the single-entry accounting. This right also applied to the parishes of the Romanian Orthodox Church was established through Appendix 2 to the same Order of the Ministry or Economy and Finances no. 1969/2007. But, as an expert in the field of the existing accounting regulations noticed, regarding the diversity of the activities

carried on by the units of the cults, "the delimitation of the public, philanthropic character, without a lucrative purpose and of the private, even economic character of many activities within the religious units from the public character dedicated to the general interests of preaching the faith among the believers is very hard to accomplish in the context of the present regulations which prove to be contradictory and insufficient as they don't approach these aspects in a distinct manner, ..." [5].

As "legal persons of private law and of public utility" (acc. to Art. 41 par. 1 of the Statutes of the Romanian Orthodox Church), the administrative-territorial units of the Romanian Orthodox Church – both local (the parish, the monastery, the deanery, the vicariate, the eparchy and the metropolitanite – and central (the Patriarchate) – are entitled to "two unique fiscal registration codes: one for the non-profit activity and the other for the economic activity" [6].

The Law of the Cults (489/2006) and the Statutes of organisation and functioning of the Romanian Orthodox Church (2008) make no specification or mention with regard to the manner of organising the accounting within the units of the cults. But, taking into account the fact that these ones, although they have the status of legal persons without a lucrative purpose, were discharged of the obligation of keeping a double-entry accounting record on the basis of Article 18 of the accounting Regulations of 1993, completed through the norms of the Ministry of Public Finances no. 460051/2001, which gave them the right to keep „a single-entry or double-entry” accounting record (pt. 1, 2 par. 10), this category of "legal persons without a patrimonial purpose", which can also organise and govern the single-entry accounting includes – apart from the units of the cults – the Associations of owners.

Within the Romanian Orthodox Church, only the Parishes are keeping a single-entry accounting record, because the other units – from the deanery above – apply the double-entry accounting record.

We should also mention that the relationships between the religious units and the authorised persons – natural persons or legal persons – who keep or govern the accounting are established „on the basis of a contract of service provision (of

collaboration)" [7], according to the Law no. 130/1991, to the Law of accounting no. 82/1991 and to the fiscal Code approved by the Law no. 571/2003.

Finally, one must know that "not drawing up, drawing up in a wrong manner and/or not using the supporting and financial-accounting books, forms or documents according to the methodological Norms of the Ministry of Public Finances, approved by Order no. 3152/2008 or the other orders of the Ministry of Public Finances will be punished according to the legal provisions" [8].

Therefore, we shall notice that, in accordance with the fiscal regulations in force, the religious Cults from our Country, which have the status of legal persons without a patrimonial purpose and also carry on economic activities are under the obligation to organise and govern the accounting, analytically and distinctly, for the activities without a lucrative purpose [9].

The management accounting is organised by every unit of the religious cults according to the nature of its activity and to its own necessities.

According to the Order of the Ministry of Finances no. 1969/2007 regarding the approval of the Accounting Regulations for the legal persons without a lucrative purpose, the financial year will start on January 01 and will end on December 31, except for the first year of activity, when this will begin on the date of the establishment of the legal persons without a lucrative purpose, respectively of the religious organisations that fit into this category of economic entities.

In our country, the religious cults which, according to the fiscal regulations in force have the status of legal persons without a patrimonial purpose, also carry on economic activities and, consequently, they have the obligation to organise and to govern the accounting, analytically and distinctly, for the activities without a lucrative purpose.

Based on the resolutions of the Holy Synod of the Romanian Orthodox Church and on the Norms of the Ministry of Public Finances [10], the parishes have the right to keep the single-entry accounting record by option.

4. The accounting regulations and the religious units of the Romanian Orthodox Church

According to the provisions of the Order of the Ministry of Finances no. 1969 / 2007 regarding the approval of the accounting regulations for the legal persons without a patrimonial purpose, the religious units of the Romanian Orthodox Church, too, that carry on activities without a patrimonial purpose are under the obligation, according to the law, to administer the double-entry accounting and to draw up financial accounting statements. In this context, the religious units of the Orthodox Church, - except for the Parishes - that is deaneries, the monasteries, the eparchies, the metropolitanites and the Patriarchate, as they belong to the category of legal persons without a patrimonial purpose, according to the law must keep the double-entry accounting. In fact, the following categories of units of the Orthodox religious Cult are under the obligation to govern the double-entry accounting:

- the entities which create their own funds for self-financing, as well as the funds received as a complement in the form of subsidies from the state budget;

- the deaneries, the monasteries, the eparchies, the metropolitanites and the patriarchate, which keep the record of their incomes and public expenses;

- the church units that own sectors of auxiliary production which are distinctly organised into units destined to the production of objects and goods peculiar to the religious units;

- the church units the activity of which is focused on the preservation and restoration of the monuments of religious architecture which belong to the national patrimony;

- the church units which benefit from funds from the state budget for:

- the establishment and the restoration of the religious Orthodox places;

- the strengthening, preservation, restoration and promotion of the objects of cultural patrimony, either mobile or non-mobile.

According to the republished Law of accounting[11], the responsibility for the organisation and the governing of double-entry accounting falls on the administrator or

another person who is under the obligation to manage the respective unit.

The Orthodox religious units which carry on economic activities according to the law are under the obligation to organise and govern the analytical and distinct accounting for the activities without a patrimonial purpose, including the activities with a special purpose.

If the accounting of the religious unit is not organised in distinct compartments and if that unit has no qualified staff according to the law or no contracts of service provision in the field of accountancy signed with authorised natural persons or legal persons, the persons responsible for the observance of the accounting norms will be the administrator or the person who is under the obligation to manage that unit, respectively. Anyhow, the existence and the increase in the material resources of the Orthodox church units lead to the necessity to administer, manage, preserve and keep the accounts of the church patrimonial goods.

The administrative-territorial units of the Orthodox Church, which, in accordance with the accounting and fiscal regulations in force have the status of legal persons without a patrimonial purpose and carry on economic activities[12] (ex. they make church furniture, candles, religious objects, etc.), are under the obligation to organise and govern the accounting, analytically and distinctly, for these activities without a lucrative purpose. As regards the management accounting, it is organised by every church unit according to the nature of its activity and to its own necessities.

The supervision and control of the administrative activity and of the administration of the parish goods at the level of a parish as at all levels of church administration is made both by the church body and by bodies of the state, according to the law.

The control of the administration activity of the parish patrimony has the following purposes:

- the accomplishment of the financial plan and the integrity of the patrimony;

- the observance of law and the assuring of a rigorous order as the use of the funds is concerned;

-the prevention, finding and compensation for the damages brought to the assets of the parish;

- the call to account of the ones guilty of breaking the laws and of causing prejudice to the assets of the parish;

The supervision, the legal guidance and the control of the activity of the Romanian Orthodox Church at parish level are made directly by the following church bodies:

- the Bishop, through work, guidance and control[13] visits, on the basis of which periodic reports to the Holy Synod are made;

- the eparchial inspectorship and the monastery exarch, by the order to the local hierarchy;

- the eparchial administrative bodies: the administrative vicar, the counsellors and the chief accountant of the eparchy;

- the parish priest, who supervises, guides and controls the epitrops[14].

The supervision and control from the part of the state is made by the following state bodies:

- the bodies of the former Ministry of Culture and of Cults, including the auditors from its Body for financial and management guidance and control;

- the financial inspection made by the General Direction of territorial Public Finances;

- the specialised bodies of the state: the Police, the Public Prosecutor's Office, the State Control Office with the approval of the central state and church bodies.

At the parishes, the preventive and at the same time operative control is exerted by the parish priest and the post-operative control is exerted by the other bodies.

The control of the integrity of the patrimony of the parish, be it preventive, operative, present or subsequent is made in a constant manner with the purpose to prevent any prejudice to the assets of the parish, to discover the damages in time, to compensate for them and to establish a spirit of responsibility and good administration, to that, with a view to the appropriate expense of funds.

The compensation for the prejudice brought to the church patrimony will be made in accordance with the legal provisions. The parish council, in case it has brought prejudice to the assets of the church will be dissolved by the decision of the Bishop.

5. Conclusions

As a conclusion, the members of the administrative bodies of the parish church assets are responsible for the prejudice brought to these assets through dishonesty, negligence or ignorance.

The civil liability does not exclude the penal liability and the approval of the management is not a discharge of responsibility for the disorders found subsequently[15].

The bodies in charge of the control of the acts of administration are liable for all the prejudice caused to the church assets by not exerting the control they were obliged to exert or by exerting an insufficient, superficial control[16].

According to the legislation in force[17], the religious cult has its own religious consistories for the problems of internal discipline, according to its own statutes and regulations. The existence of these own religious consistories does not obstruct the enforcement of the legislation with regard to infringements and offences within the jurisdictional system.

The Impact of the Current Financial Crisis on Romania’ Budget

Mițac Mirela

National Bank of Romania, Constanta Branch

mirela_mitac2002@yahoo.com

Abstract

Global economy was significantly affected by the global financial crisis and especially the budget balance of all countries.

Starting with 2008 the global economy has been confronting the deepest economic downturn since the Great Recession in 1930. The crisis had a high level of synchronization, both the developed and the emerging economies being affected, showing a significant increase of the inter-dependence between the world economies.

Many countries experienced recession in 2008 and Romania went into recession in the third quarter of 2008.

In this article we present the impact of the present crisis on the Romania’ budget and fiscal sector between the end of 2007 and the end of 2010 and the forecasts for 2011 and 2012.

Key words: financial crisis, budget, deficit, fiscal policy

J.E.L. classification: G01; G20.

1. Introduction

The financial and economic crisis has entailed a generalized and severe worsening of fiscal positions in all European Union countries.

Research methodology used by authors is specialized literature review and the review of specialized analyses provided by national and European authorities in this field of interest.

Due to the “Financial Stability Review” edited by European Central Bank in June 2011 the five key risks to euro area financial stability are:

1. *The interplay between the vulnerabilities of public finances and the financial sector with their potential for adverse contagion effects*

2. *Bank funding vulnerabilities and risks related to the volatility of banks’ funding costs*

3. *Losses for banks stemming from persistently subdued levels of, or a further decline in, commercial and residential property prices in some euro area countries*

4. *Risk of a market-driven unexpected rise in global long-term interest rates, with possible adverse implications for the profitability of vulnerable financial institutions*

5. *Tensions related to international capital flows, asset price growth in emerging countries and the risks associated with a re-emergence of global imbalances.” [1]*

In Romania, one impact of the crisis over Romanian economy was the sharp deterioration of budget deficit ratio.

2. Economic situation of the government sector in European Union

The evolution of general government budget balance of European Union member states between 2007 and 2010 and its forecasts for 2011 and 2012 are presented in Table 1.

Following the sharp deterioration in 2009, and its value from 2010, the government budget deficit ratio in the European Union as a whole is expected decline to 4.6% of GDP in 2011.

The deficit in 2010, on the one hand, is affected by: still unfavorable cyclical factors, the continued impact of fiscal stimulus measures, capital injections in the banking sector and the pick-up in interest payments.

On the other hand, tax increases and spending restraint are contributing to a better fiscal position.

Concerns about some governments’ ability to restore sustainable public finances over the medium term have again fed tensions in government bond markets in the past months, leading to a tightening of refinancing conditions for some countries in particular. Their high budget deficits and high and rising government debt ratios remain a risk to financial stability in all European Union member states. [1]

Table 1. The annual dynamics of general government budget balance

Year	General government budget balance - % of GDP-
2007	- 0,6
2008	- 2,0
2009	- 6,3
2010	- 6,3
2011*	- 4,6
2012*	- 3,9

* - forecasts

Source: European Central Bank

3. Economic situation of the government sector in Romania

In most non-euro area EU countries, which Romania is part of, the prospects for economic activity have improved since the end of 2009.

In many non-euro area EU countries, domestic drivers of growth remained depressed, while output growth continued to depend on foreign demand. Narrowing or stable credit default swap as well as interest rate spreads, rising stock prices and appreciating currencies vis-à-vis the euro suggest that financial conditions have improved somewhat.

In some countries with IMF/EU financial assistance program, however, financial conditions weakened on account of market concerns regarding the continuation of assistance.

Due to the negative effects of current crisis over the Romania economy the Romania’ budget deficit evolution between 2007 and 2010 and its forecasts for 2011 and 2012 is presented in Table 2.

Table 2. The annual dynamics of Romania’ budget balance

Year	General government budget balance - % of GDP-
2007	- 2,6
2008	- 5,7
2009	- 8,5
2010	- 6,5
2011*	- 4,4
2012*	- 3,0

* - Forecasts

Source: Ministry of Public Finance - Romania Convergence Program 2009-2012

The budget deficit has increased from 5,7% of Gross Domestic Product in 2008 to 8,5% by the end of 2009, mainly as a result of the impact of the economic contraction on the budgetary revenues and expenditures (automatic stabilizers), but also due to related measures to sustain the economic recovery and stability process.

Although the Romania’ Ministry of Public Finance expects a gradual further reduction of the budget deficit, fiscal imbalances are expected to persist over the next 2 years, with the deficit, under current policies, estimated to stay in the range of 3,0% to 4,4% throughout 2011-2012.[4]

Because the increase of the Romania budgetary deficit at 8,5% at the end of 2009, Romania entered under the excessive deficit procedure.

The excessive deficit procedure is governed by the Article 126 of the Treaty and the Council Regulation regarding the acceleration and clarification of the excessive deficit procedure implementation.

The excessive deficit procedure sets down the criteria and the deadlines for the European Council to adopt a decision regarding the existence of an excessive deficit.

“The excessive deficit Procedure is initiated when the actual or forecasted deficit exceeds the 3% of Gross Domestic Product (GDP) ceiling, except the situation when the deviation is of an exceptional and temporary nature outside of the control area of the respective member state and has a major impact on the fiscal position, or due to a major contraction of the economic activity.”

According to the Council Decision dated July 7, 2009 Romania is facing the excessive deficit procedure. According to this decision, the Romanian authorities implemented in a strict manner the provisions in the previous Council Decision.

However, considering the higher than expected negative impact of the international context on the Romanian economy, the Council has issued a revised recommendation whose main provisions are as follows:

- the Romanian authorities have to implement the budgetary measures agreed for 2010 and diminish within a medium term framework and in a sustainable manner the budget deficit to less than 3% of the GDP until 2012;

- the Council sets down the deadline of 16 August 2010 by which Romania has to implement the agreed measures for attaining the consolidation objective in 2010.

The progress report will be based on the outcome assessment compared to the European Commission’s autumn forecast;

- adopt and implement the Pension Law and improve the long-term sustainability of the pension system;

- make efforts for an average annual consolidation of 1,75 percentage points for the 2010-2012 interval and elaborate the necessary measures for reaching the deficit objective of below 3% of GDP and, if cyclical conditions allowing, to accelerate the reduction of the budgetary deficit only if the overall economic conditions are more favorable compared to the initial forecasts.

The initial budget and rectifications realized in 2009 by Romanian government foreseen budgetary measures in order to reach the assumed objectives, some of the most important being:

- (i) an increase of 3,3 percentage points of the social security contributions;

- (ii) increasing the excise for tobacco and spirits;

- (iii) creating a minimum income tax for contributors who declare a lower income tax compared to the legal threshold;

- (iv) expenditure rationalization by freezing public sector wages, reducing the bonuses and benefits, freezing the public sector employment and elimination of the vacancy jobs;

- (v) reducing the subsidies and goods and services expenditures;

- (vi) implementing a VAT non-deductibility regime with some exemptions for vehicles and fuels expenditures for certain transportation means.

The measures took by Romanian government in 2010 were mainly focused on containing the current expenditures by:

- (i) diminishing the wages expenditures by freezing the salaries (with the exception of the wages situated below the minimum monthly ceiling of Ron 705), freezing the public sector employment and continue the replacement policy of 1 for 7 (leaving the public sector) and cutting down the expenditures related to the bonuses and supplementary hours;

- (ii) making savings by freezing the pensions (except the social ones) and by a better rationalization of the disability and anticipated pensions taking into account a more restrictive implementation of the existing legal framework;

- (iii) diminishing the goods and services and transfers expenditures;

- (iv) reassessment of property taxes, increase of the excises for tobacco and fuels and implementation of the turnover tax on medical products distributors.

Government’s expenditures will be restructured with the aim of containing the current expenditures and increasing the public investment space while on the same time promoting the adjustment of the budget deficit.

4. Conclusions

Regarding the period 2011 – 2012, the future actions that will be taken by Romanian government are presented in “Romania Convergence Program 2009-2012”.

One of the objectives assumed by the fiscal policy during the forecasting period is the reconciliation between the reduction of the budget deficit and meeting on a sustainable basis of the convergence nominal criterion while at the same time elaborating the necessary set of measures aiming to contain the effects of the global economic and financial crisis on the Romanian economy.

To this purpose, the budget policy aims at smoothing functioning of the economy through the cycle, reducing the inflationary

pressures and containing the external imbalances.

The Convergence Program describes the Romania’s ability of diminishing the structural deficit to less than 3% of the GDP up to 2012, and creating a safety margin to avoid exceeding the 3% level.

On long term, the Government will continue its efforts for the fiscal consolidation in order to reach a balanced budget along the economic cycle, creating at the same time a safety margin in order to avoid exceeding the ceiling of 3% of GDP given possible future adverse economic conditions with a negative impact on the economic growth rate. Implementation of the fiscal responsibility law is an important anchor from the perspective of changing the institutional incentive framework and increasing the probability of benefiting from sound fiscal policy decisions, able to allow the achievement of this objective.

Also, Romania maintains its commitment of adopting the euro currency by the 1st of January 2015, being an important anchor in promoting the necessary budgetary and structural reforms aiming at increasing the flexibility of the Romanian economy.

The Government’s vision on the fiscal policy area focuses on ensuring a motivating and unbiased environment, being at the same time centered on measures aiming at consolidating the transparency, stability and predictability of the fiscal policies. In addition, improving the sustainability of the public finances is a crucial objective taking into account the adverse demographic trends. The consolidation of the tax base continues to be the key to ensuring the necessary resources for the economic development and the fulfillment of Romania’s commitments as an EU Member State.

The Overall Strategic Communication in Marketing Events in the Current Economic Crisis

Moise-Titei Adina

“Ovidius” University of Constanta, Faculty of Economic Sciences

adinatitei@yahoo.com

Moise Daniel

Bucharest Academy of Economic Studies, Marketing Faculty

moisedaniel@gmail.com

Abstract

Communication strategies, the nature and content are derived in relation to other strategies, more general subject of management and strategic marketing. Within the overall management process, they are situated among strategic marketing components as a strategic mix variable. Consequently, communication strategies through events, in the current economic crisis, occur as part of the communication mix. Organizations have to find new means to reach the public and to determine them to adopt different types of behavior, in order that the companies should reach their objectives. In this situation, communication strategies within event marketing fall into the general strategic line described by business general strategies and marketing strategies, bearing in mind to make an event cost efficient and also a green event.

Key words: events, marketing strategies, mission, communication, budget planning

J.E.L. classification: M30

1. Introduction

General strategies of a company are management tools that are subject to market-oriented strategic planning. They are of great variety and directs the overall activities of the enterprise, and are therefore known as corporate strategies, business strategies etc. Taken in connection with the event, both as a business area and as communication tools, the most important general policy instruments are: market-oriented company mission, business areas, development

strategies, new product planning and budget planning. [10] The economic global crisis has also affected Romania, especially the companies in the service sector, and even the companies realizing events for other organizations. The struggle for survival, especially for the companies in the service sector, is at the highest peak.

2. Market-oriented company mission

According to some authors, a business mission is a concise statement regarding the goal of the company, the reason for its development. The expected success of any enterprise in fulfilling its mission, it can be achieved only if all levels of the organization adhere to its mission and act so as to contribute towards achieving them. [2]

In the event industry, the company's mission has a double aspect, a tool: on the one hand, the company – whose main activity is to organize events, and have customers – organizations and customers, participants – having emphasis on creativity, inspiration, impressions and spectacular; on the other hand, the company – whose main activity is not organizing events, but wants to send certain messages through such events that adhere to the organization's mission and vision, in this case the emphasis is usually placed on products / services / customers.

It is likely that the missions, both for event organizing companies and those that communicate through events to be very similar. We must not omit the fact that, for the companies in the first category, in terms of mix, the event is a part of their product, while the second category, the events are part of the promotion policy, and thus differences

can occur between the vision and the mission of a corporation.

It can be concluded that the mission of the two types / categories of organizations vary, depending on the strategic line. And the strategic line is shown by how the events are located in the mix, either in product policy, promotion policy, or there are a few cases in which they are part of both. [3]

After it was determined how the organization wants to position the event in the minds of consumers, there can be designed a positioning statement. This should create clarity, consistency and continuity in how the organization communicates with the market.

A positioning statement is a document that is created only for the use within the organization – it is being used in almost all communications in the planning department. [7] It is essentially an internal document which helps the company to target its marketing efforts by communicating a consistent and unified view, together with a common goal that can be shared by everyone in the organization.

A. Delimitation of business areas

In event marketing, the instrument appears in the management of event organizing companies. Defining the scope of operation is a management tool which determines subsequent processes and is based on careful analysis of the results of research in which strategic planning tools were made and used. The analysis is done carefully because it takes into consideration the relationship between the products / services - markets - management tools, the most valuable formula being the one that allows the most efficient use of marketing tools. An analysis requires experience, comparison, auditing, and especially vision, the specialist imagining the evolution of marketing processes on different tracks, defined by the possible alternatives within the operating range. [13]

In the case of companies, other than those organizing events, business areas delimitation creates prerequisites for using events as communication tools in a manner that takes into account, because of their interdependency, the way in which the business domains were divided. Basically, it

is a similar separation and the way of using events as communication tools. [4]

B. Development strategies

Development strategies are marketing management tools through which the organization can improve its activities. In event marketing, these have a double role. On the one hand, there are development strategies of organizations that communicate via events and on the other hand, those of the companies that organize events for other organizations. For organizations that have as their primary goal creating events, they must decide whether, in order to achieve the objectives of communication and marketing, is in their best interest to communicate through events, or just to promote in a traditional manner, without developing an event, product/service subject to development strategies. [13]

A company hired to carry out events for other organizations, has, in this case, a different approach to strategies that can be used for developing the service portfolio, taking into account the complexity of events, but also the human and material resources that are involved when organizing an event.

The best known approach belongs to Igor Ansoff, according to which strategic alternatives are presented in the product-market matrix. We could use Ansoff matrix according to table 1, and the main types of strategic options that can be used are the following[8] [13]:

Table 1 Market Matrix – products in the field of services

services	Current services	New services
Current markets	Market penetration	Development of services
New markets	Market development	Business diversification

Source: (Ansoff) V – *Managementul Serviciilor, Publicing House Eikon, Bucuresti, 2005, pg. 132*

a. Market penetration – through organizing events, the company tries to attract new customers and organizations and retain their loyal customers

b. Development of services - introducing new types of events on the existing market, which may be new to the market, such as the use of new communication technologies for a conference

c. Market development – the current events are organized inside new markets

d. Business diversification - offering new events, inside new markets, a strategy that is adopted by few companies, given the high degree of failure in this case, and also the reluctance of both organizations and participants

Development alternatives, that the organization may consider, are detailed in more specialized literature and take into account other variables, however it is actually a more detailed Ansoff's matrix in table 2. [2] In this manner, the strategies of an organization, that communicates through events, can be analyzed, and depend on the strategies used, thus they develop certain events. Of course, it is appropriate to use events as a means of communication in an orderly manner, both for those representing communication through events and those that target the external and internal environment.

Thus, depending on the quadrant in which lie the organization's offered products, we can use different types of events, but this does not exclude the possibility of the company to turn to other types of events if it believes that its marketing goals will be achieved.

- For penetration strategies, given the current market and product, we may have recourse to fairs and exhibitions where to display products and highlight the benefits they provide to potential customers in comparison to the competitors' products; and, for the employees we can use trainings, team buildings and happy hours;

- For market development strategies, the types of events that can be used, taking into account that there are current products for the company and new markets, we can use: participation in fairs and exhibitions, sponsoring, seminars and even workshops. And for employees, we can carry out trainings, team buildings, happy hours and also seminars for those working in the sales department;

Table 2 Alternatives of the market strategy based on its growth vector

Products / Markets	Current	Improvements in current(existing) products	New products produced by similar technologies		New products produced by different technologies
			New types of products	New product lines	
Current	Market penetration	Reformulation	Replacement	Expanding product line	Horizontal diversification
New	Market development	Market expansion	Product differentiation and market segmentation	Concentric diversification	Lateral (Conglomerate) diversification

Source: Balauș V, Cătoi I, Vegheș C. - Marketing Turistic; Publishing House Uranus, Bucharest, 2005, pg. 257

- For product development strategies, because the product is new, you can organize conferences, seminars, product launches, workshops for prospective customers, participation in fairs and exhibitions; but, since they have some seasonality, it is likely that the launch of the product on the market will not coincide with the fair, exhibition. For

company employees - trainings, team buildings, happy hours, seminars, as well as events along with the launch of the new product;

- Strategies for diversification - in this case, there will be a concentrated effort and the number of events, that address the internal and external environment, will increase exponentially, given that it is a new product on a new market. We can use all of the above event possibilities, and in addition to these, we can add, traveling shows, open days and product launches. For employee, the emphasis will be put on seminars and events along with the launch of the new product;

No events, such as the General Assembly of shareholders, have been mentioned, because joint stock companies are forced by law to hold this meeting at least once a year. Moreover, there are the religious holidays which depend upon the policies and budget of each organization.

C. Budget planning

For communication through events, regardless of whom they are addressed, the objective is to determine the minimum budget needed so as to achieve the marketing proposed targets. We should also consider the distinction between the events of some organizations that are produced by other companies, and events that the company itself organizes, using only providers of various services and products for optimal deployment of the event. [5]

In practice, often low efficiency of some marketing activities is mainly caused by a complicated system of resource allocation of the budget action.[13] The budget for an event must be very flexible, processes are very complex and often take place at maximum speed. All these are also imposed by the external environment, which is very much in connection with the event. Within the organization, many marketing processes are initiated and carried out in response to threats or to opportunities, any delays having hard repercussions. The correct solution of such situations is possible by using the budget management system of events, whose existence and design is another compulsory requirement for the development of most marketing processes.

In practice, often initiating marketing activities cannot be done promptly and with high efficiency without the existence, in advance, of planned and allocated budgets for such operations because they are designed, usually, based on the principle "everything the company can afford ", any other alternative being especially costly. The problem is simplified when used as a system of budget allocation, a share of its profits or sales, the same amount of money that the competition uses, the turnover as the marketing literature recommends. [16]

When planning an event, it is good for the budget to be presented based on costs, so there is an overview of the items that can be purchased without exceeding the budget. Monitoring the costs gives the opportunity to use alternative options if the budget for the event is exceeded. [6]

It is good that all the costs involved in the event should be recorded, without forgetting any detail. Prices should be communicated in writing or in electronic format because when spoken, some things may be misinterpreted and thus, the message may not be perceived accordingly.

Each event requires different expenses, that is why you cannot use a formula, or a fixed format when setting a budget. Costs should be reviewed, as you get estimates or actual costs. Suppliers, usually provide information on prices.

It is necessary, in designing the event, to take into account as many suppliers as possible, their prices and tariffs on the products / services they offer. [14] The event may also generate profit, in the form of: event sponsorships, sale of promotional products, ticketing fee for participation, contributions, etc. .. Expenditure on an event is divided into three categories [9]:

1. Fixed costs - costs that are not dependent on sales or profits and cannot be influenced by the number of participants. These costs include: audio-visual equipment, speakers, security and insurance costs, promo costs, location costs, staff salaries, translators, entertainment and transport.

2. Variable costs - are costs that fluctuate depending on the number of participants. They can be calculated as costs per person. They can be listed as: accommodation, communication, food, gifts, brochures,

invitations, special menus, badges, photographs, cameras, promotional materials, fees, transportation, security (growing proportionally with the number of participants), and salaries for employees etc.

3. Indirect costs - are related to administrative costs, salaries of employees of the organization that conducted the event and the equipment used for the event.

Regarding the costs with the location of the event, they can be of two kinds [12]:

- Direct Costs - are costs paid to the owners of the location where the event will take place. They include costs for rent, meals and other services. It is not unusual for a location to overcharge for cleaning: removal of confetti, balloons and other decorations left after the event. Some administrators do not allow their use at all. It is good for all costs to be stipulated in the contract. It is usual for managers to have a place of exclusive or preferential contracts with suppliers of audio visual equipment, catering, etc.. This can raise the cost of such services above the market rates.

- Indirect costs - are paid to other suppliers or another third party and are necessary for the smooth running of the event, or because various provisions of regulations imply it, such as those regarding the obligation to ensure security and protection services, fire rescue, etc.. [15] Municipalities require a fee to obtain special permits for the event to be held under maximum security conditions for both organizers and participants.

We can also calculate the break-even point (if this is a profit making event) to see how many participants are needed in order to overcome it. If the break-even point is not achieved, we must consider the following alternatives: increase the number of participants, raise the fee, request for sponsorship, or reduce spending, although this may have a negative effect on the event. Not all types of events generate profits, such as events that are addressed to the internal environment of the organization. [11]

The list of costs involved in an event must include even the most seemingly insignificant or unimportant elements, such as whether the service charge which will be granted for waiters, will be of 8% or 10% of the total bill, or a fixed amount.[1] At the end of the event it is good to see which were the

actual costs, since managers of locations can charge fees for consumed electricity, water and other utilities.

The budget must be constantly updated, reviewed, numbered and stored in separate files for post-event analysis. This allows last-minute charges, which often appear and were not initially foreseen. [9] Knowing the financial situation allows you to offer additional gifts to participants or have an open bar.

Before the bills are paid, it is good to see if they correspond with the numbers and amounts stated in the contracts and if there are differences between the figure on your list and the invoice received. Regarding the signing of contracts, it is a good idea to make a table with certain dates, when the bills are paid, in case you need to negotiate these dates or delay the payment due to lack of funds or cash. This table of bills will be made in accordance with the list of costs, with changes in the number of items or services required for the event, or the number of participants.

Companies deploying events for other organizations, have not only to practise the lowest price, but also come with innovative strategies and policies to realize and promote the event, by choosing the appropriate channels to reach the potential audience for it, offering an integrated event service, with feedback of the event from the audience and, of course, media coverage of the event through the mass communication channels.

The Training Needs of Public Servants. The Role of the National Agency of Public Servants (NAPS) in Planning Professional Training and Development Programmes

Morariu Alunica

“Ștefan cel Mare” University of Suceava
alunica.morariu@gmail.com

Abstract

The present paper focuses on the present trends in the training and development programmes of public administration employees and on the methods used to assess the training needs for public servants in relation to the recorded performance indicators and to the strategic objectives of the public administration entities. The scientific research methodology of the present paper relies on national and international professional literature, on the analysis of concepts, theories, typologies, methods and instruments used in identifying the training needs of the staff employed in professional organisations. The empirical research focuses on the planning of professional training in relation to the training needs of public servants and makes use of synectics methodology and comparative statistical methods, graphs and dynamics.

Key words: human resource, training needs, professional training, public servants, NAPS, local/central governing structures.

J.E.L. classification: H83, O15

1. Introduction

According to the most recent strategies, the EU is highly focused on lifelong training programmes, as part of the social policies for the “Europe 2020” strategy. The standpoints of several European institutions whose activity is related to this specific field convene on the strategic goal “of contributing through lifelong learning to the development of the European Union as a knowledge-based society, with a sustainable economic growth, with more and better jobs and greater social cohesion and also focusing on protecting the environment for the

welfare of future generations” [1].

The lifelong training of human resources performing in the central and local governing structures, with the specific goal of enhancing professional performance, has been a highly debated topic of the *Romanian Government’s Programme 2009-2012*.

Our belief is that both the development of the organisation and the enhanced professional performance of the employees depend on the training and the feedback conveyed by the trainees upon completing a professional training programme. A very efficient method of bridging the gap between the suggested and the reached target consists in the involvement of employees in lifelong training programmes at the workplace or in specific training programmes with external funding, either individually, as employees of the public entity (beyond the organisational strategy and operative planning), or by the public organisation as a whole, with the aim of relating the professional training of the employees with the specific objectives of the organisation.

If we contemplate the current progress of science and technology and the critical economic-social situation, the constant changes in expectations and needs of the individuals as part of a local or central community, we conclude that it is genuinely necessary for public servants to undergo a systematic process of improving their knowledge, their behaviour and motivation in order to re-establish the balance between their underlying characteristics and the requirements of public service duties[2]. If we adopt this viewpoint on the professional training and development required in public organisations, we would also share the opinion of Michael Armstrong [3], according to whom, training needs to have a purpose, and this purpose can only be set if the learning needs of the organisation, of the

groups and of the individual employees within these organisations are systematically identified and analysed.

Given the specific context of the above mentioned circumstances, our goal is to identify the present training trends in public administration, as well as the methods used to assess the training needs for public servants in relation to the recorded performance indicators and to the strategic objectives of the public administration entities.

The scientific research methodology of the present paper relies on national and international professional literature, on the analysis of concepts, theories, typologies, methods and instruments used in identifying the training needs of the staff employed in professional organisations.

The empirical research focuses on the planning of professional training in relation to the training needs of public servants and makes use of synectics methodology and comparative statistical methods, graphs and dynamics.

2. Training needs assessment from an organisational perspective

2.1. General reference points on the training needs assessment on an organisational level

The training needs assessment is a method used to determine whether there is a need for training and, if so, identify the type of training required in order to make up for the lack of training/development [4], depending on the goals and needs of the organisation and the specific sector it operates in.

The purpose of a training needs assessment is to prevent a hasty approach of the human and organisational development issues.

The proper identification of the training needs is carried out by collecting and analysing the answers to such questions as, [5], [6]:

- What are the objectives of the organisation?
- What are the tasks to be performed in order to reach those goals and objectives?
- What kind of competencies should each employee possess in order to carry out those tasks?
- What knowledge, skills or competencies do employees lack (if identified) in order to perform the expected duties?
- What other organisational factors or other characteristics/actions/inactions of the

employees prevent the organisation from reaching the targeted performance indicators?

These questions also reflect on the planning of the human resource, on the recruitment and selection of the staff, and thus emphasize the correlation among all these procedures related to the management of human resources. The answer to the above mentioned questions will enable the identification of the purpose and specific performance requirements. If the actual need for training prevails, we believe to have also identified the need for a training initiative in order to diminish/remove the deficiencies [7].

The human resource planning objectives are actually the starting point for the training need assessment. The gaps between what is currently in place and what is needed, the overall performance, the individual performance of each employee or other factors influencing these can contribute to the identification of the training objectives under the following two circumstances:

- (1) the identified needs should be significant enough to be considered on an organisational level
- and
- (2) the need has to be rectifiable through training.

Therefore, training is not a cure. What often seems to be a training need at first, may be rectifiable through a different approach, activities or methods.

Sometimes, the actual training programme is specifically designed at the request of a manager, without taking into account the fact that the personnel's training programmes must be planned and organised based on the training need assessment.[8]

Consequently, we share the opinion according to which [9] the training need assessment process is a very complex procedure that comprises three stages, as follows:

1. collecting the information;
2. analysing the collected information;
3. designing the professional training and development programme.

Professional literature [10] recommends that the detailed analysis of the training needs should rely on such methods as:

- Mission statements, human resource strategic plans;
- Job description;
- Learning or training needs;

- Performance evaluation;
- Training needs assessment.

Once the needs assessment is completed and the training objectives identified, the design phase of the training programme is initiated.

2.2. The training needs assessment procedure for the public servants of the local and central governing structures

Public administration structures are presently complying with a regulatory and institutional framework of professional training for public servants, meant to provide an integrated set of standards that apply to the training of public servants. In this respect, the National Agency of Public Servants (NAPS) has designed the specific regulatory framework and supported the implementation of the lifelong professional training policies, along with the control and assessment procedures related to these policies.

The following paragraphs outline the main juridical standards that govern the professional training of public servants:

- Law no. 188/1999 on the Statute of Public Servants, altered and revised up to date, is the general legal framework of the civil service and public servants, with extensive provisions on the professional training of public servants;

- Government Decree no. 1066/2008, for the adoption of the standards regulating the professional training of public servants;

- The Ordinance of the NAPS Chairman no. 13601/2008 for the adoption of the terms and standard procedures used for conveying the information about the annual professional training plan and the funds allocated for the training of public servants;

- The Ordinance of the NAPS Chairman no. 1233/2009, establishing the priority training programmes organised for public servants employed in management and control positions, as well as specific public offices associated with these;

- Government Decree no. 1000/2006 on the organisation and activity of the National Agency of Public Servants;

- Government Decree no. 611/2008 setting the regulations for the organisation and development of the public servant career, with the subsequent alterations and amendments.

Apart from the juridical framework that regulates the specific expertise of public servants, the training needs assessment

procedure applied by the Human Resource Department of public organisations must also include criteria related to: the changes in the organisational structure; the changes in job description; the demands of the public servants performing in the department; the individual performance in relation to performance objectives measured for the previous year; the “technical” progress in the field; and last but not least, the reform of the public service, outlining certain issues, such as: [11]:

- Conducting an analysis of the number of employees who have completed the training programme and the prospective target groups (with different training needs) to be identified;

- Establishing the training strategy and programme, as well as whether to initiate the training procedure directly or to identify and prepare internal instructors;

- Selecting the materials to be used in the training programme;

- Prepare the assessment of the training sessions;

- Organise seminars with the national officials of the NAPS or other international officials of the EU or other similar organisations.

The identification and analysis of the training needs also calls for the allocation of a priority level, established by the head of the department (maximum, average, minimum), associated with each field of professional training that has been identified based on the criteria mentioned above.

The identification and analysis of the training needs also calls for the assignment of a priority level (timeliness: maximum, average and minimum), established by the head of the department and associated with each field of professional training that has been identified based on the criteria mentioned above.

The need to prioritize the training mainly derives from the needs of the system, established in the strategic objectives of the organisation, as well as from the mandatory training of public servants in the specific fields that support the implementation of the public administration reform or provide the competencies and skills to access and manage structural funds.

The training manager has to focus on two specific elements when addressing the specific professional training of public servants [12]:

a) on the *professional training fields* that provide training programmes to be completed at the initiative or for the authority or the public organisation, based on the job description tasks that have been identified as necessary for individual performance evaluation and are listed in the annual training plan developed and in compliance with the law. Training also covers those competencies that have been identified after the occurrence of certain changes in the legislative or institutional framework and whose funding is entirely covered from the budget of the authority or the public institution;

b) on the *priority training fields*, established by the Ordinance of the NAPS Chairman no. 1233/2009, and listing the national training priorities for public servants in management and control positions, identified in relation to the government’s strategic planning and to the general priorities identified in the reports of the local and central governments for the year 2009.

3. Lifelong training assessment and training needs of public servants employed in Romanian governing structures in the year 2010 as outlined to NAPS

The presentation of the main methodological elements used in the training needs assessment for public servants employed in local and central governing structures must be followed by a detailed outline of the training needs that have been reported to NAPS in the reference year 2010.

Figure no. 1. Percentage illustration of the professional training and development fields for the public servants employed in central governing structures [13]

Figure no. 2. Percentage illustration of the professional training and development fields for the public servants employed in local governing structures [13]

Following the collection of the data and information available on the professional training and development of public servants, the options expressed by the representatives of the central and local governing structures for the year 2010 have addressed the following fields of professional training: economic, juridical, engineering and political sciences, humanities and, last but not least, natural sciences.

We will continue our endeavour with an analysis of the needs and the fields of interest, by taking into account the lack of competencies recorded at a local and central governing level [13].

Therefore, we found that the field of economics accounts for the largest part of the needs and training requirements, with a percentage of 52,07% at the level of central governing structures (*The general management of projects, European funds and structural funds – 12,21%, Financial management –*

6,36%, *Public and strategic management* – 0,40%, *Performance management* – 1,82%, *Human resource management: the management of the public service and public servants* – 17,56%, *Internal public audit, control, examination* – 4,44%, *Public acquisitions, investments and concessions* – 3,83%, *European affairs and policies* – 5,45) and 40% at the level of local governing structures (*The general management of projects, European funds and structural funds* – 7%, *Financial management* – 13%, *Public and strategic management* – 2%, *Performance management* – 2%, *Human resource management: the management of the public service and public servants* – 7%, *Internal public audit, control, examination* – 1 %, *Public acquisitions, investments and concessions* – 6%, *Economics and marketing* - 2%).

In economics, both the local and central governing structures have addressed the need for training in the secondary field of *Management* (38,35% and 31%, respectively), followed, at a considerable difference by *European affairs and policies* (5,45%) at the central governing level and *Public acquisitions, investments and concessions* (6%) at the local governing level. Thus, we identify the concern of public servants employed in central governing structures with the subject of *European trends and policies*, while the public servants employed in local governing structures who deal with the interpretation and enforcement of regulations are mainly concerned with *public acquisitions, concessions and investments*. This is mainly due to the fact that the tasks performed by the two categories of public servants employed at different administrative levels differ and so do the needs of the respective communities.

Apart from the field of economics, central governing structures have expressed the need for training and development in the area of social and political sciences (*Modern methods and techniques of boosting the efficiency of public administration* 11,81%, *Communication, Public relations and decisional transparency* 5,65%, *Ethics and integrity* 0,10%), closely followed by engineering sciences (*Information technologies* 12,21%) and juridical sciences (*Legislative techniques and administrative contentious proceedings* 12,11%). The training and development needs at the level of local governing structures amounted to a 40%

interest in the field of social and political sciences (*Modern method and techniques of boosting the efficiency of public administration* 9%, *Ethics and integrity* 2%, *Communication, Public relations and decisional transparency* 9,9%, *Public services* 13%, *Local community police* 6%, *Documents and archives* 0,1%), thus amounting to the same levels as economy-related subjects.

The opposite is the case of humanities (*Foreign languages*), with a very low, almost insignificant level of 1,61% in central governing structures and 0,1% in local public administration structures.

4. Conclusions

As far as we're concerned, we highly appreciate the strategic role played by NAPS in managing the professional training and development policies of public servants. The training needs of the contract personnel are still managed by the public institutions or by each individual employee, the latter being one of the least desirable situations. We agree with the views expressed by the National Agency of Public Servants, whose data reflects the low interest of the respondents, as the information provided by the local government structures is very scarce in relation to the total number of main credit release authorities of the local public administration structures.

This particular situation may also be determined by the deadline set for transmitting the data to the Agency (the first half of the year), even though the agency has continued to collect the information after the fixed deadline, mainly because of the delayed approval of the local budgets.

When referring to the training fields identified by the public servants as relevant for their training needs, even though the training needs planning has been performed after the assessment of each individual's performance, the relevant weight of the management sub-domain leads us to believe that the public servants in management positions are highly interested in their training and development, and this particular training need may often be identified on the labour market. The weight of management training and development need of 38,35% and 31%, respectively, makes one wonder whether the executive personnel is provided equal opportunities to plan their lifelong training and development needs and if

the training needs assessment in relation to the individual performance of each employee is accurately mirrored in the planning of professional training and development.

Fundamental Theories on Consumer Behaviour: An Overview of the Influences Impacting Consumer Behaviour

Moraru Andreea Daniela

„Ovidius” University of Constanta, Faculty of Economic Sciences
amoraru@univ-ovidius.ro

Abstract

Consumer behaviour is a component of the economic behaviour, which in its turn is a manifestation of human behaviour. As a consequence of the social and economic development of modern societies, the study of consumer behaviour has undergone a strong development process, during the past years consumer behaviour acquiring its own status among sciences. However scientists concern with the study of consumer behaviour covers a time span of many decades. Due to the multiple interdependences and parameters emerged from the coalescence among consumer behaviour, economic and human behaviour in general, there have been several approaches related to consumer behaviour concretized in fundamental theories and models, such as the Marshallian economic model, the Pavlovian learning model, the Veblenian social-psychological model or the Freudian psychoanalytical model. These theories and models of consumer behaviour have been developed at different moments in time and bear the peculiarities of the era; they are rather episodic than systemic approaches. This paper aims at discussing the most important influences impacting consumer behaviour as presented in the four fundamental theories mentioned above.

Key words: consumer behaviour, influences, economic man, irrational consumer, fundamental theories

J.E.L. classification: B13, N30, M31

1. Introduction

As a direct consequence of the social and economical dynamic development, the study of consumer behaviour has experienced a

remarkable evolution during the past years. However, scientists' preoccupations for the study of consumer behaviour may be traced back to the work of economists in the 19th century and the beginning of the 20th century, such as Hermann Heinrich Gossen or Carl Menger. Subsequently, beside economics, consumer behaviour was the object of other behavioural sciences – sociology, psychology or anthropology.

As a result of preoccupations of scientists from different domains, fundamental theories in the field of consumer behaviour emerged. These include the Marshallian economic model, the Pavlovian learning model, the Veblenian social-psychological model and the Freudian psychoanalytical model. However, these theories developed at different moments in time do not benefit from the advantages of a systemic approach. Later developments in the study of consumer behaviour enriched the field by bringing an integrated approach, thus adding value to the discipline and the fundamental theories these subsequent theories and models were built upon.

The focus of this paper is to discuss the influences on consumer behaviour as they were considered in the fundamental theories mentioned above. Consumer behaviour in a large context is viewed as a subset of human behaviour therefore factors influencing people's daily lives also influence their behaviour as consumers [3]. Under these circumstances it is understandable that consumer behaviour represents the object of interest for scientists in different areas of the behavioural sciences, each of these sciences focusing on their appropriate intrinsic processes and factors shaping consumer behaviour.

2. Landmarks in the Study of Consumer Behaviour

The foundation of consumer behaviour research lies in the work of economists, who starting with the 19th century, provided the basis for consumer behaviour research development. Economists regarded consumers as rational beings, trying to attain specific predetermined goals, at the lowest costs possible. Hermann Heinrich Gossen considered that “each man endeavours to make his life as full of pleasure as possible” [6], thus proclaiming the principle of parsimony that is people look to satisfy their needs at the lowest expense. Further more, Gossen asserts that “men behave according to the principle of parsimony, hence in a completely predictable way” which opens the possibility for calculating human actions [6].

Following Gossen’s rationale Carl Menger appreciates that any rational man would allocate their income to different types of expenses so that they obtain equal satisfaction for equally intense needs. Therefore the individuals tend to optimize their resources allocation so that may obtain at any time the greatest total usefulness, within the limits of their resources.

A synthesis of economic theories on consumer behaviour was achieved by Alfred Marshall, based on the ideas of classical economists and the advocates of the theory of marginal utility. As a need is being satisfied through consumption the additional benefit derived from a given increase diminishes with every increase.

The model however does not comprise the diversity of factors influencing consumer behaviour and cannot be used to explain real life situations; its value resides in explaining the processes and mechanism of consumer behaviour, taking into account the economic factors.

Other factors such as attitude, perception, motivation, learning, personality, and culture, ignored by the economic model are subject to psychologists and sociologists interest in the field of consumer behaviour.

Significant in this respect is Copeland’s theory of characteristics of goods (1923), which suggests that one could classify all products into three categories – convenience, shopping or speciality goods. This relates to factors of influence on consumer behaviour

such as extent of information search and levels of perceived risk [1]. However, Copeland’s product classification has a number of deficiencies, such as the subjectiveness of the assignment of products to particular categories and the unrealistic division of consumer goods into three discrete categories without considering the differences between products. [5]

The theory of learning developed based on the research of Ivan Pavlov introduces the concept according to which the human behaviour is the result of a learning process.

Of great importance to consumer behaviour research development is considered to be the contribution of the psychoanalytical theory of Sigmund Freud. His model had a strong impact on the 20th century thought, Freud rejecting the idea that man dominates its own psyche. It assumes that the psychological factors affecting and influencing the behaviour are mostly unconscious, people rarely being able to fully grasp their motivations.

Ernest Dichter, a Freudian psychoanalyst, shortly after the World War II applied psychoanalytical concepts to consumer behaviour research in an approach referred to as motivation research. In this approach he used in-depth interviewing techniques to bring to light an individual’s hidden or unconscious motivations [2].

Due to critiques related mainly to the subjectiveness of this approach, it was abandoned in the ‘60s, after leaving two main legacies in the field of consumer behaviour research – the focus on consumer motivations and the technique of in-depth interviewing [2].

The social and cultural influences on consumer behaviour are addressed to by the social-psychological model proposed by Thornstein Veblen. In this approach the behaviour is considered to be a result of social pressures exerted in the individual’s quest to fit within the desired social group.

During the 1950’s, the research on consumer behaviour started to focus on the behaviour of the consumer rather than following a macroeconomic orientation. In this context Abraham Maslow developed his hierarchy of needs and formulated his widely accepted theory of human motivation.

In the 1960's and the 1970's several of the best-known models in consumer behaviour emerged: the model developed by Howard (1963), the Nicosia model (1966), the Howard-Sheth model (1969), and the Engel, Kollat and Blackwell model (1968). However, the popularity of consumer behaviour model building decreased in the 1980's.

These models are still used as a superstructure for the research in the field despite the criticism received by the traditional models. At present, a focus on emotional and situational factors in the study of consumer behaviour is obvious.

3. The Economic Man and the Irrational Consumer

Following in the footsteps of Adam Smith and Jeremy Bentham, Alfred Marshall accomplishes a synthesis of economic theories on consumer behaviour starting from the concept of marginal utility. In his model, Alfred Marshall, advocates the theory of marginal utility, that is as a need is being satisfied through consumption the additional benefit derived from a given increase diminishes with every increase.

The law assumes that no changes would occur in the consumers' character or tastes, “we do not supposed time to be allowed for any alteration in the character or tastes of the man himself” [4]. Therefore, assuming that the man has not changed, although the observations are made over time, then marginal utility “diminishes steadily with every increase in his supply of it”. [4]

The model observes the effect of only one variable - the price – on consumer behaviour assuming all other factors remain unmodified. In his famous tea example, he demonstrates that demand depends solely on price, as long as other variables such as price of competing products, tastes, preferences and variety of existing goods remain constant.

Marshall refers further to the utility that induces the buying behaviour function of consumer income. The marginal utility of money is perceived differently by consumers with different levels of income – “the richer a man becomes the less is the marginal utility of money to him”[4]; therefore, an increase / decrease in income increases / decreases the

price a consumer is willing to pay for a given benefit.

In this model all men are considered to be rational buyers and the market is viewed as a collection of homogenous buyers. It is considered that buyers behave in a similar manner under given circumstances and their ultimate goal is to maximize the value obtained for the money spent.

Although the model leaves out a large diversity of factors which impact consumer behaviour, it takes into account the economic factors thus explaining the mechanisms of consumer behaviour and representing a solid basis on which later models were developed.

Unlike their economic counterpart theories the psychological theories consider consumers as irrational, impulsive buyers. The view regarding consumers as being vulnerable and subject to external influences was rather an obvious reaction to the “economic man”, whose behaviour is rational and based solely on conscious economic calculations.

The two major psychological theories referred to here are the Pavlovian learning model and the Freudian psychoanalytical model.

The learning theory emerged from the research developed by the Russian psychologist Ivan Pavlov, who subsequently to undertaking experiments and introducing the notion of conditional reflex, concluded that learning is a result of a process of association, which can be used to explain a large component of human behaviour. Further research led to the emergence of a model of human behaviour based on four fundamental factors: drives, cues, response and reinforcement. The model concludes therefore that the consumer's response is based on learning and experience.

The Freudian psychoanalytical model dismisses the idea that man dominates its own psyche, thus assuming that the psychological factors affecting and influencing the behaviour are mostly unconscious.

The model operates with three notions, those of id, ego and superego, each responsible for different behavioural manifestations. The id is the source of instinctual manifestations, urges and drives. The ego is the liaison between the id and the superego which is responsible for

transforming the instinctual manifestations into socially accepted behaviour. The urges are often repressed from the conscious by denial or by their transformation in socially accepted expressions, but they cannot be completely eliminated or controlled and may emerge taking the form of different kinds of manifestations. Explaining consumer behaviour according to this theory requires therefore an in-depth analysis that leads to the unveiling of symbols and motives behind the buying decision.

Further refinement of the model includes the approach according to which consumer behaviour is based on mechanisms that explain the process according to biological and cultural elements.

In the social-psychological model proposed by Thorstein Veblen social and cultural factors are considered as main influences on consumer behaviour. The social pressure on individuals ingrains certain behaviour.

Behaviour is therefore subject to the influence of levels of society, culture, sub-cultures, social classes, reference groups and family and consumption is viewed as a way to gain and signal social status –“since the consumption of these more excellent goods is an evidence of wealth, it becomes honorific; and conversely, the failure to consume in due quantity and quality becomes a mark of inferiority and demerit” [7].

In his theory of conspicuous consumption, Veblen considered that consumption of goods and services is motivated both by primary and secondary purposes. The primary purpose resides in consumption that serves human life or human well-being, while the secondary refers to the social confirmation brought about by consumption. The consumption that does not serve “human life or human well-being on the whole” is considered “waste”, though not in a deprecatory sense because it does have utility for the individual consumer. Further more, Veblen admits that it is highly improbable for goods to exhibit only one type of utility – “it would be hazardous to assert that a useful purpose is ever absent from the utility of any article or any service, however obviously its prime purpose and chief element is conspicuous waste; and it would be only less hazardous to assert of any primarily useful product that the element of waste is in no

way concerned in its value, immediately or remotely” [7].

Veblen asserts that preferences are determined socially, the individual relating himself to other individuals positioned in the social hierarchy. Moreover, individuals strive to imitate the behaviour of others holding a better position in society, the lower class following in the consumption patterns of the upper class.

4. Conclusions

The economic models of consumer behaviour consider in their simplest form that consumer behaviour is influenced solely by price, information, and available budget thus the consumer is rational and his behaviour is the result of conscious economic calculations.

However, considering that consumer behaviour is a part of the economic behaviour which is in its turn an intrinsic part of the human behaviour it is only natural to accept that psychological factors impact choice as well. In opposition to their economic counterpart theories on consumer behaviour, the main psychological theories discussed above bring to attention the psychological processes behind the purchase decision.

The creation of the fundamental theories and models presented in this paper was independent that is they have been developed at different moments in time and bear the peculiarities of the era; moreover the authors have considered only the perspective and instruments of a scientific domain without taking into account the interdependencies and correlations needed to explain human behaviour.

Although they may be considered as episodic rather than systemic approaches to consumer behaviour they represent the solid foundation subsequent theories and models have been developed on thus guiding the evolution of the field to the current state of art.

Tendencies Shaping Consumer Behaviour in the Present Context

Moraru Andreea Daniela

„Ovidius” University of Constanta, Faculty of Economic Sciences
amoraru@univ-ovidius.ro

Abstract

Due to the multiple interdependences and parameters emerged from the coalescence among consumer behaviour, economic and human behaviour in general, there is a vast interest in the study of consumer behaviour, and not just in the field of economic sciences. As a direct consequence of the social and economic development of modern societies, the study of consumer behaviour has undergone an important development process and is permanently enriched with new contributions. At present, consumer behaviour is interpreted not solely through the act of buying, but also as far as its impact on our lives, on the way we perceive our own image and ultimately on our state of being is concerned. The current context shaped by the economic crisis is remodelling mentalities and re-lays the foundation for a new conceptual model of determinants of consumer behaviour. This paper aims therefore at presenting the current frame of consumer behaviour manifestation and the main influences considered to have an impact on consumer behaviour during the historical development of the field. Further, it aims at presenting several tendencies in consumer behaviour determined by the present context.

Key words: consumer behaviour, economic crisis, influences, impact, new consumer

J.E.L. classification: M31, N30

1. Introduction

The global economic crisis has affected the world economy and its effects are visible and undeniable - the rising unemployment, the increase of inflation, the decrease of purchase power. These are realities faced everyday by consumers almost in all markets over the world.

Moreover, the constant mediatization of the present economic context boosts the emotional impact of the crisis effects on consumers' lives and projects a state of uncertainty.

The economic crisis has impacted consumer behaviour determining consumers to become more economical, more attentive, and to weigh more carefully their options. But more importantly, the direct and indirect effects of crisis have caused an augmentation of the psychological pressure felt by consumers, with strong impact on their buying behaviour. The most obvious consequences of this increased pressure include: the general reduction of spending, the postponement of high value purchases or the decrease in consumption of leisure and entertainment goods. Impulse buying becomes subject to control and the tendency for indulgence purchases is reduced.

This paper will first present the historical development of the field with a focus on the most relevant theories and the factors influencing and shaping consumer behaviour as considered in those theories, will then summarize the main features of modern consumers, and finally will present a perspective on actual and potential changes and transformations in consumer behaviour moulded by the present economic and social context, based on international studies conducted during the recession.

2. Consumer Behaviour and the Long Way from Marshall's “Economic Man” to the 20th Century Consumerism

The foundation of consumer behaviour research lies in the work of economists, who starting with the 19th century, provided the basis for consumer behaviour research development. Economists regarded consumers as rational beings, trying to attain specific predetermined goals, at the lowest

costs possible. Hermann Heinrich Gossen considered that “each man endeavours to make his life as full of pleasure as possible” [5], thus proclaiming the principle of parsimony that is people look to satisfy their needs at the lowest expense. Further more, Gossen asserts that “men behave according to the principle of parsimony, hence in a completely predictable way” which opens the possibility for calculating human actions [5].

Following Gossen’s rationale Carl Menger appreciates that any rational man would allocate their income to different types of expenses so that they obtain equal satisfaction for equally intense needs. Therefore the individual tends to optimize their resources allocation so that may obtain at any time the greatest total usefulness, within the limits of their resources.

A synthesis of economic theories on consumer behaviour was achieved by Alfred Marshall, based on the ideas of classical economists and the advocates of the theory of marginal utility. As a need is being satisfied through consumption the additional benefit derived from a given increase diminishes with every increase.

In this model all men are considered to be rational buyers and the market is viewed as a collection of homogenous buyers. It is considered that buyers behave in a similar manner under given circumstances and their ultimate goal is to maximize the value obtained for the money spent.

The model however does not comprise the diversity of factors influencing consumer behaviour and cannot be used to explain real life situations; its value resides in explaining the processes and mechanism of consumer behaviour, taking into account the economic factors.

Other factors such as attitude, perception, motivation, learning, personality, and culture, ignored by the economic model are subject to psychologists and sociologists interest in the field of consumer behaviour. Unlike their economic counterpart theories the psychological theories consider consumers as irrational, impulsive buyers. The view regarding consumers as being vulnerable and subject to external influences was rather an obvious reaction to the “economic man”, whose behaviour is rational and based solely on conscious economic calculations.

The theory of learning developed based on the research of Ivan Pavlov introduces the concept according to which the human behaviour is the result of a learning process.

The psychoanalytical theory of Sigmund Freud rejected the idea that man dominates its own psyche. It assumes that the psychological factors affecting and influencing the behaviour are mostly unconscious, people rarely being able to fully grasp their motivations.

Ernest Dichter, a Freudian psychoanalyst shortly after the World War II applied psychoanalytical concepts to consumer behaviour research in an approach referred to as motivation research. In this approach he used in depth interviewing techniques to bring to light an individual’s hidden or unconscious motivations. [3]

Due to critiques related mainly to the subjectiveness of this approach, was abandoned in the ‘60s, after leaving two main legacies in the field of consumer behaviour research – the focus on consumer motivations and the technique of in-depth interviewing [3].

The social and cultural influences on consumer behaviour are addressed to by the social-psychological model proposed by Thornstein Veblen. In this approach the behaviour is considered to be a result of social pressures exerted in the individual’s quest to fit within the desired social group.

During the 1950’s, the research on consumer behaviour started to focus on the behaviour of the consumer rather than following a macroeconomic orientation. In this context Abraham Maslow developed his hierarchy of needs and formulated his widely accepted theory of human motivation.

The following years were characterized by consumerism, generated by individuals’ desire to improve their social condition by possession and consumption of goods. However, it did not succeed in making people happier; the so-called “paradox of happiness” standing as proof. Studies have shown that substantial increases in real per capita income do not correspond to equivalent increases of individual happiness. Moreover, negative correlation between real income and happiness were observed. [1]

3. Consumer Behaviour and the “Paradox of Choice”

The last decade alone has brought about enormous and unprecedented developments in technology that improved communication and the possibility to connect with each other. In this context, perhaps the most important recent developments in consumer behaviour include the movement toward a global consumer culture and the digital revolution [7].

At the moment, consumer behaviour surpasses the act of buying, extending to having and being, according to Solomon, et.al. (2010). This view supports the idea that the study of consumer behaviour goes beyond the act of buying to the study of how having or on the contrary not having affects our lives and ultimately our image of ourselves and our state of being.

The last decades have brought about also a paradoxical situation - the consumers are facing the difficult task of searching and choosing the product that best suites their needs among a huge diversity of products.

At a first glance, the diversity of products giving each of us a great freedom of choice is a positive aspect of our everyday lives. However, the increased opportunities for choice doubled by consumers’ legitimate desire to obtain the best out of every situation may lead to a decrease in well-being. One of the factors leading to a decrease in well-being is regret – a person does not feel regret following a decision if they feel they made the best choice; but the more options they have, the more probable is to experience regret. [6] The increased number of opportunities leads also to a higher opportunity cost perceived by the consumer and to a rise in people’s expectations [6], transforming them in ever more demanding consumers harder to be satisfied and more importantly, harder to feel satisfied.

We may assert that consumer behaviour is structurally and continuously changing due to the social and economic dynamism characterizing modern society, with people seeking to attain emotional content through more meaningful, more lasting experiences that offer deeper satisfaction.

4. A Perspective on Transformations in Consumer Behaviour in the Present Context – The New Consumers

The financial crisis has impacted consumer behaviour determining consumers to become more economical, more attentive, and to weigh more carefully their options. The crisis is providing the frame for the emergence and development of new types of consumers, more considered and more rational.

The global crisis has affected the world economy and effects such as the rising unemployment, the increase of inflation, the decrease of purchase power have determined an augmentation of the level of anxiety perceived by consumers, leading to a reconsideration of their priorities concretized in the general reduction of spending, the postponement of high value purchases or the decrease in consumption of leisure and entertainment goods, and the decrease of impulse and indulgence purchases.

The situation is reflected by the results of the Nielsen Global Online Consumer Confidence Survey [10], with the Global Confidence Index declined in the second quarter of 2011 to 89, the lowest level in six quarters. The data for the second quarter of 2011 revealed that consumers have returned to a recessionary mindset, after a year of improving though still cautious spending. The spending intentions declined as well, only 27% (compared to 35% twelve months before) considered the present time as appropriate to buy the things wanted and needed.

Although the present context cannot be characterized as positive, many perceive the recession as an opportunity to chase away their former consumption patterns and embrace instead a more considered approach. These are the new consumers. [9] They have taken the current economic context as a convenience to find a better way forward. As the economic situation becomes more uncertain, it is only natural for consumers to become more rational. The new consumer turned away from overconsumption and mindless excess in order to take a more considered stance to spending. The study concluded that there may be identified four paradigms of the new consumer summarizing

the newly adopted behaviours and attitudes. [9]

The first paradigm, entitled *Embracing Substance* describes the new consumer as satiated with the shopping culture, worried about the superficiality characterizing a society too preoccupied with unimportant and hollow matters. Instead they long to feel more connected with other people and nature, seeking more substance. Modern society has led people to experience a keen isolation, sometimes resulting in feelings of alienation. Consequently they feel the desire to be part of an important cause, to lead a more spiritual life and build a stronger connection with religion or life philosophy.

The second paradigm, *Rightsizing* addresses the pressure put on consumers by the enormous variety of products meant to improve their lives, but instead became exhausting. Bearing in mind the vast diversity of products the consumers have to find their way through and the “paradox of choice” discussed earlier in this paper, it is rather natural to relate to this paradigm. The demand for simplicity may be considered as generated by the current context, although it has been noticed even prior to the recession [2]. The overwhelming diversity adds to the stress felt in periods of recession thus the increasing need for simplicity comes as a natural consequence.

The stupendous diversity of products combined with the bent for accumulating goods that characterized traditional consumers, seems to have fatigued consumers up to the point where they feel the need to return to the simple things. The new consumers are embracing “intelligent simplification”, admiring people who live simply and focusing on the functional features of the products.

The third paradigm, *Growing Up*, refers to the phenomenon of the recent decades of generations that do not behave according to their age and rather live a prolonged adolescence, postponing adulthood. However, the recession has bound them to grow, their financial choices becoming the instrument they appeal to in order to take control and accept responsibility for their choices.

The fourth paradigm, *Seeking Purposeful Pleasure*, records the changing of what makes people feel good and satisfied, the

new consumers seeking more purposeful pleasures that last longer and bring more satisfaction.

They are more risk aware, but they assess they have a better control of their lives and welcome the “proactive mindfulness” by shopping more carefully and paying more attention to the environmental and social impact of the products they buy; they manifest their desire and intention to reduce the negative impact on the environment and other people. Their focus surpasses products and reaches the companies that produce them; they have the tendency to relate to companies sharing the same values, practising sustainability and stating a purpose that goes beyond profits.

4. Conclusions

The present economic crisis creates an unprecedented frame as far as its dimensions and severity are concerned. As a direct consequence of the negative impact of the crisis at both economic and social level, the way consumers behave has changed.

We are witnessing a shift from the traditional consumer who pursues shopping with religious dedication to the new consumer who is embracing a more rational and conscious approach. The current context is a turning point which gave people a chance to reflect and take a step into the era of the “mindful spending”.

The recession has determined consumers to take a more rational and mature approach to consumption. This has at least two direct consequences - the first is obviously related to price. Consumers are becoming more price-sensitive, and are putting particular emphasis on quality. The second relates to changes in behaviour generated by brand loyalty.

The need for simplicity is a rather obvious reaction to the huge diversity of products that has become overwhelmingly tiring and adding to the stress felt in this context of the recession.

Although the levels of anxiety are high, consumers remain positive considering the recession as an opportunity to turn to substance, to connect with others and finally lead a more spiritual life.

In a world dominated by uncertainty consumers optimism is welcomed – the recession and its effects are perceived not as much as a burden but as an opportunity to find a better way forward.

Study Regarding Development of Electronic Commerce in Romania

norinapopovici@yahoo.com

Abstract

Over time, trade has undergone profound changes gaining new features and valent forms as a result of trade and technology development. Electronic commerce is the use of value-added in a network applications such as electronic transfer of documents (EDI), the fax communication, bar codes, file transfer and electronic mail.

Key words: trade, development, economics.

J.E.L. classification: L 81

1. Introduction

In concept of Economic Cooperation Organization and Development (OECD) electronic commerce (E - Commerce), represents conducting business via the Internet, sale of goods and services taking place offline or online[1].

Another definition of electronic commerce is given by Robin Mansell: "*Electronic commerce is the use of the network of value-added applications such as electronic transfer of documents to fax communications, bar code, file transfer and email. Tremendous interconnectivity of computers in Internet development in all segments of society, has led to a more obvious trend for companies to use these networks in the area of a new type of commerce, electronic commerce on the Internet, to call - in addition to old services mentioned - new ones.*"

It provides benefits both buyer and companies. From the position of the buyer, the benefits are related to: time (buyer can visit multiple shops in a very short time), the freedom to choose (because of the large

stores, the customer will be able to choose a product based on a greater number of options)[2]. In terms of companies using electronic commerce, there are the following advantages: significantly increase the speed of communication, especially for international communications, there is a quick and convenient way of providing information about the company: through Web sites, intranets and extranets, alternative sales channels: doing business through such a site.

2. The beginning of Romanian e-commerce

According to Internet Web Archive, the first online store in Romania was launched in 1997 by PC Net and it was called CyberShop.ro, selling CDs music. Soon after, eShop.ro started, the first store to that introduce the concept of shopping cart.

Meanwhile, appear in businesses online other retailers: Romanian Music Online and AllOnline.ro until on 14 September 2000 launches the first successful store: eMania.ro followed shortly by Rate.ro and MagazinulTău.ro, the latter being launched by retailer Best Computers.

Also during the 2000s, Netbridge Investments company starts OKazii.ro, an online auction site somewhat similar to the famous eBay. In winter holidays in 2001, eMag.ro was launched - currently the largest online store in Romania. We can say that the start of Romanian e-commerce took place in 2000, with the few large projects: eMania, Rate.ro, MagazinulTău, Okazii and eMag.

In terms of e-commerce websites, they were rather informative - "product catalog" type - few are choosing to buy online. Trafic.ro, a monitoring Internet traffic portal,

offered in March 2001 (according to Internet Web Archive) following statistics: OKazii.ro only get 7179 unique visitors per week, followed by Rate.ro with 4838 visitors and eMania.ro with 2357 visitors. If, at that time, conversion rate generally accepted was 1%, we can say that Okazii had about 72 transactions per week, Rate.ro - 48 transactions per week and eMania.ro - nearly 24 transactions.

3. Electronic commerce in Romania during 2005 – 2010

Romanian e-commerce began in September 2005, to show his true value. Until 2006 there were shy attempts to make e-commerce, most sites were actually extensions of existing retail business classic.

The first half of 2006 brought a value of only 2.7 million from online processing of e-commerce transactions. At that time there were nearly 500 online store that only 200 had signed a contract payment processing in 3D Secure.

2007 is the first year that total balance reported by RomCard is higher than in 2005. Basically, for the first time, pure Romanian electronic commerce exceeded the volume resulting in 90% of cases, thus 2007 ended with about 35 million online trading card from the 3D Secure system.

Table 1. E-commerce online payment by credit card(thousands)

	2008	2009	2010
Number of transactions	612	1.246	2.260
Value of trades (EUR)	53.000	92.800	127.800

Source: www.insse.ro

E-commerce online payment by credit card in 2009 increased by 75% over 2008, reaching 92.8 million euros value, according to data from RomCard. E-commerce online credit card payment in 2010 increased by 38% compared to the previous year, reaching 127.8 million euros.

Online stores will increasingly differentiate more than traditional ones by introducing new products, specialized or niche, in a context that, they will be favored because of advantage such as proximity, one

click away from the buyer, as well as reduced costs storage and presentation products[3][4].

4. The analysis of e-commerce stores

Until 2008 research that were made focused on shops that are online, currently operates and communicates and are active on the Internet as a business, had the following evolution:

Table 2. The evolution of online shops during 2005-2008

2005	2006	2007	2008
412	433	640	875

Source: own processing

After 2008, e-commerce market has grown, the number of online stores increasing by about 50% annually. Thus in 2009 the number of online stores exceeded 1,300 stores, and in 2010 reached number 2100. Top 5 cities with most online stores are: Bucharest, Cluj, Brasov, Timis, Bihor, Constanta.

There is no surprise in the geographical distribution of e-commerce stores in Romania. Large commercial centers have posted top leading Internet tradition. Bucharest (if we and Ilfov) holds more than half of the market, while the pursuers are about 20 times the distance. There is no improvement predict in the future in these figures since the stores are heavily dependent on logistics centers, rather than the actual location. Most likely we will witness the phenomenon of store-online-marketing tool (will provide the orders to those who deliver on commission)[5].

At present, Romania follows the evolution of the world in most of the products offered for sale in online shops, these are the technology (plus various gadgets) and communications.

Figure 1. The range of products traded Online

Source: www.insse.ro

Strong products (games, toys, flowers, watches, tickets) occupies only 20% of the products we find to buy in Internet commerce in Romania. Culture (book and information) is only a percentage below 10% as the number of shops dealing with look and dress[8]. It is important to remember that the direction for 2010-2011 will remain on IT in terms of products offered in online windows.

5. Consumers behavior and preferences in online trade

The Romanian e-commerce shows serious signs of strengthening, even if consumption is still into the global financial crisis. This is the conclusion of studies in recent years, a very important aspect were consumer behavior and preferences in online stores, etc. products traded. In a study by Underclick.ro company that handles the annual National Survey of Electronic Commerce in Romania, have identified several issues related to consumer habits in the electronic commerce market[9].

One important aspect represents what customers buy in Romania on online trading sites, products or services. The study results are presented in the previous figure.

Figure 2 – Online acquisitions

Source: www.insse.ro

As you can see the tendency of buyers is to purchase products which offer greater certainty in terms of materials and removing to a certain extent the mistrust to purchase.

Regarding the categories of products purchased, the application is closely related to existing shops in the market. Thus were taken as potential products to be purchased the following: computers, software accessories, hardware, clothing, shoes, books, magazines, DVDs, electronics, telecommunications services, cosmetics, pharmaceuticals, baby items, tickets, vacations, travel services, hotel services[7].

Among them are the following results in the highest values of online shopping, being situated on top: auto transport tickets, train tickets, computers, software accessories, hard, and stays, travel services, hotel services.

Figure 3. The results of online ticket holidays, travel services, hotel services purchase

Source: www.insse.ro

Average order for holidays, travel services, hotel services is 265 RON.

Figure 4. The results of online purchases of automobiles ticket, train, plane

Source: www.insse.ro

Average order tickets for car, train, plane is 305 RON.

Figure 5. The results of online ticket purchases of computers, software accessories, hard

Source: www.insse.ro

Average order for computers, software accessories, hardware is 1241 RON. Of the previously mentioned product categories that have the greatest frequency of purchase are: cosmetics, pharmaceuticals and computers, software accessories, hard[10].

Figure 6. Frequency for the results online ticket purchases cosmetics, pharmaceuticals

Source: www.insse.ro

Average frequency for cosmetics, pharmaceuticals is 152 days.

Figure 7. Frequency for the results online ticket purchases of computers, software accessories, hard

Source: www.insse.ro

Average frequency for computers, software accessories, hardware is 167 days.

As it can be notice the common element, both in terms of value of online purchases, and purchase frequency, is the IT products. Hence the high retail outlets offer products of this type. The most important criteria that led to the decision to purchase the buyers are:

Table 3. The main criteria behind the decision online shopping

Criteria	Percentage
Best price of products or services	51.14%
Short delivery period	28.55%
Store reputation in the market	19.73%
Recommendations of friends	19.99%
Advertising	28.13%
Old relations shop/ contractual relationships	55.33%

Source: own processing

As it can be notice the price is a decisive factor in deciding to purchase and trade online. Time that will come into possession of the product / service purchased is also very important.

As with traditional commerce, notoriety and advertising that the company has, and recommendations are determinative strengths in procurement process.

6. Conclusions

The unprecedented development in the last two decades due to the need of information technology storage and rapid transmission of information with the lowest costs, has revolutionized global trade, direct trade or retail, redefining the traditional principles of marketing. Today, the term electronic commerce has become synonymous with profit growth.

Electronic commerce is taking place all over the world, the world essentially as a concept and its implementation, very quickly and by closely following the exponential growth of the Internet and World Wide Web. The impact of electronic commerce on firms and society will be great both in scope and intensity. Regarding the impact on firms, electronic commerce offers unique opportunities for business reorganization,

redefinition of markets or create new markets. E-commerce initiatives can generate cost reductions, revenue increases and operational efficiencies for companies seeking to gain a competitive advantage in today's economic environment[6].

Although penetration of Internet and e-business default is increasing, this increase is actually a slow growth, mainly due to lack of trust in online transactions and security offered, due to the opposition of some in the change, when a person perceives a change as too sudden, holding too little information on its implications.

Thus the transition from the traditional model of transactions going through the purchase of "tangible goods" store, the new purchase of a product model "based on images and information" found on the website of the organization, is found by many Romanian to be a sudden transition. This could be easily removed by a gradual transition to how online purchases through the Internet as a support implementation of the initial current offline business conduct.

The Efficiency of the Management of Social Assistance Benefits

Mostavi Mihaela Cristina
„Ovidius” University of Constanta
mihaelamostavi@yahoo.com

Abstract

Social policies are defined as the amount of principles, values and customs which dominates over the social relationship among persons, communities and institutions and signifies state’s measures and actions transposed and within strategies, programs, projects, institutions and legislation. The aim of the social policies involves the collective welfare, in order to achieve the target, state’s actions presume a process which regards modification of the social life’s features of the community. The main consequence of the state’s social policies represents the social protection of the population, which is realized gathering various factors, for instance the economy, the labor market, the non- governmental area, the community. Social protection implies a continuous process of adjustment to economical changes, which causes a plethora of reforms and massive amount of laws, which have an effect on putting other laws in force, provoking incoherency within the social assistance system.

Key words: social assistance, social benefits, reform, efficiency, inclusion.

J.E.L. classification: H53, H75, I38.

1. Introduction

The national system of social assistance, according to social assistance framework law, Law No. 47/2006, is described having the status of a compound of the social protection system and includes the social benefits and services allocated with the purpose of developing individual or collective abilities, ensuring the social requirements, improving the quality of life and promoting the unity principles and social inclusion [1].

The organizing and the functioning of the national system of social assistance are governed by the same law, as well as by particular laws referring the protection of children, old persons, disabled persons, domestic violence victims. The Ministry of Labor, Family and Social Protection accompanied by the subordinated institutions issues specific public policies, administrates and coordinates the national system of social assistance, promotes the legal rights of the family, children, lonely persons, old persons, disabled persons and of each person who needs specific assistance, financial and technical support within the social assistance programs.

The main important are the social benefits, the support programs for developing the social services and the subventions allocated to the specific active NGOs, describes a strengthening manner of the social cohesion and an increasing manner of the social inclusion. [2]

2. The description of the current situation

Regarding the money transfer, achieved from non-contributory proceeds, approximately 57% from Romania’s population is covered within direct or indirect mode. Among these types of proceeds, preponderant are the allowance for children, 52%, followed by the complementary allowance, 7,9% and the special aids for disabled persons 4,4%.

In the year 2010, via National Agency for Social Benefits managed, financed and assigned rights of social benefits, for instance allowance, compensations, support and financial aid, home heating aid, subventions designed for associations and foundations which manage social assistance units for approximately 7,5 millions of beneficiaries, physical persons. The budget allocated to the mentioned purpose, was in the year 2010, in

amount of 9.127.211 RON, the preliminary payment until December 31st, 2010 was in amount of 9.062.478 RON, respectively 99,3% from the allocated budget. In the year 2010 the made payment were with 945.271 RON higher than in the year 2009, respectively 11,43%.

The social assistance system reached this increased rank of *generosity* due to the lack of *ex-ante* analysis; the politic deciders, governmental or parliamentary competed in recommendations of raising of the quantum, as well as of the specific benefits without analyzing the relevance, the opportunity and the sustainability of their procedures. Thereby, at the end of the year 2010 Romanian population exceeded the value of 84%, being covered at least by a monetary benefit. The mentioned aspect is realized directly or indirectly due to the incomes division among the house members. Referring the money transfer, almost a half of the population has in the house, at least one income resource, obtained from contributory proceeds of social protection. In the last years the expenses designed for social assistance benefits had a considerable increase, and the social assistance system has developed significantly. Nearly all beneficiaries are children due to the universal method of granting the allowance, followed by the beneficiaries of complementary family allowance, and than the beneficiaries of monoparental family allowance. We noticed the evolution of beneficiaries of monthly incentive for reinsertion within the labor market given to the parent who received compensation for children care. Gathered data proved that, in the year 2010 the beneficiaries of this type of proceeds was 35% lower than in 2009 and 45% lower than in 2008. [3].

Considering that birth rate maintained its parameters, the situation is justifiable due to the unfavorable evolution onto the labor market, caused by the global financial economic crisis, the persons preferred to remain beneficiaries of the system than retuning onto the labor market.

Within these conditions, the compound from the Ministry of Labor Social Solidarity and Family budget, designed for social assistance benefits had an increasing rate, from 582 millions RON, in the year 2003, to 9026 in the year 2010, with reference to

GDP, in the year 2010 the total amount of expenses for social benefits, increased from 0,29% , in the year 2003, to 1,77, in the year 2010. If we include more expenses, for instance the expenses designed for social retirement allowance or other types of proceeds, we noticed that in the year 2010 the total amount of expenses for social benefits reached 2,86 form GDP. These expenses represents a significant compound of expenses for social assistance from the state’s budget, comparatively with the low rate designed for social services. [4]

Label 1 The evolution of the Ministry of Labor Social Solidarity and Family (MLSSF) budget, designed for social assistance benefits within GDP, during years 2003-2010

Year	2003	2004	2005	2006	2007	2008	2009	2010
Budget MMFFPS (mil.lei)	582	1.361	1.606	3.394	5.750	7.600	8.100	9.062
Increase against 2003	0%	134%	176%	518%	888%	1206%	1292%	1460%
PIB (mil.lei)	197,5	246,5	288,05	342,4	404,7	503,9	491,3	513,6
Increase against 2003	0%	25%	46%	73%	105%	155%	149%	160%
Percentage	0.29%	0.55%	0.56%	1.05%	1.42%	1.51%	1.65%	1.77%

Source: MLSSF processed data

The mentioned evolutions prove that the social assistance system became highly expensive related to the recorded data, below the estimated data, for instance the increase of the birth rate or the equitable raise of the existence system referring to the special support of the beneficiaries.

Developing the social protection programs, within the providing benefits process, discovered a few negative aspects, as follows:

- A high reliance rate, 2,2 millions of adult persons, with proper working age, within the families which are beneficiaries of social benefits, not working or/are not included in the educational or professional training system;
- The amount designed for the families with low income, decreased from approximately 48%, in the year 2005 to 43% in the year 2009, for more persons these transfers of money mean the singular source of income,

not a complementary manner of social protection;

- The irregularities recorded within the developing programs for disabled persons, were in amount of 12% and respectively 14%, during the year 2010;
- The low number of social assistance beneficiaries allowed according to the evaluation of the real situation of the family-social investigation, and the inadequate manner of evaluation, verification and inspection determined the presence of the errors, fraud, related to cost/profit the inefficient system of social benefits;

In order to solve these issues, considered the following aspects:

- Establish a integrated system of social benefits payment;
- Reevaluate an area of the social benefits;
- Elaborate the Strategy on reform concerning social assistance 2011-2013.

3. The efficiency of the management of social benefits

As a first stage of the efficiency process of the social benefits system has been granted by establishment of Ministry of Labor, Family and Social Protection in order to manage the payment system of the social assistance and of the accordingly budget throughout of a new informational system:

- improved informational data collection system accordingly UE standards;
- unitary informational data system of social benefits payments;
- data analyze system which allow efficient procedures and policy development;
- system to cover all social benefit payments.

Data base and the records of the beneficiaries are based on following criteria: name, surname, personal number code

The second stage is based on focusing on granting the allowances to the families with a high poverty level. Considering that one of the specific conditions agreed by the Government, throughout the Loan Program for policy and development signed with the World Bank, *Public Financial Management Consolidation, of social protection and Financial area (DPL Program)* has targeted the family allowances, respectively, completed family allowance and sustaining

family allowance for single parents, the implementation of the program has been orientated towards sustaining the poorest families. Thereby, throughout Law 277/2010 for *sustaining family allowance* was decreased the income level for granting the allowance from 470 ron/person to 370 ron/person and have been enforced conditions for granting the allowance such as the evaluation of the family income, the value of the allowance based on the family's income and the children number, attendance to school with the option of decreasing the allowance.

In the same matter, throughout the OUG 111/2010, regarding *maternity leave and the allowance for the child rising*, has been regulated the method of granting the allowance for rising the child, for the children born as of January 1st 2011, in the way that the parents could choose one of the following options:

- the maternity leave and the allowance for child rising, upon 1 year age, in value of 75% of the net income over the last 12 month prior the date of the child birth, the allowance value is between minimum 600 ron and maximum 3400 ron. If the parent returns to work before the child's 1 year age, is receiving an incentive in amount of 500 ron and in case that the parent does not returns to work after the child is turns 1 years, will receive unpaid leave for rising the child up to 2 years age;
- the maternity leave and the allowance for child rising, upon 1 year age, in value of 75% of the net income over the last 12 month prior the date of the child birth, the allowance value is between minimum 600 ron and maximum 1200 ron. In this case the incentive is not granted. [4].

The third stage of the efficiency process of the social benefit system is based on development, accordingly with the Government objectives during 2009-2012 as well as the action plan provided by the governmental program and by PNR 2011-2013, of *Reforming strategy of the social assistance*, approved by *Memorandum* in 2011, Throughout the *Strategy*, is special attention is granted to the social benefits managed by MMFPS, identifying issues but also correcting measurements of those, for the period of 2011-2013.

The efficiency issues identified in usage of the available funds are:

- the fraud of the system or wrong granting of the benefits;
- addition of a high number of persons of this benefits;
- high number of benefits but with a low value;
- predominant benefits over the social services;
- low active participation and low responsibility of the beneficiary.

Also the *Strategy* establish the error control process, frauds and corruption (EFC) for the social benefits system as the central element of the social assistance reform, Due to that has been established the main components of EFC as following:

- prevention by ensuring the control over the highly risk programs of EFC and restriction of errors or of the fraudulent requests;
- detection by constantly checking of the granting method of the social benefits with a high EFC's;
- discourage, by creating and implementing of an efficient sanctioning system.

The main objective of control of EFC's aims that most of the beneficiary's of social assistance programs, to receive the proper benefits, in the right amount and to the right time.

The action plan conducted by MLFSP regarding the error prevention and control, fraud and corruption will focus on:

- simplify the social assistance system and managing of it (prevention);
- empowerment of the local authorities to verify the appliance's eligibility; (prevention)
- increasing the social activity inspections over all programs with high risk of EFC;
- identify the high risk of EFC cases based on MMFPS data base and other Ministers and guidance of the social inspection towards the identified cases; (detection)
- Ensuring resources for General Directorate of social inspection in order to detect the errors and frauds; (detection)
- Discouragement of errors, frauds and corruption by implementing a penalty plan; (discouragement)

The objectives set by the Strategy of reforming the social assistance system 2011-2013) aim decreasing the poverty, by year

2013, at least over the two population's deciles; promoting the work as the best social protection, for those able to work, in compliance with the income protection of the persons and of the low income family's; improving the development measurements of equal opportunity for the disabled persons; granting the benefits to the entitled ones by limiting the errors or frauds. [5].

Improving life quality by promoting policy regarding social inclusion, is a new direction of the social policy, direction which does not only follow the fight over the poverty of social exclusion, but also the development of a cohesive society, based on equal opportunities.

The social inclusion implies measurements and actions over the social protection, labor, accommodation, education, health, information-communication, mobility, security, justice and culture, designed for fighting against the social exclusion, In this respect, the increasing number of the employed disadvantage persons, becomes one of the prior objective of the system. Due to the fact that increasing the employment percentage is, most of the times, leading to increasing the life quality, the policy regarding social inclusion follows the stimulation of employment, as well as development of the enterprise spirit of all persons, but mostly of the disadvantage persons, by development of the private industry. [6]; [7].

The social inclusions suppose also the fight against poverty. The money transfer representing the granted benefits as well as the social inclusion indicators are monitored by the Social Inclusion Department of MLFSP. In label 1 are highlighted the indicators poverty level, in context of the gross minimum wage and of the main program of fighting against poverty, in Romania, the minimum guaranteed wage, in year 2010, Thereby, we ca see that the level of VMG (minimum guarantee wage) for a single is lower then the poverty thresholds, based on the price level of 2009, which mean that the allowance granted does not reach its purpose.

Label 1 Comparison regarding the social inclusion indicators (ron/person/month)

Source: From MMFPS, statistics of 2010

However, following the chart, is found that in Romania the poverty risk has decreased due to the found transfers, done throughout the social assistance system, as example, over the year 2009, has been recorder a decrease of this indicator by 6.7 points, as the result of granting the minimum social retirement allowance. [8].

4. Conclusions and recommendations

Even if has been noticed real progress of the social assistance and fight against poverty policy, in the way of developing an inclusive society, following analyze, a series of malfunctions of the system are highlighted, still being in a reforming process. Throughout this, the main are poor implementation of the opened coordination method, low number of analyzes, studies and researches, existence of some legislative regulation, methods and parallel evaluation criteria, which generate confusions and incoherent of the system; insufficient monitored and control of the specific activities, different administrative regulation of the service providers; lack of contraventions; lack of qualified staff; as well as improper development of the training system.

For the efficient and effective implementation, by the local authorities, of the social assistance policy, is recommended, on one side, to create a communication channel between the responsible authorities, and on the other side, the development of the ability of the monitories, evaluation and analyze systems of the social assistance and social inclusion indicators, in order to ensure quality services.

The analysis of existing data and research results on the evolution of the Romanian population and the interdependence between

population, development, poverty, environment, consumption and pollution levels, indicate the need to formulate legislative proposals necessary for Romania to cope with problems posed by population trends, and developing a national strategy on population through which to implement measures in the social, medical, educational and economic, child-centered, maternal and young family spheres.

Social inclusion policies, in order to be effective and sustainable must be built on the principle of proximity, integration and transversality, and in accordance with the respect for diversity and differences, equality in the exercise of rights and co-responsibility in decision making. To realize such policies, it is recommended to strengthen the capacity of analysis, research and evaluation of the impact of measures implemented in the social inclusion area. It's also recommended, the developing of a map which is to include supply and demand in social services and social benefits and social needs identified in each county, promoting the development of a fair, harmonized and integrated social service at national level. Also, integrated measures of social inclusion should be implemented, in order to avoid social assistance dependency, and also the open method of coordination, civic education campaigns in community schools, the development of a participative and proactive culture among the population and beneficiaries of social services, and social responsibility for both local government officials and citizens.

Development disparities between regions remain a difficult problem to solve, but are essential in resource allocation for implementation of social intervention programs based on real needs and not equally. To identify problem areas it's recommended to do data collection at village level so that intervention through projects to be punctual and not throughout the region or city.

To prevent access to both social protection system component of social assistance - persons with disabilities, and the social insurance component - disability pensions, given that there are people receiving both types of benefits, it is recommended to review the classification criteria for the two categories of benefits, in order to establish a clear dividing line between the two systems.

Another solution, in order to improve cost with benefits for these categories, it is to merge the two systems, given the material features of the social security system, namely in the field of expertise of working capacity.

Given on the one hand, global economic crisis which obliges the state to direct funds to support economic recovery, especially to the public investment sector, and on the other hand, the costs involved in social care sector and the problems found in its operation, it is recommended for decision makers to focus their efforts on accelerating the reform process in this system. This will increase the effectiveness of social protection measures, will considerably reduce the possibility of fraud in the system and will ensure the directing of funds to the most vulnerable. In this respect it is advisable to reduce the universal financial benefits and implementing them based on needs assessment, because the current system is providing a large number of beneficiaries with very small allowances, many of them having a value below poverty. It is also recommended to rethink the relationship between gross national minimum wage, unemployment benefits, guaranteed minimum pension and minimum wage, in terms of balancing their average values in order, on the one hand to encourage employment, decreasing the trend of retiring as a means of providing income, and on the other hand, to combat poverty and social exclusion among the categories of beneficiaries.

It is recommended, both in social assistance area, as well as in employment area, the transfer of interest of the responsible institutions, from the area of the passive measures - social benefits, unemployment compensation, in the active measures area - social services, namely, stimulation services of employment and properly attracting beneficiaries in this process. The concept of social economy is increasingly cited, particularly as a specific objective within programs of social inclusion. There are enough projects in implementation through which the social economy structures are created. Being at the edge between capitalist economy and public economy, is recommended that legislative reglementation of the concept, that way ensuring the sustainability of the social inclusion,

Steps of Competitive Economic Development in Romania

Moşnianu Cristian
"Ovidius" University of Constanta
cristianmosnianu@gmail.com

Abstract

Retrospective development of Romanian economy may lead to the conclusion that it has been marked by transition, being conceived as a long and complex process of transit from one type of society to another, taking into consideration the fact according to which the concept of evolution combines institutions, structures and elements of the new society along with those of the previous one. Historically, modern Romanian economic life in all its aspects, has been under the influence of Western models and experiences.

Key words: stages, market, evolutionary, transition, competitive.

J.E.L. classification: C70

1. Introduction

Thus, in the second half of the eighteenth century, substantial transformations affected the Romanian countries in all areas, that were caused by the collapse of the old feudal relations of production and the emergence of capitalism that would develop in the first half of the next century.

This transitional period (the "crossroads of time" as C. Conachi in 1822 called it in the moment of the investment of John Sandu Sturdza at Constantinople) was characterized by increasing social division of labor due to the importance of the manufacturing production, the gap between natural economy and the one based on exchange due to the considerable broadening of the internal market and the economic and cultural links among the Romanian provinces.

2. Evolutionary stages

Early forms of modern economy appeared almost at the same interval with the reforms of Constantine Mavrocordat (1739-1749), which produced substantial changes in social, fiscal, justice and administration area, creating the social premises of the Romanian national state formation, development of organic regulations were meant as a step forward in the preparation of institutional unification of the Romanian Principalities, in agreement with the aim of state organization standardization, the development of commercial contacts, the formation of a single market and a community that is being based on a solid economic activity. In order to facilitate commercial transactions, the same currency was established and freedom in respect of the people of the principalities to acquire movable and immovable properties.

The union of the Principalities has marked the beginning of a crucial period as regards the construction of modern economic structures. The laws and decrees that were adopted during the period 1859-1877 (including the development of the Romanian Civil Code and the Romanian Commercial Code) are only facets of a vast restructuring act that builds the foundation of the capitalist world: individual freedom, freedom of contract and private property.

The institutional renewal topic that was perceived as legislative action, the law of consecration of phenomena, processes and modern economic relations were subject to controversy, thus involving philosophical, sociological, economic, political, and social ideas with socio-economic and political consequences regarding "forms without substance". In the decades that elapsed until the late nineteenth century, the key institutions of Romanian capitalism were established, among which the most

significant appeared to be the National Bank of Romania.

In terms of the state's protective aspect the legislative imposed an accelerated development path, according to the economist Stephen Zeletin. Between the two World Wars the economic policy was focused on legislative measures and institutions the role of which being to reinforce and accelerate economic development, as confirmed at the end of the interwar period. Romanian capital and capitalism were concrete realities, with notable performances at European level in respect of some areas.

In the years 1945-1950, in Romania were, however, imposed laws and legislative measures, aimed at the basic segments of the economy in the sense of establishing a new type of economy in which dominant was the existence of state property, acquired by means more or less in agreement with the new elaborated legislation. Thus, in 1948, by Law no. 119, the nationalization of the main means of production was introduced, on which occasion the former private companies were taken over by the state, the same year by Decree no. 303 and Decree no. 134 pharmaceutical units and healthcare institutions along with cinemas were nationalized; in 1950, by Decree no. 92, the buildings with different destination than the productive one were transferred into state property. In this situation, the private property right was, practically, abolished, thus, all the principles of market economy were also replaced by new principles and a model (theory) of the command economy appeared, the distinct feature of which being the orientation of business agents is centralized through the state apparatus.

Therefore, a specific economic law was structured, law of proportionate development plan of national economy that displayed the ratio causal determination between the use of national resources and the degree of satisfaction of social needs. Although apparently this concept would meet the requirements of a typical economic model of social market economy, in reality it had proved a failure due to the objective impossibility of being applied, mainly characterized by generalized public property, which should have led to the standardization

of social needs and thus creating a single social strata.

In this period, laws of market economy have been suspended starting with the suspension of applicability of the Commercial Code, supply-demand relations were governed exclusively by a single political decision, without a realistic basis of productivity, which led to the accelerated deterioration of the economic situation of Romania.

In less than half a decade, the international economic isolation determined the destruction of principles and foundations of competitive market economy that required efforts on an interval of more than a century. Historically, Romania did not approve for decades this market economy standard and stood for a different way of organizing economic relations by means of so-called socialist production relations, characterized by the dominance of socialist property on production means through the generalized action as regards the economic laws of socialism, as a result from the abolition of private property and competition.

Being perceived as generators in point of economic and social exploitation of labor force, private property and competition were explained as being harmful elements of development, although, in essence, their role was recognized in a certain manner: private property, had appeared, determining competition, competition that expressed "the struggle of private goods manufacturers for more favorable production and sale conditions".

Monopoly of state property has led to a series of negative effects, which affected the emerging market economies. Among them are included the following:

- ✓ monopoly of state property caused an excessive concentration of property as regards important economic units - hence the serious difficulties in sourcing and providing resources

- ✓ monopoly of state property represented the basis of super - centralized management -the local government's role was dramatically reduced to extinction, leading to increased bureaucracy and formalism

✓ monopoly of state property decreased the initiative and the responsibility of investment risk, altering, finally, the efficiency.

Abstract

Retrospective development of Romanian economy may lead to the conclusion that it has been marked by transition, being conceived as a long and complex process of transit from one type of society to another, taking into consideration the fact according to which the concept of evolution combines institutions, structures and elements of the new society along with those of the previous one. Historically, modern Romanian economic life in all its aspects, has been under the influence of Western models and experiences.

Key words: role, consolidation, law, transition, competition.

J.E.L. classification: C70

Promoting the culture in the field of competition, process which today is being initiated and performed by the Council of Competition, is an especially important aspect of the operation of applying the competitive rules, next to using the specific tools in order to control the anticompetitive practices and to control the economic “cartels” and the government benefits, and to achieve the main goal, which is the accomplishment and consolidation of a functional market economy that can ensure the integration under the best conditions of the Romanian economy into the European one.

In this context, the role of the Council of Competition is undoubtedly linked to the politics of competition, which, on its turn, is essential for the good functioning of the market mechanisms and obtaining lasting advantages for the consumers, concomitantly to optimal allocation of the resources and promoting the economic growth. The existence of a set of rules and of the

institution watching over respecting these rules by correcting the behavior of the economic actors and of the authorities is needful to any functional market economy.

Concretely, the changes applied at the end of 2003 to the two main laws in the field – The law of competition and the Law of state benefits – marked the beginning of a new step, legislative and especially institutional. Removing the malfunctioning created by the existence of two institutions delegated to administer the main laws (The Bureau of Competition and the Council of Competition) and assigning the tasks to only one authority, the Council of Competition respectively, and taking over the newest communitarian regulation regarding competition and government benefits, attracted the necessity to modify the secondary existing laws, as well as to adopt new rules and instructions to completely put under practice the recent changes made to the Law of competition and the Law of state benefits.

The new legislation gives increased authority to the Council of Competition, so the Council can disagree to any legislation that has opposite ideas to the ones regarding competition. These changes contributed to the completion of the institutional construction of the competence authority and, with the support given by the Government in the field of the needed insurance of the logistics, from which can be named the insurance of a proper main office for a company, put the bases of an institution according to the European demands.

The Council of Competition was established under the Law of competition number 21 from 1996, with the ulterior changes and completions as an autonomous authority in the field of competition. Considering its organization method, the Council of Competition was ensured the independence in decision making in the field that is administrating. This way, the Council

of Competition, as an autonomous administrative institution, performs its activity, deliberates and makes decisions in plenary and commissions. The decisions made in plenary are taken with the majority of the votes, considering that each member of the council can vote once and, in case of equality, the decision made by the president is being taken.

The Competition Council is made of seven members: a president, two vice-presidents, and four councilors. The members are named under decree by the President of Romania, at the request of the Government. One mandate lasts for five years and a member can be renamed only one more period. As an autonomous public institution in the field of competition, it also contains specialized bodies, with tasks related to performing investigations in the field of concurrence and state benefits, to analyze the notes concerning economic “cartels” and the state benefits that enter under the incidence of the law, research and supervise the markets, to make the inventory, reports and to monitor the state benefits, and in the field of European integration and international relations.

The role of autonomous administrative authority given to the Council of Competition has two aspects: a preventive one, to monitor the markets and to supervise the behavior of the economical agents, so by its interventions to avoid a significant distortion of the market competition, and to get involved in the legislative process in order to avoid the dispositions with anticompetitive character; the other is a correctness aspect, to reestablish and maintain a normal competitive environment.

The law of competition confers to the Council of Competition the authority and the specific instruments to achieve its final goal, which is to protect and stimulate competition to ensure a normal competitive environment, in order to promote the interests of the consumers. Into practice, this idea showed that a functional market economy, based on competitive mechanisms, is the best way to reach the wellbeing of the consumers, with all the imperfections that this solution may bring.

In a competitive market practically functions the law of supply and demand and the buyer has the chance to choose products

with lower prices and superior quality. It is known the fact that a normal competitive environment leads to satisfying the clients’ demands, as well as an efficient allocation of the resources in economy. To maintain these mechanisms functioning, rules and institutions are needed to permanently watch over respecting it, and to interfere when certain acts or facts can lead to the elimination or to a significant distortion of the competition. This role of “guardian of the market economy” goes to the Council of Competition. At the same time, by the authority conferred by the law, the Council can oppose to adopting any legislation that may contain anticompetitive regulations which, also, contributes to maintain and develop the competition.

Should be noted the fact that the role of the Council is to defend the competition, under the conditions that to enter the market is a free process, not blocked by artificial barriers, and the inefficient operators leave the market objectively, through bankruptcy. The economic operators have to “defend themselves” by growing their efficiency and respecting the rules of the game.

The competencies of the Council in the field of competition and state benefits are mainly the following:

- ✓ To regulate
- ✓ To investigate
- ✓ To make decisions
- ✓ To sanction
- ✓ To release notices, recommendations and proposals.

Consolidated Accounts – Management Instrument for the Group of Companies and for the Thirds Information

Motoniu Ioan Dumitru
“Valahia” University of Targoviste
ioan.motoniu@bnro.ro

Abstract

The purpose of the present paper is that one to emphasize the fact that the companies operate very well having on their base the consolidated accounts, these consolidated accounts being as a matter of fact an important management and information instrument for the companies of a group, and for the thirds also.

Key words: consolidated accounts, management instrument, group of companies, mother-company

J.E.L. classification: M41

1. Introduction

At the beginning of their being, some groups of companies were establishing consolidated accounts for their management needs or at the request of the foreign mother-companies. Afterwards, the obligation to publish the consolidated accounts conduced to the consolidated financial information development. From this legal obligation, the interest in the consolidated accounts occurred, related to the internal information they contain, the consolidated accounts to be published being nothing else than the results of this information. To that effect, in France, the Stock Exchange Operation Committee (C.O.B.), had an important role in accelerating the establishment and implementation the regulations regarding the consolidated accounts, through the implementation and adaptation in the French Accounting Law of the provisions of the European Community VIIth Directive from July 1983 and of the international practices in the field.

In compliance with the French example, I consider it would be beneficial the initiative to involve the National Securities Commission from our country in a process of starting to prepare and implement the specific legal regulations.

2. Consolidated Accounts – Management Instrument for the Group of Companies and for the Thirds Information

In order to appraise the branches management, the mother-company managers may dispose, depending of their location (in the country or abroad) of the national regulations and activity sector – **homogenous bases**, that is financial documents established on the basis of the same principles. Such a thing allows: the decentralization, which paves the way for the dialog using a common language; establishment of forecasting elements on standardized bases; the control, at the mother-company level, of the reliable documents base; diagnosis, on the basis of reliable information. As a general rule, the dispersion and multiple activities make the synthesis carrying out of the group of companies consolidation service level to often become extremely delicate. The consolidation procedure carrying out require a standardized, regulated and controllable information circuit. In such a way, the mother-company can: establish the goals which are in charge of each company of the group, the commonly established provisions being assessed in homogenous terms; valueate the companies performances and compare among them, the forecasting elements included; proceed to sub-consolidations per activity branches. In a complementary way, the accounts consolidation organization must allow to get specific analyses, especially

those ones regarding: consolidated financing table; results per activities branches – when the group carry out activities of very different kinds, having the possibility in this way to highlight the contribution (positive or negative) of each branch to the holding global productivity ; comparison at each branch level of the rate between the got result and the used means (production means, financial means, etc.); geographical areas results. Finally, in a more global way, the consolidated accounts and the documents resulting from the consolidation allow to the group management team to better understand : the group evolution – taking into account the turnover, profit, investments, activities branches or geographical areas development; holding financial standing; holding „weight” and global productivity in relation to other holdings.

The consolidated synthesis documents allow to get the **forecasting consolidated accounts**: information regarding the forecasting basic activities, forecasting consolidated financing table, calculation of the forecasting consolidated self-financing capacities, all these allowing to the group management team the following: definition and figuring of the most important options of the group; continuous researching of the best financing ways; rational distribution of the available resources; communication with the companies inside the group.

The consolidated accounts must be considered more and more the true accounts of a company considered to be the group of companies leader. Hence, acc. to the ARB 51 Norms, in U.S.A., the consolidated statements are considered as being more significant than the individual ones and, generally speaking, necessary for the real description of the activity of a company pertaining to a group which has a direct or indirect financial interest allowing the control over other companies.

The consolidated accounts usability, as regards the external information, is conceived by the meaning of *insufficiency of the mother-company individual accounts* and the difficult problems of interpretation when these accounts are simply juxtaposed over the accounts of the group companies.

The mother-company accounts, individually, can not inform correctly the „readers” of the financial statements about

the assets structure inside the group or the actual results.

For example, in France:

*in the mother-company's balance sheet, the possessed participation titles are valued to their purchasing cost and this does not allow to know the respective investment progress, which are the assets of each company part of the holding, which are the financing ways, etc.

*in the results account, the mother-company include only the received dividends; these dividends may be – and the most frequently they are – different from the registered results;

*an external person can not know the content of the mother-company consolidated accounts, that is to know if the turnover are completely in compliance with the sales towards different external thirds or an important part of them is the result of a stocks transfer, etc.;

*it is not possible to know if an important profit is not counter-balanced by a loss of similar value registered to another company from the same group.

The consolidated accounts **allow** to avoid all these inconveniences and to supply, to that effect, extremely useful information.

The consolidated accounts allow to present;

a) on a hand, a general information, particularly analyzed by fiscal-grade assessments;

b) on the other hand, information required by the financial statements analysts:

***for the financers** (bankers or private financers), the consolidated accounts allow to know the way of the credits volume adjustment, depending on the group actual needs and reimbursement possibilities, as well as a first assessment of the risks to which they are subject to: if that one who lend (loaner) is the mother-company, the consolidated accounts indicate „the financial face” of the group, on the contrary, if it is another company from the group, such information can allow the assessment regarding the financial support power of the group in case of bankruptcy;

***the partners** find in the consolidated accounts the net result of the economic assembly set up by the group, the self-

financing capacity (global or per share) – elements which allow the actual assessment of its value potential;

***financial analysts** can assess in a different way, on the basis of the consolidated accounts information, the ratios regarding the productivity, investment capacity, business volume, etc.;

*finally, **other thirds parties**, particularly the employees, customers, suppliers can find in the consolidated accounts elements regarding the group size and importance, its economic and financial capacity and potential, etc. As a conclusion, starting from the group definition and of the relationships established among the „bind” companies in its framework, it is stand out in relief **the need and utility of the consolidation carrying out and consolidated account submitting.**

Thus, the consolidation is directly connected to the group concept, and the purpose of the consolidated accounts is to describe the patrimony, financial standing and results of the assembly established by a consolidant company and the companies attached to it, as they would be a single entity.

The need and usability of a mother company consolidated account drawing up and submitting derives from the taking into account **of at least two points of view:**

a) the accounting data, that is:

* **the patrimony**

The consolidated account give points to the entire patrimony form whom the group is responsible. This patrimony can be represented by plants, immovables, intangible assets or even financial assets and it is much more probative than the consolidated companies titles mentioned in the consolidant company's immobilized assets.

* **financial standing**

The consolidated accounts shows all the creances and debt claims and debts towards external third persons qui have an incidence over the companies included in the consolidation regime, the mother-company balance sheet mentions the loans towards the other companies of the group. In the consolidated accounts, these internal debt claims and debts are excluded, and only the actual (true) claims and debts towards the

third persons are included. In such a way, the sterling actuality of the debts towards the external debt-holders.

• **the results and the activity**

By means of the consolidated accounts, the turnover achieved by the group is easier quantized. This thing is also valid for the results, given one of the rolls of the consolidated accounts to emphasize the quota from the results of each company fiscal year which is assigned to the group, either these results are distributed, or they are kept in reserve.

In the annual accounts of a consolidated company the following are showed only: the branches dividends (result connected to the previous financial years); provisions for the depreciation of the low results branches.

For the rest, the consolidated result does not find out the profits coming from the group internal results: dividends, trade margins applied to the stocks rising from a group company, added value related to the assets surrender, etc.

b) the group management:

In the case when the group purchased the titles of a consolidated company, the consolidated accounts stipulate the writing off of the titles purchasing difference. The group results must allow the writing off of this purchase difference, otherwise the group future would be flooded.

Vice versa, if an external growth realized through some companies purchasing is a success, the consolidated accounts allow the detection of the lever actions which may represent the in case group management.

Therefore, the consolidated accounting become **an useful information means of the internal and external users**, offering data regarding the group patrimony, financial and results status.

At the same time, it represents a **management means allowing to measure the group results and to analyse the productivity, depending on different criteria.** In such a way it is possible to compare the groups among them and also the companies of the group among them, the consolidated accounting being the start point of a good managerial politics and of good strategical decisions regarding the investments, financing sources, group productivity.

3. The consolidation area, the control percentage and the interest percentage – an important matter of the consolidation process

The consolidation area definition was given through the article 357 of the Law of July 24th, 1966, which stipulated the following: „Each year, the commercial companies establish and publish consolidated accounts as a report regarding the group management, for those ones which are controlled in an exclusive way or simultaneously (one or many companies) or when they exercise a strong influence upon them.”

To define the consolidation area means to establish the companies which **are** kept in the **consolidated assembly**. This issue still represents the subject of various disputes in the international accounting community.

One of the basic issued the authors of the new regulations regarding the consolidation must face was that one regarding the definition its **implementation area**. And this because, at the macro-economic level, another problem occurs, is that of the number of entities forming alongside with the mother-company the consolidated assembly, that is the **definition of the consolidation area** – here is an extremely important issue.

The financial analysts know very well, for example, that the consolidation exclusion of a financial branch of an industrial group because its turnover is low conduce to the risk to produce a bad image of the group status.

A law system which would allow numerous exclusions will conduce, without doubt, to evil consequences on the accounts compatibility and the financial analyses pertinence. This issue is connected to that one of the control definition, of knowing if a company is part of a group and to be consolidated, it is necessary to determine the influence degree the mother-company exercise on it. It is the matter of a difficult problem which involve the need to take into consideration different concepts of control: economic control or legal control, etc.

The **control percentage** or the **votes**

percentage represents the quota of the votes the mother-company owns to another company. This percentage takes into account

the number of votes, not the numbr of shares owned by the mother-company. In the developed countries practice there are:

- * common shares: a share – a vote;
- * priority dividend shares : without vote;
- * double or multiple voting shares.

In order to establish the control percentage, it is necessary to also take into account the connections which exist between the mother-company and the other companies (direct, indirect, crossed, circular).

The **interest percentage** represents the quota owned, directly or indirectly, by the mother-company in the capital of the companies kept in the consolidation area. This interest percentage must be calculated taking into account the number of the owned shares and the type of relationships which are there between the companies. In the consolidation process framework, **the interest percentage** is used for the elimination of the participation titles owned directly or indirectly by the mother-company in the consolidated company capitals.

It results then that the control way is established depending on the control percentage, and the interest percentage will be reserved when proceeding to the consolidation method implementation.

Generally, the various law systems and theories agree to not involve in the consolidated assembly the companies on which the consolidant company exercise a weak influence only, they having a reduces importance for the management.

On the contrary, two big problems cause the occurring of different concepts.

The first problem : it is necessary to keep in the consolidated assembly only those companies for which the consolidant company survey the management control or, contrariwisely, to extend this assembly with all the companies on which an important influence is put even this influence is not sufficient for a dominant position exercise.

The first concept points the getting together in the consolidated assembly only those companies to which a coherent strategy can be

imposed. The second concept, more

comprehensive, is of financial inspiration.

The second problem : in order to establish if a company can controle another company, it is necessary to take into account the legal criteria, such as: owing the majority

of votes in the general assembly or, on the contrary, to apply to economic type criteria which allow to establish a dependence relationship ?

In order to answer this question, I consider as an example the contractor company „A” whose orders would come almost exclusively from a very powerful group „H”, group which also owns a part of the „A” capital interest. It is clear that implementing a control criterium of economic type, the „A” company will be included in the „H” group, this reasoning being related to the economic dependence. In the contrary, selecting a criterium of legal type, would mean the exclusion of „A” company from the consolidated accounts of „H” group.

Thus, if the utilization of an economic type criterium seems to be logic, it is necessary to take into account the actual requirements of the dependence real status of the respective companies – which often may be difficult, even impossible to be managed and can arrive even to contesting. The legal type criteria have the advantage to simplify the operation putting, but their inconvenience consists in frustrating and not taking into account the existant economic realities.

The legal criteria allow the establishment of the developed control case, beyond this every other situation being doubtful and being necessary to select them cautiously.

The **exclusive control** may be: by rights, de facto, contractual or statutory.

There is the **exclusive control by rights** when a company owns, directly or indirectly, the majority of votes in another company, that is more than 50% of the votes in the shareholders general assembly.

The **de facto exclusive control** results from the owning, during two consecutive financial years, of the majority of the members number in the managing board. When the shares of a company are distributed among a greater number of persons, there is the possibility of the exclusive control, even owning less than 50% of the votes.

The **contractual or statutory exclusive control** is when a company has the right to

exercise a dominant influence on another one, on the basis of a contract or of a contractual clause (statutory).

This control way takes place when a limited number of associated shareholders share the control of a company and the

decisions which are made are the result of their common agreement. Such a control is met in the case of the multi-group companies.

For the simultaneous (common) control, two requirements must be met:

- * the power (control) sharing;
- * availability of a limited number of shareholders or associates.

The „simultaneous” (common) denomination means the fact that none of the companies can, individually, exercise an exclusive control.

In the international law (for example, the French one), the important influence on the financial management and politics of a company is considered when a company hold, directly or indirectly, a part at least equal to 20% (1/5) of the company's **votes**.

Holding 20% of the votes does not represent something else that the presumption of an important influence; practically, the power (influence) effective action is required.

At the doctrine level, a company has an important influence on another one if it takes part to its decisions making process. This participation means:

- * representation in the management bodies;
- * existence of some operations between the companies;
- * personnel exchange;
- * information exchange.

The I.A.S.C. Norm no. 3, afterwards modified, is clearly different of the French regulation as regards the exclusive control definition, this being conceived in a legal way, as follows: „The control represent the possession, direct or indirect, over the branches of more than half of the votes in a company. In the exceptional cases, the control done by a company can also be accepted when this company possess the majority of the normal capital without possessing the majority of votes or when it has the power to legally or contractually control the financial management and politics of the in case companies. At the same time, a similar situation is registered when it has the power to designate the majority of the administrators, related to the management contract or as a result of a legal decision.”

This restrictive concept has developed at the same time with the project to revise the I.A.S.C. Norm no. 3, the ED 30 text project, stipulating that „under few circumstances, the

control can result from the capacity to unite the majority of the directors, as well as also if the investor possess less than half of the votes.” I.A.S.C. has also a position different of the French one as regards the consolidation exclusions. The I.A.S.C. Norm no. 3, as well as the ED 30 text project, do not mention, among the possible exclusions, the case of the companies for which the information required for the consolidated accounts building up can not be got without excessive expenses or during sufficient periods of time. The mentioned norm underline that „the exclusions based on these reasons are often subjective and can result in practice from the important differences between the companies which account similar situations.”

This norm does not mention for the optional exclusion in the case of the low importance branches, since the importance principle represents one of the basic principles of the I.A.S.C. Norm no.1. The F.A.S.B. Norm no. 94 notes a merely legal criterium for the control qualification: the votes majority property which represents, in principle, the basic condition for establishing the control availability as regards the consolidation exclusions. The F.A.S.B. Norm no. 94 provides its maximum diminishing. The previous norm, A.R.B. no. 51, allowed to the companies to be excluded from the consolidation process **when** the control were temporary only or implemented for reason related to legal or bankruptcy re-organization. At the same time, the A.R.B. no. 51 Norm did not allow to exclude, under certain conditions, the branches presenting a heterogenous activity, as well as the foreign branches submitted to the exchange control and limitations.

4. Conclusions

It is not possible the consolidation exception of the branches having an activity called „heterogeneous „ - financial-banking branches or having the insurances as activity object . F.A.S.B. made this decision after it found out that, after few years, the exclusion of the financial branches prejudicial to the consolidated accounts and headlighted by the financial analyses was proliferating.

Finally, the foreign branches consolidation exclusion is possible only under the same conditions as for the branches.

The European and international present regulations do not deliberately stipulate the consolidation exclusion cases, but only the serious and lasting restrictions imposing such situations.

Therefore, under the reserve to explain in the annex drawn up by the consolidant company or participation, it is left out the consolidation area when serious and lasting restrictions occur as regards, especially:

- * the control or influence exercised by the consolidant company over the participation branch;

- * possibilities to transfer the funds to the branch or participation.

Abstract

The permanent progress of the human society and that one of our present days particularly, have propelled the information as an indispensable need for the decision making process. More and more, the economic entities management is based on dynamism, flexibility and forecast, all these enjoining the use of operative and complex data for the decision making process. The volume diversification and growth of the information/data which are related to the in-house processes of the economic entities and the need of solving a series of categories of more and more complex problems, generated by the moving to the market economy, make the management accounting to be one of the manager's basic instruments in the managerial process, that is in the opportunities appraisal, action directions orientation and organizational strategy drawing up. The goal of this paper is to highlight the importance and role of the connection between information, management accounting and decision in the managerial process of an economic entity.

Key words: information, accounting information, management accounting, decision, managerial process

J.E.L. classification: M41

1. Preamble

Generally accepted, the information is a reality form of knowledge through which there are supplied news/messages from a certain field of knowledge regarding the kind, features and size of the objects, events, phenomena

and processes composing the environment. In the social-economic life, one of the basic form of the information is the economic information, and inside its framework, it is the accounting information which vehiculates reflection and control knowledge regarding the patrimony status and the results achieved.

The accounting information is got through own accounting economic data processing methods, procedures and instruments, being the more realistic, accurate, complete and operative information, representing the base of the managerial process. The majority of the decisions made in the managerial process are based on the information got from the accounting department.

The management accounting is a detail accounting, offering the information necessary to the appraisal of the production factors utilization way in the framework of the in-house technical and organizational structures, acting for the record and supply of information regarding the expenses level in contrast with the expenditure budget, as well as the cost of the products, works and services, actually steering the managers in making the best decisions within their managerial activity. Such a thing denotes the fact that the accounting information has generally an important place inside the economic records system and especially inside the economic information system, system which represents the base of the managerial process.

2. Relation: information - managerial accounting - decision, in the framework of the managerial process

The unprecedented progress of the human society of our present days has propelled the information as an indispensable need for the

decision making process. This article aims at demonstrating which the relation: information – management accounting – decision, in the framework of the managerial process. The information system represents an organized and integrated data and information assembly, including the procedures and means used for their acquisition, processing and transmission. The economic information represents one of the basic forms of the information, generally being generated and used in the economic activity, by the processes and phenomena carried on in this field. Actually, it is an assembly of indexes and ratios which constitute the set of data required by the economic activity organization and management.

The economic entity appears in a triple aspect: as an information generator, as an information consumer and as an information vehicle. At the level of an economic entity, the economic information can have the form of: production factor; company's intangible resource; base of the analyse, decision and control process; specific form of representation; capitalization of the organizational knowledge. For the economic and financial analyse, the economic information represents the basic raw material because this analyse is based on information and, in its turn, it supplies information which are the base of the economic entity whole activity.

The accounting information reflects the economic entity status at a moment, the economic activity development, the measure in what the business is profitable or not and offers to the managers, as well as to other interested persons, an overview about an economic entity. Thus, the accounting information is proved to be all-important to a manager, being the main instrument through which the manager can know his company's evolution.

The decisions foundation at the economic entity management level (which corresponds to the decisional sub-system) is based on the information coming from the information system level. This thing is particularly important for the economic entity activity because its health depends, in a predominate degree, on the decision making speed and their accuracy, decisions which are based exactly on the information supplied by the information system.

The accounting information is produced by specialized structures, organized inside the economic entities as distinct functional departments (accountancy or financial-accountancy) or outside it, as independent legal entities or certified physical persons (certified accountant, chartered accountant/auditor) and whose activity object is the accounting information getting.

The accounting information must allow to the present investors, as well as to the potential ones, to identify, measure, classify, appraise all the operations and activities of an economic entity, being supplied by the accountant. In order to have useful accounting information in the managerial system framework, four main qualitative features requirements must be met, that is: intelligibility, relevance, credibility and compatibility. The accounting information privalently addresses to the company's external users, but the economic entity's internal users, as managers, place must not be neglected.

Analyzed in terms of the information theory, the accounting information has a double determination: qualitative or of rating and quantitative or of status. The qualitative determination designates the kind and nature of the patrimony element to what the information refers (fixed means, raw materials, liquid funds), and the quantitative determination refers to the condition of the patrimony element, or to the value defined by reporting.

The multitude and diversity of the information administrated and supplied by the accounting information system can be firstly separated in legal and financial information, which refer to the operations generated by the relationships with the thirds, allowing to know at any moment the sums owed to the suppliers, employees, social legal bodies, creditors, etc., as well as the sums to be received from the customers, debtors and other debenturers, presentation, towards the fiscal bodies, and substantiation of the turnover, incomes and expenditures, based on which the result, as profit form, had been established. In the second place, they are ranged in information of economic nature, which refer to the knowledge of the goods cost price, works execution costs or services supply costs, the profitability level achieved after their selling on the market, the value amount of the factors which caused or

determined the volume of the results got during and at the end of a financial year and, at the same time, for the prospective knowledge of the evolution way of the debts, claims, price costs, final results, etc. within the next period, based on such information which are supplied to the economic entity administration, the whole its economico-financial activity can be well learnedly managed and directed.

Practically, the accounting information are identified with the financial-accounting data regarding the status and movement of the patrimony elements and also with the economico-financial indexes and ratios regarding the resources and the got results.

A more realistic or purer accounting information can be got during the practice of the cash accounting, where only the actual aspects from the treasury accounts level are registered: bank accounts reserves, cheques and other bank bills and for the rest, the accounting information can be considered to be enough at the moment when it is in compliance with the standards, but the conformity to the accounting standards is a thing which is defined very difficultly, these standards containing a number of exact rules for which the economic entity practice conformity can be facilitated as regards its representation, a last reference being its faithful image.

The accounting information of an economic entity can be classified in two important categories: financial accounting information and management accounting information. The financial accounting information is intended for the external users, such as investors, employees, creditors, government or public and it is designated through the consolidated balance sheets or, shortly, financial reports/statements. Yearly, the economic entities administrators must draw up a set of financial reports, in standardized form, including: the balance sheet, profit-and-loss account, own capital modifications status, treasury/cash flows status and accounting policies and explanatory notes to them.

The management accounting information is intended for the in-house users, that is the economic entity management. The external users are very different: shareholders, funds borrowers, public power, employees, trade unions, associations of employers, customers, suppliers, public, legal bodies and consumers

groups. The growth of the number of favoured users entails an input of new elements and new extensions regarding the accounting notional framework. The built up information is intended for the administrators, as in-house beneficiaries, who must answer the question „how to distribute and use the resources utilized by the investors for the profitability carrying out”.

The accounting information is not standardized, often it not in money and includes information regarding the products unit cost, costs behaviour against the activity volume or profitability per product. The reports are supplied to the administration, from time to time, at short periods of time – monthly, weekly or daily and are circumscribed to some economic entity subdivisions called responsibility or profit centres. An information system well organized in the financial field, which contains relevant indexes and ratios for the managers, calculated on the basis of correct and actual data, acquire a place more and more important for the respective economic entity and for its business partners also. More, the financial analyse ratios will be used to the draw up a diagnosis regarding the profitability, the risk and the value profitability. We can then say that the field which meet in the best way the administration information requirements is the management accounting. The competition growth caused economic relationships more and more complexe, relationships which required better and better accounting systems and, in such a way, the management accounting became more and more important for the managers' decision making process.

Professor Mihai Ristea defines the management accounting as being „the analytical representation of the in-house processes of the companies which produce qualitative and quantitative transformations in the patrimony mass”. The process, as regards the diversification of the economic life exercise forms, as well as regarding the technics used in the accounting exercise, resulted in the accounting sedimentation and consecration as a scientific discipline, having a solid practical and academic base. The accountancy definition encountered, during its process, mainly, as regards the category in which it should be included, being considered art, or technics, or scientific discipline.

Different authors, such as Michael Capron, consider the accounting as being „a quantitative technics of information gathering, processing and analyse, applied to the companies economic and judicial events”. But, once the accounting theory had been developed and built up, theory which is based on the accounting system, the technics stage is overpassed. According to other authors, such as the Professors N. Feleaga and I. Ionascu, the accounting is considered as being „a mature scientific discipline, including a plurality of paradigms and discipline groups (scientific communities), opened to the basic and applicative research”.

At present, the accounting is described in a dual way, being divided in two distinct, but interdependent components: the financial accounting, oriented towards the in-house information consumers, as well as towards the external consumers, and the *management accounting*, exclusively oriented towards the in-house information consumers. Even in the accounting theory there is the usage to place at opposite poles the financial accounting and the management one, this rupture is artificial, because in fact there is not an information system for the financial accounting and another one for the management accounting. But, there are analytical treatment procedures of the accounting data/information which allow the supply of information useful to the management, the result of the analytical accounting being understood depending on the purposes, otherwise said, depending on the expected results.

At present, the accounting role in the economy is very important: the information supplied through the accounting reports substantiate the economic decisions, at the economic entity level, but also at the country level, even at the international economic relations level. At present, the information society within what we live, needs fresh feed” as : well substantiated information, which, for the economic field, comes, in a predominated quantity, from the accounting area.

Thinking to the future, the only presumption is that the management accounting role as an information supplier will increase and will acquire new dimensions, being an useful instrument which feeds the planning and budgeting process for the resources forecast distribution and which will be used for the results

comparison. The foreground goal of the management accounting is the aggregate result structure analyse, in order to establish the contribution of different activities or products to this result.

The efficient administration of an economic entity supposes the best possible utilization of the available resources for the targets achievement, the profitability goal being one of them. In order to reach the expected/assumed goals, it is necessary to make decisions and to implement them at the same time, so that to get the estimated results; these can be represented as in the following sequence:

Having as final goal the supply of information which can facilitate the decisions making, the management accounting represents an instrument which is able to facilitate the decision making process, instrument which is essential in the economic entity steerage, having two main purposes: costs knowledge, but mostly the influencing of those who can act over them.

The management accounting is not used only in the costs calculation, but, particularly, it must allow a better control of the costs, to allow the action upon them. A true management accounting is based on the idea of the analyse of the couple “costs-profitability” which must not throw into the background any area of the economic entity.

The management accounting supplies the information on which the studies and arguments allowing the decisions making for the economic entity future can be based. As a whole, the information supplied by the management accounting are all-important for a forecasting management. Such a thing supposes to know the costs from the previous periods which allow to forecast the future costs depending on the kept activity levels and therefore to establish the budgets which explain the forecast action programmes.

The budgetary management allows the simulation of this action, the study of a great number of possible scenarios and making decisions depending on the estimated results. The management accounting supplies the information necessary to the drawing up of

reports and in-house analyses used by the organization management in its decision making process.

The presentation demands and the analyse of the information supplied by the management accounting are not restrictive. In the management accounting organization, the economic entities shall have an eye to assure the conditions so that the got information meet not only the present information needs, but also those ones which are in permanent changing process. Even the regulations in the field refer to the management accounting utilization by the economic entities, till present there are not minimal norms regarding these regulation application in the field. The management accounting place in the economic entities information structure is given by the capacity to offer information about the in-house processes carried out exclusively under the company's authority.

The analyse of the company's performances and information necessary to the management control are not possible without knowing the management accounting goals which are used to the accounting information integration in the managerial activity. On the basis of the information supplied by the management accounting, the economic entities administration has the possibility to survey and control the cost prices structure and level. The information supplied by the management accounting about the costs and the utilization of the allocated resources are necessary to the managers for the strategical orientation and planning, for the choice of the optimal solutions in solving the problems the economic entity must face.

Through the management accounting organization, the economic entity is more efficiently managed, having the possibility to make in due time the decisions which the company's success depends on. The measure in which the management accounting meet the information goals and requirements expressed by the decisional factors, depend on the chosen calculation method of the costs with different informative potentials, oriented towards the decision factors specific requirements, meeting in such a way the accounting exercise requirements.

The information supplied by the management accounting are mainly intended for the in-house users. The managers represent the main category of the accounting

information users, and their demands are extremely various, depending on the work charges they have on their working place, but also on the company's kind and activity volume. One of the main role of the accounting information is that one to help the decisional process at any of the administration levels. Beside the managers, the executive directors and/or the Board Chairmen take part also to the managerial process.

The management accounting information are confidential, they are not transparent for the thirds. They serves to the economic entity interests, being not intended for their external supply and publicity. Often, the reports supplied by the management accounting refer to the respective organization profitability and therefore such information escape would offer an advantage to the competitors. The usability of the information supplied by the management accounting is established after the way in what it serves to the management activity in the decision making process which are the base of the carrying on of the economic processes and facts inside the organization.

One of the management accounting and costs calculation task is the preparation of the information necessary to the managerial decisions adopting and making these information available for the organization administration just in time. Hence, this system is required to supply in due time the requisite information, based on which the company's administration be able to make the proper decisions. The information must be efficient, simple and accurate, bringing new, advisable and integrable elements for the administration.

As a matter of fact, the management accounting purpose consists exactly in the information utilization in the decisional process. According to *H.Simon (1960)*, a decisional process includes many stages, for example: gathering of the information required for the decisional matter formality; decisional matter classification; decisional matter minding; alternatives identification (their projection); appraisal principle choice; decision choice; decision implementation.

The management fact includes, essentially, the decision capacity. But, it is a decision correctly directed , only on the basis of the information resulted from the analyse of the technical, economic and organizational

factors, of the effects and causes these information generate. Any manager, regardless the hierarchical level where he operates, is obliged to know the cost in order to act adequately.

The American economist Bertrand Thopson, writes: "the wisdom beginning of a manager is the exact knowledge of his price cost". The costs of the production activities, as management ratios, represents one of the most important sources of information, allowing the survey of all the operation process stages, starting with the execution technical documentation and the required materials assurance up to the made products and works reception. Any manager, as per his post requirements, must know as exactly as possible, the price costs, products self-cost and their productivity in order to establish the directions of the commercial and production policy.

Generally, the definition and understanding of the decision concept involve the taking into consideration of two basic idea : decision means an option conceptualization as a mental image or as an explicit model. Therefore, the decision mission consists in the aware direction towards the purposed results, control adjustment and actions forecast, knowledge, thoughts and aspirations transformation into actions.

3. Conclusions

As a conclusion, we can induce that the information usability is established after the way in what this one serves to the management activity in the decision making process. The management accounting supplies essential information for the control of an economic entity current activities, for the future activities planning, for the assurance of the resources optimal utilization, for the performance measuring and appraisal of all the economic entity sub-divisions, for the winning and keeping of the competition place. The decisional process is carried on according to many stages, each stage having a particularly important role in the final decision making as regards the economic entity goals achievement.

Some Dobroudjean Religious Settlements, Attraction Elements of Product in Tourism Marketing

Muhcină Silvia
“Ovidius” University of Constanta
muhcina@gmail.com

Abstract

In tourism marketing, the tourist product involves natural and anthrop resources and a chain of specific tourist services (accommodation, food and beverage, transport, entertainment). Next to the natural patrimony there are various cultural, historical, religious monuments and buildings which can be considered basic elements capable of creating a distinct tourist offer and of contributing to a better knowledge of people, countries or tourist areas. Among these objectives, some Dobroudjean religious settlements can be considered as important elements of a special tourist offer, contributing to a good knowledge of Romanian spirituality. Located in isolated places, in unpolluted places, next to rural communities, these Dobroudjean testimonies of spiritual life can both ensure good recreation and acquaint foreign tourists with a significant facet of Romanian culture and history.

Key words: religious, settlements, tourism, attractions, product, marketing

J.E.L. classification: M31

1. Introduction

The tourist resources or the tourist patrimony constitute the essential physical framework of tourist attraction. They materialize in the structure of varied tourist products by means of specific services, tourist services, that is the ones that furnish content to the tourist product and which consist of a series of basic services (accommodation, meals, transport, entertainment), services organizing and commercializing the tourist offer and additional services.

2. Attraction Elements of Some Possible Tourism Products

As far as resources are concerned, they can be natural or anthrop, that is they can be natural or man-made (cultural, artistic, historical, architectural, etc.) and constitute the support of tourist attraction.

Starting from these aspects and taking into account the motivations, requirements and exigencies of the various categories of tourists, tourism operators can elaborate different types of tourist products.

People travel for various purposes (recreation and holidays, business, culture, sport, etc.) and, on numerous occasions the main objective of a trip is accompanied by various secondary objectives (for instance, the schedule of a business meeting taking place in a certain tourist destination is in most cases completed by visits to the most important tourist objectives in the area).

The Dobroudjean attractions that can represent constituent parts of tourist attractions include, apart from the natural resources usually visited (the sea and the beach), a series of architectonic and architectural, cultural and religious objectives (the Casino, the Roman Edifice, the walls of the ancient City of Tomis, the Mosque and the Cathedral of Constanța, the ancient Cities of Callatis, Enisala, Histria, the Monasteries and Nunneries of Techirghiol and Cocoșu, Celic Dere, Dervent, etc.), objectives constituting testimonies of the culture and civilization of this history-imbued place and exemplifying the way of life of the inhabitants of ancient Scythia.

Rendered special by the Christianize act that coincided with their formation as a people, the Romanians belong to the large European family and testimonies of this lengthy and eventful process reside in the numerous Christian and palaeo-Christian vestiges to be found all over Dobroudja.

Scythia Minor, that is the territory of present-day Dobroudja, was a constituent part of the Roman Empire, situated at its northeastern periphery, between the Danube and the Black Sea, and was evangelized by the Saint Apostle Andrew himself.

Archaeological excavations prove that this place witnessed the oldest and most organized Christian life in all Romanian provinces. From the north to the south and from the east to the west, this region is full of testimonies which provide life of first Christians. At the same time, the province was destined to the exile and martyrdom of Christians during the great Christian persecution between the 1st and 4th centuries A.D., especially in the time of Decius (249-251), Diocletian and Maximian (284-305) and Licinius (308-324).

Among the monuments and places of worship that constitute a veritable mirror of religious life, of our very civilization, that can answer a fundamental tourist motivation – taking the shape of a pilgrimage or of a holiday – or that can bring their contribution to tourist needs – being added to a certain tourist offer – there are the monasteries and nunneries of Cocoș, Celic-Dere, Saon, Dervent and Techirghiol, each with its own history and magic.

Between the Orthodox monasteries and nunneries from Dobroudja the following can be considered the most important.

“Celic-Dere” Nunnery is situated in a woodland area, in the vicinity of Telița village. Romanian and Russian monks initially founded the nunnery in the period between 1841 and 1844. Its church was built after the plans drawn by architect Toma Dobrescu of Bucharest and was founded by Bishop Partenie Clinceni in 1901-1916, being dedicated to the “Assumption of the Virgin” feast.

Architect Dumitru Berechet improved the initial plans, and in the year 1932 Bishop Cosma Petrovici sanctified the church initiated in 1901. The church is covered with frescos painted by Gheorghe Eftimiu and Ion Dima sculpted its iconostasis in Brancovean style (Brancovean style = style typical of the reign of Wallachian prince Constantin Brâncoveanu, 1688-1714).

The nunnery has an old school of painting, carpet weaving, embroidery and weaving workrooms.

Situated at the end of an accessible staircase, standing guard over hills filled with quietness and greenery, the church shelters the nunnery’s greatest treasure, that is the “The Miraculous Working Icon of the Holy Virgin”, brought to the church by a family of believers from Ismail county.

“Saon” Nunnery, whose history is closely related to that of “Celic-Dere” Nunnery, is situated on a hill on the shore of lake Saon, a former branch of the Danube, and used to be a monastery.

In 1881 Bishop Iosif moved the monks of “Celicul de Jos” Monastery to the “Saon” Hermitage, founded in 1846.

To be followed by a church with “The Ascension” dedication day, the hermitage was rebuilt with two bodies of cells. Nowadays the church has three dedication days: “Acoperământul Maicii Domnului” – “The Virgin’s Veil” (the new church), “Înălțarea Domnului” – “The Ascension” (the old church) and “Intrarea în biserică a Maicii Domnului” – “The Virgin’s entrance into the church” (the chapel), and has been reconverted into a nunnery with the removal of the monks to “Cocoș” Monastery in 1930.

According to historical documents, the third significant monastic dwelling in the area, The “Cocoșu” Monastery, dates from the year 1833 and is the work of the monks Visarion, Gherontie and Isaia, natives of Neamț and pilgrims to the holy Mount Athos. The monastery was built next to a rocky hill known as “Dealul Cocoșului”, having as its starting point a hermitage dating from the end of the 17th century (1679). Initially built as a wattle church, it was pulled down and a second church was built in the year 1853, itself to be pulled down in 1910 (due to the impossibility of adequate consolidation).

The present-day church of “Cocoșu” Monastery, built after the plans drawn by Toma Dobrescu, the same Bucharest architect that also drafted the initial plans of “Celic-Dere” Monastery, was dedicated in 1913 with the “Descent of the Holy Ghost” dedication day.

The unique scenery of lime-tree woods surrounds the monastery, and the monks inhabiting it are protected from the world behind its high city-like gates. The Italian F. da’Biase made the paintings in the monastery.

Legends connect the name of the monastery (cocoș = cock) both with the grouse that could be heard from the neighboring hill and with the biblical significance of the cock's crow to Apostle Peter.

The importance of the monastic life in this monastery has grown with the bringing – starting with the year 1973 – of the relics of four martyr saints, Zotikos, Attalos, Kamassis and Philippos, all kept in the same wood coffin.

These relics were discovered in the course of excavations made in 1971 in Niculițel village (situated on the foundations of the ancient city of Novidonum), in the vicinity of “Cocoș” Monastery, and starting with 2001 they are returned to the crypt of Niculițel on their dedication day. The three monasteries and nunneries, Cocoș, Saon, Celic-Dere, and the basilica of Niculițel form together an oriental cross, testimony of the notable Christian life in the region.

Apart from these, in the north of Dobroudja there are two more testimonies of the old faith, unique in the world, that is “Vovidenia” Nunnery, situated at a distance of about 50 km from Tulcea, in Slava Cercheză village, and built in the 7th century, as well as “Uspenia” Monastery, built in the same period.

A new monastery is “Sfântul Ioan Casian” (John Casian Saint), who was a disciple of “Sfântul Ioan Gură de Aur” (“Saint Gold-Mouth John”), build near the cave where he became to preach, on “Casimcea Valley”.

In the opposite part of Dobroudja, in the southeastern region of Constanța County, there is the Nunnery of Techirghiol, whose church, “Saint Mary” is built of wood. It was initially taken from Maiorești village, Mureș county, in the year 1934 by King Carol the 2nd, to Sfânta Ana (Saint Anne) Sheepfold in Bucegi mountain, and brought from there to Techirghiol by Patriarch Iustinian in 1951.

Believers are healed both bodily, through the benefits of Lake Techirghiol, and spiritually, through the prayers and benediction of the great father confessor Arsenie Papacioc.

Other new nunnery on this area is “Sfânta Elena de la Mare” (Sainte Helen from the Sea”), sainted in the interbelic period, in the presence of a great Romanian historic - Nicolae Iorga.

In the southwest of Dobroudja there is the “Dervent” Monastery. Situated in the vicinity of the Danube, near the Bulgarian border, in Galița village, Ostrov commune, on D.N.3 (National Highway 3), “Dervent” Monastery was founded by monk Elefterie Mihai.

There is a close connection between the history of the monastery and the Christian martyrdom in this Romanian region.

At the end of the 1st century A.D., Saint Apostle Andrew preached the Gospel in the land of Scythia Minor, living for a period of time in a cave situated in the vicinity of Ion Corvin village, situated at a distance of 37 kilometers from present-day “Dervent” Monastery. In 1990 “Peștera Sfântul Andrei” Monastery (“The Cave of Saint Apostle Andrew” Monastery) was founded in the vicinity of the cave, in a natural landscape of breathtaking beauty, at a small distance from the “Trophaeum Traiani” Monument in Adamclisi.

Martyrologies make mention of the frequent attempts made by the Roman authorities to persuade the Christians to give up their faith. In the city of Dervent, situated at a distance of about 15 kilometers from the ancient Durostorum (Silistra), four followers of Saint Apostle Andrew contributed through their sacrifice to the Saint's missionary work, the place of their martyrdom being marked by believers with four crosses of stone with healing powers.

The presence of these healing crosses establishes a connection between the historical past of the 1st-3rd centuries and the end of the 1st millennium, when the settlement began to flourish. At the beginning of the 19th century, the crosses were situated on an estate belonging to a descendant of a chief of the Turkish rayahs (rayahs = territories subject to the Ottoman Empire) on the shore of the Danube, Ahmet Bey, who ordered the destruction of the crosses. Two of the crosses that were hastily hidden by Christians under the ground were miraculously rediscovered after the war of independence by a shepherd who regained his hearing after taking shelter under two broken arms of the large cross. The two crosses of Dervent, one capable of healing humans and the other of healing animals, represent a place of pilgrimage for the Christians in the surrounding areas, thus inspiring the All Sainly Ilarie Teodorescu to

found a nunnery around the year 1923, although the foundations of the present-day church were only laid in 1936.

The church has three dedication days: “Sfânta Parascheva” – “Saint Parascheva”, “Sfântul Mucenic Gheorghe” – “Saint Martyr George” (the chapel on the right side of the church) and “Înălțarea Sfintei Cruci” – “The Holy Cross”. The absis on the left side of the church shelters another priceless treasure: “The Icon of the Virgin and Child”, dating from 1820.

At almost 200 meters from the nunnery there is a spring of pure water, whose history is connected to the Saint Apostle Andrew, who preached the Gospel in these lands. The spring provided the nunnery with its fourth dedication day, “Izvorul Tămăduirii - “The Healing Spring”, a feast that gathers hundreds of believers in a pilgrimage on the Friday of Shrovetide Week.

This presentation cannot end without mention being made of the Archiepiscopal Cathedral “The Saints Apostles Peter and Paul” (“Sfinții Apostoli Petru și Pavel”), situated in the half-isle area of Constanta, next to the ruins of the old city. Functioned as a monastery in the present days, the foundations were laid in the year 1883 and the church plans were drawn by the famous architect Ion Mincu and inspired by the traditional Romanian architecture of the 17th and 18th centuries. The great tower is 35 meters high, the oak wood sculptures including the iconostasis were made in Paris, in Andre Dorea’s studio, and one of the Cathedral’s priceless treasures, apart from the relics of Saint Pantelimon and of the Martyr Saints Epictet and Astion, consists of a “Miracle Working Icon of the Holy Virgin”.

All these spiritual treasures and architectural riches that have contributed to the formation of our national identity can and must be known, both nationally and internationally, since they represent a way of knowing the cultural and spiritual nature of Romania.

These places of worship can constitute – with due care and measure – tourist objectives that can be either included in the framework of a tourist product such as the

package tour or the pilgrimage, introduced in an independent offer or provided so as to diversify other tourist products.

Next to other places of worship, already known and visited by tourists coming from other countries (the most popular tourist region visited being of course Bucovina) Dobroudjean monasteries constitute testimonies of the way in which religious life has left its mark on the specific nature of our people, and, moreover, the archaeological evidence of the religious life unfolding in the Dobroudjean space in the first centuries of the 1st millennium confirm the fact that Romance and Christianity appeared and coexisted naturally, having a common evolution.

3. Conclusions

The inclusion of these religious objectives (with the support of the religious authorities of our country) in the framework of tourist programs meant especially for foreign tourists could provide them with a better understanding of Romanian spiritual life. Together with other material and immaterial elements of tourism product (tourism services, infrastructure, tourism equipments etc.) can contribute to a better understanding of the cultural and spiritual profile of the Romanian people.

The Effect of the Economic Crisis on the Value of Global Brands

Munteanu Claudiu-Cătălin

The Bucharest Academy of Economic Studies, Faculty of Marketing
munteanu.katalyn@yahoo.com

Abstract

In 2008 the most severe economic crisis since the Great Depression hit the global economy. The current economic crisis has a negative impact on both people and organizations and changed many aspects of the global economy, such as government policies, corporate affairs or investors behavior . This article empirically examines the effect of the economic crisis on the value of global brands correlating the Interbrand model for assessing brand value with the dynamics of the global economy. The findings reveal that macroeconomic events such as an economic crisis do not necessarily affect brand value, but have a negative impact on the growth and development of individual brands. Moreover, a large scale economic crisis exerts a significant influence on how the monetary value of a brand is established and concentrated in today's markets.

Key words: brand value, economic crisis
global brands, macroeconomic factors

J.E.L classification: M31

1. Introduction

A brand can be regarded as a unique personality that differentiates the product, service or company from the fierce competition[1]. As a result of a more complex and dynamic environment individuals and businesses are faced with a lot of tough choices. Consumer feelings and perceptions about products and services are becoming the core of a strong consumer marketing orientation. According to Hamish Marshall, ex-CEO at Philip Morris:"the future of consumer marketing belongs to the companies with the strongest brands"[2].The general strength of a brand reflects on the monetary value of a brand. Brand value is

driven by the overall market performance of the brand.[3] But how this performance is influenced by external factors such as macroeconomic climate changes? Any company that owns a well-known brand can ask such a question.

Macroeconomic climate influence important marketing variables like consumer behavior, competition or marketing strategy. All this variables affect sales and firm performance, thus affecting the monetary value of the brand.

One of the most important economic phenomenon that causes major mutations to the macroeconomic climate are business cycles. A business cycle can be defined as an economy wide fluctuation that occurs around a long-term growing trend and involves a shift between periods of economic growth (economic expansion) and periods of economic decline or stagnation (economic recession)[4]. Often, an economic recession leads to a global economic crisis. The focus of the current research is to deliberate whether the economic crisis from which the world economy tries to emerge has a significant influence on the value of global brands.

Brands begin "to be global" when they are perceived to reflect the same set of values in different regions of the world. A global brand will take advantage of large cost economies and can realize value from being "global"[5]. But this aspect can leave them more vulnerable to large scale negative events such as a global economic crisis. The constant danger a global brand is exposed to because of macroeconomic fluctuations, creates the necessity of a careful assessment of company assets.

Measuring the value of a brand is an important, but a daunting task. Information contained in brand measures is often associated with information that the financial markets use to update expectations of future cash-flows[6]. This is a factor of maximum

importance because the brand itself currently accounts for more than 30% of market capitalization and in some rare acquisition cases the value can be even higher[7].

Prior research, demonstrated that brand value can not be adequately explained using accounting measures. A lot of models try to assess brand value by mind-set measures (e.g.: brand saliency, brand awareness, brand loyalty etc.). But this kind of approach, even if it is correct from a marketing point of view, it is unappealing from a financial point of view. A mere assessment of brand attributes is often not sufficient because this value can not be translated into financial values.

In this circumstances, highlighting the effects on brand value, of large scale macroeconomic mutations, such as a global economic crisis can prove difficult. This is due to the fact that stock returns are associated not only with accounting performance but also with perceived relevance and energy of a brand[6]. The Interbrand model used to estimate the monetary value of a brand takes into account this important aspects of value measurement. Therefore, is appropriate to use estimated values based on this model for the current research.

2. Conceptual background&hypotheses

The market performance of a brand depends on a multitude of factors. Scholars do not agree on all this factors, but a thing is certain: between a brand and its consumers there is a symbiotic link[3]. A brand cannot "live" without its customers. In order to build a strong brand, companies need to create a positive and appropriate customer mindset related to their brand. Only brands that succeed in this process can transform the value created in the minds of their costumers in monetary brand value.

A well known fact is that an economic crisis will affect both consumer ability to buy (as an expression of current and expected future income) and also their willingness to buy (as an expression of their shopping behavior). In order to build brand equity that can be transformed in brand value, the right customer mindset is needed. Factors like the economic crisis make it almost impossible for the right customer mindset to be created,

thus affecting the overall value.

Not only consumers change their behavior when confronted with an economic crisis but also corporate affairs and politics are severely affected forcing drastic changes in organizational behavior (e.g.: less money spent on research and development). These changes may have a negative on brand value[8]. Accordingly to the issues described above, I hypothesize the following:

H₁: Drastic changes of macroeconomic factors caused by the economic crisis have a strong and negative impact on the value of global brands.

Business cycles have an impact on the overall potential of development and growth in any economy. In periods of economic expansion this potential expands exponentially, in contrast with periods of economic recession where it contracts dramatically[4]. This aspect leads to the following hypotheses:

H₂: A continuous, strong and positive relation exists between the macroeconomic climate and the growth in monetary value of global brands.

H₃: Macroeconomic factors changes caused by the economic crisis have a strong and negative impact on the growth and development of individual brands.

In macroeconomics, studying the inequality that appears in any given system has a major importance, because it can explain the system variables and can help forecast their evolution. Large scale macroeconomic events will cause major discrepancy between system variables and can cause significant fluctuations of macroeconomic indicators and welfare distribution[9]. In general, the impact of an economic crisis on macroeconomic indicators and welfare distribution is intuitive: it will cause major breakpoints that coincide with the beginning of the economic crisis, thus affecting their dynamics.

Researching how monetary brand value is concentrated can offer valuable information on the efficiency of accounting measures used to determinate brand value as well as the process of converting the perceived relevance and energy of a brand in monetary value for the brand. Brands are also a powerful tool used to generate welfare. Therefore, at a global level, it is expected that

the monetary brand value distribution will follow the general welfare distribution pattern. This naturally leads to the following hypothesis:

H₄: Over time, the degree of concentration is curvilinear in the shape of an U with a hard inflexion point that coincide with the beginning of the economic crisis.

3. Research

In order to test these hypotheses, data regarding brand value and growth rates before the economic crisis outbreak (2007) was collected from Interbrand.

Table 1. Best global brands in 2007

Brand	Brand value (mil\$)	Brand value change (%)
Coca-Cola	65.324	-3
Microsoft	58.709	3

TOTAL	616.618	+162

Source: <http://www.interbrand.com/en/best-global-brands/best-global-brands-2008/best-global-brands-2007.aspx>

As shown in table 1, only the 20 best global brands were selected. Data can be considered relevant, because global brands are owned by transnational corporations that are an important part of the global economy. If the global economy is considered a Pareto efficient system, as scholars suggest[10], it is safe to assume that brand value distribution obeys the Pareto principle.

The economic crisis started to show its effect in U.S.A in the middle of 2008 and spreaded fast, becoming a global problem. By the year 2010 the entire global economy was facing one of the biggest recession in history. In order to analyze the impact of the economic crisis on the value of global brands, similar data was collected from Interbrand in regard to the year 2010.

Table 2. Best global brands in 2010

Brand	Brand value (mil \$)	Brand value change(%)
Coca-Cola	70.452	2
I.B.M.	67.727	7
Microsoft	60.895	7
Google	43.557	36

TOTAL	658.296	+109

Source: <http://www.interbrand.com/en/best-global-brands/best-global-brands-2008/best-global-brands-2010.aspx>

To test the four proposed hypotheses, after the obtained data was checked for consistency, an empirical investigation was started using various statistic methods and models.

4. Results

No support for H₁ could be found using both the sample size mean comparison method ($-.5581 > Z_{.05}$) or the Cohen's algorithm method ($.7653 < F_{.05/19,19}$). This is due to the fact that a strong growing trend affects the dynamic series as suggested by the great discrepancy between the net % increase of median and mean values

(+12.86% compared to +6.75%).

If the two distributions analyzed are considered the result of the action of one independent variable (economic crisis) and one depended variable (individual brand performance over time) it is possible to analyze the effect of the economic crisis on the value of the brand. Results, using a standard Anova model ($16.781 > F_{.05/1,18}$), show that individual brand performance over time is the significant factor that influences brand value.

Although no support could be found for the main hypothesis (H_1) of the study, a significant result was found for the relation between the macroeconomic factors and the growth in monetary value of global brands, using the sample size mean comparison method ($-2.481 < Z_{.05}$). Not only the economic crisis has a strong influence on growth rates of global brands, but it also has a negative impact on the development of individual brands.

By analyzing brand value growth trends and individual growth trends before and in the middle of the economic crisis using the Student's distribution ($-.449$) it can be concluded that the economic crisis acts like a brake in front of the natural growth and development of brand value. A significant gap between actual growth rates and expected growth rates (calculated using weighted moving average method) was identified as a result of the economic crisis ($\chi^2_{(1)}=5.85$, $p=.05$). This results illustrate that both H_2 and H_3 are confirmed.

In order to test H_4 , several concentration indicators were calculated. The results for both 2007 and 2010 are shown in table 3.

Table 3: Concentration indicators

Year	Ginni coefficient	Entropy coefficient	Tideman Hall index
2007	.1171	.9739	.1235
2010	.1218	.9723	.1248

Results suggest a very high degree of concentration in both cases but no significant change could be noticed (variation is less than 5% in any case). Calculating kurtosis for both sets of data, highlights a relatively peaked distribution in both cases ($KURT_{2007}=5.527$, $KURT_{2010}=1.122$) that

suggest an over time curvilinear degree of concentration. The significant increase in peakedness correlated with no significant changes of concentration indicators suggest the existence of a hard inflexion point which overlaps the outbreak of the economic crisis. Macroeconomic events such as a large scale economic crisis have a significant influence on the monetary value differences of global brands, thus H_4 is fully demonstrated. It can be concluded that there is a link between brand value concentration and general welfare distribution.

5. Conclusions

This study investigates the effect of great changes in the macroeconomic climate (focusing on the current economic crisis) on the value of global brands. The impact of the economic crisis on the value and growth rates of global brands was tested, as well as the relation between monetary brand value distribution and general welfare distribution

Results show that drastic changes of macroeconomic factors do not have a significant negative impact on the value of global brands. In line with previous research[11], it can be concluded that there is a very strong correlation between the monetary value of the brand and the consumer mindset. Even if macroeconomic factors can influence consumer mindset, their impact on the relationship between consumer and brands is minimum. Brand value is a result of a multitude of exogenous and endogenous factors, where the last category plays the key role. Managers need to focus on this endogenous factors and keep a watchful eye on the evolution of exogenous factors in order to build strong global brands.

Although the economic crisis plays a secondary role in the process of creating superior brand value, it has a major influence on the growth and development of global brands. Because business cycles exert a major influence on the potential of growth and development in an economy, a global economic crisis will diminish the natural potential of growth and development brands have. Managers are urged to develop and implement counteractive measures in order to maximize this potential and diminish

negative implication during a period of recession. Organizations need to make a shift in their politics in order to consolidate brands and assure a healthy brand value growth even during an economic crisis. This translates into "doing the right thing at the right time" regarding strategic brand management[12].

The results of this study reveal that brand value concentration is influenced by events such as the current global economic crisis. Furthermore, there seems to be a link at a global scale between brand value distribution and general welfare distribution. This link suggests that global brands may have a positive impact on communities and the environment. Therefore, global brands can generate welfare and can become powerful "engines" towards a more sustainable world.

6. Limitations

At least two limitations of this study should be considered; they also can provide avenues for further research.

First, in order to fully explain the effect of the economic crisis on the value and growth of global brands, a multiple regression model might be needed. This model needs to take into account five key dimensions of the consumer mindset (awareness, activity, attachment, attitudes, associations,)[13] and the influence of external factors (e.g.: globalization, macroeconomic climate etc.) on this dimensions.

Second, a solid future research on the effect of the economic crisis on the value of global brands needs to take into account sufficient amounts of data from three key periods: before the economic crisis, the middle of the economic crisis and after the economic crisis.

Mood and Investor Behavior

Murgea Aurora

West University from Timisoara, Faculty of Economics and Business Administration
aurora.murgea@feaa.uvt.ro

Abstract

Our brain is daily confronted with a huge amount of information and stimulus, hard to be understood and assimilated. In this context the investment decision is often determinate by inter-temporal restrictions, psychological factors and less probable by purely rational factors. Weather factors as humidity, temperature, amount of sunshine, length of the night, wind, geomagnetic storms or changes in biorhythm have a strong impact on investor moods and indirectly on investor behavior. The aim of this paper is to create a conceptual framework for analyzing the investor behavior taking into consideration weather and biorhythm changes.

Key words: mood, seasonal variation, biorhythm, investor's behavior

J.E.L. classification: G10,G11, G15

1. Introduction

The role of mood, feelings and emotions in human decision form an emergent body of research. Since the weather factors and biorhythm determine broadly uniform fluctuations in the mood of large group of people and in their investment behavior, the equilibrium stock prices are also affected ([29], [28],[26],[9], [10], [3])

The role of mood in economic decisions was explained by two opposite theories: AIM model (affect infusion model) proposed by Forgas [13] and MMH model (mood maintenance hypothesis) proposed by Isen, Nygren and Ashby in 1988 [19].

In AIM model, the investor bad mood is associated with an increase of the risk aversion. The investors with good mood will take an increased level of risk that will generate an increase of the price. Consistent with the principles of AIM, Kamstra et.al

[22], Dolvin and Pyles[8] and De Vries et al.[5] found strong connections between seasons, mood, assumed risk and prices.

In MMH, the individuals with good mood accept low risk levels in order to maintain this disposition, while the individuals in bad mood will take higher risks hoping that the success will determine a change of mood. This idea is also supported by Parker and Tavassoli [32] who demonstrate in their work that the individuals with a better mood have a higher risk aversion.

Even if apparently irreconcilable, those two models could be considered both valid in specific circumstances. If the bad mood is persistent in time, how it is the case of individuals suffering by SAD, AIM model could represent the right choice. MMH is more consistent with the case of one individual who is in a temporarily bad induced mood state.[37].

The paper is organized as follows. In section 2 we discuss the connection between weather, mood and stock market evolutions. The section 3 is dedicated to the way biorhythm data (geomagnetic storms, seasonal affective disorder, lunar phases, and daylight saving time changes) impact on human sentiment, risk tolerance and hence stock returns. Section 4 take a short look to the future, to the way the climate change will impact on capital markets and Section 5 concludes.

2. Weather effects

Many researchers examined the relationship between weather – induced mood and equity returns. Starting from the seminal work of Saunders [35] there were many positive correlations found between several proxies reflecting weather (clouds cover, temperature, precipitation level, wind).

Focusing on three indices (DJIA index value, value-index index and NYSE/AMEX equal weighted index) , Saunders investigate

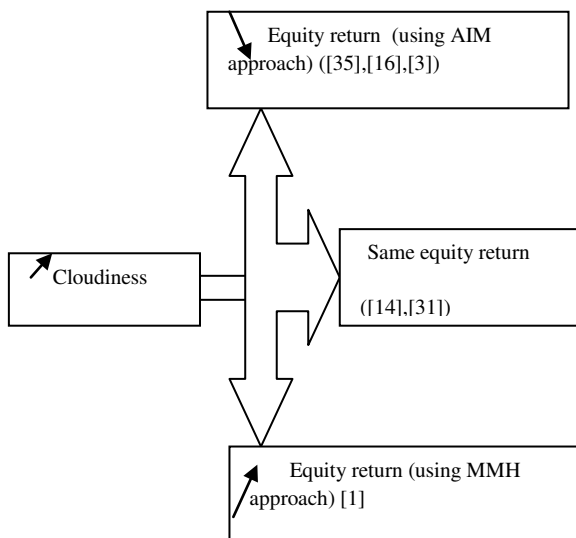

the stock prices variations correlated with the **numbers of cloudy days**. He starts from the hypothesis that the bad mood induced by weather generates depression. As a result the stock prices will be lower. In sunny days the good mood will determine an increase of the assumed risks and an increase in equity prices.

The results obtained by Saunders were confirmed during time by other researchers. Hirshleifer and Shumway [16] extended the research realized by Saunders on 26 stock exchanges in 1982-1997 being able to confirm the same correlation. Chang et al [3] confirmed it using a threshold model with GJR-GARCH process on error terms, on the Taiwan capital market.

On the other hand, Goetzmann and Zhu [14], after an analysis of the trades in 5 large USA cities, on six year period, found no dependency between individual propensity to buy or sell equities in cloudy days in opposition with sunny days. The same results were obtained by Pardo and Valor [31] who found no evidence of any influence of cloud cover and humidity levels in Spanish index returns.

Bhattacharai and Joshi [1] tested Nepalese capital market using weather variables and they found a significant positive relationship between stock returns and cloud cover, inconsistent with the negative relationship found earlier, but consistent with the MMH assumption, as one can see below.

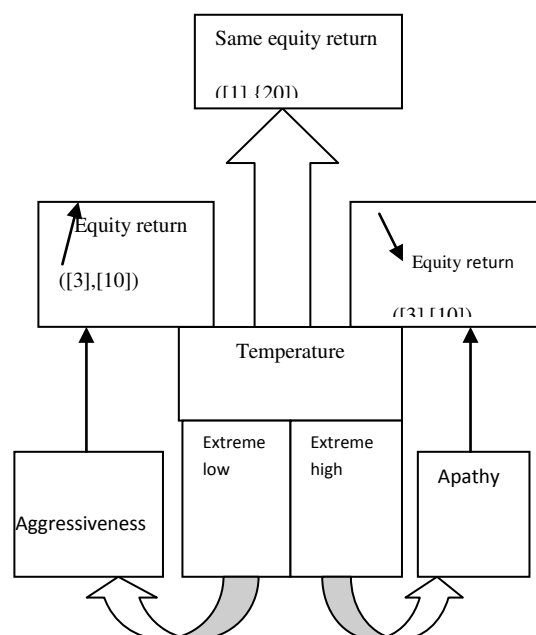

Figure 1. Cloudiness and equity returns

Several studies tested **temperature** as weather variable able to influence the equity returns. Cao and Wei tested the correlation using 21 countries sample, on seven years period. Their starting hypothesis is that the extreme temperatures determine an increase of aggressiveness. Low temperatures are associated with an increase in the propensity to bear risks and increased returns. High temperatures could determine aggressiveness and apathy (high and low returns), dependent to the dominant side. This correlation seems to be weaker during summer compared to the winter. When temperatures are extremely high the apathy is dominant and the returns are lower. Also the study shows that the prices of small-cap stocks respond to investors' mood change in a much more pronounced fashion. The same line or argumentation is also used in Chang et al[3], Dowling and Lucey[10]. Both studies provide evidence of the direct temperature influence on equity returns.

Testing of temperature-return correlation is not undisputable. Theissen[40] found no evidence between the predictions realized by the German investors and the temperature from the moment when it been realized. Bhattacharai and Joshi [1] and Jacobsen and Marquering [20] were unable to find any evidence in favor of temperature explanation. More Jacobsen and Marquering consider that a simple winter/summer dummy would best describe seasonality. For a synthetised view, see the figure below:

Figure 2. Temperature variations and equity returns

Precipitation level is also present in several studies which tried to link weather changes with capital market returns but there are no serious evidences of this kind of connection.([3],[9]). Dowling and Lucey also tested for **wind**-equity correlation but they found no evidence to support the idea of such a relation despite Shu and Hung[36]. In a study realized on 18 European countries from 1994-2004, they analyzed the relationship between wind speed and daily stock market returns. They found that the influence of wind on stock returns is significant and hence the wind could be used as a good proxy for mood.

A potential explanation could be the cultural differences between the analyzed countries, the different samples taken into consideration and not in the last place the status of the analyzed capital market/markets. Some evidences points out that the correlation between weather and the capital market evolutions is much more powerful in times of positive market performance ([30],[9]).

3. Biorhythm and stock returns

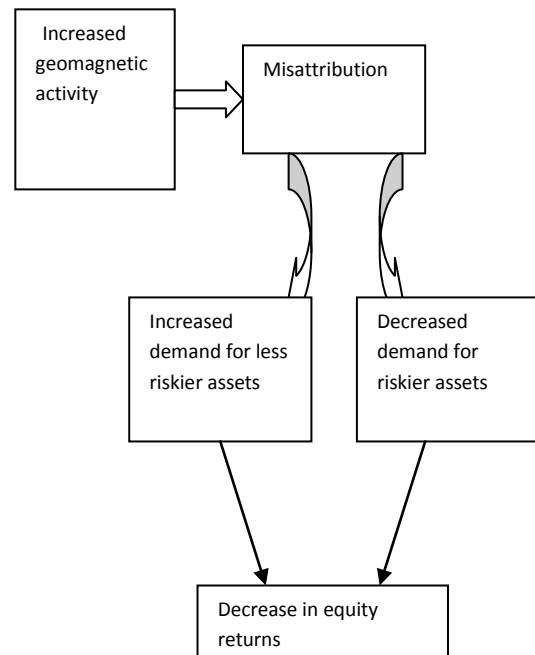

During time, several researchers pointed out the impact of **geomagnetic storms** to the level of mood disorders and to human health. Geomagnetic storms have been found as an important determinant of the increase in anxiety, sleep disturbances, altered mood, and depression. Kay [24] found that hospital admission for individuals diagnosed with depression increased with 36,2% in periods with high geomagnetic activity. Almost similar results were found by Raps, Stoupele and Shimshoni [33] testing for the correlation between monthly number of first psychiatric admission and the presence of geomagnetic storms.

Human health is also affected. Mental and cardiovascular diseases seem to increase almost two times compared with calm geomagnetic periods. The geomagnetic storms influence the activity of pineal gland and cause imbalances in the production of melatonin. As a result, the probability of mood disturbance increases.([39],[45]).

Krivelyova and Robotti [27] have documented a strong link between geomagnetic storms – mood -stocks prices. In periods of high geomagnetic activity,

individuals are tempted to attribute their bad mood to negative economic prospects and sell riskier assets, due to the decrease in risk tolerance. The increase in demand for less risky asset determines low stock prices and low returns in periods of high levels of geomagnetic activities (as one can see below):

Figure 3. The connection between geomagnetic activity and stock market

This effect seems to have a higher intensity in the small cap stocks since the individual investors are the predominant ownership [15]. The connection between geomagnetic activity and equity return was found to be stronger in countries as Canada, Germany, Great Britain, Australia and New Zealand and lower in South Africa, Sweden and Japan. At global level, the effect on stock returns around the world is found to be negative and strongly economically and statistically significant.

In recent literature several sensation-seeking measures have been studied in order to judge the propensity to take risks in financial decisions ([43],[17],[41],[12],[22]). **Seasonal affective disorder (SAD)** is a mood disorder that affects many people during the seasons with relatively fewer hours of daylight (in USA more than 10 mil.

Individuals were diagnosed as suffering from SAD). Many researchers in psychology have documented a strong link between seasonal depression and lowered risk taking behavior. Because of this effect, a seasonal variation in number of hours of sun can be related to a seasonal variation in equity returns. If we consider that market equilibrium occurs at prices where marginal buyers are willing to exchange with marginal sellers it is easy to notice that aggregate demands and supplies for risky versus risk less assets can affect equilibrium. Kamstra [22] have demonstrated that returns are usually lower during fall and winter, but this effect is not necessarily a symmetrical one.

Despite the dominant view in psychology that there is no relationship between mood and **lunar phases** ([34], [25]) two teams of University of Michingan researchers ([6], [44]) documented the negative relationship between stock returns and lunar phases. They found that returns are significantly higher in the days surrounding new moon dates than in the ones surrounding full moon dates.

The weekends with **daylight savings time changes** could represent another proxy for biorhythm in relation with equity returns. Kamstra et al. [21] documented lower returns after the weekends with this kind of changes because, no matter of the direction these changes affect sleep patterns and generate anxiety.

4. Climate change and capital markets

The world we live is continuously changing. The climate is not less susceptible to that especially because the industrialization phenomenon heavily increased the probability of extreme events such as droughts, floods, and super-hurricanes [37].

The projected effects on the main weather variables are presented in the next table:

Table.1. Projected effects of global warming

Projected effect	Probability estimate
Higher maximum temperatures. More hot days and heat waves over nearly all land areas	Very likely (90-99%)
Higher minimum temperatures, fewer cold days, frost days and cold waves over nearly all land areas	Very likely (90-99%)
More intense precipitation events	Very likely (90-99%) over many areas
Increased summer drying over most mid-latitude continental interiors and associated risk of drought	Likely (67-90%)
Increase in tropical cyclone peak wind intensities, mean and peak precipitation intensity	Likely (67-90%) over some areas
Intensified droughts and floods associated with El Nino events in many different regions	Likely (67-90%)
Increased sian summer monsoon precipitation variability	Likely (67-90%)
Increased intensity of mid-latitude storms	Uncertain (current models disagree)

Source: IPCC(2001)

The climate change impact on capital markets has both an objective a subjective side. From the objective point of view the expected weather changes would determine some shifting in the capital markets positions. The new orientation could be orientated towards the abundant renewable energy sources - such as solar and wind - to generate sustainable profit without the pain of another speculative profit bubble that inevitably builds to the bursting point. Also, in order to protect against weather associated risk the derivatives sector could develop new products and techniques.

The subjective side is not a negligible one, either. We have already pointed out the influence of weather on investor’s mood. An increase in extreme events and temperature, precipitation, wind and other correlated effects are for sure able to determine some important mutations in investor’s attitude towards risks and in the final in the equity’s returns.

5. Conclusions

The traditional financial theories which were neglecting the human with all its traits, as a main determinant of capital market evolutions are for sure history. In the actual chaotic world, human decisions are in a continuous change and depend both by rational factors and by subjective, irrational ones. Taking into consideration weather and biorhythm factors for assessing future capital markets evolutions, appears as a imperious step to do.

Responding to the Impact of the Global Crisis on brain Drain: The European Perspective

Neagu Olimpia

"Vasile Goldis" Western University of Arad

olimpian2005@yahoo.com

Abstract

The paper is focused on exploring, from the european perspective, the possible reactions to the impact of the global crisis on brain drain. The policy responses to an accelerated brain drain process can be analyzed at three levels: countries of origin, countries of destination and EU level. For sending countries, actions to reduce the detrimental effect of brain drain could be: encouraging the return of the expatriates, stimulation of the internal demand of human capital, monitoring of public spending on human capital(education and health). For destinations countries the main challenges are related to cover the economic and labour market needs with immigrate highly skilled wokers and to attract and retain foreign researchers in order to face to the global competition. At the european community level, immigration is a significant component of any strategy to boost economic growth and competitiveness.

Key words: brain drain, migration policies, human capital

J.E.L. classification: J61, J68, J24

1. Introduction

The process of the brain drain implies the outflow of highly qualified workers, usually by transborder or transcontinental migration, and refers to both source countries and receiving countries. Highly qualified migration is basically driven by negative factors in the source countries (outflow) and positive incentives in the receiving countries (inflow).

As international phenomenon integrated in the global economy, brain drain is affected by the shock of the financial and economic

crisis. These impacts can be expected to have economic and social consequences on the sending and receiving countries. The challenge for them is to discern exactly what these impacts are and how to draw appropriate national policy to respond to these changes. As a global actor and competitor on the global market, the European Union has to have a reaction on

The global financial crisis, which began in the second half of 2008, has led to a significant downturn in the global economy. The crisis has evolved through three phases, from a crisis of the financial markets, to a crisis of the real economy, to an employment crisis (6). A fourth phase, the present one, is a public debt crisis, as many analysts predicted.

The paper aims to explore the appropriate policy responses to the brain drain taking into consideration the effects of the global crisis on the European economy. The rest of the paper is organized as follows: after a short presentation of the effects of the global crisis on migration and, particularly, on brain drain, in the section 3 there are described the possible policy responses at the EU sending and receiving countries levels and there are discussed the key points of the EU-level brain drain policy. Section 4 is dedicated to conclusions and further directions of research.

2. The impact of the global crisis on overall migration

2.1. The effects of the crisis on migration

Growing disparities in development, the global jobs crisis, the segmentation of labour markets, revolutions in transportation and communications, and a burgeoning migration industry combine to explain why there is an unprecedented number of migrants in the world today — over 200 millions(5), 2009).

Immigrants now make up more than 10% of the EU population (2) and 12,9% in the US (10).

The international migration of workers is affected by the global on short term and on long run.

The short-term effects of the economic downturn on international migration(1) are:

- Return migration of some migrant workers to their homelands as a reaction to unemployment or lower earnings (this has been observed in the case of Polish workers in Britain and Ireland);
- Reduced levels of migration from origin countries to destination countries;
- Attempts by governments to provide incentives to unemployed migrant workers to leave (e.g. Spain), with mixed success
- Specially large declines in irregular migration, which is especially sensitive to availability of jobs (observed in the case of Mexico-US migration);
- Reduced remittances (money transfers) from migrants to their home communities, leading to possible hardship in communities dependent on such transfers;
- Increased hostility to migrants among majority populations, leading in some cases to conflicts and violence.

The effects of economic downturns on migration are complex and hard to predict on the long run. The current crisis may have deep-reaching effects that we cannot foresee. It is probably mistaken to believe that migrants will serve as a sort of safety valve for developed economies, by providing labour in times of expansion and going away in times of recession. When economic conditions get bad in rich countries they may be even worse in poorer origin countries. At times of recession, the motivation to migrate may be even higher than before, and remittances may prove a resilient form of international transfer, because of migrants' obligations to their families (1).

In conclusion, overall, financial crises have an impact on migration and development through a reduction in remittances, the acceleration of the 'brain drain', and where large-scale returns occur (5).

2.2. The effects of crisis on the brain drain

As a part of international migration, the skilled emigration is accelerated by the global crisis. The developed countries are more attractive for highly-skilled people from developing countries. The motivation to emigrate is intense and stimulated by the lack of opportunities in home countries and the stimulating rewards packages and the living standards from the host countries.

High income industrial countries do not produce enough graduates -let alone world classes graduates in mathematics, sciences, engineering, health professionals (8) to meet their firms and to cover the economy needs. And the best among they do produce they lose to other developed countries with more competitive firms, much better-funded universities and R&D facilities, greater opportunity for advancement and much more attractive compensation packages(9).

Among the destination countries of brain drain, the US has a competitive advantage to attract and integrate the highly skilled -due to the top universities, excellent facilities research and environment, the high rewards to successful business men and women. Analysts argued that US remain on its laurels and that without more active strategies providing an attractive immigration package it may lose some of its traditional advantage(3).

3. Possible policy responses to the current situation on brain drain

We can easily conclude that the policy response to the brain drain can be discussed at three levels: countries of origin(sending countries), countries of destination (receiving countries) and the EU level.

For sending countries, the aims of these policies are different as in the destination countries and are including: (1) to manage the brain drain, (2) to limit its negative effects on human capital accumulation, labour market and economic growth, (3) to transform brain drain into a beneficial phenomenon for economic growth.

In sending countries, the main components of an emigration policy aiming to address the crisis effects could include the following key aspects:

-*Encouraging the return migration of highly skilled expatriates;*

-*Stimulation of internal demand for human capital, for specific skill needed on the labour market;*

-*A careful monitoring of the public spending on human capital (education and health).*

Encouraging the return of the highly skilled expatriates means policy measures targeted to individuals to return to apply in their home countries the skills acquired abroad through attractive compensation packages(rewards, opportunities for advancement, research of excellence).

Stimulation of internal demand for human capital means policy measures aiming to retain in the country the skilled individuals by creating jobs and opportunity in economic sectors vital for the country's development, public investment in tertiary education according to the local employers interests, respectively, public subsidies that encourage the acquisition of those particular skills which are most needed domestically.

During crisis, a severe *monitoring of public spending* is highly recommended. The issue of the efficiency and effectiveness of the public spending for education and health gained the first place on the policy agenda of the governments due to the crisis pressure. It became more important that the public resources be used in the most efficient and effective way. The efficiency and effectiveness of the public spending on human capital(education and health) can be evaluated through several methods like *production possibility frontier*, which indicates feasible output levels given the scale of operations (the greater the output for a *given* input or the lower the input for a *given* output, the more efficient the activity is), *DEA* ("Data Envelope Analysis") *technique*, "*Free Disposal Hull*"-*technique*, *regression analysis*, *covariance structure models*(7).

From the migration policies already implemented by the European developed countries (3), I selected two of them, that I consider appropriated for the current situation on brain drain:

-*Facilitate foreign researcher entry:* specific legislation regarding particular visa procedure, work permits, funding for

family members, research exchange programmes, health insurance etc.

-*Facilitate the entry of skilled workers in current demand:* flexible work permits system, reducing administrative burden of intra-company transfers, accelerated hiring procedures for particular sectors (IT, R&D), job-cards etc.

Over the coming decades, all industrialized countries will experience native workforce declines due to the ageing population and some of them will decrease the total population. The European Union estimates that the EU-27 labour force by 2025 will decrease with 25 million workers. Taking into consideration demographic changes, labour shortage, skills and locational mismatches, rapid expansion of some economic sectors (elderly care), the policy makers have to decide to complement their workforces with qualified immigrants.

The recent European brain drain's literature focuses on the individual motivation to migrate and consequently the policies suggested is to create individual incentives for skilled workers to come back or to decide to migrate in Europe. These policies regard: languages courses, incentives and facilitations to the researcher's family, incentives and facilitations to the researchers and theirs career, grants and scholarships, tax and salaries, marketing & recruiting policies and intellectual property rights (3).

The EU performs a crucial role in these migration policies by collecting and reviewing the existent policies and by acting as coordinator of common policies inside the EU. The current situation on brain drain shows that it is not sufficient to increase the investment in R&D, but are necessary concrete policies and strategies to stop the European brain drain and to reverse it (by attracting foreign brilliant scientists). the European Commission is trying to coordinate the brain drain policies of the Member States, but actually there is no coordination between the European countries, regarding their brain drain policies. The EU Commission try to create an unique brain drain policies but all the EU's Members implement independent policies focused either to stop their national brain drain either to compete to the other European Countries to attract the European and the non-European brains. In this context

there are countries that reach this goal and others that suffer an increasing brain drain (3).

Unfortunately, EU shows a limited capacity to implement for EU-level migration policies. There are currently two bodies devoted to EU-wide policy implementation in this field: Frontex-the border management agency, that relies on Member States for hands-on implementation and, as of mid-2011, The European Asylum Support Office (EASO). There is no agency devoted to the implementation of legal migration policies. For this reason, implementation is delegated to the Member States, or when appropriate, to international organizations like International Organization for Migration(IOM), or The United Nations High Commissioner for Refugees(UNHCR), or the International Center for Migration Policy Development(ICMPD)(3).

In my opinion, policies on brain drain at the EU level have to be drawn on three key points:

-analysis of the migration: policies in the Member States, trends in R&D, dynamics of innovation and research in Europe and competitor countries;

-a mechanism for cooperation between european sending and receiving countries, in order to limit the negative effect of the human capital drain;

-a genuin partnerships between EU and US (the favourite destination country of european brain drain) based on an improved coordination between EU players in international science and innovation and USA.

4. Conclusions and a way forward

Responding to the effects of the global crisis on brain drain is a difficult and complex work. The levels of response described above are interrelated and under the pressure of the social and economic facts.

In the context of ongoing economic and demographic changes, flexibility and the ability to learn from domestic and international experiences lie on the heart of effective brain drain policies, at any level: microeconomic, macroeconomic or european.

A deeper cooperation between sending and receiving countries is required for an effective management of the brain drain process, that can be beneficial for all parties involved. For example, there are several ways to improve the cooperative relationship between European Union and United States on brain drain policies(movement of professionals, ongoing dialogue and exchange of good practices).

Impact of World Economic Crisis on the Competitiveness of South-East Europe

Nechita Daniela

"Dunarea de Jos" University of Galati, Faculty of Economics and Business Administration
dananechita2002@yahoo.it

Abstract

The deep crisis that crosses the American financial system, a real challenge for the proponents of globalization, has sent a strong shock wave throughout the global market, and the effects they can cause a systemic reconfiguration requires adaptation of the instruments of intervention. This crisis is not reversible, meaning that we will not back where we started, when the crisis will be overcome, as we enter into an era of increasing international regulations on financial markets, and from the perspective of States, in a prolonged period of high inflation and large deficits. The spread of these effects makes the uncertainty regarding economic developments of the variables to be extremely high, which helps to enhance the crisis by the negative effects it has on the expectations and increasing the degree of caution at the level of consumers and economic structures.

Key words: uncertainty; competitiveness; financial crisis; global market.

J.E.L. classification: G 01

1. Introduction

Over the past decade, South-East was subject to dramatic transformations. Progress in democratic reforms, economic development, regional cooperation and integration in the global economic and financial market have been inconceivable 10 years ago and are unprecedented in modern history of the region. But 2009 proved to be a difficult year for the Balkan economies. The financial crisis that began to affect Western markets in the second half of 2007 has gotten harder in the South-Eastern Europe, but in the last quarter of 2008, it was clear that the

region will face a major economic crisis. In early February 2010 there were signs that production has begun to stabilize. However few people expects big growth rates similar to previous years, to return in the near future.

2. Focuses on the world economic crisis on the global economy

The origins of the world economic crisis are already well known. They are the result of unsecured loans and real estate market downturn in the United States. Problems in the United States and in several other big economies, such as the United Kingdom, have become evident in the second half of 2007, and this situation has deteriorated rapidly in industrialized economies. United States went into recession in the last quarter of 2007, Japan in the first quarter of 2008, Germany in the third quarter, United Kingdom in the last quarter of 2008, and France in the first quarter of 2009.

In mid 2008, it was clear that the global financial system shock was so strong as it has happened since the great depression of the 1930s. At that time, the economies of South-Eastern Europe were still rising. Many people here seem to not know or may not be affected by what is happening worldwide. Banks have continued to aggressively gain market share, both on the liquidity and assets. Foreign direct investment in the region record amounts and growth continue. Over the first eight months of 2008 there is still this feeling that South-Eastern Europe will escape the effects of the crisis.

Business and Government were optimistic, following several years of strong growth in combination with macroeconomic stability, strong and positive investment support received through the integration into the European Union States in the region. In fact, the care of many countries macroeconomic

from South-East was not that will be affected by the crisis, but rather how to deal with inflation began to increase sharply, mainly because of higher oil prices and consumer goods.

The situation began to change notably in September 2008. The collapse or the nationalization of large financial institutions in the United States, such as Lehman Brothers, AIG, Freddie Mac or Fannie May has caused global crisis which everyone understood how serious it is and that no country is immune to its effects. However, the belief that time was in South-Eastern Europe will take place and a consequential slowdown of progress towards the end of 2008 and in 2009, but the results would remain positive in all scenarios.

3. The effects of the economic crisis on competitiveness of countries in South-Eastern Europe

The extent to which economists have underestimated the severity of the crisis may be demonstrated by means of two examples: the first column of the table 1 compares forecasts for growth of gross domestic product in 2009 compared to October 2008 with the actual statistics of 2009 offered by the International Monetary Fund, and the second column shows the same data and predictions on the 2008 real 2009 statistics provided by the European Bank for reconstruction and development. The difference is amazing: in Macedonia was recorded by 7.5% less than expected a year

ago and more than 13% in the case of Romania (was expected an increase of 4.8% in 2008 and it was registered -8.5% in 2009).

Table 1. GDP growth forecast for 2010

Country	FMI		BERD	
	Oct 2009	Oct 2010	Oct 2009	Oct 2010
Albania	6,3	0,7	5	3,0
Bosnia și H.	5,0	-3	4,5	-3,1
Bulgaria	4,2	-6,5	3,8	-6,0
Croația	3,7	-5,2	2,0	-5,4
Macedonia	5,0	-2,5	4,7	-1,6
Montenegro	5,0	-4	5,0	-4,1
Romania	4,8	-8,5	3,0	-8
Serbia	6	-4	3,0	-4

Source: FMI, BERD

Monthly data on industrial production and gives them an idea of the time when the crisis began to hit the region. In October 2008 all countries had negative growth in industrial production with the exception of Bosnia, which has received a large refining reopening. In 2009 there are some signs of growth in most countries, even in Montenegro where the statistics are very small, reflecting the continuing difficulties faced by the major national companies. These data do not include the majority of economic activities in the region, which are dominated by services.

The magnitude of the recession in 2009 may be also measured by the value of exports, most countries having yet another positive growth in the last quarter of 2008, but the effects of the crisis you see better in early 2009.

Graph 1 – Export quarterly

Source: BERD

Decline in economic activity has had a significant impact on other macroeconomic variables such as inflation, government deficits and current account deficits. It also was expected to show a negative effect on unemployment and poverty, increasing the possibility of social unrest.

Inflation was threatening to become a serious problem again in mid-2008, with a two-digit level at that time in Bosnia and Herzegovina, Bulgaria, Serbia and Montenegro. Decline in domestic demand, combined with the steep fall in the price of oil and other natural resources of the second half of 2008, contributed in some cases when the lowest rate of inflation seen in this region. Bulgaria has gone from the highest rate in the region in the first half of 2008 to one of the lowest in the present, and Bosnia and Herzegovina has reached even to deflation. In the case of Romania and Serbia—two countries which have had difficulty in keeping inflation under control—less inflation has allowed a significant reduction in monetary policy rates.

In a similar way, current account deficits have decreased significantly during the crisis, following a steep fall in imports was more than counterbalanced the decline in exports. As a percentage of GDP, the deficit for 2009 was estimated at more than 10 percentage points in Bulgaria and Montenegro and the good values in Romania and Serbia.

Even at lower levels, current account deficits must be financed; otherwise the effect will be seen through a loss of foreign reserves. The region has invoked this funding and has received a lot of foreign direct investment, which entered the region in significant quantities, culminating with a record of \$ 32.5 billion in 2008. But last year foreign direct investment decreased steep on average almost 50% in the first half of the year. The magnitude of the reduction varies by country, Albania and Montenegro have seen an increase due to significant privatization offers: a petroleum refinery in Albania and in the energy sector in Montenegro.

Graph 2 – Foreign direct investment into millions \$

Source: Sanfey, Peter, „South-eastern Europe: lessons from the global economic crisis”

While the process of integration has brought enormous benefits to the region over the past ten years, the negative side is that any crisis that originated elsewhere will affect the region, regardless of the actions that are taken to mitigate the effects. In the case of South-Eastern Europe, the fall in production has many causes. Three explanations are particularly important. First,

foreign demand in key export markets had fallen drastically, especially for certain key products that are now produced in the region. Secondly, access to finance has become more difficult or expensive, which is a serious impediment to the operation of enterprises in the region. And third, the volume of money transfers has fallen slightly, which is reflected in the reduction of domestic

demand, and the impotence of the development of small enterprises.

In the first half of 2008, most countries had exports growing at about 30-40% from month to month. Since September 2008, the demand from abroad and exports collapsed, at a level of 40% in early 2009. As the other factors described above, there are signs of stabilising, with the possible exception of Croatia (in view of the exceptionally rapid growth).

In order to gain a better understanding of the causes that have led to a reduction in exports, it is important to point out what countries and where it is exported. In recent years, many countries in the region have specialized in certain key sectors. Steel sector is particularly important in Bosnia and

Herzegovina, Macedonia, Romania and Serbia. Aluminium is the principal export product in Bosnia and Herzegovina and Montenegro. Romania has a strong automotive industry through the Dacia plant (now owned by Renault). Tourism is an important part of the Bulgarian, Croatian economy and muntenegrine. All these industries were particularly affected by the global recession, and this is a major factor behind the decline in production in the region. Exposure to the EU-27 has offered little protection; exports had tended to perform poorly even though they were made by the European Union or not (such as Macedonia, where 78% of exports were in the EU or Serbia, where just 54% of exports go to EU member countries).

Graph 3. Exports to countries in South-Eastern Europe (in 2009)

Source: Sanfey, Peter, „South-eastern Europe: lessons from the global economic crisis”

Banks and other financial institutions have been leaders of the drivers of economic growth over the last decade, but also of increasing vulnerability. Virtually all countries in the region had four or more years of expansion of crediting, defined as the total annual growth rate of loans in the economy by more than two percentage points of GDP. The most extreme example is Montenegro, where increased funding at some point was almost 200% (from month to month). The effects of this growth could be seen in different ways. Many small and medium businesses have prospered because they have accessed loans at reasonable prices, perhaps for the first time in their existence. The population enjoyed the new capability to buy consumer products, as well as mortgages for the purchase of properties. A rapidly growing real estate market has become evident in the

main cities of the region-Bucharest, Belgrade and Sofia, as well as in coastal tourist area as well as in Bulgaria, Croatia and Montenegro.

The crisis has contributed to a dramatic slowdown in lending growth. In most countries, increased access to credit was still positive (November 2009), but has fallen to a level expressed in a single digit. In contrast, growth in lending in Bosnia and Herzegovina, Croatia and Montenegro has already become negative toward the end. The most important reason for which the credit has not been stopped completely must lie in the fact that foreign banks dominate the region and, as recent research has demonstrated a high presence of foreign banks has contributed to mitigating the capital outflows. Graph 4 indicates the percentage of the total foreign capital banks in each country. The figures range from 75%

to 95% in Serbia in Bosnia and Herzegovina. In other words, foreign banks in control of the banking sector in the region, with all the

benefits and risks incurred by this domination.

Graph 4. The share of foreign banks in banking (in 2009)

Source: Sanfey, Peter, „South-eastern Europe: lessons from the global economic crisis”

Finally, the crisis has affected the transfer of money, which proved to be a vital source of currency over the years for most of the region, as well as a lifebuoy for many families and small businesses. Graph 5 below describes recent reports on changes in the percentage of money transfers (2nd quarter of 2008 compared with the 2nd quarter of 2009). A few countries indicates a significant

decrease, in particular Romania and Croatia. However, data indicates that the transfers seem to have stabilized in Bosnia and Herzegovina, Macedonia, Montenegro and Serbia have increased significantly because of unexpectedly large an influx in the second quarter of 2009. In Bulgaria, money transfers of workers increased slightly, by 0.5%.

Graph 5. Percentage changes of money transfers

Source: Sanfey, Peter, „South-eastern Europe: lessons from the global economic crisis”

4. Conclusions

The global economy still has many unknowns, and the impact of the current turmoil on the global market is difficult to predict and quantify. Transmission and spread of a crisis within the main global economic structures relate to interaction: the involvement of the "actors" in the markets, the risk assessment in the framework of global relationships and increased price risk affecting all types of financial instruments.

Particularities of the Intangible Assets Evaluation in Terms of Financial Crisis

Necsulescu Ecaterina

Onose Valeriu–Laurențiu

„Danubius” University of Galati

Body of Expert and Licensed Accountants of Romania, Galati Branch

ecaterinanecsulescu@univ-danubius.ro

laur_onose@yahoo.com

Abstract

Intangible assets include all assets that have no physical form, but which contribute, directly or indirectly, to obtaining a business profit.

Taking into consideration the analysis of our study, the conclusion of the paper is that in Romania, the evaluation of intangible assets is rarely used due to extremely poor casuistry. From a sample of 100 companies we analyzed, only 4.5% revealed the existence of intangible assets with values higher than 3% of the total assets and none of the companies reviewed these assets. In crisis conditions, the study concludes that the companies' value decreases (Bad Will), and while economic growth. The value of companies increases (Good Will). An effective leadership during crisis may contribute to the evaluation of intangible assets as a method to increase the liquidities of the company, by not paying the income tax.

Key words: residual value, Bad-Will, Good-Will, savings

J.E.L. classification: M41

1. Introduction

In the economic theory dated to the beginning of the third millennium, there are frequently used concepts of intellectual capital, intellectual property, industrial property or intangible assets. The differences between these concepts consist mainly in their coverage area. For the first time, the classification and the evaluation methodology of intangible asset was

presented in the International Valuation Standards, Sixth Edition, 2003, in GN4 - Evaluation of Intangible Assets [1]. The approach of the intangible assets' value was determined by the dramatic increase of these assets balance in within the total assets owned by companies from 5% in 1978 to 72% in 1998 and to 75-85% present. [2]

The most known intangible assets are classified into trademarks, patents, know-how, contracts, research – development projects, software and commercial capital. Practically, there are applied, just like in the case of tangible assets, three approaches (by cost, comparison and income) and many other methods of evaluation among which the best known are: the residual net profit, economic benefit, over profit capitalization, future net profit upgrade, contribution to profit, exemption from fees and residual method [3].

Many of the intangible assets owned by companies (or more correctly, by most enterprises in Romania) are not included in their balance sheet. In my view, the intangible assets should be included in the balance sheet of the business for at least two reasons:

1. in order to better reflect the company's potential for development;

2. as a form of defence of the company against the abuse the state and local authorities taxing

The fact is that there are standing points coming from the national and international organizations, accountants and of companies 'evaluators, to create an unified vision for the recognition of the value of these assets in financial situations and consequently, for their credible and questionable evaluation.

2. The management of intellectual capital

Since 1990, especially after 2000, once with the unprecedented development of the economy based on knowledge, in the literature on management, it was introduced the concept of **intellectual capital**. The intellectual capital of an enterprise is being frequently referred to as the source of income of a company and the mean to increase the competitive advantage. Therefore, in the theory enterprise management, it emerged the newest economic discipline and practical direction meaning "**intellectual capital management firm.**" The evaluation of a company's intellectual capital is a separate chapter or field of this discipline, with over 20 intellectual capital evaluation methods.

3. Similarities between the valuation of tangible and intangible assets

In the literature of specialty [4], **an initial** similarity between the valuation of tangible and intangible assets, lies in the fact that both types of assets are evaluated through the same three approaches:

- a. by costs;
- b. by comparison;
- c. by income.

A **second similarity** has in view the concept of value, meaning that both types of asset value are due to a subjective assessment, based on some assumptions which lead to a financial perception in the head (mind) of every person interested in a transaction involving assets. In my opinion, **the third similarity** between tangible and intangible assets valuation is the use of common concepts which leads to determining the value of an asset such as: the capitalization rate, discount rate, the increase in gross domestic product, basis risk, replacement cost rent, total revenues, total costs, depreciation, gross profit, net profit, dividend tax, cash flow, etc.

4. Differences between the valuation of tangible and intangible assets

I did not encounter in practical cases and neither in economic theory references or some direct assessments on differences

between the methods for the valuation of tangible and intangible assets. Therefore, I would like to present further an opinion resulting from the works required by the Court Law or Court Judgement and by the economic agents from Galati - Braila area, and those I have done in my accounting office with a part of my collaborators.

The main difference lies in the degree of market data interpretation: there is a restricted interpretation to tangible assets, while to intangible assets; there is a probable interpretation, imaginative, of scenarios, of future capacity evaluation. Obviously, in the case of intangible assets imagination, flair, experience and luck play an important role.

A **second distinction** consists, in my opinion and that of my collaborators, in the diversity of methods for estimating value: about 10 methods for tangible assets and over 20 methods for intangible assets.

A **third difference**, lies in the degree of ingenuity when choosing the appropriate method for evaluating an asset. If a tangible asset, imagination plays a role less important, while for the intangible asset, I would say that imagination has no limits. The more ingenious you are, the more you can determine a value much closer to reality, meaning in an actor's perception with respect of selling and buying.

5. The particularities of the intangible assets evaluation

We further present a short synthesis of the main particularities of the intangible assets evaluation in the view of Sorin Stan and his collaborators [5], in order raise the readers' awareness on the issues and diversity of information necessary to the intangible assets evaluation.

Table no. 1. Characteristics of intangible assets evaluation

Identifiable intangible assets	Preferred evaluation methods (p) and the secondary one (s)	Orientated level of the actualization rate	Critically problems of the method
Management software	Recreation cost (p)	> cm _{pc}	The depreciation quantification area
	Comparison method (p)		The expenditures area
	Profit		Insufficient information's Profit allocation

Identifiable intangible assets	Preferred evaluation methods (p) and the secondary one (s)	Orientated level of the actualization rate	Critically problems of the method
	contribution		
Trained labour	Replacing Cost	cmpc	Historical share of the costs of recruiting, hiring and training of total salary costs
	Profit contribution		Insufficient information's
	Comparison method (s)		Profit allocation
Patents	Costs savings (p)	cmpc	The economical life rested period
	Royalty free	cmpc	idem
	Updating allocated surplus profit	cmpc	idem
Licenses / franchises / authorizations	Recreation cost (s)		The expenditures area Depreciation and high risk
	Profit advantage (p)	cmpc	May be issued on limited terms or renewable (so, forecasted)
	Profit contribution (p)	cmpc	
Product Brands	Costs savings (p)	cmpc	
	Royalty free (p)	cmpc	Forecast
	Updating allocated surplus profit (p)	cmpc	Forecast
Contracts (advertising, purchase, rental)	Profit contribution (p)	cmpc	When could not be applied the previous methods, idem
	Recreation cost		The expenditures area and theirs updating
	Updating allocated surplus profit (the unique method)		Different level of the actualization rate
Employment contracts	Economies update generated by a key person		The economical life rested period
Copyrights	Royalty actualization	Different rates	The fixing of two actualization rates
Non-proprietary manufacturing technology secrets, know-how	Updating allocated surplus profit (p)	> cmpc	The economical life rested period; The highly risk quantification
	Costs savings (p)	> cmpc	
Customer Lists	Recreation cost (p)	cmpc	The economical life rested period;
	The allocated profit	cmpc	

Identifiable intangible assets	Preferred evaluation methods (p) and the secondary one (s)	Orientated level of the actualization rate	Critically problems of the method
	actualization (p)		
	Comparison method		Insufficient information's
Non-competes agreement	The difference between CFN with and without Non-competes agreement (p)		The concurrence period and the turnover reducing probability
	The profit loose actualization (p)		idem
Industrial drawings	Recreation cost (p)		Depreciation estimation
	Profit contribution (s)	cmpc	The economical life rested period;
Technical library and archive	Recreation cost (the unique method)		The expenditures area
Unfinalised researching and developing projects (IPR&D)	The allocated profit actualization (p)	> cmpc	Residual net profit determination allocated to the researching and developing projects
	Recreation cost (s)		The economical life rested period;

6. Case study

The approach based on assets, also known as the patrimonial approach, the approach based on costs or the approach through cost replacement, lies in correcting (adjusting) the book value of individual assets and the enterprise liabilities towards transforming them market values. In this approach, there are included two evaluation methods, that of:

- net adjusted asset (NAA)
- asset liquidation or net liquidation value (NLV).

According to GN6 - "Business Valuation", the asset-based approach lies in "estimating the value of an enterprise and / or of participants using methods based on the market value of the individual enterprise's assets, minus debts." [6]

The above definition corresponds to the essence of the NAV method. This method directly calculates the amount of capital to shareholders (ACS). Therefore:

NAV= the market value of assets - market value of debts

The application of the ANA method requires several steps to follow and the most important are:

- Getting the balance sheet or trial balance, on the date of valuation;
- Valuation of assets and liabilities, which could mean:
 - taking a book value if corrections are not justified on that value,
 - book value transformation of some assets and liabilities into market value;
- Developing "economic balance" and calculation of net adjusted asset.

The method presupposes hiring a large volume of work from the evaluation team because it implies dividing the enterprise into distinct fractions which must be evaluated individually.

7. Summary of application NAV method

After covering all steps for the evaluation of the assets' categories, which requires corrections of their book value, as well as of debts, the synthesis and calculation will be registered into a table.

Some synthetic conclusions deduced from the asset-based approach are:

- Adjusted net asset method (ANAM) was applied on the assumption that the evaluated company will continue its normal activity in a foreseeable future. The other method of assessment, included in the asset-based approach, but in the event of closure, is called net liquidation value method (NLV).
- Through the ANAM method it is calculated the shareholders' amount of capital and not the amount of invested capital
- ANAM reflects a control value, respectively a control value of shareholders' capital because the buyer has the opportunity to decide the sale of some assets or of all acquired assets.

In order to determine the adjusted net accounting asset (ANAA), there were used specific techniques to the nature of the analyzed balance elements. The analysis results of the evaluated patrimony are presented in the annexes bellow. The applied balance adjustments refer to the revaluation of fixed assets and debts, as follows:

Table no. 3. Adjusted Net Asset Accounting

Element's name	Nr. rd	Balance 31.08.2011	Corrections	Values corrected

8. Conclusions

The evaluation of intangible assets is conducted in accordance with the International Valuation Standard 4 - NG 4. Intangible assets include all assets that have

no physical form, but which contribute, directly or indirectly, to obtaining a business profit. The best known intangible assets are classified into trademarks, patents, know-how, contracts, research – development projects, software and commercial capital. Practically, there are applied three approaches: by cost, comparison and income.

In Romania, the evaluation of intangible assets is rarely used due to extremely poor casuistry. It was noticed that in crisis times the companies' value decreases (Bad Will), and while economic growth. The value of companies increases (Good Will). An effective leadership during crisis may contribute to the evaluation of intangible assets as a method to increase the liquidities of the company, by not paying the income tax.

The Impact of the Global Economic Crisis on the Local Economy. Case Study Pitesti City

Nedelea Adelin Daniel
University of Bucharest, Faculty of Geography
adelindely@yahoo.com

Abstract

The economic crisis are started in 2007, on the American continent, he recorded in time an expansion on around the world. The Economy represent the source of oxygen for each country, depending on the level of economic development, the country can register a positive or negative trend on the standard of living.

The natural resources currently available for mankind, must be used with precision, with a definite purpose. Use resources in a precise scope and a corresponding proportion, influenced the economic conditions for next generations.

The economic decline registered in the United States of America, was noted in our country since 2009, including the city of Pitesti, at the beginner level, but, over time this decline was deepened. The most important effects caused by the economic crisis are: reducing production capacity, the cessation of production in the manufacturing units, disappearance of jobs and decrease of the investment [1].

Key words: economic crisis, reducing of the investment, layoffs.

J.E.L. classification: O1; O11

1. Introduction

The city of Pitesti was relealed in many works of different authors, the researches having like theme various aspects from areas such as geography, history, economics, urban planning, architecture and others. Among the most remarkable works on the city of Pitesti, mention „History of Pitesti city” (Popa P., Dicu P. Voinescu S., 1988), „Water resources in the High plain of Pitesti and Pitesti city water supply” (Posirca Rozica, 2004), „Pitesti. Tradition and contemporary” (Popa

P., Dicu P. Voinescu S., 2008), „Urban ensemble medieval Pitesti” (Greceanu Eugenia, 1982). Important data on the economy Pitesti are highlighted in various studies and works such as General Urban Plans, Local Agenda 21 and Integrated Plan Urban Development.

2. Materials and methods used

The materials used from this study are represented by the statistic and economic dates on economic activities and population trends in the analyzed period, these data were provided by the direction County of Statistic Arges and Pitesti city Hall and various studies on urban economy. Like methods used in the current study may be mentioned: the method of collecting statistical data on economy and population, method of examination the information, questionnaire method and the explanation method [2].

3. Case study

Pitesti is the most developed urban center, both economically and in number of inhabitants, compared with other localities in the county of Arges. Located in the central part of the county at confluence Arges River with Doamnei River, in a transition zone between two different geographical regions, area of hills and plains, the city of Pitesti has developed both under the influence of natural factors and anthropogenic.

One of the important factors on the development of the city was the economic factor. Economic activities were those that influenced the development of the city since ancient times. The first economic activities in the city where those of crafts and trade [6], and then the economy has seen a diversification of industries, but also an evolution in terms of production capacity. Location of the city at the crossroads of

important trade routes influenced the practice of trade from ancient times, by merchants and craftsmen, both within the inside city of Pitesti and other localities, with products from those places.

The local economy has developed over time, the number of industrial units has grown and diversified aspect that influenced the increase in population within the city. Due the development of industry, the commercial sector recorded a decline, so, a good part of the population of the city was framed in the industrial sector, and at the beginning of socialist period the industry represented the main branch of economy [2]. At the present it seems that we are witnessing a new reclassification, respectively the industry sector recorded a drop in front of the tertiary sector, especially commercial field. This change is mainly due to the flow of commercial complexes (hypermarkets and malls) what have emerged especially after year 2002. It may indicate that by the occurrence of these comercial complexes started a new „era” in trade activity. These commercial complexes are located both within the municipality, but, and on the outskirts of Pitesti city, on the villages territory limitrophe, mainly due to lower land costs and higher ongoing surface. Much of the employed population from Pitesti, working in these comercial complexes. Their location within the urban area was made taking into account various aspects such as the use of vacant space, or redevelopment of an area being used for other activities. This last aspect has influence on surface modification for certain functional areas. Some of them have low surface, it's case the industriale area, while others increased their surface, such as commercial area, by arrangement of hypermarkets and shopping malls. Currently the number of these comercial complexes is enough, given the population from Pitesti city, but also localities population neighboring. If the number of these comercial complexes will continue to grow, there will be an overcrowding, which will influence in the future suppression of some of them.

Regarding the economic crisis appearance that affected the national economic situation, in Pitesti city this problem has made its presence felt through massive restructuring in the production capacity in the industrial

units, the number of employees, rising unemployment, closure of certain industrial units, reducing wages and other problems that have impeded or negatively affected the economic situation locally.

The economic crisis is the second important issue for the local community, with the period after privatization of economic entities, especially after year 1997, when the Law no. 15 of August 8, 1990, allowed after a set period, some action on production and staff profile [4]. The consequences of the privatization process were represented by renaming unit, changing production profile and reduce the number of employess. By such measures the number of people employed in industry fell, much has been readjusted to other sectors like commercial sector, wich to outlined very well lately.

The present study includes information that was obtained by achievement of a questionnaire on population perception, conducted on a sample of 350 people in Pitesti, consisting of 20 questions. This method is commonly used in recent years, of numerous researchers in carrying out various studies.

The questionnaire was applied to a sample of 350 people aged over 18 years who working in different areas, and some questions are about economic issues within the urban area, respondents answers are beneficial to achieve the current study.

Thus, the questions „*At present, the city of pitesti is characterized by: a) economic growth, b) economic decline, c) economic stagnation*”, respondents answers were the basis to achieving the graph in figure 1.

Looking at figure 1, we see that the lowest percentage of responses is recorded by economic growth, these it was perceived by 11,18 % of the population, followed by economic stagnation by 35,66 %, and a most part of the people questioned, respectively 53,14 %, to perceived the economic status of Pitesti city, in present, as a economic decline.

Figure 1. Questionnaire results – question 13

The most important aspects that influenced the population in choosing the response of decreasing economic, are related primarily to the economic crisis manifested by closing certain industrial units and therefore dismissal of the number of employees.

The questionnaire also included a question with free response of the respondents, the main reason being a population perception of the main problem currently in Pitesti („What do you think is the main problem facing today Pitesti city?”). Can we wonder why we included this question in the questionnaire? Represent a question that people can answer freely, without replies, and after analyzing the responses it can be concluded which is the main problem encountered in the city of Pitesti.

After processing and analyzing responses of respondent population, we found that the main problem existing in the city of Pitesti is related to the economy sector. In figure 2 are represented the weights for the variants of answers, from the questioned population, thus, the population believes that the main problem in Pitesti is the lack of jobs (45,14 %). Restructurings carried out in industrial units, the reduce of production, the downsizing and finally closing the unit, are the causes that led to an increase in unemployed persons.

With a rate of 17,42 % are the answers what considers that the main issue of the city, the economic crisis. The other responses showed lower values, namely, lack of parking 15,71 %, the unemployment 11,42 %, the pollution 6 % and at the category other problems (such as homelessness, stray dogs, bureaucracy, lack of young people, traffic congestion) the result is 4,28 %.

Figure 2. Questionnaire results – question 20

In conclusion, lack of jobs, is the most important issue facing the city of Pitesti today. This situation has created, in particular due to industrial restructurings that occurred in the system, both in terms of production capacity and the number of employees. In some cases the industrial units have stopped work activity and entered the stage of liquidation.

Regarding the recovery situation existing from the present the state departments charged with such problems, must adopt certain projects and programs to restore and bring to a normal state, the industrial situation. Perhaps one of the solution on restoration of favorable economic situation in the city is the implementation of projects to strengthen the industrial parks. As a location, industrial parks are located within existing industrial sites, through a reorganization of existing space and facilities. Because the administrative area of the city is low compared to other urban areas of the same rank, the space should be managed and used after well-established criteria, for a more efficient use.

Between the directions for development of strategic Pitesti city, the most important, at local level, are being outlined as follows [7]:

- Creating an economic environment, competitive and attractive for business local and foreign investment, which to enable the development of entrepreneurship;
- Development of a performance economy, sustainable and environmentally friendly, through effective management of local economic development;
- Effective management of local government activity;

Pitesti is one of the country's major urban centers what must to be supported by various means, for as the economy to record favorable results in the future. Local authorities should adopt certain measures for as the local economy to record positive results and one of measures can be the economic planning, this representing „the predictable activity most complex and active in anticipating a social-economic system with a variable scope of coverage, aiming at achieving consistent and effective structures, by allocation and training of appropriate means” [3]. Businessmen had the following opinion on the economic sector: „economic sector development is base of the development of the whole society” [5].

4. Conclusions

The global economic crisis represent a negative aspect for the companies in the current period. Many of these, have faced and still facing various problems due mainly economic crisis. Some companies, have reduced their production, number of employees and others went bankrupt.

The economic crisis problem, should be solved in a short time period, for not extend the currently existing negative.

Restructuring companies, influence the migrations of people of the city in abroad, for a job, or in native places to practice agriculture.

In the future, must be adopted some recovery measures for companies and developing economic activities to remedy problems of economic, that have occurred in the city.

Romania is Suffocating from Economic Point of View

Negoescu Gheorghe

"Ovidius" University of Constanța, Faculty of Economic Science

negoescugl@yahoo.com

Abstract

Continuously recording budget deficit after 1989 led to a continuing destabilization of the economic situation in Romania. Currently, Romania has become in a chronic condition when must borrow money every month to cover the budget deficit for the payment of pensions, wages and investment part. If there is no growth or is insignificant growth of 0.5 to 1.5%, Romania entered into an inflation spiral that does not allow growth even if they provide money for investment. There are several solutions: stimulating investment which creates jobs, the use of European structural funds, promote savings widespread population while developing entrepreneurial skills and financial knowledge to a mass at least as high as 60-80% of the population .

Key words: investor, employee, economy, crisis, promotion

J.E.L. classification: E44

1. Introduction

Romania will give, in a relatively short time, bankruptcy. That should not to scare us. Bankruptcy will mean an opportunity for Romania to help their economic imbalances. Bankruptcy economy of Romania is a consequence of the accumulation of large contradictions in the country's budget deficit.

We don't have a healthy demographic policy, we have social assisted much more than active taxpayers, "bureaucrats" are more than people involved in industrial or agricultural production, and reforms in health, education, justice and administration beat up on the spot.

2. Robert Kiyosaki

In my opinion we need a new concept in school curricula of secondary school to university, to promote entrepreneurial culture in the sense Kiosaki, which identified four color [1] of "earned" money as shown in the figure below:

Figure no. 1: Money Quadrant

Source: Processing by R. Kiyosaki, "The CASHFLOW Quadrant. Rich Dad's Guide to Financial Freedom", 2nd edition, Curtea Veche Publishing, Bucharest, 2008

In Robert Kiyosaki view, this means that early in his career, we should be aware that there are four situations in which money is earned as follows: employee, self employed, employer and investor [2].

The left side of the money quadrant is directly related to time work arrangements. The more you work, the more money you have. When not working, do not receive money. Another feature of quadrants 1 and 2 is that taxes are high and can not be modified except by law enacted by Parliament and this is not the reach of ordinary people.

On the right side of the figure, the time worked does not matter. What matters is the use of multiplication of two levers.

- OPT – other people time;
- OPM – other people money.

To go through the employee to the investor, you need to strengthen financial literacy that have shaped them early. The problem is to accumulate the knowledge that let you live financial decent sense Larry John.

3. Financial IQ

According to Robert Kiyosaki, there are five levels of financial knowledge, classified IQ's:

- IQ no. 1: how to make money;
- IQ no. 2: how to keep money;
- IQ no. 3: how to place money;
- IQ no. 4: how to use leverage;
- IQ no. 5: how to inform you financially?

In my opinion, after over thirty years experience, I think it would be six levels of IQ and less reversed order, as follows:

- IQ no. 1: from where I go or "my financial potency";
- IQ no. 2: how to financial inform ;
- IQ no. 3: how to make money;
- IQ no. 4: how to keep money;
- IQ no. 5: how to place money;
- IQ no. 6: how to use leverage.

4. Proposals

Switching from dial I - "employee" in quadrant IV - "investor" can be achieved through a continuous effort, directed towards the so-called total financial transformation by passing most of the population in a comprehensive process of saving the expense of debt without coverage. Robert Kiyosaki, calls this process <<From the "Mousetrap" to "Fast track">> [3].

Final target of this new concept of education should be reversing pyramid levels of initiative in figure below:

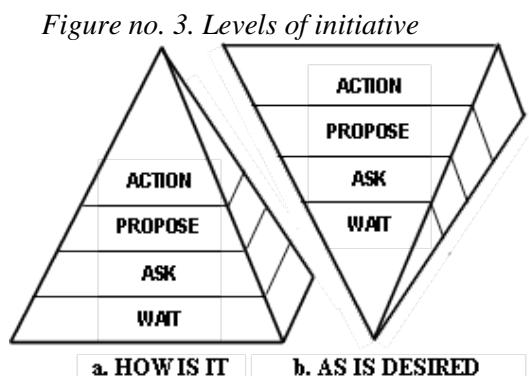

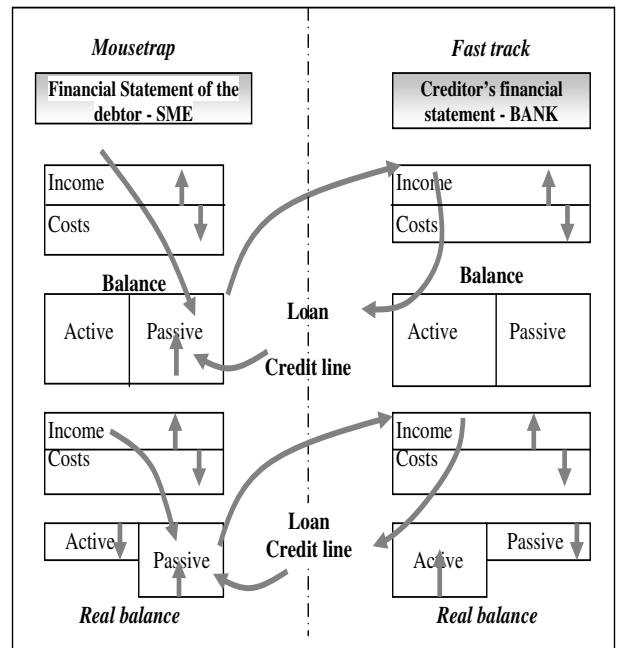

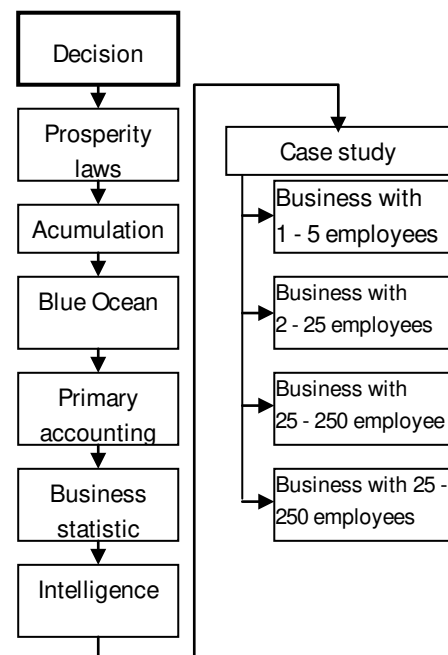

Figura nr. 2: From the "Mousetrap" to "Fast track"

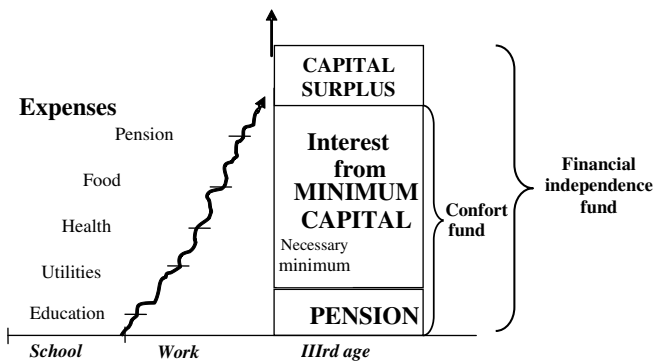

Source: Processing after R. Kiyosaki, „Rich Dad, Poor Dad. Financial education in family”, 3rd edition, Curtea Veche Publishing, Bucharest, 2008

In my opinion, it should be invented an entrepreneurial culture manual that will teach elementary school, middle school, high school and college knowledge in a series of increasingly more complex. For universities I propose a manual with the following structure:

Figure no. 4. University manual structure

5. Comfort Fund

6. Fundamental concepts

Fundamental economic concepts should be presented in the manual of entrepreneurial culture, in my opinion, are:

Chapter I. DECISION

1. Objectives
2. Tree of expectations
3. Robert Kiyosaki prosperity laws
4. Life cycle of a business
5. SWOT analysis. Case Study
6. Business exotic "Knives and pretzels"
7. Financial engineers: "PFA – income norm"
8. Examples of multiple-choice questions

Chapter II. PROSPERITY LAW

1. Objectives
2. Recapitulare
3. George knows everything!
4. Case study – Business promotion
5. Randy Gage prosperity laws
6. Jim Collins prosperity laws
7. At the begining it was the idea
8. Final project structure
9. Exotic Business: Ice "as at the grandmother"
10. Financial engineers "Profit with zero tax"
11. Examples of multiple-choice questions

Chapter III. ACUMULATION

1. Objectives
2. Recapitulation
3. S.O.S. Asylum
4. Acumulation

5. Acumulation amplification
6. Case study - Chart
7. Exotic Business: „ZIPCAR”
8. Financial engineers: „Division”
9. Examples of multiple-choice questions

Chapter IV. BLUE OCEAN

1. Objectives
2. Recapitulation
3. Two business, the same trick
4. Blue Ocean
5. EDDC Matrix
6. Strategic Vela
7. Exotic Business: „Christmas Tree”
8. Key business: „Commercial space”
9. Financial engineers: „PFA or employee”
10. Examples of multiple-choice questions

Chapter V. PRIMARY ACCOUNTING

1. Objectives
2. Recapitulation
3. Balance
4. Profit and loss account
5. Absolute indicators
6. Derived indicators
7. Model report for determining the state of insolvency
8. Exotic Business: „P2P credit markets”
9. Key business: „Commercial space”
10. Financial engineers: „FACTORING”
11. Examples of multiple-choice questions

Chapter VI. FINANCIAL INTELLIGENCE

1. Objectives
2. Recapitulation
3. Larry John’s golden rules
4. A necessary evil - marriage
5. Financial IQ
6. Exotic Business: „Products portioned to order”
7. Key business: „On-line consulting”
8. Financial engineers: „House in lei”
9. Expectations tree
10. Examples of multiple-choice questions

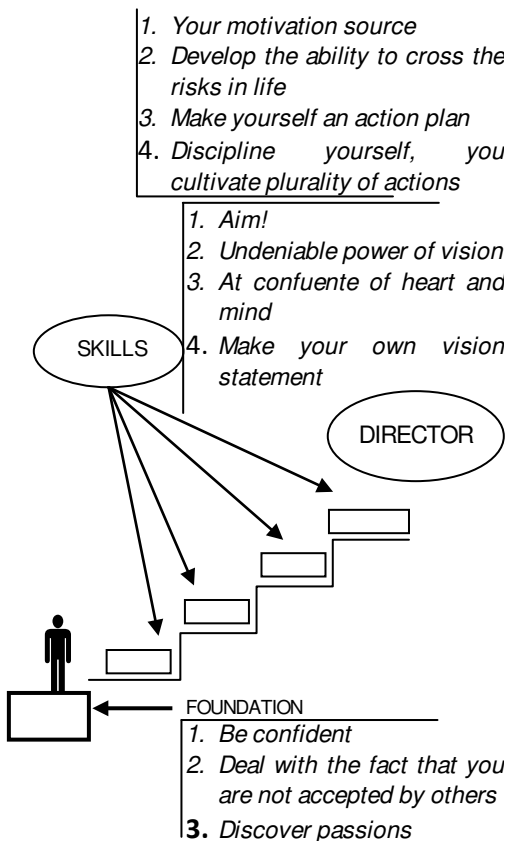

ANNEXES

- Annex no. 1. Stages and documents necessary to set up a PFA

- Annex no. 2. And taxes have a limit
- Annex no. 3. Model for determining the risk of bankruptcy to XTB - export import
- Annex no. 4. Balance Sheet and Profit and loss for ECONSULTING Company

Purpose of acquiring entrepreneurial knowledge seemed explicitly presented in the book "Total Leadership. Practical guide to transform your life vision into reality", prepared by Anthony Silard and translated in Romania in the Old Court House, the collection Profit [4].

Figura nr. 4. The trip

Source: Anthony Silard, *Total Leadership. Practical guide to transform your life vision into reality*, Curtea Veche Publishing, Bucharest, 2010

7. Conclusions

1. Entrepreneurial knowledge after the financial crisis started in October 2008, turned from the "luxury" to "necessity".
2. Romanian must learn to engage in business and earn money over the life of all four quadrants of Kiyosaki: employee, self employed, employer and investor.
3. Second pillar pension, voluntary pillar of retirement and the new law for expenditure financing will encourage Romanians health desire to acquire entrepreneurial knowledge.

Fundamental Contradictions Generated by Transition to Market Economy

Negoescu Gheorghe
"Ovidius" University of Constanța, Faculty of Economic Science
negoescugl@yahoo.com

Abstract

N.N. Constantinescu was considered a promoter of new trends in the global economy in the 1970s when they recognized that there are contradictions in socialist economies. Then he said that there are contradictions, but true-born, that which can be solved by knowing their working class. Political line dictated the idea that socialism is superior just because capitalism has solutions for any problem. That was not so, have demonstrated the events of 1989 and how fundamental economic correlations have evolved during the transition from a planned economy to a market economy. We are currently in a very delicate situation in terms of financial deepening disparities generated by generating antagonistic contradictions which can ultimately lead to bankruptcy of a country's economy.

Key words: contradictions, disparities, antagonistic, education, school

J.E.L. classification: B22

1. Introduction

The most important disproportions are: "white collar" which increased disproportionately due to weaker of "black collar", production of goods decreased at the expense of basic services, the number of engineers capable of fundamentally low expense of bureaucrats (lawyers, economists, notaries, writer). The danger is still the deterioration of productive - unproductive relationship and to be inundated by bad material and human waste.

Economically these disproportions have led the price increases in an inappropriate direction: 30% of actual costs of production and 70% promotion expenses, insurance and financing.

Figure no. 1: The spending on a car structure

2. Nicolae N. Constantinescu

Nicolae N. Constantinescu (1920-2000) is a distinguished personality of the Romanian economic science, professor of exception, esteemed by generations of students and doctoral researcher at the prestigious national and international.

Nicolae N. Constantinescu was a member of the Romanian Academy (1974) and member since 1990. Since 1994 I have been granted academic scientific titles correspondent of the Royal Academy of Doctors in Spain as well as honorary member of the Academy of Agricultural Sciences and Forestry in Romania. Nicolae N. Constantinescu won the title of Doctor Honoris Causa of the University: Craiova (1995), Timisoara (1995), Oradea (1996), Sibiu (1997) and the Academy of Economic Studies in Chisinau - Moldova (1995). From 1949 to 1992 he worked first as lecturer and consultant in 1992 as a professor at ASE Bucharest, then lecturer and teacher, Professor Head of Department at the Academy of Economic Studies. Nicolae N. Constantinescu left a large work with undeniable contributions in areas of importance to science and practice of economic development not only in Romania and internationally. As a coordinator and / or author, published volumes I-III of the "economic history of Romania," Romanian Academy Publishing House, vol IV-VI

continued with by a team of researchers prestigious, under the direction of academician Iulian Văcărel. Analyzing the scientific activity of academician NN Constantinescu, note that the historical contributions of the national economy: Economic History builder of discipline in economic higher education, the true-born founder of the theory of socialism, the development of many distinct works or extensive chapters of economic history, numerous studies and works, participation in national and international scientific economic history, creator of the scientific student of economic history, manager, factor targeting research the history of research.

Professor dr. Gheorghe ZAMAN [2] shows that aspects of the economic crisis 1929-1933, analyzed by Professor N.N. Constantinescu, in many respects have resonance with the financial and economic crisis in Romania in the years 2009-2010, especially in terms of public-private partnerships, private-private and public-public (Brundtland report, 1986), to economic-environmental theory, developed countries - developing countries, labor theory of value based on intangible assets, creative human capital, technological progress and research - innovation development, the methodology research in economics in multi and transdisciplinary context).

3. New fundamental contradictions

In Romania were kept contradictions "true-born" of socialism and have added new contradictions.

The most dangerous new contradictions emerged after the events of December 1989, are:

1. rich are richer and the poor are poorer;
2. increasing gap between the favorable areas to unfavorable areas;
3. disproportionate development of cities, starting with Bucharest;
4. attractive salaries in favorable areas, compared with negative areas;
5. active population ratio - the population assisted;
6. access to information of politicians compared to people not involved politically.

Consequence of the rise of fundamental contradictions in the Romanian economy in

Romania to be extremely only exist as a state. Germs of extreme initiatives can be observed already in real life: drugs, hallucinogenic plants, suicides, drain departures abroad.

I recently found out that a well-known professor of Galati and bought a house in Cluj, motivated by the fact that Romania will be divided into zones of influence and will be signposted Transylvania and Wallachia West, Dobrogea and Moldova will be under Russian influence.

One thing is clear: Romania's population is declining and is increasingly hopeless.

It needs a new development strategy of Romania [1] and especially of a new political class, I would say an elite to govern Romania to save the country and people.

4. Education Law, "three times yes"

I appreciate that national education law No. 1 / 2011 [3], is the best law school in the last 50 years.

Although not perfect, we must recognize that education has deteriorated continuously and needs a law to stop the continuous decline of this area, I would say that from 1947 to the present. Transformation forced laborer and / or academic peasants, the "troubled" conception of "intellectual". In promoting socialism forced laborer in the director or deputy mayor appointed or the Grand National Assembly amended the ladder and led to the belief that workers are more important than the intellectuals ("we work and think not!").

I appreciate that it is time to channel efforts towards application of new concepts of education, for which in my opinion, we must say YES three times!

YES - for no.1/2011 education law. YES - for classifying universities.

YES - for criteria for promotion for lecturers and teachers.

No matter how hard we will have to be confirmed in the posts, I think the university needs a "cold shower".

5. Proposals to amend the evaluation criteria for the teacher, associate professors and researcher in economics and business administration

I₁ Category

Consider only works whose content corresponds to the field of economics and business administration.

Publication or citation to a single indicator falls, taking into account the most favorable candidate recruitment.

n_i - the number of authors of publication in which the candidate is author or coauthor.

I_1 indicator which characterise numerical the article which presents original scientific contributions, in extenso, published in the ISI relative influence score greater than or equal to 0.25.

$$I_1 = 100 \cdot \sum_i \frac{s_i}{n_i} \quad \text{where } i \text{ mentions}$$

articles presenting original scientific contributions, in extenso, published by the author or co-applicant. The ISI that influence relative score greater than or equal to 0.25, and s_i represents the relative influence score of the journal.

I₂ Category

I_2 characterize numeric indicator showing items original scientific contributions, in full published in ISI journals with lower impact relative score of 0.25 and in journals indexed in international databases recognized.

For Economics and Business Administration, recognized international databases are as follows. ISI Web of Knowledge, Scopusl, EBSCO, EconLit. RePEc, DOAJ, Cabell's, JSTOR, Science Direct, SpringerLink, ProQuest.

$$I_2 = \sum_j \frac{w_j}{n_j} \quad \text{where } j \text{ mentions the}$$

articles presenting original scientific contributions, in extenso, published by the author or co-applicant in magazines that match the categories in the table below, and w_j is awarded points according to the following table:

Table no. 1 Evaluation criteria for articles

Category falling within article i	w_j
Article presenting original scientific contributions in estenso, published in an ISI score with a nonzero relative influence and less than 0.25	8
Article presenting original scientific contributions, in extenso, published in an ISI with a score of 0 relative influence	7
Article presenting original scientific contributions, the extensor published in a journal indexed by at least 3 of the recognized international databases	6

I₃ Category

I_3 indicator characterizes the number published in specialized books and volumes. Books, conferences volumes collective volumes considered are only those published by the international prestige. The author must prove that the publication of the book or volume has gone through an evaluation process by submitting reports scientific reviewers nominated by publishers.

It is considered that a book or volume are published in a prestigious international publishing abroad only if the publication is made in a foreign language, which can be English, French, German, Italian or Spanish, otherwise the book or volume are treated as points, those published in the country.

p_k is the number of pages that share the author or co-applicant of the number of total pages of the book / the volume k. Is calculated as the ratio between the number of pages that have the author or co-applicant and total number of pages of the book / volume.

$$I_3 = \sum_k p_k \cdot \frac{CS_k}{n_k} \quad \text{where } k \text{ mentions the}$$

professional books or study / chapters in books, collective volume or volumes of conferences, published by the candidate, as the author or coauthor, and CS_k is awarded points according to the following table:

Table no. 2. Evaluation criteria for publications

Category falling within k publication	CS _k
The published book to a publisher with international prestige abroad (with ISBN)	16
Study / chapter in a book expert, collective volume or volume of a conference, published / A to a publisher with international prestige abroad (ISBN or ISSN)	12
The published book to a publisher with international prestige in the country (with ISBN)	8
Study / chapter in a book expert, collective volume or volume of a conference, published in a prestigious international publisher in the country (with ISBN or ISSN)	6

I₄ Category

I₄ indicator characterizes the number presentation of scientific studies (working papers) in international conferences. Consider only the scientific studies presented directly by the candidate. Scientific studies presented at the conference must be reviewed by at least one reader designated by its organizers. The conference program will prove that scientific study has been commented on by at least one reader and presentation of scientific study was done by the candidate. Also, studies presented at the conference or at least their summary to be made public through various means of dissemination: conference website, CDs, etc. printed volumes. An international conference held abroad is considered that the scientific studies are presented in an international language that can be English, French, German, Italian or Spanish conference is otherwise treated as points, international conferences held in country.

$I_4 = \sum_t CF_t$ where I mentions scientific studies, and CF_t is awarded points according to the following table:

Table no. 3 Evaluation criteria for studies

Scientific Study (working paper) / presented at an international conference	CF _t
Scientific Study (working paper) presented at an international conference held abroad	2
Scientific Study (working paper) presented at an international conference held in the country	1

In my opinion I₁ indicator should be amended to the effect that should be encouraged and those teachers who have a direct connection with actual economic practice and not only those published in ISI journals. Thus I₁ it could be: $I_1 = \sum Ci$ where Ci is the share of jobs created in the real economy calculated as the ratio of man / years of jobs created and number of years of experience in business.

Based on this indicator, the dignity of a teacher, lecturer and researcher would have access and people who know the requirements of the labor market.

I₅ Category

I₅ indicator characterizes the number of published citations. Count only citations from ISI citations, journals indexed at least 3 of international recognized databases, or from books or volumes, published by the international prestige publishing houses.

6. Conclusions

1. Education Law is a law that can stop the decline of higher education began in 1947;
2. It takes commitment and recognition of teachers in accepting the new rules over those who find reasons to apply law enforcement to "Greek calends";
3. I recommend the stimulation of specialists that created and managed jobs to fill the dignity of being associate professor or researcher.

Needs of Changing the Budgetary Process at the European Union Level

Neguriță Octav

„Spiru Haret” University, Faculty of Financial Management and Accounting Constanta
octavnegurita@yahoo.com

Abstract

The recent economic developments of the Member States of the European Union emphasize the need for a continuous reform of the EU budgetary process. However, the significant economic distortions and the massive budget problems, of certain EU countries over the past two years, come to fill in the need to accelerate this process or completely change the mechanisms of the formation of the EU budget. The deepening of the national debt, for whatever reason, is perhaps one of the reasons why a difficult situation, in terms of budget, was reached. It is absolutely necessary to fully understand the budgetary needs at Community level, the causes that led to this concern, as well as the modification of the proposed budget processes so far.

Key words: budget, reform, expenditures, policies.

J.E.L. classification: F33

1. Introduction

European Union is financed from its own resources that are provided by member countries. Own resources are fixed by the European Council and are ratified by national parliaments. The financing of the European Union favors a certain dilution of budgetary responsibility: while increasing spending seems to be a goal for the European Commission and for the European Parliament, member states make their net balance as objectives of their positions on the ground of common policies.

The EU budget can not be compared with a national state budget, because it presents significant features. For example, in decision-making process and operation, the EU must respect its own principles and make compromises

between different states, especially in issues such as agriculture and regional development. In such problems, interests of individual Member States are different and sometimes even antagonistic. In addition, the E.U. budget must be differentiated from the budget of international organizations because it is financed by contributions from Member States as its main objective is deepening integration. To this end, the EU budget is drawn up and running by specific rules. Its resources are used for determining the rate of GNP of the Member States, which are set each year by budgetary procedures, taking into account all revenues. The implementation of the European budget, regardless of its ways to achieve, should always follow the condition of efficiency. The responsibilities of European institutions are not only to provide financial support for certain types of projects, but they have a broad spectrum, especially following the European money to be spent properly and the proposed objectives to be met. The current reform of the Community budget should take into account the particularities of the new Member States and to ensure continued support in real terms, so that to achieve the objective of convergence and the gap of efficiency and competitiveness against the old member states.

Changing the structure of EU spending in Europe 2020, backed ably by domestic policy measures, could accelerate the economic structure change among new EU states. At this point, the Commission activities focus on the evaluation of plan expenses. National parliaments have not actually a real influence and citizens, which ignores the cost of Europe, continues to see the community as a satisfactory source for financing the loans. Net balances problem remains in the center of the debate, but has the flexibility and transparency of national contributions necessary to meet the needs of Member States, including the budgetary cost of EU

membership and the extent of transfers between the member states.

2. The mechanism of the community budget process

The debate on future EU policies and budgets is still just starting. On June 8th, 2011, The European Parliament approved its position on the multi-year budget for 2014-2020. Will there be new revenue sources for the EU budget? Is the European Union, in the middle of an economic crisis, ready to support the ambitious strategy set out in EU 2020? Is there going to be any financial support for the new tasks included in the Treaty of Lisbon? If there is such support, what will happen to the traditional political areas such as agriculture and regional politics? Unfortunately, these and other questions remain to be addressed in future years when EU Member States and the European Parliament must agree on the financial framework of the European Union for 2014-2020. [1]

The European Union budgetary process includes several stages, namely: Budget preparation, adoption, execution, execution control, discharge. The responsibility of the Community budget execution lies with the European Commission but also with the Member States by which directly run about 83% of expenditure and most income.

a. The development and adoption of the budget

The European Commission prepares, by July 1st of each year, the preliminary draft of the European Union budget, based on estimated costs. This estimation of costs is made by each EU institution. The Council must take a decision on the preliminary draft budget by October 5th. From this document, the preliminary draft becomes the budget project. For this purpose, the Council shall consult with the Parliament regarding compulsory expenditure, deriving directly from the Treaty and the normative acts adopted under the Treaty. Within 45 days, the Parliament examines the draft budget and there are three possible situations:

- The Parliament does not initiate any action, and the budget is considered approved;
- The Parliament approves the budget;
- The Parliament decides to make changes.

Within 15 days, the Council shall examine the proposals made by Parliament. In case of non-compulsory expenditure, the Council is empowered to make changes and the amended text is sent back to the Parliament. In the case of mandatory expenditures two situations may occur:

- Parliament's proposals will increase the total budget. If the Council agrees with qualified majority, the proposals are accepted. Without this majority the proposals are rejected;
- Parliament's proposals do not increase the total budget. In this case, the Council may reject proposals with the qualified majority.

The Parliament also has the right to modify the non-compulsory expenditures by an absolute majority of its members and three/fifths of the votes cast. The budget may be rejected by an absolute majority of its members and three / fifths of the votes cast.

For a good development and adoption of the EU budget, consultation regarding the budget priorities was institutionalized by a trilogue between Parliament, Council and Commission, resulted in institutional arrangements, and through joint working sessions. At these joint meetings, participate, those responsible for budget in the three institutions, followed by conciliations between Parliament and Council where Commission representatives attend.

In 2001, for the first time, during budget preparation, The European Commission approached the annual budget debate and political orientations, starting from the 29 political areas of the EU. This approach ensures a coherent and comprehensive view of the targets set for each political area of the Community and on human, material and financial resources, necessary to be achieved, within the limits contained in the financial perspective. Budgeting on specific activities will be completed at the level of the European Union departments, with the introduction of activity based management. [2]

b. Implementation of the budget

For the revenue side, Member States are required to transfer their respective incomes, to the EU budget from January 1st. The implementation part of the expenditure requires the existence of a legal base, which

means that a budgeted expense can be executed only if a legal provision has been adopted, which results in an expenditure obligation for the EU. The exception to this rule, meaning that certain expenditures may be effective only on the basis of their inclusion in the budget, for amounts that are "insignificant" in the four cases explicitly defined:

- Pilot schemes of an experimental nature;
- Preliminary action for the preparation of a legislative proposal;
- Actions initiated by the Commission in the implementation of duties such as stages and social policy options;
- Actions of individual institutions within its administrative autonomy.

The Commission and other EU institutions bear full responsibility for the implementation of their part of the budget. In practice, licensing officers, accounting officers and financial controllers are the people who implement the budget. This internal delegation of competences seeks to avoid a conflict of interest and abuse of power.

The authorizing officer has the power to authorize the expenditure to take effect. The accounting officers make the payments, being the only ones authorized to handle money and other assets. Financial controllers conduct the execution, monitoring and auditing in fact the legality of transactions. The financial controllers have some independence, meaning that, in some cases, they may engage actions before the Court of Justice.

Performing any expenditure must take the following four stages:

1. engaging expenditure, which is made only if the financial controller checks for the legal basis and budgetary provision;
2. the validation of the expenditure is made by the licensing officer who verifies the payment obligation to a creditor, the payment amount, provided that the payment becomes chargeable;
3. authorizing is the operation by which the authorizing officer requests the accounting officer to pay for an expense that has been validated. Payment order is being sent for a preventive visa to the financial control;
4. payment is the final action conducted by the accounting officer and which

terminates the institution's obligation to the creditor.

Member States implement the policies, the projects and the programs on agriculture and structural operations. As a result, approximately 83% of the European Union expenditures are carried out by the Member States, which, together with the European Commission are responsible for how EU resources are being used.

c. The control of budget implementation and discharge

During the financial year, the Commission sends monthly reports to Parliament and the Court of Auditors on the implementation of EU budget revenue and expenditure. After the completion of the financial year, by May 1st of the following year, the Commission, elaborates the consolidated account of the implementation of the budget revenue and expenditure, the balance sheet assets and liabilities of the EU and an analysis of the financial management. Based on these documents and their own analysis, the Court of Auditors elaborates its own report on the compliance with the law, in implementing revenue and expenditure and of a sound financial management practice. Auditor's report is submitted to the Parliament, which may or may not discharge. [3]

3. Community budgeting procedures

The European Community Treaty, Article 272, noted that the various stages of the procedure and time limits must be strictly followed. In the EU the budgetary procedure laid down in the Treaty should be placed in the period September 1st- December 31st of the previous budgeting year. In practice, the procedure takes place in several stages, as follows:

1. The elaboration of the draft budget, by the European Commission, and its transfer to the budgetary authority by June 15. After comments and debate on political and budgetary priorities for the next year, the Commission selects the data required to prepare the budget, by doing an internal arbitration. At the end of this stage, the Commission brings together all the elements in a draft budget that includes the overall revenue and expenditure forecast for the next year. Later, this

project may be modified, by the Commission, through a letter of amendment.

2. The establishing of the budget project by the Council. The Council reads first the draft budget and then adopts, before July 31st, based on the initial project and after discussions with a delegation of the Parliament, a project that they forward during the first half of September.
3. The first reading in Parliament, of the draft budget of the Council is in October, the amendments on expenditure, being voted by an absolute majority of members. The second reading of the draft budget, by the Council, is in November, having been previously discussed with the European Parliament delegation. At this stage, the draft budget may be modified by amendments or proposed amendments voted in Parliament.

The Council deliberations result leads to the final amounts for compulsory expenditures, the Council having the final decision for this category of expenditure. The draft budget with this content is returned to Parliament by December 22nd. The second reading of draft budget in Parliament is compulsory, thus the Council may accept or reject proposals.

The Parliament votes the budget, the President notes the vote, and the budget becomes enforceable now. In certain circumstances, the Commission may propose, during the year, the modification of the voted budget, based on changes, based on a timetable of the budgetary procedure of the Council of Europe.

4. The stage of clarification of the EU budget system

Significant changes in the financial and budgetary system plan took place after the third wave of integration, 1986 (Spain and Portugal) and the adoption of the Single Act. European financial and budgetary reforms were initiated by J. Delors and consisted of:

- 1) *The method of determining the overall limit of their own resources*, for all categories as a percentage of FNB of the EU and not the VAT, as before;
- 2) *The introduction of the annual financial planning together with a double limit on expenditure*: the annual budget payment

limit may not exceed the overall limit, expressed as a percentage of GNP in the EU (which is 1.27%) and limiting each expenditure at a fixed cost for each year.

The reform of the EU budgetary and financial system has resulted in the adoption of two packages:

1. *Delors Package 1*, adopted by the Council in 1988, limited expenditures for agriculture, whose growth was capped at 74% of average GDP growth in the EU; the structural funds established allocations were doubled, it was constituted the fourth resource to finance new expenditures, based on each country's GNP.
2. *Delors Package 2*, adopted in 1992, redistributed resources in favor of structural programs and created the Cohesion Fund. [4]

5. New trends in budget

The new Community financial framework (Financial Perspective 2007-2013) is a new classification of expenditure in the EU budget, the main lines are now sustainable growth, competitiveness and cohesion and shared natural resources, subdivided between farm payments and other natural resources. Without the possibility of doing a direct comparison with the old EU budget (the structural operations could be identified separately), the new financial framework includes most of the former "structural operations" in chapter cohesion of "the sustainable growth".

Although programming, partnership, additionality and focus remain the key principles of regional policy, at the structural funds programming level, there are substance changes. For instance, although the obligation to maintain multi-annual programming, the National Development Plan and Complement Plan preparation obligation disappears, and it is required only the development of two types of programmatic documents, of strategic nature (National Strategic Reference Framework) and operational (operational plans). Even on the level of funds, management changes are introduced. Thus, under the *Convergence* objective, an audit authority will be created (an independent body responsible for checking the proper functioning of

management and control systems), a certification authority (responsible for certifying statements of expenditure, and payment applications prior to their transmission to the Commission) and the paying authority will disappear. Under the European territorial cooperation objective, there will be created, a certification authority, a single control authority and financial control groups (each consisting of an inspector appointed by each Member State, to support the role of the control authority). [5]

6. Legislative changes

On 29.09.2010, the Commission adopted the most comprehensive package to strengthen economic governance in the EU and the euro area since the launch of economic and monetary union. The proposals submitted represent the translation in specific legislative proposals of the recent Commission's communications from May 12th and June 30th, on the economic governance. Following intensive preparatory work and a broad stakeholder consultation, including the economic governance Task Force, chaired by European Council President Herman Van Rompuy, these political proposals of the Commission emphasize the strong desire to achieve, as quickly as possible, the necessary reforms. All these reforms are compatible with the Treaty of Lisbon and are likely to ensure that the EU and the euro area have a more effective coordination of the economic policies. The role of this approach is to give the EU and the euro area, the necessary capacity and strength to carry out sound economic policies, thereby contributing to a sustainable growth and to create jobs, according to Europe 2020 strategy. [6]

The legislative package consists of six legal texts, namely: four proposals addressing tax issues, including an ample reform of the Stability and Growth Pact (SGP), and two new regulations dealing with the detection and effective approach of macroeconomic imbalances emerging in the EU and euro area. These changes will facilitate enforcement and will limit discretionary tendencies in the implementation of sanctions. In other words, the PSC will become more "focused on the rules" and

sanctions will become a normal consequence of a violation of their commitments, by one country or another.

1) *An amending regulation of the legislative substrate in the corrective part of the Stability and Growth Pact:*

Through the corrective component of the SGP, it is intended to prevent committing serious errors in the conduct of budgetary policies. The regulation amendment is designed to more closely monitor debt developments and link it with the development of the deficit in taking a decision related to the excessive deficit procedure. Member States whose debt exceeds 60% of GDP should take measures to reduce this debt at a satisfactory pace, defined as a reduction of 1 / 20 of difference from the threshold of 60% over the past three years.

2) *An amending regulation in the legislative substrate of the preventive component of the Stability and Growth Pact:*

The preventive component is designed to ensure that Member States follow prudent fiscal policies in times of prosperity so that they have reserves in less favorable times. In order to delineate the sufficiency shown in times of previous economic prosperity, the monitoring of public finances will focus on the new concept of prudent fiscal policy, which is designed to ensure convergence towards the medium term objective. Commission may issue a warning if it finds that euro area Member States significantly deviate from prudent fiscal policies.

3) *A regulation relating to the effective implementation of budgetary surveillance in the euro area:*

Changes of the corrective component and of the preventive component are supported by a new set of financial penalties staged for the euro area Member States. In the case of the corrective component, if it is established that a country has an excessive deficit, the country should constitute a non-interest bearing deposit, amounting to 0.2% of GDP. This can be turned into a fine for non-compliance with the recommendation to correct the excessive deficit.

To ensure implementation, a "reverse voting mechanism" is considered, to impose such sanctions, meaning that the Commission proposal for a sanction shall be considered adopted unless rejected by the Council with

qualified majority. Accrued interest on deposits and fines will be redistributed to states in the euro area when there is no excessive deficit, nor excessive imbalance. The changes are designed to facilitate the potential transition to an insurance system related to the EU budget, as provided in the Commission's communication on June 30th.

4) *A new directive on requirements for the budgetary framework of the Member States:*

Because fiscal policy is decentralized, it is essential for the PSC objectives to be reflected in the national budgetary frameworks, namely the set of elements that form the foundation of the national budgetary governance (accounting systems, statistics, forecasts, fiscal policy rules, procedures, budget and budgetary relations with other entities such as local or regional authorities). The directive establishes the minimum requirements to be met by the Member States.

5) *A regulation on law enforcement measures to correct excessive macroeconomic deficits in the euro area:*

As in the budgetary field if it is established that a member of the euro area does not comply with the Council's recommendations repeatedly, in order to remedy excessive imbalance, it will have to pay a fine equal to 0.1% of the annual GDP. The fine can be stopped only by a qualified majority vote ("reverse voting", see above), expressed exclusively by the euro area Member States.

6) *A new regulation on the prevention and correction of the macroeconomic imbalances:*

The excessive imbalance procedure is a new element of the European Union for economic surveillance. It includes a regular assessment of the risks of imbalances based on a scoreboard of economic indicators. On this basis, for Member States with a high risk, the Commission may launch thorough examinations, after which it will identify the problems causing this situation. For Member States with severe imbalances or imbalances that jeopardize the functioning of Economic and Monetary Union, the Council may adopt recommendations and may initiate an "excessive imbalance procedure". A Member State to which the excessive imbalance procedure is applied, must submit a corrective action plan, submitted to the

Council, which will determine the deadline for the implementation of corrective actions. If it is found repeatedly that corrective actions are not done, it shall be subject to sanctions (see below).

7. Conclusions

It is absolutely necessary to design a debt management program for each of the European Union States, attracting funding should be considered for a long term process and executed as soon as possible, even given the strong risk of not covering the debt issuance announced.[7] In the future, Member States will not only have the problem of supporting banks, they will have their own problems for the issuing of the debt issuance. Moreover, in an illiquid market, there would be no one interested in taking over the debt of a Member State, such as Romania or Greece. For such countries, the most acute problem is not the obligation to reduce public debt or budget deficit, but the risk of being sanctioned by the international financial markets and private capital, following the loss of their credibility.

Romania versus Bulgaria. Black Sea Tourism. Case Study

Niciporuc Tudor

“Babeş-Bolyai” University of Cluj, Faculty of Economics and Business Administration
tudorniciporuc@yahoo.com

Abstract

The purpose of this paper is to present a detailed comparison between Romania's and Bulgaria's Black Sea tourism. We shall deal with the differences and similarities regarding the way privatisation was carried out in the two countries and their respective outcomes. Furthermore, we will highlight the natural climate and the tourism attractions in the Black Sea area. Last but not least, the services offered by the tourism sector of both countries will be thoroughly analysed.

Key words: touristic potential, investments, development

J.E.L. classification: L83, R11

1. Introduction

The tourist potential of the Romanian seaside is terrific, as the natural climate is truly unique. The golden sands are well known for their fineness, and the intertwining of land and sea is gradual, the beaches moving down slowly into the sea so that the water remains shallow for long distances from the shore, thus being adequate for children, or for those who cannot swim. In addition, because the Black Sea has a low level of salinity in comparison with other continental seas, tourists can practise freely underwater or water sports. Furthermore, there are no tides and no dangerous marine animals, and the playful dolphins can be a spectacular sight for the lucky viewers.

However, Romania is incapable of taking advantage of its natural resources, as the tourist sector has no vision, no coherent programmes and absolutely no development plan.

2. The Romanian seaside

The Romanian seaside is maybe the most edifying example of an unsuccessful privatisation process. It started back in the 2000's, when the government decided to sell all its remaining hotel assets. They were however sold at unbelievably low prices to business men close to the circles of power, consequently, the tourist sector was not at all encouraged. For instance, the government did not make sure that the new owners will modernise the hotels and bring them to an upstanding, pre-defined standard. Just as we go over the list of buyers, we conclude that these entrepreneurs have had no previous experience in tourism. Whether these so called investors bought such assets because they had been offered a bargain price (as they had close relations with the governors), or in order to speculate great real estate deals, for self pride or just to show off is unclear, but it is certain that they did not acquire them with the view to developing the local tourist sector.

For instance, among the investors, we can spot *Celco Plc.*, a commercial entity which purchased 4 hotels in Neptun (Delta, Sulina, Dobrogea and Traian) and one in Mamaia (Condor). However, *Celco* is the former concrete factory from Constanța, so its main activities are related to the construction industry and by no means to tourism. Among other important investors we can identify are the Micula brothers, managers of a well-known beverage company, who bought nine hotels in Neptun and Olimp summer resorts, and three others in Mamaia. However, they showed little interest in redeveloping and modernising the assets, consequently, most of them are today virtually completely outdated.

We reach the same conclusion when it comes to those responsible for managing the beaches. Almost half of the leased surface of the Romanian seaside – 570,000 square feet –

is managed by 10 private companies, among which only 3 have their primary activity registered as tourism, while other businesses include newspaper editing, trading car parts and the handling of harbour commodities. These companies took part in suspicious auctions between 2006 and 2008, and eventually managed to lease several patches of sand for a period of up to 25 years.[1]

What is worse is that even nowadays, business in the summer resorts is handled by the same fake investors, always protected by the authorities who turn a blind eye when it comes to their wheeling and dealing.

The results can be clearly highlighted in the tourist services offered: almost everywhere we can find hotels and restaurants that are completely outdated and derelict, poor services at steep prices, merely no customer care, filthy beaches, seaside water full of algae, improvised and unattractive terraces. In addition, among the over 300 hotels that operate on the seaside, only 2 are affiliated to an international hotel chain: Golden Tulip and Best Western Savoy, both located in Mamaia.[2] The international brands are a vital system of distribution for any tourist destination, because they are an attraction especially for the tourists who have a culture of holidays and who consider it to be a guarantee of a successful vacation.

According to an analysis carried out by the Trend Hospital consulting company[3], the Romanian seaside hotels lack even the most basic features when it comes to the security of the tourists and the structure of the services that are offered. For instance, while our hotels are crammed on tiny surfaces, the Turkish and Greek summer resorts are spread on thousands of square feet of sand.

Given the circumstances, the business has once again been rescued by the week-end tourists: according to Forbes, almost 110,000 tourists – most of them Romanians, confronted with a pay cut and a gloomy outlook as far as the security of their job is concerned, but willing to have a whale of time – have invaded the Black Sea summer resorts from Friday to Sunday night.

During[4] the 12 summer weekends of 2010, tourists spent € 450,000,000. Although this sum may seem high at first sight, the number of tourists and the money they spent at the seaside are not much for an industry

that occupies almost 245 kilometres of beaches and boasts approximately 130,000 places for accommodation. In other words, the weekend tourists have delayed for another year the long-awaited bankruptcy of the previously mentioned impostors. In order to take full advantage of the wonderful gift nature gave us – the Black Sea – the restructuring of the Romanian tourism is badly needed, to allow this sector to be taken over by people really interested in investment and development.

3. What is the situation in Bulgaria?

By comparison, the Bulgarian seaside is 378 kilometres long and can accommodate up to 350,000 people. Extremely varied, it comprehends open beaches ending in lagoons and deep gulfs, tiny dunes and craggy cliffs, fishing villages and camping places. The privatisation process began in 1993[5], and not after the 2000's, like in Romania, and covered a whole resort, whereas in Romania each hotel asset was sold separately. This meant that in Romania, the hotel was owned by one investor, the restaurant by another and the pool or the terrace belonged to a third party. Once a Bulgarian investor bought the property, s/he immediately sought the help of major tour operators such as TUI or Neckerman, which not only offered their know-how, but spent important sums of money in renovating the hotels, or even in building new ones, according to German quality standards, nonetheless. Once finished, tour operators started pouring in foreign tourists, who brought the Bulgarian summer resorts to life. Finally, the investors in Bulgarian tourism had brand new assets, filled with tourists, and moreover, they were included in an international hotel chain that would supply tourists for a long period to come.

Another important aspect is the fact that Bulgarian hotels, built after the German recipe, are mainly three, four or five - star – meaning western standards – while in Romania, the majority of the hotels have only two or three stars, which makes them unattractive to foreign tourists, meaning that the four or five-hotels are the exceptions that confirm that our tourism is mainly directed towards less well-off people.

Figure 1. Mamaia versus Golden Sands infrastructure

Rating	Number of hotels	
	Mamaia	Golden Sands
5 star	4	4
4 star	14	30
3 star	22	33
2 star	22	8
1 star	3	0
Note : The grid does not include villas, hostels or apart-hotels		

Source: The Association for Promoting the Black Sea Coast and the official map of the resort The Golden Sands

To add insult to injury, the prices applied by the Romanian seaside hotels are comparable to those in Bulgaria, even though there is a huge discrepancy between the quality and services offered by the two countries.

Figure 2 Tarrifs from Mamaia versus Golden Sands tarrifs

Hotel	Double room/night (Euros)	
	Mamaia	Golden Sands
5 star	225-245	75-123
4 star	99-195	40-124
3 star	49-73	17-60
2 star	20-30	16-30

Source: www.booking.com

The Bulgarian tourism is not perfect whatsoever. The country is in danger of losing an important share of its western tourists, as their security has been quite an issue during the past few years. Diplomats from Great Britain, Ireland, Holland, Denmark or Norway urged Bulgarian officials to take prompt actions against thefts committed in Sunny Beach, Bulgaria's biggest summer resort.[6] Foreign diplomats have met with Sunny Beach officials and with police representatives in order to draw up a plan meant to reinforce public safety alongside the Black Sea resorts.

Furthermore, taxis without a valid license are more and more common, while the blackmailing of foreign tourists is increasingly growing. The latest case occurred in May 2010, when a taxi driver and an accomplice took hostage a tourist and

demanded €200 worth of ransom. What is more, due to the surge in the number of visitors, parking your car could prove to be a huge challenge. In addition, sometimes the cars belonging to the tourists are stolen right from the hotel's car park, and in other cases, tourists are stopped and fined by fake police officers. Another drawback is the difficulty for getting an entry visa for non-EU citizens, who are a main target for the Bulgarian hotel owners.

In a nutshell, we can conclude that Romania's seaside tourism has drowned and the news[7] that the German based TUI tour operator has placed our country 7-8 years behind Bulgaria as far as the development of the tourist sector is concerned should not come as a surprise. At the same time, tourism south of Romania seems to be thriving, despite the drawbacks we have listed above.

Food Security in the Future Common Agricultural Policy

Niculescu Oana Marilena

The Bucharest Academy of Economic Studies, Faculty of International Business
[oananiculescu24@yahoo.com](mailto: oananiculescu24@yahoo.com)

Abstract

Common Agricultural Policy (CAP) has been the centerpiece of European integration, being the strongest common policy of the European Union. Although, due to its long history, it has been reformed on many occasions.

Health Check is already a matter of past, so, the reform of the CAP post-2013 represents a hot topic and a major concern for EU member states.

The reform of the CAP should continue in order to ensure the growth of competitiveness, efficient use of natural resources, to adopt the right measures in order to respond to several challenges, one of them being food security. Facing these challenges, CAP will contribute to “EU 2020 Strategy” in terms of smart, sustainable and inclusive growth. While EU citizens demand high quality and a wide choice of products, EU agriculture is facing a more competitive environment and should be able to respond to world food demand.

Key words: CAP, reform, challenges, volatility, EU 2020 Strategy

J.E.L. classification: Q18, Q13, F59

1. Introduction

In over half of century of existence, CAP has been the most debated, controversial, analyzed and reformed European policy. The initial objectives of the CAP have remained over the years, but the weight given to different objectives and the instruments used for their achievement have changed drastically.

If in the beginning it was based on output subsidy and protection of internal markets against non-European producers, subsequently, subsidy aimed to support

directly the income, not the stimulation of production, focusing on rural development and environment protection.

2. Food security along CAP reforms

The CAP has its roots in the post world war II situation, when agriculture had been crippled and food supplies could not be guaranteed. Incentives to produce were provided through a system of high support prices to farmers, combined with border protection and export support with financial assistance for the restructuring of the sector.

In 1968, a report of the Commissioner Sisco Mansholt emphasized the need for a radical reform, proposal rejected by member states. The debates were generated by surpluses, explosion of costs and production didn't materialized, the consequence being the failure of the program. CAP became “the victim of its own success”, the achievement of the objective regarding production and food security in EU countries had to be paid through its secondary effects, some being unacceptable, “mountains” of cereals, meat and other goods and over-products as well as market distortions, finally pressing also over the developing economies and poor people (Andrei [1], 2009).

Till '80s, CAP didn't change substantially, a radical change took place in 1984. Through “Livre vert” a radical reform of the CAP was required, the development of agriculture according to environment protection requests, one of the objectives of the reform being the decreasing of the surpluses. The reform of the 80's meant the giving up to the principle of guaranteeing prices for unlimited quantities and a new budgetary discipline. In 1984, the quotas for milk production were introduced while on the other markets with surpluses the maximum guaranteed quantities were established.

Substantial changes took place in 1988 when the Council of Ministers decided to cap the increase of agricultural expenses and the extension of applying the production quotas to the entire agricultural production (Miron [5], 2002). These limits called “stabilizers” had a limited success, the surpluses were still accumulated so the need of the reform was obvious.

Although the CAP was very successful in moving the EU towards self-sufficiency, by the 1980s had to contend with almost permanent surpluses of major farm commodities, some of which were exported (with the help of subsidies), while others had to be stored or disposed of within the EU.

This led to a fundamental reform process of the CAP which started in 1992 and was later deepened in 1999 with Agenda 2000. While in the early years the main objectives were to ensure food security, to increase and improve productivity, market stabilization, the **MacSharry Reform** dated **1992** brought among its targets the limitation of rising production, the reduction of supply to the level of the demand, low stocks for most of the commodities with a view to create a more free agricultural market. In the period 1992-1999, the mechanisms created to check availabilities could not prevent the increase of surpluses which implied higher stocking costs.

Adopted in **1999**, **Agenda 2000** aimed at deepening the MacSharry Reform, by replacing price support measures with direct aids and promoting a coherent rural policy. The issued approach included also food of high safety and quality. Sustainable development policy of rural areas focused on individuals and groups, other than farmers. This led to the diversification of food production and the decreasing of the guaranteed prices, compensated by direct prices to farmers, improved supply-demand balance on the common market for the agricultural products, etc., one of the effects being the stabilizing of the demand-supply balance on the agricultural common market.

The detailed analysis of the **Fischler Reform (2003)** - initially called **Mid Term Review** - whose general objective was the higher support for the rural space, emphasized several factors, concerns about environment, food safety and food security being one of them. One of the effects of the

reform consisted in the reduction of the incentives for overproduction.

Adopted in **2008**, **Health Check** represents a package of amendments to policy regulations and made only small steps, at technical level, towards the reform. Intervention on markets is reduced, modulation is extended and decoupling is carried on. National milk quotas were supplemented with 1% per year, going to be eliminated in 2015. Health Check resumes to less tools for market regulation and for funds transfer from the first pillar to the second one. Health Check could not define a common position of member states regarding the direction of the reform after 2013. It is already a matter of past, debates within EU are subject to the CAP post-2013 and its reform.

Europe should stimulate the development of a modern agriculture, create workplaces and manage properly the EU agricultural territory. In order to fulfill these goals, it must find solutions to ensure community preferences, the use of new instruments to stabilize agricultural markets and risk management, assuming the role of EU's net exporter to third countries, to meet the new challenges we are facing today.

3. Food security, a challenge for the CAP post-2013

After a wide ranging of public debate, the Commission presented on **18 November 2010** a **Communication on “The CAP towards 2020”** which outlines options for the future CAP and launched the debate with the other institutions and with stakeholders. The conclusion was that the future CAP should remain a strong policy structured around its two pillars (a first pillar greener and more equitably distributed and a second pillar focused more on competitiveness and innovation, climate change and environment).

One of the aims recommended is the preserving of the food production potential on a sustainable basis throughout the EU, so as to guarantee long-term food security for EU citizens and to contribute to growing world food demand. The recent events regarding market instability in the context of climate change must be taken into account.

Another aim is to support farming communities that provide European citizens with quality, value and diverse food, sustainably produced, according to the environmental requirements.

Reform of the CAP must continue in order to promote competitiveness, efficient use of taxpayer resources and effective public policy returns European citizens expect, with regard to food security, the environment, climate change and social and territorial balance. All these need also to happen within the constraints of limited budgetary resources and taking into account the severe impact of the economic crisis in agriculture. By responding to the actual challenges, CAP will also contribute to the “EU 2020 Strategy” in terms of *smart, sustainable and inclusive growth*. This means green growth in the agricultural sector and the rural economy as a way to enhance well being by pursuing economic growth while preventing environmental degradation (European Commission [11], 2010).

We need a reform in order to respond to the new challenges like: improving sustainable management of natural resources, maintaining competitiveness in the context of globalization growth, addressing rising concerns regarding EU and global food security, strengthening EU cohesion in rural areas, increasing the support of the CAP for member states, farmers and active farmers.

Food security is one of the challenges that agriculture is facing, the primary role for agriculture being to supply food.

A strong agricultural sector is vital for the highly competitive food industry to remain an important part of EU economy and trade. EU citizens demand a high quality and diversity of food products, reflecting high safety and welfare standards, including local products. The environment EU agriculture is facing today is more competitive, as the world economy is highly integrated and the trading system more liberalized. This trend might continue in the next years, in view of the possible conclusion of the Doha round negotiations and of agreements under negotiations. This is a challenge for EU farmers but also offers an opportunity for EU food exporters. Therefore, it is important to continue to enhance the competitiveness and productivity of the EU agriculture sector. On medium-term, the perspectives for

agricultural markets are expected to be characterized by greater uncertainty and increased volatility. The economic crisis that has affected the whole economy and implicitly agriculture, has a great impact in the context of the future CAP. After a decade of mere income stagnation, agricultural income dropped substantially in 2009 adding to an agricultural income significantly lower than that in the rest of the economy; in the same time, income per inhabitant in rural areas is considerably lower than in urban areas.

Viable food production, one of the objectives for the future CAP, means (European Commission [11], 2010):

- ◆ to contribute to **farm incomes** and limit farm income variability, recalling that price and income volatility and natural risks are more marked than in most other sectors and farmers’ incomes and profitability levels are on average below those in the rest of the economy;
- ◆ to improve the **competitiveness** of the agricultural sector and to enhance its value share in the **food chain**, because the agricultural sector is highly fragmented compared to other sectors of the food chain; in addition European farmers face competition from the world market while having to respect high standards relating to environmental, food safety, quality and animal welfare objectives requested by European citizens;
- ◆ to compensate for production difficulties in areas with specific **natural constraints** because such regions are at increased risk of land abandonment.

The 2009 dairy market crisis highlighted the important role that existing mechanisms play in supporting the market in times of crisis. However, some specific adaptations appear necessary, most notably in streamlining and simplifying instruments currently in place, as well as in introducing new policy elements with respect to the functioning of the food chain. The removal of dairy quotas will take place in 2015; in the sugar and isoglucose sectors, the current regime is set to expire in 2014/2015. Improving the functioning of the food supply chain is necessary. The share of agriculture in the food supply chain has decreased from 29% in 2000 to 24% in 2005, while the share

of the food industry, wholesale and distribution sector have all increased over the same period of time.

On 12 October 2011, the Commission presented a set of **legal proposals** designed to make the CAP a more effective, efficient and understandable policy for a more competitive and sustainable agriculture and vibrant rural areas in order to help the farming sector to become more competitive and to deal with the economic crisis and increasingly unstable farm-gate prices. The proposals aim to strengthen the competitiveness and the sustainability of agriculture and maintain its presence in all regions, in order to guarantee European citizens healthy and quality food production, to preserve the environment and to help the development of rural areas. Following a debate in the European Parliament and the Council, the approval of the different regulations and implementing acts is expected by the end of 2013, with a view to having the CAP reform in place from 1st January 2014.

Different points of view recommended, among the main objectives, to conserve the food production potential through the territory of EU in order to guarantee the long term food safety for the European citizens in terms of crisis and to contribute to the growing food demand at global level as well to support the farmers communities that supply the European citizens with quality and diverse food in terms of sustainability, according to the environmental demands.

Dacian Ciolos, the Commissioner for Agriculture and Rural Development, reflected in his speech the statements on the key points: better targeted income support, tools to address crisis management which are more responsive and better suited, a “green” payment for preserving long-term productivity, additional investment in research and innovation, a more competitive and balanced food chain, encouraging agri-environmental initiatives, facilitating the establishment of young farmers, stimulating rural development and entrepreneurship, better addressing sensitive areas, a simpler and more efficient CAP.

4. Food security at european and global level

Global food production has risen over the last fifty years, surpassing population growth and leading to an increase in food availability per person. Development policies are therefore needed in order to deliver more evenly distributed economic growth and a fairer distribution of income as a means of improving food security for the most vulnerable. Over the next 50 years, however, an increase in world population and the growing impact of climate change are likely to result in a global increased demand for food. The response to this could further increase the environmental impact on agriculture. While food security has been a matter of concern in 2009, on longer term it has to go hand in hand with environmental security.

Given the demand worldwide will continue rising in the future, the EU should be able to contribute to world food demand which is expected to increase by 70% till 2050 (in the conditions of an increase of world population to 9 billion in 2050), according to FAO estimations. It is essential that EU agriculture maintains its production capacity and improves it while respecting EU commitments in international trade and policy coherence for development.

Food security will remain a critical issue for the international community. During the meeting of G20 Agriculture Ministers held in Paris in June 2011, it was stated that “All the countries have stressed the need to adopt improved and more effective agricultural policies at the global and national levels, better international coordination and concrete implementation of political commitments to promote food security and sustainable agricultural production.” Among the main objectives of the Action Plan are: to improve agricultural production and productivity, to increase market information and transparency, to strengthen international policy coordination, to improve and develop risk management tools for governments, firms and farmers, to improve the functioning of agricultural commodities derivatives markets having in view the extreme price volatility of the agricultural commodities.

At the 37th Session of the Committee on World Food Security held in Rome on October 2011 it was stated that food security is a complex and multidimensional issue. When it is threatened by global food price volatility, there is need for both national and international responses. Some of the recommendations consisted in investing in agriculture with a long-term view necessary to prevent a repetition of food crisis. New public and private investment in both research and development is necessary as well as preservation of agro-biodiversity and the creation of new varieties. Countries need a national comprehensive food security strategy in line with the special characteristics of each country. Such strategies should include policies to reduce, manage and cope with price volatility.

A new vision for agriculture is needed. The principles upon which our food system in general and research concerning agriculture and food system in particular should be based are (SCAR [14], 2011):

- ◆ **well-being:** food and agriculture should serve the well-being and quality of life of all stakeholders involved;
- ◆ **resource use efficiency and optimality:** given the increasing scarcities in vital resources, resources should be used as efficient as possible;
- ◆ **resource conservation:** to avoid the irreversible loss of nature resources, critical natural resources, including biodiversity, land and water should be maintained;
- ◆ **diversity and inclusion:** food and agricultural systems should reflect the territorial diversity within the EU and worldwide;
- ◆ **transdisciplinarity:** research and innovation underpinning future food and agricultural systems should be truly interdisciplinary but also transdisciplinary;
- ◆ **experimentation:** research should be diverse, ranging from blue sky research to applied research;
- ◆ **coordination and impact evaluation:** research should be better coordinated across thematic domains as well as member states;
- ◆ **public involvement:** strong public investment in research remains crucial.

5. Conclusions

The purpose of this paper was to analyze the importance of food security in the long history of the CAP and mainly in the future reform in the context of global food price volatility. Food security remains one of the main challenges CAP is facing, the reform post-2013 should help farmers adapt to market's changing needs and secure a sustainable food supply.

Algorithms for Maximum Entropy Parameter Estimation

Nidelea Marinela

„Titu Maiorescu” University of Bucharest
matemaia@yahoo.com

Abstract

In this paper, we consider a number of algorithms for estimating the parameters of ME models, including iterative scaling, gradient ascent, conjugate gradient, and variable metric methods. Surprisingly, the standardly used iterative scaling algorithms perform quite poorly in comparison to the others, and for all of the test problems, a limited memory variable metric algorithm outperformed the other choices. Maximum entropy (ME) models, variously known as log-linear, Gibbs, exponential, and multinomial logit models, provide a general purpose machine learning technique for classification and prediction which has been successfully applied to fields as diverse as computer vision and econometrics.

Key words: GIS, entropy, ME models, probability, heuristic

J.E.L. classification: L63

1. Introduction

In natural language processing, recent years have seen ME techniques used for sentence boundary detection, part of speech tagging, parse selection and ambiguity resolution, and stochastic attribute-value grammars, to name just a few applications [1]. A leading advantage of ME models is their flexibility: they allow stochastic rule systems to be augmented with additional syntactic, semantic, and pragmatic features. However, the richness of the representations is not without cost. Even modest ME models can require considerable computational resources and very large quantities of annotated training data in order to accurately estimate the model's parameters. While parameter estimation for ME models is conceptually straightforward, in practice ME models for typical natural language tasks are

usually quite large, and frequently contain hundreds of thousands of free parameters. Estimation of such large models is not only expensive, but also, due to sparsely distributed features, sensitive to round-off errors. Thus, highly efficient, accurate, scalable methods are required for estimating the parameters of practical models. In this paper, we consider a number of algorithms for estimating the parameters of ME models, including Generalized Iterative Scaling and Improved Iterative Scaling, as well as general purpose optimization techniques such as gradient ascent, conjugate gradient, and variable metric methods. Surprisingly, the widely used iterative scaling algorithms perform quite poorly, and for all of the test problems, a limited memory variable metric algorithm outperformed the other choices.

2. Maximum likelihood estimation

Suppose we are given a probability distribution p over a set of events X which are characterized by a d dimensional feature vector function $f : X \rightarrow R^d$. In addition, we have also a set of contexts W and a function Y which partitions the members of X . In the case of a stochastic context-free grammar, for example, X might be the set of possible trees, the feature vectors might represent the number of times each rule applied in the derivation of each tree, W might be the set of possible strings of words, and $Y(w)$ the set of trees whose yield is $w \in W$. A conditional maximum entropy model $q_{\theta}(x|w)$ for p has the parametric form:

$$q_{\theta}(x|w) = \frac{\exp(\theta^T f(x))}{\sum_{y \in Y(w)} \exp(\theta^T f(y))} \quad (1)$$

where θ is a d -dimensional parameter vector and $\theta^T f(x)$ is the inner product of the parameter vector and a feature vector. Given the parametric form of an ME model in (1), fitting an ME model to a collection of

training data entails finding values for the parameter vector q which minimize the Kullback-Leibler divergence between the model q_θ and the empirical distribution p :

$$D(p \parallel q_\theta) = \sum_{w,x} p(x,w) \log \frac{p(x|w)}{q_\theta(x|w)} \quad (2)$$

or, equivalently, which maximize the log likelihood:

$$L(\theta) = \sum_{w,x} p(x,w) \log q_\theta(x|w) \quad (3)$$

The gradient of the log likelihood function, or the vector of its first derivatives with respect to the parameter θ is:

$$G(\theta) = E_p[f] - E_{q_\theta}[f] \quad (4)$$

While all parameter estimation algorithms we will consider take the same general form, the method for computing the updates $\delta_{(k)}$ at each search step differs substantially. As we shall see, this difference can have a dramatic impact on the number of updates required to reach convergence.

3. Comparing estimation techniques

The performance of optimization algorithms is highly dependent on the specific properties of the problem to be solved. Worst-case analysis typically does not reflect the actual behavior on actual problems. Therefore, in order to evaluate the performance of the optimization techniques sketched in previous section when applied to the problem of parameter estimation, we need to compare the performance of actual implementations on realistic data sets [2]. Minka [3] offers a comparison of iterative scaling with other algorithms for parameter estimation in logistic regression, a problem similar to the one considered here, but it is difficult to transfer Minka’s results to ME models. For one, he evaluates the algorithms with randomly generated training data. However, the performance and accuracy of optimization algorithms can be sensitive to the specific numerical properties of the function being optimized; results based on random data may or may not carry over to more realistic problems.

And, the test problems Minka [3] considers are relatively small (100–500 dimensions). As we have seen, though, algorithms which perform well for small and medium scale problems may not always be

applicable to problems with many thousands of dimensions.

4. Implementation

As a basis for the implementation, we have used PETSc (the “Portable, Extensible Toolkit for Scientific Computation”), a software library designed to ease development of programs which solve large systems of partial differential equations [4].

PETSc offers data structures and routines for parallel and sequential storage, manipulation, and visualization of very large sparse matrices.

For any of the estimation techniques, the most expensive operation is computing the probability distribution q and the expectations $E_q[f]$ for each iteration. In order to make use of the facilities provided by PETSc, we can store the training data as a (sparse) matrix F , with rows corresponding to events and columns to features. Then given a parameter vector q the unnormalized probabilities q_θ are the matrix-vector product: $E_{q_\theta}[f] = F^T q$

By expressing these computations as matrix-vector operations, we can take advantage of the high performance sparse matrix primitives of PETSc.

For the comparison, we implemented both Generalized and Improved Iterative Scaling in C++ using the primitives provided by PETSc. For the other optimization techniques, we used TAO (the “Toolkit for Advanced Optimization”), a library layered on top of the foundation of PETSc for solving nonlinear optimization problems [5].

TAO offers the building blocks for writing optimization programs (such as line searches and convergence tests) as well as high-quality implementations of standard optimization algorithms (including conjugate gradient and variable metric methods).

Before turning to the results of the comparison, two additional points need to be made. First, in order to assure a consistent comparison, we need to use the same stopping rule for each algorithm.

For these experiments, we judged that convergence was reached when the relative change in the loglikelihood between iterations fell below a predetermined threshold. That is, each run was stopped

when:

$$|L(\square^{(k)}) - L(\square^{(k-1)})|/L(\square^{(k)}) < \square\square \quad (5),$$

where the relative tolerance $\square\square = 10^{-7}$. For any particular application, this may or may not be an appropriate stopping rule, but is only used here for purposes of comparison.

Finally, it should be noted that in the current implementation, we have not applied any of the possible optimizations that appear in the literature [6], [7] to speed up normalization of the probability distribution q . These improvements take advantage of a model’s structure to simplify the evaluation of the denominator in (1). The particular data sets examined here are unstructured, and such optimizations are unlikely to give any improvement.

However, when these optimizations are appropriate, they will give a proportional speed-up to all of the algorithms. Thus, the use of such optimizations is independent of the choice of parameter estimation method.

5. Experiments and Results

We performed experiments on the well known US Postal Service handwritten digit recognition task (USPS).

It contains normalized greyscale images of handwritten digits taken from US zip codes of size 16X16 pixels.

The corpus is divided into a training set of 7,291 images and a test set of 2,007 images. Reported recognition error rates for this database are summarized in Table1.

We used the most direct features possible in the experiments, which also have an interesting relation to Gaussian Models. Features of order 0, 1 and 2 are given by:

$$f_k(x, k') = \delta(k, k')$$

$$f_{k,i}(x, k') = \delta(k, k')x_i$$

$$f_{k,i,j}(x, k') = \delta(k, k')x_i x_j, \quad i \geq j$$

respectively, where $\delta(k, k') := 1$ if $k = k'$, and 0 otherwise denotes the Kronecker delta function. In the context of image recognition, we may call these functions appearance based image features, as they represent the image pixel values. The duplication of the features for each class is necessary to distinguish the hypothesized classes.

In most of the experiments performed we obtained better results using ‘feature normalization’. This means that we enforced for each observation during training and testing that the sum of all feature values is equal to one by scaling the feature values appropriately. Thus, we obtain new feature functions:

$$\forall x, k, i: \tilde{f}_i(x, k) = \left(\sum_{i'} f_{i'}(x, k) \right)^{-1} f_i(x, k)$$

In the following, we only report result obtained using feature normalization.

Table 1 shows the main results obtained in comparison to other approaches along with the number of free parameters of the respective models [8]. Taking into account the class information in training using the maximum entropy framework (i.e. switching from maximum likelihood to maximum mutual information criterion) improves the recognition accuracy for first-order features from 18.6% to 8.2% error rate. Furthermore, it can be observed that the maximum entropy models perform better for second-order features than for first-order features, which stands in contrast to the experience gained with maximum likelihood estimation of Gaussian densities [9]. Note e.g. that the maximum likelihood estimation of class specific diagonal covariance matrices already imposes problems for the USPS data as in some of the classes some of the dimensions have zero variance in the training data. Here, the maximum entropy framework offers an effective way to overcome these problems. Using the equivalent of a full class specific covariance matrix, i.e. second-order features, the error rate of 5.7% approaches that of a nearest neighbor classifier, which has more than five times as many parameters.

Figure 1 shows the log-probability (2) on the training data for first-order features as a function of the number of iterations for standard GIS and heuristic speed-up GIS. It can be observed that on this data the proposed speed-up can save around 90% of training time.

Figure 1: Log-probability (2) on the training data (USPS, first-order features) as a function of the number of iterations for standard GIS and heuristic speed-up GIS.

Table 2: Overview of the results obtained on the USPS corpus using maximum entropy modeling in comparison to other models (error rates, [%]). ML: maximum likelihood, MMI: maximum mutual information with pooled diagonal covariance matrix.

model	training criterion	# parameters	ER[%]
Gaussian model*	ML	2 816	18.6
maximum entropy, first-order features	MMI	2 570	8.2
second-order features	MMI	331 530	5.7
nearest neighbour classifier		1 866 496	5.6

6. Conclusion

We showed the use of the maximum entropy framework for object recognition and introduced a new heuristic speed-up technique for the training of maximum entropy models. The framework allows the estimation of a large number of parameters reliably and the corresponding optimization problem has a number of desirable properties. A further advantage of the maximum entropy approach is that it is easily possible to include new feature functions into the classifier.

We evaluated the approach for image object recognition using the US Postal Service handwritten digits recognition task. The best result of 5.7% error rate using second-order features is competitive with other results reported on this dataset, although approaches with significantly better performance exist. (Note that the latter are highly tuned to the specific task at hand while the maximum entropy approach is of very general nature.)

The accuracy of the resulting model shows that the maximum entropy approach allows robust estimation of a large number of parameters even on this small training set, which may be a problem for approaches based on maximum likelihood.

Abstract

Sovereign between fuels, raw materials for industry leading longed important factor in the prosperity of peoples, "black gold" dominates contemporary civilization economy and authority, creating a true "oil era". Increasingly acute thirst for oil, caused, on the one hand, depletion of natural reserves and the increasing consumption on the other hand, is mobile efforts by developed countries to control more and more states in the Middle East, where are the main source of world oil. Almost half of the total mineral raw materials are the oil extracted. Because of this modern petroleum economy, direct or indirect influence on the development and location of the European economy.

Key words: energy, crisis, oil, petroleum product

J.E.L. classification: F50, F59

1. Introduction

Today, over 40% of the energy is obtained from petroleum. And we can not talk without energy industry, consumer and economy. Given that every day, on the European continent over 1 million barrels are extracted under conditions that Europe, with 130 of those refining its crude oil processed 770 million in 2009, can not overlook a market that has produced year past, only the extraction of oil, about 450 billion dollars.

When we talk about oil, imagine two sides of its default: a useful source of energy, engine development company, which is why the oil was metaphorically called *black gold*, but also a darker side to him, the troubles and

disputes for the possession of oil resources that it generates. Greed, corruption and human belligerent spirit reveal ever more dark side of the pool.

In the present context of a society increasingly dependent on reserves in increasingly meager oil, oil barrel price trend is volatile, unpredictable and sensitive to many factors: the ratio supply/demand, strategic oil reserves to a time, economic circumstances, political factors, military factors etc. Most industries are dependent on oil and its price fluctuations propagate throughout the economy.

The paper comes to highlight discrepancies tooth high consumption of petroleum products in Europe while the reserve area are modest, being the only notable reserves in the North Sea and Russia. Thus, until the Europeans will be able to replace oil use, new sources of energy such as solar energy, electricity, biofuel or the waste coming from, because the entire continent is higher consumption of resources will continue to be dependent on imports of parts with rich oil reserves (the Middle East, Africa etc.).

This attempt to replace oil with other energy sources worldwide should involve at least two reasons: it is estimated that current oil reserves, while maintaining consumption will be exhausted in the next 30-40 years. However, concern for the global biosystems involves, first, to reduce global pollution and oil is one of those energy sources are not *very friendly* environment.

2. Need to import oil

2008 year meant for European Union 656.9 million tones of crude oil consume

(about 6 billion barrels). As most European countries are poor in oil resources, their solution is to fill the deficit through imports.

The only EU countries which achieved net oil exports are: Norway, Denmark and Great Britain. Romania fails to provide about half of its oil from domestic farms. Rests of EU countries are dependent on resource-rich oil reserves. These countries use oil imports in proportions over 80-90% of the total.

Of the three oil-exporting countries of Western Europe, Norway is the country with the richest deposits, so has the ability to provide 15.5% of EU imports. Extract oil prices in Western Europe has the disadvantage of a much higher price than imported from other European countries but prefer areas such crude oil imports for its quality and much lower transport costs.

Hungary	61,40	44,00	82,70	79,90

Source: EU Energy and Transport – Statistical Pocketbook 2009

Energy dependence is calculated in percent as: $dependent = net\ imports / (consumption + reserves)$. Values exceeding 100% are found in cases which are stocks, small amounts of reduced dependence reveals that state and negative values imply that that country is exporting.

Russia is a country in Europe with rich oil reserves, so that one third of EU oil imports come from Russia. Europeans also prefer to import oil and Norway due to much smaller distances and hence lower transport costs. Other major oil suppliers of the EU member countries are: Libya, Saudi Arabia, the Middle East and Iran.

Table no 2 EU oil imports and their origin (2004-2008)

Provenance	2004	2005	2006	2007	2008	%
Russia	170,8	188,9	188,0	189,6	185,3	34,0
Norway	106,4	108,6	97,5	89,1	84,3	15,5
Libya	45,5	50,0	50,6	53,2	55,5	10,2

3. European Union and international transactions of finished petroleum products

Figure 2 How Europe adjust their demand to the supply of petroleum products

Source: Europa Annual Report 2009

Growing consumption of diesel fuel and reducing appetite for gasoline makes it difficult for European producers. While in the early '90s gasoline demand was 35% higher than the demand for diesel in 2008 the situation is completely opposite: the annual demand of 195 million tones of diesel and only 100 million tons of gasoline. We note in this period, therefore, an increase of 95% for diesel and a reduction in demand for gasoline by 25%. This imbalance occurs in the portfolio of European refineries.

Figure 3 Evolution of international transactions on petrol, diesel and kerosene in the European Union

To balance the surplus gasoline production deficit of diesel, European refineries have found an ingenious solution: gasoline exports to other countries (especially the U.S., a

major consumer of gasoline) and diesel imports, mainly from Russia and CIS.

In 2006, the EU exported 42 million tons of gasoline to the United States (51%), European countries are not EU members (5%), the remaining 44% being exported to various parts of the world.

In the same year, the European Union imported 31 million tons of diesel fuel, mainly from Russia (89%) and 11% from various other countries. However, the European Union refineries exported 5 million tons of oil mainly by non-EU countries.

Figure 4 U.S. is the main market for export of petrol

Figure 5 Russia and CIS countries are the main source of oil imports

4. Conclusions

Studying the global and European energy market and especially the European market for oil in the global context, we observed a high dependence of most European countries against imports of crude oil from Russia, Norway (the only European Union member state exporter of crude oil). Arab Emirates,

Libya, Middle East etc. And this dependence is intensified by the growing demand for oil in Europe. It is the second region after the United States, oil consumption in the order here being used 18 percent of annual global consumption of oil.

Given the positive dynamics of the appetite for oil while reducing oil resources (it is estimated that the reserves reported in the current consumption will be exhausted in about 40 years), the European countries will have to switch to other energy sources such as would be electricity, solar, biofuel. Germany has taken this issue seriously so that annually produces 5 million tons of biofuel which is sold in combination with traditional petroleum products (diesel and gasoline).

Another reason that urges shift to other energy sources is a barrel of oil price volatility (which is an unprecedented increase), which proves very sensitive to economic factors, political and even military. Since all economic areas are directly dependent on energy from oil, this vulnerability to oil price spreads throughout the economy.

European Commission places great emphasis on reducing carbon dioxide emissions and minimize pollution effects. It is well known that petroleum products are responsible for the deterioration of global ecosystems and, despite the fact that automobile production increasingly ecological disasters caused by pollution remedial reduce oil consumption and replacing it with green energy sources is impetuous required.

Borrowing Costs – Object of IPSAS Review

Nistor Cristina Silvia
Deaconu Adela

„Babeş Bolyai” University of Cluj Napoca
cristina.nistor@econ.ubbcluj.ro
adela.deaconu@econ.ubbcluj.ro

Abstract

At international level, there was need for a review of IPSAS 5 Borrowing Costs. In this context, a project has been subject to public debate – Exposure Draft (ED) 35 Borrowing Costs, by whose modeling based on subscribed observations and proposals, to be able to rebuild an international standard for public sector on this topic. Through a positivist research, based on the combination between quantitative and qualitative research, we analyze the impact of this ED on the respondents, tracking and quantifying the degree to which it meets the needs of specialists from different countries. The study is very topical, considering that in the current period, at IPSASB level there is the process of final actualization of the standard, taking into account the particulars brought to ED.

The study is of great importance for both the theoreticians and the practitioners who can get the answer to some problems of borrowing cost.

Key words: IPSAS, borrowing costs, comments, terms, debate

J.E.L. classification: M40, M41

1. Introduction

Borrowing costs include interest and other costs incurred by an entity in connection with loan funds. Borrowing costs are subject to International Accounting Standard IAS 23 and IPSAS 5.

IPSASB, the International Public Sector Accounting Standards, focuses on accounting and financial reporting of national governments, regional or local government agencies involved, and the constituencies they serve. It addresses these needs by

issuing guidelines, the promotion of reference and facilitates exchange of information among accountants and those working in the public sector or relies on activity in the sector.

Public Sector Accounting Standards are a starting point the International Financial Reporting Standards (IFRS International Financial Reporting Standards).

These were discussed and reviewed by experts in the field, although most European countries have different characteristics and issues on how to adopt national accounting standards.

Financial reporting standards, auditing standards and professional ethics add credibility to financial information, thus stimulating investment growth, stability and economic development in general.

Therefore, IPSAS development sites should consider the following elements: the statements and views of the IASB, national regulatory experience, views professional accounting organizations, other organizations interested in financial reporting, accounting and auditing public sector.

This raises the need to regulate public sector borrowing costs. On the basis IPSAS 5 Borrowing Costs, IAS 23 Borrowing Costs is issued by the IASC, International Accounting Standards Committee in 1993. In September 2008 IPSASB reviewed amendments to IAS 23 Borrowing Costs by subjecting to debate the ED 35 Borrowing Costs, with subscription term in January 2009.

This paper aims to identify topics and themes that generate discussion and comments.

Through an empirical study of the responses IFAC member countries participating in the debate on this subject, is estimated how the final form of referential will require changes in form and content.

We also interpret the position of some countries and how they support this process

Romania's public sector also falls under IPSAS sites, our country being an EU member. It wants the harmonization and convergence with international accounting standards, Romania has to take into account the provisions of IPSAS 5.

2. Review of evolution and content of ED 35 Borrowing Costs

On the basis IPSAS 5 Borrowing Costs, IAS 23 Borrowing Costs is issued by the IASC, International Accounting Standards Committee in 1993.

IPSAS 5 Borrowing Costs issued in May 2000 prescribes the accounting treatment for borrowing costs. This standard requires, in general, immediate recognition as an expense borrowing costs. However, the standard allows, as an allowed alternative treatment, the capitalization of borrowing costs directly attributable to the acquisition, construction or production of a qualifying asset.

In early 2007, the IPSASB has initiated a development project sites in accordance with IPSAS latest changes to IFRS sites in terms of public sector. As part of this project, the IPSASB has studied the amendments made by the IASB to IAS 23 Borrowing Costs in March 2007 and opened in September 2008 an Exposure Draft witch revising IPSAS 5 Borrowing Costs.

IAS 23, revised version, requires entities to capitalize borrowing costs that are directly attributable to the acquisition, construction and production of a qualifying asset. Reference treatment for the recognition of an expense the costs that occur during the duty has been withdrawn.

In considering the applicability of the principles established in IAS 23 to the public sector, the IPSASB was cognizant that qualifying assets in the public sector, apart from those in GBEs, would not ordinarily be anticipated or intended to generate positive cash inflows, and that public sector entities frequently borrow for public policy purposes, including to maintain a benchmark bond rate, to sustain deficit financing and to further the government's monetary policy. At a national government level, and often at lower levels of government, borrowings are often not attributable to a particular asset acquisition or

capital project. For these reasons, the IPSASB has decided that borrowing costs in the public sector should be recognized immediately as an expense, except in certain specific circumstances [1].

The IPSASB continues, however, to maintain its strategy of converging IPSASs with IFRSs where appropriate [2]. Therefore, it permits entities that incur borrowing costs specifically to acquire, construct or produce a qualifying asset to capitalize those borrowing costs in the same way that an entity applying IFRSs would . In all other circumstances entities shall recognize an expense for borrowing costs in the period in which they are incurred.

By considering the ED35 to IPSAS 5 Borrowing Costs [3], is interested to know the answer IPSASB various organizations and professional bodies on the following topics:

- Borrowing costs should be recognized as an expense immediately, unless the borrowing costs due to a qualifying asset. In these cases the entity is allowed but not required, to capitalize those costs (1).
- Appears as the expression "specific borrowing costs incurred" in place of the term "Borrowing costs directly attributable" (2).
- The standard does not apply to borrowing costs directly attributable to acquisition, production or construction of an asset initially recognized at fair value (3).

3. Research Design

The main objective of the study is the possibility of increasing the timeliness of IPSAS 5 Borrowing Costs .

In this approach we started from a theoretical approach of the problem of the public accounting regulations with focus on borrowing costs. Subsequently, through an empirical research we will determine the degree of acceptance of the standard on three levels: on each topic questioned, on each respondent country, and as whole. By quantifying 1 (YES) or 0 (NO) we will appreciate the acceptance or refusal of each point (N = 3) under discussion.

Subsequently, we will motivate positive or negative responses depending on specific public accounting system of responding

countries.

The scientific research contributes to the efforts to deepen the knowledge required by retrospective nature imposed by the realized normative research, and by the prospective nature, given by the realized empirical research. Among the human socio science methods used in this approach, we can specify: analysis of documents, comparative method and observation method.

So, we formulate the following hypotheses:

H1. Challenging the ED 35 and its application is deemed beneficial by the respondents.

H2. Issue and application of this standard will be achieved in these discussions

To validate or invalidate the formulated hypotheses, we will analyze and interpret the answers given by respondents with reference to the three topics of discussion raised by the IPSASB on the final form of IPSAS 5 Borrowing Costs (ED 36).

4. Results

Schematic representation of the responses provided by respondents is presented in the following table:

Tabel 1. Summary of responses / countries

Question Respondent	1	2	3	Acceptance degree
Australia (3)	1	0	1	55.56%
	1	1	1	
	0	0	0	
New Zealand (5)	1	0	0	46.66%
	1	0	0	
	1	1	1	
	0	0	1	
	0	0	1	
Japan	1	1	1	100%
Great	0	0	0	58.33%

Britain (3)	0	0	1	
	1	1	1	
Canada (4)	0	1	1	41.67%
	1	0	1	
	0	0	1	
	0	0	0	
USA (1)	1	1	1	100%
Netherlands (1)	1	0	1	66.67%
Sweden (2)	1	1	1	83.84%
	0	1	1	
Scotland	1	0	1	66.67%
Switzerland	1	1	1	100%
Acceptance degree/ subject	66.87%	44.48%	78.26%	

Figure 1. Questions Acceptance degree

The table and chart above show that the subject with the lowest degree of acceptance is subject two, which means that respondents are not fully agree with the replacement of terms and use of appropriate analytical skills to understand the contents differ IAS 23. It should be noted that it is still a significant percentage of 43.48%.

At the opposite end is the last subject at a rate of 78.26% which is the best accepted by respondents. In other words, that standard does not apply to borrowing costs directly attributable to acquisition, production or construction of an asset initially recognized at fair value, is accepted as the best percentage of the three subjects analyzed.

The most important observation that should be made is that the most active members in this analysis are of the opinion that the terms used and not replaced explain very well and this contributes to the difficulty of comparing financial statements of public sectors entities.

For example the Canadian Institute has expressed disagreement with regard to the phrase "substantial period of time" and the differences between "controlling entity", "controlled entity" and "economic entity" need to establish criteria for borrowing costs in the event that the transaction involving several entities for the loan, asset acquisition or construction of a long life cycle.

Also very important is that the country with the highest degree of acceptance is the USA, Switzerland and Japan. Canada fined himself in the other extreme; this is probably due to the large number of active members.

For better highlighting of these issues will discuss in detail below country level which were the reasons for which respondents agree or not.

Australia agrees with the option to capitalize or to recognize as an expense borrowing costs when those costs specifically incurred in connection with financing construction or production of an asset purchase calificat. We are of-agreement with the proposal to require the immediate recognition of the costs of borrowings expenses when borrowing costs are not specifically incurred in relation to finance acquisition of construction or production of a qualifying asset [1].

United Body of Accountants believe that any decision to withhold or remove option and then apply the valuation standards IPSAS framework should be made only after an assessment of the relevance of information to users' needs. Because users have different needs from public sector entities to users participating in capital markets encourage a more thorough research in this area.

Although encourages the removal of options to improve comparability of financial reporting entities do not believe that the target is more important than ensuring the comparability of information that the proposed standard equilibrium. They draw attention to the fact that the fungible nature of cash makes it hard to distinguish the purpose of lending funds.

Japan agrees with this proposal. If borrowing costs are recognized immediately as an expense revised IAS 23, borrowing costs that are directly attributable to the acquisition, construction or production of a qualifying asset are capitalized to form part of the cost of that asset.

Under the revised IAS 23, borrowing costs that are directly attributable to the acquisition, construction or production of a qualifying asset are capitalized to form part of the cost of that asset. In IAS 23, borrowing costs that are "directly attributable" to the acquisition, construction or production of qualifying assets are those borrowing costs that would have been avoided had the expenditure on the qualifying asset not been made. Such borrowings are not limited to funds borrowed specifically for the purpose of acquiring, constructing or producing a particular qualifying asset. In conclusion, they think it rational that borrowing costs be basically recognized immediately as an expense, and not capitalized.

Whether an entity is permitted, but not required, to capitalize borrowing costs that are specifically incurred on qualifying assets. Borrowing in the public sector for financing activities may be allocated to deficits in the present fiscal year or to public investment on the acquisition, construction or production of a qualifying asset. It may be rational that borrowing costs to allocate public investment on the acquisition, construction or production of a qualifying asset be capitalized when incurred, and the depreciation charge be recognized for future generations of citizens who use this asset. In conclusion, they think it rational that an entity is permitted, but not required, to capitalize borrowing costs that are specifically incurred on qualifying assets.

Audit Scotland notes the proposals in the Exposure Draft but does not believe that the basis for conclusions justifies the proposals in the circumstances of local government in the UK. Local government in the UK

borrowers generally but, in broad terms, only for capital purposes and is not allowed to borrow to run revenue deficits. In principle therefore they can see no significant difference between the circumstances of local government in the UK and the circumstances of a private sector group with a central Treasury management function, which are specifically provided for in IAS 23.

The UK Accounting Standards Board (ASB) welcomes the opportunity to comment on the International Public Sector Accounting Standards Board's (IPSASB) proposals for amending IPSAS 5 'Borrowing Costs'.

The proposals in ED 35 differ markedly from those in IAS 23 in that the latter generally requires capitalization of borrowing costs where they are material, whereas ED 35 proposes prohibiting this (except in the case of borrowing costs that are 'specifically incurred' which we address below). Although they support IPSASB's strategic objective to converge IPSASs with IFRS, except where there are strong public sector reasons for departure, they agree with the proposals in ED 35. In particular, we agree that in the public sector there is often no meaningful way to attribute borrowing costs to qualifying assets because borrowings are frequently used to finance current spending and because public sector entities may borrow for public policy purposes and to provide liquidity to the capital markets. Because they believe that IPSAS should only depart from IFRS where there are strong public sector reasons, they consider it important that the proposed standard sets out its arguments as clearly and persuasively as possible.

They do not agree with the proposal to permit, but not require, capitalization where borrowing costs are specifically incurred on qualifying assets. They believe options in accounting standards impair comparability and are therefore rarely appropriate. In their view, the standard should require borrowing costs that are specifically incurred for the acquisition, construction or production of a qualifying asset to be capitalized as there should be no difficulty in identifying the relevant costs.

Canada believes that an asset with long life cycle is defined as an asset that requires a substantial period of time that can be used for the purpose of good. For this standard to be

applied and interpreted correctly by the public sector institutions need to clearly specify what "substantial period of time."

Sweden believes that inclusion is not observed the relevance of different accounting policies of the current version of IAS 23. It is clear that public sector borrowing requirements are different requirements for the loan business. They are generally established for reporting public entity sector or as a whole. If there life qualifying assets and borrowing costs directly attributable, they should be required capitalization of these costs. Do not understand why they allow but not require capitalization of borrowing costs where they can be directly attributable to a qualifying asset life. Thus it is not claimed convergence towards IAS / IFRS. It is considered important to eliminate as many options as possible to ensure comparability.

5. Conclusions

This study demonstrated the timeliness and complexity of the issue of borrowing costs. It noted the comments made by respondents as the main obstacles posed by the specialized language, lack of examples of the effect and specific peculiarities of national accounts, own both the Anglo-Saxon and Continental models.

However, hypotheses H1 and H2 are found to be valid, in whole or referential being accepted. Given the lack of involvement of CECCAR in the debate ED 35, the next research we aim to determine the extent to which these claims are found in ED accepted or adapted to Romanian public accounting system.

Basic Accounting Principles – Reference for the Consolidated Financial Reports

Nistor Ion

“Valahia” University of Targoviste
smaranda_gabrielescu@yahoo.com

Abstract

Through the implementation of the VII-th European Directive in the national legislations, the Community countries had established which are the companies obliged to draw up and publish consolidated accounts. Therefore, as a general rule, the mother company is obliged to supply, alongside with its own synthesis documents, to draw up and submit the consolidated accounts also (balance sheet, profit-and-loss account, annex), in compliance with the basic accounting principles. This paper purpose is to emphasize which are these principles found on the basis of the consolidated financial reports building up.

Key words: basic accounting principles, consolidated financial reports

J.E.L. classification: M41

1. Introduction

The group of companies established around a mother-company which assure their administration is more and more pregnantly present nowadays. Such a group forms an economic entity. It has no legal personality, but it has a sigle decision center, called group leader.

During the latest 15 years, this phenomenon became vast in scope, including a large range of activity sectors.

„The top of the tree” of the developed economies is represented by the big industrial, commercial, bank groups, or those recently established having a composite structure.

If, at the beginning of the group nascency, this one was formed from big companies, the

group structure is more and more adopted by the small and middle companies.

Between the companies forming a group, connections more and more strong has been establishing, and practically an economic unit is built up, which, in its ”wish” to have informed the group, draw up, submit and publish consolidated accounts (consolidated financial reports), the company which control the group being called *consolidant company* (mother company), since the other companies are called consolidated.

To consolidate means “to substitute the sum of the participation titles which are posted in the company's balance sheet with the part of the own capitals of the issuing company, held by the consolidant company, including the quota of the financial year result to which these titles correspond.”

The consolidation represents “inclusion of all the financial reports of the economic entities forming a group in a single set of financial reports and their submission as financial reports pertaining to a single economic entity.”

That is to say that the consolidation purpose is to describe the financial standing, performances and financial standing development, regarding the entities included in the group (and which, draw up and submit social account especially) as it would be a single economic entity.

The consolidation is a technics and/or procedure which allow the single submission of the accounts of an assembly of companies, independent from legal point of view, but connected from financial point of view or depending on a common decision center. It allows the financial reports submission, balance sheet and results of the assembly of companies as it would be the case of a single company. For the consolidated financial reports preparation, an economic entity puts together the financial reports of the mother-company with those ones of its branches,

item by item, by the addition of the similar elements of assets, liabilities, own capitals, incomes and expenditures.

The accounting information market, organized through accounting standardizing and harmonization processes must conduce to the accounting optimization communication. If we speak about a market presence, then, compulsorily, we must speak about a product presence, and in this case the product is represented by the accounting information, which can exist only depending on the principles which define it. Therefore, the accounting principles principally underlie the accounting shaping of the economic entities.

2. The basic accounting principles – reference for the consolidated financial reports built up

In order to have consolidated financial reports which describe financial information about a group as a single economic entity, many steps must be covered, that is:

(a) the accounting value of the investment done by the mother-company in each branch and the mother-company's part from each branch own capital are excluded (according to IFRS 3, which describes the treatment: fund-commercial-result);

(b) the minority interests in the profit or loss of the consolidated branches for the period for which the reporting is done shall be identified;

(c) the minority interests in the net worth of the consolidated branches are identified separately from the own capitals of the mother-companies shareholders. The minority interests in the net worth are represented by: the value of those minority interests at the date of the initial combination calculated according to IFRS 3 and the minority part from the own capitals modifications at the combination date. The companies obliged to establish and publish consolidated accounts and a report regarding the group management can be: share companies, limited responsibility companies, share limited partnership, partnership companies and sleeping partners companies. The drawing up of these consolidated accounts is there since the moment on what a company control in an exclusive or common

way one or more other companies or when the respective company has an important influence over other companies. The consolidation allows the supply of significant information regarding the economic and financial actual standing of an economic entity set up by a company called mother-company and the companies which are under its control or on which it has a great influence, independently from the legal personality of eachone of these companies.

Practically, the accounts consolidation is defined as being an assembly of technics and operations which, on the basis of the annual accounts of the companies under consolidation, conduce to the establishment of the consolidated annual accounts: balance sheet, profit-and-loss account, annex – at the group level.

All these consolidated documents must follow the general accounting principles. The definition of the accounting principles and of the valuation methods specific to the group must take into account the following aspects:

- the legal regulations which impose a certain number of principles;
- the regulations related to the accounting principles applied by each economic entity of the group;
- elements related to the principles kept for the group communication with its external environment and with the group politics administration bodies;
- regulatios related to the trustworthy image concept.

The accounting principles applicable to the annual and consolidated accounts are:

- regularity, sincerity and trustworthy image;
- constancy of the methods: modifications occurred from a financial year to another one may be accepted for exceptional cases only and, compulsorily, such situations shall be described and explained in the annex;
- the opening balance sheet intangibility – the opening balance sheet of a financial year must correspond to the closing balance sheet of the previous financial year;
- operation continuity;
- prudence;
- designation: at the entry date in the patrimony, the goods purchased by onerous title are registered at their purchasing price;

- financial year independence: the related incomes and expenditures are distributed to each financial year.

The accounting principles and the valuation methods regards: the used methods , specifying those ones which are not certified for the individual accounts drawing up; the valuation methods kept for the valuation of some goods or liabilities when there is the possibility to use many methods; waivers from the accounting provisions as regards the assurance of the trustworthy image; re-evaluation, keeping of a value resulted from a re-organization; the writing off methods of the immobilizations, purchasing differencies, assets and ways to take over the purchasing differencies, liabilities.

The principles and ways of the accounts consolidation particularly regards: the methods used in the case of the equality establishing; selected option; in-sequence consolidation and direct consolidation; financial year closing data; treatment of the difference found out at the first consolidation; conversion methods used for the foreign branches consolidation.

The consolidated accounts are established only on the basis of the accounting principles and valuation rules, specific to the General Accounting, subject to some specific provisions and taking into account the characteristics of the consolidated accounts against the annual accounts. The accounting principles represent conceptual elements which guide the standard authors in their work of accounting norms drawing up, on the basis of the accounting postulates. At the same time, the accounting principles represent supporting elements for the financial information producers, for a correct identification in the financial reports of the transactions and other events, as well as for an accurate description of the financial standing, performances and financial standing development , by means of these synthesis documents. The accounting principles are also guides for the auditors in their activity of accounts certification. They have a more reduced generality degree than that one of the postulates, but higher than that one of the accounting norms.

The accounting principles and methods of valuation applicable to the consolidated accounts can be grouped as follows:

- **imperative :**

- o homogenization;
- o postponed taxation;
- o exclusion of the incidence on the accounts;
- o as a result of the fiscal regulations implementation;
- o consolidation rules (in-house exclusions, purchasing differencies).

- **optional :**

- o valuation of the patrimony elements through the indexed historical costs method only;
- o valuation of the patrimony elements through the change value method only;
- o stocks valuation through the last in-first out method (**LIFO**) only;
- o withholding of the borrowed capitals interests (intercalate interest) in the stocks prime cost;
- o to register in assets the goods had by the company at its disposal through leasing contract or other similar means;
- o to register in the profit-and-loss account the conversion differencies coming from debentures and liabilities in currency;
- o to keep the goods detained by other organisms in the individual accounts, under the specific valuation rules, at the resulted value.

The **drawing up of a referential of accounting principles and valuation methods applicable to the group** conduce to the need to proceed to **re-treatments and/or re-rating** (modifications of the individual accounts) for the companies which had utilized another referential in their individual accounts.

The notable references are: national regulations; national regulations and IASC norms; regulations of different countries where the accounts consolidation is done and which have a legal framework in this direction (U.S.A., France, Great Britain, Germany).

The **homogenization** of the valuation rules and implementation of such rules is required when a similar situation is met to many consolidated companies. The implementation of these homogenous rules has its **restrictions** also, when certain

companies carry on activities in sectors or geographical areas presenting their own economic particulars.

For the both cases, the selection of the valuation rules must be explained and meet the requirements of the methods continuity principle observance.

Depending on their implementation place (inside the contry or abroad), for the branches management assessment, the mother-company managers can dispose of the national regulations and the activity sector – **homogenous bases**, that is financial documents established in compliance with the same principles. It is what allows:

- the decentralization, which paves the way for the dialog using a common language;
- establishment of forecasting elements on standardized bases;
- the control, at the mother-company level, of the reliable documents base;
- diagnosis, on the basis of reliable information.

The consolidated documents must observe the general accounting principles. The consolidated accounts are established on the basis of the accounting principles and valuation rules only, specific to the general accounting, subject to some specific provisions and taking into account the particular characteristics of the consolidated accounts in regard to the annual accounts. All these principles based on which the consolidated financial reports are drawn up must be included in the *consolidation manual*. This is a document used by the consolidation service of the consolidated company, document which establishes the options this one does, in the framework of the laws and standards in force.

This manual is transmitted to the branches, when they carry out consolidation operations. As regards its content, the consolidation manual is made up, having its established form, and it is revised from time to time and validated by the auditors group who express their opinion regarding the consolidated accounts. This consolidation manual must contain few reference information, such as: presentation of the consolidated financial reports (balance sheet, profit-and-loss account, cash flow table, own capitals variations status, annexes regarding the accounting politics and the explanatory notes); organizational chart of the companies

forming the consolidated assembly; definition of the consolidation service and consolidated entities role; consolidation schedule, which shall describe the time carrying on of the annual, semestrial, quarterly or other dates closing operations; detailing of the consolidation principles and methods selected by the consolidant company.

3. Conclusions

The principles used for the financial reports drawing up of the consolidated companies can not always to be completely aligned to those ones regarding the consolidant company, because of reasons, such as: the companies established abroad shall generally observe, for their annual accounts drawing up, accounting rules, fiscal rules eventually, specific to the residence country; the diversified groups can include companies which develop activities very different, one in regards to another one, fact which explains accounting processing adapted to the respective activities; some re-treatments occur as compulsory: exclusion of the registrations incidence generated by the fiscal rules implementation and postponed taxes accounting. As a result of the existence in the accounting practice of such reasons, the drawing up of a accounting principles manual seems to be a basic work and therefore all-important to such consolidated groups.

Abstract

Computer systems that form larger, comprehensive study is an essential field in business administration and management, areas considered major economic zone. Thus, systems must respond to the problems of managing hardware, software, data and computer networks in a strategic way to success in business. The importance of information systems lies mainly in the understanding of effective and accountable to all the leaders (managers) or persons in an organization need to adapt to the global information society. Computer systems today are increasingly becoming a vital component of business success for an organization or an entrepreneur. Managers or users (or end) does not need to know complex or abstract concepts or technologies specialized applications in the field of computer systems, but have defined the concept in at least five areas, namely: basic concepts of computer system, computer systems technology; systems applications, software development, management information systems.

Key words: business decision, information systems, computers, management

J.E.L. classification: F50, F59

1. Concept of management information system

To understand the concept of management information system, you must first presented the concept of management information system.

A management information system consists of all data, information, information flows and circuits, as well as treatment methods and information processing cups in order to achieve an organization.

The management information system is a liaison between management system (management) and executive system in two ways: through the transmission system management decisions at the executive system "top down" and by sending information backwards, from the executive to the management system (see Fig. 1).

It is thus seen that all three systems are open systems in that data can enter and exit freely. In case of the management system, entries are presented as objectives to be achieved and outputs as results. In case of the information system, they are the primary information inputs and outputs of information processed by this system. In the executive system, the entries are represented by all the resources (financial material and human), and the outputs of goods or services company.

A management information system is actually a computerized management information system. Thus, information system report computer system is part of the whole.

A management information system is an organized combination of hardware, software, resources brainware (those who implement and those who use the computer system), telecommunications networks that collect, process, transmit and distribute information within a firm.

Any person in the firm that uses a computer system is considered an end user. The major beneficiaries of these

systems are effective managers, and decisions based on reports provided by computer systems.

The computer system has the following main functions:

- a) generation of information in electronic form;
- b) storing information in databases created with database management systems (DBMS's), information storage capacity and data access speed is the criteria for assessing the performance of a computer system;
- c) processing of information relating to operations such as:
 - Conversion of analog information into digital form and vice versa;
 - Creating and uploading databases;
 - Updating a database (update) involving deletion of information no longer needed and introducing the latest information to meet the needs of the IT users;
 - Database query that information equivalent to selecting certain criteria, in this case, the language SQL (Structured Query

Language) is the most popular query language of databases.

d) communication, which ensures the transfer of information within the network of computers or between computers and telecommunications networks, communication within the marketing information system is through direct consultation and network terminals outside the system by transmitting multimedia information from remototypically using web technologies;

e) the use of appropriate means for achieving comunicare information output from the system;

f) control or check system resources with respect to equipment, information base, by appointment and their allocation. Extremely important information is to verify the existence of unauthorized withdrawals from the system if they find information that competitors could cause damage. In general, access to information is restricted by password, access to information is authorized system administrator.

Anyone in the marketing department that uses the computer system is seen as an end user. The major beneficiaries of these systems are the directors / managers who can effectively underpin decisions on the basis of reports provided by computer systems.

2. The evolution of informational system inside companies

In the last five decades have been significant changes (see Fig. 2.) In the pattern of their information structures that have become in recent years of computer time.

Until the 1960s, the role of information systems was simple: use them to record operations and critical functions related to transaction processing. In the late 1960s is the concept of management information system that will transform over time management system. Its role was to provide managers predefined reports, reports containing information they need decisions.

Fig. 2 - Evolution of information systems

In the period 1970-1980 noted that the predefined reports provided by information systems (Management Information System ", MIS) managers were insufficient for decision making, given that significant changes have occurred in environmental conditions, including reference to the markets. Hence the concept of decision support systems ("Decision Support System"-DSS). These systems offer end-users, especially managers, support interactive decision making process. In addition, these systems were better adapted to different management styles.

In the period 1980-1990 have revealed new roles of information systems. This period is characterized by the development of microcomputers, software packages, and telecommunications networks. Now, end users can use computerized information resources that are required to perform support duties, rather than expect an indirect support of IT services within the departments.

Fig. 3 – Types of informatics systems by their structure

It was found that most managers do not use directly any reports from management information systems (Management Information System - MIS), no analytical models of decision support provided by decision support systems ("Decision Support System - DSS). Hence the concept of executive information systems ("Executive

Information System - EIS). These systems provide critical information managers exactly what they want in the format you prefer.

Also during this period and especially in the late 1980s have emerged and have developed applications of artificial intelligence (AI) in business processes and appeared as expert systems for business ("Business Expert System"). Today, expert systems playing the role of consultants in economic problems of any company.

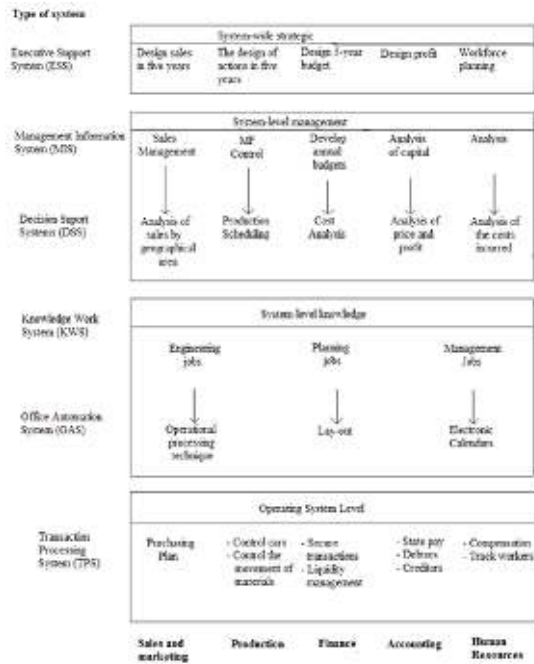

The last decade of the millennium is characterized by the development of strategic information systems ("Strategic Information System"-SIS). They play a direct role in achieving a company's competitive advantage. Michael Porter's model was the basis of numerous such strategic information systems. Companies today must rely on information technology to be competitive in highly competitive markets.

3. The 6 types of management information systems used by the company

The firms can meet the six types of information systems structured on four levels: (a) the strategic level, (2) tactical (3) knowledge and (4) Operations (Fig. 3.).

To the strategic level corresponds executive information system ("Executive Information System - EIS). At the tactical level decision support system we find ("Decision Support System - DSS and data management system (Management Information System - MIS). In the knowledge-based system locate knowledge ("Knowledge Based System "- KBS). In operational level - the system office automation activities (Office Automation System "- OAS) and transaction processing system (" Transaction Processing System - TPS). The main features of these information systems can be summarized in Fig. 4 below.

Fig. 4 - Types of information systems related organizational pyramid

Information processing methodology	information is produced by extracting and manipulating the operational data provided by TPS	The information produced by the analytical modeling data, in particular foreign
------------------------------------	---	---

TYPE SYSTEM	MIS management information system	DSS decision support system
INFORMATION	-	-
Decision support	-	-
Type of support	provide information about organizational performance	Provides information for making decisions in conditions of confrontation with real world business problems
Types of decisions referred to	structured planning and control decisions at tactical and operational level rarely	Semistructured or unstructured decisions for planning and control at the tactical level and rarely at the strategic level
Type of decision support	Indirect support for managerial decision making	Directly support the specific needs of managers

4. Information systems support for decision making (Decision Support System-DSS)

Decision support systems (DSS-Decision Support System) is an important category of information systems to support managerial activities. They generate an interactive computerized information support for decision-making process in an organization.

Decision support systems are in the pyramid organizational and tactical level using analytical models, specialized databases and interactive modeling decision-making processes unstructured or semistructured. There are systems that provide a rapid response information needs of end users.

Fig. 5 - The relationship between a decision support system and a management information system

TYPE SYSTEM	MIS (Managerial Information System)	DSS (Decision support system)
INFORMATION	-	-
Form and frequency of information	Regular reports on demand or in exceptional times	Forms and interactive responses
Format information	default; fixed format	Adaptable and flexible format

Decision support systems (DSS-Decision Support System) focuses on generating predefined information and decision support focuses on providing an interactive medium for various types of decisions, they assist managers in dealing with unstructured or semistructured problems which often occur in the real world, unlike the Management Information System, that address structured decision-making processes involved in planning and control at the tactical level.

Fig. 5 highlights the differences between a decision support system and a management information system.

Decision support systems (DSS-Decision Support System) are the only systems that support all four phases of decision-making process: intelligence, design, optimal solution and implement the decision. Management information systems (Management Information System), for example, are designed to provide intelligence support only for the first phase and last phase of implementation, monitoring success in the first instance decision.

For example, sales managers use management information systems (Management Information System) to get reports on sales analysis. These reports

contain performance product line sales, salesperson, region, etc..

A decision support system (DSS-Decision Support System) presented in an interactive way for sales managers on the effects of their sales performance to changes caused by various factors (such as increased spending to promote or reward sales agents) . A decision support system can use certain criteria (eg market share) to evaluate and rank sales performance factors.

4.1. Components of a decision support system (DSS-Decision Support System)

A decision support system (DSS-Decision Support System) is composed of hardware, software, data, models and human resources.

(A) Hardware resources - employee workstations are the primary hardware resources of a decision support system. Usually, these workstations ("work - stations) are connected in a local area network (LAN-Local Area Network) to facilitate information sharing.

(B) Resources software - software packages for decision support system software modules include database management, software modeling and software decisions for end-user dialog - system.

(C) Data Resources - a database of a decision support system contains data extracted from the organization's internal databases, external databases and personal databases of managers. The data are stored according to the specific type of decision.

(D) Resources of models - based on statistical and mathematical models and analytical techniques are stored as programs, files and database tables.

(E) Human resources a DSS can be used by professional managers who can explore decision alternatives.

Decision support systems (Decision Support System) are designed, implemented and developed by specialists in information technology (IT Specialists "). A Decision Support System (DSS) that can be sreprzentat Fig. 6

Fig. 6 - A type computerized decision support system

4.2. Types of analytical models used in a decision support system

Using a decision support system (DSS-Decision Support System) process involves an interactive analytical modeling. Specialized software packages for decision support systems allow managers to send requests and receive responses from them quickly.

Were highlighted four types of analytical models used in designing a decision support system: analysis of "what would happen if ...", sensitivity analysis, goal analysis and optimization analysis follow.

Analysis of "what would happen if ..."

The end user of a decision support system modifies some variable or the relationship between variables and observe the resulting changes in the value of other variables in the model.

Sensitivity analysis is a special case of analysis of "what would happen if ..." In this case, the value of one variable is changed repeatedly and observe the changes that affect other variables in the model. Analysis defines the purpose of tracking a target (goal) for a variable and makes changes to other variables until the target value is reached.

Optimization analysis - in this analysis instead of defining a target value for a variable is defined multiple target variables, subject to certain constraints and search for the optimal value. Then one or more variables subject to changes until it covered the optimal target value. It is an extension of the tracking analysis of the goal.

Raymond Panko, in "End User Computing: Management Applications," a reference book for managing information technology presents specific examples for these four types of analytical models used in decision support system, as can be seen in Fig. 7

Fig. 7 - Analytical models used in decision support system

ANALYTICAL MODEL TYPE	ACTIVITIES AND CONCRETE EXAMPLES
ANALYSIS OF TYPE "What would happen if"	- To observe how some variables affect other variables change Example: "What would happen if you reduce the advertising budget by 10%? How would affect sales?"
Sensitivity Analysis	- Is seen as repeated changes of variables affect other variables. Example: "Reduce by \$ 10,000 monthly advertising budget and to observe the effects on sales"
ANALYSIS OF TRACKING THE GOALS	- The repeated changes are made to variables until some variable reaches a target value Example: "Let's grow up monthly advertising budget when sales will reach \$ 1 million."
OPTIMIZATION ANALYSIS	- Find an optimal value for several variables, subject to certain constraints Example: "What is the best that we can spend on advertising, depending on the choice of type of media and marketing department budget."

In conclusion, decision support systems (DSS-Decision Support System) modeling and analysis tools used very complex and gives managers flexibility, adaptability and rapid responses to their requests for information.

5. Conclusions

Ethical dimension of information systems issues ensuring that information systems technology is not an improper or irresponsible manner that affects the individual or company. From this point of view is very important in the global information society to all its members benefit from information resources and have common strategic goals both at the individual level, nationally and globally. Using the organization's information systems may lead to increased profits and savings in raw materials, energy and other important resources globally.

Information systems play a vital role in the success of an organization. Thus, they can ensure internal and external information infrastructure, inter for the business needs: ensuring operational efficiency, efficient management, ensuring a competitive advantage.

A successful system must be measured not only by its efficiency (minimizing the cost, time or resource usage information) but also by the support it provides in: business development strategies, development of business processes, improving organizational structure and culture of the organization; increased turnover and business value in a dynamic environment, competitive.

In the present period most large companies have developed systems globally as a consequence of differences in raw material costs and labor in various places around the globe, while the existence of flourishing small and medium businesses using the Internet becomes a primary means of communication for the business, so an important means to promote.

Business process consists of any group of activities undertaken in order to produce a specific result-oriented to customer or market. This result appears as a consequence to step three. In a modern organization of information technology is leading to new guidelines require the use of capital and increasingly sophisticated artificial intelligence, expert systems, etc. The business environment is constantly changing and require new techniques and methods developed in this process.

Restatement of the business process is based on a new type of gândireși changes in the conduct of business which is characterized by radical changes and new approaches to its effects on cost, quality, service and speed of deployment.

Abstract

The main reason of competition policy is determined by the market that can not, naturally, to function normally, requiring intervention from outside that would ensure proper development. Thus, this paper aims to analyze the competition and competition policy in the Euro-Atlantic in global business sectors. In a such sector there are some basic strategic alternatives such as global competition with a broad product line, global focus, and focus national protected niche. In the context of the analysis appears a number of trends that are very important for competition in global business sectors and creating new ones.

Key words: competition, market, competition policy, global focus, global activity

J.E.L. classification: F1

1. Introduction

Analysis of competition and competitive policies in the Euro-Atlantic area can be realised on three distinct levels: competition policy in the European Union competition policy in U.S.A. and competition policy in Romania.

The most representative country of Anglo-Saxon type of market economy, the most liberal and most avant-garde while in anti-trust legislation, the U.S. can be considered a landmark in the regulation and implementation of modern competition law.

From the institutional point of view we remark compatibility between EU, U.S. and Romania. Supervisory role of the competitive environment in the U.S. is including the Bureau of Competition Federal Trade Commission. Federal Trade Commission imposes consumer protection and antitrust law, playing an important role in the elimination of unfair and deceptive practices, while ensuring that markets function based American competition. It shall:

- Oversee mergers and acquisitions in order to prevent those that can generate higher prices, fewer competitors or less innovation;
- Identify and prohibit anti-competitive practices in the market, including trends in the formation of monopolies and cartels between competitors;
- Promote competition in areas where the impact on consumers is high, as in health, oil and gas, real estate, technology or consumer goods;
- Provides information, organizes conferences and workshops for consumers, business competition and market analysis.

American literature is distinguished by major contributions in the analysis of competition and competition policy. One example is Joseph Stiglitz, Nobel laureate in economics, which systematizes the main drawbacks of lack of competition. He says that the four major sources of inefficiency of imperfect competition [1]: restricting production, managerial inefficiency, insufficient attention paid to research and development, behavior rent seekers.

For each of these arguments are obvious: restrictions in production are determined mainly by monopolies, which attempt to maximize profit limited quantities brought to market, leading to increased prices. Managerial inefficiencies that come down to in practice, very large companies that do not have to face strong competition, tend to abandon the goal of minimizing costs. Limiting investment in research - development in industries with weak competition is generated by self-sufficiency in monopoly firms. "Searching for rent" refers to a situation that monopolies tend to consume resources in unproductive economic ways.

Also important contributions to the theory of competition brought American professor Michael Porter, whose work competitive advantage - User survival and growth of firms in the market economy [2], and competitive strategy [3] have made significant contributions in addressing competition.

2. Competition in global business sectors

Competition in global business sectors raises unique strategic problems than domestic competition. Although their resolution depends on the sector and the host and guest countries involved, the issues analyzed below will be taken into account and global competitors.

Sectoral policies and competitive behavior. Global business sectors are characterized by competitors that operate globally. Except the United States, companies and governments in the country of origin should be considered together when resort to competition analysis. Between companies and governments in their countries complex relationships are establishing, involving various forms of regulation, subsidies and other assistance. Governments of countries of origin were often targets of such employment and balances of payments, which are not strictly economic, viewed from the perspective of the firm. Sectorial policy objectives of government can set up companies, providing funds for research and development and, in many respects, the influence of their position

in global competition. Origin country governments can negotiate the home for business in global markets (e.g. construction of complex aircraft production), financed by central bank sales (agricultural products, products for defense, ships) or apply political leverage to defend the other self-interested ways. In some cases, the home government is directly involved in the company that owns, partially or completely, of the firm. A consequence of this support could be to increase exit barriers.

Competitive analysis is impossible in global business sectors without a thorough examination of relationships between firms and governments in their countries of origin. Sectorial policy of the country of origin must be understood as economic and political relations with governments of countries that government is the main global markets for the product.

It is true that, often, in global business sectors, competition is distorted by political issues, which may or may not relate to economic aspects. Acquisition of aircraft, defense products or computers may depend on political relations between the country of origin and countries of purchasing and only of the merits of producing company. This factor requires not only as competitors in a global business sector to gain insights about political issues, as well as business relations with the government of his country and the governments of countries to become truly strategic buyer. Competitive strategy should include actions aimed to produce political capital, such as positioning assembly operations in major markets, although not prove economically efficient.

Relations with governments of countries that are major markets. Business relations with governments of countries that are major markets are a key issue in global competition. Governments have a variety of mechanisms which may harm the operations carried out by global companies. In some sectors, governments are the main buyers, while other sector of their influence is indirect, but equally strong. When host governments are willing to exercise power, they can block the global competition or create strategic groups in the industry. Studies undertaken by Doz have identified three groups. The first is composed of companies that compete on a global coordinated, second, from

multinational companies (which have often a lower market share) which is a sensitive strategy to local issues and not one to integration. These companies get rid of many government constraints and even benefit the host government support. Finally, the third group consists of local firms. For international companies, sensitivity to the concerns of government becomes an essential strategic variable.

Company trying to globally compete will be involved in some major markets to obtain the necessary savings. For example, it will require some major market volume to meet global production strategy. It will be concerned with protecting the strategic position they hold in these markets, as this position will influence its ability to implement global strategy as a whole. This requirement provides the governments of host countries bargaining power and the company will have to make some concessions to defend their overall strategy. For example, Japanese companies in TVs and car industry must carry out some manufacturing operations in the United States to relieve political concerns in the U.S., so to be able to maintain sales in the U.S., which is a essential source of competitive advantage globally. Another example is provided by our company policies on hiring local IBM employees only in the host country, transfers of goods balanced between company units from different countries and undertaking research and development activities locally.

Systemic competition. By definition, a global sector is one where firms start as something global competition and build their strategies accordingly. Therefore, the competition involves global coordination of issues related to market position, facilities and investment. The overall strategy of competitors will be required, usually only a partial overlap of markets served, the geographical location of factories, etc. To maintain a competitive balance in terms of systemic investment firms will have to take defense purposes in certain markets, not to let the competitors to take advantage to strengthen their global position. Studies undertaken by Knickerbocker on international competition revealed precisely this pattern of behavior.

Difficulties in competitive analysis. This analysis is difficult because of the predominance globalized sectors and foreign companies need to review the systemic relations. Information on foreign firms are more difficult to obtain than those of U.S. firms, although this phenomenon known some improvement lately. Analysis of foreign companies may involve consideration of institutional aspects that are difficult to understand for those outside the system (such as labor practices and management structures).

3. Strategic alternative in global sectors

There are a number of basic strategic alternatives in a global sector. The most important choice the company must take refers to the way of compete: globally or by finding niches that can build a defensive strategy needed competition on one or a limited number of national markets.

Alternatives are:

Global competition with a broad product line. This strategy is directed towards global competition with the entire line of products in the industry, with global sources of competitive advantage or differentiation needed to obtain a position characterized by reduced total costs. Implementing this strategy requires substantial resources and a long time horizon. To maximize competitive advantage, the company will focus in dealing with governments on reducing impediments that stand in the way global competition [4].

Global focus. This strategy targets a certain segment of the industry in which the company will compete in the world. The segment is chosen aiming that the impediments that stand in the way of global competition to be as small as possible and firm position to be defended from incursions of global competition that appeals to a broad line of products. Strategy allows either obtains low cost or differentiation in the segment.

National focus. This strategy seeks advantage of differences in national markets, focusing on a market approach to national focus, which allows the company to surpass (in terms of performance) the firms compete

globally. This version aims to be the differentiation focus strategy, or the registration of reduced costs in meeting the specific needs of a particular national markets or segments in this market, which are most economical impediments in the way of global consistency.

Protected niche. This strategy seeks countries where governmental constraints exclude global competitors, requiring the product to be achieved mostly locally, using high tariffs etc. The company is building its strategy to deal with national markets subject to such restrictions and pays special attention to the host government to ensure that you receive proper protection.

In some sectors of the global and national strategies focus search protected niches can not be implemented because there is no impediment to global competition, while in other sectors such strategies can be defended the global competition. An approach that is gaining more ground in trying to implement more ambitious strategies in global business sectors is that of transnational coalitions or agreements of cooperation between companies from different countries operating in the industry. Coalitions allow competitors to cooperate to overcome the difficulties of implementing a global strategy in areas such as technology, market access etc. Aircraft industry (GE-Snecma), the car (Chrysler-Mitsubishi, Volvo-Renault) and electrical products (Siemens-Allis-Chalmers) are examples of sectors where global or near global coalitions have a dominant role.

4. Trends affecting global competition

In the context of the analysis made, there are a number of trends that are of great importance for global competition in sectors and creating new ones.

The reduce of differences between countries. Some analysts have contended that economic differences between developed and newly developed areas such as reduced income, cost factors, energy costs, marketing practices and distribution channels. Part of this reduction is due to aggressiveness of their techniques in the spread of multinational companies around the globe. Whatever the cause, this aggression can reduce impediments that stand in the way of global competition.

More aggressive sectoral policies. Sectoral policies in many countries are "flow". Governments of Japan, South Korea, Singapore and Germany have gone from passive or aggressive protectionist one, aiming to stimulate carefully chosen sectors. They have abandoned also considered to be inefficient sectors. This new policy provides support to the companies in those countries for taking bold action that will transform the business sectors in global sectors (e.g. construction companies' large and significant investment for entering new markets). Although companies in sectors not seen favorably by governments may fail to be noted that companies remain in global business sectors may behave differently. The noneconomic objectives brought into attention by the government involvement will have an increased role. Of course, there is the possibility that international rivalry to escalate as a result of action of these factors as barriers to increase output, with effects on stimulating rivalry.

National recognition and protection of distinct assets. Governments tend to be increasingly concerned with their distinct knowledge resources in terms of economic competition, are increasingly willing to obtain economic advantages due to the possession of these assets. Natural resources (eg oil, copper, tin, rubber) are examples of assets that were controlled by the government, either directly or indirectly through joint ventures with government-established manufacturers. The presence of numerous workforce, low paid, unskilled or semi-skilled (South Korea, Taiwan, Hong Kong) is another asset that is explicitly recognized in some countries. Intense exploitation of such assets by governments' distinct change in philosophy is a reflection of sectoral policies.

This may have consequences for global competition in core business sectors in which such assets are protected strategic importance. Foreign firms can be no effective control of key resources. For example, in oil, such a reorientation of government policies led to a reorientation of oil companies from retail and other activities designed to make profit from production to profit on each vertical stage. In other sectors, reorientation can provide companies of home advantage in competing in the global core [5].

Technological flow more freely. A freer flow technology offers a large number of companies, including those in new countries (NTD), the ability to invest in modern facilities worldwide. Some companies, particularly Japanese, became particularly aggressive in selling their technology worldwide. Also, a number of technology companies that have purchased are willing to resell other companies, in terms of prices. All these developments tend to promote increased global competition.

Gradual development of large scale new markets. Although the United States has long been a strategic market for global competition due to its unique size, China, Russia and possibly India, can become important future markets. This possibility has a number of consequences. First, if China and Russia will control access to their markets, their companies can become global competitors in first class. Second, gaining access to one or both markets may become a future key strategic variable due to the high volume of products they can sell the companies in these markets.

Competition from new countries developed. A phenomenon in recent years is the competition of new countries developed global business sectors, especially Taiwan, South Korea, and Brazil. Traditionally, NTD compete by appealing to labor and / or cheap natural resources in sectors such as textiles, toys and products of plastic. However, competition from NTD has a growing business sectors greater capital-intensive, such as shipbuilding, television production, steel production, fiber, etc.

5. Conclusions

The new developed countries are increasingly better prepared to make substantial capital investments in large scale facilities, to buy new technologies and to take risks especially large. Sectors most vulnerable to competition from both NTD are lacking following entry barriers:

- Technology is changing rapidly and can be held in property through patents;
- highly trained labor force;
- Sensitivity to the time factor;
- Distribution and complex services;
- A high content of consumer-oriented marketing;
- Load complex sales, technical

Some of these factors are impediments to global competition, as shown above. Although they may not discourage competitors from developed countries, there are difficult problems for companies in NTD, because they lack the resources, qualifications, experience, credibility, relationships and ability to understand the requirements that differ from traditional developed local markets requirements.

Abstract

In classical period the economists saw the difference between income and consumption economy in the way of a simple empirical difference, and that because the relatively low degree of institutionalization of the end of Middle Ages society. Late seventeenth and early eighteenth century brings in "the eyes of classics" the antithesis between the noble luxury spenders (destruction of capital) and the economic bourgeois (capital creative). This opposition generates the classical conception that "economies growth can be achieved only through a reduction of consumption." In the same period Jean Stuart Mill said: "capital is the result of saving, and the only way to accelerate the growth of capital is to increase savings."

Late nineteenth century brings the emergence of a large number of individuals, potential savings and economies fructification institutionalized form, with the development and institutionalization of national banking systems of society.

Key words: saving, mercantilism, economic liberalism, investment, economic thinking

J.E.L. classification: B1, B11, B12, E2, E20, E21

1. Introduction

The transition from medieval to modern society was a radical change of perspective in the assessment of wealth and its sources. Representatives of the church, whose doctrine prevailed in the middle Ages, put emphasis on the afterlife and religious canons

and word bearers' officials' feudal society were dominated by the problem of ensuring power consumption of the community members. In these new conditions, businessmen (merchants) and new politicians moved the focus on immediate problems of individuals, to the context of money, for material wealth. In continuation of such optical extension they were followers towards a market economy, trade and disintegration amplification of heterogeneous empires, established by military force. Hence the result was the first economic thinking current, the mercantilism which put in new terms the relationship investments - wealth [1]. The three fundamental ideas of mercantilist doctrine reflect, in one form or another, this relationship and his ways of training.

2. Classical School - a true landmark of contemporary

The mercantilist supports the view that the ideal form of wealth is money, respectively the precious metal from which they were made. Therefore, the accumulation of increasing quantities of gold and silver they represent a suggested way to increase wealth. The aim of any commercial business activities, including trade order is profit. Admitting non-equivalent nature of trade (as domestic and global terms), mercantilist believes that profit results from the difference between selling price and purchase price of traded goods. Generalizing it, they acknowledged that some transactions partners loose and some wins. In their conception the foreign trade represented the

most profitable area of activity, which, in turn, ensuring the highest profits [2]. In economic and political practice, the mercantilist doctrine based the measures aimed to increase the stock of precious metals with the active support of the state, both in domestic policy as in foreign economic policy.

The main merit of representative's mercantilism (Jean Bodin, Th. Mun, Th. Gresham) is to develop measures to help stimulate trade and the establishment of accumulation of wealth, on which were created modern capitalist economy infrastructures in training. Commercialism remains current economic thinking in the first preclassical period. Such an assessment is based on the fact that they focused their attention on the scope of the movement and tried to explain the problem of the modern economy through the prism of this sphere, including savings, investment and development problem. Physiocrat economic doctrine occupies a special place in explaining wealth and its sources. For general characterization physiocrats believe are defining the following aspects, embodied in the original concepts of:

- natural order in society and optimal economic policy;
- wealth and role of agriculture in its creation;
- net product and its role in economic development;
- creation, circulation and the distribution between social classes;
- simple reproduction macroeconomic scale.

Unlike the theory supported by the mercantilist, physiocrats related concept of wealth is completely opposite. On the one hand, they believe that wealth is useful goods and precious metals, and on the other hand, it is created in production, especially in agriculture. The "economic picture", whose author was F. Quesnay, the relationship net-wealth-income economy is caught in an ingenious way. From our point of view, "economic picture" has the following merits: Quesnay expressed the production by its repetition, so as a breeding process in economy scale, this model was the first scheme of simple reproduction of capital, it is an analysis of production and circulation in

the double expression - material and money, finally the scheme was revealed that reproduction mobile (net product), which is created only in production. To continue without interruption the reproduction process - consider Quesnay – it needed to comply with certain correlation between capital and income, between final consumption and reproduction [3].

3. The contributions of A. Smith, D. Ricardo and J.S. Mill to the study the process of saving

Classical economic liberalism reached maximum rates with the creation of Adam Smith and David Ricardo and it was synthesized in the work of John Stuart Mill. The term "classic" shows substantial theoretical and methodological contribution of these thinkers in creating economic science (political economy) and economic policy foundation in the spirit of free trade. Specific current economic thinking is based on the classic three main principles: i) the first principle is the aspiration of freedom (of action and thought) of participants in economic activities, ii) practical support of freedom is the classical view, private ownership property, the foundation of modern market economy, iii) the principle of individualism in the sense that the best decisions can be made by each participant in the economic life according to his interests [4].

Within this paradigm they are discussed and considered issues relating to wealth, development and their makers. In this sense, the motivation of actions and decisions they take free private economic agents is their desire to obtain profits and gains as big advantages. Become fundamental in his classic "Wealth of Nations" Adam Smith has a new theory based on the ratio of capital increase and the law of progress. In "Wealth of Nations", he postulated that the saving and the accumulation of productive resources, and on this basis, growth capital, is a law of general progress. Moreover, the classic of political economy relates the development of a nation to the level of the nation wealth, respectively to the capital accumulated within a national economy. More deeply investigating the crucial role of work in

creating and increasing wealth, Smith compares the sphere of production work with other types of work, emphasizing the need to increase the production workload. This is the quantitative aspect of the problem. Analysis of this side of the research work is continued with the qualitative edge, which is made in relation to the accumulation of capital, with investments [5].

Productive potential of labor, amplified by the division of labor and by reducing unproductive workers can be further increased by invested capital through improved working tools. Hence, Smith analyzed the role of capital as a production factor and then the importance of capital accumulation by converting a portion of profits in additional capital. He observes and analyzes the different roles presented by the two components of capital: fixed capital and working capital [6]. The accumulation of capital, particularly fixed capital is required to increase the productive power of labor. But growth depends on the size of fixed capital gains that can be reinvested, requiring prior accumulation of resources. Reading between the lines, Smith tells us that investment is the way to increase individual fixed capital, the investment is rational decision by each participant in the economic life of increasing their wealth, and by aggregating all of these increases is obtained to increase national wealth. In the theory of Smith, measuring the effectiveness of investments is reflected in the effects they have on increasing the amount of work, especially in their effects on work output, in increments of products provided by the same amount of work. It is noted that this reasoning is valid only for what Smith called productive work "There is a kind of work that adds value to labour objects over which it exercises and another that does not have this effect." The first kind of work is called by Smith productive work, while the second kind of work is "unproductive" [7].

The theory developed by Adam Smith is supported by economist Jean B. Say that brings a certain correction motto "enriched by your production." The french economist argues that production can not continuously spores without creating that income to afford the products. It's the law of outlets, each production that creates its own market. On the same line of thought David Ricardo

referred to investment activity, first as an investment in creating means of production, following the example of the hunter who had produced his own hunting weapons. Critically analyzing how income distribution is made in England of his time, Ricardo proposes the following formula to improve the situation: "If a significant part of currency in circulation would have taken from the lazy people and from those who live in fixed income and would be transferred to farmers, industrialists and traders, the proportion between capital and income would be modified in the benefit of capital, and the country production in a short time would be much larger "[8]. What is important at Ricardo is the observation and registration in a scientifically appropriate framework, the orientation of the producers to the providing the highest level of profit activities. Orientation and reorientation of capital in investment activity is displayed by him in modern terms. Capital allocation is made by a manufacturer not absolutely changing the use of capital, but only reducing the amount of capital he has in this usage. In all rich countries there are a number of people who form the so-called class of money lenders, these people are not engaged in any activity, but live on interest. Bankers use also an important asset for the same operations.

Ricardo identified by this the investment capital sources (own sources, private loans and loans from banks), omitting his conception of liberalism because government borrowing.

Many specialists have always considered that the classical school of political economy synthesis is carried out by John Stuart Mill. Recognizing the existence of three factors of production, it brings new elements, especially in relation to capital. J.S. Mill said that all capital is productive and that results in savings. For Mill all goods are part of capital, since they exist, and their value is given by a production process.

As A. Smith, Mill believes that saving is the birth of capital. Without saving any accumulation is not possible. But, he continues, saving, absolutely necessary, is easier for the rich and painful for the poor. Mill passed Smith's conception on the definition of wealth. He proposed definition of wealth capital stock or volume.

Finally, he defines "accumulated wealth as the means and owned entirely by individuals and communities to achieve their objectives" [9]. John Stuart Mill carefully studied economic dynamics, dynamic equation put into savings - accumulation - investment - development.

Mill's definition of economic dynamics become classical: "There is a progressive movement that continued without historical interruption from year to year, from one generation to another, an increase of wealth, an increase in what is called material prosperity. All nations which we call civilized normally increase their production and population "[10].

Unlike the Ricardian concept that a single variable analysis of the development - profit, JS Mill dealt its three factors: population, capital and technology. If the population grows faster, without the technical and capital can move at the same rate, then real wages fall, and the rents and profits increase. If capital growth is fastest when nominal and real wage rises, profits fall, rents continue to rise. If technology develops rapidly, rents and profits may fall and real wages can rise. Stopping capital accumulation and technical progress in a mean steady state economy. Mill added their vision, which he regarded it as feasible that he anticipated and systematized a series of ideas presented earlier by the English classics.

4. Conclusions

Classical theory on the process of accumulation, saving, successfully passed the exam time, exceeded the experimental knowledge, perception, its role is to interpret the facts in some respects unaltered today. In fact, the economy of the developed world (contemporary) arises after liberal scheme without equal in force emulation. In fact, they have also brought neoclassical and contemporary neo-neoclassical the construction of this scheme? Complicated economy and they claim embroidered with a classic message refresh or upgrade. The finding of facts, easily observable and can not be neglected, that the world is automatically configures rich and poor, can

be seen as a mechanism in which some faster than others prosper, it has sparked interest in determining the forces acting on this mechanism and that make it work differently in time and space.

This was the end of empiricism approach to saving as the difference between income and consumption in parallel with the target of economic policy change from micro to the macro approach. Abandon the gold standard and the transition from a system of fixed exchange rates, floating rates have influenced the doctrinal approach to the phenomenon saving manner.

Multinational Enterprises – Key Sources for Global Development and Competitiveness

Ogrean Claudia
Herciu Mihaela

”Lucian Blaga” University of Sibiu, Faculty of Economic Sciences

claudia.ogrean@ulbsibiu.ro

mihaela.herciu@ulbsibiu.ro

Abstract

The academic literature (in the field of international business, but not exclusively), as well as (all kind of) global statistics agree and emphasize more and more on the role and contribution of the multinational enterprises (MNEs) within the global economic context – as key sources for development and competitiveness.

The realities of nowadays and the predictable outlooks for tomorrow confirm these analysis on one hand, and raise new challenges (opportunities and threats) on the other – the emergence of multinationals from emerging countries being just one of them.

The paper aims to schematically capture in just one picture all the above mentioned transformations and evolutions that mark the present and influence the future of MNEs in terms of their contribution to global development and competitiveness.

Key words: multinational enterprises, globalization, development, competitiveness

J.E.L. classification: F23, F43, O10

1. Introduction – the global(ization) context of multinationals

Globalization reaches today (more or less, positively or negatively) all the aspects and domains of the humankind and life. Cumulative result of some very different qualitative, as well as quantitative processes and transformations which took place over time within the most different domains of the human existence, *globalization* has become the referential for almost each economical, political, military or environmentally related discourse, which *emphasizes* either on the

positive effects globalization brings to the development of the society (as a whole and of the different entities within it), or on the unwanted *failures that it determines and/or accompanies*. But one thing is for sure: we are living now some very turbulent times – some call them an age of discontinuous change – which are redefining the global (economic) architecture – or, at least, the way we were used to perceive it and to report to it until recently. It seems to be more like a *turning point* or a *transition* to another phase [11].

Some already define this new phase as *globality*, which “is not a new and different term for globalization, it’s the name for a new and different global reality in which we’ll all be competing with everyone, from everywhere, for everything. (...That’s because...) Today we look forward and see a new era emerging. We call it *globality*, a different kind of environment, in which business flows in every direction. Companies have no centers. The idea of foreignness is foreign. Commerce swirls and market dominance shifts. Western business orthodoxy entwines with eastern business philosophy and creates a whole new mind-set that embraces profit and competition as well as sustainability and collaboration” [15].

The same idea is differently expressed (into a rather antagonistic approach) as follows: “In an early stage, global companies entered emerging markets mainly to lower their costs of supplies. Today, their roles are shifting and they are key players in the development of emerging nations, which are eager to build their infrastructure and develop their domestic consumption. But *tomorrow, global companies will have to compete with the homegrown companies and brands that are being born and bred in today’s emerging nations. Emerging markets are becoming*

emerging powers. The partners of today will become the challengers of tomorrow” [9].

Under these circumstances, all the entities – countries and companies, as well – are in search for *global competitiveness*. Considering the different theoretical approaches on this subject, we believe that a good definition of the competitiveness levels is given by Karl Aiginger, as follows: “according to my interpretations, the consensus will soon be that *competitiveness* should be *defined* as the *ability to create welfare*:

- on the *firm level*, business economists and management scientists search for factors which create “competitive advantage” and then for capabilities and processes which help to “sustain” the advantages created;
- on the *regional level*, we look for supportive institutions, firm clusters, spillovers, and forward and backward linkages;
- on the *national level*, economists analyze the innovation system, the quality of education, life long learning, physical and intangible infrastructure, trust, etc.” [1].

2. Multinational enterprises – the engine of the global economy

Everybody agree now that multinationals are the engine of the global economy. But the definition of the multinational enterprise / company / corporation takes a lot of different shades, considering the different authors / academic fields / period of time, etc. it is exposed. In order to exemplify this, we will stop at two of the 2008 definitions of the multinationals:

- “a *multinational enterprise* is a large company with substantial resources that performs various business activities through a network of subsidiaries and affiliates located in multiple countries. One of the hallmarks of MNEs is that they tend to carry out R&D, procurement, manufacturing, and marketing activities wherever in the world it makes most economic sense. In addition to a home office or headquarters, the typical MNE owns a worldwide network of subsidiaries. It collaborates with numerous suppliers and independent

business partners abroad (sometimes termed affiliates)” [5].

- “a *multinational or transnational enterprise* is an enterprise that engages in foreign direct investment (FDI) and owns or, in some way, controls value-added activities in more than one country. This is the threshold definition of a multinational enterprise (MNE), and one that is widely accepted in academic and business circles, by data-collecting agencies such as the Organisation for Economic Co-operation and Development (OECD), UNCTAD’s Division on Investment, Technology and Enterprise Development (DITE), and by most national governments and supranational entities” [7].

The academic literature on international business emphasizes among the *proactive and reactive motives* of internalization the following:

- seek opportunities for growth through market diversification;
- earn higher margins and profits;
- gain new ideas about products, services, and business methods;
- better serve key customers that have relocated abroad;
- be closer to supply sources, benefit from global sourcing advantages, or gain flexibility in the sourcing of products;
- gain access to lower-cost or better-value factors of production;
- develop economies of scale in sourcing, production, marketing, and R&D;
- confront international competitors more effectively or thwart the growth of competition in the home market;
- invest in a potentially rewarding relationship with a foreign partner [5].

Given the wide variety of the *international firms*, within the theoretical field, the well known specialist in international business Alan Rugman classifies the multinational enterprise in *four categories/types* in terms of spreading of their sales:

- firms in their home region of the triad: these are labelled *home-based MNEs*, or *home region oriented firms* – with at least 50% of their sales in their own region of the triad;

- firms in two region of the triad: these are labelled “*bi-regional*” firms – with over 20% of their sales in at least two parts of the triad plus less than 50% of sales in their home region;
- firms in a foreign region of the triad; these are “*host-region oriented firms*” – with over 50% of sales in a triad region other than their own;
- firms in all three regions of the triad: these are labelled “*global*” firms – with sales of 20% or more in each of the three regions of the triad, but less than 50% in any one region [13].

3. Basic theories on the emergence and evolution of the binomial multinationals – development

The internationalization theories have evolved over time, reflecting the realities and tendencies, the opportunities and threats, the needs and possibilities of each evolutionary phase they have been through, and also the academic field of the researchers (international economy, international business, industrial economy, resource-based theory, etc.). As a result of that, the internationalization determinants and (proactive as well as reactive) motivators, the modes of entry, the specific strategies and the evolutionary models have emphasized, each of them, on country specifics, on firm specifics or on both of them; there have been developed simple models as well as models that were trying to comprehend all the facets of internationalization (as act and or process) over time; multiple levels of analysis and multi-inter disciplinary approaches were also present [12].

During the last half of century there has been identified about *five classes of different theories* of the multinationals (as they are summarized by Wladimir Andreff into his book from 2003) reflecting sometimes very different backgrounds and approach angles – regarding the emergence and evolution of the multinational enterprises (in relationship with development):

- *the international economy of multinationals* – founded on the comparative advantages of nations;

- *the industrial economy of multinationals* – emphasizing on the competitive advantages of industries and firms;
- *the institutional economy of multinationals* – based on firm specific advantages;
- *the systemic economy of multinationals* – explaining the MNEs development in relationship with the process of economic globalization;
- *the investment development path* – an explanatory model of the foreign direct investments that is relating them with the development level of the host countries and the countries of origin for the FDI [4].

Regarding the *relationship between multinationals and development*, as the literature in the field of argues: “MNEs are vehicles through which capital and technology are transmitted to developing economies; they have the potential to increase consumer welfare, provide jobs, raise labor and environmental standards, and contribute to improved living standards and poverty alleviation. The potential impact of MNEs on development is influenced by international institutions and agreements, civil society and NGOs, and home and host country policies; the policies and practices of each of these groups must be considered and balanced alongside the motivation of MNEs themselves, to maximize the potential positive impact of MNEs [14].

But, the problem is far from being solved, because there is no unanimously recognized and assumed definition of *economic development*: “unlike economic growth, which is measured as changes in some economic magnitudes, the definition of economic development takes various forms often depending on the purpose for which the concept is being used. Thus, it may be defined to include a persistent rise in real income per capita as well as the quality of life. Others may include increasing equality of income distribution, or the degree of improvement in the lives of the lowest 20 per cent of income recipients. Furthermore, some may consider the degree to which the population of a country participates in its governance as a relevant indicator of the level of development” [2].

4. Multinational enterprises – evidences from global statistics

As Alan M. Rugman has emphasized, the generally accepted “unit of analysis” for research in international business is *Fortune Global 500*: “firms that dominate international business. They account for over 90% of the world’s stock of FDI and nearly 50% of the world trade. (...) They are the key vehicles for both FDI and trade” [13].

So, if we take a look at the most recent ranking of the *Fortune Global 500* we have the *top ten* of the world’s largest corporations as the Table 1 reveals it [8].

Table 1. Top Ten in Fortune Global 500 - 2011

Rank	Company	Country	Revenues (\$millions)	Profits (\$millions)
1.	Wal-Mart Stores	US	421,849	16,389
2.	Royal Dutch Shell	Netherland	378,152	20,127
3.	Exxon Mobil	US	354,674	30,460
4.	BP	Britain	308,928	-3,719
5.	Sinopec Group	China	273,422	7,629
6.	China National Petroleum	China	240,192	14,367
7.	State Grid	China	226,294	4,556
8.	Toyota Motor	Japan	221,760	4,766
9.	Japan Post Holdings	Japan	203,958	4,891
10.	Chevron	US	196,337	19,024

(source:http://money.cnn.com/magazines/fortune/global500/2011/full_list/index.html)

Taking into consideration the *location country* for the top 500 multinationals (Table 2), top three gathers together US, Japan and China (with US having an approximately double number of MNEs in top 500 than its challengers – Japan and China), while France, Germany and Britain – the second echelon – have about a double number of MNEs in top 500 than their challengers.

Table 2. Number of MNCs per country in Fortune Global 500 – 2011

Rank	Number of MNEs	Countries
I	133	US
II	68	Japan
III	61	China
IV	35	France
V	34	Germany
VI	30	Britain
VII	15	Switzerland
VIII	14	South Korea
IX	12	Netherlands
X	11	Canada
XI	10	Italy
XII	9	Spain
XIII	8	Australia, India, Taiwan
XIV	7	Brazil, Russia
XV	5	Belgium
XVI	3	Mexico, Sweden
XVII	2	Denmark, Ireland, Singapore
XVIII	1	Austria, Belgium / Netherlands, Britain / Netherlands, Colombia, Finland, Luxemburg, Malaysia, Norway, Poland, Saudi Arabia, Thailand, Turkey, Venezuela

(source:<http://money.cnn.com/magazines/fortune/global500/2011/countries/Australia.html>)

All of these firms are multinationals, but this ranking only takes into consideration the total turnover, and not the internationalization degree. In order to fix this weakness, UNCTAD has established (since 1995) a synthetic indicator named *transnationality index* (TNI). The TNI of one MNE is defined as the simple arithmetic average of three indicators: percentage of foreign assets in total assets, percentage of foreign sales in total sales and percentage of foreign employees in total employees. According to UNCTAD, a MNE is defined to be *global* if at least two of the three indicators are bigger than 50%; it results (from calculus) that less than a half of the Top 100 the biggest MNEs are global [3].

The TNI makes possible the ranking of the first 100 MNEs based on their internationalization degree. The most recent report available from UNCTAD is *The world’s top 100 non-financial TNCs, ranked by foreign assets, 2008*. Its top 10 is very different from the top 10 in Fortune Global, as we can see in Table 3 [16].

Table 3. The world's top 10 non-financial TNCs, ranked by foreign assets, 2008

Rank	Company	Home country	TNI (%)
1	Xstrata PLC	Britain	93,2
2	ABB Ltd.	Switzerland	90,4
3	Nokia	Finland	90,3
4	Pernod Ricard SA	France	89,1
5	WPP Group Plc	Britain	88,9
6	Vodafone Group Plc	Britain	88,6
7	Linde AG	Germany	88,3
8	Anheuser-Busch Inbev SA	Netherlands	87,9
9	Anglo American	Britain	87,5
10	ArcelorMittal	Luxembourg	87,2

(source: <http://www.unctad.org/templates/page.asp?intItemID=2443&lang=1>)

5. BRIC countries and their MNEs – the gaining actors of the global economy?

All the above presented graphics reveal a very important (and relatively new) tendency of the global economy: the emergence and the strong momentum of the *new actors* – the so called *BRIC countries* – acronym that groups countries such as Brazil, Russia, India, China ... and maybe the South Africa, countries that are sometimes perceived to be *the winners of the XXIst century*. These big emergent countries powerfully raise essential questions/problems: their emergence within the global economic world, the rapidity of change and evolution in times of globalization, the evolution of the geo-economy under the effects of delocalization of MNEs, international division of the production process – all of these judged in terms of consequences for the developed as well as developing countries – all actors of the globalization process [6].

But who are these countries and why are they important? Into a study developed two years ago for the European Commission (which has analyzed BRICs in terms of challenges and opportunities for European competitiveness and cooperation – so, it has been taking seriously the BRICs), it was set that “the BRICs’ *common features* include *large territory and population, low income levels but also fast economic growth* resulting in the emergence of a prosperous local middle class. (...) Beyond their common

features the individual BRIC countries are rather *heterogeneous, posing quite different challenges and calling for specific policy responses on the side of their partners*, especially the EU. *Opportunities* for trade and investment in the large and rapidly expanding BRIC markets are obvious and companies from the EU are already well positioned there. Major *challenges* include the cost competition in product markets, changing patterns in global commodity flows (energy, metals and food), non-tariff barriers to trade, regulative deficiencies e.g. concerning intellectual property rights and various institutional impediments to foreign investment” [10].

6. Conclusions

The academic literature (in the field of international business, but not exclusively), as well as (all kind of) global statistics agree and emphasize more and more on the role and contribution of the multinational enterprises (MNEs) within the global economic context – as key sources for development and competitiveness.

The realities of nowadays and the predictable outlooks for tomorrow confirm these analysis on one hand, and raise new challenges (opportunities and threats) on the other – the emergence of multinationals from emerging countries being just one of them.

The paper has tried to schematically capture in just one picture all the above mentioned transformations and evolutions that mark the present and influence the future of MNEs in terms of their contribution to global development and competitiveness.

The Increase of Competitiveness in the Romania SME's on the Current Crisis

Oncioiu Ionica

„Tomis” University of Constanta

nelly_oncioiu@yahoo.com

Abstract

SMEs are outnumbering other types of firms in the Romanian economy. For this reason, the importance given to this type of enterprises must increase.

In order to gain competitive advantage, the Romanian SMEs must choose the type of competitive advantage that it is trying to obtain and the field in which it will obtain it. The choice for the competitive field or for the activities of the firm can play an important role in determining the competitive advantage because the firm aims to establish a profitable and sustainable position against the forces that determine the competition in its field of activity. More specifically, this paper will be explored the answer of the following questions: Is the increase of the competitiveness in Romania SMEs associated with greater innovative efforts? Is in the actual crisis context a link between competitive positioning and the nature innovative efforts?

Key words: competitiveness, crisis, enterprises.

J.E.L. clasification.: G01

1. Introduction

The concept of competitiveness evolves from static competition where competitive advantage was given the gift of technical factors, the competitive dynamics of the motor factors are: the technical progress, increasing wages and modern management methods, which made the competitive advantage to overcome the economic dimension by increasing financial and productive power of the country, education, safety and quality of life. The competitiveness of a country is reflected in the evolution of macroeconomic indicators

that are presented by the national accounts.

All countries statistics result that SMEs dominate in economy, representing over 99% of the total of companies, having substantial ponders in obtaining GDP and work place distribution.

«The World Competitiveness Yearbook» the most famous Annual Report on the competitiveness of nations which examines 60 countries and competitive economic regions based on four competitive factors: economic performance, government efficiency, business efficiency and infrastructure. An important objective of governance is to support SMEs to become competitive, according to the single internal market rules.

In 2009 "The World Competitiveness Yearbook" - the most famous annual report on the competitiveness of nations - developed by the World Economic Forum ranked Romania rank 68 of 131 countries (Bulgaria reached the place 76), this being a climbing 6 places rankings from last year when it was ranked 74, came close to the place in 2005 when it was ranked 67.

The creativity of smaller companies represents the fuel of entrepreneurial spirit and of economic growth. In a transition economy, as ours is, located yet in a consolidation process and of getting stronger of SMEs sector, environment factors (generally powerfully unstable) they act through numerous and diverse compromises. Maybe the most important are the ones who have a legislative order, which are based on taxes (fiscal, firstly) dissipated, changing and sometimes contradicted.

Romania Governance Program during the period 2009 - 2012 devotes a chapter competitiveness, business environment and SMEs, and has the objectives of the government "Supporting small and medium enterprises to become competitive, according to the rules single internal market and not

distort fair competition conditions.

The base of the long term success of a firm is made by the obtaining and maintaining the strategic competitive advantage. That is why the key element in strategic marketing is represented by the identification of the resources and firm's behavior that can lead to strategic competitive advantage.

In the context of current crisis the SMEs are being affected by the situation but they should be seen also as a factor of economic revival.

2. Literature review

In terms of product innovation, it would appear that, historically, smaller firms may have contributed greatly to the improvement of existing products and even to the creation of new ones (Acs and Audretsch, 1988; Rothwell, 1978). Nevertheless, the amounts of money dedicated to research and development are not large, and the existence of a laboratory or a research team is exceptional in the SME environment (Santarelli and Sterlacchini, 1990; Kao, 1983). Formalized R&D activities continue to be concentrated in the larger companies, as shown by the official data from the OECD and the empirical studies of Acs and Audretsch (1987, 1988). In smaller companies, these activities remain informal (Santarelli and Sterlacchini, 1990; Kleinknecht, 1987), often based on the creative talents of a few individuals including the owner/chief executive officer (CEO) himself (Kao, 1983).

A firm that wishes to maintain and improve its competitive position may also consider new computer-based manufacturing technologies (Lefebvre et al., 1991). Specific strategic advantages have been associated with the adoption of these technologies: a larger flow of new products, greater customisation of products, and shorter product life cycles (Buffa, 1985). To this list, other authors have added improved product quality, improved inventory turnovers and shortened delivery cycles (Meredith, 1987; NRC, 1987; Skinner, 1984, 1985). All of these advantages enable firms to improve their competitive positions (Blois, 1988; Meredith, 1987). For smaller firms, technology adoption is indeed a crucial

decision. Special concerns might be raised regarding their capacity to modernize their facilities in order to respond to the increasing competitive pressures expected in the coming decade (Schroeder et al., 1989). Admittedly, it might seem that the adoption of innovative production processes is the prerogative of large firms, given the necessity for a substantial capital investment and the skilled workforce required to install and operate the new technologies. Nevertheless, this assumption is increasingly being challenged on the grounds that the introduction of new manufacturing technologies has contributed to making small-scale production economically feasible and therefore accessible to smaller firms (Carlsson, 1991; Carlsson et al., 1991). Meredith (1987) has further justified the adoption of technology by smaller businesses, suggesting that such firms, less hampered by organizational inertia than larger ones, can react more quickly to internal and external pressures. Because managers, even at the highest levels, are less isolated by the organizational hierarchy, they are able to play a greater role in the process of introducing the technology.

The sources of the strategic competitive advantages can be found in three categories: the first category contain the competitive advantages seen from the point of view of the industry structure, being enounced by Michael Porter in 1998. The second category is based on the resources and the third category is based on relationships. So, in the vision of Michael Porter the five competitive forces which influence the firm's activity and which put pressure on it, are: the threat coming from the new firms entered on the market; the intensity of the current competition; the pressure from the replacement products; the negotiation power of the buyers; the negotiation power of the suppliers.

The resource based perspective it is based on exploring strong and weak points of the competition in order to identify the causes for a potential strategic competitive advantage. Barney defines the firms' resources as it follow: "the firm's resources gather all the goods, abilities, organizational process, firms' attributes, information, knowledge etc. controlled by a firm which allow it to conceive and implement strategies that are improving its effective power and

efficiency”.

Empirical research in less developed countries shows that SMEs are poorly placed to deal with technical change and upgrading (Lall, ed., 1999). Not only do they lack the information and resources to access new technologies and skills, they often do not know how weak they are. They may be unaware of competing technologies in other countries. They may not realise the nature of the new skills and techniques needed to keep up. They may lack the entrepreneurial knowledge and education to seek the technology or assistance needed. The problem is clearly much greater for SMEs in the traditional and rural sectors of developing countries, but information and skill problems affect SMEs everywhere.

SMEs have a generic lack of resources and overall resource strategies and action plans. Thus rapid decision making by inspired leaders can fail to incorporate innovative practice due to a basic lack of fundamental resources. Mosey et al's (2002) research into innovation in SMEs showed that what they called “low growth incremental improvers” made poor use of knowledge and information, especially external customer and market information, in comparison to innovative high growth SMEs.

3. The main barriers for Small and Medium Enterprises in Romania

Romania, like other former communist countries, is in the situation of reinforcing the SME sector. In the context of current crisis, rapid development of the SME sector represents a priority, not only for the general reasons which sustain this sector in the developed countries.

Those despite economic reform, small and medium enterprises in Romania are still confronted with a series of obstacles which, in view of the economic and political instability, lead to uncertainty and to inhibition of the entrepreneurial spirit.

1. Legislative constraints: the co-existence of authoritative documents belonging to different legis systems generate ambiguities and are not in concordance; the frequent changes in legislation, the elaboration of authoritative documents which are subject to interpretation, and their deficient application, also have a

negative impact on small and medium enterprises — SMEs are known to have a limited capacity for assimilating new legislative conditions. At the time, this situation does not stimulate potential entrepreneurs, but rather creates an image of inaccessibility of the business field.

2. Fiscal constraints: at present, small and medium enterprises bear an excessive tax burden, in the sense that taxation is the same for all sectors of activity and for all sizes. This situation leads to SMEs becoming undercapitalised, making it impossible them to invest.
3. Institutional constraints: the absence of an integrated institutional framework based on collaboration and co-operation between the institutions and organisations involved in porting the SME sector, as well as the large number of these institutions, the overlapping of their functions and responsibilities, generate confusion among entrepreneurs.
4. Financial and banking constraints: although the state has taken a series of measures with a view to encouraging financial credits for SMEs, the absence of financing for these is still one of the major obstacles to the development of these firms. The large instalments of bank interest repayments and their fluctuation make this modality of financing uninteresting; entrepreneurs are forced to rely on their own resources, which are very modest; on the other hand, even the banks are not interested in co-operating with small and medium enterprises because of the very high financing costs. These costs are generated by administrative expenses and expenses for gathering information; the existing banking system is not adapted to the financing of small and medium enterprises.

Experience shows that clear competencies and responsibilities for these institutions have to be settled in order to avoid duplications and confusions and to delimit the area for action. Nevertheless, the Romanian government is not in a position either to guarantee favourable framework conditions SMEs, or to counterbalance unfavourable conditions by financial measures. Today, the view which is taken as a current guideline is

that the most important way of supporting small and medium enterprises is to encourage the business environment and the general development of the economy. Long term economic difficulties are focused attention on the importance of innovation and technological progress for business competitiveness, sustainable growth and job creation.

4. Conclusions and implications

The pillars of competitiveness are described separately, are not independent: not only they are related to each other, but they tend to reinforce each other. For example, innovation is not possible in a world without institutions that guarantee intellectual property rights, cannot be performed in countries with poorly educated and poorly trained labour force, and will never take place in economies with inefficient markets or without extensive and efficient infrastructure.

Small and medium enterprises represent an equilibrium factor at micro and macro-economical level. Having a rightful correspondent of middle class from the society, small and medium companies infiltrate monopolies and oligopolies, reducing market control of bigger companies.

In permanent economic changing environment, SMEs are flexible and possess a greater adaptation capacity, favoured by reduced dimensions and rapid decision process. They adapt easily to consumer exigencies and requirements, being more appropriate to market.

Another important aspect is the fact that these generate in a big proportion technical innovations economy applicable. Many work places will come by innovation, and new discoveries will give birth to some new entrepreneurial adventures.

Systematically, the sources of obtaining strategic competitive advantages can be divided in:

1. Characteristic capabilities. The strategic competitive advantage is obtained by constant development of new capabilities and resources as a response to rapid changes of the market. Among these resources and capabilities, the knowledge represents the most valuable asset.

2. Human resources. In the modern economy, the competition is a matter of goods and services. Factors that can differentiate an organization by its competitors, producers of goods or services from public or private sector, is represented by its employees that are the way the firm administrates and use its human resources.
3. Radical innovation. The firm's long term success is related to its capacity of innovation. The firms' investments in products and processes improvement are leading to profit, but the radical innovation is one that will lead the firm on new markets.
4. Knowledge management. The growth and globalization, combined with the rapidly development of the information technology had enabled firms to create sophisticated systems of knowledge management in order to create strategic competitive advantages.

Needless to say, the policies adopted must be context specific, geared to the particular conditions and institutions of the economy: what works well in one country may do poorly in another. The generic market failures that affect SMEs are similar, but there are also significant differences by level of development, industrial structures and business traditions. Devising SME support strategies is not easy – but it is imperative for national competitiveness.

Financial Regulatory Reform – National and International Actions and Proposals

Orăștean Ramona

“Lucian Blaga” University of Sibiu, Faculty of Economic Sciences
torasib@yahoo.com

Abstract

Since 2008, the G20, the US and the EU have taken important steps to safeguard financial stability and reshape the global financial system. Some arrangements are being put in place at the national, regional and international level. The regulatory framework includes now OTC derivatives, hedge funds and credit rating agencies. At the EU level, it was created a new institutional framework of supervision the financial market (2009) and appeared market reform proposals regarding derivatives and short selling (2010). In the US, the Dodd-Frank Act entered into force in July 2010. At the international level, it was adopted a new Basle Acord – Basel III, in September 2010. By comparison, European regulatory structure remains more fragmented than that of the US. This paper discusses some issues regarding financial regulatory reform, analysing a set of national and international actions and proposals.

Key words: financial regulation, reform, actions, proposals

J.E.L. classification: G15, G18, G28

1. Introduction

Financial world has been left to develop their own reasons to exist, and now we need new regulations of financial markets because there is a lack of adequate regulation and supervision.

What is needed is a reform of the international and European financial regulations and institutions, a new architecture for tacking global governance.

2. Strategies for actions

For many years, the global structure of financial regulation remained the same. Also, countries that had important roles in shaping the financial system remained the same. Davies and Green focus political attention on financial regulation, describing how the Asian financial crisis led to the creation of the Financial Stability Forum (FSF), which brought together for the first time finance ministries, central banks and regulators from the main financial centres [1]. They also argue that the FSF had not fulfilled its early promise because it lacked authority (it was only a Forum), capacity (it relied on others for its work) and legitimacy (its membership did not include fast growing markets like China).

Today the situation has changed, the global financial crisis revealed the weaknesses in the system, both the institutions and the rules that govern them.

In September 2008, French President Nicolas Sarkozy declared that “the under-regulated system is now finished” and added “self-regulation as a way of solving all problems is finished. Laissez-faire is finished. The all-powerful market that always knows best is finished”. At the same time, German Finance Minister Peer Steinbrück said that “the crisis marks the beginning of a multi-polar world, where the US is no longer a superpower” (cited in the EU Observer - [2]). Steinbrück's criticism of the US has been the sharpest made since the beginning of the crisis.

The main problem is that the regulation and supervision are liability of the individual states, while financial markets and their operations are global. These national differences were played out at the start of the G20 meeting in London in April 2009. The German Chancellor Angela Merkel and the French President Nicolas Sarkozy demanded

the G20 summit to open the way for a new era of global regulation of banks, hedge funds and tax havens, while US President Barack Obama and British Prime Minister Gordon Brown have agreed that “global solutions are required for global problems“. Obama insisted on solving the problem by creating regulations that are “up to the task”, mentioned that there is “a lot of convergence” and “enormous consensus” about this (cited in The Guardian - [3]).

In 2009, Angela Merkel attacked the US Federal Reserve, the Bank of England and the European Central Bank, warned that “we must return to independent and sensible monetary policies, otherwise we will be back to where we are now in 10 years’ time” (cited in Financial Times - [4]).

Significant political events were the *G20 Summits* that have been held in Washington in 2008, in London and Pittsburgh in 2009, and in Toronto and Seoul in 2010.

At G20 Washington Summit on November 2008, the G20 leaders agreed to continue to stabilize the global financial system and improve the international regulatory framework.

G20 Summit in London on April 2009 established a comprehensive plan to reform the international financial system in two major directions being recognized that a global crisis requires a global solution. The first direction concerns the strengthening of the international financial system, the participants agreeing with the transformation of the Financial Stability Forum (FSF) in the Financial Stability Board (FSB) and improving regulation of banks, hedge funds and credit rating agencies. The FSB, a group of central bankers and financial regulators, coordinates and monitors tougher financial regulations, working with the IMF to ensure cooperation across borders. The second direction aims to reform the international financial institutions to overcome the current crisis and prevent new crises. In this respect, it was decided to review the IMF system for attracting the resources and the financial instruments used, strengthening supervision and improving representation in IMF of the emerging and developing countries and to explore ways to restore emerging and developing countries’ access to credit and resume private capital flows which are critical for sustainable growth and

development, including ongoing infrastructure investment.

At G20 Pittsburgh Summit on September 2009, the leaders of the G20 decided to turn a page on the era of irresponsibility by adopting reforms to meet the needs of the 21st century economy. The member countries have pledged to change the system of IMF quota subscription setting for a better representation of developing countries, to transfer shares toward developing countries and emerging markets and to a dynamic modernization of the IMF and World Bank Group as a key element of the effort to improve the credibility, legitimacy and effectiveness of these institutions. They agreed that all standardised derivatives contracts should be centrally cleared.

In May 2010, representatives from finance ministries, central banks, regulatory authorities and academia met in Berlin to review the achievements made so far in reforming the regulatory and supervisory environments for financial markets, instruments and actors, and to discuss the remaining challenges and map the road towards more effective regulation.

At the G20 Seoul Summit on November 2010, leaders of the world’s largest economies defined the core elements of a new financial regulatory framework, including bank capital and liquidity standards, as well as measures to better regulate and effectively resolve systemically important financial institutions, complemented by more effective oversight and supervision.

At the Meeting of G20 Finance Ministers and Central Bank Governors in Paris on February 2011, they agreed to implement the Basel III new standards for banks within the agreed timelines and the FSB’s recommendations on OTC derivatives and on reducing reliance on credit rating agencies’ ratings.

International Monetary Fund, World Bank, Bank of International Settlements, European Central Bank, Financial Stability Board and other related bodies propose *strategies for action* that address vulnerabilities and develop and implement strong regulatory, supervisory and other policies in the interest of financial stability.

The ninth Geneva Report on the World Economy examines the main threats to international financial stability - from a macro and micro perspective - focusing on the implications of the major changes that have occurred in the global financial system in the past two decades [5].

The eleventh Geneva Report on the World Economy shows that actions that banks take to make themselves safer can - in times of crisis - undermine the system's stability. In this context is deemed necessary a micro (at bank level) and a macro prudential (at system wide) regulation, and careful coordination of the two. The authors Report insist on the fact that macro and micro prudential regulation should be carried out by separate institutions since they differ in focus and expertise required [6].

In normal times, the Global Financial Stability Report (GFSR) seeks to play a role in preventing crises by highlighting policies that may mitigate systemic risks, thereby contributing to global financial stability and the sustained economic growth of the IMF's member countries.

In 2007, IMF published a comprehensive report analysing the causes and consequences of the current financial turmoil together with a list of suggested policy actions [7] and in 2009 discussed the evolution of the financial crisis, assessed the policies taken to mitigate its effects on economic activity and provided policy advice on navigating the financial challenges on the road to recovery for the global financial system [8].

In 2009, Financial Stability Board has released a report to G20 leaders on actions to strengthen transparency and accountability, enhance sound regulation, promote integrity in financial markets and reinforce international cooperation [9]. Two of the most important policy challenges ahead are those related to transparency and liquidity [10]. On April 2011, FSB highlighted differences in derivatives regulation and some countries risk missing the 2012 deadline to implement reforms.

In the UNCTAD Trade and Development Report it is recognized that a major factor that led to an increase in the number of financial crises in both developed and developing countries was financial deregulation [11].

3. Regulatory reform proposals

In some major economies such as the US and Europe were introduced national regulatory reforms while some Asian countries (e.g. China) are emerging from the crisis more financially secured and with greater international influence.

Since 2008, major reforms of regulatory framework took place in the post financial crisis period. At the EU level, it was created a new institutional framework of supervision the financial market (2009) and appeared market reform proposals regarding derivatives and short selling (2010). In the US, the Dodd-Frank Act entered into force in July 2010. At the international level, it was adopted a new Basle Acord – Basel III, in September 2010.

The new institutional framework of supervision the EU financial market was proposed in 2009, as a two-tier structure: micro-prudential supervision (by creating of the European System of Financial Supervisors) and macro-prudential supervision (by creation of the European Systemic Risk Council).

Jacques de Larosière Report (2009) recommended a new body - *European Systemic Risk Council (ESRC)*, chaired by the ECB President that should pool and analyse all information, relevant for financial stability, pertaining to macro-economic conditions and to macro-prudential developments in all the financial sectors. It also proposed an *European System of Financial Supervisors (ESFS)*, a largely decentralised structure providing central coordination for regulators, but leaving day-to-day supervision to member states [12].

In September 2009, the European Commission proposed to replace the EU's existing supervisory architecture (CEBS, CEIOPS and CESR) with the ESFS, consisting of three European Supervisory Authorities - European Banking Authority, European Securities and Markets Authority, and European Insurance and Occupational Pensions Authority - having the role to coordinate the application of supervisory standards and guarantee strong cooperation between the national supervisors. One year later, on 22 September 2010, the European Parliament voted the new supervisory

framework proposed by the Commission to work from January 2011.

Analyzing the EU economic governance reform, Dăianu defines the basic principles that should reform the regulatory and supervisory framework of the EU financial market [13].

Some *market reform proposals regarding derivatives and short selling* emerged in 2010.

On 15 September 2010, the European Commission adopted a Regulation on OTC derivatives, central counterparties and trade repositories in order to reduce systemic risk increasing the safety, efficiency and transparency of the OTC derivatives market. The Regulation introduces a reporting obligation for OTC derivatives, a clearing obligation for eligible OTC derivatives, measures to reduce counterparty credit risk and operational risk for bilaterally cleared OTC derivatives, common rules for central counterparties and for trade repositories, and rules on the establishment of interoperability between for central counterparties.

It has also adopted a proposal for a regulation on short-selling and credit default swaps (CDS) to create a harmonised framework for coordinated action at European level, increase transparency and reduce risks. This new framework means regulators – national and European - have clear powers to act when necessary, whilst preventing market fragmentation and ensuring the smooth functioning of the internal market.

In the United States, *Dodd-Frank Act*, signed by President Obama in July 2010, wanted to promote the financial stability of the USA by improving accountability and transparency in the financial system, to end “too big to fail”, to protect the American taxpayer by ending bailouts and to protect consumers from abusive financial services practices.

According to Michael Barr [14], this act:

- grants the Fed authority for clear, strong and consolidated supervision and regulation of any financial firm. Before Dodd-Frank Act, the Federal Reserve did not have any authority to set and enforce capital requirements on investment banks and nonbank financial institutions. The Fed is required now to use macro-prudential supervision, which takes into

account not only the risks within the institution, but the risks that the institution poses to the financial system as a whole;

- regulates derivatives markets with new rules for exchange trading, central clearing, transparency, capital and margin requirements;
- creates an essential mechanism for the government orderly to liquidate failing financial firms without putting taxpayers at risk;
- transforms regulation of the shadow banking system regarding securitization, requiring deep transparency into the structure of securitizations, including information about the assets and originators.

The *Financial Stability Oversight Council* (FSOC), established under the Dodd-Frank Act, has to identify threats to the financial stability of the United States, to promote market discipline and respond to emerging risks to the stability of the United States financial system.

In a brief speech about the future of financial regulation, USA President makes a list of seven principles of regulatory reform [15]:

- serious oversight by the government of the financial institutions that pose systemic risks;
- strong regulatory system to withstand both system-wide stress and the failure of one or more large institutions;
- openness, transparency and plain language throughout the financial system;
- strong and uniform supervision of financial products marketed to investors and consumers;
- strict accountability, starting at the top;
- a system of regulations that cover appropriate institutions and markets, and is comprehensive and free of gaps;
- high regulatory standards in the United States and in other countries to prevent global crises.

On September 2010, the Group of Governors and Heads of Supervision of the Basel Committee on Banking Supervision announced a strengthening of capital requirements - *Basel III*. The Committee agreed a package of reforms that raises the minimum common equity requirement from

2% to 4.5% and requires banks to hold a capital conservation buffer of 2.5% to withstand future periods of stress, bringing the total common equity requirements to 7%. But these new standards are to be fully implemented by 2019.

4. Conclusions

For many years, the global structure of financial regulation remained the same. Today the situation has changed, the global financial crisis revealed the weaknesses in the system, both the institutions and the rules that govern them.

Since 2008, the G20, the US and the EU have taken important steps to safeguard financial stability and reshape the global financial system. Some arrangements are being put in place at the national, regional and international level. The regulatory framework includes now OTC derivatives, hedge funds and credit rating agencies. At the EU level, it was created a new institutional framework of supervision the financial market (2009) and appeared market reform proposals regarding derivatives and short selling (2010). In the US, the Dodd-Frank Act entered into force in July 2010. At the international level, it was adopted a new Basle Acord – Basel III, in September 2010. By comparison, European regulatory structure remains more fragmented than that of the US.

Economic cycles can not be removed, so that crises will occur in the future. It is required to identify appropriate policy and regulation in the international and also European financial markets and to create a financial stability framework in the world and in the EU. These are crucial to avoid future severe financial crises, to minimize the costs when they happen and to prevent a financial disaster with its effects on the real economy. The main problem is that the regulation and supervision are liability of the individual states, while financial markets and their operations are global. But an unified international regulatory system of the financial markets it is hard to imagine now.

The international financial system needs a regulatory structure that try to balance the incentives for innovation and competition with protections from excessive risk-taking. The new rules should consider to reduce the

cross-border regulatory arbitrage and to provide financial stability at the global level.

The Importance of Rating in the World Market.

Orheian Oana Mihaela
The Bucharest Academy of Economic Studies
oana.orheian@gmail.com

Abstract

The market of the credit rating is characterized by low competition and a potential conflict of interest, due to the system of remuneration of the rating services, which impairs the reliability of the judgement delivered. Multiple credit rating means further costs for companies, because of the fees paid to more than one rating agency, but it does bring significant benefits in terms of the dissemination, on the market, of judgements concerning the companies.

Key words: rating agencies, split-rating and multi-rating

J.E.L. classification: G14, G29

1. Introduction

Financial failures of the recent important companies have had negative repercussions on the credibility of the major rating agencies. Criticism of the agencies behavior focuses primarily on their effective independence from the companies they rate: agencies, in fact, are considered to have an inclination to up-rate rather than down-rate, so their decisions cannot be considered a trustworthy measure of the real value of the rated securities.

This lack of trust by the market could determine an increase in the costs incurred by companies in collecting capital resources: a possible solution to this problem is multiple credit rating. Investors in the financial markets do not have access to the same sets of information and large-scale differences among participants trading on the same market (i.e. horizontal information asymmetry) may negatively affect capital flows.

2. The rating process

The main bond rating agencies in the United States are Moody's Investors Service (Moody's) and Standard and Poor's (S&P). Since the mid-1980s there has been a tremendous increase in rating activity. In the 1980s S&P and Moody's employed only few dozen whereas today they employ thousands. Moody's annual revenue reached \$600 million in year 2000, of which more than 90% was derived from bond rating, and its total assets amounts to \$300 million. Moody's financial results reveal high profitability with annual net income in 2000 reaching \$158 million (52.8% of its total assets).

In 1975, the SEC (Securities and Exchange Commission) recognized Moody's, Standard & Poor's, and Fitch as the first NRSROs (Nationally recognized statistical rating organization). But since then, only four additional rating agencies – McCarthy, Crisanti & Maffei in 1981, Duff & Phelps in 1982, IbcA in 1990 and Thomson BankWatch in 1991 – have gained regulatory approval. Since then a market has developed that is skewed towards Standard & Poor's and Moody's, accounting for 80% of market share. Fitch has tried to maintain its competitiveness by purchasing IbcA, Thomson and Duff & Phelps, which had earlier acquired McCarthy.

According to rating agencies definition, a rating is an opinion on the creditworthiness of an obligor with respect to a particular debt. In other words, the rating is designed to measure the risk of a debtor defaulting on a debt. Both Moody's and S&P rate all public issues of corporate debt in excess of a certain amount (\$50 million), with or without issuer's request. However, most issuers (95%) request the rating. The rating fees are based on the size of the issue and not on any known characteristic of the

issuer. These fees are relatively small compared to the size of issues.

When an issuer requests a rating for its issue, S&P assigns a special committee and a lead analyst to assess the default risk of the issuer before assessing the default risk of the issue itself. The committee meets the management for a review of key factors affecting the rating, including operating and financial plans and management policies. Following the review, the rating committee meets again and discusses the analyst's recommendation. The committee votes on the recommendation and the issuer is notified of the decision and the major considerations. The S&P rating can be appealed prior to publication if meaningful additional information is presented by the issuer. The rating is published unless the company has publication rights, such as in a private placement. All public ratings are monitored on an ongoing basis. It is common to schedule an annual review with management. Ratings are often changed.

Principal factors considered in assigning a rating are: industry risk (e.g. each industry has an upper limit rating – no issuer can have a higher rating regardless of how conservative its financial posture); size – usually provides a measure of diversification and market power; management skills; profitability; capital structure; cash flow and others.

3. Characteristics of the rating agencies

The value of the service provided by rating agencies is based on their reputation, and a different reputation determines a different degree of importance of the rating assigned on the investors' decisions.

The analysis of the ratings assigned by agencies shows that investors react differently to the available information on a company, based on the characteristics of the agency announcing them. The principal differences among rating agencies consist in the reactivity of the rating to the new information and to the different capacity of the models employed to assess the credit risk of companies operating in certain industry sectors or countries. Small differences of assessment may simply be due to the different sets of information used

for rating purposes, besides the different requirements imposed on the company in order to ensure its ongoing inclusion in a certain rating class. Based on the analysed data and adopted criteria it is possible that the evaluations made by a certain agency are more or less reactive to the changes occurring in the company's characteristics.

The different reactivity of the assessment is obvious, above all, when one examines the rating classes that discriminate between investment grade and non-investment grade securities: it is possible, in fact, to distinguish between agencies assigning ratings sensitive to any new information on a company, from those that proceed to up-rate or down-rate a company only in the face of very significant changes.

Moreover, there can be significant differences in the rating assignment by the same agency if, in the period concerned, there are substantial changes in the assessment criteria used to identify the class in which to rate the company.

The market assessment of a rating announced by an agency, therefore, may change in time, according to the changes perceived in the evaluation criteria employed.

The characteristics of the industry sector or of the country where the company is based can affect the credit riskiness of the company and the agencies' capacity to accurately assess it. The rating's capacity to accurately determine the risk profiles of an investment in companies operating in a certain industry sector or country partially depends on the broadness of the benchmark sample on which the rating model is calibrated: the bigger the number of companies belonging to a certain sector and/or country assessed by the agency, the greater the capacity of the model employed by the agency to accurately identify the risk profiles of the investment in securities issued by companies with the same characteristics. Differences in the calibration of the analysis models cause agencies to assign systematically different ratings: some agencies, in fact, tend to overestimate the riskiness of certain types of companies, while others may underestimate it. Irrespective of the problems related to the possibility of conducting assessments based on more or

less broad samples of customer companies, there is empirical evidence of the fact that locally-based companies are assessed according to more favourable criteria by certain rating agencies, especially the smaller ones.

Moreover, it has been found that split ratings for the same company has different effects on different industry sectors. This type of split rating is typical primarily of those companies that post intangible assets in their financial statements whose evaluation is greatly influenced by the analysis criteria. Split-rating can be interpreted differently by the market, according to the relative weight given by the market participants concerned to the discordant announcements: the higher the value given by the market to the discordant announcement, the greater and prompter the reaction to the split-rating assignment.

The small number of rating agencies on the market (less than 50) can be justified in the light of the strategies adopted by the agencies to compete on the market. Agencies, in fact, have no incentives to compete, with regard to the stringency of the assessment criteria or the fees applied: in the former case, the adopted policies would determine a loss of the trust by the market in the medium-to-long term; while in the latter case, the decision to cut proceeds would have a negative effect on profits, because the rating process costs are substantially fixed costs. Therefore, rating agencies tend to pursue an acceptable competition, such as not to reduce their profits and not to risk their reputation by introducing less stringent rating practices.

Theoretically rating agencies offers an objective evaluation of firms and aim to define prudential evaluations for the risk of reputation losses. Empirical evidence demonstrates that the relationship between a securities issuer and a rating agency entails the frequent exchange of information and - in the medium-to-long term - the interests of the two parties may converge, leading the agency to favour its client by assigning a particularly favourable rating.

Studies have shown how the larger the number of agencies involved in the credit rating process, the more independent and reliable that process will appear to the market; and if the ratings assigned by the

different agencies ultimately agree, this may generate - in the long run - positive effects on the price of the issued securities. Moreover, multiple rating could also represent a means for achieving the following goals:

- ✓ obtaining financing at lower interest rates, thus creating the conditions for charging intermediaries less, in terms of asset requirements, in the event supervisory authorities provide that these requirements may be estimated in accordance with the borrower's rating;
- ✓ giving out positive signals to the market, by requesting other agencies to assign rating, in order to provide a full picture of the issuer's financial potential and, consequently, to place the issued securities at better prices.

Multi-rating has significant advantages, especially if the new rating is better than the previous ratings: therefore, if all the rating agencies have an equal reputation, companies will prefer to hire the services of those which, as a rule, assign more favourable ratings (so-called “rating shopping”).

The fact that positive effects only ensue as a result of the announcement of a good rating by a rating agency tends to encourage issuing companies to hire those that disclose the results of the rating assignment process only with the companies' consent: in this case, the rating can be assimilated to an option exercised by the company, with the decision to divulge its rating only if this translates into favourable effects for the company.

4. Conclusions

The rating market is characterized by a lack of essential conditions for assuring competition and the objectivity of the ratings assigned is ensured mainly by the reputation of the rating agencies. The need to maintain one's current reputation is the sole deterrent against an opportunistic behaviour on many financial markets; but on the credit rating market, in order to further reduce the problems descending from the impossibility of an *ex ante* assessment of the quality of the services supplies, alternative solutions may be found, such as multiple credit rating.

Multiple rating means higher costs for companies, which are required to pay the fees of more than one agency. Such a decision may be justified only if the indirect return on this investment - translating into the possibility of placing one's securities on the market at higher prices – is sufficiently high. The empirical surveys presented in the literature on the subject highlight the possibility of making profits through by this means, but there are numerous difficulties in quantifying the overall impact on securities issued by a company, in connection with a new rating announcement by a different agency.

The impact of split-rating varies according to the characteristics of the rating agency and, in particular, the more influential the agency, the higher the securities-trading impact of the different rating announcement. The effect of changes in rating is also influenced by the nationality and industry sector of the company concerned: ratings by domestic agencies are more highly considered by investors, and a greater expertise in a certain sector is highly appreciated by the market, which thus takes its judgement into greater account.

The evolution of the rating market, and its future prospects, seems to outline a number of scenarios in which the choice by companies to call in more than one rating agency might bring greater benefits and represent not only a possible alternative but, in some cases, become a necessity, in connection with the placement of its securities.

The Complexity of Educational Services

Pariza Manea Natalia

Alexandru Vlad Cătălina

„Spiru Haret” University, Faculty of Marketing and International Economic Business
The Bucharest Academy of Economic Studies, Institute for Doctoral Studies

nataliamanea@yahoo.com

vld_catalina@yahoo.com

Abstract

The evolution of services in general and education in particular, is determined by their complexity. The need to address educational activities in a marketing optics is given by the similarities they have with the economic activities of service provision. Particularities of educational services market should be seen in relation to divergent nature of education: the collective good in terms of supply and the demand side private good.

Key words: complexity of services, marketing services, education, services market

J.E.L. classification: M31, I21

1. Introduction

According to American Marketing Association (AMA), "services are activities, benefits or utilities that are offered on the market or provided in conjunction with the sale of a commodity". For Philip Kotler "service is any activity or benefit that one party can offer another, which is generally intangible and whose result does not imply ownership of a commodity"[1]

On the same line is KJ Blois who believes that "service is any activity that provides benefits without necessarily implies an exchange of tangible goods"[2] One of the definitions given by experts of the field in Romania is that the service "is a human activity, with specialized content, resulting in effective, immaterial and intangible designed to meet a special need. The same time, services are independent, autonomous activities in deepening the social division of labor and are held separately in a sector called tertiary sector "(Ioncica 2000)[3]

2. The content of marketing educational services

Marketing services is a specialized field of marketing. The services approach has resulted in the establishment of two distinct areas: general marketing, in which all the common elements are highlighted and marketing services sector (the branch) in which elements of differentiation are specific to certain categories of services. In this category is educational marketing, too. The essence of marketing education is to provide a marketing mix tailored to market needs. Educational institutions and programs recognize that good service, efficient, are ways to better meet target market. Without satisfy their target market, institutions will find themselves adrift and will be forgotten. Market needs means that the institution will not neglect its distinct mission and competencies to provide only educational programs that are in fashion at a time. Rather, consumers will seek education institutions to be interested in the current offer and then adapt the offer to make it as attractive. An educational institution marketing oriented focuses on understanding and meeting the needs of its beneficiaries.

3. Particularities of educational services

The most striking particularities are found in terms of the marketing mix. So, defining the **product starts** at the widest sense given its graduates expressed "delivered" on the labor market, a product made from a complex process in which are found both activities undertaken by educational institutions, and efforts by their own people in order to achieve certain performance studies in the narrow sense product includes only activities

which provide "model students" and students according to consumer needs and workforce skills "raw material" at their disposal. Making "product" in the narrowly sense on issues relating to the manner of operation of the educational process.

Price policy in education services is done differently. If public education costs are borne by the state budget and in most part by fees paid by some of the students, those admitted to the form of education "pay". In private universities payment of benefits is done by students and other sources (commercial activities, supplies, services). In many cases (especially for post-graduate courses, the various contracts between students and companies) are fees paid by certain organizations, whose employees are or will be people in the study. This takes the form of scholarships.

Distribution policy addresses the educational services, first market agents, beneficiaries of the "product" offered by them in the market. In conditions of growing competition fierce in the market of educational services, many medium and higher education institutions, included in the scope of cooperation concerns with economic agents in the proper placement for graduates. Such an orientation has proved particularly valuable, increasing the prestige universities and offers a host of opportunities forward for closer ties with the "market".

Its content, distribution of educational activity is reduced in scale compared to other sectors. Practically, therefore, strategic options are based on using only two criteria, namely: the number of brokers to market behavior. Number of intermediaries such strategic alternatives apart: direct distribution through intermediaries and mixed.

In case of direct distribution of its educational unit is a section that makes direct contacts with current and potential market agents, informing them and providing students, organizing student-agent market meetings. Distribution through intermediaries means institutions conducting activities with the help of specialized work placement (companies, government agencies) or by contacting a number of institutions of representation of market agents (employers' associations, ministries). Mixed distribution strategy is achieved by simultaneous use of two variants. Compared to all the above

educational institution may adopt active behavior, initiating contacts and cooperation with economic agents alternatives or passive behavior, responding to their requests in accordance with their interests.

In the educational services are aimed **promotional activities** alike, students (in their capacity as potential students), undergraduate alumni (to complete their university training) and businesses, occupying in this respect, in the marketing mix, a product similar position.

The central objective of all policies to promote the establishment and strengthening it forms a real image and positive affirmation of prestige and providing information to potential clients.

Direct printing (brochures, leaflets and brochures), free advertising, public relations and brand use (university logo).

Very frequently used a series of actions designed to cultivate an attitude of pride to all who have crossed the threshold of the university, both during their studies, and subsequently by the establishment and support of student sports teams, the issue of jubilee wafers, using symbols, printing name and logo on various promotional materials (pens, bags, clothing).

Among specific actions stands and organizing symposia, scientific sessions, editing scientific publications, support of special scientific (congresses, meetings), organizing events highlighting moments homage evolution prestigious institution.

4. The complexity of educational services

Process is given by the character of the benefit, because almost each activity can be decomposed into partial processes. In the first phase, there are processes for partial cycle's primary, secondary, high school, higher education, which interact with each other. Then, within each period can be addressed as partial processes, activities for a year of study. In a year of study for each semester there are processes, and in the first half of each subject in hand. Specific tools such benefits are the curricula, syllabi, textbooks and courses provider-client relationship itself is a special type enshrined in laws and regulations.

Addressed in terms of marketing these relationships is as follows: (Olteanu) [4]

- Are subjected to processing people through tangible actions;
- Relationships are strong, formalized, delivery is discontinuous;
- Provider-client contacts ensure a high degree of customization while the benefit system permits limited;
- Application (students, graduate), and annual cycles fluctuate, the resilience of the low bid;
- The client is moving at the benefit, there is one place of delivery with multiple outlets (buildings, rooms, laboratories);
- Staff contact has high influence on the benefit, while a small equipment;

5. Conclusions

Institutions that understand and apply marketing principles often reach their goals more effectively. They need to attract resources to motivate employees and to attract consumers of education. Marketing is the applied science concerned with efficiency and effectiveness of trade and is applicable as well for educational institutions. Why is marketing important educational? Because: university autonomy increases, because the number of students decreases, but increases competition in both public and in private and not least to diversify potential beneficiaries' expectations. So, marketing offers tools to compare what is now the institution's mission and objectives. Careful, detailed analysis is the basis for programs that address real problems. Marketing helps to identify problems and to plan responses to help the institution in fulfilling its mission.

Current Trends in Public Services Delegated Management in Romania

Faculty of Economic Sciences and Public Administration

liap@seap.usv.ro

irinab@seap.usv.ro

Abstract

Public services must play a very important part in the local public administration of Romania and of all the other European states, in the light of the significant effects they have on the economic, administrative, social and political sphere.

The present paper focuses on emphasizing the need to inculcate administrative law contracts for the management of public services in the administrative practice, in an attempt to highlight the noticeable benefits they bestow on serving the general interest should the administration delegate management to other public or private entities.

Key words: public services, delegation, management, public administration.

J.E.L. classification: K23.

1. Introduction

The homogenous juridical and institutional framework, the objectives, the competencies, the duties and the specific instruments employed in setting up, organising, managing, financing, operating, monitoring and controlling the provision of public utilities community services have been established in Romania through the enforcement of Law no. 51/2006 for public utilities community services (published in the Official Gazette of Romania, no. 254 of 21.03.2006).

Given the diversity of the activities performed by local communities, the administrative practice has revealed three main local management procedures: direct

management, delegated management and partnerships.

Direct management is employed when a local authority assumes the responsibility of controlling the organisation and functioning of a public service. This service will therefore fall under their supervision and, as such, no public or private law legal person can interfere between the public service and the community.

Delegated management occurs when the local community that has created the public service decides to entrust its management to a public or private person from outside the local community.

Partnerships function as “local management methods when a local community volunteers in an activity organised by another community or by the state, when this activity has a direct impact on the development of their area as well”.

2. Types of public services delegated management

The juridical relationships between the administrative-territorial units or, as the case may be, between the inter-community development associations dealing with public utilities services and operators are governed by:

a) orders for commissioning, established by the governing bodies of the administrative-territorial units – in the case of direct management;

b) orders for assigning and delegated management contracts, established and approved, respectively, by the governing bodies of the administrative-territorial units – in the case of delegated management.

The juridical agreements between the suppliers of public utilities and the actual

beneficiaries of these services are governed by contracts, developed in compliance with the framework contract for the supply/provision of public utilities services, drafted by the specific regulatory authority, in compliance with the current legal provisions, service regulations and their specific tender books.

The public and/or private property assets of the administrative-territorial units that are part of the public utilities systems and are used for the supply/provision of services can be:

a) commissioned to operators, based on the commissioning order – in the case of direct management;

b) leased to operators in compliance with the law, based on the assignment order and on the contract that delegates the management of the service – in the case of delegated management.

According to the provisions of Article 30, paragraph 1 of the Law, delegated management is defined as the management method by which the local public administration authorities or the inter-community development associations handling the provision of public utilities, on behalf and on account of the member administrative-territorial units, assign to one or more operators all or just part of their own competencies and responsibilities related to the supply/provision of public utilities, as well as the leasing of the public utility systems related to those services, respectively the right and the obligation to manage and operate those services, based on a contract, hereinafter called management delegation contract.

The public utilities delegated management contract is an administrative contract, regulated in Art. 30, paragraph 6 of the law and defined as “a written contract by which one or several administrative-territorial units, either individually or in association, as delegators, assign, for a defined period, to an authorized operator, as delegate, who acts at his own risk and responsibility, the right and obligation to supply/provide a public utility service or, as the case may be, the activities entailed by that particular service, including the right and obligation to administer and operate the technical-urban infrastructure related to the services/activities supplied/provided, in exchange for a fee,

depending on each case”. The delegated management contract can also be signed by the inter-community development association handling the public utilities services on behalf and on account of the member administrative-territorial units that act as delegators. For instance, the order of the Suceava Local Council no. 33/25.02.2010, has mandated the Inter-community Development Association “County Association for water and sewerage Suceava (A.J.A.C. Suceava)“, registered in the List of associations and foundations at the record office of the Suceava Court of Justice with the no. 26/2002/A/I, of February 9th, 2010, whose member is the Suceava municipality, Suceava County, to sign the *Delegated management contract for the water and sewerage services with S.C. A.C.E.T. S.A. Suceava*, represented by their legal agent, on behalf and on account of the Suceava municipality, Suceava county.

The very legal provision underlines the fact this type of contract is part of the administrative documents and complies with the provisions of the Administrative Contentious Law no. 554/2004, with its subsequent alterations and addenda. *De lege ferenda*, paragraph 6 of Article 30, the final thesis, should be altered so as to specifically define the delegated management contract for public utilities as an administrative contract, instead of the current disposition to be included in the category of administrative documents, a definition that should also be included in other regulations that govern this type of contracts. Law no. 241/2006 for the water and sewerage services (published in the Official Gazette of Romania no. 563 of 29.06.2006), is a specific disposition of Law no. 51/2006; Law no. 92/2007 for the public transportation services (published in the Official Gazette of Romania no. 262 of 19.04.2007), concerning the leasing of the local public transportation services, provides that this specific operation is performed by means of a delegated management contract, by observing the management delegation procedures, in compliance with the provisions of Law no. 51/2006.

Delegated management is performed through operators, or private regional operators, that can be:

a) business units with registered capital of the administrative-territorial units, set up by their governing authorities;

b) business units created after the restructuring of the local or county government owned corporations or after the reorganisation of local or county public services, functioning at the time the present law was enforced, and whose registered capital is entirely owned by the administrative-territorial units, as partner or single shareholder;

c) business units with private registered capital;

d) business units with mixed registered capital.

The operators that perform their activities under delegated management terms, supply/provide public utilities services by operating and managing the existing technical-urban infrastructure, based on the delegated management contract, as well as on the license conferred by the governing regulatory authority. Operators as business units, whose registered capital is entirely owned by administrative-territorial units, are organised and perform their activities in compliance with an operating regulations code established by the governing bodies of the administrative-territorial units or, as the case may be, by the general assembly of the inter-community development association that handles the public utility services.

It has been rightfully argued that there are regulations governing special administrative contracts whose general framework or specific common law provisions haven't been established by internal regulations. Moreover, the belated emergence of administrative contract regulations did not allow the beneficiaries of this law to acquire and employ the necessary administrative practice in a democratic society founded on the principles of non-discrimination, transparency, proportionality, efficiency in the use of public funds and professional responsibility.

3. Current orientations in litigations

On the other hand, patrimonial disputes involving claims concerning the deferred payment of the services supplied or performed by operators, are settled based on common law practices.

The initial drafting of Article 51 provided that the settling of patrimonial and non-patrimonial disputes related to the formation and execution of legal contracts, as well as the disputes generated by the deferred payment for the services supplied/provided, fell under the jurisdiction of administrative contentious law courts and were mostly handled in emergency procedures. In one particular test case, the court stated that the relationship between operators and users is commercial in nature and argued that, according to [art.1](#) paragraph 3 with reference to [art.2](#) paragraph 1, letter *a*, of the Civil Proceedings Code, the court of justice has the authority of settling the claims. Furthermore, in light of Art. 51, paragraph 2 of the Law no. 51/2006, providing that the claim is registered at the trial court whose authority governs the residence of the user, the court established that the Braila Court of Justice was the governing authority where the claim was to be filed (Order no. 92/06.03.2008, passed in the File Case no. 317/113/2008, of the Braila Trial Court, at www.legenet.indaco.ro).

The enforcement of the Government Emergency Ordinance no. 13/2008, has been followed by the amendment of the material and territorial authority in settling contract related disputes between operators and users, the claim being registered at the trial courts governing the territorial units where the user resides (Order nr. 123/17.04.2008, passed in the File Case no. 708/113/2008 of the Braila Trial Court, at www.legenet.indaco.ro). Published in the Official Gazette of Romania, no. 145/26.02.2008, the head note of the Ordinance mentions the timeliness of the alterations performed on Law no. 51/2006, determined by the need to eliminate the inconsistencies of the main legislative acts that govern the organisation and functioning of the public utility community services – the local public administration Law [nr. 215/2001](#), republished, Law no. 51/2006 and the Government Emergency Ordinance [nr. 34/2006](#) regulating the assignment of the public purchase contracts – as well as by the need for accuracy, compatibility and harmonization with the provisions of the Sector Operational Programme – Environment, authorized by the European Commission, towards accelerating the application procedures for European funding

assigned for the modernisation and/or development of the technical-urban structure of the local public utilities services.

The latest draft of the Law no. 51/2006 also mentions the procedure for settling the disputes between the administrative-territorial units or, as the case may be, the inter-community development associations dealing with the public utilities services, and operators, concerning the assignment, formation, execution, alteration and ceasing of the delegated management contracts, as well as the procedures that govern compensatory damages, performed in compliance with Law no. 554/2004. The claim is registered at the administrative contentious section of the trial court whose jurisdiction covers the premises of the operator.

Article 51 has also been subject to certain unconstitutionality pleas mainly arguing that the purport of the law assigning the authority of administrative contentious courts in settling patrimonial and non-patrimonial disputes related to the formation and execution of the contracts governed by Law 51/2006, as well as the disputes related to the deferred payment for the supplied/provided services, contravene the provisions of art. 52, art. 73 paragraph (3) lett. k) and art. 126 paragraph (6) of the Constitution, since the juridical agreements between the operators and the users of public utilities services are contractual in nature and must comply with the private law procedures. Bearing in mind the date when the Constitutional Court has been notified on the unconstitutionality claim, the claim has been repealed as incongruous, given the fact that the notification preceded the amendment of Art. 51, paragraph (3) of the Law no. 51/2006, by art. I point. 51 of the Government Emergency Ordinance no. 13/2008 (Order no. 648 of 10.06.2008 of the Constitutional Court). Similarly, Order no. 1077 of 14.10.2008 of the Constitutional Court.

But, since the effect of the provisions of art. 51 paragraph (3) of the same Law assigned these disputes to the administrative contentious courts, there was a clear breach of the constitutional provisions according to which the specialized law courts in administrative contentious matters have the authority to censor the disputes concerning the administrative documents drafted by the

public authorities and regarded as harmful for the rights or interests of a person.

4. Conclusions

The matters related to the other types of patrimonial and non-patrimonial disputes over the formation and execution of the contracts governed by Law no. 51/2006, fall under the jurisdiction of the administrative contentious law courts. The specific characteristics that define the above mentioned contracts as administrative in nature are: one of the parties is always an administrative unit or an association of this unit, thus establishing the juridical disparity between the parties; the contract includes derogatory clauses from common law and is formed based on a special statutory procedure; the purpose of the contract is serving the public interest; the disputes related to the formation and execution of the contracts, according to the aforementioned characteristics, fall under the authority of administrative contentious law courts.

The Implications of Corporate Governance in the Quality Financial Reporting

Paşcu Ana-Maria

“Alexandru Ioan Cuza” University of Iasi,
Faculty of Economics and Business Administration
pascuanamaria26@gmail.com

Abstract

Quality financial reporting is a measure imposed by the century we live in. The concept of financial reporting receives increasing attention in public policy debates in terms of quality on auditing and corporate governance. Nowadays, the accounting information continues to occupy a privileged position within the multitude of information changing on various markets and, for that, we have to be attentive with the attitude regarding the audit activity which is considered to be based on verification and validation. In this purpose, it is necessary to analyze how the quality financial reporting can be influenced by the corporate governance and its participants.

The purpose of this study is to present the state of knowledge reported in terms of quality of financial reporting and the factors that determine and influence the quality of financial statements.

Key words: Internal audit, audit committee, corporate governance, external audit, financial reporting.

J.E.L. clasification: M14, M41, M42, O16.

1. Introduction

For capital markets to function efficiently and effectively, participants must have confidence in the financial reporting process which is very important for the state of company. Quality financial reports, including reliable financial statements free of material misstatements due to errors and fraud, can be achieved when there is a well-balanced, functioning system of corporate governance. As referred by **Cohen, Krishnamoorthy** and **Wright** one of the most important functions of corporate governance is to ensure *the*

quality of the financial reporting process [1]. *Corporate governance* is a mechanism of managing, directing, and monitoring a corporation with the goal of creating shareholder value, while protecting the interests of other stakeholders (such as creditors, employees, communities, suppliers, regulators and customers). The concept of corporate governance hinges on total transparency, integrity and accountability of the management. A constant of history, accounting has a great influence within organizations, helping managers and providing useful information that will allow them to be better equipped in their management and control functions. In this purpose, accountants and auditors are playing an important role in helping corporate governance participants to fulfill their responsibilities.

2. Literature review

In a larger sense, corporate governance is defined as a system for directing and controlling the activities of companies. Corporate governance defines the relationship between the shareholders, the Board of Directors, management and other stakeholders. Good corporate governance ensures investors that their investment is being used prudently by management to grow the company's financial and business activity. It involves the protection and the cooperation with stakeholders who have a legitimate interest in the company's performance, such as employees, consumers, creditors, the government, the public, and so forth [2]. Management should produce high-quality, transparent financial reports and present objective, consistent, transparent, and comparable financial results. In these conditions, auditing activity is responsible for the system of internal control while being

one of the triggers of quality financial reporting. The internal audit function focuses on a broad range of activities and is becoming integral to corporate governance. Internal auditors should continuously look for red flags. Indicators such as excessive related-parties transactions must be reviewed to detect opportunistic behavior.

With an increasing role in corporate governance, internal auditing is an independent, objective assurance and consulting activity designed to add value and improve the organization's operations. It brings a systematic and disciplined approach to evaluate and improve the effectiveness of risk management control and governance processes. In this purpose, the scope of internal auditing within the organization is the efficacy of operations, the reliability of financial reporting, detecting and investigating fraud, safeguarding assets, and compliance with laws and regulations. At the same time, there is an important connection between management and internal auditing, referring to the fact that internal auditors perform audits to evaluate whether the policies and processes established by managers for helping the organization to achieve specific objectives, were made. That is why managers and directors had to adapt and to cope with situations of unknown complexity and with difficulties created by a world in constant motion. For that, the development requires a new perspective from the companies and a new approach of their management, in terms of ethics, responsibility and practice, all known as corporate governance.

Referring to the importance of internal auditing it is known that it can be analyzed from a double perspective, once through the corporate governance and later through the action of internal audit over financial reporting. We can not forget the importance of the internal audit function which plays a unique role in corporate governance by monitoring organizational risks and ensuring that organizational processes are efficient and effectively controlled [3]. The vital role that the internal audit function played in the implementation of the reporting requirements of the Sarbanes-Oxley Act of 2002 (SOX) highlights the importance of the function to maintaining strong corporate governance [4]. The former Chief Accountant of the

Securities and Exchange Commission stated that effective internal auditing is “crucial to the success of a company in stemming fraud and abuse, and in the preparation of accurate financial statements” [5].

Now, more emphasis is being placed on the entire corporate governance responsibility, not just the connection between the above mentioned elements.

The accounting profession focused primarily on *the board of directors and the audit committee*. For instance, the Public Oversight Board (POB 1993) defined corporate governance as “*those oversight activities undertaken by the board of directors and audit committee to ensure the integrity of the financial reporting process.*”

In time, it was concluded that there are many elements involved in the process of implementation of quality financial reporting, and a part of them are related to *corporate governance*.

3. Connection between audit committee, internal auditor, external auditor, the board of directors and their relation with the quality financial reporting

The interactions among the audit committee, external auditor, internal auditor, the board, and the management are crucial to effective governance and to achieving high quality financial reporting (Sarbanes-Oxley Act 2002). An interview study with experienced auditors (Cohen et al. 2002) revealed that management has a significant influence over these parties. Some of the auditors in that study argue that if management does not want to be “governed”, they can’t be [6]. The audit committee (composed of non-executive and independent board members) oversees corporate governance, financial reporting, internal control, and audit functions. *The more vigilant the audit committee, the lower the probability of financial statement fraud.* The success of audit committees depends on their working relationships with other corporate participants. When audit committees receives information about possible fraud, they should investigate and report to the board. This is one essential element that can influence the success in fulfilling the mission of audit committee and, why not, the possibility of

diminishing fraud. The Enron’s audit committee was criticized for its lack of vigilant oversight. Its infrequent meetings were brief and limited in scope, and the committee failed to question management decisions about the special-purpose entities. There is a strong, proactive and obvious connection and participation between the board of directors, the audit committee, top management, internal auditors and external auditors which reveals continuous improvements in the quality of financial reporting. The increasing interest in, and the demand for, vigilant corporate governance and high-quality financial information have created a unique and timely opportunity for management accountants to align their strategic vision with the emerging demands for more effective systems of corporate governance [7].

The relationship between audit committees and external audit is a complex one, stemming from both the demand for audit services by the client and the supply of audit services by the external auditor [8]. A higher quality audit should improve the quality of financial reporting and reduce the risk of the auditor providing an incorrect audit opinion. In these conditions, the connection between internal auditing, the audit committees, Boards of Directors, managers represent the executive part which is essential for good corporate governance. All these elements are in a positive relation with the external auditing, forming the non-executive part, which leads to the quality of financial reporting.

4. Relation between accounting scandals and corporate governance. Present and perspectives

In recent years, the importance of good corporate governance has received significant public and regulatory attention. A crucial part of an entity’s corporate governance is its internal audit function. At the same time, there has been significant public concern about the level of fraud within organizations. The results of **Paul Coram, Colin Ferguson, Robyn Morone** research shows a significant positive relation between an organization, having an internal audit function and the number and value of self-reported frauds [9]. Accounting scandals at Enron, WorldCom,

and other companies, have led to an intense focus on corporate governance, effective oversight, and good internal controls. The financial collapse of Enron Corporation during the last quarter of 2001 drew extensive attention to its auditor, Arthur Andersen, from the media, regulators, and the accounting profession. Disclosures about Andersen’s audit of Enron caused a decline in its reputation and as a result, Andersen clients suffered significant loss of market value [10]. Recent corporate scandals and earnings restatements have resulted in an increased emphasis on the need for strong corporate governance to ensure financial reporting quality [1], [11], [12].

The American Institute of Certified Public Accountants (AICPA’s) issued Statement on Auditing Standards (SAS) No. 99, “*Consideration of Fraud in a Financial Statement Audit*,” which requires auditors to approach every audit with skepticism and not presume management is honest. Auditors should brainstorm about how fraud could occur and identify the risk as well as management’s incentives, opportunities, and ability to rationalize it. They should design tests responsive to the risks of fraud, conduct procedures that would be unpredictable and unexpected, and test for management override of audit controls.

The results of **Paul Coram, Colin Ferguson, Robyn Morone** (2008) research shows a significant positive relation between an organization having an internal audit function and the number and value of self-reported frauds [13]. For those organizations with internal audit, reliance on a partial or full in-house function increases the likelihood of detecting and self-reporting of fraud when compared with organizations that outsource the entire function. This finding is particularly interesting because it puts outsourcing in a different perspective from prior studies, which found that financial statement users do not perceive a difference between in-house internal audit and outsourcing ([14], [15]) and companies which believe that an external provider is technically more competent [16].

Overall, we noticed that internal audit has changed in several ways during the time of the US accounting scandals and these changes varied somewhat with company characteristics. We expect internal auditing to

continue to change because all accounting practices are in a continuous process of changing, harmonizing and normalizing. We encourage additional research on changes in the mix of internal audit's activities, internal audit quality measures, and the structure of the internal audit function. Meanwhile, is important to realize the relationship existing between the internal control, internal audit, corporate governance and external audit, all these elements making a ritual of verification and validation.

5. Conclusions

As the activity of organizations has increased immeasurably, the governance of these entities has assumed considerable importance while internal audit process has taken different connotations. In these conditions is important to realize the relationship existing between the internal audit, corporate governance and external audit. A professional internal audit activity will supplement senior management's actions, by providing independent and objective assurance on the effectiveness of the organization's governance processes, how well it use to manage all kinds of risks, and whether internal control processes are operating, as required, to manage risks to an acceptable level.

In the same time, but in other conditions, we have to recognize the relationship existing between the audit committee, external auditor, internal auditor, the Board of Directors and the management, given that they are crucial to effective corporate governance and to achieving high quality financial reporting.

Nowadays, verification and certification activities are essential to support the investment decision of investors as well as efficient and effective quality reporting of accounting information presented in annual financial statements. Thus, the higher the accounting manipulation the lower the quality of the financial information presented by the company.

Customer Oriented Organisations

Pau Adriana

West University of Timișoara, Faculty of Economics and Business Administration
adrianapau2009@gmail.com

Abstract

Customer orientation is a complex, multidimensional concept, that includes dimensions like: motivation of an employee for meeting the customers' requirements, abilities necessary for an employee to satisfy the customer's needs, freedom of the employee to make decisions aimed at meeting the customer's needs and desires. Customer oriented organisations offer services with a high level of quality that ensures the customer's satisfaction.

Key words: customer orientation, organization, training, employees, performances.

J.E.L. classification: M31

1. Introduction

The concept of *customer orientation of service employees* represents an important research topic at present. Customer orientation is a salesperson's of assisting a customer in his or her decision making that determines the customer to buy whatever satisfy his or her needs [1].

2. Customer orientation

2.1. The Impact of Customer Orientation

Customer orientation leads to a feeling of pride for belonging to an organisation in which all the departments and all the individuals work for the common aim of serving customers. Customer oriented organisations have employees who strongly believe in organizational objectives and values, who are willing to make considerable effort to satisfy these objectives.

The results of empirical studies have brought to light the fact that *customer oriented organisations offer services with a high level of quality that ensure the customer's satisfaction.*

Customer orientation has a direct impact on several results of the employees (job effort, job satisfaction, team spirit and commitment) and on organisational performance [2]. There are also indirect effects of customer orientation on performance in the reactions of the employee to his work and his job. These direct and indirect connections of customer orientation highlight relevance for obtaining the desired results or organisational performance.

2.2. Training the Employees

Training the employees has become a key component of the effort of changing organisational paradigms or ways of doing business. The ideal of this model supposes identifying all the factors that facilitate or limit transfer in time, as well as identifying the extent to which each of these factors influence the transfer. Contextual factors regard wider situations that shape a specific climate of transfer. They include structural factors (job technology) , enabling factors (leadership, team work), continuous monitoring and broad climate factors (resistance to change, stress, and ambiguity). The climates of change and of training transfer have a significant impact on the customer orientation of the employees. Thus, the research performed has demonstrated that the employees who attended trainings have higher customer orientation as compared to those who did not participate in such activities. The employees' reactions to change and role change may go beyond, but they do not necessarily eradicate the positive influence of the transfer climate. The employees are more easily convinced to

accept change when the connection between the existent organisational identity and new initiatives is made clear.

2.3. Attitudes and Behaviours of Customer Orientation

The distinction between attitudes and behaviours of customer orientation is essential for managers, as they have to try to understand and influence both. Attitudes are stable, as behaviours are, if the managers can establish a high level of customer orientation in the attitude of their employees, and a higher level of stability in behaviour. It is difficult to influence attitudes, but there are managerial approaches that are able to do that. Thus, managers can select employees according their customer orientation or they can try to introduce positive attitudes of customer orientation in the training for recruitment. Customer orientation is regarded as the ability of salespersons of assisting their customers by engaging in behaviours that increase customer satisfaction. The consequences of customer oriented behaviour with positive effects on sales performances and on the quality of services have also been studied. Customer oriented employees deliver services of exceptional quality, creating customer satisfaction. Different types of customer orientation based on “internalising customer services” and “customer oriented behaviours” were identified. Customer oriented attitude includes affective, cognitive and co-native elements, being complex and multidimensional. In the opinion of some authors, customer oriented attitude is something simple, one-dimensional, referring to the quantity of affect for or against an object [3]. Customer oriented behaviour is the ability of the sales person to assist his or her customers engaging in activities that increase customer satisfaction. Behaviours are less stable than attitudes, and they can be influenced relatively easily by activities of the organisation. Customer oriented attitudes, as lasting characteristics, are more stable than behaviours. If organisations desire to implement a long-term customer oriented strategy, it is important for them to focus both on attitudes, and on behaviours, seen as two dimensions of customer orientation.

Empathy will strengthen the connection between the customer oriented attitude of the salesperson and his or her customer oriented behaviour. The higher the empathy of the salesperson, the stronger the relationship between the customer oriented attitude of the salesperson and his or her behaviour. The salespersons with a high level of knowledge about the services in the organisation are competent in solving problems and they know more about the offer of the company and the customers’ needs. Employees with higher levels of empathy, reliability, and expertise, are able to transfer their customer oriented attitudes to customer oriented behaviours, thus increasing the level of customer satisfaction. Restrictions of job autonomy may inhibit transfers of customer oriented attitudes. Elimination of those restrictions will determine an increase of the probability of people engaging in customer oriented behaviours.

3. Conclusions

A high level of customer orientation leads to an increase in the degree of development of relationships. The organisations that concentrate on customer orientation and identify the desires and the needs of their customers will have high performances. Customer oriented individuals act more efficiently and contribute to the efforts of the organisation of developing excellent relationships between sellers and customers.

Customer orientation tends to facilitate market differentiation and leads to higher satisfaction of customers regarding the services they are offered.

Measures to Stimulate the Activity of Research&Development in Romanian Enterprises

Păcurari Doina

Pravăț Ionela-Cristina

“Vasile Alecsandri” University of Bacau, Faculty of Economic Sciences

doinap_ro@yahoo.com

crisspra@yahoo.com

Abstract

An important objective for the national authorities of States Member of the European Union is to stimulate the activities of research and implementation of research results to increase economic competitiveness. Since joining the European Union, Romania started the National Plan for research-development and innovation NP II for 2007-2013 period. The purpose of the programs developed in this general plan was to stimulate public and private investments in research-development. Regarding the enterprises, these programs provide support in form of State aid. In addition, Romanian tax legislation, in line with the European legislation, provides fiscal incentives for companies engaged in research and development. To qualify for the State aid, enterprises must meet several conditions. Both State aid and fiscal cuts are calculated on the amount of eligible expenses. In this paper we present the conditions for granting and method of calculation for these two forms of supporting enterprises in our country.

Key words: research activity, state aid, fiscal incentives.

J.E.L. classification: O38, H32

1. Introduction

The activity of research-development includes scientific research, experimental development and innovation based on scientific research and experimental development. These activities are supported by State being considered generators of economic and social progress. Applying the

research results and the latest technologies can lead to an improvement of the quality of products offered on the market, but it also involves high prices of their sale (that allows recovery of investments made in research). In order to avoid this increase in prices and to allow buyers access to the new and quality products, the amounts invested in research are partially compensated by State aid and fiscal incentives. We present in the following the way in which Romanian companies can benefit from state aid and fiscal incentives.

2. State aid

State aid for research, development and innovation (RDI) can contribute to economic growth, competitiveness boost and increase employment of labor. These aids are very important, especially for SMEs, whose facilities for accessing the latest technological developments and highly qualified personnel are reduced.

State aid is granted as financial assistance non-reimbursable. The aid actually consists in settlement of expenses that, according to the contract funding, are eligible. Total eligible expenses reimbursed can not exceed the applicable State aid intensity per project (gross aid intensity is the sum of it, expressed as a percentage of eligible project costs)

State aid is eligible for companies where research-development is part of their object of activity, regardless of their legal status or their way of financing. These companies may be small, medium or large.

- Small enterprises are those that have a number less than 49 employees and annual net turnover or total assets of up to 10 million euros. In this category micro-enterprises are also included;

- Medium enterprises have a number of employees between 50 and 249, net annual turnover less than 50 million euros and total assets of up to 43 million euros.
- Large enterprises are those that have over 250 employees and total assets of over 43 million euros.

Young innovative enterprises can also benefit from State aid. These are small companies have been of existence for less than 6 years at the time when the aid is granted and, which shows that the expenditure for RDI was at least 15% of total operating costs in at least one of the last three years preceding the grant funding (if the enterprise is newly established and there are no financial statements to prove this, an external financial audit for the current fiscal period is necessary, audit that verifies the compliance with these conditions).

In order to benefit from funding as State aid, the beneficiary must also fulfill a number of conditions, such as:

- have no outstanding obligations to the general consolidated budget (fees, taxes, contributions);
- his legal representative has not been convicted in the last three years by a final decision of a court;
- other additional conditions specific to the call of projects for financing.

Companies in difficulty can not be supported by State aid scheme. According to the Community Guidelines on State aid for rescuing and restructuring firms in difficulty (2004/C244/02), an enterprise is in difficulty if it is unable, through its own resources or funds that can be obtained from its shareholders or creditors, to stem losses and which, without government intervention will almost certainly leave the business in the short or medium term.

The National Plan II for RDI, for the 2007-2013 period (NP II, approved by Government Decision nr.475/2007), provides for involvement of the private sector in RDI activity. The plan aims, inter alia, stimulating the interest in the economic sector for the activities of RDI, its participation in partnerships with public entities, with consequences on the growth of private investments in RDI.

NP II supports the infrastructure development and technology transfer services for a better use of RDI results in the

economic environment, with the protection of intellectual property. Also, through NP II it shall be ensured wide access for innovative firms to financing for RDI projects, especially those in collaboration with research universities and institutes. Financing the firms in these projects made in partnership takes the form of State aid.

State aid is granted only for industrial research and experimental development, for technical feasibility studies and for obtaining and validating industrial property rights for SMEs.

For example, through PN II, in the Partnership Program - Collaborative Applied Research Projects, the funding that can be given from the State budget to an enterprise is calculated by applying the following maximum rates to eligible costs:

Table no.1. Maximum rates for financing from State budget

Activity	Type of enterprises		
	Large	Medium-sized	Small
FR	100%	100%	100%
IR	65%	75%	80%
ED	40%	50%	60%
TFS(IR)	65%	75%	75%
TFS(ED)	40%	50%	50%
PIPR(FR)	-	100%	100%
PIPR(IR)	-	60%	70%
PIPR(ED)	-	35%	45%

Source: http://uefiscdi.gov.ro/articole/2626/Program-PARTENERIATE_Proiecte-colaborative-de-cercetare-aplicativa_Competitia-2011.html

where: FR-Fundamental research; IR-Industrial research; ED-Experimental development; TFS (IR)-Technical feasibility studies (for industrial research); TFS (ED)-Technical feasibility studies (for experimental development); PIPR (FR)-Protection of the industrial property rights (for fundamental research); PIPR (IR)-Protection of the industrial property rights (for industrial research); PIPR (ED)-Protection of the industrial property rights (for experimental development).

Expenses for research-development and innovation considered eligible, which according to current regulations (Government Decision nr.134/2011) can be financed from the State budget are:

- personnel expenditure (salaries and other incomes assimilated to salaries as well as their related contributions);
- expenditure on logistics;
- capital expenditure: expenditure for acquisition of tangible assets (facilities, equipment, furniture, computers and accessories and suchlike), expenses for purchase of intangible assets (computer software, licenses, patents and suchlike);
- expenditure on stocks (raw materials, supplies, inventory objects, materials not stored, the energy and water used directly in the program, living organisms, plants, animals);
- expenditure on services performed by third parties (maintenance and repairs, obligations, management sites or rentals for assets used directly in the project, transport of goods, postage and telecommunications expenses, expenses for accessing databases, libraries, archives, publications and other sources of information, publication expenses, the value of IT services, financial auditing, expertise, evaluation or technical assistance services, maintenance of equipment used in the project, translation and interpretation services, copying services, etc.);
- traveling expenses: travel, accommodation, per diem (the limitations imposed by the Tax Code regarding deductibility of delegation and deployment allowances will be respected), fees for participation in scientific meetings, health insurance for traveling abroad, fees visas and suchlike;
- indirect costs (overhead)
The following types of expenses are not eligible and are not funded by the state aid scheme:
 - dissemination of research results through communication and publication at national or international level;
 - participation in technical-scientific events in specific areas of the project (roundtables, workshops, symposiums, fairs, etc.);
 - participation in training and development courses;
 - organization of training and development courses;

- connection to national and international research networks;
- work visits/exchanges of good practice.
However, these expenses can be reimbursed from the co-financing budget of the project.

3. Fiscal incentives

Fiscal incentives for the activity of research and development (RD) consist in reducing taxable income and applying the method of accelerated depreciation for devices and equipment used by the contributor for this type of activity.

The activity of RD includes:

- fundamental research - the work carried out primarily to acquire new knowledge of phenomena and processes and for the formulation and verification of assumptions, conceptual models and theories;
- industrial research – the activity aimed mainly to improve or develop new products, technologies and services by using scientific knowledge;
- experimental development - consisting of the activities of systems engineering and technological engineering, through which it is designed the application and transfer of research results to the economic operators, as well as in social area, aimed at introducing and materialization of new technologies, products, systems and services, as well as improving existing ones.

These incentives are granted only if the RD activities leading to obtaining research results, capitalized by the contributor for its own benefit in order to increase revenues.

Reducing taxable income, according to article 191 of the Tax Code, is achieved by additional deduction of 20% of eligible expenditure for RD activities. Additional deduction is calculated once at three months or annually, depending on the contributor's fiscal period. If the tax loss is recorded, it shall be recovered from taxable profits in the coming years, according to tax matters (in the next 5 or 7 years, in accordance with Article 26, Tax Code).

Regarding the eligible expenses taken into account in granting additional deduction, these are:

- depreciation of tangible assets created or acquired by the contributor as new and used for RD activities and costs of work performed by third parties for maintenance and repairs on these tangible assets;
- expenses with salaries of staff directly engaged in RD activities;
- depreciation expenses of intangible assets, acquired by the contributor, used in RD activities;
- operating expenses, including expenses on consumables, inventory, raw materials, experimental animals and similar products used in RD activities;
- overheads that can be allocated directly or proportionally to the research results by using a key of distribution (examples: rent of facilities where activities of RD are developed, corresponding facilities, supplies, office supplies, postal services, administrative and accounting services, etc.).

In order to be eligible when establishing additional deduction granted as fiscal aid, these expenses must be accounted on the basis of documents in proof and be performed for the purpose of achieving revenues.

Eligible costs are added together and entered in the tax register, specifying the amount representing the tax deduction. This deduction shows distinctly in annual income tax declaration (Declaration 101 "Income Tax Declaration" at rank 18 "Other deductible amounts" and at rank 18.1 "Additional deduction for research-development").

In terms of fiscal facility regarding the regime of depreciation for devices and equipment used in RD activity it is allowed to apply the accelerated depreciation method. According to Article 7 of OMPF 2086/2010, the facility can be applied only to devices and equipment provided in subgroup 2.1."Technological equipment" and 2.2."Devices and equipment for measurement, control and regulation" from the Catalogue on the classification and normal operating duration of assets (Catalogue approved by Government Ordinance no. 2139/2004). Normally, accelerated depreciation is acceptable for fiscal purposes only for technological equipment (machines, tools, installations),

and for computers and their peripherals equipment. The method allows the calculation of depreciation of up to 50% of the asset value in the first year of operation.

Example:

The company carries out research-development activity for which it acquires a technological equipment worth 70,000 m.u. and a measurement and control installation in the amount of 30,000 m.u.. Both assets have a duration of 10 years of service.

For the calculation period (year N) there are known:

- salaries of personnel directly engaged in the RD activities - 10,000 m.u.;
- costs of services from third parties - 6,000 m.u.;
- costs of consumables – 5,000 m.u.;
- overheads allocated to RD activities - 8,000 m.u.

We consider the year N as being the first year of operation of both tangible assets purchased for RD activity.

We suppose that taxable profit in the absence of granted fiscal incentives is 40,000 m.u. (taxable profit calculated on the assumption that the company has applied the accelerated depreciation method for the technological equipment and the linear depreciation method for the measurement installation). In these circumstances, the income tax is 6,400 m.u. ($40,000 \times 16\% = 6,400$)

Application of fiscal facilities includes:

a) additional deduction of depreciation expense, as a consequence of applying the accelerated depreciation method for the measurement and control installation: linear depreciation 3,000 m.u. ($30,000 \text{ m.u.} / 10 \text{ years}$), accelerated depreciation 15,000 m.u. ($30,000 \text{ m.u.} \times 50\%$), results in additional deductible expense of 12,000 m.u.;

b) additional deduction of 20% of the eligible expenses for the activity of RD:

- o Eligible expenses = expenses with salaries (10,000 m.u.) + expenses of services from third parties (6,000 m.u.) + expenses of consumables (5,000 m.u.) + overheads (8,000 m.u.) + equipment depreciation expenses ($70,000 \text{ m.u.} \times 50\% = 35,000 \text{ m.u.}$) + expenses with depreciation of the measurement installation ($15,000 \text{ m.u.}$) = 79,000 m.u.

- 20% of the eligible expenses: $79,000 \times 20\% = 15,800$ m.u.

Taxable income calculated under the conditions of applying fiscal facilities is:

$$40,000 - 12,000 - 15,800 = 12,200 \text{ m.u.}$$

and the income tax is 1,952 m.u.

The company therefore benefits from a reduction of 4,448 m.u. from the income tax (6,400 m.u. – 1,952 m.u.), with beneficial effects in terms of treasury and faster recovery of the sums invested in research.

4. Conclusions

We believe that the forms of support which the companies in our country can benefit from are really useful, they can financially sustain the enterprises wishing to invest in RDI activities. In particular, their collaboration with research organizations, in partnership funded by the National Plan for research-development NP II, can bring important economic benefits and can lead to the development and promotion of competitive products on national and international market.

The Role of Migration in Shaping the Future

Pădurețu Elena

The Bucharest Academy of Economic Studies

elenapaduretu@yahoo.com

Abstract

Migration is often seen as a negative cause in the economy. Stereotypes portraying migrants as ‘stealing our jobs’ or ‘scrounging off the taxpayer’ abound in sections of the media and public opinion, especially in times of recession. This paper seeks to broaden and rebalance perceptions of migration to reflect a more complex and highly variable reality. Movement has a huge potential for improving human development. Our vision of development as promoting people’s freedom to lead the lives they choose recognizes mobility as an essential component of that freedom. Also, we want to emphasize the role of migration during history and the benefits in shaping the world as it is now, with future perspective.

Key words: migration, culture, future, remittances, globalization.

J.E.L. classification: F22, R23, O15

1. Introduction

The outcomes in all aspects of human development, not only income but also education and health, are for the most part positive. All the fears about migrants taking the jobs or lowering the wages of local people, placing an unwelcome burden on local services, or costing the taxpayer money, are generally exaggerated.

When migrants’ skills complement those of local people, both groups benefit. Societies as a whole may also benefit in many ways—ranging from rising levels of technical innovation to increasingly diverse cuisine to which migrants contribute.

When tailored to country-specific contexts, the changes made in the migration policies can amplify human mobility’s already substantial contributions to human development.

This paper is analyzing who migrants are, where they come from and why they move. We have analyzed data from Human Development Report 2009, looking at the multiple impacts of migration. Some of the solutions found are: opening up existing entry channels so that more workers can emigrate; ensuring basic rights for migrants; lowering the transaction costs of migration; finding solutions that benefit both destination communities and the migrants they receive; making it easier for people to move within their own countries; and mainstreaming migration into national development strategies.

2. Historic overview of the migration phenomenon

Migration is an effect of demographic growth, development of trade and production, existing ever since the beginning of time in the human history. The events that led to migrations, voluntary or forced were warfare, conquest, formation of nations, states, empires. Also the enslavement and deportation of people was the first form of labour migration. At the same time, in Africa, pastoral farming stood as a foundation for distance trade, cultural exchange and settlement of people [1].

Even if the nature of migration has changed over the past two centuries because of revolutionary technological and economic developments, mobility has always been a part of human history. This process started with European mercantile and colonial expansion, accelerating after the Industrial Revolution.

The development of European states and their colonisation of the rest of the world, gave a new meaning to migration through movements of soldiers, traders, forced slavery in Africa, indentured workers from India and China to East Africa, the Caribbean and elsewhere [2].

Beginning in the seventeenth century, North Sea countries, and further extending throughout Europe in the eighteenth and nineteenth centuries, the spatial diffusion of the processes of capitalist development and the associated demographic transitions resulted in large-scale rural-to-urban migration within Europe and North America [3].

In the first wave of globalisation (1870-1914), in which transatlantic migrants reached over 50 millions, technological progress facilitated longer journeys [4]. The interwar period (1918-1939) was characterised by increasing protectionism and also more restrictions on migration.

After 1929, the Great Depression further restricted population mobility. Refugee movements go far back in history, such as the migration of Muslims and Jews to Morocco and the Ottoman Empire after the completion of conquering of the Iberian Peninsula in the late fifteenth century.

Processes of large-scale rural-to-urban migration within and across borders in the nineteenth and twentieth century were connected with the processes of colonisation, the progressive incorporation of peasant economies into the capitalist economy and globalization.

These processes of colonisation and capitalist development created a new demand for cheap labour, which set in motion rural-rural and, particularly, rural-urban migration patterns which significantly differed from pre-colonial population mobility.

Although colonial administrators generally wished to restrict population mobility, they could not prevent increasing settlement of migrants in mining towns, major cities and other urban centres, according to Bakewell.

After decolonisation, rural-urban migration continued and often even intensified. Although many governments have tried to stop this ‘rural exodus’ they were not able to prevent this migration, which was driven by processes of economic restructuring, demographic growth and urbanisation.

Decolonisation in the 1950s and 1960s created the conditions for new patterns of movement from former colonies to the mainly European metropolis at an unprecedented scale. This postcolonial

migration was facilitated by common historical and linguistic links.

In some European countries such as the UK and France, part of this labour demand was filled by immigration from former colonies. However, over the 1950s and 1960s an increasing proportion of demand was met by migration from poorer, often neighbouring countries such from Mexico to the US and from southern Europe, the Maghreb and Turkey to northwest Europe [6].

3. Social and economic effects of migration today

If people expand their social, economic and human capital this tends to coincide with increasing potential levels of mobility. Increased income, income differentials and associated relative deprivation as well as improved access to information and education tend to increase people’s *capabilities* and *aspirations* to move. It is therefore no coincidence that highly developed societies also tend to be highly mobile.

The share of international migrants in the world’s population has remained remarkably stable at around 3% over the past 50 years, despite factors that could have been expected to increase flows.

Demographic trends—an aging population in developed countries and young, still-rising populations in developing countries—and growing employment opportunities, combined with cheaper communications and transport, have increased the ‘demand’ for migration [7].

Only 37% of migration in the world is from developing to developed countries. Most migration occurs *within* countries in the same category of development: about 60% of migrants move either between developing or between developed countries (the remaining 3% move from developed to developing countries).

One obvious reason why there is not more movement from developing to developed countries is that moving is costly, and moving long distances is costlier than undertaking short journeys.

Figure 1 displays the evolution of the share of people from developing countries in eight developed economies that have

comparable information. In all but one case (the United Kingdom), there were double-digit increases in the share of migrants from developing countries. In many European countries, this shift is driven by the increase in migrants from Eastern European countries classed as developing according to their Human Development Index. For example, during the 1960s only 18% of developing country immigrants into Germany came from Eastern Europe; 40 years later that ratio was 53%.

Fig. 1. Share of migrants from developing countries in selected developed countries

Source: HDR 2009

Mobility can have profound consequences for social, class and ethnic hierarchies in origin communities if lower status groups gain access to substantially higher income streams. These are welcome changes, which can disrupt traditional, caste-like forms of hereditary inequality based on such things as kinship, skin colour, ethnic group or religion, which are associated with unequal access to land and other resources. According to Newland and Patrick, the ideas, practices, identities and social capital that flow back to families and communities at origin are known as *social remittances* [8].

Table 1. Policy measures aimed at international migration in poverty reduction strategies 2000-2008

Proactive/facilitative	No. of countries
Export labor	10
Encourage female migration	1
Promote student mobility	3
Sign bilateral agreements	9
Improve labour conditions abroad	6
Pre-departure training	6
Develop consular services	3
Regulate recruitment industry	2
Facilitate portability of pensions	2
Promote refugee integration	7
Facilitate remittances	9
Encourage legal remittance channels	13
Engage diasporas	17
Promote investment by diasporas	8
Import skills	4
Participate in regional cooperation programmes	8
Promote more reseach/monitoring	8
Build institutional capacity	5
Combat HIV/AIDS amongst migrants	7
Re-integrate trafficking victims	5
Regulation/control	No. of countries
Combat trafficking	19
Modernise customs	18
Strengthen border control	17
Combat illegal migration	12
Promote refugee return	10
Tackle the brain drain	9
Support return	7
Sign readmission agreements	2

Source: Black, R. and J. Sward. 2009

Several strategies articulate policies towards migration. There can be distinguished between policies that are broadly ‘proactive/facilitative’ and those focused on ‘regulation/control’ (table 1). Combating trafficking, preventing irregular migration and modernizing and strengthening immigration and customs service feature frequently. It is striking how some of these policies echo those promoted by rich country governments.

Hanson thinks that a popular measure of the impact of migration, though not one that necessarily reflects its true economic and social effects, is the perception of the changes it brings to the government’s fiscal position [10].

People across the political spectrum often share concerns about the implications of migration for the welfare state. European Social Survey of 2002 suggested that up to 50% of the region’s population worry about migrants being a net fiscal burden, with those most concerned tending to be less well educated, older and/or unemployed. The concerns are most acute in the Czech Republic, Greece, Hungary and Ireland, much less so in Italy, Luxembourg, Portugal and Sweden. Some people are worried about increased costs, others about sustainability in the face of reduced social cohesion.

A recent study predicted that, among European countries, Estonia, France and Latvia were likely to face a higher public finance burden due to the costs of migrants’ welfare benefits during the 2009 downturn, whereas Austria, Finland, Germany, Ireland and Spain would register less-marked increases [11]. In many developing countries, the issue of rising fiscal costs during a time of recession typically does not arise, because welfare benefits are simply unavailable to anyone.

4. The future of migration

Many people are now suffering the consequences of the worst economic recession in post-war history. Asian countries have suffered from collapsing export demand, while increases in the cost of external credit have adversely affected Central and Eastern Europe. African countries are battling with collapsing commodity prices, the drying up of capital liquidity, a sharp decline in remittances and uncertainty concerning future flows of development aid. UNRWA analyzed some of the largest emerging economies, such as Brazil and the Russian Federation, will dip into negative growth, while others, notably China and India, will see severe slowdowns [12].

The negative correlation between numbers of immigrants and economic growth suggests that migrants are likely to be badly affected not only in OECD countries but also in the Gulf, East Asia and South Africa. A jobs crisis is generally bad news for migrants [13]. Economies tend to call on people from abroad when they face labour shortages, so they tend to lay off migrants first during times of recession. This is partly because, on average, migrants have a profile typical of workers who are most vulnerable to recessions—that is, they are younger, have less formal education and less work experience, tend to work as temporary labourers and are concentrated in cyclical sectors.

Aging of populations is a widespread phenomenon. By 2050, the world as a whole and every continent except Africa are projected to have more elderly people (at least 60 years of age) than children (below 15). This is a natural consequence of the decline in death rates and the somewhat slower decline in birth rates that has occurred in most developing countries, a well-known phenomenon known as the ‘demographic transition’. By 2050, the average age in developing countries will be 38 years, compared to 45 years in developed countries.

Fig.2. Projections of working-age population by region, 2010-2050

Source: HDR 2009

For every 100 working-age people in developed countries, there are currently 49 who are not of working age, roughly half of whom are children or elderly. In contrast, in developing countries, the ratio is higher, at 53, but three quarters of the dependents are children. Over the next 40 years, as the effect of lower birth rates is felt and the proportion of children falls as they reach working age, the dependency ratio will remain roughly stable in developing countries, reaching just 55 by 2050.

However, the proportion of elderly will rise in developed countries, so that there will then be 71 non-working-age people for every 100 of working age, a significantly higher fraction than today. These dependency ratios would increase even more rapidly without the moderate levels of immigration included in these scenarios: if developed countries were to become completely closed to new immigration, the ratio would rise to 78 by 2050, according to HDR 2009.

5. Conclusions

We have come to the conclusion that movement reflects people’s need to improve their livelihoods. This movement is constrained by policy and economic barriers and the pressure for increased flows will grow in the coming years. Migration is shaping the world ever since the beginning of it, ultimately, the structural factors will affect the flow of people in the future depending on the policies taken by the decision factors, mostly in host countries.

At present, policy makers in countries with large migrant populations face conflicting pressures: significant levels of resistance to increased immigration in public opinion on the one hand, and sound economic and social rationales for the relaxation of entry barriers on the other.

The twenty-first century will bring major new challenges to migration policy with demographic, economic and environmental changes leading to fundamental shifts in the flows of migrants. The global community is becoming connected in a manner not experienced since our small-world evolutionary origins in Africa. Our ability to meet the challenges of the twenty-first century requires a better understanding of our deep migration impulse and its impact on our future.

Negative Immigration from a Cultural Perspective

Pădurețu Elena

The Bucharest Academy of Economic Studies

elenapaduretu@yahoo.com

Abstract

From a cost-benefit perspective, things don't look good for migrants all over the world, especially in Europe. EU nations are tightening border controls, raising red-tape barriers to legal migration, reducing the length of work permits, and shutting off access to the social welfare system. Some countries have closed the door to both work and social assistance. Other nations think that the “boat is full”, that there are too many migrants increasing unemployment, abuse the welfare system and take jobs from natives.

With all these, Europe is a place where migration is especially useful from an economic perspective. European citizens are not mobile and there are large productivity differences across and within countries. Spatial arbitrage by mobile workers – migrants – reduces the economic burden of these rigidities. This article comes in shedding a light unto this subject.

Key words: migration, cross-culture, welfare, remittances, globalization.

J.E.L. classification: F22, R23, O15

1. Introduction

Migration has an important role in global and local processes of economic, social and political change. It should be analyzed as a part of development and global transformation processes and not like an effect of some sort of social and economic causes.

International migration is characterized by cluster of immigrants in ethnic communities. Examples are widely known as Turks in Germany, Tamils in Switzerland, Moroccans in the Netherlands and Belgium, Italians in Argentina, Greeks in Australia and Ukrainians in Canada.

For example, Macedonians from Skopje have come to make up a notable part of the population of Gothenburg, Sweden. In the United States, noticeable clusters of Mexican immigrants exist in California, Texas, Florida and Chicago. Three-fourths of migrants from Guanajuato, the Mexican state with the highest emigration rate to the U.S., go to California or Texas.

When immigration is subject to adverse selection, it increases competition for jobs and lowers immigrants' salaries. Clustering may also minimize the desire to learn the language of the host country, trapping migrants in poverty [1]. These negative network externalities limit the benefits immigrants can obtain from clustering.

In this paper I would evaluate the culture manifesting in the process of migration for the migrants, those remaining in the sending areas, and people already living in the recipient locations. Though actors behave differently, within a group there are economically important shared beliefs (customs, values, attitudes, etc.), which we commonly refer to as culture.

The connection between ethnic conflicts and international trafficking is also an issue discussed in this paper. The main argument is that internal conflicts encourage the internal displacement of individuals from networks of family and community, and their access to economic and social safety nets. These same individuals are particularly vulnerable to being trafficked, by the hopes of better economic prospects elsewhere [2].

People's motivations to be mobile depend on human development and political, economic and social constraints in the places where they live. Development constraints are likely to motivate people to move to another country or place [3].

If people migrate because of extreme constrained conditions such as refugee migration, it will involve a decrease in wellbeing. In other cases, migrants may have

benefits from their mobility but not necessary in macro-structural change and national development. This is because their decision of moving depends on how they perceive the opportunities in the destination societies. Depending on the circumstances, mobility can have positive and negative implications. In this paper I am analyzing the negative ones.

2. Migration through the changes of time

International migration is the ‘great absentee’ in the era of globalization. While the barriers to international trade and capital mobility have been largely removed, labour markets are the most tightly regulated area of economic activity [4].

Population movements have always been part of human history. Warfare, conquest, formation of nations and the emergence of states and empires have all led to migrations voluntary or forced. In many parts of Africa, pastoralist was often associated with long distance trade, cultural exchange and settlement of people [5].

Today the patterns of migration have changed over the past two centuries because of revolutionary technological and economic developments and the incorporation of an increasing number of regions and countries across the world within international capitalism [6] starting with European mercantile and colonial expansion and accelerated after the Industrial Revolution.

The 1973 “oil crisis” was a turning point in global migration patterns. It accelerated the decline of labour industries in Europe and North America. In Europe began a period of economic stagnation and restructuring, rising unemployment and a lower demand for unskilled workers. European countries tried to encourage migrants to return. But they failed because they didn’t offered opportunities for economic reintegration. Paradoxically, the restrictive immigration policies and the introduction of visa restrictions had the effect of pushing migrants into permanent settlement rather than the reverse [7].

Since 1970s, advances in road, air transport and a breakdown of trade barriers have increased a second wave of

globalization [8]. Wealthy countries have increased legal restrictions and intensified border controls on migration from poorer countries. But the lower costs of transportation makes outsourcing more feasible and minimises the demand of more developed countries for immigrants.

Due to social, economical and political circumstances of globalization in the 21st century along with changes in education and business environment, many countries have developed intercultural relations, mainly because of the foreign immigrants [10].

Although the relative number of migrants has remained stable over the last century, the overall mobility of people has increased, facilitating the massive growth in tourism and business travel and commuter mobility, but has also vastly increased the scope for migrants to travel back and forth and maintain transnational social, economic and political ties with origin countries [11].

Moreover, non-migration mobility can give rise to migration, for instance to service tourist needs, and tourism and student migration can metamorphose into de facto labour migration [12].

3. Negative effects of migration

The contemporary migration patterns are linked to capitalist development, globalisation and the social, economic and demographic transformation of origin and destination places. When people increase their social, economic and human capital, they tend to increase also potential levels of mobility. A high income and improved access to information and education increase people’s aspirations to move. Highly developed societies tend to be highly mobile [13].

Standard theory assumes migration takes place in the context of efficient labour markets. In reality, wage setting institutions, minimum wages and unemployment benefits drive a wedge between labour supply and demand. This wedge can create a link between immigration and unemployment, both among natives and immigrants [14].

When a country closes its borders to migrants, migration flows are diverted disproportionately to other nations, so the other nations react by closing their borders.

Thus, migration may entail significant direct and indirect costs. The direct costs include unemployment among natives. The indirect costs include higher taxes or social security contribution related to the payment of unemployment benefits and/ or social transfers. A large pool of unemployed immigrants may also be associated with other indirect negative effects (externalities). Unemployed immigrants may become involved in survival-oriented illegal activities and become an easy target for organized crime. Potential negative externalities from immigration into unemployment are also generated by the involvement of immigrants and illegal activities.

One of the negative influence of migration is that people need certain freedom and access to resources in order to migrate [15]. But freedom of mobility also pertains to the freedom not to migrate. If people are constrained in moving due to asylum, political conflicts or slave trade, migration can be a lack of freedom. This form of forced migration may have a direct effect on economic interests of other countries but often means a decrease in the well-being of the migrants.

Welfare benefits also affect incomes of natives and migrants indirectly, for example, via changes in the skill content of migration. According to Roy's model, a welfare state compressing the wage distribution by skill level increases the inflow of low-skilled workers [16]. As migrants face a higher risk of becoming unemployed, access to welfare benefits can also increase the size of migration flows. Thus, welfare benefits affect income in the receiving countries directly, by redistributing income from the native to the migrant population, as well as indirectly, by affecting the size and composition of the migrant population.

As part of the labour force remains unemployed, not all migrants are absorbed by the host labour markets. Following the Harris-Todaro tradition, jobs are allotted within the domestic and foreign labour forces randomly. The employment opportunities of migrants are, however, assumed to be lower than those of natives. This implies that the unemployment risk is partially shifted from natives to immigrants. The unemployment risk of foreigners is twice as large as unemployment among natives.

Under labour market clearing, gains from migration are substantial: an immigration of 1% of the population increases GDP of the total region by roughly 0.3%. The gains from migration are not uniform across the board, however. Most of the gain accrues to the migrants, whose incomes increase by between 130 and 150% in the different scenarios. In the receiving countries, the wages of manual or non-manual workers decline from 0.04 to 0.56%, depending on the assumptions as to the skill composition of the migrant population, while labour wins in the source countries.

The native population in the recipient nation may lose out from migration, particularly when there are institutions that prevent wages from adjusting to supply shocks. As minimum wages and wage floors set in the context of collective bargaining are binding mostly for the unskilled workers, immigration with a low-skill content increases the conflict of interest between natives and immigrants.

Migration of low-skilled workers also increases income inequalities in the recipient country as wages of manual workers decline more than wages of white-collar workers and the former have virtually no access to capital markets.

This, together with the fact that migration induces faster income per capita convergence, explains why migration reduces income inequality in the enlarged Europe.

Migration may have positive or negative concrete impacts on the lives of people, depending on the type and causes of migration, the selectivity of migration and the broader developmental context in which migration occurs.

Rather than a response to destitution, migrations tend to be a livelihood strategy pursued by social groups in reaction to relative deprivation [17] to spread income risks and, if possible, improve income levels.

Total EU27 outflows amounted to 30.3 billion euro in 2009, compared with 32.6 bn in 2008 (-7%). These figures include both intra-EU27 and extra-EU27 flows. The decrease in workers' remittances in 2009 compared with 2008 was almost the same for extra-EU27 flows (-7%) and for intra-EU27 flows (-6%). The share of extra-EU27 remittances in the total stood at 73% in 2009, the same level as in 2008. The outflow of workers' remittances was highest in 2009 in Spain (7.1 bn euro or 22% of total EU27 remittances), Italy (6.8 bn or 21%), Germany (3.0 bn or 9%), France (2.8 bn or 9%) and the Netherlands (1.5 bn or 5%).

Because many remittances are sent through informal channels, the actual importance of remittances is even higher than

official figures show. Even relatively small amounts of remittances can substantially improve the livelihoods and wellbeing of migrants and their families in sending countries[18]. Poor non-migrants may be affected *indirectly* through the economy-wide effects of remittance expenditure on wages, prices and employment in migrant sending communities and countries [19].

Taylor [20] found evidence that the combination of lost-labour and remittances may affect production in migrant sending regions negatively initially but positively eventually.

While remittances can bring substantial financial gains for individual migrants, their families as well as origin communities, the loss of human capital through the loss of ‘brawn’ and ‘brains’ are often seen as undermining the economic development potential of communities and nations of origin.

Some authors now claim that the brain drain may sometimes encourage the economic development of poorer sending countries [21], while others claim that migrant remittances may harm those countries’ development prospects [22]. Such claims are based on the supposed effect of the brain drain and of remittances upon the incentives for economic growth within the sending countries.

The massive departure of young, able-bodied men and women from rural areas has been typically blamed for causing a critical shortage of agricultural and other labour, depriving areas of their most valuable, able-bodied working force. The research literature indicates that largescale out-migration from rural regions can disrupt economic production and lead to a decline of productivity in the agricultural and other traditional sectors. However, on the longer term this immediately negative effect can be counterbalanced by remittance-fuelled investments, provided that the regional investment environment is sufficiently attractive. Adams [23] concluded that international migration does not tend to take a very high proportion of the best educated.

On the other hand, there is some evidence that migration may also create *negative* incentives for education. This seems specifically the case in migration systems predominated by low skilled, often

undocumented migration, where few if any positive externalities of education can be expected.

Migration also tends to affect socio-ethnic structures and culture in sending communities and even on the national level. Even more than with economic impacts, it is difficult to oppose negative and positive impacts, because they are often two sides of the same coin, and some members of families and communities may be affected more positively or negatively than others.

For instance, migration, particularly by women, often disrupts traditional care arrangements for children and the elderly [24] and causes longterm separation between spouses and parents and children. On the other hand, migration remittances may enable households to improve their livelihoods, children’s education and to substitute family carers for paid carers.

Migration and remittances can have profound consequences for social, class and ethnic hierarchies in sending communities if lower status groups manage to migrate internally or internationally, which may upset traditional social hierarchies. While traditional elite groups might view such migration as a devastating process, lower or middle-class groups may have a more mixed or positive opinion.

The social and cultural changes affected by migration and remittances are themselves likely to affect future propensities to migrate. In this context, the literature refers to a ‘culture of migration’ in which international migration is associated with personal, social, and material success, where migration has become the norm rather than the exception, and staying home associated with failure [25].

In the case of migration cultures, those with a propensity to migrate will have forgotten, or mythologized, the reasons why earlier generations left. By the same token they may continue to migrate even though a rational choice may suggest that staying at home is more advantageous. The term ‘culture of migration’ can be misleading in the sense that it might suggest that the rising aspirations and outward-looking mentality is the exclusive consequence of the exposure of non-migrants to migrants’ wealth and their relative well-being.

Migration by men and women also tends to affect gender relations in sending communities. Although it has been sometimes assumed that migration of men encourages the emancipation of women who stay behind [26] limited empirical evidence suggests that migration has no or only a limited structural impact on gender roles, and may actually serve to reproduce them. When women migrate themselves, the potential for gender roles to change may be larger, but should also not be overestimated.

It has also been argued that remittances can contribute to undesirable currency appreciation [27] create disincentives for domestic savings and support private consumption of (imported) goods instead of financing investment, which can potentially hamper competitiveness and increase trade deficits.

Conflicting empirical findings on the economic macro-impacts of remittances are not necessarily at odds on a theoretical level: The macro-economic impact of remittances is disparate across countries because it is ultimately contingent on the social relations and structures in which the remitted foreign currency becomes embedded.

4. Conclusions

Migration is a vital part of risk-spreading livelihood strategies pursued by households and families in developing countries. Depending on the specific context in which migration occurs, migration can affect human development both positively and negatively, and such impacts tend to vary across different classes and population groups and are also contingent on spatial and temporal scales of analysis.

Under unfavourable conditions, migration may actually decrease the capabilities of people, and even when its aggregate impacts are judged to be positive, the fruits of migration are not always equally distributed among different members of households and communities [28].

Remittances have the potential to improve well-being, stimulate economic growth and reduce poverty directly and indirectly, while their effects on inequality are much more ambiguous, and primarily depend on the selectivity of migration.

Can migration and remittances *alone* trigger economic growth? Probably not. Although migration and remittances play a vital role in securing and actually improving the livelihoods of millions of people in the developing world, it would be naïve to expect that remittances alone can solve more structural development obstacles, such as an unstable political environment, misguided macro-economic policies, lack of safety, legal insecurity on property, bureaucracy, corruption and deficient infrastructure.

Positive vs negative debates on migration and development can be overcome by integrating agency structure dialectics in the analysis of migration impacts.

For instance, migration occurring under extremely constraining conditions is unlikely to contribute to national development in origin countries, at least in the short term. It is also likely that many ‘temporary’ migrants will become permanent settlers if economic and political conditions in origin countries remain negative and if immigration policies of destination countries become more restrictive.

Structural Policies, Monetary and Fiscal Crisis Recovery in Romania

Pepi Mitică

"Ovidius" University of Constanta, Faculty of Economic Sciences

pepi.mitica@gmail.com

Abstract

Economists have likened under graphical form, the dynamics of the current crisis in the form of letters. If after recession follows a period of growth, than it has shaped V. If after the rise follows again a new period of recession and then again an increase, then it is shaped W. It may exist and another form, the one of the letter O or, rather, of a circle. Closing the circle would mean the exit out of recession, so a reason for satisfaction and success of government policies. My opinion is that we shouldn't joy, but on the contrary, we should worry about such a success, because the exit out of recession through retouching the entry point in recession represents the missing of the opportunity to solve the structural problems that the Romanian economy has.

Key words: sustainability, recession, inflation, financial, macro stabilization

J.E.L. classification: G01

1. Introduction

It was announced frequently getting out of recession. Is a notice that does not contest because, statistically, it is possible that two successive trimester of this year to record an increase, even if extremely modest. According to a questionable but unanimously accepted definition, an increase in the level of two consecutive quarters of means, statistically, the exit from the recession

I stressed that it was only one exit from the recession of statistically in order to attract attention to the lack of relevance of such output would have it on the current state of the economy and, implicitly, the general public. It is only the expression of a trend of the economy and halt the fall was a trend for relaunching them. Exit from the recession

can be achieved on the basis of structural policies, monetary and fiscal, that we enunciate in below:

2. Ratio of recession and crisis

From ignorance or knowingly, official has spoken numerous times to "exit the Romanian crisis". At the level of image analysts or commentators talk show has been criticized and corrected the formal approach by emplacing the difference between recession and crisis, with particular emphasis on the cyclic nature of the crisis. It was shown that it is possible to exit from the recession but the crisis will last for a period, probably between 3 and 5 years as determined by the duration of the international financial crisis. It is a correct approach. Unquestionably, the recession may not be forced out of the crisis but, in my view, the problem is more complicated than that of the international financial crisis.

This crisis has influenced our economy but not in the financial sector but by type subprime contagion effects taken over Romania by the overwhelming dependence of our external relations of force at the core of the European Union. As long as over 70% of our export and import is straight to this kernel was unavoidable contamination. Inevitability does not explained just by straightway but also the structure of import and export, which in turn is determined by the structure of the Romanian economy.

The international crisis, no matter how tough to be the "merit" and has to reveal the existence of a profound structural crisis that Romania has inherited from the Communist regime and that, unfortunately, in many areas has deepened over the period of transition. This crisis of structure does not refer only to the profound macro economy equilibrium, but also to a structure of sectors and branches of activity unlikely to capitalize with a major

raise added value for competitive advantage domestic factors.

For these reasons I think you need to take into account not only the effects of the current international financial crisis but also the structural crisis which Romania still felt them with acuity for several years. The current structure of the Romanian economy has some features that are in a dangerous position, to the registry of the international crisis on an exceptionally serious structural crisis. Among the most important features, which leads to structural crisis having, mention the following three:

a) the Romanian economy is essentially the effect of relocation company, a subcontractor specializing in spare parts, sub-assemblies and products of behalf of the Western European markets

b) inability of the economy to harness its own resources, agricultural transforming it into a market subscription depended import in proportion of coca 70%

c) character of Economics emphasis on manufacturing Assembly "at the expense of the status of" economy and innovation research. "

Are the features that lead to a crisis of domestic production capacity and capitalization of a value added are compatible with the European average. If these features should be taken into account when you make statements of exit from the recession, you reach a deeper understanding of the situation in which we find ourselves and there would be a positive expectation unrealistic about the success of the measures taken or to be taken, they could have towards relaunching the economy by increasing rates extremely optimistic for the years 2011 and 2012.

In conclusion, if at the end of the quarter three of this year we will get out of the recession doesn't mean either that we will eliminate the effects of the international crisis, nor that we remove or at least mitigate the effects of the structural crisis.

3. The report of the phase out of the recession and the exit of economic recovery phase

Economists have likened the graphic form of the current crisis, the growth in the form of letters. If after a period of recession are

growing, then has the shape of the letter V. If after the period of growth is again a period of recession and then rising again, then has the shape of the letter w. might be another form of the letter a or, rather, of a circle. Is a form that I am afraid that you might have declared this exit from the recession. The explanation is simple. If we imagine the starting point of the recession as the top point of the circumference, lower circumference until it reaches the bottom of it, after which the economy climbs up on the circumference of the circle is closed, that is, until you reach the lowest point of the circumference, from which it was originally left.

Closing the circle would mean coming out of recession, so a reason of satisfaction and success of government policies. My view is that you should not rejoice, but on the contrary, let us worry about such a success, because coming out of recession through the entry point touch again in recession are famously missing out on the opportunity to solve the structural problems that we have on our economy and we have mentioned above. Measures which the Government has taken to achieve the indicators for macro stabilization negotiate with the IMF have not, in my view, than the chance to get out of recession through a spin on the circumference of the circle, i.e. without any possibility of structural change. Success would be simply to return to the point before the recession, under no circumstances to a situation different from that of the positive changes in the structure, the efficiency and competitiveness of the economy.

Rotating in circle might not take us, at the time of removal from the recession, than at the same level of underdevelopment of agriculture that we had in 2008, the same primary subcontracting industry to foreign firms, for Assembly of products designed and sold by others on the same recovery incapacity of national potential competition on the European market. 2011 will bring out of the recession, but in the absence of proactive measures rather than genuine transformation of the economic activity in advance of 2008 in a higher rate based on a new economic structure, capable to make the internal factors of competitive advantage, we could not hope for a real economic progress. We continue to spin in a circle.

4. Strengthening and securing macro stabilization

Exit from the recession should be not only an effect of macro stabilization obtained by agreement with the IMF, but also a general framework for the transition from recession to recovery. The question is: how secure is this enhanced and macro stabilization? My view is that this macro stabilization is extremely fragile. The explanation may be given by the type of measures taken in the direction of macro stabilization. They were exclusive, type reductionist "lunches" with immediate effect without any attribute off. Measures of dismissals of staff and reduction in consumption have, indeed, the immediate effect of macro stabilization, but unfortunately generates and effects contraries (perverse) macro stabilization, estimated in the absence of proactive measures taken at the latest the measures reductionist (austerity).

It must also be added and that the maintenance condition of macro stability, under the conditions of a country dependent on food imports, more than 70% and petroleum in the ratio of CA. 65 percent, is subject to the international market and balance. How is inevitable significant increase in the price of cereals and meat and oil, and becomes more problematic macro stabilization and context that it should provide the re-launching and more unpredictable.

The production does not cover consumption

Almost all of the growth of inflation in the first four months of the year was due to food prices, while domestic production could not cover consumption. Exist no viable alternative to the report that was created between adjustment and financing. More on meaning, domestic production does not cover consumption, so it appears inflationary pressures.

The favorable labor market

There are favorable conditions for reducing the level of inflation by the end of the year. Labor market conditions remain favorable disinflation would be easy, which

helps a lot in monetary policy decisions. Externally there are, however, further inflationary pressures on the prices of raw materials, talking about forecasts for the next period. Internally, the Elimination of subsidies to the heat will have an impact on the consumer index and has remained in the category of this factor on the evolution of inflation risks. The fuel price increase inflation expectations can damage.

The unfavorable evolution of inflation and increasing food prices helped fuel

-Factors that have contributed to the unfavorable evolution of inflation are substantial increases in the prices of food commodities on the domestic market and fuels. As regards the factors which have contributed to this negative development, we primarily offer nature adverse shocks. They were reported in the previous report as liabilities and, unfortunately, were materialized in full. It is the substantial increase in prices of food commodities on the domestic market, our index of consumer prices. Such increases were followed by adverse shocks to foreign markets and a situation less favorable to the internal market. The second factor has been the prices of fuels. There significant increases in prices and quotations of international petroleum, in the context of the turmoil in the Middle East and North Africa, and domestic excises. Such increases and abolition of the exemption from excise duty on energy products with content of biomass led to the rise. Inflationary pressure for the weakening of demand driven deficit scenario, being a gradual advance mitigation of the influence of this factor to disinflation, as the economy comes back and install their economic growth. There have been reported so far, and this is a good thing, heartening, inflationary pressures in the labor costs. Wage increases were less than productivity growth.

Helped us and an appreciation of the euro versus dollar, moderate enough for about 4%. According to BNR, the annual inflation rate in the first quarter of 2011, two exceeded the estimates of the National Bank, reaching 8,01%, compared with 7.6 percent in February, making it possible to exceed the forecast for the end of the year, if not

restarted the process of disinflation in semester two. The recent evolution of macroeconomic indicators points to increase the annual inflation rate at the level of 8,01% in March 2011, compared with 7.6 percent in the previous month, due to the materialization of risks by nature offer related to the significant increase in prices of foodstuffs and fuels highlighted in the Report on inflation in February 2011, in the context of growing pressure from accumulating on the international markets of raw materials, announced BNR.

Forecasting of 5.1 percent inflation for the year end

The inflation forecast for this year is by 5.1 percent. 5.1 per cent forecast for this year does not include the increase which realize that it will happen, probably in the autumn, to understanding that this level may be exceeded.

Inflation over the past four months, caused almost entirely by higher prices of the food

Of foodstuffs and fuels highlighted in the Report on inflation in February 2011, in the context of growing Growth of inflation expectations over the past four months was due almost entirely to the segment of the goods. Public dialogue on the causes of the rise in inflation is considered dangerous for that reason there is no problem. The figures, almost all the increase in inflation in these first four months was due to segment goods in internal and external causes. If I had a better production, with a good situation and international developments would not have been so disadvantageous could have avoided this situation.

In a comparison with countries in the area of Romania is in first place at soaring vegetables and between countries with a relatively large rise in oils and fats and sugar. Romania stood better in bakery products, where the rise of prices was determined by the existing stocks and the fact that the wheat was better. The biggest increases in prices of food have been reported in Bulgaria. However, in Romania, the share of food without beverages, in the consumer basket is 33.1 percent, compared with 17 percent.

Other factors that contributed to the growth of inflation expectations were those related to the situation in North Africa and East and petroleum price trends internationally, but also by removing the reduction in excise duty on energy products containing biomass. According to BNR, the annual inflation rate in March of this year exceeded the estimates of the National Bank, reaching 8,01%, compared with 7.6 percent in February, making it possible to exceed the forecast for the end of the year, if not restarted the process of disinflation in semester two.

The recent evolution of macroeconomic indicators points to increase the annual inflation rate at the level of 8,01% in March 2011, compared with 7.6 percent in the previous month, due to the materialization of risks by nature offer related to the significant increase in prices pressure from accumulating on the international markets of raw materials, announced BNR.

Excessive appreciation of the course, unfavorable

The Central Bank considers a strong appreciation of the unfavorable exchange rate. It does not consider that an excessive appreciation of the course is favorable and not support a high volatility in exchange rates.

Inflation will fall in the range being targeted in the first quarter of 2012

Inflation will fall in the range being targeted in the first quarter of 2012 and will have a certain growth in the first half of the year 2013. It will be in the range being targeted in the first quarter of 2012 and we will remain there, with some growth, and early in the year 2013. The Board of Directors of the National Bank of Romania (BNR) decided in February to maintain inflation target for the 2011, 2012, at the level of 3%, plus/minus one percentage point and to adopt a stationary target, starting in 2013, 2.5%, plus/minus one point.

The monetary policy

The Central Bank's monetary policy will continue to monitor the market and will not change its attitude so far in its monetary policy. Continuing his-and the role of supervisor of the market. It will relax monetary policy, will not concede in front of interpretations, when inflation will show the snarl also will have to reduce their reference interest rate, the interest rate for monetary policy. The Board of Directors of the National Bank of Romania has decided to maintain the monetary policy interest rate to 6.25 per cent per annum, proper management of the liquidity of the banking system, maintaining current levels of reserve rates applicable liabilities in lei and foreign currency of credit institutions.

Positive reports on the economy complicates monetary policy

An improvement in sentiment of the country, attested in the reports of international analysts, will attract volatile capital flows which will affect the exchange rate, which will complicate the Central Bank's monetary policy. A case of deviation from the inflation projected trajectory, from the external environment, is that relating to volatile capital flows. We have a better sense of the country, resulted in reports that international analysts. For many years has never seen such an avalanche of positive reports. For BNR is a complication. We complicate monetary policy, how to act on these flows that will affect the exchange rate. It helps us in the short term, but it has adverse effects on the long term. An inflation targeting seeks a low inflation keeping longer periods. The Central Bank is interested in long-term sustainability.

We are not interested in influences on the prices in the short term. We want long-term sustainability. Capital flows with positive evolution over the course helps us in the short term. It is necessary for inflation to drop at a sustainable level without damage perspective on medium and long-term.

Risk of deviation from the inflation target is descending

Risk of deviation from the inflation target is on an upwards, one of the causes being the year 2012, the year of elections. Risk of deviation from the inflation target is up. Approaching 2012, year of election, and there is temptation or pressure related to relief in respect of the program of fiscal consolidation. Also trust in the evolution of inflation persists, but distrust stems from the fact that any of the risk factors influence could have a higher risk. Confidence is maintained, we cannot say that expectations are not anchoring but we observe a weakening confidence on inflation. Any of the factors likely to have a significant influence.

The Board of Directors of the National Bank of Romania (BNR) decided in February to maintain inflation target for the 2011, 2012, at the level of 3%, plus/minus one percentage point and to adopt a stationary target, starting in 2013, 2.5%, plus/minus one point.

Correction of the external deficit suggests that the Romanian economy has changed

The external deficit Correction is based on fundamentals, show that the Romanian economy has changed, but the economic equilibrium will take a long time. External deficit correction shows that something has changed in the Romanian economy. The correction is based on fundamentals. Romania also has at its disposal sufficient time to achieve economic equilibrium.

Equilibrium will take longer and we have "enough time to do we keep them". The Central Bank does not have the data needed to be able to affirm that the appreciation of the exchange rate is in line with economic fundamentals It was said that appreciation is consistent with the fundamentals, because we have not yet needed data. We have no data to say that we are in a position to have an appreciation rates. There is nowhere and here, and retention to help us with this exchange rate in order to win a battle in the short term.

The Central Bank reluctance to handle monetary policy interest rate is justified by the fact that an evolution it would induce alternating uncertainties and would influence in a negative way prices. About the reluctance of BNR in the interest rate to maneuver for monetary policy is arguably not known for its short term goals are not achieved. The manner in which appears this connection and the stability of a rough estimate involves many factors. An evolution of growth and declining interest rates, it would cause confusion, because, according to her handling of contradictory factors influencing prices would not be beneficial.

The Insurance Market and the Crisis

Petrescu Eva-Cristina

Ionciță Diana

Bicăjanu Vasile

The Bucharest Academy of Economic Studies

eva_petrescu@yahoo.com

Abstract

The Romanian insurance market had and continues to have a similar evolution to the Romanian economy, being heavily influenced by changes in the environment. Nowadays, the insurance market is affected by the crisis. The evolution of the insurance market recorded an ascending trend till 2008, but in 2009 it recorded a decrease which continued in 2010. Causes of the decreases are related to the economic crisis, the significant contraction of sales of vehicles, of motor leasing, of the freezing of bank loans and due to the decrease in the purchasing power, but causes are related also to consumer behaviour. In this paper a documentary study regarding the main characteristics of the Romanian insurance market in the crisis period and the results of a survey regarding the perception on insurance are presented.

Key words: Romanian insurance market, crisis, perception, survey

J.E.L. classification: M31, G22

1. Introduction

Insurance in Romania has a longstanding tradition and the insurance industry has known a spectacular increase in Romania in the period of economic upsurge. The Romanian insurance market had and continues to have a similar evolution to the Romanian economy, being heavily influenced by changes in the environment. The Romanian economy nowadays is strongly integrated in the international economic system [2]. It is also true that Romania has a huge development gap to bridge to reach the average level of the European Union [3]. After the fall of

communism in 1989, the national economy has developed, and along with it the insurance sector. After entering NATO (2004) and EU (2007) the premises for a sustained development existed, however the crisis affected the Romanian economy (the insurance industry included) starting with 2009.

2. The main characteristics of the Romanian insurance market in the period of crisis

In Romania in 2010, at the beginning of the year there were 45 insurance companies authorized to function by CSA, and at the end of the year there were 43 insurance companies (one company has entered in 2010 on the Romanian market and three companies left the market).

The supply on the Romanian market is varied and there is a continuous diversification of insurance products. The development is mainly due to foreign insurance companies. At the beginning of 2010, foreign investors held 88.65% of the insurance societies' share capital and at the end of the year 91.40% of the share capital was foreign capital. Regarding the supply, we can state that the insurance sector in Romania is fully integrated in the world wide industry, the big players being present on the Romanian market.

The potential of the Romanian insurance market is high, due to the large number of people: the population of Romania in 2009 was of 21.46 million people, decreasing to 21.41 million people in 2010, being on 7th place in EU (after Germany, France, UK, Italy, Spain, Poland), due to size of the country: 238391 km², 9th place in EU as geographical area (after France, Spain, Sweden, Germany, Finland, Poland, Italy, UK) and due to the large number of

properties: 8.38 million properties [5], [7]. However, real demand is quite low. The starting point of the Romanian insurance market was very low: in 1995 the volume of gross written premiums was of 142.5 million USD, in 2008 the premiums reached the highest level: 3.15 billion USD and in 2010 dropped to 2.59 billion USD (equivalent of 1.9 billion euro or 8.3 billion lei – see Table 1), a small drop in the world premiums of 2010 of 4339 billion USD [8].

Table 1. Indicators for the Romanian insurance market 2005-2010

Years	Gross written premiums* (lei)	Gross written premiums** (mil. euro)	Real change* ^a (%)
2005	4417165819	1201.3	17.01%
2006	5729284541	1694.2	23.68%
2007	7175789699	1987.6	17.53%
2008	8936286505	2242.4	17.15%
2009	8869746957	2097.8	-5.24%
2010	8305402152	1938.3	-13.26%

*Sources for data: CSA (2011), 2010 Annual Report; CSA (2007), 2006 Annual Report,

** Own computation function of the exchange rate leu/euro 2005: euro 3.6771; 2006: euro 3.3817; 2007: euro 3.6102; 2008: euro 3.9852; 2009: euro 4.2282; 2010: euro 4.2848 (the exchange rate leu/euro from <http://www.cursbnr.ro/arhiva-curs-bnr>)

^a The real change is adjusted by inflation

Nowadays, in Romania the insurance market is affected by the crisis. The evolution of the insurance market recorded an ascending trend till 2008, but in 2009 it recorded a decrease which continued in 2010. The insurance market recorded a decrease of over 5.24% in 2009 compared to 2008 and a decrease of 13.26% in 2010 compared to 2009. According to Swiss Re’s latest study “World insurance in 2010”, in 2010 as compared to 2009 the world insurance premium volume increased 2.7% on an inflation-adjusted basis.

The low development of the Romanian insurance market is also revealed by the low level of the degree of insurance penetration - see Table 2.

For the first time after the liberalisation of the Romanian market (in 1990) the insurance penetration was declining: in 2009 the

indicator was of 1.8% and in 2010 of 1.62%. The gap compared to developed countries is significant: the insurance penetration for industrialised countries was in 2010 of 8.6% (USA: 8%, Japan 10.1%, UK 12.4%, France 10.5%, Germany 7.2%, Italy 8.1%).

The level of insurance density is also far behind the level of developed countries. In 1995 the insurance density was of 5.6 USD. The highest level of insurance density was in 2008 of 147 USD (equivalent of 104 Euro or 416 lei) and in 2010 the insurance density was decreasing at 121 USD.

Table 2. The degree of insurance penetration and the insurance density 2005-2010

Years	The degree of insurance penetration* ^b (%)	Insurance density* ^c (lei/person)
2005	1.54%	204
2006	1.67%	266
2007	1.77%	332
2008	1.77%	416
2009	1.80%	413
2010	1.62%	389

*Sources for data: CSA (2011), 2010 Annual Report; CSA (2007), 2006 Annual Report

^b The degree of insurance penetration is representing premiums as a % of GDP

^c Insurance density is representing premium per capita

The non-life insurance sector is much more developed in Romania than the life insurance sector and relies on motor vehicle insurance: the optional insurance: land transport vehicles insurance (other than railroads) and the mandatory insurance: third party motor liability insurance. The CSA data shows that in 2009 and in 2010 the structure of the market was similar.

In 2009, the non-life insurance sector represented 81.64% of the total volume of written premiums (CSA 2010). In 2009 the motor insurance represented 77% from non-life insurance and the fire and disaster insurance was 13% from non-life insurance. The optional home insurance represented 43% from fire and disaster insurance. Optional home insurance had a volume of premiums of 94.5 million Euro (4.5% of the total volume of gross written premiums), the number of contracts closed being around 1.5 million in 2009. There was a low level of insurance contracts compared to the number of homes (only about 18% of the total

number of properties having an insurance contract in 2009).

In 2010 the non-life insurance sector represented 79.94% of the total volume of written premiums. Motor insurance represented 74.51% from non-life insurance: land transport vehicles insurance, other than railroads (36.94%) and the third party motor liability insurance (37.57%). The decline of the market in 2010 is due to the decline of the optional insurance for motors (the land transport vehicles insurance, other than railroads). Causes of the decreases are related to the economic crisis, the significant contraction of sales of vehicles, of motor leasing, of the freezing of bank loans and due to the decrease in the purchasing power. Compared to 2009, in 2010 third party motor liability insurance (mandatory insurance) was increasing.

In 2010 fire and other natural disasters insurance was the third category as share in non-life insurance (14.57%).

The home insurance premiums in 2010 were of 94.7 million Euro, representing 42% of fire and other natural disasters insurance. The optional insurance premiums were of 87.8 million Euros and for mandatory home insurance against natural catastrophes issued according to the Law 260/2008 (the system which became operational in July 2010) were of 6.9 million Euro. At the end of 2010, there were 2.081.682 home insurance contracts (1.714.393 optional and 367.289 mandatory). There are 8.38 million privately owned homes in Romania (4.5 million in urban areas and 3.8 million in the rural environment), which means a degree of insurance coverage of houses in Romania of about 24.8%.

Most gross premiums were underwritten in 2010 in the Bucharest area, 49.93%.

The insurance demand on the Romanian market does not have a uniform character. The insurance demand is focused on geographical areas with a high economic potential and on the above-average income population [4].

3. Perception of the Romanian insurance market in the period of crisis - survey

Within the research of the Romanian insurance consumer behavior and the factors

influencing it (project CNC SIS – UEFISCSU number 915 / 2009 PNII – IDEI 1773/2008) we analyzed the perception of insurance among Romanian consumers by using the survey. The survey is a selective quantitative market research. The quantitative research aims at generalizing results at the level of the entire population studied [1].

We have studied the opinions of the population having an insurance contract concluded. We have used the market survey on a representative sample of 1068 insured persons. The survey was conducted with a probability of 95% and a margin of error of +/-3% in April - May 2011. The interview was conducted face to face with the subjects, with the help of a written questionnaire filled in by the interviewer.

In this paper we are presenting the results of the research regarding the opinions related to the perception of the necessity of insurance, the perception of the accessibility of insurance, the perception of the effects of the crisis on the insurance industry.

In order to study the opinions of the subjects interviewed regarding their perception of the insurance market we have used the Likert scale with five levels. The subjects interviewed were asked to express their opinions regarding a series of affirmations from total agreement (+2) to total disagreement (-2).

The results showed that the perception is the following: the insurance is necessary even if it implies a financial effort (score 0.97) – see Figure 1.

Figure 1. The perception regarding the necessity of insurance

Source: survey

The opinions related to the statement regarding the inaccessibility of insurance

indicate that 40.2% of the subjects consider that insurance is inaccessible (score 0.24).

Figure 2. The perception regarding the inaccessibility of insurance

Source: survey

The perception of 39.4% of the interviewed subjects is that insurance companies develop in Romania a benefic activity for the population, 21.8% of the interviewed subjects disagree with this idea and 38.8% do not have a clear point on this matter – see Figure 3. The score was of 0.21.

Figure 3. The perception regarding the benefic activity of insurance companies

Source: survey

55.7% of the interviewed subjects consider that the crisis has severe effects on the insurance industry, 31.2% of the subjects do not have an opinion and 13.1% of the subjects disagree with the statement.

Figure 4. The perception regarding the effects of the crisis on the insurance industry

Source: survey

The total score was 0.63, indicating that there is an agreement with the sentence: “The crisis has a serious effect on the insurance sector in Romania”.

There is an agreement with the statement: “The economic situation makes long term insurance unattractive“ (score 0.43) – see Figure 5.

Figure 5. The opinions related to the statement: “The economic situation makes long term insurance unattractive“

Source: survey

18.5% of the interviewed subjects totally agree with the necessity of insurance during crisis and 30% of the subjects consider that insurance is necessary during crisis. Only 17% do not consider insurance necessary during a crisis.

Figure 6. The perception regarding the necessity of insurance during crisis

Source: survey

The score of 0.46 indicate that the subjects interviewed agree that insurance is necessary during a crisis.

4. Conclusion

The insurance market is affected by the crisis, being influenced by changes in the environment. An important influence was related to the negative evolution of car sales and of motor leasing. The causes of the decreases on the Romanian insurance market are related to the economic crisis: the decrease of the purchasing power of potential insured, but also to the insured behaviour.

The difference between the potential demand and effective demand can be explained in the first place by economic factors: the low level of income of the population, and, in the second place, by sociological and cultural factors.

The market survey realized in April - May 2011 indicated that the perception is that insurance is necessary even if it implies a financial effort, that insurance is perceived as inaccessible by a large part of the

interviewed subjects; the interviewed subjects consider that the insurance companies develop in Romania a benefic activity to the population, the perception is that the crisis has severe effects on the insurance industry and the subjects interviewed consider that insurance is necessary during a crisis.

Education can change the behaviour of the potential insured and mentality can be influenced by the insurance companies. Therefore, the role of insurance companies is extremely important; they have to educate and to create a new mentality.

nic_petria@yahoo.co.uk,

renetanase@yahoo.com

Abstract

The recent financial crisis, this time started from the most powerful and liberized economy has affected the entire world. Its causes and effects are still intensely debated in political circles, in academic environments, within NGO's and financial markets. An incresigly prevalent conclusion that emerges from this debates is that a global approach to address the crisis is needed, through collaboration and coordination of the necessary actions ment to restore the trust in the international financial system.

The crisis brought into a new light the special role that IMF and World Bank are called upon to play in their actions of reforming and rebuilding the trust within the international financial system.

In this respect, our work aims to present some of the challanges launched by the recent crisis to the International Monetary Fund and the World Bank. These challenges are related to the way in which the main international financial institutions plan to act in order to resolve the current crisis and to prevent and address the future crises.

Key words: financial crisis, IMF, World Bank, challenges

J.E.L. classification: E02, E59, F33

1. Introduction

The analysis of the financial crises that occurred in the past 20 years, but especially of the one triggered in June 2007, revealed a strong and dynamic dimension of globalization and the consequences of this phenomenon. It also highlighted the huge increase in volume and the volatility of

capital flows, and also the degree of interconnectivity between financial markets leading to a fast paced contagion with triggering a financial crisis. An extensive literature deals with the factors, causes and effects of these crises and proposes solutions to solve them.

Out of this factors the most nominated were[2]: 1) the financial deregulation process started in the '70's, following an opinion trend that supported a so called fundamentalism of free markets which become self-regulated and self-balanced. Consequently emerged a process of removal of the banking regulations set up after the 1930's Big Depression; 2) the financial innovation and the deeper segmentation of the financial products which became more and more complex and sophisticated end up by being misunderstood by the market players; 3) the lax monetary policy promoted low interest rates which lead to a cheap liquidity excess on the financial markets; 4) the excessive leverage, the indebtedness of the households, companies, the financial intermediaries and of the nations, also the maturity asymmetries between assets and liabilities; 5) poor incentives, the regulatory and the supervisory gaps in certain important segments of financial system; 6) pro-cyclical dynamics in the regulatory system, accounting and risk management, with low standards in the processes of subscription, registering, regulating and market monitoring; 7) the greed manifested by large financial institutions looking for excessive returns, associated with risks outsourcing in order to protect their balance sheets, in the context of a large opacity and market fragmentation within which the risks location and exposures was unclear and became cloudy; 8) the poor corporate governance which promoted an excessive risk tolerance

and a risk mismanagement both in the financial corporations and in their regulators and supervisory bodies. As well, it promoted a remuneration, bonus and incentive system for the managers, dealers and financial market brokers that overcompensated the short term performance whilst they assumed long term risks. This led to the excessive risk taking and a lack of transparency that generated an asymmetry of information in important financial market segments; 9) originating and distribution models of complex products which created perverse incentives for investors which not only blurred the relationships between lenders and borrowers, but on top of it, they distracted the capacity of debtors to pay the loans without collateral foreclosure. In this way was sometimes intentionally underestimated the risk of liquidity and many financial institutions mismanaged the process of coordinating the maturities; 10) the inadequate activity of Credit Risk Agencies (rating agencies), manifested by promoting on the market of a weak perception of credit risk and default by rating AAA the so called “senior tranches” of structured financial products as CDOs (Collateralized Debt Obligations), the same rating as the one for governmental bonds. This action was taken without having historical data to back and show the evolution of default rate for these products in turmoil and crisis conditions. 11) large current account and budget deficits recorded by most economies; 12) the excess of indebtedness of the U.S. economy and population and the saving surplus of the developed and emerging states from Asia and especially China;

All this factors constituted as many causes that determined the trigger of crisis, being generated by the activity of financial institutions, companies, the regulatory agencies, the supervisory and rating agencies and also by the politicians. Within these actors banking system plays a crucial role.

Even though regarding the factors, causes and actors that contributed to triggering and deepening financial crises we may not always find a consensus, however there is one that states: the solutions needed in order to solve the problems generated by the crisis must be global. These solutions must be found and implemented through cooperation and consensus by key players of national and

international financial markets.

Within the process of addressing the financial crises, of recovering and restoring the stability and confidence in the financial-banking system, a crucial role is reserved to the international financial institutions (IFI), respectively to the International Monetary Fund and the World Bank.

Being the main institutions with a global activity and having key attributions such as: providing a wide monetary and financial cooperation aimed at contributing to the balanced development of trade, financial and monetary foreign exchange, enabling balanced and sustainable growth of all economies and the reduction of poverty at a global level, IMF and World Bank are forced to face new and remarkable challenges.

In order to efficiently contribute to addressing the serious issues facing both developing states and emerging and developed countries, IMF and World Bank are called upon responding to new challenges. These challenges are related to: global commercial imbalances and payment balances, strengthening the financial supervision in the global economy through cooperation and collaboration with other agencies, the need to increase the credit resources and to improve the credit instruments, to improve the financial governance.

Starting from the elements mentioned above, this article aims to present and debate some of the most recent challenges that the occurring financial crises put in front of IMF and World Bank.

2. Challenges to the IMF and World Bank

As the main international financial institutions, also known as Bretton Woods Institutions, the two great institutions promoted in the 80's and 90's the neoliberal paradigm of economic development under the primacy of the so called: “Washington Consensus”. It involved a series of recommendations on economic development policies in respect to: financial discipline with avoidance of large fiscal deficits relative to GDP; redirection of public expenditure priorities toward fields offering both high economic returns and the potential to

improve income distribution, such as primary health care, primary education, and infrastructure; tax reform (to lower marginal rates and broaden the tax base); interest rate liberalization; a competitive exchange rate; trade liberalization; liberalization of inflows of foreign direct investment; privatization of state enterprises; deregulation (to abolish barriers to entry and exit); secure property rights;. The term Washington Consensus has commonly come to be used in a second, broader sense, to refer to a more general orientation towards a strongly market-based approach (sometimes described, typically pejoratively, as market fundamentalism or neoliberalism).

These prescriptions have long been recommended and applied as standard packages of reform in developing and emerging countries to solve the problems they faced.

It was considered that by adopting and applying these prescriptions it definitely led to strengthening the macroeconomic framework of the member states, public sector deficit and sovereign debt reduction, to the enforcement of monetary surveillance and reduce distortions in resource allocation in an inflationist environment. It was also considered that capital account and market liberalization contributed to attracting foreign direct investments and to the trade increase leading to economic growth, financial stability and prevented financial and economic crises.

Granting by IMF and World Bank of financial support packages to the countries with financial difficulties was conditioned by respecting these prescriptions and by implementing the recommended economic policies. All these prescriptions usually reflected the vision of the developed countries towards how economic development should unfold.

Many developing and emerging countries did not share this vision, but they were constrained to apply these policies.

Implementing the IMF and World Bank recommended policies, although it had some partial achievements, didn't lead to balanced development and growth of economies nor to the elimination or substantial reduction of financial and economic crises or to widely reduce poverty and underdevelopment. As a testimony to this are the frequent crises that

occurred in the 90's in Latin America, South-East Asia, Russia and Turkey. The poverty and underdevelopment didn't reduced dramatically.

A study conducted by the World Bank shows that 90 percent of the developing countries are severely threatened by the dramatic increase of the poverty levels as an effect to economic crisis [1]. Frustration and dissatisfaction to the inconsistency of action of the two institutions accumulated between both emerging and developing countries and also among the developed ones. Thus, there was a great criticism of the organization, leadership and action of both IMF and World Bank to the lack of conclusive results in provision, preventing and resolving the financial crisis by these two institutions. The critics aimed mainly the weaknesses and the inadequate policies promoted and the impact of these policies to large sectors of the population and development.

There are criticisms aimed at IMF and World Bank's ability to realize the role and purpose for which they were built, the governance and power structure, lack of responsibility for the errors made in promoting and enforcing the financial and economic policies, how they implement the conditionalities imposed on member countries in granting financing. The current crisis only brought forward with more intensity the realism of these critics and underlined once more the vulnerabilities of the international financial institutions (IFI). They must face new challenges determined by the effects of the crisis and globalization in order to fulfill the role and the purpose for which they were established.

The first challenge they must cope with is generated by the explosive growth of markets and capital flows, and also by their extreme volatility that has a consistent potential for imbalances and may generate devastating crises. The crises from South-East Asia, Russia and Argentina, showed that IMF approach for addressing them was inadequate and that there is an imperious need to improve de prediction, prevention and solving capabilities to address the crises.

The neoliberal paradigm, which asserts that the markets are rational, self-controlled and self-balanced, proved inconsistent and insufficient and must be supplemented with other approaches. The countries that resisted

the IMF pressure and applied with caution the liberalization and deregulation such as Chile, Colombia, China, India, coped better with the challenges generated by capital flows.

A second challenge is generated by the massive reverse of the previous large capital flows from the developed countries towards the developing countries. Flow reversal was determined on one hand by the withdrawal of capital from the developing countries due to increased risk aversion in financial markets, making these countries capital exporters and, on the other hand, as a consequence of certain measures undertaken by developing and emerging countries to insure against the risk generated by the capital markets volatility through accumulating of large capital reserves. Major holders of foreign reserves are: China 2.34 trillions \$, Russia 439.8 billions \$, Taiwan 347.2 billions \$, India 283.7 billions \$, South Korea 273.8 billions \$, Hong Kong 255.8 billions \$, Brazil 240.5 billions \$, Singapore 187.9 billions \$, Algeria 149.1 billions \$, Thailand 138.4 billions \$, Mexico 99.9 billions \$, Libya 99.67 billions \$, Malaysia 97.6 billions \$ etc. As a result, many of these countries became capital exporters, mainly to finance de deficits of larger developed countries.

The effect is a poor allocation of resources across the economy and widening of the imbalances that have been one of the causes of the current crisis. IMF and World Bank must find solutions in order to fight this tendency. The third challenge consists in understanding the neoliberal paradigm of economic development based on free markets and according to the Washingtonian Consensus had inconsistent results. The Latin American countries that embraced with enthusiasm the IMF prescription regarding market liberalization, deregulation, strengthening of public financing etc., registered during the last 10-15 years of applying these policies yearly economic growth of barely have of the ones registered during the period 1930-1970, years in which they applied their own policies. By contrast in the same recent years, a group of countries from Asia amongst which are China, India, Vietnam, South Korea and others, registered high rates of economic growth by guiding themselves after a different and more interventionist model of development that

combined a graduated opening of the capital account and a protectionism generated by taxes and subsidies used as incentives. This contrast raises questions about the effectiveness of IMF and World Bank recommended policies, and asks for a rethinking of those in accordance with the current market conditions and requirements. The fourth challenge raised to IFI by the financial crises, is represented by the need of reforming the way the financial resources are attracted and by reforming the mechanisms and the credit instruments. The effects of the current crises have generated great demand for funds to support countries and economies in financial difficulties. This time, capital demand came also from developed countries, fact that complicated once more the financing operations realized by IFI.

The sovereign debt crisis triggered within the European Union sets more pressure upon the IMF resources, which are requested to sustain the bailout processes of highly affected countries such as Greece, Ireland, Portugal, Italy and Spain. But IMF resources are limited and insufficient in the current conjuncture. This implies a great challenge to IMF, which must urgently increase financing resources beyond current mechanisms and instruments, General Arrangements to Borrow (GAB) and New Arrangements to Borrow (NAB) through loans on bilateral bases with the new owners of financial resources: the emerging countries. Although IMF increased its funds up to 750 billions \$ through new SDR allocation and by supplementing the NAB as a consequence of the G20 decision, the need for funds is still high. It is estimated that only Italy alone will request in the near future 650 billions \$ in order to sustain its sovereign debt. In the situation in which other developed countries will face the same problems regarding the sovereign debt the need for funding remains a big challenge.

The recent UE decision taken at the Brussels summit in 8-9 December 2011 to lend to IMF 200 billions EUR is meant to address this demand for funds. In terms of reforming IMF credit policies, it must follow several important objectives, namely: diversification and renewal of credit instruments, increasing the speed of response to requests for credit, increase the flexibility of compliance, focusing on objectives rather

than on specific actions.

Another important challenge is the reform of IMF governance and its surveillance over the global economy. The current IMF governance is dominated by the developed countries, which detain the voting and decision powers and also provide the main financial resources. The power structure is more heavily contested due to the fact that it doesn't reflect anymore the new balance of power within global economy.

The new emerging countries, especially the BRICS Group (Brazil, Russia, India, China, South Africa), claim more power within the IMF Board, reflecting their country's position in the global economy. They believe that in order to ensure more credibility and representation IMF must respect a series of principles, namely [3]:

- a) The institution should not be dominated by creditors;
- b) Potential debtor and debtor countries should have a strong voice within the decision process but not the majority in decision-making processes;
- c) The overall voting power of creditor and possible debtor countries should be approximately balanced. This increases the probability that every case would be judged according to its own merits.
- d) The IMF contribution and the access to its resources should be in concordance with the size of the economies of the member states;
- e) The IMF size should increase in line with the potential need for its resources, being closely linked to the global trade expansion and the international capital flows growth.

There is also required a review of the IMF participation rates that would make possible a stronger affirmation of emerging countries that conquered new positions in the global economy. The challenge for IMF is closely linked to its power to adapt in order to be able to effectively meet these new requests. One last challenge that we took into consideration is to answer the need to strengthen the financial system and global economy supervision by extending collaboration and coordination with other institutions and agencies.

3. Conclusions

The crisis reiterated the need to address its effects, rendering confidence on markets, and also underlined the need of a strong cooperation and coordination between national and international authorities at a global level. It also reiterated the important role of the International Financial Institutions (IFI) in the process of predicting, preventing and solving the crises. For this role to become effective and efficient, IFI must address the challenges of increasing the speed of response to requests from member states, to make more flexible the mechanisms and instruments of attracting resources and granting financing.

IFI must improve its governance by changing the balance of power within its boards and the allocation of shares in accordance with the new changes in position of member countries in the global economy. The crisis also emphasized the need of coordination and a stronger correlation between the processes of markets and economies' regulation and supervision as a huge challenge for IFI. It remains to be seen how the IFI will respond in the future period to this tasks and challenges.

Analysis regarding the International Competitiveness of the Business Sector in Romania in the Context of the Global Economic Crisis

Pirnea Ionela Carmen
Căldăraru Elena Alexandra
The Bucharest Academy of Economic Studies

Abstract

Economists argue that the SME sector is the most important Romanian economy and also the only sector that can bring economic recovery. The entrepreneurs are the key of the economic recovery and they are stimulates the enhancement of SMEs to contribute to ensuring economic growth resources in difficult times. Paper aims to reflect the impact of global economic crisis on the number of SME development in Romania. The article is based on an analysis of research conducted by the Doing Business Report 2010, at the level of 183 countries worldwide. The article highlights the Romania place in the global ranking depending on a number of indicators analyzed.

Key words: performance, economic crisis, SME, competitiveness, indicator

J.E.L. classification: L25, H12

1. Introduction

Peter Drucker said that "*small business is the main catalyst of economic growth.*" These businesses contribute to the basic objectives of any national economy, becoming the "*driving forces*" of economic and social progress [1].

Small and medium enterprises represented primarily by small businesses, are the engine of the European economy. Most businesses in the European Union are small businesses [5].

SMEs play a decisive role in European competitiveness and economic growth. To help them realize their growth potential, the EU promote entrepreneurship and create a

favorable business environment for small businesses.

SMEs have become increasingly important in our society as providers of employment opportunities and key elements for the welfare of local and regional communities. Unfortunately, SMEs have been quite affected by economic and financial crisis [4].

2. Impact of global economic crisis on the number of SMEs in Romania

Currently, the economic crisis has seriously affected a number of companies and has produced a series of changes in short and long term strategies, particularly in the context of the Romanian market where it has entered a number of companies offering competitive products and services of the local market. [2]

Impact of global economic crisis was felt strongly in the Romanian economy as a whole, which was affected by a substantial slowdown in growth, with immediate adverse effects on people and companies focusing primarily jobs and sales volume.

Romania's SMEs have been affected by economic crisis and lack of coherent economic programs, excessive bureaucracy and corruption had a negative influence on the performance of small and medium enterprises. [7].

In 2007-2009, the development of SMEs has revealed a number of particular issues. The process of entry and exit from the market in the SME sector is a natural one stemming from the building upon its characteristics of new market opportunities and adapt to innovation, technological development, qualitative change and orientation towards the needs and customer demand continues.

Tabel 1. Join SME Development in 2007-2009

Period	2007	2008		2009			
		Sem.I	Sem.II	Total an	Sem.I	Sem.II	Total an
Registrations	140.073	76.460	64.182	140.642	60.979	55.043	116.022
Strike-off	20.401	6.495	11.181	17.676	12.037	31.578	43.615
Suspensions	12.012	7.194	4.825	12.019	71.250	62.112	133.362

Source: Annual Report on the SME sector in Romania, developments between the difficulties and challenges, 2010, section "Publications", pg.28.

One can see that in the crisis year 2009, the establishment of SMEs has continued at a less dynamic, while output rose sharply in the economic environment by radiation and in particular the suspension of activity.

Thus, in 2009 more than 133,000 SMEs have suspended activity compared with only 12,000 in the year 2007 and 12,019 in 2008, representing an explosive increase of over 11 times compared to previous years. It is also apparent that the suspension of activity had a spectacular dynamic, both as compared to the previous years and compared with the number of erasures final. The main form of exit from the market in 2009 was suspended activity which has grown three times larger compared with the number of erasures.

The fact that in 2009 the creation new SMEs has fallen dramatically demonstrates on the one hand, potential coaches of Romania, on the other hand, need to support the development of SMEs, as an exit and a way to revive economic growth.

3. Analysis of international competitiveness of the business sector in Romania

"Doing Business Report" is one of the most comprehensive global comparative studies are conducted regularly at intervals of one year and is conducted by the World Bank. Research conducted annually comprises 183 countries worldwide.

Global economic crisis in Romania were the loss of 10 positions in the global rankings on the ease of doing business. Thus, the overall index on "ease of doing business" ranked 45 places Romania in 2008 and

ranked 55 in 2009, ranking of 183 countries surveyed. In the figure below we can see Romania's position in the rankings, but also important in this neighborhood hierarchy.

Figure 1. Romania's position in the overall standings Doing Business Report

Source: Doing Business Report 2010, World Bank, <http://www.doingbusiness.org/reports>

It can be seen from Figure 1 that the index in terms of overall "ease of doing business", Romania ranks 55 and positioned in front of Poland (position 72), Czech Republic (item 74) and Moldova (position 94), but behind Hungary (position 47) and even Bulgaria (item 44). Figure 2 presents the seats obtained by Romania, in terms of each indicator included in this analysis, the dynamics of the two years 2009 and 2010. The analysis highlights both the set of 10 indicators of deterioration in previously held positions as well as improvements in performance on other criteria analysis.

Figure 2. The evolution of Romania's position in relation to each indicator in 2010 and 2009

Source: Doing Business Report 2010, World Bank, <http://www.doingbusiness.org/reports>

Overall business targeting global index, Romania lose 10 positions. As can be seen in Figure No. 2, causes deterioration of the position in the rankings are due to loss of position in nearly all criteria for analysis, but with a significant loss, ie 15 positions at the indicator "Enforcement", 12 positions to the indicator Opening a business.

The only indicator where Romania's position has improved in ranking is "Registering Property" and 92nd position in 2010 compared with 112 in 2009.

Figure 3. Romania and neighboring position in the rankings depending on the indicator "Registration of property"

Source: Doing Business Report 2010, World Bank, <http://www.doingbusiness.org/reports>

The "Registration of property, although improved by 10 positions in the rankings, placing Romania (92nd) far behind many countries in the region, namely from Poland (position 88), Czech Republic (item 62), Hungary (position 61), Bulgaria (item 56).

Also in the world ranking, positioning can be observed on top of Moldova (position 17), Slovakia (item 11).

4. Research methodology and results

Based on the foregoing and considering the fact that Romania has lost the position in almost all indicators included in the analysis, research based on analysis of Romania and neighboring position in the rankings according to each indicator separately, using data supplied by Doing Business Report.

Place 149 for the indicator "Payment of fees and taxes"

This index places Romania on the world ranking 149 with a total of 113 payments per year, with payment procedures that involve a

number of 202 hours allocated to a level of gross sales tax 16.04% taxes employment and social security contributions as a percentage of 34.2% and a total tax rate that amounts to 44.6%.

Figure 4. Romania's position in the neighborhood and according to the indicator tables "Payment of fees and taxes"

Source: Doing Business Report 2010, World Bank, <http://www.doingbusiness.org/reports>

In the above figure can be seen that all countries in the region included in this analysis is placed in the second part of the rankings, that the position 95, occupied by Bulgaria and to position 151, occupied by Poland. Except in Poland, Romania has the most disadvantageous position, which leads to the conclusion that the adoption of public policies, regulations and systems to simplify the required paperwork and procedures administratively easier to pay taxes.

Place 113 for the indicator "conditions of employment of labor"

This place 113, positioned Romania just ahead of Moldova (position 141) and far behind Slovakia (position 81), Hungary (position 77), Poland (position 76), Bulgaria (position 53) and the Czech Republic (item 25), the latter being the best positioned among all states in the region on this indicator.

Figure 5. Romania's position in the neighborhood and according to the indicator tables "Conditions for getting a new hire labor"

Source: Doing Business Report 2010, World Bank, <http://www.doingbusiness.org/reports>
Place 115 for the indicator "Access to credit"

This vantage point places Romania in the world rankings in a tie with Poland and Slovakia, but also far ahead of other countries in the region and Moldova (position 87), Czech Republic (item 43), Hungary (position 30). With regard to Romania, this place 15 is derived from a score of 8 points in the enforcement of legal rights index strength (1-10), five reference points in depth information on the credit index (0-6) and viewed coverage offered through the Public Register which comprises 5.7% of the adult population of the country.

Figure 6. Romania's position in the rankings and neighborhoods depending on the indicator "Access to credit"

Source: Doing Business Report 2010, World Bank, <http://www.doingbusiness.org/reports>

Place 41 for the indicator "Protecting investors"

Romania was assigned an index based on the 41st of September on the coverage of public information (index methodology evolved from 0-10), an index of 4 on a scale of 10 units which assesses the ease of identifying ownership and not least for a score of 6 points out of 10, for the strength of investor protection.

Figure 7. Romania's position in the rankings and neighborhoods depending on the indicator "investor protection"

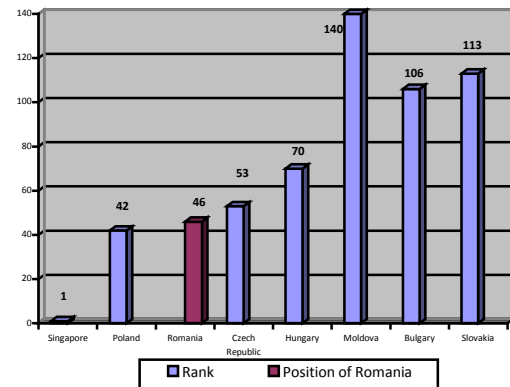

Source: Doing Business Report 2010, World Bank, <http://www.doingbusiness.org/reports>

This place positioned Romania at the same level with Poland, Bulgaria and before Hungary (position 119), Moldova (position 109), Slovakia (position 109) and Czech Republic (position 119).

Place 46 for the indicator "External trade"

With a slight deterioration in the position in the rankings this place as a result of a number of documents required five operations and a number of six export import documents, requiring about 12 days in duration to ensure compliance to export and 13 days for import operations, which require cost U.S. \$ 1.275 per container for export and U.S. \$ 1.175 per container import.

Figure 8. Romania's position in the rankings and neighborhoods depending on the indicator "foreign commerce"

Source: Doing Business Report 2010, World Bank, <http://www.doingbusiness.org/reports>

It can be seen from the above figure, however, that Romania's position is well ahead of other countries in the region and Moldova (position 140), Slovakia (position 113), Bulgaria (position 106), Hungary (position 70) and Czech Republic (item 53).

Place 91 for the indicator "Closing a business"

Procedures for an average within 3.3 years and requires a cost amounting to 11% of the property. This indicator positioned Romania behind many countries in the region such as Slovakia (position 39), Hungary (position 58), Bulgaria (position 78), Poland (position 85) and Moldova (position 90), yet in the Czech Republic which had position 116 in rankings conducted by the Doing Business Report.

Figure 9. Romania's position in the rankings and neighborhoods depending on the indicator "Closing a business"

Source: Doing Business Report 2010, World Bank, <http://www.doingbusiness.org/reports>

Place 91 for the indicator "Obtaining building permits"

The process requires going through 17 procedures that require a period of 243 days and whose cost amounts to 87.9% of income per capita, a significant downward trend compared to 2007.

Figure 10. Romania's position in the neighborhood and according to the indicator tables "Obtaining building permits"

Source: Doing Business Report 2010, World Bank, <http://www.doingbusiness.org/reports>

This place, respectively 91, positioned Romania before Poland (position 146), Moldova (position 161) and Bulgaria (position 119), but behind Hungary (position 88), Czech Republic (item 76) and Slovakia (item 56).

Place 42 for the indicator "Opening a business"

In Romania, a business establishment is based on six procedures, lasts an average of 10 days is 2.9% of average income per capita and the share of the costs of making the

business relative to the minimum starting capital, amounting to 0.9 % of average income per capita (past issues recorded a slight decrease in the last two years). From the perspective of this index, Romania is placed before Poland (position 117), the Czech Republic (position 113), Moldova (position 77), Slovakia (position 66) and Bulgaria (50), but behind Hungary (position 39).

Figure 11. Romania's position in the rankings and neighborhoods depending on the indicator "Opening a business"

Source: Doing Business Report 2010, World Bank, <http://www.doingbusiness.org/reports>

Place 55 for the indicator "Enforcement"

According to research conducted, Romania included a number of 31 procedures to be followed, a period of 512 days for their completion and a cost that rises to 28.9% of the amount claimed.

Figure 12. Romania's position in the rankings and neighborhoods depending on the indicator "Enforcement"

Source: Doing Business Report 2010, World Bank, <http://www.doingbusiness.org/reports>

This position places Romania long before Bulgaria (position 87), Czech (position 82), Poland (position 75) and Slovakia (position 61), but far behind Hungary (item 14) and Moldova (position 22).

5. Conclusions

Romania's economy was heavily affected by global economic crisis.

The global economic crisis had the following consequences for SMEs in Romania:

⇒ 133,000 SMEs have suspended business activities, which represents an increase over 2007 by 11 times;

⇒ 43 600 firms were deleted from the Register of Commerce, which represents an increase of more than 2.3 times the number recorded in 2007;

⇒ process of setting up new SMEs has slowed, however a number of 116,000 to set up new businesses;

⇒ main exit from the market as was the suspension of activity, number of firms suspended Oti was 3 higher compared to the number of removals;

⇒ most affected sectors were intermediere estate services, construction, industry and administration and support services, wholesale and retail trade;

⇒ most new legal entities were created within the scope of business activities, scientific and technical.

According to the Doing Business Report 2010, Romania is in 2009, where 55 out of 183 countries assessed, the fund recorded a deterioration of the global crisis of the place formerly held 10 positions.

Employment Policies Working in Romania - between Theory and Reality

Pivodă Roxana Mihaela
« Spiru Haret » University
roxana_pivoda@yahoo.com

Abstract

Important tool to regulate the labor market, employment policies are concerns of state intervention in the labor market in order to ensure the highest level of employment and reduce the possible undesirable effects of unemployment. The transition process of the Romanian economy, which began 20 years ago, resulted in profound changes in all areas of society: political, economic and social emergence and development of unemployment is only one of them.

Key words: labor market, flexibility, measures set

J.E.L. classification: J68

1. Introduction

Many scientists and politicians agreed that the social problems of unemployment can not be resolved without a major reform of social policy in general and employment in particular, issues necessarily imposed by the government to adopt employment policies designed to the one hand to help the unemployed and the other part to help reduce and maintain the level of unemployment in certain proportions.

Thus, the state's role in managing labor market consists of various direct and indirect actions, which stimulates the creation of new jobs in the modern economy.

This stems from the fact that most activities in the economy is privately owned, and the structure being freely determined by entrepreneurs and the government only participate in these activities to some extent, public enterprises are managed in the same way as the private, on the same principles of free market.

Thus, the developed economies have a well-established entrepreneurial tradition, a variety of qualifications, financial institutional and economic structure of a coherent and dynamic adaptable, allowing problems of employment in accordance with the requirements of economic efficiency, social, ecological and demographic. In such a context, employment policies have an important job, which is of concern both theorists and practitioners.

2. The policies to stimulate the employment

Thus, the developed economies have a well-established entrepreneurial tradition, a variety of qualifications, financial institutional and economic structure of a coherent and dynamic adaptable, allowing problems of employment in accordance with the requirements of economic efficiency, social, ecological and demographic. In such a context, employment policies have an important job, which is of concern both theorists and practitioners.

Employment policies vary from state to state, is a set of measures that are developed by state to intervene in the labor market in order to stimulate job creation, improvement of labor resources to adapt to the needs of the economy, the fluidity and flexibility ensure efficient labor market, thus reducing imbalances and disruptions in the labor market, which include labor market support programs, achieved through passive measures and active measures.

Passive the policies are those that start employment in the occupation considered given and seek solutions to employ surplus labor resources. These policies take into account that the level of employment is determined by general economic conditions, which are regulated by the market and focus on protection of the unemployed, particularly through unemployment benefits and active

confident individuals to withdraw from the labor market. They have a dominant character may encourage long-term unemployment, while constituting a factor for some labor demotivator. Meanwhile, long-term unemployment, social security and eroding drains revenues that fuel the basic structure of unemployment.

Measures that make these policies and aims one nine defensive character of labor market segmentation and relative decline, further, persons employed. However, such measures are correlated with overall size of the productivity effects of which serve to cover the economic units, the cost of unemployment benefits. But should be taken into account that raising productivity is likely to cancel the effect of creating new jobs as a result of shortened work week, the economic units.

Of employment policy measures passive, more significant are reducing working hours, reduction of retirement age, increasing the period of compulsory schooling, unemployment, support allowance; restricting immigration.

Active employment the policies are those that involve a mix of measures, methods, processes and tools with which it aims to increase employment levels, the development of coherent systems of active measures at national and local solutions and to maintain unemployment levels acceptable. They include measures to encourage increased mobility of the active population and the creation of new jobs based on investment. Such measures are offensive and promotes adaptation to the requirements of the working population available vacancies.

Of active policy measures are most relevant: improving the content of education at all levels, improve educational and vocational guidance of youth, while correlating the re-qualification requirements and labor, stimulate the mobility of assets to new jobs; information, mediation and placement, subsidized employment for certain categories of unemployed, facilities for both employers and employees, stimulate free initiative of the unemployed by providing loans, investments that enhance economic fundamental act that generates the greatest capacity to create jobs.

Job creation is actually one of the most active of boosting can be achieved by several means and methods.

For example, new jobs may result directly from the creation of business incubators, technological parks or financial assistance for the creation of small and medium enterprises, or may be the result of present actions that generate effects in the future, such as courses training and retraining, retraining programs and career guidance, advice and support entrepreneurship, mediation, counseling and vocational guidance.

It should be noted that the mere creation of jobs does not necessarily lead to increased employment rate or unemployment rate decrease, while necessary and concerns regarding the level of training of the workforce, its ability to adapt to the pace more rapid change; necessary conditions for some of the new jobs created.

As a result of the implementation of active policies has a significant impact for the purposes of stabilization and even slight decrease in unemployment, while led to their widespread application in both public and private sectors, thus helping to stimulate individuals to develop economic activities in accordance with the needs perceived as such, while ensuring and increasing the employment rate.

Effectiveness of employment policy measures based on both passive and active, was often challenged, especially because the instruments used, which are often modeled in accordance with examples of states that exhibit traditional market economy, being in fact a mixture of strategies do not focus strictly on the specific national profile, which is why the law in our country has seen many changes from up to date.

The main employment policies, management policies understood as global demand for labor, failure to meet the domestic market must be in conjunction with appropriate structural policies aimed at economic recovery. In agreement with the structural changes required to be performed training and workforce flexibility by promoting proactive programs, medium and long term prospective.

3. From theory to reality

Romania's transition from centralized economy to a market economy has been a difficult period for our country, showing a series of disturbances across the economy, the labor market is one of the most affected by this transition.

If before 1990, only those who remained did not want to work outside the labor market, job guarantee is a feature of society based on centralized economy that offers a sense of stability and security for most people, thus protecting them the possibility of entry into unemployment after 1990, unemployment in Romania, became a reality and a priority issue when there was surplus labor, due to restructuring and privatization in particular industries, appearance had the effect of releasing a significant number of jobs, whose absorption by creating new jobs by the private sector was not possible, the phenomenon of unemployment is so strongly felt as a result of socio-economic imbalances that were created and age forwarded to those who were left without a job, with the closure of unproductive economic structures.

This has required the creation of an institutional framework of their legislation, at the same time adapted to international practices, on which to protect the unemployed, thereby constituting employment policies that include both active measures and passive. It was also established by law, unemployment fund, necessary social security fund, the income from these funds in most of the contributions of employers and employees, and deficit financing being borne by the public budget.

In Romania, this system was introduced in 1991, the main regulatory liability policy conditions for unemployment benefits which requires the person to be served at least one year or in some cases at least six months in the last 12 months preceding date of registration, not to fulfill the retirement, to have a given area of land, not realize taxable income and be able to work.

Also unemployment benefit payment may cease before the expiry of 9 months (maximum duration of unemployment aid) if unemployed unjustifiably refuse appropriate job training and his health. Also in the passive measures and the amount of this aid was regulated, differentiated by seniority and

salary unemployed, which calls for a 50% of salary for less than five years old, 55% for an age range between 5 and 15 years and 60% older than 15 years.

As can be seen from Table 1, passive policies in 1993, made provisions only for payment of unemployment benefits and support allowance [1]. Subsequently the structure of these expenses has changed, meaning that since 1994 have been introduced for regulatory, expenditure on payment of the professional integration of graduates for a form of education, while spending allowance payment there was no support, all as a result of legislative change.

Table 1 – The structure of active and passive measures costs in Romania

	1993	2008
Aggregate expenditure	17787900	1386224687
Expenses passive measures	15782600	723360607
Of which:		
Weight in total expenditure	88,72%	52,18%
Unemployment benefit	11040000	634347612
Help employability		29712976
Support allowance	4742600	
Compensatory payments		59300019
Expenses active measures	2005300	662864080
Of which:		
Weight in total expenditure	11,28%	47,82%
Trainig	110800	27468059
Payment graduates	92300	56565971
Payments to foster:	graduates	3558704
	unemployed to undertake before the expiration of unemployment	14402498
	labor mobility	6481252
	employers hiring unemployed disadvantaged category	101500373
Combating social exclusion		15943897
Other expenses	1802200	436943326

Source: <http://www.insse.ro>, SOM102A and processing their own

Another change in the structure of expenditures passive measures was the introduction since 1997, spending on compensation payments to redundant employees from collective cocendierilor, chapter of expenditure is maintained today.

Before proceeding to analyze the value of spending on social protection should be noted that due to currency denomination in 2005 was necessary to transform the value of

expenditure in the years 1993, 1995 and 2000 of ROL in RON, the values recorded in the table 5.6 is expressed as long as RON, transformation necessary for a clear picture of development spending on passive measures and active.

It is noted that the entire analyzed period is characterized by passive measures the share of spending, even though in 1993 they accounted for 88.72% of total social protection expenditure and at the end of 2008 only 52.18%.

Passive the policies with all the attractiveness and popularity enjoyed by certain categories of people, does not contribute to increasing the employment rate. For example maintenance support allowance in the period 1993-2004, led to the discouragement of the unemployed from seeking work or to return to work, be content with low income provided by the state for 18 months without May be they need to make any effort to obtain it. As shown, the support allowance spending is increasing, thus emphasizing the tendency of dependence on the state aid, which is why since 2005, this form of social protection was repealed.

Another aspect of passive measures to be reported is related to the introduction of compensatory payments in 1997, provided as a welfare measure. Paying them in a single payment we can unbalance the budget for social welfare, unemployed receiving amounts exceeding wages previously had much redundancy.

Figure 1 shows that the share of total compensation costs for social protection expenditure decreased by 49.81 percent in 2008 compared to 1997, also share in total expenditure passive measures showed a reduction of 56.66 percent. Financial support through these compensation was misunderstood and had no stimulating character, to determine the behavior of unemployed actively seeking focused on work.

Figure 1 – Expenses for of compensation payments in Romania

Source: <http://www.insse.ro>, SOM102A

With the labor market did not work very well, active measures must play an important role in the eradication of unemployment, but at first set of measures used in national assets was very limited, consisting only of qualification and retraining of the workforce, grants to employers for employment of graduates and nederminatã term loans for SMEs, which should create new jobs.

Viewed as a whole can be said that expenditure on active policies have had an upward trend due to increasing understanding of the importance of these measures in reducing unemployment and later as a result of national employment policy alignment to EU objectives.

Training unemployed regarded as one of the roots in key active measures to combat unemployment, has been since the beginning of 1991, the attention of Labour and Social Protection Departments were concerned with organization and retraining courses for people seeking job.

The number of unemployed included in training courses has gradually increased until 2000, after which there is an involution of them, which is maintained until the end of 2008, as results from the statistical data recorded in Table 2. Not the same can be said about the training participation rate of persons seeking employment, increasing 11.01 percent in the period analyzed [2] [3].

The explanation stems from the fact that by 2000 the absolute number of unemployed increased, which resulted in the same direction and movement of the unemployed enrolled in courses. After this year due to lower total number of unemployed and the number of people participating in training programs has decreased, but their share has increased.

Table 2 – Efficiency of training the unemployed in Romania

	1991	2008
Total unemployed	337440	403441
Total unemployed enrolled in courses	12758	59703
Rate of participation in courses	3,78%	14,79%
Unemployed who graduated	3663	44490
Graduation Rate	28,71%	74,51%
Unemployed who were employed after graduation	1265	8924
Employment rate	34,53%	20,05%
Success rate	0,37%	2,21%

Source: <http://www.insse.ro>, SOM101B, SOM104A and processing their own

It should be noted that:

- The category of total unemployed, the unemployed are included indemnify and unpaid unemployed, registered at the end of the record of the National Agency for Employment

- The rate of participation in class = (Total unemployed enrolled in courses: Total unemployed) * 100

- Graduation rate = (unemployed who graduated: Total unemployed enrolled in courses) * 100

- Employment rate = (unemployed who were employed after graduation: Unemployed who graduated) * 100

- Success rate = (unemployed who were employed after graduation: Total unemployed) * 100

The explanation stems from the fact that by 2000 the absolute number of unemployed increased, which resulted in the same direction and movement of the unemployed enrolled in courses. After this year due to lower total number of unemployed and the number of people participating in training programs has decreased, but their share has increased.

In terms of efficiency as such active organization can say that overall it shows a downward trend (in 2008 only 20.05% of people enrolled in a training program were employed after completion of a course, compared to 34.53% in 1991).

Even if the absolute value people who were employed after completion of a training program shows an upward trend, dissonance is created by variations in the number of unemployed who have completed a course.

Training success is evident through this measure in 1991 and 1265 people have committed, or 0.37% of the total number of unemployed registered at the national level, compared to 2.21% how many were registered at the end of 2008.

With the creation of the employment policies in 1991 were included and other active measures such as the payment graduates representing employers subsidies for indefinite employment of different categories of graduates and other categories of expenses that include loans to businesses SMEs to create new jobs.

4. Opinion

If in 1993, passive policies incur costs only for payment of unemployment benefits and support allowance, then, were introduced under existing legislation and regulations for payment of the expenses for the professional integration of forms of education graduates, as well as for payment of support allowance while there were no, all as a result of legislative change. Later in 1997, were

introduced compensatory payments for dismissed employees from collective redundancies.

In the beginning, that with the advent Legii1/1991 set of measures used in national assets was very limited, consisting only of training and retraining services, labor, employment subsidies to employers for graduates and nederminatã term loans offered SMEs, which should create new jobs.

The number of unemployed included in training courses has gradually increased until 2000, after which there is an involution of them, which is maintained until the end of 2008. The overall training success is evident through this measure in 1991 and 1265 were committed by people or 0.37% of the total number of unemployed registered at the national level, compared to 2.21% at end 2008.

Results of Active Employment Measures in the Employment of Romanian Space

Pivodă Roxana Mihaela
Spiru Haret University
roxana_pivoda@yahoo.com

Abstract

Active employment The policies are those that involve a mix of measures, methods, processes and tools with which it aims to increase employment levels, the development of coherent systems of active measures at national and local solutions and to maintain unemployment levels acceptable. They include measures to encourage increased mobility of the active population and the creation of new jobs based on investment. Such measures are offensive and promotes adaptation to the requirements of the working population available vacancies.

Key words: adjustment employment policies, stimulate employment, diversification measures
J.E.L. classification: J68

1. Introduction

Of active policy measures are most relevant: improving the content of education at all levels, improve educational and vocational guidance of youth, while correlating the re-qualification requirements and labor, stimulate the mobility of assets to new jobs; information, mediation and placement, subsidized employment for certain categories of unemployed, facilities for both employers and employees, stimulate free initiative of the unemployed by providing loans, investments that enhance economic fundamental act that generates the greatest capacity to create jobs.

2. Subsidies to various forms of education graduates

With the creation of the employment policies in 1991, included a series of active measures such as the payment graduates representing employers subsidies for indefinite employment of different categories of graduates and other categories of expenses include loans small and medium enterprises to create new jobs.

Table 1 – Dynamics expenses incurred by active measures in Romania

	1993	2008
Aggregate expenditure	17787900	138622468
Expenses active measures	2005300	662864080
Of which:		
Payment graduates	92300	56565971
Weight in active spending measures	4,6%	8,53%
Weight in total expenditure	0,52%	4,08%
Other expenses	1802200	436943326

Source: <http://www.insse.ro>, SOM102A and processing their own

Due to unavailability of statistical data regarding the effectiveness of active measures embodied in the number of persons employed on the basis of these measures, we analyze the evolution from data given in Table 1, because the share of these categories of expenditure, total spending on active measures, and total spending on social protection, even if the amounts of these subsidies have suffered major over time.

Values in this table confirms the concerns in terms of job creation and employment of certain categories of unemployed, in a proportion as high.

Employment of graduates of vocational education, secondary and university, was from the beginning of a priority employment policies, as confirmed by rising costs made by this measure [1].

If in 1993, subsidies to employers to indefinitely classification of certain categories of persons seeking employment, accounted for 4.6% of the total active measures at the end of 2008, these expenses were 4, 08% of the total amount provided for employment policy.

3. Loans to employers for the creation of new jobs

Lending activity to create new jobs, either for development of existing businesses or create new businesses know the value terms increased significantly. Evolution of the number of jobs created by this measure is difficult to establish only after the expenditure, due to the fact that although these loans are granted in proportion to the number of new jobs created, interest expense shall be paid all in this chapter costs, they vary depending on the annual average recorded in the county, reported the national annual average. Also credits can cover 75% of certain costs incurred by the employer, but can climb to 90%, when creating an enterprise takes place at the initiative of the unemployed.

The three categories of active measures and specific vocational training, shown in previous work, graduate employment subsidies and loans offered to create new jobs, were the only active policies to stimulate the employment, pending the Law 76/2002 the unemployment insurance system and employment stimulation, the law that repealed the regulations under the Act nr.1/1991 on social protection of unemployed and their professional reintegration, with all subsequent amendments.

New legislation retained the three types of active measures, even if modified some conditions regarding the rights and obligations of persons benefiting from these active measures, but especially emphasized the role of these measures for increasing employment work. Today and regulations stipulated by Law 76/2002, amended and supplemented by other regulations, as a

permanent necessity of adapting legislation to new requirements arising in the labor market in Romania.

The new active measures stimulate employers to staff employed unemployed, but stimulates and persons seeking employment to fall before the period for which they are entitled to unemployment benefits.

Thus as can be seen from Table 2 and 3, active employment policies have seen a large expansion, both in terms of their diversity and in terms of their effectiveness, reflected in the reduction of a large number of unemployed.

Table 2 - Effectiveness of active measures in Romania

	2004	2009
Total people employed by active measures	548932	304588
The average number of unemployed	607191	572973
Number of unemployed by 31 December	557892	709383

Source: <http://www.mmuncii.ro>, Statistical Bulletin no.49, 69

Active measures taken have reduced the number of unemployed in the period 2006-2008, an amount exceeded the number of unemployed at the end of the existing and that of the average number of unemployed registered in that year, as seen from table 2. Do not exit the same situation in 2004, the number of persons in active measures, was surpassed by the number of unemployed [2] [3].

In 2009, economic and financial crisis have contributed to an increase of 75.83 percentage points of unemployment compared to 2008. Amid the large number of unemployed and economic circumstances exist in Romania, employment policies have contributed to the absorption of a number of 304,588 persons, 108,334 less than in 2008. Decrease from year to year the number of people employed, employment policies do not reflect inefficiency, this was due to either decrease the number of unemployed in the period 2006-2008, or inability of the national economy in 2009, to provide more jobs.

It should be borne in mind that lack of these concerns may have contributed to 98% increase in the number of unemployed in 2004 and by 43% in 2009.

As can be seen from Table 3, active measures have contributed at a rate higher or lower, increasing the employment rate to the success of obtaining a job. Before starting the brief presentation of active measures should be noted that the employment of a person may be the result of two or more active measures, so that the amount of active measures does not coincide with the total employed persons.

4. Labor mediating

Active measures with the highest contribution to the employment of a person, labor mediation, refer to the individual coaching of people looking for a job, regardless of their state labor market so that they can find work their background or to have still another active measure leading to the same result. Labor mediation techniques have been developed and continuously improved by introducing new methods of conducting an interview, by developing the action plan for the person seeking employment, issues that have contributed to employment in 2009 of a percentage of 78.78 persons, more than in 2004 with 19.75 points.

5. Professional counseling

Information and professional counseling, initiated and developed after 2006, knowing the same success as the previous measure. This measure helps assess the applicant's personality and self-evaluation in terms of professional orientation, develop confidence in learning and improving techniques for finding a job, as confirmed by the growing success of this measure, in terms employment. Thus in 2009, it accounts for 17.62% of total persons employed, compared to 4.06%, as was recorded in 2006.

Concerns about employment policies for the organization of training programs that assist people seeking employment, taking into account any future time or labor market, helped by hiring a number of 15 222 people in 2009, up to 3779 people in 2004.

6. Stimulation enrollment unemployed before the expiration of unemployment and labor mobility

Stimulation enrollment unemployed before the expiration of unemployment and stimulate labor mobility have seen a downward trend.

30% of unemployment benefits received in each month until the end of the period for which it was entitled to the allowance primescă respectively equal to the first frame of two minimum salaries in the country, received by people who engage in a distance of 50 km from home, showed a growing interest for unemployed low in Romania, emphasizing the idea that in some cases passive measures can lead to lack of interest of unemployed also seek work or to return to work.

Table 3 – The contribution of active measures to reduce unemployment in Romania

Total people employed Of which by:	2004	%	2009	%
	548932		304588	
Mediation	324054	59,03	239958	78,78
Information and counseling			53683	17,62
Training	11443	2,08	15222	4,99
Stimulation of unemployment to employment before the expiry of the unemployed	85704	15,61	21036	6,9
Stimulate employers employment of certain categories of people Of which:	48138	8,76	8497	2,78
<i>Persoane peste 45 ani sau întreținători unici</i>	25781	4,69	4740	1,55
<i>Individuals have three years until retirement</i>	420	0,07	58	0,01
<i>graduates</i>	21634	3,94	3605	1,18
<i>Persons with disabilities</i>	303	0,05	94	0,03
Stimulation of labor mobility	5774	1,05	2233	0,73
Creating jobs through loans	6830	1,24		
Advice for starting a business	1596	0,29	869	0,28
Public works of interest	62113	11,31	21982	7,21
Solidarity contracts concluded under the law 116/2002	2451	0,44	710	0,23
Other active measures	829	0,15	668	0,21

Source: <http://www.mmuncii.ro>, Statistical Bulletin no.49, 69 and own processing

Thus in 2004, employment before the expiry of unemployment has stimulated a number of 85,704 unemployed, compared to only 21,036 unemployed were assigned early, in 2009, while labor mobility contributed in 2009, to fill a number of 2233 people, compared to 5774 recorded in 2004.

7. Stimulate employers

And encourage their employers regarding employment of disadvantaged people showed interest in decreasing both overall and on each measure. If in 2004 the employment rate of 8.76, representing a total of 48,138 people were employed as a result of this measure in 2009, the number of markers attributable to this measure fell by 39,641 people.

Stimulate employers regarding employment subsidies for employment of certain categories of unemployed, differ from the measure as follows: employment of persons aged 45 years or maintained single family and employment of disabled persons, grants employer for one year, a minimum wage exemption security contributions and unemployment, provided that the employment contract for two years, employment of persons who have three years until retirement, the employer a minimum gross salary per economy for three years, without being exempt from the contribution to fund unemployment, employment of graduates exempt employer contribution to fund unemployment payments for a period of one year for each graduate received, depending on the type of education graduated equivalent of 1, 1.2 or 1.5 minimum gross wages in the economy, provided that the employment contract for a period of at least three years.

Loans with interest subsidy granted to create new jobs in manufacturing, services and tourism registered a downward trend, although in 2006, for each employment rate increased from 7.500 to 10,000 Ron.

If in 2004, were created at national level jobs 6830, following the development of existing activities or engaging in business due to the unemployed, those sectors, in 2009, this measure helped to create any jobs.

8. Advice for starting a business

Closely related to the extent of credit, while seen as a complement to this activity, is a consultant to start a business, provided people looking for a job as legal services, marketing, financial, efficient methods or techniques management.

As lending, advice for starting a business knows the same downward trend, but until 2009, when economic and financial crisis amid a growing number of people remain without a job and a business would be for some of them a possible alternative.

This has led to the creation in 2009 of a number of jobs increased by 276, compared to 2008 while the share of total marker present and in 2009 the same level of 0.29% registered in 2004, even if during this period are recorded certain oscillations.

9. Public works of interest

Work done in the interest of the community, embodied in the restoration and maintenance services of infrastructure, sanitation and public utility execute works, provide employers, local authorities, private companies or governmental associations with local public opinion, subsidized employment rate of 70%, or 100%, depending on the year in which they engage these people, 1 April to 31 October, that November 1 to March 31. However, in 2009 only 21,982 people were employed, down 40,131 from 2004, this measure also share in the total number of admission records from year to year a continuous decrease. In addition to these works and public services for the community, the unemployed can be employed in the provision of social services provide care domiciliu of certain categories of people such as children, the sick, elderly, disabled.

10. Contracts concluded under Law 116/2002 solidarity

Solidarity contracts concluded under Law 116/2002, providing for the insertion or reinsertion of some categories of young people aged up to 35 years who are at risk of marginalization and social exclusion; category they belong to young people from orphanages or detention, young single or

married with dependent children, other categories of disadvantaged young people. This measure of growth of employment opportunities has helped even in the year 2009, a total of 710 persons having a job, which represents 28.96% of the marker due to this measure in 2004.

11. Other active measures

Adapting permanent employment policies in the labor market has made since 2007, to introduce another active measure to increase employment, which provides for an amount equal to half the gross minimum wage in the economy, the employer within individuals among students or students who wish to work during the holidays.

he lower activity of enterprises, as a result of economic and social crisis manifested in Romania, contributed to lower employment, increase of unemployment and lower employment.

This unfavorable circumstances led to the development and implementation of new active measures and programs [4], which provide employment to 4,000 people in some rural areas, which recorded a low level of economic development by creating *Program 155, especially for 155 cities in rural areas*, employment of 4,800 people in urban areas affected by increases in the number of unemployed by *Program 25, especially for 25 urban villages*, employment of a number of Roma people by 3115, *Program 150, especially for communities with the number than Roma*, in addition to these programs, active measures were presented continues to contribute to reducing unemployment levels possible.

12. Opinion

Overall active measures to stimulate the employment, led to the classification of a decreasing number of people, either because there is a small number of unemployed, either because of economic crisis, manifested by inability to absorb the labor market a number higher labor, a reduction in vacancies.

However, we can say that active employment policies of the labor force are more effective than passive watching mere

payment of unemployment benefits, not only because of the high cost of the latter, but also because active policies to combat unemployment and encourage the development builds competence and competitiveness in the labor market.

Employment of graduates of vocational education, secondary and university from the beginning was a priority of employment policies. If in 1993, subsidies to employers to indefinitely classification of certain categories of persons seeking employment, accounted for 4.6% of the total active measures at the end of 2008, these expenses were 4, 08% of the total amount provided for employment policy. Active employment The policies have seen a large expansion, both in terms of their diversity and on their effectiveness, with the entry into force of Law 76/2002, developed as a permanent necessity of adapting legislation to new requirements arising on labor market in Romania.

Labor mediation, active measure with the highest contribution to the employment of a person contributed to employment in 2009 to 78.78 percent of a person, more than in 2004 with 19.75 points.

Information and professional counseling, initiated and developed after 2006, knowing the same success. Thus in 2009, it accounts for 17.62% of total persons employed, compared to 4.06%, as was recorded in 2006.

Stimulation enrollment unemployed before the expiration of unemployment and stimulate labor mobility, it proved equally effective. Thus in 2004, employment before the expiry of unemployment has stimulated a number of 85,704 unemployed, compared to only 21,036 unemployed were assigned early, in 2009, while labor mobility contributed in 2009, to fill a number of 2233 people, compared to 5774 recorded in 2004.

Loans with interest subsidy granted to create new jobs in manufacturing, services and tourism have been a downtrend in 2004, was created in 6830 at national level jobs as a result of development activities already existing business following the initiation of the unemployed, compared to 2009 when this measure has not contributed to any job.

Advice for starting a business, provided people looking for a job as legal services, marketing, financial, led to the creation in 2009 of a number of jobs increased by 276,

to 2008, while the share of total markers have the same level in 2009 to 0.29%, recorded in 2004.

Work done in the interest of the community, embodied in the restoration and maintenance services of infrastructure, sanitation and public utility execute works, records from year to year a continuous decrease in 2009 was employed only 21,982 people, down 40,131 from the 2004.

Solidarity contracts concluded under Law 116/2002, providing for the insertion or reinsertion of some categories of young people aged up to 35 years who are at risk of marginalization and social exclusion, even in conditions of 2009 contributed to the classification of a number of 710 persons.

Abstract

The distribution of goods in the urban areas has experienced significant growth in recent years due to both of their spatial extension, but also generated activities and n diversifying urban population demands on the types of products sold. This led to increases in freight applications, with effects on the urban environment.

Key words: distribution, goods, urban, strategies

J.E.L. classification: O10

1. Introduction

Distribution of goods is a highly debated topic, especially in recent decades. Origins of efficient distribution of goods and its concerns, however, is identified with the advent of the first forms of marketing. The importance of this topic derives from its complexity, a process with a heterogeneous structure and diversity of participants. Its complexity is due to the broad scope of activities involved, interference of a large number of problems associated with the large number of restrictions, but perhaps most importantly, it is determined the need to obtain solutions that provide the most effective response to buyers' requirements.

One of the most important influences on customer service has distribution policy, which aims to ensure consistency of decisions on product, price, promotion and placement, by choosing the appropriate manner of distribution. Physical distribution is the term used for a wide range of activities involved in moving from production sites to

final delivery points, including moving and handling functions of supplies or transportation, packaging, storage, physical transfer between transport modes. Distribution system evolves dynamically as a result of technical innovations, the new information and communication technologies and developments in the field of financial flows. One effective strategy in response to buyers requirements, optimizing physical distribution is key[1]. It is not sufficient for a product to offer the highest parameters in terms of quality or to meet the standards required by customers in terms of product utility. To meet customer requirements is necessary to take into account aspects of spatial and temporal utility, crucial quality characteristic distribution of goods.

Thus, physical distribution can be considered multidimensional construction, can be defined as a set of interrelated activities offered by a supplier, creating time and space utility and providing useful form. Physical distribution process is thus derived from customer requirements on time and place of delivery. Moreover, one can identify quantitative and qualitative performance indicators in relation to delivery requirements for each component of the distribution process. Global optimization process provides distribution, but the best solution, which means that the total efficiency is accepted lower performance of individual components work. Based on the ability of customer information on order characteristics, and mode of delivery intervals, continuing with the optimization of transport, handling, storage, selection strategy urgent deliveries, minimizing the number of errors on the performance of orders, all this is in approach targets related to the adoption of a strategy to respond to consumer demands. On the other

hand, in adopting a strategy of serving customers in the distribution of goods can not ignore the fact that some customers and some products are more profitable than others, so therefore will maintain the highest levels of service combinations of the most profitable customer - product.

2. Peculiarities in the distribution of urban goods

Distribution of goods in large urban agglomerations is a highly complex process induced by space restrictions determined by the city. Urban distribution environment is characterized by striking dissociation between the more residential areas, workplaces and shopping areas, geography flows are determined by differences in the routes, the polarization commercial areas. Approach in analyzing and optimizing the distribution of goods it is necessary to consider the elements of economics and urban, large urban areas is not only a consequence of demographic developments, but also economic activities. Integration of distribution networks of goods in urban areas means relative to the transport problems in terms of traffic restrictions and interactions with public and private transport people and equipment to existing urban infrastructure. Optimize urban distribution of goods requires the acquisition procedures for distribution of goods to final delivery points in a way that minimizes the total cost of distribution.

Although urban physical distribution system components do not differ from those outside the urban area, a number of differences regarding the characteristics can be identified in conurbations. In this sense, the most affected part of the distribution system is the transport of goods. Differentiation occurs in the transport of goods in urban areas to suburban freight is determined by high traffic and limited infrastructure of urban areas.

Limitations relative to the type, technical characteristics, capacity, vehicle emission to require a physical transfer of goods between modes of transport or vehicles belonging to the same mode of transport, but of different sizes and characteristics[2]. Such a transfer may be perceived as disadvantageous consumption causing additional financial

resources, additional time, generating a number of additional risks. There are also ways to reduce these disadvantages by using standardized cargo units and transshipment process automation. Distribution of goods in urban areas is associated with a series of failures that reduce the efficiency of distribution: extended delivery times due to traffic congestion and access to points of delivery, failure to deliver goods vehicles to be within the predetermined time intervals because of the situation emergency (traffic congestion, damage).

In addition, it is necessary to take into account a number of problems associated with distribution of goods such as uncertainty of different parameters (eg urgent requests for goods), the need for urban vehicles to avoid empty return flights, ensuring a coefficient correlation as high load and transport plans for distribution of products returned collection needs.

The process of distribution of goods has been a long time an important goal in optimization problems. Between the first linear programming solutions were found applications in transportation planning and design of deposit[2]. Later optimizations have been used to solve network design and routing problems later for the fleet.

For distribution in urban areas, specialized firms need continuous and updated information on distribution processes to meet their customers' needs quickly and to solve arising in distribution. For example, the navigation system offers a choice of freight route, avoiding traffic congestion. Geographic information systems provide for the creation of visual responses to the problems of space, allowing overlapping information from

- different sources. GIS makes it possible, for example, a distributor interested in the location of a distribution center, so reducing transport costs and local market and spatial
- distribution of activities, simultaneous display of these different types of information. Mobile telephony, the implementation of geographic information
- systems, the GPS in the development of applications in urban distribution of goods[3]. Tracking vehicles, addresses and identifying their characteristics, transmission and distribution process

analysis, tracing the flows of goods, spatial analysis related to physical distribution networks of goods, management of freight vehicles travel streets with traffic congestion, reducing delays in deliveries freight fleet management are some of the immediate benefits of introducing new information technologies in urban distribution of goods.

They also allow determination of optimal routes, identify the nearest vehicle to a collection point or delivery, animated graphic possibilities parcourse for vehicles to determine time of arrival at various points down.

Significant reductions in transport costs and hence in distribution costs can be measured using a specialized program for dynamic routing and scheduling vehicles, taking into account elements such as rolling speed, optimal order size and the shortest routes and the fastest the delivery of goods. The use of such software allows also to obtain routes that minimize transport time restrictions under delivery time periods relative to the hours of operation and distribution centers.

Urban logistics strategies, possible solution to optimize the distribution of goods Urban freight distribution system with its essential component, freight, causes air pollution and noise, congestion affects traffic safety.

On the other hand, the urban structure and action by local communities to limit the negative effects pose problems of accessibility and efficiency of transport logistics system of goods. Limitations caused by urban space can generate increased transport time, using an expanded fleet and delays in delivery times. One way to address these problems is to implement a new distribution system that allows efficient distribution of goods both commercially and in terms of urban community.

In this respect, an important urban logistics is defined as the global optimization of logistics and transport activities by private companies in urban areas, by considering the social, environmental, economic, financial and energy of urban movement of goods.

There is a wide range of solutions that can be adopted, such as: relocation premises sale, distribution centers, the use of low emission vehicles and adapted to urban traffic. Most of

the measures taken relate to the physical characteristics of vehicles and distribution of access time windows in urban areas.

White Paper on European transport policy aims in international projects on urban logistics organization, development of urban freight logistics platforms. From studies in urban logistics it was found that large cargo platforms on the outskirts of cities have an impact on urban traffic when connected to terminals smaller urban areas. Urban terminals reduce distances traveled by vehicles in urban areas and thus distribution urban traffic, and at the same time, increase the efficiency of urban deliveries by clustering capabilities by destination of goods or delivery areas. On the other hand, urban access restrictions high capacity vehicles generate a negative impact on urban traffic by redistributing the load on a large number of relatively small vehicles. Urban Logistics can also rely on underground logistic systems. Such a system allows movement through a network of underground electric driven vehicles from a logistic terminal located on the edge of urban areas to final delivery points or a transshipment center, located in urban areas, from delivery to recipients can be made by road transport, surface[4]. Version involves underground transport projects for the new metropolitan urban logistic system designed entirely to meet the urban distribution of goods. Importance of reducing emissions in urban areas caused by urban transport solutions for goods to avoid these inconveniences. Tram for public urban transport of persons, can be used for particular times of low passenger traffic, freight transport. Infrastructure dedicated to travelers can be used with little additional investment goods. There is already such an urban logistics system: CargoTram in Dresden. Such a system requires the existence of load - discharge of electric vehicles used for delivery of goods in urban centers.

In order to solve environmental problems, the relative traffic congestion in urban transport, the solution could be the design of urban travel plans, to establish certain principles of organizing the transport of goods and people, that the movement and parking of vehicles in space urban. A travel plan aimed at solving problems related to urban goods delivery by regulating

access of goods vehicles in urban areas, delivery scheduling, sizes and weights of vehicles with access in urban areas, taking into account infrastructure requirements, necessary facilities achieve the optimal conditions of supply, to reduce traffic congestion and parking areas and duration. This plan proposes a tailored solution using existing logistical infrastructure and determine the location of future logistics infrastructure in a multimodal perspective.

In urban travel plans is concerned the action of public bodies involved in the harmonization between the participants involved in urban transport, taking into account the main generators of goods: logistics platforms, industrial areas, commercial areas peripherals. The complexity of management problems arising from urban area, may make it difficult to develop public-private partnerships. In the narrow sense, this term refers to dividing expenses, profit, loss between the two parties involved. But often used broadly, it involves dissemination of information and communication, cooperation and collaborative work.

Application of public private partnerships in urban goods distribution management issues aimed at urban transport vehicles with low emissions, and use of urban transshipment assembly centers, intermodal centers, reduce congestion, use of intelligent transport systems[5]. These types of partnerships offer significant reductions in the number of vehicles - km and the number of vehicles and have been successfully developed in countries like Germany and Switzerland. All these measures for urban logistics strategies that result in streamlining urban traffic, with direct effects on reducing transport costs and hence of the distribution. They also reduces transport time, delivery intervals, with positive consequences in the strategy of serving customers.

3. Conclusions

Urban logistics opens the prospect of a new phase in the evolution of transmission and distribution of goods through the establishment of new types of cooperation between logistics and channel links in the business of delivering goods in urban areas.

The Cultural Conditioning of Goods and Services Consumption

Ploae Cătălin

"Ovidius" University of Constanta, Faculty of Economic Sciences
catalinploae@gmail.com

Abstract

Value is commonly associated with utility preferences that are located at the individual level. When looking at economic behavior, the focus is on individuals and the rest can be studied by looking at groups and social relations. From this point of view, the concept of value starts making more sense because it incorporates the question of why people value things. A person's preferences are based on his view of the world and beliefs about how best to act. Nobody creates these views by himself. Coming to grips with the field of cultural production, David Throsby hypothesizes that "the economic is individual, the cultural is collective."

The purpose of this paper is to contribute to understand the differences between of the Homo economicus and Homo culturalis behavior by considering the role of the economic and cultural values, cultural diversity, impact of international integration on local cultural dynamics and cultural identities.

Key words: cultural values, economic consumption, Homo culturalis, Homo oeconomicus

J.E.L. classification: A12, B40, P40

1. Introduction

Starting from the basic assumption of economics that people are generally rational, *homo economicus* of the classical theory is the personification of the principles of the businessman. The businessman wants to conduct every business with the highest possible profit: he wants to buy as cheaply as possible and sell as dearly as possible. By means of diligence and attention to business he strives to eliminate all sources of error so that the results of his action are not prejudiced by ignorance, neglectfulness,

mistakes, and the like. For standard "homo economicus" agents, the cultural good does not produce any additional benefit than pure materialistic private value and consumption is therefore solely determined by a market price comparison with other close economic substitutes. "*Homo culturalis*" agents are however ready to pay a premium for the cultural good attached to their cultural group externality.

2. From recognizable values to one dimension: Homo oeconomicus

There are different taxonomies of values. Hofstede divide values into the desirable and the desired. Yet other authors classify values into global values, domain-specific values, and evaluations of product attributes. Global values are the most centrally held, while attribute evaluations are the least central and are situation specific. Hofstede's landmark study of the dimensions of culture can be considered, an etic approach to the study of cultural values.. Hofstede's study revealed four dimensions of culture: power distance, uncertainty avoidance, individualism, and masculinity. (Hofstede, 1980) Values seem to be the manifestation of culture most often studied by researchers, which confirms that values are a central construct in an individual's cultural identity. In other words, values may be the most important of the four manifestations of culture (Hofstede, 1997), and can be used effectively to distinguish one culture from another.

Classical economists find value to be determined in production, that is, in the workshop or the factory, not the market place. Since most of the costs of production can be reduced to labor, this approach is refined into the labor theory of value. Ricardo explicitly excepts goods, like rare paintings, whose price depends solely on their scarcity, from the general principles of value determination through labor time.

They recognize that the usefulness or use-value of a commodity is a precondition for its having exchange value, but also point out that the overall usefulness of commodities had no correlation with their value.

Neoclassical economists view value in terms of the relation between costs of production and subjective elements, called supply and demand. They emphasize that prices also depend upon the level of demand, which in turn depends upon the amount of consumer satisfaction provided by goods and services. The neoclassical theory of value, therefore, is a neoclassical theory of supply-and-demand behavior. For neoclassical economics, the value of a commodity is determined only by its subjective scarcity, that is, the degree to which people's desire for that a commodity exceeds its availability. It is the marginal theory of value or subjective theory of value. Typically, the neoclassical answer to these value questions involves the specification and use of what might be called market analysis. Markets are considered locations or sites where values are determined.

Because of the commitment to the ideal of the market, neoclassical theory is unlikely to be able to take on board this critique since it challenges the most important building block of the theory, namely *homo economicus*. The central issue here is that norms, and values, do not just help us to carry out better the goals which we already adhere to, they also determine the kind of people we are or want to become. They will, to give just one trivial example, determine whether we avoid joining a pressure group because we calculate that while our contribution to the cause will be slight the cost is not, or whether, on the contrary, we join because that is the kind of person – with certain specific values – that we are or aspire to become. Norms provide the context of rationality in part because they influence both means and ends.

The present capitalist model is built on the logic of mostly quantitative economic growth, and in the fact that the rise of capitalism was indeed associated with a growing impersonality of economic transactions.

What becomes clear is that, at its core, the dispute over what ails the modern market economy (and what ought to be done to address it) turns on our understanding of

human nature. (Wilson, 1993) And the prevailing modern understanding (at least within the context of economic thinking) is that human beings are little more than rational wealth-maximizers. It is assumed that *Homo economicus*—“economic man”—populates the roles of consumer, entrepreneur, stockholder, employee, director, and officer in our modern economy. *Homo economicus* “is cold and calculating, worries only about himself, and pursues whatever course brings him the greatest material advantage.” *Homo economicus* is a single-minded, wealth-maximizing automaton, who does not take into account “morality, ethics, or other people.” (Stout, 2008) Not surprisingly, subscribing to the *Homo economicus* model of humankind leads to characterizing problems and framing solutions in economic terms of benefits and costs, incentives and disincentives. (Kapur, 1999).

Many have doubted the existence of *Homo economicus*, challenging whether the evidence of actual human behavior fits the theoretical model. (Stout, 2003). And, if *Homo economicus* does indeed exist, some have argued that he is to blame for what ails contemporary capitalism. (Barry, 2001)

3. Is ‘Homo economicus’ a dead concept?

In general, the analytical approach defines the basic agent of economic action in terms of a *homo economicus* understanding of human nature – that the individual is a self-interested actor, competitive in nature, who undertakes to achieve the rational maximization of personal utility.

The first characterization of economic behavior came with John Stuart Mill's creation of *homo economicus*, a man restricted in his emotional range solely to economic motivations. In his *On the Definition of Political Economy*, Mill defines science of economics as follows: “The science which traces the laws of such of the phenomena of society as arise from the combined operations of mankind for the production of wealth, in so far as those phenomena are not modified by the pursuit of any other object”.

Since Mill confines the subject of political economy to those affairs or phenomena which are most relevant to the desire of wealth, it is reasonable to assume that human beings will try to maximize their wealth. However, with respect to those human actions of which neither wealth nor self-interest is the principal object, the assumption of economic man will not be true even in the abstract. From this point of view, it is reasonable to suggest that Mill would not agree with Gary Becker on expanding the sphere of economics into all areas of life, such as the family.

Mill's characterization of homo economicus is an "abstraction" from whole man (Mary S. Morgan, 1996). This abstraction is necessary to Mill, for only by delimiting the scope of the subject domain of economics can anything specific be said of economic behavior. The notion of homo economicus was specifically introduced to make the science of economics possible, by defining the science of economics as a separate science, and to create a character like homo economicus in order to promote the scientific method in economics. Therefore, when the principles of political economy are to be applied to a particular case, it is necessary to take into account all the causes which counteract the desire of wealth and all the individual circumstances of that case.

His *Principles of Political Economy with Some of Their Applications to Social Philosophy* can be deemed as a result of this necessity. In the preface of the first edition of the *Principles* published in 1848, Mill points out: "For practical purpose, Political Economy is inseparably intertwined with many other branches of social philosophy. Except on matters of mere detail, there are perhaps no practical questions, even among those which approach nearest to the character of purely economical questions, which admit of being decided on economical premises alone (Mill, CW, II: xci)".

Mill believed that there is only one constant positive motivation, namely, a desire for wealth, accompanied by the only two "perpetual" impediments being "aversion to labour, and desire of present enjoyment of costly indulgences" (p 321). As is entirely appropriate for a "classical" economist, Mill's definition shows the contemporary concern

with production (not consumption as in twentieth century economics) and with wealth (not utility).

The principle of buying on the cheapest market comes into question here only in so far as the choice is between several possibilities, otherwise equal, of purchasing goods; but it cannot be understood, from this point of view, why someone buys the better suit even though the cheaper one has the same "objective" usefulness, or why more is generally spent than is necessary for the minimum—taken in the strictest sense of the term—necessary for bare physical subsistence. On the contrary, it could be said that with the scheme of the homo economicus classical economics comprehended only one side of man—the economic, materialistic side. On the other hand, it is not a pertinent observation in so far as it is understood as meaning that, according to classical economic theory, a person engaged in business always acts in the manner described. (Ludwig von Mises, 2003)

As for the neoclassical economic theory, most particular the Walrasian welfare economics, it is obvious that we find a dependence on the computable general equilibrium (CGE) superstructure that comes to support the economic analysis of market exchange (Gowdy and Iorgulescu Polimeni, 2005). The entire Walrasian welfare policy is supported by two theorems of Pareto optimality: the first, stating that Pareto optimality is implied by maximization of preferences under budget constraints and maximization of profits under given technology and the second, asserting that a Pareto optimum can be achieved as a competitive equilibrium with appropriate lump sum transfers (Lockwood, 1987; Mass-Colell et al., 1995; McKenzie, 1987). Starting from these two assumptions, the present leading research community is very preoccupied to question the notions of Homo economicus and perfect competition. But a CGE is impossible without taking into consideration the behavioral assumption describing Homo economicus and the biophysical assumptions describing perfect competition. Therefore, it is important, when describing the conditions for the existence of general equilibrium, to take into consideration the axioms of consumer choice, and to refer, as Arrow and Debreu (1954)

did, to individualistic behavior, rational expectations, the fact that all agents are price-takers and that there is no asymptotic information and to state the existence of a barter economy where we don't find the money as a mean of exchange.

Regarding Homo Economicus, we can find in contemporary economics two offset trends. First of all, we can observe that the recent behavioral economics, experimental economics and the game theory provided empirical evidence able to literary demolish the concept of rational choice in human decision-making. Secondly, we can also observe that scholars increasingly use the CGE models in order to propose economic policy recommendations that includes concepts as global climate change (Nordhaus, 1992, 2001), biodiversity protection (Weitzman, 1992, 1998) and the international trade (Bhagwati, 1979). At the same time the foundations of CGE are being discredited by credible research, its use as a policy tool continues to spread unabated (Gowdy and Iorgulescu Polimeni, 2005).

Welfare economics may have a role to play in describing economic behavior in a competitive but impersonal market. But it is inadequate as a general theory of the economic process (van den Bergh and Gowdy, 2003).

Therefore we may say that, when formulating economic policies, two very important ideas we should have in mind, related to our paper's subject: first of all, the human preference formation is a social process, and second, the economies are part of and co-evolve with the biophysical universe.

4. From Homo economicus to Homo culturalis

The individual is, not only economic, but also biological, social, cultural. Food, clothing, shelter, are, vital goods, but they are not the only aspects that define the quality of life. Observations of actual markets and people – especially recent research in behavioral economics, the cognitive sciences and neuro-economics – have unanimously documented: Human decision-making proceeds constantly outside the homo economicus-model, both below its logic (i.e. based upon non-rational impulses) and above

the same (i.e. driven by moral reasons superseding the conceptions of technical rationality within economics). The oft-lamented prognostic failures of the homo economicus-model are hence by no means incidental but instead indicative of its inadequacy to capture the contextualized richness, the internal complexity and especially the cognitive as well as cultural dimension of human economic agency.

For standard "homo economicus" agents, the cultural good does not produce any additional benefit than pure materialistic private value and consumption is therefore solely determined by a market price comparison with other close economic substitutes. "Homo culturalis" agents are however ready to pay a premium for the cultural good attached to their cultural group externality. A given cultural community size (ie. the fraction of "homo culturalis" agents) in society, will therefore determine an equilibrium allocation of resources through usual market clearing conditions.

Many years ago, Edgar Morin reopened in his *The Lost Paradigm: Human Nature*, the debate on the human nature, "the man is a cultural being by nature, because is a natural being by culture" (Marin, 1973). Announcing from the title of his book, the great lost paradigm is the human nature itself. E. Morin states that the human being is a synthesis, in two ways: as a result of nature, but also a creation of the culture.

Moreover, the newness of the cultural theories consists in explaining and understanding actions by reconstructing the symbolic structures of knowledge which enable and constrain the agents to interpret the world according to certain forms, cognitive structures or regular mental acts.

In his famous article, "The Globalization of Markets," Harvard professor Ted Levitt (Levitt, 1983) argued that new technology would lead to homogenization of consumer wants and needs because consumers would prefer standard products of high quality and low price to more customized high-priced products. Levitt's argument was based on the assumption that consumer behavior is rational and that consumers always want to maximize profit. The assumption of rationality is increasingly regarded as unrealistic and places consumers outside of a cultural context. (Süerdem, 1993).

The paradigm of economics is that consumers will maximize their own utility and will prefer low-priced, high-quality products to high-priced, added-value brands. This paradigm fits the old scarcity societies where people had to make either/or decisions, for example either a washing machine or holidays. In post-scarcity societies, people have more choices that make them less rational in their buying behavior. When comparing post-scarcity societies that have converged economically, one observes that national wealth is no longer a useful variable for explaining consumption differences. The new paradigm is culture, which becomes an increasingly important variable to explain consumption differences and brand preferences.

5. Conclusion

To understand culture's consequences for consumer behavior, culture must be integrated in the various aspects of consumer behavior theory. Ideally, theories of consumer behavior are developed within cultures, studying people's behavior within each nation. For comparing cultures, variables and constructs must be found that allow discovering how these cultures or groups of cultures are different from or similar to each other. Generally speaking, the older the product category, the stronger the influence of culture. This explains why consumption of food products is persistently culture bound. The wealthier countries become, the more manifest the influence of culture on consumption. When people possess more or less enough of everything, they will spend their incremental income on what most fits their value patterns.. With converging wealth, the influence of income on consumption decreases. Cultural values are the main variable to explain differences in consumer behavior.

Therefore, we can conclude by paraphrasing an old saying: "Homo economicus is dead! Long live Homo Culturalis!".

International Crisis in the Context of Globalization and Money Laundering

Popa George Dorel

„Ovidius” University of Constanta, Faculty of Law, Public Administration and Sociology
popageorgedrd@yahoo.com

Abstract

Today, globalization and economic and financial crisis are the terms used to describe changes in society and the world economy. It is widely agreed that globalization has increased international trade and cultural exchanges, removing economic barriers. Increasing interdependence in international relations, besides positive aspects undoubtedly bring some negative aspects related to economy and security and public order. An economic and financial crisis that occurs in a country directly affects not only this country but the entire geographic region and even the world economy as a whole. Globalization in the current economic crisis will always lead to economic recession, lower loan rates, low budget world countries, the general economic downturn, which favors the growth of the underground economy and crime especially the phenomena of money laundering. Moreover, globalization has led to a border removal, which favored the cross-border organized crime. Today, organized crime, in various forms (trafficking of weapons, human beings, drugs, illegal immigration, money laundering) and terrorism are global threats and the actual economic and financial crisis tends to increase those phenomena having new forms and engaging new players on the world stage. Organized crime and money laundering in particular are not new phenomena. The novelty is the way of expansion, the magnitude of these phenomena and the way more people are involved in this system of organized crime.

Key words: Globalization, Crisis, Money Laundry, Criminality, Effects;

J.E.L. classification: K00

1. Introduction. Globalization and the present financial and economical crisis

The phenomenon of globalization has led to increased trade and investments, removed barriers and lead to increased economic interdependence, political, social, and military technology between countries of the world. The World Bank defines globalization as "the possibility and ability of individuals and firms to initiate voluntary economic transactions with residents of other countries." I.M.F. defines globalization as "the increase in economic interdependence of countries worldwide through increasing volume and variety of goods and services transactions across borders, circulation of the international capital flows more freely and faster, but also a wider diffusion of technology. (IMF, World Economic Outlook, May 1997). Globalization has made international integration on several levels: economic, political, military and security. Globalization creates great opportunities and lead to progress in many areas. Financial markets and trade are the main beneficiaries of globalization, by intensifying unprecedented flows of goods and capital. Production of goods acquired unprecedented dimensions, especially as traditional economic barriers have been removed. Multinational companies gained specific corporate features having unprecedented dimensions. Technical progress, especially in communications and transport is more than obvious, especially that education gained international features unequivocally. Globalization is first an economical process and then political and cultural. This is not just the integration of the world's economies. Today it is changed dramatically the qualitative characteristics of these economies in elements of the same

system. It changed, in a way the notion of "national economy" itself. Now, the main economic element is the multinational corporation, which placed its factories, plants and other elements of production where labor cost is cheaper and taxes lower. Multinational corporations are producing where the costs are low and then are selling products where profit is greatest, without regard of frontiers of the world. Because of the current economic and financial crises world-wide, there is a deeper process of international division of labor and world markets are becoming increasingly complex. Financial markets are becoming increasingly dependent on each other, so one negative effect that affect one national banking system, affects in a way all the other banking systems. Increasing interdependence within international relations, besides positive aspects undoubtedly bring some negative aspects related to national security and public order. Deepening globalization increases the number of external factors that influence the working way of society and the stability of the economy. There are unfortunately a number of negative phenomena that globalization brings on the current international system:

- weakening of social cohesion, national sovereignty of states and the traditional system of values;
- increasing inequalities, both at national economies and international level;
- the increasing of nationalist and protectionist tendencies;
- change the classic hierarchy of values and issuing of new values;
- intensification of transnational organized crime, terrorism and organized crime. Intensification of globalization led to increasing of the amount of the capital resulting from illegal activities. As a direct effect, it has intensified dramatically the number of the operators engaged in money laundering. This phenomenon occurs due to the necessity of recycling funds from organized crime activities and reintroduction of these funds in legal financial circuit.

2. Economical and financial crisis and money laundering

The general opinion of experts is that the current economic and financial crisis is originated in the United States. Investment Bank Bear Stearns and the Lehman Brothers Bank bankruptcy kicked off in terms of the credit market instability, increasing trade deficit and massive loss of stocks market. Preliminary globally losses are estimated at over 1,000 billion dollars. The world in 2011 is facing one of the biggest challenges: the second phase of the economical crisis. That's because the world's largest economy, the United States of America's economy is on the brink of the second phase of a severe recession. After he "started" with the real estate crisis, the global economy hits now new obstacles: economic downturn, financial and banking crisis, rising unemployment, lack of confidence in the banking system, massive withdrawal of investors and unprecedented increase economical and financial crime, particularly money laundering. After pioneering of the years 1920 - 1930, when America's organized crime bosses used to dry and "wash" dirty money coming from organized crime activities, over time, funds recycling schemes began to evolve and become increasingly complex. Currently, money laundering has become a very complicated process to go through several stages and involves many people, institutions and organizations. Recycling funds today involves a complex of activities from which the money came from criminal activity are transferred, transformed and combined with other funds from legal activities, in order to disguise their illegal origin. Practically all this complicated business comes from criminals need to conceal the illicit origin of the money. But beyond the complexity of this phenomenon, dirty money behaves like water: follow the path of the minimum resistance. The operators engaged in recycling of the funds are seeking permanently places of the world where the legal system is the most permissive, and banks are willing to accept funds without asking too many questions.

Today, the term "recycling of funds" is closely associated with drug trafficking, gambling, prostitution, human trafficking,

weapons smuggling and other such international criminal activity. Money laundering schemes are extremely laborious and complicated but because they are very profitable, are attractive for financial institutions. Within money laundering, financial mechanism is implemented by false representation of the facts. Very often are invented a civil contracts in order to “clean” money obtained from illegal activities. In this way, between an owner of an asset and a company that seems to be independent of it is concluding a sale contract, but in reality the contract has been created by the owner just to give the appearance of a legal transaction which actually exists only on paper. The United Nations has defined the term money laundering as "concern to disguise the origin, nature, disposition, movement or owner of the funds from illegal activities, by moving or converting them, in order to give the appearance that these funds are the result of the legal activities". Because the international community wanted to adopt uniform regulations in dealing with the whole complex of criminal activity associated with money laundering, the European Community Council Directive number 91/308 on 10 June 1991 defined in a more complete notion of legal money laundering.

Thus, money laundering is considered:

- Conversion and the transfer of ownership, knowing that such property is the result of criminal activity in order to conceal or disguise the illicit origin of property, and helping anyone who is involved in conducting this kind of activity, to avoid the legal consequences of this actions;

- The concealment or disguise the nature of the source, position, character and movement of the real property, knowing that it comes from criminal activity or participation in this kind activity;

- Acquisition, possession or use of property, knowing at the time of receipt, that such property is the result of criminal activity or from participation in this kind of activity;

- Participation in association, abetting, concealing, facilitating and advising of the

realization of any action mentioned in previous paragraphs.

Globalization phenomenon and organized crime coupled with economical and financial crisis, unprecedented financial and economical openness has led to intensified recycling of funds in Romania and all over the world. For this reason, there is an imperative regulatory of the national banking system by successive acts. Thus, the Romanian Parliament first adopted in 1999 Law No. 21 for the prevention and sanctioning of money laundering, and then in 2002 the Law number 656 for the prevention and sanctioning of money laundering, and finally in 2005 was adopted the latest law in this area, aligning Romanian at the European legislation in this area. This last act, stipulates as the crime of money laundering the following facts:

- Change or transfer of property knowing that comes from committing crimes, the purpose of concealing or disguising the illicit origin of such property or to help the person who committed the crime to evade prosecution, trial or execution of sentence;

- The concealment or disguising the true nature of the origin, location, disposition, movement or ownership or rights over their property, knowing that the goods come from crimes committed;

- The acquisition, possession or use of property, knowing the criminal origin, association or initiation of an association, membership or support.

3. The impacts of the current financial and economic crisis on the money laundering

The beginning of the third millennium shows great extent of economic activities taking place in the whole world. International economic relations reached unprecedented dynamism, new states and markets are integrated in this economical system. It is clear that in this endless economical territory are initiated, developed and completed an impressive number of illegal businesses, which, very often is known as the business criminality phenomenon. Fraud, in this context of financial and economic crisis, “injured” more than ever the global economy, causes huge financial losses, damaging social stability, threatening

democratic structures. As well, the financial and economical criminality causes loss of confidence in the economic system, subverting and undermining economical and social institutions. Concerned about economical and financial criminality, the international banking community looked attentive at causality and effects, recommending to the governments to take concrete measures to limit them. Variety of legislation, coupled with social and economical features deriving from the development stage of different countries, have made impossible to define precisely, using a single definition of the economical and financial criminality, especially in the area of money laundering. In this regard, the most effective solution of the problem of international money laundering is primarily international cooperation and creation of unique control systems and uniform regulations concerning the penal investigation in each country. International money laundering system is based on exploitation by financial operators of the financial and banking differences between the countries of the globe. Specific activities of international money laundering operators have significant effects on the global economy through: serious damage of the national economies, corruption of the financial markets, reducing public confidence in the international financial system, increasing the risk concerning economical stability, leading to the slowing of the global economical growth, already severely affected by the global crisis. On the international level has been observed that some operators involved in transnational organized crime (including money laundering) could destabilize the national economy of specific countries by transferring important funds out of those economies (in the case of Colombia and Argentina). Of course, all these activities couldn't take place without corruption of officials, civil servants and important politicians. International money laundering operation, are based on differences between financial and legal systems of the states. Therefore, to combat an international phenomenon the only way is, to adopt international cooperation measures. In recent years this phenomenon has been

favoured by the increased globalization of world economy and financial markets.

Worldwide, money laundering problem was treated for the first time in an organized manner by United Nations Convention against Illicit Traffic in Narcotic Drugs and Psychotropic Substances, adopted in Vienna on December 20, 1988. This convention emphasized in detail the mechanisms and effects of drug trafficking, emphasizing the fact that drug trafficking is an important source of black money that allows organized crime to penetrate and corrupt international institutions and state agencies, business and financial sectors. Following this international legal act, the states have adopted one by one legal and institutional measures to prevent and control the activities of operators working for recycling of "black" funds. Sources of dirty money and recycling possibilities were extended and significant parts of the underground economy activities are infiltrated in the real economy using various methods. Transparency and the health of financial markets are key elements for efficient functioning of economies, but the financial markets could be seriously threatened by money laundering phenomenon. The deterioration of the financial system could be instant, having serious effects, hard to be predicted and the recovery process is long and uncertain. In a scenario unlikely but not impossible, a cartel of criminal organizations controlling significant financial resources, could destabilize and compromise a national economy by coordinating the transfer of funds abroad or implementing massively large amount of "black" money in the real economy. Quantifying the effects of such assumptions is impossible because there may be a first moment of apparent growth, increasing interest of investors for certain objective. But later will appear the first signs of insecurity - the cessation of payments to a bank, financial institution or a freezing of funds, decreasing the rating of a country. Moreover, the "black" funds will create instability because market reaction could not be effectively controlled, rumors and speculation taking place of the rational financial actions.

Referring to this, Jean Francois Burgelin, general prosecutor at the Supreme Court of France, in his book "Blanchiment de l'argent et criminality organize" cautions that an unknown operator, which, in a tropical paradise transfers tax in bank accounts around the world millions of dollars of illegal origin, it seems, in the opinion of the community, less dangerous than a criminal who tries, using different means to break a bank. However, recycling of funds is a more dangerous operation for the stability of national economies than robberies and different violent actions. Although apparently more difficult to accept, is a correct view, because any criminal activity must be followed by placing money obtained from criminal activity in the real economy. In this way the fair competition existing on the market is seriously affected. That is why, during the current crisis is required more than ever to adopt new institutional measures to prevent and combat money laundering activities. More then ever should be increased the place and role of the international institutions having responsibilities in this area - INTERPOL, EUROPOL, FRONTEX and the harmonization of the legal systems could contributes to decrease the effects of the crisis and money laundering.

The Establishment of the Implementation Mechanisms for the Integrated System in SMEs

Popa Liliana Viorica
Maritime University of Constanta
lili_vio@yahoo.co.uk

Abstract

To survive and achieve to develop their activities in an increasingly competitive environment, small and medium sized enterprises have to increase their competitiveness and, progressively, reduce their operational cost.

It is necessary to develop a flexible and unique management system for these enterprises to use to integrate all management systems or activities related to quality, safety and environmental issues and improve their overall business performance and also to get prepared for certification according to the relevant international standards.

The output of this paper is a route map of activities for the implementation of the integrated management system, incorporating tools addressing specific management areas using quality, safety and environmental issues to focus them. The route-map has the potential to integrate the overall management activities of an organization. The tools of the route map were partially implemented to two SMEs, giving positive validation of the concepts.

Key words: standard, SMEs, route map, safety, quality.

J.E.L. classification: M11

1. Introduction

SMEs are and will be a significant task to work on within the framework of the European Union economy. The global trend indicates that today and in the near future big firms will be united to giant enterprises, which will dominate the market, influencing all its parameters and determining prices.

Due to these reasons, SMEs will face many perils and run the risk of being excluded from the marketplace, if they do not manage issues like cost reduction and competitiveness immediately and in the most efficient way.

The European Union's concern about enabling SMEs to survive in a rather difficult business environment is very obvious. It is important to mention that:

- In the 1996 British Quality Foundation & EFQM edition of the Business Excellence Model and the process of Self Assessment, special guidance for Small Businesses is provided for first time.
- The Regulation (EEC) 1836/93 for Eco-Management and Audit Scheme (EMAS) gives emphasis to the way that it can be implemented to SMEs.
- Most of the Research Programs funded by the European Union provide opportunities for projects that deal with SMEs development and their performance improvement.

Additionally, management system standards like the ISO 14004: 2005 "Environmental Management Systems - General Guidelines on Principles, Systems and Supporting Techniques" and the BS 8800: 1996 "Guide to Occupational Health and Safety Management Systems" make special reference to their applicability to SMEs.

Quality, safety and environmental issues reflect all aspects of competitiveness. More precisely:

- the concept of Quality Management, as a means to achieve benefits for all stakeholders groups through sustained customer satisfaction (ISO 9001: 2008 "Quality Management Systems - Guidelines");
- safety, as a management field for controlling and reducing all kinds of losses and the relevant cost;

- environment, as a synthesis of internal and external parameters to be managed for the benefit of both the organization and the society create, in synergy, a triangle basis for developing a management system that SMEs need and are able to implement and which can be extended to serve the overall management needs of these enterprises.

2. Development of an innovative unique generic system for managing quality, safety and environmental issues

By examining the special characteristics and needs of SMEs, among which the necessity for cost-effective management systems and procedures and the limited resources are the most critical ones, the importance of establishing and using management systems that unify a number of issues in these organizations becomes very obvious.

Although a number of articles have addressed the IMS approach for quality, safety and environmental issues, no generic management basis has been established yet for SMEs. Standards, models and regulatory documentation demonstrate a structural relationship between the management methodologies of these three issues but there is a big difference between their objectives and orientation as they appear to be put in practice at the moment:

- Quality management basically aims at satisfying customer expectations and needs
- Safety management primarily aims at fulfilling legal obligations
- Environmental management aims at proving the existence of a social responsibility.

By integrating these issues through the development of a unique management system and a common framework of objectives, a significant aid is provided for SMEs to achieve competitiveness and continuous improvement targets.

3. Preparation of SMEs for ISO 9000 and ISO 14000 certification

ISO 9001 and ISO 14001 certification is very important to SMEs for various reasons:

- It provides strong marketing tools to these companies that really need them;
- It increases their products or services reliability;
- It creates a sound background for culture change;
- It produces "formal paths" of communication to SMEs where the high rate of informality could cause problems;
- It gives SMEs the opportunity to become suppliers of bigger organizations which consider such certification a requirement for starting a collaboration with a supplier;
- It upgrades their image to all groups of stakeholders.

4. Increase of SMEs organizational flexibility

An advantage of SMEs is that their size helps them maintain their flexibility. Apart from that, the organizational structure is a critical parameter for an organization's flexibility. By integrating management systems eventually a lean-structured cross-functional process-oriented organization is gradually formed.

Fewer horizontal functions substitute separate vertical ones and fewer people are needed while more activities are accomplished. The IMS route-map implementation should lead SMEs to create more flexible organizational structures and increase their efficiency.

5. Reduction of SMEs operational cost

Quality, safety and environmental management systems provide cost reduction benefits to companies, through:

- minimization of cost of non – conformity
- improvement of productivity;
- continuous reduction of losses and of the relevant cost;
- improvement of process management;
- implementation of preventive actions instead of corrective actions.

The synergy achieved by integrating these management systems will multiply the benefits mentioned above. The IMS route-map will additionally help SMEs control their overall operational activities more effectively and efficiently through specific tools.

6. Establishment of mechanisms for SMEs continuous assessment of performance improvement

Based on the eight quality management principles and the principles of Business Excellence Model, the IMS route-map introduces ideas and techniques of continuous improvement assessment that suit SMEs.

It must be mentioned that SMEs needs for performance assessment are different from these of big enterprises; for SMEs, parameters like time and response speed are much more critical, as their time horizons are inevitably shorter and their financial and other resources are limited.

Their assessment system must continuously monitor their overall performance, giving them the possibility to take immediate action as soon as problems or system deficiencies occur.

7. Increase of SMEs competitiveness

The combination of organizational flexibility, operational cost reduction and continuous total performance improvement assessment will increase SMEs competitiveness dramatically.

An IMS route-map can act as a platform for the development of a new management style that will be based on:

- simplified purposeful procedures
- value-adding process planning
- front-line management practices

8. Steps of the IMS route-map development procedure

As the IMS route-map addresses to SMEs, the first issue that had to be studied and analyzed was their special characteristics and needs as they were indicated by the literature review and the data collection procedure. The analysis led to two groups of results:

- results showing how these organizations operate, their overall weaknesses and strengths and what they actually need and the IMS route-map should provide;
- results related to the way quality systems are usually implemented to SMEs and to the characteristics of these systems.

The former group of results strongly influenced the content of the IMS route-map as the input of the user group, whereas the latter group of results influenced the structure of the IMS route-map and the points related to its applicability.

A very important aspect of the IMS route-map development procedure was the design and development of a number of particular tools to be implemented within its framework, or even independently.

9. IMS route-map tools development

The particular tools of the IMS route-map aim at:

- introducing a systems approach to areas that, generally, are not managed that way in SMEs;
- fulfilling the needs of SMEs;
- satisfying the requirements of the applied standards;
- providing simple, cost-effective ways for SMEs to cope with specific issues, by integrating activities;
- facilitating the IMS implementation in SMEs.

The development of each tool was based on the following axis:

- determination of the areas of concern to be addressed by the tool, that would ultimately specify its aims;
- identification of the standards requirements to be met by the implementation of the tool;
- design of the tool, by modifying the content of its particular step or phase and the sequence between them, based on the expected final output of the tool.

The priority of the tools introduction within the framework of the IMS route-map was determined by the integrated basis of quality, safety and environmental management standards.

10. Conclusions

The fundamental elements of the paper were:

- the special characteristics of SMEs and their needs for survival and development, as they were determined by the literature review and the analysis of the results of the relevant standards;
- the quality, safety and environmental management principles and the requirements and / or guidelines of the relevant standards.

Evolution of Foreign Direct Investment during the Global Economic Crisis

ggculita@yahoo.com

Abstract

FDI had a positive development before the global crisis, on the background of global economic growth, foreign investment regime, liberalization and internationalization strategies by increasing the number of transnational corporations. The crisis has adversely affected access to financing, corporate profits fell over, limiting their ability to invest in production capacity expansion as a result of markets deterioration and unfavorable economic outlook . If in 2008 the worst affected were developed countries, the decline in FDI flows in 2009 included all world economies at global level reporting a perceived decrease in FDI inflows of 16% in 2008, 37% in 2009 and in 2010 the volume of global FDI flows received only a marginal increase by 1% respectively from 1144 billion USD in 2009 to 1122 billion USD in 2010.

Key words: foreign direct investment, economic and financial crisis, declining corporate profits.

J.E.L classification: F21

1. Foreign direct investment worldwide

Developing a strong economy based on competitive market principles can not be achieved outside its connection to the world economy even as growth and progress can not be achieved without the investment including foreign direct form.

Foreign investment flows between countries and groups of countries are formed according to specific targets varying from country to country in relation to the economic and technological development,

economic structure and factor endowment, the progress of computer science and telecommunications, the internationalization of financial markets and the expansion of corporate cooperation. During 2003 - 2007, FDI flows have registered an upward trend, supported by global economic growth, liberalization of foreign investment regimes and implementing large-scale internationalization strategies by increasing the number of transnational corporations. This system embedded in 2007 approximately 75,000 transnational corporations and 650,000 foreign affiliates, representing 25% of world production. Top 100 transnational companies have a dominant position in the international system of production. They amounted to a turnover of 5.200 billion USD assets over more than 9,000 billion dollars and over 15 million people [1].

Financial instability occurring in the U.S. in the summer of 2007 led to a progressive deterioration of the situation of foreign investment worldwide.

After a relatively calm period in the early months of 2008, the crisis suddenly erupted when leading financial firms such as Lehman Brothers U.S. and AIG and then financial institutions in Europe such as Fortis, Dexia recorded cases of insolvency. Thus it became clear that this new manifestation of the crisis is a symptom of a serious situation of global financial services, going beyond the financial sector causing shortly serious repercussions on the real economy.

The year 2008 marked the end of their international investment growth [1] that began in 2003 and reached a historic high of 1.9 trillion in 2007.

According to UNCTAD, after a decrease of 16% of FDI flows perceived in the world in 2008, their volume fell by another 37% in

2009, exceeding the minimum threshold of \$ 1 trillion. The decline of international investments in 2008-2009 has two main causes:

- reducing the company's ability to invest because of restricted access to financial resources internally (decline in corporate profits) and external (scarcity and high cost of funding sources);
- reduce opportunities for companies to invest in expansion of internal / external production capacity due to deterioration of markets (especially in developed countries), the unfavorable economic outlook and increasing of risk aversion.

Diminishing profits and stock exchange quotations fall, drastically reduced the number and value of cross-border mergers and acquisitions, the main way of entering foreign direct investment markets. The total volume of sales of transnational corporation subsidiaries implanted abroad, rose in 2009 to over 29 billion USD, almost two times higher than world exports of goods and services in the same year, of 15.716 billion USD.

In turn, exports carried out by subsidiaries of transnational corporations abroad amounted to USD 5,000 billion, representing a third of world exports of goods and services in the same year. Although sales of foreign affiliates of transnational corporations implanted abroad as value added, gross product generated by them was reduced by 4-6% in 2008 and 2009, their contraction was lower than the decline in global economic activity, that is why the share value added related subsidiaries reached a new historic high of 11% of global GDP in 2009.

Despite diminishing sales and added value, the stock of FDI worldwide and assets held by foreign subsidiaries were re-enrolled on growth track in 2009 (after a reduction of 5% in 2008, assets increased by 7.5 % in 2009) due to increase by 15% of the stock of foreign direct investment.

According to the report for monitoring international investments UNCTAD in 2010, the volume of foreign direct investment flows has increased by only 1% from 1114 billion to 1122 billion USD in 2010.

Stagnation of investment activity worldwide is a concern because public investment and economic stimulus packages initiated by governments around the world in

order to reduce the negative impact of global financial and economic crisis are about to exhaust their effects.

2. Foreign direct investment in developed countries

The main generators of foreign direct investment flows are developed countries because they have large accumulation and material resources, technical and human resources and technology and managerial experience.

The high degree of concentration of investment flows to both input and output takes place within groups the European Union, North America and Japan. The largest flows of direct investment take place in developed countries but there are differences between countries due to size, their economic and technological power, the structure factors of production and technological and managerial experience.

Unlike 2008, the impact of global financial and economic crisis on FDI has been important in terms of large regions, groups of countries - the most seriously affected being developing countries in the epicenter of the financial crisis, decline of FDI flows in 2009 was widespread covering all three major groups of economies, the developed ones, developing and economies in transition.

After falling by 29% in 2008 [3], FDI flows oriented to the group of developed countries has decreased by 41% since 2009. If the 2008 champion absolute rhythms in EU-27 was negative (-40%) and the U.S. and Japan have registered increases in investment inflows (17% and res \rightarrow respectively, 8%), in 2009 the decline in FDI received by the EU-27 was also attenuated (-29%), USA and Japan recording a decreases of more than 50%. In these circumstances, EU-27 share in total FDI flows globally perceived increased from 30% in 2008 to 34% in 2009 (but was much lower than in 2007, 43%), while the U.S. share decreased from 19% to 13% in 2009.

Despite the serious imbalances in financial markets stemming from the U.S. and witch led to the worst U.S. last decade recession in the last decades, the United States in 2009 maintained its position as the largest recipient country, both in the group of developed

countries, as well as globally. Flows received by the developed economies in 2010 decreased by 7%, despite the recovery in some of these states. The only notable increase in this group of countries has been the U.S.A, where investment has increased by 40% compared to 2009 due to strong expansion of the reinvested profits of foreign subsidiaries. However Europe in 2010 has been shown as a sub-region with the lowest flows of investment drawn (22%), after reducing by 28% in 2009. Within the EU-27 the received flows decreased by 20% in 2010 due to Luxembourg and the Netherlands which recorded negative values of drawn foreign investments as well as to the uncertainties related to sovereign debt of Ireland and Italy (Greece and Spain are not large receiving countries).

If the large EU economies such as France and Germany, the received flows slightly decreased in 2010, they decreased dramatically in Japan due to major disinvestment processes, such as Ford.

3. Analysis of foreign investment in the economy of developing countries

Compared to developed countries the share of foreign direct investment in developing countries in total world investment is low (30%). In these countries economically developed countries predominantly invest and the decision is influenced by a number of natural factors, the degree of risk, the existing infrastructure of the economic and legal status of labor but also the processes of privatization and liberalization of foreign investment.

For FDI flows to developing countries and those in transition, which continued to grow in 2008 by 17% and 26%, helping to increase the share of both groups of countries in the overall volume of investments decreased by 35% and by 39% in 2009, following the effects of global economic and financial crisis. In 2010 we are witnessing a 10% increase in foreign direct investment attracted to these states.

In the context of perceived general decline of these countries in 2009, a notable exception is China, which has managed to improve performance as host country → railings. After increasing by 30% drawn flows in 2008 (to 108 billion USD,

equivalent to a 6.4% share of total world), China has managed to maintain their high attracted flows in 2009, detaching net of any of the regions of the world, attracting 95 billion USD, to reach in 2010 to an increase of volume to 101 billion USD.

In 2010 developing countries and transition together attracted more than half of global investment volume for the first time. Latest estimates of UNCTAD indicates a recovery-oriented power flows to developing countries in Asia and Latin America, which would offset the decline in foreign direct investment flows to developed countries (despite the U.S. performance). Since 2009 half of the perceived global flow was drawn to developing and transition countries, who have returned a quarter of the flows generated in the world.

Although developing countries have long been reluctant to direct foreign investment, the new context in which these flows are (changing competitive conditions, changing attitudes and policies) have led in the recent decades not only to advantageous ways for investors but also for host countries. These are the exclusive property of the transition from foreign companies investing in the means of production, with all rights implications arising from this, access to credit in the financial markets, the shift from direct control of the company's total foreign investors and the management of a subsidiary participation of host country firms, management control and decision making.

4. The analysis of FDI flows received by the EU – 27

When FDI directed to the EU-27 FDI fell by 40% in 2008 (from 504 billion. USD) compared to the record in 2007 (842 billion. USD) - a decrease of almost three times higher than the recorded globally (14%) and more pronounced than that of the group of developed countries (29%), declining investment flows received by the EU-27 continued in 2009 but with a smaller scale (-29%) in 2010 by 20%. The crisis has affected to varying degrees-27 EU member states and caused intra-barriers in the hierarchy of major host countries. Some of the old Member States have seen dramatic reductions in their position in terms of FDI received health, the most striking

example is Britain, which lost its traditional position of the largest FDI recipient country not only in the EU, but also the group of developed countries in Europe. After being hit by the financial crisis in 2008 - when the received FDI inflows halved, reaching 97 billion USD, United Kingdom faced an unprecedented collapse of their 2009 volume itself only mandate 7 billion USD. As a result, Great Britain since 2008 has lost the traditional position of leadership in Europe in terms of FDI attracted, whom it gave to France. In 2010 it was able to obtain a slight increase of 1.2%.

And the EU-27 countries can talk about a general decline of FDI received, although there are some exceptions. Thus, in Italy, whose perceived FDI flows declined noticeably in 2008 (17 billion dollars from 40 billion USD in 2007), they increased to 30 billion USD in 2009 (76%) for in 2010 to decrease by 35.5%. Germany, whose FDI inflows recorded in 2008 a decline of 56% to 2007 (reaching only 25 billion dollars and causing a lowering of the developed country group to 7th place in 2007, 9th place in 2008) has increased FDI by 41% in 2009 (35 billion USD) in 2010 their volume to decline by 3.5%. The Netherlands - host country for major financial TNCs (which contributes to the volatility of FDI flows, mainly through intra-company creditors), the received FDI became negative in 2008 (- 3, 5 mil USD, compared with 118 billion USD in 2007), to increase to 38 billion USD in 2009 and in 2010 to decrease by 24.7 billion USD. Also, FDI flows received by Finland and Ireland, became negative in 2008 (-4, respectively, - 20 billion, compared with 12 and 25 respectively billion in 2007) increased to 3, respectively 14 billion USD in 2009. In 2010 FDI in Finland have remained constant, the Irish to fall by 66.3%.

In terms of making FDI modes, there were revealed two major trends that explain the strong decline of FDI in 2008-2009: on the one hand, although it decreased investments in extending economic activities abroad either through M & A transactions or through new investment projects, and on the other hand, exceeding the volume of new investment by companies - disinvestment or other transfers of funds from subsidiaries abroad implanted by the parent companies (eg repay debt, reverse loans).

The disinvestment process means partial or total suspension of border ownership relations, whether as a result of firm-level strategic decisions on the geographic scope of activities creating added value (concentration resources at national, regional or global level) or of a change in the means of supply (eg by turning from local production to export) or the complete withdrawal of FDI in a host country. The evolution of global FDI in 2010 was characterized by divergent trends in terms not only regional but also the composition of FDI and their methods of entry. Thus, it is considered that improving economic conditions in 2010 led to an increase in reinvested earnings, while capital investment (in the form of shareholdings) and inter-firm loans remained at relatively low levels. While the growth in profits of branches abroad, especially in the developing countries, have boosted reinvestment profits, the uncertainties in the global economy, the volatility of currency markets and sovereign debt in the European region have resulted in a negative trend of inter-firm credit and a lower level of capital investment. Regarding to the way of market entry of FDI, cross-border mergers and acquisitions increased by 37% in 2010, while new projects have continued to decline in number and value. However the volume of the latter value was much higher than the value of cross-border mergers and acquisitions.

5. Conclusions

After a 16% reduction in flows in 2008 it fell by another 37% in 2009 while outgoing FDI fell by 43%. All components of FDI flow fell in 2009 in shares prices, inter-groups and profit reinvestment. Reducing international mergers and acquisitions was the main cause of reduction in FDI in 2009. These were reduced by 34% (65% in value) while the number of projects to create new units did not decreased more than 15%.

UNCTAD estimated that [4] FDI flows began to recover in 2010 to a level of 1122 billion dollars expecting to reach the 2011 level from 1300 to 1500 \$. It is considered that in 2012 there be reached pre-crisis level by investing between \$ 1600-2000 billion. It is expected that improving macroeconomic conditions in 2010, strengthening and

increasing profits TNCs stock market quotations coupled with increased confidence of business circles in 2011, to result in an increase in investment activity. On the other hand there are still some risks in perspective, especially related to the economic downturn by "original impetus" of the recovery process, the volatility of currencies, sovereign debt and protectionism in the European region for investment. Vigorous recovery of global FDI will depend on achieving sustained economic growth and revival of investment activity in developed economies.

Quality Improvement of the Offered Services – Solution for the Banking System Management in Romania

Popescu Dan

The Bucharest Academy of Economic Studies

Dinculescu Elena –Silvia

Bursugiu Mihaela

“Constantin Brancoveanu” University of Pitesti

nataliadinculescu@yahoo.com

Abstract

Quality management banking perspective is extremely interesting, from the point of view of the activities specific, and of the permanent area competition imposition. Banks being aware of the quality problems also lead to the appearance and requirement of some area working standards. Standards imposing and issuing together with the performance measure system are to be the main elements of a quality programme.

Key words: Quality, performance, banking services

J.E.L. classification: G21, G24, E43

1. Introduction

The adjusted number of the banks lead to an increasing competition and to the market banking services' awareness, in order for the „desired quality/issued by the bank” together with the one perceived by the client, to be both taken into account.

Philip Kotler defines the term „service” in the following way: „a service is any action or operation that one party can offer to another party and which is essentially intangible and it does not have for a result getting possession of a thing. Its production may or may not be related to an existing product in physical shape” [1].

There are relatively recent items regarding banking area quality management (the start has been issued within the years 80s of the 20th century), but researches for constant improvement have proved their importance, especially for the developed states. For example, north-american and west- european

banks have continuously worked for their clients' support and the performance of their needs (also by constant evaluation of their contentment)[2].

2.The evaluation of technical quality

In the economic environment, this situation demonstrates the necessity of being different from the competition through a different service which exceeds the expectations through superior quality. In the banking environment, which is already characterized by strictness and exigency, this situation demonstrates the necessity of providing an irreproachable service. One distinction can be made between: quality as a consequence of the service *characteristics* and quality as a consequence of the lack of flaws.

Another distinction is made between the technical quality and the functional quality of services. While technical quality expresses the result of the performance (what the client stays with after the interaction with the provider), the functional quality refers to the way in which the service is provided.

According to researches, the Romanian banks' private clients are both interested in the product's purchasing costs and also in the bank's vicinity to their homes. The added value for a bank's client also includes the following important specifications, which present one or more adequate target values and unique items, certain bank's structures being active for each of them[3]:

- products' merchandising conditions – as better as possible;
- bank's accessibility – as great as possible;
- products' purchasing costs- as low as possible;

- the product’s variety of the offer;
- interests value –higher for the deposits and lower for the credits;
- products’ purchasing durations –as fast as possible;
- staff’s attitude and behaviour– more turned to the client.

Starting from an external method for quality evaluation „mystery shopping”, we can evaluate the technical and functional quality of the service „the personal needs credit”, which is present in 5 versions on the banking services market from Romania, eventually identifying adequate improvement strategies. The 5 services analysed are: Personal needs credit –BRD-Groupe Société Générale, „DIVERS BCR” – credit BCR, „The personal needs credit”–INGBank „The personal needs credit”– OTP BANK, and „The personal needs credit”–BANCPOST BANK

We excluded such elements as: the value of the taxes and commissions or the number of documents required, which are considered less important in making the buying decision. Next, we established the assessment scale that is to be used.

For measuring the quality of the services above, the chosen technique is „mystery shopping”. Concentrating on the interactions between employees and clients, that is on the so-called „truth moments”, the applied technique will evaluate the functional quality of services. Because of practical impediments, there are however differences between the theoretical version of the method and the way in which this is applied. Firstly, from the theoretical point of view, the method involves buying the tested services, „the mystery client” being allocated a budget for this purpose. In this study we tested just the „pre-shopping”stage. Secondly, the method implies making repeated tests in the same bank with more „fictitious clients”. In the present study, we tested services belonging to different banks (one for each), with just one „fictitious client”.

According to theory, the technical quality expresses the result of the performance (what the client stays with after the interaction with the supplier).

For the majority of elements we set a score from 1 to 5, 5 being granted to the most favourable value existing on the market, and 1 – to the least favourable value. For

intermediary grades, the intervals were established mathematically. In the case of non-valorical elements, grade 5 was granted for the most favourable situation on the market and grade 1for the least favourable situation. For a better relevance of the results we also used importance coefficients. (Table 1)

Table1 Evaluation of the service technical quality

Elements	MS	MP		G	C	T
„k”	1	2		4	5	-
BRD	5	5		4	3	58
BCR	4	5		5	4	66
ING	3	4		2	2	38
OTP	2	3		4	2	40
BP	1	1		1	2	24

Source: author's data

The importance coefficient - „k”

The maximum borrowed sum – MS

The maximum crediting period (years)-
MP

Interest value-I

Garantig method-G

Collaterals-C

Total-T

While technical quality expresses the result of the performance, the functional quality refers to the way in which the service is performed (the way in which the interaction with the supplier takes place).

3. The evaluation of functional quality

The functional quality is specific to services and clearly linked to the „truth moments”. In order to identify the elements of the functional quality we took into account the 5 dimensions identified: tangible elements, seriosity, responsiveness, safety and empathy. These were decomposed in components, taking into account traditional definitions, but also introducing new elements, in order to ensure the possibility of their manifestation in the „pre-shopping stage”. In this case we also established an objective assessment scale. If in the case of technical quality, the assessment scale was established by reference to the market situation (the evaluation of the characteristics of a bank’s service is made by referring to the most favourable offer or the least

favourable one on the market), in the case of functional quality the assessment scale was established by referring to the ideal situation.

Table 2. Evaluation of the service functional quality

The assessed elements	BRD	BCR	ING	OTP	BP
Tangible elements					
modern endowment	4	4	5	3	2
pleasant environment	5	4	5	3	2
space organization	4	3	5	2	2
staff appearance	5	4	5	3	2
Total	18	15	20	11	8
Safety					
staff competence	5	5	5	3	2
polite staff	5	3	4	5	3
information provided	5	2	5	4	2
Total	15	10	14	12	7
Seriousity					
interest in solving problems	5	4	4	3	3
sufficient resources	5	4	5	3	2
transparency	4	3	3	2	1
Total	14	11	12	8	6
Empathy					
flexibility	5	3	4	3	3
visual contact	4	3	4	3	2
active involvement	5	4	5	4	2
Total	14	10	13	10	7
Responsiveness					
waiting time	5	3	3	5	3
availability to help	5	4	5	3	3
staff presence	5	5	4	3	2
Total	15	12	12	11	8
Maximum possible score	80	80	80	80	80
Score effectively obtained	76	58	71	52	36
Percentage	95%	72,5%	88,75%	65%	45%

Source: author's data

4. Conclusions

The service provided by BRD- Groupe Societe Generale registers the biggest number of maximum grades. The functional quality is very close to perfection. Obviously, the client's expectations were exceeded.

In the case of the service provided by BCR it is noticed that the score is maximum for technical quality, but minimum for functional quality - 66. The strong points of the service are the borrowed sum and the long crediting period, but mainly not requesting collaterals and the possibility of transferring a part of the borrowed sum in the personal account.

In the case of the service provided by ING Bank, we can remark the interest for solving the clients' problems quickly, the pleasant environment for discussion, the sustained visual contact and the employee's interest to find the product that best suits the customer's needs.

The weak points refer to technical quality, through the considerable collaterals requested and the transfer of the whole sum in the account of the educational institution.

In the case of the service provided by OTP BANK, the total technical quality is medium, the weak point being the request of important collaterals and the strong point the transfer in the client's personal account.

For the service provided by BANCPOST, we notice the minimum score for functional quality. From this point of view, the service is obsolete. It is recommended either to abandon it or to update it. In the case of functional quality, most of the scores are medium, especially the lower degrees for staff presence at working points, availability to help, staff competence and information provided.

Clients' perception can greatly be improved by using a very efficient marketing and by sustained interest for quality improvement, their needs and requirements satisfaction. A client should be given the impression he is the most important, in order for him to be willing to attend the specific bank's services. It is considered to be much more expensive for a bank to attract new clients, than to keep the old ones, so all banks should try by any possible mean to improve clients public department.

Standards imposing and issuing together with the performance measure system are to be the main elements of a quality programme[5].

Which is the situation on the banking services market? The practical study we made offers a comprehensive answer to this question. There are negative surprises (waiting time and carelessness from employees in a bank with tradition; insufficiently informed staff in three banking institutions), but also positive ones (the ability and the care of the staff would make the client return only for „the sake” of interaction). It is intriguing that the negative events which impressed most (the so-called „critical incidents”) have obvious, easily identifiable solutions. By simply recording the clients’ complaints and replacing the non-functional systems identified by them would lead to a substantially improved service.

Still, there is not considered to be a priority for most of the east-european banks, to work upon a quality management system.

Abstract

In the global economic crisis, the competitiveness of companies is provided by the competence, experience, employee productivity. The key word is to reduce costs, which can be achieved through flexibility and savings. Employees working flexible represent an effective innovation work in the period of economic crisis. We know that innovation is the main engine of growth in the current context, and innovation at work not only ensures the survival of firms, but thus maximizing their internal customer satisfaction.

Key words: competitiveness, employee, flexibility, innovation, employment

J.E.L. classification: M5, G01, O31, J24

1. Introduction

Socio-economic entities are those that resist competitive and even grow under conditions of global economic crisis. Moreover, in any economy where competition is increasingly fierce, competitive became a desire for any company. To ensure the competitiveness of firms make special efforts, not only permanent adjustment to market conditions and its requirements, but to create environmental conditions favoring their development. Concerned as more of the global crisis, maximize customer satisfaction,

companies are willing to seek solutions to streamline costs, flexibility and quality assurance activities.

Moreover, knowledge-based economy generates new models of organization and economic activity. This is an economy based on knowledge and ideas, an economy in which people work more with their brains instead of machines, in which communications technology creates global competition, in which rapid change is a constant, in which innovation is more important than production table, the investor buys new concepts or new ways to create than new machines[4]. Survival and development of firms came from innovation and not derived from optimization. Innovation and competition are the engine of development entity.

The success of firms in knowledge-based economy is determined by how they manage to spur technological innovation, to develop business relationships, promote and develop specialized skills type learning networks. This is because the informational economy is characterized by rapid change of paradigms: manufacturing processes, organization (work) and business management[4]. As such, markets are global firms operating, dynamic, requiring the creation of business networks to develop, promote entrepreneurship, to develop flexible hierarchies, flexible organization of production and labor.

2. Importance of increasing the competitiveness of firms in the current economic crisis

In firm theories we found stakeholders theory showing that managers may not maximize firm value if ignored objectives, the needs of all stakeholders: shareholders, employees, suppliers, creditors, customers, communities, etc. .. In other words, the state of competitiveness cannot be achieved by an entity, if not taken into account the interests of the main partners, at least.

Competitiveness - complex concept, can be addressed at individual level, organizational and societal or general. Thus, in general, competitiveness means the ability of competition to keep and obtain economic benefits in the context of that environment. This general approach applies to both individual and organizational level. At the societal level, however, expresses the capacity and competitiveness of that country's ability to efficiently use seized and identified opportunities globally.

Research on competitiveness has revealed a number of interrelated factors of competitiveness: profitability, investment, improves the quality (of products and activities), expansion and diversification, proactive behavior. But if competitiveness is addressed from the perspective of modern management, namely in terms of two key factors: profit entity and its impact on the market - through the products and / or services and proactive behavior, it is essential to increase competitiveness of the companies in the context of global crisis. This is because profit is not just a company's purpose, but a means that may ensure the survival and / or development. In this sense, the economic crisis, the primary objective is to maximize customer satisfaction firms and all those interested. Companies that are based on studies of customer needs (internal and external) will be able to identify competitive advantages and to act in order to capitalize on market opportunities and even to create conditions for increasing competitiveness, promoting entrepreneurship and innovation. After two years of crisis, the EU has published a new strategy for accelerating the development of new products and services in

the hope of increasing employment and hence economic growth. One component of Europe 2020 initiative, called "Innovation Union" aims simulation and accelerating innovation in Europe[6]. The term "innovation" has different meanings depending on context it is used or studied.

3. The role of innovation factor in ensuring the competitiveness of firms

It is generally known that innovation, the main engine of growth for any entity, may be approached conceptually as a process or a problem solving approach[1].

Obviously, innovation is based on the results of new technologies on innovations in related fields or different from the approach, the combination of new technologies, and the use of knowledge used by other entities in different contexts. So innovation is an activity that results in: a new product, a significantly improved product, a new process, new procedures, new or significantly improved technologies and techniques, new ways of working and new tools or significantly improved. Whether it's developing products, services or new ways of selling or marketing, identifying ways to increase employee work efficiency, increased market value offered by the company, innovation creates economic effects and consequences for society. Moreover, innovative management, organizing working process and human resources together with the ability to anticipate market requirements and trends in development, contribute to the success of other directions of innovation[1].

Innovation is usually regarded by managers and others interested individuals in the company as a long term investment. But, there is a possibility that, many of these investments to be viable and profitable in the short and medium term. If we adopt innovation as an approach which solves a problem, then employees' flexible work is an innovation, because it looks of the fulfillment for their needs.

3.1. Flexiwork - effect of innovation at work”

In the global economy, knowledge-based economy, the growing importance of free time, place all a question of flexibility in production, labor, hierarchies and structures. Innovation at work not only new ways of organizing work, but also new ways of developing the potential for innovation and creativity of employees. In this respect, leading to increased flexibility of employees work their creative potential as people, bearers of culture, are different and how they work, and their efficiency at work is different: some individuals get great results if you work in very rapidly, at certain times of day, others work more slowly, thoroughly solving things. Diversity represent a source of creativity and innovation.

Flexibility at work is the opportunity for employees to change working time taking into account personal and family problems, but also the needs and objectives of firms. However, employees who have time to meet their essential and existential needs will be more motivated to work better, getting the results expected by employers. Freedom given by a flexible working time leads to increasing innovation and creativity of every individual.

Innovative projects are funded by the European Union in the hope that investments in skills and innovation will be reduced during the crisis. Such a project co-financed by European Social Fund Operational Program Humane Resources Development 2007-2013 - Harmony[8]. Innovative measures to reconcile work with family, brought to the attention of employees and employers Romanian innovative practices and creative solutions in work organization in Italy and other European countries to promote equal opportunities on interregional labor market.

Thus, Romanian employers, and employees were informed on how, and revealed practices in the field of flexible working hours and benefits of their implementation. The three solutions of flexible work project proposed by Romanian employers and employees are short hours working time or part-time, job share, flexi

time, tele-working, project work and intermittent work[8].

Part-time is the result of rules reduced from 17.5 to 28 hours per week and job share is a form of work organization resulting in a post division by two or more part-time employees.

In our country, in some industries, for example in IT & C, the flexi time practice, flexibility practiced on the arrival, departure and break time. Also, tele-working, a result of the new information technologies is already applicable in dynamic sectors, based on the use of electronic media activity. As such, employee’s activity elsewhere than in the operational units of employers leads to this modern form of work organization.

In knowledge-based economy or, as some experts, the knowledge economy, competitiveness of companies is provided by the development of networks of companies, partnerships and joint development of products and services. As a result, the organizational, regional, interregional, national and global projects are developed more or less large scale. In this context, work on the project becomes absolutely necessary, which is actually the newest and most modern form of flexible work.

The services sector, sector predominantly affected by the current economic crisis, competent people with experience are called to carry out their specific training, intermittent and discontinuous.

3.2. Advantages and disadvantages of flexi work

All these forms of work organization are possible if the entities involved (employers and employees) are willing to win together. The employer will get an increase in employee productivity, will be spending cuts staff, while employees want additional material gains, will work where, how and when they want and, most importantly, will save time.

Implementation of pilot project results show that flexible working helps to increase productivity by: reducing the distracting elements of employee work, reducing the time lost in transit by employees (including due to traffic or weather conditions), reduce absenteeism sick leave due to light illness,

eliminating the risk of transmitting diseases to other employees, employees can work at unconventional hours, etc..

Also, employers will have fewer fixed costs arising from ensuring normal working conditions (equipment, tools, workspace, environment, etc..), And specific investments, for example, new product development projects and / or services , new business units, etc.

Flexible employees will contribute to lower labor costs by reducing staff specialized personnel costs (being able to appeal to such persons only in certain cases), reducing overtime costs we (employees perform their tasks when they want, which will lead to elimination overtime work by streamlining and reducing downtime of the work), the elimination of personnel costs of business downtime, etc.

Companies that organize their work in a flexible manner will benefit not only from the reduced expenses but also from the skills, competencies and experience of specialists in different fields. And employees harmonizing flexible life can get additional income, they can cover more working time, can reduce their travel expenses and other costs (food, clothing, footwear, etc..), will be able to manage effective career etc.

It is true that there may be difficulties in communication processes, and social integration at the organizational level but can be reduced and even eliminated if the companies will establish, develop and implement strategies focused on customer, quality, flexible organization of production and work on organic organizational structures, flexible, entrepreneurial culture, the innovation and creativity based

3.3. The implications of flexible working on increasing the competitiveness in Romanian companies

Balancing work-life, as a result of flexible work, generate more motivated employees, efficient, competent, responsible and loyal to the organization, which increases the competitiveness of these firms employing.

Flexible work evidently requires organizational and flexible hierarchies, and a flexible organization of production. This means that companies will have organic

charts, flexible, that will constantly adapt to changes in their environment action. As such, flexible entities will survive and will grow even in conditions of crisis by increasing their competitiveness.

Flexible work will also generate maximization of customer satisfaction by providing products and/or service quality, as required by them (even outside working hours, wherever, whenever and however) and the increasing number of loyal customers of the company.

The idea of flexible working time is a characteristic of knowledge-based economy, sustainable and profitable especially in the economic crisis, firms have to seek to identify competitive advantage for survival and/or development.

4. Conclusions

In the context of globalization and especially the global economic crisis, companies are required to develop appropriate socio-economic strategies, realistic and pertinent, to remain competitive in the long run. Increasing the quality of goods and services and maximize short term profits are no longer sufficient.

At present, efforts should be focused companies to customers by maximizing their satisfaction. Thus, based on customer approach as Kotler's marketing philosophy, company internal customers are equally important, sometimes more important than external customers. Company's internal customers, namely its human capital are the essence of a synergistic social and economic entity. Therefore, innovation in work by its flexibility is an effective way of meeting the needs and desires of employees of companies, which provides a highly competitive, regardless of socio-economic

The Impact of International Financial Crisis on Bank Lending to Households. A VAR Approach

Popescu Iulian

“Alexandru I. Cuza” University of Iași, Doctoral School of Economics

ipopescu1974@yahoo.com

Abstract

The recent international economic and financial crisis has led to a sharp tightening of lending activity. For the banking system the shock was so strong that its ability to lend to the real economy played and still plays a major role in exacerbating the current crisis, which in turn undermines the strength of banks, highlighting the existence of a continuous mutual potentiation.

The objective of this paper is to test, considering the Romanian case, the impact of the strong reduction of gross domestic product growth on banks lending to households. In order to do so, we use a vector autoregressive (VAR) model. The main results of VAR analysis indicate a positive relation between GDP and loans to households, but also the fact that a small share (less than 10%) of the variation in lending to households was determined by a shock of gross domestic product variable.

Key words: credit crunch, VAR model, financial crisis, loans to households.

J.E.L. classification: E51, C32, G01.

1. Introduction

Before the outbreak of the international financial crisis, in a period of significant development of lending activity (with the very high growth rates generally seen as a step forward in the catching-up process [1]), Romanian credit institutions were mainly focused on retail activity, leading to a strong increase in households loans, particularly in consumer credit. Thus, the annual real growth rate of credit to households was 66.2 percent (2004-2005), 76.4 percent (2005-2006), 70.6 percent (2006-2007) and 30.5 percent (2007-2008) [2].

Non-government credit growth slowdown due to adverse domestic macroeconomic evolutions, particularly to those related to gross domestic product, unemployment and wages, tighter lending standards and terms, currency depreciation and increased exchange rate volatility, the sudden stop of parent bank financing and the worsening of financial prospects for households and companies were visible starting with the last quarter of 2008, both for loans to households and firms- so that in 2008, real growth rates decreased from 2.7 % (2007) to 1.3%.

The year 2009 marks the entry into negative territory for both components of non-government credit (-3.6 percent for loans to households and -3.7 percent for loans to non-financial corporations).

For households, in 2010, the negative annual real growth rate accelerated (up to -5.6 percent), while for corporations loans narrowed only marginally (-0.4 percent). Higher negative annual rate in respect to household's credit was due to the strong reduction of the consumer credit component.

2. Methodology and data

The construction of a VAR model is based on considering both variables involved as endogenous or dependent, and not assuming from the beginning the exogeneity of one variable [3]. It is the case of such an assumption, given the bilateral relationship between the two variables.

The imbalance of lending activity has many implications, especially in the sense of economic contraction (lower GDP); in turn, the reduction of economic growth affects lending activity. This is the main reason why we analyzed the relationship between the two variables using a vector autoregressive (VAR) method.

Vector autoregressive model also highlights properly the impact of innovations (shocks); actually, the residual error on variables taken into account [4]. Thus, the value of each variable is influenced both by its own shocks (innovations), and the shocks of other variables, which justifies, once again, the use of VAR to capture the interlinkages between our variables, namely *GDP* and the volume of *household loans*.

Academic literature offers a series of large studies analyzing the effects of monetary policy on the financial system or the real economy. In order to point out the macroeconomic implications of monetary policy decisions or the effects of real economy imbalances, the VAR model was used in a wide range of works, such as those of Sims (1980), Christiano, Eichenbaum and Evans (1999), Peersman and Smets (2001), Angeloni, Kashyap and Mojon (2003), Antohi, Udrea and Braun (2003), Egert and MacDonald (2006), Haan et al. (2007).

Based on a VAR analysis, Lown and Morgan (2006) showed that the changes of credit standards strongly influence credit volumes, real GDP and investments in the commercial sector. In case of tightening of these standards, lending activity and production levels will decrease [5].

More recently, Ciccarelli et al. (2010) used a VAR model with data from surveys on country-level bank lending to assess the impact of macroeconomic changes on credit standards, making a distinction between credit supply factors and demand factors.

The authors focused on the current financial crisis and examined the role of bank balance sheet constraints in reducing GDP under the influence of credit risk provisions and concluded that indeed, restrictions in corporations credit supply played an important part in the decrease of Eurozone output growth. However, stricter standards for mortgage loans in the U.S. have significantly contributed to the GDP lowering [6].

Bassett et al. (2010) use the information from Senior Loan Officer Opinion Survey to obtain "unexplained changes" in lending standards, interpreted as pure effects of credit supply. Based on a VAR analysis the authors prove that loan supply shocks have important economic implications on real GDP and lending capacity [7].

While all these studies analyze the impact of lending fluctuations on real economy (which are in fact monetary policy transmission mechanism-orientated), this paper considers the reverse relationship, namely the influence of GDP growth slowing down on credit, particularly on loans to households.

The simplest form of a VAR model tries to explain the mutual influence between two variables due to the direct effect of the same variable values from previous periods and the values of the considered variables [8]. For example, as it is the case, the loan reduction starts from its previous values (lags) and the previous values of gross domestic product.

The above-mentioned model will be implemented by using as variables GDP and the volume of loans to households. Time series are available on the website of the Romanian National Institute of Statistics (www.insse.ro) and interactive database of the National Bank of Romania (www.bnro.ro). We work with seasonally adjusted quarterly data.

Figure 1-2. Evolution of household lending and GDP in Romania in the period 2007-2010 (quarterly data) -mil. RON-

Source: The National Bank of Romania and Romanian National Institute of Statistics databases, 2011

In order to avoid heteroscedasticity problems we'll use logarithmic series. However, in subsequent interpretations the variables will be treated as elasticities (for example, an increase of gross domestic product by x percent, generates a reduction/increase of the credit volume by y percent).

3. Results

For checking the stationarity of a time series we use the two tests, Augmented Dickey-Fuller (ADF) and Phillips-Perron (PP). Under the null hypothesis the series has a unit root (is non-stationary). If the probability is greater than the significance level we accept the null hypothesis. The results for the *households' loans* variable are presented in table 1:

Table 1. Testing for the stationarity of “loans to households” variable

Augmented Dickey-Fuller Test	t-Statistic	Prob.*
	-3.861220	0.0120
Significance level	1%	-3.959148
	5%	-3.081002
	10%	-2.681330

Phillips-Perron Test	Adj. t-Stat	Prob.*
	-4.292457	0.0054
Significance level	1%	-3.959148
	5%	-3.081002
	10%	-2.681330

Source: authorial calculation

According to the results, the *volume of loans* is a stationary variable (we reject the null hypothesis of a unit root presence because the probability is smaller than the 5% significance level).

Reformulated in econometric terms, the variable is integrated of order 0: $I(0)$. The same tests will be used for the GDP variable, confirming its stationarity. In order to determine the number of periods used we run an exclusion test for insignificant lags (VAR Lag Exclusion Wald Test). The test results are shown in Table 3:

Table 3. Lag Exclusion Wald Test with no significant influence on credit to households - the case of Romania

	L_LH	L_GDP	Joint effect
Lag 1	8.983578	123.2892	126.7419
	[0.011201]	[0.000000]	[0.000000]
Lag 2	0.665426	38.69414	43.61584
	[0.716976]	[3.96e-09]	[7.71e-09]
df	2	2	4

Source: authorial calculation

As shown in table 3, the first period or in other words the values of variables in previous quarters, and their joint effects have a significant influence on the evolution of the dependent variable as p probability (highlighted in square brackets) is smaller than the significance level. Lag 2 is significant for gross domestic product or, reformulated, lending activity reacts both to GDP from the previous quarter and the quarter before. As such, we consider a number of two lags. The VAR model results are presented in table 4:

Table 4. The VAR indicating the relationship between the volume of household's loans and GDP in Romania (2007-2010, quarterly data)

	L_LH	L_GDP
L_LH(-1)	0.394555	0.200486
	(0.33997)	(0.05989)
	[1.16057]	[3.34770]
L_LH(-2)	0.123255	-0.024530
	(0.28143)	(0.04958)

	(0.83377)	(0.14688)
	[1.81975]	[7.51807]
L_GDP(-2)	-0.753017	-0.732210
	(0.93013)	(0.16385)
	[-0.80958]	[-4.46880]
C	-0.005472	4.068910
	(4.92143)	(0.86695)
	[-0.00111]	[4.69338]
R-squared	0.939290	0.983295
Adj. R-squared	0.912308	0.975871
Sum sq. resids	0.029086	0.000903
S.E. equation	0.056849	0.010014

F-statistic	34.81134	132.4405
Log likelihood	23.37077	47.68006
Akaike AIC	-2.624395	-6.097151
Schwarz SC	-2.396160	-5.868916
Mean dependent	18.32657	11.61447
S.D. dependent	0.191973	0.064469
Determinant resid covariance (dof adj.)		2.67E-07
Determinant resid covariance		1.10E-07
Log likelihood		72.40055
Akaike information criterion		-8.914365
Schwarz criterion		-8.457895

Source: authorial calculation

The VAR model equation is:

$$\text{Log_LH} = 0,394555 \times \text{Log_LH}(1) + 0,12325 \times \text{Log_LH}(-2) + 1,517262 \times \text{Log_GDP}(1) - 0,80958 \times \text{Log_GDP}(-2) + 0,005472 \quad (1)$$

The results of VAR analysis indicate a strong and positive connection. The lending level increases as a result of GDP growth from the previous quarter. As shown in Table 4, in this case, the most influential variables are: the *volume of lending* in the previous quarter (acting as a psychological factor: increased lending in the previous period could stimulate population to lend even more) and the *gross domestic product* of the previous period (the economic contraction from quarter_{t-1} has visible effects in quarter_t when, because of restricted financial resources, there is a need for economic austerity measures both in the state and private sector). The second lag variables lose influence on the dependent variable. Commercial bank lending activity is less responsive to indicators made 4 or 7 months ago, being strongly connected to the changes of macroeconomic environment from the last quarter.

4. Analysis Robustness

The VAR model is confirmed if all conditions of stability, no serial correlation and normal distribution of errors are met. We verify the stability by applying AR roots test as graph and table. The results are presented in table 5:

Table 5. The verification of VAR model stability based on AR table

Roots	Module
0.562228 - 0.458328i	0.725372
0.562228 + 0.458328i	0.725372
0.678743	0.678743
-0.304426	0.304426

Source: authorial calculation

According to table 5, the VAR model has four roots: two real and two complex with the same module value. In case of subunitary roots we have a stable model. Next, we verify model *stability hypothesis*. The graphical representation of the table indicates the same conclusion (VAR is stable if no point exceeds the circle).

Figure 3. The verification of VAR model stability based on AR Graph

Source: authorial calculation

The hypothesis of *no serial correlation* of error hypothesis is checked based on Portmanteau and LM autocorrelation tests. Portmanteau test verifies the partial correlation up to a specified lag-usually one level higher than the VAR model order (in this case, the first 3 lags). Null hypothesis states the lack of serial autocorrelation.

Table 6. Residual Portmanteau Tests for autocorrelations

Lags	Q-Stat	Prob.	Adj Q-Stat	Prob.	df
1	5.975531	NA*	6.435187	NA*	NA*
2	7.872287	NA*	8.648069	NA*	NA*
3	8.321542	0.0805	9.219848	0.0558	4

Source: authorial calculation

The value of p , greater than the 5% significance level allows us to accept the null hypothesis and to assert that there is no serial correlation between errors. The results are also confirmed by multivariate LM test for partial correlation up to a certain lag. To confirm VAR, we apply one last test, for the normal distribution of errors.

Table 7. Testing for normal distribution of errors

Component	Skewness	Chi-sq	df	Prob.
1	0.065819	0.010108	1	0.9199
2	0.085586	0.017092	1	0.8960
Joint		0.027200	2	0.9865
Component	Kurtosis	Chi-sq	df	Prob.
1	1.800988	0.838617	1	0.3598
2	1.173250	1.946593	1	0.1630
Joint		2.785210	2	0.2484
Component	Jarque-Bera	df	Prob.	
1	0.848725	2	0.6542	
2	1.963685	2	0.3746	
Joint		2.812410	4	0.5897

Source: authorial calculation

Table 7 displays the results of testing the distribution of residuals. All assumptions of normality are accepted due to a p -value greater than the significance level (5%) for each situation. The positive and close to zero asymmetry coefficient reflects a growing trend of model errors. Kurtosis coefficient is smaller than 3, which means a low probability of extreme events occurrence that would rapidly and strongly influence bank lending activity.

5. Granger causality test

According to Granger causality test, we accept the null hypothesis (GDP change is not a causal factor for the volume of short-term loans), as the probability value is greater than the significance level. Under these conditions, it can be said that gross domestic product does not influence the amount of short-term loans to households by separation from the external environment.

Table 8. Short-term Granger causality test

Dependent variable: L_LH (natural logarithm of loans to households)			
Excluded	Chi-sq	Df	Prob.
L_PIB	3.314325	2	0.1907
All	3.314325	2	0.1907

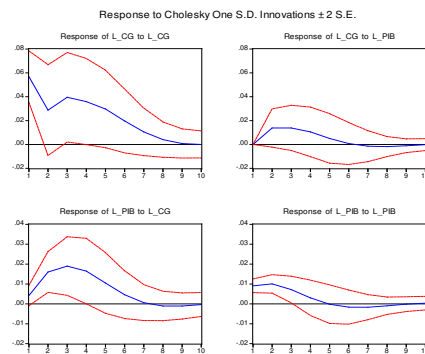

Source: authorial calculation

It should be noted that such tests must not be interpreted as causal but only consistent with genuine causality, meaning that the effect has to succeed the cause.

6. Response function to shocks

All VAR model assumptions were verified and now we can proceed to analyzing credit response to external shocks (Impulse Response) and to decomposition of the influences acting on loans to households volumes by separating gross domestic product from other influencing factors (Variance decomposition). Graphical representation of credit response to changes in gross domestic product levels is illustrated in figure 4.

Figure 4. Variables response to shocks affecting their evolution

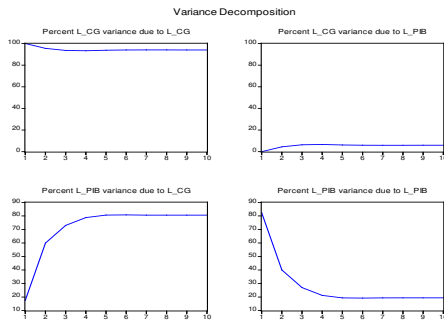

Source: authorial calculation

As can be seen, loans volumes respond significantly to shocks occurred in lending activity and to a lesser extent to shocks affecting gross domestic product dynamic. GDP growth leads to upward changes in the volume of lending in a period of two quarters. Instead, GDP decrease generates a reduction in lending activity after 5 quarters. However, the results validity is influenced by the presence of the 0 value, which highlights the lack of response to shocks (the results are not statistically significant).

7. Decomposition of variance (dispersion)

The influence of economic downturn on lending activity can be separated, as figure 5 shows:

Figure 5. Variance decomposition

Source: authorial calculation

In our case, GDP changes explain less than 10% of lending amounts variance. The largest proportion of credit variance is determined by its own innovations, with a value of almost 90%.

8. Conclusions and future research

VAR analysis results reflect a positive link between *GDP* and *credit to households'* variables.

The three main results returned by VAR analysis were:

(i) *Response function to shocks (impulse-response)*: the volume of lending to households reacts significantly to lending activity shocks and to a lesser extent to shock affecting gross domestic product. GDP growth has led to an upward change in the volume of lending within two quarters. Instead, GDP decrease generated a credit reduction after 5 quarters. However, the results can be challenged because of the 0 value 0 presence in the confidence interval (which means that the results may not be statistically significant).

(ii) *Variance (dispersion) decomposition*: a small share (less than 10%) of loans to households' changes in the considered interval was determined by a *gross domestic product* variable shock. The largest proportion (90%) of *loans to households'*

variable variance in the same interval was due to its own innovations (shocks).

(iii) *Granger causality test*: gross domestic product does not affect the amount of short-term loans to households by separation from the external environment. It should be noted that such tests cannot be interpreted as causal, but only consist with genuine causality, meaning that the effect has to succeed the cause.

Given that after the start of the international economic and financial crisis started we noticed an increase of credit institutions preference for investments in government securities amid a sense of risk aversion of banks, but also of large budget deficit, which led to a strong growth of government loans (with 157.3 percent in real terms in 2009 compared to 2008) and in the same time a sudden increase of non-performing loans, the quality of bank loan portfolios recorded a marked worsening (NPL ratio and risk credit ratio as key indicators used by the NBR in its financial stability reports displayed a sharp increase, of about 8 and 5 times in the last three years), we indicate as future research a VAR analysis considering *gross domestic product* and *government debt* as variables, respectively, *gross domestic product* and *outstanding amounts of debt service*.

Considerations regarding the Effects of Economic Crisis on Employee Communicational Behavior

Abstract

The economic crisis has caused significant changes in socio-economic entities strategies. In conclusion, firms were obliged to develop strategies for crisis as a result of their focus on customer, without understanding the customer as an employee. Moreover, strategic changes are not the result of company development, but as a direct effect of economic context. Otherwise, firms do not reflect the strategic communication behavior of their employees. Therefore, such a strategy may not be viable and even less in the crisis.

Key words: employee, crisis, behavior, communication, strategy

J.E.L. classification: M5, J24, E24, D83

1. Introduction

Some of the obvious manifestations of the global economic crisis are lower sales volume, decreased number of clients, budget, liquidity crisis, reduced investment, loss of competent human resources, etc. The solutions adopted by many companies in the current targeted the decline of investments, lowering any kind of costs, especially in marketing and personnel cuts. The new mentality emerging on the market is "customers at any cost", i.e. retain existing customers and attract new customers. But this approach doesn't relies, mostly, on studying customer needs and identify the competitive advantages of firms, but on company's products discounts, combined offers and other advantages for customers. So companies only interested in customers are

ignoring employees (internal customers of the firm) and sometimes even market products and services.

But short-term solution for reducing costs, lowering personnel costs, adopted in 2009 by most companies, should be avoided at present, because not only potential buyers of their products and services have changed their behavior, but global economic crisis is also manifested in changing employee behavior. According to the study "Emerging from the Downturn - Global Power of Retailing 2010" conducted by Deloitte buyers purchase goods according to their value, lean towards their own brands, buy small quantities of products, preferring self-consumption, brands known and well-grounded economic purchases. In this sense, economic entities, concerned with the efficiency of their business will invest in their brands, to attract valuable work force, the choice of effective and even relocation sites, the foundation and development of strategies for attracting and retaining customers has customers and effective communication strategies with them.

2. Strategy to focus on client - effective strategy in times of crisis

The economic crisis has changed the behavior of internal customers (employees) and external (clients, customers) firms, with visible effects on how they developed their profits. Focus on client approached as Kotler's marketing philosophy[1] is in the current context, sometimes the only chance of survival for some firms and certainly an effective way of development of all socio-economic entities. Especially since, in the

knowledge economy, economic relations, the focus is on innovation and building networks. This increases the competitiveness of companies, in firms to face competition, moving from a philosophy based on the product and sales, to one based on the customer and incorporating the concept of marketing. Companies are required to provide quality products to their customers, so they are likely to throw customers into the crisis arms. Also, firms need to maintain quality of the products they sell because the current customer is a modern one with higher education and increasingly higher expectations. Thus, the success of companies in the economic crisis is no longer achieved by improving what is already known, but by mastering the unknown, and is the ideal way to unlock opportunities agility and reaction speed networks that companies are willing to build. This is because firms are related to a customer destiny, competitors, and their members and, of course, on their action environment. In fact, today, in order to gain customer loyalty and getting new ones, firms make strategic alliances with suppliers and distributors, on their desire to offer better products/services to final customer. This leads to the development of marketing networks formed by company in question and all suppliers, distributors and its customers, with whom it has established close ties of interdependence.

Customer-oriented strategy requires, first, define and research its needs. Thus, the company will give customers what they require, what they need or what it is really necessary. Of course, customer satisfaction in this way involves a thorough study of the market. Especially that, companies are aware that a loyal customer can mean a significant source of income over a long period of time. Also, a customer-oriented company will periodically review the level of customer satisfaction, establishing and improving its main objective.

In the context of economic crisis, all companies should be customer oriented. Of course, any change in company strategy known three major obstacles: resistance organization, the slow pace of learning and tend to forget quickly[1]. Passing the company on customer orientation is possible because in the global economy will be based

on education for lifelong learning. Moreover, in the customer oriented companies, all functions work together in order to know, serve and satisfy consumer, because company without customers has no value.

Often, to achieve the main objectives, such as survival, market share, increase sales volume, increased profits, etc., firm's strategy is to enhance customer satisfaction, giving them a high degree of comfort, after-sales service, a quality product at a fair price, etc. But this strategy can be viable if firms have *competent staff* that is willing to provide quality services to customers.

3. Communication behavior of employees in the economic crisis.

In the knowledge economy and, especially, in conditions of economic crisis, educated workforce is crucial to increase productivity and promote innovation, although many companies have abandoned their valuable employees with the purpose of lowering all costs.

Specialists and practitioners know that the basic rule of customer loyalty campaigns substantiation refers both to the knowledge of customers, their needs and desires and their purchasing habits and motivate sales forces, or employees[6]. The implementation of client-centered strategy also involves choosing the most effective communication channels with customers. Profitable management of existing and potential customers represents a goal of all managers in crisis.

Connect to this reality by focusing on customers is a necessity, especially given the global economic crisis. This situation requires a strategic vision both in leadership and in business activity, and strategic approach to communication is a way of ensuring a certain level of performance of a business based on customer needs and desires and all business partners. Such an inward orientation of the company (employees) and external (clients) requires a process of integration of current actions in future conduct that subordinate them, ultimately, long-term objectives. In this respect, in any company must be a vision in terms of communication because the company,

consisting primarily of people, means communication[5].

In the knowledge economy, communication behavior has got universal facets, being improperly used in explaining institutional deficits and global communication seems to direct the contemporary models of social development[5]. In this context, communication, essentially a phenomenon, a process, an art and a science is required in company, regardless of how privileged manifestation of interactions between the firm and the environment[4]. Communication offers scientific support, theoretical and practical which can provide a high efficiency activities of the enterprise communications by generating a culture in which all organizational members have awareness of the market, product and company[5].

But a study in a socio-economic entity from the field of services regarding the communicational behavior of employees found that they communicate more informal, rumors and gossip being the usual forms of verbal communication. Within the organization communication process considered the following components: source, transmission, message, channel, receiver, context, recipient, source of noise. Discussions, dialogues, meetings, exchange of ideas through words, gestures, attitudes, employee communication behavior reflects the negative feelings of inequity within the organization. Loyal employees are very unhappy with the situation and amplified organization management.

Analyzed entity communicates with whole baggage of causes and effects which formed the basis of the past communications acts both inside and outside. A beneficial element in the efficient conduct of business communication is recognizing that the whole organization is going through a process of change as a result of communication with its external environment (change legislation, global economic crisis, demographic decline, etc.). Moreover, the communication accompanied the change.

Rewarding employees is poor, with no coherent policy of reward. Although there is a tendency to involve employees in making decisions that affect them directly, the

information provided about the situation of the organization are not real. Experts agree that in bad economic times is very important that employees receive some security of employment so as to not be affected productivity. As such, in the analyzed organization, employees have workplace safety, but this is the result of their promotion activities of the entity among beneficiaries and their work with good and very good communication and not as a result of the organization reality communication by top management.

Any economic entity should consider in fundament and elaborating strategy by the fact that the actions and events company internal and external customers are influenced by the needs and the needs of each individual and the action of economic factors, social and psychological. As such, communication behavior of employees is deeply changed in a negative way, which contributes to the disruption of activities. Stress at work is the result of conflicts arising from the sense of inequity within the organization. This is because there is no clearly established reward system; employees on the same post with different wages set without taking into account the skills and abilities of each individual separately. The crisis has brought to the stress and fatigue studied entity, and the lack of common sense of senior management has fueled existing tensions. Internal climate is unproductive because senior management does not motivate employees by recognizing individual merit and contribution to the development entity. This is because not all employees are equally important for top management, as beneficiaries of the entity. Negative effects have already shown the departure of people who have found employers to respect the professional aspect. Moreover, although communicated performance standards that relate to organizational members, evaluation, control and motivate staff ignores them.

Senior management plan overall resources, without sharing resources in each department in accordance with results obtained by them. So the profit in two departments used to cover the needs of other departments within the whole entity. This policy creates tensions and conflicts between departments and non-

transparent communication lead to changes in communication behavior of employees.

Studied entity may use certain measures to increase employee satisfaction, with minimal costs to change their communication behavior by[7]:

- creating a sense of internal fairness in the way that no one should be favored, and resources must be allocated according to the results obtained by each employee and operational structure;
- clear communication of unpopular measures: employees will feel that this company do everything possible to improve working conditions and at least will not live in uncertainty, not knowing what awaits them;
- internal communication accomplishments of the organization;
- consulting employees the most important measures;
- providing all employees unpretentious meals at special occasions in the life of the entity;
- accurately assess employee performance and recognize the work and its value by honorary degrees, messages of thanks, awards, etc..;
- implementation of internal training sessions, etc..

The organization is characterized by a specific communication behavior since the communicational process supports the influence of entity personality, reflecting mainly the personalities of the founders. The organization interacts with the environment in which they operate, under its cultural uniqueness footprint and employees communicate with their entire life experience, by virtue of their personalities. Thus, the specific communication behaviors of employees, which may occur, are the result of the influence of internal and external factors, and derives even from the way each employee interacts with management entity.

4. Conclusions

Given that the effects of the global economic crisis are becoming increasingly hard to bear at an individual, organizational, and societal is required the organization of the firm under the concept of social marketing. The concept of social marketing claims that the task of a firm is to determine the needs, requirements and interests of internal customers (employees) and external ones (buyers) and provide the satisfaction expected in a more efficient way than its competitors, so as to maintain or increase welfare recipients and society in general. In this way employees are treated by companies as their loyal customers, communicative behavior becomes positive, which is reflected in achieving high performance by any socio-economic actor.

Abstract

Bank management can be defined as a set of knowledge, concepts, principles and methods, which through a corresponding mix of material, financial, human, information elements available to a bank on the one hand, and the environment in which operates on the other hand, ensure that the objectives for which the bank was founded are achieved. This paper presents comparative analysis of two banking institutions in terms of bank management.

Key words: banking sector, management, performance, resources.

J.E.L. classification: M 21

1. The concept of bank management

If we consider what happens now with the global vision of the organizational environment, which are the main changes taking place in the business community, we are entitled to say that management as a whole, will restructure.

An important component of the organizational landscape is the banking system. In any developed country, the economy can not function without the existence of performance under a coherent and stable banking system. Moreover, in the globalized world economy, the role and functions of banks increases continuously[1].

Although banks and, in general, the banking system operates according to specific objective laws, essentially they are pursuing the same common goal: planning, organizing and coordinating

resources to achieve best results. Maximizing profits coupled with maintaining a permanent liquidity could be the main attribute of bank management. In defining the content of management in general and bank management, in particular, it is necessary to relate the triad: resources, organization of resources and the ultimate goal[4].

Bank management is *the coordination process of human resources, information, physical and financial, to achieve the banking organization goal, or more complex, bank management can be defined as a group of activities that include planning and decision making, organization management and control orientation towards human resources, financial, physical and information of an organization to achieve its objectives efficiently and productively*[3].

The bank management goal is to maximize the profit, including an action under the minimum risk exposure and comply with the restrictions imposed by regulators. As a global strategy for maintaining the viability of the bank is to create conditions for its activity now and in the future.

2. BRD - Groupe Société Générale S.A. and Transilvania Bank S.A. – general presentation

The following are the two financial groups, representative of the Romanian financial market, how they are organized, and ownership structure.

BRD - Groupe Société Générale is the second Romanian bank after bank assets and holds the second capitalization on the Bucharest Stock Exchange. The Bank is present in all the counties through a network

of 937 agencies and over 9.500 employees. At the end of 2010 BRD counted 2.5 million individual and corporate active customers and more than 2 million cards included in the 3D Secure. Transilvania Bank ranks fifth on the Romanian market, after banking assets and in 1997 became the first banking institution in Romania, which was listed on the Bucharest Stock Exchange.

The two financial institutions operating on the Romanian market have different **shareholder structure**, both in composition means, and especially its dispersion. Both companies are listed on the Bucharest Stock Exchange, Transilvania Bank was listed since 1997 (becoming the first Romanian bank listed) and BRD was listed on 2001, over the years has become one of the most traded companies.

Figure 1. Shareholder structure for Transilvania Bank and BRD, 2010

Source: own processing on data available at: <http://www.brd.ro/banca/profil/actionariat/> and http://www.bancatransilvania.ro/bt/despre_noi/structura_actionariatului.html

BRD administrative process is influenced to a large proportion of other shareholders such as, financial investment firms, EBRD or other shareholders, natural or legal persons. This is very important from the perspective that the administrative process of BRD included many interests, visions, experiences

and information compared to Transilvania Bank, which anchors BRD activity better in the market.

Transilvania Bank is the largest banking institution with Romania major shareholder and the European Bank for Reconstruction and Development, which owns 15% of the share capital is a significant shareholder. Although the bank is listed on the Stock Exchange, shareholder structure is compact, consisting of natural and legal persons, Romanian and foreign, EBRD.

Besides shareholder structure, are interesting and useful observations about the **structure activities** of these two financial companies. Thus, the following are detailed subdivisions which form the two financial companies. In the table below are summarized some similarities and differences between how these two financial companies have shared group activities.

Table 1. Differences and similarities between the structure of BRD and BT groups

Activity	BRD		BT	
	Da	Nu	Da	Nu
Natural person funding, cards management, consumer loans etc.	X		X	
Leasing	X		X	
Operating leasing	X		X	
Corporate Finance	X			X
Factoring		X	X	
Retirement fund management	X		X	
Brokerage and financial investment		X	X	
Medical Leasing		X	X	
Asset management	X		X	
Life insurance	X			X

Source: own processing

Based on these elements, related to the organization and shareholder structure of the group can draw some conclusions. SoGen BRD shareholder structure is more dispersed compared to the Transilvania Bank, which gives it a more concrete information from the market, extra experience and greater transparency of the activities. They seem to be advantages of SoGen BRD and is emerging idea that Transilvania Bank would

be lower than BRD, but it is not true. Transilvania Bank carries out several activities on the Romanian market than SoGen BRD, which helps at least two levels: the dispersion of market risks and the opportunities.

However, Transilvania Bank, has a group structure more detailed in terms of activities and how they are grouped into independent legal entities, which makes the management process within them to be more easily, their organizational structures to be efficient, the range of activities related to each entity to be smaller and more manageable, risks are more manageable, opportunities of each activity to be more easily exploited.

3. Bank management - comparative analysis of two banking institutions

In the following are presented aspects of management of two largest banks operating on the Romanian financial market, such as vision, mission, values, purpose, objectives, profit, environment, opportunity, market share.

3.1. Analysis of external environment

Romanian financial environment was not very favorable for the development banking and financial activities in the past two years. This state has mainly two main reasons: the global economic recession and the inability of governments to cope with new situations and to stimulate the national economy.

The main coordinates which characterized the Romanian economic environment during 2010 are summarized as follows: the annual inflation rate rose to 7,96% level in December 2010, has fared well above targets set by The National Bank of Romania, the national currency had a fluctuating evolution, often unfavorable for both banks and for other companies, the exchange rate reached maximum 4.3688 Ron/Eur in June and minimum of 4.0653 Ron/ Eur in March, the rate monetary policy has made the value of 6,25%, real wages fell by 6,4% in 2010, consumption fell by 1,1% in households in 2010, retail trade fell by 5% , budgetary salaries decreased by 25%, VAT increased from 19% to 24%, Romania's GDP decreased by 1,2% in 2010, less than official

estimates of the authorities, who anticipated a reduction 1,9 - 2%.

3.2. Transilvania Bank and BRD Bank - vision, mission, values

The two banks, BRD and Transilvania Bank presents the following characteristics related to vision, mission and values promoted by their management and the whole set of activities, services and products.

Table 2. Vision, mission and values of BT and BRD SoGen

	Vision	Mission	Values
BT	Innovation, dynamism, quality, high quality services.	Long-term partner for all customers, wide range of products, high standard of quality.	Customer needs, high professional standards, flexibility.
BRD	Innovation, respect, growth and profit by the high quality of customer service.	Developing goodwill through a strategy of long-term partnership with its customers.	Quality, motivation, performance developing companies.

Source: <http://www.brd.ro/banca/profil/> and http://www.bancatransilvania.ro/bt/despre_noi

From the data above we can see that the two banks share many similarities in terms of vision, mission and values they promote. Innovation and long-term partnership with their customers are central issues in the management of these two companies and the quality services and products.

The two banks differ in terms of values, declarative speaking, that Transilvania Bank promotes customer satisfaction, increase company value for shareholders and support entrepreneurship, and BRD SoGen that refers that preparation, performance and motivating employees are very important to support customer needs and the development of companies and municipalities. It is necessary to underline that BRD recognizes the importance of human resources.

3.3 The main objectives banks

In the current internal and external context, difficult management priorities are related primarily to improve operational efficiency, gaining additional market share and reach first place in the top commercial banks in Romania. However, BRD and BT are two companies that are differentiated by strategic objectives that lead to different ways of achieving the ultimate goal, to be the first bank in the Romanian market[5].

SoGen BRD brings its priority objectives of the strategic field such as innovation, sustainable profitability and adaptation of organizational structure and activities to market demands, which distinguishes it from Transilvania Bank that focus more on customer needs, satisfaction of shareholders and expansion territorial. These are logical and because the two banks are different because the number of units in the territory, the number of employees and as a starting point in their activity on Romanian financial market.

The BRD objectives are to keep relationships with customers, support them, when they are in difficulty, creating products for a diverse range that can compensate for reduced demand for credit, the overall market orientation towards of natural persons customer. But Transilvania Bank has as main objective to satisfying the high demands of customers, territorial expansion and hiring appropriate staff to ensure high quality of services advertised.

BRD SocGen development is expected to be less aggressive because the French already have a strong position in Romania, BRD is the second largest bank on the Romanian market and most profitable.

3.4. Coordination and training of human resources in banking

Human resources are one of the most important investments of an organization. They spend large sums to their employees, but investment in people has proven to be the surest way to guarantee the survival of a company or to ensure competitiveness and its future. The problem facing the banks in terms of human resource management refers to the following coordinates: development and retention, motivation, cost control, effective

training[2]. Given these problems affecting the banking sector, below is shown the employees' evolution in the two bank analyzed:

Figure 2. BT and BRD employees evolution during 2007 - 2010

Source: own processing on the basis of annual reports of BT and BRD

During 2007 - 2008, the labor market in the banking system there is a real "battle" for hiring, retention and loyalty of qualified staff, both BT and engaged BRD recruitment, both bank employing around 1000 people. Year 2008 is the year when our country was affected by the crisis and its consequences were felt in the banking sector. Thus, banks have stopped recruit, trying different ways to maintain the existing one. It was only in 2010 that things began to change favorably, both BT and BRD have resumed their recruitment activity, but in a slower rhythm.

3.5. Evaluation of bank performance

Performance of the banking system reflects the mobilization and allocation of capital efficiency as a whole and in particular, therefore banks must mobilize domestic savings to allocate investment funds to contribute to structural changes in the economy and increase productivity, facilitate payments so that the market can

operate at lower costs and to find correlations between effort and just as effective, that means efficiency and effectiveness[6].

BRD register appropriate values of return of capital rate, although these values have decreased over the period analyzed, compared with BT which has much lower values especially in the years 2009 and 2010.

In terms of cost / income ratio it is maintained at a good level, despite the increase in general expenses, the situation is favorable for BRD during the entire period analyzed. BT still record a continuous decrease of this ratio, which demonstrates that bank management focuses on limiting spending.

The liquidity indicator for both banks registered in 2010 is located at a suitable time compared to minimum set by NBR no. 24/2009. Solvency ratio was 13,66% for BT and 14% for BRD at the end of 2010, including profit, maintaining a high level throughout 2010.

4. Conclusions

Romanian economic environment has been severely shaken by the negative effects of the recession in Europe and so many companies from all fields had to face a serious situation that no longer have been seen, many of them reached bankruptcy, others reorganization, some have reached the position to be taken over by larger companies and others were saved by declaring insolvency.

Financial institutions - banks, to deal with these objectives problems should seek methods and management techniques that would be beneficial in a given situation. These methods and techniques of knowledge management are provided by bank management, which includes the entire set of elements, methods and techniques that are used in long-term development.

Based on these elements, we performed an analysis on BRD Groupe Societe Generale and Transilvania Bank where we have studied factors such as vision, company mission, plans and objectives. We analyzed human resources and banking performance.

Thus, while BRD focuses on preparing employees, as it believes that training is essential to obtain good final results, BT focuses on customer satisfaction and increase company value for shareholders.

Objectives BRD focuses on innovation, sustainable profitability, continuous adaptation of the organizational structure and activities to market demands, which distinguishes it from Transilvania Bank that focus on shareholder satisfaction and territorial expansion. A common point is to maintain a steady development and a satisfactory long-term profitability at the current market conditions.

Regarding human resources, last year, BT employed to four times more people than BRD, but the bank was not concerned too much of their professional training, as was the case with BRD.

The most important analysis is the analysis of bank performance. Thus, Transilvania Bank ranks fifth on the Romanian banking market, as net banking assets, while BRD, is in second place. Regarding performance indicators, ROE stands above the average for both banks established on banking sector, cost - income ratio is favorable for BRD bank, liquidity and rate of bad loans had an oscillating evolution, but both were in favor of Transilvania Bank.

From Financial Crisis to Euro Crisis or the Aftermath of a Prolonged Recession

Popovici Veronica

"Ovidius" University of Constanta, Faculty of Economic Sciences

verovnp@yahoo.com

Abstract

In this paper we analyse what caused the financial crisis of 2008-2009, how its aftermath lead, indirectly and among others, to a recently escalated crisis in the Euro zone and which would be the effects and solutions of this new economic reality.

We must admit the fact that, economically speaking, we live in a world of major unbalances, affecting the capacity of global financial markets to sustainably recover from such a strong challenge as the one posed by the past few years.

Moreover, it seems like the Euro zone experiment was not such a wise idea after all, with its possible disintegration bringing a whole new twist to the ongoing financial crisis and our viable options to overcome it.

Our aim to determine the correlations between these major economic phenomena and this way to hopefully render possible solutions in a clearer light.

Key words: financial crisis, Euro zone crisis, global economic uncertainty

J.E.L. classification : G01

1. Introduction

The financial crisis of 2008-2009 rearranged the global economic reality and shifted many priorities. At the same time, it accentuated many differences between geopolitical entities and made room for increasing uncertainty and fears of all kind, that paralyzed an important attribute in decision makers all over the world: courage.

The weakened, debt-burdened nations in the Euro zone flowingly faced a new challenge and one that is not yet overcome – the newly triggered crisis of the Euro zone or the sovereign crisis debt as it has been officially called. This brings more panic and

fear than the latest financial crisis because the risks are much higher at the global economy level, with Euro stability being crucial for all sorts of stakeholders

The truth is that Europe's march toward a common currency was, from the beginning, a dubious project on any objective economic analysis. The continent's economies were too disparate to function smoothly with one-size-fits-all monetary policy, too likely to experience "asymmetric shocks" in which some countries slumped while others boomed.

Nevertheless, this was the pursued model and now we have to face the consequences of its failure. The question is how are we going to do this and is that going to be a wise-enough strategy? We can not answer this question, but we can analyse the events that led to the current situation and its root causes, in an attempt to clarify the big picture of the ongoing financial crisis and the best scenarios we might imagine in order to improve this situation.

2. The latest financial crisis – how it all started

We could call the financial crisis of 2008-2009 is one of the major starting points for the dismal global economic conditions we face nowadays. Many people still ask themselves what happened back then and why did it all degenerate so much? Of course there is no one-faceted answer to this question, the multitude of factors that come into play here make any radical appraisal almost impossible. But there are a few clearer patterns and rationales that could help us better understand the big picture.

For instance, looking back at the pre-crisis period now, we can say that ever since 2006 there were reasons to expect tragedy. Huge U.S. account deficits suggested that the dollar would have to fall eventually. The entire

world was fooled mainly by two factors. Firstly, U.S. real interest rates weren't significantly higher than rates in other major economies, so the danger wasn't really acknowledged. Secondly, the large U.S. external debt being overwhelmingly dollar-denominated acted almost as a reassuring fact that the country couldn't be risking a currency crisis of the extent that it eventually did.

So yes, there were in fact reasons to worry back then, even without the “original sin” of dependence on foreign-currency debt (Krugman, 2008). But sadly, even those who seriously considered the evidence of a mammoth bubble on the real estate market failed to foresee the financial implosion that followed.

And the “economic blindness” didn't stop there. When the turmoil arrived, everybody would have expected central banks to be very effective in fighting asset-price-driven deleveraging with reduced interest rates that support asset prices and help balance sheets, in addition to their usual effects. In reality, however, at least as conventional monetary policy was concerned, such reductions quickly hit the zero lower bound and no further efforts were pursued.

Under such circumstances, when worldwide economic stability seemed to be headed full-speed on the downward spiral and no measure was bold enough to stall this process, another important factor came into play. The fact that asset-price deflation has no indirect stimulative effect on the economy made the situation even worse and its effects are still visible up to this day. The counter-example would be that of financial crises in emerging markets, which are often followed by “phoenix-like” recoveries (Cavo et al, 2006). We saw that in the case of Chile (1981), Finland (1990), Mexico (1994), Korea, Malaysia, Thailand and Indonesia in 1997 and almost 10 years ago in Argentina. The downturn brought by currency depreciation makes room for extremely competitive exports, bringing a positive swing to the trade balance and very rapid growth.

Unfortunately, plunging prices of houses don't produce any corresponding macroeconomic silver lining. So here is the question everybody has been asking ever since Lehman's failure: how long should

recovery be expected to take this time around? The sad news is that there aren't many useful historical models we can use for such an assessment. Every major financial crisis in the history of modern economy had a different set of triggers and exogenous factors affecting its unfolding. This eventually classifies as hazardous any sort of comparison and prediction based on historic analysis. But the example that comes closest to the situation of the past few years is that of Japan after its late-80s bubble burst, leaving serious debt problems behind. The bad news in this case however is that Japan has never really escaped from its deflationary trap, so if we refer conceptually just to the U.S. case in this context, even partial recovery could take as much as a couple of decades. But we have to be realistic and admit the entire situation severely changes when we put it into a global perspective and in the light of recent economic and geo-political developments.

3. The aftermath of the financial crisis – a global reality shift

If 2008 brought a time of terror, at least things were very clear; policy makers everywhere shared the common goal of avoiding the plunge into the financial abyss. Today on the other hand, we are witnessing a series of contradictions that accentuate all sorts of economic dangers and paranoia. China, India and Brazil are growing still very rapidly, while America, Europe and Japan remain in depression. Inflation is very high in the emerging world, while the prices of oil and food, which are determined in global markets and are largely driven by demand from those emerging nations, have soared; but underlying inflation in the wealthy nations remains low. Basically, whatever we might be afraid of, be it inflation or unemployment or fiscal crisis, it's happening somewhere — but the problems are different in different places. The key aspect in this contrasting landscape is that such inequalities were to be expected in the aftermath of a financial crisis that inflicted huge damage on many major economies.

The global financial crisis of 2008-2009 had its roots in more than two decades of growing complacency in wealthy nations, a

complacency whose main financial manifestation was ever-growing leverage. The great debt level of bankers and households alike was sustainable only in a perfect world. As soon as something went wrong, everyone tried to pay back their debts at the same time, which inherently triggered depression or what we have generally been living ever since.

But if we are talking about a global crisis, how come we still see booming economies out there? The truth is that not everyone was caught up in the same cycle of complacency as Europe or the U.S. Emerging nations — and in particular, the BRICs (Brazil, Russia, India, China) — have followed a very different trajectory. As previously mentioned, the decades before the latest financial crisis constituted an era of repeated currency crises in the developing world. This forced for very cautious behaviour not only on the part of governments — which paid down their debts and accumulated important reserves — but on the part of the private sector as well, which drastically reduced financial fragility.

As a result, in the light of the crisis emerging economies proved to be far less vulnerable than wealthy nations. The panicky months after the fall of Lehman were merciful to no one, but once the free fall ended the emerging countries managed a strong recovery, continuing their mesmerizing growth. Nevertheless, these booms are causing rising inflation on the other hand. China and India grew more than 10 percent last year, Brazil more than 7 percent. These economies are overheating, and inflation is the natural result.

But where do wealthy nations stand in this picture? Well, unlike emerging countries, America and Europe experienced a period of relative economic calm before 2008, which — very bluntly said — took them by surprise and transformed them into debt-burdened entities once the crisis struck. Especially for some European economies, the past few years brought but an ever more tangled aggravation of their financial situation. Economists called it the sovereign debt crisis and so far it is taking its toll on the Euro zone, whose survival is definitely challenged under the current conditions.

4. The Euro zone crisis – the definition of escalated uncertainty

In trying to understand the root causes of the euro zone debt crisis, we find ourselves facing two contrasting points of view: the one pointing towards local causes and another one blaming systemic causes.

Some believe that the crisis was fundamentally caused by irresponsible behavior of governments and individuals in from the Euro zone periphery. What is usually understood by that are countries like Greece, Portugal, Ireland, and possibly Spain. Italy has not been accused of such behavior to our knowledge, being considered a victim of contagion rather than the cause of the crisis. Thus, the *local causes* point of view emphasizes government deficits and debt in the EU periphery being so large that once the financial crisis came along, investors lost confidence in the ability of those countries to remain solvent. Thus by excluding them from their plans they triggered another escalated crisis.

An alternative point of view is that, while the crisis may have had some local triggers, much of the current problematic situation is the result of forces and decisions outside the control of peripheral Europe's governments. In other words, the crisis could have non-local, *systemic causes*.

Analysing key indicators such as the nature of the deficit predicting the crisis or of that growing after Euro adoption in the concerned countries, it seems that the Euro zone crisis is more consistent with the systemic causes view than the local causes view. The same verdict is supported by the evidence of government spending and/or personal consumption after euro adoption, which proves that countries in the Euro zone periphery behave responsibly in a macroeconomic sense, spending more on investments goods and less on personal consumption.

It is true that maybe these countries didn't always take the best decisions, but the Euro zone crisis is such a complex phenomenon that is certainly can not be attributed exclusively to them. We must consider the fact that these countries were up against powerful exogenous forces such as capital flow bonanzas and sudden stops. Such forces were set in motion as soon as those countries

adopted the Euro, imminently pushing them towards financial crisis. Conclusively, we have to admit that some of the blame should go to the crisis countries themselves. But it is not their irresponsible behavior that set the stage for this new crisis; the common currency itself made this happen.

But what does this mean? Everything eventually leads us back to Krugman’s „original sin”, who nails down the entire essence of the current Euro zone crisis in a NY Times article earlier this month:

„What has happened, it turns out, is that by going on the euro, Spain and Italy in effect reduced themselves to the status of third-world countries that have to borrow in someone else’s currency, with all the loss of flexibility that implies. In particular, since euro-area countries can’t print money even in an emergency, they’re subject to funding disruptions in a way that nations that kept their own currencies aren’t — and the result is what you see right now.”

This reiterates the old argument of Euro zone skeptics, that such a financial experiment is not sustainable in the long run, that it was nothing else but a bold and unthought through experiment of certain ideologists. Even if this is right, it is far too late to stop and just contemplate this sudden realization. We are in the middle of the tornado and all we can do is trying to predict where it will lead is and how we will be able to pick up the pieces from there.

5. Future expectations and conclusions

Austerity, fragile economic growth and threatening sovereign debt, which can lead to the disappearance of the common currency. This is the picture describing Europe at this time, a continent that is going through the most powerful convulsions since the end of World War II.

On the other side of the globe, the U.S. must be happy not to deal with such a complicated story. Nevertheless, the American economy is still very vulnerable and there are several voices accusing the government of not handling the crisis very well: fiscal stimulus has been inadequate, financial support has contained the damage but not restored a healthy banking system. So the indications are that serious economic

depression will continue for years to come.

On top of this, the collapse of the Euro area would be like a lightning struck for the entire world economy. Since everything is interconnected, we can anticipate firstly that it would lead to the disappearance of some of the strongest U.S. companies; Coca-Cola, Accenture, Phillip-Morris or McDonald’s are only a few names currently gaining impressive margins from their European operations. Should the Euro zone crisis accentuate, so will their fate become uncertain.

Emerging countries are facing serious risks as well, should this newly escalated crisis go on. Giant economies such as China are significantly dependent on exports, a large part of these being directed towards the EU. Negative scenarios on this side of the world imply also a high risk for emerging economies, who may not have enough time or resources to counter-balance their situation by strengthening internal development.

It turns out that Euro zone stability is crucial for the entire global economy. But can we still talk about stability, is this an attainable goal or are we already past the point of no return? In the light of latest events, more and more eyes are turning towards the IMF, viewed as the only entity able to sort out the European mess. So far, Europe has tried to solve this crisis on its own, while the IMF has acted only as a partner in bail-out efforts of Greece, Portugal and Ireland, along with the European Commission and European Central Bank.

But governments and officials from outside Europe and financial markets began to lose their patience with the EU decision-making process, considered by many extremely lengthy and difficult. Thus, new decisions could increase the IMF’s role in resolving the crisis. This time, recommendations on fiscal and structural reforms in Italy necessary to avoid a crisis of proportions will be submitted by the representatives of the Fund. With this decision, the IMF could impose itself as a leader of anti-crisis efforts, in an attempt to redeem the confidence of other participants in the global market. After all, the IMF is the only creditor with sufficient funds to venture into a bail-out attempt of Italy or Spain.

All in all, such critical times definitely call out for critical measures. One thing is clear: it is already too late to any longer drag the bold decision making process. Turning back to Krugman for a last word of wisdom, one of his affirmations about national financial crises dating back one decade still stands valid nowadays at a global scale. Thus, we must fear that intellectually consistent solution to a global financial crisis of this type are likely to seem too radical to be implemented in practice. And partial measures are likely to fail. We can only hope that our contemporary power holders will not settle for that and aim instead for success.

Factoring – Current Method of Financing Foreign Trade in the Context of Global Financial Crisis. Presentation, Analysis and Accounting Treatment

crisspra@yahoo.com
doinap_ro@yahoo.com

Abstract

In today's global context of frequent financial blockages, of reduction of external transactions and more, companies are forced to find alternative sources of financing for traditional bank loans, factoring being one of them.

Until the global economic crises started, many entities pursuing different transactions considered inappropriate that other entity would handle the settlement of bills, the delays in payments of foreign partners not being particularly noticed. However, after growing resentment of financial and economic crises' effects, perception suddenly changed, factoring and other modern financial techniques being promoted with priority, due to their benefits in the meaning of assuring the necessary financial resources for conducting and development of economic international economic transactions in useful time.

Therefore, we considered as important the presentation and analysis of this method of financing and of the particularly financial-accounting aspects that poses, due to major advantages attracted by factoring through streamlining and developing international trade.

Key words: external trade, financing factoring, accounting, financial crisis.

J.E.L. classification: M41, P33.

1. Introduction

Financing represents all mechanisms, techniques and tools by means of which necessary funds for achieving economic-social activities, particularly business, are purchased [1].

Broadly, we can assess that in development of international economic transactions, economic agents are based on the following categories of financial resources:

- internal resources (own), established with the purpose of financing its current activities, or in order to achieve investments, but also resources resulting from the entity's economic activity – profit, reserves, advances received from the customers, other funds;
- external resources, attracted from various financial institutions, banks or banking consortium, the financing relation being based on lending procedure.

Intensification and increasing complexity of economic international trades are largely the effect of loans' relations development, but also of financial-banking techniques. In these exchanges, the term *loaning* was actually replaced by *financing*. In other words, although international trade financing is structured on a loaning relation, *it requires a series of elements that are related to actual financing technique, or to countries' economic policy* [2].

Development of international trade, in the context of increased competition, of increasing the volume of complex products with considerable value, but also of risk elements such as increasing the insolvency degree risk of foreign partners, global liquidity crisis, lead to attraction of new

financing resources with the purpose of sustaining these activities, the role of commercial banks in the context of foreign trade financing mechanism being an essential one.

One of the special financing methods for short-term foreign trade financing, which is more and more used in present economy, is factoring.

2. Factoring – definition, presentation, ways of achieving

Factoring represents a technique for transactions financing and commercial debts recovery, used since the 18th century in the trade operations of U.S.A. colonies, technique by which a firm, the **adherent**, sells its unpaid bills to another person, the **factor**, that takes over the settlement of invoices, in exchange of a fee calculated at the bills’ value.

Initially, factoring was only limited to textile and clothing industry, but now, this modern manner of financing expanded its coverage on a wide variety of areas, mainly developing due to increased use of payments accounts, that allow to make the settlement at a specified term from the delivery/invoicing.

Factoring is the operation developed on the base of a commercial contract between the *factor* (specialized institution) and *adherent*, by which, the former, in exchange of a fee, takes over the obligation to pay the adherent the value of its bills, meaning the debts ceded by exporter through contract. In other words, factoring is an immediate financing instrument, slim (is only realized based on bills, without real warranties), that protects the exporter from the risk of not collecting the exports value. It becomes more advantageous as the distance creditor – debtor, respective delivery – collection it widens.

Foreign trade society that makes use of this technique may collect within 24 hours from submitting specific documents 80% from the export invoice’s value. It does not have the tracking tasks, namely the collection of receivables.

International factoring, settled by UNIDROIT Convention, Ottawa, 1988, has two forms:

- direct form (direct-factoring) – realized through existence of one factor, namely the export, without the presence of a correspondent factor in the country of import (see figure below);
- two factors form (two factors system) – characterized by the existence of two factors; it is the most commonly used form (see figure below).

Figure no. 1. Direct factoring

where:

- (1) sale-purchased contract;
- (2) claims ceding;
- (3) subsequent settlement.

Figure no. 2. Two factors factoring

Two factors form takes place in two stages: the first one (I) the exporter cedes own claims resulted from export operations of a factor resident in his country, factor which, once with taking over the claims also takes over the loaning risk. The exporter benefits, therefore, by a financing without warranties. In the following phase (II), the export factor enters in relation with import factor, with the purpose of cashing the values of invoices from the importer-debtor.

The export factor strictly follows the exporter, and the import factor strictly follows the importer, both factors having strong knowledge regarding local market and specific legislation of countries where they operate, working on a code of rules concerning factoring. Between the two

factors involved in operation, only the import factor is responsible with cashing from importer and his watching, the professionalism and worthiness of the latter, who evaluates the credit risk of the operation, and who, at due-date, collects the revenues, being extremely important.

Depending on when the factor makes the payment of invoices, two types of factoring operations can be observed:

- *classic factoring* – the factor pays the bills when retrieval occurs, practically, takes place the crediting of adherent by the factor until the due-date given to creditor-debtor by exporter to importer, for which the factor retains an interest (the discount rate is 1,5-3% above the one from bank);
- *due-date factoring* – the factor pays the value of claims to exporter in the moment of their chargeability retaining a mediation commission.

The factor’s commission is formed of agio and guarantee fee. The factor also retains the risk guarantee collection, which will be refunded to adherent after cashing the invoices from client debtors (importer).

Agio represents the sum retained from the adherent in the case of transmitting the sums to the adherent provider and the use of this sum, before the claims chargeability.

2. Accounting treatment

A first version of the factoring accounting in exporter accountancy is the following [3]:

a) goods supply (and the issuance of trade effect with the specification that the beneficiary is the factor, the trade effect accepted by the importer not being returned to exporter drawer, but to its beneficiary):

4111 „Customers”/ Importer	%	V
	707 „Incomes from sale of goods”	
	708 „Incomes from various activities”	
	766 „Interest incomes”	
	472 „Deferred incomes”	

b) transfer of factors’ claims, with the purpose of its invoice payments:

4111 „Customers”/ Factor	=	4111 „Customers” /Importer	V
--------------------------------	---	----------------------------------	---

c) collecting the claims from factor (of invoices’ counter-values), excluding deductions (commission and interest):

5124 „Currency bank accounts”	:	4111 „Customers” / Factor	V- (C+D)
-------------------------------------	---	---------------------------------	-------------

d) registration of interest and commission retained by the factor :

668 „Other financial expenses”	:	4111 „Customers” / Factor	C+D
---	---	---------------------------------	-----

The second variant of reflecting in adherent’s accountancy is presented as follows [4]:

a) it closes the claim accepted by the factor through 267 account “Other financial assets” by the time of collecting sums from the factor:

267 „Other financial assets”	=	4111 „Customers” /Importer	V- (C+D)
---------------------------------------	---	----------------------------------	-------------

b) it highlights the accountancy commission and interest retained by factor in accounts 622 “Commissions expenses”, respective 666 „Interests expenses”:

%	=	4111 „Customers” /Importer	C+ D
622 „Commissions expenses”			C
666 „Interests expenses”			D

c) the value retained by the factor as risk warranty will be registered also on 267 account „Other financial expenses” at an analytic distinct from the invoice value analytic.

The use of last variant would be preferable if we think that foreign trade society does not delivery goods to factor, but, practically, sells invoices. Therefore, the factor realizes financial assets distinctly viewed as debts assets and fixed payments.

We cannot say that the application of one of the above presented variant is rigorously imposed. Although, the first variant prevails the second, with the mention that, in order to record the interest and commission retained by factor, we recommend to use the accounts 622 „Commissions and fees expenses”, respective 666 „Interest expenses”.

3. Why financing through factoring (bank loan guaranteed by assignment of trade receivables)?

We will present an example for a firm that appealed to the two methods of financing, starting from two simplified balance sheets for the two cases:

Case I:

Table no. 1. Simplified balance scheme, in the case of not using factoring by the entity

Indicator's name	Balance at the end of financial exercise N -lei-
1. Fixed assets	350.000
2. Stocks	400.000
3. Claims	375.000
4. Cash and bank accounts in lei	50.000
5. Short term bank debts	300.000
6. Suppliers	250.000
7. Other short term debts	25.000
8. Equity	600.000

Case II:

Table no. 2. Simplified balance scheme, in the case of use of factoring by the entity

Indicator's name	Balance at the end of financial exercise N -lei-
1. Fixed assets	350.000
2. Stocks	400.000
3. Claims*	75.000
4. Cash and bank accounts in lei	50.000
5. Short term bank debts	-
6. Suppliers	250.000
7. Other short term debts	25.000
8. Equity	600.000

(*) Claims receivable from factor

Because, in the case of factoring, the exporter may collect within 24 hours from submitting the documents that proves the export, 80% from claims value, we considered, in order to realize a more accurate comparison, that the bank deposit is also 80%, although, generally, the bank advances only 50% of invoices' value.

For the two cases, there will be calculated the indicators from the above table:

Table no. 3. Comparative calculation of liquidity/debt indicators for the two cases

No.	Indicators	Calculation formula	Case I	Case II
1	General liquidity	$L_g = \text{Current assets} / \text{Current debts}$	1,43	1,91
2	Debt rate	$R_1 = \text{Debts} / \text{Net situation}^{**}$	0,96	0,46

(**) Net situation = Total assets /Liabilities

There may be noticed that in the latter case, because the exporter has sold the receivables, its sheet will only highlight the difference to receive from the factor, respective 75.000 lei, and not the whole debt (375.000 lei) as in the former case.

Although in the presented example the same advance percentage (80%) was considered, overestimating therefore the benefits of financing through a bank loan secured by assignment of trade receivables, it results, of course, from the values of the two indicators, that the exporter would present a

much better situation if he would turn to factoring.

3. Conclusions

In conclusion, we may say that factoring financing presents many advantages for its users, such as:

- it protects against the risk of default/covers the risk of nonpaying the invoices;
- the exporter does no longer deal effectively with claims management/taking over the suppliers duties regarding the prosecution and settlement of invoices;
- reducing the time span between export and the actual recovery of the claim, assuring therefore liquidity needs;
- simplifying the financial-accountancy formalities;
- providing consulting services;
- etc.

Despite the advantages mentioned above, this financing method entails some risks, such as [5]:

- debtor insolvency (of buyer);
- poor diversification of debtors;
- breach of trust by the debtor as a result of incorrect common understanding of its factoring client;
- unforeseen difficulties in the case of foreign borrowers, sometimes due to legal regulation from their original countries;
- negative reactions of borrowers on compliance clauses;
- etc.

Also, a series of risks concerning strictly the factoring client are highly visible [6]:

- poor customer dispersion factoring;
- poor quality of products or services delivered by the client for factoring;
- breach of contract or breach of trust conditions of the factoring client.

Green Accounting – From Green Policy to Eco-Balance

Radu Florin

“Valahia” University of Targoviste
florinuniv@yahoo.fr

Abstract

The accounting domain is booming. The environmental implications of business activity place the companies in the middle of sustainable development debates.

The natural environment for the economy can be seen:

- *as source: the environment provides the stock of natural resources used for human activities;*
- *as warehouse: the environment serves as a receptor for waste and pollutants;*
- *as living environment: the environment provides habitat for living humans.*

These functions are limited and finite. The objective of green accounting is to contribute to sustainable economic development by improving knowledge and understanding of the increased interactions between environment and economy.

Key words: Green accounting, environment, development

J.E.L. classification: M41

1. The evolution of green consciousness – from indifference to concern

The public concern about environmental issues is the result of a long way, sprinkled by scientific developments and political and social commitments. As far as multinational companies are concerned, they are somehow late “*turning green*”. Relying only on the managerial principles of shareholders, the directors of these companies have long been satisfied just to obey the laws of their adopted country.

In the 90s of last century, this approach evolved gradually towards an integration of all stakeholders, including employees and directors, but also interest groups, regulatory agencies, shareholders, suppliers and

customers or local community. From now on, the commitment to environmental issues is greater within corporate societies that recognize the economic value of environmental measures.

For companies, these efforts lay at both strategic and operational level. Given these factors, *the managers’ needs regarding financial and accounting information about the environment have evolved gradually.* Green accounting requires various tools that allow a better information to all concerned, both at domestic decision makers and foreign partners of the enterprise.

The genesis of environment management observed in the last 3-4 decades is closely related to global awareness of the negative effects of human activities on the environment. First, the warning signals of researchers or environmental groups led to international meetings dealing with the environmental consequences of human development. On the other hand, the awareness of different actors influencing the market has inspired to integrate the concept of environment into the development strategies of enterprises [1].

This trend determined that some industries to consider environmental risk management *by adopting principles to follow the best practices on the environment.* Gradually these initiatives have evolved to become management systems first governed by national rules and then international.

Mobilizing the companies for the protection of environment result from a long process of awareness that has taken shape since the 1950s at a time when industrial society was in full euphoria, immediately after the war [2].

Contesting groups who denounced the ecological damage caused by industrial production have emerged in this period, but their number was quite low and the efforts, many times, were in vain. For example, the first international symposium *How can a*

human change the world, held at Princeton in 1965, was completely under indifference and ignored. Despite the presence of leading scientists of that period, the conclusions were not convincing and the ignorance on environmental issues extends to all levels of society [3].

For most of the Western population, the possibilities offered by progress and science seem endless. The international community does not hold no meeting on environmental issues and the companies deny the existence of negative effects of their activities on the environment.

But technology limits were brutally highlighted in the 70s of last century, by major environmental accidents such as Seveso (1970), Amoco Cadiz (1978) or Three Miles Island (1979). In 1972, the United Nations Conference on Environment and Development in Stockholm led to the creation of the United Nations Environment Programme (UNEP), while the Club of Rome published a report entitled *Stopping growth*. Ideological debate *confronts industrial logic with green logic*.

Only in 1980, the states have recognized the need for international laws and high-level meetings on environmental problems multiply. In 1987, the publication of the report *Our common future*, also known as the *Brundtland Report*, lay the foundation of *sustainable development* concept and shows the limits of development. Faced with these new concerns, some companies assume responsibility for the environmental effects of their actions and take stand for environmental cause [4].

2. Perspectives in green accounting

The development of green accounting has accelerated over the past 20 years both at research and practice level. However, the implementation and utility of accounting methods and financial accounting rules exposed during this chapter of our work are not generally recognized in the business environment. While some elements are integrated into the managerial practices of the company, such as environmental management systems and environmental reports, many other components of green accounting are only used by a limited number of corporate companies.

The general recognition of green accounting as an integral component of accounting passes through several key factors of development, such as the increasing demand of disclosure stock market environment, the trend of implementing business strategies focused on sustainability, the efforts of accounting professionals in research, promoting green accounting and also the global guidelines in this domain.

Various researches on this topic have led to conflicting conclusions: on the one hand *it could not establish a direct link between financial performance and environmental information disclosure*, while others have concluded that *an adequate disclosure of environmental information would favourably influence the listing of shares*. This relationship could be confirmed in the next years, through an increased need for responsible investment. [5].

The popularity of business strategies focused on sustainability is another key factor in the emancipation of green accounting. Inspired by multinational companies who have chosen to focus on sustainability, a growing number of corporate companies in the next years will be tempted to join this movement.

Worldwide, sustainability strategy is growing. The study conducted in 2006 by PricewaterhouseCoopers in addition to large international corporations showed that 79% of heads of department believes that sustainability is vital to their profitability, while 71% are willing to sacrifice short term profitability for a long-term value for the shareholders [6].

Many avant-garde companies that had implemented business strategies based on sustainability are now the object of analysis in terms of environmental impacts of these strategies. The International Federation of Accountants (IFAC) consider that sustainability acts as a factor of change in organizations [7].

The link which unites the accounting profession and environmental issues is not clearly recognized in the business environment. Since 2006 the International Federation of Accountants (IFAC) sustains the involvement of professional accountants in the field of sustainability. The organization undertakes to promote the acquisition of knowledge and skills in relation to this

concept which considers as a challenge and an opportunity for their profession. According to IFAC, the role of professional accountants on sustainability assumes the following responsibilities [8]:

- development, implementation and control of sustainability policies and also the management of inherent risks;
- support shareholders through the management of reliable and easily accessible information;
- involvement in developing, implementing and monitoring policies for purchases, standards and management systems related to the value chain;
- inclination towards a benchmarking to provide reliable, relevant and comparable information;
- maintaining and enriching the knowledge of law;
- preparation and communication of information necessary to decision making.

Recognized for its competence in collecting, analyzing and providing reliable information, IFAC considers that professional accountants are well positioned to play a significant role in sustainable empowerment of the company. Instead, the same IFAC recognizes that, in terms of sustainability, professional accountants' knowledge are sometimes insufficient. Accountants will have to accept a significant change of their mentality, they have to integrate new criteria in their analysis and not focus only on monetary evaluation.

The lack of professional accountants' involvement on green accounting limits the implementation of management accounting methods and development of new green services that may be offered to them. From one point of view, it would damage the emancipation of green accounting, and from another, professional accountants could let the business opportunity to pass up front the profession. This situation can be explained by two elements, the professional accountants' discomfort to evolve in the dependent and less structured context of green accounting, or the poor appreciation of the importance of sustainability challenges for their own profession.

A series of key factors identified throughout this chapter, gives the impression that in the future, green accounting

(environmental accounting) may occupy an important place within the accounting profession. The efforts made by national accountants' body to raise its members on the major importance of environmental challenges are a significant contribution to general recognition in this field. Growing demands of the stock market regarding the provision of environmental information are, equally an important pressure circle, like the global trend of using the rules and tools of green accounting. The popularity of business strategies focused on sustainability produces a significant demand of financial and management information for managers and shareholders.

If accounting disciplines delay to consider the environmental dimension of business activity and performance, we believe that the spread between the accounting image and economic and social reality is likely to increase. Thus, the accounting could not bring trust between different partners, would lose its social legitimacy and would depart increasingly from the principle of accurate picture. For this, we consider that the implementation of an educational system into the green accounting may participate to the awareness of the importance of opening the information profession and management system for environmental information. We appreciate that among the objectives of a professional training that takes into account the environmental dimension of the enterprise and in a broader manner, its social responsibility, we can find:

- the awareness of the shortcomings of existing accounting practices;
- the understanding of concepts and alternative theories;
- the familiarity with environmental management systems;
- the assessment of environmental costs and environmental responsibility;
- the reflection on the notions of green accounting, social investment, eco-efficiency, eco-justice, sustainable development.

3. Conclusions

Green accounting is at the intersection of environmental information system and accounting information system and participates in a large sense, to the

assessment of flow between company and environment, and also in management and communication in both environmental and financial plan.

Green accounting can be present at the following three levels:

- *international systems*, which involve assessing the value of natural capital and measure on global scale the conditions of the environment and human welfare;
- *national accounting* covering the integration of environmental components into the value of gross domestic product, assessment of natural environmental changes and the impact of human activities in order to account the monetary and financial flows relative to use of natural resources;
- *corporate green accounting* practiced at enterprise level.

An important leverage for green accounting lies in accepting in the business environment, *the link between the exchange value of shares traded and the inclination to environmental disclosure*.

The analysis of green accounting practices enables us to conclude that *this branch of accounting succeeded, in theory, to achieve its objectives* which were originally assigned. It is about developing tools for decision making and management control regarding the management accounting and the accounting treatment of environmental issues and communication of environmental information for what is financial accounting. However, *in practice some elements cause a decrease in achieving these goals*. First, the rules underlying the provision of environmental information does not apply to everyone, but only for public corporate companies. The information published by companies are sometimes inadequate to the expectations of stakeholders.

Increasingly more companies *focus on the environmental dimension in their activity both at strategic and operational level*. All opinion - those dealing with accounting, control and audit - must be aware of all environmental issues and trained in techniques and procedures required by an environmental management system.

The Influence of Globalization on Information Systems

Radu Florin

“Valahia” University of Târgoviste
florinuniv@yahoo.fr

Abstract

Today, more than ever, is necessary that enterprise can exploit the best information at the best moment. It means to be help by this in choosing an information system near to its needs and its way of organizing and which will help it to take a decision.

Globalization, development of the knowledge society, spread of the Internet, the newest business methods represent the same amount of arguments for which the information systems of organizations must be seen from another perspective.

Key words: globalization, new economy, information systems

J.E.L classification: M00

1. The characteristics of information systems in the context of globalization

Globalization, electronic commerce and development of new technologies have made the number of the international enterprises to grow up in an accelerated rhythm. This thing had generated a series of complications concerning the planning, development and exploitation of information systems.

Being subject of constant changes to keep pace with modifications occurring all the time at any level of economic and social activities, the information systems, in the context of globalization, are perhaps the most searched because of the adapting to newest requirements imposed by this process.

The products, the clients, the activities carried out, resources available or human component are important factors for enterprises, and when we speak about global enterprises, all these factors are elements which can be influenced by information systems, thus [1]:

- the products – always will be the same, even if are made by the central enterprise or by the subsidiaries located in any point of globe. So, the information system has the possibility to facilitate the production, marketing and quality control activities, because it is necessary to know in detail every geographic region, both for the existing resources and customer requirements of that area. Information about these aspects can be easy to obtain by making an integrated information system. Integration of information system is more important if the majority of the products are made by assembling the components obtained in different areas. This activity is influenced by the advantages of the raw material price and obtained materials, workforce or fiscal facilities.
- the client – the commercial activities made by an enterprise, can be helped by the information system offering some services for satisfying the clients needs in a short period of time. So, through the newest information and communication technologies, the clients have the possibility to participate in the design of their desired products, only if the producing enterprises have implemented a system that allow to run activities of electronic commerce.
- the activities – when it is a global company these activities are usually very complex. A lot of products components are assigned to the subsidiaries which are influenced by the economic, social and politic conditions. Taking in consideration this situation, it is very easy to understand that to successfully cope with all changes that appear in the existence of this enterprise, the information system should have a high level of flexibility because it is a factor which provides the adaptation to the new conditions. By integrating upstream firms (connection with the

supply channels and abandoning the production of components within the same firm), its can obtain benefits such as achievement of economies of scale, specialization, flexibility in the adoption of production lines for manufacturing the products required by the market, reduce costs through greater market discipline.

- the resources – even if its are used in common, the material, human and financial resources, this use means also a specific distribution between the subsidiaries of the global firm. The information system, because of its applications, can keep a strict record of these resources, concerning the allocation of the resources and their size.
- the human component – the knowledge and the experience of the human resources can be used easily in supporting the efforts from the firm, only if the information system has the element for the working groups – teleconference, video, Internet, Intranet, e-mail.

For organization to be competitive on the new economy, information systems managers should take in consideration the following dimensions [2]:

- a) economic, politic and cultural mutations that these must have:
 - the cultural problems refer to difference in language, cultural interests, social attitude and political philosophy;
 - political framework is different from a country to another, there are countries where it is forbidden the transfer of dates abroad and also they have restrictions on the import of hardware and software;
 - geographically, even if the telecommunications had a strong development, there are still physical distances (time differences);
 - there are difficulties in finding the specialists or attracting them from another countries, because of the differences between the standard of living and workforce costs.
- b) achievement of applications to ensure the coverage of all information requests: these applications of the systems depend mostly on the adopted business strategies, the running activities, the market competitors, available resources, clients and their products, knowledge and experience of

employers, level of centralization of the system architecture. Nevertheless, there is a series of general applications that can be used by any kind of society, like:

- support systems for group decision making;
 - financial applications;
 - global applications for stock management;
 - applications for regional centers for data processing.
- c) integration of system strategies in the total strategies of global firm: at a global society level, the most important strategies that should be set refer to virtual activities, global markets, clarity of orders and customer satisfaction, clarity of production, dynamic management of resources. Taking in consideration all this aspects, the information system strategies should be directed to:
 - integrated systems and logically consolidated, but physically distributed;
 - use of common data across all parts of society;
 - development of specialized applications fields;
 - d) developing a solid information infrastructure: it refers to hardware, software, telecommunication networks and other facilities to process data. Choosing the technological platform is not only a technical problem, but also a problem with political and cultural implications.
 - e) improving data management:
 - one of the major problems is the cross-border data flows, namely economic data flows that cross international borders through telecommunication networks [3]. There are a lot of countries which consider these types as violation of national sovereignty, arguing that these cross- border data flows do not respect the rules of import and export of goods and services or the rules that aim to protect local and regional industry or jobs. Another aspect refers to the management of data and their standardization, just because of differences between culture, language and informational architecture.

f) providing more flexibility to adapt: the issues that should be consider for developing information system of a global society are [4]:

- conflicts between the requests of local information and the global system;
- difficulties in implementation and maintenance of the system due to geographical positions;
- difficulties in establishing common characteristics of the system;
- difficulties in implementing a system to share resources and different operating systems, depending on the local technical equipment.

Concerning the information systems of the international firms it should be mentioned that they are different from other distributed systems, they are distributed information systems which support some similar economic activities in various environments, specific to different international business locations [5].

2. Conclusion

Being subject of constant changes to keep pace with modifications occurring all the time at any level of economic and social activities, the information systems, in the context of globalization, are perhaps the most searched because of the adapting to newest requirements imposed by this process.

The products, the clients, the activities carried out, resources available or human component are important factors for enterprises, and when we speak about global enterprises, all these factors are elements which can be influenced by information systems.

For organization to be competitive on the new economy, information systems managers should take in consideration the following dimensions:

- economic, politic and cultural mutations;
- achievement of applications to ensure the coverage of all information requests;
- integration of system strategies in the total strategies of global firm;
- developing a solid information infrastructure;
- improving data management;
- providing more flexibility to adapt.

The globalization process can: obtain scale advantages, exploitation of synergistic benefits, enjoyment of geographical advantages. Aspects of globalization can be seen at the product level, sales level on market, competitive level, as well as at the level of consequences which globalization will have on environment.

Analysis of Labour Productivity Dynamics of SNCF Navrom SA Progress through the Review of „Turnover” Indicator Evolution Based on a Unifactorial Model

Radu Riana Iren
"Dunarea de Jos" University of Galati,
Faculty of Economics and Business Administration
raduriana@yahoo.com

Abstract

In economic practice, an econometric model is used to explain the variation of a phenomenon in relation to the other variation for estimating the probable change of the analyzed phenomenon.

This paper aims to assess the dependencies of labor productivity through the development of the indicator "turnover" by unifactorial model.

The author proposes in the paper to check the plausibility of unifactorial model using dispersional analysis which shows that the estimated linear model is appropriate and is representative for describing the dependencies between the labor productivity at the analyzed company, SNCF NAVROM Corporation and its turnover in the period 1997-2010.

Key words: dynamic, unifactorial model, dependency, plausibility

J.E.L classification: D22

1. Introduction

In business practices, an econometric model is used to explain the phenomenon of resultative variation y in relation to its variation factor x , to estimate the probable values of y phenomenon (its simulation) based on potential value which, economically, x factor can record, and finally, the forecast of y phenomenon according to the x phenomenon values, on the forecast interval v , $v = 1, 2, \dots, h$ [1].

To allow users to check (performance) of an econometric obtained model, it must be presented with the following information:

$$\hat{y}_t = \hat{a} + \hat{b}x_t;$$

$$(s_{\hat{a}}) \quad (s_{\hat{b}})$$

- R- correlation report
- d - Durbin-Watson variable
- $s_{\hat{a}}$ - deviation of the residual variable.

With this information you can try:

- independence of errors \rightarrow „d” test - Durbin – Watson;
- significance of the estimators \rightarrow „f” test;
- model similarity \rightarrow „F” test.

To illustrate the possible use of the econometric unifactorial model, we start from accounting data on turnover and productivity indicator during 1997-2010 reported for the SNCF Navrom SA (the two indicators are expressed in prices of December of 1991, establishing the company). Data are processed by the financial information provided by representatives of society.

2. Presentation of input data

Table no. 1. Input data

Year	Turnover hundred of thousand lei	Work productivity hundred of thousand lei /person
1997	19,4993	0,0103
1998	18,6432	0,0099
1999	17,8246	0,0095
2000	32,2796	0,2306
2001	38,0252	0,1311
2002	35,4559	0,1604
2003	41,6633	0,2022

Year	Turnover hundred of thousand lei	Work productivity hundred of thousand lei /person
2004	51,8927	0,2760
2005	56,9798	0,3183
2006	56,5489	0,2976
2007	59,2460	0,3151
2008	73,3357	0,2716
2009	55,1573	0,1061
2010	42,5050	0,0819

Source: Processing after the financial information provided by representatives of the SNCF Navrom Company

3. Specification, identification and estimation of model parameters

We intend for this case study the following objectives:

- a) specification, identification and estimation of econometric model describing the relationship between two variables;
- b) verification of the verisimilitude of the model parameters and significance.
 - a. Specification, identification and estimation of econometric model describing the relationship between two variables - based on the problem to build an econometric model unifactorial form: $y = f(x) + u$

where:

y – actual values of the dependent variables;

x – actual values of independent variables;

u – residual variable representing other factors influence the of y variable, unspecified in the model, factors considered casual, with insignificant influence on the variable y.

Data analysis in Table. 1, in relation to the economic process described, leads to the following specification of variables:

y – Productivity Work Indicator, variable representing the result;

x – Turnover, factor considered by the working hypothesis with the strongest influence on the variable y.

Specifying an econometric model also requires the choice of mathematical functions (f(x)) which can be described by the relationship between two variables. In a unifactorial model, the process is the most

common graphical representation of the two rows of values helping by „corelograma”.

Figure 1. Labor productivity based on turnover

Source: Own contribution

From the graph we can see that the empirical distribution points can be approximated by a straight line. As such, the econometric model that describes the relationship between two variables is transformed into a linear unifactorial model $y_t = a + bx_t + u$, $t = \overline{1,14}$, a și b representing the parameters of model, $b > 0$, slope of the line being positive because the correlation between two variables is linear and direct.

The next operation consists in estimating model parameters, a și b, helping by \hat{a} și \hat{b} estimators. În acest scop se va utiliza For this purpose it will use the method the least squares (M.O.T.L.S.).

$$F(\hat{a}, \hat{b}) = \min \sum_{t=1}^{14} (y_t - \hat{y}_t)^2 = \min \sum_{t=1}^{14} (y_t - \hat{a} - \hat{b}x_t)^2$$

The condition of minimum of this function results in:

$$F'(\hat{a}) = 0 \Rightarrow n\hat{a} + \hat{b}\sum x_t = \sum y_t$$

$$F'(\hat{b}) = 0 \Rightarrow \hat{a}\sum x_t + \hat{b}\sum x_t^2 = \sum y_t x_t$$

$$\Rightarrow \begin{cases} 14\hat{a} + 599,0564\hat{b} = 2,4207 \\ 599,0564\hat{a} + 29.400,8800\hat{b} = 124,3101 \end{cases}$$

After solving the system of equations are obtained the two estimators:

$$\hat{a} = -0,0625$$

$$\hat{b} = 0,0055$$

Based on estimators will be calculated estimated the values of the variable y:

$$\hat{y}_t = -0,0625 + 0,0055 x_t$$

4. Checking the significance of of the parameters and of the verisimilitude of the model

In order to verify the significance of the parameters and of model, will be calculated:

- residual variable values:

$$\hat{u}_t = y_t - \hat{y}_t$$

- standard deviation of the residual variable, $s_{\hat{u}}$:

$$s_{\hat{u}} = \sqrt{\frac{\sum (y_t - \hat{y}_t)^2}{n - k - 1}},$$

where k – number of exogenous variables

$$s_{\hat{u}} = \sqrt{\frac{0,0612}{14 - 2}} = \sqrt{0,0052} = 0,0718$$

$$s_{\hat{a}} = \sqrt{s_{\hat{u}}^2 \left[\frac{1}{n} + \frac{\bar{x}^2}{\sum (x_t - \bar{x})^2} \right]} = \sqrt{0,0052 \left[\frac{1}{14} + \frac{1830,9618}{3.767,4159} \right]} = \sqrt{0,0029} = 0,0536$$

$$s_{\hat{b}} = \sqrt{\frac{s_{\hat{u}}^2}{\sum (x_t - \bar{x})^2}} = \sqrt{\frac{0,0052}{3.767,4159}} = 0,0012$$

- correlation report:

$$R = \frac{\sqrt{V_x^2}}{\sqrt{V_0^2}} = \sqrt{1 - \frac{V_u^2}{V_0^2}} = \sqrt{1 - \frac{\sum_{t=1}^{14} (y_t - \hat{y}_t)^2}{\sum_{t=1}^{14} (y_t - \bar{y})^2}}$$

$$= \sqrt{1 - \frac{0,016}{0,1759}} = \sqrt{0,6485} = 0,8053$$

- Durbin-Watson alternative, d:

$$d = \frac{\sum_{t=2}^{14} (\hat{u}_t - \hat{u}_{t-1})^2}{\sum_{t=1}^{14} \hat{u}_t^2} = \frac{0,0611}{0,0618} = 0,9877$$

Thus the estimated model becomes:

$$\hat{y}_t = -0,0625 + 0,0055x_t$$

$$R = 0,8053$$

$$d = 0,9877$$

$$s_{\hat{a}} = 0,0536$$

$$s_{\hat{b}} = 0,0012$$

$$s_{\hat{u}} = 0,0718$$

Using the Durbin-Watson test to check if the phenomenon of autocorrelation has been removed - for a threshold of significance $\alpha = 0,005$, $k = 1, n = 13 \cong 15$ theoretical values of the Durbin-Watson variable are $d_1 = 1,36 < d = 1,9872 < 4 - d_2 = 2,64$, which indicates independence of errors, thus eliminating autocorrelation.

Checking the verisimilitude of the model is done using dispersion analysis (analysis of variance) - see Table 2.

From distribution of Fisher-Snedecor table, with a significance level of 5% and depending on number of degrees of freedom $v_1 = k = 1$ și $v_2 = (n-1)-k-1 = 11$ is taking the theoretical value $F_{0,05;11} = 4,84$.

Because $F_c = 7,9475 > F_{0,05;11} = 4,84$, is resulting that the linear model is properly estimated.

Correlation ratio is significantly different from zero if the inequality is verified:

$F_c \geq F_{\alpha;v_1;v_2}$, where empirical value of the variable-Snedecor Fisher is:

$$F_{cr} = \frac{R^2}{1 - R^2} \cdot \frac{(n-1) - k - 1}{k} = \frac{0,4194}{0,5806} \cdot 11 = 7,9475$$

Is found that $F_c = 6,2426 > F_{0,05;11} = 4,84$, so for a 5% significance level, the correlation ratio is significantly different from zero.

Table no. 2. Dispersion analysis

Variation source	Variation measure	Freedom grades number	Corection of dispersions	F test value
The model explained variance	$V_{x^*}^2 = 0,0342$	K=1	$s_{y^*/x^*}^2 = 0,0342$	$F_c = 7,9475$
Residual variance	$V_{z^*}^2 = 0,0474$	(n-1)-k-1=11	$s_{z^*}^2 = 0,0043$,
Total variance	$V_0^2 = 0,0816$	(n-1) - 1=12	-	,

Source: Own contribution

5. Conclusions

$\hat{y}_t^* = -0,0287 + 0,0053x_t^*$ model can be considered as representative for describing the dependence of productivity SC CNFR NAVROM company and turnover of this company during the period 1997-2010, explaining 41.94% of the total variance of the dependent variable, meaning, the labor productivity is due in proportion of 41.94% of turnover:

$$V_0^2 = V_x^2 + V_u^2 \Rightarrow 100 = \frac{V_x^2}{V_0^2} \cdot 100 + \frac{V_u^2}{V_0^2} \cdot 100$$

$$\Rightarrow 0,0816 = 0,0342 + 0,0474$$

and therefore can be used to determine prognosis.

After verifying the verisimilitude of the model using dispersion analysis is resulting that linear model is properly estimated and is representative to describe dependencies between labor productivity at SNCF Navrom company and its turnover in the period 1997-2010.

In conclusion unifactorial econometric model used, revealed that the variation in labor productivity is due on proportion of 41.94% to turnover. Financial risk represented by the economic crisis does not affect the model. According to Professor Negoescu, the risk is "the variability of results being possible based on an uncertain, unclear event"[2].

Decision-Making Model for the Company’s Obligations Reduction in Current Crisis Conditions from Romania

Radu Riana Iren
"Dunarea de Jos" University of Galati
Faculty of Economics and Business Administration
raduriana@yahoo.com

Abstract

In the actual economical - financial crisis, companys' managers are increasingly faced with the need to address decisions subject to instability of the economic environment. As a result, special connotations began to act for the debt management problem, especially while reducing cash available to traders through bank financial institutions lending operations.

In this paper I aim to develop a decision model, which taking into account both external influences (economic crisis) and the various interests and internal influences, to provide the best solution for reducing the company's obligations under the current crisis in Romania.

Key words: decision-making model, crisis, manager, obligations

J.E.L. classification: M10

1. Introduction

Facing with lower demand, companies from Romania and from other countries from EU, once the crisis started, have decided to reduce production and to send some employees in unemployed. In professor's Negoescu opinion, „Romania, (...) can not overcome the financial crisis without business development.”[1].

Thus, it appears that economic agents are facing today with a dynamic economic environment transformed by the direct effects of the economic crisis. In these circumstances managers entities are forced to adapt their economic activities through various types of decisions.

An important consideration is given to financial decisions. Financial issues touch all aspects of economic life of an agent. In this

context fits debt management. Debt management problem can be approached through a decision model. In this chapter we aim to develop a decision multidimensional model through which to streamline the debts management of CNFR NAVROM company, in order to reduce them.

2. Decisions fundamentation

To substantiate decisions, the source information is in times past, and proper evaluation and comparison of alternatives aimed the decision-making horizon, meaning that is referring to future consequences, which will be obtained in the future.

Methods and models used are extremely varied because of the variety of decision situations. Methods of substantiation decisions are different, having regard to:

- How important are the issues addressed, the result of the consequences of decisions to be approved;
- Certainty of information that can be used, factors that can influence;
- How big is the decision horizon;
- Decision criteria and their number;
- Decision problem and its reflection in the company.

For each decision problem is developing a model which must contain data about the accuracy of assessments and methods of substantiation.

3. Elaboration of decision-making model

The proposed decision model provides a framework for identifying the best methods of debt management company.

In making a decision to reduce debt, decision style and level of participation

required of the group are influenced by three important factors:

- quality of decision: how important is finding the right solution? As required quality higher opinion, the more should be sought even more people.
- Involvement: how important it is for others to support the decision? The more necessary is the approval of others, the more it should be involved more people.
- Available time: How long is available for decision making? The more time is available should be involved much more people.

Table no. 1. Submission criteria

Decision criteria		Departments participating in decision making	
x1	The level (amount) of payable debts	P 1	Financial Department
x2	The level of receivables trade	P 2	Judicial Department
x3	Stock value	P 3	Human resources department
x4	The level (amount) of financial debts	P 4	Supply Department
x5	Nivelul (cuantumul) datorilor sociale	P 5	Marketing (sales) Department
x6	Liquidity (short term investment + banks)	P 6	Accountancy Department
x7	Repartizarea profitului (129)	P 7	Investments Department
x8	Cash flow	P 8	Mnagement Department
x9	Net profit		
x10	Turnover		
x11	Working capital requirement		
x12	The value of fixed assets		

Source: Own contribution

To determine which of these ways are best suited to make debt relief, is necessary to answer a few questions in the affirmative-negative way and then to be built a decision-making scheme. There are five questions:

- Have the debts came to maturity?
- There are funds for payment?
- Does the claims cover the receivable debt amount?
- You can renegotiate payment terms?

- What are the methods that can be made to obtain funds?

Relations between hierarchical decision criteria for each department are directly involved in decision making:

Table 2. Ordering criteria

	p1	p2	p3	p4	p5	p6	p7	p8
Order by degree of importance (descending)	x8	x10	x1	x12	x4	x9	x5	x3

4. Conclusions

Heuristic or rational models are used in particular in economic theory to explain in the simplest way a complex system of dependencies and interdependencies that are manifested in the economic field. The theoretical model is actually a simplified form of the real model because in its frame can not be included all factors.

Decision-making and operational models are mainly used in economic practice, being used to substantiate the economic policy decisions (simulation) and forecast economic phenomenon [2].

Abstract

Innovation should be a product food solution, idea, object, procedures or process that is absolutely new or relatively new and implemented to the market is a source of profit for a company.

Innovation activity of enterprises, including the enterprises of food industry, concerns different areas of activity: technology, organization and management, marketing, finance and logistics as well as.

Now, there are five sub processes involving in bringing the new solution to the market: imaging the dual techno-market, insight, incubating to define commercializability, demonstrating contextually in products and processes, promotion adoption, sustaining, commercialization, are the stages of creating a different kind of value which determines the sense of the whole process and future profits.

The innovation commercialization process starts with the concept or a new concept processed. Willing to introduce-an innovation, one needs to imagine first its potential, to combine an idea technology with a potentially attractive market opportunity.

Key words: poultry products, quality, nutritive addition

J.E.L. classification: O320

1. Introduction

The problems accruing during creating and implementing innovation are : to create and develop a new solution properly and to

transfer the solution from the mind to the market profitably.

The next step, incubation of innovation, defining resources need to be involved in developing and implementing the innovation and evaluating future benefits.

At this stage one needs to define the formal activities that have to be arranged in order to implement the innovation.(intellectual property rights) and final arguments able to convince others of the advantages (profits) of implementing a new solution.

After visioning and defining all expeditors, benefits, barriers and opportunities, the innovation needs to be demonstrated in the form of sale able products and process. The challenge is to show the market potential and possibility of its realization.

Promoting the innovation on the market is the determinant of successful commercialization.

The promotional challenge has tow dimensions the : to persuade the potential client to adopt, to create a proper infrastructure in order to the level the innovations full benefits.

To receive all the benefits from solution implementation one expects, the innovation needs to be sustained on the market. Sustaining means developing and improving the solution, watching forces creating new applications of the solution.

The main activities and main problems discovery at the stages of the service innovation commercialization process are presented in the fig. no.1. The commercialization process proceeds within the innovation system of a company.

Elements of these system are: people characterized by defined abilities objectives appointing direction of the innovating policy, procedures and principles ensuring systematic and coordinated activity and supervising the development of new undertakings in order to maximize the exploitation of the enterprises resources.

System solution should include also measurement of results of innovation actions. So that, the level of development of the innovative system determines the success innovation of commercialization.

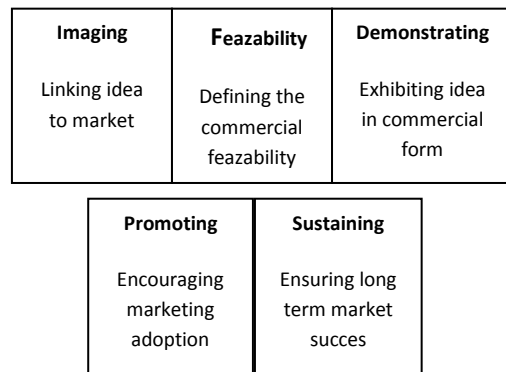

Following the policy of promoting the total quality management the company SC AVI-TOP SA Iasi had reached its strategies long-term objectives such as: improving the quality of the primary materials by constructing new and modernizing the chicken farms, has made important investments for the improvement of a slaughter house by implementing the system HACCP on technological flow, which can function at European standards. Starting with 2009 the company SC AVI-TOP SA IASI had defined a new strategic objective, respectively the introducing of new products made of chicken meat on the North-East Region market of Romania. With this goal the company had accepted the collaboration with USMAV Iasi within a research project for the achievement of some chicken meat semi-products. Thus the products were tested from the physical-chemical and nutritional point of views, controlling the new technological recipes which can satisfy different categories of consumers. The present paper is completing the series of determinations, by presenting the possibilities of technological transfer of the researched chicken meat recipes at the level of industrial production.

The positive results obtained by the determinations of nutritive substances and the study of the optimum quality level for different conditions of storage and conservation of the chicken meat semi-products represents the arguments for the technological transfer for the production company but also for the de trustworthy consumers. They are watching the company products, their quality as well as their food safety in order to follow a more healthy and balanced nutrition.

2. Material and method

Through competitiveness is one of the most often mentioned concepts nowadays surprisingly there is now single and accepted definition and measurement methodology of it in literature. Most of existing models and methods are eligible to major competitiveness at national level, international and national literature competitiveness measuring methods at corporate level is rather modest.

Fig.1–The process of innovation commercialization

The most cases the innovation commercialization process starts with a new technology processed. For to introduce an innovation, one needs to image first it is necessary to combine an new technological idea – mew product with potentially attractive market opportunity. The next step if defining the commercial feazability of the innovation through requires materializing market opportunities : defining the resources need to be involved in developing and implementing the innovation and evaluating future benefits.

After defining the benefits, barriers and opportunities the innovation needs to be demonstrated in the form saleable products and processes.

Promoting the innovation on the market is the determinant of successful commercialization. The promoting challenge has two dimensions: to persuade the potential client to adapt, to create a proper infrastructure in order to deliver the innovation’s full benefits.

The sustaining of the innovation means developing and improving the solution, watching forces influences its use, being aware of competitors and creating new applications of the solution.

The development process of a new product consist of : the phase of generating ideas and of delineation of the concept of new product, the new product dvelopment phase and production and commercialization phase. The changing from one phase to another is an important decision and it must be based on a preestablished set of clear and precise criteria, which must be in concordance with the innovation policy and global strategy of the firm.

1.The 1st stage of generating ideas for new products is meant to produce a large quantity of ideas which, afterwards crossed through differents filters, to be subdue to a process of selection of the most valuable and feasible of it, to be improved and developed in trhe next stage.

2.The 2nd stage includes selecting ideas which are to undergo of much deeper evaluation to establish the technical and commercial perspectives of development, is a necessary and important process, meant orientate the efforts to some certain directions, established by the innovation strategy at the level of organization.

3.The 3rd stage consist in transformation of ideas into new products concepts and it is essential to be able to test their validity.

4.The commercial analyses of the product ideas, is realised throughout financial costs and expenditures, the planned profit but also the period of the investment recovery, the product life time, direct and indirect costs, the price calculation and break even.

5.The preliminary technical analyse must establish if the product is feasible technically speaking, the level of concordance with the technological potential of the company and its evolution, development, integration and adoption of new technologies possibilities.

3. Results and discusions

Examined enterprises don't have any intended innovative policy. There is lack of formalization and procedures connected with the measurement of effects of innovative actions. The innovation is not an integral of a

values system of enterprises and has no reflection in practices.

Fig.2–Effects from implementing innovation in last three years in examined enterprises

The majority of innovative actions are selected by the need to accommodate itself to formal – legal and market requirements. So that, commercialization process is low coordinated with strategy and procedures within the companies.(SC AVI-TOP SA Războieni, SC Safir SRL Vaslui, SC Agricola Bacău).

Fig.3–Subjects responsible for innovativeness in examined subjects

All examined enterprises pointed workers as valuable resource of the company and important stakeholder of commercialization process should be planed on the strategic level and carry out by deeply involved personnel.

For the commercialization process to success it is important to manage the innovation's stakeholders' needs properly.

Fig. 4–Barriers of innovative activity in examined subjects

Additionally it is internal situated barriers of innovative activity that proves about the potential of the innovation development.

4. Conclusions

Commercialization is a process of creating certain value which is demanded by customers and should be seen as planned activity. The aim of the process is to put innovation into market existence in gain benefits.

It depends on many factors processed resources, ability to exploit them affectively positive, context for innovation activities.

System solution influence the proper functioning of innovation commercialization process.

The researches show that examined enterprises are still not well propose to gain full benefits from the innovation commercialization.

The first step is to enhance awareness in order to improve innovation system creating the environment, for new solution commercialization.

The Impact of the Arab Media on the Economy

Resit Iren

Aivaz Kamer Ainur

„Ovidius” University of Constanta, Faculty of Economics Sciences

kamer_aivaz@yahoo.com

Abstract

Before the war in Afghanistan in 2001, the Arab media was almost unknown for the countries outside the Middle East. Media is probably one of the most important weapons of the governments in order to manipulate and to mobilize people and due to this fact it can have a major influence on the global economy.

The development of the Arab media can be divided into 3 historical stages: the colonial phase, when the Arabic media was created due to Napoleon, the post-colonial phase, which tried to use media in order to shape national transformation and independence and it was mainly influenced by loyalists, and the 1990s phase, when the first transnational satellite media emerged. Media itself can be defined as a battle zone.

This paper has the aim to present the Arab media in brief, to show its relations with other international media and to present its influence on the media industry and economy.

Key words: Arab media, history, transformation, industry

J.E.L. classification: F01,F52,F53,F59,Z12

The concept of mass media is complex and it creates numerous debates, especially when we have to discuss about mass media in the Middle East. Mass media represents more than just a modality to inform, educate and entertain people; it is also a reflection of the economic and political situation of a country.

In the Arab world, mass media is a controversial issue, as the media in the Arab world plays a greater role in the political playground. It is also a challenge for the Arabs, due to the fact that other powers of the world pay special attention to the Arab mass

media, they monitor it 24 hours a day in order to detect the Arab policies and ideas. In the late years, the development of the Arab media is remarkable. If we compare and contrast the media in two Arab countries, we can clearly observe that the governments have a significant influence in its development.

In order to understand the development and the impact of the Arab media, it is necessary to make an incursion in its history. Ayish (2001) said that there are three historical stages of the development of the Arab media: the colonial phase, the post-colonial phase and the 1990s phase.

When the Arab media emerged, it was part of the colonial stage and its main purpose was to manipulate people in order to serve the interests of the colonizers and to promote their ideas.

After the Middle Eastern countries were not a colony anymore, the main roles of the media were to promote the nation building and to encourage the development. Therefore, new cultural and political strategies were adopted. As Mustapha Lahlali (2008) notes, the post-colonial phase was characterized by “the dominant paradigm”. During this phase, media was the main instrument used in order to transform these countries and to promote the independence. It is important to mention that due to the high illiteracy rate, radio was the most popular medium of communication.

It must be mentioned that the media has and will always be controlled or influenced by the government. If during the colonial phase, the colonizing countries were the ones that were promoting their own culture identity, religion and political views, whereas after the colonial phase the governments of the Arab countries tried to preserve the Arab identity and unity by promoting their own ideas and by controlling the media. Another

reason for which the Arab governments are controlling the media is that they are trying to protect the government.

The last stage, as well as the most significant one, was in the 1990s when the mass media in the Arab world has significantly expanded.

Due to the fact that the media in the Middle East represents a domain that can be discussed in very much detail a summary of all the media and its influence would be superficial. Therefore, this paper is going to take the example of Al-Jazeera and its influence. All the media in the Arab world has been created for certain purposes, aims different subjects and has different funding. Al-Jazeera is the oldest and it can be argued that it is also the most important transnational media in the Middle East due to the fact that it is broadcast in most of the countries of the world and due to the fact that it has the most viewers between the visual media from the Middle East.

Al-Jazeera is a Qatari channel which was launched in November 1996 and the meaning of "Al-Jazeera" in Arabic is "peninsula". Because prince Hamad bin Khalifa wanted to transform Qatar to into a Middle Eastern country that had a role similar to Switzerland in Europe, Al-Jazeera was the first transnational channel in the Middle East and the Qatari Ministry of Information decided not to censor the media anymore. Due to the fact that BBC English was in conflict with the Saudi government, the BBC English was forced to close, and Al-Jazeera benefited from this hiring 120 out of 250 journalists from BBC.

First of all, what Al-Jazeera brought new in the Middle East was a platform for discussions and debates. What is more important is that Al-Jazeera was that it was the first channel that wanted to change the flow of information. Instead of having information from Europe and from the USA to the Middle East for example, now the information goes from the Middle East to the other parts of the world. In this way, people can have a better image of the events and of the culture and the concept of monopoly concerning the news is starting to lose territory. The four main broadcasting centres of Al-Jazeera are in Kuala Lumpur, Doha, London and Washington DC. The motto of

Al-Jazeera is "the opinion and the other opinion".

Moreover, Al-Jazeera offers a large variety of programs that deal with all aspects of life: politics, culture, history, religion, education, sports. It can be stated that Al-Jazeera has a significant role in education, as people in the Middle East prefer to watch a Middle Eastern channel, rather than a foreign one. This was a challenge for Al-Jazeera as well because they had to combine the programs that dealt with all the aspects of life in order to gain popularity. Maybe that due to the fact that Al-Jazeera was a pioneer in the transnational televisions in the Arab world, it succeeded in gaining more popularity and therefore in having a greater influence on the public. Mass media is the main tool for mobilizing masses, for changing or developing the ideas, for influencing people.

In the beginning, Al-Jazeera was welcomed by the countries outside the Arab world because it symbolized the fact that the Arab world wants to embrace democracy and to follow western patterns.

Al-Jazeera allows people to call and express on air their opinions. Therefore, Al-Jazeera was also accused for being detrimental for the Arab unity and for being divergent for the Arab governments. Al-Jazeera has received many critics regarding its coverage about Qatar. Some voices say that Al-Jazeera does not criticize the Qatari government and that it does not intervene in its politics. The answer of Al-Jazeera was that Qatar is a small country with nothing negative to comment upon.

Some of the governments in the Arab world did not approve Al-Jazeera's policies, and even though they tried to pursue Al-Jazeera to change its policies, the Qatari government was not influenced. Some countries like Morocco, Egypt and so on closed the bureaus of Al-Jazeera or others, as Saudi Arabia, did not allow the channel to open a bureau. Saudi Arabia did not allow this due to the fact that Al-Jazeera was very critical on several internal characteristics of the country, for example of not allowing women to drive.

One of the programs that shocked most was "The Opposite Direction" which was highly critical on kings or presidents for example and the program had many reactions. This program was banned for a

period of time when a gentleman called in and criticized the Qatari emir, but it was relaunched and it still exists.

Al-Jazeera was the only one who had a base in Afghanistan because the other channels refused to have a bureau there before the war. Therefore, Al-Jazeera was the only channel to broadcast from Afghanistan.

Kuwaiti government protested about Al-Jazeera when a gentleman criticized the Kuwaiti emir on air and Al-Jazeera said that this is an open channel and that people are offered freedom of expression.

Al-Jazeera was the first channel that allowed an Israeli official to speak in the media. Al-Jazeera was the only channel that has broadcast the messages of Osama Bin Laden and Al-Qaeda.

It was and still is considered to be the most influential channel on the Arab public.

In the beginning, Al-Jazeera was welcomed by the countries outside the Arab world because it symbolized the fact that the Arab world wants to embrace democracy and to follow western patterns.

Even though in the beginning, the USA was happy with the creation of Al-Jazeera, the events from September 11 changed the position of the USA towards the channel. Al-Jazeera was the only channel that covered the events in Afghanistan and the USA complained to the emir of Qatar about this monopoly. The USA bombed the bureau of Al-Jazeera in Kabul. The journalists from the USA were forced to live the country.

Al-Jazeera has received many critics. The channel was accused of not being responsible regarding its coverage, of lack of professionalism, fairness and honesty, of being aggressive. What is most important, Al-Jazeera was accused of rising Arabs against other nations.

Al-Jazeera gained more influence in the worldwide media after the 9/11 events.

In 2003 was launched the website of Al-Jazeera, and in 2004 they launched a mobile service in order to permit the public to interact. Now the site of Al-Jazeera is in French, Turkish, Urdu and so on. From 2011 Al-Jazeera started to transmit its news from the Balkans, particularly in the countries from former Yugoslavia, in the local languages and it has studios in Serbia, Croatia and Macedonia.

What needs to be mentioned is that Al-Jazeera English is following the international laws, whereas Al-Jazeera Arabic does not follow these rules so the context can differ.

It can be summarized that Al-Jazeera created multiple reactions in the world. Now, the channel is the most influential in the Middle East. It is also interesting how other transnational channels have emerged after the creation of Al-Jazeera. Due to the fact that President Bush considered that Al-Jazeera was hindering the image of the United States of America and has perceived Al-Jazeera as a threat, saying that it expresses anti-American feelings, Al-Hurra and Radio Sawa were launched. It is interesting that it was never mentioned that Al-Hurra and Radio Sawa were broadcasting from the United States of America. The main purpose of Al-Hurra and of Radio Sawa was to promote the foreign policies of the United States in the Middle East. Al-Hurra and Radio Sawa lost their credibility due to the fact that some people considered that the United States of America are trying to colonise the Middle East, because they did not offer a debate platform and the people could not intervene on air in programs and because of the content - for example instead of broadcasting the death of Sheikh Ahmad Yassine, they were broadcasting an advert about a sandwich. Moreover, it must be mentioned that Al-Jazeera does not have to respect the same broadcasting laws as Al-Hurra does, because Al-Hurra is an American funded channel and it must respect the American charter. What Al-Hurra broadcasts must not contradict this charter and sometimes Al-Hurra cannot broadcast anything about certain subjects.

A feature of the transnational media is that it can overcome the difficulties of the censorship laws and it can somehow surround them. The transnational media can unite people from different cultures and can help people in understanding and learning about the other people with the help of the communication and debate platforms. Therefore, it can be stated that Al-Jazeera does not have so strict laws as other national media. Being a transnational channel, it cannot be the tool of the governments. There are many discussion regarding Qatar and the channel and Al-Jazeera was criticized for avoiding to put Qatar in a bad light. The answer of Al-Jazeera was that Qatar is a

small state and that there is nothing to say about Qatar. All in all, the affirmation that Al-Jazeera is freer and more accurate than national channels can be made due to the fact that not all the Middle Eastern governments could influence Al-Jazeera. If this would happen, there would probably be no transmission or no viewers.

Another point that needs to be mentioned is that being a transnational channel, Al-Jazeera is forced to take into consideration what the people from all over the Middle East want and need. Al-Jazeera can be described as a forum for debates. This particular feature of the channel has changed the people themselves by offering them a voice and, implicit, power. Their voices are now heard all over the world and what is more important; their voices are heard by Arabs from all over the globe. By stating their opinions, their needs, their wishes, all of them can be considered as the core of transformations. One good example is the Arab Spring. People have stated their wishes for changes, their desire of creating and living in democratic countries. Even though these wishes and desires are not new, with the help of the transnational media the Arab people could communicate and agree upon what is going to happen next. The power was not solely in the hand of the government, but in the hand of the people by using the most influential and powerful weapon – the transnational media.

It can also be stated that the transnational media can help people from all the layers of the society to reach the same level. By sharing ideas and thoughts, by asking questions – Al-Jazeera allows people to call in different programs or to post almost everything on their internet site; they can understand and learn what they would like. This has a significant role in the education as young people are the most likely to watch television, especially the ones which were born with the television era. The media can shape their minds.

What needs to be mentioned and must not be forgotten about Al-Jazeera is that on many occasions it was the only channel that presented other sides of the stories. For example when the Americans started the war on Iraq, Al-Jazeera was the only channel that showed on air how innocent people are dying. The reporters of Al-Jazeera have

raised numerous questions and have given remarks that other channels did not show. The war on Iraq was one of the best examples of how can people be influenced by television. If the United States of America were showing only terrorists, Al-Jazeera was showing the public what a war means, what a war does to innocent people. Some might argue that Al-Jazeera tried to provoke the West, but this is a question that needs to be analyzed from all points of view and not solely from the West or from the Middle East. It would also be improper to state that Al-Jazeera does not want to be one of the main channels of the world, but the question is how the channels achieve this.

Some have argued that Al-Jazeera instigates the Arabs and accused the channel of not being aware of its actions. The main points that were criticized at Al-Jazeera were that the channel was offering the public images about war, dying people, and hurt people. Another normal reaction was that as long as these unfortunate events do happen, they should not be hidden.

Another positive side of Al-Jazeera is that it helped the Arabs in having a common identity. Through history there were many attempts to create a united Arab nation. Being as well an Arab channel, it is the most likely to achieve this, as each individual has national feelings. By educating and offering the people a platform to discuss and debate, Al-Jazeera has also given the people a feeling of a greater belonging. The religion, the language, the culture, although they have some differences from one country to another, is still uniting all Arab people. This sense of belonging underlines and increases the power of a Middle East with a single voice – the voice of its own people.

If we compare the Middle East with the European Union or with the United States of America, it can be stated that the Middle East, through transnational media as Al-Jazeera, could be more powerful. This is because the United States of America or the European Union has the powerful tool of transnational media to unite the people and to facilitate communication between them. Moreover, having a common language, the Middle East can communicate more easily than the nations from the European Union and many bodies, either governmental or non-governmental, are not needed.

Another point that needs to be mentioned about the media is that one single minute of transmission can express more than an entire newspaper or a whole hour of radio. The mix of sound, image and writing where needed, can offer the public the exact image of what the producers or the broadcasters want to transmit in only one minute. This has a greater influence on the public.

Moreover, it can be also said that Al-Jazeera has helped the economy. In order to create a transnational channel, big investments are needed in order to have the right infrastructure. Furthermore, people needed to be trained, equipment had to be bought and even the city's infrastructure had to be changed in some cases.

Conclusions

In conclusion, Al-Jazeera is one of the key agents of change in the Arab world. The status of being a pioneer in the field of transnational mass media in the Middle East was challenged by many factors, not only the challenges that a transnational media has, but also the challenges of being the first transnational media in a region from which the West does not have accurate data. Al-Jazeera was started a chain of changes. Not only that the channel manages to offer a platform for debates and communication, but it can be stated that Al-Jazeera has strengthen the powers and the voices of the people.

The result can be seen as a common government. One of the desires of the Arab people was to be united and represented by a single voice, but without cancelling the features and the characteristics of each of its nations.

Al-Jazeera is this voice.

Al-Jazeera offers a platform for the Arabs to learn and discover their culture, but it also offers them a platform to show the other parts of the world the other part of the reality or their own opinions.

Al-Jazeera provoked the monopoly of the countries outside the Middle East and it faces and endless fight against constrains.

Abstract

*The energy sector, an industry sub-branch, is the basic strategic infrastructure of national economy, on which the entire development of the country is based. At the same time, energy represents a public utility with a strong social impact. The particularities of the energy sector, such as: long implementation periods for various sectoral policies, reaching the aimed strategic objectives, large capital needed for the development of this system, the necessity of achieving production simultaneously with consumption, and others, require the existence of **medium and long term strategies**, as well as the **organization and implementation of management accounting** in order to ensure an operational information basis for increasing the efficiency of activities run by managers that operate in this system. The goal of this scientific approach is to underline a few essential issues regarding the purpose of management accounting in the energy sector.*

Key words: management accounting, energy sector, relevant information, purpose.

J.E.L. classification: M40, M41.

1. Introduction

The information helps any decision-maker to keep under continuous observation the development of economic processes in any sphere of activity, and enables the possibility of working effectively on them. The management information is being used by management factors of economic entities as a product of management accounting.

One of the compelling needs of the energy sector is both organising and leading a management accounting by implementing modern costing methods, able to facilitate the determination of performance.

2. Research methodology

This article is part of a doctoral thesis, the applied research method is the **basic** research, and the information on the topic was gathered by studying the national and international literature in the field, by analyzing the legislation, by navigating specialized websites and various articles from databases. The main research methods that were used in my scientific approach were **documentation, analysis** and **synthesis**.

3. The purpose of management accounting in the energy sector

Management accounting has an active role, being that type of accounting approach that allows the separation and structuring of financial results and assets into subdivisions, identifying how profit or loss was generated and being based on the principle of effective management of assets.

Management accounting may be defined as “*mainly aiming to reflect all operations of collection and distribution of expenses by destination, product, work, service, order, manufacturing stage, activity, department, etc, aiming also to settle the obtained production, as well as to calculate the production cost of manufactured products, provided services and production in progress*”[1].

Defined by literature as managerial accounting, cost accounting or internal accounting, management accounting provides confidential information about the consumption of resources, the calculus methods of costs and the internal management of the entity. *“Still, we believe that there should be a distinction; thus, management accounting should include the specific elements of financial (general) accounting, and particularly the elements from the other side of accounting, cost accounting. A special place in management accounting should belong to management control which is responsible for the proper functioning of the information system necessary for making decisions within an entity. Internal control should be added to these elements, it helps the entity reach its objectives, making systematic assessments and improving risk management and the control and management of processes”* [2].

Management accounting provides confidential information necessary to prepare reports and conduct internal analyses used by the entity’s management to substantiate decisions. *“In systems of analytical accounting, the main logic is to cumulate the costs of the products manufactured during the production cycle”*[3].

The study of costs aims to solve the issues of production costs, while costing is the set of mathematical operations used in accordance with the appropriate methodological provisions to determine the production cost per unit.

4. Principles, premises and factors of costing in the energy sector

Accounting law no. 82/1991, republished, mentions five **principles** for ensuring a real and accurate content of cost structure:

- the principle of separating expenses related to the production of costs;
- the principle of delimiting costs in time;
- the principle of delimiting expenses in space;
- the principle of delimiting production expenses from expenses that are not related to production;

- the principle of delimiting expenses related to the finished production from the expenses related to production in progress.

Mentioning these principles is not relevant, because it implies that each entity that operates in the accounting environment knows them, what is relevant is complying with them.

Among the objectives of costing are included: delimiting costs by using cost techniques, procedures and systems, establishing sale prices on the basis of cost structures, determining profitability and control efficiency through rates of return, assisting the decision-making process by providing the necessary information for operations management.

The premises of organizing costing aim:

- to choose and implement costing methods;
- to choose the specialized department in executing the costing procedures;
- to plan and establish the length of time necessary to conduct the costing procedures;
- to choose the necessary means for executing the costing procedures.

“Costing shouldn’t be perceived just as a post-factum action, as we are tempted to do, but as a corollary of three costing methodologies: provisional costing, current costing and past costing”[4].

The factors underlying costing are numerous, among them are found: the type of entity, the type of structure, the type of production, type of the used technology, the degree of specialization and integration, the degree of mechanization and automation of production, the character of the production process.

Depending on the size of the entity, organizing costing is achieved differently: in a centralized manner for small and medium-sized entities and in a decentralized manner for large entities; costing at technical and organizational level (workshops, departments, factories, plants); the determination of the evaluation base for the elements that compose the production of the exercise.

5. Conclusions

The pressure exercised by the gradual settlement of globalization, the development of information technology and of production had the effect of changing the features of global economy, generating significant changes in how entities manage their activity. These changes led to new expectations and to the development of new costing and cost management techniques. Most entities have abandoned the classic costing systems and adopted activity-based costing systems.

The purpose of management accounting in the energy sector is not just to quantify immediate results, but to ensure a viable information basis for the management of entities that operate in this sector through good organization and management.

Financial Crisis’ Effects on Financial Reporting

Rotariu Valentin
Tak Isa

Faculty of Accounting and Informatics Management*
rotariu.valentin@yahoo.com
isatak23@gmail.com

Abstract

Accounting practices are tightly related to the current financial crisis and therefore it can be considered a significant matter which requires to study the measures which were taken by the main regulators, IASB and FASB, which were the effects and which are the most probable modifications to be made in the near future. The article took into consideration all participants, regulators, entities, professionals, in order to have a full and clear picture of what imply the crisis on financial reporting.

Key words: financial crisis, financial reporting, financial performance, globalization.

J.E.L. classification: M41

1. Introduction

The financial crisis is a complex global problem that arose from the increasing defaults on sub-prime mortgages in the United States. The real start was given in the fourth quarter of 2008 which was a cascade of negative economic news, including five of the 10 largest single-day losses in the history of the Dow Jones stock exchange index. The housing market in the US crashed, being followed by the immediate collapse of the banking sector. The shock wave moved from west to east, covering in a matter of 2-3 years, the whole world. The crisis generated numerous debates, discussions, theories and rules in the financial area. These were linked to confidence restoring in the long term, which needed businesses to understand and manage risk better, through improved financial and operational efficiency. It can be considered a tough task considering the

transition from a stable global economy to an unstable one, characterized by a fast moving inflow of financial information.

The milestone for a new financial beginning is represented by the well known financial statements. From the accounting profession perspective, the private and academic areas militated for aligning the financial information under the same rules. The reporting function was in a continuous development in the last decades, with its multidimensional feature, being the result of some major changes in professional accountants’ way of thinking, no matter if it was an academic perspective or a purely practical one. The crisis lead to a repositioning in the older financial theories and some features like transparency were suddenly emphasized as necessary. A fair valuation and presentation of financial performance are a must, taking into consideration that it can prevent financial collapses and wrongdoings. It can be easily seen without any doubt the actual needs for financial information as a main concern, in financial performance terms, for the global regulators, entities, financial institutions, syndicates and civil society. This article aims to identify and explain the possible effects of the financial crisis upon financial reporting.

2. Research

There are two main issues which concern the regulators as regards financial reporting: fraudulent and incorrect financial data presentation. Most of the damages on real economy come from unfair financial statements. In order to avoid eventual damages in the economy, each side of the financial information, users and producers of the financial information, must trust each other in the market. Ones the public trust

decreased so the collapses in the financial market accelerate and consequences of the manipulation in the financial information may cause huge losses as experienced before and in current time. Consequently, the main purpose of financial statements is to present high-quality financial reporting to the users of financial information, in order for them to take healthy economic decisions. The main purpose of financial information manipulation is to deceive the investors by publishing financial statements that do not present the financial position and the performance of a company fairly. Financial information manipulation prevents decision makers from making rational decisions. So, it is of utmost importance to detect financial information manipulation and prevent it before the financial statements are made public. This subject reveals that the space which accounting occupies can be extended easily, bringing this profession into a new zone called creativity. As a very disputed term, accounting creativity can be developed through financial deregulation. Some accounting professional sustain the idea that concept is useless as the accounting options have always existed, frauds can't be characterized through creativity and some subjective financial evaluations are inherent risks which are also not subject to creativity. The starting point for any debate relating financial creativity is financial misrepresentation, accompanied by three objectives: net result maximization, debt rate reduction and equity raise.

An example of avoiding using tricks in financial reporting was due to a major change in economy, being called Sarbanes-Oxley^{act}. This act was issued following to some major bankruptcies like Enron, Tyco International, Adelphia or WorldCom. These bankruptcies shrank the US economy after were discovered financial frauds. Sarbanes-Oxley was addressed all the companies listed at the New York stock exchange, with the purpose of introducing rules as regards financial reporting:

- It were diminished the risks associated to auditor's independence restriction. It is specified the audit rotation as a must and the prohibition of offering other services to the clients, in case the audit company was employed to audit financial statements.

- It was extended the responsibility limits concerning data accuracy.

- It were enhanced disclosure notes through data presentation concerning stock markets and transactions performed within.

- It was issued an ethical code concerning stock market agents and some possible interest conflicts.

- It was imposed as mandatory the signature of CEO (Chief Executive Officer) on fiscal declarations.

- It were tighten the punishments for frauds through section “White Collar Crime Penalty Enhancement Act of 2002.”

The benefits observed represent the common denominator for most of the accounting regulations:

- It was raised the credibility rank in front of creditors, business partners and other participants.

- The fraud risk was reduced significantly, reason for which the litigations number was reduced.

In other terms, financial reporting is being more and more aligned to globalization which determined rapid and major mutations in the business environment, especially in developed and emerging countries. Joseph Stiglitz, Nobel prize winner for economy in 2011, offered a simple but complete definition for globalization: *In essence, it is a more powerful integration of countries and populations, as a consequence of major reduction in communication and transportation costs and artificial barriers disappearance in the flow of goods, services, data and human beings* (Stiglitz J. E. – *Globalization. Hopes and delusions*, Economical Publishing, 2003). This international accounting alignment lead to significant changes in dimensions, politics and organizational forms of all companies. As geographical and economical barriers disappeared, the implications were seen in different areas tightly related to the global economy. In accounting, it appeared the immediate necessity of developing the actual international financial reporting standards, as a unique and transparent financial language. Accounting globalization went further through IASB which continued to make additional efforts in order to be adopted in new countries, not only for large companies but also for small and medium sized enterprises. Aziz Tayyebi, ACCA director,

considers that *a successful normalization process for adopting and implementing international standards it must begin with the commitment of all owners of national interests. They are those who should prove the objectives and benefits brought by convergence, underlining their roles and responsibilities for establishing an achievable workflow for the process that is to be performed* (Aziz Tayyebi – *Accounting and audit global standards: issues appeared in adopting and applying, Audit Financiar Magazine, Chamber of Financial Auditors of Romania*). A successful IFRS adoption and utilization is based on several factors:

- the quality has to be at the highest level.
- convergence with GAAP and an appropriate practice has to be a priority for national accounting regulators.
- international regulators must remain open to the national ones in order to ensure a complete and fair IFRS practice.

In accordance to these requirements, IFRS general framework presents some qualitative features which determine the data usefulness and fairness. The first is called intelligibility, that essential quality which offers the users to understand easily the information presented in financial statements. It is based on the hypothesis that users have enough economical know how in order to understand financial statements. The second one, called relevance, it is that characteristic, valid in the case information influence a user's decision. Credibility is number three, being supposed to reveal that financial statements do not contain major errors and users can have faith in a fair representation. Neutrality comes to complete the range of characteristics, indicating the need for free influence. In an ideal situation, financial statements are supposed to present a fair image of any entity financial performance and position. Since financial crisis began, the International Accounting Standards Board (IASB) continued to develop International Financial Reporting Standards, issuing a large number of new and modified existing standards. Most of them had as a target improving the quality of disclosures to financial statements. The latest amendments, as comprehensive responses to financial crisis, were related to consolidation, joint ventures, disclosures of

interests in other entities and fair value measurement.

Disclosure of interests in other entities

IFRS 12 *Disclosure of Interests in Other Entities* meets the disclosure needs for all forms of interests in other entities including associates, joint arrangements, special purpose vehicles and other off balance sheet vehicles. During the financial crisis it was noticed that there was a lack of transparency about the reporting risks due to entity's involvement with other structured entities. The disclosure requirements includes risk exposures for these kind of entities even if it no longer have any contractual involvement.

Joint Ventures

IFRS 11 *Joint* aims some deficiencies joint arrangement reporting by requiring a single method of account for interests in jointly controlled entities.

Fair value measurement.

The concept was very disputed among the most important bodies like European Financial Reporting Advisory Group and the Hundred Group of Finance Directors. IFRS 13 *Fair Value Measurement* enhances the actual methods of measuring fair value for entities which have investment properties, hold financial instruments, and make annual revaluations of property, plant and equipment or intangible assets. It has as a main purpose to reduce complexity and improve consistency in applying the standard when measuring mark-to-market technique. This is completed through enhancing disclosures about fair value and convergence with US GAAP which was modified by FASB. There was made an alignment in reporting standards “fair value” having almost the same meaning in IFRS and US GAAP.

The standard underlines the new approach as a response to financial crisis through following basic elements:

- fair value is presented as the price that would be received to sell an asset or paid to transfer a liability, regardless entity's ability, in an usual transaction between market participants at selling/purchase moment.
- the reference point is the market with the greatest volume and level of activity for the asset or liability. Otherwise it is the market where is maximized the amount that would be received to sell the asset or

minimizes the amount that would transfer the liability.

- management must use the assumption that market participants would use the asset or liability when making a price offer.

- for non-financial assets the professional accountant must consider the highest and best use of the asset by other market participants.

The impact of IFRS 13 on financial statements will depend on each entity’s historic valuation practices, accounting policy applied and activity area.

Consolidation

IFRS 10 *Consolidated Financial Statements* has the purpose to improve financial reporting by leading to more appropriate consolidation decisions in situations in which not a single party holds more than 50 per cent of the voting rights of an investee.

Financial statement presentation

The IASB and the US FASB made some modifications that are meant to enhance and align the presentation of items of other comprehensive income in financial statements.

Post-employment benefits

IAS 19 *Employee Benefits* was subject for some amendments including the removal of the option for deferred recognition of changes in pension plan assets and liabilities.

As presented, financial crisis ingrained some effects on financial reporting, through measures which were taken by the main regulators, IASB and FASB. The authors’ opinion regards these present and future effects covers subjects like impairment of assets, pensions, financial instruments, cash flows and estimates disclosures having as a base, professional judgment. These areas will continue to remain focus areas for the regulators and entities, across all business areas. As regards impairment, since the crisis began, more companies started to report higher values as impairments and will continue to do so.

Figure 1. Percentage of companies by area that presented impairments.

Source: Ernst&Young, <http://www.ey.com/GL/en/Issues/IFRS/Publications>.

As regards, accounting for employee benefits should meet new amendments in the near future as the last one which does not permit anymore choices on how to account for actuarial gains and losses on pensions and similar items. The future removal of corridor approach will require the unrecognized liability to be fully recognized, having a significant effect on entity’s net assets. Also, standard setters could consider to make a more clear differentiation between some disclosures like those for judgments and those for estimates which are usually mixed, despite the IFRS requirements.

3. Conclusions

Despite the numerous efforts made by standard setters regarding a fair presentation, the existing accounting theories, standards, still present weaknesses but the latest amendments demonstrate a procyclical feature of IFRS and US GAAP. While the users’ requirements concerning financial data reporting have raised, the regulators continued to develop the existing standards and to add new ones in order to keep the pace. This means bigger efforts for the professional accountant who is more and more forced to enhance the quality of reported financial data, the main pillar for trust in entities, regulators and markets. Without any doubt we can affirm there will

be more enhancements to IFRS and US GAAP standards, but it is necessary to be focused around professionals, whose abilities, competencies influence the most the quality level associated to financial statements. It can be called added value and real facts prove that the professional is more than just a pawn on the accounting chess table.

Romania's Foreign Trade with Third Countries after EU Accession

Rusu Nicoleta

„Alexandru Ioan Cuza” University of Iasi,
Faculty of Economics and Business Administration
nicol_2182@yahoo.com

Abstract

The adoption by Romania of the commercial policy of UE on multilateral, inter- regional, regional and bilateral plan concerning the relation with third extra-communitarian countries inevitably brings important changes in the extern commercial policy of our country. The aim of the article is to underline the evolution of Romania's foreign trade with third countries after EU accession. Although, as in previous years most intense trade flows were made with the member states of the European Union, in the last period, there was a tendency to orient the trade flows to third countries. This might be possible because of the trade flows that were directed to countries that were less affected by the economic crisis.

Key words: third countries, economic crises, foreign trade, imports, exports

J.E.L. classification: F13, O24, N70.

1. Introduction

After the transition period from After the transition period from centralized economy to market economy, and after accession to the EU, Romania faces a series of new difficult challenges related to adapting to new economic structures and legislation. Our country must face the changes in economic and trade policies and external shocks due to economic crisis and of the effects of globalization.

Accession to the European Union meant for Romania new pressure on state and private sector, and the exporters had to adapt to the requirements of the Single Market [1]. The past years have revealed significant changes in our country's trade structure, due mainly of the macroeconomic conjunctures,

which required to all commercial operating continuously adapting to the changes.

The increasing degree of the Romania's integration in the new organizational structures and international institutions accelerated the restructuring process. By associating to the main global organizations which has attended, Romania manifested openness and free trade option, accepting some risks involving such a process, but at the same time aware of the possible long-term benefits that involves the internationalization.

Over the time, three rounds of trade negotiations (Tokyo Round (1973-1979), Uruguay Round (1986-1993), Doha Round (since 2001)) and even alignment to the Community have led to massive reduction and elimination of the tariffs and the establishment of a common customs tariff and the elimination of the quantitative restrictions. Restrictions in the sensitive areas such as agriculture, textiles, clothing and services where provided. Integration in European and global market has imposed liberal conditions not only to tariffs but also regarding non-tariff barriers applied across of the border.

The bilateral regional agreements have come to play a larger role, with preferential rules which exercises a great influence on patterns of trade and on investment in certain sectors such as textiles, motor vehicles or clothing.

2. EU and the third countries

EU ends the bilateral agreements to promote its specific trade policy objectives and ensure that its bilateral agreements always are consistent with the commitments under the World Trade Organization. Some of them cover all aspects of the business and others cover only certain areas of trade.

The motivations to use the bilateral agreements in the EU's trade policy are given by [2]:

- trade development of global scale and the need of increasingly and acute rules accepted by the game players according to the World Trade Organization;
- need to stimulate the development generally and to promote the regional development;
- the support of EU concepts such as "Neighborhood Policy" or "Wider Europe" which have already resulted in relations with the Mediterranean countries

3. Romania and the third countries – implications of the global crises

Starting with accession of Romania to EU, were eliminated the last restrictions from the mutual trade with goods with the member countries of and the adoption of EU trade policy by Romanian on multilateral, interregional, regional and bilateral plan in its relations with third countries outside the community inevitably brings important changes in our country's foreign trade policy in the following directions [3]:

- absolute deregulation of Romanian trade with EU;
- alignment of custom duties in our country, towards the third countries, to the ones in EU, which generally implies custom duties to a level sensible reduced toward the third countries compared to the level of custom duties in Romania, especially for the industrial products;
- adjustment with the EU agreements to OMC in the field of trading with goods and services;
- accession to the OMC Agreement regarding the public purchase;
- transformation of Romanian from a country beneficiary of SGP in a grantor country of custom preferences;
- retreat from the Global System of Trading Preferences between developing country and from the "Protocol of 16" developing countries, by abrogation of preferential trading agreements with third countries and of other agreements concluded with these countries;

- hold up the status of developing country and, as a consequence the advantages Romania beneficiaries from in the field of trading policy, in the virtue of this status; this fact also imply the retreat of Romania from the group of unofficial developing countries from OMC and from the "Group of 77" developing countries which acts in OUN;

- retreat of Romania from agreements with CEFTA, AELS from the free trading agreements concluded with Turkey, Israel, from the free trading agreements with the countries from the Western Balkans, in case it concluded any agreements with these countries;

- because EU did not concluded a free trade agreement with Moldavian Republic until the date of Romanian accession to EU, starting from 1st of January 2007 the free trade agreement between Romania and Moldavian Republic had been terminated;

- participation of Romania to EU preferential and non-preferential trading agreements:

- accession of Romania to the European Economic Space (EES), to which EU and Ireland, Liechtenstein and Norway participate;

- participation to the preferential agreements of Euro-Mediterranean partnership and to the partnership between EU and African countries, Caribbean and Pacific (ACP);

- access of Romania to free trade agreements between EU and countries from Latin America, Persian Gulf and other countries with which EU will conclude such agreements.

The European Union has signed numerous free trade and cooperation agreements with the third countries. Some of them cover all aspects of the commercial relations, and others cover only certain areas of trade.

Thus, although in recent years Romania's trade with the European Union countries has increased, there is a slight tendency to orient them to non-EU countries.

Fig. 1 Extra-EU27 trade, total product million of Euro

Source: Eurostat – data processed by Extra-EU27 trade, by Member State, total at 15.10. 2011

Participation to the foreign trade is important for the growth and economic development of the country. The access to developed country markets can stimulate increased use of labor and capital resources of developing countries, and can arise the favorable opportunities for international exchange, trade turns out to be a stimulating factor for economic growth[4].

As we can see in the figure 1, since 2004, after the new wave of the enlargement, the EU's external trade with third countries had an upward trend until 2008, when the global economic crisis effects appeared. The economic crisis had more effects over the imports then the exports with lower tendency to decrease, a slight recovery of for both of them felt in the following year.

The Romanian foreign trade was conducted mostly with the European Union member states. As we can see in Figure 2, there was a tendency of orientation of small scale to third countries. Certainly Romania, as part of the European Union, has more benefits that would have an individual country in stimulating the trade with third countries.

Fig.2 Romanian trade whit third country, total product (million of Euro)

Source: Eurostat – data processed by Extra-EU27 trade, by Member State, total at 15.10. 2011

Despite the economic crisis, Romania registered in last year a high level of the exports, partly due to the increased supply of non-EU markets less affected by the economic crisis, such as China, Japan, Canada, Russia, Azerbaijan and South Africa. Keeping afloat in international trade is vital for the EU and other export oriented countries and for Romania.

Romanian products which have arrived in these countries are the most diverse: from carpets, wines, optical instruments and energy equipment to ships and fluvial ships.

According to the Ministry of Economy, Romanian exports to third countries increased by 38,7% last year compared to 2009, which is well above the average growth rate of supplies to the European Union registered 24,4%. However, their share in the total of exports is still limited, given that 72,1% of sales went to the EU (where they come 72,4% of the imports)[5].

The successive enlargements of the European Union and consolidation of the Single market have reinforced the Community's position, becoming a pole of attraction and one of the main actors in the international negotiations, both bilateral ones with third countries and in the multilateral with WTO.

The commercial blocks follow a tendency to strengthen their position in the global economy. With the new wave of expansion and penetration of new actors on the European market, the need for structural adjustment is inevitable; Romania as part of the European Union also participates in the achievement of trade with major trading blocs.

Fig. 3. Bilateral trade between Romania and regional trade blocks in US Dollar thousand

Sources: ITC calculations based on COMTRADE statistics, data processed at 20.10.2011

An overview of Romanian exports and imports with major trading blocs shows that the share of growing trade flows happened with APEC member countries, but certainly the imports far exceed the exports to these countries, which contribute to a continuous alteration of the trade balance. Contributions to the appreciation of the trade balance have had NAFTA and ACP countries.

The global financial crisis and the requirements of sustainability requests economic adjustments in environmental protection and natural conservation and will continue to change the business models, they will modify or will create new markets, which increases the need for a new strategic approach.

Fig.4. Romania's exports with third countries (Euro thousand)

Sources : ITC calculations based on COMTRADE statistics, data processed at 20.10.2011

Among of the countries with significant exports are Japan (74,73%), which exported auto components, bearings, electrical products, glassware, wine, South Korea 49,37% (energy and industrial equipment, ships, fertilizers and forage), China 45,15% (auto accessories, fertilizers, energy equipments, tires and rubber products, wine). In Canada there was a tripling of exports (321%) in this market; were delivered in last year, electrical machinery, boilers and nuclear equipment, components and parts of aircraft.

Regarding the U.S., Romanian exporters were able last year to their sales with over 61%, Americans are particularly interested in auto parts and chemical fertilizers. On the

Mexico market, the exports increased by over 51% (with tires, carpets, various steel products, optical instruments and car accessories).

In the Russian Federation, another large consumer market, the exports have increased by 62,12% (with auto components, refrigerators and furniture), in Ukraine for more than 53% (mineral products, machinery and electrical equipments, automobiles and auto components) Turkey – 76,8% (mineral products, chemical products, metal ware, electrical machinery, automobiles and auto components).

A 50% increase in exports was recorded also in: Armenia (510,91%), Azerbaijan(112,59%), Kazakhstan (66,86%), South Africa, (99,49%), Libya (50,11%), Republic of Vietnam (74,82%), Brazil (61,61%). The Ministry of Economy did not specify the actual values recorded for each country listed.

The imports to Romania continue comprising investment goods or industrial products (65,8 %), on one hand, and raw materials (3,7 %), on the other, and they mainly come from Germany, Italy, Hungary, France and China posing for over 48 %, whereas 4 % of the imports arrive from the Russian Federation, an important raw materials supplier to Romania.

Fig.5 Romania's imports from third countries (Euro thousand)

Sources: ITC calculations based on COMTRADE statistics, data processed at 20.10.2011

Romania imports machinery and transport equipment, raw materials, chemicals and fuels. Its main imports partners are other

European Union members with Germany, Italy, Hungary and France being the most important.

After a decrease in 2009, significant increases in imports were registered from China who had the largest growth in recent years on electrical, machinery, nuclear reactors, and footwear, from Russia on fuels, mineral oils, ores, slag, fertilizers, from Turkey – with cars, nuclear reactors, rail vehicles and Japan with electronics, machinery, nuclear reactors and plastic materials.

4. Conclusions

The existence of the growing and liberalized markets means an increase of the competition between the companies and of the countries. Inclusion in this competitive process of certain countries with different development levels can lead to widening the disparities between developed and emerging countries, or even deepening of underdevelopment.

Due to increasing of the globalization process and regionalization, the international trade must adapt to the changing world in order to stay efficient. The European Union is more dependent on the foreign trade, therefore the conclusion of an increasing number of cooperation and free trade agreements are more than necessary.

Entrepreneur - Essential Vector of Economic Growth

Abstract

Economic growth is a goal that is embraced by most contemporary economies, the main concern being to identify the key factors to start the process, but also to make it sustainable. Entrepreneurship (as activity) and indispensable, the entrepreneur, through his actions, are important vectors of economic growth. This paper seeks to clarify through views identified in the specialty literature, the role of entrepreneurs in starting and supporting this process.

Key words: Entrepreneurship, development, economic growth

J.E.L. classification: L26

1. Beliefs about entrepreneurship

Some economists' followers of development distinguish three major stages of development. First the economy is specialized in agricultural and small-scale production. In the second stage, the economy move from small-scale production to industrial scale production. In the third stage, with increasing wealth, the economy is oriented towards services. The third stage is marked by an increase in entrepreneurial activity.

There are three reasons for entrepreneurial growth in the final stage of economic activity. In the first place services firms provide more opportunities for entrepreneurship. Second, during the post-war technologies were aimed at industries in which entrepreneurial activity is important, while in the third place in an economy characterized through high levels of

aggregate elasticity of substitution, we must expect a higher level of development to more entrepreneurs and small businesses.

According to Inman quoted by Sebastian Văduva [2] switching within the structure of economic activities create new opportunities for smaller new firms, because in many areas of activity involving supply of services, economies of scale and other barriers for market entry are lower than production.

Schumpeter [3] feared that even small and medium replacement by large companies could adversely affect the values of entrepreneurship, innovation and technological change.

New businesses create new jobs and contribute to economic growth, stimulating the labor market and product market. In view of Bygrave and Minniti [4] various cultures and regions of many countries indicate a geographical concentration of entrepreneurial activities. Entrepreneurship can create good conditions for development of new markets and new business opportunities, leveraging the entire set of economic activities.

Increasing income per capita also helps to multiplying business activities due to increasing demand for services.

According to Sebastian Văduva [5] changes of technology represents probably the most important reason for the existence of entrepreneurial opportunities more numerous in the late twentieth and early twenty-first century. In every age, new technologies have the potential to generate new goods and services and create opportunities for launching new businesses, but one of the most important factors of restructuring the modern economy has to do with new information and communication technologies that have appeared. These technologies have drastically reduced

transaction costs and have lowered minimum efficiency thresholds in many fields. This reduction of transaction costs and the corresponding effects on the thresholds have opened a door for many small businesses, which previously were not able to compete on the market.

Economists associated with the Austrian school of economics [6] have focused on entrepreneurship study, considering that if entrepreneurship is omnipresent, it can not be due to economic development. Rather, for economic development to take place, some state institutions and a legal framework must be present for the entrepreneurial aspect of human action to flourish.

The entrepreneur is increasingly seen as indispensable for economic growth and prosperity, even among former skeptics [3] who believed that large corporations would become the main driver of innovation and technological change.

To explore the causal relationship between entrepreneurship and economic growth, we must think more broadly. The entrepreneurial spirit manifests itself differently within alternative institutional regimes, and some of these events are in accordance with economic development, while others are not. Simply economic growth determined by entrepreneurial spirit can not be explained without reference to institutions. Through a historical analysis of economic development, through the concept of entrepreneurship it can be concluded that a number of institutions have facilitated entrepreneurs in their role as innovators and agents of change.

For example, in the context of underdeveloped countries, Hoselitz perceives managerial skills and leadership as the most important aspects of entrepreneurship, while financial skills have only a secondary aspect.

For neoclassical economists, institutions do not have mattered thus we had to wait until the postwar period at which point economists have begun to realize the importance of the entrepreneur as the engine of economic progress.

2. Entrepreneurship and innovation

Institutions [6], or in other words, legal framework or rules of the game provide support and an environment that guides activity, removes uncertainty and makes the

actions of others predictable. In short, institutions serve to reduce the costs of action and facilitate coordination of knowledge dispersed throughout society.

Political regimes directly affect both the consequences of development desired as well as through the unwanted to their involvement in institutional environments. Two of the most important elements for encouraging entrepreneurship it represent well-defined property rights and the rule of law. It is well established that those countries where these fundamental institutions are developed have a growth record.

Financial markets [8] in most developing countries are underdeveloped and susceptible to manipulation. Governments play an important role through public policy (fiscal policy, trade policy, regulatory policy, and so on) that affects the incentives for entrepreneurs.

Studies [6] identified several general relations between the institutional, legal and economic activity underground. First, there is a correlation between the percentage of total GDP comprised by informal economy and of a country's laws - in countries with strict regulations and excessive underground economy comprises a large part of GDP. Second, higher taxes on businesses can generate higher levels of economic activity underground. Thirdly, corruption within the government, police and courts, leads to higher levels of informal economic activity.

Dejardin citing Murphy, Shleifer and Vishny says: "Talent goes to work with the largest private benefits that do not require the greatest social benefits" [9].

In the interview taken by Iacomi Tiberius (arenabiz.ro) to Daniel Daianu he says: "where there is a crisis is both and the opportunity" [10].

In a fair competitive environment [11], gaining advantages (competitive) by a firm reflects the quality of forecasting entrepreneurial activity (by affirming talent, knowledge and entrepreneurial innovation) thus became the source of increased profitability. Otherwise, in a distorted economic environment, namely a market ceases to be free, obtaining a competitive advantage is the expression of practices "rent-seeking" pursuing, through various practices, to capture government privileges, after all, any government may, by

preferential treatment of firms or groups of companies, to provide improving their competitive positions.

Rent-seeking activities [9] can come both from the public and the private sector. Regarding the link between entrepreneurship and economic growth, the emergence of paid but unproductive activities, is not only projects with positive or negative social impact are in competition, but also that there is a potential diversion of entrepreneurial talent. Therefore diversion of entrepreneurial talent to unproductive activities will have a negative impact on growth rate.

For example, organized crime [12] it can be considered a model of entrepreneurship, but unlike the rent-seeking, which contributes nothing to the production process, but does not affect, except the opportunity cost of this activity, there is an entrepreneurial spirit whose result is substantial destruction of both outputs (outputs) and the production capacities.

Baumol [12] continues by stating that while the total number of entrepreneurs varies among different countries, their contribution to productive activities vary more due to be shared between productive activities such as innovation, and unproductive activities, such as rent-seeking or organized crime.

In conclusion it should not believe that entrepreneurship will always contribute positively to productivity and economic growth.

3. Entrepreneurship by development

Entrepreneurship is a consequence of the development of a country - notably through the adoption and development of elements that encourage entrepreneurial aspects of human action. Stimulating entrepreneurial action will turn boost economic development and growth. Institutional elements that are efficient in one country may not have the same impact elsewhere. This is because they operate in a moral and cultural context, which in some cases may prevent the market. This is not a result of the market as such, but rather how agencies decide to act within its framework. [6]

If entrepreneurship is a low status, [13] being of poor quality, it is often the only type of entrepreneurship that can be observed.

Many regions of the world are now stuck in this vicious circle and is even more difficult to overcome.

The legal framework and its effective use [9] define an environment favorable for entrepreneurship and also to rent-seeking behavior. Property rights, the conditions of their application, and compliance with these rights are crucial factors. Entrepreneurs or that ones for whom the rent-seeking activities may influence by voting or lobbying the organizations and political decisions. The idea is that the political environment, responding to interest groups will make decisions that favor the maintenance of it. In conclusion because the burdening how to get of the rewards entrepreneurial the rent-seeking activities adversely affect entrepreneurship.

The result of entrepreneurship is the creation of new firms [14]. Thus, a key result of the entrepreneurial process is the creation of new businesses. The evolution of companies to a substantial size involves strategic activities that have been called strategic entrepreneurship. Entrepreneurs can create and adapt the basis of resources of the new firm to develop new products, launch of products in foreign markets, and creating alliances with other firms. These dynamic capabilities are central elements of strategic of entrepreneurship. If an entrepreneur is able to build these capacities in the early dynamic company, this will increase the likelihood of sustained new companies.

Developing market economy over time, served as an incentive for entrepreneurship. But entrepreneurial spirit has returned the favor in turn contributing to constant economic growth and major market. [12]

According to Venkataraman [13] reference elements in entrepreneurship are:

- a) the absolute level of economic performance which provides a profit for entrepreneurial effort,
- b) The social contribution of individual effort.

Audretsch and Thurik [15] distinguish three ways in which entrepreneurial capital affects economic growth:

- a) The first way would be through the existence of abundant information (knowledge spillover). But the literature that identifies the creation of mechanisms to get plenty of

knowledge is less developed. However new information technologies [16], especially the Internet, allows knowledge to spread rapidly being available to anyone with access to computer and phone.

- b) A second way in which entrepreneurship capital generates economic growth is through increasing the number of enterprises and the development of competition.
- c) A third method is the diversity between the firms.

4. Conclusions

Entrepreneurship has been, over time, a decisive factor in the development of market economy. The difference between companies that are progressing and regressing is that the last ones have productive entrepreneurs.

Recognizing how entrepreneurs contribute to economic growth has also strong political implications. If we assume that entrepreneurship is not evenly distributed across countries, we can say that countries with a low growth rate simply do not have enough entrepreneurs. If we argue that entrepreneurial activities are more evenly distributed across countries or populations with slower growth occurs in those countries where entrepreneurs are, for various reasons, less productive. A possible future research direction would be comparative investigation of the role of entrepreneur in economic growth of developed countries than in emerging economies.

Entrepreneurship capital can contribute to economic growth by creating diversity and serving as a channel of information, which eventually leads to more competition.

We finally have, however, Thurik's opinion, saying that more should be studied to explain more clearly the links between entrepreneurship and economic growth.

The Study of Corporate Governance in Romania

Sarchizian Sergiu

“Alexandru Ioan Cuza” University of Iasi

ssarchizian@yahoo.com

Abstract

Before 1990, Romania has a large number of public enterprises. After this year, the privatization of this enterprises was inevitable.

Key words: corporate governance, listed companies, non-listed companies, shareholders rights.

J.E.L. classification: M14

1. Introduction

The collapse of the old regime, the whole system of economic relations based on planning and administrative enforcement disintegrated. The answer to this situation was Law no.15/1990, On the Reorganization of State Enterprises, a cornerstone of the economic reform passed in July 1990, which changed the legal status of state "socialist enterprises". Two types of economic entities were created: the "autonomous organizations", state-owned organizations on the French model of the "regies autonomes", dedicated to activities in "strategic sectors" (defense, energy, mining, railway etc.) and the "commercial companies", most of them joint stock companies having the state as unique shareholder. Commercial companies were granted great freedom to take decisions, but their legal status was still equivocal, as very few specialists were familiar with notions such as stocks and shareholders.

Consequently, Law no. 31/1990, The Commercial Companies Law, instituted the general rules for creating and running different types of commercial companies, and granting non-discriminatory entry rights to all entrepreneurs and equal treatment for all entities, private or state-owned.

The methods used for privatization program was:

a) The Mass Privatisation based on free distribution of "Certificates of Ownership" to each Romanian citizen over 18 years old. In this mode, they became shareholders in "Private Ownership Funds".

b) The MEBO method (Management and Employees Buy Out), who became the dominant method of privatisation when a special law (no. 77/1994) granted substantial facilities to the managers and employees who wanted to buy shares.

c) The foreign investments, after 1997.

d) The Stock Exchange privatization.

2. The Corporate Governance Environment

The corporate governance environment in Romania is very much a product of the transition from central planning to a market economy. This includes the direct impact of that transition, through new laws, the development of new institutions, the creation of new firms and, very importantly, the privatisation process.

In 2009, according to Romanian Statistics Yearbook, there were 519.441 active enterprises. The majority are small (98,10%). Only 1,60% are medium and 0,30% are large companies (Table no.1).

Table no. 1 Active enterprises by size class, in 2009

Enterprises	Number	Weight
Total, of wich:	519.441	100,00%
0-49 employees	509.558	98,10%
50-249 employees	8.312	1,60%
250 employees and over	1.571	0,30%

Source: Romanian Statistics Yearbook 2010

As privatization result, 99,84% from Romanian companies are with private majority capital and 5,76% of total are entirely foreign capital (Table no.2).

Table no. 2 Active enterprises by type of ownership, in 2009

Enterprises	Number	Weight
Total, of wich:	519.441	100,00%
State majority	848	0,16%
Private majority	518.593	99,84%
Of total, with entirely foreign capital	29.943	5,76%

Source: Romanian Statistics Yearbook 2010

Most of private enterprises are “limited liability companies” (Table no. 3)

Table no.3 Active enterprises by legal type

Enterprises	Number	Weight
Total, of wich:	519.441	100,00%
Autonomus bodies	116	0,02%
Stock companies	7.462	1,44%
Limited liability companies	506.466	97,50%
Other types of non-co-operative companies	3.526	0,68%
Co-operative companies	1.871	0,37%

Source: Romanian Statistics Yearbook 2010

Only 74 companies are publicly traded on Bucharest Stock Exchange and 100 are publicly traded on RASDAQ, which means that less then 0,03% from the total number of companies are listed.

3. The legal rights of shareholders

The Company Law sets the two general principles that govern shareholders treatment: the principle of equality among shareholders in the same class and the principle of indivisibility of the shares. The law grants shareholders two types of rights: patrimonial and non-patrimonial.

The “*non-patrimonial rights*” refer to:

- The right to participate in the general shareholders meetings.
- The right to vote. Every shareholder has the right to vote in proportion to the number of shares he/she holds.
- The right to information. Shareholders have the right to examine the shareholders’ registry and the register of the minutes of shareholders meetings. They can also

examine the financial statements before the annual meetings, as well as the administrators and the censors’ reports. Shareholders may ask for excerpts or copies from these documents.

Special minority rights:

- shareholders representing 10% of the voting rights (or less if the Constitutive Act so provides) may ask directors/administrators to convene a general meeting;
- every individual shareholder has the right to notify the censors on certain facts he deems they should investigate.
- shareholders representing more than 10% of the shares have the right to ask the court to appoint experts for investigating certain operations of the company.
- shareholders have the right to contest in court the decisions of the general shareholders meeting and to ask for redress.

The “*patrimonial rights*” are:

- The right to dividends. Dividends are paid in proportion to each shareholders’ contribution to the paid-in capital, unless the Constitutive Act establishes different distribution criteria.
- The right over the reserves. According to the law, shareholders that leave the company have the right to reclaim not only their paid-in share capital, but their share in the equity of the company.
- The preemption right. In case a company increases its capital through public subscription, the existing shareholders have a preferential right to subscribe to new shares in proportion to the shares they already have. The preemption right is to be exercised during a limited period of time.
- The right to the proceeds from the liquidation of the company – again proportional to the contribution to the capital.
- The right to sell shares. Unlike the social parts, shares are freely transferable. The main shareholders’

duties with respect to the company are:

- To pay for the shares subscribed;
- To comply with the provisions of the Constitutive Act and with the decisions of the general shareholders meetings.
- To bear the losses of the company up to the value of their shares.

4. Abuses of shareholders rights

During the last two decades there was many complains regarding the violations of minority shareholders' rights. One of the main explanations for the deterioration in performance is related to abuses of majority shareholders and lack of sufficient monitoring and control from other stakeholders.

The most important forms of abuse are:

- ✓ Diluting minority shareholders of companies through:
 - Capital increases without prior revaluation of existing capital.
 - Capital increases through in-kind contribution of the majority shareholder.
- ✓ Transferring profits outside the company.
 - ✓ The “*empty shell*” tactic, by which the assets of a company are transferred to other parties by:
 - abusive sale of critical assets of a company;
 - use of the assets of a company as collateral for credits obtained by the majority shareholders;
 - transfer, through mergers and divisions, of the assets of a company to new entities controlled by some of the existing shareholders, directors or executives.
 - ✓ Abusive allocation of profits.
 - ✓ Delays in the payment of dividends.
 - ✓ Limited access to information for minority shareholders, who only rarely have a seat on the board or the censors' committee.

5. The main steps in the implementation of Corporate Governance in Romania

An important step in implementation of corporate governance in Romania was made by the Bucharest Stock Exchange in 2001, when elaborated “The Code of Corporate Governance” for public companies. The Code contain recommendations for the companies listed on the Bucharest Stock Exchange or traded on the RASDAQ, according to the O.E.C.D principles of corporate governance. In 2001, Bucharest Stock Exchange also launch “*the extra transparency category*”, for the public traded companies with the highest standards of corporate governance. In 2003, Bucharest Stock Exchange founded “The Corporate Governance Institute” with the main objectiv to promote the best corporate governance practices in Romania.

The Corporate Governance Initiative for Economic Democracy in Romania was the first large scale systematic effort to bring corporate governance issues into public debate. The project was conducted by the International Center for Entrepreneurial Studies (CISA) in collaboration with the Strategic Alliance of the Business Associations (ASAA) and it was sponsored by the Center for International Private Enterprise (CIPE), an affiliate of the US Chamber of Commerce.

Through conferences, debates and studies prepared by high-caliber Romanian professionals, the Corporate Governance Initiative had a significant impact on the business community. Between 2000-2002, a lot of workshops were organized in different cities, with board members from local companies. In the end, in march 2002, a “*Voluntary Code of Corporate Governance*” was elaborated.

The Code is a collection of best practice recommendations and is aimed at setting standards for corporate governance applicable to “*any commercial company, but principally to the companies listed on the stock exchange or traded on the RASDAQ*”, no matter where their capital originates from, state or private sources.

The centerpiece of corporate legislation in Romania is the Commercial Companies' Law no. 31/1990. One of the major objectives, during de 2004-2006 years was to bring

Romanian companies legislation in line with EU regulations. The second main objective was to harmonize the Law 31/1990 with the O.E.C.D. principles of corporate governance.

6. Conclusions

In Romania, the prevalent corporate governance structure is “*the non-listed companies*”. Many companies are small or medium, with a single shareholder who is also the manager of the company. There are also large companies with many shareholders, as result of MEBO privatization method. Only a small number of companies choose to be listed on Stock Exchange or RASDAQ.

In the last decade, in Romania was made important steps in corporate governance implementation. The Romanian companies legislation is now harmonized with the international standards. However, there is gap between the legislation and the real situation, in practice.

The solutions are: increasing of number of listed companies, a gradually enforcement of the corporate governance principles by the regulatory organisms and extension of this principles also for the non-listed companies.

Corporate Governance Systems Around the World

Sarchizian Sergiu

“Alexandru Ioan Cuza” University of Iasi
ssarchizian@yahoo.com

Abstract

Corporate governance is defined as the “set of mechanisms that control and influence senior management”. There are many different models of corporate governance around the world. These differ according to the variety of capitalism in which they are embedded.

Keywords: corporate governance systems, shareholders, managers.

J.E.L. classification: M14

1. Introduction

Corporate governance is the system by which companies are directed and controlled. Corporate governance involves a set of relationships between a company’s management, its board, its shareholders and other stakeholders.

Corporate governance also provides the structure through which the objectives of the company are set, and the means of attaining those objectives and monitoring performance are determined. Good corporate governance should provide the proper incentives to pursue objectives that are in the interest of the company and shareholders and should facilitate effective monitoring, thereby encouraging firms to use resources effectively.

Good corporate governance is now widely recognised as essential for establishing an attractive investment climate characterised by competitive companies and efficient financial markets.

Analysts of corporate governance often make a distinction between two types of system:

- The Anglo-Saxon Countries System;
- The Continental Europe System.

However, since 1990, another system began to take shape in Central and South-East European Countries.

2. The Importance of Corporate Governance

In its study “Global Investor Opinion Survey”, McKinsey analysed between 2000 and 2002, opinions of over 200 institutional investors and found that 80% of the respondents would pay a premium for well-governed companies.

They defined a well-governed company as one that had mostly out-side directors, who had no management ties, undertook formal evaluation of its directors, and was responsive to investors’ requests for information on governance issues.

The size of premium varied by market, from 13%-14% for North America and West Europe companies to around 30% for Africans and South-Eastern Europe companies (Chart 1).

Chart 1 The size of premium for well-governed companies in 2002, according to McKinsey

3. The Anglo-Saxon Countries System (“outsider-based system”)

This system is common in U.S.A., The United Kingdom, Canada and Australia and is characterized by:

- Numerous and dispersed shareholding.
- The owners of firms tend to have a transitory interest in the firm and do not have close relationships with those in senior managerial positions within the company.
- The existence of an active “market for corporate control” - takeovers, particularly hostile ones, are seen as both a remedy for managerial failure and a disciplinary mechanism on managers, ensuring that they act in the best interests of shareholders.
- Tends to emphasize the interests of shareholders.
- The presence of mutual funds and pension funds as shareholders in the companies.

The main criticism made to the Anglo-Saxon System of corporate governance is that the system facilitates speculative transactions with securities.

4. The Continental Europe System (“insider-based system”)

This system is common in Continental European Countries and also in Japan and is characterized by:

- The owners of firms tend to have an enduring interest in the company and often hold positions on the board of directors or other senior managerial positions.
- A stable and close relationships between management and shareholders. This stability of ownership is often coupled with legal or institutional barriers to prevent hostile takeovers.
- Existence of formal rights for employees to influence key managerial decisions, often through supervisory boards or works council-type bodies.
- Recognizes the interests of workers, managers, suppliers, customers, and the community.
- Banks presence as shareholders in many companies (in Germany and Japan),

what determines the credit more easily for this companies;

- The presence of family-owned companies in France, Italy and Spain.

The main criticism made to the Continental Europe System is the ease with which banks lend to companies that are shareholders, leading to increased bank risks.

5. The Central and South-Est European Countries System

The present ownership structures in Central and South-Est European countries show some common characteristics and reflect the history of the privatization programmes. Ownership structures are characterised by:

- a significant control by insiders and more precisely by managers, who have secured control either through direct ownership or indirectly by “*de facto*” control over employee shares;
 - the importance of remaining state ownership and control, especially in large firms and utilities that are still to be privatised;
 - the emergence of various forms of institutional investors, mainly former privatisation funds, that play a significant role in the ownership structure of enterprises.
- These common characteristics (significance of ownership by insiders, remaining state ownership and control, and the emergence of various forms of institutional investors, mainly former privatization funds), engender a series of specific problems and difficulties regarding corporate governance practices:
- ❖ Insider domination easily leads to abuse of minority investors, asset stripping and problematic handling of conflicts of interest.
 - ❖ Remaining state ownership and control may be an impediment to restructuring if the State does not really exercise its role as shareholder or if management of state shares is dominated by political concerns rather than business judgement.
 - ❖ Emerging institutional investors may have a significant impact on corporate governance practices.

Abuse of the rights of minority shareholders remains one of the most severe weaknesses of corporate governance practices in Central and South-East European countries.

Regulatory reforms and implementation and enforcement efforts should therefore focus on measures and remedies to provide protection of minority shareholders against this abuse.

Protection of minority shareholders requires the effective implementation of specific procedures for changes in control and major or related party transactions. These procedures include strict disclosure requirements and approval by a qualified majority of board members and/or of the extraordinary shareholder meeting. They also necessitate the development of fair evaluation processes.

At a more fundamental level, the protection of minority shareholders relies on the fiduciary duties of board members and on their independence. Their duty to act in the interest of the company and all its shareholders should be clarified and sanctions increased against misconduct by board members.

An inventory of the most important forms of abuse against minority shareholders includes:

a) **Diluting minority shareholders of companies**, through:

- **Capital increases without prior revaluation of existing capital.**

The “nominal” capital of companies has eroded because of the high inflation prevailing in South-East European Countries. As the National Accounting System does not provide for automatic corrections, periodical “revaluations” are done. If a majority shareholder decides in the general assembly to increase the capital without performing such revaluations, shareholders which do not use their option to participate in the capital increase are diluted by much more than normally allowed. This would not be true if the correct value of the initial capital had been used.

- **Capital increases through in-kind contribution of the majority shareholder.**

Minority shareholders are confronted with three forms of abuse: for in-kind contribution, the legislation does not provide preemption rights for the existing

shareholders, which are necessarily diluted; the in-kind contribution is usually over-valued and sometimes has nothing to do with the activity of the company; the in-kind contribution is performed without prior revaluation of the existing capital.

b) **Transferring profits outside the company.**

The “*empty shell*” tactic, by which the assets of a company are transferred to other parties by:

- abusive sale of critical assets of a company;
- use of the assets of a company as collateral for credits obtained by the majority shareholders;
- transfer, through mergers and divisions, of the assets of a company to new entities controlled by some of the existing shareholders, directors or executives.

c) **Abusive allocation of profits.**

The employees associations, majority shareholders in companies privatised through MEBO, decide in the general shareholders meeting to distribute to employees more than half of the profits as “*employee profit sharing*”. Not much is left for the dividends to which outsiders are entitled.

d) **Delays in the payment of dividends.**

Although the decision is taken in the general shareholders meeting on the distribution of the dividends, companies postpone for years the effective payment.

e) **Limited access to information for minority shareholders**, who only rarely have a seat on the board or the censors’ committee.

The Central and South-East European countries have made significant progress in corporate governance over the last few years. Recent and current reforms have improved the legal and regulatory framework by providing better protection against abuse.

Several national initiatives to issue guidelines, statements of best practices or to set up specialised good corporate governance tiers on the stock exchange have contributed to raising the awareness and improving the practices.

Finally, stock exchanges and securities regulators have reinforced their monitoring of companies’ conduct.

6. Conclusions

Corporate governance is important in all countries, even in the more developed. The American corporate crises of 2001-2002 when collapsed big corporations like Enron, WorldCom, Arthur Andersen, Global Crossing and Tyco prove these statements. More so, corporate governance is important in developing countries, whose corporate governance system is imperfect.

There is not an optimum model for corporate governance around the world. However there is a “*common body*” of corporate governance principles. The differences between corporate governance systems reflect the social, economic and cultural differences around the world.

Changes in Public Expenditures Policy at European Union Level (after 1990)

Sava Anca-Ştefania

„Alexandru Ioan Cuza” University of Iasi, Doctoral School of Economics

sava.anca@yahoo.com

Abstract

The aim of this paper is to present the significant changes in public expenditures policy at European Union level, after 1990. Firstly, the paper analyzes the dynamics of public expenditures over a period of time between 1991-2009 and shows that countries which started to reduce public expenditure since the 1990s have recorded considerable decreases, in comparison with those who have started the process of fiscal reform later (after 2000). Secondly, in order to explain the dynamics of public expenditure, there has been done an analysis on the functional and economic structure of public expenditure. There are differences in the dynamics of these categories of public expenditure from one EU Member State to another, depending on the degree of economic and social development, but also on tax reform policies of the public authorities.

Key words: public expenditures policy, fiscal reform, economic crisis

J.E.L. classification: J68, E62, E32

1. Introduction

At European Union level, public expenditures amount to quite high levels, data from Eurostat statistics [1] showing that almost half of gross domestic product “passes through the hands of governments”.

Analyzing the dynamics of public expenditures over a period of time between 1991-2009 were found significant changes in terms of public expenditure both at Member State level, but also making comparisons between countries, as many of them have started or continued to reduce the level of public expenditures in GDP many years ago.

Table 1. The dynamics of public expenditure as a percentage of GDP in 2009 (or nearest) compared to the maximum (%)

Countries	Year	Maximum level of public expenditure % in GDP	Year 2009 or the nearest one	Change (%)
Belgium	1993	56.5	54.2	-2.3
Bulgaria	2000	41.3	40.8	-0.5
	1995	54.5	45.9	-8.6
Denmark	1993	60.2	58.4	-1.8
Germany	1995	54.8	47.5	-7.3
Estonia	2009	45.2	45.2	0
Ireland			36.8	
	1992	41.1	(2007)	-4.3
	2009	48.9	48.9	0
Greece	2000	46.7	46.5	
			(2007)	-0.2
	2009	53.2	53.2	0
Spain	1995	47.6	45.8	-1.8
France	1996	54.5	52.8	
			(2008)	-1.7
	2009	56.0	56.0	0
Italy	1993	56.3	51.9	-4.4
Cyprus	2009	45.8	45.8	0
Latvia	2009	44.2	44.2	0
Lithuania	2009	43.6	43.6	0
Luxembourg	1992	45.8	42.2	-3.6
Hungary	1995	55.7	48.8	-6.9
Malta	2003	47.9	43.2	-4.7
Netherlands	1995	56.4	45.9	-10.5
Austria	1995	56.3	52.3	-4
Poland	2003	44.6	43.2	-1.4
Portugal	2009	48.2	48.2	0
Slovenia	2009	49.0	49.0	0
Slovakia	1996	53.7	41.5	-12.2
Finland	1993	64.7	56.3	-8.4
Sweden	1995	64.9	55.2	-9.7
United Kingdom			44	
	1992	45.2	(2007)	-1.2
	2009	51.5	51.5	0

Source: own calculations

First countries that recorded a maximum level of public spending, after which they operated significant reductions were:

Luxembourg, at 51.9% of GDP and the UK, with 50.7% of GDP, with reforms started in 1981, followed by Ireland, with the level of 56.2% of GDP in 1982, Belgium with 63.8% of GDP and the Netherlands, with 58.3% of GDP in 1983 [2, p.11].

Looking more closely at the percentages listed in table 1 we can see that there are countries that operated significant reductions in public spending, such as Slovakia, more than 12% reduction since 1996, also the Netherlands, for which public expenditure fell from 1995 to 2009 with 10.5% of GDP, as well as for Sweden, whose share in GDP declined by almost 10 percentage points, from nearly 64.9% in 1995 to 55.2% level in the last year of analysis, and for Czech Republic the share in GDP declined by 8.6 percentage points of GDP, from 54.5% in 1995 to 45.9% in the last year of analysis. For Ireland, Greece, France and Great Britain, although maximum levels were reached since the years 1992, 2000, 1996 and 1992 respectively, in 2009 public spending reached the highest level, far superior to those previously recorded.

According to Hauptmeier et al. [2], fiscal reform in Sweden, one of the ambitious reformers in reducing public spending, began in 1993, when the share of public expenditure was 73% of GDP (according to AMECO statistics [3]), the budget deficit exceeded 10% of GDP and public debt was about 70% of GDP. Discretionary measures imposed by the government, consisting of increases in taxes and public spending cuts, have reduced by 16% the level of public spending in GDP within 7 years. The main categories of expenditure reduced were transfers and subsidies (from 27% of GDP in 1993 to 19% of GDP in 2000, especially social security spending), government consumption and public spending on pensions.

We find that for countries like Cyprus, Latvia, Lithuania, Slovenia and Greece were recorded significant increases in public spending to GDP, whereas the maximum level was reached in 2009, year marked by the effects of the economic and financial crisis and by the intervention of public authorities through fiscal instruments, such as subsidies and transfers, for economic recovery.

In the case of Ireland, it is important to note that it is one of the ambitious reformers in reducing public spending, with two reforms, one started in 1982 when inflation had risen long enough and the country was facing a high unemployment rate, large budget deficits of over 15% of GDP, public debt reached 85% of GDP and the level of public expenditure in GDP was 47.5%, and the second reform was continued in 1992, when their level reached 41.1% in GDP. The peak considered was that registered in 2009, 48.9% of GDP, by almost 10 percentage points up compared to 1992.

For Austria, Denmark, Italy, Belgium and France, cuts in public spending were quite small, these states are assigned according to the study of Hauptmeier et al. [2] in the category of timid reformers.

Analyzing the dynamics of public expenditure for the period 2000-2009, according to Eurostat database [1], significant increases were recorded for the UK, from 39% in 2000 to 51.5% in 2009, for Ireland to 31.3% in 2000 to 48.9% in 2009 and for Estonia, from 36.1% in 2000 to 45.2% in 2009. Only for Slovakia there is a significant decrease, by 10.6 percentage points of public expenditure in GDP, from 52.1% in 2000 to 41.5% of GDP in 2009. As a general feature, it is found that the share of public expenditure in GDP for the period 2000-2009 is lower than the one between 1995-1999.

Public spending as a percentage of GDP should be linked with human development index for each country. According to the HDI ranking in 2009, on the first 10 positions were: Norway, Australia, New Zealand, USA, Ireland, Liechtenstein, Netherlands, Canada, Sweden and Germany. We find that Denmark, with the highest level of public expenditure in GDP in Europe, in 2009, of 58.4%, is not within top 10 countries with the highest level of human development, but ranked 19th, with a HDI of 0.864. The following positions throughout Europe stood in 2009, to Finland, with 56.3%, France 56% and Sweden with 55.2% of GDP. Only Sweden is found in top 10 countries, ranking 9th (an HDI of 0.884), while Finland is found on the 15th position (an HDI of 0.869), a better result than that registered by Denmark, while France ranked 16th (an HDI of 0.869).

Thus, this finding leads us to conclude that there is not a strong relationship between the level of public expenditure in GDP and HDI, as Norway, with a share of public spending to GDP of 46.3% in 2009 (according to Eurostat database) recorded the highest level of human development, according to the value obtained for the HDI in 2009 of 0.937. Therefore one state can achieve a high level of education, health and gross income per capita to a level of public expenditure in GDP of about 46.3%, taking into account public sector efficiency issues and the connections with the private sector.

2. Changes in public expenditures policy according to their economic and functional structure

In 2009, as regards the economic structure of general government spending, there was a predominance at the EU Member States of the current expenditures, while capital expenditures were less than 5% in some countries (Denmark, Austria, Belgium, Germany), under 10% in others (Lithuania, Ireland, Latvia, Luxembourg, Czech Republic), and in some cases below 15% (Bulgaria, Estonia, Poland, Romania).

Within current expenditures, social benefits had the highest specific gravity, with the share above 40%, followed by compensation of employees and intermediate consumption. Weights of staff costs in total public spending had values of over 25% in most states, suggesting a large budgetary staff reported to the number of population, while below this limit was Germany, with 15.6% of staff costs in total expenditures.

Table 2. The dynamics of public expenditures categories according to economic classification as a percentage of GDP in 2009 (or nearest year) compared to the maximum of public expenditures during 1991-2009

Countries	Year with the maximum level of public spending	Intermediate consumption	Social benefits	Compensation of employees	Capital transfers payable	Subsidies	Interests	Gross capital formation
Belgium	1993	0,7	2,3	0,6	0,3	0,8	-7,4	-0,2
Bulgaria	2000	-1,1	1	-0,8	0,1	-0,1	-3,4	1,2
Czech Republic	1995	0	4	0,8	-12,4	-0,8	0,3	-0,9
Denmark	1993	2,5	-1,9	1,7	-0,3	0	-4,8	0,3
Germany	1995	0,4	1,7	-1,3	-6,6	-0,8	-0,9	-0,5
Spain	1995	1,3	1,8	0,7	-0,7	0,1	-3,3	0,7
Italy	1993	0,8	3,2	-0,7	0,3	-0,9	-8,1	-0,2
Luxembourg	1992	0,7	0,9	-2	-0,4	-1,1	-0,1	-1,6
Hungary	1995	-0,2	1,7	-0,5	-5,1	-1,2	-4,4	3
Malta	2003	1,1	0,6	-0,5	-2,2	-1,1	-0,3	-2,9
Netherlands	1995	1,7	0	-0,6	-4,6	0,5	-3,4	1
Austria	1995	-1,2	1,7	-2,7	0,6	1	1,3	-1,7
Poland	2003	-0,4	-2	-0,5	-0,2	0,3	-0,4	1,9
Slovakia	1996	-4,3	2,2	-1,7	-4,9	-2,3	-1,1	-1,8
Finland	1993	2,2	-4,1	-1,6	0,5	-1,8	-3	0,1
Sweden	1995	-1,1	-2,2	-1,1	-0,2	-2,1	-4,1	-0,3

Source: own calculations according to Eurostat database on public expenditures levels

As can be seen in table 2, according to the economic structure of public spending, the largest reduction in the expenditure category concerned public interests, and from 1993 to 2009 two states, Belgium and Italy, have operated significant reductions, of 7.4 and 8.1% of GDP, followed by Denmark, where

the change was -4.8% of GDP, while for the period 1995-2009 two other states, Hungary and Sweden, have recorded reductions of 4.4 and 4.1% of GDP.

Also, another category of public spending which recorded changes is the one for transfers, and countries that operated significant reductions were the Czech Republic (-12.2% of GDP), Germany (-6.6% of GDP), Hungary (-5.1% of GDP), Slovakia

(-4.9% of GDP) and the Netherlands (-4.6% of GDP). Intermediate consumption has dropped by up to 4.3% of GDP for Slovakia, while for gross capital formation there were no important changes, some EU Member

States reduced their spendings with 0,2-0,5% of GDP, while in Bulgaria, Poland, Hungary were recorded increases of 1.2, 1.9 and 3% of GDP.

Table 3. Changes in public expenditures for social security, health, education and economic affairs, as a percentage of GDP in 2009 (or nearest) compared to the maximum level for the period 1991-2009

Countries	Year	Social security	General public services	Health	Education	Economic affairs
Belgium	1993	0.1	-5.9	1.8	0.1	1.3
Bulgaria	2000	0.4	-2.5	0.8	0.1	0.5
Czech Republic	1995	2.1	0.3	2.1	0.7	-12.6
Denmark	1993	0.6	-3.8	1.9	0.7	-1.8
Germany	1995	0.8	-0.6	0.6	0	-7.5
Spain	1995	1.7	-2.2	0.5	0.4	-0.1
Italy	1993	2.7	-6.8	1.3	-0.5	-1.0
Luxembourg	1992	0	-0.5	-0.3	-0.3	-1.8
Hungary	1995	-0.4	-3.5	-0.9	-0.1	2
Malta	2003	0.6	0.9	-0.5	-0.7	-4.5
Netherlands	1995	-4.3	-3.2	2.3	-0.1	-0.1
Austria	1995	-0.1	-1.6	0.5	-0.4	-0.7
Poland	2003	-3.2	-0.9	0.8	-0.4	-1.5
Slovakia	1996	-2.8	-2.9	2.4	0.5	-6.1
Finland	1993	-4.3	-0.9	1.4	-0.7	-3.4
Sweden	1995	-3.6	-3.2	1.2	0.3	-1.1

Source: own calculations according to Eurostat database

Table 3 shows that there were cuts in public spending on social security especially for ambitious reformers in terms of public spending since 1995-1996, like Finland and the Netherlands (4.3 percentage points), Sweden (3.6 percentage points), Poland (3.2 percentage points) and Slovakia (2.8 percentage points). According to Eurostat database [1], countries with the lowest level of social security expenditure per capita (in €) in 2008 registered the largest annual increases. This is the case of Latvia, Lithuania, Bulgaria, where annual increases in 2008 compared to 2007 ranged from 22.01% (Bulgaria) to 28.31% (Lithuania), unlike Finland, which spends more (€7103, 88/capita in 2008) and the increase is 5.16% for the period 2008/2007.

In most EU Member States expenditures for general public services recorded significant downward shifts. It is the case of Belgium (from 15.1% of GDP in 1993 to 9.2% in 2009), Italy (from 15.5% of GDP in

1993 to 8.7% in 2009), Denmark (from 11.3% of GDP in 1993 to 7.5% in 2009), Sweden (from 10.7% of GDP in 1995 to 7.5% in 2009), while in Malta these expenditures have increased, from 6.3% in GDP in 1995 to 7.2% of GDP in 2009.

For health there were minor reductions in public spending for Hungary, Luxembourg and Malta, while in countries that operated significant reductions in total public expenditure since the years 1995-1996, namely the Netherlands, Slovakia, Sweden, Czech Republic, were increases, given the importance of this area for the members of society but also for society as a whole, contributing to economic growth. Analyzing the dynamics of public health spending per capita, expressed in euro, we can find the same differences between developed and developing countries from the European Union. Countries that have spent the most per capita over the period were Denmark (in 2010, € 3621.98 / capita), Luxembourg (in 2009, € 3885.11 / capita), Ireland (in 2009, € 3179.44 / capita), Austria (in 2009, € 2695.50

/ capita), Netherlands (in 2009, € 2362.76 / capita), while Bulgaria has allocated for health amounts between € 48.6 - € 200.33 per capita.

Analyzing data from table 3 we can see that there were small reductions in public spending on education (taking into account their positive contribution to human development) even for the countries that have operated significant reductions in total public expenditures, namely for the Netherlands, which recorded a decrease by 0.1 percentage points, while for Sweden, Slovakia, the Czech Republic have increased, these states supporting education, given its crucial contribution to the overall progress of society. In 2009, the countries with the largest allocations of GDP, according to Eurostat database [1], were Denmark (8%), Sweden (7.3%), Estonia (7%), Cyprus (7.1%), and at the opposite stood Romania (4.1%), Slovakia (4.3%) and Bulgaria (4.4%). Comparing the dynamics of public expenditure on education in GDP with the amounts in euros per capita, according to the same statistics, Luxembourg and Denmark are on top positions, allocating € 3,820 and € 3,232 respectively per capita, while with percentages between 4.3-4.4% of GDP, Bulgaria allocates € 203/capita, while Slovakia € 503/capita and Germany € 1,277/capita, the differences depending on the levels of development for each EU Member State.

In what concerns public expenditures for economic affairs as a percentage of GDP, significant downward shifts occurred in the Czech Republic (from over 20% of GDP in 1995 to 6.9% in 2007), Germany (from 11.1% of GDP in 1995 to 3.1% in 2007), Slovakia (from 10.1% of GDP in 1995 to 4.1% in 2007). Years 2008-2009, marked by economic and financial crisis have led to much higher public spending, so in most states were recorded increases, on the first position being the Czech Republic, Ireland, Latvia, with over 7% of GDP. There were significant changes for Germany, for which budgetary allocations were reduced by 59% since 1995 (€ 2626.33/capita) to 2009 (€ 1058.26/capita).

According to The Ageing Report from 2009 of the European Commission [4], public expenditures in the EU-27 are projected to grow by 1.5 percentage points of GDP till

2060, due to the combined impact of ageing, potential improvements in health status and the effect of changes in the national income. For individual countries, the increases range from less than one percentage points for countries such as Latvia (0.6% of GDP), Cyprus (0.6% of GDP), Bulgaria (0.7% of GDP) and Sweden (0.8% of GDP), to more than 3 percentage points of GDP for Malta (3.3% of GDP). In the EU-27, aged-related public expenditure is projected to increase on average by 4.7 percentage points of GDP by 2060, most of the increase being on pensions, health care and long-term care, while for education and unemployment benefits are very limited.

Public pension expenditures are projected to increase for the EU-27 with 2.4 percentage points of GDP by 2060 and data from European Commission shows a large diversity across Member States. For Cyprus (11 p.p. of GDP), Greece (12.4 p.p. of GDP) and Luxembourg (15.2 p.p. of GDP), the increase is projected to be more than 10 p.p. of GDP, while for other countries will be below 5% of GDP (Belgium, Bulgaria, the Czech Republic, Germany, France, Lithuania, Hungary, the Netherlands, Austria, Portugal, Slovakia, Finland, the United Kingdom). On the opposite, for Estonia, Italy, Latvia, Poland and Sweden, are projected decreases by 2060.

For health care, public expenditures in the EU-27 are projected to grow by 1.5 percentage points of GDP (from 6.7% of GDP in 2007 to 8.2% of GDP in 2060). For individual countries, the increases range from less than one percentage points for countries such as Latvia (0.6% of GDP), Cyprus (0.6% of GDP), Bulgaria (0.7% of GDP) and Sweden (0.8% of GDP), to more than 3 percentage points of GDP for Malta (3.3% of GDP).

In what concerns public spending for long-term care, in the decades to come, are projected to increase in the EU-27 with 1.1 percentage points by 2060. For Bulgaria, Estonia, Cyprus, Portugal and Romania, the change will be less than 0.2 percentage points, while for Greece, The Netherlands, Finland and Sweden the projected change is more than 2% in GDP, which reflects the differences in the provision of formal care.

Public spending on unemployment benefits are projected to decrease with 0.2 percentage points over the long run, on the assumptions that unemployment rate will fall by more than one percentage point.

The Ageing Report from 2009 of the European Commission stated that although it is possible to decrease the number of children in the coming decades, the current objectives of educational policy at EU level may require increasing spending in the future. “Investment in human capital of young people and adult workforce will be crucial to future productivity growth” [4, p.5]. It is therefore possible that the slight decrease in the share of public expenditure on education during 2008-2060, of 0.2%, determined solely by demographic composition changes (fewer children in the future) to not materialize.

3. Conclusions

As a result of the analysis performed it was noticed that most EU Member States had begun the reform of reducing public expenditures at a time of economic decline, although according to economic theory, the reduction of public expenditure is to be carried out during the period of economic boom.

According to the functional structure of public expenditure, over the period considered were recorded significant reductions in social security for the ambitious reformers, such as Finland, Netherlands, Sweden, Slovakia, while for the other expenditure categories were not significant changes. According to the economic structure, the largest reductions in public expenditure focused on the category of interests and transfers.

On the basis of the analysis performed I believe that it is necessary on long-term and also as a solution to the current economic and financial crisis a reconsideration of the level of public expenditure within the meaning of rationalizing, focusing on the effectiveness of budgetary allocations.

Economic Crisis an Essential Factor in the Outbreak of War Perspective

Savu Cosmina Silviana

Abstract

An armed war between great powers is unlikely possible, but the big powers are waging an increasingly intense economic war, to establish a political, economic and financially world leadership .

Key words: human suffering, economic crisis, population, cognitive elite

J.E.L. classification: F01

1. Introduction

Through the history of the world economy, we find that the early nineteenth century is marked by economic, social and political conflicts that actually triggers the two world wars.

Nationalist spirit, who have a strong footprint in economically developed countries of Europe and the belief that the interests of these countries are threatened, made to adopt a strategy of arming and increasing naval capabilities.

The solution of finding foreign markets and the politically imposition was the onset of World War I (1914-1918). During 1929 - 1933 was characterized by a worldwide slump in productivity, through a major decline in consumer demand, particularly severe rate of unemployment and a sharp financial panic.

This period called the Great Depression was the longest and acute economic crisis that has been almost everywhere. The economic crisis has had devastating effects in countries with advanced economies, industrialized countries, but also in all

countries whose economies depend on these countries by exporting raw materials. The devastating impact of the Great Depression was human suffering.

Due to the rapid decrease in productivity on a global scale, there is a sudden drop in living standards. A quarter of the workforce of the industrialized countries remained jobless, inevitably leading to lower consumption, which generated the main cause of the Great Depression, which really pushed the world's population to despair and panic.

2. Great economic crisis

The rivalry between racism, nationalism, and militarism, as well as the increasing doctrines Italian Fascism, German Nazism and Japanese imperialism, plus the threat of the outbreak, „Revolution World”, planned by the Communist International, lead to the outbreak of World War II, war in which died at least 60 million people.

The two world wars in which the states have faced in armed struggle, have left behind millions of dead and huge destruction of goods and works of art. Immediately after the Second World War has been a strong industrialization, a massive industrial production. They demanded more and more machinery, especially agricultural ones, household appliances and so on. Also, production of aircraft and river and sea vessels increased in that period of time.

All of these have to grow at a rapid pace productivity, and once they have created many jobs. It starts the need for establishing international economic relations, creating the interdependence between national economies

of the countries of the world, forming complex and strong networks, of which no nation, however powerful it was, cannot be possible to exclude in a realistic way.

Basic features, essential in the postwar period is made up of interstate economic integration, economic cooperation gaining a special dynamic.

After the Second World War have complex changes in the conditions of scientific and technical, economic, political, social and cultural development that creates new perspectives. Now after 80 years of the Great Depression, the world economy faces a serious financial and economic crisis, more severe, in the context of the major world economies that went into recession.

The idea of the danger of a third World War is one of the current economic figures, about Austan Goolsbee¹, says: "If Europe does not solve the problem of undercapitalized banks, the situation can become explosive and can turn into a global war". His statement was supported by the Polish Minister of Finance, Mr. Jacek Postowski. Paul Krugman, Nobel Prize for economics, said: "We need, in fact, the financial equivalent of war".

What really ended the Great Depression was huge public expenditure program, known as the Second World War. After so many years the world has changed, has not stopped the production of weapons and arms race continues on the contrary, the weapons are more powerful and sophisticated, and their power of destruction is much higher.

Currently existing nuclear weapons could destroy at least 100 times the globe. However, an armed war between great powers is unlikely possible, but the big powers are waging an increasingly intense economic war, to establish a political, economic and financially world leadership .

This confrontation between great powers has always been, but in recent years has intensified, becoming a war that makes collateral damage in small states, states with weak economies, which depend of great economic powers.

It is a silent but fierce battle of strong states in terms of economic and financial, to buy and hold as more and more important assets in competing countries and in small

states, thereby imposing itself and directing the whole economic process politically and financially.

In a word, the great economies have the power in this whole area, which handles power to their advantage just by holding their assets in financial and economic sectors most important and very strategic.

Given the memories of two world wars, was cautious throughout Europe for decades and still is, in terms of economic domination and leadership on the European continent. For more than half a century after World War II, Germany was the one who provided the money and was pleased to be a great industrial power , but the political leadership was left to France.

Germany wishes were always made in Europe in terms of policy promoted and supported by France, a policy that always consider not to use force.

Germany with a strong capital, money made on products manufacture, quality, survived the last two years paid, and covering large deficit countries in Europe. However she avoided and still avoids assume management tasks, while both France and Italy declined in influence, not having a clear vision on how to avoid financial and economic problems in the future.

Although the question of its move away from Europe, Germany is aware that his success and money learn from those around him. A major economic and financial crisis would certainly affect Germany. Currently, governments in Europe and the world fail to maintain economic stability, fail to create jobs and fail to indicate a direction to be worked to ensure a real and necessary growth.

Most leaders of the world present economic crisis as a natural disaster (tsunami) in the way that you cannot push aside. Nobody does anything to alleviate the crisis and unfortunately the most affected are ordinary people, workers. Economic crisis, with its negative affect alters the quality of national social-economic and cultural life of people. Man facing problems that directly affect the existence and spends much of time to provide food for himself and his family will have to learn that work is the best treatment against poverty and economic

growth is the safest jobs creator. In these conditions we can assist to a radical change in mindsets of the people.

People appreciate better financial opportunities, orders its priorities exactly and purchases and shopping lists contain only the necessary minimum. With a careful and thorough analysis addresses issues of bank loans and analyzes in detail the possibilities of return, taking into account the possible problems that may occur in conditions of crisis (wage cuts, or even temporary loss of job). The global economic crisis takes its toll on the political, economic, military and financial hierarchy. Since ancient times there was a rivalry between the most powerful states in the world. This rivalry has permanently changed positions and hierarchies in terms of economic, political, military and financial.

Unfortunately, worldwide, especially in Romania, everything is politicized and private world secures its private world peace through subscribing for parties reached power politics, or support certain political issues, which of course bring their advantages.

The economic crisis started about four years ago. Even economic process cycles have changed, so that coming out of crises no longer spans long periods of time, yet economic efforts and attempts to find solutions are tremendous (Anca.Vârgă Ungureanu, Ad.Ungureanu - The effect of globalization of the Human Development Index in-Romania, *Industrial revolutions, from the globalization an post-globalization perspective*, 2009, pag 359-36). The economic crisis is the undeniable effect of weak leadership prepared unable to exercise the obligations of managers and they perform different industries, functions and senior positions in leading countries, obtained by political aservilism.

The political parties have a major lack of professionals, serious people who have experience and power to solve problems that inevitably occur at the level of institutions, the state and worldwide.

Superficiality in preparation, arrogance and hypocrisy even party members are the only items that are prepared under the careful observation of the heads of parties in the so-

called "summer schools" There are still many young people, always eager to learn new things, to deepen knowledge and to apply the experience and their ability to move things forward on the right track, bringing major benefits for most people.

Education is the best way to achieve intellectual gifts and abilities necessary for success. Center for Education and Workforce at Georgetown University by recently made studies demonstrates that a diploma from one of the faculties of prestigious, internationally recognized, not only bring added value, but also a substantial addition to salary.

If a college graduate in the U.S. can earn 3.6 million a year, who only finished high school, cannot hope to gain 1.3 million per year. According to the same study considers that a person may earn college 75% more, after a working life than one that has only

Area	Percentage of increase
America de Nord	22%
Europa	74%
America Latină	144%
Asia	203%

high school. Another weekly statistics made by The Chronicle of Higher Education shows that during 1990-2007 the number of students increased.

Worldwide in 2007, a total of 150 million young people were attending university, and of these 70 million were in Asia. The current recession has left a strong impression in this area, making major felt a drop in demand for college graduates. The world population at present is given as follows:

Global active population:

2,3mld.	2,7mld.	3,1mld.
1991	2001	2011

Source: Statistics published in Money EXPRESS no. 177(14)/03.10.2011

Global workforce.

1. Full-time employee 40%
2. Self-employed full-time 31%

3. Employed part-time, likes 12% full-time
4. Part-time employee does not want full-time 10%
5. Unemployed 7%

Unfortunately statistics show that world population has increased, have created more jobs, but the number of places are not working has increased and is increasing.

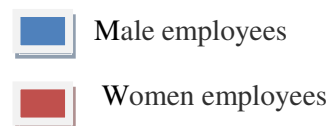

Source: FMI, OMM, Gallup, Fortune, EIU, "The Economist", "EXPRESS MONEY" - no.177(14), 03.10.2011

3. Conclusions

The recession that rocked so many workers begin to feel and cognitive elite. The best and brightest in rich countries begin to compete for jobs with those in poorer countries, as well as accepting their jobs more difficult and less pay.

New technologies, constantly upgrading and progress in the computer world, leads to the disappearance of many jobs (especially those that require repetitive work).

This inevitable as appreciation of many economists, including Paul Krugman, will create an „excavation” with their jobs. Thus college graduates with good results will be more easily outsourced. Since they still expect a spectacular evolution, whose results can push forward to a continuous development concepts.

In these young people we have to make large investments because expectations must match. The state must intervene to create conditions in areas of national research and allocate the necessary funds. Research in Romania has started to revive after a long period when it was neglected. Before 1990 there were 150,000 workers in Romanian institutions.

Source: Statistics published in Money EXPRESS no. 177(14)/03.10.2011

The economic crisis makes people's mentality to change radically. First, excessive growth of the phenomenon of unemployment due to economic crisis, is to increase this fear of becoming unemployed, especially in the areas of research, sales departments, real estate, banking, auto and insurance.

In heavy conditions of crisis, the intervention of massive state for appropriate distribution of resources in areas that there is a clear potential to create jobs have the ability to recover economically.

Abstract

Complex and dynamic phenomena, both migration and entrepreneurship represent key factors for economic growth in a country.

This paper aims to present the main findings of a research carried out among Romanian immigrants in Andalusia, Spain in order to identify and to describe the entrepreneurial approach of the Romanian immigrants in Andalusia, from the perspective of both migration-entrepreneurship relationship and the migration-demand-supply relationship, focusing on grocery stores type of business. The paper outlines the story of a Romanian immigrant owning a grocery store with Romanian food products in Andalusia, focusing on highlighting a series of specific features of the business owned by the Romanian immigrant, from the two previously mentioned perspectives. Furthermore, the paper intends to provide a role model for Romanian immigrants in Spain - in particular - and worldwide - in general.

Key words: migration, entrepreneurship, demand, supply, food products.

J.E.L. classification: F22, L26, O15.

1. Introduction

History shows how migration has determined the world population [11]; world history is marked by periodic episodes of human migration [21]. America would have been a desert until its discovery by Europeans, if the Asian hunters and farmers

had not “ventured” thousands of years ago on the portion of land that, at that time, connected the icebergs in Siberia to those in Alaska. Today, major cities in Europe would be empty if a continuous flow of immigrants did not offset the balance between births and deaths, negative over the centuries [17].

In 1948, the right to move is approved along with other rights by the Declaration of Human Rights, where in Article 13 is stated: “1. Everyone has the right to move freely and to choose their residence within the borders of each state. 2. Everyone has the right to leave any country, including his own, and to return to his country” [5]. Since then, the volume of international migration has begun to grow, the phenomenon being supported by technological progress, the improvement of means of transportation, and especially by globalization.

Even if it represents an ancient activity, migration has never seen so much attention as it currently has. Never before have political leaders given such an importance and priority to migration related issues as in present times [4]. For example, issues associated with the positive effects of migration on the development of the countries of origin of immigrants represent the centre of policy initiatives; in recent years, there has been an abundance of events regarding the influence of migration on the development of the countries of origin of immigrants [10],[22],[7].

Also, as migration clearly contributes to the numerical evolution of population (migration effects are similar to those of birth (immigration) or of death (emigration)), in recent years, at global level, a very high interest for the debates on migration as a potential solution for low birth rates and/or

aging has been seen [20], [9], [6], [12]. In what concerns the scientific literature in economics on human migration, according to Dustmann and Preston [8] there is a vast empirical economic literature focused on identifying the effects of migration on the economy. For example, recent articles published in scientific journals of international impact mainly address the relationship between migration and the labour market [2], [13], [15], [16], [18] or analyse the effects of migration on the migrant's country of origin from the perspective of remittances [3], [16]. In what concerns the pieces of research on the relationships between migration and entrepreneurship, there is a vast literature on the analysis of the profile of the immigrant entrepreneur, differences between countries, their needs and potential, and their comparison with local entrepreneurs [14]. From the various studies offered by the scientific literature on immigrant entrepreneurship, it can be assessed that, in general, the businesses initiated and developed by immigrants mainly focus on the sale of ethnic products, retail, construction, intensive agriculture, high intensity personal services, and hospitality and food [1].

The present paper aims to present the story of a Romanian immigrant entrepreneur of a grocery store with Romanian food products in Andalusia, Spain, in order to provide a role model for Romanian immigrants. The paper focuses on highlighting a series of specific features of the business owned by the Romanian immigrant, from the perspective of the migration-entrepreneurship relationship and the perspective of migration-demand-supply relationship. In this sense, the paper is structured into two main parts, apart from the introduction and conclusions. The first part of the paper submits a series of methodological aspects, while the second one outlines the main information related to the business owned by the Romanian immigrant in Andalusia.

2. Methodology

During May-June 2011, a research was carried out among Romanian immigrants in Andalusia, Spain, aiming to identify and to describe the entrepreneurial approach of the Romanian immigrants in Andalusia, from the

perspective of both migration-entrepreneurship relationship and the migration-demand-supply relationship, focusing on grocery stores type of business, in order to answer the following question: What is the entrepreneurial approach of the Romanian immigrants, owners of grocery stores with Romanian food products in Andalusia?

Thus, in order to reach the proposed objective, an investigation on the internet for grocery stores with Romanian food products active in Andalusia, and an inquiry among a series of representative figures of the Romanian community in Andalusia about the existence of grocery stores with Romanian food products in the area were conducted. In order to identify grocery stores with Romanian food products active in Andalusia on the internet, special websites addressed to Romanian immigrants in Spain and discussion forums of the Romanians in Spain have been consulted. The investigation on the internet and the inquiry conducted led to the identification of four grocery stores with Romanian food products active in Andalusia. The next step of the research consisted in contacting the entrepreneurs owning the grocery stores in order to be interviewed. But, out of the four entrepreneurs, only one entrepreneur was interviewed. One grocery store had been closed in January 2011, but its commercials were still available on the internet when the stores were searched. The other two entrepreneurs could not be contacted.

In order to protect the identity of the interviewee, further on in the paper she will be addressed as Entrepreneur X. Also, for the same reason, the place where the grocery store is opened will be addressed as Place X.

The fact that the specific scientific literature in the field of migration-demand-supply relationship is narrower than the specific scientific literature in the field of immigrant entrepreneurship represented the main argument for the choice of an in depth analysis of the topic. In this sense, the method used for gathering information was an unstructured interview. The conducted unstructured interview was informal and it did not have a predetermined list of questions. Even so, a clear idea about the aspects intended to be explored was defined. The interviewee was given the opportunity to

talk freely on the subject, and the interview was conducted face to face.

3. Best practices - an example of a Romanian immigrant entrepreneur in Andalusia willing to succeed

Before presenting the main findings resulted following the interview, the authors of this paper want to respectfully express their sincere and grateful acknowledgements to Entrepreneur X who took part in the conducted study.

With previous experience as an entrepreneur, Entrepreneur X is not at her first attempt to start and develop a business. Before moving and initiating the business in Place X, Entrepreneur X ran a business in Romania. Although the area of activity of the two businesses is similar - respectively commerce - the traded products belong to different branches, namely construction in Romania and food in Spain. However, even if the two businesses implied two different branches and they were developed in two different places, it can be assessed that Entrepreneur X has expertise regarding the entrepreneurial process, has a raised level of awareness concerning the issues involved by the entrepreneurial approach, and has a developed entrepreneurial spirit.

“In Romania, along with my husband, I owned an enterprise selling building materials. Here, in Place X, I run a grocery store where I sell Romanian food products.”

One of the factors that led to the migration of Entrepreneur X and the opening of the grocery store with Romanian food products in Place X was the economic crisis. From one perspective, the economic crisis represented for Entrepreneur X an obstacle and an inhibitor regarding her business in Romania, but in the same time - from another perspective - it represented an opportunity generator for migrating and initiating a business in Spain.

“By the middle of 2008, the activity of our company in Romania took an unexpected turn. The number of clients started to fall increasingly every day and the clients we had were not able to pay their bills anymore on time. Until the middle of 2009, we continued our business related to the construction industry as we were hoping that things will

start to improve. This did not happen and at one point we decided that we had to reorganize our lives.”

Nevertheless, the decision could not be taken without a remarkable level of confidence, a high risk attraction and a very pronounced entrepreneurial spirit.

“Along with my husband and kids, I decided to close the business in the construction industry, to sell our house and cars and move to Place X in order to start a new business, and a new life there.”

Another factor that led to the migration of Entrepreneur X and the opening of the grocery store with Romanian food products in Place X was exactly the place. With its specific beauty, resources and climate, Place X represented for Entrepreneur X an important pull factor, becoming the perfect place to start a new life and business

“In 2002, along with my husband, I first came to Place X on vacation. We had some Romanian friends who were living there and who were inviting us all the time to come to Place X to spend our vacation with them. We returned again on vacation in 2004 and 2006. We loved the place so much that we told ourselves that whenever things won't work in Romania anymore we will go there to start a new life.”

Place X was not chosen in total unawareness. It was quite familiar to Entrepreneur X, being previously visited and known, as some of her friends were already living there. Entrepreneur X's social network (her friends) represented a powerful source of support, also contributing to the development of the business idea, by providing her the necessary information on the new venture opportunity.

“The friends we had in Place X kept telling us that there is a huge demand for Romanian food products which cannot be satisfied. They kept encouraging us to come to Place X and open a grocery store with Romanian food products, because Place X is extremely populated by Romanian immigrants, very willing to buy and consume Romanian food products, and there were no such stores in the area.”

Even if she had the support of her social network and family, the entrepreneurial process was not easy. Her expertise in the entrepreneurial area, courage, determination,

motivation, and risk-oriented character conducted her to develop the business idea even if the start was extremely difficult.

“The store was opened in 2010 and the first year was the most difficult one; we almost spent all the financial resources we had from Romania. But, after one year, the business started to be profitable.”

The clustering of Romanian immigrants in Place X and the potential demand for Romanian food products manifested by the Romanian immigrants in the area, created entrepreneurial opportunities for Entrepreneur X. Therefore, Entrepreneur X filled a market niche previously untapped. She based the business on selling food products specific to Romania, products not sold by local businesses, usually consumed by Romanians.

“The main clients of the store are Romanian immigrants who are buying the products we sell very often; on a scale from 0 (very seldom) to 6 (very often), the shopping frequency of Romanian immigrants can be assessed with 4.”

However, even if the main targeted clients were Romanian immigrants, Entrepreneur X addressed also the Spaniards living in the area. The introduction of new products (specific to Entrepreneur X’s country of origin) contributed to the growth of the available range of products on the market specific to Place X. Entrepreneur X wanted to stir Spaniards’ appetite for Romanian food products, by introducing and promoting them on Place X’s market. Even if Spaniards have not got familiar yet with Romanian food products, because of their high level of traditionalism in what concerns food, Entrepreneur X still tries to make the Romanian food products known and appreciated among the Spaniards in the area.

“The Spaniards do not visit the Romanian grocery store very often, and when they want to buy something from the store, they buy beer. If I assessed the shopping of the Spaniards in my shop, on the same scale as in the case of Romanians (0 - very seldom to 6 - very often) it would be 1.”

Even if the Romanian food products have not been introduced yet in the daily food consumption habits of the Spaniards living in Place X, the grocery store represented for Entrepreneur X an important means for

integration in the Spanish society.

“The grocery store I own helped me and my family to be accepted and quickly integrated by the Spaniards. The grocery store is something like a brand for me and my family. The Spaniards perceive us in association with the store.”

As a final consideration it can be appreciated that Entrepreneur X is a young woman, both family and business oriented, willing to succeed in any circumstances, ready to assume calculated risks, and to live new experiences.

“I am not afraid of tomorrow. Even if this business doesn’t work, I can start another business in the same branch or not, or in the same place or not. It doesn’t matter. As long as I have my family with me, I have their support, and if I am healthy I can do anything.”

4. Conclusions

Migration represents a very important phenomenon at global level, taking into consideration its diverse implications such as demographic, socio-economic, socio-cultural, territorial, environmental, etc. [19].

The paper briefly presented the story of a Romanian immigrant owning a grocery store with Romanian food products in Andalusia, Spain, based on the information obtained through an unstructured interview conducted with her.

The interview revealed a young woman entrepreneur, with previous experience in the entrepreneurial field, with a very developed entrepreneurial spirit, very oriented towards taking risks, business opportunity seeker, motivated and very determined to succeed.

The analysis of the interview presented in this paper was conducted from the perspective of migration-entrepreneurship relationship, as well as from the perspective of migration-demand-supply relationship. In the first case, issues concerning the factors that led to the opening of the grocery store (such as the economic crisis, the place where the store was opened, the social network) were approached. In the latter case, the potential demand was addressed. Also, the modification of the range of provided food products on the market was studied focusing on the main clients, and on the perception of

locals towards the new typical Romanian food products available on the market.

The Necessity of Central Bank’s Involvement in Ensuring the Financial Stability

Abstract

Central Bank is one of the most important actors of economic life. The policy that this institution leads is important both in relation to achieving different economic policy objectives (economic growth, unemployment rate, price stability, balance of payment equilibrium) and in relation to the policies pursued by other players on the macroeconomic stage (government, employers, trade unions, European and international institutions). As a monetary authority, Central Bank has as objectives the implementation of the monetary policy, prudential supervision and supervision of commercial banks. In the current financial crisis and its effects on the global economy, it is discussed more and more the issue that the Central Bank has to involve in ensuring financial stability.

This paper proposes a logical analysis of theoretical and practical foundations which support the necessity of Central Bank involvement in order to ensure the financial stability, the reasons and limits of its actions.

Key words: global financial crisis, price stability, financial stability, monetary stability, macroeconomic balance, prudential supervision, risk management, monetary policy objective

J.E.L. classification: E52, E58, G01

1. Theoretical considerations

Generally, the contemporary economists agreed that an important role in ensuring financial stability belongs to Central Bank. However, because of the relative nature of the concept of financial stability, Central

Bank’s tasks in this field are quite controversial in economic doctrine, and the stipulation of these tasks in legal texts is also imprecise and sometimes different from one country to another.

Still, it is consider, that there are some functions and tasks of Central Bank that can contribute to ensuring and maintaining financial stability. These functions are:

- ✓ banking regulation and supervision;
- ✓ management and oversight of payment systems;
- ✓ the function of lender of the last resort;
- ✓ guarantee of bank deposits.

It is noted that these are the traditional functions of Central Bank, which appear precisely for the gradual involvement of this institution in ensuring financial stability. Indeed, sometimes the inherent instability of commercial banking system imposed the control by the Central Bank, that had to perform a regulatory function and refinancing of banks which are in such a situation that are not able to face – with their reserves and usual assets – massive demands of deposits withdrawals. If the Central Bank had not assumed this role, it wouldn’t have been anyone to do this and customers would have suffered important losses from full non-recovery of their deposits. In fact, even through the involvement of Central Bank, in many cases, these losses couldn’t have been avoided, such situations including Romania.

It means, that from a historical point of view, the Central Bank’s function as the lender of the last resort appeared as a mean of guarantee the system’s liquidity and solvability.

This function was completed by the role of the Central Bank as the competent authority in elaboration and implementation of prudential regulations. [1]

The utility of these functions is questionable because sometimes the Central Bank itself confronts with a problem of asymmetrical informing. Indeed, the Central Bank does not always have all necessary information in order to determine whether a commercial bank is insolvent or has only temporary liquidity problems, and therefore, has no choice but to help all banks or does not help any of them.

However, it is clear that the banking financial stability must be ensured above all. From here, the idea of creating separate supervisory institutions from Central Bank, which impose commercial banks rigorous prudential rules, as currently, the most known prudential rules at European level are defined by Basel II and more recently by Basel III.

In this historical evolution of Central Bank's functions, some recent phenomena are added, such as globalization, deregulation, the increase of financial innovation process, foreign exchange liberalization, that strengthen the links between banking sector and other important sectors of financial system (insurance, financial market). This defragmentation of capital markets creates new challenges for Central Bank, inducing it to assume new tasks and functions.

Among these new responsibilities that involve more and more the Central Bank in ensuring financial stability, we mention the monitoring of financial assets prices and supervision of financial conglomerates. In these new conditions, some economists state that the Central Bank should primarily deal with elaboration and implementation of monetary policy. The main cause for this special interest of modern Central Banks in ensuring financial stability is the fact that monetary policy can't be fully effective, unless it is based on predictable transmission mechanisms that requires a quite stable environment. Mutually, price stability – the final objective of monetary policy – is a necessary condition, although not sufficient to ensure financial stability.

Regarding the relation between price stability and financial stability, in literature, recently has been formulated the idea of what is called “new environment hypothesis”, and after that, together with the inflation stabilization at low levels, it is created a new economic environment, where financial

stability is no more guarantee.[2]

In literature, it is obvious that, financial instability and, in particular, banking crisis, may have important macroeconomic risks, what requires the involvement of the Central Bank too. Therefore, at the moment, there are many authors who consider that the sole objective of the Central Bank should be price stability and there is an incompatibility between this objective and financial stability.

The truth is that Central Banks own a series of instruments that make themselves able to act in order to achieve the price stability objective and to ensure the stability of financial system. Although it is true that usually financial stability is not an explicit objective for modern Central Banks, the systemic financial instability can cancel their performance in achieving the final major objective: the price stability.

Because it is created the need to inject additional liquidity in banking system, a crisis of this sector can directly affect the monetary stability. Hence, the complementarity between price stability and financial stability appears, although the achievement of first objective does not involve necessarily the latter.

The defining of financial stability in a specific economic field can have many approaches, in literature and in practice, known as a broad vision and one narrow of financial stability, both with implications for the Central Bank.

The broad definition focuses on the functioning of the whole financial system, representing the situation in which financial system has the capacity to attract and to invest funds efficiently and to resist at shocks without damaging the wealthy functioning of the real economy. In these conditions, the Central Bank can be involved in prudential supervision of the financial banking system.

The narrow definition focuses on the necessity of avoiding financial crisis, representing the situation in which banking crisis do not appear, and assets price and interest rate lead to a high stability level. In this context the Central Bank is primarily concerned on the efficiency of policy interest, because it can lead to a certain tension between price stability objective and financial stability objective.

Usually, the financial stability concept is defined in financial stability reports released by Central Banks. The broader definition of financial stability from Central Banks reports is the bigger concern for the issues related to the stability of the entire financial system, and the larger amount of information and analyses in these reports. [3]

In Romania’s case, the financial stability is defined as “that characteristic of the financial system to resist to systemic shocks on a sustainable basis and without major disturbances, to allocate efficiently financial resources in the economy and to identify and to manage efficiently the risks”. [4]

2. The Central Bank and financial stability in the context of the current financial crisis

The main reasons for which a modern Central Bank must play a key role in ensuring price stability can be presented such:

- ✓ the Central Bank is the sole issuer of the currency “primary” constituting the legal (final) means of payment;
- ✓ the Central Bank is the sole institution responsible for the proper functioning of national payments system, that is the main channel of transmission and amplification of system risks;
- ✓ the banking system is the main institutional component of the monetary policy’s transmission mechanism to the real economy;
- ✓ the monetary stability and the financial stability are closely related, one of the usual causes of financial crisis is the excessive increase of money supply. Sometimes, the Central Bank itself has difficulties in adjusting the volume of liquidity in the economy in terms of its monetary policy objectives.

Once the financial crisis began in 2007, the National Bank has tended to become a net creditor of the banking system, and the foreign capital inflows decreased significantly. But this fact does not mean the enforcing of monetary policy, because, due to the spreading of financial crisis at global level, the volatility on monetary and exchange markets increased very much, and the economic activity tends to slow down.

The reduction of external financing, the existence and persistence in the recent years of large external imbalances determined the depreciation of the national currencies in the region, including Romanian leu that makes the inflation rate increase and the maintenance of relatively high interest rates become necessarily. In these conditions, the debtors in euro and other currencies, and thus the entire financial system are vulnerable to a significant depreciation of Romanian currency. The high costs of lending for all the players on the market (including the states with large debts) could imbalance very strong the financial sector and thus to appear the delicate problem of the compromise between the monetary policy objectives (price stability) and ensuring financial stability.

The effectiveness of monetary policy in achieving the primarily objective, price stability is limited if there is no financial stability, considering that the frictions in financial plan significantly influence the business cycle and, at the moment, in the world this thing is very obvious. World’s Central Banks try to maintain financial stability and to avoid recession and economic depression.

Romania’s experience shows that financial stability has a special importance for price stability. Between 2006 and 2010 our country registered a consumer price index evolution between 4.84% and 7.85%, being often criticized for delays in disinflation. These evolutions are due to insufficient structural reforms, and if NBR had filled this lack of reforms, the financial situation of companies and households would have been more damaged.

The monetary policy plays an important role in starting and managing banking crises, although in the recent decades the lending trends in aggressive rhythms favored the speculative increasing of assets’ stock and real estate prices and stimulated the indebtedness of economic agents which created the source of economic and banking difficulties, the appearance also characteristic to Romania in the current economic and financial crisis.

In this context, the importance of monetary policy promoted by the NBR, and especially the success of this is given by the level of interventions that are done as lender of the last resort (the amount and the interest

on which is carried out), but also by the level of macroeconomic measures which shall be evidenced by their nature more discreet than the measures of budgetary and fiscal policy. Thus, the measures taken by the National Bank of Romania in the years 2009-2010 as successive reductions of the monetary policy interest rate (to 6.25 percent current level) were likely to reduce the cost of bank loan, to improve the situation of debtors, although the recovery of economic growth and lending activity failed.

Adopting inflation targeting, NBR left the more the market place in setting the exchange rate. However, there were times when domestic currency fluctuations have been far beyond the limits justified by the fundamentals in exchange rate. So was the

Table 1. Inflation potential determinants of deviations from projected trajectory

CAUSES	BALANCE RISK
The conduct of fiscal policy and incomes in the public sector	Risk of upward deviation
Structural rigidities in the economy	Risk of upward deviation
Uncertainties regarding the horizon of overcoming the adverse consequences of the global crisis on the national economy	Relatively balanced
Perception of risk from the emerging economies of Europe in the context of Greek public finance crisis	Relatively balanced
Administered price trajectory	Relatively balanced
Volatile prices dynamics of food products	Relatively balanced

Source: National Statistic Institute, National Bank of Romania

During 2010, the Central Bank has adopted a series of measures to solve the severe tensions observed in some segments of the market, which affect the monetary policy transmission mechanism and, therefore, the effective implementation of the monetary policy to maintain the price stability over the medium term.

The Central Bank has decided to conduct interventions in the euro area public and private debt securities markets, under a securities markets program, to ensure depth

case several times between 2004 and 2007, when there were large capital inflows and the domestic currency has appreciated very much. It happened at certain times, and after the international financial crisis started including 2009. These were the reasons for which the Central Bank adopted a managed floating exchange rate, but this does not mean that Central Bank intervenes in the foreign exchange market in its sole discretion [5].

NBR’s policy regarding foreign exchange intervention was guided by the philosophy that high exchange rate volatility is harmful for both the inflation objective and the financial health of the real and financial sector.

and liquidity in those market segments that are dysfunctional. The objective of this program is to correct the malfunctioning of securities markets and to ensure the proper functioning of monetary policy transmission mechanism. The main actions promoted by the Central Bank in financial crisis situation are:

✓ ***In order to maintain the liquidity in the economy:***

- NBR has reduced the monetary policy rate from 10,25% (July 2009) to 6,25% (May 2010);

- NBR has reduced the minimum reserve requirement rates:

- from 40 to 20% for foreign currency liabilities with residual maturities shorter than two years, in four stages of 5 percentage points (June, August, November 2009, and April 2011);

- from 40% to zero for foreign currency liabilities with maturity longer than two years, from 18% to 15% for domestic resources (June 2009).

✓ ***For stimulating the revival of credit process:***

- the flexibility of provisioning system for overdue loans for more than 90 days and/or for which legal proceedings were initiated by deducting up to 25% (instead of 100%) of the value of collateral (April 2009);

- the flexibility of the conditions for the maximum degree of indebtedness of the debtors for some loans categories such as mortgage-backed loans and securities backed by State (February 2009);

- different treatment for rescheduled loans, that allows their reclassification in a higher class, with a corresponding reduction of the provisions (September 2009). The improving of the structure and level of own funds, including intermediate profit obtained during the year, and the profit recorded at the end of that financial year (September 2009).

The global economic and financial crisis strongly manifested in 2009 represented the dominant context deeply negative where Romanian real and financial sector operated. The current account external deficit adjustment has strongly impacted on the companies' performance, incomes of the economy and on the evolution of financial system, significantly increasing the vulnerability of the economic system.

The banking system, with comfortable levels of solvency and liquidity, has absorbed well the crisis shocks but with the cost of a lower performance, of growing risks of dynamics and persistence of non-performing loans, prolonged inhibition of loans demand and a relatively high dependency on external financing.

A stabilizing factor has been the funding agreement signed by authorities with European Union (EU) and International Monetary Fund (IMF).

The prospects of banking system and, generally speaking, of national financial system mostly depend on economic system revival and regional developments.

3. Final considerations

Central Bank is one of the institutions with the pivotal role in ensuring financial stability that has as main objective the price stability.

A fundamental role in ensuring price stability and also financial stability returns on medium and long term to the monetary policy conduct and its transmission mechanisms to influence positively the dynamic of aggregate demand and prices in the economy.

Channels or specific transmission mechanisms of monetary policy in literature and economic practice revealed the following: interest rate channel, credit channel, exchange rate channel, wealth and balance sheet channel, inflation expectations channel.

The consistency with that Central Bank aims to achieve the price stability objective (as a prerequisite for financial stability) significantly affects economic agents' expectations regarding inflation. Therefore it is necessary that the actions and measures taken by the Central Bank increase their transparency and their credibility. Communication work with business, academia and the media has enough reserves to intensify, especially in explaining the Central Bank objectives, the instruments and the transmission mechanisms of monetary policy and the impact on financial stability, especially in this period in which economic and financial crisis's effects require drastic austerity measures in all components of the economic and social life.

However, it is necessary to emphasize that beyond the influence of monetary policy, the dynamics of aggregate demand and prices is also determined by the conduct of other components of the set of macroeconomic policies, namely fiscal policy and income policy, which in turn should stabilize the fluctuations of the economic cycle and contribute to the strengthening of the financial stability.

Abstract

Computer usage is continuously and rapidly expanding, especially in the urban environment, and Romanian ecotourism is progressively relying on promotion via online advertising.[1] Computer networks have extended, thus fostering the creation of websites in which every entrepreneur is present without necessarily having a personal site, but simply by registering in a database that is a site which allows the consumer a clearer visualization of the offer on the market in a shorter time, without navigating on the Internet long. Therefore, once the interest in Internet services has increased, the computer has started to play an important part in commerce and in our daily lives, but the current economic situation is slowing the pace of expansion in the number of Internet users.

Key words: model, business, online, crisis, Romanian

J.E.L. classification: M21, R11, R15

1. Introduction

The utility of business models is dictated by a series of characteristics that are typical of public services: users consider them a service necessity, a higher service feasibility, the capacity to use them at maximum being limited. This paper analyzes utility online business models and their future role in society and implicitly for businesspeople.

Each business model has certain factors that influence the business according to the nature of the business. In order to understand

the nature of the ecotourist online business model it is essential to integrate the business in a general business context. An online business model is in fact a method to make money. Each online business model has its particularity, which makes it different from the other models and through which it creates its own value.

In every industry, be it tourism or of another nature, the methods to do business can vary greatly, the limits being imposed by technological factors, allocated budgets, competition and, most importantly, by consumer demand (expectations, preferences etc.). [2]

Throughout the years, various attempts to classify business models put into practice have been made, especially as far as the Internet is concerned.

2. Theoretical Foundations

At a global level, during the 1990s online commerce drew great attention to business models. In the case of Romania the situation is different; Romanians started to use the Internet massively after 2000, and the confidence in online commerce came later, increasing exponentially every year.

Hence, the Internet opened the door to new opportunities for online transactions, but a lot of businesspeople considered that they could not make profit out of online business, that it was only brand promotion and that they made themselves known on the market, continuing to focus on traditional business. [4]

E-business refers to the electronic means that a company uses to conduct business, unlike e-commerce, which defines the means

through which the company website offers the possibility to purchase or sell products online.[5] E-purchasing presupposes the acquisition of goods, services or information through electronic media (most often the Internet). By moving acquisitions online, companies have already saved millions of dollars. E-marketing describes the process through which companies inform their customers, promote and sell products and services with the help of the Internet. There are various terms that begin with an “e”: e-finance, e-learning, e-service etc. However, we may notice that the moment the great majority of businesses is conducted in an electronic environment, this “e” will be given up (Kotler and Keller 2006, 493). Informatic solutions for e-business allow the integration of company internal and external processes. Electronic businesses can be directed using technologies such as: the World Wide Web, the Internet, the intranet, the extranet, or combinations of these.

3. Online Customer Behaviour

The European Interactive Advertising Association (EIAA) has ordered a survey to Synovate and SPA on a group of 7000 interviewees who will participate in telephone queries in European countries, including Romania.

The main idea that results from the study and which is astonishing from the perspective of the impact of the Internet nowadays is that *40 percent of the buyers modify their acquisition decision as a result of the research performed on the Internet*. The user is guided in his/her research on the Internet by a simple principle: Search, Compare, Purchase. The person who wishes to purchase the brand (most probably as a result of having been influenced by one form of advertising or another) has his/her enthusiasm diminished after searching the Internet, as s/he discovers here the experiences of other users with the respective product or with other products of higher quality. The Italians are the least impressionable, whereas the Romanians are the most so.

What is interesting is how acquisition is performed: search engines are the first option of the online buyer, followed by viral publicity of the type: the others’ experiences,

price comparison websites, known websites etc.

Figure 1: Decision factors for online shopping

Source:

<http://blog.boom.ro/blog/29.10.2010.comportamentul-consumatorului-online.html/factori-deciziei-cumparam-online/>

80 percent are online buyers (penetration is 84 percent in the countries in the study) and they ensure a European market of €1,32 billion. Tourism is a leader and it ensures through both tickets and holiday destinations the top of online sales.

In Romania there are six online business models that are used and through which profit can be achieved: blogs, affiliation, information, online shops, programs and software, as well as online services.

The action plans for the six models have the following points in common:

1. market research – in short, the identification of problems that the user of Internet services is faced with (the more stringent the more profitable financially) in order to know which segment to address and with what proposals

2. the search of key words that describe the problem – these form a core around which promotion campaigns will develop (see Google Keyword Tool, Market Samurai, social media)[6]

3. the creation of promotion platforms (WordPress, Joomla, Blogger, Facebook, Squidoo, YouTube, Stumbleupon etc.)

4. establishing the means to make profit (direct sale, affiliation, Adsense, CPA, articles, announcements, lists, association, consultancy etc.)

5. the measurement of results (Google Analytics/Sitemeter/aWeber etc.) and what changes must be made in case of failure to achieve the objective – profit)

6. the choice of a solution to the problem. I do not think that novelty can be brought in the field; competition will be studied and the saleable services or products will be chosen, along with the information that remedies the problem. A few corrections to what the competition does can be brought (improvement of the format, of the appearance, of the manner of presentation etc.).

4. The Role of Information in Business Models

During the past few years, major changes have taken place in the business world developed by the majority of companies and corporations worldwide. Increased needs to ensure flexibility and rapid response to actual market conditions, exacerbated local or global competition, as well as the ongoing re-technologization process to the purpose of increasing enterprise efficiency have determined modern companies to possess the characteristics that we have enumerated above. Pressure of any nature has determined enterprises to use information technology in such a way as to transform and modernize the means to organize and do business.[7]

Information and communication technologies are used at both individual and company levels with increasing flexibility, using intensively a huge amount of information, with direct impact on all human activity. It is a new stage, of the “globally computerized” society – whose main characteristics are digitization and interconnectivity.

The next developmental stage of human society is constituted by the “society of knowledge or the society based on knowledge”, whose main operation tool is the piece of knowledge manipulated with the help of information and communication technologies.

The society based on knowledge presupposes a revolutionization of economy in which innovation is a key factor. Such a society has at its foundation knowledge management, the production of new technological knowledge and the

dissemination of knowledge through progressively effective electronic means (the Internet, cards, electronic books, e-learning etc.).

This evolution of human society is based upon the continuation of the race of informatization, under the circumstances in which computers will be ever-present in society. In this context, economy will rely on information and communication evermore, which will presuppose the use of information as a factor of production, acknowledgement and expansion of virtual goods and services.

A system based on knowledge is an information system that solves problems from the real world, using knowledge about the field of application and the tasks that will be performed within it.

The conception of a system of knowledge bases entails a previous stage of knowledge or documentation transfer between human experts, and an information tool, so that in the end a knowledge basis should be available for consultation by any user as an expert.

The knowledge model describes the behavior and type of knowledge that are necessary to the system to solve problems, independent from the implementation constraints.

In the present stage information systems become capable of moulding, so that they do not only render the model of external reality, but also transfigure a new virtual reality which they project and transmit to the information user. In order to design and exploit modern information systems, it is mandatory to know the prospects of the usage of information systems globally and to formulate an adequate information politics based on these, a politics that should be subsequently applied consistently.

No approach or model, no matter how sophisticated, can solve a real problem single-handedly, combinations of various reasonings being necessary (since the one based on a model and the heuristic ones appear as complementary, a cooperation between them seems interesting).

To conclude, we will be able to call the next generation, subsequent to the globally computerized society, that of intelligence and knowledge, which will place at the core of attention the exploitation of information.

5. Decision-making Principles

The factors that influence decision-making are knowledge (information) and consensus. As far as knowledge is concerned, the fundamental difficulty comes from uncertainty. No leader can assert that s/he has all the information that is necessary for decision-making. Knowledge is incomplete and uncertain. Under these circumstances, the one who makes the decision needs to find out the answer to two questions simultaneously: through what methods can one decide something under the circumstances of uncertainty? and how can one cope with the negative consequences of uncertainty? Subjective probabilities are usually used, these signifying the degree of certainty/uncertainty regarding the knowledge that one has, the chance attributed to knowledge of being an accurate depiction of reality. Their use has positive effects as long as alternative solutions are nevertheless sought and compared.

In direct connection with the problem of knowledge that is necessary for decision-making, there is the problem of consensus. Groups from any organization seem to be characterized, in their initial state and in relation with a given decision, especially by disagreement. The achievement of agreement can be done either through democratic decision-making, or through the acceptance of the delegation of authority towards a particular individual. Difficulties arise from at least two directions: on the one hand, the paradox of participation is at work; on the other hand, to the purpose of achieving a flow that should be headed towards collective decision-making, a “hierarchy” of individual actions in relation to the goal at hand and to existent resources needs to be drawn. [8]

A frequently applied but often flawed strategy is the one in which managers adopt the first solution that they manage to come up with, without considering any alternatives or the drawbacks of the solution that they have chosen. They proceed in this way usually because it is a simplified strategy and because they save time and avoid the stress that is intrinsic to decision-making.

However, this comfortable strategy has a backlash: most of the times managers face the repercussions of such rushed, thoughtless

decisions without being able to solve them as quickly as they made the wrong decision.[9]

Proper preparation for decision-making entails primarily the appraisal of all the alternatives. This includes reviewing the solutions that were formulated at the previous stage (the prognosis), and their completion with other versions that are being devised on the way. In other words, the decision-making stage begins with an exercise of inventiveness and imagination in which every new idea is welcome.

6. Conclusions

Nevertheless, during the past two years, the Romanians have rapidly adapted to the Internet age, and a discussion of business models is impossible without taking into consideration the Internet.

In order to understand the nature of the business model that regards Romanian ecotourism, it is useful to integrate it in the context of business in general.

An image of the future concerning business based on online business models has started to be drawn in general lines. Demand is continuously increasing from the part of both the users and the businesspeople.

Users have come to depend on online services, ranging from payment of bills to shopping, holiday scheduling, socialization and information acquisition. These services save time and money.

In Romania online businesses are relatively new, that is why I consider that it is useful to put at the reader’s disposal definitions for technical terms that will be used, for reference. Thus, the reader will have two separate sets of definitions available for consultation, one with web-related terms, and the other with concepts regarding ecotourism.

Abstract

Identifying, assessment and prioritization of risks, followed by economical implementation of resources in order to minimize, monitor and control the probability or impact or unfortunate events or maximizing the opportunities is what we call risk management. Through different methods, definitions and aims are trying to settle the nature of the risk: financial, security, industrial, economic, safety, project management, etc. The strategies adopted to manage risks are applied with the purpose of transferring the risk, avoiding it, reducing the negative effects, accepting the consequences of a certain risk. Its purpose is to generate ideas and promote good practice for those involved in the business of managing risk.

Key words: risk management, economic environment, monitoring, market factors, analysis.

J.E.L. classification: D81, G32

1. Introduction

Economic risk can be defined through the action method in a business environment where less controlled or uncontrolled factors may occur at random and negatively influence the activity results an economic agent. The risk must be evaluated and accepted only within certain limits. Business risk should be considered as a ubiquitous

factor in the market economy conditions, as a natural selection factor which requires it increasingly obvious as a function of managerial competence.

2. Risk evolution

The risk is in constant change, it evolves in complexity, in addition to traditional exposure to hazard, adding operational risk, financial, strategic, market, country, legal, human, fraud, risk and complex nature can be attributed to several factors in the specialty literature are grouped and internal and external factors.

External factors are:

- Economic: changes in interest rates, inflation, insurance, taxes, sudden economic changes.
- Policy: ambiguous and changing legislation, certain protectionist policies, regulations and compliance, sectoral policy priorities.
- Competitive: changes in the market pressures of large companies, types and services, fashion trends, use of media, applications and customer expectations, contractual claims.

Internal factors can be considered:

- Social: ethics and beliefs of employees, individual culture of the people involved concerning the risk, the pressure exerted by the employees through the remuneration or the service of improper activities, frequent changes of staff, relationships between employees.

- Economic: changes in computer processing, material substitution, better security of new products and technologies, better operating system in terms of operating procedures and operating methods, the need to reduce losses, the expectations of investors and shareholders, the strategy adopted.

- Physical: the destruction of buildings, fraud made by the acts or intentions of employees or customers.

Sources of business risk carried out in Romania would be located, in the opinion of experts consulted, mainly in the strategic risks, keeping the world economy characteristic profile, even if the ratio is in some way different (49% risk of a strategic nature in the Romanian economy compared to 58% risk of a strategic nature for the considered European large companies).

Regarding the impact of an operational risk, Romanian companies are exposed to these risks in a proportion estimated at approx. 29%, comparable to that estimated for large European companies (31%) the significant difference was registered by the estimations of financial risk, in relation to which Romanian companies are exposed at an estimated rate of 19%, compared to only 6% estimated exposure for the large European companies. If the large European companies appear not to be significantly affected by hazard, for Romanian companies, it represents a real threat even if is not estimated a dramatic impact of hazard (estimate 3.2%).

In this context, more and more companies use risk management. Risk management is a concern not only of the modern world. He emerged from the establishment of human communities, manifested in various forms of conservation or confrontation, and developed gradually to risk deliberate action treatment, to prevent attacks or amendment of vulnerabilities.

While the concept of acceptance (tolerance) of risk belongs to Greek and Arabic civilizations, risk monitoring concept is relatively new, being outlined only between 50's to '60s.

Risk management has become an intense research topic the, based on three major conclusions since 1994:

- similar to chance, an unknown activity involves a risk;

- the association between risk and hazard is not always particularly accurate;
- the interest, collusion or emergency can not be dissociated from risk, even if the action initiated by them was a success.

Business risk management is to confer, first of all, protection of your employees, customers, your investment, as well as adapting to environment where you perform by assimilating the information that can help your business plan.

In business, standard risk management is a policy or program that is administered to prevent all kinds of problems caused by natural degree of vulnerability to risk, which may occur even due to uncertainty of the entrepreneurs.

The purpose of risk management in an organization is to help understand the risks to which is exposed an organization so that it can be managed. The main advantage of a risk management program is economic efficiency, because managers are aware of the risks affecting the organization and manage them properly, so they do not occur.

Risk management is a process of identification, analysis and response to potential risks of an organization, an information system or project. For example, when the focus is on information security, security risk management occurs.

3. Risk management principles

International Organization for Standardization has identified the following principles of "risk management" (ISO / DIS 31000):

- Risk management can be value measured;
- Risk management is an integral part of organizational process;
- Risk management is an integral part of decision-making process;
- Risk management explains Uncertainty;
- Risk management should be systematic and well structured;
- Risk management must be based on the highest quality information;
- Risk management must be properly represented;
- Risk management must take into account the influence of human factor;

- Risk management must be transparent and comprehensive;
- Risk management must be dynamic, iterative and responsible to change;
- Risk management must be able to allow the continue development of the organization.

4. Methods of risk reduction

„Risk Reduction” can be achieved, since the beginning of activity through organizational function of management, adopting measures to:

- Programming activities (with network graphs that allow limiting the risk since the planning phase of work organization);
- Continuous training of staff (this positively influences the productivity and quality of work, helps to reduce the probability of incidents and therefore reduce operational risks);
- Redesigning the control system periodically (depending on the outcomes of periodic evaluations of the organization's activity, the risks can be diminished through a judicious redesign of the control system).

“Risk-sharing” is an important decision in an efficient risk management, based on the axiom as the risk allocation must be performed by organizational segment which may best manage it.

To implement appropriate risk management should be considered:

- Monitoring the ways optimal to control all aspects of risk situations, especially in commercial transactions.
- Management strategies to minimize the intensity and frequency of risks.
- Hazard identification and vulnerability to risks that may interfere with activities and taking measures to reduce the intensity of their business.

Risk management is an element of internal control system by which the significant risks are discovered, the ultimate goal being to maintain these risks at an acceptable level.

The main objectives of risk management are:

- to maintain the threats of acceptable limits;
- to take appropriate decisions to exploit opportunities;

- contribute to improving overall performance.

Risk management is an on-going process and cyclical based on continuous monitoring and control activities, which includes:

- setting appropriate objectives hierarchical levels;
- identify risks that may affect achievement of the objectives, respect for rules and regulations, confidence in financial information, protect property, prevent and detect fraud (for this can be done “list of possible risks”, internal and external, set in the session devoted to analysis risk based on information already known and presumed the possible risks).

During these sessions is very useful the experience of the employees, that may identify risks that managers have not noticed. External risks may originate in various legislative modifications at the macroeconomic level or may occur as a result of promotion of new technologies.

5. Risk management solutions

To identify potential risk is very useful, and even practiced by the companies through participation of firms’ representatives to scientific communications and conferences or a series of thematic or professional meetings;

- defining risk categories (external, operational, concerning change), and the inherent risk, residual risk, appetite for risk.

Exhaustive analysis of the risk, which involves identifying economic, social and political effects that they might have on the organization and establish weaknesses and strengths of the company in the new context, as well as opportunities and threats that will affect the activity of the organization . This analysis is based on the use of econometric methods known, adapted to organisation's own data, such as “Monte Carlo method”, “decision tree method” or “method of determining the expected value”.

- Defining "the frame (field) of action of risk" and identify "risk agenda";
- Choosing the "risk response" (embodied in scenarios and concrete measures to "reduce", "eliminate" or "distribution" of risk.

An organization that turns out to be a great adversity towards risk analysis or a superficial and formal treatment of the theme will have few chances to resist on the economic market).

- evaluating the probability that the risk to materialize and the size of its impact;
- monitoring and risk assessment and the adequacy of internal controls.

In other words generic stages of risk management are:

- Establish the context: determining strategic context, organizational and risk management and determine the structure analysis and the criteria upon which risks will be assessed, identifying the affected parties/ interested in and defining policies of communication and consultation;
- Risk identification: identify, as a basis for further analysis of what might happen, why and how, including the dangers and consequences associated;
- risk analysis in terms of probability and severity, the possibilities and effect of control measures to the severity of consequences, probability of occurrence and severity can be combined to estimate the level of risk;
- assessing and ranking risks: comparing the estimated risk levels with predetermined criteria, the risks can be ranked to identify priorities;
- risks identified as having low priority can be accepted without being treated, being only subject to monitoring and review;
- Risk treatment: development and implementation of a management plan, which should include considerations on the allocation of financial and other resources, such as deadlines for action;
- Communication and consultation: consultation and communication with affected parties / interested in, internal and external, in each stage of risk management;
- monitoring and reviewing risks and performance evaluation of risk management system and changes that might affect it.

6. Conclusions

Lack of a risk management can lead to financial wastage, such as loss of profit or generating other nonsense issues, situations that may arise as a result of implementation of safety and protection inadequate measures. For example, implementation of an inadequate risk management reduces chances concerning access to contract a bank loan in the future, thereby reducing the institution's trust towards capital management skills, and thus of your business.

Although the current risk management procedures may vary from a small company to a large one, problems that arise because of an inefficient management could be the same.

The Role of the Conditional Structures in Business Negotiations

Stan Silvia

“Ovidius” University of Constanta

sylvys2010@yahoo.com

Abstract

The present paper attempts to demonstrate that negotiation skills represent key elements for the economic domain, nowadays, when the global recession has affected most of the countries around the world. Negotiation dialogues are very important as the two parties try to obtain the best results out of their own resources, with the minimum costs. Conditional structures are necessary for the negotiation replies, which refer to the quantity of goods, to the prices, to the discounts, to the delivery of the merchandise or to the means of payment. If-statements embrace various forms and their position in the context, the order in which the condition and the concession are placed or the addition of other supplementary words/sentences to the conditional structures convey different meanings.

Key words:business, negotiation, condition, concession, structure;

J.E.L. classification:F00

1. Introduction

The actual situation of the global economy and, in particular, the crisis the world has passed through, has led to many changes among the business people and even among the business strategies they use. These days, negotiations are necessary as they usually precede oral or written business agreements, which may be important for a company to survive in the market. Such dialogues stimulate the bargainers place demands in order to obtain mutually beneficial results and simultaneously preserve a long-term cooperation between them.

2. Tailoring the If-Clause to the Business Discussion

The competitors try to be formal, polite and direct, but at the same time creative so as to be as convincing as possible. This is why, the linguistic structures play a significant role as they contribute to the production of a message in which various elements may be accentuated or attenuated, deleted or added and the attitude to be different. Therefore, asking questions, stating clearly the position, using exclamatory clauses, making the structure persuasive or putting conditions are constant preoccupations of the message issuers and the linguistic resources are continuously adapted to the new negotiation circumstances.

Conditional structures represent linguistic resources in a business negotiation as they convey the condition which must be fulfilled versus the acknowledgement of the opponent's viewpoint. They are employed in various stages of the conversation such as the exploration of the opening positions, the exchange of offers and concessions, the verification of the understanding or the closure of the deal. The purchasing/selling negotiations, which are the commonest in the economic realm, make use of such clauses, while they debate around the quantity, the price, the discount, the delivery terms or the means of payment.

There are numerous ways of expressing the significances that get expressed in English conditional sentences. Various factors such as the conditional semantics, the way in which the *if*-statement and the main clause are placed, the insertion of the consequent in an interrogative structure or the insertion of the conditional sentence in the whole dialogue, the type of the conditional sentence, the temporal settings including tense and aspect and the

hypothetical adjuncts may change the meaning of the discussion session.

Eve Sweetser, in “From Etymology to Pragmatics” (1) has classified conditional meanings according to three criteria, the content, the nature of knowledge and its connection with the truth, justification or belief, and the type of speech act. Content-based conditionals are understood by relating the content of the two clauses to each other. A typical way in which content conditionals can be understood is for the *if*-clause to refer to a situation which causes or automatically results in the state of affairs signaled by the main clause as in the example:

“If you order 2240 cases, we’ll offer 20% discount.”

Epistemic conditionals are understood as expressions of the reasoning process. If the state of affairs represented by the *if*- clause turns out to be true, then the message receiver is licensed to believe what he/she is told in the *if*-clause as we can see in the sentence “If we order 2240 cases, this means you deliver before Christmas rush.”

Speech act conditionals are understood as pre-posing to a speech act or *if*-clauses that identify the situation which got the speaker to provide the speech act. Thus, we can exemplify by “To show our goodwill, if you like, you could pay by monthly installments.”

The position of various conditional sentences in a negotiation can indicate a specific semantic shade, as well. The condition usually follows the concession. By placing the concessive clause at the end of the sentence, the speaker is eager to state his/her proposal and he/she makes the hearer admit that particular argument easily as in

“If you want to make a counter-offer, it must be better than ours.”

If-clauses are used many times during the stages of the negotiation, with different significances. For instance, at the beginning of the negotiation, during the presentation of the proposals, the conditional structure is more the equivalent of an imperative clause and when the participants exchange concessions, the conditional structure fulfills its real role and reveals the subordinating nature of its clauses. In order to illustrate this viewpoint, let us consider the following examples:

“How would you feel if we set up a regular ordering policy – a fixed amount per month, for example?”(2)

“We could only accept this if you offer a 2% discount.”

The insertion of the concession into an interrogative structure not only increases the uncertainty of the speaker with reference to his/her opponent’s perspective, but also stimulates him/her. We can illustrate this through

“If we can help with careful planning, what’s your best offer for each delivery of 500 parts?”

An *if* clause usually speaks about more or less variable events. It often refers to a condition, namely something which must happen first, so that something else can occur. The verbs used in the conditional structure may influence the whole meaning of the negotiation dialogue as they can add supplementary meanings to the negotiation.

The open hypothetical conditional statement is the commonest in negotiations as it strictly refers to the object of that meeting. It indicates a possible situation, but which may become true and which is desired by the speaker, if a condition is fulfilled. Moreover, the request made through such a structure is polite and incentive enough to be accepted: “If we said we were prepared to deliver in March would you make a firm order?”(3)

Present-present conditional form means a situation which refers to a general rule, mutually accepted in the business world, when discussing the terms of an agreement. For instance: “If we pay at 30 days rather than 60, surely there must be room for maneuver there.”

The future tense in the concession indicates something the two parties already knew and agreed on in the past to happen in the future. The conditional structure is only used to officially accept the situation. Moreover, the request is direct and neutral: “We will reduce the price by 15% if you give us a firm order in advance.”

Present perfect, instead of simple present is particularly used in the *if*-clause in case of very polite requests. This is to put an extra focus on the completion of an action: “I’ll do that as soon as I have had time to talk to Production and Logistics.”

Several linguistic forms such as “a little” or “any” may add other auxiliary meanings to the conditional sentences. The adjectival form “a little” indicates a positive interest while “any,” in the relevant meaning, is generally welcome only in sentences expressing a negative interest. Let us examine the following examples:

“If we agree *a little* to create more jobs we might think about a productivity deal.”

“If you find *any* money, you'll be prepared to create a subsidiary in your country.”

The “will”-“will” form of a conditional sentence is frequently dedicated to carefully negotiated offers. The explanation of these forms is general and the negotiation aspect of the interpretation in case of these sentences is merely the sentences' ability to express both participants' interests, as in the following structure: “If we will give you 90 days' credit instead of 60 will you give us the interest you would have paid?”

The presence of another modal verb other than “will” in the conditional clause can bring extra meanings such as future possibilities, permission, advice or, as in the next example, the facility or potential for something: “If we *can* help from that point of view, what's your best offer for each delivery of 500 parts?”

The subordinating conjunction “if” is usually used in a conditional structure as it suggests the neutral nature of the relationship between the independent clause and the dependent *if* -statement and, consequently, the formal relationships between the negotiation partners. But, sometimes, other words are employed in order to highlight various meanings. Therefore “suppose” or “supposing” are used in place of “if” to emphasize the logical thinking, “unless” indicates that the accent falls more on an order than on a restriction, “on condition that” can be used instead of “if” to say that a particular condition, mentioned at the moment of that discussion, must be met in order for something to happen, “provided that” can be used instead of “if” to say that a particular condition, which is already known, must be fulfilled so as something to occur, “as long as” and “as far as” can be used instead of “if” to say that a particular condition is already met in order for

something to happen in the future. Let us consider the following examples:

“*Suppose* that we were to order in large quantities, would you give us a quantity discount?”

“*Unless* you can improve your packing, we won't be able to avoid returning goods regularly, which is waste of time and money.”

“*On condition that* we receive a firm order by fax or e-mail we could certainly deliver within two weeks.”

“There is no problem *as far as* delivery is concerned – we are 100% within our delivery forecast.”

There are situations when no conjunction is used, but the conditional meaning is preserved: “I can cut prices slightly *but* do you think you can beat our rival's deadlines?”

Sometimes, other words such as “well,” “now” or “then” may be introduced into a conditional structure. For example, the result clause might be preceded by “then” only when the *if*-clause comes first, followed by the continuous aspect. Thus, an example like “If you accepted our order, *then* we'd be willing to cover insurance as well” indicates a correlative phrasing.

3. Conclusion

To sum up the whole, we should say that each *if*-clause and each component of a conditional structure could have its grammatical independency, but their truth simultaneously is subordinated to the surrounding context. Therefore, the whole meaning of a conditional sentence depends upon the truth values of its elements and the significance of a negotiation dialogue represents the sum of meanings created by the individual structures and, in particular, by the conditional sentences.

The Commercial Influence of Quality

Stanciu Anca

Abstract

Quality, long time considered like a mean, especially an industrial one, changed nowadays its size and become a larger concept, named “the total quality”. Answering to the customer requirements it involve now relevant factors linked to human resources, organization, marketing etc.

The total quality must be incorporated into a strategic context. More and more researchers and praticiens give the quality a special place in the strategically decisions of a firm, and must be taken into account two levels: one objective, intrinsic and another, perceived by the client. In practice, paradoxically, the objective quality is often the most difficult to be appreciated by the customer and we can see that an industrial qualitative service could not be appreciated in the absence of a global quality of the performance. Marketing offer many examples to confirm that point of vue.

It is obviously that the quality of a product influences the demand. A disappointed customer doesn’t make a good publicity and that means a diminution of sales.

Key words: quality, commercial influence, competition, marketing.

J.E.L. classification: M19, M21, M31

1. Introduction

During a long time, quality was considered “functional”, this idea is no more present and it becomes very important to

underline the key points were quality could be sources of profit.

It is obviously that the quality of a product influences the demand. A disappointed customer doesn’t make a good publicity and that means a diminution of sales. In the meantime is very difficult to appreciate that influence, otherwise, very important to know.

It is also necessary to underline that the quality has a great influence on the demand. A good level of quality will increase the orders and the reverse.

A high level price will reduce orders and if a product registers a diminution of sales due to a poor quality, in order to restore the sales volume we must reduce the price.

2. Content

The role of marketing is primary in the field of quality.

First, because in “upstream” it means the customer needs research and second because it define the tasks (handbook).

A badly defined tasks handbook will generate important costs (customer insatisfaction, errors etc.).

And the most important is that the role of marketing is to present the quality to the different customers on the market.

The level of satisfaction of the customer could be revealed by questionnaires that give information’s about the brand of the firm, the level of the maintenance costs to the customer fiability, performance etc.

The relationship between quality / price / demand (request) could be illustrated by a series of curves:

Source: Lyonnet, P., *Les outils de la Qualité Totale*, 1995

These trends allow appreciating the quality of a certain product. We have to note that for certain products the price is imperative and for others the quality. Thus, we are discussing about demands:

- Inelastic related to price;
- Inelastic related to quality.

Quality index

Due to the after-sale studies or to the customer investigation, we can note certain parameters considered very important for the product and using a scale, conventional agreed:

Like global quality index we will tend to be much dosed to 1. It is more interesting to note different parameters (like maintainability, aesthetics etc.) and to appreciate a global index in order to reveal the weaknesses.

With the purpose to obtain this index, P: Lyonnet proposed a grid, exemplified below:

Parameters	Estimated index	Weighting (%)	Global index
Fiability	1.1	100	1.08
Maintainability	0.8	80	
Performance	1.2	100	
Maintenance cost	0.9	90	
Aesthetics	1.5	60	

The benefits of Total quality for the customer

Total Quality is measured by the satisfaction of the needs or services appreciated by the client or user.

Behind this concept we can find an assembly of key points to be managed, like:

- The product or service fiability;
- Characteristics and performances;
- Durability;
- Maintainability;
- Security;
- Environment protection ability;
- The cost of possession, price;
- Just in time intervention.

But if we want to enlarge the concept of Total Quality we have to add the ability to satisfy also auctioneers and employees.

Better satisfy the client, at the minimum price

This philosophy is recommended to be adopted both by consumers, and firm and its environment, and it must concern:

- All functions of the firm;
- All activities;
- All contributors;
- All interval relationship of the firm;
- All the relationship with other firms;
- All the product life cycle.

As the commercial changes have nowadays a global size, the users are mostly thinking about quality in quantitative terms.

Everyone, inside the firm is both customer or provider and engage right and duties. This relationship customer/provider is part of the total quality. The present trends met the individuals face to face with their professional activities and issue certain characteristics like the research of satisfaction, as shown by face a revelation

inside the firm activity, leading to the mentality transformation.

The ideas of the Total Quality

Having in view the quality is not supported, is not an observation but a construction all over the life cycle of the product. This idea could be resumed as follows:

Controlled Quality	Total Quality
Preoccupation just for products	Area of action enlarged to all production activities
Control a posteriori	Control a priori
Focus on effects	Identification and focus on causes
Deficiency became "normally"	Non quality is ejected
- habits	- excellence
- tolerance	- ambition
- norms	- voluntarism
Control assigned to an individual or a service	Control is the job of everybody at its ova level
Customer is a buyer	Customer is an user
The price of over costs is covered in order to obtain Quality	Costs are managed and evaluation is very important
Distrust	Trust
Internal	External
Quality is expensive	Responsibility Fame
Quality is supported	Quality pay
	Quality is involved

The main idea is to make "good" for the first time that means "good thinking to better action".

More time is given to study, well defining the needs (functional review) for better building, better understanding. It means the minimize of risks starting with studies (preliminary review of risks, fault tree) for better managing the risks.

We have to learn from worse experiences (deficiencies, breakdowns), in order to better fiability, maintenance, creation of database. A breakdown, a deficiency must be used. And that is the quality marketing.

We have to learn from deficiencies, as in the following image:

It must be identified the sources of non quality and to hierarchize them. Starting from this study we could act to prevent.

From the marketing point of view a quality diagnosis must be done, in order to establish an appreciation of the quality key points, as:

- costs of bad working: to locate quality costs in the different departments of the firm;
- internal deficiencies: rejects, retouches etc.;
- rejects detection: control costs a posteriori, trials;
- external rejects : warranty costs, after sale service, penalties for delays;
- global cost of non quality;
- delay technique – the measure of non evaluation linked to the new technology which could cause looses of potential;
- the degree of customer satisfaction: due to questionnaires it is possible to gain an idea of the firm brand image, to understand the exploitation costs appreciation, fiability, maintenance, performance.

The objectives of the strategic quality

The concept of quality must be enlarged than usually. It is striking to see the very little space given to that issue in the marketing studies while purchase and mainly the customer fidelity depend essentially on this factor. It is totally un useful to defect the customer requirements if we don't answer from the qualitative point of view better than competitors. That's why four objectives could be assigned to the strategic quality:

✚ The product quality

This stance of quality should be extended at two levels: one of the intrinsic or objective qualities and another of the quality perceived by the client.

From that point of view quality became very popular by the quest of “zero deficiency”. This quality has a price but could also generate measurable savings and positioning (more difficult to be measured). Inside a very competitive environment, the relative cost of quality tends to diminish and it expresses the report between the quality improvement price and the savings obtained.

That’s why the quality research should base on a very precise system that is the Total Quality Control System because this approaches very systematic guarantees the conformity and homogeneity of the whole process.

And finally, quality must be designed like a whole all over the product circuit. That means it constitute an action where are associated providers, distributors and customers, a weakness of any of them causing the cancelation of the other partners.

In practice, paradoxically, the objective quality is very often the most difficult to be appreciated by the customer point of view. This observation bring the marketing specialists to study the relation quality/price and to note that often, in the absence of precise means, the buyer identify the quality scale trough the price quality. Consequently, an increasement of quality is not perceived by the customer and could not generate a better cost.

✚ The quality of “total product”

The concept of “total product” was developed by T. Levitt and conduct to distinguish four dimensions in the product definition:

- The generic product: the materiel product and its commercial environment;
- The expected product: that involve the commercial services (for example, after sale service, an adapted horraire etc.);
- The enlarged product – that involve material components or new services like an extension of the warrantee;
- The potential product – that translate the existence of something “added” and unexpected.

These four dimensions are not stable during the time. A factor related to the potential product could become a simple element of the expected product when is generalized to the competition and that means the necessity of a constant attention payed to this parameter of quality.

The value of the Levitt analysis consists in the observation of the fact that the customers develop their opinion concerning the global quality of the product starting from the enlarged and potential stage. And this reaction is quite logical thinking that the basics qualitative factors (generic and expected products) are identically for all competitors.

✚ The firm’s quality

From this point of view we pass from the place of product to the place of firm in the perception of the customer. This firm’s quality doesn’t address to single customers but to the whole firm’s public.

Low prices could constitute criteria in the case of firms having a decisive cost advantage. High prices could often induce a quality image imposed in the lack of best criteria of selection.

The big majority of firms have to answer at a very mislead question: “in what consist the specificity of our firm?”

This specificity could be relived by an internal diagnosis to show a competitive advantage, perceived strong and objective by the customer.

And that could be achieved by developing investigation of customers in order to establish the real specificity perceived and develop consequently the firm’s quality.

✚ The branch quality

Every firm depends on an assembly of upstream providers and downstream clients.

That’s why the branch quality will depend on reports more or less strong between different partners. They will base both on classical quality procedures (like the audit of providers, for example) and on more advanced cooperation forms, like consulting formula in order to help the partner to progress in quality.

3. Conclusions

The role of marketing is very important in the field of quality. From one side because of the customer needs research and from the other side because it is useful to define the tasks handbook.

A bad made handbook could generate big costs of non quality (customer dissatisfaction, errors repetition).

And the most important role is to know and to recognize the customer perception of the quality.

Estimating Potential Output in Romania using a Structural VAR

Stoica Tiberiu

The Bucharest Academy of Economic Studies

tiberiusstoica@yahoo.com

Abstract

This paper estimates the potential output in Romania using seven structural VAR models. During the period of economic boom the potential GDP growth in Romania was around 6.5 %. The severe economic crisis that started in the last quarter of 2008 generated a significant reduction of the potential output. The potential economic growth dropped at around -2.8 % during the steep contraction of the economy in 2009 and at 1 % in 2010, according to the model estimates. The economic crisis changed significantly the potential growth in Romania due to the structural changes that affected the country. Labor input as well as capital accumulation negatively affected the potential output during the crisis. As regarding the crisis effects on total factor productivity (TFP) in Romania, the connection is uncertain.

Key words: potential output, Structural VAR, crisis, structural break.

J.E.L classification: C32, E01, E29, E39, E66.

1. Introduction

Potential output is defined as the maximum level of durably sustainable production, without tensions in the economy, and more precisely without acceleration of inflation. The difference between the actual output and the potential output, called the output gap, provides information whether the economy is operating above or below a sustainable level. Using this information, policymakers are able to do fine-tuning operations in order to bring the actual economic growth as close as possible to its potential. Although the potential output is a supply-side indicator, the output gap indicates the inflationary pressures in the

economy, being a key indicator for monetary policy analysis. The potential output is a theoretical concept and therefore can not be observed directly. Measuring the potential output is not an easy task, as economists have tried different statistical and mathematical methods in order to obtain reliable results. The calculation of the output gap depends on the model specification, the method of estimation and the time horizon. There are two basic approaches for estimating the potential output: 1) univariate methods 2) multivariate methods. The univariate methods for estimating potential output are the deterministic trend, Hodrick-Prescott (HP) filter, Baxter-King (BK) band pass filter and Christiano-Fitzgerald (CF) band pass filter. The multivariate methods for estimating potential output are Structural VAR (SVAR) with long-run restrictions, Production function (growth-accounting approach) and Dynamic Stochastic General Equilibrium (DSGE). In this paper I calculate the potential output in Romania using Structural vector autoregressions (SVARs) and I try to explain how the crisis that started in the second part of 2008 affected the potential GDP.

2. SVAR with long-run restrictions

HP and band pass filters are statistical methods that do not incorporate economic theory. The use of a multivariate structural model could offer an improved image of the real economy and could provide better estimates of the potential output and the output gap. SVAR identified using the Blanchard-Quah (BQ) Decomposition is a widely-used structural method for the calculation of the potential output. De Serres, Guay and St-Amant (1995) use a SVAR with long-run restrictions in order to estimate the potential output in Mexico. As in the Mexican economy the oil sector is very important, they introduce the oil price in their

model in order to capture the world shocks on the raw materials market. They find that world oil shocks have an important contribution in influencing the potential output in Mexico. Claus (1999) implements the same multivariate method in order to calculate the potential output in New Zealand. Benk, Jakab and Vadas (2005) present different methods for revealing the potential growth in Hungary, including a Structural VAR approach. Magud and Medina (2011) estimate the potential output for the natural resource and the non-natural resource sectors in Chile using a SVAR with long-run restrictions. They find a structural break in 1998 due to the Asian crisis, which diminished the potential output in Chile to 3-4 % from 7 % in the previous period. SVAR identified using BQ Decomposition is used to obtain an estimate of the transitory and permanent components of GDP. This methodology has important advantages. The method incorporates economic theory, as it assumes that potential output is influenced by different structural shocks that could have transitory or permanent effects on output. Baxter and King (1995) consider HP and multivariate filters inaccurate at the beginning and at the end of the samples. Structural VAR models overcome the “end point problem”, as they use a higher number of macroeconomic variables (Klaus, 1999). SVAR does not rely on statistical assumptions that are not clearly indicated by the economic theory (Mishkin, 2007). SVAR with long-run restrictions has several disadvantages. A limitation of this technique is that the number of distinct shocks is equal to the number of variables introduced (Blanchard and Quah, 1989; Enders, 2004). The correlation between the shocks and the macroeconomic variables must be explicitly indicated by the economic theory. The method also requires a larger database as compared to other methods. The potential output estimated using SVAR could be very close to the actual output if there is a weak correlation between the variables used and output (Gălăţescu, Rădulescu and Copaciu, 2007).

3. Data

SVAR literature indicates many macroeconomic variables that could be used in order to estimate the potential output and the output gap. The first indicator that should always be used is a variable for quantifying output evolution. This type of indicator could be real GDP growth or real GDP level. Other variables indicated by SVAR literature are CPI inflation, core inflation, unit labor cost, average real earnings, employment, unemployment, real exchange rate, capacity utilization, industrial production, oil price and monetary aggregates. BQ technique requires that at least one of the variables must be nonstationary, as stationary variables do not have a permanent component (Blanchard and Quah, 1989; Enders, 2004). The variables should be introduced in a stationary form in the model. The models implemented in this paper use quarterly data from 2001 Q1 to 2011 Q1 taken from Eurostat. The macroeconomic indicators are:

- gdp – real GDP percentage change as compared to the same period last year.
- ulc – unit labor cost percentage change.
- u – unemployment rate according to International Labor Bureau methodology.
- hipc – harmonized consumer price index
- core – harmonized consumer price, all items excluding energy and seasonal food.
- rer - Real Effective Exchange Rate (deflator: consumer price indices - 16 trading partners - Euro Area, 1999=100).

The variables gdp, ulc and u are seasonally adjusted. I used the Augmented Dickey-Fuller Test (ADF) in order to verify if there are unit roots. gdp and hipc are I(0) while the rest of the variables are I(1).

4. Structural breaks

“A structural break (change) is a sudden event that changes the structure of the econometric model” (Kapetanios and Tzavalis, 2004). The structural breaks could be determined by changes of monetary policy strategy, fiscal policy as well as the evolution of the international context. In 2005, the National Bank of Romania (NBR) adopted a new monetary policy strategy, inflation targeting, while the government introduced the unitary tax rate in the same year. In

September 2008, the collapse of the investment bank Lehman Brothers generated a global liquidity crisis that hit the emerging markets in Europe. Romania faced a severe recession, as the real GDP slumped by 7.1 % in 2009 and by 1.3 % in 2010. The global crisis as well as the macroeconomic imbalances accumulated in the pre-crisis period generated a severe adjustment of the Romanian economy. The domestic demand slumped due to the liquidity problems faced by households and companies, while the real estate market collapsed. The government adopted austerity measures in order to reduce the public deficit, which was well above the 3 % level established in the Maastricht Treaty. As for 2011, there are signs indicating a slight revival of the economy as the real GDP went up by 1.7 % year/year in the first quarter of the year mainly driven by the positive evolution of the export-oriented industry and the increase of net taxes. Therefore I consider that the economic crisis reduced the potential output in Romania due to the structural changes that affected the country. Gălăţescu, Rădulescu and Copaciu (2007) calculate the potential economic growth in Romania during 2000-2006. They find that the average potential economic growth was 3-4 % between 2000-2002 and around 6 % between 2002-2006, which indicates that the actual growth was above its potential during the economic boom. According to NBR Inflation Reports, the output gap was negative during the crisis, denoting that actual output was far below its potential during the period of turmoil. In the paper I consider only one structural break that occurred in the last quarter of 2008 due to the global liquidity crisis, although there could be more during 2001 Q1 – 2011 Q1. Chow test also indicates a structural break in Q4 2008 due to the global liquidity crisis that resulted in output losses and the hike of the unemployment rate. SVAR provides unreliable results of the potential output during the crisis period when the structural break is ignored. Therefore, I transform the time series as indicated by Fuentes, Gredig and Larraín (2007) and Magud and Medina (2011) to account for the structural break in the late of 2008. I divide the period in two separate sub-periods: 2001 Q1 – 2008 Q3 (pre-crisis period) and 2008 Q4 – 2011 Q1 (crisis period). I calculate the average

economic growths for the two periods. The average annualized growth is 6.3 % during the pre-crisis period and -2.9 % during the crisis. Then the variables are de-meanned in order to account for the structural break in the last quarter of 2008.

5. The model

SVAR with long-run restrictions can be written in a moving-average form as following:

$$\Delta x_t = A_0 \varepsilon_t + A_1 \varepsilon_{t-1} + \dots = \sum_{i=0}^{\infty} A_i \varepsilon_{t-i} = A(L) \varepsilon_t$$

$$x_t = [x \ y \ z]' \quad \text{and} \quad \varepsilon_t = [\varepsilon_1 \ \varepsilon_2 \ \varepsilon_3]'$$

x_t represents the vector of macroeconomic variables introduced, while ε_t is the vector of structural shocks. In the equations above I assume that there are three macroeconomic variables, although there could be situations where there could be only two. In order to determine the evolution of the potential GDP in Romania, I use seven SVARs with the following variables: [gdp ulc], [gdp u hipc], [gdp u ulc], [gdp core], [gdp hipc], [gdp rer hipc] and [gdp rer core]. The order of the variables introduced is very important, as in each equation there will be specific restrictions regarding the permanent and temporary effects of structural shocks.

6. Results

The average potential growth in each of the three periods is the average of the results provided by the seven different SVAR models. The results are provided in the table below.

Table no.1. Potential GDP evolutions
 (average percentage growth)

2004 Q1 – 2008 Q3	6.57
2008 Q4 – 2009 Q4	-2.83
2010 Q1 – 2011 Q1	1.06

Source: E-views calculations

According to the results provided by the models, the registered economic growth was above its potential during the period of economic boom in Romania. Therefore, the

output gap was positive, the National Bank of Romania (NBR) adopting a prudent monetary policy in order to temperate the inflationary pressures. The results are similar to the ones obtained by Gălăţescu, Rădulescu and Copaciu (2007). The economic crisis that started in the last quarter of 2008, generated a slump of the potential GDP, according to the SVAR estimates. The immediate impact of the crisis on the potential growth was severe, as the potential growth was around -3 % during the period of deep recession. In 2010 although real GDP continued to drop, the rate of decrease diminished considerably, due to the better than forecasted evolution of the export-oriented industry. In conclusion the economic crisis changed significantly the potential growth in Romania due to the structural changes that affected the country. The reduction of the potential output could be the result of the changes in labor input, capital accumulation as well as the total factor productivity (TFP) according to the economic theory. The recession generated a hike of the unemployment rate. During the crisis, a great concern for policymakers is the high unemployment rate at young persons. This could have a negative impact on the future potential growth, as the persons that are not employed for a longer period lose their skills. A long and deep recession could discourage labor force participation (Estevão and Tsounta, 2010). In Romania the registered unemployment rate posted a downward trend after March 2010, reaching 4.8 % at end-June 2011, as many persons retired, emigrated, died or started agricultural activities, and therefore ceased to search for a job. Labor force participation is low as compared to the European Union average. Demographic changes can influence significantly the potential output (Estevão and Tsounta, 2010). The reduction of the total population as well as the migration of a part of the skilled labor force could affect potential output in the future. In conclusion, there is very difficult to determine the impact of the labor input on potential growth during the crisis as there are many factors that can be very difficult to evaluate. However, the changes of the labor market indicate that those had a significant impact in reducing the potential growth during the crisis and could have long-run effects on the output trend. In Romania, the tightened lending standards as

well as the increased risk aversion determined a reduction of investments. During the period of economic boom, many investments were directed towards the real estate market due to the high yields. The collapse of the real estate market in the second semester of 2008 nearly froze this sector, as households and companies faced liquidity constraints. According to recent research, a crisis that is generated by the collapse of the real estate market could generate significant output losses and could have long-lasting effects on the economy (IMF, 2011). The capacity utilization in the manufacturing industry dropped at 69.9 % in the second quarter of 2009 from 82.2 % in 2008 Q3 due to the contraction of the demand in foreign countries. In conclusion, the impact of the crisis on the capital accumulation was significant. As regarding the crisis effects on TFP in Romania, the connection is uncertain. Estevão and Tsounta (2010) consider in their model that TFP is the difference between output and capital stock, capital utilization and total labor hours adjusted by certain coefficients. Therefore, TFP is the part that explains output evolution that is not quantified by labor and capital. However, this assumption could be slack and can not explain in detail this phenomenon. A detailed survey regarding companies' investments in research and companies' innovations could have provided better results.

7. Conclusions

This paper estimates the potential output in Romania using seven structural VAR models. The use of multivariate structural models, like SVARs with long-run restrictions can provide better estimates of the potential output as compared to univariate filters. During the period of economic boom the potential GDP growth in Romania was around 6.5 %. The severe economic crisis that started in the last quarter of 2008, generate a significant reduction of the potential output. The potential economic growth dropped at around -2.8 % during the steep contraction of the economy in 2009 and at 1 % in 2010, according to the model estimates. The economic crisis changed significantly the potential growth in Romania due to the structural changes that affected the

country. Labor input as well as capital accumulation negatively affected the potential output during the crisis. As regarding the crisis effects on total factor productivity (TFP) in Romania, the connection is uncertain.

Improving Human Resources Recruitment in Maritime Domain

Surugiu Felicia
Dragomir Cristina
Maritime University of Constanta
economie.umc@gmail.com

Abstract

In order to improve maritime human resources recruitment, most crewing and shipping companies implement an internal procedure of recruitment and management of ship's crew. Based on observations at several crewing companies, this paper presents an example of such procedure meant to ensure that qualified and competent personnel is recruited and all ships in the fleet have crew members understanding their roles, duties and responsibilities and capable of working effectively in teams.

Key words: recruitment, maritime transport, shipping, crewing, seafarer

J.E.L. classification: J21, J29, M54

1. Introduction

In the context of the complexity of the global labor market, recruitment of the best needed seafarers and cadets represent one of the most essential strategies for a maritime company to acquire and develop competitiveness.[1]

The traditional methods of recruitment and selection for the Merchant Navy are well known. A very common method was for an applicant to write to a shipping company and, if he had the right academic qualification, he was summoned to an interview at the company's office. The choice of whether the applicant should go into the deck, engine-room or catering department was usually left entirely to the applicant with absolutely no measurements of his aptitudes being taken.[2]

2. The process of recruitment in maritime transport

Today, many maritime companies perceive the recruitment process as one of the most important activities related to human resources management and devote a great deal of effort to improve the recruitment process. For example, one particular company, Irish Shipping Limited, uses a panel of sea staff and a full battery of properly designed test to select the right recruits. Selection may be done by a company's own staff or by an independent firm of psychological consultants. [2]

The process of recruitment and selection involves several steps to establish the need of recruitment, the analysis of the recruitment demand, defining the characteristics of the available position, intern recruitment, selection of the candidates, developing questionnaires, interviews, tests and taking the final decision. [3]

In present times, a shipowner has several means to recruit suitable seafarers for its vessels crews. The seafarers can be recruited directly by the company, or through a national organization, by a syndicate or by a crewing agency. The recruitment process is not similar worldwide. In some flag countries there are specific regulations for recruitment. In some countries the unions highly influences the recruitment process, while in others the union has only a formal signification. The shipping company and the human resources department of a shipping company are more influenced by these issues above than of the company's organizational structure. There are times when a decentralized system of management on board influences crew recruitment or the number of crew members needed on board, but all formalities are to be met by shore staff. The flag state has a regulatory role with economic implications.

The shipping companies are free to recruit internationally, but often they are subject to flag state regulations concerning the selection of crew, their terms of employment and working conditions. In some cases, some flag states insist on the employment of nationals. [4]

In the context of the complexity of the global labor market, recruitment of the best needed seafarers and cadets represent one of the most essential strategies for a maritime company to acquire and develop competitiveness. The recruitment process in maritime transport is the main process to bring new seafarers to the company. In today context, when a large number of sea accidents happen due to human error, a highly importance must be paid to recruitment in order to maintain quality and safety of maritime operations.

Apparently, the process of recruitment and seafarers' selection seem easy, but in reality there are no easy recipes for the success of this process, as it depends on the knowledge and skills of the ones involved [5].

Recruitment of seafarers can be made from an existing pool of internationally trained seafarers due to expansion of the company, promotions, study leave, retirement or sickness. Historically, international shipping companies with tradition have their own „cadet” programmers to ensure a progression through ranks of seafarers who had grown up with the company's culture. This method of replacement has diminished over the last decades and nowadays companies use to outsource and collaborate with crewing companies. The benefit to the owner is a reduction in office overhead but the negative affect might be the lack of loyalty from the trainee.[6]

If the shipping company directly recruits their crews it is necessary to have a human resources department or crewing department to carry out all activities related to seafarers on board, beside the activities related to shore staff. Such departments meet several problems like recruitment of the best crewing personnel, the quality issue, maintaining the pool size as electricians and engineers onboard can be easily drawn out by other industries etc.

Some basic steps must be made in order to recruit seafarers. Firstly, it is necessary to identify any legal requirements concerning seafarers, including flag requirements. Secondly, it is necessary to identify the minimum requirements of shipowners that need to hire seafarers. Both general requirements and special seafarers' skills related to the type of vessel and voyage should be also known. [7]

3. Improving human resources recruitment by implementing a recruitment and labour management internal procedure

Most crewing and shipping companies implement an internal procedure for the seafarers' recruitment and labor management aiming to ensure that all ships in the fleet have qualified and competent personnel. Following is presented a Recruitment and Management of Ship's Personnel Internal Procedure implemented at several crewing companies.

The recruitment and labor management internal procedure enlist the activities to be made and the records that should be kept in order to recruit, hire and manage the work of with a very good knowledge on relevant international and national maritime legislation and adequate working skills.

According to such a procedure, the Fleet Manager ensures – through the Manning Office that appointed Masters are qualified for command according to the shipping company's qualification and experience requirements.

The Manning Office has several responsibilities. Firstly, it ensures that qualified, medically fit and competent personnel are employed. Another responsibility is to manage the directly or indirectly recruitment of all seafarers, including selection, qualification and verification of records as well as certification details. The records and certification details of all seafarers including performance, appraisals and family contacts should be maintained properly. The Manning Office ensures that the verification assessments are carried out on a sampling basis with regards to seafarers' certificates validity and authenticity in line with the issuing authority.

Additionally, it ensures that data (dates) related to certificates and/or endorsements do correlate to previous experience and vessel type.

The procedure points out the responsibility for the vessel’s Master who ensures that his vessel is always manned in accordance with international, national and flag state regulations, as well as company’s requirements.

Also, according to the procedure, all staff should have adequate background in order to understand and actively participate in the Safety Management System, to strive continuously to improve operations and where possible, to contribute towards new methods and ideas designed to enhance safe and efficient ship operations. Records are retained in the electronic database, and retention rates for differing ranks and nationalities are monitored.

3.1. Applications

Seafarers’ applications are accepted even if there is not an immediate vacancy (for future offer of employment). Every first time a candidate will complete the “Seaman’s Application” form and provide evidence of education, medical background, training & certification, previous employment history and other information that is necessary to evaluate the applicant’s qualifications.

3.2. Interviews and nominations

All first-time candidates are interviewed, regardless of their rank at Ship Personnel Manning Office. The Ship Personnel Manning Office carries out the initial interview and a “*Candidate for Employment Interview Check List*” – rank specific - is completed by the interviewer. For senior officers a subsequent interview, is carried out by the Ship Personnel Manning Office and/or Fleet Manager at Manning Office premises, to assess as to whether, candidates meet the requirements for the intended position. The hiring company conducts pre-employment assessment for job competence for officers and ratings through Ship Personnel Manning Office. Most of the recruiting companies use “*Seagull Competency Evaluation Scheme (CES)*” computer-based software to confirm job competence before confirmation of

employment. CES is a large knowledge database with over 5,000 multiple choice questions specific to seafarer knowledge as defined by STCW. CES is structured to use pre-defined test types with a built in question randomization feature to maintain its secure integrity. This software is also used as part of the refresher training process for existing shipboard personnel.

Nominations will be carried out upon the receipt of a request for replacement from a vessel’s Master. A search for acceptable candidates in the crew availability database will be carried out and the potential candidates shall be contacted and informed. The validity of their certificates of competence, as well as their travel documents is checked or assessed in order to ensure they remain valid throughout the period of their contracts. In case there is no suitable or available candidate in the crewing company’s pool, recruitment and nomination may be extended with the new applicants done by the Manning Office.

The Manning Office is also responsible to arrange all necessary formalities in order seafarer nominated to be ready before their embarkation as per hiring company’s and STCW’95 requirements. In addition to the above, an extended interview process for Masters and Chief Engineers is conducted either by the Manning Office senior crewing operator or Fleet Manager, which includes an introduction to company structure and an outline of defined responsibilities. Records of this process are recorded for a period of several years. The Manning Office is responsible for all appointed seafarers recruited, to undergo prior to their embarkation, specific training seminars.

A briefing is held at the Manning Office for Senior Officers familiarization purposes concerning the conditions and operational status of the vessel to which they have been nominated, technical, operational and procedural standards to be maintained on board, the standards to be maintained onboard with regard to the hiring company’s policies, mission and vision.

Finally, prior to employment, seafarers sign applicable company’s policies ensuring understanding and acceptance.

4. Conclusion

Today there are several methods to recruit seafarers. Shipping companies striving for business excellence show a great interest in performing recruitment adequately in order to carefully hire the most suitable and competitive seafarers.

The recruitment and labor management internal procedure is presented by the maritime company's staff and acknowledged by all the responsible persons. All records referred in such a procedure are kept for two or three years at the company's headquarters.

A procedure like the above, aiming to improve the process of seafarers' recruitment and the activities involving human resources management, has become today a standard manning activity both in international and Romanian crewing and shipping companies.

Management of Quay Crane Exploitation in Constanta Harbour Area

Surugiu Gheorghe
Dragomir Cristina
Maritime University of Constanta
economie.umc@gmail.com

Abstract

Most of the quay crane work activities can be reported to the following five functions of management: planning, organizing, staffing, directing and controlling. Taking into consideration the connection between management functions and management of quay crane exploitation, the work of the cranes can be improved. This paper presents the functions of management applied to quay crane exploitation.

Key words: quay crane, management, exploitation, harbour.

J.E.L. classification: L16, L 62, L 91, L 95.

1. Introduction

Quay cranes are particular transportation devices used in Constanta harbour area. Quay cranes are one of the main port machineries useful for loading and unloading freight. In the harbour activity these cranes are seen as driving the whole work technological process.

In order to make loading and unloading of ships, quay cranes must perform a series of actions (maneuvers), for cargo to be introduced or removed from any area of the ship. Quay cranes are large-sized heavy machinery equipped with complex systems, capable to execute all maneuvers, while ensuring appropriate operational productivity. Achieving high productivity by a quay crane is required to ensure fast loading and unloading ships. Worldwide, shore cranes building enterprises make permanent improvements and refinements in construction and operation in order to achieve equipment according to today's demands in the operating process.[1]

A large number of operating cranes in Constanta harbour area are old and need to adapt to new manufacturing conditions before their eventual replacement. An old technologically quay crane device produces high operating costs. Some exploitation costs can be maintained under control by establishing and improving exploitation management.

Operation's safety and parameters like cost, reliability, availability, maintainability, and productivity should be fulfilled [2] and carefully taken into consideration while exploiting quay cranes. Quay crane productivity has always been one of the critical components of terminal productivity and implementing or improving the management of exploitation can increase productivity and all the above parameters [3].

2. Management of cranes and quay crane exploitation

Implementing a management system is suitable for the technical characteristics of the quay crane. A crane management system can supervise and collect crane status data continually. It helps to report and analyze the cause of a fault or alarm, it helps to recover from crane failure early, and increases crane productivity.[4] But also it is essential to implement a work management with a focus on improving the crane activities.

The position that managers provide in planning, organizing, leading and controlling is an essential responsibility in any business. A manager must organize these functions in order to reach company goals and maintain a competitive advantage [5]. Similarly, the crane has to know and to apply the following management functions in his daily work in order to reach the planned objectives.

In this paper the work management consisting in planning, organizing, staffing, directing and controlling, is related to the

craner work duties and responsibilities. In the planning function of management, cranes work duties are established before starting the quay crane's exploitation. It follows organizing the work activities. The coordination function involves both craner coordination and the coordination of the specialized technical personnel responsible for supervising the work. Both the craner and the technical personnel will also develop the function of controlling.

3. The function of planning

Planning is the basic function of management. This function consists of all work processes through which we can determine the main objectives of the organization and its components, as well as resources and necessary means to achieve them. Planning answers to the following questions: “What should we do and what can be done within the organization? [6]. It deals with chalking out a future course of action and deciding in advance the most appropriate course of actions for achievement of pre-determined goals. Planning is determination of quay crane courses of action to achieve desired goals. While planning, the craner thinks systematically about ways and means for accomplishment of pre-determined goals. Planning is necessary to ensure proper utilization of crane and human resources and to reduce risks and wastages. The results of planning are divided in forecasts, plans and programs. The horizon of forecasts cover a minimum 10 years period, have a character of approximation and are not obligatory. Plans refer to the period between 5 years and one month. Current plans are detailed, while the company's plan for 5 years includes only the main fundamental objectives of the company and related resources. The programs have a short horizon, often a decade, a week, one day, a shift, an hour. They are very detailed, with a high degree of certainty and the listed items are required.

If we take into consideration a cranes program for one working day, before starting the work, the craner can plan the following:

- how to ensure the operation of the crane according to manufacturer's instructions;
- how to use the signal code;

- how to act the mechanism in cases of repairs, maintenance and overhaul, maneuvers are to be executed under the direct supervision of the specialized technical personnel responsible for supervising the work;
- to take into custody and to deliver the crane by making records in the register of crane monitoring;
- how to light the station lights (in the case the cranes are equipped with such machines) when is poor visibility and at night
- how to participate in repairs, maintenance and overhaul etc.[7]

The planning function is also exemplified in the case of planning quay cranes' revisions, repairs and maintenance activities, investments in buying new equipments or in building facilities etc. In Constanta harbour area the supervisors overseeing technical facilities prepare the annual plan of regular technical checks and submit it to ISCIR territorial unit to which it belongs within the deadline.

4. The function of organizing

The organizing function means the whole organizing through which management processes are established and delimited into physical and intellectual work processes and their components (movements, times, surgery, works, tasks, etc.) and are grouped into positions, work teams, departments and assigned to personnel, according to certain managerial, economic, technical and social criteria, to achieve in the best possible conditions the predicted targets. Organizational function answer to the questions: who and how contributes to the objectives of the organization?

Organizing the crane exploitation involves how to classify and group the working activities, how to assign cranes' work duties and how to create responsibility and coordinate authority.

For example, before starting the work, the craner has to organize the following activities, in a logical order: to check the power line, to check the tread rigidity, to check the lubricating grease, to check the wear and operation of the hook, to check the signaling installations, to check lighting,

ventilation and air conditioning, to verify the existence and integrity of parts of the crane etc.

A proper organizing will aim safety. For example, activities like lubrication, cleaning, maintenance or repairs will not be organized during the crane operation.

Another example of organizing work refers to organizing work preparation steps and organizing steps of actual work. The craner is organizing the following main stages of quay crane preparation before starting the actual work:

- Coupling the main switch of the crane for placing the supply current in the operating port facility;
- Probing of all the running without load while checking the limiters and acoustic signaling system;
- Stopping the operation of the crane;
- Fix the crane’s lock pliers on rail, if the storm is announced;
- Decoupling the crane’s main switch to stop the input power.

Organizing the deployment of work phases consist in the following (it is considered the case of working with the hook for unloading the ship):

- Swinging the arm system in order for the hook to be brought vertically at the location of operating cargo;
- Lowering the hook at the place of taking the goods;
- Lashing cargo and binding the connecting ropes to the crane hook;
- Lifting the load;
- Swinging arm system so that the load is brought vertically to the place where it must be placed;
- Lowering the load;
- Untying the cargo ties from the hook;
- Lifting hook;
- Swinging arm system to bring the hook vertically in order to takeover the cargo.[1]

5. The function of staffing

In management, the function of staffing is the function of manning the organization structure and keeping it manned. The main purpose of staffing is to put the right craner in the right crane to make the necessary working activities. The analyzed crane

operating companies from Constanta harbour applies the function of staffing to specialized units like: quay cranes exploitation unit, specialized unit for mounting cranes, repairs unit etc.

6. The function of directing

The function of directing actuates the organizational methods to work efficiently for achievement of organizational purposes. Direction deals directly with influencing, guiding, supervising, motivating subordinates for the achievement of organizational goals. Direction has following elements: supervision, motivation, leadership and communication. Supervision- implies watching and directing the cranes.

Supervisors overseeing technical facilities authorized by ISCIR must have theoretical and practical knowledge in the field of quay cranes. They have the following main tasks: keep records of installations and follow-term performance of official technical verification, monitor the training facilities and test-tasks necessary for official technical checks and participate in their performance, watch quay cranes to be used in accordance with the technical requirements, operating instructions and rules of work protection etc. They carry out professional instruction and quay crane safety training once a semester and organize regular review and participate in the review commission. For each crane, the unit holder shall prepare a register of supervision. The cranes, the service staff and team leader for maintenance and inspection are required to record in this register, under signature, all observations taken on the crane and brief description of the deficiencies, failure, maintenance activities and repairs. Registers will be kept in good condition at the crane, and responsible for overseeing facilities will check this register periodically, at least once a semester.

7. The function of controlling

Controlling function can be defined as all the processes by which performance of the organization, its subsystems and components are measured and compared with the objectives and standards set initially, to eliminate shortcomings and integrate positive

deviations. It answers to the question “with what results has completed the work done?”[6]. Controlling implies measurement of accomplishment against the standards and correction of deviation to ensure achievement of organizational goals. An efficient system of control helps to predict deviations before they actually occur. Controlling has the following steps: establishment of cranes and quay crane standard performance, measurement of actual performance, comparison of actual performance with the standards and finding out deviation if any and making a corrective action, if necessary [8].

For example, after work a crane should check whether load and unload latch to lift the load is in the top position, the crane is moved to the place fixed for the rest, the crane is secured to the mounting clamp or anchor devices or on horseback, to avoid movement due to wind or to vibrations and all control devices are shut off. After completion or termination of work load will not remain suspended. In exceptional cases, when the crane can not down load, it will take measures to ensure the load restriction site and the provision of appropriate safety signs.

8. Conclusions

In this paper we applied the management theory and in particular the theory of management functions to the quay cranes work activity as observed at some operators in Port of Constanta. Most of the quay crane work activities can be reported to the following five functions of management: planning, organizing, staffing, directing and controlling. Taking into consideration the

connection between management functions and quay crane exploitation, the work of the crane can be improved. Further study will be needed in quay crane management in order to analyze the influence of the above management functions to losses reduction and productivity raise.

Forecasts and Guidelines in Hospitality Business

Sztruten (Lefter) Gina Gilet
Romanian American University of Bucharest
lefter_gina@yahoo.com

Abstract

Tourism is a vast field of activity with deep implications both in its diversity and in the collateral economic side of its work. Forecasts for international tourism market as a reference term for development prospects of the hotel industry, under the current crisis and global recession manifested quite profoundly, can influence the decision-making of tourist activities as a whole.

Hospitality industry development guidelines that concern the implementation of clean technologies, diversification of services and customer loyalty are influenced by the same global economic condition. Therefore, development and expansion plans of large global hotel groups are taken, mostly on short and medium time horizon.

Key words: tourism, hotel industry, tourism market forecasts, guidelines.

J.E.L. classification: L83

1. International tourist market forecast - a reference point for the hotel industry perspectives

A phenomenon that registers an important dynamics in terms of specific indices, international tourism manages with its content to footprint the specific market with new permanent change and novelty.

Being under the influence of many factors, international tourism market is especially characterized by dynamism, concentration, diversity, as it generates for all its major components important specific features.

Hospitality industry, major component of the tourism industry and international tourism market shows the same features as the belonging industry, influenced by all these changes manifested globally in the

economic, political, social, technological, ecological areas.

All these factors, with the direct impact on tourism and hotel can be sized through specific indicators, which are themselves reference elements for all actions to be undertaken for the industry. The quantification of factors, particularly economic, is the development strategies pillar for medium and long term programs.

There for, the analysis of achievements and trends in the international tourism market is an important milestone that management of tourism and hospitality industry must go through in order to define specific areas of business strategies.

Reference elements in the practice of management of the tourism industry are presented by the statistics and forecasts developed by the World Tourism Organization, World Tourism Travel Council and the European Commission Eurobarometer.

According to estimate projections of the international tourism market and its impact on the world economy, hotel market will follow and for the next time horizon 2011-2021 the dynamics of the including industry.

In the WTTC estimates, important are the issues relevant to the development of tourism and travel industry, which for the next ten years is predicted positive, upward total contribution to GDP from its 5991.9 billion USD (9.1% of GDP) in 2011, to 9226,9 billion USD (9.6% of GDP) in 2021 .

In terms of total number of employees for the year 2021, there is an estimate of an increase of the number to 323.8 million (9.7% of total employment) from 258.6 million (8.8% of total employment) in 2011.

Although travel and tourism industry exports will record an increase, from 1162.7billion in 2011 to 1789.2 billion USD, with a rate of 6.6% per year, its total contribution in exports will be reduced from 5.8% in 2011 to 4.7% in 2021.

Investment in travel and tourism industry in 2011 will record a value of 652.4 billion USD (4.5% of total investments) and for the year 2021 there are projected increases to 1487.9 billion USD.

Romania is in the global trend of growth within the main indicators of tourism and travel industry. This is confirmed by the WTTC estimates that in terms of contribution to GDP there will be a growth for 2021 that is forecasted at 15.219 billion USD from 6.417 billion USD in 2011 approximated. In terms of exports growth there is estimated growth at 5.742 billion USD in 2021 from 1.995 billion USD in 2011. Investments also recorded an increase to 1.210 billion USD in 2021 from 974 billion in 2011. Consequently, our country has an important tourism market potential in Europe, as shown in all international studies as part of the bloc of countries whose natural potential is modestly exploited, but with positive perspectives in developing the tourism industry on all segments, including travelling, from the hotel market point of view, in full growth phase.

Compared with other regions and countries, Romania is not of particular interest to investors on the international tourist market, the region of East Asia and Pacific still represents a major point of attraction for the investment flow, China being the best example in this case.

According to studies and estimates of the World Tourism Organization at international scale, tourism trends on the year 2021, indicates some changes in purchasing behavior and consumption of tourist services (mainly caused by the economic crisis).

The trend with perhaps the greatest impact is diminishing vacations budgets, tourists travel packages choosing preferences is heading towards a better value for money, rather than on a low price or "lowest price".

The main motivational factors in purchasing travel packages covers: local attractiveness, cultural heritage and entertainment possibilities. Other important elements in choosing a destination remain safety, services quality and the environment.

It is therefore noted that, the tourism market trends indicate not only change in travel motivation, depending on budget, but also in terms of opportunities for leisure, nature or environment is representing an

important milestone in decision to purchase tourist packages.

The strong link between the development of tourism industry, hospitality industry and hotel industry, link that is directly influenced by all that is now global change, regardless of their nature (political, economic, environmental, social, cultural and environmental). The investment-profit-impact equation on the natural environment becomes the priority of all the strategies defined in the local and multinational corporations. Therefore, the hotel industry is obliged to take all those elements that will assure a permanent economic development reported to sustainability.

2. Orientation in hotel industry evolution

It is understandable that the international development of the hotel industry is given by the growth of tourism, trade and international commerce. It is expected that tourism in countries from the Asia-Pacific region to continue to have the same growth rates as in previous years. Some resorts are planned to be developed in Indonesia, Malaysia, Thailand and Vietnam. Moreover, there are important opportunities for hotel industry development in Eastern Europe, Russia and other countries of the former Soviet Union, where major hotel groups want to shift the growth strategy with new hotel construction and the acquisition of existing properties. In Asia, Hong Kong's growth has been encouraged by the economic boom that has swept South East Asia and also by the tax system. Major hotel corporations have headquarters in Hong Kong due to their low tax system; among them there are the hotel groups Mandarin Oriental, Peninsula, Shangri-La etc. In developing countries, the hotel industry has significant growth perspectives, based on sustained political stability, as part of social and economic progress, such an example was Romania, along with other former communist countries, which provides expanding opportunities for hotel corporations.

The tourism industry is a perspective field, where it is necessary and compulsory to be attracted significant investment for the development of its infrastructure, in particular, but also to generate new

perspectives for the development of the hotel industry. In other words, by joint efforts, tourism can become one of the main branches of national economies, and at the same time, the most powerful action point of all its components.

Orientation in the development of the tourism industry, and further, in the hospitality industry has to start from the premises of development of these industries. Hospitality problems, of great diversity - from design and location of units to their management – lay a heavy burden on the quality of accommodation services, hospitality and operations efficiency and, indirectly, on the dynamics of tourism and its influential factors acts as the guiding elements in its evolution. In this context it is expected a radical change on the approach of the hospitality industry's from top management that is directly concerned to use successful ecological methods and models internationally identified on various tourist regions, which can be adapted and implemented among hoteliers, depending on the specific local environment.

In this new orientation of socio-economic development, hospitality industry must adapt and solidify quickly to all changes required by local and international environmental action, so the correlation between profit-increasing needs of tourists, to be an optimum.

Existing permanent mutations in the global economic market have favored the expansion and diversification of the hotel business, the objectives of sustainable concerns overlapping economic objectives. Adapting the general requirements of contemporary society based on advanced knowledge and developing rational use of economic resources in a responsible manner in relation to the environment, led to a series of new guidelines on how to manage and organize a hotel unit.

A new focus on the implementation of clean technologies and make changes in the operationalization of modern technologies simplified by reservations systems and high speed internet access.

Continuous search for innovative approaches due to permanent increased competitive pressure causes shifts to diversify services in order to attract new segments and customer loyalty.

Adapting the hotel offers to the new structures of customers on one hand providing facilities for people with disabilities, and on the other hand increases the segment of female clients has resulted in oriented strategies to ensure comfort with specific equipment.

Encouraging customers to use web sites reservations for direct booking by reducing fees allocated to operators of sites for each booking, which will lead to optimization on pricing policy.

3. Conclusions

Hospitality industry is currently working under the tutelage of influences of cultural, social, ecological, political and economic nature, which, in different contexts generates a series of mutations in the working mode of operation and functioning, but also in terms of hotel management; adapting to changes imposed by external factors, require speed and flexibility in carrying out specific actions, so that changes in the active market are valued positively.

Environment and environmental factors, are a raw material for tourism and hospitality industry and it represents the starting point in determining management strategies, for which grant them a paramount requirement is urgent operationalization of how the hotel premises.

Financial Innovations and Their Implications for Monetary Policy

Șargu Alina Camelia

Faculty of Economics and Business Administration

s_alina_camelia@yahoo.com

aboariu@uaic.ro

Abstract

Over the past few decades, many financial innovations have ensured a more efficient allocation of resources, being thus considered an engine of economic growth, but at the same time, their rapid development complicated the environment in which central bank implements its policies. In this context, the aim of our research is to analyse the impact of financial innovation on the monetary transmission mechanism, highlighting how financial innovation affects these mechanisms both by altering the channels through which monetary policy operates and by changing the overall impact of monetary policy decisions. The results of our paper underline the fact that an appropriate knowledge of the mechanisms through which monetary policy affects the economy, especially in times of stress, is of crucial importance in order for the central bank to stabilise the economy and promote long-term economic growth.

Key words: financial innovation, monetary policy, central-bank policies, financial markets

J.E.L. classification: E51, E52, E58.

1. Introduction

It has become evident the fact that a developed financial system helps and promotes a long term sustainable economic growth rate. Such a financial system allows the economic agents to diversify their portfolios and meet the required liquidity levels of their specific field of operations. The financial resources are allocated more efficiently and enhanced risk management techniques are becoming available on a larger

scale. The existence of such financial elements can facilitate the development of the production capabilities of an economy and provide the incentives for a long term economic growth. Using the same rational argument we can state that financial innovation which enhances the operational capabilities of the financial system can have a comparable effect also on the long term growth rate of an economy.

The global financial systems and markets have registered a tremendous expansion in the last decades especially starting with the 1980 and 1990. The changes have lead at the same time to the development of the business practices from the financial sector. On a broad scale, the financial sector has developed a large number of new financial instruments and techniques which allow it to better adapt to an ever changing global environment. Depending on the given abilities of the national financial systems to promote and foster financial innovations, these have determined more or less a strong development of these specific economies. At the same time, the raise of the importance that the financial sectors has in a modern economy and the rapid innovation rate that exists in this sector have lead to the development and extension of the researches focused on the financial innovation process.

The researches undertaken by Miller (1986) and Merton (1992) represent some of the earliest attempts to analyse the importance that the new financial services and products are having for the financial sector [3]. Financial innovations tend to appear under a variety of forms and in heterogeneous institution, expending in different sectors of the economy. We must underline the fact that many new financial assets and liabilities have been developed lately. Many of these new innovations have

appeared in what is generally called banking, since commercial banks are the main suppliers of financial services and products in many economies. In section 2 we will underline the factors that are behind the development and adoption of these new products and services in the banking sector.

Still, financial innovation determines also at the same time the development of certain worries regarding its possible negative that such new services and products can have. One of the greatest concerns is related to the way in which financial innovation affects the monetary policy of the central banks. Financial innovation influences the structure of the financial markets, the behaviour of the economic agents and the type of financial products which are traded. This is the reason why financial innovation influences the whole monetary policy transmission mechanism and enhances the uncertainties in the environment in which central banks implement their monetary policies. In order to meet these challenges, the monetary authorities usually react through an enhancement of the pragmatism with which they implement their monetary policies and by tightening the prudential supervision rules.

In order to underline these evolutions our research is organised as follows: *the first part* is dedicated to the introduction remarks, *the second part* highlights the driving forces behind financial innovation, *the third part* focuses on the relationship between financial innovation and monetary policy, emphasizing at the same time the challenges related to this relationship, while *the fourth part* contains the concluding remarks.

2. Determinant factors for financial innovation

Financial innovation, like most of the economic activities is determined by the achievement of further benefits, this fact being underlined by a cost-benefits analysis. In this context, a financial innovation either determines for its developers a diminishing of the cost, an enhancement of the revenues or in some cases both outcomes can be achieved. In regard to the diminishing of costs, the endogenous *technological changes* have determined the development of a series of financial innovations which have led to a

diminishing of the trading costs. For example the progresses made in the field of informational technologies have determined a significant diminishing of the operating costs of certain financial institutions like mutual funds which rely heavily on the accuracy of the economic provisions in order to enhance their revenues. Other financial innovations which rely on an enhancement of the computation capabilities and speed of action are represented by the portfolio insurance products and index arbitrage transactions, these products benefiting greatly by the upgrade of the computer speed. ATMs, which have in a predictable way diminished the operating costs of banks through the automation of most of the retail transactions carried out by a bank teller represent one of the most conclusive examples of financial innovation which have benefited from the technological progresses made in the last decades.

In a broad sense, *financial innovation* can be defined as representing the process of development of new financial products and services, of new ways of organisation in more sophisticated and complete financial markets [12], which improve resource allocation, diminish costs and risks and provide services that better satisfy the particular needs of the participants to the financial system. The central point is that a financial system has in a modern economy and the importance of achieving a long term sustainable economic growth determines new requirements regarding financial innovations. Since financial fluxes represent inputs in all production sectors and most of the consumer sectors, any changes in the financial sector will have positive effects and direct ramifications in the whole economy.

In general, all profit based organisations, including banks, are trying constantly to find ways to improve their products, processes and organizational structures which can determine a diminishing of the operating costs can better satisfy their customers' needs and lead to an enhancement of the profit margins which can be obtained. Banking customers demand a certain variety and novelty from the products and services which are offered and also easiness in usage. They want products which can satisfy their particular needs. The technological boom which took place in the last decades has helped the banks to

successfully meet these challenges.

Among all the technological innovations which have been adopted in the banking sector the internet banking (or on-line banking) represents the one innovative service which registers the highest degree of popularity among costumers. This service has facilitated the replacement in time of the old agencies networks with a new architecture based on integrated branches, ATMs, call centres and nevertheless systems which are using the Internet. As a result of these evolutions the changes which have took place in the payment systems for goods and services and have started with the popularisation of the plastic cards have had a tremendous impact on the demand for cash and the role of these in the economy.

Another factor which influences the development and adaptation of financial innovations is represented by *the legislative and taxation systems* used by a given country. Although a great series of researchers have presented the connection between financial innovation and fiscal regime used, we consider the vision of Tufano (2003) the most comprehensive one on the subject, underling the fact that “the main impulse which has been behind the development and implementation of viable financial innovations in the last twenty years has been provided by the fiscal regimes used by the governmental authorities”. The list of financial products that have been developed as a direct effect of the fiscal regimes used is long and varied, some of the most notable cases being represented by the: zero coupon bonds, euro-bonds, the different types of financial investments used in order to cash in on the owning of financial instruments but which are not subject to the fiscal regulations, and also the different institutions for the management of portfolios. These types of financial innovation separate the owning rights of a financial instrument from its benefits which can be obtained from holding it, thus avoiding the taxes and fees needed to be paid for the owing rights (see the researches of Santangelo et Tufano, 1997 or Tufano, 1997, 2003).

At the same time *the competition* between commercial banks and other types of financial institutions has become more intense. The development and globalisation of the financial markets has underlined the need for the change of the structure and conditions of the

financial system. The financial regulations have been changed, usually in favour of the diminishing of removal of existing restrictions regarding the activities which could be undertaken by financial institutions, a good example in this case being represented by the liberalisation of the interest rates. This type of *deregulation* has determined the creation of incentives for the adoption and implementation of innovative ideas on the financial markets, since banks didn't represented anymore the only institutions which could offer high interest rates. Because of these the availability of funds which could be used for traditional banking lending activities has been diminished accordingly.

3. The impact of financial innovation on monetary transmission mechanism and the reactions of central banks

The monetary policy decisions are transmitted to the real economy through the financial system, which represents the interface between the monetary policy and the real economy. Because of this, any financial innovation which affects the conditions and the structure of the financial market has the potential to affect directly the monetary transmission mechanism [6]. On the other hand, through the impact which it exercises through the monetary policy transmission mechanism, financial innovation also represents a challenge for the conduct of the monetary policy by the central banks.

In the academic literature there is an ample discussion regarding the transmission mechanism of the monetary policy. In general, the transmission mechanism of the monetary policy is composed by several different transmission channels which are interconnected. From the perspective of the impact that financial innovation has on the monetary transmission mechanism we can consider these channels: *the interest rate channel*, *the exchange rate channel* and *the credit channel*.

The interest rate channel reflects the impact that monetary policy has on the real economy through the variation of the short term interest rate, determined on the actions undertaken by the monetary authorities, which influences the consumption and investment decision of the non-financial agents (the substitution effect), determines a shift in the

value of assets, especially the ones held by these agents (the wealth effect) and has an impact on the consumption speeding and the investments of the non-financial agents, depending on their debtor or creditor stand (the income effect). Financial innovation has enhanced the role of the interest rate channel in the monetary transmission mechanism, through the contribution brought to the raise and diversification of the financial assets held, enhancing the wealth effect of this channel. On the other hand, financial innovations like future and option contracts enhance tremendously the ability of economic agents to protect against the interest rate risk, thus counteracting any possible oscillations of the financing cost. As a result of these, financial innovations can reduce the impact that monetary policy decisions could have on the real economy through the interest rate channel.

The exchange rate channel is based on the variation of the exchange rate, which determines a shift in the capital fluxes with a direct impact on the level of the foreign exchange course. This has a direct impact on the real economy through its influence on the prices and the competitiveness of the national enterprises. Through the impact that financial innovation has on the exchange rate channel it is worth mentioning that the development of the derivative market (like future, option and swap contracts) can reduce the impact of the monetary policy decisions on the real economy through this channel. The explanation is that derivatives financial instruments allow economic agents to gain protection against the exchange rate fluctuation risk, thus the efficiency of the monetary transmission mechanism through this channel is reduced. Still, the enhanced globalisation of the financial markets has underlined inevitably the importance of the exchange rate channel for the transmission of the monetary policy. To this we add the fact that the international interdependence of the monetary mechanism can determine central banks to develop monetary policies in accordance with the events that are taking place at the international level. A domestic monetary policy which is not in accordance with the economic fundamentals will determine a rapid exit of capitals; while on the contrary, a raise of the international interdependencies between economies can

determine that the monetary policies of foreign states can have a direct effect on the domestic economy.

In regard to *the credit channel*, we can approximate that financial innovation may weaken the monetary transmission mechanism through this, especially in regard to the bank lending channel [11]. Financial innovation offers the enterprises the possibility to finance themselves through the capital market, thus they are becoming less dependable on the bank's lending. From the banks perspective, financial innovation offers the possibility to issue debt securities which is making them less dependable on the funding through secured deposits. Also, the usage of credit market innovations by banks, such as loan sales and securitisation which allows them to diversify credit risk exposures and increase lending has reduced even more the efficiency of the monetary transmission mechanism through the credit channel. As a result of these, financial innovation represents a challenge for the conduct of the monetary policy.

Financial innovation represents also an ongoing phenomenon. Thus, in practice, most of the time is hard to underline the exact dimensions of this process and is difficult to assess the effects that it could generate, this being the reason why it adds a level of uncertainty to the financial system. The elements of financial innovation [3] which enhance the level of uncertainty are:

- *off balance-sheets items*: the raise of the transactions made with innovative financial instruments can lead to an enhancement of the financial statements opacity that hinders the coherent supervision of the changes that occur in the assets and liabilities of a financial institution;
- *the raise of the credit risk*: innovative financial products can expose financial institutions to new types of risks. As a consequence of this fact, the quality of the assets held by these institutions can become dubious which can lead to a higher degree to the manifestation of risks.
- *the raise of the number of riskier financial products*: financial products with high returns and even a higher associated risk, but with a very good rating can be introduced on the market,

posing a serious treat for the systemic stability of the financial system.

The development of the electronic means of payment and especially e-money represents a good example of financial innovation which has a direct impact on the transmission mechanism of the monetary policy. The expansion raise of the usage of this alternative for of money can lead in the future to a complete replacement of the cash. This could lead to the disappearance of demand deposits and other form of extremely liquid deposits, which will have a direct effect on the transmission mechanism of the monetary, weakening the link between the deposits held by financial institutions and the changes that occur in the sectors of the real economy. Moreover, the enhancement of the usage of e-money could lead to a diminishing of the reserves that banks must have at the central banks. The technological progresses made in regard to the payment systems allow for a much faster settlement of inter banks transactions, thus diminishing the need for excessive reserve at the central banks for these types of transactions. In this context these new available financial resources could be relocated toward other sectors of the economy.

Some financial innovations can determine a change of the way in which the economy reacts to the changes made in the monetary policy, while other innovation can lead to a shift in the structure of the indicator used for the development of the monetary policy. For example, the changes that have occurred in the financial structures as a result of the securitisation process can lead to an increase of the direct financing importance and implicitly diminish the wealth effect as mentioned earlier. Households and non-financial institutions would prefer to use direct financing sources when they consider their spending options, also holding a large amount of their wealth in financial instruments such as bonds and treasury certificates, which would lead to an extensive financial disintermediation process which would diminish the role of the bank lending as a mechanism of monetary policy transmission. To this we can add the fact that the easy access to information sources because of the technological progresses registered in the communication sector can lead to the erosion of the competitive

advantages that the banks have in an asymmetrical informational environment.

New financial instruments can be issued in some sectors of the economy which are not taken into account for the monetary and financial statistics, this fact having the potential to lead to abnormal behaviour of the monetary aggregates underlined in these statistics. In the process of implementing the monetary policy, central banks could find out that their available economic and financial indicators cannot accurately reflect the real situation in which the economy is. As a result of these evolutions it becomes necessary the reconsideration of the monetary aggregates in order for these to be able to underline and include the new types of financial derivatives which are very liquid.

The development of a stable financial system is the main objective followed by most of the central banks. In the current phase of development, which is characterised by rapid development and changes of the financial markets, the activity undertaken by the banks and other financial institutions is subjected to ever greater risks and uncertainties which could lead to the compromising of the whole national and international financial system, a good example in this case being represented by the current financial and economic crisis. This means that the old regulations of the central banks regarding financial institutions must be revised and enhanced in order to better answer to the new existing market conditions. This is the only way in our opinion through which the benefits of the financial innovations can be harvester without the enhancement of the underling risks.

4. Concluding remarks

Financial innovations have an impact on the monetary transmission mechanism and influence the structure and conditions of the financial markets. From the perspective of the direct impact of the financial innovation on the monetary transmission mechanism, in our research we have focused on the interest rate channel, the exchange rate channel and the credit channel. Overall, in our research we have underlined the fact that financial innovation has a direct impact on the monetary transmission mechanism

strengthening the role of the interest rate channel and weakening the role of the bank lending channel, this being the reason why in our opinion financial innovation represents a challenge for the conduct of the monetary policy. In order to overcome this challenge, central banks must supervise the financial landscape, closely following the changes that innovative financial products and services are having in practice and being thus able to early identify the adverse effects that some of these could have on the stability of the financial system.

Some of the forms of financial innovations could lead to the change of the way in which the economy reacts to the impulses send through the monetary policy, while other innovations could distort the indicators that the central banks are using in order to fundament their policy decisions. Taking into account the fact that more and more data are becoming available we consider that through the extension and development of researches which analyse the way in which financial innovations are impacting the different monetary transmissions channels, the monetary authorities will be able to gather a significant and adequate volume of information which will allow them to know and even anticipate certain implications that financial innovation may have for the monetary policy.

Abstract

The model of economic growth that Romania adopted was not sustainable. The recent economic crisis proved that. With the continued growth in salaries and pensions without a complex analysis of the budget and its future projections, and without an increase in productivity, Romania was turned into the perfect victim in front of the disequilibrium of the foreign markets. The IMF and the European Union played a significant role in saving Romania from what might have seemed another Greece at the time. This paper will analyze the effects of the external loan in the long run and also the absolute necessity of the loan. Recent events like the crisis of the sovereign debts in EU just show that the loans have only postponed an even greater crisis. The deficit will not reach 3% without a real economic growth and the external debt is growing rapidly. So, the loan had its price, maybe by sacrificing the sustainable development.

Key words: deficit, external debt, external loan, sustainable development, economic growth.

J.E.L classification: H63, E62, E21.

1. Introduction

By analyzing the Romanian economy before the crisis started in 2007, one will find a picture of a poor country in which bureaucracy, lack of confidence in the government and corruption are only the tip of the iceberg. The authorities were confident that Romania will resist the international

crisis because the model of growth based on attracting foreign investments was still promising. However, the end of 2008 showed that Romania was not ready for the fall of exports, the drastic cuts of investments and the threat upon the sovereign risk. Real Gross Domestic product (GDP) dropped by 13% in the fourth trimester of 2008 from the growth of 9% before the crisis. The main reason was the drop in consumption and the depreciation of RON. For a country dependent on foreign direct investments (FDI) and exports towards major countries in the EU, the need for an external loan slowly became a need for survival.

The economists Stiglitz and Walsh [1] stated in 2005 that an external loan is justified only when it is used in areas that would further generate incomes such as infrastructure, financing some projects of development in the future, increasing the competitiveness of the products for export and “the profit must be at least equal with the total cost of the external debt” This paper will make an analysis regarding how effective were these money for Romania and how this loan will have an impact on the future durable development in Romania.

2. The “need” for external debt

Romania had a model of economic development that was based on the continued growth of the volume of FDIs. This model has proved completely ineffective when the crisis stroke. Once the crisis started credits froze thus limiting the access of the population to resources for consumption, and the access of banks to internal and external sources of capital was limited. The exports dropped due to the lower demand from the

richest countries. The investors' lack of confidence that Romania will survive this crisis along with the excruciating need for reforms in the public sector, especially the pension fund did not leave any room for an expansionary fiscal policy.

So the government had to cut and it made massive cuts in order to survive. But the problem was the monthly payments. With the economy in real impasse the incomes dropped but the payments were necessary. Financing from the capital markets was not an option due to the lack of confidence so the easiest solution as an external loan. Without an analysis and a long term plan regarding how the money would be returned, the government used 20 billion euro only for consumption so that the country would not reach default. Romania started to pay the mistakes made in the past when the wages in the public sector grew artificially without an increase in productivity. The need for reforms in the public and social sector became a subject of great importance and finally the rules of IMF took control of the economy.

With 12,9 billion euro IMF was the major lender through a stand-by agreement. Nevertheless, before the crisis Romania had an impressive growth (2006-2008) and the IMF warned the government that the increase in wages was not sustainable and that in case of troubled economic times the risk of default would be imminent. The stand-by agreement was not approved by the opposition and the general public. According to Jungman, the most important aspects of the agreement stated the following [2]:

- Introducing the law of the Fiscal Responsibility that limits the number of state employees in one year and new rules for reducing public expenses and a limit of the budget deficit agreed with IMF;
- New laws and internal regulations necessary for the implementation of the new reforms for tax administration;
- Unitary wages law in order to stop the increase in wages in the public sector;
- Cuts on expenditure by assuring a budget deficit of 6.8% of GDP;
- A plus in incomes by increasing the VAT from 19% to 24%;
- The fiscal strategy for 2011-2013 assures a budget deficit of 4,4% in 2011, the elimination of the 13th wage for the employees of the public sector and cuts in the number of state employees reaching 1.290.000 until the end of 2011;
- Adjustments in the laws of local budgets in order to reach a certain fiscal discipline;
- New powers granted to the fiscal administration in order to reduce corruption.

According to this agreement, Romania needs has a long road towards a fiscal consolidation and many social and fiscal reforms have to be implemented in order to create an environment for future economic development. In order to do this the population will feel a decrease in their life standard and the GDP per capita will be reduced considerably. In the short term the effects of the IMF loan will for sure be the image of a weak economy troubled by recession and a poor country in desperate need of liquidity and investments.

However, the need for convergence and stability could be fulfilled by restructuring the fiscal expenses towards productive investments and increasing the absorption of European funds. Productive investments should be those investments that would generate incomes in the future such as in infrastructure, Greenfield investments and others. These would create a favorable business environment for Romania, by bringing longtime economic development and establishing the background for durable development. In order for this to be done Romania needs to restore the confidence of potential investors in this country, mainly by relaxing the fiscal mechanism and incentives for new workplaces. Investors need a secure place in which they can conduct a business and a major role is played here by the government.

Sovereign rating, the budget deficit, the external debt, a secure and stable coin are crucially important. We may notice that, simultaneously with the external loan, Romania started a series of reforms that need to respect a certain budget deficit in order to be implemented. So, Romania kept its part of the deal and the budget deficit is inside the agreed variation. In 2012 it would be 3%, in

the limits of the Maastricht agreement in order to adopt the Euro currency. But the problems will appear when the loan along with its associated interest will have to be returned. The expenses will increase so extra measures will be needed in order to increase the incomes. Without a sustainable economic growth that can assure the reimbursement of the loan, the deficit will increase once again and probably an extra loan would be needed and the history would only repeat itself.

According to the IMF respecting the deficit is imperative in order to ensure Romania’s fiscal sustainability and also, by 2020, the budget deficit would barely reach 1% if the recently started reforms continued.

Figure 1: Budget deficit evolution for Romania 2000-2014

Source: Projections after Romanian National Institute of Statistics, IMF

If Romania manages to sustain the convention and reforms agreed upon with the IMF, then the budget deficit should reach the limit of 3% of GDP in 2012. However, these projections were made before the crisis of the sovereign debts in Europe from 2011. Also, USA’s credit rating dropped, Greece seems more likely doomed to default, and countries like Italy are more likely to step on the same path. The uncertain outlook for the nation’s future fiscal health is growing and this could negatively influence the future of the Euro zone, the supremacy of the USA, the rise in borrowing costs.

3. Sustainable development at risk

Without fiscal sustainability, there is absolutely no chance for Romania to develop a model of real economic development, and with all the resources addressed for sustaining consumption, the future does not look bright. The external debt has grown rapidly and it continues to grow after the 20 billion euro loan. We can see that the external debt of Romania grew constantly from 2003 and in August 2011 it reached almost 100 billion euro. There is still no motive to worry about the risk of default at the moment, but for the future, considering the risk of a second wave of crisis, it does not seem comfortable. Analyzing the real GDP growth of the economy during the exact same period we can see that when the economy reached the worst drop in GDP in 2009 of -7,2%, the external debt grew by almost 15 billion euro, the biggest difference in the last decade. With the risk of default being somehow counterbalanced by the external loan the problem that still remains is whether this loan jeopardizes the durable development of Romania or not. This depends on various issues: the ability to increase the absorption of European funds, the reforms of the public pension system, lower tax reforms regarding labor market to encourage lower unemployment rate. The reality is that a rapid growth in the external debt is a real motive to be worried, by simply looking at countries like Italy, Spain or Greece.

Figure 2: Comparison of external debt evolution/ real GDP growth, 2003-2011

Source: Projections after NIS, NBR,
<http://www.indexmundi.com>

There is no reason for a country to risk a continuous growth in its external debt except for the situation when the government can respect the rules of financing a budget when the debt needs to be paid. A lot of countries seemed to ignore this economic warning and now they are facing a tremendous debt that can no longer be paid and they still continue to borrow in order to pay off old debt [3].

The best example for this situation is Greece with an external debt of 130% of GDP. All the money that Greece is trying to get from the IMF and the European Union will be spent on consumption in order to fulfill the monthly expenses of its budget and maybe to repay some of the old debts. In 1993 Belgium had a public debt of 141% of GDP, but it managed to cut it by 50% during the 1993 – 2007 period. This was possible due to the economic boost in the most important commercial partners of Belgium. The same was the case with Italy that had a debt of 132% in 1998. The situation is very different today because all the countries had a lot to suffer from the crisis and maybe they still have. Even Germany and France, two of the most important economies in the EU, have problems and registered a quite weak economic growth. Moreover, USA’s rating downgraded and even China seems to experience some problems. Bearing this in mind it seems almost impossible for a country to be able to repay such debt. With even Germany opting for austerity the future does not look bright. With a very low savings rate it is very difficult to find the resources to repay the debt.

And this is also the problem of Romania. In 2010 the savings rate in Romania was 22%. Considering that in Greece it is lower than 10%, Romania still has a good situation and it is still far from default. But the problem of the deficit still remains. The main reason for the loan was the incapacity to finance the deficit. It appears that Romania managed to avoid the risk of default but with the price of jeopardizing its durable development. In 2003 the economists Grafe and Buiter [4] created a mathematical model that would establish the optimal level of a budget deficit so that the future development would not be affected. The rule proposed

was the following: the incomes from taxes are constant and permanent. In case of some unfortunate events, these incomes will assure the long time solvability of the budget. According to this economists, the deficit should respect the following formula [5]:

$$d \leq (n + \pi) \times b + g - g^P + k - k^P + [(r - r^P) - (n - n^P)] \times b$$

d = deficit;

b = public debt;

r = internal interest rate;

r^P = the long run interest rate;

n = economic growth;

n^P = the long run economic growth;

g = government expenses;

k = incomes (total incomes- taxes)

k^P= ratio of general government capital stock to GDP;

(n+π)*b= how much the debt drops due to the increase in nominal GDP;

k - k^P= incomes without permanent taxes/ incomes without current taxes (as a share of GDP);

(g-g^P) current governmental expenses/ permanent government expenses (share of GDP);

[(r-r^P)- (n-n^P)]*b = actual interest rate/ actual interest rate adjusted by inflation and rate of growth.

According to the statistical data available for Romania in 2010 and the forecasts for 2011 (from NSI, NBR, Fiscal Counsel 2010)

Table 1 : Data for estimating
Romania’s deficit

d	6,5%
n	-1,2%
n ^P	1,5%(estimation for 2011)
r	6,5%
r ^P	6,25%
b	34,9%
g	39,107%
g ^P	37,3%
k - k ^P	0

Source : NBR, Ministry of Finance, Fiscal Council annual report 2010

So, the formula shows that the deficit should have been :

$$d \leq (-1,2+8)*34,9+(39,107-37,3)+0+[(6,5-6,25)-(-1,2-1,5)]*34,9$$

$$d \leq 3,42\%$$

The budget deficit in Romania at the end of 2010 was 6,5% of GDP, almost the double of the estimated amount, according to this model. Still, we may notice that in 2010 Romania managed to keep the budget deficit in the limits approved by IMF (6,8%) with 6,5%. If we look at this model we may observe that Romania’s deficit should have been 3,42% in 2010 in order not to affect the future economic growth and Romania’s durable development on the long run. Through this loan and the austerity measures adopted Romania could keep the deficit in certain limits. But what’s the price of this? It is clear that by these drastic measures the consumption dropped so the quality of life dropped, as well as the per capita GDP. And following this model we may also add the jeopardizing of the country’s durable development. Furthermore, through this loan Romania reached a dangerous level of its public debt and it still continues to grow. For now, the level of 60% needed to enter the Euro zone is basically impossible to reach.

It’s time for Romania to figure out what is the “point of no return” in regards to the public debt? What level of the debt could not be returned? Would this be more than 60% of its GDP (Maastricht criteria), 100% the public debt of (USA), 120% (Italy) or 150% (Greece)? Starting from 1992 and 1993 when Romania had 0% external debt, but an amazing inflation rate, the future showed a dependence towards the “easy money” from the IMF and then from the EU. The 20 billion euro loan equates to about 1000 euro for each person in this country, for two years. It seems a lot considering that the consumption continues to drop, the saving rates are very low and the fiscal burden continues to grow. Then what can we expect from Greece, where the external debt equates to about 36000 euro per person? It looks like 2012 is the year that will decide how we will handle paying out this debt. This year we must repay 173 million euro to IMF and 148 million towards European Union. The tip of the iceberg would be reached in 2015, with a

need to return 1,8 billion euro, that represents about 1,5% of our current GDP. Knowing that for 2012 the forecasts regarding the economic growth for Romania dropped to roughly 1,1%(BERD) due to the dependence on Greece. In this case the public debt is more likely to grow even further.

Table 2: Evolution of public debt in Romania

Year	Public debt (%of GDP)	Change (%)
2005	20,4	
2006	18,4	-2
2007	19,8	+1,4
2008	21,3	+1,5
2009	29,6	+8,3
2010	37,9	+8,3
2011(31 AUG)	39,4	+1,5

Source: Ministry of Finance

The economic growth projections were also modified for the EU and the Euro zone, lower than during the crisis started in 2007, to 1,3% and 1,1% (according to IMF projections). Even Germany is expected to have a very weak economic growth in 2012(1,4%). The perspectives for Greece and Portugal are negative -2 %, and -1,8%. Romania’s economic growth is depending on the growth of exports for the EU countries, mainly Germany, Italy, Austria, France. With this negative perspective it is hard to believe that Romania will manage to keep its “plus” on GDP and avoid a second wave of crisis. And a second wave of crisis would further impact on consumption, drawing other austerity measures. The sustainability of the budget, fragile as it is now, would be attacked. So who is to say that we would not once again appeal to the IMF in order to calm the situation and let the problem of returning the money to another government? All of these show that Romania was not ready to deal with the crisis and its economy is still weak and unready to survive another recession.

4. Conclusions

The major problem of our country is that Romania did not make a proper analysis before taking the loan. There hasn't existed any strategy regarding the loan and the external debt. There should have been a strategy regarding the effects of the loan, the economic growth needed in the future years so that the loan could be returned and how exactly the money should be used. It is well known that the basic economic “rules” state that an external loan is justified when it is used in areas that could generate future incomes. Driven by the circumstances and without a proper analysis regarding a loan of such importance, the government used the money extensively on consumption. Monthly expenses of a government such as pensions and public wages should not be covered by a loan without jeopardizing future durable development.

The strategy that the government adopted is not effective in any form because this loan could affect the economic development on the long term and the decisions taken last year, this year and in 2012 will be crucial for the future. It seems that the strategy adopted by the government is “solving the problems as they come” without a real growth strategy in the long run. Durable development is a complex process that needs to be approached as a complex process of a sustainable economic development that can create the basis for productive industries, an increase in exports and productivity of the labor force. Romania has another stand-by agreement of 5 billion euro at its disposal that could be used if the economy drops again in recession. In the light of recent events with the uncertainty upon the situation in Greece and even the questioning of the Euro zone existence, this loan seems very probable. In case of not achieving the economic growth of 1,5% agreed with IMF for this year, or not respecting the budget deficit of 4,4% of GDP and if there would be some doubts regarding the solvability of the monthly expenses, it is very plausible that the government would use these money. The history would only repeat itself. Unfortunately, the biggest fear is that in 2012, the election year will bring out the same stories as before and the battle for power will emerge once again and it would

as always be more important than the well being of the country.

If the officials have not learned anything in the last years, than, most likely, in case of a new government, there will be new reforms and the ones started last year along with the loan will be modified or dropped down and new ones would emerge. Although the loan seemed the best possible solution for solving the immediate problems of our country and preventing it from default, no one is to say what the future reserves. The new government may accuse this one of incompetence. It is clear that Romania needs to learn how to save and how to increase its productivity in order to create a model of economic development. There is no sustainable development in Romania at the moment because in order to have it Romania needs to inspire confidence to investors, needs to have a proper infrastructure, stable exchange rate, institution that inspire trust and not lack of trust and corruption. The continuity and synchronization of government and reforms is the key subject in order to have durable development in Romania. A study realized in 2011 by Daniel Daianu [6] concluded that 80% of the fiscal consolidation in Romania is realized through expenses cuts and 20% through tax changes. The study suggests that Romania suffers a lot because of the lack of transparency and we totally agree to this. The problem is in the public acquisition, in spending the public money, and establishing a standard cost system like other countries.

Pricing Decisions

Șerban Comănescu Adrian

“Ovidius” University of Constanta, Faculty of Economic Sciences

Abstract

The area price is a compromise solution to mitigate the inconvenience of the two previous solutions. The territory is divided into several areas and each area has its price level.

In conclusion, for low weight products, when delivery costs are small, the ex-works price seems to be the simplest solution.

Instead, when we talk about large and heavy goods, which means high transportation costs, the area price method allows alleviating the higher price differences relative to competitors.

Key words: price, product, market

J.E.L. classification: M31

Once set the price targets, the enterprise will have to make decisions on these two situations:

- setting the price of a new product for the first time
 - price changes based on the enterprise's opportunities and the general market situation
- a) The decision on the price of new products

Studying the life curves of the products, one can see that a product recently introduced on the market does not immediately reach a great number of consumers. Without any doubt, the new product must first be the object of advertising and sale promotion. According to well-known J. Dean, there are only two ways of possible action: market skimming or the penetration of the market as fast as possible.

The “market skimming” policy means setting a relatively high price, so that at the beginning of the launching operation, one can reach only limited clients, even if later on a price reduction will be made.

The advantages of this policy are motivated by four reasons:

- market skimming is based on the observation according to which sales are less sensitive to price in the launch phase. It is the period when all the efforts of commercial dynamic (sale promotion, advertising, stimulating the sales team etc) have the biggest effect on the turn over.

- market skimming allows to take advantage of a market segment which accepts high prices, before trying other groups of consumers more sensitive to prices. In other words, one can get, at the beginning, extra-sales among those who are not at all price-minded, meanwhile one gains experiences for reaching larger markets in the future, through more attractive price levels.

- with this price policy, the commercial agents explore the market. Indeed, it is more advisable to begin with high prices and later on to cut them, when the first segment of the market was entirely checked and satisfied, rather than beginning with low prices, which afterwards are put up to cover some unanticipated costs.

- high prices, for a market which seems to be favorable to the product, determine bigger sales than low prices can do.

The market penetration consists of the fast conquest of an important part from a large market, due to low prices, with the help of intense advertising and through a large distribution policy.

Choosing such a policy is preferable in the following four cases:

- when the volume of the sales is very sensitive to price, right in the launch phase of the product.

- when making savings in the unit costs of production and distribution through the release of high quantities.

- when you know that the product will be threatened by a lively competition since the launch on the market

- when there is no market for the elite, in other words, when there is no customer of a high price for the acquisition of the latest news.

The advantages of the penetration policy are in the barricades against possible rivals.

The prospect of a reduced profit even of a temporary loss shows big chances of stopping the rivals or even their final discouragement. Furthermore, the enterprise conquers such a force position on the market, that it will be able to use its potential, when necessary.

The inconvenient of the policy of penetration is its expansive character, because it requires great investments and involves a large amount of inventory.

b) The decision on price changes, which takes into account the opportunities of the enterprise and the general situation of the market.

The marketing responsible often has to change the prices of his products, meaning cutting them, rising them or establishing some criteria of deviation from the price list.

Price cuts. Such a decision is motivated by external causes, as well as internal ones.

- External causes. If a competitive opponent takes the initiative of cutting price for a product, then one has to think of price changes. But one must know that price cuts made by the opponent are either temporary (by sold outs he can improve his treasury) or forever.

In the first case, if the consumers aren't too sensitive to price variations, the reaction is slower than in the second case. If the second case is confirmed, then we deal with other problems. Do we have to align ourselves to the price of the opponent? Do we have to reduce the price and still keep a superior level in comparison with the opponent? Do we finally have to begin a real war of the prices, putting ourselves under the set value of the opponent? There cannot be a straight answer to this. Actually, the decision depends mostly on the nature of the product. When the goods are homogenous, easy to compare by the possible clients, it is preferably to align ourselves to competition's price, with the condition that the operation stays profitable. But when the products are different, when the consumers don't seem to pay attention to the price level anymore, when the brand is very famous, we can afford to ignore the opponent.

Although the price cuts seem easy to do or imitate, they are often dangerous for production enterprises. Indeed, such

decisions often lead to overbid. They always diminish the profitability of the firms and they lead some of them to bankruptcy.

Only the retail firms and the consumers benefit from these competitions and they share the benefit of price cuts.

- Internal causes. The price cuts can also be motivated by causes from the inside of the firm, such as: reducing costs or the initiation of the promotional action.

When the costs are reduced due to technical progress, we can keep the price level and we can obtain a bigger profit. But we can also reflect the price cuts on the sale price, as the manufacturers of electronic computers did in the past years. Often, one has to take some precautions. The price cuts don't have to alarm the consumers and doubt themselves about the quality of the product. This strategy of reducing the price on the basis of minimizing the costs has to be followed out only then, when the product is widespread and so became popular.

The price cuts may have the origin in a promotional advertising. However, in this case, the strategy is limited in time. When the promotion is over, the price is brought back to its initial level.

Rising prices. There are categories of reasons which can explain such an action: the rising of the costs, a decision to improve the profitability and the will of changing the image of the product. The eventual rising of the costs makes the commercial managers ask themselves if they have to reflect the rising of the costs (partially or totally) on the sale price. The answer to this question depends on the nature of the product, on the consumers' sensitivity to price waves and the opponents' decisions. If the last ones see that their profit goes down, then they'll react and rise their sale price. From this moment on, it is possible to have higher prices.

The decision of improving the profitability is seldom taken. Still, this decision can be taken when a firm has a stable and efficient element of monopoly, but with the condition that the demand should be less sensitive to price waves. It is also gut to check if there is no other substitute at a lower price.

If we want to make the best image of the product, it is possible, even recommended in certain cases, to increase the price, but without engendering any refusal to changes from the consumers. We will have to change,

for example, the distinguishing elements of the product: color, shape, conditioning.

As for the consumers' reaction to price changes, it is difficult to give an answer. We can however analyze the competitors' ripostes to previous attacks. Because of the lack of information about previous periods, certain authors stipulate the use of the theory of the games or calculation of the probabilities, but the real use of these complicated techniques is extremely rare.

Forasmuch, the choice of prices or their changes represent decisions coordinated with other marketing mix options, we will perform a logical operation scheme, which settles down the main steps to follow.

Through this logical scheme, one gets to the base price and the real price will be settled down from it. The last one varies in terms of quantities that are bought, in terms of distance or client etc. Finding the real price is based on establishing standards of deviation.

Establishing the scales of deviation. Once the base price had been written down in the catalogue, we will establish a price scale in terms of a certain number of criteria such as: discount from the manufacturer to his wholesale or retail clients, price standards in terms of distance, price standards for a certain period of time.

We usually have three categories of price cuts:

- the rebate (discount) means exceptional price cuts, which is good, for example, to sell out the old articles or those with slow sell.

- the refund is established in percents and it is applied to all orders in period of time; so thereby, 3 % from the annual purchase come to recompense the consumers' constancy.

- the draw is a discount made from different reasons, going from the base price:

The draw for the quantity one bought. This is a discount from the supplier, with the aim of transfer to his client the saving made at the sale costs (prospect costs, packaging, storage, delivery etc). These calculations must be accurately made, beginning with the information from the analytical bookkeeping.

The draw for quick payments. When adjusting of the credit invoices is the usual way of working, discounts can be made for quick payments.

The draw according to clients. When the representatives of a manufacturer meet their clients (wholesale or retail enterprises), they negotiate the prices based on the values registered in the suppliers' catalogue. The mission of the buyer is to try to reduce the value announced by the manufacturer. The manufacturer may also be compelled to except the terms of the negotiation in order to get more orders from the customers.

The draw paid as remuneration for services that the clients rendered to supplier (storage, date of delivery, organizing promotions etc).

As for the price scales according to distance, the practitioners take into account several solutions: factory price, ex-works price and area price.

The factory price from the catalogue doesn't take into account the transportation and insurance costs, which have to be paid by the client. This price has the advantage of being easier to calculate, because it doesn't include the transportation costs and, being reduced, it has a positive psychological effect on the client. The drawback of this factory price is the fact that, the more distant the customers are from the production place, the less competitive the products become, compared to those of the best located customers.

The ex-works price includes transportation and insurance costs in the base price. As an advantage, in this case the customer knows immediately what he has to pay. In the promotion action, the supplier may also use as an argument the "single price" for the entire national market. This price has its drawback: the closest buyers bear the costs of transportation, which should normally be paid by the far located clients.

The area price is a compromise solution to mitigate the inconvenience of the two previous solutions. The territory is divided into several areas and each area has its price level.

In conclusion, for low weight products, when delivery costs are small, the ex-works price seems to be the simplest solution.

Instead, when we talk about large and heavy goods, which means high transportation costs, the area price method allows alleviating the higher price differences relative to competitors.

Finally, there are scales of fixed prices for periods of time. The rates may vary over time. When the demand is strong, prices are set at a high level, then they are decreased when the number of regular customers reduces itself, in order to win new customers. For example, the telephone communications cost less in the evening and at night and on free weekdays.

The Impact of Digital Economy for a Sustainable Rural Environment

Șerbu Răzvan

“Lucian Blaga” University of Sibiu, Faculty of Economics
razvan.serbu@ulbsibiu.com

Abstract

Most research on digital economy is being directed towards urban areas and developed economies. A small attention is being granted towards rural area.

After documentation in literature of specialization it is being observed that the impact of digital economy on rural environment is being more attentive studied in international literature of specialty and less in the national one. This paper completes the emptiness of information.

The impact of Internet services in the rural environment could be huge and will generated new forms of performing typical activities in the new e-way. The paper focuses on the impact of Internet, more generally, of ICT (information and communication technology) facilities, upon the rural economy. The aim of this paper is to highlight the opportunity of electronic environment analyzing some important elements that can stimulate the rural economy.

Key words: digital economy, sustainable environment, information society, information and communication technology

J.E.L. classification: (L81, Q57)

1. Introduction

Researches suggest that information and communication technologies can eliminate the handicap of distance concerning distance and social interaction. Donald Janelle used the expression “convergence time-space at the end of year `60 in order to describe the capacity of transport, of technologies, in order to approach different places” [1].

It is said that technology of communication from telegraph and phone, from email to internet, will produce change, regarding space and time. Therefore due to

development of the virtual space of work through phone, online shopping, and other activities such as: exchange of electronic documents online, means there is no longer necessary for people to be in need of physical transport in order to interact with other people whom find themselves in remote places. As a result, the electronic commerce has a particular relevance within rural areas. One may say that such commerce eliminates the importance of physical proximity for many economic, social, cultural, political activities, in this way changing the rural areas in attractive places for business, services, relationships, to be established.

Motivations of people who live within rural areas, to adopt and use information technologies and those of communication, mostly electronic commerce can differ from the reasons people have within the urban environment.

Using electronic commerce might have greater impact on some persons within the rural area, than another one who lives in the urban environment, because a person who lives in rural area can now access information, goods and services and information that they couldn't before.

A better understanding of the people's needs who live in the rural area and how the electronic commerce can be decisive in satisfying such needs will lead to a better knowledge of such users would like to have regarding the design of new products or services that are being offered by the electronic commerce.

After documentation, we manage to identify an electronic urban, rural division. So far, most of international studies which examine electronic commerce have focused on urban areas. International discussion on this team suggests that geographic location influences the development of electronic commerce. The Organization Cooperation and Economic Development identifies this division as a discrepancy among followings

house-holds, business and geographic areas at different social economic levels regarding both opportunities to use electronic commerce and the use of the internet for a wide array of reasons.

2. Features for digital economy implementation for rural sustainable development

The Organization Cooperation and Economic Development come with reports on the site and outlines that the access on the internet in Organization Cooperation and Economic Development countries is higher within urban areas than rural ones. It also stressing the fact that inhabitation within urban areas are more likely to access the electronic commerce [2].

The cost of the internet are to be higher and the quality of services weaker within the rural areas. Where we discuss on using the electronic commerce, the inhabitation in the rural areas have the disadvantages of lacking infrastructure of educate telecommunication and of course that technology is much more expensive. People within rural areas are the last who usually use the electronic commerce. So the first who adopt the internet are the young people.

The uneven use of electronic commerce between the urban and rural environment is linked to the studies of Hollfield and Donnermeyer for the use of electronic commerce within rural areas and isolated once [3].

The statistics confirm that more countries are dealing with division type of using electronic commerce. Firstly, we can refer at Eurobarometer from July 2002: the internet and the public which study the access to internet in European homes of fifteen states members UE in period May-June 2002. The results showed that the access to internet in European homes is bigger in metropolitan areas (45%) and in urban areas (41%) than in rural areas (31 %). The study is underlining the fact that the typical use of internet from home or office is more probably man, with age between 40-54 years old, with superior studies and he lives in metropolitan/urban area.

When you speak about the daily use of internet, those who lives in urban areas are more exposed to use internet daily or almost

daily, in comparison with those who lives in rural areas:.. This represents a summary of UE, which knowing the position of Romania in some kind of tops doesn't represents a hypothesis inconvenient for us.

With all these, when people use internet at home/office or school, the general pattern of the access to internet in rural areas have a similar trend with those in metropolitan or urban areas.

People who lives in rural areas of Europe are more exposed to use internet at home (69%) than at office (41%) or at school-university (19%), public point of access (1 %) or by mobile phone (9 %).

We can not talk easily about the electronic commerce use in different areas equally maybe with urban/rural styles of life.

The present study comes to stimulate the implementation of digital economy within the rural area and wishes to reveal that this may be a solution to increase the competitiveness and sustainable development.

In the article published by Ioan Varga, in business forum it is outlined that regarding modern digital implementation of technologies we are on the top in urban environment, but the rural one remains in the last century.

The results of a poll done by Gallup in 2010, shows that 52% of Romanian households had at least one computer (7% even more) .The UE average was of 74%, but in 2006 only 26% of families owned a computer as compared to 60% at European level.

The economic approach of the implementation for the information technology for the development it's very wide and can not be property realized without giving more importance to the rural space.

A brief assumption of this idea belongs to the American professor Gary S. Becker, Nobel price winner for economy in 1992, based on some studies and long analyses exposed in reference papers, sustains that: “live has revealed the conclusion that in contemporary economy, characterized throughout multiple interdependence and more closed to together and through a very special dynamism, almost all the areas need also an economic approach.

As Nicolae Georgescu Roegen said “on one hand resolving the deciding problems of the environment are very connected to the scientific, technologic and informatics progress of human society, but in the same time only the existence of generalized progress of human race, can not resolve automatically the ecologic problems, which all the people and the accelerate development of humanity starting with the Industrial Revolution which created them [4]. The deciding point is representing by the will of human society, to resolve the existing problems.

In this way, the will may drive to the implementation of digital economy in the rural areas, project that can be considered a new chance for economic prelaunch.

We have to believe that the revolution which digital economy, the information and communication technology can bring in the rural area for reducing the urban-rural differences. Most of the citizen, for example “Questioning the “rural” adoption and use of ICT’s” written by Rosemarie Gilligan [5] but also the “Business adoption of information and communication technologies in the two-tier rural economy” written by Mitchell S. and Clark D. suggest that digital economy represents the potential to exclude the distance handicap regarding the location interaction. [6].

Because of the development of virtual space based on the internet, the interaction between the distanced people is easier, online payments and other activities such as information and document sharing online, physical transport being useless among the few sources which shows an unequal usage of digital economy between urban and rural area, are the national studies which take place especially on other continents: Australia, Canada and US (works of Hollifield in 2003, Wadden in 2000 and Ramirez in 2001)[3]. This shows examples of differences in adopting the electronic field between the rural and urban area, but the particularities of Central and Eastern Europe and Romania are not developed yet.

At national level the term is highly traded, we can mention here professor’s Dumitru Patriche’s book “Rural Trade” and Mircea Dute “ Between to be and to have” which identifies the need of reliable solutions for balance regarding the third thousand year

from Christ’s burned. As Alvin Toffler says “the third wave” could generate more richness than the present economy or industrialism than ever. They could increase not only the monetary richness also the human one – the untold richness also in money witch we create for us and for our beloved ones [7].

As far as the digital economy is an irreversible process it is opening a new perspective for development by offering great opportunities mostly for rural areas and this is to be noticed in other economies too.

The implementation of digital economy within the rural area will allow enlargement of competitive environment with the help of digital economy so necessary for development of markets specific for free economy, the backing the sustainable development of the rural community [6].

Actions that have to be taken considering that the rural area is disadvantaged and the encouraging of the digital economy will open new horizons and will increase the attractive level for the investors and the potential clients, improving the life level of the locals, resulting a diminution of the differences compared to other rural areas from Europe.

According to European Commission report, the growth potential is high in Romania’s case and this growth also comes from the rural area based on the high added value production. Even according to this advantage, the differences between the rural and urban areas are big, therefore there will take many years to diminish them and the period depends on the attention that is given to this space. The same phenomenon is also available in the transition which is confronted and will be confronting with big difficulties and because of the environment, the social tensions and emigration tendencies will accentuate.

Just like the way in which Stefan Masu presents in this book [8], “The human being of the 21 century and the world government”, the actual tsunami of the world economy, firstly set up as a unconfirmed optimism, like a 2008-2010 crises”, establishes with an unwanted logic the failure of an inadequate and un adapted economic development which consumes the natural resources and condemns to poverty the majority of the population. Even though in the last 50 years of the 20 century the world production has

raised 6 times and the world population only 2 times, the differences between nations and within the nations accentuated, becoming a source of concernment and potential conflict. From this point of view, the information and communication technology and the implementation of digital economy in the rural environment can be a development solution and diminution of the urban-rural discrepancies.

Regarding the adapting of the digital economy by implementing the information technology and communication and the utilization of this technologies in the rural communities called by argued by the fact that the people that live in the rural area have more restrictions regarding the every day activities and have less access to information, goods and services compared to those who live in the city.

The quality studies that we made in the rural areas suggest that there are different and interesting motivations that are not questioning the needs of the people who live in the rural communities in adopting and using the information and communication technology and are somehow different from the motivations of those who live in the urban areas.

In fact, the use of this technologies may have a great impact in the life of a person that lives in the rural community compared to the people who live in the urban areas because the person who lives in the rural area can have, with the help of the informational technology, access to information, goods and services that the person could not have access in the past.

3. Conclusion

By better understanding the needs of the people which live in the rural area we will have a better view of the new products design of the information technology and in the computer applications for the users from the rural area.

A day by day activity, regardless the place you live is shopping .For example, in the rural areas the chain stores that we see in the urban centers are missing, and in certain rural communities the supermarkets, the clothes, music stores, the bank can be missing. As a result the people who live here have less choices when there comes to buying products

and services and can not be able to make a good deal, as in the urban markets .In addition to this arguments we could ask ourselves if the internet can offer a larger variety of goods and service, which are available in the small rural communities and at competitive prices. I believe we can. Beside the outlined problems, we must pay attention at the way the rural term is defined and in what the rural concept consists. In fact there is no universal definition for the term “rural” .As the specialty literature says, we can see that there are different typologies about the rural area, different types of people that live in rural communities and different ways in which the “rural” term is defined for statistic purposes.

To reach the best solutions we have to take into consideration all the alternatives to address these challenges using scientific methods.

Most problems or difficulties that come out in cities are related to durability and quality of life [9].

However some rural areas especially those that are far away, depopulated or addicted to agriculture will have difficulties facing new challenges in the coming years.

With all this I try to close the circle of ideas with the thesis of Patrick d’Humieres according to which “sustainable development will kill capitalism” in the sense that the present crisis already makes possible the succession of eco-capitalism after the dying of financial capitalism“.

We must convince ourselves of this thing that not everyone is aware of the fact that old systems died.

The old world’s mechanism is crushed. Is the same about the globalization that we have known for thirty years. Sustainable growth is what brings progress, improving living standards for all. Sustainable globalization is the one in which each of us by development contributes to the others development.

If we intend to save capitalism it must become once more one and the same with progress and not with regress.

The Contribution of EU Cohesion Policy to Regional and Global Growth

Șorici Costin Octavian

„Ovidius” University of Constanta, Faculty of Economic Sciences
costin.sorici@pms.ro

Abstract

The Cohesion Policy is the most important of the EU Policies in terms of regional development and growth, using the majority of EU budgetary resources for this purpose. The current study tries to outline the major contribution brought by the present Cohesion Policy to EU regional and global growth as compared to the former one and tries to suggest some improvements to be done in the future.

Key words: cohesion policy, macroeconomic models, regional development

J.E.L.classification: R10

1. Introduction

Cohesion Policy has a broad vision. This vision encompasses not just the economic development of lagging regions and support for vulnerable social groups, but also the social and environmental sustainability of development and respect for the territorial and cultural features of different parts of the EU. The breadth of vision is reflected in the variety of Funds, of programmes, of areas of intervention and of partners. In terms of the regional economy, Cohesion Policy has created some 1 million jobs in enterprises across the EU, as well as perhaps adding as much as 10% to GDP in Objective 1 regions in the EU- 15. As various studies indicate, this tends to boost the trade and exports of net contributor countries, offsetting their contribution to the funding the policy

2. Using macroeconomic models to estimate effects

Cohesion Policy aims to improve the economic performance of regions in terms, in particular, of GDP, employment, productivity, investment and the trade balance. Since these

and other macroeconomic factors interact at the regional, national and EU level and are affected by a range of influences both internal and external, the only way of examining the effect of Cohesion Policy on them is by using macro-economic models.

Two macroeconomic models —HERMIN and QUEST— are used to do this concentrating on the convergence objective [1]. HERMIN is a macro econometric model with neoclassical features on the supply side. QUEST is a New-Keynesian micro-founded dynamic general equilibrium (DGE) model with endogenous growth. The use of two different models with very different assumptions about how economic forces work makes the results more robust. Nevertheless, it must be borne in mind that both HERMIN and QUEST do not measure the impact of policy, they model it. So far as possible, the properties of the model are in line with empirical evidence, though this is not always unambiguous. However, the incorporation of a number of assumptions about the workings of the economy, even if reasonably plausible ones is inevitable. [2]

Like any evaluation method, macroeconomic models have their strengths but need to be used with other evaluation methods to complete the picture. This especially so, since Cohesion Policy has goals which go much further than only GDP growth. Any assessment of macroeconomic impact must start from the actual expenditure funded by Cohesion Policy (Figure 1). Since funding in the EU- 10 countries only became substantial after they joined the EU in 2004, Spain, Portugal, Greece, Ireland and the regions in East Germany and Southern Italy (Mezzogiorno) were the main recipients in the 2000–2006 period.

Figure 1: Cohesion policy expenditure relative to GDP, average 2000-2006

Source: Fifth report on economic, social and territorial cohesion, „Investing in Europe’s future”, European Commission, november 2010

In the 2007–2013 period, the situation is very different. The EU- 12 countries now account for just over half of Cohesion Policy expenditure, with much of the rest going to the EU- 15 countries or regions listed above (Figure 2)

Figure 2: Cohesion policy expenditure relative to GDP, average 2000-2006

Source: Fifth report on economic, social and territorial cohesion, „Investing in Europe’s future”, European Commission, november 2010

3. Macroeconomic impact of the 2000–2006 programmes

When assessing the impact of Cohesion Policy, there is a need to distinguish between the short-term (largely ‘demand-side’) effects and long-term (largely ‘supplyside’) effects. The short-term effects occur during the period when the programmes are being implemented. Expenditure on, for example, road construction or training schemes, tends to boost output and employment (e.g. of construction workers or trainers) which creates additional demand. As firms as well

as individuals earn more, they also invest and consume more, which further adds to output (the so-called Keynesian multiplier effect). This effect largely occurs in the implementation period when expenditure is taking place, though can extend beyond it because of multipliers. For the 2000–2006 programmes, the implementation period lasted until the end of 2009 (Figure 3)

Figure 3: Estimated impact of Cohesion Policy on GDP, average 2000-2009

Source: Fifth report on economic, social and territorial cohesion, „Investing in Europe’s future”, European Commission, november 2010

The demand-side effect can be seen in the HERMIN model especially which has a strong focus on this. According to HERMIN, Cohesion Policy is estimated to increase GDP in the main recipient Member States by an average of 1.2% each year over the course of the spending period. These effects, it should be emphasised are cumulative, so that by 2009, GDP in these countries is estimated to have been around 11% higher than it otherwise would have been as a result of Cohesion Policy. As would be expected, the impact in the different countries is closely related to the scale of funding. However, there are differences in the results of the two models. In HERMIN the financing costs of cohesion spending are ignored. In QUEST the EU- 15 Member States also contribute to the financing costs of Cohesion spending and as a result *net* Cohesion receipts for these countries are smaller than the gross receipts shown in the section above and simulated in HERMIN. Also, in QUEST, the stimulus to demand is estimated to be less than in HERMIN because Cohesion expenditure leads to real appreciation of exchange rates

(in those countries not part of the Euro zone) and crowding out of some private expenditure and therefore the effect on output is smaller. The short-term demand-side effect, though positive, is not the ‘raison d’être’ of Cohesion Policy, which is to bring about structural change and long-term growth through ‘supply-side’ effects — a better transport system, a stronger enterprise base, an increased rate of innovation and more skilled people. These effects in improving the productive potential of regional economies are long-lasting. The estimates of the two models of the effect on GDP of Cohesion Policy for the 2000–2006 period in 2014, 5 years after spending came to an end, again differ (Figure 4).

Figure 4: Estimated impact of Cohesion Policy expenditure on GDP in 2014

Source: Fifth report on economic, social and territorial cohesion, „Investing in Europe’s future”, European Commission, november 2010

In this case, QUEST estimates the effect on GDP to be bigger, largely because, being an endogenous growth model, it captures the impact of investment in human capital development and RTD on growth. HERMIN, on the other hand, assumes that the effect from investment gradually declines over time. The clear message, however, is that, under different assumptions about how economies work, Cohesion Policy has strong effects on GDP and growth — both in the short term and in the long term. Even under the HERMIN model’s more conservative assumptions, Cohesion Policy over the 2000–2006 period resulted in a return of EUR 2.1 for each euro invested. According to QUEST, the return in 2009 is the equivalent of EUR

1.2 per euro invested. However, by 2020, the return is estimated at EUR 4.2 per euro invested. Cohesion Policy also helped to increase the level of employment. HERMIN estimates that in 2009, the number employed was 5.6 million higher as a result of policy in 2000–2006 (Figure 5), or an average of 560 thousand more a year than without Cohesion Policy.

Figure 5: Estimated employment creation induced by Cohesion Policy 2000-2009

Source: Fifth report on economic, social and territorial cohesion, „Investing in Europe’s future”, European Commission, november 2010

4. The macroeconomic impact of Cohesion Policy 2007–2013

As a result of larger funding in the EU-12 in the 2007–2013 period, the expected impact of Cohesion Policy on their GDP is much bigger than in 2000–2006. As before, HERMIN estimates larger demand effects during the period, though the effects estimated by both models are significant for all countries and in line with spending (Figure 6).

Figure 6: Estimated impact of Cohesion Policy expenditure on GDP 2007-2013

Source: Fifth report on economic, social and territorial cohesion, „Investing in Europe’s future”, European Commission, November 2010

Again, there are significant and persistent long-run effects on GDP estimated as well as a substantial impact in the short-term. The application of a HERMIN-type model in Poland shows that these results are reproduced at the regional level⁷². Estimates of the cumulative results of expenditure in 2004–2006 and 2007–2013 indicate that all Polish regions are likely to derive considerable gains to GDP from Cohesion Policy. The gains depend in part on the scale of spending, but also on the economic structure and spending profile of the region. Central and western regions, with sizeable manufacturing sectors, are estimated to benefit most, while eastern regions with large agricultural sectors and smaller and less efficient manufacturing sectors the least, although the estimated effects here are still significant, ranging from 8% to 12% of GDP.

5. Impact on net contributors and on the EU-27

Cohesion Policy, of course, also affects the countries which are net contributors and, accordingly, have higher taxes than they otherwise would in order to provide the finance required. The countries concerned, however, tend to have more advanced economies, producing many of the kinds of capital goods and services that are required by the net recipient countries as they develop. As a result, the effect on them of needing to raise finance is mitigated by their increased exports [3]. This is confirmed by the HERMIN model, which indicates that the boost to exports is significant, though more in some countries than others, depending on trade relations [4]. For instance, France and the UK gained considerably from their relative high trade with Spain and Ireland, respectively, while Germany exports relatively large amounts to most of the net recipient countries.

The QUEST model has been used to estimate the net effects of Cohesion Policy on the EU economy as a whole. The cumulative net effect on the GDP of the EU-25 of the 2000–2006 programmes expenditure is estimated at 0.7% in 2009 (i.e. GDP was higher to this extent as a result of

policy). This was estimated to rise to 4% by 2020. In the EU-15 alone, the estimate is a cumulative net effect on GDP of just over 3% by 2020.

6. Conclusions

Nevertheless, there is room for improvement: grants to enterprise and R&D are a useful tool, but too often in the past they have been used at the expense of other instruments. The trend towards a more balanced mix, including financial engineering (loans and venture capital) as well as ‘indirect’ instruments (i.e. non-financial instruments such as advice, networking and clustering) is a welcome one. The European Commission, in close partnership with the EIB, is actively encouraging such diversification through initiatives such as JEREMIE, JASMINE, JASPERS and JESSICA.

In addition, past Cohesion Policy investment in motorways and roads in the less developed parts of the EU-15 means that the job is now largely done. Investment should shift towards more environmentally-friendly modes of transport (notably rail and urban transport systems), though in the EU-12, the need to improve transport links considerably remains a challenge. Cohesion Policy needs to cultivate a focus on performance. This has to start from programmes identifying only a limited number of policy priorities (concentration) with a clear view of how they will be achieved and how their achievement will contribute to the economic, social and territorial development of the regions, or Member States, concerned.

Monitoring and evaluation systems need to be improved across the EU to track performance and to help redirect efforts as necessary to ensure that objectives are attained. This requires a clear strategic vision of what the programme aims to achieve and how success will be recognised and measured (proper target setting). It also requires a greater recourse to rigorous evaluation methods, including counterfactual impact evaluation, cost benefit analysis, beneficiary surveys, as well as a more rigorous use of qualitative methods, such as case studies.

The Added Value of EU Cohesion Policy

Șorici Costin Octavian

„Ovidius” University of Constanta, Faculty of Economic Sciences
costin.sorici@pms.ro

Abstract

The Cohesion Policy is the most important of the EU Policies in terms of regional development and growth, using the majority of EU budgetary resources for this purpose. The current study tries to analyze the major sources that generate the added value brought by EU cohesion Policy to member states regions.

Key words: regional development, growth, convergence, cooperation

J.E.L.classification: R10

1. Overall effects of cohesion policy

Cohesion policy has both redistributive and allocative effects: It transfers resources to the poorest regions (81.5% of total means available for cohesion policy are allocated to convergence regions) (As a result, for each euro the EU invests in the more developed regions more than 9 euro are invested in the less developed ones.)

It supports new actions in favour of growth, jobs and sustainable development across Europe, both inside and outside the convergence regions (The 2007-2013 programmes were designed to support the delivery of the Lisbon and Gothenburg priorities in all regions of the EU, supported by a process of setting targets for the share of resources to be "earmarked" for these priorities.) There is therefore a clear contribution to EU priorities.

It produces spillover effects from convergence regions to the rest of Europe, via increased trade flows.

It induces – through its delivery system – institutional and administrative change, promoting long-term planning, mobilising a wide range of partners, diffusing a culture of evaluation and monitoring of public policies, and reinforcing control and audit capacities.

Analysis of the performance of cohesion policy in 2007-2013 shows that the policy has an even stronger added value in many Member States in the current economic crisis [1].

The policy provides resources to maintain public investment in the context of pressures on domestic budgets. In some cases (e.g. Poland), cohesion policy has helped to protect against economic upheaval through maintaining domestic demand and high levels of investment, while in Latvia and Bulgaria the policy represents the only anti-cyclical measure in place. France has used EU cohesion funding to accelerate implementation in such areas as sustainable development, digital infrastructure and energy efficiency for housing.

Cohesion policy is also instrumental in the establishment of a dialogue among the partners (EU/Member state/region/local) on development strategies and their implementation, which otherwise would most likely not take place. As outlined in the report from Professor Monti on the single market [2], all EU regions will continue to experience a mix of opportunities and adjustment needs with the expansion of the single market. Cohesion policy has stimulated trade flows, upgraded infrastructure and enhanced mobility of goods and services, has influenced the choice of location for economic activities, and has ensured that environmental standards enjoyed by European citizens are applied, contributing thus to reduce the development gaps between economies.

Trade between the EU12 countries and the rest of the Union has experienced a dynamic development over the course of the last decade. Part of this growth reflects the gains which other countries have drawn from the structural support allocated to poorer regions. According to the macro economic model designed to estimate the combined effect of levying taxes to raise the necessary

revenue as well as of the expenditure [3] the Structural and Cohesion Funds are estimated to have increased economic growth across the EU27 as a whole. The GDP of EU27 is predicted to increase by about 0.2% at the end of the current programming period

2. Contributing to growth in convergence regions

The results of two macro economic models (Hermin and Quest)¹⁶ find that the **Structural and Cohesion Funds have had a substantial effect on economic growth in convergence regions**. This is the case in Greece, Portugal, Spain and, to a lesser extent, Ireland, as well as in Southern Italy and Eastern Germany and in all of the EU10 countries.

In the EU10 countries taken together, the models estimate that GDP in 2009 was almost 5% higher than it would have been without Structural and Cohesion Fund support, despite the short 2004-2006 programming period in these Member States.

A recent academic study of the dynamics of regional GDP growth in the EU15 between 1995 and 2006 [4] found a sharp discontinuity between those regions in receipt of Objective 1 funding at the beginning of the period and the other regions. Comparing regions near the eligibility cut-off, per capita GDP of Objective 1 regions grew an average of 0.8-0.9 percentage points more than similar regions on the other side of the cut-off. This implies an extra 10-12% on GDP over the two programming periods. In Eastern Germany, an innovative study compared enterprises assisted to similar non-assisted enterprises. An average grant of €8,000 per employee generated around €11-12,000 of additional investment, demonstrating the clear leverage effect [5].

Closing of the gap has been achieved also by improving connections between the more less and more developed parts of the Union via the upgrading of the motorway and railway systems, notably the transport networks:

In 2007-2013, cohesion policy is investing €75 billion in improving transport systems in convergence regions.

In the 2000-2006 period, 60% of the existing and new motorway network in the EU12 was co-financed by the funds, but

needs remain significant, as illustrated by the fact that the density of the network in the EU10 was at just 34% of the EU25 average in 2006, up from 31% in 2000. The rail network has been improved significantly as a result of investments co-financed by cohesion policy. The funds contributed to the construction and upgrade of 7,260 km of rail in 2000-2006. For high speed rail, by 2006, 56% of all network increase was co-financed by the funds, while in some cases, like Spain, all the total increase in network was supported. Reduced journey times have been important, for example, between Rome and Naples (from 114 minutes to 65 minutes), as well as between Madrid and Andalusia (Madrid-Malaga from 240 minutes to 160 minutes).

In short, cohesion policy has strengthened the overall level of investment, growth and economic, social and territorial convergence to an extent which would not have occurred without EU transfers. This has had the effect of strengthening the long term growth potential of the Union, since convergence regions are using the factors of production more efficiently.

3. Smart Growth

Some €80 billion is being invested in support for enterprise and innovation in 2007-2013, the largest field of expenditure in most regions. This includes direct financial aid to investment and R&D, but also, increasingly, non-financial assistance, in the form of networking and innovation systems, business advice and incubators, all of which have been proved to increase the knowledge content of support. Evaluations for the 2000-2006 period recorded: At least 1 million jobs estimated created in supported projects (This happened in the context of an increase in employment in the EU27 of 13.8 million over the period 2000-2007. However, it should be noted that the 1 million figure represents jobs reported created in supported firms and does not take account of displacement or substitution effects. In addition, not all Member States or regions reported against this indicator.)

An estimated 230,000 enterprises (mainly SMEs) received direct financial support - mainly grants but also loans or venture capital.

An estimated 1.7 million enterprises (mainly SMEs) received advice, expertise and support for networking .

4. Green Growth

Even before combating climate change was embraced as a central objective of the EU, cohesion policy started to put in place measures to improve energy efficiency of enterprises (example: Czech Republic) or set up renewable energy production facilities (example: the Azores, Portugal). Future interventions to tackle climate change can benefit from the experience accumulated during the implementation of these investments, even if they do not receive financial assistance from cohesion policy.

Half of the Member States have included indicators for the reduction of greenhouse gas emissions in their cohesion policy programmes for the 2007-2013 period. Austria, Germany, France and Italy have reported a reduction of over 27,000 kilotonne equivalents.

Close to 20 million people now have access to improved water supply as a result of cohesion policy assistance in 2000-2006. Out of the estimated 40 million people whose wastewater has begun to receive appropriate treatment in this period, 23.5 million people are connected to investments financed by cohesion policy. There are numerous examples not only for improved water infrastructure like the drinking water and sewage in the Torysa river basin in Eastern Slovakia or the Dublin wastewater treatment plant, but also establishing specialised systems for animal waste in Hungary or closing hundreds of illegal waste disposal sites all over Europe

5. Inclusive growth

The European Social Fund (ESF) supports the development of human resources and facilitates a better response to local labour market needs and, together with the ERDF, employment possibilities. One third of the unemployed in the EU participated in ESF supported programmes each year.

The ESF supports gender equality, by helping women into employment, promoting their lifelong learning, supporting their participation in science and technology as well as assisting them to start up businesses. In 2000-2006, €4.5 billion ESF, went on measures to promote gender equality and gender mainstreaming. The largest expenditure on gender-related measures was in Germany, accounting for 25% of the total across the EU.

6. Cooperation across the EU

Cohesion policy promotes exchanges and joint programmes between countries and regions. Cohesion policy fosters territorial cooperation in its three dimensions (cross-border, transnational, and interregional). Addressing common problems together allows for a more efficient use of public resources and circulation of ideas and good practices.

The added value of European territorial cooperation lies in the fact that it offers possibilities for joint action which are needed to address challenges that increasingly cut across national/regional boundaries. Territorial cooperation can also provide important contributions to achieving the Europe 2020 strategy by addressing challenges that increasingly cut across national boundaries. In addition, co-operation programmes play an important role in bringing Europe closer to the citizen, given that they allow for regional and local actors across Europe to engage in joint projects and thus in a "European experience".

7. Social Cohesion

Investing in people is not only a core EU policy but also makes economic sense. According to OECD data, the average private and public rate of return on education and training is between 8% and 11.5%, well above most other public investments. Financial support at EU level through the European Social Fund spurs national reforms towards common employment objectives. EU spending in employment, education and social inclusion has helped its capacity to leverage additional public and private funding, which would otherwise not have

been channelled to these areas. By concentrating on the modernisation of labour market and education institutions in a systematic way, EU programmes allow every euro spent to support on the employability of a higher number of people. Over the period 2000-2008, the ESF supported approximately 76 million people and 1.7 million organisations. ESF participants have been recruited into one in four of all new jobs created and the ESF was directly responsible for half the progress made on the EU-level life-long learning benchmarks. (The data presented in this section comes from the ESF ex-post evaluation as well as 2009 data from MS provided in annual implementation reports.)

Each year over the 2007-13 programming period, projects funded by the ESF are estimated to help 1.7 million people into employment (two-thirds of people supported by the ESF are unemployed or inactive; 10% are long-term unemployed; more than half are women and about a quarter are under 25.

Under the 2007-2013 programming period, young people are supported in all Member States and in 91% of the ESF Operational Programmes, accounting for 68% of the budget. Between 2007 and 2009, 5.8 million young people have benefitted from the ESF through training or mentoring

The benefits of building the human capital of future generations of workers are usually felt in the long run and are often difficult to estimate. The stability of the EU programming periods offers all actors a *stable environment* to undertake the necessary long-term strategic planning required in employment policy, often compensating for the fact that domestic funding tends to be more vulnerable to short-term shifts.

A Review of the Research Methods Used to Study the Tax Compliance Behaviour

Ștefura Gabriela

“Alexandru Ioan Cuza” University of Iași

gabi.stefura@gmail.com

Abstract

Tax compliance has grown in a very important subject of research, especially in the last 15 to 20 years and the methods of research used to better understand the behaviour of taxpayers have evolved during time. Research on the matter has adapted to the need of proving the utility of the theories elaborated through real, empirical data.

This paper aims to describe the methodological context of tax compliance research, through the examples provided by a selection of articles which have approached the subject. The information presented could help especially researchers interested in understanding taxpayer behaviour, by offering some starting points for conducting a research on the matter.

Key words: behaviour, tax compliance, research methods

J.E.L. classification: H26, H39

1. Introduction

The study of taxpayers' behaviour has been in the attention of many specialists in economy and the research methodology used is quite diversified, in order to better understand their behavioural features.

Most of the articles studied concern the individual taxpayer and his behaviour towards income reporting or paying the income tax, in short term, individual tax compliance.

The first approach of the subject uses modelling in order to illustrate the complex nature of what constitutes the compliance behaviour of taxpayers. Empirical research in the field, through qualitative and quantitative methods, began to take shape after 1985, experts beginning to understand that

theoretical modelling, without coming up with real life examples, is not sufficient to explain the phenomenon of taxpayer behaviour. However, even in the latest years, modelling was further used to explain various phenomena related to the nature of taxpayers.

Tax compliance behaviour is illustrated by examples involving mainly quantitative research methods, i.e. surveys, experiments or statistical analysis of existing data sets.

Figure 1: Research methods used in tax compliance research

Figure 1 shows that the largest share (63%) belongs to empirical research methods and, among these, experiments and the analysis of existing data sets have the highest percentages: 33% and 16%. The experiments also included those studies in which post-experiment questionnaire used as a supplementary method of data collection.

The purpose of this paper is to review the methodological aspects regarding tax compliance research, by highlighting the methods used by specialists in the past and describing their applicability and utility for the subject.

In the following sections of the paper, each method of research is discussed separately, using examples from the research literature available.

2. Modelling and theoretical approaches

The modelling of taxpayer behaviour is made with the help of simulations based on mathematical equations, at the origin of all the studies that have been analyzed being the work of Allingham and Sandmo [2] and Yitzhaki [51]. The starting point for the equation models is a simple function of the expected utility of taxpayers. To this function are added various economic or fiscal factors of influence [2; 8; 34; 51], but also non-economic factors such as: social norms [19], taxpayers' pessimism [9], the uncertainty or the ambiguity that taxpayers feel sometimes [12; 38], neuro-economical effects [15] or tax morale [46].

Although these models have tried to capture at the very best the behaviour of taxpayers, they are purely theoretical, and often do not capture what happens in practice. The main criticism brought to these models regards the fact that they do not fully describe the institutional environment and the nature of the relationship between taxpayers and tax institutions can not be revealed as it is in reality [25].

In studies after 1990, there can be observed, more and more, the evolving of the models described, by trying to incorporate various factors of influence, and especially non-economic factors that could better explain the tax compliance behaviour.

Fischer et al. [25] consider that the studies based on modelling are useful, especially as a starting point for empirical studies, but cannot provide results in terms of dissemination of causal relations.

To support the theories developed by modelling, some authors have used empirical research and managed to demonstrate the practical application of the simulations performed by equation [1; 22]. However, the difficulty of testing theoretical models in real conditions it is recognized, caused by the high level of abstraction used in the development of the models, and the lack of direct estimates of certain parameters used in

modelling, so finding the corresponding variables in practice is not really possible [37].

Theoretical studies summarize the major views on tax compliance behaviour, representing an important basis for documentary research on the subject, but also for understanding the conceptual aspects and the definition of basic concepts [5; 24; 25; 39; 49]. Without a careful review of the literature, it is not possible to trace correct empirical research directions.

Both modelling and theoretical studies are extremely important in analyzing the tax compliance behaviour, but they should be always supported by concrete data, obtained directly from those involved in fiscal process.

3. Experiments

The most common choice made by specialists, the experiment, is justified by the fact that taxpayers' reactions can be captured in a way that they do not feel harmed or intimidated. Experimental approach facilitates the problem raised by obtaining honest answers regarding the illegal behaviour of taxpayers [42].

Experiments, in general, are classified in impact studies and judgement studies [25, p. 11]. This classification applies also to the study of tax compliance behaviour. Impact studies refer to situations where participants simulate the actual tax act, and judgement studies refer to the situations where they are asked to imagine a certain aspect, based on a scenario set in advance by the researcher.

Depending on where the experiment is done, there are also two options available to researchers: laboratory and field experiments.

The quality of an experiment is given the degree of validity obtained by the researcher, respectively the degree to which the experiment measures what was originally proposed. Validity may also be of two kinds: internal and external. Internal validity is "the ability to attribute the effect that was observed to the experimental variable and not to other factors" [16, p. 131]. So, if the researcher can demonstrate that the phenomenon studied is caused only by those variables considered as being experimental, the experiment has internal validity. External validity refers to the degree to which the results obtained by the experiment can be

generalized to the actual population or situation [16; 32]. Thus, laboratory experiments can provide a greater degree of internal validity, but being considered more artificial, external validity represents the strong point of field experiments. Also, people selected as subjects of study in laboratory experiments are not always representative for real people.

The experiments used in the analysis of tax compliance behaviour are both laboratory and field experiments. Alm, Jackson and McKee [3] support the use of laboratory experiments due to the accurate measurement of individual non-compliance. However, the control over the variables and the conditions in which the experiment takes place provides a high degree of internal validity that helps supporting the results, especially when investigating, for example, the role of government policies on the tax compliance behaviour [6].

Torgler [42] points out that experiments should not be too long or complicated, and instructions must be clear and understandable. He believes that all procedures related to tax compliance and the tax morale have revealed that many taxpayers have a more refined motivational structure than traditional economic theories report. Laboratory experiments, however, do not offer a high degree of external validity, so the conditions created must be as close to real conditions as possible [40; 25] in order to reduce the artificiality [42], but also to obtain the generalizability of the results.

The subjects for laboratory experiments are mostly chosen from undergraduate students or master graduates. This was very criticized by some experts, because students would not be representative of the target market (taxpayers). Alm and McKee [5] emphasize that students' cognitive processes are not so different from taxpayers' in general, so this approach is not a mistake in experiments. They also underline a weakness of this method of research: subjects may change their behaviour just because they know they are part of an experiment.

In order to achieve greater external validity, some of the specialists in tax compliance have chosen the method of field experiments [13; 17; 40; 41; 50]. The use of this method has allowed the extraction of information directly from taxpayers,

eliminating any deficiencies found in the laboratory.

Quasi-experiments can be found somewhere at the boundary between laboratory and field experiments, being often used especially when the researcher's budget is reduced. A feature is considered to be the designation of their participants and their exposure to the treatment, in a non-random manner. In the taxpayer behaviour research, quasi-experiments were carried out either on samples of students or samples of taxpayers, keeping a relatively simple line of experimental design.

Some authors that used quasi-experiments, applied different treatments at the same time, using the same instrument (usually questionnaires that included a practical case) to the experimental groups, relying on the fact that subjects had received individually the research instrument and thus could not realize that they were subjected to an experiment, and also did not communicate with each other [11; 20]. Other authors have used the courses attended by students or taxpayers as the context of ongoing research, thus maintaining some of the characteristics of a laboratory experiment [14; 23; 30; 31].

The highest percentage among the studies analyzed for this paper that approached experimentation as research method is held by the impact studies, with 68% of the total. Also, most of the researches have chosen laboratory experiments (55%), but neither the other types of experiments are less important (field and quasi-experiments): 45%.

4. Surveys and the analysis of existing data sets

As experiments are quite expensive and sometimes time consuming, an alternative research method is the use of existing databases and related statistical analysis.

The research studies have been made particularly with the help of with international databases, which conduct surveys on various topics in a wide number of countries, at an interval of approximately 5 years. In the data collected, there are also questions or surveys which aim taxpayers' compliance behaviour, giving researchers the opportunity to make connections between different variables, at a global level.

Examples of such databases or surveys used in research compliance behaviour are given in Table 1.

Table 1: Databases used in the research of tax compliance behaviour

Database	Authors
IRS databases (Internal Revenue Service from USA)	Dubin, Graetz, Wilde, 1987; Ali, Cecil, Knoblett, 2001
European Social Survey	Lago-Peñas, Lago-Peñas, 2010
European Values Survey	Alm, Martinez-Vasquez, Torgler, 2006; Torgler, Schneider, 2007
International Social Survey Programme	Torgler, Schneider, Schaltegger, 2010
The Global Competitiveness Report	Riahi-Belkaoui, 2004; Richardson, 2006
Taxpayer Opinion Survey (IRS)	Torgler, 2003
World Competitiveness Year Book	Riahi-Belkaoui, 2004; Richardson, 2006; Tsakumis, Curatola, Porcano, 2007
World Values Survey	Torgler, 2003 ; Alm, Martinez-Vasquez, Torgler, 2006; Alm, Torgler, 2006; Torgler, Schneider, 2007

The survey is an option taken in consideration by many experts, as the use of questionnaire as research instrument would satisfy most validity conditions in quantitative methods [26]. Moreover, a considerable number of experts have chosen the survey to obtain data necessary for describing the tax compliance behaviour (approximately 14% of the studies addressed). In addition, there are studies in which the survey is completed by a second research method (described in the section next topic) and those who have approached their research by experimentation have almost always used the questionnaire to collect certain data [23; 28; 30; 33; 40; 47].

The advantages offered by questionnaire-based surveys, in general, refer to having a direct contact with the respondents, especially during surveys which take place face to face, but also the possibilities offered by sampling, the researchers managing to determine with a better precision the

population and representative sample. However, for sensitive topics such as the behaviour of taxpayers, direct contact may turn into a disadvantage, inhibiting and reducing the likelihood that the respondent's answers are honest. Also, the interviewer may face the refusal of the target population to answer to the questionnaire.

If the questionnaire is chosen to be the research instrument, the questions should be carefully constructed in order to get answers as sincere as possible; gradual questions, less direct, get better answers in terms of honesty [26]. Even if the answers on non-compliant behaviour seem to be sincere, there is also the issue given by a discrepancy between what taxpayers believe that non-compliance represents and how it is viewed by the authorities [25].

The costs of a large scale survey are also not to be ignored, and the time needed for data collection, which sometimes exceed the limits imposed by the researchers.

5. The mix of methods

The mix of methods contains at least two research methods, quantitative or qualitative. The most common choices in building a research methodology refer to the use of existing data sets alternated in the same research with modelling [1; 22] or experimentation [18].

An interesting choice, which has many advantages, is the use of the experiment and the survey in the same research. Dijke and Verboon [20] tested two hypotheses in their study, by two different research methods (experiment and questionnaire-based survey), managing to obtain similar results, thus providing a degree of trust and a greater support of the conclusions offered. Both experiments and surveys have strengths and weaknesses in the explaining of tax compliance behaviour and using both in a single study can eliminate those "deficiencies" that occur when they are used separately.

Of course, the qualitative methods approached must not be forgotten, but they are hardly ever used and always in parallel with a quantitative method. Thus, scientists have used case studies [27] or focus-group research [10].

Gërzhani [26] makes several criticisms regarding the use of other research methods, especially the qualitative ones. For example, the observation is more difficult to apply in this case because non-compliance cannot be studied by a simple analysis or observation of the interaction between people. The author also reveals the possibility of using interviews, but their main disadvantage is the lack of anonymity.

6. Conclusions

The subject of tax payment is quite sensitive, especially from the perspective of taxpayers. Therefore, the choice of the research method can be difficult, and the investigator must be very careful because people are reluctant to question too direct like "Do you pay your taxes?" [26], the main obstacle being dishonest answers.

The choice of the research method to study taxpayers' behaviour depends a lot on the country-specific, the tax system, political regime, but also on the budget and time available for each researcher.

As no method of research has proven to be the best or the worst choice when dealing with tax compliance, researchers should to choose the method or the mix of methods that better fit the context of the research and the population studied.

As future directions of research regarding the methodology used to study tax compliance behaviour, each method described in this paper could be approached separately, for a better understanding and dissemination.

Distance Education Strategies for Rapid Business-Related Vocabulary Acquisition

Tamas Cristina

Parvu Roxana Elena

„Ovidius” University of Constanta

cristina_tamas2003@yahoo.com,

roxanaelenaparvu@yahoo.com

Abstract

Nowadays, distance education has become a genuine science because it is targeted at a different audience which is comprised of a series of generations. Distance education learners are people who enrol for undergraduate university degrees with an aim to get access to further education in order to either maintain or change their workplace. Motivated by these goals, learners perceive distance education as a means of acquiring and developing knowledge. In order to increase and enrich the quality of this type of education. To increase and enrich the quality of this type of education, universities have dedicated a full course which simultaneously envisages a theoretical background, a practical study method and a series of pedagogical tools. Thus, an interactive pedagogical instrument is at the core of teacher-mediated and individual instruction. At present, printed documents are sent via the internet, a trend which facilitates both autonomous and interactive education. The internet becomes a vehicle for sending learning and teaching materials. It is not the mass media resources that influence the learning process that a student or an intern is engaged in, it is the way that the educational resources are presented. By creating a real life working environment, instructors involve their students in business simulations to develop business communication skills and gain full knowledge of business-related vocabulary.

Key words: employees, distance education, interactive, business vocabulary, simulations.

J.E.L. classification: I21

As a result of the current financial crisis, employees feel forced to continue their studies and acquire a wide range of qualifications. To facilitate their acquisition and disseminate knowledge in a pedagogical environment, universities have resorted to distance learning which takes the form of both initial and further education programmes. When teaching business vocabulary to adults employed by various business organizations, the specialized business terms must be correlated with ordinary language terms. The study of the business discourse does not only involve the study of a hermetic terminology because this type of specialized vocabulary is closely related to ordinary life. “The business discourse is based upon current language terms. It is a link between two riversides which are connected by a bridge. This bridge is sometimes explicit, implicit or imaginary.”

Distance education has become a genuine science in our contemporary world. Universities have dedicated a full course which simultaneously envisages a theoretical background, a practical study method and a series of pedagogical tools. Distance education is a system which resorts to media as an educational tool to provide information; yet, the word “teleuniversity” is not synonym to “educational television”.

The first question to ask is: what are the criteria to be met by distance education to become a high-quality educational system? Obviously, mediated or individual learning processes cannot become part of distance education unless they are integrated into a series of learning activities and into an interactive educational setting. Generally, teaching in a distance learning classroom follows at least five steps: the writing phase, the editing process, the distribution of the course, the placement and assessment of the

students. That is why distance education is defined as the set of techniques applied before the direct pedagogical interaction between teachers and learners.

For more than a century, correspondence education has provided education for students, whose textbooks have been delivered by post. Nowadays, audio and video recordings are also sent through the postal system. However, the development of electronic communication networks has generated a change in the distance education system which now offers electronically mediated courses and provides both autonomous and interactive learning and teaching styles.

On the one hand, self-study programmes include printed or recorded courses which are created in advance; the distance education network will have as a unique purpose the distribution or download of the educational software and exercises. On the other hand, interactive education places teachers in direct or indirect contact with their students which aims at providing academic knowledge.

We have stated that there is an implicit bridge which correlates business and current terms in a business discourse. We mean that there is an analogical rapport which allows the use of common terms with a specialized connotation. Among the terms which the teacher first introduces to business students mention should be made of the following: *acteurs, branche, branch, entrepreneur, stratégie, strategy, demande, demand, offre, production*, etc. Sometimes the term *acteurs* (actors) may be replaced by the term *personnage* (characters). Thus, there are texts entitled *The Entrepreneur, a Key Character* or *The Main Actors in Balneo Tourism*.

Metaphors are frequently used. For example: *branche d'une industrie / branche d'un arbre; exode des capitaux / exode d'un peuple; érosion monétaire / érosion d'une falaise; cadre supérieur / cadre d'une armoire; les acteurs de l'entreprise / les acteurs du théâtre*. Careful attention should be paid to the way these metaphorical terms are translated into Romanian. For example, the ordinary meaning of the word *taux* is *weight*, while the specialized meaning of the same word indicates a rapport between prices, salary and lifestyle. Its Romanian equivalent is *rată*; yet, the phrase *taux de*

change means *curs de schimb*, while *taux d'escompte* means *rata/taxa scontului*.

The morphological resemblance and the semantic closeness between terms can erroneously determine us to interpret these terms as being equivalent synonyms. Let's analyse the terms *dévaluation/devaluation* and *dépréciation/depreciation*; not only do they have in common the prefix *dé/de*, but they are also derived from the nouns *valeur/value* and *prix/price* which have almost the same meaning. However, they are not equivalent synonyms because each is used in a certain specific context: the word *dévaluation/devaluation* is used in a fixed exchange rate system, while the word *dépréciation/depreciation* is a term used in a floating exchange rate system. The nouns which are preceded by *télé* provide a similar example. *Télévente* means *teleshopping*, while the meaning of *télévirement* is *electronic money transfer*.

There are also business terms which are frequently used in plain language, which have totally different meanings in a specialized context. For example, the plain meaning of the term *entrées* is *outings*, while its technical meaning is *goods, services, income*. These metaphors are taught to distance learning students either by means of workbooks or directly in the classroom.

The main characteristic of distance education is that there is mediated communication between the teacher and the learner. The educational resources used to send information should be more than enough. However, practice shows that none of these educational resources, if used exclusively, do not satisfy the criteria for the pedagogical efficiency required by both students and teachers. These criteria can be met by combining educational information resources. Course mediation necessitates the adaptation and transformation of all educational information resources. The role of distance education is to use these resources to develop pedagogically effective learning environments. One of the common methods used in modern distance education is web content recommendation. Teachers indicate websites that students can access and explore. A very useful teaching resource is the website designed and built by Lafarge, a French enterprise located in Medgidia which produces cement. Students are thus exposed

to a wide range of business-related vocabulary such as terms referring to cement production, finance, human resources or company structure. This electronic teaching and learning tool replaces or recreates the social working environment that students need to become expert performers in the instructional process.

The role that educational resources play within distance education can be synthesized as follows:

- providing a vehicle for transmitting learning materials and the educational information resources;
- delivering the teacher’s educational discourse;
- representing certain relevant aspects of reality which become observation, study and analysis instruments;
- providing students with full support to successfully complete their educational programme.

It is not the way educational resources are sent that influences the learning process that a student or an intern is engaged in, it is the way that these educational resources are presented.

Specialists and experts dealing with distance education have managed to develop a descriptive grid which shows the characteristics of the educational information resources they have studied: printed books, radio, television, audio and video materials and telematics.

One of the most frequently used methods is simulation, ranging from phone conversations to complex simulation activities whose objective is to set up and run a small family-operated business such as a flower shop, a bakery, etc. Business simulations place students in the role of a business owners and give them the opportunity to participate in everyday life situations, interact with their colleagues, communicate in a business context, develop business communication skills and prepare to succeed in passing any business examinations. Simulation activities build students’ self-confidence, help them present their arguments for and against a business proposal, put forward their views in a persuasive way, present plans and projects to their colleagues in a professional manner.

The educational purpose of foreign language teaching within a distance education system is influenced by two major perspectives, which are both complementary and contradictory. The Common European Framework of Reference for Languages focuses on the primary communicative and functional objective of language learning and teaching and integrates the concept of task into the term „actional perspective”.”This perspective mainly focuses on users and language learners who are social workers in charge with various tasks, which are not always language-related, under a certain set of circumstances and in a given environment. If speech acts are performed during language activities, they become part of the action itself and of the social context.

Global simulation becomes a complex pedagogical tool whose main purpose is to live entirely “globally” in a context where the participants are imaginary characters from start to finish.

Up until 1987, there were two generations of distance education, which were based upon the following resources: correspondence, printed texts, radio and television. In 1987, a third generation of distance education emerged with the introduction of computer-assisted communication. Due to the implementation of multimedia systems, the computer has managed to combine printed texts, images and sounds in a two-way interaction.

Organizational Management, Efficiency, Efficacy and Competitiveness

Tănăsoaica Laura-Georgeta

Romanian American University of Bucharest, Faculty of Management-Marketing
lauratanasoica@yahoo.com

Abstract

Management guarantees the increase of functionality and competitiveness of the companies and it has an impact of organization efficiency and efficacy. A performance management uses an approach that joins the two concepts, at strategy level. Also, competitiveness is an important concept that represents the essence of progress, setting quality and price standards, determining the growth of productivity, supports innovation and improving. The grounds for achieving competitiveness are given by the competitive advantage. It represents the organization's ability to control the competition forces. Competitiveness, efficiency and efficacy of an organization are given by its ability to excel on the market it covers with its products and/or services.

Key words: management, efficiency, efficacy, competitiveness.

J.E.L. classification: M10.

1. Introduction

Management guarantees the increase of functionality and competitiveness of the companies.

A performance management uses an approach that joins the concepts of organizational efficiency, efficacy and competitiveness.

2. Organizational efficiency and efficacy

Economic efficiency represents the main component of all the economic activities, argument sustained by the limited nature of resources. Therefore, economic growth may be obtained

through a better usage of the resources, economic efficiency being the qualitative measure of it – it guarantees absolute growth of the effects with the same volume of efforts, and also achieving a higher living standard for the population.

The contribution of management to the growth of the efficiency takes into consideration factors such as: time, social aspects – immeasurable factors - the circumstances for achieving efficiency (circumstantial approach is required especially by Romania's accession to EU) and organization potential, diminishing the importance of the results of the organization in the analyzed period.

Besides the contribution that management brings to organization efficiency, it also has an impact of organization efficacy, emphasizing again the fact that efficacy does not equal efficiency; therefore, an organization may prove efficacy without having a favorable balance between revenues and expenses.

Therefore, a performance management uses an approach that joins the two concepts, at strategy level.

3. Organizational competitiveness

As far as competitiveness, is concerned, there isn't a generally accepted definition, this concept being extremely complex, becoming the focus of many economists. Among the definitions that see the concept of competitiveness as an ability of certain companies, economies etc., strictly connected to competition there are the following ones:

- ✓ „The ability of individuals, companies, economies to keep themselves in national and/or especially international level competition and to obtain economic advantages (and not only), in a certain business environment”[10];
- ✓ „The ability of companies, districts, regions, states or supranational

organisms, being under international competition, to guarantee a sustainable high income from the value of the production factors, as well as high income from labor force” is the definition adopted by OECD[3].

- ✓ “The degree in which a nation, on free and honest market, can produce goods and services which can pass the test of foreign markets, at the same time being able to increase the real income of its citizens”[6];
- ✓ “The ability of certain products and services to face competition”[5].

Considering the factors involved by competitiveness and its effect, the following definitions stand out:

- ✓ “Competitiveness involves productivity, efficiency and profitability”, not being a purpose, but only a means to increase life standard and social wellbeing, according to Ciampi;
- ✓ “Competitiveness may be defined as that precise set of institutions, policies and factors that determine the current level or productivity of a country”[4];
- ✓ According to professor Robert Carbaugh, the company is competitive as long as it produces high quality goods at a lower price than its competitors.[2];

Professor Stefan Nedelea gives the concept of competitiveness two functions [7]: to evaluate the evolution of the organization and the market and to channel its evolution, by various means (quality, cost, price, change, viability), under a competitive environment.

Any organization under a competitive environment must know and meet the consumers’ needs. Dan Voiculescu[13] identified and categorized the elements that define competitiveness into primary, main and essential factors.

At the beginning, the product of a company is competitive through one of the following factors: price or quality. Another factor, *price/quality ratio* is revealed after a brief analysis of the reaction of the competition, which leads to structuring of the market in several interconnected layers, each layer corresponding to a certain price level and a certain quality level. The decisive factor in achieving a price/quality ratio acceptable by the market is the *cost* of the product, very relevant when compared to the selling price. Thus, another factor of

competitiveness emerges, that is the *profit*, resulting from the difference between the selling price and the cost. From a dynamic perspective on the two factors: cost/profit emerges the cost/profit ratio. Thus, each company aims to obtain a cost/profit ratio as small as possible, this generating competitiveness on the market.

The connection between the primary and the main factors is the fact that the latter control the former, being mainly qualitative, except the *volume of production* which is a quantitative factor. This factor is important when compared to the medium cost per unit curve. Thus, a company is competitive from this point

The main factors are controlled by essential factors of competitiveness, the most important being: *re-using previous labor ratio, axiological stability, applied innovation, harmony level, identifying and promoting values.*

- ✓ *Re-using previous work ratio* emphasizes the need to use the results of previous work, whose results may be: capital, science, technology, etc. Thus, the more work a company reuses (may it be top technologies, high fixed and variable capital level, high quality of management) the more competitive it will be compared to other similar companies that do not capitalize on the mentioned items. It is worth to be noted that not any previous work can produce value without new efforts or holds the ability to emphasize the effect of these new efforts.
- ✓ *Axiological stability* refers to the stability of the system of values of the company, which includes elements such as:
 - contractual discipline – originates in the system of formal and moral restrictions, therefore “a system that promotes contractual indiscipline penalizes competitiveness”[14];
 - The symmetry of the relations between asymmetrical partners - refers to the aspects regarding the relations between asymmetric partners (in weight and role); asymmetry in the relations between the dominant and dominated partner appears. The high competitiveness of the countries that put effort in achieving symmetry between asymmetric partners.
 - *Applied innovation* refers to technological innovation, in management, in

communication, in organization, in structuring personal relations. The lack of innovation would lead to eliminating weaker or smaller agents. This does not happen, so small companies, due to their dynamic nature, capitalize on the applied innovation, unlike the large companies, where this thing does not happen, because they are using applied innovation at a level which is below average.

- ✓ *Harmony level* shows that, when the quantity of work is in harmonic relation with the quantity of fixed capital, the agent is competitive; at the same time, it refers to the harmony between production and consumption, between the various forms of competition: free, economic, etc. Harmonic competition takes into consideration maximizing the positive effects created between organization and market, between economy and society, between national and global economy.
- ✓ *Identifying and promoting own value* – identifying the persons with value and their strong domains, training them in accordance with their skills, and, afterwards, capitalizing those skills in order to meet personal and organization’s needs and interest – “the success of a company, more precisely its competitiveness, is given by the proportion in which the company manages to use the human fixed capital with which it is naturally equipped”[14].

4. Competitive advantage

Competitiveness represents the essence of progress, setting quality and price standards, determining the growth of productivity, supports innovation and improving. The grounds for achieving competitiveness is given by the competitive advantage which represents the organization’s ability to control the competition forces [11]: new competitors, the threat of substitutable products, the negotiation potential of buyers and suppliers, the rivalry between the existent competitors, and in the end, it takes the form of higher quality products for consumers, compared to the products of the competition.

Professors Nicolescu O. and Verboncu I. define the competitive advantage as “the

ability of a company to produce goods and services that are, from a certain point of view, important to customers, better than similar products of most of the competitors” [8]. Thus, two essential features of competitive advantage are emphasized:

- ✓ It targets the element or elements that are important for the consumer, which determines him/her to buy the product/service;
- ✓ The company must produce that element, at a higher quality level than those obtained by competitors, so that it would be positioned in the upper part of the hierarchy of products or services.

There are several factors of influence of the competitive advantage: the organization’s type, the domain, the competition’s type and the competition’s level of knowing.

The sources of the competitive advantage are [9]:

- ✓ *internal*: differentiating the products, the ability to react, the structure of costs, flexibility, knowing the strong and weak points, technologic abilities;
- ✓ *external*: knowing the business environment, the competition, market segmentation.

From Porter’s point of view, there are two types of competitive advantage that can be achieved by a company: low cost and product uniqueness, thus resulting first strategies (table no. 1)

Table no.1. Strategies

Low costs	Product uniqueness
Cost leadership strategy	Differentiation strategy
Focus cost strategy	Focus differentiation strategy

Generic strategies identified by M. Porter

Therefore, the concept of *sustainable competitive advantage* appears for the first time and its first definition is given by J. Barney: “A company holds sustainable competitive advantage when it implements a strategy that creates value, a strategy that no other current or potential competitor is using and/or these competitors are not able to take advantage of the benefits of this strategy”[1]. The concept of sustainable competitive advantage is based on company and product uniqueness and low costs.

The sources that guarantee sustainable competitive advantage are: higher experience and the existence of various resources that must be: rare, valuable, un-replicable and irreplaceable. The organization, by combining the resources and experience may achieve competitive advantage that would allow it to face the fluctuations of the business environment.

5. Conclusions

Competitiveness, efficiency and efficacy of an organization are given by its ability to excel on the market it covers with its products and/or services, the performance being: “the outstanding result obtained in management, economy, commerce etc.”[12]

The environment, characterized by stronger and stronger competition, becomes more and more agitated and demands efficient management to the ones in charge of the organization, this way guaranteeing its performance. Thus, these may better capitalize the opportunities presented by the environment and may meet the requirements of the customers in a better and more efficient manner.

niculai.roman@caom.ro

Abstract

From a general point of view, performance is defined as the degree to which a member of an organisation contributes to the realisation of the objectives of the organisation, and it is the most important objective for any organisation, because it assures both the company’s and the employed personnel’s survival and development. Work performance is understood as a form of the degree of accomplishing the tasks, duties and responsibilities defining an employee’s work position, and the employee’s contribution to the accomplishment of the objectives of the organisation, respectively. This work intends to present a study realised at Iași Regional, a regional railway transportation company, about the relationship that could be established between the work satisfaction and the work performance of the employees from this field of activity. The research is based on a questionnaire applied to the employees of the company. The results offer some interesting conclusions with practical availability.

Key words: performance, employee’s assesment, railways transportation

J.E.L. classification: L92, M54

1. Introduction

The personnel’s assessment is a process determining the possibility of evaluation of the employees’ manifestation in the work process. This complex process intends to evaluate two types of characteristics: human and professional. Performance evaluation is a complex process, and it needs a certain degree of organisational maturity in order to

become a system in an organisation, contributing also to the employees’ motivation for reaching superior levels of performance.

2. Performance criteria and standards

Performance evaluation of the personnel of a company should be based on the analysis of the job position and on the performance standards per employee and per work position. A *performance standard* should describe what an employee produces or realises by the development of specific activities, or should aim the obtaining of a specific result or of a certain behaviour of the employee on the job position occupied (discipline, relationship with colleagues, communication skills, etc.) [1]

The characteristics determining performance standards of an employee/job position are: quantity; quality; cost; time; use of resources; means of realisation.

Performance standards are established before starting the activities, so as all the employees know what they have to do and what is expected from them.

Performance evaluation criteria are expectations of the company in what concerns the results and the behaviours from the previous period, or the potential future of the employee under analysis.

The most used criteria of the personnel’s performance evaluation, from the point of view of individual and professional characteristics, team adaptability, and social aspects are: personal characteristics (aptitudes, behaviour, personality features); competences for job responsibilities; flexibility and adaptability on the job position and within the company; professional knowledge; work efficiency; teamwork; degree of creativity and innovation.

Each employee is assessed according to: the existence/inexistence of the supposed intrinsic qualities, presence or absence of identified behaviours and attitudes, conformity of performances according to directives or procedures, difference between accomplishments and objectives established initially.

Among the factors contributing to the determination of the level of performance of the personnel in a company, the highest determinant results of the process of performance evaluation are leaves of absence, personnel fluctuations, and complaints/appreciations.

The leaves of absence are analysed from at least two points of view: *economic* – by calculating the material and financial losses determined by the employees’ absence from work, and *psychological* – by the profile of the individual (“lazy”, “irresponsible”, “disloyal”, etc.).

Personnel fluctuation is defined as “the report between departures per time unit, and the average of the existent employees in that specific time unit”[2].

The complaints refer to the employees’ discontent concerning the administrative measures applied at a certain moment.

The performances of the personnel in a company can be evaluated according to the following situations:

- performance evaluation during training;
- performance evaluation in real work activity;
- performance evaluation in simulated work activity.

3. Implementation of an evaluation system

In order to implement an evaluation system of the personnel of a company, one should take into account the fact that this is a process realised progressively, and a series of other measures are involved:

- preparation measures; they have the purpose to inform the personnel regarding the philosophy of the system, its mechanisms and development, its consequences, etc.
- measures of formation of the employees involved in this system; the necessity of these measures results

from the fact that the information regarding the evaluation system applied facilitates its acceptance, therefore the evaluators’ formation contributes to the increase of the system credibility.

The premises of personnel’s strict evaluation are: the criteria of the personnel’s evaluation are different, according to the nature of the positions held, to the potential of the company, and to its objectives; evaluation should be unitary, i.e. there should be the same evaluation criteria for the personnel of the same speciality, or with identical positions; evaluation should be realised on sufficiently long periods of time, in which the employees under assessment are confronting themselves with the main problems specific to the positions they are hired for; the methods and techniques used should consider the specific of every work position; evaluation should be based on true and verifiable information; the result of the evaluation should be communicated by the evaluators directly to the person, together with the necessary recommendations.[3]

The main groups of errors, from the evaluator’s point of view, which appear in the personnel’s performance evaluation process are: the “halo” effect, superior/inferior evaluation determining the error of tolerance/strictness, fear of making discrimination. Moreover, we also meet the following types of errors: the logical evaluation error, the contrast and similarity error, the proximity error, the agreement or fidelity among evaluators.

4. Methodology

The purpose of the research consists in the identification of specific directions of action in order to adapt the practices of human resources management to the needs of the employees from the field of railway transportation, with the purpose to improve their professional performance also with the increase of work satisfaction.

Consequently, the objectives of the research are:

- identification of the dimensions of the satisfaction (if there is any), strongly associated with the performance level;
- evaluation and description of the correlation between the satisfaction

perceived, and the performance obtained by the employees of the company.

The study was realised at Iași Regional CFR SA (Romanian Railways), on the total number of the personnel, from which a target group of 105 persons was extracted. In the choice of the target group we intended to keep a good representation of all the categories of the entire personnel. In order that the answers obtained were as honest as possible, and to avoid that the employees influenced each other in their answers, we organised the questionnaires in the same day, in a three hours period. According to the presence at work in the day of the questionnaire, and to the representation of the categories of age, sex, studies, number of years in the organisation and position occupied, we decided to include 105 persons in the target group.

The instrument used was the questionnaire. The results were processed with the SPSS programme.

5. Results

The individual performance is an aspect difficult to self-evaluate by the employees, due to the high degree of subjectivity involved. Therefore, because it is a self-administered questionnaire, the performance aspect was revealed in this study by the use of two significant questions, with an acceptable degree of objectivity:

A. Which was the grade/rating you obtained at your latest performance evaluation realised by your superiors? (Example: Very good/good/satisfactory/unsatisfactory, or number of points)

B. What would help you to have better performances at your present workplace?

The answers received at the first question allow the realisation of a hierarchy of the employees according to their recent performances. The second question offers to the respondent the freedom to suggest to the company leaders ways of improvement of their own performance.

Table 1. Distribution of the employees according to the rating obtained at the latest performance evaluation

	Which was the grade/rating you received at the latest performance evaluation realised by superiors?	
	Count	%
Very good	51	48,6
Good	52	49,5
Satisfactory	2	1,9

Most of the employees of the railway transportation company (16.19%) consider that *the assurance of adequate material, technical, and technological equipment* for the activities developed would help them improve their work performances. In the increase of professional performance, a very important role is also given by the subjects to the *assurance of the training and development of the competences* necessary in accomplishing work responsibilities, aspect which was mentioned by 14.29% of the employees.

Table 2. Methods of improvement of work performance suggested by the employees

No	Name	Num-ber	%
1	Assuring corresponding material, technical and technological equipment	17	16,19
2	Assuring the necessary competences training and development	15	14,29
3	Better work conditions	9	8,57
4	Actions directed to the improvement of the activity management	9	8,57
5	Harmonious team relationship	8	7,62
6	Diminution/elimination of bureaucracy	8	7,62
7	A higher salary	4	3,81
8	Adequate information	4	3,81
9	Rest	4	3,81
10	Support of family and friends	4	3,81
11	Stability and safety	3	2,86
12	Offering rewards/bonuses for high performances	2	1,90

In order to evaluate the connection between work satisfaction and performance at the employees of the railway transportation company, we estimated and tested the correlation coefficients between the performance indicator (score from 1 to 3 given by the personnel participating in the study, based on the ratings mentioned in the questionnaire), and each of the 10 indicators of work satisfaction (the scores determined for the total satisfaction and for its 9 dimensions).

In this case too, due to the fact that all the indicators included in this analysis have an ordinal nominal nature, an adequate correlation coefficient is Spearman coefficient.

Table 3. Spearman correlation coefficient between performance score and total satisfaction score

		Total satisfaction
Performance scor	Spearman correlation coefficient	0,193
	Sig. (significance level)	0,048

Table 4. Spearman correlation coefficient between performance score and dimension satisfaction score

	Performance scor	
	Spearman correlation coefficient	Sig. (significance level)
Payment	0,218	0,026
Career promotion	0,201	0,040
Supervision	0,068	0,491
Benefits	0,099	0,313
Rewards	0,124	0,207
Conditions	0,025	0,802
Colleagues	0,108	0,274
Work nature	0,134	0,172
Communications	0,158	0,107

If the significance level is very low (≤ 0.05), then the correlation is significant, and the connection between the two variables is described by a linear model, and the other way around.

Even if the correlation is not significant between the two variables analysed, the variables can be correlated, and the connection between them is not linear.

After the estimation and testing of Spearman correlation coefficient used for the evaluation of the correlation between the performance score and the total satisfaction score, as well as between the performance score and dimension satisfaction score for each of the 9 dimensions of the work satisfaction, the results are as follows:

The values of the correlation coefficients obtained vary between 0.025 and 0.218, indicating either the inexistence of a connection (in the case of values very close to zero), or the existence of very weak and direct connections between work satisfaction and work performance.

The only dimensions for which there is a weak connection to work performance are: *payment* and *promotion* (direct connection), for which we registered values of Spearman coefficient slightly higher than 0.200.

The values of the test significance, sig., lower than 0.05 indicate that the values of correlation coefficients are significant in what concerns the entire personnel from whom we extracted the target group analysed, for these variables and for *total satisfaction*.

Figure 1 presents the graphical representation of the evolution of the percentages of the employees with satisfactory, good and very good performances, as long as their level of work satisfaction increases, particularised for each aspect of the satisfaction.

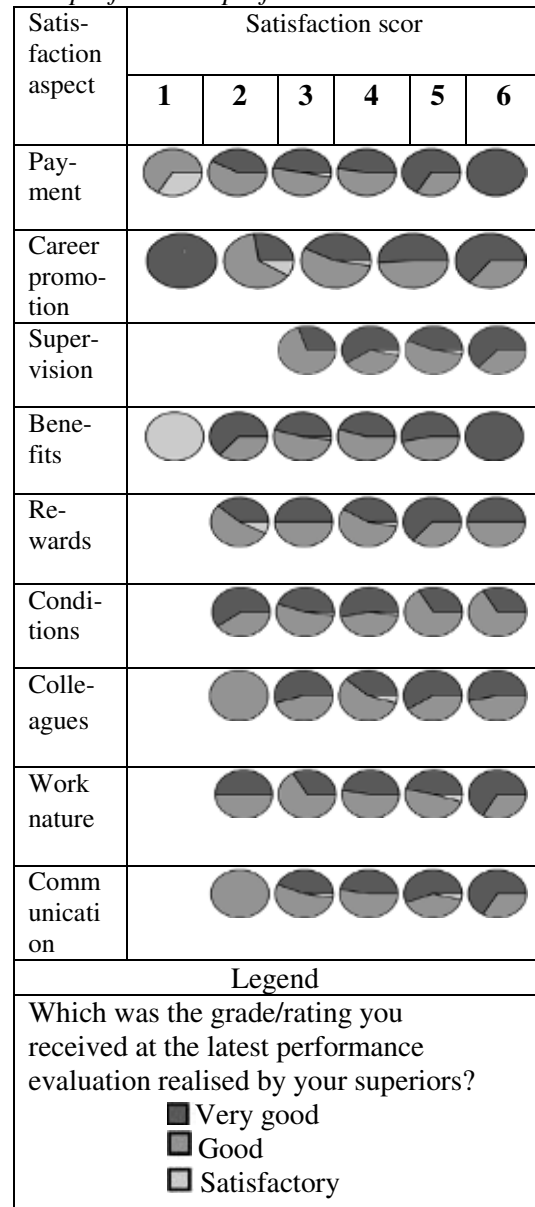

The analysis of the structure graphics for the 9 aspects of work satisfaction complete and confirm the results of the correlation analysis, as it follows:

We notice direct weak links between the levels of the employees’ satisfaction and performances aspect, i.e. the percentages of very good performance are higher at those with higher levels of satisfaction (symbolised by scores 5 and 6).

Satisfactory performances (the lowest ones) appear mostly at the employees with lower levels of satisfaction (symbolised by scores 1 and 2), situation specific for the aspects: *payment*, *promotion*, *benefits* and *rewards*.

Obvious exception from the pattern mentioned above is the aspect *conditions*, referring to rules and procedures, where the satisfaction levels 5 and 6 (moderate and high, respectively) correspond to the lowest percentages of very good performance.

Figure 1 Distribution of the employees according to the level of work satisfaction, on aspects of satisfaction, and according to the professional performances obtained

The analysis of the distribution of the employees according to the level of total satisfaction felt, and to the work performances obtained (figure 2) emphasises the fact that very good performances are specific especially for the employees with a

high level of work satisfaction, satisfactory performances are mostly present at the least satisfied, while good performances are associated to average levels of satisfaction.

Figure 2. Distribution of the employees according to the level of total work satisfaction and the professional performances obtained

Which was the grade/rating you received at the latest performance evaluation realised by your superiors?

- Very good
- Good
- Satisfactory

6. Conclusions

Surprisingly, the results obtained in the research do not clearly demonstrate that there is a connection between work satisfaction and work performance. Therefore, after the estimation and the testing of Spearman correlation coefficients, the result was either the inexistence of a connection, or very weak connections between work satisfaction and work performance of the employees of the railway company. However, from the research results that the majority of the

employees belong to the category of average satisfaction, and implicitly have an average level of performance. This is determining us to wonder about the employees' degree of implication in the work process, with consequences over the work efficiency as well.

Meanwhile, there are also dimensions of the work satisfaction with which the employees of the railway transportation company are not satisfied, as well as salaries and salary raises, benefits package, operating conditions, and promotion opportunities. Interesting results are offered by the analysis of the performance development methods suggested by the employees. We would have expected that salary payment was on one of the top places, however, the methods suggested belonged rather to work conditions and continuous formation: assuring a corresponding material, technical, and technological equipment; assuring the necessary training, and competences development; better work conditions, etc.

The Present Economic-Financial World Crisis – One of the Most Important Phenomena of the 21st Century

Todericiu Ramona
Dragomir (Fraticiu) Lucia Mariana
Popa Liliana

„Lucian Blaga” University of Sibiu, Faculty of Economic Sciences
lucylucyda2005@yahoo.com

Abstract

The present world is still facing one of the most severe economic-financial worldwide crises, which causes losses of billions of Euros. Through its economic consequences and its magnitude, the present economic-financial world crisis has surprised many and has caused one of the largest economic unbalances, favoured by business globalisation and company internationalisation.

Key words: economic-financial crisis; globalisation; recession.

J.E.L. classification: G01

1. Introduction

The current world economic-financial crisis, considered to be similar to the economic crisis that shook the world in the 1930s, is one of the most important phenomena of the 21st century, phenomenon that we are all in the process of experiencing.

It initially started in the United States in the context of globalisation, but the crisis rapidly spread in the rest of the world, proving, without a doubt how interconnected the economies of different states are. It is well-known the fact that in the context of globalisation, a phenomenon travels with maximum speed, be it positive or negative.

Nowadays, the economic order that used to exist is about to crash. Despite the attempts to solve the problems generated by the economic-financial world crisis, recession affected, without exception, all the states of the world, and, as for the perspectives, they are rather uncertain and grim.

The magnitude of the financial crisis and its generalized consequences, has started a wave of reunions, most of them urgent, at a European and international level, in order to find coordinated solutions and adopt adequate measures that would allow surpassing the recession and economic revival. Among the coordinated actions of the government of the US and the EU members, we can mention:

- bank recapitalization;
- deposit guarantees (some countries instituted the complete deposit guarantee) ;
- guaranteeing interbank deposits;
- bank nationalisation;
- passing completely new financial market legislation
- the authorities recommended applying more efficient and more rigorous risk management practices;
- liquidities management practices are strengthened;
- the measures for identifying risk and risk prevention are improved.

2. The causes of the current economic - financial world crisis

The attempt to identify the causes that caused the current crisis is difficult due tot the fact that they span a long period of time.

Moreover, the causes that are at the origin of the crisis are numerous and complex, and can be identified at a macro and micro-economic level. An analytical classification of these factors would point out the structural factors (creators of the generally favourable conditions for generating the crisis) and cyclical factors (which contribute to the crisis continuation). The current economic-financial crisis has started in the USA, where

the first signs appeared, even from June 2007 [3].

In the view of the American professor Paul Krugman, the winner of the Nobel Prize for Economic Sciences in 2008, „the return of the decline economy” is explained by the fact that „such diseases that became resistant to antibiotics, the economic maladies that caused the Great Crisis, returned in our days.”

Several specialists [2,4], have identified a series of problems that caused the crisis, among which we would like to mention:

- the limits of the American economic growth model based on credit and on consumption demand;
- the severe unbalance of the economic markets of the US;
- the excessive growth of the volume of credits – in the attempt to increase the profit of banks or the bonuses received by bankers;
- financial innovation and strong development of the market of derived products;
- the rapid increase of the interest rate in the period 2001 – 2006 and the expiration of the warranty periods, determined an accelerated increase of the volumes of overdue credits.

It is considered that the origin of the current crisis lies on the financial system of the countries that are massively focused on consumption, including by granting advantageous credits, especially in the housing sector. The financing of consumption was done not only at the level of individual person or company, but it even became a state policy.

Due to the fact that since the Great Depression the prices of the housing have presented an almost constant increase in value [7], and, for this reason, refinancing the housing loans was relatively easy, the financial titles that were issued held, on some components, the highest ratings, AAA.

Some of the causes of the crises of the 21st century are considered to be globalisation and business internationalisation and, especially, economic-financial interdependence at a world level. The development of the financial markets and the globalisation of the capital flows have influenced in the past decades the activity of companies and banking societies,

which made great efforts to adapt to the new conditions of the markets. Company internationalisation and business globalisation are phenomena that amplified the correlation, interaction and interdependence among national economies, creating business opportunities, but have also exponentially amplified the existing risks and even determined the occurrence of new risks. The structures in the global economic environment became even more complex, favouring the formation of financial loops and accelerating the spread of the financial crisis at a global level. The existence of the global market competitiveness for goods, services and capital is a fundamental economic reality that influences the behaviour of organisations and governments at a global level. The intellectual and financial capital will go where it is wanted and will stay there as long as it is well treated. Subsequently, the economic integration forces governments and organisations to compete [8].

Business ethics was often ignored. With the attempt to justify the attribution of high, or rather exorbitant, remunerations, the managements of great financial institutions were involved in financial operations with high outputs, but also high risks. Respective to this final aspect, a Romanian author said that „The USA unregulated dishonesty”. [9]

Specialists [1] believe that the renowned bankruptcies of large organisations were due to known risks, which were not taken into consideration, which should be an alarm signal for all managers, because these bankruptcies involved a high and dangerous responsibility.

3. Solutions to the challenges of the crisis

Isărescu[5] believes that, in the future, governments will be confronted to numerous challenges. Thus, on a short term, the main challenge is constituted by finding solutions that re-establish the trust of investors and consumers. On the long term, the main challenge is represented by adjusting the principles that guide the reform of the international financial system, mainly regarding the transparency, improving the norms regarding the accounting of bonds and

shares, ensuring the adequate norms of markets, companies and financial products, ensuring the integrity of financial markets (regarding market manipulation and fraud), and strengthening the cooperation among the financial world institutions (modernising the government structures of the International Monetary Fund and of the World Bank). Business ethics is present on the list of challenges of the future.

4. Conclusions

The contemporary business world is characterized by intensive competitiveness, aggressive business strategies, product and services standardisation, the desire to create profit with costs as low as possible, in the detriment of quality, etc. These practices determined an unsafe behaviour of organisations, one that had a disastrous finality, with global repercussions, which are the economic-financial world crisis.

Taking into consideration the challenges caused by the current economic crisis, in the current economic context, it becomes natural the preoccupation to find solutions to overcome the crisis and ensure the premises for economic growth which are capable of ensuring social welfare and an efficient business environment.

Overcoming the economic-financial crisis will lead to multiple changes, on all levels, such as: a new approach of performance, a new approach of human resources as main strategic resources of the organisation, a new approach of sustainable, lasting development.

The Social Responsibility of Organizations in Times of Crisis: the Case of Toyota Motor Company

Toma Sorin-George
Burcea Marin
Papuc Razvan

University of Bucharest, Faculty of Administration and Business

tomagsorin62@yahoo.com

marinburcea67@yahoo.com

razvan-mihail.papuc@drept.unibuc.ro

Abstract

Since the end of the nineteenth century and the beginning of the twentieth century scholars and researchers from different domains (e.g. management, economics, business, sociology, philosophy, theology, law, etc.) have become interested in theorizing the social responsibility of organizations concept. The aims of our paper are to present in short the concept of social responsibility of organizations, and to identify and analyze their social responsibility principles during a period of crisis. The research type is a literature review combined with a case study. The results of our research have shown that social responsibility has remained a key asset of organizations in times of crisis.

Key words: social responsibility, crisis, organizations, Toyota Motor Company.

J.E.L. classification: M14.

1. Introduction

Since the end of 2007 and the beginning of 2008 the global economic and financial crisis has acted not only on the advanced economies, and the developing and emerging economies around the world, but also on the big corporations and the small and medium-sized enterprises. The world “is facing the severest economic crisis in decades, affecting families and communities across the planet” [6]. The economic and financial bubble exploded in the United States of America (USA) with the burst of the subprime mortgage housing bubble.

Increase of the oil price, declining stock markets, increase of the interest rates, liquidity contraction of the banking system, deflation of the house price bubble, losses in consumer and investor confidence, drastic drop in demand for goods and services, global trade contraction and bankruptcies were among the main issues that contributed to the propagation of the current crisis at a rapid pace. As T. F. Geithner, the President and Chief Executive Officer of the Federal Reserve Bank of New York, stated in 2008: “The origins of this crisis lie in complex interaction of a number of forces. Some were the product of market forces. Some were the product of market failures. Some were the result of incentives created by policy and regulation. Some of these were evident at the time, others are apparent only with the benefit of hindsight. Together they produced a substantial financial boom on a global scale.” [3]

In their turn businesses have experienced a long process of change as their economic, social and environmental goals have not proved to be independent or in conflict. This is why H. B. Maynard Jr. and S. Mehrtens consider that “individual business corporations will survive only if they undergo a major shift to address individual and societal needs and become more democratic in their processes.” [5].

In the past decades there has been a clear tendency within the business world towards the incorporation of other social and environmental variables beyond the pure economic ones. Moreover, the financial scandals and the corporate bankruptcies have led to a mutation in the business perspective

of stakeholders (e.g. entrepreneurs, managers, stockholders, etc.).

Starting from the above discussion, one key question arises, as follows:

Is there a social responsibility of organizations in times of crisis?

In order to obtain information on this question, the authors used a research based on a literature review combined with a case study. In this respect the case of Toyota Motor Company represents a valuable example.

The aims of our paper are to present in short the concept of social responsibility of organizations, and to identify and analyze their social responsibility principles during a period of crisis. The second chapter of the paper deals with the concept of social responsibility. The case of a business organization is analyzed in the third chapter. This is followed by the final conclusions.

2. The social responsibility of organizations in times of crisis

Since the end of the nineteenth century and the beginning of the twentieth century scholars and researchers from different domains (e.g. management, economics, business, sociology, philosophy, theology, law, etc.) have become interested in theorizing the social responsibility of organizations concept. Step by step, the concept has become the subject of considerable studies, debates and commentaries, especially after the end of the Second World War.

In essence, any responsibility an individual/organization has towards the society (within he/she/it functions) as a whole is called social responsibility. According to the ethical principles individuals and organizations have the moral obligation to acting in the benefit of society at large. Organizations are part of a whole socio-economic system that includes other interconnected parts (Figure 1). The most important principles of social responsibility are remained the same in times of crisis, as follows:

- Accountability.
- Transparency.
- Ethical behavior.
- Respect for human rights.

- Respect for the rule of law.
- Respect for international norms of behavior.
- Respect for stakeholders' interests.

Figure 1. Organizations: a part of the whole socio-economic system.

Either passive (e.g. by avoiding engaging in harmful or destructive actions, etc.), or active (e.g. by achieving environmental and social goals or promoting an active citizenship, etc.), more and more organizations (e.g. enterprises, companies, corporations, public institutions, non-governmental organizations, etc.) have understood the need to operate in a responsible manner [8]. There are several benefits of the social responsibility of organizations such as:

- increased public trust;
- good organizational reputation;
- employees' safety, loyalty, and morale;
- better relationships with their stakeholders, etc.

The corporate social responsibility (CSR) concept appeared when the multinational and transnational corporations began to take critically into account the impact of their processes upon the communities and/or societies within they acted. P. Kotler and N. Lee defined CSR as “a commitment to improve community well-being through discretionary business practices and contributions of corporate resources” [4]. According to the Commission of the European Communities, CSR is a concept whereby companies integrate social and environmental concerns in their business operations and in their interaction with their stakeholders on a voluntary basis [2].

A. Carroll considered that the four social responsibilities can be divided into the following main categories [1]:

- economic responsibilities;
- legal responsibilities;
- ethical responsibilities;
- discretionary/volitional responsibilities.

In a time of crisis the implementation of CSR models should take into account the following issues [7]:

“1. CSR model implementation can be assessed as innovation, a key concept for achieving long-term entrepreneurial survival, a logical objective in situations of crisis.

2. CSR provides the desired atmosphere (internal culture, motivation) in which exceptional periods (crises) can be approached.

3. CSR gives adequate treatment to stakeholders, changing their possible position of risk towards the firm to an attitude of alliance.

4. CSR implementation reinforces business strategy, a necessity always covered but which has special relevance in periods of crisis.

5. CSR model implementation strengthens companies’ market position, when it is perceived as such. That is why communication and transparency are important. These two characteristics are inherent to CSR.

6. CSR offers a guarantee and confidence to investors, due to information offered by responsible companies. Financial resources are always necessary but they become critical in times of crisis.

7. CSR implementation obligates one to reflect deeply about main concerns clearly linked to long-range survival: identity (including mission and vision), systems (incorporating procedures and rules), accountability (defining what and how much responsibility is wanted) and transactivity (clarifying who affects and who is affected by the firm’s activity).”

In spite of the economic turmoil corporations have implemented and developed many CSR models. Toyota Motor Company is one of them.

3. Corporate Social Responsibility at Toyota Motor Company

In 1933, K. Toyoda created an automobile division within the Toyota firm, founded by his father, S. Toyoda. Two years later, K. Toyoda produced the company’s first prototype after recruiting several Japanese automobile experts. Finally, he established the Toyota Motor Company in 1937. In time, Toyota proved to be one the most successful automaker in Japan. Since 2007, Toyota Motor Company has been the largest automaker in the world (Table 1).

Table 1. The world’s largest automotive corporations in 2010

Rank 2010	Corporation	Revenues (USD millions)
1.	Toyota Motor (Japan)	221,760.2
2.	Volkswagen (Germany)	168,041.0
3.	General Motors (USA)	135,592.0
4.	Daimler (Germany)	129,480.6
5.	Ford Motor (USA)	128,954.0
6.	Honda Motor (Japan)	104,342.1
7.	Nissan Motor (Japan)	102,430.0
8.	Hyundai Motor (South Korea)	97,408.4
9.	BMW (Germany)	80,099.4
10.	Peugeot (France)	74,250.6

Source: [10]

Severely hit both by the financial and economic crisis and mostly by the 2011 earthquake, Toyota Motor Company has kept the features of a humanistic enterprise system. This is why management, shareholders and workers view themselves as parts of one single group jointly trying hard to ensure the prosperity of their company, namely Toyota. The roots of the well-known Toyota Production System (TPS) are found in its “respect for humanity” philosophy. Established in 1992 and revised in 1997, its guiding principles are the following [9]:

1. Honor the language and spirit of the law of every nation and undertake open and fair business activities to be a good corporate citizen of the world.
2. Respect the culture and customs of every nation and contribute to economic and social development through corporate activities in their respective communities.
3. Dedicate our business to providing clean and safe products and to enhancing the quality of life everywhere through all of our activities.
4. Create and develop advanced technologies and provide outstanding products and services that fulfill the needs of customers worldwide.
5. Foster a corporate culture that enhances both individual creativity and the value of teamwork, while honoring mutual trust and respect between labor and management.
6. Pursue growth through harmony with the global community via innovative management.
7. Work with business partners in research and manufacture to achieve stable, long-term growth and mutual benefits, while keeping ourselves open to new partnerships.

All these guiding principles are in total harmony with the principles of social responsibility above mentioned. They have highly facilitated the implementation and development of a specific CSR policy at Toyota Motor Company.

Since its foundation, Toyota has continuously strived to contribute to the development of society within its functions. According to its CSR policy, Toyota is seeking harmony between people, society

and the global environment, and sustainable development of society through manufacturing and provision of innovative and quality products and services that lead the times. For example, quality assurance is seen like a contract entered into by Toyota Motor Company and its customers. Therefore, quality is all Toyota employees’ responsibility. This is why quality circles were created and developed within the Japanese company. The Japanese automaker is convinced that the responsibility for quality assurance rests with the manufacturer, and he must satisfy his customers with quality in his products and/or services.

4. Conclusions

Today’s turbulent business environment is characterized by continuous change. In times of crisis the social responsibility of organizations has to be encouraged, stimulated and promoted on a large scale.

Our research has shown that in spite of the fact that the current economic and financial crisis has produced negative effects on businesses around the world, social responsibility has remained a key asset of organizations. Acting in a highly competitive globalised market, more and more business organizations around the world have begun to run their activities and processes in a more socially responsible way. As a veritable social responsible organization, Toyota has always been fully aware of its multiple responsibilities towards various stakeholders (e.g. customers, shareholders, employees, society etc.).

Entrepreneurial Culture and Entrepreneurship Policies

Trofin Maria Irina

„Anghel Saligny” Technical College of Bacău
dromereschi_irina@yahoo.com

Abstract

The influence of culture on economic activities of various companies was investigated at the beginning of '20. Weber showed the influence of religion on society's economic performance. Inglehard showed that large economic differences are related to cultural differences. Zhao Bing alleged strong links between culture and regional economic development level. But the cultural components have a positive influence on economic development? For the level of entrepreneurial activity differs significantly between countries and even between regions within a country?

The force of entrepreneurship is vital for growth and offers many social opportunities. Entrepreneurial capital investments are needed not only to form a "stock" for aspiring entrepreneurs but also the long term, to maintain a leading position in the global economy. Modernization should include cultural and institutional transformation. Culture acts as a conductor and entrepreneur as a catalyst for entrepreneurship.

Key words: entrepreneurial culture, entrepreneurship policies.

J.E.L. classification: L26, M13, M14.

1. Introduction

When the engine revs not enough economy or micro or macro-economic reasons are needed redesign strategy or economic paradigm, entrepreneurship is practical and sustainable solution. Experience periodic reversions to jelly by the combined creative entrepreneur resources and ask who he is, who should be in new contexts or the attributes we need to overcome when critic. Răspunsurile belonging to each era or school of thought, are different and inevitably incomplete.

2. Entrepreneurial culture - conceptualization

The concept of "entrepreneurial culture" became popular and accepted internationally as an expression of attitude to trade at a certain level of business. He describes a positive attitude, prevalent, and permissive social scale to support entrepreneurial activity [1]. The motivation lies in the emergence of economies and regions have flourished at the end of sec. XX and sharing a "business culture", which can be broadly described as "entrepreneurial" [2]. This type of culture, almost a sub-culture, describes the ability of these economies to adapt to the changing needs of the market economy and responsiveness to changing demand, innovation, types of products, opportunities and technologies but also includes historical experiences, beliefs, attitudes and values [3].

Internationally, there are a variety of entrepreneurial culture, each enabling and supporting entrepreneurial behavior in different degrees. Their diversity reflects future expectations and aspirations not only business but society as a whole and has its roots in highly personalized activities - entrepreneurs design their visions and ambitions and efforts to reorganize the social environment to make them materialize .

Arguing usefulness and ability to give sustainable business culture business environment, there should be an environment that combines the attributes of social, political and educational [4]. In societies where entrepreneurship has been contaminated with allegations of fraud, speculation, violence and crime, he was not well received (Chicago, 1930, Eastern Europe, 1990).

This negativity may be an inevitable stage of development but can facilitate the transition to strong and sustainable anti-entrepreneurial values. In these circumstances, it is difficult to change culture

when people are aware that survival is at stake but when survival is considered desirable [5].

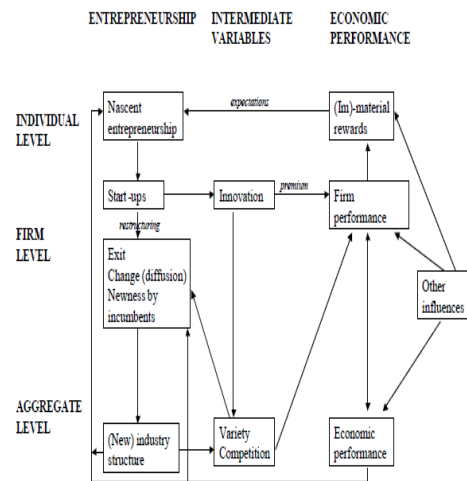

In chronological order we find cultural cognitive model of the initiation of a business consisting of [6] and improved over and Abramson, Lane, Nagai, & Takagi in 1993 [7]. It brings together the social context (social mobility, ecological niche, market conditions), cultural values (individualism, uncertainty avoidance, power distance, masculinity, orientation to time) and personal variables (risk taking, locus control, achievement motivation). Model name indicates the intent and key court decision to start a business: cognition, that cognitive structure and process. Cognitive structure related to the rational calculation of risk, the possibility or the extent to which it can be controlled assessment start-up opportunity and realistic anticipation of benefits. Cognitive process that maintains the cognitive scheme of feed availability heuristic, representation/design-redesign, trust and attachment.

Entrepreneurial culture values and norms are powerful forces for the control and direction of human behavior. In 1993, Erez and Earley [8] notes that cultural patterns provide cognitive scheme that assigns meanings and values to guide choices and motivational variables, commitments and standards of behavior. Moreover, because the values are usually determined early in life, they tend to be "programmed" into individuals resulting in behavior that are consistent with the context and culture takes time [9].

Closer look at interdisciplinarity, diversity and better anchored in the reality of institutionalized West in 1996 van der Horst points out that the key components associated with entrepreneurial culture, Entries (religion, education, politics, family, history, role models, other cultures, personal characteristics) that correlate different national culture, regional, found in the individual micro-scale business. Culture is the ideology, attitudes, behaviors, values, expectations, aspirations and social constructs manifested as economic, political, institutions, structures, classes and contexts [10].

Most often the concepts of entrepreneurial culture, entrepreneur or entrepreneurial spirit are put under scrutiny in terms of research closer to their immediate goals and utility that are associated with economic growth and development patterns. Wennekers and Thurik The 2002 leverages key element of any action / entrepreneurship: entrepreneurial spirit, analyzed at different levels of complexity. Secvețelor sequence and presentation of economic connections is presented as a theoretical fair value model synthesis [11].

Figure 1. Entrepreneurship and economic performance

Source: Thurik, Wennekers, Uhlaner, 2002

In 2005, A. Morrison provides a summary of moving more in line with changing realities. Entrepreneurial culture begins with positive attitudes towards entrepreneurship businesses seen as a vehicle of creating new jobs and wealth. It must enjoy the support and affordability policy framework and to support socio-economic structure competitive local/regional.

Renaud's research worth mentioning Redien-Collot (2006) even though its approach is anthropological said. From this point of view it noted the existence of two trends: 1. entrepreneurship as a need for life (in the most general sense, people live their lives so, the company is a way to be, to achieve maximum satisfaction in conditions at a time) and 2. entrepreneurial culture can be defined as a sub-culture that endorses many cultures, even if they were never in

contact with each other [12]. This last approach rather than proven stated enjoys more attention from researchers because of the two existing methodological approaches: a) first focuses on the comparison of characteristic variables for a sub-culture and b) the second focuses on high level interconnection between individuals and entrepreneurship implicitly defined as a sub-culture.

In addressing the descriptive parts entrepreneurial culture as subculture, Max Weber, more than others adopted an evolutionary approach to defining the culture of entrepreneurship as one of the major engines of Western modernization. He proposes to value strong arguments both for Reform moderation and for expansion of capitalism. Fundamentals of capitalism in Europe were made by entrepreneurial strategies implemented by Protestant merchants, bankers and craftsmen from the XVI and XVII. Weber is the first to consistently analyze various ways in which the principle of moderation is the expression of the cultural matrix that justifies all of the sub-culture of entrepreneurship. In fact, he describes the support that is reconfigured modernity and Western European capitalism. Inspired by Weber's theory, Brigitte Berger (1993) defines entrepreneurship as a sub-culture system configuring features, characteristics and indicators (a cultural pattern)[13].

In turn, Morrison (2000) distinguish several aspects of the interaction sub-culture and entrepreneurial environment that develops. He makes a list of cultural dimensions significantly influence entrepreneurial behavior: collective action in contrast to individual action, conformist behavior in contrast to the divergent and egalitarian treatment contrasts with the elitist. Equally, it suggests that entrepreneurial activity may impact on the environment contrasting psychological and moral country, but not explicit in specifying what he means when the environment can be considered culture.

Some observations ought to be made on the report culture - business activity:

- any entrepreneurial project or micro-scale or macro-scale cultural items recovered;

- for entrepreneurs, culture is seen as a force double stake: individual and creating new value, it helps the individual to produce social and cultural values;
- environmental and social-economic interaction summarizes "products" sustainable cultural when viable, desirable and fair;
- cultural dimension is often instrumentalized as a factor influencing the development of entrepreneurial projects;
- the degree of ambiguity of the relationship increases when they reach higher levels: consumption and production of culture, the default entrepreneurial culture;
- the short and medium intervals community culture means repetition and reproduction of the latter is insufficient to obtain, produce new forms of cultural expression;
- is an intervention that can come from individuals / entrepreneurs exception, structural reforms and / or interaction with other cultures.

Beyond social and chronological differences, the extent of reporting culture - sub-culture, individual or universal model of the entrepreneur, entrepreneurial activity items are subject to ebb and flow of cultural, cultural birth and rebirth, transformation potential that culture is constantly has.

Figure 2. A model of culture, institutions and new business activity

Source: Levie, Hunt, 2005

In 2005, J. Levie and S. Hunt proposed a model that interacted cultural values (as defined by Schwartz and Hofstede) against a particular economic and institutional context

[14] and in 2006, Zoltan Acs demonstrate how entrepreneurship is engine of economic growth [15].

Figure 3. Global Entrepreneurship Monitor (GEM) Conceptual Model

Source: Acs, Z.(2006)

Huiping Guo Yifu and Nie (2006) proposed measuring the level of entrepreneurial culture through analysis of five dimensions: the ratio of industrial output of private and total industrial production (X1), the number of self-employed workers to total population (X2), the number of patents granted per capita (X3), the number of private companies per capita (X4) and the number of private investors (X5). Using X1 X2 X3 group independent variables that measure of entrepreneurial culture and regional GDP per capita in 2004 as a measure of the degree of development, the authors found a strong correlation between X3 and X4 and another, very close (0.6859) threshold 0.7 A standard coefficient of correlation between X1 and X5's Guilford.

The empirical analysis indicates that regional economic development and entrepreneurial culture there is a high correlation coefficient of 0.90. The authors' conclusion was that some entrepreneurial culture tend to align more closely with entrepreneurial orientation than others and as reverse, entrepreneurial orientation has an impact on regional economic development. They believe that the system of values specific to a particular region determines the development of certain personality traits and motivates some people to engage in behaviors that may not be as widespread in other regions. According to their research, entrepreneurial activity may be one of these

behaviors vary from one region to another due to differences in cultural values and beliefs [16].

Modernization must include cultural transformation. From this perspective, entrepreneurial culture is developing "bottom up" so that potential foster entrepreneurial business culture. As such, despite the presence of a relatively hostile environment, people are motivated by factors such as financial rewards, achievement, career and social rewards and individual fulfillment, will start their own business, while if the environment is very favorable entrepreneurial activities, will be very easy to initiate / develop entrepreneurial activities.

3. Entrepreneurship policies – a tool

Traditional triad: the policy instruments of coercion, in essence, the freedom to contract business-regulation, competition policy and public ownership of business policy is less relevant in a global economy. The new approach focuses on creating and marketing knowledge and answer process guidance for small businesses, which face a cost disadvantage inherent size scale to commercialization of knowledge, entrepreneurship and knowledge-based entrepreneurship.

Entrepreneurship policy is a relatively new phenomenon. An important distinction should be made between traditional policies regarding small business and entrepreneurial policies. Small business policy refers to policies implemented by an agency or government ministry charged with the mandate to promote them. The current definition of small business varies considerably across countries, ranging from businesses with fewer than 500 employees in some of the most developed countries like the United States and Canada, more than 250 employees in the European Union to 50 employees in many developing countries. Thus, small business policy is almost exclusively oriented towards the existing stock of business and virtually all instruments included in the portfolio of policies designed to promote the viability of small businesses.

By contrast, entrepreneurship policy has a larger spatial and temporal horizon and a more varied range of instruments. While small business policy, focuses on the existing

stock of small, entrepreneurial policy is more comprehensive in that it includes potential entrepreneurs. This suggests that entrepreneurship policy is focused on the process of change, regardless of the organizational unit and has a higher sensitivity to framework or contextual conditions that shape decision making by entrepreneurs and potential entrepreneurs. While small business policy at the organizational level positions in business, entrepreneurship policy includes several organizational units and levels of analysis. These vary from individual to enterprise, to cluster or network and may involve the sector size, industry or services, or a spatial dimension, such as a neighborhood, city, region or country. As each of these levels requires at least one important objective for policy entrepreneurial interactions and links between these different levels are also important. In this sense, entrepreneurship policy tends to operate a system while small business policy is punctual and relatively static. However, it is important to emphasize that small business policy, remains the heart of business and the need for institutional adaptation to operational policy for entrepreneurship.

The second significant difference is the tools. Almost every country has an agency or government ministry responsible for promoting the viability of small businesses. These ministries and agencies have now developed a well-established arsenal of tools for small business promotion policy. Needless to say, but there are no such agencies to promote entrepreneurship but no fee to promote entrepreneurship. Relevant issues covered by the policy entrepreneurs can be found on a wide range of ministries and agencies, ranging from education, trade and immigration issues. What is lacking is the vision of unified correlation that instruments used by a ministry or another, maturity, flexibility and adapt to complex economic realities of these instruments. Instruments of restraint such as freedom of contract, antitrust regulations and public property are generally controlled and used for federal or national level.

By contrast, entrepreneurship policy instruments are generally applied at decentralized (at the state or city or local, not national or federal). It is important to

establish the locus of entrepreneurship policy instruments such as indirect taxes, immigration and education, and more direct instruments, such as providing funding or training. If entrepreneurship policy can be seen as an attempt to create a new form of economy, entire institutions that were the cornerstone of the economy Solow (1957) should be reconfigured, at least in OECD countries to create an entrepreneurial economy.

4. Building a support system for entrepreneurial culture

If there are entrepreneurial society, building a support stand is based on encouraging entrepreneurship and entrepreneurial culture.

Entrepreneurship is considered a central force of economic development because it creates growth and serves as a vehicle for innovation and change. It is necessary to improve the entrepreneurial climate coupled with efforts to improve attitudes towards entrepreneurship. A solution would be to create a favorable environment for entrepreneurs.

Flowchart enabling environment to achieve that entrepreneurs and their activities is a circular and evolving.

Figure 4. The impact of environment on entrepreneurial activity

The purpose of maintenance and enhancement must give entrepreneurs more opportunities to learn, that learning associated with the development of entrepreneurial knowledge: the opportunity for recognition [17] and the necessary opportunity exploitation [18]. Both types of knowledge are expected to come primarily from individuals engaging in various types of practical work experience that exposed them

to concrete decisions and solving problems during their careers or in their training.

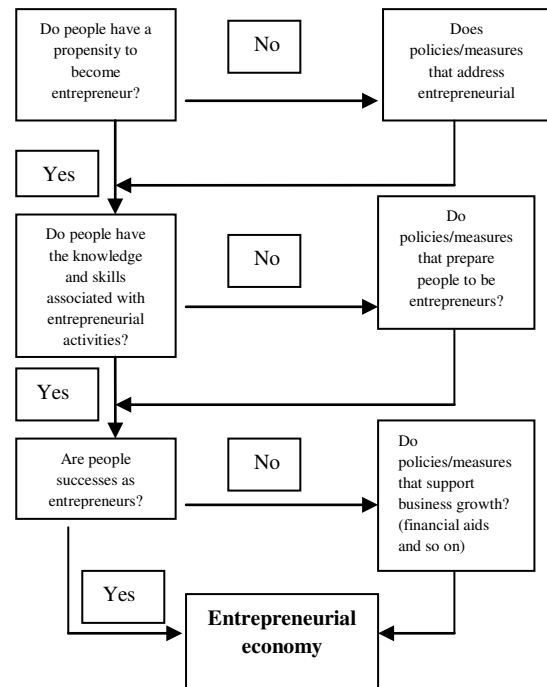

The use of ways to encourage entrepreneurial activities is another solution for encouraging entrepreneurship and developing entrepreneurial culture. Entrepreneurial culture medium is often submerged for entrepreneurial activities. Entrepreneurs were often agree with statements like "start-up means risk but also excitement / challenge", while non-entrepreneurs the majority concluded that "failure means loss of boldness, respect "[19].

In order to promote entrepreneurial culture, developing countries, regional constraints to break ideological attempt to develop innovative ideas and concepts to promote economic growth. Ways to encourage entrepreneurial activities such as the entrepreneurial net, network systems to provide support and networking events, project / projects, business support advisers and experts, successful entrepreneurs as role models, organizing forums regional education.

Reality shows that a region's economic development depends not only on building economic infrastructure - "hard power", but also the cultural specificity and its strength - "soft power". Cultural factors change slowly, but not easily, or when designing the past and adapt even when, as now for the future (culture can make to encourage entrepreneurship - long term and a culture that cultivates and rewards their contractors can attract new businesses and further activate latent entrepreneurial characteristics of its residents). Changing patterns of individual and group behavior ultimately affects the company culture, and the cycle begins again. A benign interaction between cultural development and regional economic development will be formed in this way and the competitive position of a region will be high.

As a logical scheme of control in understanding cultural and social bases of a given region, can provide a more appropriate starting point to build a more entrepreneurial society and economy.

Figure 5. Framework for system of antrepreneurial culture

Source: Yifu Guo, Huiping Nie, 2010

5. Conclusions

Entrepreneurship is a concept on how to upload the current on the cultural significance. He should be treated in terms of historical, social, political, economic specify which appeared and developed. Direct correlation with the manifestation of his country's economic development comes only to update its strategic importance, invariably interdependent with other factors that influence development. Expression of free enterprise and entrepreneurship is done mainly in small and medium companies that provide effective and stimulating the exercise decision. During the recent evolution of SMEs in Romania entitles us to ask more from the Romanian business environment, more support and accountability from the state and more consistencies of policy makers.

The Uppsala Internationalization Process Model and the Concept of Learning

Trufin Ovidiu Serafim

“Alexandru Ioan Cuza” University of Iasi, Center for European Studies
ovidiu_trufin@yahoo.com

Abstract

The Uppsala internationalization process model is revisited in the light of changes in business and teoretical advances that have been made since 1977. Now the business environment is viewed as a web of relationship, a network, rather than as a neoclassical market with many independent suppliers and customers. In the light of recent work of learning in organization, this paper adresses some issues related to how the process of learning is conceptualized in the Uppsala Model. The consequences of the strong emphasis on individuals as the holders of market-specific knowledge is also discussed. The paper concludes with some remarks on the emergence of interesting research issues about the internationalization behavior if a broader concept of organizational learning is applied.

Key words: multinationals (MNE), Uppsala Model, Learning, Internationalization.

J.E.L. classifications: F23, F43, O11.

1. Introduction

The internationalization of the firm has attracted scholarly attention from several perspectives, but these fall into two main themes. On the one hand, and largely attributable to the dominant form of international business at the time in the mid-1970s, theory emerged from an economics heritage to explain the very nature of the large MNE. Under this market internationalization theory, imperfections in international markets motivate transactions cost minimising firms to bring exchange into the governance structure of the firm. The large MNE became a structure of geographically dispersed, internal markets. This explains well the nature of the large

MNE, but it is static and it demands that markets are imperfect or missing. At the same time, Nordic school of thought, internationalization process theory, sought to explain the process through which internationalising firms traversed as they moved into foreign markets and deepened their involvement in these markets. This approach took on a behavioural heritage in attempting to bring dynamism into understanding the internationalization of the firm, and it attributes internationalization dynamics to managerial commitment, resouces and acumen. While both of these explonations sometimes are identified whith the process of firm internationalization, Uppasa Model expansion through international extension is clearly of the latter Nordic genre [6].

2. Methodology

This article aims to identify the relationship that exist between the Uppsala Model and concept of knowledge and learning.

In order to achieve this goal a content analysis of 7 relevant articles have been made. The analysis was focus on identifying a definition of Uppsala Model and the concept of learning in this internationalization process. The selected articles were published during 2001-2011 in the Journal of International Business Studies, Management International Review, World Business, International Business Review.

The results of this analysis will be showed in part five of this article. So, the third part will focus on the Uppsala Model, in order to surprise the the obtimal mode for entering a market by analyzing their costs and risk while the fourth part concentrates on the Uppsala Model and the concept of learning.

3. The Uppsala Model

The Uppsala Model views internationalization of the MNEs as a dynamic evolutionary process where the firm gradually increases its international involvement. Researchers in the Department of Business at Uppsala University in the 1970s made empirical observations that contradicted the established economics and normative, international business literature of the time. According to that literature, firms choose the optimal mode for entering a market by analyzing their costs and risk based on market characteristics and taking into consideration their own resources. A number of industry studies of Swedish companies frequently began internationalizing with *ad hoc* exporting. They would subsequently formalize their entries through deals with intermediaries, with agents who represented the local companies in the foreign markets. Usually, as sales grew, they replaced their agents with their own sales organization, and as growth continued they began manufacturing in the foreign market to overcome the trade barriers. We labeled this dimension of the internationalization pattern the *establishment chain*. Another feature of the pattern was that internationalization frequently started in foreign markets that were close to the domestic market in terms of *psychic distance*, defined as factors that make it difficult to understand foreign environments. The companies would then gradually enter other markets that were further away in psychic distance terms. This process had its origin in the *liability of foreignness*, a concept that originally explained why a foreign investor needed to have a firm-specific advantage to more than offset this liability. The larger the psychic distance the larger is the liability of foreignness[2].

We searched primarily in the theory of the firm for explanations for the deviations between what the extant theories prescribed and the Swedish pattern on internationalization of the MNEs. First, firms change by learning from their experience of operations, current activities, in foreign markets. Second, they change through the commitment decisions that they make to strengthen their position in the foreign market. We define commitment as the

product of the size of the investment times its degree of inflexibility. While a large MNE investment in saleable equipment does not necessarily indicate a strong commitment, unwavering dedication to meeting the needs of customers does. Experience builds a firm's knowledge of a market, and that body of knowledge influences decisions about the level of commitment and the activities that subsequently grow out of them: this leads to the next level of commitment, which engenders more learning [7].

The model does not specify the form that increased commitment might take. Indeed, commitment may decline, or even cease, if performance and prospects are not sufficiently promising. Contrary to the views expressed by some, the process is by no means deterministic. We assumed nonetheless that the process of internationalizing will continue as long as the performance and prospects are favorable.

We also assumed that learning and commitment building take time. This explains why moves into more risky, but potentially rewarding, modes and moves into markets that are more distant in terms of psychic distance are made incrementally.

We considered the model to be descriptive, largely because we based it on Cyert and March (1963). It is generally been characterized in the subsequent literature as behavioral, compared with other theories that are seen as economic, such as internationalization theory (Bucley and Casson, 1976), transaction cost theory (Hennart, 1982) and the eclectic paradigm (Dunning, 1980) [5].

4. The Uppsala Model and the concept of learning

A basic assumption of the Uppsala Model is that lack of knowledge about foreign markets is a major obstacle to internationalization operations, but such knowledge can be acquired. Acquiring knowledge is first of all a question of being active in the new environment rather than of collecting and analyzing information. By operating in the market, the MNE not only acquires information about that market, but also becomes closely connected to the market in such a way that it is difficult to use its

resources for other purposes.

A second important assumption is that decisions and implementations concerning foreign investments are made incrementally due to market uncertainty. Incrementalism can be seen as a management learning process in which 'learned by doing' is the basic logic. The more the firm knows about the market, the lower the perceived market risk will be, and the higher the level of foreign investment in the market. The firm postpones each successive step into a certain market until the perceived risk associated with the new investment is lower than the maximum tolerable risk [1].

A third assumption is that knowledge is highly dependent on individuals and therefore difficult to transfer to other individuals and contexts. The problems and opportunities intrinsic to a certain market will be discovered primarily by those who are working in the market, people in a sales subsidiary or some other frontline unit. For them, the adaptation and extension of the present operations will be the natural solution to a problem or the reaction to an opportunity. Experience generates business opportunities and is supposed to work as a driving force in the internationalization process. The model is founded on four core concepts: market knowledge, market commitment, commitment decisions and current activities. Market knowledge and market commitment at a certain point of time are assumed to affect the commitment decisions and how the activities are carried out in the subsequent period, which in turn will influence market knowledge and market commitment at later stages. On the basis of these four concepts, and by making the assumption of incrementalism, the model predicts that the basic pattern of firms' internationalization is: (1) to start and continue to invest in just one or in a few neighboring countries, rather than to invest in several countries simultaneously; and (2) that the investments in a specific country are carried out cautiously, sequentially and concurrently with the learning of the firm's people operating in that market [4].

Firms are supposed to enter new markets with successively greater psychic distance and the market investments develop according to the establishment chain. The Uppsala Model deals with how organizations

learn and the impact of learning on organizational behavior. The main emphasis is on experiential learning through the ongoing activities. However, research during the two last decades indicates that organizational learning includes several dimensions with consequences for firm's behavior. For instance, it has been pointed out that, through their business relationships, organizations can gain access to the knowledge of other firms, without having to go through exactly the same experiences as these firms. Imitative learning, learning by observing other firms with high legitimacy and acting in a similar way, has also been focused upon by many researchers as a common learning mechanism. Different 'short-cuts' to get knowledge by acquiring other organizations or hiring people with the necessary knowledge have also been included in the concept of organizational learning. Finally, it has also been maintained that organizations can learn by conducting a focused search for new information rather than through experience from own activities.

A closer look at the literature also reveals that organizational learning has two different meanings in connection with an organization's effectiveness. The first of these stresses that learning, if it is positive, increases the organization's knowledge about the possible alternatives. It clearly emphasizes that learning does not have to increase the organization's effectiveness, or even its potential effectiveness. New findings can always overturn what was previously known to be true. The more the range of alternatives is enhanced, the more the organization has learnt, and the larger the number of potentially useful alternatives in the future. While this perspective highlights the information aspect of learning, the other meaning focuses on competence. Over time, the organization learns to carry out its operations with an increasing degree of effectiveness. This process is often thought of in the context of a learning curve and of an accumulation of knowledge and skills. Learning is supposed to increase the performance and reduce the variation in the performance. By doing 'more of the same' the number of alternatives are reduced over time, as the organization becomes more and more proficient at its current activities, procedures and technology. It has sometimes been

argued that, at the extreme, the result is a competence trap. The Uppsala Model deals more or less exclusively with experiential learning. This is stated explicitly by the model builders in relation to their discussion of market knowledge, which emanates from 'personal experience' and 'arises from their current activity. Consequently, learning through imitation, learning through incorporating people or organizations, or searching and scanning for new information have a limited impact on how the firm's internationalization behavior is modeled. In the model, learning has very much in common with 'the learning curve thinking'. The model emphasizes that learning is linked to current activities in specific markets. That is, by continuing to do what it is already doing a firm learns more about the actual business, and increases its competence to continue with and deepen its activities in that particular market. Therefore, it will prefer to stick to a certain market and learn more about that market rather than to try new alternatives. The learning curve perspective is also reflected in the way the concept of market commitment is used in the model. Investment in current activities will increase the commitment to other actors in the market and reduce the alternative uses of the committed resources. The decision maker prefers to reduce uncertainty by learning more about the existing business rather than exploring new business alternatives. One can also argue that the Uppsala Model employs a reactive rather than proactive perspective of experiential learning. By reactive learning, we mean acquiring more knowledge about the already identified solutions, while proactive learning focuses on the search for new solutions. This distinction is significant as the various forms of search might be carried out by different types of organizational unit or through different types of search process. The distinction also reflects the fact that the stimulus of learning can be a problem or an opportunity. The reactive nature of the model is reflected by its concern with problemistic search. An organization is supposed to start its learning when a problem arises that is related to current activities. The solution of the problem is sought in the neighborhood of existing solutions. When a satisfactory solution is found, learning is terminated. The

application of organizational learning in the Uppsala Model is limited to certain aspects, leaving out the other aspects. This has certain implications for the model's ability to explain and predict the internationalization behavior accurately [3].

5. Conclusions

Although the Uppsala Model seems to equate incremental behavior more or less with experiential learning, it is not totally clear whether incremental behavior is simply a consequence of experiential learning or whether it is an independent variable. However, these two variables are conceptually different. Above all, incremental behavior reflects the organization's perceived uncertainty. The higher the uncertainty, the smaller each step, because high steps involve risks that are too great. Experiential learning reflects the need for market knowledge, because such knowledge is difficult to acquire through other means of learning. But it does not tell us whether learning will be carried out by taking up activities that are closely related to the existing ones, or by taking up totally new activities.

The standard version of incrementalism with its emphasis on frequent, multiple, small changes is not necessarily the only learning strategy. It is also reasonable to assume that the level of tacit knowledge, acquired by the firm, has an impact on the firm's perceived uncertainty. If we treat experiential learning, and incremental behavior as two distinct variables rather than two sides of the same coin, it becomes apparent that they have a different impact on the internationalization process.

By learning from conducting its own activities in a certain market, the firm acquires tacit knowledge that will reduce the perceived uncertainty about that market. This, in turn, will reduce the need for incremental behavior. The risk of making mistakes by taking large steps is reduced when the firm has more knowledge about the market. Consequently there is actually a negative relationship between experiential learning and incremental behavior. This means that the internationalization process involves an increasing pace of the firm's investments made in a certain market. If

experiential learning has a strong and direct impact on market knowledge and consequently on the need for incremental behavior, the cautious character of the internationalization process will weaken after some time. This conclusion is supported by research that indicates a positive relationship between the market knowledge and the pace by which firms commit resources in foreign markets. This reasoning is also in line with the notion that experiential learning favors simultaneous rather than sequential entry strategies. Experience leads to higher confidence in the mind of the decision maker and therefore reduces the expected cost of entry. The propensity to postpone the entry into different markets will therefore decrease with an increasing experience.

Some Considerations Regarding the Role of “Academic Nepotism” in the Economic Research – the Case of Romania

Țăran-Moroșan Adrian
Brătian Vasile

“Lucian Blaga” University of Sibiu, Faculty of Economic Sciences

adrian.morosan@ulbsibiu.ro

bratianvasile@yahoo.com

Abstract

The existence of a situation commonly found in economic research and sometimes called academic nepotism, other times methodological nepotism, characterized by the adoption by young researchers of almost unanimously accepted ideas by the academic world, rather out of convenience than conviction was observed and shown in detail in the scholarly literature. In this study we aim to analyze whether the legal regulations applicable to evaluate the research of the academic environment representatives in Romania encourages methodological (or academic) nepotism.

Key words: academic nepotism, methodological nepotism, long tail theory, economic research in Romania, evaluation criteria for research

J.E.L. classification: B40

1. Introduction

A few weeks ago, taking part in a roundtable held in a stately building of a beautiful university from the famous university town of Cambridge in Great Britain, the intervention of a U.S. participant has brought into focus a highly topical issue of how economic research was made in the past and how it is generally made today. The American professor recalled how a work written in his youth and sent to a journal to be reviewed and published was brutally refused by the journal’s reviewers, the only sentence written by them in the review being “How dare you?”. The researcher remembered with humour that it took him

several weeks to understand what happened. What rule of conduct did he violate and how did he violate it? After a considerable period of time he got the answer - of disarming simplicity - to the questions that troubled him: he had sent an article whose profile didn’t match the profile of the journal. And this didn’t happen because he had sent an economic article to a gardening magazine, or because he had sent an article about marketing to an international accounting journal. No! ... The response of the journal’s reviewers was determined by the fact that the American professor, heterodox economist, challenged (economic) concepts which were “unchallengeable” for the representatives of mainstream economics and dared to do so in a magazine belonging to them.

2. On the mechanism of academic nepotism

The description of the presented situation remembered us of one of the concepts invoked very often in the last decades by social sciences researchers, and thus by those from the economic field: academic nepotism. At first glance, the employed term creates confusion, especially in our country, where the use of the concept of “academic nepotism” has a totally different connotation when it is associated with topics related to academia. In Romania, academic nepotism is often invoked in its proper sense and designates the situation where the staff of an academic structure comprises more people who are in a family relationship. But this is not the sense in which we use the concept of academic nepotism in our paper. We shall use the mentioned concept as synonymous with methodological nepotism, which,

according to some authors [1] designates that situation in which out of convenience and because of the "publish or perish" rule applied increasingly often in today's academic world, researchers choose even from their youth to apply certain principles and methods that have been proven productive to date. The alternative, to challenge those methods is much less useful for the person who chooses it because of the reason suggestively presented in the example mentioned by us, given by the American professor. The objectors of fundamental economic theories inconvenience, most of the times, the representatives of mainstream economics and therefore risk not to be published in journals controlled by them. Or, it is exactly these journals that count the most in the majority of situations, when the evaluation of researchers is made by taking into account the rating systems which are based on the importance of the number of quotations of articles published.

In these situations a young researcher faces a choice between two alternatives: disputes the theory or adopts the theory: If the researcher choose the first option he may be wrong, especially where the theory is part of the hard core of economic science, supported by most researchers in the field, since it implies that they have analyzed it prior to its adoption and considered it accurate. However, if the young scientist is strongly convinced that he noticed a weakness of the theory in question, it is possible that the above mentioned argument does not stand. He may decide, in this situation, despite opposition from the "great minds" that preceded him, to challenge the theory in question. But he also should have where to do so in order to be heard. And the easiest way is to use the services of a well positioned journal within a rating system. Thus, the young researcher will choose from a specific list of publications the one among the first and corresponding in terms of treated topics to its research theme. This choice will be based on the rational expectation that a magazine dealing with similar research topics addressed by a particular author will be read by other researchers interested in those topics. Thus, by publishing the research results in such a journal, the researcher may notify the academic world that the old theory

is not properly grounded and should be replaced with a new theory, proposed by him.

If for the researcher this is the way forward to maximize the impact of his research, from the journal's perspective the situation changes fundamentally. In most cases, the journals that are highly rated in the economic sphere belong, or are managed by representatives of the mainstream thinking. It is natural to be so and believe that it will always remain the same, because, as we talk about current dominant thinking in a field, this means it was adopted by most researchers belonging to that field. Or in this situation, the young researcher we are talking about will be in the situation, not favourable to him, to send an article through which he wants to make the results of his research known, which challenges the fundamental theories of the field, to those persons responsible for the authorship of those theories, or their "grandchildren" (from the methodological and not biological point of view, of course). The chances of such an article to be published in such a journal are obviously extremely low.

The creators of certain theories or their supporters (who in the given situation are also the publishers of the type of journals we talked about) are facing the situation of either publishing the article they receive (which if it supports correct ideas, demonstrate their own theories, proving their futility and driving away the readers who share the same views with the editors) or reject the said article, defend their own theories, retain their readers and continue to be cited. The choice in this context is not difficult because, often researchers are not indifferent (and thus objective) about the fate of their own theories.

In the given situation the young researcher is facing two other alternatives from which he can choose: either to publish the article in a lower rated journal and therefore less visible, whose reviewers are not part of the representatives of the mainstream thinking and who could adhere to the ideas presented by the researcher and decide to publish the article that supports these ideas, or to abandon his contesting ideas and adopt the mainstream thinking. In the latter case the author can develop further research in which to cite authors that are part of the mainstream thinking, which he will send for

publication (with big chances of success) to journals in which those authors have published, which thus support them. In the first case the young researcher risks not to be quoted (or be rarely quoted) because his article will have reduced visibility, being published in a lower rated journal. However, in this case there is also the possibility that, if research results are accurate and have a major impact, the article to attract more and more supporters, to be increasingly quoted, to raise the rating of the journal in which it appeared and to overthrow the previous rankings, a situation known in the scholarly literature [2] as the long tail theory. This is, however, extremely rare because both researchers and representatives of academic journals know that the likelihood of such a case is extremely low and therefore, out of convenience, often tend to ignore it.

As a result of what was said so far, we find that the natural tendency of a young researcher who wants to become quickly known in the academic world is to become a practitioner of academic nepotism, his chances to succeed in this situation being on average, much higher than if he chooses the option of challenging the theories. We are certainly aware that the fundamental scientific theories known today from most fields belong to objectors of old theories, but most of the representatives of the academic world today cannot boast the paternity of such theories, but only of a number of studies, more or less quoted. Thus, in order to be a successful representative of the current academic world, the magic indicator that one must accomplish and which is more important than anything else is the "number of quotations" (of the article or the journal in which the article is published, according to specific national regulations).

National regulations have, as it can be noticed, a deep mark on the natural tendency to adhere to the practices of methodological nepotism, being possible to emphasize it, or to discourage it.

In what follows, we will try to present the effects of the Romanian national regulations concerning the evaluation of researchers from the academic environment on the mentioned tendency.

3. The evaluation system of Romanian academic research - stimulus or hindrance for the methodological nepotism

In recent years, in Romania, it was tried through legal regulations developed in the field of evaluating the scientific research conducted by the representatives of the academic environment, to align these criteria to those used internationally. Romania currently has an evaluation system which takes into account as determining factor the number of publications of Romanian researchers in journals classified by the number of appeared quotations. Thus, national legislation encourages the publication of articles in the most quoted journals which, as we have seen, belong to the economic sphere and not only to the mainstream thinking. If the young researcher we were talking about in the beginning of our article has not published the results of his research in these journals, he will not be able to advance.

Thus, we believe that the natural inclination of researchers to join the academic nepotism practices in Romania is backed by the legal regulations which amplify this tendency.

The supporters of this evaluation method of academic research will say nevertheless that such a system is practiced in all civilized countries. Such an assertion, however, ignoring the fact that it is at odds with reality, cannot be logically grounded in the case of Romania. If in developed countries in terms of research the methodological nepotism is encouraged, among others, in order to also preserve the hegemony of that state in that field of science, in our country such an approach can only encourage the maintenance of the current state of affairs, which not is desirable. Of course, it is not recommended either to use certain evaluation criteria that are different from all those used by other states, but must, in addition to the "classical" criteria, used internationally, to also create country-specific criteria to allow the development of the aforementioned "long tails" which the Romanian research in general and the Romanian economic research in particular certainly need. Using a single determinant criterion for evaluating the

Romanian scientific research is certainly not in its advantage and not in Romania’s advantage.

General Aspects on the Superior Education Sector in Romania and its Potential Contribution to Economic Development

Tigănașu Radu

„Alexandru Ioan Cuza” University of Iași,

Faculty of Economics and Business Administration

rtiganasu@yahoo.com

Abstract

The performances achieved in economy depend in a good measure on the possibility of developing innovative projects. The development of this capacity at national level is a goal that a country should always pursue.

In the present paper we intend to realize an analysis of some of the problems in educational sector and some performances of the tertiary education in Romania in comparison with other central and eastern European countries, in terms of some specific indicators, relevant especially for innovative process and the economic progress. Our statement is necessary for Romania as the indigenous human capital is clearly under-utilized by the neglect of public and private spending in education and research.

Key words: superior education, economic development, employment.

J.E.L. classification: I 21, J 21, J31.

1. Introduction

The present stage of evolution at global level and the open competition have generated the need of special attention in investing, at national or even community level, in the human resources which are supposed to be able to produce, adapt and implement innovations. This imperative is the main reason for which we tried to analyze in the present paper the situation of the Romanian tertiary education, which should be the first field to generate added value in what is concerning the preparation of the young specialists and their formation in a manner that will stimulate them to try to

bring their own contribution in their domains, through innovative projects.

Romania has a good potential in what is concerning the innovation possibility, fact that is proved by the numerous prizes obtained by the Romanian inventors at international competition in field, but in our opinion this potential is not only far from being utilized at its maximum capacity but it has not, in some cases, the possibility to affirm and develop. This situation occurs in principal because of the lacks of the educational system, especially of the tertiary education, which are not able to encourage the creativity and to support the exceptional students with low financial possibility. This system is created to pursue some immediate interest and goals and have little performances in what is concerning the long time results of the instructed students and their added value in the field they work. The systems based mainly on testing and individual study, the lack of interest of the teachers are only some aspects that require immediate measures. We do not intend to make here a qualitative analysis of the tertiary education, because of the low space available, but we hope that the presented facts and data will be sufficient to get an appropriate image of the issues we proposed for analysis.

In what is concerning the education and the tertiary education in general, other paths to change are possible. On a national level, we may consider Finland as an example. As the unemployment rates were almost 19 percent in the early 1990's, Finland consciously coordinated economic and educational transformation. The nation's effort to develop a creative and flexible knowledge economy was accompanied by the development of a significantly more decentralized education system. Finland now has a largely local curriculum and virtually

no standardized testing. Finns control teacher quality at the most important point, the point of entry. Applicants to teacher education programs have only a 1 in 10 chance of acceptance. Even though teacher pay is only average for industrialized nations, teacher retention is high because conditions are good. Within broad guidelines, highly qualified teachers create curriculum together in each municipality for the students they know best.

In classes rarely larger than 20, Finnish teachers know their students well. Teachers are free from excessive paperwork, endless external activities and they receive generous specialist support as needed. With these advantages, teachers strive for quality by quietly lifting all students up one at a time. In each university, the rector is seen as part of a "society of equals", not as a line manager. The results: Finland boasts with one of the best tertiary education system in the world. It also ranks at or near the top in economic competitiveness [1].

2. General considerations on education sector in Romania

Among the elements that characterize an educational system we can include transparency, simplicity, the accessibility of funds, investment in education, good remuneration of labor in education etc. To see which the situation of education in Romania is, we will present some data collected from the National Institute of Statistics. Thus, from Romania's total population of approximately 22 million inhabitants, we found that the distribution of persons registered in an educational system is as follows:

Figure 1. Enrolled population in Romania

Source: National Institute of Statistics, Bucharest, 2009

The educational sector in Romania presents the following characteristics:

- ✓ in *primary and secondary education*, as expected, we notice the highest participation (in the school year 2000/2001 there were 2498139 children and in the school year 2008/2009 their number arrived to 1790000). The trend is upward and a possible explanation of this fact could be more pronounced decrease of birth in Romania after 1989;

- ✓ in *high school education* in the period 2000-2009 is observed a slight increase of the scholars (from 694,376 in 2000/2001 to 792,000 in 2008/2009);

- ✓ the smallest rate of enrollment we meet in *vocational and apprenticeship education* and in *post high school* (220,000 persons in 2007/2008) and *foremen education* (46,000 persons in 2008/2009);

- ✓ in *tertiary education*, has been recorded a growing rate of schooling (from 452,621 persons in 2000/2001 to 907,000 people in 2008/2009).

Consequently, the analysis shows that the largest growth concerning the population enrolled in education, we meet after 2000 in tertiary education. Although the number of students increased approximately four times between 2000-2009 years, their percent per 1000 inhabitants in Romania is lower than in the other eastern European countries, and among the lowest in Europe. This is certainly a premise for some of the failures of this country, both economically and socially.

In the Table 1 are presented the number of graduates on different level of education in Romania, considering its population of 21.53 millions in December 2008.

Table 1. Number of graduates on level of education

Number of graduates on level of education	2006/2007	2007/2008
Secondary education	231800	219500
High school education	185300	187600
Vocational and apprenticeship education	150200	133800
Post high school and foremen education	15900	12700
Tertiary education	112200	125500

Source: National Institute of Statistics, Bucharest, 2009

Through the Lisbon Agenda, EU established 5 indicators showing the extent to which a country and the Union, in its totality, are capable to face the challenges of knowledge economy. Five EU benchmarks for 2010 are [2]:

- I. No more than 10% early school leavers;
- II. Decrease of at least 20% in the percentage of low-achieving pupils in reading literacy;
- III. At least 85% of young people should have completed upper secondary education;
- IV. Increase of at least 15% in the number of tertiary graduates in Mathematics, Science and Technology (MST), with a simultaneous decrease in the gender imbalance;
- V. 12.5% of the adult population should participate in lifelong learning.

Romania's positioning in relation with the third, fourth and the fifth knowledge economy indicators (“Lisbon indicators”) is presented in the Figure 2:

Figure 2. Positioning Romania in relation with the Lisbon indicators

Source: after Eurostat, 2010

From the analysis of these data, a clear conclusion results: the current educational system is not capable to ensure a competitive position in the knowledge economy. We can see that these proportions are worrisome. Although the targets were established for 2010, we observe that for Romania will be quite difficult, if not impossible, to achieve this value, the more so as today the rate of premature leaving school is 23.6%. Another quite sad obtained result refers to PISA tests, where the percentage of those who have not

managed is 41% compared to the EU average of 19.4% [3]. Although the participation of parents in education is always vital, is only 1.6% the proportion of those who take part in this, there is therefore a great disparity with the EU average which is 10.8%.

Unfortunately, in Romania, despite the interventions up to now, great inequities are maintained. The belonging to the rural environment is associated with great disasters: currently only 24.54% of the children from the rural environment manage to attend high school. The proportion of students from the rural environment, who obtain poor results at Romanian, mathematics and sciences is 2-6 times bigger than that from the urban area; the proportion of those who obtain very good results at the same subjects is 2-3 time smaller [4]. The infrastructure and resources from the educational system are of poor quality. Over 82% of the total of school buildings were built before 1970, sometimes even much more time before, therefore their equipments no longer correspond to the current training standards. Only 36% of the schools are connected to the internet, their predominant majority being formed of the high schools from the urban area. The human resources are becoming alarmingly old (the age average of the didactic personnel is of 40 years old in women and 44 years old in men).

At national level, some specialists in education field have proposed a strategy, called *Education and Research for a Knowledge Society* and its objectives, which should be achieved until 2015, refers to [5]: situating the performances of Romanian students at the international tests (PISA, PIRLS, TIMSS) in the top 10 of countries in the world; the positioning of at least three Romanian universities in the top of the first 500 universities in the world; increasing the scientific production five times and tripling the global innovation index, in order to achieve the current average of EU; reducing the premature rate of educational system leaving under 5%, percentage that is currently of 23.6%; eliminating the essential differences between the rural and urban education, between the “learning” opportunities offered to the minority groups and those offered to the majority. Other objectives are transforming the permanent education in a current social practice at the

level of each public or private institution, the increase up to 20% of the adults' rate of participation to the permanent education, „transforming the didactic personnel in a professional elite of the nation", focusing the school on the beneficiary' needs, allocating at least 7% of the GDP for education and research and making the quantum of resources allocated to the units from the system dependent upon the effectively obtained results.

3. Characteristics and performances of tertiary education in Romania

In order to get an as comprehensive image of the preferences of students in the tertiary educations in Romania, we found appropriate to analyze the repartition, by group of specializations, in the academic year 2008/2009. A representation of this indicator can be seen in the Figure 3.

Figure 3. Repartition of students, by group of specializations: 2008/2009

Source: National Institute of Statistics, Bucharest, 2009

As it is easy to be observed, the percent of the students at economic sciences is the highest, fact that could be explained by the need of specialists in the field, educated in the capitalist spirit. Anyway, our opinion is that in the next interval, this percent should and will decrease, in favor of the other specialization, especially technical and medical sciences. We stated that the Romanian realities, especially now, in the context of economic crisis, affect in a very large measure all graduates. Jobs are hard to

find and the salaries are not very high. Also, the wages in education are a problem in Romania and the motivation to learn for the young generation is very affected. These facts put in evidence a sad reality. With low gains, far below the EU average, it is very hard to do performance. If we make a comparison with the U.S., presented in the Table 2, the situation is still dramatic.

Table 2. Earnings versus unemployment rate in U.S

Education attained	Median weekly earnings	Unemployment rate
	in 2008 (USD)	in 2008 (%)
Doctoral degree	1,555	2
Professional degree	1,522	1.7
Master's degree	1,228	2.4
Bachelor's degree	978	2.8
Associate degree	736	3.7
Some college, no degree	645	5.1
High-school graduate	591	5.7
Less than a high school diploma	426	9

Source: Bureau of Labor Statistics, Current Population Survey, 2008: <http://www.bls.gov/oco/home.htm>

Note: Data are 2008 annual averages for persons age 25 and over. Earnings are for full-time wage and salary workers.

The data show that, in average, an individual with 8 grades or less earn less than a person with a baccalaureate diploma; another 4 years of education may produce an increase in average earnings by 30%. An individual licensed earn much more, so that only 4 years of school may also almost double the anticipated income of a person while a person who has doctorate earn on average about 17% more.

But returning to Romania, it is difficult through a very small salary to get very high scientific results as people are not sufficiently aware that education plays a crucial role in the formation of human capital. Education increases, in general, anticipated earnings of

an individual during his life, being seen as a long term effort [6]. Therefore, earnings are, among others, a motivation that determines the “brain” to go out of the country in the U.S. or in other European countries where they earn more.

In order to have optimal results is normal as remuneration to be increased in Romania although, in medium perspective it is very difficult to specify what will happen to this country education. If before installing the financial crisis, spending for research and development were relatively small as a percentage in GDP, now, when the situation is more delicate in financial terms, certainly the funds addressed to education will be lower.

In what is concerning the employment rate, by highest level of education attained -; Tertiary education - levels 5-6 (ISCED 1997), we can see in the table below the percentage in some central and east European countries, including Romania.

Table 3. Employment rate, by highest level of education attained; Tertiary education - levels 5-6 (ISCED 1997); % of age group 25-64 years

Year	2005	2006	2007	2008
Hungary	82.5	81.2	80	79.5
Latvia	84.6	86.9	86.9	86.9
Lithuania	86.3	87.8	88.1	87.7
Romania	84	86.1	85.8	85.7
Slovenia	86.6	87.8	87.5	87.5
Slovakia	83.2	83.9	83.1	83.8
Poland	81.1	81.7	82.8	83.7

Source: Eurostat

The obtained percent in Romania is not far from the average of the countries analyzed. But, if we have in consideration that the number of students per 1000 inhabitants is in Romania one of the lowest in Europe, the gap is still present. An eventual increase of the student number in the future, although welcomed, will face the limited possibility of absorption on the labor market, because of the low competitive economy (including the private sector), especially after the economic crisis. Only a very optimistic scenario could have in consideration that the employment

rate, by highest level of education attained will remain the same or it will increase.

4. Comparison on innovation impact on productivity

The data presented, sustain our appreciation that Romania could, with an appropriate strategy, to gain an important place and advantage between the countries with the highest rate in what is concerning the innovation possibility. In the table below are presented the proportion of the turnover from innovation in the total turnover in some countries in central and east Europe, including Romania.

Table 4. Turnover from innovation (% of total turnover)

Year	2004	2006
Hungary	7.0	10.5
Latvia	5.1	3.4
Lithuania	9.7	12.4
Romania	16.6	18.5
Slovenia	14.3	13.3
Slovakia	19.2	16.7
Poland	13.5	10.1

Source: Eurostat

The permanent need to adapt of our people, due the challenges faced in the last five centuries, have developed creative skills which should be used with no delay in producing prosperity. The fact that the innovations have an important role in economic growth, can be deduced from the following table, in which are presented the growth rate of labor productivity per hour worked in Romania and some central and east European countries.

Table 5. Growth rate of labour productivity per hour worked, % change over previous year

Year	2005	2006	2007	2008	2009
Hungary	3.8	3.5	1.5	1.9	-2.9
Latvia	7.1	8	7.5	-1.2	-2.3
Lithuania	1.7	6.8	5.7	1.6	-7.5
Romania	5.4	6.2	5.4	7.6	:

Slovakia	3.2	6.8	8.4	2.3	2
Poland	1.5	2.9	2.3	1.6	:

Source: Eurostat

The positive trend of the labor productivity is an important gain for the Romanian economy, but it should be interpreted having in consideration the fact that Romania has one of the lowest levels in Europe in what is concerning this indicator.

5. Conclusions

We have highlighted in the present paper some characteristics of the Romanian tertiary education, and some indicators on its performance and we tried to highlight the fact that, although with an insufficient number of students and with many other unsolved problems (like the insufficient number of students in the mathematics, sciences and technologies fields), Romania prove its potential through positive results in what is concerning turnover from innovation and growth rate of labor productivity per hour worked.

This situation makes us conclude that if Romania will increase the investment in human capital, we could hope for the future at economic growth and an increase of the standard of living. No matter how many funds the European Union or any other international financial institution allots us, without an understanding and a significant effort to increase the quality of educational system, and especially the tertiary one, Romania have no chances to improve its condition.

The example offered by Finland is relevant. There is no excuse for the lack of action in this field, as without it, the future is compromised. The benefits of investing in human capital are in the same time individual and general. This means that the governments should play without doubt the central role in the direction of forming and developing the human capital. A solid frame should be built in what is concerning the education, which should not limit the responsibility of all citizens in this direction.

World Economic Crisis: Present and Future

Turcas Mioara

The Bucharest Academy of Economic Studies

mioara.turcas@btrl.ro

Abstract

The effects of the financial crisis that began in 2007 are still being felt in the global economy.

Despite the fact that its low point was apparently reached, the economic recovery will last long, with an economic growth below potential and a gradual decrease of unemployment over several years. Developed countries with major economies emerged from recession in the second half of 2009, but economic performance is uncertain. In 2012, the world will enter a new phase of recession. Will the great powers find the solution to get out of the crisis?

Key words: global crisis, global economy, bankruptcy, developing countries, recession

J.E.L. classification: A10, E31, E60, O11

1. Worldwide crisis premises. Evolution to present time

The current crisis was triggered by the chaos in the financial system in the United States and through the globalization that included the Western Europe and then rapidly spread worldwide.

The attempts of the Americans to make massive infusions of funds into the financial system, to acquire shares in bankrupt institutions and reduce taxes have failed to restore public confidence in the banking system, in real estate and investment funds and the capacity of the authorities to regulate credit markets.

In 2008, the shares traded on international markets fell by 20-70% of the value they had in 2006, 2007. This makes the priority for political leaders in a large number of countries to be preventing the collapse of the financial system through coordinated anti-crisis measures.

The crisis has affected developed countries, then emerging countries and also countries on their developing process that were thought initially not to be affected all too much, because they were not strongly anchored in the global financial system.

Although emerging countries are not at the origin of financial and economic crisis, they suffer the most dramatic consequences due to the expansion from developed countries because of unconscious leadership of financial institutions, due to speculative practices and the immoderate desires to obtain quick and artificial profits from real economy.

Emerging countries have been affected by financial and economic crisis more serious than anticipated, thus their economic growth slowed down despite the years before this crisis, some of these countries have made it possible to reduce external debt, have created new jobs, have helped boost their business activities and have attracted development funds. The first signs of crisis were visible in the second half of 2007, and the effects on the real economy occurred in 2008 with the political, strategic and social consequences.

All sectors of emerging economies were affected. The impact trade on the current account decreased, economic growth fell and unemployment rose. Foreign investment level also decreased due to the economic prospects of developing countries affected by the economic recession and decreasing the ability of firms to make investments, due to their difficulty to access funding sources and increasing of the financing costs.

Due to massive investments made in the years leading up to the crisis, many investment projects were in progress when the crisis began. Some of these projects have not been completed due to decreasing funding investment and thus uploading the banks' balance sheets with unperformed loans, and the other part was completed, but with an excess in production because of the

lack of power absorption on the market, increasing the deflation risk.

Many developing countries survive by exporting raw materials and agricultural products, and one of the crisis effects is to reduce substantially their exports in the context of severe reduction of trade expansion rate recorded on the last decade. Some exporters of the developing countries also face difficulties in obtaining commercial loans, which are essential for them, and this affects the export sector.

In developed countries, the crisis begins to diminish; however, they are amplified in developing countries, sinking more and more in this continuing crisis. Developed countries have passed more easily over the effects of the crisis, being just a temporary interruption of their prosperity, while in developing countries an entire generation will be seriously affected by poverty. During previous financial crisis, poor countries passed through the food crisis, which led to higher prices of basic products affecting subsistence of millions of people. They were also affected by the energy crisis, leading to depletion of most resources, especially in countries that do not own petrol or natural gas resources necessary to carry on economic and crisis activities generated by the climate change, with drastic consequences in developing countries, where crops are affected infrastructure is destroyed .

Stretching the crisis on a long period in developing countries constitutes an obstacle in the global growth. Around 1.4 billion people live in poverty in developing countries and any economic crisis has disastrous consequences for them.

2. Forecast

In comparison with the 2010 forecasts of the International Monetary Fund, the 2011 economic recovery has become even more uncertain. The global economy is at the from over 5 percent in 2010. Real GDP in advanced economies is expected to grow slightly from a rate of about 1.5% in 2011 to 2% in 2012.

WEO proposes four solutions for solving the debt crisis: repairing the defects of the current system, a reform in economy, rebalance and reconstruction of economic

confluence of two negative developments. The first is the slow evolution in early 2011 of the developed economies as some of them have failed to understand what was happening. The second is the pronounced increase of the uncertainty in fiscal and finance area. Each of these developments is disturbing and their interaction and combination can cause serious damage.

The growth that was felt in 2010, decreased this year, which did not cause too much concern. This slowdown was forecasted as following the events that took place in the world: the devastating earthquake and tsunami in Japan and the turmoil which occurred in gas production

The economist Nouriel Roubini, who predicted the economic crisis of 2008, predicts a new global recession in 2012, which will affect mostly Brazil, Russia, China and India. In a television interview for Bloomberg TV in August 31, 2011, in the show "We are going into a Recession", he said: "The global economy is now in a state worse than it was three years ago, and the causes that led then to the global financial earthquake seem minor in comparison to the problems that the great powers are facing nowThere is a 60 % possibility for a new recession to install next year and, unfortunately, time is running and we have not acquired yet the well-developed policy tools We will deal with a monetary relaxation (reduction of interest) and quantitative easing, made by Federal Reserve System and other central banks, but the credit channel is collapsed, the markets are growing a lot now waiting anxiously forecasts for the third quarter, but I think it will be a short term rally. Macroeconomic market, labor market and credit market will have an increased decline and they will begin to correct themselves again".

World Economic Outlook Projections (WEO) indicates that global growth will drop to approximately 4 percent by 2012 mechanisms. Will they be effective to mitigate the effects of global financial earthquake?

Revitalizing Agriculture, a Way out of Crisis for Romania?

Țurcas Mioara

The Bucharest Academy of Economic Studies

mioara.turcas@btrl.ro

Abstract

Although affected by the crisis, in a lesser extent than developed countries, Romania can find the strength to recover by giving greater importance to agriculture, by implementing a coherent set of measures to support production and productivity of this sector.

Regarded from a traditional perspective the agricultural sector refers to activities that relate to the exploitation of the earth in order to raise plants and animals. Although our country has an agrarian vocation due to weather conditions and terrain, but also the skills of most of the labor force, agriculture is not sufficiently supported in terms of financial and investment in order to make performance. To reduce this handicap, it takes a larger integration of the sector in the modern and financial market mechanisms.

Key words: economic crisis, the agricultural sector, economic growth, modernization, financing, competitiveness.

J.E.L. classification: E 23, E60, J43, O13

Romania's economy experienced the effects of the international crisis. The banking system was less affected because it was not exposed to toxic bank assets and was protected by the prudential and administrative measures of NRB. Also, the recession in the developed countries affected to a lesser extent in sectors of the Romanian economy, because Romania was not a major player in global stock market and the fact that Romania is not in the euro area contributed to maintaining a fiscal and monetary balance. Another factor was the influence of low level credit default swap, of 245, lying after other nine countries with greater risk as Greece, Italy, Ukraine, Portugal, Ireland, Spain, Iceland, Croatia and Hungary.

In 2009 services were affected, tourism, the decrease of 6% GDP (gross domestic product), and in 2010 there were affected the constructions, the construction materials and hence the real estate sector.

The agriculture suffered insignificant decreasing in comparison with other sectors of the economy, recording in 2009 a decrease of 1.1% while the economy was decreasing by 7.1% and 0.8% in 2010 while the economy decreased by 1.3% .

This differential evolution of agriculture from other sectors is due primarily to the fact that agricultural goods are goods of first necessity with a relatively constant demand, and secondly the product offer is influenced by the weather conditions, so at a worldwide level, a low offer combined with a constant demand leads to higher prices, diminishing the decreasing in agriculture in 2010.

Romania is an emerging country by the fact that major industries are low added value and energy-intensive and agriculture can change economic performance from growth to recession and vice versa.

Agriculture can develop and can maintain growth in a positive territory. Romania has the potential to feed 80 million people.

In the second half of the nineteenth century, Romania occupied the second place in world grain exports and nearly 92% of the population was living in villages and was engaged in agriculture.

Romania was one of the main exporters of wheat and was regarded the “breadbasket of Europe” before the World War II, when the price of wheat was established in Braila.

Romania's arable land is 9.427 million ha and represents 61.6% farmland in Romania. It amounts to 14.7 million hectares, or 23% of the arable land of central and eastern European countries and 12% of the arable area of EU countries, ranking the 6th place with a value of about 0.41 ha / inhabitant. The GVA (gross value added) in the

economy is 6.26% in 2009 compared to 1.9% EU average.

The variation of the relief, climate and soils enable for a varied production, thus practicing cereal crops, industrial crops, fodder, vegetables, horticultural and ornamental plants, flowers, seedlings, saplings, potatoes and fruit. Add to this the hill and mountain pastures, ideal for a natural and healthy food for animals. The share of the agriculture in GDP is only 10-11%, although 40% of the Romanian population lives in rural areas.

Currently, there is a lower level of subsidy than subsidies in EU and on the cultivated land there is a differential subsidy system to encourage high-cost crops (except for sugar beet crops, tobacco, flax, hemp fiber and hops).

Lately, the government sought to protect small farmers through the “first crop” program from the risk of losing a price margin in favor of traders because of their inability to store or put up with storage expenses in order to sell at a high price on term. This initiative was not appreciated by Romanian farmers because of bad speculation on price increases on term.

Also, another maintenance measure of the government was to encourage the fusion of the agricultural areas by providing an annuity for land owners over the age of 60 years who quit their land in favor of registered agricultural land holdings. This measure has not continued this year, due to EU restrictions, however, the owners who do not cultivate the land will be fined, thus encouraging land fusion.

Romanian banking environment has become more permissive and attractive in the last months in financing the agricultural sector, allowing medium and large farms to better control costs, to perform the agricultural work on time, becoming more competitive and more profitable.

Romania’s integration in the EU has allowed financing for farmers with holdings of over 200 ha of funds for modernization and retooling that reduce the significant productivity and efficiency differences from other EU countries.

In order to achieve a level of development similar to that of other states’ agriculture it is required a considerable investment volume in the Romanian sector.

It came into force the National Programme for Rural Development through the European Fund for Agriculture and Rural Development which is an EU funding instrument to support Member States to implement the Common Agricultural Policy.

On medium and long term the advantages obtained increased agricultural productivity, stimulating the development of medium and large agricultural holdings and improving the EU market access for agricultural products.

Price formation for agricultural products in the current economic situation is not strictly about the game of supply and demand, given the complexity of the mechanism which influences these developments.

International prices have increased significantly in the last years due to increased demand for nourishment influenced by the increased number of inhabitants and standard of living in Asia. There has been an increased demand for bio fuels in the U.S. and the EU where under severe weather conditions the agricultural production has been drastically reduced in most countries. Accelerated economic growth of China and India were reflected in the evolution of the food stock commodities, energy and metals. Romania may be competitive in organic or eco crops; its potential is of 1.5-2 million hectares of cultivated land in organic system. The revival of agriculture in Romania may be a solution for Romania to exit the crisis and mitigate its effects as up to now. The agricultural sector may involve a large part of the population and may interfere with several adjacent sectors.

A modern agriculture requires the application of modern technologies in terms of quality seeds, chemical fertilizers, herbicides, insecticides and degree of mechanization, as well as advanced integration in modern market and financial mechanisms.

For 2012, a growth factor will be the absorption of European funds. The WEO mission chief says that “the investment projects financed from European funds could be an important engine of growth”.

Influence Factors on the Value of Reliability Estimators in Marketing Research

Ursachi George Marian
„Alexandru Ioan Cuza” University of Iasi
ursachi83@yahoo.com

Abstract

This paper presents a number of issues related to research instruments reliability estimators.

The first part presents an introduction into the field of instruments reliability and reliability estimators reviewing some important research in this field.

The objectives of the doctoral thesis focuses on the discovery of external influences on the value of reliability estimators, objectives outlined in the second chapter of the paper. In the third part, Cronbach Alpha estimator is briefly described, with its advantages and disadvantages, while in the final part are presented some limitations of this estimator and a possible solution to overcome a part of them.

By overcoming these limitations and by finding possible external factors that influence reliability estimators we can ease the titanic work that marketing field researchers realizes to adapt their research instruments to the environment (target population).

Key words: reliability, internal consistency, reliability estimators.

J.E.L. classification: M310, C130.

1. Introduction

Research instruments are those that provide the way to progress for any science. The safer they are and the better they are suited to their purpose, the more the data they collect will help in developing conclusions more relevant and which accurately reflect the reality, the phenomena, the actions, the intentions, the perceptions or any other issue which the researchers aimed to clarify.

To provide useful data, research instruments must simultaneously fulfill two conditions: to be valid and to be reliable. Reliability is given by the consistency of an instrument on the measurement of a phenomenon. More precisely said, reliability means that for many measurements of the same phenomenon the instrument should provide the same result. This does not imply, however, that the result should be also the correct one. Validity on the other hand implies the accuracy of the measurement, meaning that the instrument really measures what it says it measures. For example, a scale which will indicate each time the value of 9 for an object with a mass of 10 kg is reliable, but is not valid. If the scale indicates the value of 10, it will be a valid instrument.

To be valid, however, an instrument must be, first of all, reliable. To measure the reliability there have been developed over the time a number of techniques and methods, each one with its particularities.

In marketing research, the most used reliability estimator is the indicator Cronbach's Alpha, developed since 1951 by Cronbach, as a generalization of another estimator used until then, KR-20, created in 1937 by Kuder and Richardson.

Alpha estimator has been and continues to be, maybe because its excessive use, the subject of extensive analysis and controversy. Several authors question the estimation power of this indicator and seek alternative methods for estimating reliability [1], [2], [3], [4]. Others seek ways to improve the quality and the predictive power of the estimator by identifying factors influencing the level of its values. Most such research focuses on internal factors such as the number of scale items, type or length of the scale test [5], [6], [7], [8]. Lately they occur a small number of attempts which seeks to investigate the possible influence that different external factors may exert on the

instrument's reliability estimator value, factors not related to the instrument [9].

Such influences are very important for marketing, where external factors are varied and always changing. Determination of causality or such influencing effects would greatly help researchers build their research instruments more proper to their purpose and to quickly adapt them to the characteristics of the population studied.

2. The Purpose and the Objectives of Doctoral Research

The proposed doctoral thesis has a multidisciplinary approach, whereas the achievement of the aim and objectives requires knowledge of marketing, statistics and econometrics.

The paper is realized from the perspective of the marketing researcher who wants to know and master the external factors of influence on the precision of the instruments used in research. To get better results, research instruments require to be best adapted to the environment where applicable. A good knowledge of the possible factors that may affect the accuracy of the instrument can facilitate this adaptation.

The study implies a theoretical part and a practical part. The theoretical part aims introducing the context and establishing the current state of knowledge in the field. The practical part follows the discovery of possible external factors influencing the estimator Alpha's value and the determination of the direction and intensity of these influences.

The overall purpose of the research is to discover and test one or more regression equations which capture the relationship between the estimator Cronbach's Alpha's value and the most important external factors of influence.

The general objectives of the research are derived from its purpose and are the following:

- Discovering the external factors that has influence on the value of Alpha;
- Discovering the intensity and the directions of that influences;
- Creating the regression equations to link the value of Alpha to the external factors of influence;

- Testing the previously developed regression equations.

Following will be presented the methodological approach proposed for achieving the overall goal and the objectives of this research.

3. Methodology Proposal

The first part of the work is represented by the literature review, in which is made an introduction in the field, is presented the current state of knowledge in the domain and are underlined some relevant research, direction pursued by these, and limitations they present for the estimator Cronbach's Alpha. To overcome some of these limitations we realized, together with the distinguished colleague PhD. Ruben Seiberlich, from Konstanz University, a code in GAUSS programming language, with the help of wich much of the limits that estimator Alpha posed can be overcome, if certain assumptions are taken.

The next part of the work, the practical one, implies a series of steps:

- Step 1. Selection of a number of three scales commonly used in marketing, to be applied for data collection;
- Step 2. Data collection. This includes defining the population (as wide as possible), setting the sample (must be representative to satisfy the conditions of Bootstrap) and conducting the survey;
- Step 3. Data analysis and model development. This includes database making, data analysis (using SPSS, GAUSS) and model development (using SEM, SPSS).

In the section below I will shortly present a number of studies refering on Cronbach's Alpha, a number of limits that this estimator presents and the solution I propose for overcoming some of these limits.

4. Cronbach's Alpha. Limits. Bootstrap

4.1. Cronbach's Alpha – a controversial but still used estimator

Cronbach's Alpha is questioned for many years. Subject such as how to interpret its results or the excessive use of it to verify the

reliability of a research instrument created long term debates and controversy.

If initially were considered reliable tools that received a score of minimum of 0.70, after the recommendations of Nunnally and Bernstein [10] or 0.77, as recommended by Peterson [11] a number of other authors like Bernardi [1] come to validate that are precious and anchored in reality some research with Alpha value less than 0.70 [1], [10], [11]. Others such as Iacobucci and Duhachek are more cautious in interpreting the outcome and suggests us to consider the probability of the coefficient Alpha and to consider this coefficient as a part of its confidence interval and not as a fixed value [12]. Therefore, if the interval falls too low it is possible that the instrument may not present a high degree of confidence, even if its estimator value is above 0.70, for example. Otherwise, even if Alpha's value is below 0.70, the confidence interval can pass its threshold, so Alpha might be in that area and the instrument might be valid; that would explain demonstrations like that made by Bernardi [1].

A number of other authors such as Van Aelst and Christmann attempts to improve the power of Cronbach's Alpha estimator by eliminating its infancy sensitivity of some disturbing factors (outlier in this case). Through these changes the two authors create a more accurate estimator which will estimate the level of confidence of the majority of data obtained by eliminating data with other sources [2].

Others such as Tarkkonen, Puntanen and Vehkalahti go beyond, building an estimate more powerful with a more generally coverage area, for which Cronbach's Alpha is just a special case, one-dimensional and which can be used only with observance of certain restrictions. Estimation power of this new estimator is much higher because it exceeds the particular problems that Cronbach's Alpha presents [13].

Over the time there have been some research on the the influence of some factors on the value of reliability estimators, but these factors were always internal factors related to the number of constructs involved in the test construction scale, the scale type (formative or reflective) or the length of the test, factors that can be put in general under

the responsibility of content validity or criterion validity [5], [7], [12].

A small number of researchers focus their attention to the possibility of influence manifested by a series of external factors on the level of estimator Cronbach's Alpha value. Among them point to remember is Montag, who made an extensive study on the influence of completing rate on the estimator [9]. The results indicate an insignificant influence of this factor on the value of the estimator, but is a step towards consideration of external factors of the instrument as being possible factors influencing the estimators value.

4.2. Limits in the use of Cronbach's Alpha estimator

Besides the construction limits of the estimator, as indicated by Vehkalahti, Puntanen and Tarkkonen, there are many shortcomings that Cronbach's Alpha presents [13]. Of them I will mention only some, which I will try to focus in my doctoral paper:

- We can not make a distribution and therefore we can not apply tests;
- Does not allow comparisons between two measuring instruments;
- Because we do not have a distribution we can not make a statement regarding the representativeness of the differences obtained between two or more values of the estimator for separate groups of subjects;
- The estimator value is obtained after the fact and therefore we can not know the consistency of an instrument until we apply it;
- The obtained consistency is valid only for the sample which it has been applied to and by extrapolation to the population to which the sample is representative.

My doctoral thesis will focus on searching solutions for some of these shortcomings, beginning with creating a simulated distribution and facilitating some techniques of comparison between different values of the estimator, in a studied population. By facilitating comparisons between different values and if I will try to find out if external factors may have significant influence on Cronbach's Alpha value, and if so, which are

the most important factors of this kind or/and where are they coming from.

4.3. Overcoming certain limits using Bootstrap

The Bootstrap method is very useful in overcoming certain limits presented by some of statistical indicators. This method can also be used to overcome some of the limits that the Cronbach's Alpha estimator presents.

For a possible solution of some of problems that the Alpha estimator presents, in this paper I propose a simulation of the estimator's distribution, using GAUSS programming language, by the Bootstrap technique, based on a sample that we consider representative for the target population. To keep in mind that we assume that the sample is representative, without this assumption it would not support the conclusions.

Bootstrap method will be used to verify the significance of the difference of Alpha values 's for two groups with different sample characteristics; different characteristics can constitute the factors that influence Alpha values. Bootstrap method contribute to the achievement of the objectives regarding the identification of external factors influencing the estimator.

5. Conclusion

In conclusion, to make precious research, researchers need instruments that accurately measure the phenomena of concern; these tools must be reliable. This paper is a research proposal for a thesis that seeks to overcome some of the problems encountered by the researchers, especially in the field of marketing in the process of evaluation and adaptation of research instruments. The findings of this thesis could ease the work of some of the researchers in their efforts to adapt their research instruments to the environment by providing guidance about the external factors that may influence the research instrument's reliability estimators value.

6. Acknowledgment

Studying Motivation and Productivity in Academic Research. A Methodological Proposal

Ursachi (Horodnic) Ioana Alexandra
„Alexandru Ioan Cuza” University of Iași
ursachi_ioana_alexandra@yahoo.com

Abstract

This study is a brief overview of the field of motivation and productivity in academic research and, also, of the link between these two concepts. It presents the factors that influence teachers' motivation and productivity and a methodological proposal for data collection. There are described the steps proposed for the collection of data: developing the instrument, testing the instrument, data collection, data analysis and model development. In addition it comprises a brief presentation of the steps undertaken so far and also the results I have obtained (regarding the instrument development and the content validity test).

Key words: academic productivity, content validity test.

J.E.L. classification: J21, J23, M30.

1. Introduction

The performance of academic employees who have a dual role as both teachers and researchers, determines the quality of educational act experienced by the students.

Most universities have a mission to provide students a quality education act. This mission can be accomplished only through teachers; therefore, their motivation is crucial. In addition, research has an important role. First, keeps alive teachers interest on their topics of interest and secondly, helps achieve a positive image of the institution they work for.

Authors such as Rowley believes that teachers who are well motivated publish a lot, and this leads to their international recognition and, hence the recognition of university which they belong. This has a positive impact in terms of several aspects:

valuable students are attracted, funds for research are attracted and consulting contracts are signed. For this reason, the motivation is considered the key to success in increasing the quality of higher education [1].

In addition, measuring the output of a researcher is becoming increasingly important for justifying the acceptance of projects, for selecting some researchers, or for providing some scientific awards [2].

From this perspective, identifying factors that increase the motivation of university teachers is useful both in local level, to universities leadership and in the national level, for those in ministry that can sustain a national strategy to increase the country's international visibility.

The doctoral paper proposed is multidisciplinary in nature, since the attainment of research goals requires knowledge in several areas such as marketing, psychology, human resources and statistics.

The paper is made from a marketer's perspective who wants to know the factors that motivate researchers from academia (professors) to be able to act on them to improve the "product". In other words, researchers are considered a product (through their output: publications, projects, inventions, etc.) that must be stimulated and promoted nationally and internationally. So, from this perspective, an "advanced product" can only be achieved by influencing motivational factors.

Although analysis of motivation is not a new area, applied research studies in academic area are very rare and almost non-existent on the Romanian market.

2. The Purpose and the Objectives of Doctoral Research

The purpose of doctoral research is to build and test a model of motivation to research for teachers of economics and business in Romania. It also aims to find out the link between motivation and productivity in academic research.

Overall research goals derive from its purpose, as follows:

- identifying factors that influence motivation and performance in academic research;
- developing a suitable model to measure motivation and productivity of economics professors in Romania;
- identifying the link between motivation and performance in academic research;
- providing some guidelines for increase economics professors motivation (this goal has prescriptive character and it is secondary one).

This paper presents the methodological approach proposed for achieving these objectives and the stages completed so far.

3. Methodology Proposal

To define and delineate the area studied, as well as to identify factors that influence teachers' motivation and productivity I had proposed a literature review.

In order to develop a motivation model of Romanian professors in economics I had opted to conduct a survey. On the other hand, for collecting data regarding the productivity I will use the annual universities reports. For obtaining all the data I need, I had proposed four crucial steps:

- developing the instrument (identification and evaluation of the main scales that can be used to measure motivation in research - the finality is to choose the most appropriate one; evaluation of the indexes and indicators identified in the literature for measure the academic research productivity - the finality is to choose the most appropriate one; extraction of variables necessary to measure teachers' motivation and productivity in academic research - the finality is to build the questionnaire);

- testing the instrument (scale translation - using two-way translation; testing content validity - using expert judges; testing face validity - using the opinions of a small sample of respondents; pilot survey and final instrument development);
- data collection (defining the population and the sample; choosing the survey type for collecting data regarding teacher motivation; conducting the survey for collecting data regarding teacher motivation; collecting data regarding teachers' productivity from the annual reports of universities);
- data analysis and model development (making a database that includes the data on motivation and productivity of teachers in economics; data analysis - including data treatment - and model development using Structural Equation Modeling).

In the next section I will make a brief presentation of the steps undertaken so far and also the results I have obtained.

4. The Results Obtained So Far

- **The studied domain: definitions, variables, ways to measure**

Motivation, initially studied by researchers in psychology, is one factor which has sparked the interest of persons from various fields. Marketers turn to studies motivation in several circumstances: when they want to anticipate consumer behavior, when develop or promote a product, when they want to establish strategies for a product or a company etc.

The word "motivation" comes from the Latin word "movere" which means to move, to do [3], [4], [5]. Currently, the concept of motivation has more than 140 definitions, most of those being centered on the mechanism of activation and supporting the effort to achieve certain needs or aims [6]. However, paradoxically, in the early twenty-first century the domain is considered being atheoretical, contestant and poorly predictive [5].

One of the simplest definitions of the concept is the following: motivation can be defined as a force that makes us move, act or do things [3]. Intrinsic motivation refers to engaging in an activity only for the work

itself. Extrinsic motivation refers to engaging in an activity to get a reward separable from the activity itself [7], [8], [9].

In literature there are some studies that explored the influence of different variables on motivation to research: money and prestige [10]; motivating factors and demotivating factors [3]; the assessment of work done, good working conditions, pay, assistance in case of personal problems, involvement in decision making, job security, loyalty to employees, free choice of subjects to teach, promote and professional development and teaching field [11]; intellectual challenge, social status, career advancement, professional recognition, contributing to the emergence of new knowledge, personal pleasure, material rewards, participation in professional organizations and the development of processes/ products [12].

The research is part of the job duties of university professors. To investigate teachers' motivation to do research I had identified four adequate scales that measure the motivation at work: WOFO - Work and Family Orientation Questionnaire [13], WPI - Work Preference Inventory [14], WTMST - Work Tasks Motivation Scale for Teachers [15], MAWS - Motivation at Work Scale [16]. After analyzing the items of these scales, in accordance with the objectives of doctoral research I chose WPI scale.

Evaluation of scientific research is crucial but it is not easy to measure academic productivity, even though numerous studies have been conducted in this area. In the past, productivity was measured mainly in terms of quantity. Now, academic productivity is measured in terms of both quantity (e.g. number of articles) and quality (e.g. peer review, number of citations, journal reputation).

Bibliometric indicators that measured academic productivity can be used for different levels of analysis (countries, regions, institutes and centers) are they are described extensively in literature [17], [18], [19]. In contrast, indicators that measured individual performance are less studied because they are considered a big challenge. This is due to the need of collecting a complete and accurate database [17].

Studies that have examined individual performance have used different data sources: c.v. [20], [21], institutional reports [22], questionnaires and surveys [23], bibliographic databases [24], [25].

There are numerous bibliometric indicators being classified in different ways [26], [2], [27], [28], [29]. Some of them take into account only one variable: papers, citations, authors, patents or journal impact, and we can call them simple indicators. The others take into account of at least two variables among: the number of paper, the number of citations and journal impact, and we can call them composite indicators. The indicators that focus on the number of paper and the number of citations are: h-index [28] and its more than fifty developments (for a complete list and short description see [30]). The indicators that focus on the number of papers and journal impact are: CLpn [31] and its developments (e.g. indicators for economics and business administration developed by Handelsblatt Institute see [24]).

The simple indicators do not provide a complete view of productivity, which is why I opted to use a composite indicator. I analyzed the weaknesses of these indicators and I took into account the small average number of citations in the economic field, and I concluded that the most appropriate indicator for this research is CLpn (which is developed for economic field). Even so, there are no perfect bibliometric indicators, in results interpretation being necessary to take into account its limitations [32].

The literature comprises some studies that explored the influence of different variables on academic productivity: age [33], the field of specialization, academic pedigree, present academic environment, personal circumstances, academic and biological age [34], life cycle [35], financial rewards [36], promotion [37].

The number of studies that analyze the link between motivational factors and productivity in academic field is quite limited. Those studies analyzed the link between productivity and: intrinsic and extrinsic factors [38], desire for promotion [39], doctoral program graduated [40], the affiliations and the school graduated by the researcher [41], individual determinants and collective effect determinants [42].

Each of these studies was focused on different areas, taking into account only a limited number of variables. Among these variables, for my doctoral research, I selected the following variables:

- for measuring productivity (by using CLpn equation): number of ISI articles, number of pages for each article, number of authors for each article, publication year for each article, the journal where each article was published, the impact factor of those journals (by using EconLit weighing scheme). These data are available on university reports starting with year 2005.
- for measuring motivation to do research (by questionnaire, using WPI): enjoyment scale and challenge scale (for intrinsic motivation), outward scale and compensation scale (for extrinsic motivation). For details about the items and variables see [14].
- professional occupation data (by questionnaire): academic position, the year when doctoral studies started, the year when doctoral studies were graduated, year of hiring in university, the average number of weekly hours allocated to teaching activities, the average number of weekly hours allocated to research.
- *demographic data* (by questionnaire): age, sex, income.

In addition, the questionnaire will include a few items from a scale that measure social desirability (see [43]). These items will be used to verify the sincerity and to remove the outliers.

- **Scale translation and content validity**

WPI has 30 items. Those items are written in the first person, and respondents are asked to indicate the extent to which each item describes them (on a 4 point scale, from 1= never or almost never true about me to 4= always or almost always true about me).

For translation I used the two-way translation method. First, I translated the scale from English to Romanian. Second, I sent the Romanian version of the scale to an authorized translation centre. Comparing the two versions in English, the original version and the one obtained after translation, I found out that 9 of 30 items had remained exactly

the same. The other 21 items have kept the meaning even if the words did not remain exactly the same.

After translation, I tested the content validity of the scale. Although it was tested for the American context, to make sure the instrument I use is valid I consider that content validity testing is necessary for the Romanian context as well. In this way I can ensure that the questions I will use didn't lost the meaning and they are representative for the analyzed domain.

The content validity is testing if the instrument appears consistent with the theoretical domain of the construct in all aspects, including item wording, response formats and instruction. For that, the items are evaluated by a number of experts in the analyzed domain. Therefore, I offered the Romanian version of the WPI scale to six professors with knowledge in human resources (since I analyze the work motivation). These professors were asked to rate how well each of the 30 items of the scale reflect the different dimension of work motivation using the following scale: 1 = clearly representative, 2 = somewhat representative, and 3 = not representative at all. They were also asked to signal any problem regarding the writing or the meaning of the items.

Results showed that five of the items have the mean bigger than two, which means in the professors' opinion those items are somewhat unrepresentative for the domain. These items are: “I prefer to figure thing out for my self” (2,17), “I believe that there is no point in doing a good job if nobody else knows about it” (2,33), “I prefer working on projects with clearly specified procedures” (2,17), “I’m less concerned with what work I do than what I get for it” (2,5) and “I prefer having someone set clear goals for me in my work” (2,33).

Regarding the writing and the meaning of the items I received the following suggestions: to move the item “I have to feel that I’m earning something for what I do” from outward subscale to compensation subscale (two opinions) and to split the item “I seldom think about salary and promotion” in two items (one opinion). I also received some suggestions about how to make the items to be easier to read (friendlier with the respondent).

After this analysis I will not remove any item because neither has an average very close to 3 (not at all representative), but after the pilot study, if the same items occurs "problems" I will have to make a decision on them.

5. Conclusion

In conclusion, there are many ways to measure teachers' motivation and productivity. Choosing between them is a difficult decision. Even after the choice is made, there are many tests to run to ensure the validity of the used instrument. This study presents a summary description of the domain analyzed, a methodological proposal, the instrument used and the content validity test results.

Social Security in Times of Crisis

Utureauu Simona-Luize

„Ovidius” University of Constanta, Faculty of Economic Sciences
simona_utureauu@yahoo.com

Abstract

The combination of slow economic growth and the effects of accelerating population ageing had a big impact on the social and economic environment. But despite this, in the recent period could be observed that the social security systems best able to manage the crisis' social and economic impacts were of those countries which had comprehensive social security programmes already in place (Bonnet, Ehmke and Hagemeyer, 2010). These programmes not only provided policy-makers with immediate responses to help sustain aggregate demand, but also provided a greater choice of instruments with which to reach out, sometimes selectively, to different population groups at risk.

Key words: social security, private pension, pension funds, financial crisis

J.E.L classification: E 23, J 32

1. Introduction

In mid-2007 the global financial and economic crisis, which weakened the region's economies had commenced. Even if the crisis seems to have come to an end now that stock market values have recovered, the economic growth in Europe and North America is still limited and some countries are even having a negative growth. Because the major economies still have weak points, numerous commentators argue that further financial and economic crisis shocks should be expected. Therefore, one should be careful when making statements like: the remainders of the crisis are already well overcome. It is obvious that recovering of the financial-turned-economic crisis countries is influencing the real economy. This can be seen in the increasing labour market difficulties, growing unemployment.

Almost all the countries developed complex social security programs. In practice, the economic and politic relations are formed by imperative short term goals depending on what it can be done and not on the long term vision. Unexpected events, like natural disasters and economic crisis, have a immediately impact on the national politics and they lead to changes and to a re-hierarchy of the politic priorities. In these situations, despite the fact that the long term goals remain unchanged (e.g. the extension of the access to social security systems), the change of the short term goals is necessary for adapting to the new economic context. Obviously, the global macroeconomic context evolved significantly, starting with 2007, with a major financial crisis. The crisis, followed by the economic recession, affected the global economy. For many countries, their social security systems, especially in 2008, experimented decreasing values of the national social security pension funds. The increase of the level of unemployment and the poverty lead to higher expenses for social insurances regarding benefits of insurance and fiscal assistance and to a proportional loose of the incomes. In addition, the decrease of the aggregated demand reduced the government's incomes (from taxes). Even if countries were affected in different ways, most of the countries experienced this.

The crisis had a big impact on the nature of the policy reform and change of the social security. For example, recently we could notice the statutory pension age reform (e.g. Brunei Darussalam, Greece), the increase in the poverty measurements (e.g. Brazil, South Africa) and initiatives to decrease unemployment (e.g. Australia, Germany). Many organizations stated that several measures for stabilizing and restoring social security programme finances were taken. In the current context, when the population is aging, even if the economical growth started

being positive, the number of countries adopting such reforms is likely to increase.

It needs to be mentioned that the crisis stimulus packages which were introduced in different countries determined the extension of social security provision (e.g. Brazil, The People's Republic of China).

In order to make social protection more accessible, in many national social security and health care systems, the long term reforms should focus on extended coverage. This is the case in low and middle income countries, where the reforms try to provide to a maximum number of elders a minimum pension. These developments should reduce poverty and state that even lower income countries should afford to provide a minimum package of tax-financed social protection benefits to their population.

2. Improving the design of the social security system

The finances of many social security systems were tested by the current crisis. Analysis of the crisis' impact shows that the social security system design can be improved in six points. The crisis has uncovered some of the strong and weak points of different pension systems, it revealed the need for a suitable risk sharing between individuals and the state and between the fully pre-funded and pay-as-you-go schemas. The crisis raised questions about what an appropriate asset allocation is, when investing social security funds. It is important to have an ex ante design of social protection programmes which are able to react in a flexible and quick way to crisis scenarios. The crisis reminded of the need for an adequate and efficient regulation, investment and supervision policies and it highlighted that in many countries the unemployment insurance benefits may be inadequate or even absent.

3. The role of social security in national recovery plans

Despite the fact that the financial crisis affected the financial position of many social security programmes, it underlined the role of the social security systems in the slowdown of the economic growth. While trying to diminish the impact of the

unemployment increase, of the income decrease, poverty increase, the countries recognized the importance of the social protection programmes. Through local offices, the households should be reached. Also, the financial resources should be quickly channeled towards different population groups, to the most vulnerable or to the unemployed.

In addition to the efforts to stimulate the aggregate and employment demand, decisions makers admit that the social security systems quickly deliver income to the persons and families in need. Not like public infrastructure investments which need time for planning and implementation, the social protection benefit payments are operatively executed.

In the design of social policy replies, many countries considered that these are meant to be a temporary help during crisis situations. They could have undesired durable effects. They could encourage workers to remain unemployed or to retire before time. They could encourage companies to fire employees which could become eligible for pension or invalidity benefits. They could decrease the resources of the social protection systems which are anyway threaten by the demographic aging. Some proactive countries, like Australia and Portugal, tried to structure their measures in order to avoid the creation of a group of people which will be permanent unemployed or of inactive people.

We can draw some conclusions which empathizes the role of the social security systems during crisis:

- The social security systems showed that they are an important component of the crisis strategy, offering social policy measures which could contribute to the revitalization of the economy by stimulating the aggregate demand and by assuring an adequate protection to the vulnerable people;
- The social security policy replies should be associated with active economical policy measures regarding workforce market and they should not create long term dependencies for social security performances;
- The financial losses weakened the financial capacity of the public social protection and of the private pension

systems which need to face the challenges to follow. This matter exposed to the governments the potential new financial risks, to assure a minimal income. In the same time, it is necessary to review the regulations of private pension administration and especially the acceptable investment strategies;

- The public social insurance programme and the people exposed to financial risks (poverty). The state responsibility to deliver an adequate social protection should not be transferred in the private sector;
- Social security organization must operate towards risk management.

4. The impact of the crisis on pension schemes and its social consequences

Many countries have increased the role of national pre-funding pensions systems, since the 1990s. In 2008, different funds put at risk the future retirement income prospects of many individuals by harshly contracting portfolio values.

Recent performances of social security funds statistics show that some social security funds have started already the recovery. But it will not be an easy and fast process to recover after the major losses from 2008.

The pension incomes have been relatively little affected by the crisis because nowadays the majority of the countries has state financed pensions in a pay-as-you-go (PAYG) system. States have chosen to accept increased deficits to let pension systems play the role of automatic stabilizers.

The crisis effect on the retirement will be different according to how much the pension systems will differ from the actual ones. In the majority of the countries, the budgetary restrictions lead to the decrease of public pensions. In some countries the crisis impact resulted in lower indexes.

Based on the theoretical replacement rates it is possible an analysis of the professional career interruptions impact on the pension benefits. The younger generations could be affected by the actual pension reforms. The activity interruptions (unemployment) could affect, on long term, in a negative way the pension benefits, considering that the benefits

of the PAYG scheme are calculated according to the active period, the total income. The protection of the benefits of future retired people during unemployment periods is in development stage in most of the pension systems from Europe.

Moreover, as a consequence of the crisis, some countries decided to increase the pension contributions, others introduced the increase in the retirement age (e.g. Hungary), and others considered it (e.g. Switzerland, Spain, Latvia, Ireland, Slovenia and Romania).

4.1 Funded defined-benefit and hybrid pension schemes

The resulted benefits from an occupational defined-benefit scheme are connected to the income and the career of the employed population. This is the scheme which handles the investment risks and usually also the longevity risks. They make a promise to the affiliated scheme member.

The financial crisis caused the decrease of the assets compared with the predictions and the hypothesis regarding the investment return has not been accomplished. The EU and national regulation frame have the role of guaranteeing that the pension funds are taking fast measures to protect the contributions to the pension funds on the long term. The national authorities of private pension funds supervision took quick measures to correct the crisis effect. For example, they have aimed to allow pension funds more flexibility than normal, e.g. funds were given more time to submit funding status reports and recovery plans, and the normal maximum period allowed for recovery from deficits has been extended.

Some fall back arrangements could be introduced to assist the pension fund in case of deficit, but this may be lower than the pension would be in normal circumstances. These fall back arrangements could be sponsored by the employer which could decide to increase the contributions without increasing the pension rights or to change the level of investment risk. Other measures which could be taken are to increase the pensionable age.

In defined benefit and hybrid schemes case, questions about inter-generation fairness and redistribution are posed. For

example, if scheme rules are conditionally applied on investment performance, the retired population is likely to be more affected by it than the ones still in the working field. On the other hand, the active population will be more affected if assets are changed in future benefit accruals or rebalanced with increased employee contribution.

4.2 Funded defined contribution pension schemes

The investment risk is assumed by the scheme member in the case of the defined contribution (DC) plan. Moreover, the investment performance is directly affected by this risk as well. In the course of 2008, private pension funds lost more than 20% of their value. Many of these pension funds have been able to recover some of their losses until now. If the pension fund has a poor performance, the member is at risk, but, on the other hand, it also benefits from any positive performance. In 2009 and early 2010, in many Member States DC funds regained much of the value lost in 2008.

Therefore the ones far way from retirement recovered their positions because there might be enough time for asset values to recover. On the contrast, for those close to retirement the impact can lead to lower pension income than expected, or delayed retirement. Possible solutions to the impact of the crisis are investment strategies such as “lifestyle”, meaning higher risk investments for younger members or cautious investments for individuals closer to retirement. Many of the currently retiring members will have also other sources of income beside the DC pension income.

Abstract

Currently, many enterprises have massively expanded marketing operations, supply and production in the global market, managing to create global structure which allows them to quickly convey information and ideas in a corner of the world in the other. Businesses face a competitive environment than larger and more complex than in the past. Since most trade with investment activity are related, if not undertaken by transnational companies, no country can develop as part of the world economy without help from a substantial presence within the borders of the STN them.

The new trend in the STN sites emphasize efforts to promote corporate social responsibility that contributes to change the attitude of many corporations and individuals working for them. Company efforts are visible in contributions to community development and environmental impact. Corporations want to impose their own standards of development which reflects some positive attitude towards regulations that support behavioral codes which they argue.

Key words: transnational companies, globalization, crisis, development

J.E.L.classification: F 01

1. Introduction

Globalization has opened the way for limited progress, offered alternatives to local development, has generated deep changes, n dimensional complex with sometimes unpredictable consequences on economic development and socio-institutional.

We all know and live a more difficult period of economic history, that of a global crisis. If until now almost all economists analyzing the phenomenon of rising global economic boom in globalization today, the same economists studying the phenomenon of global economic crisis, încearcând roots to find them, analyze them and to carve another route the great globalization. Liviu Voinea after witnessing the greatest economic crisis after 1929 and the systemic failure of capitalism, the profession of academic economics and the economy as understood and taught her all over the world. (Voinea, 2009)[1]. Few were those who foresaw the crisis, but to no avail, because there was no time to be listening, indeed have been sidelined until reality gave them justice. In this context, transnational corporations are the most important force determining and promoting global interdependence.

2. The content

In the 80s, transnational companies had one-third of industrial output, more than half of foreign trade. The value of goods and services provided by American transnational provenance during this period, amounted to 350 billion dollars. Expressed as a percentage, representing U.S. firms in 1999, was about 71.8% of the top 50 transnational companies in the world. Through direct investment abroad, major U.S. companies boost profits, but mostly gets the opportunity to control sources of raw materials from poor countries and developing ones. U.S. companies are present on the developed markets, which have reached a high level in terms of consumption, and it provides a well-defined profit. All the same border are less

present in terms of geographical regions producing dissolution resources, raw materials, because they are not as market interest. An advantage for the rest of the world, from American transnational, the transfer is outside the U.S. model of planning and business management, and equally high efficiency new technologies and productivity. Globalization of the economy lead to the develop American transnational companies. They are, now, a powerful force in the global economy and a true American economy binder, and they can be found across national borders.

They manifest simultaneously in all economic areas known that micro - macro - mondo, eliminating, in fact, the boundaries between them. In terms of global competition, European and American companies have to face, even in their home countries, Asian companies (eg Sony, Toyota, Samsung), which applies a policy of aggressive marketing and highly competitive (as the concept of full competition). A special role in the global economy plays American transnational companies: Coca Cola, Colgate, Microsoft, Ford, IBM, General Electric, Intel, Exxon, Wal-Mart, McDonald 's, they are actually the U.S. image worldwide. In the top ten transnational corporations in the world, the first five are, of course, from the U.S.. Their work focuses on branches with real growth prospects and raise profits. Moreover, transnational companies are at the forefront of American offensive in the context of economic globalization.

The crisis has actually gone from securitization, sub-standard loans, but its scope of coverage was much higher. In other words, the crisis from the U.S. went out there with roots very well determined by excessive investment in innovative financial derivatives, with a chase to report more and more profit while the phenomenon of corruption and deregulation already appears. The next step of the crisis was made in Europe, where penetration and expansion mechanism was different in the West against East. Western Europe was transmitted mainly through toxic assets of financial institutions in East, and then was transmitted by reducing the current account financing. Romania, in this view can be joined Eastern economies as Hungary, Bulgaria and the Baltic countries.

Currently, many businesses and massively expanded marketing, supply and production in the global market, managing to create global structures which allow them to quickly transmit information and ideas from other corners of the world. Businesses face a competitive environment than larger and more complex than in the past. Some believe that the world is run by giant companies, megacorporations those who are not only interested to sell as many goods on international markets but also to purchase, to produce various components and materials from/or abroad. Therefore, transnational firms have to coordinate the functional operations across state borders by a rapid transfer of knowledge, helping them to increase efficiency. (Gurgu, 2011)[2] To meet the challenges of business globalization, many companies form strategic alliances and other business provide still competition. Mergers, acquisitions and strategic alliances are logical and inevitable consequence of competition in a global economy without barriers, and becoming more integrated. We are witnessing a globalized economy combined with information technology, which enables TNCs sites to strengthen the control on a scale that has not been possible until now.

Corporations today are open to everything new, able to respond rapidly to new information and changes in international markets, as these corporations adopt strategies based on the implementation of learning behavior. Equally important for TNCs sites is the ability to keep pace with the markets, they can adapt and respond to competition, may produce goods in conditions of efficiency, but also understand the phenomenon and to protect local companies, which is important to strengthen local communities both economically and as socially. Many transnational corporations have not done all it would be best to improve working conditions in developing countries. These companies have gradually come to understand things, which at their home, understood them much more difficult. Providing better working conditions may actually contribute to increased labor productivity and lower overall costs - or at least limiting their growth. (Stiglitz, 2005)[3] Some believe that the world is governed by these giant companies, megacorporations

those who are not only interested to sell as many goods on international markets, but to buy, to produce various components and materials / or abroad. All statements come from the camp of criticisms regarding unpleasant in transnational companies, which have as main objective the production of money and only have primary responsibility for their shareholders.(Helsam, 2004)[4] Therefore, transnational companies must coordinate operations across functional boundaries of states, by a rapid transfer of knowledge, managing to increase its efficiency. One example is Ford Motors, the second largest producer of automobiles, which seeks to become a truly global company in the field.

Globalization of economy require thought and work, which means the ability understand the world as a single market, the conditions and laws are very different. Manager with a true global mindset is one that has the capacity to adapt to national and regional particularities and which does not distinguish between inland and abroad.

Currently, globalization is contested by everyone. There are complaints about it, but not missing any praise. Globalization can be a force for spreading the good: the globalization of ideas about democracy and civil society has changed people's way of thinking, while political movements leading products worldwide to ease the debt burden. Globalization has led to hundreds of millions of people to achieve higher living standards, also, economic globalization has brought benefits to countries that have profited from it by identifying new export markets and attracting foreign investment. Stiglitz said that countries had benefited most, were those who took their own fate and have realized the role of the state can play in the development, abandoning the idea is also based on a market capable to solve their own problems. Globalization has had beneficial effects on democracy, national elites trying to replace dictatorship with the dictatorship of international finance. Some countries were obliged to markets and international financial institutions to give up their sovereignty, which allowed the capital markets, including speculators whose concerns were short-term economic growth, and long term growth of a country with living standards, to "bring order", telling them what to do and what not

to do. For millions of people say that globalization has not brought anything, or even a negative impact because of their moral situation worsened, their jobs were abolished, people become powerless before the force of globalization that could not control, while attending to undermine democracy and the erosion of their own cultures. Growth - including that induced by globalization - will lead to urbanization, undermining traditional rural societies. Retailers that operate internationally and have a great shopping devastate small businesses and communities in which business is carried on those.

Developing countries that have been most successful, most of East Asia, opened to the world, but they did it slowly and following certain steps. Countries have benefited from globalization to boost exports, and therefore to develop a faster pace. They are abandoning the protectionist measures carefully and consistently, when they have created new jobs. These countries have ensured that there is enough capital to create new businesses and jobs or even have themselves contributed to this effort. China has eliminated trade barriers not a very long time but at a distance from when already begun to travel the road to market economy, during which has grown extremely fast. However, gobalization is just one of many forces that affect our societies and economies. Technological changes have increased the importance of skills in certain markets, so that, those who benefit it today, are those who have or can obtain those skills. Changes in technology may ultimately prove a more important factor than globalization, even in declining wages of unskilled sector. (Stiglitz, 2008)[5]

3. Conclusions

In conclusion, I think of three possible scenarios on the future of corporations. A first scenario would be one in which a not too distant future corporations would come to rule the world, dividing it between them. Thus we live in a world that large corporations would go where it holds a monopoly position. In this context they should have the ability to control and manipulate the global market, the global production, the trend of consumption and the

price too. A second scenario would be to limit the power of multinational corporations in the future. This could be achieved through legislative measures For instance local or regional trends and anticompetitive practices to limit or restrict the emergence and development of monopoly. A third possible scenario would counterbalance corporate power through incentives and support SME development. Moreover in some particular situations may even proceed to grind or large corporate reorganization in smaller companies, possibly narrower specialized competence in areas that can perform.

A New Model for the Global Economy - Economy of Communion

Vlad Maxim

„Ovidius” University of Constanta, Faculty of Theology
parintele_maxim@yahoo.com

Abstract

The "Economy of Communion" is an experience of social economy fostered by the Focolare Movement, an ecumenical and inter-religious organisation that originated within the Catholic Church in the 1940's and is present in about 180 countries. The Economy of Communion is a global project involving over 750 businesses in a network of solidarity.

Businesses operating according to this paradigm seek to respond concretely to social inequality, through partnership with the marginalized, whilst remaining commercially viable in the market economy. They thereby seek to present a realistic social model to the commercial world.

This paper identifies systemic factors which underlie the rapid development and spread of this third way between capitalism and socialism. The study is part of a wider review of the systemic underpinnings of such social movements, seeking to understand why some succeed and impact the structures of society whilst others flower briefly then stagnate or die.

Key words: Business ethics; new economy; economy of communion; Focolare; business dynamics

J.E.L. classification: F00,F01,F02,F15,Z12

1. Introduction

The 19th and early 20th century were a melting pot of ideas and experimentation in the search for more just and equitable economic structures. Many of these, such as the Fabian Society and the Distributivists, stayed in the realm of ideas, contributing to the development of political society, some more and some less successfully. Some, such as the Co-operative Movement, the Quaker businesses and the Friendly Societies

established businesses based around their ideal. Many have been successful at national or international scales. But in their success they have generally merged with the prevailing business ethos to the extent that their outward face to the world is indistinguishable from that of their competitors. Others, if they still exist, remain at a local scale and do not present a credible witness of a third way between the ideal of Socialism and the success of Capitalism.

2. A third way

For more than a century, the term a third way has been used by individuals, movements, and parties on the right and the left of the ideological spectrum. In the late 19th century, Pope Leo XIII called for a third way between socialism and capitalism that would put a more human face on the free market. In the 1930's, the classical liberal economist, Wilhelm Roepke, saw the third way as the free society that lay between socialism and historical liberalism. Half a century later, Meidner (1980) suggested that Sweden's welfare state constituted this third way between American capitalism and Soviet communism.

In the early 1990's, the a third way became a popular mantra for politicians, especially those on the left, who saw that their ideologies held reduced appeal in the world that followed the collapse of the Soviet Union.

Thus, British Prime Minister Tony Blair has frequently referred to his search for a Third Way, even writing a booklet on the subject (Blair, 1998). Former US President Clinton went so far as to declare in his 1998 State of the Union address: "My fellow Americans, we have found a Third Way". Schroeder in Germany, Prodi in Italy and Government leaders from the Russian Federation to Brazil have proclaimed as their

own this new vision of the last decade of the 20th century.

Business leaders also captured this mood for change. Religious leaders, also, had not forgotten their century old search for a Third Way. In 1994, the 6th World Assembly of the World Conference on Religion and Peace included in its final report a call to the religions of the world to work together to find a new approach to economy, between the Marxist and capitalistic economies, "an economy of communion based on mutual love and respect for the dignity of the human person...". In the midst of this mess of history, platitudes and polemics, the praxis of the Focolare Movement provides a striking contrast with its 'Economy of Communion'.

This is not an economic theory in search of supporters, but rather practitioners living an ideal and creating an economic theory. It is part of a global praxis a living 'Third Way'.

3. Economy of Communion

The genesis of the Economy of Communion 'In Freedom' lies with the foundress of the ecumenical and inter-religious based organisation, the Focolare Movement.

The Focolare is an entity within the Catholic Church, formally approved in 1962 by Pope John XXIII. It's 'internal' membership comprises some 150,000 - 200,00 people who have extensive formation in and made a deep commitment to its spirituality. These include some 50,000 who belong to other Christian denominations and to other Faiths. A further 4 to 5 million live its spirituality with varying degrees of commitment. It is present in over 180 countries. The Focolare would appear to be unique within any Christian Church in that its statutes provide for adherents not only from within the Catholic Church, but also from other Christian Churches, from other Religions and even from 'people of good will with no religious belief'. It has, for example, a committed following within the Muslim American Society and Japanese Buddhist Rissho-Kosai-Kai.

The spirituality of the Focolare fosters a profound belief in the unity of the human family, regardless of differences of race, nationality or religious belief. It emphasises

the ethic that its adherents should live a 'communion of goods', as a free and personal choice, in the manner ascribed to first century Christians (Acts 2:44-45), so that none in their community are in need.

The Focolare accepts the right to private property. At the same time it recognises that, just as it would be outrageous for the parents of a family to eat fully whilst their children starve, it is equally outrageous in our social family that there should be some with plenty whilst others starve. Accordingly, since its origins in war ravaged Italy in 1943, the Focolare has sought to inculcate a 'culture of giving' amongst all its members from the children to the eldest. The committed core, about 5,000 people, live this totally - a kind of 'Christian communism' - putting all wealth in common, keeping only what is essential for healthy living and giving the rest for communal distribution. Other internal members, with greater or lesser radicalism live this 'communion of goods' by giving of their surplus to those in need. (Pochet, 1985; Gallagher, 1997).

4. Genesis of the Economy of Communion

When the foundress and president of the Focolare, Chiara Lubich, visited Brazil in 1991, she faced the reality that the 200,000 Focolare members there included so many poor that the traditional communion of goods, notwithstanding the heroic idealism of members, was insufficient. Some remained homeless, others were unable to send their children to school, or buy them clothes. The sick could not afford medical treatment.

"This led to the idea of increasing the amount of money put into communion by setting up business enterprises that would be entrusted to competent people capable of making them work efficiently and profitably."

As a practical response to the evident poverty, Lubich launched a worldwide initiative focussing on building an Economy of Communion - a program aimed at establishing employment projects, based on the spirituality of the Focolare in particular, and on Catholic social justice principles in general. In enterprises operating under this framework, the profits (after just

remuneration) would be distributed three ways:

“A part of these profits would serve to bring ahead the business; a part to help those in need, thus making it possible for them to live with a little more dignity until they could find a job, or offering them a job in these very businesses. Finally, a part of the profits would be used to develop structures for the formation of men and women who desire to base their lives on the “culture of giving,” “new men and women”, because without new people, it is not possible to build a new society.”

This may sound utopian. However, within ten years the results are expressed in bricks and mortar in the Araceli, Brazil, where Lubich first issued her challenge. A 50-hectare industrial estate has been developed with the infrastructure required by modern manufacturing or service industries. It is managed by a joint stock company, ESPRI, which has more than 3,000 shareholders), many of whom are numbered among the poor.

By 1999, the industrial estate housed eight businesses run according to the philosophy of the economy of communion, with a number of other ventures in the planning phase.

5. Guiding Principles of the Economy of Communion

The economy of communion is based on entrepreneurs freely acting according to the

Focolare Movement’s communitarian principles. Entrepreneurs who want to participate remain owners of their firms and keep the right to opt out of this ‘new economy’. They freely put in common a share of their profit that, in conformity with the Focolare Movement’s spirit, is then used for the following three objectives.

One part of the profit is used for capital reinvestment. This serves to help this social ideal penetrate the firm’s activities and internal functioning. In addition, it aids job creation, which the Economy of Communion sees as a fundamental solution to social inequality.

The second part of the profit sharing is distributed to people who do not have the means to meet their minimum needs (food, clothing, housing etc.) and who have no

possibility to raise the necessary funds. Everything that such a person receives is an untied gift and corresponds to his or her true needs that are freely put in common by this

person. The aid aims to re-establish the material autonomy of the person in need. This focus is not one of charity, but of mutuality based on the ethic that one does not have a right to wealth whilst others starve.

This communication between the poor, who receive the one-third of the Economy of Communion business, and the businesses themselves, must grow. The poor must not become something abstract ... the poor are an integral part of every Economy of Communion business because they are the main beneficiaries. (We must seek to) create amongst these people and ourselves an attitude of reciprocity, of true partnership. The third part of the profit focuses on the long-term improvement of society, on the elimination of the institutional roots of social injustice. The funds are mainly used for the development of training centres and educational programs that introduce a wider audience to this social ideal and give them the personal and technical skills to transform their own lives in this way. They also assist in maintaining support relationships for Economy of Communion businesses around the world.

The Economy of Communion, however, is not simply about the use of profits. It demands a radical transformation in all business relationships, between the owners of capital and employees, between managers and staff and between staff and clients.

Each enterprise operating within the Economy of Communion does so freely, independent of any control by the Focolare Movement. However, the spirituality of the

Focolare underpins its fundamental ideology. The Focolare structures promote the ideal, provide the spiritual and ethical formation that underpins it, and provide encouragement and moral support for the entrepreneurs and foster solidarity among the businesses.

A feature of the Focolare Movement itself is the decentralisation of responsibility and initiative within its powerful unifying spirituality. It is organised into some 70 ‘zones’ covering over 180 nations. In a matrix type framework, there are also 20+

branches, organised at international and zonal levels, which focus on different social or religious spheres.

The New Humanity Movement is a branch whose charter is to foster the Focolare ethic especially within the various economic sectors (education, health, the arts, etc). It is organised on an international level, with a full-time secretariat, and with local secretariats in every zone. It runs conferences and education programs and provides ‘moral support’ for entrepreneurs (or aspiring entrepreneurs) who are involved in the Economy of Communion. It has also established a number of specialist bureaux, including the International Bureau on Economy and Work. The latter is an accredited United Nations NGO that acts as a coordinating think-tank for the Economy of Communion. It includes experts from the areas of economics and management, including university academics, senior government bureaucrats and senior private sector executive.

6. Developing a theoretical framework

The Economy of Communion is built from the lived experience of the Focolare. However, a vibrant intellectual ferment has accompanied the growth in businesses, with some 65 graduate, Masters and PhD theses (including at least two from the UK) written since 1993 on diverse dimensions of the Economy of Communion, covering its anthropology, sociology, economics, philosophy, psychology and theology. Many of these theses and dissertations are published on the Internet (<http://tesi.ecodicom/.com>).

There are also annual international conferences, under the auspices of the International Bureau on Economy and Work. The most recent conference, held in June 2001 in Genoa in anticipation of the G-8 Summit, presented the Economy of Communion to 1,000 delegates.

7. Systemic Factors Associated with Development and Spread of the Economy of Communion

Drawing on the factors suggested by Dawkins, Heylighen and Pluta, the following

are seen to be the key systemic factors that underlie the successful and rapid spread of the idea of the Economy of Communion. These factors are divided between the Focolare base, which gave birth to and sustains the Economy of Communion, and the Economy of Communion businesses themselves. Space does not permit a comparative analysis of these factors with the models proposed in the works cited above.

The Focolare Movement Base

The Focolare Movement provides a critical philosophical and organizational support framework for the Economy of Communion businesses.

Philosophical / Ideological

- A profound belief in the unity of the human family, regardless of differences of race, nationality or religious belief; and
- Preparedness to ‘give ones life for one’s fellow human being’, expressed in a ‘culture of giving’.

Praxis

- 55 years of living, at a local scale, a personal ‘communion of goods’;
- 55 years of activity in local, regional and international, social justice projects; and
- 55 years experience in experiential based formation and training.

Moral Authority

- A charismatic leader, Chiara Lubich, the foundress and president of the Focolare, who initiated and continues to give priority to the Economy of Communion;
- Endorsement within the Catholic Church by Pope John-Paul II and by local Bishops, by leaders within other Christian Churches and other Religions;
- Endorsement by academia in diverse cultures through the award of Honorary Doctorates to Ms Lubich specifically for her work for the Economy of Communion; and
- Endorsement in the political sphere by parties of the left and the right in the European Community and in Latin America.

Organisation Structure

- A strongly connected (by personal relationships and communication), but highly decentralised cellular structure, present in virtually every nation;
- A strongly coupled matrix of coordinating bodies based around the Branches and the Zones, animated by a shared spirituality, personal relationships and communication;
- The New Humanity Movement, with a full-time international secretariat, and zonal secretariats, promoting the Economy of Communion; and
- The International Bureau on Economy and Labour acting as a specialist ‘think tank’.

Infrastructure

- Education / formation framework, at international and national levels with a pedagogy strongly based on experiential / praxis approach;
- Global and national communications networks (for example, every month there is a global telephone conference call, linking all Zones, which includes an inspirational meditation followed by, typically, 40 minutes of news of Focolare – including Economy of Communion – activities around the world);
- Publishing houses providing videos, books, journals and newsletters in many languages;
- Comprehensive and professional Websites in diverse languages; and
- Centres of formation and training in many nations.

Membership Coverage

- A committed core membership of 150,000 – 200,000;
- Reasonably regular contact, face-to-face or by the various communications media, with 4 to 5 million adherents or sympathizers;
- Through close links with the Muslim American Society and the Japanese Rissho-Kosai-Kai (Buddhist) Movement, exposure of the Economy of Communion ideal to a much wider audience estimated in excess of 8 million; and

- A strong penetration of the Focolare ethic among young adults, coupled with the idealism of the Economy of Communion, has tapped an enthusiastic youth response evident in the profusion of academic research.

The Economy of Communion Companies

The entrepreneurs, employees and beneficiaries of the distribution of profits are linked, not only through their involvement in the Focolare itself, but also through their own experiences in giving life to this new social ethic. These experiences are widely shared through ad hoc conferences, seminars, journals, newsletters and so forth. Significant systemic factors supporting this, additional to the foregoing, include:

- Diversity of totally independent businesses, allowing for experimentation in modes of management, organisation and activity;
- Forums and diverse communications channels for sharing ideas between stakeholders in the diverse businesses; Idealism, supported by explicit appropriation of capital to organisation development, promoting the development of a shared vision of the business amongst entrepreneurs, management and staff;
- Idealism, supported by explicit appropriation of capital for expansion and job creation, promoting entrepreneurial risk-taking to broaden horizons;
- Ethic which promotes quality staff management and quality client service; and
- Impetus to develop relationships and to cooperate with other businesses, including competitors;

8. Summary and Conclusions

The rapid spread of the praxis of the Economy of Communion prompted this study. Why do some ideas, such as this, “take off” whilst other, arguably equally valid and important, languish. Were there particular systemic factors that created the framework for success.

The praxis of the businesses in turn gives witness to the values of the Focolare and challenges its adherents to emulate this altruistic love in their environments.

Relationships with Institutional Customers as Development Factor of Underwear Industry in Podlaskie Voivodeship

Widelska Urszula
Bialystok University of Technology
Michalczuk Grażyna
University of Bialystok
widelskau@wp.pl
michal149@vp.pl

Abstract

The effectiveness of the activities necessary to stabilize and strengthen the position of companies in the market is determined to a large extent by the ability to build lasting relationships with customers. Currently, the customer is not only a part of the company's environment, but first of all its resource. The knowledge about customers and their needs allows the company to convert new customers into regular ones. This is reflected in the creation of long-term loyalty-based relationships with target markets. These activities are vital for the development of the underwear industry, which is susceptible to frequent changes in fashion trends, preferences and tastes of buyers.

This article aims to present the scope and importance of relations between underwear producers and institutional customers. The aspect of the exchange of information between producers and traders is particularly exposed.

Key words: underwear industry, institutional customers, customer capital

J.E.L. classification: M3

1. Introduction

The functioning of modern enterprises in the variable and unpredictable conditions requires undertaking a series of actions necessary to stabilize and strengthen their market position. The effectiveness of these activities is determined to a large extent by the ability to build lasting relationships with

customers. Currently, the customer is not only a part of the company's environment, but first of all its resource. The knowledge about customers and their needs allows the company to convert new customers into regular ones. This is reflected in the creation of long-term loyalty-based relationships with target markets.

This article aims to present the scope and importance of relations between underwear producers and institutional customers. The aspect of the exchange of information between producers and traders is particularly exposed.

Undertaking the analysis of the subject, the fact should be stressed that the underwear industry is a specific industry. The situation in the analyzed sector is complicated because of frequent changes in fashion trends, preferences and tastes of buyers. Also very high sensitivity to changing conditions in the external environment is evident, not only in relation to the economic sphere, but also to cultural, demographic, competitive and technological spheres.

Conclusions in this paper were supported by the results of research included in the report "Study of brand recognition of the Podlaski Underwear Cluster", which was realized with the participation of the authors of this paper.

2. Situation of the underwear industry in Podlaskie Voivodeship in comparison with the industry in the country

An important segment of the clothing industry is the underwear industry. The value of Polish underwear market is estimated at

about 5 billion PLN, which represents more than 21 percent of the total clothing market value (the clothing market value at the end of 2007 - 23 billion PLN). The industry still remains in a developing phase, taking into consideration the fact that Polish society has not reached the level of affluence of Western societies yet. The estimated increase of earning potential and the expected changes in shopping habits of Polish society as its consequence are the determinant of opportunities for further growth and development of quality clothing market (including underwear market). The market is conditioned by such factors as: changes in the level of material and cultural life of the society, technological progress, seasonal character, and susceptibility to fashion trends.

The development of the clothing industry (including underwear one) in Poland and other EU countries was significantly affected by the changes that have taken place in recent

decades in the international structure of production and trade of products in this industry. Reallocation of the world's major centers of clothing production to developing countries (including China, India, Bangladesh) with substantially lower production costs has affected the reducing of the production potential of enterprises in Poland [1].

The underwear industry, similarly as clothing industry, is fragmented and is characterized by high competitiveness. Only a few companies of this industry have appropriate organizational and production capacity and necessary capital to build a complete product offering, strong brand and extensive sales network. To tell the truth, concentration processes occurring in this market are noticeable, but they are very slow. In the region of Podlasie Voivodeship more than 40 entities operates in underwear market. Their dynamics is illustrated by Figure 1.

Figure 1. Number of entities operating in the underwear industry in Podlaskie Voivodeship in years 2005-2009

Source: own calculations based on the Voivodeship Statistical Office in Białystok

In the years 2005 - 2009 the pace of changes in the number of entities varied. The highest level was recorded in 2008 and the lowest in 2006. Between these periods the underwear enterprises grew by almost 17%.

The underwear industry in Podlaskie Voivodeship at the end of 2008 constituted less than one percent of domestic production. (Table 1)

Table 1. Underwear output in Podlaskie Voivodeship in comparison with the country in years 2005 – 2008

Description	Quantity (in thousands pcs.)			
	2005	2006	2007	2008
Underwear output:				
- Podlaskie Voivodeship	204	338	271	160
- Poland	21831	21245	18631	17894
Share of underwear output made by producers of Podlaskie Voivodeship in comparison with domestic production of underwear	0.9%	1.6%	1.5%	0.9%

Source: own calculations based on the Voivodeship Statistical Office in Białystok

This low level was characteristic also for the year 2005. Whereas more than 1.5% of production was realized in years 2006-2007.

The situation within production sold is much better. The high quality of offered products causes that they manage well in this competitive market. (Table 2)

Table 2. Production sold of underwear in Podlaskie Voivodeship in comparison with the country in years 2005 – 2008

Description	Quantity (in thousands pcs.)			
	2005	2006	2007	2008
Underwear output:				
- Podlaskie Voivodeship	185	323	265	154
- Poland	15503	13934	12721	16239
Share of production sold of underwear made by producers of Podlaskie Voivodeship in comparison with domestic production sold of underwear	1.2%	2.3%	2.1%	0.9%

Source: own calculations based on the Voivodeship Statistical Office in Białystok

In the analyzed period the share of production sold in output of companies of Podlaskie Voivodeship constituted more than 95%, whereas at national level, the indicator stands at just 73%. As a result, in 2006-2007

the share of production sold of underwear of producers of Podlaskie Voivodeship in comparison with domestic sales exceeded 2%.

Table 3. Production sold of underwear in Podlaskie Voivodeship in comparison with the country in years 2005 – 2008

Description	Value (in millions PLN)			
	2005	2006	2007	2008
Underwear output:				
- Podlaskie Voivodeship	2129	4204	3612	2238
- Poland	363466	382599	394816	353850
Share of production sold of underwear made by producers of Podlaskie Voivodeship in comparison with domestic production sold of underwear	0.6%	1.1%	0.9%	0.6%

Source: own calculations based on the Voivodeship Statistical Office in Białystok

This higher growth in sales was also caused by lower prices of products offered by producers of underwear in Podlasie Voivodeship. As a result, at the end of 2008 underwear producers from Podlasie made 0.6% of the entire national underwear market in terms of value.

3. Relationships with customers as a resource of enterprises

Companies run their business in conditions of a faster and faster increase of the number of products and competitors. This means that there is not a shortage of products in the market but the customers. [2] Therefore a long-term success of the company will be the result of building lasting relationship with the customer based on loyalty. In relation marketing the product is not an article itself, understood in the category of a marketing instrument, but relationships a company makes with the customer. The product cannot be defined in isolation from the relationship, because it blurs the difference between the product and service.

Relationships with customers are related to all processes and activities that occur after the sale of the product and during its use. Unlike traditional marketing, the core of activity of a company is not limited to sales of products for which there is market demand, but use of a company's skills to build a relation with customers, leading consequently to building competitive advantage.

In the literature on the subject, customer capital is often referred to as relation capital. It is identical as in the case of a broad understanding of the category of customer capital, which are components in this approach [3]: the activities within the organization network and strategic alliances, access to complementary resources in the process of innovation, image and reputation of the organization, position of the company in the market, owned brands and their value, the ability to knowledge sharing, financial links and cooperation with other companies, customer value and loyalty, customer satisfaction, marketing research. In a narrower view it refers to creating relationships with the customer – customer and user of the company's offerings and

includes [4]: customer base, relationships with customers, potential of the customers.

Customer capital accumulates in the company's ability to influence markets for the goods. It is reflected in improving the sphere of the marketing organization in the enterprise and the intensification of the market activities and creation of lasting relationships with customers [5]. It should be remembered that customer capital is important in managing the whole enterprise. First, the customer is the value for the enterprise. The customer value for the company is determined by flows generated by customers; the customer value is determined by what they bring into the organization [6]. In this context, it is important to create the value offered to a customer by the company, that is benefits in terms of products and services offered to customers in order to ensure their satisfaction and loyalty, and consequently sales revenues [7]. The process of customer's value creation consists of understanding and defining the value for customers, creating the value with regard to innovation and communication and delivery of the value.

Analyzing the topic of customer capital, it should be emphasized that customer orientation is becoming the most important factor in achieving the objectives of the organization. Contemporary struggle in the market is not only a fight about products, but mainly a fight about customers.

4. Informational value of relationships with commercial companies for representatives of the underwear industry in Podlaskie Voivodeship

Institutional customers are a special link in a production process as well as in distribution. They most often contribute to an enterprise's offer and provide important market information. The relationships with institutional customers are characterized by:

- close relationships between a supplier and a buyer,
- a large value of transactions,
- rapid flow of information,
- dependence of supplier's market success on the market situation of the customer.

Such strong correlations require special attention to the relationships created between the parties of the market exchange. In the case of underwear producers relationships with the individual links of trade are particularly important: wholesalers, shops, sales representatives.

The informative value of the relationship is particularly important. Since trading companies are directly linked with end-users of underwear – hence there is special importance to create lasting and based on the realization of mutually beneficial relationships. According to traders operating in the underwear market in the Podlaskie Voivodeship, contemporary market situation requires undertaking activities to strengthen them in the customers awareness to be remembered. It is particularly important that, in comparison with Polish producers of underwear, Western brands have already learned that - they are easier to identifiable and more displayed. The need for such activities are supported by the results of research conducted among institutional customers, which show the following [8]:

1. Focusing the attention only on developing the product in its physical form, in the face of intense promotional activities, puts companies in a hopeless situation.
2. Collections which stay in female customers' memory are the highest quality products, but the quality is more broadly understood: as a convenience, comfort of wearing, ease of operation.
3. Well-known brands in the assessment of female customers are beginning to be perceived increasingly not as a luxury product but as a mass, widely available one, which is an opportunity for local producers.
4. There are still some noticeable gaps in offerings of Polish and Western collections. The differences do not refer to product quality, but to the system of promotion. A large part of Polish female customers are not aware of the existence of so many high-quality underwear products.
5. Polish producers matter in the race for the customer, however, they exercise some caution – they do not have ideas characteristic only for

themselves – some market individuality, especially in the field of intensification of the promotion.

6. Apart from concentration on the product, a brand and effective promotional campaigns are important instruments in the fight for the customer.
7. The brand is not only an important component of the offer, a company's distinctive feature, but it constitutes an independent and integral part of the product. Its image also depends on the merchandising in the point of sale. This is connected with the knowledge of the female customers' needs. The cooperation between production and trade links is important in this area.

It should be emphasized that the implementation of information function in building relation capital is particularly important, since both links work for the same target markets. Underwear is a specific product. In the process of decision making about its purchase both emotional factors and functional features of the product are taken into consideration. Mutual cooperation of production and trade links, therefore building sustainable and lasting relationships based on emphasizing the information factor may contribute to meet the needs of target markets better.

5. Conclusions

The results of the research confirm that the exchange of information between trade and production links in the underwear industry may determine the effectiveness of companies' market offer in the underwear market. Since appropriate relationships with institutional customers decide about the effectiveness of the impact on target consumers. It is important to define certain standards of cooperation in the sphere of exchanging information and experiences. Such activities will determine a strong orientation on the needs of target markets, which are the main scope of the impact of both production and trade links. Such undertakings gain particular importance in so dynamic and demanding market as underwear market.

NLP Techniques Integration in Negotiation

Zamfir Cristina-Mihaela
"Ovidius" University of Constanta
cristina_m_zamfir@yahoo.com

Abstract

If communication exchanges represent an inherent reality in any negotiation, we must reflect on the manner of achieving it. Being aware of this reality causes the negotiator another concern, the one of communicating more effectively. If we optimize our communication abilities, we actually expand our opportunities to influence others and this can be considered manipulation, which always has negative connotations. But if 'not influencing is not possible', then the ethical dilemma that may arise from this situation has only solution: we accept this fact and we develop our skills in this direction, but only with integrity, in a responsible manner and respecting the world model of the parties who are involved in the negotiation process. One of the merits of NLP is to teach us how to reduce the gap between us and our interlocutors by quoting their words back to them, getting into rapport and pacing for information before leading into agreement.

Key words: active listening, NLP techniques, negotiation.

J.E.L. classification: M10.

1. Introduction

Being found in almost any application as a component of NLP, the vision of interpersonal communication is extremely important. Neuro-Linguistic Programming (NLP), a technique that was discovered in California (1976) by the linguist John Grinder and the programmer-mathematician Richard Bandler, is an effective method of communicating with those around us and of changing the human behaviour, whose principles are based on knowledge of programming, psychology, information theory and communication theory, based on

sensory modalities or submodalities which are nothing more than representation systems. NLP is based on the following hypothesis: each behaviour can be changed or learned. The aim of NLP is to reprogram the brain by adding it new potentials, this technique relying on interpersonal communication skills. Neuro-linguistic programming allows us, therefore, to correct unwanted behaviour, representing an effective tool in achieving an integrated, self-achieved, well-structured personality. Thus, NLP is presented as an authentic manner of using the brain, especially supporting personal development and learning ways to solve conflicts.

The NLP vision on communication reveals a totally different connotation, different from the simplistic one, often adopted by many of us, thus communication is an extremely complex and dynamic process, carried on multiple plans and channels, where all the protagonists are completely involved.

2. Building relationships: The pacing and leading techniques

When we decode the message to someone, we do it through the active filters at that time, the response to the listener's message being determined by our inner response in which we decode the message, in that moment, this being also dependent on the filters that we use. In fact, we don't answer to our partner's message, but to our internal images about it, that is what we understand. The same thing happens with the communication partner. The way the response or message turns back to our partners depends on our ability to set our filters in an expressive manner and this may not always coincide with our intention. Probably, everyone has experienced the situation of not being understood, of not expressing what one intended to, of receiving reactions or responses that have intrigued

him/her. Thus, communication is the answer I receive from the other.

This vision has several relevant consequences for the negotiator. For example, the negotiator could be held responsible for the reactions produced to the his/her business partners, rather than merely understand or categorize them. The negotiator should work on his/her speaking skills and he/she should be aware of his/her failures and he/she should find the adequate ways of solving these issues.

This statement emphasizes the need to consider the feedback received from the interlocutors. What really matters in communication is not my intention, but that the dialogue partner understands what I say. Otherwise, the phenomenon of parallel communication may occur, together with distorted and possible tensions at the relationship level. In all cases in which we work with people, it is absolutely necessary to consider this feedback, otherwise our effectiveness as conflicts negotiators will be much diminished. It is impossible to be effective in a communication relationship, regardless of the context in which it takes place, in the absence of consideration and use as a self-regulating information feedback communication partner sites. Another important feature is that the feedback we receive is not always relevant through verbal communication, most often this being indirect, implicit and poorly accomplished. For this reason, we need to learn and improve some specific skills, such as calibration or pacing.

Pacing and and leading concepts are fundamental to any type of NLP intervention. In any communication, the existence of a relationship is vital, a relationship of empathic resonance between the two partners as basis of the mutual confidence which the other can feel free to manifest. We can say that establishing this rapport, this connection represents the starting point of any genuine communication, the only possible one. The existence of this relationship between two people or a group in which communication is carried out smoothly, as if by itself. Analyzing the spontaneous situations in which this arises, we can notice that partners resonate, harmonizing both nonverbal language, as well as the verbal one.

In the verbal message, the words contribute only by 7% to create this connection. Likewise, the lack of resonance at the verbal level can destroy this rapport only by 7%. However, body language and voice quality are of a much greater importance. When two people are in a resonance rapport, they tend to mirror and reflect each other in posture, gestures, eye contact and tone of voice, like a dance in which each partner responds to each other through their own movements. Their body languages are complementary in this situation. The closer and deeper the rapport, the stronger the trend mirroring, reflection and response. The emphatic rapport in clear statements can be achieved through awareness, dressing and using such skills, that we use naturally and with respect. This will build a bridge between us and his/her model of the world. Undertaking and reflecting mean harmonization. There are some typical situations to be avoided in the relationships we establish. First, the situation when the partner understands he/she is imitated. Usually, he/she interprets this behaviour as an insult and will react in one way or another. When the partner's nonverbal behaviour cannot be reflected without him/her noticing, using a mirror, it is recommended to mirror another part of the body, using the technique of cross mirroring reflection. The same is valid in two typical situations: when the partner's nonverbal behaviour is very broad, exaggerated or aggressive, or, when practising this coverage would make us feel uncomfortable. These two approaches are known as pacing and leading in NLP. Pacing builds a bridge between me and my partner's world and it is based on resonance and respect, and leading changes their behaviour so that the other person follows these changes.

NLP provides a model of interpersonal negotiation, by means of which, the parties involved in the conflict or dispute can be supported in reaching a mutually accepted result. For a successful negotiation, we should take into account the following steps:

- the situation and the subject of negotiation between the two partners are specified;
- the expected results by each party are presented;

- both parties are guided to find a common purpose or result, that is consented by both parties - for it is usually necessary to redefine the purposes and to place them at a higher level of generality;
- then the conditional conclusion of negotiations is used (conditional approval).

If there are objections, each of the negotiating partners should think of what he/she aims to get as a result of his/her complaint or what will happen if they fail to reach an agreement and expressing the consequences of not reaching an agreement. This solution will be used only if the parties do not cooperate in the negotiation.

This model offers some suggestions for the negotiator concerning the requirements that must be met early in the negotiation so that it can be successfully completed, by means of a win-win solution. Let's suppose that we are in a situation of negotiation between two people (A and B), where A proposes something to B and B raises an objection to A's proposal. It will also restate its objection to B, the basic condition to reach the conditioned agreement. Achieving conditioned agreement implies acceptance by B of A's proposal, provided to meet the objection raised by B. Satisfying these objections is often conditioned by their reformulation in order to become acceptable for both parties. In this way, the objections raised by partners are used in negotiating and reaching an agreement. The negotiator must take into account all the objections raised by the partners. If one of them refuses to consent, there are, probably, still certain objections that were not revealed.

Another useful and important technique to work with submodalities is the mental screen, which requires the customer to view a screen, on which his representations are projected. The idea of working on representations, controlling a screen image that runs in their minds includes the possibility to control representations, experiences and emotional states.

3. The skills of negotiating: The technique of questioning

The questioning technique is a specific communication skill which includes the ability to ask questions, listen to the answers, summarize (or relect back) and reframe what the interlocutor has said to ensure effective interaction. Asking questions has been recognized as a powerful method for stimulating learning, creativity and change. It has long been known that progress in any field of endeavour comes more from knowing what questions to ask than it does from the knowledge and data currently available. Answers are a matter of our current knowledge about 'what is', but questions are the product of imagination, and serve to stimulate imagination even further.

The field of NLP has been founded on the ability to ask questions. From this point of view, NLP is essentially an inquiry – a 'quest' to find the most ecological way to conduct a successful negotiation. According to Aristotle, "the types of questions we ask reflect the types of things we can know". Thus, different forms of questions reflect different levels of understanding. Open questions allow respondents to answer in any way that they wish. Closed questions make respondents choose from a limited choice of answers (which may be specific or implied by the question). By way of illustration, the following examples of both types (about negotiating authorization to attend professional gatherings) could be used by the employee during the initial stages of a negotiation to find out about the employer's reimbursement intentions. In each case there are two examples, one is a good use of the question type, the other a poor choice:

Open questions:

e.g. *What is the company's policy regarding attendance at professional gatherings?* or *What is the organization's policy toward persons at my level attending various conferences and workshops?*

e.g. *When/How will you reimburse me for all reasonable expenses and program costs?*

Closed questions:

e.g. *Will I be given the time off and will I be reimbursed for all my expenses?* or *In the past I have been accustomed to receiving reimbursement for my occasional participation in a professional seminar or*

workshop. Will I be allowed to do so here? Will I also be given the time off?

e.g. *In addition to my membership in the Society for Human Resource Management, I need to retain my active membership status. Does the company support that effort by paying for my annual subscription to HR magazine?*

Open questions do not make any assumptions about the answers that may be given. This means that they should encourage respondents to say what they think and feel. The first question defines clearly what is being asked about (negotiating authorization to attend professional gatherings). It would be hard for the question to be misunderstood. That means that the respondent will give an answer that will help the interlocutor to know more about the company's policy, which is the purpose of the question. The second question is just too open (*When/How will you reimburse me for all reasonable expenses and program costs?*). If the employee got the answer 'Fairly soon', what would he be able to understand about the procedure for getting approval for such a compensation package? Not very much at all. That is why, we should always frame questions by thinking what it is we want to know.

Closed questions are those that only allow a limited set of answers. They are useful when there are only a limited number of possible answers or when we want to ensure clarity in what the respondent is saying. For example, the question

e.g. *Have you ever considered to allow me to attend the conference on company time and reimburse me for all expenses?*

assumes that only one of two answers is possible – 'Yes' or 'No'. Many closed questions are useful, because they provide clear, straightforward information that one can use to understand the other's experience. As a general rule, it is wisest to work from open to closed questions when exploring a topic. Open questions will help us to identify the broad details, whereas closed questions help us to confirm the details.

Not only can these questions lead us to find our interlocutor's answers, but they are a primary tool in NLP for eliciting experiences and gathering information about people's outcomes, representational system abilities, internal states, cognitive strategies, and their map of the world in general. Questions can

also be used to challenge people's limiting assumptions and lead them to a wider perspective. There are occasions when leading questions in negotiations can be useful in clarifying something that people have said, especially if they are reluctant to give a really clear answer. Leading questions are those that suggest what the answer may be. Here is one example:

e.g. *You have been offered all the benefits you asked for to allow you to work from home (a new computer, tuition refund, a four-day week), yet you still don't seem ready to make your contribution to our company's bottom line. Have you not found them very effective? (Is there something the organization can do to make the whole obligation more manageable?)*

This question is designed to overcome this reluctance, to admit to a possible failing. It suggests that the weakness lies not with the employee but with the assistance. Funnily enough, this is more likely to encourage people to admit to their own weakness. Asking directly – 'Why didn't you benefit from the advantages we offered you?' – points the finger at the employee and makes him defensive. Offering an opportunity to avoid responsibility often causes people to acknowledge their own weaknesses.

4. Active listening – Backtracking in practice

Reflecting back or backtracking is another technique that helps reinforce understanding. It is simply a case of summarizing what has been said by picking out the key points. It also gives the other person a chance to identify any misunderstandings. As well as encouraging active listening, while reflecting back we can correct any errors in a positive way, link together what the speaker has just said with something that has been discussed previously, and lead into the next area of development:

e.g. Director: *Ok Patrick, explain what you have just done.*

Manager: *I've compared the case for building our own warehouse with our current price of outsourcing distribution. I've looked at two main points – the cost and efficiency in*

delivering to our customers. We can break even on the investment in the warehouse in five years at the most. After that, we can expect to save costs on distribution. The warehouse will enable us to deliver faster and more efficiently to our customers.

Director: *That’s right. Having done your research and compared the case for building our own warehouse, you looked at two main points: one, the cost; and two, efficiency in delivering. As we have seen, we’ll break even on the investment in the warehouse in just five years. Then we can have the benefits of greater cost savings and greater efficiency in the future. Congratulations for your hard work.*

5. The technique of reframing

In NLP, the reframing technique is also one of the most profound and powerful ways to help a person shift perspectives and widen his or her map of the world. Reframing involves putting a new mental frame around the content of an experience or situation, expanding our perception of the situation so that it may be more wisely and resourcefully handled. If the person has got it wrong, or hasn’t appreciated the importance of something, we need to think about *reframing* what was said. This can be thought of as ‘reflection with a twist’, and the twist is to change the emphasis or point of view of someone, or to correct an error:

e.g. Team member: *I collected the data by writing a questionnaire and asking all the members of the team to suggest alternative solutions to respond to our negotiating proposals. Nearly all the questions were closed so people could say what they really thought. I then grouped them into similar types to analyse them. I should have decided beforehand what they would say as that would have saved me a lot of time grouping the different answers.*

Team leader: *So Sarah, you used ‘open’ questions because that would let team members say what they really thought, rather than what you thought they would say?*

Team member: *Sorry, yes, open questions. Yes, I suppose that was better, not putting words in their mouth.*

The team leader corrected the team member by emphasizing the correct name for the questions she used and also turned her negative comments into a positive. This is a far less confrontational way of correcting someone. It emphasises the positives of what Sarah said and changes the negatives. This will encourage Sarah to remember both the right name for the question type and also that what she had done may have been time-consuming but it did lead to better results.

6. Building rapport

Negotiating is based on building *rapport*. Rapport is fundamental to a successful negotiating relationship. The people we are negotiating with must trust us if they are to learn effectively and to rely on our guidance and advice. Rapport is about the confidence that people have in each other, leading them to be open about their fears and feelings and to rely on others for support. It is an elusive concept. It is easier to recognise than to describe. We can see rapport when two or more people have been cooperating with each other for a long time and are able to communicate together effortlessly. NLP suggests a few ways that negotiators need in order to be able to build trust and, hence, rapport:

- asking questions (and doing so in a way that demonstrates a clear interest in other people and what they can do);
- listening actively (to understand their answers to our questions);
- reflecting back and reframing their answers (to show we are listening and to emphasise the positives)
- recognizing their emotional states (and using this to improve communication);
- behaving in ways that will earn their trust (and also show we trust them).

7. Conclusions

We do not have to work with someone for years to establish this kind of rapport, but we can achieve a rapport with someone in far less time if we follow the above principles. In this paper I have pulled together the

strategies and techniques we need to be effective as negotiators. I have seen that, as an emerging discipline, NLP brings about self-development and change, enabling certain key verbal cues – visual, auditory, kinesthetic patterns.

Paying attention to the language patterns used in a negotiation situation, the interlocutors engage themselves in a reciprocal matching-pacing-leading process. One way of checking on the understanding of the other person’s map is by means of open questions and the technique of backtracking. For this I have seen how to use different types of questions to achieve different things and that questioning is no use without active listening.

Whatever NLP techniques we apply, these are neutral in terms of value and respond to ecological criteria, how they are used being strictly determined by the negotiator’s own abilities and intentions. In fact, only by being extremely responsible, aware, only by featuring serious communication skills and

people to improve effective communication methods. When people interact and establish rapport, there is frequently a matching of

by influencing the others, can we achieve full acceptance by the parties, considering their values, their filters, their lives.

Abstract

This paper aims to highlight the evolution of e-commerce in Romania between 2008 – fourth quarter 2011.

Were processed, analyzed and interpreted data on the number of electronic stores and online transaction volume in this period.

Also, based on these data was made an estimate of the evolution of electronic commerce in Romania for 2012, expecting a significant expansion of the phenomenon.

Key words: information technologies, transactions, society, e-commerce.

J.E.L. classification: L81.

1. Introduction

The term e-commerce tends to mean different things to different people, but have stressed from the beginning that not only refers to selling products through a shop located in the web space.

Electronic commerce is a dynamic set of technologies, applications and business processes that unite organizations, customers, suppliers through electronic transactions, electronic exchange of information, goods and services. Best definition for an introduction to this field is given by the American Automotive Industry Action Group company, "Electronic commerce is the use of advanced information technologies to increase business efficiency and business relations between the partners."

In electronic trade information is processed using electronic equipment for carrying out economic activities, but with the same framework based on commercial standards and practices known. This mix of business strategies and information technology is considered to be an expression of the future economy.

Unprecedented development in the last two decades due to the need for information technology storage and rapid transmission of information with the lowest costs revolutionized global trade.

Today, the term Electronic Commerce has become synonymous with profit growth. Electronic commerce (E - Commerce), the Economic Cooperation Organization design and Development (OECD) is conducting business via the Internet, selling goods and services taking place offline or online.

Electronic commerce consists in running a business, the value generating activity, with the support the Internet and use of specific software packages.

Electronic commerce is the key enterprises' competitiveness in the Information Age, providing:

- access to new market segments (new customers);
- increase speed of the business
- greater flexibility of trade policies;
- reduce supply costs, sales, advertising, etc.;
- simplification of procedures.

Main segments of electronic commerce include:

Banking operations. A percentage of 85-90% of banking is done electronically. Banks are expected carry out these operations through the Internet to reduce costs with a substantial share. Examples of such

operations are:

- Electronic banking (Electronic Banking) - transfer of funds statements account, "self-service" customers (stopping of payments, checks, etc..) banking operations that can be

made from home (so-called "home-banking");

- Electronic Bill Presentment and Payment;
- Electronic Investment - brokerage, information and market analysis tools;
- Electronic Insurance;
- Supply Chain Management - billing electronic special accounts;
- other services in the card of debit / credit smart cards. Examples of successful sites are: Wells Fargo, NationsBank, American Express, Bank of America, Citicorp.

Retail, Internet shopping offers the possibility of making a manner with a highly customizable, allowing sellers to know and to better understand customers. Amazon.com allows Internet users to search and order any credit cards selection is made, realizing payment by credit card.

Thanks to the Internet, retailers can be connected electronically with their suppliers for better exchange of information, shortening the control and distribution. At the same time, they have access to international market outlets, without having a physical office in a certain place.

The most successful sites are: Amazon.com, CDNow, Kmart, Barnes & Noble, Walmart, Victoria's Secret.

In tourism, conducting business via the Internet has the advantage of eliminating intermediaries.

Airlines or hotels that allow customers to make reservations online and have significantly reduced costs. For example, you mentioned: TravelWeb, Travelocity, Ticketmaster Online or RoTravel on Romania.

Securities exchanges. This area is growing, for example company website can remember Schwab, which are traded weekly titles worth over \$ 4 billion, and from over 5 million customers, 2 million as investors active via the web. Other successful sites are:

E-Trade, Discover Brokerage, Ameritrade.

Production activities in this field will exist because of the Internet, many more possibilities. A commonly cited example is Boeing, which created an international network for the design of the 777. Japanese engineers have worked so portions of the wings or fuselage through electronic links across the Pacific provided by The Internet. The entire project was done with computers, without any bit of paper.

E-commerce business-to-business will improve procurement, inventory control, production activities, distribution and payment, using for this specific back-office applications using the Internet to enable better management of orders, an appointment the supply and distribution. Samsung Electronics, Fruit of the Loom, General Electric, Toshiba are just some of the reference sites in this the field. Everything here can be framed and manufacturing companies in information technology like Microsoft, Oracle, Intel, Apple, Dell, Compaq, firms were among the first who adopted the new type of economy-the Internet.

2. Electronic commerce in Romania, 2008-2011

According Trafic.ro gauge, which can be considered relevant in measuring the activity online stores in Romania, can appreciate a spectacular evolution in the number of stores compared to the size of the Internet market in Romania, during 2008-2011. Trend is observed regarding the evolution of the electronic stores in Romania, it be modified is an average of about 252 stores. Thus, if in 2008, in Romania there were 2215 stores, in 2011 the number had risen to 3354, indicating an increase of almost 46% or it. From 2008 to 2010, the number of electronic stores in Romania increased, but to a lesser extent (is by 0.7%), reaching a total of 2277 electronic stores. Instead of 2011 in semester 3 already touched 3354 online stores.

Table 1. The evolution of e-commerce stores in the period 2008-2011

Year	e-commerce	Evolution
	Number of Shop	
2008 quarter 3	2215	
2009 quarter 3	2277	+ 0.7 %
2010 quarter 3	2390	+ 5 %
2011 quarter 3	3354	+ 40,3 %

Source: <http://netindex.trafic.ro/luna/comert-electronic>

According to statistics RomCard, areas that generate the largest volumes in Romanian electronic commerce are: travel services and reservations for airline tickets, mobile bills and IT & C products, electronics and appliances.

The same source reveals that 2008 ended with about 60 million online credit card processing system 3D Secure but still, this represents only 5% of the total payments made in Romanian online stores. Note that RomCard cannot provide statistics only for traders enrolled in 3D Secure, currently number 187. It is not known but the exact number of Romanian traders who process through a process not configure external and 3D Secure.

In 2009, electronic commerce exceeds 75% in 2008 reaching 92.8 million euros value, with a total of 1,246,130 transactions, twice the number recorded last year. Note dramatic differences in terms of transaction volumes in quarters 2 (increase of 11,311,907 euros), 3 (increase of 12,975,579 euro) and 4 (increase of 10,633,805 euros) in 2009 compared with 2008.

In 2010, as in previous years, the products sold online have the same tendency: telecom sector had accounted for 45% of transactions processed by Avangate, followed by tourism with 38%, services 10% and 7 eTail %.

3. Analysis of electronic commerce in the last quarter of 2011. Forecast for 2012

In the first nine months of 2011, e-commerce online payment recorded a volume of 121.4 million euros, up by 11% over the same period last year, according Romcard. ePayment processed 89% of online

payments, that is 106.7 million euros, up 13% over the same period of 2010, according to a release of ePayment.

Although 2011 is a year marked by economic instability, e-commerce industry has maintained double-digit growth rate and remains a growing market. I refer primarily to the interest of such companies are turning to a new channel for sales and promotion, and to increase competition in the industry, especially from banks that now looks much more interested in developing and promoting this segment, which can not only be beneficial to industry.

Another positive trend in e-commerce industry is diversifying the shopping cart, a phenomenon evidenced by the increase recorded by certain categories of products. Thus, according to Romcard, segments of online stores that sell flowers, cards and gifts increased by 75%, 76% and 64% and significant increases were recorded also on other product categories such as toys (56 %) and clothing (24%), increasing average basket value, also reaching 21% and 69 euros.

The evolution of these segments indicates that the Romans are increasingly shopping online payment of various common and increasing the number of online stores determine the development of electronic commerce industry, bringing new customers and stimulate adoption of online payments. Therefore, priority will continue to be Romcard continuous improvement of services for processing, 3D Secure standard promotion and encouragement of buyers in the direction of activation cards to continue to enjoy all the full payment environment.

Romcard, and ePayment mid confirm estimates on the end, according to which e-commerce online payment market will exceed 160 million euros.

Also, according to estimates, 2012 will see a new growth market, especially due to products, services and actions to promote us, which will attract online customers.

Besides the positive evolution of the Romanian electronic commerce for ePayment, 2011 remains a reference year, marked the company's expansion in Europe by exporting technology and doubling the number of employees. Next time will definitely be very interesting because, if ever, talked online payments by card and

overwhelming market share cash payment, we will see change in this report both through the development of several payment options for buyers and by adding their loyalty programs.

ePayment is integrated eCommerce solutions provider, part of PayU International, owned by Naspers Ltd, the second player in global ecommerce.

PayU online payment integration has operations in Poland, Czech Republic, Romania and Hungary, generating 31 million transactions in 2010 worth 800 million euros.

In Romania, is the leading ePayment online payments with over 2 million transactions processed in 2010 worth 121 million euros and a 90% share of total Romcard.

The company develops integrated online payment solution ePayment for companies that own or want to open an online business in Romania or in countries where the group operates PayU.

Predicting the evolution of electronic commerce in the period 2011 Q4 -2012 was based on existing data in the paper, using the TREND function in Excel. In order to estimate the value of online transactions for the next years, the trend calculated by quarters.

Table 2. Estimation of transactions (EUR) per quarter from 2010 to 2012

Traded volume (euro)	2010	2011	2012
quarter 1	66.345.464	88.075.479	92.324.546
quarter 2	65.716.232.5	89.253.317	98.546.321
quarter 3	66.352.602.5	90.114.755	108.152.879
quarter 4	78.071.909.75	90.705.459	124.962.542

Source:Made by authors

You see an upward trend in trade volume electronic transactions, until 2012, when it recorded a value of 423,986,288 million euros. Based on data presented, it is clear that the volume of online transactions will grow from approximately 65 million (in 2010) to 423,986,288 euros (in 2012). It is estimated steady growth of

electronic commerce transactions, therefore a development of electronic commerce in Romania. If by 2006 there may be no reference to a true e-commerce development, since 2008 one can see a real expansion, revolution phenomenon. In terms of evolution of the number of e-commerce stores, you can appreciate that for 2010 projected a decrease in e-commerce stores with 9%. For years following an upward trend is observed, the increase being 12%, 11%.

Table 3. The evolution of stores in e-commerce

Year	E-commerce	Evolution
	Number of shops	
2009	2277	
2010	2059	- 9 %
2011	2314	+ 12%
2012	2568	+ 11%

Source: Made by authors

Growth and development of electronic commerce will lead to a number of significant changes in the economy. IT revolution has had a major impact in the global economy, bringing that transparency for economic development. Electronic commerce has made improvements of the Relevant in wealth, the mass production economy, after the second world war, so far. Consumers today can make better decisions, obtain more diversified products and services, many of them non-existent before the advent of the Internet.

4. Conclusions

Electronic commerce is not a concept that, to refer to use the future tense, it is a present reality in everyday life.

Advantage of the electronic commerce is reflected in two important resources of the current economy: information and time. These two resources cannot be considered separately, because not only the quality of information it provides is an asset in electronic commerce, but also much shorter time to obtain them.

It should be emphasized, however, that modern technology cannot replace strategy, working demonstrated by the recent crisis

dot.com sites, which could provide powerful and rapid evolution of the phenomenon and which are now placed in a position to review the whole strategy by finding solutions that best fit the whole their work.

The Employment of People with Disabilities in the Labor Market

Zodieriu Elena

“Alexandru Ioan Cuza” University of Iasi

elena_zodieriu@yahoo.com

Abstract

The access for people with disabilities in the labor market is a challenge and a necessity for most countries, especially with today's general line of national economies to reduce the cost of social services. This can be achieved if national policies will allocate more money for job accessibility, more careful supervision of enterprises with more than 50 employees, but not one people with disabilities and of the protected units that must protect the interests of this population.

Key words: disabilities, protected units, sheltered employment.

J.E.L. classification: J64, J71.

1. Introduction

The definition of disability suffers more connotations, depending on the country that defines it. Thus, some countries such as Luxembourg, consider the disabled as people touched by disability caused by war or by an accident so as people affected by physical, mental or sensory. These definitions focused on reduced capacities of individuals are often accompanied by a minimum threshold of disability, to be recognized as disabled workers. This threshold is 33% in Spain, 40% in Greece and 50% in Germany. States that have chosen this kind of definition are generally those that adopt a statist policy against discrimination. Other countries, like Sweden and most Anglo-Saxon countries, associated disability of the person with the environment. This definition takes into account the recommendation of the OM of Health, which moves the disability from person to the environment.

The handicap is the social disadvantage resulting from the loss or limitation of a person's opportunity - a result of the existence of an impairment or disability

(disability) - to take part in community life at a level equivalent to other members.

Disability (inability) summarizes a number of functional limitations that can be found in any population of any country in the world.(5)

The handicap describes the interaction between disabled people and the environment. The sense of this term (Standard Rules, 1993) is to focus on disturbances in the environment and the actions of an organized society, such as information, communication and education that prevent people with disabilities to participate on equal terms.

In 2005 in Romania, NAPH has developed a national strategy for protection, integration and social inclusion of persons with disabilities for 2006-2013 “Equal opportunities for people with disabilities - towards a society without discrimination”. This strategy aims to shift from a passive policy, creating opportunities for the development of active type policies (notably to increase coverage of people with disabilities with educational and training services). In December 2006 was promulgated the law 448/2006 on the protection and promotion of disabled persons, which is in agreement with the European documents. One way a person can integrate in society is through employment or labor market participation. Low level of employment of persons with disabilities is recognized both at national and European level (Commission of the European Communities, 2007).

Current legislation (Law 448/2006) provides measures to encourage employment of people with disabilities by establishing a rate of 4% for firms with fewer than 50 employees, tax incentives and protected forms of employment (sheltered workshops, protected units) which also benefit from tax breaks.(3)

Table 1 The percentage of persons with disabilities, by age, 31 of December 2010

The percentage of persons with disabilities, by age, 31 of December 2010	
age	[%]
0-4 years	2,02
5-9 years	2,58

2. The case of young people with disabilities and employment

The link between education and disability can be seen from two perspectives. On one hand, education may have an influence on disability installation. Thus, persons who have acquired higher levels of education had more chances to work in occupations with lower risks of accidents or diseases and safer work environments. In addition, education affects income levels and thus the access to care and recovery which can eliminate or limit the effect of illness or accidents. Also, education and income level can have an impact on lifestyle and therefore a lower risk of certain chronic diseases. On the other hand, people with disabilities can have a more difficult access to education and therefore a greater number of them would

have a lower education level. A previous study that analyzed data from the Labor Force Surveys 2002 and 2004 shows that in all EU Member States, including Romania, the level of education tends to be much lower as disability is more severe. In addition, people with severe disabilities from birth have an obvious disadvantage in the schooling level, reflecting less access to education. For Romania, this disadvantage also extends to those who have a moderate disability but acquired at birth. The education level is lower, the probability of having a job is smaller.

Knowing the exact number of young people with disabilities is very difficult. Most countries don't have accurate data for young people between 18 and 25 years. In Ireland in 2006 were about 393,785 disabled, of which 8.7% were young people between 20 and 29 years (according to census). In 2007 In Norway, 11% of the population between 20 and 35, had a disability (Statistics Norway, 2009). Czech Republic, all according to the census of 2007, approximately 1 million people were disabled, which is 10% of the population (Ministry of Education, 2007), about 60,621 people (5.9%) were aged between 15 and 29 years. In 2006, United States included, approximately 41,259,809 people with disabilities of which 1,501,184 were aged 16-20 years that is 3.6% of the disabled population.

The data recorded in those countries on the use of the young people with disabilities in the labor market are very imprecise; access to work is more difficult than the general population. In Ireland, the economic growth could not prevent the failure of jobs for people with disabilities so it experienced a decrease of 3% between 2002 and 2004, especially for the visually impaired.

In Norway, the share of jobs for disabled people was almost the same as for the other people, among others, holders of diplomas posts in tertiary education decreased by 10% between 2005 and 2008, even if the rest of the population increased by 7% over the same period (Statistics Norway, 2007). The only country, Czech Republic, has increased the number of people with disabilities in employment, even if the entire population, jobs and unemployment stagnated.

The difficulty of access the employment is higher for older disabled people. For example, in France, the number of requests for working of the disabled people, younger than 25 years decreased by 19% between 2003 and 2006 to 3.9% for those above 25 years. The access for young people with disabilities to university education is considerably improved over the last decade. The policy “School for All” has created equal opportunities for students with disabilities. Countries have begun to develop specific transition policies and integrate them in education.

Optimizing the transition to job involves:

- initiatives taken to optimize the role of school education for children with problems in the labor market,
- developing links between educational institutions and economic stakeholders to better recruit the workforce,
- work more closely with employment placement agencies for people with disabilities.

For a better integration of the youths with disabilities, some have developed special programs dedicated their professional insertion. In Ireland, for example, the WAM (Willing Able Mentoring) created by AHEAD (Association of Higher Education Access and Disability) and co financed by the European EQUAL program, has allowed 47 degrees of youth with disabilities in the labor market.

So Sweden has developed a program that benefited 118 students, 61% of them finding work, Germany by urban planning and support for students through counseling, their determination, will and financial support to graduate (Deutsches Studentare werk, 2008), U.S., Federal Work Study program (FWS) provides part-time jobs for students during their studies.

The program Professional Workforce Recruitment for College Students with Disabilities (WRP) allows employers to interview about 1,500 students with disabilities annually seeking work during the summer or graduation, making a profile of candidates from more than 200 secondary schools. Almost 4,500 students have benefited from this program since its inception in 1995.

In Romania, over 90% of those who have a disability and have completed more than 10 classes have a job. For those with higher education, this percentage drops to 40%. Unfortunately, even the educational system in Romania creates major disadvantages for people with disabilities. The incidence of non-schooling is seven times higher in people with disabilities to the general population. Early drop is two times higher for people with disabilities. Most disadvantaged group in terms of access to education is composed of persons with physical disabilities, serious somatic or visual, acquired by birth and who live in rural areas. They are more likely to never go to school. The access of people with disabilities in regular education, although regulated by law, it is difficult, having in most cases the refusal of the Director or teachers to get children with disabilities in school. On the other hand, the quality of education in segregated schools or home education is seen as weaker. Therefore, integrated education of disabled persons has a long way to be found even in practice. Statistics show that there are three categories of persons with disabilities,: the first category is formed by those at the bottom, which remain without education or only primary education. Then there are those who do the same as the general population, at the middle school / vocational school. And a minority of about 10% manages to reach the university level, surprisingly close to the general population (not necessarily with mild disabilities).

3. Employability of people with disabilities

The most common system of hiring people with disabilities is the form of quota. This is an obligation imposed both to employers from the public and the private sector, especially for those who have over a certain number of employees.

The Access for Work Program pays financial assistance grants. This is the only program that provides economic assistance directly to enterprises. Other aids are designed to reduce social spending, with the formation and for students with disabilities.

In developing countries, between 80 and 90% of people with disabilities don't have a job, while in developed countries, the situation is slightly better, 50-70% of people with disabilities of working age, don't have a job.(International Disability Rights Monitor, 2004).

In Romania the quota system was introduced by Law nr.57/1992 that requires employers with over 250 employees to have at least 3% disabled staff. If not, the sanction was the gross national minimum wage multiplied by the number of unfilled jobs.

Subsequent law changes have expanded the scope including companies with over 100 employees, then more than 50 employees. Also, the percentage of employees with disabilities increased to 4%, but dropped the sanctions, now being 50% of gross national minimum wage multiplied by the number of unfilled jobs.

Table 2 Employment of persons with disabilities

Year	Persons with disabilities between 15-64 years	Persons with disabilities which are employed	The percentage of persons with disabilities which are employed
1998	367.027	9.485	2,6%
1999	365.029	8.574	2,3%
2000	361.240	8.880	2,5%
2001	284.772	12.531	4,4%
2002	285.731	12.710	4,4%
2003	281.557	9.640	3,4%
2004	277.731	11.782	4,2%
2005	294.794	13.684	4,6%
2006	312.510	16.225	5,2%
2007	353.759	21.906	6,2%
2008	385.648	25.705	6,7%

Source: ANPH, 2008.

4. Employment opportunities for people with disabilities

4.1. Work at home

Persons with disabilities who wish to receive an income and cannot move to a job (for whatever reason), can have a job at

home. They are legally employed by a company but the duties they have can be fulfilled at home. Thus, the road inaccessibility from home to work is exceeded, as well as the inaccessibility of the workplace. Another advantage enjoyed by those working at home is related to the work program. According to legislation, this is determined by the employee. Only the owner reserves the right to check its activity, as determined by the individual employment contract.

- The document ends only in writing and includes the following: to be explicit about the employer's working at home.
- The program under which the employer is entitled to control employee's activity and the practical way of achieving control. In general, the verification is done during the 8 hours.
- The employer's obligation to provide transport to and from the home of the employee, the transport for raw materials and the materials he uses in his activity and for the finished products.

Working at home employees enjoy all rights recognized by law and collective agreements, such as the right to remuneration for work, the right to weekly rest, the right to annual leave paid, the right to information and consultation, the right to participate in collective action, the right to form or join a union (Labor Code).

4.2. Authorized Person

If a disabled person does not want to be hired by an employer (private or state), he can opt for the status of authorized individuals. In order to be an authorized person a person with disabilities must be registered at the Hall, according to Law 300/2004 and Norms.

4.3. Protected sites and labor units

The supply and demand of jobs for such people are distinguished by several features:

- First, the costs increase as there is no suitable means of transport or there are required additional medical care;
- Secondly, many of the people with disabilities have a lower level of education or training;

- Thirdly, these people need jobs with flexible program, because they need additional time for personal care, therapy or medical examination.
- Fourth, these people are sometimes reluctant to enter the workforce due to social benefits that they will not receive if they have a job (Council on Disability, 2007).

Jobs for disabled people - sheltered employment - fell significantly. The legal framework adopted in 1999 focuses mainly on encouraging employment for disabled people and less on the creation of protected productive structures to provide people with special needs the chance to increase their quality of life through employment and not to remain beneficiaries of passive social policies. In 2004, only 999 disabled people were employed in 42 disabled units approved by NAPH protected. As a result, most people with disabilities tend to become dependent on passive strategies of support and help with the effect of rapid increase in risk of poverty.

In 2003 figures showed that only 12,983 people with disabilities were employed: of which approximately 70.7% belonged to the category of persons with severe disabilities. A certain neglect of the means of creating jobs for different types of disability that can be partially compensated by supporting public campaigns to increase employment rates among people with disabilities in order to promote equal rights, is responsible for the passivity of this category of population. (JIM)

In 2000, in the EU protected working units were about 500,000 people with disabilities but there are significant differences between countries regarding the employment on the open market vs. protected units. Sweden and France have chosen rather to subsidize the employment of people with disabilities; the Netherlands and Poland are countries that have developed particularly segregated employment programs, protected units employing about 1% of the total working age population. Norway is the only country where the transition rate is significant - over 30%. Ireland, where the protected units are an important form of employment the number of beneficiaries and the amounts allocated from public funds, have made efforts to improve the transition rate by imposing a maximum period a person can

work in a protected unit and to put more emphasis on training component.

Similarly, the Netherlands, it has been encouraged the establishment of protected places in ordinary companies. Even so, the rate of transition to open labor market remains under 10% in Ireland and less than 4% in the Netherlands.

In 2010, in Romania there were about 400 units protected. However the number of disabled people working in protected units is very small.

Thus only 1% of employees with disabilities are working in protected units, the rest being employed in the open labor market. The protected unit has poorly developed in Romania, being absent the financial facilities to compensate for any loss of competitiveness. In Romania, the employment rate of disabled people is significantly lower than the general population. Only 12.7% of disabled people aged 18-55 years have a job, while the employment rate in the general population sample of the same age is 70%.

In recent years, a positive dynamics is observed in the employment rate of disabled people. It has doubled in the period 2003-2009, and the number of people with disabilities who have jobs increased 3 times. Currently the number of disabled employees is about 29,000 in total, including people working in small firms under 50 employees and in sheltered workshops. If we consider that all these people would be employed in the system of quota, which is not untrue, it would appear an employment rate of seats reserved for system rate of 15%, still well below other countries with system share.

5. Conclusions

Europe as a whole cannot afford to allow this inequality to continue. Therefore it is essential for the future prosperity of Europe to ensure that anyone who wants to work receives equal opportunity to access the labor market (EN 2007/IB/OT-02TL Twinning Contract). EU believes that people with disabilities should enjoy the same rights as all citizens of Europe to participate as fully in society. This includes, of course, right to work. It is known fact that in Romania employing a disabled person is difficult. Protected units in Romania are far from

enough. Financial facilities provided to potential employers and the order to pay a certain fee to the state if they do not hire people with disabilities are not sufficient. Employers prefer to pay the fee; therefore the results of these regulations are not satisfactory. Looking at the employment of people with disabilities from the perspective of employers we can see positive attitude towards the principle of the labor market integration, but a little more reticent regarding their employment. The reasons given by employers in Romania do not differ essentially from the arguments of the employers in other countries. They are concerned with the low productivity of people with disabilities, the need of supervision, increased absences caused by medical problems and costs imposed by adapting the workplace. The studies in the United States based on surveys among employers showed no differences between workers with disabilities and the others in the performance at work, presence and safety.

CAE databases comprise a very small number of unemployed people with disabilities, and businesses have turned more to NGOs and the publication of advertisements in DGASPC sites. Other employers mentioned the difficulty of finding people with disabilities who have been trained for available jobs.

This information makes us understand that there is a problem of adapting the demand for labor to the already existing one, caused by the low efficiency of labor mediation services for people with disabilities and the low level of their education. Another issue that employers need to adapt is the workplace. Both the European and national legislation provide that the employer must ensure reasonable accommodation to facilitate the right to work of persons with disabilities. This implies the possibility of changing working hours, purchase of equipment, devices and assistive technologies, changing desktop and other similar measures. Some interviewed employers said they were dissatisfied that the whole cost of these adjustments must be borne by them. The adaptations of physical environment and equipment suffer a lack of such service providers. Due to low demand and lack of expertise in assessment, prescription and

implementation of such adaptations, this market is almost nonexistent. In part, these services are offered by NGOs. People with disabilities know that employers have some facilities when employing disabled people, but still argue that when such a person wishes to engage is often rejected.

Over the last few years, Romania has embarked on an ambitious policy to assist persons with disabilities. An initial work program aimed to restructure the residential areas where people with disabilities live and looking for alternative solutions for implementation by developing services that allows greater participation in community life. With the formulation of National Strategy 2006-2013, Romania takes part in a new phase which aims to a better integration of people with disabilities and their greater access to job offers.
