The Environmental Impact of Trade Liberalisation and Economic Growth in Nigeria: An Empirical Analysis

Adediran Olanrewaju Adewole

Crescent University Abeokuta, Ogun State, Nigeria

lanre0812@yahoo.com

Abstract

This research work investigates the impact of trade liberalization on the environment in Nigeria. The research work is analytical in nature employed econometric tools using e-view statistical package for the analysis. The analyses revealed that there is a positive significant relationship between trade liberalization and the environment. And thus, have significant effect on economic growth of the Nigerian economy. Trade liberalization should be accompanied by government investments in education, skills, research and development so as to equip people to take advantage of new employment opportunities mostly human development which is a development paradigm that is about much more than the rise or fall of national incomes, and to crate adequate safety nets to protect the environment during the period of trade liberalization.

Key words: trade liberalization, economic growth, environment

J.E.L. classification: F18; O44; C10

1. Introduction

Sustainable development is a pattern of resource use that aims to meet human needs while preserving the environment so that these needs can be met not only in the present, but also for generations to come.

Economic growth, as conventionally measured, might be more rapid if such environmental pollution were not inhibited by regulations and other policies. Trade openness has beneficial effects on productivity, the adoption and use of better technology and investment promotion, which are channels for stimulating economic growth. This period ushered in the

Millennium Development Goals (MDGs) declared by the United Nations which among other broad objectives was to address the problem of poverty in a broad sweep that targets the index of poverty itself. The broad objectives of the MDGs include the following

- Eradicate extreme poverty and hunger;
- Achieve universal primary education;
- Promote gender equality and empower women;
- Reduce child mortality;
- Improve maternal health;
- Combat HIV, malaria and other diseases;
- Ensure environmental sustainability; and
- Develop a global partnership for development. (HDR, 2010)

This research work emphasizes goals seven and eight in the millennium development goals. The new dynamics of trade have increasingly created global and unfettered markets for trade and investment, which have significantly increased the destructive impact of economic activities upon the Earth. These dynamics exhaust the world's natural resources endowment and ecological carrying capacity at such a deleterious rate as they jeopardize the planet's ability to support future generations. However, Africa happens to be a dumping ground for old technologies, there is every reason to believe that trade liberalizations effect on the environment is disastrous. Trade liberalization driven by macro-economic policies and economic reforms may have environmental impacts, both negative as well as positive. Hence, a clear analysis of these effects is needed (UNEP, 1999). The main objective of this study is to examine the environmental impact of trade liberalization

in Nigeria and thereby make policy recommendations based on the findings of the study. The remaining part of this paper is divided into four sections. Section II presents literature review, Section III provides the methodological issues while Section IV analyses the results. The last section is concluding remarks.

2. Literature Review and Theoretical Framework

2.1 Literature Review

The role of trade liberalization in the growth process has been explored substantially in the literature. In some economies, trade has been instituted to perform the role of a growth engine, especially via high real productivity of the export and import sector (Tsigas, 2004).

According to Lucy (1997), many African countries urgently need to expand international trade to allow their economies grow and develop. Rising export earnings make adjustment less painful, lighten debt burdens and support higher growth rates by increasing import capacity. Growth of exports and imports also increase access to the benefits of international trade, including new ideas, modern technology, competition, economies of scale and the creation of domestic industries around new markets. Trade liberalization otherwise known as free trade has been considered highly relevant for economic development because it maximizes the output of social product. A counter argument about trade liberalization contends that the benefits of trade liberalization can only be achieved under conditions of full employment, full allocation of resources and free competition in the economy (Feridun et al; 2006).

However, much environmental damage is due to the increased scale of global economic activities (Damania, 2003). International trade constitutes a growing portion of that growing scale, making it increasingly important as a driver of environmental change. As economic globalization proceeds and the global nature of many environmental problems becomes more evident, there is bound to be friction between the multilateral systems of law governing both (Fuller et al, 2003). Trade

liberalization is of itself neither necessarily good nor bad for the environment. Its effects on the environment in fact depend on the extent to which the environment and trade goals can be made complementary and trade goals can be made complementary and mutually supportive. A positive outcome requires appropriate supporting economic and environmental policies. At the most basic level, trade and the environment are related because all economic activity is based on the environment. It is the basis for all basic inputs (metals and minerals, forests and fisheries) and for the energy needed to process them. It also receives the waste products of economic activity. Trade, in turn, is affected by environmental concerns, since exporters must respond to market demands for greener goods. (Demise, 2000)

2.2 Theoretical Framework

The Neoclassical factor endowment model known as the Heckscher-Ohlin theory of trade postulates that trade arises because of the differences in labour productivity-which they assume to be fixed-for different countries. According to this theory, the basis for trade arises not because of inherent technological differences in labour productivity for different commodities between different countries but because countries are endowed with different factor supplies. Given relative factor endowments, factor prices will differ (for instance, labour will be relatively cheap in labour-abundant countries) and so too will domestic commodity price ratios and factor combinations. The above theory therefore explains why resource-abundant (for instance, labour-abundant) LDCs are into the production and export of labour-intensive commodities in return for imports return for imports of capital-intensive goods because of their relative cost and price advantage enhanced by international specialization. Trade therefore serves as an engine for a nation to capitalize on its abundant resources through more intensive production. What this theory suggests is nothing short of free trade which was equally elicited in the Heckscher-Ohlin-Samelson (H-O-S) model which is a development of the H-O principle. (Feridun et al; 2006). The HOS model shows how an increase in the price of a commodity can

raise the income of the factors of production used most intensively in producing it. Samueson’s factor price equalization theorem postulates the conditions under which free trade in commodities narrows differences in commodity prices between countries, and in doing so the incomes of the factors of production are also brought in line. In other words, free trade offers a substitute for the free mobility of factors of production. Based on H-O-S model, free mobility of factors can lead to national resources movement from places of excess to place of relative scarcity, and the movement of environment degrading industries from their home countries to developing countries where environmental regulation is a matter of formality. (The Pollution-Haven Hypothesis)

Antweiler et al., (2001) made a much clearer extrapolation of the original H-O model of trade. They decomposed the full impact of openness of trade liberalization on environment into composition, scale and technique effects. Their approach involves both mathematical and geometrical illustrations, in their geometrical exposition, they derived the condition under which trade liberalization for a dirty good leads to less pollution, if the technique effects (which for them is always beneficial to the environment) can overwhelm the combined scale and composition effects (which for them are always harmful to the environment). In this model, trade liberalization (or reduction in trade barriers) produces the free trade-induced effects which interact to determine the environmental effects of trade. When there is a decline in trade barriers, the H-O-S model that prices are brought in line due to reduction in barriers applies.

3. Research Methodology

3.1 Model Specification

In order to establish the relationship between the variables utilized in this research, a model similar to the one used by Antweiler *et al* (2001) will be utilized. The main argument is to investigate the functional relationship between trade liberalization and environmental degradation.

$$ENVVDG_t = \alpha + \theta(EXP_t + IMP_t)/GDP_t + \psi(K_t/L_t) + \Phi(RGDP_t/K) + \lambda(RGNP_t) + \mu_t$$

Where; $ENVVDG_t$ = Environmental degradation

EXP_t = Export in year t

IMP_t = Import in year t

GDP_t = Gross Domestic Product in year t

K_t = Fixed Capital Formation in year t

L_t = Product of total labour force and the deflated average minimum wage for all sectors

$RGDP_t$ = Real GDP per kilometer (real GDP/km²)

$RGNP_t$ = Real Gross National Product

Environmental Degradation ($ENVVDG_t$):

This is the level of deforestation in hectares/years. This is measured by deforestation figures (hr/yr).

Trade Intensity ($EXP_t + IMP_t$)/ GDP_t :

Trade intensity is considered to be the addition of import and export figures divided by the gross domestic product in year t.

Composition Effect (K_t/L_t):

This is arrived at by dividing capital by labour figures in year t, where the capital is measured as the fixed capital formation and labour is derived as the product of total labour force and the deflated average minimum wage for all sectors of Nigerian economy.

Scale of Economy Activity ($RGDP_t/K$):

Economic activity is measured in terms of real gross domestic product per square kilometer. It is believed that the total income gained due to trade may be disfigured by population figures that may not be reliable.

Technique Effect ($GGDP$): This variable is measured by the real gross national product (real GNP) proxy by growth rate of GDP.

Thus, the above model was adapted to form three set of models;

$$\text{Model 1: } ENVVDG = \lambda_0 + \lambda_1 (TL) + \lambda_2 (CE) + \lambda_3 (SOEA) + \lambda_4 (GGDP) + \mu_t$$

$$\text{Model 2: } TL = \theta_0 + \theta_1 (LACF) + \theta_2 (CE) + \theta_3 (SOEA) + \theta_4 (GGDP) + \mu_t$$

$$\text{Model 3: } TL = \alpha_0 + \alpha_1 (ENVVDG) + \mu_t$$

Where; $ENVVDG$ = Environmental Degradation (Deforestation)

TL = Trade Liberalisation

CE = Composition Effect- (Fixed Capital Formation in year t / Product of total labour force and the deflated average minimum wage)

SOEA = Scale of economy activity- Real GDP per kilometer (real GDP/km²)
GGDP = Technique effect (proxy by growth rate of GDP)
LACF = Land Area Covered by forest
 $\lambda_0, \lambda_1, \lambda_2, \lambda_3, \lambda_4, \theta_0, \theta_1, \theta_2, \theta_3, \theta_4, \alpha_0, \alpha_1 =$ Parameters; $\mu_t =$ Error Term

4. Empirical Analysis

4.1 Presentation of Estimated Results

The result of the estimated model that examines the relationship between environmental degradation and trade liberalisation as well as other factors in Nigeria from 1980 to 2010 is presented in the table 4.1 below.

Dependent variable: ENVDG					
Method: Least square					
Sample: 1980-2010					
	C	TL	CE	SOEA	GGDP
Coeff.	553871. 7	99949.05	409.18	66266.7	-1248.4
Std.Err	12515.8	21549.41	1364.5	10102.6	756.07
t-stat	44.25	4.64	0.30	6.56	-1.65
Prob	0.0000*	0.0001*	0.767	0.0000*	0.111
R-Square= 0.86		Adjusted R-Square= 0.83			
F-Statistic=38.60		Durbin-Watson stat= 1.49			
Prob(F-Stat)= 0.0000					

The result of the second model where trade liberalisation is regressed on environmental

Dependent variable: TL					
Method: Least square					
Sample: 1980-2010					
	C	LACF	CE	SOEA	GGDP
	1.71	-0.045	-0.022	-0.373	0.006
Std.Err	0.33	0.009	0.009	0.144	0.005
t-stat	5.22	-4.76	2.53	-2.59	1.11
Prob	0.00*	0.0001*	0.018*	0.016*	0.28
R-Square= 0.65		Adjusted R-Square= 0.59			
F-Statistic= 11.96		Durbin-Watson stat= 2.21			
Prob(F-Stat)= 0.000012					

The result of the estimated model 3 that examines the significant impact of trade liberalisation on environmental degradation

in Nigeria from 1980 to 2010 is presented in the table 4.3 thus;

Dependent variable: TL		
Method: Least square		
Sample: 1980-2010		
	C	ENVDG
Coeff.	-1.65	3.24E-06
Std.Erro	0.35	5.12E-07
t-stat	-4.75	6.34
Prob	0.0001*	0.0000*
R-Square= 0.58		Adjusted R-Square= 0.57
F-Statistic= 40.07		Durbin-Watson stat= 1.84
Prob(F-Stat)= 0.0000		

4.2 Interpretation of Regression Results

The ordinary least square (OLS) multiple regression model result from the first model indicates that environmental degradation is positively related to trade liberalisation, technique and scale effects of liberalization but negatively related to growth rate of GDP. The estimates for the model as well showed that all independent variables – trade intensity, composition effect and scale of economic activity and technique effect of trade are significant factors affecting environmental degradation. Also, the signs of the independent variables showed that the composition and scale effect of trade liberalization are beneficial to natural resource utilization. The Durbin Watson (DW) statistic reveals that there is presence of weak negative serial correlation among the residual incorporated in the analysis to amount for other significant explained factors.

Secondly, trade intensity is positively related to the growth rate and indicating that the technique, scale and total effects of liberalization are detrimental to the environment.

In other word, the technique effect of trade more than offset the joint benefit of the scale and composition effects thus making freer trade detrimental to natural resource utilization and hence detrimental to the environment. Thirdly, trade liberalisation is positively related to the environment. The

composition effects of trade liberalization on natural resource utilization are however beneficial. Trade intensity and the technique effects of liberalization do however significantly explain resource utilization

5. Concluding Remarks

Nigeria's integration with the global economy has increased significantly aided by substantial liberalization of trade in actualization of the number seven and eight of the MDGs that is, to ensure environmental sustainability and develop a global partnership for development. This has implications on the environment, use of natural resources and Nigeria as developing countries gain greater access to the markets of developed countries. There has been a change in the composition of output in Nigeria that parallels the gradual opening up of the economy. Manufacturing output has been significantly increased from environmental degrading activities although the concentration is on crude oil. There has also been a consistent robust result that indicates that export trade has increased significantly from environmental degrading activities. Therefore, there is the need to consider strengthening environmental policies at the time when further trade liberalization is being contemplated through the World Trade Organisation. This calls for further improvements in environmental standards in specific growth industries to protect natural asset and public health and to assure foreign investors concern about corporate responsibility, particularly for future trade development of the industrial and agricultural sectors.

Nigeria should ensure that any trade agreement does not contain provisions that jeopardize its environment. Trade liberalization should be accompanied by government investments in education, skills, research and development so as to equip people to take advantage of new employment opportunities mostly human development which is a development paradigm that is about much more than the rise or fall of national incomes, and to create adequate safety nets to protect the environment during the period of trade liberalization. Knowing fully well that human development plays basic and fundamental role and remain the

most important factor in economic growth and development in countries of the world. There is an urgent need in Nigeria for the involvement of all stakeholders in the design, implementation, monitoring and evaluation of projects and programmes that are bound to affect their lives and the environment. Since environmental degradation has a significant impact on agriculture-particularly the soil and water that are essential for food production and export-food security will be severely affected if the environment is not protected.

As a result, the government should enforce environmental laws at all levels of governance so as to halt the indiscriminate deforestation as well as the over-exploitation of other flora, fauna, and marine resource-most of which are non-renewable.

The government of Nigeria needs to review the current trade policies with a view to strengthening the positive aspects of trade and minimizing the negative environmental impact of trade. Managed wisely, the new wealth being created by globalization creates the opportunity to lift millions of the world's poorest people out of their poverty. Managed badly, it could lead to their further marginalization and impoverishment. Neither outcome is predetermined. It depends on the policy choices that are made by governments, international institutions, the private sector and civil society.

The Nigerian government has the duty to clearly define property rights since well-defined property rights are central to the selection of the optimal pricing of bio-diverse natural resources. Decision-makers should recognize the fact that efficient pricing of bio-diverse renewable natural resources depends on several factors such as their intrinsic rates of biological growth, the carrying capacity of habitats, the interdependence of species, existing market prices, property rights and the underlying timeframe. Nigeria should engage in a selective and strategic integration with the world market, and she should decide on the extent to which it wants to open up its economy, the timing and sequence of opening it up, the form of cooperation and competition it wants to liberalize and those sectors that need some protection for the good of the country.

Above all, Nigeria must ensure that before going further with trade liberalization, it has the right and space to review periodically the impact of globalization on the society and its environment.

Decision Making in Crisis Conditions using Trapezoidal Fuzzy Numbers

Alecu Ionel Ciprian

Romanian Academy – Iași Branch

aiciprian@yahoo.com

Abstract

In practice one cannot speak of a “standard” method used as a single recipe that may facilitate the reduction of uncertainty in decision making.

The transition from the state of crisis to the state of opportunity becomes the ground on which technocratic, structural, cultural and political approaches make a difference in managing an organisation.

To conduct such an assessment process, we propose the use of trapezoidal fuzzy numbers, because of the difficulty to quantify exactly or probabilistically both the economic indicators and the socio-economic, technological etc. influencing factors.

Key words: management decisions
trapezoidal fuzzy numbers, crisis conditions

J.E.L. classification: M11, M21

1. Introduction

In crisis situations, management resorts to decision-making models under risk and uncertainty conditions, models which have become established relatively recently owing to the efforts of specialists in the field of insurance and finance. The true pioneers of this research field were military analysts, who explored borderline phenomena in random limit situations.

No two crises are the same, and their unfolding, dynamics and impact on the economic climate, on society and ultimately on the state (and all the institutions and services it provides) are comparable only to a limited extent and are difficult to generalise and conceptualise[1]. Often, the applied solutions emerging in such situations are not the result of applying established theoretical models, as sometimes they deviate even from the most widely accepted general principles. The need arises, therefore, to develop a meta-

theory which should contribute to grounding principles, procedures and methods synchronised with the current dynamics of the economic, social, political and cultural environment when approaching the complexity of crisis situations[2].

The crisis exposes each system/organisation to decision-making situations under uncertainty conditions of the second and third order. Entropy becomes difficult to absorb or transfer in the absence of specific methods. Mathematical models are increasingly ineffective at addressing the challenges of assessing and estimating economic and financial parameters using crisp numbers.

The difference between bankruptcy and survival most times lies in superior management based on vision [8], experience and the range of human and material resources that a system possesses at a particular moment. In the view of strategic management, events seem to follow any other path than the one foreseen based on assumptions or on the most elaborate forecasts and scenarios, and therefore will render useless even the most comprehensive plans.

In crisis situations, uncertainty emerges as a distinct phenomenon, in which case we face both the ineffectiveness of most theoretical models of decision-making and the inaccuracy and incompleteness of available information [9].

It is therefore necessary to intensify theoretical efforts and to apply interdisciplinary approaches and transfers of methods in order to construct a set of procedures and techniques that should contribute to curbing this phenomenon in decision-making processes.

As we shall observe, multidisciplinary is the hallmark of these management approach, as it integrates a series of sociological, psychological, statistical, mathematical, legal, etc. methods into an approach that is

tailored to a particular activity. This tendency will intensify due to the interdependence links between the various areas (i. e. economic, social, political, and environmental) with the aim of achieving the objective of sustainable development.

2. Considerations on the technocratic approaches to uncertainty absorption

This strategic approach incorporates a set of science-based methods and techniques aimed at assessing and analyzing the major changes that may occur in a particular environment and to forecast the fundamental trends in the evolution of the broader environment [8]. Two clear directions are in focus: the prognosis of contextual evolutions (based on statistical and probabilistic analyses, the Delphi method, the cross-impact matrix, the scenario method, enterprise modelling, etc.) and preparing decision-making situations (procedures for surveying changes in the environment, computer-based management systems, market analyses, etc.).

Taking into account the prevalence of quantitative[9] data used in grounding analyses, they fall into two main categories:

Quantitative modelling methods, which include: data series analysis, spectral time series analysis, econometric modelling, the analysis of economic and social indicators, data extrapolation, etc; these techniques are based on ever more complex tools provided by statistics, which typically focus on averages and probabilities when estimating the future states of relevant variables;

Qualitative methods based on reasoning, which analyse and coordinate systematically the opinions and judgments of a group of experts regarding future events and their potential impact on the evolution of the organisation.

These methods point to the idea of estimating a future development based on the assumptions derived from extrapolating the past and current states of the population, provided that the assumed trend is maintained. Consequently, the effectiveness of the modelling is largely dependent on the relevance of the assumption of the decision-making problem and on the extent to which the assumed relations remain valid in the future. Any potential changes in structure

cannot therefore be anticipated by the model, as they are the expression of random factors. One must also consider that many future events that may generate uncertainty have a unique character, occur for the first time, yet the interrelations with other variables cannot even be assumed; many factors can be the object of analysis only when the information related to their potential manifestation exists and is sufficient to enable extrapolation.

Among the establish methods we can list the multi-factor analysis, discriminant analysis (which serves as the basis for calculating the score function to evaluate risk, especially firms' bankruptcy risk), group analysis, the benchmark method in risk analysis, etc.

In the case of qualitative methods based on reasoning, the emphasis is placed on the experience and professional record of top managers to forecast economic, social or technological events that may have an impact on the organisation. Some of techniques for such analyses that have yielded spectacular results include the Delphi technique, impact matrices, strategic scenarios, etc.

Important changes in international relations, social behaviours, and technological advances can all result in radical changes in the decision-making context and may invalidate the forecasting capacity of the quantitative model previously used. The success rate depends on the management system's capacity to adjust to situations that are highly probable to create discontinuities and on whether it is able to integrate new findings in future forecasts.

It is not our intention to play down the importance of these methods in uncertainty absorption. It is widely acknowledged that certain events such as stock dynamics, the rate of new business formation, variations in the money supply, the trade balance, etc. can signal future evolutions of the inflation rate, the unemployment rate, the GDP, the exchange rate, etc. The use of quantitative forecasting methods can act as a key advantage in planning and grounding strategies. Numerous attempts to adapt these tools to the rapid developments in the socio-economic environment suggest the analysis of several categories of variables and specific indicators in various fields, which exert direct and indirect influence over the phenomenon under review.

3. Characteristics of a decision-making process under crisis conditions (with a high degree of uncertainty)

In delimiting a decision-making situation under crisis conditions, with a high degree of uncertainty, we must identify the following assumptions[1]:

- The crisis leads to second-order or third-order uncertainty in the organisation’s decision-making processes;
- The initial uncertainty is not completely reduced; it contributes actively to the dynamics of the decision-making process;
- Overall, the decision-making process is cognitive (searching for relevant information) and rational (knowledge is processed in rational manner);[2]
- Due to the crisis conditions there are always doubts as to the statement of the problem and the importance attached to solving it;
- Under crisis conditions it is difficult to create an exhaustive list of alternative solutions, as their cataloguing is dependent on the quality of the decision-maker’s experience and on his/her forecasting capacity;
- There is limited depth and detail, generally confined to choosing from guiding policies or strategies;
- Under crisis conditions, there are fewer criteria for ranking solutions, with a greater degree of generalisation than previous models, and more limited than in traditional uncertainty situations[1];
- It is not possible to attribute probability to the various meanings and consequences of examined solutions;
- Uncertainty causes the analytical models used in the previous cases to be impracticable;
- There is no certainty that the decision-maker will objectively identify the best solution[3];
- The decision-making strategy under uncertainty conditions is characterised by cognitive components and socio-psychological components with multiple interactions;[11]
- The decision-maker’s qualities have a considerable impact on the selection of the optimal solution;

- Alternative solutions are of equal importance to the decision-maker;
- The criteria for selecting the alternatives are as good yet superior to random selection;
- The decision strategies are characterised by vulnerability typical of uncertainty;
- The cognitive uncertainty reduction mechanisms can lead to changes in the selected course of action.

4. The optimality criterion (Hurwicz’s rule)

This method represents an attempt to formalise and express the degree of confidence in a particular decision. A coefficient α - also called coefficient of optimism - is introduced, its value ranging between 0 and 1 ($0 \leq \alpha \leq 1$).

The optimality criterion can oscillate between the results of two criteria, i.e. the optimism criterion (max max) and the pessimism criterion (maxmin- Abraham Wald). It is more complex and more synthetic than the first two techniques and involves going through several stages[4]:

- Establishing the value of the coefficient of optimism, based on the intuition, experience and forecasting capacity of decision-makers,
- Determining the minimum and the maximum along each line (for each decision-making variant V_i);
- Calculating for each action variant V_i a weighted value, by using the formula:

$$H_i = \alpha * \max_j \{ [a; b; c; d]_{ij} \} + (1 - \alpha) * \min_j \{ [a; b; c; d]_{ij} \}$$

where: α is the manager’s coefficient of optimism

$[a; b; c; d]_{ij}$ - are the consequences of the decision made by applying variant V_i , in which nature is manifested in state S_j ; in the case of our example; represent a quadruple estimation for our issue;

- Determining the optimal value based on the formula:

$$V^* = \max_i H_i \Rightarrow$$

$$V^* = \alpha * \max_j \{ [a; b; c; d]_{ij} \} + (1 - \alpha) * \min_j \{ [a; b; c; d]_{ij} \}$$

- Identifying the optimal value V_i for which $V^* = \max_i H_i$

It is obvious that this model synthesises the first two techniques described, by assigning extreme values to the coefficient:

- $\alpha = 1$ - the method expresses the principles of the optimistic criterion (max max)
- $\alpha = 0$ - the method expresses the principles of the A.Wald criterion (max min)

We will highlight the influence of α on the optimal solutions to a decision-making problem under uncertainty conditions.

Example with trapezoidal fuzzy numbers - numerical case

For our research we identified a situation of decision making under uncertainty of *third-order uncertainty (when neither the outcomes of potential courses of actions nor probability of occurrence of natural states are known)*. We aim to identify the optimum by *Hurwicz’s rule*.

In our application we will use the point of view of O. Gherasim[4]. In this case all operations with fuzzy numbers have a special associated gravity center and a special associated ranking criteria. We will determinate the matrix of utilities with equal weights.

By using variable centers of weight associated to fuzzy number, we try, through a multidisciplinary approach, to develop and complete the portfolio of political instruments that managers can use for decision-making foundation.

We will consider three possible strategies/projects, to be assessed on the possible evolution of indicators related to the market, the financial state, the economic state and the technical state.

Table 1 The matrix of consequences with trapezoidal fuzzy numbers

Project i	C 1 - initial values				CentG
V1	15	17	22	25	19,75
V2	19	21	23	27	22,5
V3	12	17	22	24	18,75
Project i	C 2 - initial values				CentG
V1	250	280	350	430	327,5
V2	270	300	360	400	332,5

V3	280	310	380	410	345
Project i	C 3 - initial values				CentG
V1	800	850	930	1000	895
V2	750	950	1050	1250	1000
V3	700	850	920	1200	917,5
Project i	C 4 - initial values				CentG
V1	33	37	39	41	37,5
V2	31	36	38	45	37,5
V3	28	39	42	44	38,25

C1- indicators related to the market
C2- indicators related to the financial state,
C3- indicators related to the economic state
C4 -indicators related to the technical state

After normalization to the minimum and maximum value of fuzzy numbers, we obtain the following matrix:

Table 2. The matrix of utilities

Project i	C 1 - initial values				CentG
V1	-1,378	-0,702	0,88	2,267	0,267
V2	-1,333	-0,267	1,6	4	1
V3	-1,6	-0,667	0,667	1,6	0
Project i	C 2 - initial values				CentG
V1	-5,143	-2	2	5,143	0
V2	-5,796	-1,755	3,102	5,592	0,286
V3	-8,571	-2,286	5,714	9,143	1
Project i	C 3 -				CentG
V1	-0,952	-0,381	0,381	0,952	0
V2	-2,381	0,19	1,905	4,286	1
V3	-1,684	-0,361	0,537	2,364	0,214
Project i	C 4 -				CentG
V1	-5,333	-1,333	1,333	5,333	0
V2	-6,667	-2	0,667	8	0
V3	-17,333	0	6,667	14,667	1

After application of the importance weights of the indicators and calculating the maximum and minimum values on each line, we obtain the following results:

Table 2. The maxim and minim for each line

	max			
V1	-0,345	-0,176	0,22	0,567
V2	-0,333	-0,067	0,4	1
V3	-2,143	-0,572	1,429	2,286

	min			
V1	-1,286	-0,5	0,5	1,286
V2	-1,667	-0,5	0,167	2
V3	-0,4	-0,167	0,167	0,4

You will need to rank fuzzy numbers to determine the next best option by Hurwicz rule. In this case, trapezoidal fuzzy numbers will have the following forms for each course of action:

V1- $[-1,286 + \alpha * 0,941; -0,5 + \alpha * 0,324; 0,5 + \alpha * (-0,28); 1,286 + \alpha * (-0,719)]$

V2 - $[-1,667 + \alpha * 1,334; -0,5 + \alpha * 0,433; 0,167 + \alpha * 0,233; 2 + \alpha * (-1)]$

V3- $[-0,4 + \alpha * (-1,743); -0,167 + \alpha * (-0,405); 0,167 + \alpha * 1,262; 0,4 + \alpha * 1,886]$

After applying the ranking criteria, we obtain the following order:

- for $\alpha \in (0;1)$, $v_3 > v_2 > v_1$
- for $\alpha = 0$, $v_1 > v_3 > 2$
- for $\alpha = 1$, $v_3 > v_2 > v_1$

5. Conclusions

The transition from the state of crisis to the state of opportunity becomes the ground on which technocratic, structural, cultural and political approaches make a difference in managing an organisation.

By using fuzzy trapezoidal numbers can be made a selection of the best solutions in conditions of ambiguity (conditions of third-order uncertainty).

Through this demonstration, we see that it is possible to combine several different strategies and indicators, qualitative and quantitative. This development of traditional methods with fuzzy numbers represents a technocratic answer to a call of interdisciplinary approach of decision-making in crisis conditions.

.Abstract

Ethnic differences influence entrepreneurship development as well as its success or failure. In Nigeria, ethnicity is one of the keys to understanding pluralistic nature of our society. One thing to note is that the various ethnic groups in Nigeria have achieved varying levels of success in their entrepreneurship development and its subsequent success. Thus, this paper tried to evaluate the disparity that seems to exist among indigenous ethnic groups and entrepreneurial success in Nigeria using and OLS estimation of primary sourced data. The results from the study suggest that though membership of an ethnic group is an important factor in achieving entrepreneurial success in Nigeria, there are some other factors that influence entrepreneurial success in Nigeria. Among these factors are: access to financial capital, education (including vocational training) at start up, and prior business experience.

Key words: Entrepreneurial Success, Ethnicity, Nigeria.

J.E.L. classification: L26, C20

1. Introduction

Understanding the relationship between ethnicity and enterprise is important because entrepreneurship among ethnic minorities is associated with socioeconomic mobility

(Light 1984; Logan, Alba, and McNulty 1994; Nee and Sanders 1985; Portes and Bach 1985; Portes and Zhou 1992; Sanders and Nee 1987; Sanders and Nee 1996; Waldinger 1986; Waldinger et al. 1990). Also, social relationships rooted in kinship ties constrain or promote economic behavior (Granovetter 1985; Portes and Sensenbrenner 1993; Rath 2000). Even in countries where immigrant ethnic groups have high profiles in business ownership, indigenous entrepreneurs own most small businesses and a significant share of medium sized establishments. More importantly, local entrepreneurs themselves have been found not to be homogenous, and this seems to be the case in many other multi-ethnic societies where some groups are popularly perceived to do better in business than others.

Nigeria, ethnicity is one of the keys to understanding pluralistic nature of our society. Estimates of the number of distinct ethnic groupings varied from 250 to as many as 400 (<http://countrystudies.us/nigeria/>). The most widely used marker is that of language. Generally, all the ethnic groups in Nigeria can be categorized into three namely Hausa, Igbo and Yoruba. One thing to note is that the various ethnic groups have achieved varying levels of success in their entrepreneurship development and its subsequent success. For example, the Igbos can be found to be more involved in trading, while the Yorubas are more prevalent in crafting while the Hausas are not quite known with any particular entrepreneurial

and/or apprenticeship development. Also, in most cases, after completing primary school, the Igbos get into apprenticeship and later graduate to become entrepreneurs while most of the Yorubas complete secondary (and many atimes, university education before going into apprenticeship). In the case of the Yorubas, many of them do inherit their family trade/business which consequently, develops in them an entrepreneurial skill.

Following from this line of thought, it can be said therefore that, besides capital and other factors that influences entrepreneurial development and success or failure, ethnicity, ethnic groupings etc. can as well contribute to the rate of acquiring skills and the sustainance of business enterprises. This to our knowledge, have not been investigated, thus, our setting out to investigate the entrepreneurial traits or characteristics to a particular ethnic group that exist. Based on the above, this study examines the ethnicity effects in entrepreneurial success in Nigeria. Specifically, the study investigates the level of entrepreneurial success achieved, in terms of participation, income, and longevity of business. Following the introductory section is the literature review contained in section two. Section three will delves into the stylized facts on Nigeria while section four presents the methodology and data analysis. Section five concludes the study.

2. Methodology

2.1. The Model

To assess the importance of ethnicity on entrepreneurial success, by investigating whether or not the size of an entrepreneurial business depends on the ethnic of its owner and, assuming it does, the extent to which this is based on inter-ethnic differences in business skills or ability, we applied a standard instrument variable estimation procedure as stated by Wiig and Kolstad (2011). The estimated equation was as follows:

$$S_{it} = \alpha_1 + \beta_1 Z_i + \gamma_1 X_i + v_i$$

From the adapted and modified model, entrepreneurial success was regressed on a vector of instruments Z_i and a set of covariates X_i . In addition to ethnicity and other observable entrepreneurial

characteristics like years of education, owning some other businesses, had formal vocational training, prior industry experience, worked in a family business or as an employee or was self employed as well as the industry type were examined. The vector of covariates X includes characteristics such as gender, access to financial capital, number of full time employees, and age of establishment. S_{it} , is the current size of business i in terms of employment, assets or turnover, and S_{i0} , the size of the same business at its start-up. The strategy adopted for testing for ethnicity effect on entrepreneurial performance consist the inclusion of the ethnicity of business owners among the Z_j 's.

2.2. Data Requirements and Sources.

The study utilized mainly primary data, which cover a random selection of manufacturing establishments in Nigeria, especially small to medium scale ones categorized with respect to their employment size. Information was gathered in the area of sales and assets of the establishment, Start-up size (defined as the number of full-time employees at the time of the start of operations), age of the establishment (defined as the number of years since its establishment), entrepreneurial success (measured by the business size of all owned businesses by the individual), where this poses a problem a dummy variable on the ownership of other businesses was used. Other information gotten includes the nature and characteristics of business enterprise, enterprise owner characteristics, apprenticeship (number, fees charged, allowances paid, apprenticeship labour), years of education of business owner, owning some other businesses, had formal vocational training, prior industry experience, worked in a family business or as an employee or was self employed as well as the industry type, gender, access to financial capital, and number of full time employees. A multi-stage sampling design was adopted for the sampling process. The first stage was the selection of the strata to be sampled. The second stage was the selection of clusters, while the third stage was the selection of the business enterprises to be interviewed. Three out of the six geo-

political zones in Nigeria, namely Southwest, Southeast, and Northwest was used as our strata. From each stratum, two states were chosen from where the business enterprises were also drawn. The states were chosen irrespective of the variations in their population for balance purposes. These were made independently in the different strata. The chosen states are Anambra, Abia, Oyo, Ogun, Kaduna and Kano. From each state, about 280 firms were randomly selected and sampled out of which 265 was returned.

2.3. Data Analysis

2.3.1. Descriptive Analysis

A total of 280 entrepreneurs were interviewed and 265 returned and used for the analysis. The summary statistics for the main sample are presented in Table 1. The table shows that the tribe of the business owner spreads across the various tribes in Nigeria with the three major ones namely Ibo, Yoruba and Hausa being dominant and constituting 40.6%, 30.6% and 21.4% respectively. Other tribes, which include Tiv, Idoma, Itsekiri, Efik, Ibibio, Edo etc., constitute 7.4%. Also, with respect to the gender of the business owner, 70.5% were owned by males while 29.5% were owned by females. Many of the business owners (76.5%) had access to financial capital though this was mainly through cooperative societies and other informal contributions like the *esusu*. The mean years of schooling was 8.45 while only 47.8 % had formal vocational training with about 38% owning more than one business establishment. It was observed that many had informal apprenticeship trainings where apprenticeship fees were paid to the masters for specified number of years. Before starting their business, many of these owners spent an average of 9.0 years working in the industry while 34.65, 46.4% and 19.0% worked in a family business or worked as an employee or was self employed respectively. Business owned varied from garment or leather work (23.2%), wood or metal work (24.5%), and textiles (28.3%). Many of the businesses have live for an average of 9 years employing an average of five workers at start up and this has increased over time to an average of 15 employees. Furthermore, a crosstab analysis

shows that over 60% of the Ibo business owners sampled were male while 21.3% of the Yoruba business owners are males. Also, females constitute more of the sample business owners that are from the Yoruba and Hausa ethnic groups (see Table 2).

Table 1: Descriptive statistics

Ethnic Group of Owners (%)	
Ibo	40.6
Yoruba	30.6
Hausa	21.4
Others	07.4
Gender of Owner (%)	
Male	70.5
Female	29.5
Other Characteristics of Business Owner (%)	
Owns other establishment	38.0
Years of Schooling*	8.45 (5.6)
Had formal vocational training	47.8
Access to financial capital	76.5
Prior Industry Experience (%)	
Number of years*	9.0 (10.6)
Worked in a family business	34.6
Worked as an employee	46.4
Was self employed	19.0
Industry Group (%)	
Garment or leather work	23.2
Wood or metal work	24.5
Textiles	28.3
Others	24.0
Other Establishment Characteristics*	
Number of Current full time employees	15.7 (12.4)
Age of establishment	09.5 (07.5)
Number of full time employees at start up	05.5 (3.45)
Number of Respondents	265

* indicates mean and standard deviation are in brackets.

Table 2: Ethnicity and Gender of Business Owner

Ethnicity	Gender of Business Owner (%)		
	Male	Female	Total
Ibo	60.6	39.4	100.0
Yoruba	21.3	78.3	100.0
Hausa	30.6	69.4	100.0
Others	17.5	82.5	100.0
$\chi^2 = 156.56$			

2.3.2. Regression Analysis

The result in table 6 indicates that the age of the establishment, access to financial capital and the ownership of other business by the business owner have a significant association with entrepreneurial success while the number of full time employees at start up was not significant and also had a negative relationship with entrepreneurial success in Nigeria. But there were some cases where loans were gotten and the business failed and this were attributed to a number of reasons by the owners involved among which was the size of the loan and the high overhead cost of running the business, especially those costs related to energy and electricity. The result on age of the establishment also suggests that older businesses and those business owned by owners with more than one business tend to succeed more than newly established ones and this can be attributed to the experience of the business owner. With respect to gender of the business owner, the coefficient for the male dummy is negative, suggesting that the female entrepreneurs in perform better than the male, though the male dummy was more significant.

Years of schooling was another factor that had a positive influence on entrepreneurial success signifying the importance of education in the success of an entrepreneur. Further decomposing education to whether or not the business owner had a formal vocational training, shows that this variable was also significant as such it is important and any potential entrepreneur should have some kind of vocational training though in Nigeria most of the small business owners go through apprenticeship training before establishing their own businesses.

This apprenticeship does have some family or ethnic undertone as many apprentices are attached to a business owned by a family member or someone from the same ethnic group. This can be linked to the reason why all the ethnic variables were significant in enhancing entrepreneurial success in Nigeria. For instance, the Ibo and Yoruba owned business were both significant at 1% level while that of the Hausas’ was significant but had a negative relation with entrepreneurial success. This also had a reflection on the industry group as the Ibos

are well known for their involvement in garment and leather works trading while the Yorubas have an edge in wood works (wood carving) and textiles (dying) and the Hausas who do have more access to leather works seems not to be doing well in this trade.

Table 6: Regression Results

Dependent Variable	Business Size
Age of establishment	0.749 (0.013)*
Owens other establishment	2.341(0.041)*
Number of full time employees at start up	-0.087(-0.007)
Access to financial capital	0.001(0.000)*
Gender	
Male	-2.841(-0.321)*
Female	0.278(0.111)
Education	
Years of Schooling	1.160(3.116)*
Had formal vocational training	0.461(1.142)**
Prior Industry Experience	
Number of years	3.162(2.906)*
Worked in a family business	-0.621(-0.171)
Worked as an employee	1.744(2.030)**
Was self employed	0.731(0.163)***
Industry Group	
Garment or Leather Work	-0.434(-0.7111)***
Wood or Metal work	1.112(4.011)*
Textiles	0.764(2.312)
Ethnic Group	
Ibo	1.912(2.017)*
Yoruba	0.7111(0.435)*
Hausa	-0.436(-1.103)***
Constant	-2.261(3.002)*
Summary Statistics:	
Number of Observations: 265	
R ² : 0.605	
Chi-Square: 965.06	
P – Value: 0.0000	

‘t’-statistics are in brackets
(***), (**), (*) indicate significant at 10%, 5% and 1% level respectively.

All the prior industry experience variables were significant except where the business owner worked in a family business. It was observed that prior working in a family business was mostly common to the Ibos and Yorubas though it was more pronounced among the Ibo ethnic group. It was noticed

that this was a long time tradition among the Ibos and as indicated by the result, many of those involved in this had experienced one form of business failure or the other while some simply changed business because they felt they were not making sufficient profit to the keep the business running. Also, many of the business owners in the various ethnic groups have that claimed to have achieved success were either self employed or worked as an employee prior to establishing their own business and this was reflected in the regression result as these variables were significant at 10% and 5% level.

In all, ethnicity measured by the ethnic group of the business owners as shown by the result indicates that the ethnicity of the business owner has a very strong influence on the size of the business as a reflection of entrepreneurial success. And having a formal education and access to financial capital also contributes more to entrepreneurial success, implying that either access to capital is important to entrepreneurial success or that more successful entrepreneurs get more credit, or both. This finding was similar to those of Wiig and Kolstad (2011).

3. Conclusion

This paper tried to evaluate the disparity that seems to exist among indigenous ethnic groups and entrepreneurial success in Nigeria using and OLS estimation of primary sourced data. In recent time there have been some argument on which of the ethnic groups in Nigeria is more successful in small business establishment, the results from the study suggest that though membership of an ethnic group is an important factor, there are some other factors that influence entrepreneurial success in Nigeria. This was also in line with the findings of other similar studies in the literature. Among these factors are: access to financial capital, education (including vocational training) at start up, prior business experience and ownership of other businesses. The study shows that the Ibos tend to succeed more than the other ethnic group as they tend to have and run significantly larger small businesses. Nevertheless, one thing to note at this point is the limitations of the study which include that the study did not include information on failed businesses and also the sample is

drawn entirely from manufacturing industries to the exclusion of businesses in services or in construction.

bianca.hrimiuc@gmail.com

Abstract

In nowadays benchmarking become a powerful management tool that stimulates innovative improvement through exchange of corporate information, performance measurement, and adoption of best practices. It has been used for to improve productivity and quality in leading manufacturing organizations. In the last years, companies of different sizes and business sectors are getting involved in benchmarking activities. Despite the differences of benchmarking practices between smaller and bigger organizations, a successful benchmarking project could also enhance small business competitiveness. This study surveys the concept of benchmarking and analyze how it can be used in small bussiness.

Key words: benchmarking, organization, performance, small and medium businesses

J.E.L. classification: M11, O32

1. Introduction

Change management and continuous improvement have become two of the most common issues of the 21st century. Companies must adopt modern instruments and techniques in order to survive and prosper in a fairly competitive environment.

Nowadays, more and more organizations realize that, in a strongly competitive environment, the policy of short-term profit maximization is no longer a guaranty for success, and that such a policy should be accompanied by a continuous improvement of the way they carry out their activity. In order to have a long-lasting development, a company that carries out its economic activity in a responsible manner, by referring to the market’s evolution, must take into

account not only satisfying the needs of customers and share holders, but also the interests of the parties, the social and environmental impact of its actions.

Benchmarking is a concept adopted by many companies in order to comply with the market requirements and to obtain long-lasting benefits as opposed to their rivals.

Therefore, benchmarking can be regarded as a functional objective which allows for the achievement of an excellent level of quality, costs and speed. In order for this to be fulfilled, the business process, the product or the service must be measured by comparing it with a process, product or service which is known to be the best in the world.

This paper studies the way in which the concept of benchmarking is regarded in specialized literature. It also comprises an analysis of the way in which small and medium enterprises use benchmarking to improve activity and increase competitiveness on the market.

2. The concept of benchmarking

Benchmarking is a well-known concept in the world of business, the most frequently used meaning of the term being the research for good methods within the industry where the organization carries out its activity, which could lead to an increase in performance [3]. This method can be used by a great number of companies in order to measure their performances and the way of achieving their strategic goals [1].

Another approach encountered in specialized literature discusses benchmarking as being the process of assessment and adaptation of the organization according to the best products and services in the industry [15]. In this definition, the emphasis falls on comparing the organization’s activity with that of the competitors’, its purpose being to find means of lowering costs, increasing

performances and quality, and identifying the best business models.

Benchmarking is a standardized method for identifying and analyzing the competing performance variables, being a method of locating, identifying and analyzing the competitors of the analyzed enterprise [11]. This presentation emphasizes the strict analysis of competitors and the adaptation of strong points to the organization's specific features.

Regarded as a process, benchmarking is a continuous assessment of the current products, services and methods of the organization in relation to the most important customers or the enterprises known as leaders in their domain [3].

Benchmarking can also be defined as the process of continuous improvement by identifying, understanding and adapting the best models from inside or outside the organization [17].

From some authors' perspective, benchmarking has become one of the most popular instruments in the world, providing the three primary components essential for management: quality management, knowledge management and the process of continuous performance improvement [2].

It should also be noted that specialized literature makes observations on the large-scale expansion of this concept, highlighting two limits: the geographical boundary and the industrial division [17]. In the current context, with globalization being a vital component of most economies, we may speak of a disappearance of geographical boundaries.

First adopted by large enterprises, benchmarking has also become an essential instrument for small and medium enterprises. Although small enterprises understand the importance and function of benchmarking, they often tend not to assimilate it due to the large amount of time required for its implementation and the high costs. However, there is a belief that benchmarking is fit for any business, big or small.

The following part of the paper introduces the way of using benchmarking in small and medium enterprises.

3. Using benchmarking in small and medium businesses

Small and medium enterprises still have issues regarding the transition to using benchmarking, but it is easier for them to incorporate new ideas and processes than it is for large enterprises which tend to be kept in place by bureaucracy, as changes can be made quicker [17].

Nowadays, the ones practicing most benchmarking in small and medium enterprises are third-party organizations. They often concentrate too much on gathering information regarding results than on the processes and methods used in order to achieve these results [6], [17].

Given the current situation, not even small enterprises can afford to remain inflexible to market changes. Globalization remains one of the primary factors that have increased the need for adaptation and continuous improvement.

The idea that benchmarking is the ideal instrument for planning and implementing changes within organizations by using the best methods has become more and more common among small businesses.

As mentioned since the beginning of this research, the adoption of benchmarking represents an expensive activity for a small or medium enterprise. So naturally, there comes the question: What is the point of using benchmarking in an organization?

The adoption of benchmarking may lead to a series of advantages, alongside the relatively high costs:

- improving the way of identifying customer needs;
- identifying the strong and weak points of the organization;
- the emergence of innovative ideas;
- encouraging the process of continuous activity improvement.

Some researches [5], [13] show that the quantity-oriented measure of performances acquired through benchmarking within small companies is rarely used. There is no quantity-related assessment of the way in which using benchmarking has improved the company's activity.

A great part of the specialized literature is dedicated to the underlying impediments for the implementation of benchmarking within the company. They refer to the lack of time,

the high costs, the lack of knowledge and experts in the domain, and even the lack of a strategic plan [13], [15].

Many companies see benchmarking as a performance instrument which improves competitiveness and efficiency, as a result of the improvement of business processes.

Among the articles used for the analysis, there is a classification of benchmarking for both large and small enterprises. The highlighted types are the following [5], [17]:

- external benchmarking - implies the comparison with external entities. This type is also divided into several sub-branches:
 - o competitive benchmarking – companies that carry out similar activities;
 - o functional benchmarking – companies that carry out various activities, but which are active in the same area, the comparison being performed at function level (distribution, production, marketing);
 - o general benchmarking – companies from different areas, the comparison is performed at work method level (for example, the way in which the same thing is handled in accounting by both entities);
- internal benchmarking - describes the comparison within the organization of various processes, as well as the identification of improvement possibilities based on internal models.

Benchmarking may be quantity-related, determined by the occurring data exchange, and of quality-related, determined by the knowledge transfer [6]. Being a flexible instrument, the success of applying benchmarking refers to the way in which acquired information is used and to the increase in quality of the decisions made.

One of the great advantages of benchmarking consists in the fact that there is a possibility to improve some classic instruments underlying the decision making (budgets, cost analysis, panel) [8]. Among small businesses it is easier for these instruments to have a higher degree of accuracy and fully reflect the organization's activity.

Among small businesses, the concept of benchmarking partners is seen more and more often [13]. It refers to the fact that collaboration must exist in order to highlight the improvement of less advanced areas of the organization, by taking and adapting ideas from a partner that, in his turn, takes

the best methods from the partnering company.

The primary role of benchmarking within small businesses is to identify, understand and rectify the processes which lead to low performances by formulating proper strategies.

4. Conclusions

In the current strongly competitive environment and the context of accelerating the globalization process, even the relatively small enterprises are forced to develop new strategies to remain competitive on a long term. The increase in quality of the goods and services, provided through long-lasting development and continuous adaptation to market conditions, can be the result of adapting the benchmarking to small and medium enterprises.

The essence of this concept is the process of borrowing and adapting ideas to the business's specific features. By adopting this instrument, companies get a lot of advantages, they stand out from their rivals and contribute to the long-lasting development.

Internal benchmarking grows ever more because there are good methods in various parts of the same organization and it is easier to identify the skills required within a company before resorting to external models.

This paper has presented the way in which small and medium enterprises regard this concept. Alongside the continuous improvement of business processes, it is important to identify other enterprises in order to establish benchmarking partners. The possibility of creating industry profiles is also suggested in order to supervise and assess the performance, especially at global and strategy level.

Scoreboard—Managerial Accounting Instrument – Prerequisites for its Implementation in Public Cultural Institutions

Andrescu Gabriela
Eftene Nicoleta

“Valahia” University of Târgoviște, Romania
gabi_andrescu2002@yahoo.com
eftene.nicoleta@yahoo.com

Abstract

Public institutions, according to their defined legal framework, have attributions regarding the management of public resources for the achievement of certain objectives of public interest. The first question public managers should ask themselves is how to manage public resources more efficiently in order to satisfy general social needs and to obtain a high performance level, providing an efficient functioning of the system which the public institution is part of as well.

The source of this research is the authors' interest for the control of the organizations in the cultural field, which lead to the formulation of the following practical questions: which are the proper instruments for the control of such organizations?

In this research we have investigated the specialized literature in order to redefine the concept of scoreboard. We have also performed a critical analysis as for the advantages and disadvantages existing in the use of the scoreboard in public cultural institutions of Romania.

Key words: scoreboard, performance, management accounting, objectives, decisions.

J.E.L. classification: M41

1. Introduction

This article covers the “scoreboard” as an instrument of managerial accounting, providing a double reading, both theoretical and practical, as it intends to perform a theoretical synthesis of the ways it is used and implemented in the case of an exhibition

organizing public institution, provided that such institutions have particular specific functions. Likewise, the theoretical framework for the analysis of previously raised issues seems to be that of controlling the cultural organizations, highlighting their strong institutional dimension, certain particularities which have a translation in terms of control.

We have focused our attention on a case of exhibition organizing public institution, the type of organization which crystallizes in an exemplarily manner the particularities of cultural organizations as well as any control decelerators which may occur. Consequently, the theoretical framework of research, described in the first part of the article, provides a synthesis of the ways to use the budgetary instrument.

This theoretical framework is used, in the second part of the article, as support for the study of an exhibition organizing public institution, which allows the blending of theory and practice.

2. Managerial accounting

Nowadays managerial accounting has become the most important source of information for economical activity, both at the organization's level and at the national economy's level. Therefore, it incurs the necessity of implementing some developed options of managerial accounting which allow the achievement of a higher accuracy of the accounting information and, particularly, which favor the production of new informational systems, better adapted to the needs of internal users. Until recently, the informational system of managerial accounting has been examined as a “black box”, analyzing its part for economic and

social entities, but the ways of exerting this part have not yet been clarified.

Professor H. Bouquin proposes the following definition for managerial accounting: “a system of accounting information intended to assist managers and influence the behaviors by modeling the relationship between consumed assigned resources and aimed finalities.”[1]

Managers coordinate the future and constantly report the present to it. [2]. The need for information is generally “caused” by the decisions to make. Whichever should be the case, the information produced needs to comply with the three criteria set forth by Emery:[3]

- 1) the information is valuable to the manager provided that it contributes to the decrease of future’s uncertainty;
- 2) any additional information is valuable provided that it affects the respective decision;
- 3) the information is valuable provided that it contributes to the “sensitive” modification of a decision’s consequences.

Presenting managerial accounting at the service of decision means the obligation of describing the conception of this decision. Herbert Simon, a Nobel Prize winner for economy, the author of the well-known works about decision systems, has showed in an initial enquiry what managers expect from managerial accounting [4]:

- to allow score keeping: “are things better or worse?”;
- to direct attention: “what issues should they be interested in?”;
- to assist problem solving: “among the various solutions, which one is the best?”.

The purpose of managerial accounting is to make, out of its information and techniques, an orientation instrument, a “scoreboard”, a counselor for determining the conditions for the inside performance as well as the macroeconomic performance of an economic-social entity. In other words, the managerial accounting information constitutes the most important source, the management’s “database” in the decisional process. Managerial accounting information provides managers with the possibility of choosing optimal programs and setting a certain economic policy direction. In addition, there is the current trend of the accounting information to become more

operational by the automation of administration calculations. The production of reasonable and efficient informational systems for the management allow the connection of economic information, in general, and of accounting information, in particular, to the requirements of modern management [5].

3. Scoreboard

The notion of “scoreboard” has been introduced in France since the interwar period. This is a piloting instrument of the company as it allows managers to have a real-time synthetic vision on the main indicators regarding the company and the business environment in order to make the decisions within their competency field.

As for the definitions provided for the scoreboard as a managerial accounting instrument, the specialized works pronounce their opinions in various forms, which shall be presented hereinafter, being thus able to better set forth its place within managerial accounting.

According to certain authors, (Buquin, 1996; N. Guedj, 1996) the scoreboard is an assembly of less numerous indicators, intended to allow the administrators to be informed on the inventory and progress of the systems which they are in charge of and to identify the trends to be influenced for a horizon coherent to the nature of their functions.

The scoreboard is an assembly of current information presented under a synoptic form, pre-established, regarding the main results of the company’s activity or of some of those, and the main factors which condition their smooth and efficient performance. (O. Nicolescu, I. Verbonicu, 1999)

The scoreboard is an information system which lets you know, permanently and as soon as possible, the data required in order to control the company’s short term activity and to facilitate the exertion of responsibilities. (M. Gertvais, 1989).

T. Aslau, 2001, considers the scoreboard as an instrument for the control of the administration, used by the company’s management, able to supply essential and strictly necessary data in order to take corrective decisions when any disruptive factors or imbalances of the current activity

are encountered, which may incur deviations as to the established objectives.

3.1 Presentation and use of scoreboards

The scoreboard may be considered as an answer to the insufficiency of general accounting to fundament the current administration decisions made by the managers. Generally speaking, it is made of an assembly of less numerous indicators which provide the administration managers with significant information in order to guide their activity. As a guiding instrument for managers' actions, the scoreboard features the following characteristics:

- it is intended for each operational manager;
- it contains a relatively low number of indicators (10 to 25 indicators, at most);
- the information is not only financial, but there are also indicators in natural or quality standard;
- it is easy to obtain, as there is the possibility to identify the origin of information;
- it is easy to be understood and construed, as the indicators are presented visually, by means of tables, graphics, in absolute values and rates.

The non-financial nature of certain indicators is a characteristic specific to the scoreboard which allows the administration managers to receive other data than the financial-accounting ones. The non-financial information (e.g. the quality level of raw materials, the clients' loyalty rate, the rate of unsold goods, etc.) allows a fast reaction decision makers to the unexpected or important changes in the business environment, because operational managers mostly exchange quantity related data (in natural standard) and quality related data, rather than financial data. Thus, by means of the scoreboard, a better connection is created between operational managers, who “judge”, in terms of quantity (tons delivered, number of parts, etc.), and the administration controller who operates in terms of value (price or cost).

The elaboration of the scoreboard is achieved following a rigorous methodology. First of all, a project is elaborated, namely the organizational context is determined and the utility of creating a scoreboard for a

certain manager of an administration center is assessed. At this stage, the manager of the targeted center is appointed, the objectives are set and an action plan is established in order to achieve the objectives.

These are the potential steps for the elaboration of the scoreboard [6]:

- Setting objectives: it is the most important aspect in order to justify the elaboration of a scoreboard. Any objective must be quantifiable and determined for a certain period, requiring the distinction between an objective and a mission. For example, the reduction of general expenses by a certain percentage, within a defined term, represents an objective, but the administration of general expenses is a mission. In order to be realistic, the objectives should be reasonably established and preferably discussed or negotiated with the general management.
- Establishing an action plan for the achievement of the objective. The establishment of the action plan shall allow the identification of the parameters which have an influence upon the objective. For example, the reduction of the company's general expenses involves the setting of the elements to act upon, i.e. the identification of the sources which have generated the growth of these expenses, such as: travel expenses, maintenance expenses for the administrative offices, exaggerated protocol expenses, etc.
- Identifying pertinent indicators. At this stage, the administration manager should choose those which he considers as most pertinent for the appreciation of his actions' result. As for the objective of reducing general expenses, the following indicators may be established for each type of expenses, such as: the number of travels per concluded contract (or the value of travels per concluded contract), the means of transportation used and the frequency of their use, the booking method for transportation tickets and accommodation (in order to benefit from certain discounts provided by service suppliers), the determination of certain norms for protocol expenses, etc.

- Elaborating the scoreboard. The construction of the scoreboard shall include all the methods which allow the best visualization of the indicators to be monitored, such as: absolute values, deviations (+/-), rates, graphics, pictograms, tables, etc. As mentioned before, the indicators retained in the scoreboard should be less numerous to allow the achievement of its function, that is the guiding of managers in their current decisions and the control upon the achievement of performance indicators.

3.2 The scoreboard and its use in public cultural institutions

The existence of cultural objectives makes it possible that the mission of a cultural organization is never restricted to generate a profit. Consequently, the situation of cultural organizations has common points with that of the assembly of organizations in the public and non-profit sector, which has consequences from the point of view of control. Here are several examples as illustration.

Therefore, the definition and measuring of performance (Demeestère, 2002, Drucker, 1990) are problematic within these organizations. Another example is that of cost calculation which is problematic in the public field, especially due to the difficult valorization of resource consumption and to the multitude of potential interpretations of the production notion (Burlaud & Simon, 2000). Likewise, it is equally difficult to define and measure the production of non-profit organizations (Le Duff & Papillon, 1997). Yet, there are various researches which imply that, despite their cultural specificity, they are “administered” and, most of all, controllable (Agid & Tarondeau, 2006; Amans, 2003 ; Bonnafous-Boucher, Chatelain-Ponroy, Evrard & Mazallon, 2003 ; Chatelain, 1996; Evrard & Chiapello, 2004 ; Gombault, 2000, 2003; Tobelem, 2005).

An experimental study has been performed in a public institution, a museum, subordinated to the Ministry of Culture. The purpose of this study was to observe the control system of this institution and, more precisely, to check on the way of using a control system.

3.3 Case overview, characteristics and experimental approach

First of all we shall brief both the company’s characteristics, hereinafter referred to as the “Museum”, and the research protocol. Further on, we shall introduce and analyze the control system, by means of the scoreboard.

The organization studied is a public institution, a museum, subordinated to the Ministry of Culture. Its purpose is to develop cultural democracy, contributing thus to the access of all types of exhibitions and cultural events. Our study focuses on the main activity of this organization, which is the appraisal of the exhibitions. Exhibitions generally make the object of a single display. At a first stage of our research, we have made an interview with the Museum’s financial manager in charge of the exhibition organization.

The interview was based on a grid regarding the administration system in general and the administration instruments privileged within the organization. In the light of this interview and of the research literature for the control of this type of organization, we have focused our attention on the issue of the performance indicators’ role.

The conditions to be fulfilled by the indicators are as follows:

- The indicators introduced into the composition of the scoreboard should be simple and not numerous (3 – 5 per activity);
- The scoreboard indicators should be clear, concise and perfectly understood by the people involved.
- Selected indicators should follow a certain strategy (the indicators decline the strategy for different decision centers);
- The indicators used should have a certain progressive trend (to be adapted according to the strategic evolutions).

Further on, we shall present a scoreboard, under the form of a table, for monitoring the performance of the commercial activity (the objective considered: the increase of cashing from the exhibition visiting by a certain percentage within a limited period of time):

Table no. 1: Sales department scoreboard

<i>Indicators</i>	<i>Month February 2011</i>	<i>Month March 2011</i>	<i>Variation (+/-)</i>
Total no. of visitors	500	580	+80
No. of visitors who have visited the museum	50	42	-8
No. of exhibitions	3	2	-1
CA from the tickets sale	2200	2500	+300

We consider that the presentation, as well as the content of the scoreboard, ensure its easy reviewing by the addressee. It has been put in very simple situations in order to be understood, analyzed and used as fast as possible. It is clear that the simplicity, the rapidity and the flexibility of a scoreboard provide new dimensions for the entity's management, registering it as means of dialogue and dynamic action for the correction and removal of errors.

4. Advantages and disadvantages in the use of a scoreboard

Among the advantages of the use of this managerial instrument, we mention: the facilitation of a better decision argumentation, the saving of the managers' work time, the systemic approach of information; the delivery of representative criteria for personnel assessment, the modeling of employee behavior, the indicators shown represent the basis of the reporting data within the permanent dialogue between hierarchical structures in order to take the right corrective measures. Each beneficiary of the scoreboard will try to exploit it to the maximum, reason for which he will review all the indicators, noting the warning signals for deviations from norms or standards which correspond to the objectives.

Among the disadvantages of the use of the scoreboard, we mention: the favoring of redundancies in the informational system, by the repeated recording of the same information categories, the relatively high consumption of time and resources for the

elaboration of the scoreboard, including the relatively high costs.

Costs, time and quality represent the foundation of managerial accounting which stresses the processes and their improvement. Thus, the scoreboard is the instrument by which the management monitors the processes performed in the company and formulates an opinion on their evolution.

5. Conclusions

Following a detailed analysis of their use in advanced countries, we believe that the utility of scoreboards resides in the fact that they retain relatively little data, being synthetic and allowing the acceleration of the information circuit. At the same time, they display partial indicators of the most important activities, selected firstly according to the criterion of representativeness and they supply volume related data and information, which do not always appear in the syntheses that other informational structures produce. Last, but not least, scoreboards make a connection between the nature of the data supplied, the responsibilities taken, accounting and extra-accounting information and the very short interval in which information is supplied represents the means serving current managerial actions.

By the use of the scoreboard, the purpose of managerial accounting must be found in an efficient use of resources, according to the objectives of the institution. It also acts for the quantification of performances, it draws a realistic state, so that the decision maker is able to take corrective measures in due time, equally contributing to the orientation of his future actions.

Abstract

“The denomination of origin” may be the name of a region, a specific place or country used to describe an agricultural or food product. “The geographical indication” may be the name of a region, a specific place or a country, used to describe an agricultural or food product. The indication of provenance and the denomination of origin serve to identify the source and origin of goods or services.

Key words: Geographical indications, region, product

J.E.L. classification: K11

1. Introducing the Main Concepts

The indications of origin or the denominations of origin do not have yet universally accepted definitions; thus [1]:

- in accordance with the Madrid Agreement, the indication of origin indicates the place where a product originates;

- in accordance with the Lisbon Agreement, the denomination of origin is a geographical name used to designate a product originating in that region or place, and whose quality or characteristics are due exclusively or essentially to the geographical environment; therefore the denomination of origin is a special case of indication of origin [2];

- under the directive of the European Economic Commission, the geographical indication is the name of a place where the product originated and whose defining quality is attributable to that geographical origin;

- under the Committee of Experts Conference of the World Intellectual Property

Organization (WIPO), the geographical indication of origin means the indication and denomination of origin;

- but according to the General Agreement on Tariffs and Trade (GATT), the geographical indication is used to cover the denomination of origin;

- finally, in accordance with Law 84/1998 on trademarks and geographical indications, the geographical indication is a name serving to identify a product from a country, region or locality of a state where a given quality, reputation or other characteristic may be attributed essentially to that geographical origin [3].

In the following, we will consider that the geographical indication includes the indication of origin and the denomination of origin and that the denomination of origin is a special case of the indications of origin, and that the content is the concept of geographical indication in the [4] European Economic Commission Directive and, respectively, in the law on trademarks and geographical indications.

The indication of origin is any denomination, expression or sign indicating that a product or service originates from a country, region or a particular place (e.g. "made in ..."). In principle, the use of false or misleading indications of origin is illegal [5].

The denomination of origin is the name of a country, region or specific place which serves to designate the origin of a product, its main characteristics which are due exclusively or essentially to the geographical environment; in other words, the natural and / or human factors.

The indication of origin and the denominations of origin serve to identify the source and origin of goods or services. However, the denominations of origin have

an additional function. While the indication of origin shows only the product origin, the denomination of origin also shows the special features of the product, which are due to the geographical area of origin. Moreover, while any expression or sign that evokes the geographical source of a product (such as a national emblem) may be an indication of origin, the denomination of origin is always a geographical name (usually the country, the region or place where the product originated, although in some cases it may refer to a specific geographical area, without specifying its name).

The use of an denomination of origin is permitted only to certain circles of people or businesses located in the geographical area and only for certain products in that area. "Champagne", "Cognac", "Roquefort", "Chianti", "Pilsen", "Porto", "Sheffield", "Havana" Tequila ", " Darjeeling " are examples of well known names associated with products of a certain kind and quality [6]. A common feature of all these names is represented by their geographical correlation, i.e. their function to designate existing places, cities, regions or countries.

However, when we hear today “Champagne”, we think about sparkling wine rather than to a French region; “Cognac” is related to “eau de vie”, matured in oak barrels rather than to a small town than in France; “Chianti” makes us think about an Italian red wine and not about a region south of Florence; “Pilsen” reminds us of a beer and not of a city in the Czech Republic and a “Tequila” reminds us of a liquor distilled from a cactus and not of a city in Jalisco State, Mexico.

These examples show that geographical indications can acquire a strong reputation, making them valuable trade goods. For this reason, they are often exposed to counterfeiting or forgery and the misapplication of their protection - both national and international - is highly desirable.

But for the law on drawing, there is probably no other category of intellectual property law which comprises such a variety of concepts relating to protection, as in the area of "geographical indications", which is relatively new and which has recently appeared in international negotiations.

The legal recognition and protection of indications of origin and denominations of origin is of general interest. They pass on to consumers important information about the geographical origin of goods and services and, indirectly, about the native quality and characteristics of these products.

Therefore, if used properly, geographical indications can help the public in decisions regarding the purchase of goods, decisions on which they frequently have a strong influence. However, the misuse of geographical indications may mislead consumers about the geographical source of goods and services, sometimes causing them serious harm.

Moreover, an entrepreneur who illegally uses a geographical indication is not only misleading the consumers, but he is also obtaining unfair advantages over competitors, even over those from the geographical region specified by indication, causing them, at times, a partial or even a total loss of their clientele and reputation symbolized by that indication.

The geographical indication is a distinctive sign, which gives a right of use. The right on the geographical indication is territorial, collective, inalienable and imprescriptible [7].

2. Conditions for the protection of geographical indications

In accordance with art. 67 para. (1) of Law no. 84/1998, the geographical indications of products in our country are protected by their registration with OSIM, according to the law or the international conventions to which Romania is party.

Geographical indications may be used only by the persons who produce or sell products for which the indications were recorded. A geographical indication registered in the name of a producer may be registered under the same conditions of any other association.

For protection [9], there must exist a close connection between the goods referred to by the geographical indication and the place of origin thereof with regard to quality, reputation or other characteristics of the goods. A geographical indication cannot be protected only for the mere fact that the

goods to which this refers have the place of origin in a certain region.

In case of homonymous geographical indications for wines, each indication shall be attended by the denomination of the association of producers of said wines. The protection shall be granted for each geographical indication, provided that said geographical indication is used traditionally and constantly, in order to describe and present a wine produced in the geographical zone to which it refers.

Those geographical indications which are protected in our country under certain international interventions are not subject to the registration procedure established by law.

Within the meaning of Art. 70 letter b) from the Law no. 84/1998 it is generic and cannot be protected as geographical indication:

- the name of a product which does not comply with the provisions of the law;
- the name of a product which represents generical names of products;
- the name of a product which misleads the public on the nature, origin and quality of the product;
- the name of a product which is against public order or common sense;
- the name of a product which, although refers to the place or region wherein the product was initially manufactured, produced or marketed, became a common name for a special type of products [10].

On the other hand, a registered geographical indication may not become generic and will not fall into the public domain.

3. Ways of obtaining the protection of geographical indications

The ways of obtaining the protection of geographical indications are, according to art. 67 paragraphs 1 and 2 of Law no. 84/1998 [11]:

- their registration to the State Office for Inventions and Trademarks, under this law or international conventions to which Romania is a party;
- through bilateral or multilateral agreements concluded by Romania. The list of geographical indications recognized in Romania will be registered at the State Office

for Inventions and Trademarks in the National Register of Geographical Indications and published in the Official Bulletin of Industrial Property. These indications are not subject to the registration procedure regulated by Law no. 84/1998.

Among the international conventions which protect the denominations of origin there is the Agreement between Romania and the European Community on the reciprocal protection and control of the name of wines, signed on 26 November 1993, ratified by the Government Ordinance no. 16/1994 (approved by Law no. 120 / 9 December 1994, Official Gazette no. 346/1994).

According to art. 2 paragraph 2 of the Agreement, a “geographical indication” is an indication, including an denomination of origin, which is recognized in the laws and regulations of a contracting party for the service and presentation of the wine originating in a Contracting Party or in a region or locality in that territory, where a given quality, reputation or other characteristic is essentially attributable to its geographical origin.

The denominations of origin are protected under the Agreement by:

a) With regard to wines originating in the Community:

- references to the Member States where the wines originate;
- terms referred to in art. 1 of C.E.E. regulation no. 823/57 which comes with special provisions relating to the quality of wines produced in specified regions;
- the following terms referred to in art. 1 of C.E.E. regulation (C.E.E.) no. 823/87 which contains special provisions relating to the quality of wines produced in specific regions:

(i) the terms “quality wine produced in a specified region”, including the abbreviation „quality wine psi” and the equivalent terms and abbreviations in other Community languages;

(ii) the terms “quality sparkling wine produced in a specified region”, including the abbreviation “quality sparkling wine psi” and the equivalent terms and abbreviations in other Community languages, and “Sekt bestimmter Anbaubetriebe” sau “Sektb.A.”

(iii) the terms “quality sparkling wine semi-Produced in a Specified region”,

including the abbreviation “quality semi-sparkling wine psi” and the equivalent terms and abbreviations in other Community languages;

(iv) the terms “quality liqueur wine produced in a specified region”, including the abbreviation “quality liqueur wine psi” and the equivalent terms and abbreviations in other Community languages;

- the following terms referred to in Regulation (EEC) no. 4252/88 on preparation and marketing of liqueur wines produced in the Community “vino generoso”, “vino generoso de licor”, “vino dulce natural”, “vino dulce naturale”, “vinho doce natural”, “vin doux naturel”;

- the geographical indications and traditional terms listed in the Annex; (art. 4 Ordinance no. 16 of January 14, 1994 ratifying the Agreement between Romania and the European Community on the mutual protection and control of wine and the Agreement in exchange of letters between the EU and Romania establishing the mutual tariff quotas for certain wines);

- the terms referred to in Regulation E.E.C. no. 4252/88 on the preparation and marketing of liqueur wines produced in the Community;

- the geographical indications and traditional terms listed in the Annex to the Agreement;

b) Regarding the wines originating in Romania:

- the name "Romania", "Romanian" or any name used to indicate the country;

- the geographical indications and the traditional terms listed in the Annex (COTNARI, PIETROASELE, MURFATLAR, MEDGIDIA, NAZARCEA, CERNAVODĂ).

As for the wines in Romania, their regime is now established by Law no. 67/1997, which classifies them into:

i) Wines for current consumption.

ii) Quality wines.

Depending on their quality level, determined by the production area, by the variety or assortment of varieties, and by the technology applied, quality wines may be: superior quality wines — VS having an acquired alcoholic strength of at least 10% by volume; and wines with denomination of origin, having minimal acquired alcoholic strength of 10.5% by volume. Superior

quality wines — VS may be exported under generic denominations of *Landwein*, *Vin de Pays*, *Country Wine*, or other similar ones, with mention of the recognized geographic indication.

iii) *Special wines*.

A wine may bear a denomination of origin, provided that it is traditionally consecrated and that it has a good reputation due to its quality characteristics resulting from natural and human factors (art. 18 and 19 of Law no. 67/1997).

Wines with denominations of origin may be obtained by following special conditions relating to: production area, variety or assortment of varieties, the sugar content of grapes at harvest, and the natural alcohol strength of the wine, the maximum yield per hectare, methods of culture, winemaking procedures, analytical and organoleptic examination, packaging, labeling and inspection.

Denominations of origin may be granted to some special wines and other wine products that meet the requirements of Art. 15 of Law no. 67/1997 [8].

The wines with denomination of origin are made from grapes produced within the area defined for the name approved by the minister of agriculture, provided that the wine production, the storage, conditioning, maturation and bottling are carried out only within the area reserved for the production of the respective wine. For the production of wines with denomination of origin by using this procedure, the blending partner with sugar reserve should come from the same delimited production area, and the sweetening operation is to be carried out only within the area reserved for the production of the respective wine.

In special cases, the Ministry of Agriculture and Food Industry may, through the O.N.D.O.V. and with the advice of the O.N.V.V. authorize that the ageing of the distillates and the bottling of the aged distillates should be made outside the area delimited for the denomination of origin claimed, on condition that the brandy be turned to account under the denomination of the place of production of the grapes used as raw material, and of distillation as well as with the indication of the unit in which the ageing of the distillates and the bottling of the aged distillates of wine were made.

The right to produce wine and other products based on “must” and wine with denomination of origin, in a certain area, is granted by the certificate of attestation issued by the bodies authorized for this purpose. The producers right to use denominations of origin for certain lots of wine produced shall be granted yearly by the O.N.D.O.V. by the issue of *certificates of attestation of the right of marketing wines with denomination of origin*.

The issue of these certificate shall be made in keeping with the following procedure:

In plantations recognized as being adequate for the production of wines with denomination of origin, following elements of the vinegrowing technology shall be checked annually by probing and at the most suitable moments: pruning system and number of fertile eyes per vine, level of grape yield, phytosanitary condition of the plantation, carrying out of irrigation on the basis of an approval, other elements provided by decisions of granting the right to make wines with denomination of origin.

After the grapes are harvested, respectively not more than 15 days after the end of must fermentation is finished, and not later than December 1 the producers of grapes and of wines shall hand in at the territorial office of the O.N.D.O.V. a vintage declaration for placing on record the wines considered apt to evolve as wines with denomination of origin.

After not more than six months since the end of the winemaking process, wines placed on record on the basis of vintage declarations shall be subject to an organoleptical examination and to a summary laboratory analysis. The wine samples sent for analysis shall be provided by the producers of wines on their own responsibility, while they should represent wines sampled by lots of types. The amount of wine produced from each sample sent for analysis shall be communicated, with indication for the vessels in which the wines are stored.

The analyses shall be carried out by authorized laboratories, and the organoleptical appreciation shall be carried out by the tasting panels acting under the authority of the O.N.D.O.V.

The wines apt to evolve as wines with denomination of origin shall be placed on record by the territorial office of the O.N.D.O.V., and shall be followed up during

their stages of storage, conditioning, maturation, and ageing. The evolution of their quality and composition shall periodically be followed up by probing, by laboratory analyses, and organoleptical appreciations made by authorized laboratories. If there should be found that certain wine lots have lost their valuable features of quality and composition, they shall be removed from the ranks of those entitled to receive a denomination of origin.

De-classification of a high quality wine with denomination of origin shall be made at the producer or merchant whenever it shall be found that the wine has modified in a negative sense its organoleptical and composition features, no longer fulfilling the conditions established for the respective wines. The de-classification shall be made as a result of the information of the representatives of the bodies with attributions along the line of the quality control of the products as well as at the written request of the producers or merchants. It shall be carried out on the basis of the verifications performed on the spot and of the results of the physico-chemical and organoleptical assays made by authorized laboratories.

The evidence wine stocks with denomination of origin is held by the manufacturer, which is required to enroll in a special register all deliveries of wine, up to the certified amount.

Abstract

The accelerated deterioration of the worldwide economic climate which occurred as a consequence of the deepening financial crisis following the Lehman Brothers bankruptcy in the autumn of 2008 created a new context in which most central banks were forced to come up with unprecedented solutions. They drastically reduced the monetary policy interest rates up to a historical minimum level and adopted a number of monetary policy measures widely acknowledged as unconventional. Under these circumstances, our study aims to carry out a qualitative analysis of the most important „unorthodox” monetary policy measures (adopted by eight representative central banks) as well as to emphasize the differences among the various concepts used to illustrate these measures in the economic literature as well as in practice.

Key words: central banks, unconventional policy, interest rate policy, balance sheet policy, financial crisis.

J.E.L. classification: E42, E44, E50, E52, E58

1. Introduction

Both the financial system and the real economy were seriously affected by the intensification of the international financial crisis determined by the Lehman Brothers bankruptcy in the autumn of 2008 and, consequently, *the monetary policy transmission mechanism* was seriously damaged, an aspect which nevertheless endangered the central banks’ capacity to meet their monetary policy fundamental

objective. Under these circumstances, monetary authorities reacted firmly by reducing the directing interest rates to a historical minimum level. The incapacity of central banks to re-establish the functionality of the financial system when the level of the directing interest rate was close to 0% proved the limit of the *mainstream* monetary policy.

In the new context imposed by the international financial crisis, the responsible decision making authorities in the field of monetary policies had to adopt a series of measures widely acknowledged as „unconventional”, „non-standard” or „unorthodox”. Considering the fact that it is the first time when central banks make use of such unconventional instruments, we may regard this attitude as a monetary policy „mutation” which occurred as a consequence of the global financial crisis which broke out in 2007. The central banks’ new approach met for and against opinions as well and created numerous topics of debate among both academics and practitioners.

This paper aims to carry out a qualitative analysis of the representative „unorthodox” monetary policies adopted by central banks, through the perspective created in the specialized literature by Borio C. and Disyatat P.

2. The conceptual frame for the analysis of unconventional monetary policies

Due to the fact that they lack a conceptual frame, the various versions of unconventional monetary policies have sometimes generated confusion among theorists and practitioners.

Borio and Disyatat [3] propose a categorization of the non-standard monetary policies adopted by the authorities in various forms specific to *balance sheet policies* according to two criteria: a) the impact of the measures on the balance structure of the private sector participants; b) the target market segment. Thus, according to these, the policies based on balance are categorized into: exchange rate policies, quasi-debt management policies, credit policies and bank reserve policies.

The classification proposed by Borio and Disyatat could help us understand the multitude of terms used in the economic literature, media, practice etc. A specific term, often used in scientific circles as well as in media, is *quantitative easing* (QE). It was first used to describe the operations of the Bank of Japan in the 2001-2006 period. Although this term can be easily associated (and sometimes used as a synonym, as shown by Bernanke [2]) with the above-mentioned bank reserve policies, there are situations when a more complex definition is required.

According to Ugai [7], QE is an approach of the monetary policy which can be described from three perspectives: a) explicit targets of bank reserves; b) a conditional responsibility to maintain future high levels of reserves; c) acquisitions supported by governmental bonds to enable the achievement of objectives regarding bank reserves. According to these characteristics, in Borio's and Disyatat's vision, QE is a mix between bank reserves policy, the quasi-debt management policy and a strategy for signaling future intentions.

The Bank of England, through QE measures, points to the acquisition of both public and private sectors assets by using the financial resources of the central bank [1]. According to this approach, the characteristics point to the policies of bank reserves, quasi-debt management policies and credit policies.

Other specialists [5] [6] have excessively used this term by associating it with any central bank operation which determines an increase in reserves, irrespective of whether the level reached by these operations was explicitly proposed or not. This approach is not found in any of the balance based policies proposed by Borio and Disyatat.

Another term, frequently used in the global financial crisis context is *credit easing* (CE). Bernanke [2] used it to describe the range of credit and bonds acquisition programmes enacted by the Federal Reserves starting with the second half of 2007. The term refers to the credits granted to all private sector financial institutions, either banks or non-banks, and to the acquisitions of bonds issued by the Treasury as well as by *government-sponsored enterprises*. Therefore, in Borio's and Disyatat's vision, *credit easing* represents a combination between the credit policy and the quasi-debt management policy. Although we might be tempted to point to the bank reserves policy as well due to the fact that these acquisitions and credit operations are financed by extending bank reserves, we are not going to do so since the increase in reserves does not represent an explicit target but a mere consequence. Bernanke also draws attention to the distinction between QE and CE and stresses on the fact that the two concepts are similar only in terms of their impact on the central bank balance, that is, on its expansion.

The European Central Bank has also implemented a number of unconventional monetary policies meant to „support financing conditions and credit flows to a greater extent than what could be achieved by reducing the representative interest rates of BCE” [12]. The set of measures, mainly focused on banks (considering the fact that banking institutions represent the main source of finance for the real economy in the euro zone) are generally known as the *enhanced credit support*. According to the annual report [12], the main purpose of the constant support of credit (ECS) was to minimize the negative effects, exerted by the malfunctions of the monetary markets, on the euro zone banks liquidity situation. Since the bank credit is utilized most of the times and due to the fact that the adopted policies have a significant impact on the BCE exposure profile to the private sector debts, we may frame these measures within the credit policies area.

3. Non-standard policies adopted by some central banks

The intensification of financial tensions within all segments of the financial market, following the Lehman Brothers’ bankruptcy, has determined firm reactions on behalf of governments and central banks. Thus, on October 8, 2008, six representative central banks took action in an unprecedented manner by reducing the directing interest rates (as in the cases of FED, ECB and Bank of England, which can be seen in Figure 1). This decision was subsequently adopted by other central banks in the world, monetary policy interest rates thus reaching the minimum historical level.

Figure 1. Monetary policy interest rates and money market rates in 2005-2011

Source: Eurostat, Bank of England, Federal Reserve Bank of St. Louis authors’ calculi

Considering the fact that monetary authorities were incapable to re-establish the functionality of the financial system by using the monetary policy standard instruments, they finally decided on working with some less conventional instruments, adapted to the economic structure and to the peculiarity of the financial system. An exhaustive list of these unconventional measures would mean keeping a record of tens of programmes in almost every advanced economy as well as in numerous emergent economies. Due to this reason, we shall use the above-discussed conceptual frame and we shall stress on the major unconventional monetary policies adopted by some representative central banks (see Figure 1).

As far as the *exchange rate policy* (as a form of „unorthodox” monetary policy) is concerned, an important number of central banks in emergent economies (Mexico, Brazil, Hungary) adopted its specific measures and the reason why they did so was to fight against the negative effects of sudden conversions of capital flows and of the powerful pressure it resulted in the currency falls. Moreover, the central bank of Switzerland turned these interventions into common practice, repeatedly intervening on the currency markets (by buying foreign currency in unlimited amounts) in order to diminish the powerful pressure and to trigger the rise of the Swiss franc (upward pressure); these efforts were mainly directed towards reducing deflationary risks and relaxing the monetary market conditions.

Due to the fact that tension persisted on financial markets, some central banks (Federal Reserves, Central European Bank, the Bank of England and the Bank of Japan) implemented monetary policy measures specific to the *quasi-debt management policy*. These consisted in governmental bonds direct acquisitions and were meant to influence *benchmark yields*. Both Federal Reserves and the Bank of England performed important acquisitions, concerted by governmental bonds. The Bank of Japan extended the range of eligible guarantees and performed simple acquisitions of Japanese governmental bonds in order to stimulate the economy; according to a bank report, this was not meant to influence the long term governmental bonds efficiency but „to create the necessary conditions to perform

operations on the monetary market without syncofes” [13]. In Europe, as a consequence of the alert growth of the *spreads* between governmental bonds with a ten year maturity, issued by some euro zone members and the governmental bonds issued by the German state (which reached record levels in the history of UEM in April and the beginning of May 2010; see Figure 2), BCE announced on May 9, 2010, a new set of „unorthodox” measures, entitled *European Financial Stability Facility* (EFSF). In this sense „the beginning of interventions in the governmental bonds markets with the purpose of maintaining the adequate transmission of the monetary policy towards the real economy in the euro zone, by reducing the disfunctionalities in some segments of the assets markets” was decided. According to the provisions of the Treaty, „the governmental bonds acquisitions performed by Eurosystem were strictly limited to the area of secondary markets” [12: 21].

As observed in the above figure, during the period marked by financial turbulence, the analyzed central banks adopted the *credit policy* specific monetary measures. Among these, we may distinguish a first group of measures adopted before the Lehman Brothers bankruptcy in September, 2008, which were focused on *diminishing the tensions on the interbank monetary market* (these tensions had unfavourable effects on the liquidity situation of sound banks). Thus, in order to reduce the short-term *spreads*, which were extremely wide on the interbank monetary market, and to enable the transmission of the representative interest rates towards the monetary market and towards the active interest rates of credit societies, central banks increased the short-term liquidity offer and adopted a series of measures destined to solve the potential problems which might occur in the fluent distribution of bank reserves. These measures consisted in:

- variations in facilitating the *discount window*;
- relaxing the collateral eligibility conditions. Before the worsening of the situation on the financial markets, central banks such as FED, BoC or BoE, as compared to other banks (eg. BCE, BoJ, SNB or Riksbank) were very strict with

regard to the collateral eligibility when the provision of liquidities was involved. They normally accepted only governmental bonds or the equivalent of market operations. Once the financial crisis intensified, the demand of the participants in the market for *assets* which could be accepted as a guarantee by the monetary authorities grew considerably, a reason for which they became scarce resources. In order to be able to cover the liquidity need on the markets, monetary authorities extended the list of assets acceptable as a guarantee. By including certain assets in the spectrum of eligible guarantees, central banks managed to provide the necessary support in an indirect, though almost surgical form, to certain market segments;

- extending the list of counterparties to the central banks’ operations. The crisis intensification affected the market participants’ trust to such an extent that the financial resources were no longer distributed fluently among the credit institutions. For example, the banks which did not perform transactions with monetary authorities lacked credibility in front of the other banking societies, thus being difficult for them to access loans from the latter. By extending the counterparty list, central banks became able to directly address a bigger number of banking societies;
- providing long-term maturity liquidities (this segment of financial markets was deeply affected). Since the *spread* between the long-term interest rates and *overnight* interest rates increased rapidly, the monetary authorities reacted by extending the maximum maturity term of the exceptional refinancing operations from relatively short periods of time (usually *overnight* or after 1 week) up to three months (as was the case of FED) or a year (as was the case of other banks);
- establishing new mutual currency agreements (*swap* lines) between central banks in order to diminish the pressure exerted by external markets financing (especially in dollars);

- introducing new programmes or relaxing the conditions of the already existing credit programmes for high liquidity assets (especially state bonds) in counterparty with less liquid assets in order to improve the financing conditions on the monetary market credit [4].

The other unconventional measures (which form another group) specific to *credit policy* were adopted as a consequence of the intensification of the financial crisis which followed the Lehman Brothers collapse. Unlike the ones in the first group, these measures were directly focused on *counteracting the more and more strict credit conditions in the non-banking sector*. Therefore, the adopted measures included offering financial resources to non-banking societies in order to improve liquidity and to reduce risk on the afferent markets (eg. The trade effects market, the asset guaranteed titles markets or the corporate bonds market). Additionally, in order to strengthen the support already granted to the mortgage market, Federal Reserves bought direct bonds issued by housing-related government-sponsored enterprises.

Up to this moment, the Central Bank of England was the only one to implement monetary measures specific to the *bank reserve policy*. The operations performed by this bank (part of the „assets acquisition facility”) were focused on increasing the monetary mass, that is „the monetary policy instruments were focused rather on the cash quantity than on its price (the directing interest rate)” [8]. Even though the Bank of England does not have a quantitative explicit target for bank reserves, it treats them (i.e. bank reserves) as a vital element in its strategy for „quantitative easing”. Bank reserves have increased in other banks’ balances as well (eg. Federal Reserves, BCE or SNB) but despite this fact, the levels which were reached represented side effects of active operations.

In terms of conventional measures in monetary policy, reaching the previously communicated interest rates imposed performing financial liquidity management operations in order to satisfy the more and more unstable reserve demand on the market. Also, in order to stabilize the monetary policy short-term interest rates,, the Bank of England Federal Reserves and the European

Central Bank narrowed the *overnight* rates corridor by modifying the levels of the permanent applied facilities at the end of the day. Moreover, in order to manage the liquidities in the system, central banks issued debt titles (the Bank of England and the Central Bank of Switzerland) or interest carrier deposit certificates (BCE, the Bank of Japan, the Central Bank of Australia) and thus Federal Reserves took over a considerable amount of deposits and paid interest to the compulsory minimum reserves (the Bank of Japan implemented the *Complementary Deposit Facility* programme in order to pay the interest for excessive reserves).

4. Conclusions

In the context created by the most critical global financial crisis of the 21st century, monetary authorities adopted a number of less „orthodox” policies which ultimately turned into a controversial topic of debate among representatives of scientific circles as well as among political factors of decision. This paper has managed to pattern the conceptual frame for the analysis of these unconventional monetary policy measures from C. Borio and P. Disyatat’s perspective (which draws a line between the standard interest rate monetary policy and the balance-based monetary policy). By this approach, we have analyzed the various concepts used to define the monetary policy non-standard measures (eg. *credit easing*, *quantitative easing* or *enhanced credit support*) and we carried out a qualitative analysis of the main unconventional monetary policy measures adopted by 8 representative central banks.

Table 1. Monetary policy measures adopted by central banks during the financial crisis

*	Form of monetary policy	Monetary policy measures	FED	ECB	BoE	BoJ	BoC	RBA	SR	SNB	
INTEREST RATE POLICY	<i>Focused on achieving the fundamental objective established through monetary policy orientation</i>	Smooth regulation operations	✓	✓	✓	✓	✓	✓	✓	✓	
		Narrowing the corridor for <i>overnight</i> rates	✓ ¹⁾	✓	✓						
		Interest payment for compulsory minimum reserves	✓			✓ ²⁾

Economic Crisis Effects Reflected in the Mass-media Speech

Apostol Mihaela-Simona

Abstract

Considered as the fourth Power in the state, mass media succeeds in transforming by the power of information the entire planet into a “global village”, rendering by specific means the crisis and after-crisis situations, the dramas that the world economy is facing on a micro and macro scale.

The fact that mass-media influences upon the dynamics of the society is a well known fact, however how does this influence take place has been and still is one of the studies of communication scientists.

Mass-media has the capacity to shape the perception of the individuals, groups, institutions and that of the entire society. Also, media has the capacity to coagulate the public opinion and how the image of the world is perceived by modifying attitudes and feeling, reaction implicitly leading to a change in the way individuals and the entire society act and this reflects to the economic environment as well.

Key words: Crisis, mass-media, communication, crisis management, organization

J.E.L. classification: D21, L21, M14

1. Introduction

Mass-media is a constant dynamic presence to the big and small happy or tensioned moments from the humanity's recent history. Considered as the fourth Power in the state, mass media succeeds in transforming by the power of information the entire planet into a “global village”, rendering by specific means the crisis and after-crisis situations, the dramas that the

world economy is facing on a micro and macro scale.

Mass-media is managed by a small number of people who misinterpret or elude from the media discourse those information producing mutations in the general speech of the public opinion, sometimes with well-intended pacifist purposes not to alarm the public with fatalist rumors, at other times with hidden purposes which do not intend to awake the attention of the sleeping force, the public opinion.

Many professionals consider that mass-media has and will have an important role in re-launching the global economy and in finding viable solutions to the working places problem, of the security and of lasting solutions.

The recovery of the economy, some analysts say, directly depends on the media active role on a global level, but especially on a local one. Analysts consider that by stimulating on a local level the communities by a pyramidal type of operation, downwards to upwards, positive results will be obtained.

Using the mass-media a coordination of each government's efforts is wanted and of each public agency in respect to the current world's problems.

In the mass-media there have been many alarm signals warning the decision organizations, economic and political factors: governments, banks, corporations, on the speculative nature of investments and shares, but such signals did not have an echo determining significant moves.

The issue of public relations in the context of the International crisis involves the resolution of the issues encountered in the economic and social space, and now more than ever it is necessary to solve the cascades of tensed situations generated by the crisis.

The generated situations must be solved in accordance to the industry situation and the existing straightening conditions. Due to the fact that entire industries are affected by the after crisis effect measures should be taken to remake and reconstruct the affected public image.

2. Media macro models as indicators of the crisis situations

The way how mass-media influences the entire society is still a problem particularly interesting the social sciences scientists. To the question if there is a mass-media influence on the society, the researchers' answer has been unanimously affirmative. Nevertheless, to the question how the mass-media influence is working on the opinions, attitudes and individual behavior, the researchers' answer is varied and analyzes the issue from multiple points of view. Knowing the way how mass-media can influence the public opinion, the decision factors, the governments, corporations etc, we can use these channels to address in crisis and after crisis situations to efficiently communicate and to minimize the economic and social crisis effects. The communication process has effects on the entire society and culture. The media effects, called long-term effects or indirect effects, can be analyzed by means of macro models. These, unlike other analysis models, are centered on the research of social roles and the mass-media interaction which are contained in the ideologies, opinions climate and knowledge differences [5]. Generally, the media macro effects are analyzed from the perspective of the three theories dominating the scientific research in the communication area: agenda – setting (agenda theory), Schwigespirale (silence spiral theory) and theory of differential knowledge (theory of cognitive abyss) [2].

The uninterrupted media stream to which the public is subject to produces effects both on a short term and on a long term with visible results on the economy. Media communication places in the center of attention the social issues, the other persons or subjects of debate, the other aspects are left in the shadow. Mass-media sets the public agenda by filtering the information and imposing subjects of debate. Depending on the ratio of mass-media and the public

there are two types of agenda: media agenda and public agenda. The agenda theory is based on these two models. Media selects certain information and enters them into the priorities agenda, and the public begins to be interested by those preferred subjects on the media agenda and writes them down on their own agenda. Media agenda underlines the aspects and interest granted to certain information, and on the other hand, researchers have found that public agenda does not look into one direction only, the public has three types of agenda in accordance to what they consider to be important for them and for the society: the intrapersonal agenda, the interpersonal agenda and the community agenda[5].

The second important theory, the silence spiral, starts from the fact that the public opinion pressure the individual to alter his behavior and not to confess his own opinions. The reason why people change their behavior is the fear of exclusion and isolation, that is why, the majority's opinions are more important, in contrast with the personal opinions [9]. This type of social pressure and oppression is responsible for generating many crisis situations. In our contemporary society dominated by the mass-media, this type of altering the opinions is frequent. Noelle-Neumann considers that mass-media, but especially the television due to its non-selective character, have great influence upon the receiver [8].

The researcher uses three key terms in explaining its theory: accumulation, consonance and public character of the information. The accumulation refers to the media omnipresence which feeds with information repeatedly thus influencing the receiving process.

The content of the media messages is flattened by the repeating and standardization of messages concentrating the attention on the same subjects. The second term, consonance, refers to the tendency of aligning oneself to a majority opinions trend. This aligning trend can be observed, says the researcher, both in case of mass-media and the public. The latest term, the public character of the information, regards the silence as a social phenomenon. Noelle-Neumann asserts that people who have the feeling that their opinions are supported and shared by the majority of people, are much

braver in expressing their point of view in public unlike the persons who consider that their opinion is pertaining to a minority and therefore could suffer a defeat [5].

The third theory, the theory of the cognitive abyss and of the differential growth of knowledge, must be looked at within a vision upon the social role and of the media influence.

Mass-media certainly influences the dissemination of the information with positive effects upon the public. There are also negative effects due to how the public understand to access and manage the information received from the media creating an abyss between the ones who access the information, those who know, and those who do not access the information, and do not know. The first category of public, “those who know”, is made of people with higher education who have a superior capacity in decoding the messages. Such people are in the loop on the social phenomena and gather the information mainly by reading the written press. The second category, “those who do not know”, connect to the information source mainly via television. The media consumption of people is in close connection with the level of culture and education. The social- economic status generates a certain consumption model, the ones with a higher statute accumulate more knowledge and faster than people with a lower status [7].

3. Delimitation of the crisis term in the context

In the international current context more than ever it is needed to define the terms and to deeply understand the phenomena that can be generated by the crisis and the way they can be managed. The word is not strictly used in the legal, politic and philosophical speech, but has a much wider semantic area. This is encountered in medicine, in Hypocrite’s treaties, and is, also, encountered in the religious speech when it refers to decoding the ritual messages. [1]. In time the semantic area of the word semantic area has widened entering the working area of several subjects. The studies centered on researching the crisis can be separated into three major directions: from a psychological point of view – aiming to research the clinical cases; the economic-political dimension – which is

concerned with the identification and defining the crisis, the differences appear though in the way how each subject understands to look at the crisis situation and to follow up certain component elements[1].

In the political sciences space, specialists consider that there are three big categories of crisis: system crises, government crises in taking decisions and crises of international confrontation. The economic field regards the crisis as a dysfunction, an interruption of the economic dynamic with serious consequences upon the economic growth.

Of course in the space of each field of social sciences specialists have tried to define their own reference area.

Crisis is defined by the specialists as: “A turning point either good or bad” [3]. “A major fact with a negative potential capable of affecting the organization, company or the industry, also it can affect the public, the product, services or other goods” [3]. “A major event with an unpredictable character which can escalate producing negative results. The event and its consequences can significantly affect the organization and its employees, products, services, financial situation and reputation” [3]. “A crisis can be defined as an unpredictable event, a major threat which can have negative effects on the organization, industry, or its shareholders if the crisis is not managed properly. A crisis is unpredictable, but not unexpected. Wise organizations are aware that they are vulnerable in front of crisis but they cannot anticipate their appearance. Crisis hit unexpectedly and this gives them an unpredictability and surprise element” [3]. “There are though exceptions from this rule there are some crisis warning early their appearance” [4].

The majority of these definitions can be grouped into two approaching directions regarding the crisis issue. One direction regards the crisis from the point of view of factors leading to the triggering of the crisis, mainly the external environment, and the second approach centers on the human perspective, the way how people look at the organization affected by the crisis.

Generally, specialists consider crisis as an unexpected event, a disturbing phenomenon with severe consequences in the dynamic and evolution of the society [1].

Another perspective is that of the researchers who consider that these crises are not due to random facts, but they are the consequence of some existing dysfunctions in the organization. This approach considers the crisis not as an inexplicable and isolated event, but as a result of deposited dysfunctions which can be fixed by the organization. It can be thus spoken of an accumulation of dysfunctional events which lead to a crisis and not by a surprise event, still the crisis can appear as a surprise as well. The real problem is not to predict the moment of the crisis and its manifestation form, but more important is to identify the hidden problems which can generate a crisis [11]. They consider that an important factor worthy of being taken into consideration is the impact that the crisis has on the entire industry scale. The problem generated by the crisis situation appeared in a certain organization can impact on the entire industry. Thus the industry in its whole is strongly affected and has massive financial losses, and in order to recover the organizations must work together.

The crisis can have a different dynamic depending on certain circumstances which make it specific: length, intensity and the way it is perceived by the public and mass-media[10].

Organizations can be looked at, in the context of crisis and the dynamic of events, as: victim organizations, guilty organizations and in extreme cases criminal organizations which due to their desire of maximizing the profit they hurt the public.

The crisis, must be underlined, is not a random fact, which cannot be prevented, but has its own dynamic, it evolves in accordance to a specific pattern that makes it predictable.

The evolution of crises and how they are perceived by the public and mass-media is in the specialists' center of attention, that is why they must know and manage this type of events in an adequate way by recognizing the patters of the crisis situations evolution.

Specialists consider that the evolution of a crisis has an initial accumulations period which become to manifest violently in the punctual period of the crisis itself and is followed by a post-crisis period. By following the set of phenomena accompanying the crisis, researchers have considered that this, in fact, can be

fragmented in a different number of stages: three stages, four or even five stages, depending on the importance they consider to own different factors who influence or could influence the crisis dynamic. Generally, the specialists in public relations agree that the first three stages are the same with the before-crisis periods, crisis and post-crisis but they consider that there must be certain special stages as the one of: prevention, detection, evaluation or learning [7]. These stages are important for the future of the organization and the way it will manage the future problems, incidents or accidents so that these do not deposit and build a new crisis. The organization must learn from its own mistakes and transform a tensioned and negative situation in a winning and progress factor. Some specialists assert the hypothesis that the crisis appearance can be a positive factor in the organization development. Although this statement may seem as a paradox many researchers underline the fact that the crisis situation cannot be exclusively defined in negative terms. The crisis is defined as a major disturbance, a fracture of the organization dynamic, creates management and stress issues, but can be considered an opportunity.

In one of his works, Gerald Meyers considers that an organization in a crisis situation can benefit from seven opportunities: a crisis can generate "heroes" if it is correctly guided and it is centered on certain people who outstand themselves during such tensioned moments; crisis can be a dynamic change factor, being known that organizations in their inertia sometimes hardly accept changes; crisis is an accelerator determining that long ignored problems become visible, and thus, to be solved; crisis determines changes among people, this refer to people's mentality and to change among the staff; the crisis by the pressure upon the organization determines that it approaches new strategies; crisis determines the organization to better prepare in the identification, prevention and managing the crises; crisis regenerates the organization by the measures taken to reestablish the institution and, as a consequence, the organization positively develops by learning from its own mistakes [9].

4. Conclusions

During crisis situations, mass-media can become an ally or a detractor, and that is why it is important that the decision factors understand the potential that lies behind the media.

The economic and politic decision factors should build plans including how media channels will be managed in the crisis situations. Also, to know how media can help to release the tension, clarify and, not in the least, to put the public opinion at ease regarding the dynamic of newly emerged tensioned situations. Understanding the media mechanisms but also the way how media can influence the society is a key element which can obviously alter the global economic and politic dynamic.

Communication specialist, John Hartley [11] said that “News comes to us as a pre-existing speech of an impersonal social institution, but which is at the same time an industry. From the moment we are familiar to its codes and conventions, we become “news literate”, capable not only to watch it and to recognize the familiar characters and events, but also to spontaneously interpret the world in the terms of the learned codes through it”. We perceive reality and we interpret the world, partly, by means of the values scale that news made us accustomed to. These are defined and shaped in accordance to the mass-media characteristics where they appear: written press, radio or television.

Mass-media speeches are not simple texts, but they are full of intentions and ideologies, which persuade ideas by means of words. The journalistic speech produces and manipulates a diversity of messages which try to build and to empower the reality of the world produced in its messages. Creator of symbolic goods, mass-media institutions are aware of the limits of their messages caught in the linear presentation game-the representation of reality.

The news stories group around six major subjects: politics, economy, international relations, local news, occasional news and sports.

Using in an efficient way the communication qualities of mass-media imply an efficient crisis management. This must be one of the priorities of any organization looking into the future.

Projecting a plan to detect the crisis, prevention, controlling and learning, is useful to any organization that aims to remove the imminence of major crises that can be generated major breaks in the organization dynamic. Maintaining the information flow, the active implication into the public life, developing managing policies to prepare the organization in an efficient way to be able to react in an efficient way in crisis situations must be on the working agenda of the visioning organization. This preparation of the organization for the future must take into account the social factors and mass-media active implication in order to make the economic environment able to successfully handle the moment when another crisis triggers.

National Economic Advantage - The Role in Creation and Development of Competitive Clusters

Asaloş Nicoleta

Ovidius" University of Constanta, Faculty of Economic Sciences

nasalos20@gmail.com

Abstract

Nation's standard of living in the long term depends on its ability to attain a high and rising level of productivity in the industries in which its firms compete.

Good productivity not only supports high levels of income but allows citizens the option of choosing more leisure instead of long working hours. It also creates the national income that is taxed to pay for public services which again boosts the standard of living.

Interest in the 'cluster' concept has been especially apparent in economic development policy, as seen in the increasing support for cluster development at both national and sub-national levels. Cluster policies have proliferated over the past decade - both those clearly designated as such and related policy initiatives such as regional innovation strategies and measures to support local production systems.

Key words: productivity, competitive advantage, competitiveness, clusters.

J.E.L. classification: O47

1. Introduction

Apart from the theories of the international trade, firm's development was explained by a series of other theories that showed the reasons that could determine a company to expand, not only within the national borders, but also beyond them. The theories of the international trade have failed to explain why firms choose a specific location instead of another, why they prefer the production abroad and not the export towards another country. On the background of the expansion of large firms and the theoretical approaches to analyze market imperfections, a category of theories trying to extend the limits of the international trade theories and to explain foreign direct investments have emerged.

The principal economic goal of a nation is to produce a high and rising standard of living for its citizens. The ability to do so depends not on the amorphous notion of "competitiveness" but on the productivity with which a nation's resources (labor and capital) are employed. Productivity is the value of the output produced by a unit of labor or capital. It depends on both the quality and features of products (which determine the prices they can command) and the efficiency with which they are produced.

2. Conceptual issues of national advantage

Advantages offered by specialization, explained by the **theories of absolute advantage** (Adam Smith, 1776) and **of comparative advantage** (David Ricardo, 1817), and later by the theory of factor endowments, have been taken and adapted for the level of the firm.

The theory of absolute advantage brought to the attention for the first time the possibility for a country to produce cheaper a given product than another country. In this case, countries' specialization in the production of goods with smaller costs and the trade of the production surplus was beneficial for both countries. Although it represented a major step in demonstrating the benefits of specialization, Adam Smith's theory could not offer the same perspectives for the countries that did not pose an absolute advantage for any category of products.

From this situation, David Ricardo demonstrated that specialization is possible and beneficial even when a country doesn't pose an absolute advantage in the production of any good. Resources' allocation toward those goods that can be obtained cheaper than others and their export

can bring benefits to both countries. This was a major demonstration that fundament the theories developed later, regardless of the fact that they confirmed, enriched or contradicted the hypotheses of the comparative advantages theory.

At the beginning of the 20th century, two Swedish researchers Ohlin and Hecksher argue that the difference between countries is given by the production factors, and the products are different because of the production factors incorporated. According to the model (**Ohlin – Hecksher factor proportion theory**), a country holds a comparative advantage and thus will export the product that incorporates the abundant production factors in the respective country. Thus, the more abundant a production factor is, the cheaper it becomes. So, the difference in the production factors is given by the difference in their prices, generating the competitive advantage.

Technological developments in the '60-ies and the substantially ample development of multinationals lead the specialists to look for new theoretical fundamentals that explain the complex evolutions of the international trade. Of much interest is the new **theory of competitive advantages** launched in the last decade of the last century by Michael Porter in his book “The Competitive Advantage of Nations”. Porter’s diamond, as the fundamental elements of the theory were called, represents an economic model that explains why some industries become competitive in certain situations. The diamond has four constitutive elements, plus two factors of influence: production factors, demand, support industries, firm structure and competition at branch level, governmental regulations and the chance. The theory of competitive advantages considers those six elements interact one with each other, allowing the creation of those combinations to enhance competitiveness’ increase.

The development of transnational companies from certain countries and industries verify some applications from Michael Porter’s theory. In media, for instance, American firms have a higher level of competitiveness. They come from a market where advanced production factors are very well emphasized, meet a sophisticated demand from buyers with strong purchasing

power and requirements, where upstream and downstream industries function without problems, and the competition within the industry is extremely high.

3. How we create and sustain the competitive advantage?

A firm must understand what it is about its home nation that is most crucial in determining its ability, or inability, to create and sustain competitive advantage in international terms. But the same question will prove to be a decisive one for national economic prosperity as well. As we will see, a nation's standard of living in the long term depends on its ability to attain a high and rising level of productivity in the industries in which its firms compete. This rests on the capacity of its firms to achieve improving quality or greater efficiency. The influence of the home nation on the pursuit of competitive advantage in particular fields is of central importance to the level and rate of productivity growth achievable.

But we lack a convincing explanation of the influence of the nation. The long-dominant paradigm for why nations succeed internationally in particular industries is showing signs of strain. There is an extensive history of theories to explain the patterns of nations' exports and imports, dating back to the work of Adam Smith and David Ricardo in the eighteenth century. It has become generally recognized, however, that these theories have grown inadequate to the task. Changes in the nature of international competition, among them the rise of the multinational corporation that not only exports but competes abroad via foreign subsidiaries, have weakened the traditional explanations for why and where a nation exports. While new rationales have been proposed, none is sufficient to explain why firms based in particular nations are able to compete successfully, through both exporting *and* foreign investment, in particular industries. Nor can they explain why a nation's firms are able to sustain their competitive positions over considerable periods of time.

Productivity is the prime determinant in the long run of a nation's standard of living, for it is the root cause of national per capita

income. The productivity of human resources determines their wages, while the productivity with which capital is employed determines the return it earns for its holders. High productivity not only supports high levels of income but allows citizens the option of choosing more leisure instead of long working hours. It also creates the national income that is taxed to pay for public services which again boosts the standard of living. The capacity to be highly productive also allows a nation's firms to meet stringent social standards which improve the standard of living, such as in health and safety, equal opportunity, and environmental impact.

The only meaningful concept of competitiveness at the national level is national productivity. A rising standard of living depends on the capacity of a nation's firms to achieve high levels of productivity and to increase productivity over time. Sustained productivity growth requires that an economy continually *upgrade* itself. A nation's firms must relentlessly improve productivity in existing industries by raising product quality, adding desirable features, improving product technology, or boosting production efficiency.

4. From competitive advantage to competitive clusters

Porter observed that competitive success of companies in particular ‘fields’ coincided with strong clusters. Porter is unequivocal in defining success in terms of productivity and productivity growth relative to rivals. The above definitions correspond to the question Porter wished to answer regarding the location of successful international competitors. Although Porter set out to identify the causes of national competitive advantage, it is not the only context in which the cluster has relevance. Clustering is appropriate for considering related but distinct issues of industry and regional development that include business and/or industry origins, evolution and decline.

The nature of interconnection can vary across cluster members, which makes a simple definition challenging, but the impact of interaction is seen in the contribution made to cluster members’ individual and overall competitiveness. A cluster may

include producers of goods or services, their specialised suppliers, service providers and any associated institutions, from industry or trade associations to universities and standard-setting agencies, normally within the boundaries of a country or across a region. Cluster members may compete with other members in their field or support the competitiveness of other cluster members by resource-sharing.

A key feature of Porter’s cluster concept is that co-operation as well as competition underlies cluster activities allowing member firms to have higher productivity than would otherwise be possible.

The essence of the cluster concept has its roots in work on what Marshall, as far back as 1890, called ‘externalities of specialised industrial locations’ (Marshall, 1920). Somewhat paradoxically in the current context of increasingly globalised markets, firm location and interdependence are significant explanations of their competitive performance according to cluster theory.

Location is one of the few sources of differentiation that competitors outside a cluster are unable to imitate. Porter’s cluster concept includes elements of location, competition, cooperation and strong relative performance in a manner that was not otherwise conceptualised, but recognising that: “most past theories address particular aspects of clusters or clusters of a particular type”.

The identification of locations with a distinctive business environment that influences how individual businesses choose to compete is a novel feature in Porter’s work. The cluster emerges from Porter’s analysis of the quality of the economic environment of a location for business and an appreciation of the concept requires that it be placed in this broader context.

The factors that Porter included in his ‘Diamond’ framework for competitive advantage (the microeconomic business environment of firms and clusters) facilitate or hinder the development of successful firms and clusters.

Each ‘Diamond’ element may influence the other elements to generate an environment conducive, or not, to successful business performance.

The cluster emerges ‘naturally’ as the result of interactions of ‘Diamond’ factors in a location and “the nature and depth of clusters varies with the state of development of the economy”. The cluster is intrinsically linked to and defined by the system of features described by the ‘Diamond’.

Porter argues that where strong clusters exist, they enhance productivity. Yet not every firm operates, or is presumed to operate, within what may be classified as a strong or active cluster.

For a group of interrelated firms to qualify as a cluster four conditions must be met:

1. Proximity: Firms must be close enough geographically to allow for positive spillovers to be enjoyed and/or for resources to be shared;

2. Market Relationship: Firms must have a common goal (e.g. meeting the needs of the same market), or requiring highly skilled specialised labour in a specific field to benefit from interaction.

3. Active Interaction: Active relationships must be developed for positive cluster effects to emerge; and

4. Critical Mass: A sufficient number of participants must engage in active interactions before any meaningful or significant impact on company performance results. The number depends on the particular cluster, its location, its target market etc.

The three issues at the heart of cluster-based analyses - competitiveness, productivity and innovation - can usefully be considered by perceiving the economy as organised around clusters.

These issues are also central to policy concerns, as evident in Europe’s goal of becoming the world’s most competitive and dynamic knowledge-based economy in the world by 2010 (as stated in the Lisbon goals). There appears to be a broad consensus that sound macroeconomic performance is necessary but insufficient to achieve productivity improvements across the EU and microeconomic issues are increasingly centre stage in policy discussion on competitiveness improvements. The sources or explanations of performance, and its absence, may be found from the examination of clusters and the characteristics of location, competition and cooperation that define them which are grounded in the microeconomic features of an economy, as organised in the

The analysis of economies as systems of clusters, based on ‘Diamond’ conditions, affords policymakers an explicit framework on which to organise focussed policies and launch initiatives across main cluster players, from companies, to state agencies, universities, labour unions or industry associations, based squarely on how businesses conduct their competitive and co-operative activities. Cluster analysis focuses on important inter-firm linkages, complementarities, and spillovers in terms of technology, skills, information, marketing (among others) that describe the ongoing dynamic process of how firms compete. Such linkages and the actual and potential external benefits clusters can generate point to a scope for joint actions by companies, industry groups and/or government to support cluster development.

A cluster-centred view of economic development poses particular challenges for policymakers.

It makes redundant the notion that any specific industry or sector should be targeted by industrial policy since all clusters have the potential to contribute to prosperity and emphasises that business support programmes should best be structured to enhance the competitiveness of groups of related firms rather than individual businesses. Cluster-based thinking accords contributory roles to domestic and foreign companies which are both important in securing productivity improvements. The role of the policymaker in cluster-based economic development is to relax any identified impediments or constraints to productivity and to emphasise and enhance the cross-company linkages and complementarities that facilitate and generate business competitive advantage. This almost certainly implies a role for more cluster initiatives at sub-national and local levels and the development of trust not only by leaders and members of such initiatives in the policy sphere but also in the businesses that populate clusters since they are conduits for information and inputs on the barriers they face to developing their cluster.

For cluster-based economic growth, it is not the role of policymakers to impose cluster development on un-cooperative businesses. Should businesses themselves view clustering as a feasible and beneficial

activity that could increase their probability of achieving competitive success, then facilitation could be provided through state and business representative agencies with requisite responsibilities for supporting business development.

5. Conclusions

The only meaningful concept of competitiveness at the national level is national productivity.

A cluster may include producers of goods or services, their specialised suppliers, service providers and any associated institutions, from industry or trade associations to universities and standard-setting agencies, normally within the boundaries of a country or across a region.

Cluster members may compete with other members in their field or support the

competitiveness of other cluster members by resource-sharing. The three issues at the heart of cluster-based analyses - competitiveness, productivity and innovation - can usefully be considered by perceiving the economy as organised around clusters.

The Role of the Accounting Professional in the Management of the Economic Crisis

Baba Camelia Mirela
“Transilvania” University of Braşov,
Faculty of Economic Sciences and Business Administration
mirela.baba@unitbv.ro

Abstract

The present paper is focused on the accounting professional's role in the management, confinement and lessening of the consequences of present economic crisis. The article presents some considerations about how the financial – accounting information can be used by an economic entity in order to survive the recent changes within its economic and financial environment.

Key words: professional accountant, financial crisis.

J.E.L. classification: M41- Accounting.

1. Introduction

The accounting professionals have an important role, as they ensure the credibility of the accounting statements, and the accounting profession must take an active part in the counseling of the businessmen and be a support for the evaluation of the present and future events. The most discussed problem of the present time is the financial crisis, which inevitably affected Romania as well, and the accounting profession could be considered an essential element in the minimalization of the effects of the crisis. The present crisis leads to an increase of the need for quality accounting services, enhancing the role of the accounting inside the entity, transferring over to him some of the responsibilities of the management.

2. The importance of the accounting information

The present economic situation determines the companies to search for solutions to

continue their activity in optimal conditions to avoid bankruptcy. The businessmen should be aware of the great importance of the accountant for the financial management, as well as for the monitoring the health of the company and increasing of the lucrativeness of the company they manage. The accounting professional can be consulted in order to optimize the costs, to find proper solutions for assets management, debt restructuring, a better management of the cash flow and, not the least, for the drawing-up of the financial statements. The economic instability make some measures necessary, as the strict control of all the economic operations, a responsible resource management, filtering and lowering the costs, within the possibilities, and the adjustment of the strategies to the new market conditions. Below are mentioned a few of the financial-accounting solutions to be considered by an accounting professional in order to diminish the effects of the crisis at the company level.

To respect the accounting standards

First of all, the accounting professional must make sure that the accounting standards are respected for each situation they analyze. The importance of complying with the accounting standards, foundations of the independent accounting profession, is the warrant for a modern and achieving professionalism, capable to answer to the most pressing requirements. Building the trust in the national regulations, but also in the International Accounting Standards are other responsibilities of the accounting specialist. In the present situation, of economic instability, it is crucial to find the legal possibilities that an economic entity has in order to save time and money, and not only does the real accounting professional work accurately, but he is also needed to counsel his clients about the opportunities offered by legislation.

To assess the tangible assets of the company

The accounting professional has the responsibility to prudently verify the sums in the statements of the company, to reevaluate all the previous estimations referring to the assessment of the assets from the balance, because the future economic benefits coming from the assets' estimation may differ comparing to the previous years. On the other hand, according to the current accounting regulations, the accounting value of the assets cannot significantly differ from their just value (according to IAS 36, 'Impairment of Assets'). In this respect, the impairment test can be applied to check if the carrying amount may be in excess of the greater of the net selling price and the value in use of those assets.

To calculate and rationalize the costs

The economic and financial crisis obliges to a detailed analysis of the production, sale and management costs. For this matter, the management accounting is a source of information at hand for managers, revealing them the key aspects of the activity of a company which provide them support for planning, organizing and control of the activity they manage. Accounting management provides information required by managers to survey the production process and creates the premises for keeping track of the expenses and actual salaries at the level of the productive unit.

The manufacturing costs are important due to the fact that they determine the price and, hence, the price decisions are based on them. The managers analyze most often the possibility to economize, especially on the level of the employed staff, but also on the level of administrative costs, such as office rent or commuting expenses (daily allowances, lodging). One solution could be the limited employment, the limited employment contract. It would be recommended to start cost and profit centers. A distinct department as a cost center the cost can be much more easily and identified and more objectively distributed, and the profit centers are able to identify the profitable activities.

To calculate and analyze the sales figure

A skilled accounting professional can also be a good financial analyst. He is able to and must analyze the financial-economic state of

the company, to analyze its costs, revenue, sales figure, to determine the cash-flow, to find ways to maximize its profits and solution for any occurring problem. The analyze of the sales figure on the level of the clients, of the stages of the products' life cycle, reported to the demand and the production capacity direct the decisions about the future placement of the economic agent. The accounting professional is able to inform the management about the ranking of the sales figure, regarding the overall activity or the products, about the ways to increase profits, the main sources of revenue and ways to vary it. A lower sales figure during a period of crisis does not necessarily mean that the company has become less competitive, but it indicates a transformation of the volume of the entire market that imposes an adjustment of the activity to the reduced demand of the respective period.

To analyze the liquidity and solvability

Managers need information about the financial risks, counseling about credit opportunities, warning about the virtual insolvencies, they need analyses of the solvency, liquidity and financial flexibility of the company, etc. During a period of economic crisis, the most frequent problem the managers have to face is the lack of liquidities. The accounting professional is able to minutely analyze the causes that could lead to lack of liquidity. Every business decision aimed to protect against economic crisis has financial effects, and that is why the managers must have accurate calculations in order to direct the resources towards those actions that are able to maintain liquidity and safeguard the company beyond the dangers that can appear in the macroeconomic environment. Thus, it is necessary to make available for the managers a detailed and multipurpose analysis of the claims and debits of the company. The clients and accounts receivable of the company must be closely surveyed, especially in order to determine their financial status and to decide accordingly whether to continue or cease the relationship. During a period of economic crisis, it is also advisable to access inexpensive financing sources, to re-finance the existing loans for the lowest costs possible, to finance the investments from long term (or at least six-month term) investment loans.

To suitably manage the cash-flow

Most of the financial problems the companies have are connected with the drop of liquidity due to improper matching of the cash receipt and disbursement. The cash receipt and disbursement must be matched in time, so that to keep the company out of trouble and to ensure the equilibrium of the balance of payments, which is absolutely necessary in order to increase the capacity to create profit of any monetary unit. The accounting professional is the one who counsels the manager and help him understand the difference between cash-flow and profit. Errors of profit forecast may appear, due to independent causes, which can cause the profit to be present in writing and not in fact, as cash. The accounting professional, together with the head of the institution, can set out a corresponding management of the cash-flow, by careful choice of those providers who promptly deliver the orders, so that the activity can function with minimal stocks, by organizing efficiently the collection of the value of the merchandise sold, ensuring a minimal period for debt recovery in order to avoid the risk of deficit of liquidity, by simplifying and speeding the operations of cash and payment and comprising the cycle of buy-pay-sale-cash. Managers need to ask all the time information about the fluctuations of the available cash to be able to find opportunities of profitable investment when the cash allows or to remedy the situation in case of deficit. Planning of treasury on terms of payments and revenue will lead to the increase of outcome and of profitability of an economic entity. As during the crisis the cash-flow of the economic agent cannot be regular, some of the activities have to be reorganized and some solutions are imposed, such as: leaving off all the unnecessary expenditures, stocks optimization, a credit policy which could stimulate payments, etc.

Fulfillment of predictions

Prediction, but more than that, planning are mental creation activities through which the managers, regardless of their hierarchical level, connect the necessities and the opportunities to the present and past reality. Prediction is one of the basic functions of accounting, involving the perception of the future economic events and economic process based on financial information within a

relevant time limit. In order to obtain a realistic prediction, the accountant must consider the financial state of the company, of the third parties and the governmental policies.

3. The accounting professional - warrant of the quality of the accounting information

The competence and qualities of the accounting professional

During the economic crisis, the qualities of a good accountant are prudence and professional competence. In the given situation, the accountant must profess prudence and responsibility, as he does not simply provide accounting services, but are also expected to help the companies to surpass the economic impasse they are crossing at present. By competence is generally understood the capacity of a person to pronounce a judgment about a phenomenon, based on thorough knowledge of the matter in question. The accounting professional must provide professional services carefully and assiduously and is constantly subjected to the expectations of a client or employer, so he is expected to prove a high level of knowledge and professional attitude. The accounting expert is a well-informed counselor, able to bring added-value to the economic unit. He must be honest and fair in the professional services he provides, he must be impartial, he must respect the confidentiality of information he acquires and must comply with all his professional requirements. The accounting profession is represented by undertakings of financial and accounting nature which compete for the achievement of important objectives and tasks of the economic units and other patrimonial units. The main attribution of the accounting profession in Romania is organization and drawing-up of the statements for the economic agents, self-employed persons or legal entities within the legal circumstances, and the basic normative act that governs this activity in our country is the accounting law, law 82/199. The accounting profession must take the challenges of the new technologies, and the accounting professional should be capable to access, check and list the information from

the accounting data base. Managers, and users of accounting information in general, need relevant, understandable, consistent and, most of all, comparable information, presented in a universal accounting language. The accounting professional must be able to provide financial information starting from the data of the economic transactions and he must be able to interpret and analyze, to certify and validate that information as well. The financial-accounting information provided by the source – which is the accounting professional – can offer a bird’s eye view over an economic entity; they influence the decisional process of the manager and should be able to lead, within a company, towards problem solving, by identifying the causes and alleviation of the effects of a problem.

Assisting and preparing taxation services

The accountant is needed for the assistance and preparing of the tax statements. The accountants make the monthly, trimestrial, semestrial or annual statements and present them to the entities that required them. Each financial statement or VAT declaration, etc., require the completion of forms following formal rules, which, if not respected, need to be done again and the delays of filing are amended and penalized. Because of that, the taxation services for the Romanian economic units are undertaken by accountants, because this profession, excessively regulated, is subordinated to the taxation interests even from the beginning of the regulation process. A great deal of the time dedicated to the accounting activity is allotted to the study of the accounting legislation and regulation, which change constantly, because their knowledge is vital for the quality of the accounting services. Apart from solving the various issues concerning the various state organisms, a good accountant must help with the financial aspects of the business.

Preparation of the financial statements

The mission of the chartered accountant in a company is, before other current duties, to prepare and, according to the situation, to organize and manage the financial-accounting activity which ensures the preparation and creation of the financial statements. The preparation of the balance sheet require the presence of the accountant for every operation going on in the entity, to monitor and notice, firstly for the rigorously and

legality of the assets exploitation and than for the accuracy of the reflection of every management act in accounting process and in the financial statements. Having a multidisciplinary formation, doubled with experience, the accountant is able to intervene with evaluations and valuable propositions in extremely varied domains of competence. Such a professional intervention needs to be regulated by internal norms of competence and professional norms of the institutions and professional unions. The image of the institution reflected in the financial statements depends on the professionalism and objectivity of those who build this image, and equally of the correct perception of the message transmitted by the accounts from the users of the accounting information. The intelligibility of the financial statements also depends on the professional accountants, and they must strive to present financial statements which are understandable for as many of the users as possible, using a simple structure. The role of the accounting professionals is, among others, to increase the reliability of the information comprised within the financial reports.

4. Conclusions

The accounting professionals are the first of the specialists involved in the activity of a company, because the first to get a piece of information in a business unit is the accountant. The role of the accounting professional in periods of economic crisis derives from the role of the accounting profession, which is different from other professions because it takes responsibility in front of the public interest for all the parties interested in the activity which takes place in a company: shareholders, employees, suppliers, creditors, budget by financial reporting characterized by transparency, relevance, consistency, comparability and reliability. The accountants are able to help the managers in their endeavor to lead the company in the troubled waters of the economic recession. A qualified accountant plays an important part in the welfare of a company. One of the main roles of the accountants is that of attentive observers of the ways the resources are used and the results are obtained at the company level.

By his activity, the accountant must reflect reliably, clearly and completely the financial position of an economic unit, this aspect being an important matter which differentiates the accounting professionals among themselves.

Good financial reflections of the economic situation, provided by the accountant, help managers to surpass the economic crisis, to obtain funds and to attract investors. We consider that the success of an economic entity relies on the ability of the accounting professional to put to good use the financial-accounting information and to deliver them in optimal time.

The Global Crisis' Impact on the Romanian Banking System

Badea Leonardo
Popescu Constanța
“Valahia” University of Târgoviște

Abstract

In our paper we would like to make a detailed presentation on the way the world economic-financial crisis has affected the banking system in Romania.

Key words: economic-financial crisis, banking system, credit balance, loan balance
J.E.L. classification: G21, G28

We will start by saying that, beginning with the autumn of 2008, we have witnessed a considerable diminution of the credit and especially of the retail credit, due to the restrictions established by the Romanian National Bank (BNR) during the second half of the year 2008, “concerning the limitation of the credit risk, for the credits meant for natural persons.” [Badea, 2010, p. 193] Simultaneously, some of the banks gave up offering certain credit products, especially in exotic currencies.

Actually, when the crisis began to be felt, the credits' cost sensibly increased because of the worsening of the economic environment and because of the drawing in of increasingly rare and expensive financial resources. The population diminished its appetite for credit, both because of the increase of the credit cost, and because of the uncertainty concerning what tomorrow might bring, as the unemployment level increased. In exchange, people began to put money aside, as the interest rates for the bank deposits turned excessively positive. So, the banks passed from the ecstasy and the euphoria of the last few years to agony, with the number of the bank institutions decreasing by over 90 and with over 3,000 employees from the banking sector losing their jobs. However, the prudential indicators remained within the stability limits, even though some of them worsened,

while the profitability of the banking system continued to be positive, although the profit dwindled to a considerable extent. A fact worth mentioning is that no bank of the Romanian banking system went into payment default, during the crisis. The increased capitalization of the banking system has assured, according to the Romanian National Bank's report, the preservation of a capital at comfortable levels.

So, the solvency ratio grew from 13.76% in 2008, to 14.67% by the end of 2009, going significantly over the minimum level granted by the regulations. Actually, all the banks in the system recorded a solvency ratio over 10%, this being considered as the minimum level, during the validity of the financing agreement with the EU, IMF and other international financial institutions.

Under these circumstances, we have analyzed the reaction of the Romanian National Bank. So, here are its first measures: in order to diminish the “hunger” of lei, BNR decreased the percentage of the minimum obligatory reserve by 2%, in this way injecting significant sums and lending “a finger” to the banks; yet, according to the Romanian proverb (“Îi dai un deget, și îți ia toată mâna.” / “The one to whom you lend a finger will want to take your whole hand”), what followed was the banks' desire to take “the whole hand” as they requested that this percentage should continue to decrease. Simultaneously, BNR increased the monetary policy interest rate on seven consecutive occasions (from 7.5% to 10.25%), in order to alleviate the inflationist pressures.

The interest rates on the market grew significantly, and we witnessed, during a first stage, their exaggerate growth on the interbank market, which at some point triggered a conflict between the central bank and certain banks in the system, suspected of causing an artificial liquidity crisis, after an attack by certain external speculators on the Romanian foreign currency exchange market.

A second stage concerning the interest rate increase took place through an increase both for the credits and for the deposits. If until the autumn of 2008 the banks competed with one another concerning the credit products, later on the competition occurred in point of drawing in resources from the population. The interest rates attained historic levels, determining at the same time an increase of the costs for newly granted credits. This phenomenon was due largely to the dwindling of the credit lines received by some countries from abroad and to the increase of the price of these resources, as Romania’s credit rating went down. So, from the first signs of crisis until the end of November 2008, the banks in Romania increased the credits costs twice as much as their sister banks in the region, the margin used by them for the calculation of the variable interest rate for mortgages becoming

the highest in the central and south-east European region.

On this background, a very worrying situation occurred, namely the substantial increase of the non-performing loans. So, due to the internal economic and financial context, the Romanians became increasingly more bad payers, and a significant “contribution” to this phenomenon was certainly due to the banks as well. And on top of it all, the beginning of the year 2009 welcomed us with record levels of devaluation of the Romanian national currency in relation to the euro, the exchange rate going over the level of 4 lei for one euro. If we look at the evolution of the loans for a longer period of time, we can notice that the increase rhythm of the credit balance continually decreased since the beginning of the year 2008 until the first part of the year 2010, after which a timid comeback occurred.

Graph no. 1 – Evolution of the total credit balance, during the period 2008-2010 [%]

Source: www.businessday.ro

In our opinion, the main obstacles hindering real estate credits were the following:

► Some residential centers were built chaotically, without any access to an adequate infrastructure, and, from this point

of view, the quality of the real estate warranties is not adequate from the perspective of the bank risk management;

► The banks in the system had less and less liquid resources available, which were necessary for credits, as the mother banks

became thriftier and more expensive when they refinanced their subsidiaries in Romania;

► The exchange rate for the national currency went through a strong devaluation trend, determining the potential contractors of mortgages in foreign currencies to think twice before deciding to invest;

► The resources drawn by the banks for financing the credits became more expensive, as the cash available on the monetary market decreased, and so the interest rates for mortgages in lei and foreign currencies increased significantly;

► The political instability contributed as well to the aggravation of the uncertainty;

► The international economic crisis had a say in the Romanian economy as well, through a contagion effect, many Romanians losing their jobs and at the same time the possibility to become potential mortgage contractors. At the same time, in some sectors there have been salary diminutions and the perspective of such trends continues to exist. So, the diminution of the revenues of the employees in the budget system, who, for the banks, represented an important category of clients, had an essential contribution in the preservation of a descending credit trend;

► Due to the increasingly precarious economic conditions, the ratio of the nonperforming loans granted to the population also increased, exerting pressure in this sense on the banks' solvency and liquidity.

That is why we consider that not everything can be blamed on the Romanian National Bank (BNR), as the banks, according to the Romanian saying, “should have had a chariot built during the winter and a sledge built during the summer” (“trebuiam să-și facă iarna car și vara sanie”).

Practically, before the Regulation no. 18 concerning the limitation of the credit risk for natural persons came into force, the banks had given free rein to an aggressive loan distribution campaign, and now they have to face the consequences of their own actions. However, at this moment we can notice a fact that can inspire hope, namely that concerning the population, the last eight months of the year 2010 were months of growth, and concerning the companies, the annual increase rhythm of the loan balance has been positive for the last ten months.

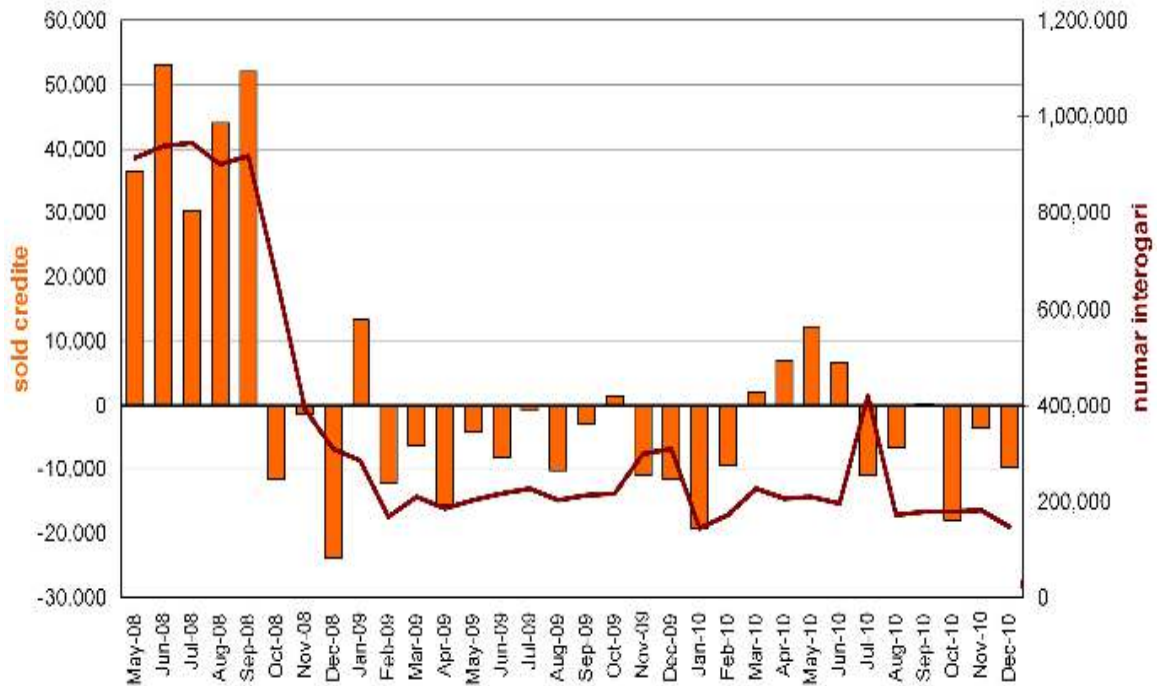

On the other hand, the loan balance for consumer credits concluded by natural persons has been free falling for two years, the general ascending trend being supported only by mortgages, supported in their turn by the program “The First Home” (“Prima Casă”). In 2011, the impact of this program will be much more limited, the government offering the banks warranties of only 200 million euros.

Also in the case of the loans granted to companies, the evolution of 2010 was not very encouraging, so that the loan balance for the companies in agriculture grew by 10.7%, the loan balance of the companies in the industrial sector grew by 9.6%, while the increase in the construction sector was of just 5.6%.

For the year 2011, one can expect that the loan balance increase rhythm will continue to remain anemic, as the economy shows no serious re-launch signs.

According to BNR data, during the month of December 2010, the banks carried out a number of 146,933 interrogations of the credit risk control database (CRB), which means 19% less interrogations compared to November 2010 and 53% less interrogations by comparison to December 2009.

Graph no. 2– Variation of the balance per number of loans compared to the credit risk control interrogations number

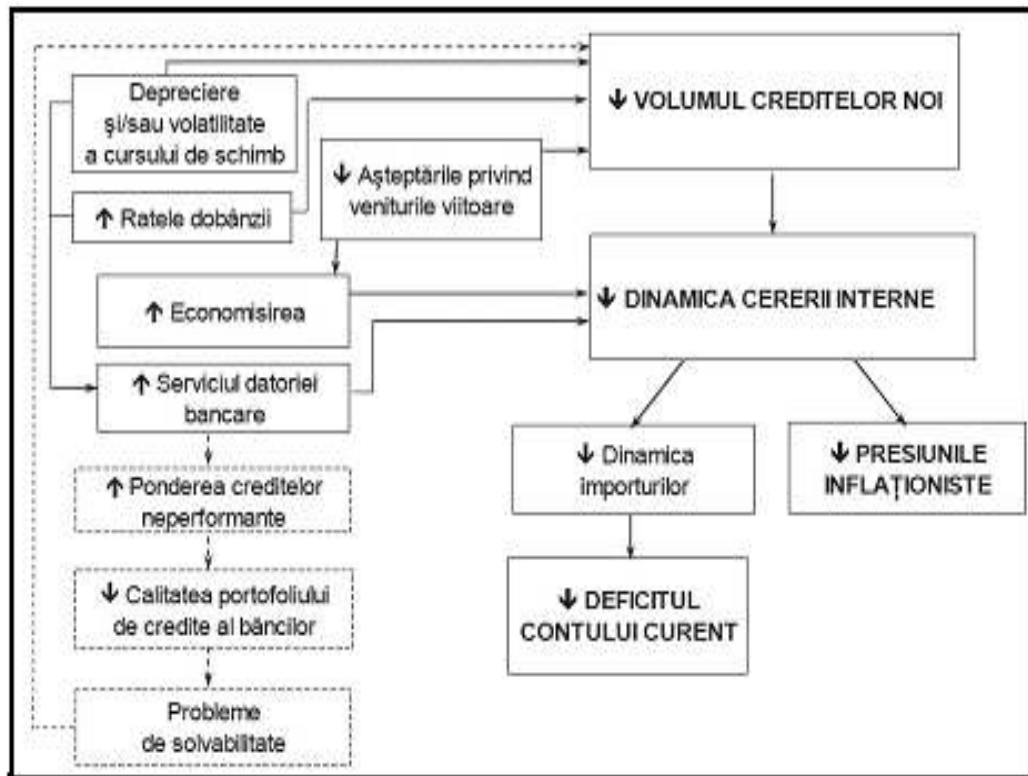

Source: www.businessday.ro

A bank, when it wants to find out the good standing of one of its actual or potential clients (or when a person wants to obtain a loan), checks that person using the credit risk control (CRB), so that the evolution of the number of interrogations largely shows the evolution of the interest in loans. In this context, the month of December 2010 was the weakest month of December of the last seven years, respectively since 2003, when the number of the interrogations was 39,189. All in all, in the year 2010 there have been 2.43 million interrogations, namely 12.5% less than in 2009, and 78% less than in 2007, the best year for loans. At the same time, 2010 was the weakest year since 2004.

As far as the loan balance for the ongoing loans over 20,000 lei is concerned, it has decreased by 9,368 in December and by 49,270 during the whole year 2010, attaining the value of 1,482,884. The decrease of this balance shows that the number of the new loans granted by the banks is smaller than the number of the loans that have reached their date of payment or paid back in advance. In December 2010, the loan balance for the loans granted to the population was 1.9% higher than by the end of the year 2009, and in the case of the companies, the loan balance increased by 8.7% during the same period.

Figure no. 1 – Possible macroeconomic consequences of the loan balance diminution

Source: Silviu Cerna – Criza economico-financiară mondială și efectele sale asupra României (The international economic-financial crisis and its effects on Romania)

During the two years of crisis, respectively 2009 and 2010, the population's deposits in the banks grew from 82.9 billion lei, to 104 billion lei, while the companies' deposits grew from 68.5 billion lei to 73.4 billion lei. By the end of the month of November 2010, the number of the people who had not paid their monthly installments in time was of 725,364, namely by 9,412 lower than at the end of October, yet by 69,457 higher than in the same month of the previous year. For a comparison, between November 2008 and November 2009, the number of the natural persons who had recorded delays of over 30 days on the payment of their installment rates had grown by 213,000. One should note, however, the fact that during the period April-November 2010, the number of the people who had not managed to pay their monthly installments in time fluctuated between 710,000 and 734,000, which means that the situation was beginning to get stable.

As far as the commissions constituted by the banks for non-performing loans are concerned, they have reached the level of 23.4 billion lei, the increase of the year 2010

being of 9 billion lei or 62%. At the same time, the ratio of the credits other than belonging to the standard category in the total loan balance continued to grow in 2010, namely: out of the sum of 204.3 billion lei representing the total loan balance, 46.5% represent standard loans, namely loans with no problems (the ratio was 53.9% a year ago and 63% two years ago), 21.3% is the loan balance under scrutiny, 10.8% are substandard credits, 4.2% are loans categorized as “doubtful” and 16.7% represent losses (the ratio was of 11.5% a year ago).

According to the BNR data, by the end of November 2010, the monthly installments not paid in time to the banks totaled 16.35 billion lei, by 452 million lei more than by the end of the month of October and by 8.3 billion lei over the level recorded a year before, so that the ratio of the installments not paid in time in the total loan balance had reached the level of 7.81%. Taking into account this worrying aspect, one can conclude that the governmental authorities' measures against the crisis in Romania were not rigorous and did not have significant

positive effects, the only oasis of discernment remaining the Romanian National Bank, which has battled silently against the inflation and against the evolution of the exchange rate.

Recovery Measures of Public Services in the Current Economic Crisis

Barbu Andreea Mihaela

The Bucharest Academy of Economic Studies, Faculty of Marketing
abarbu@mk.ase.ro

Abstract

The current economic crisis affected both the private and public sector of Romanian economy, leading to financial instability, inflation and decreasing purchasing power.

Its adverse effects include also the rising unemployment, greater pressure on employees who have taken over the responsibilities of their colleagues, lower wages or delay in their payment. Inevitably, this is leading to staff dissatisfaction, which affects public services delivered for the community.

In addition, limited financial resources are managed with difficulty, and some activities such as researching the consumers' needs and desires are put in the background.

To overcome these obstacles, the public service organizations can focus on the quality level of their offer, establish clear and easy to evaluate objectives, or adopt decisions on increasing the professionalism and motivation of their employees.

Anyway, the most comprehensive means of overcoming the economic crisis and increasing performance is the marketing plan that can encompass the aforementioned solutions.

Key words: economic crisis, public services, service quality, public employee, marketing planning

J.E.L. classification: M31

1. Introduction

According to marketing research conducted in 2009 [20, 21, 22], the economic crisis has led to lower levels of confidence in central government institutions and the increasing dissatisfaction of the Romanian Government activity. The Romanians also are dissatisfied with government support for certain categories of persons, as elderly,

unemployed ones, or people with low incomes.

However, the crisis has affected the education of children and led to reduced wages and other benefits as well as loss of employment. Among the measures adopted by households in Romania, to overcome the crisis, include deferred payment for utilities, medical services, cheaper or smaller quantities food purchase, and delaying the purchase of durable goods.

According to the Romanians, the public administration system in Romania provides difficult access to public information, is inefficient and less transparent, it requires high taxes to solve problems of citizens, and it is also complicated and difficult to understand.

In private business, the economic crisis has resulted in reducing the number of orders and customers, lower liquidity and wages, and in lack of jobs. Other consequences of the economic crisis that affected Romania are financial instability, inflation, reduced purchasing power and rising unemployment.

These weaknesses of the national economy can be overcome by adopting both in the private and public institutions some correlated measures, which are well planned and in accordance with the requirements of the target audience.

2. Means of overcoming the economic crisis

The international specialty literature mention that high service quality performance produces measurable benefits in profit, cost savings, and market share.[3, 13]

This is why a first measure that public service organizations can adopt concerns the quality of service. Although in some markets of the public sector there is not an intense competition, as in the private sector, organizations should not neglect their consumers' needs. A decrease in their

number may lead to difficulties in meeting their business performance.

Thus, the management personnel of these organizations should identify the causes of a poor quality service and address these issues.

According to the specialty literature, one of the causes of a poor quality service that is encountered also in the field of public services may be the establishing of inadequate quality standards. [19]

This obstacle in designing and delivering public services may be the consequence of the following mistakes: incorrect perception of managers on what their customers want, limited financial resources due to the economic crisis, and institution's inability to formulate and follow certain procedures designed to reduce the variability of services, on one hand, and at least to maintain a certain quality level of benefits, on the other hand.

Therefore several measures are necessary in order to improve the delivery of public services, especially since it is known the Romanians' unfavorable perception on various aspects of public sector: low wages, poor working conditions, bad management.

These measures may include:

- setting clear tasks and responsibilities, communicated to employees through job descriptions;
- motivating employees with financial and other benefits;
- training and strengthening work teams because it is known that teamwork gives better results than competition between employees;
- enabling employees to come up with new ideas in the design and delivery of services without limiting their activities only to the provision.

Personnel of public service enterprises have an important role in creating and delivering services with high quality level, and in determining a high level of customer satisfaction. The public enterprise should consider the following recommendations, in order to form professional civil servants:

- the value system of employees and their interests and needs;
- civil servants' personality, their work capacity and desire to succeed in everything they undertake, on the one hand and how they perceive themselves, on the other;

- staff orientation to careers and occupations that require physical actions or for activities that involve thinking, analysis, organization and understanding;

- extent to which employees are effective as subordinates (to obey to structures, laws and regulations) or leaders (are able to persuade others);
- the social environment, the amplexness of technical and organizational changes, the great mobility of professions and specialties, education and training, social situation, environmental and occupational level, autonomy at work. [14]

Secondly, the recovery measures should focus on the knowledge of the needs and aspirations of customers. Although the importance of customers is highly recognized within organizations providing public services, they are not making significant efforts in order to know the target audience, its needs and expectations. This discrepancy between the assertions and the facts in the public sector is the result of lack of marketing research, on one hand, and of a poor communication between employees and customers, on the other hand. In this situation the public service is far from being a qualitative one.

However, there are inexpensive solutions that can be applied in a relatively short time, such tools to collect grievances, customer complaints and suggestions (on paper, by calling a free phone number, or by Internet).

Also, in recent years and especially after Romania's integration into EU structures, has been made many barometers of opinion among citizens in order to identify the image of public institutions or the Romanians' satisfaction regarding the functioning of organizations in various public sector fields. In addition, the results of this research can be accessed for free and unlimitedly, while giving the public service providers a chance to learn more about potential customers and to adapt their offer and activity to their needs.

Thirdly, for public service companies that have a marketing vision, the customer satisfaction is very important, but they should not neglect the financial issues, which allow them to conduct their activities. Even public institutions are interested in the financial aspects, because their activities must be

correlated with the predetermined budgets, allocated by the state.

A business must be primarily able to create a consumer, hence the need to establish a marketing objective. Businesses must be able to innovate, to avoid being overtaken by competitors, thus the need for an objective of innovation. All businesses depend on three factors of production (labor, material and capital resources), so there is need to establish objectives for their recruitment and development. Resources must be employed in a productive way and their productivity must increase to ensure the survival of the business, so that productivity objectives are needed. Businesses exist in society and must assume responsibility for the impact they have, setting objectives that take into account the social dimensions of business. [5]

The objectives of a public hospital may cover issues such as monitoring the number of complaints, the average waiting time for consultation, the number of nervous crisis in mental health department, the number of hours of program with the public, the time used to complete an administrative process, the number of persons on the waiting list at a medical office, the time used for diagnosis, the average time of hospitalization, or the degree of customer satisfaction. [6]

Also, public sector companies can focus on the following objectives:

- Increasing the service awareness (type of service that is offered to potential customers, when it is available);
- Increasing the use of public services (as visiting museums or other cultural institutions);
- Educating the target (achievement of preventive medical examination).

Anyway, the most comprehensive means of overcoming the economic crisis and increasing performance is the marketing plan that can encompass the aforementioned solutions. This measure may generate financial resources for daily operations, in order to pay debts and eventually to obtain profit.

In the international literature, numerous studies and papers have focused on the usefulness of the marketing plan, while trying to demonstrate that the development of a strategic marketing planning process can lead to market success record. However,

some scientific approaches have limitations related to methodology [18], and determine the professionals to pay more attention to both theoretical and practical. Thus, further better documented studies address strategic planning as a source of competitive advantage. [7, 16, 12]

Other studies examine the relationship between strategic marketing planning and financial, non-financial, or corporate performance, [17, 2], and marketing capabilities that are necessary to increase the performance [15].

Malcolm McDonald [10] argues that the organization's benefits resulting from implementing the marketing plan include: systematically identification of both opportunities and threats that may arise, high capacity to cope with change, maintaining competitive advantage, and also a more efficient management of limited resources. All these positive consequences are able to assist public service organization to overcome the difficulties imposed by the economic crisis.

However, if failures occur after the conception and development of marketing plan, they relate to cultural and cognitive dimensions of the planning process. [11]

In addition, the pros for implementing the marketing plan are found in recent work as barriers between private and public sector have been eroded. Thus, the performance of public institutions affects the smooth running of private companies and national economies. [4, 1, 9]

Moreover, this measure is very important, whereas in public services, strategic planning at corporate and division level affects the efficiency of the whole sector. This activity involves four steps: (1) defining the mission, (2) determination of strategic business units, (3) the distribution of resources for every strategic business unit and (4) planning new activities and restricting the old ones. Corporate strategic planning is done within government, and the division one is specific to each ministry.

In the public sector, the planning at the corporate level has some constant elements. Divisions are entities whose work area is maintained on an interval of at least four years. If changing the political regime, these divisions that are represented by ministries can change their title, but generally they are

responsible for carrying out the same type of activities. As such, the mission established at corporate level actually consists of promises and actions included in the new government program. Determination of strategic business units is to appoint ministers, while their financial resources are provided according to the priorities and needs of the nation as a whole.

In other words, corporate-level planning in public services has the following steps:

- Elaborating a government mission (part of the government program);
- Naming the division (ministries);
- Allocating the budget funds to all divisions established in the previous phase, according to the State Budget Law.

Divisional planning is identified with planning within each ministry. Also, the ministries have their own mission and they decide which strategic business units should receive money and the amount of these budgets. For example, in the case of defense, public order and national security services – currently represented by the Ministry of National Defense – there are decisions regarding the amount of financial resources from the state to be granted to various units such as police, gendarmerie, prison or judicial authorities, in order to operate continuously and effectively.

Thus, a marketing plan can be effective because it can provide so more discipline in the strategic planning process, with the consequence of setting strategic directions for the company or business units.

Other benefits of the marketing plan are: (1) it reveals things unknown to the company before it was created, (2) it avoids focusing only on certain areas and takes into account the most profitable ones, which may had been omitted by negligence, (3) it prevents errors, (4) it determines the critical factors leading to a successful company, (5) it gives to the marketing expert the possibility of establishing clear marketing objectives. [8]

3. Conclusions

In essence, all these measures require that the employees of public service companies should look inside the company and beyond, in order to see results of past marketing decisions, and to know the market in which it

operates.

Meanwhile, it is necessary not only identifying and selecting the right people for a job with specific duties and responsibilities, but also to adapt the job description to the employees' qualities and training.

This flexibility avoids monotony and dissatisfaction that can arise in public employee's professional life, while leading to staff retention and more active involvement in business activities. This will improve the image of the organization and its internal communication.

Regarding the marketing plan, this is a document resulting from the marketing planning process. Decision-making process has a good structure and rigor through formal marketing planning. It culminates with a written plan, usually once a year or when a marketing decision is adopted, which involves allocating a budget and the participation of other internal resources.

The marketing plan gathers and selects in one document all the culture and experience of a company and foreshadows a way for achieving the marketing goals. In addition, it involves the communication of marketing priorities to other departments of the organization, and dialogue with senior management, followed by the establishment of a certain budget and useful internal resources.

In conclusion, the marketing plan is essential for any successful business. It is the heart of the business, the base to begin with all other operational plans. Marketing gives each company an amount of information that properly applied could lead in principle to its success.

“Marketing is the blood that gives life to every business. You can have a great product, technical know-how and years of experience in financial management, but if you want your business to grow well and vigorously – to grow by herself – you need marketing. And the first and most important step towards this is the marketing plan.” [8]

Mutual Funds and the Impact of Financial Crises

Barna Flavia

Abstract

During the last few decades, mutual funds have passed through a period of significant development regarding the managed assets volume and number of funds, as well as regarding the investment strategies and financial instruments used. The present paper wants to analyze the main evolutions on the world mutual funds market, for the 2004-2010 time period and to identify the impact the financial crises had on the structure and performance registered on this market.

Key words: mutual funds, financial crises, risk, globalization

J.E.L. classification: G01, G20

1. Introduction

In the last decades, it was noticed that the commercial barriers were eliminated and the free flow of capitals was stimulated. Due to the technological innovation, access to information became easier which created the premises for the diversification of investment alternatives as well as for modifying the capital markets' structures. This shows that the financial globalization had as effect a multiplication of investment opportunities and a reorientation of the investors' interest towards the emerging capital markets.

The international capital flows promote an efficient allocation of the global savings towards the most efficient users, allowing emerging markets to have access to international financial resources, meant to complete the limited national resources.

Still, there is a high sensibility of the capital flows that depends on the relation profitability-risk, and manifests itself through

major oscillations both in the case of mature markets and in the case of emerging markets, due to the effect of crises contagion that is spread over a global market.

The mutual funds come into being in the context of a pre-existing well shaped, liquid, transparent and credible capital market. A modern, competitive economy that is capable of adapting itself to the present demands of globalization is unthinkable without the existence and functioning of an efficient capital market.

In this context, the worldwide open mutual funds market suffered major mutations.

As noted by Eichengreen and Mussa [3], Pazarbasioglu, Goswami, and Ree [10] and Lane and Milesi-Ferretti [9], the growth of international mutual funds has been facilitated by technological change, privatization in emerging markets, macroeconomic and trade reform in developing countries, which have rendered emerging markets more attractive.

Although mutual funds have become important contributors to financial market integration, little is known about their investment allocation and strategies. Kaminsky, Lyons and Schmukler provide an overview of mutual fund activity in emerging markets [6].

The few papers analyzing mutual funds worldwide have so far studied the determinants of the size of the industry per country [7] and the level of mutual fund fees [8]. These papers show substantial differences across countries in the development of the fund industry and link these to a combination of legal, regulatory and demand- and supply-side factors.

The evolutions registered on the capital market in the last few years have shown the increasing aversion towards risk that the

investors feel. This has led to significant corrections of the prices that the financial instruments were evaluated at and to the important reduction of the financial investments’ performance (including the investments of mutual funds), the asset allocation decision becoming vital for the investors.

In the specialized literature, a series of studies have analyzed these aspects. For example, Ikiw states that asset allocation focuses on finding mathematically optimized portfolios of domestic and foreign asset classes [5]. The author maintains that these portfolios are based on assumptions in order to achieve specific risk-return objectives with high confidence. These portfolios are “no-brainers” because they do not incur additional costs [5].

Other authors, such as Bikker, Broaders and Dreaw [1] study the impact of stock market performance on the investment policy of Dutch pension funds and show that their investment policies are partially driven by the cyclical performance of the stock market. In addition they point out that pension funds respond asymmetrically to stock market shocks: rebalancing is much stronger after negative equity returns.

According to Swensen [12], construction of a financial asset portfolio involves a combination of science and art. The science encompasses the application of basic investment principles to the problem of combining core asset classes in an efficient, cost effective manner. The art concerns the use of common-sense judgment in the challenge of combining incorporating individual characteristics into the asset allocation process.

Mutual funds with a more diversified portfolio perform somewhat better than funds with a less diversified portfolio [2]. He finds no evidence to indicate that investment outside the fund's primary investment universe will enhance performance.

The research performed offers information on the main evolutions of the mutual funds market for the period between 2004-2010, analyzing the impact of financial turbulences over the structure and performances that were registered on this market.

2. The analysis of the worldwide mutual funds market trends

In the last decades, individual investors have shown an increased interest towards the mutual funds, generating an increase in the number of such funds, in the volume of administrated assets as well as a diversification of the investment strategies and financial instruments used. Investor demand for mutual funds is influenced by a variety of factors, not least of which is funds’ ability to assist investors in achieving their investment objectives.

As the open mutual funds have become victims of the financial crises that were felt on the capital international markets, investors have reoriented their capitals towards other investment alternatives that seemed more attractive from the point of view of the ratio between risk and profitability.

The evolution of this market is characterized by an evident increase over the whole period between 2004 and 2007, followed by a decrease in 2008, when the effects of the financial crises were felt for the first time in the field of investment reorientation through the reduction of the assets administrated by the mutual funds with 27.6% at worldwide level (see graph no.1.)

The biggest decrease was registered by the European mutual funds. Their assets have decreased with 2.3% in the second trimester of 2008, down to 5.457 billion euros. The second decrease registered was that of the mutual funds of the United States that have lost 0.13% of their assets, down to 7.407 billion euros.

Graph no. 1. Worldwide Total Net Assets of Mutual Funds
Billions of U.S. dollars, year-end

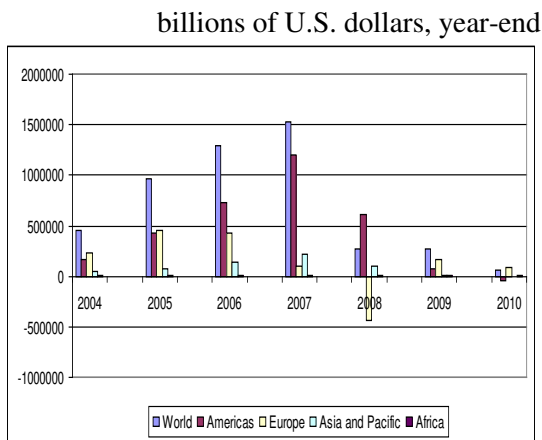

Source: Worldwide mutual fund assets and flows, ICI, 2010

One of the most affected sectors of financial intermediation was that of the shares funds.

The increased volatility felt on the shares markets, especially in USA and Europe, significantly reduced the individual investors’ appetite for investments in the shares funds that have disclosed net outflows of about 25 billion euros in Europe only in the last trimester, according to the statistics provided by the European Funds and Assets Management Association (EFAMA).

Graph no.2. Worldwide Net Sales of Mutual Funds

Source: Worldwide mutual fund assets and flows, ICI, 2010

The net outflows have increased in the context of increasing panic of the investors that were seeking shelter from the unseen before volatility of the bonds and credit markets but also from the avalanche of negative news concerning the impact of the financial crises over the real economy.

In Europe, the less affected by the aggressive financial turbulences mutual funds were those of Luxemburg and Ireland taking into account that these two markets based their asset sales on clients from outside of Europe, namely from Asia and South America.

Regarding the number of mutual funds that were active on this market, we can notice a decrease only in 2009, the rhythm being much slower, of only 3%, as shown in Graph no. 3. A possible explanation can be the solution adopted by the managers of these institutional investors, of restructuring their portfolios, by reallocating the assets.

Graph no.3. Worldwide Number of Mutual Funds

Source: Annual Report, ICI, 2011

On the worldwide mutual funds market, the geographical spread of such funds is a relatively etherogen one, the first place being held by USA that was administrating 48% of the total assets on the market, at the end of 2010 (table 1).

Table 1. The U.S. Had the World's Largest Mutual Fund Market

Percentage of total net assets, year-end 2010

Total worldwide mutual fund assets	\$24.7 trillion
United States	48
Europe	32
Africa and Asia/Pacific	13
Other Americas	7

Source: Annual Report, ICI, 2011

The restructuring portfolio measurements, the reorientation towards the emerging markets and towards the fix income instruments have led to a revival of the market, especially in the last year of the analyzed period (2010).

With \$118 trillion in assets, the US mutual fund industry remained the largest in the world at year-end 2010. Total net assets increased \$700 billion from the level at year-end 2009, largely reflecting the continued rise in stock prices in 2010. At the same time, investor demand for mutual funds declined further in 2010 with net withdrawals from all

types of mutual funds amounting to \$297 billion.

Investor demand for certain types of mutual funds appeared to be driven in large part by the interest rate environment and the tepid pace of the economic recovery.

Thanks to the sustained demand for long-term funds and higher asset valuations, total European investment fund assets increased by 13.7% to €8,028bn, representing 60% of GDP1 at end 2010, compared to 55% at end 2009.

Worldwide investment fund assets under management increased by 16% in 2010 to €18,484bn. Measured in U.S. dollar terms, fund assets increased by 3% to \$23,696bn. Measured in Euro and taking into account funds of funds, U.S. mutual fund assets rose by 17%. The other markets in the world also showed positive growth with a 35% increase in Japan, followed by a 31% increase in Australia, reflecting a significant exposure in equity funds and other funds' assets.

A comparison with the worldwide mutual funds industry level situation shows that Romania is far from the level of assets that are sold on the markets of the neighbor countries not to talk of the impressive distance if compared with the American market.

The evolution of net assets held by the mutual funds in Romania

Source: Personal analyze of data from www.aaf.ro

If in the case of Romania, mutual funds administrate an average of 6.5 billion euros, in Slovenia the average level goes up to 27 billion euros while in Poland it reaches 164 billion euros. The situation is no better if we take into account the percentage held by the net assets of the open mutual funds in the IBP. For Romania, this percentage is of only 0.2%, while for Poland and Slovenia is around 9-10%, for Slovakia is around 6% and for the Czech Republic around 4%.

In this context, the mutual funds managers of Romania must join forces by adapting the investment policy in order to reduce the lagging behind they have in respect to the other participants from the world market in this field.

3. Conclusions

The financial instruments issued by the mutual funds represent a significant pourcentage in the structure of investments made by the population, indicating the preference investors tend to have towards this form of investment.

The effects of the financial crises were strongly felt in the worldwide mutual funds market, fact that is proven by the variation in the number of funds and assets managed in the analyzed period.

In order to conclude, there is a need for improved settlement standards and an increase in the mutual funds supervision level, so that the financial turbulences do not lead to the outflow of resources from this market but to a geophycy restructure of the managed assets. Another purpose of the mutual funds managers is to ensure an increased transparency in their activity in order to offer better protection to the investors and to minimize the investment risks.

The Decision to Invest in the Crisis Situation

Bălan Ioana

„Alexandru Ioan Cuza” University of Iași, Doctoral School of Economics
ioana_balan85@yahoo.com

Abstract

Entering into a new period of recession makes the financial crisis issue draw more and more the specialists' attention. The cyclical evolution of modern economies is following the pattern of a boom highly fuels the interest in this topic. The issue of investing during these periods is currently in the spotlight, as it always turns to be when the world economy is affected. Searching for an economically correct explanation to the reasons for which volatility and instability appear, and also for the spread of the global financial crisis, perfectly justifies the interests of actors who take part in this area. Analyzing the effects these crisis generate both in the economic and social fields allows a better understanding of the ways in which they arise and develop in the present context and trying in the same time to find solutions which will solve in the best way possible this problem.

Key words: crisis, business, intangible assets.

J.E.L. classification: M41 - Accounting.

1. The concept of "crisis" subject to various interpretations

The current economic environment characterized in general by uncertainty about the volatility of prices, difficulties in valuation of financial instruments and assets and liabilities. More and more organizations face liquidity problems that could threaten the very existence. Under these conditions, saving organizations becomes increasingly important concern to those interested in directly, "survival" is the term most often used in today's global economy. Multiple causes (governments, creditors and internal or external investors, financial institutions)

and the potential benefits have led to continuous deepening of globalization. The second half of the twentieth century raised a new stage of development which has characterized the global economic system on the participation of a large number of developing countries to conduct economic transactions therein. The high degree of integration of the economies of participating countries has increased the interdependence between the economies of developed and developing economies from all regions of the world. Analysis in the current context, the evolution of these interdependencies assumes a special importance for understanding the nature of crisis and offer new perspectives on the effects of training that they have internationally.

Crises can be defined as situations characterized by a pronounced instability, and thus accompanied by volatility and uncertainty in growth in most markets (capital markets, oil markets, money markets and foreign exchange, employment, etc.). In times of crisis (whatever form it take it) we are in a constant state of anxiety and uncertainty about the future, fear or even panic. Our instinct to defend and preserve us to sometimes behave irrationally and to emphasize further this volatility, because each of us with cognitive ability that we filter information and understand the phenomenon in our way and then translating it into a market-related behavior.

Crises arising from a period where the price of assets (financial or otherwise) artificially increased greatly, and when the market becomes aware of this over-reacting accordingly.

Etymologically the word "crisis" comes from the Greek word "krisis" which means a situation requiring a decision [1].

Mishkin [2] defined the crisis as "a situation where adverse selection and moral hazard worsens, markets are no longer able to channel resources to the most productive

investment opportunities."

On the other hand, the crisis has conceptul for M. Friedman also has a different approach[3], which considering that the crisis has a strong psihologică. The crisis is often associated with lack of conditions to allow a decision [4] to be taken. The emergence of a crisis can be difficult early element of surprise associated with such a situation is fundamental [5]. In some cases, the crisis is defined as an event with low probability of occurrence but has large implications for society, organizations or individuals [6]. The problem with defining these crises is to say how great to be volatile or falling markets evolved to fit into the category of such a crisis. There are no clear definitions on how much is inflation, unemployment or decreased GDP of a country to assess its entry in a crisis. Conventionally, it was established that the economy entered the phase of recession as two successive quarters when we deal with the fall in GDP of a country or region [7].

There are different classifications of the current crisis. A first classification relevant to our discussion as follows [8]:

- depression small scale short term are the least dangerous and most common. Are generated by external shocks (oil price increases on international markets, border conflicts, natural disasters in the region) that generates a fall in GDP and rising unemployment. Governments can counter the negative effects of this crisis through fiscal measures. Even in the absence of explicit measures economy quickly find the path of recovery and response to the negative effects of a given external environment.
- structural crises: caused due to a lack of adjustment/ adaptation of the structure of domestic production to the international situation. These structural crises often lead to problems of balance of payments due to loss of external competitiveness, failure of adaptation of the new requirements of international markets. These crises have a long and destabilizing the economy more.
- systemic crises: crises are no longer can find the solution within the economy in terms of production structure data. There are crises that require a recasting of the entire system in an economy that is

engaged (e.g. reforming the international financial system).

Another interesting classification was made by Ishihara [9] that in the literature identified five different forms of economic and financial crisis:

- the liquidity crisis in banking financial sector (defined as a situation where a country falls more financial institutions unable to meet payment obligations in the short term (liquidity crisis) or liabilities are lower than bank assets leads to (bank insolvency).
 - balance of payments crisis: it was first defined by Krugman and Obstfeld [10] as that situation where a country's international reserves significantly diminishes amid massive purchase of foreign currency operations on Forex market motivated by some expectations of an imminent devaluation of the exchange rate in the near future.
- Kaminsky and Reinhart[11] have defined and its balance of payments crisis as an abrupt collapse of international reserves without proposing an objective criterion to characterize the crisis as a collapse. Measurement of such crises is based on the rate of change of a country's international reserves (reserves that finds its balance of payments equilibrium for a fixed period). Such a collapse of international reserve occurs not only to speculate on the currency market but also a situation of chronic current account imbalance (imports greater than exports over a prolonged period).
- currency crisis: it is characterized by a significant depreciation of the exchange rate due to strong growth of foreign demand, inflationary pressures [12].
 - external debt crisis: first defined by Dornbusch [13] as that situation where a country is unable to meet debt service and repay its related rates.
 - financial crises: the literature has not yet drafted a unified point of view on this type of crisis. Financial crises are associated with a drastic reduction of investor confidence in the financial system. Amid the declining credibility capital is withdrawn from the financial markets and repatriated to their country of origin. This effect produces a decrease in liquidity on the stock exchange

transactions, foreign exchange pressure (due to increased demand for currency conversion amounts required divestiture of the capital market) and a pressure on interest rates (due to diminishing demand for securities).

It is difficult to make judgments when a financial crisis becomes an economic or an economic crisis creates a financial crisis or vice versa. In principle always talk generated an economic crisis or financial reasons, political or social. The financial crisis is only a manifestation of economic crisis and reflects confidence in the financial system, a significant decrease in the volume of transactions on the stock exchange, a condition of market mechanisms. Stock trading is the barometer of economy and business of different sizes and from different sectors. When these business market (real estate market, oil market, labor market) they suffer disturbances or major corrections will be reflected in the profitability of business listed on the stock exchange and therefore the price of financial assets (shares or bonds) directly depending on expectations investors. Panic about the economy does nothing more than to emphasize the magnitude of these corrections and to induce new uncertainties in the economy. Hence to reduce the appetite for savings and investment and then to increase market interest is only one step.

2. The effect of global economic crisis on the Romanian business capital

In an attempt to liberalize the economy and to attract international funding, many developing countries have bought into schemes of private companies. As the global economic crisis has hit especially private companies, there are many companies that have either fallen or have decided to use their business equity to obtain funds to keep them afloat. Meanwhile, private firms have acquired a reputation that is almost as unpopular as that of investment bankers today. The competitive climate before the crisis when demand was high, Romanian companies have taken advantage of context and grew. Many of them, or rather, most have not done it in a sustainable way, step by step but in a fast, skipping some steps. Development of competitiveness, or rather to

obtain competitive advantages has not been a priority for Romanian companies. There is no news that the economy is affected by phenomena that increase or decrease in cyclic succession. The Romanian economy is currently in a phase of decline. Many analysts consider this, but do not stop to observe only the negative side but rather try to find solutions from within the organization to eliminate the negative effects of the crisis. These resources are designed to create advantage competitively, translated by the phenomenon of differentiation process.

Differentiation is through quality, service, innovation, image, knowledge, information processing ability, culture, etc. Organizations that fail to differentiate crisis will last. Moreover, at the end will have a strong market position. At a time when "the cost assets worldwide" difference do intangible assets of the company. Ability to differentiate a company is closely related to intangible assets. In addition, given the success of a company is how it manages to combine in a proper, coherent and created all these elements that generate added value [14].

2.1 "Differentiation process" in Toffler's view

Alvin Toffler said: "What matters in the broader perspective of each nation are products of mental work: scientific and technological research, education, employment, sophisticated software, smarter government, advanced communications, electronic finance. These are key sources of strength tomorrow and, among these strategic weapons, none is more important than higher organization-in particular the organization of knowledge itself. Creating competitive advantage is a continuous approach for companies that want to be market leaders. One advantage that a company it is today, will be replicated at very short-term competitive environment so it is no longer a differentiation between companies.

2.2 Theories of "differentiation"

In support of the idea of differentiation through competitive advantages have been launched over the years a number of theories. Added value chain of Porter[15] tried to understand how companies address the

strategic problem of creating competitive advantages and concluded that a company has two options: the first related to the attractiveness of the industry and two related to positioning the company in the industry. In the mid-twentieth century these ideas were already overcome so Porter has proposed another model, the "value added chain" by which we can find the sources of competitive advantage for a company through systematic analysis of the activities of a company and how they are interconnected.

2.3 Peter Drucker and the knowledge society

Peter Drucker in 1993 said in his book "Post-Capitalist Society" [16], that enter a new stage and a new society - the "knowledge society" - in which firms face constant change process involving systematic management knowledge. This can be done as part of a systematic process to improve each company's activities and continuous innovation. This continuous process of knowledge creation is closely linked to learning. Senge spoke in 1990's about the concept of learning organization [17] seeing in learning a source generating competitive advantage. Such an organization is built around a shared vision by all employees, adopt systemic thinking and facilitate peer learning.

2.4 Resource-based vision

The latest theory is based on firm resources view, which considers the skills, capabilities, skills, sources of competitive advantage. This concept appeared amid tight competition between companies faced with constant changes caused in part by the phenomenon of globalization of the 1990's. All these theories have had their moment of "glory". They have succeeded one another appearing as a solution to the moment of companies. But none of them is, "universal truth" as, indeed, time and confirmed. But each contains one "ingredient" that could be used by organizations in the "recipe for success." Perhaps this crisis is, in fact, many organizations the opportunity to enter the knowledge economy. But to go in this direction and in order to ensure success requires vision, coordination and

commitment from management, a holistic approach to achieve an alignment of strategies, processes, technologies and organization by its members.

2.5 Leadership and strategic thinking

And more than that, it takes leadership and strategic thinking to reassess the importance of intangible assets in generating added value for customers. Perhaps now more than ever, the most important need to understand customer needs and to anticipate the movements of competition. This means encouraging people who are directly involved with the change to, communicate, and why not make decisions. Thus, the company's response time decreases and increases its flexibility to market movements. Therefore, to better manage change, each organization is obliged to seek recipe that is best fit to achieve success and the main ingredients in this recipe are intangible assets.

3. Corporate governance in the organization and the economic environment

In theory it is considered that the concept of organization is associated with a whole presenting the harmonious operation, whose main goal is to maximize shareholder value and wealth. Due to the emergence of new and complex necessities, have developed other views on the organization. Thus, its definition can be based on the notion of social interest, its purpose being the creation of wealth, due to the collaboration of participants in the life of the company (shareholders, managers, creditors, employees, customers, suppliers, public power). Thus, a company objectives are social, but also to maximize profits. [18] The definition according to the first theory leads to a mainly financial information facing investors, while the second definition is oriented financial information needs of all users. One of the key factors influencing the efficient use of resources, enterprise managers shareholder confidence, success in achieving enterprise and economic efficiency is corporate governance system is controlled by a company. This system promotes

fairness, and transparency in the company, being a set of rules of conduct which seeks the welfare of society as a whole, but especially that of shareholders and other stakeholders: managers, creditors, employees, customers, suppliers, public power, etc. [19]. Shareholders, one of the key elements of the enterprise funds are necessary to carry apertorii and in turn are concerned that these funds be used and managed as well as correct by the managers appointed for this purpose. The relationship between owners and managers is controversial, since the two categories of participants may have different interests, often contradictorii. Agency theory through which the enterprise is seen as "a knot of contracts" [20] is that which is permitted by resolving "conflicts of interest between shareholders and managers of enterprises ". This theory establishes a set of relations, mutually beneficial, on the one hand, between shareholders and managers, but also from other stakeholders to a business (employees, creditors, etc.). However, shareholder-manager relationship is one that generates the most complex conflicts of interest and their resolution is closely related to organizing an effective system of governance that would "encourage managers to align the interests of shareholders" [21]. Stimulation of managers so that they fulfill their responsibilities correctly refers in principle to financial benefits (salary, stock options application technique that creates advantages and strengths of the nature of dividends generated by the sale value of its parts), but also in kind (car, home service, etc.). An important role in conflicts of interest between shareholders and managers we have auditors. They made a correct assessment, impartial, independent on the financial statements of the company, having the role of shareholders present the real situation. Through the audit, shareholders benefit from an important tool to evaluate the efforts made by managers in order to achieve the enterprise, and that maximize property owners. Creditors are third parties who provide loans to companies, and interest in the interest and principal. Thus, creditors are directly interested in the enterprise to make profit, which is the source of cover interest on loans. As for shareholders, loans may be a viable solution for obtaining new funds, the

risk associated is high, because the efficient administration of the resulting total equity depends on the attitude, skill, and especially the manager's interest. Employees have multiple interests in an enterprise. They are one of the most important resources available to the company. The main concern the interests of employees pay, benefits in kind (and gift vouchers, telephone, life insurance, tours, car service, etc.). In this regard, employees follow the evolution of profitability and business continuity. Customers and suppliers is the company's trading partners. Customers are interested in the company's ability to continue activity and prices, since they are directly concerned if their supplier can provide them with goods / services they need for good business conduct. Suppliers so if the company has sufficient resources to the client to be able to pay financial obligations [22]. Corporate governance system may differ depending on the importance given to categories of participants, but the relationship between shareholders and managers occupy a central position, as their relationship with the most divergence.

4. Conclusions

Financial crisis which began in the summer of 2007 internationally and their signs are felt today. Uncertainties, bankruptcies becoming more numerous, investors' risk aversion, liquidity low, tightening credit conditions, price volatility are some of the manifestations of the phenomenon of crisis. As a result, all participants in economic life are affected, directly or indirectly, to a greater or lesser crisis. Consequently, changes are needed, both in attitude and practice level in its action, communication is essential as a tool for survival and even exit. Managers, as the first responsible for the smooth running of companies will have to develop survival strategies and powerful tools of risk management. In addition, prudence and conservatism are the main attitudes of investors, which until the outbreak of the crisis have shown willing to take risks. Creditors who have proved relatively tolerant during the expansion of credit will become more stringent eligibility analysis of their potential customers. The importance of

auditors will increase as both lenders and investors and the public generally is based on their independent expert opinion. Employees will become directly interested in the success or failure of the company where they work, because of the dependency relationship that involves employee activity. The binder of all these changes in attitude will be communication.

Sustainability of Economic Policies

Bălăceanu Cristina
„Dimitrie Cantemir” Christian University
movitea@yahoo.com

Abstract

The smaller or the bigger role which the state has in the economy arises or, on the contrary, reduces the cohesion of the socio-economic function, in the conditions in which it is able to orientate through public policies the development trends of the economy.

Key words: investment, productivity, market economy, state.

J.E.L classification: A11, A19

1. Introduction

The world we are living in is full of contradictions, both of a social and institutional nature and economic nature as well. Most of these contradictions start from from the lack of satisfaction of individual's needs, from the fundamental ones to the rational ones of identity and identification of the motivational principles of each economic subject, from the individual and colectiv point of view. Now we are facing with some of the most strict restrictions: lack of resources, the oversising of the demand for economic goods, the growth of an increase of the financial needs, the shortcoming in the labour motivation as a consequence of a payment which does not cover the needs of a normal payment, discontinuities in allotting and distributing public goods. Considering these facts in my opinion a new approach of the state role in economy, a new definition of its functions, an adjustment in the basic state principles in accordance with the present and future economic principles is necessary.

2. The basic state functions

I consider that economy can not develop outside the market; the market allots the economic resources respectively the economic goods depending on the market ballance, the demand and the supply, at a

certain price. The price adjustment is made simultaneously to with the chance of the two market forces, the demand and the supply. At present, like the above said, for most of the economic goods, the demand is oversised as volum and structure, further to the extreme consuming society roles and the creation of a well being ilusion for a greater number of the population through an almost unlimited access to financing, resulting in the presence and continuation of the state of inflation. Under the circumstances, the market is no longer in the situation of establishing a real, correct ratio, between the demand and the supply, as the demand is not made depending on the solvent incomes, but on certain potential incomes and the offer does not come into this pattern of the growing demand but at a much more increased price. Therefore, through the market mechanism, only those economic activites which are eclusively meeting the demands of the market conjuncture; the outhere economic activites which are not on demand or do not meet the market needs at a certain moment are benefitting from low prices, respectivly low incomens which do not cover the present needs, facilitating debt prerequisites. In accordance with J. K. Galbraith: „nothing determines more a useful effort of the society than the pecuniary perspective reward, both one can require with its help and, not often as through the satisfaction granted by its possession” [1].

From this perspective the state role is to encourage the economic activities achieving an efficient allocation of the economic resurces creating outlets for seling the economic goods, using as levers the price subvention, fiscal facilities, measures of the deconcentrations of productions of certain markets and removing the niches through which the economic activities are becoming part of the underground economy.

The state must become the most efficient and transparent manager: on the one hand because it administers public funds taken from the economic activity of the economic agents, on the other hand because it is in charge of guiding the economy to the development of those activities which are necessary and creative of individual and collective welfare. The creation and allocations of public goods is exclusively in the state's charge; these public goods accomplish as a whole any society, ensuring the economic support for the development of infrastructure. To this end, Adam Smith wrote: „the state has to raise and maintain certain public works and public institutions, which could not have ever been in the interest of a single person, and of a small group of people, to make them rise and keep them at this level, although the profit for a great society, can be much bigger than covering the expenses” [2].

Regarding the growth of individual welfare, the state can not perform directly; the way of obtaining and allotting the economic resources depends on each person. Is this the real state of things?

Taking into consideration the different establishment of the income rate level in economy, the state adjust the level of the available income allotted to consumption and saving. Also, through the increase of the fee rate, the work motivation is adjusted in a direct proportion to productivity and the employee's efficiency. Incomes from the economy cannot be influenced just through the fiscal political guidelines; the mix of macroeconomic policies are favoring capital accumulations, the growth of public and private investments and an encouragement of the economic activity.

Now, I consider that the state does not have a time orientation of macroeconomic policies, a orientation which is not enough to be achieved only by the market. As the market is related to meeting the demands of the current and solvent needs, leaving to uncertainty (which in the market view would be administered by an insurance company) the allocation of resources for meeting the future needs of the society. These needs are also in the area of public goods, which should be connected to the development perspectives of the society, to the population dynamics and pattern, but also to the steady

adjustment of infrastructure to this end, as well as to the allocation process of the existing conventional resources, which are fewer and fewer and their price is consequently increasing, mostly because the development rate of the society is sine die connected to the usage of these resources. Therefore, the environment policies sustain the drawing and utilisation of nonconventional resources in the economic process. This fact is extremely argued: on the one hand great amounts are necessary for technologies implementations leading to the utilisation of nonconventional energies in consumption, and on the other hand the existing monopolies on the conventional resource market hampers the proliferation of green energy at the level of economy through tariff and nontariff barriers sustained by big interest groups. These facts can be overcome by state investments.

The green economy is the future economy. New working places can be created, the gap between the economic and natural environment is made, some costs are diminished, respectively the negative externalities of the market linked to pollution. It is a great opportunity for the state to orientate the economy to the incorporation of the green economy in the statutory economy. Although, as I have mentioned, the power poles of the world economy will not facilitate a loyal competition between the two systems of production (based on conventional and nonconventional energy sources) further to the loss of advantages on the market gained in the industrialisation era by the first one, even if the quantified and nonquantified advantages are by far in favour of the green economy.

How can public investments be achieved?

The state invests as much as it has financial resources. These financial resorts are resulting in the economic activity or they are coming from the external debt. In order to increase the state incomes, economy should generate transparent, competing, adequate income flows, to the immediate and perspective requirements of solvent demands. Thus, a big part of the existing disequilibrium in economy, caused by the inadequacy of aggregate offer to aggregate demand.

Therefore, the state should guide the interest of economic agents to viable investments, creative of added value. The investors are interested in economic developed regions or with development potential, with high level of infrastructure and mostly by fiscal facilities. Through the competence policy, the investments needed by the state can be drawn, considering the stages of negotiation, the potential advantages which can be transferred to the society: number of working seats created, supplementing the internal offer, creating the competitive levers, with a view to reducing the prices of certain economic products, the growth of the collecting income level. On the other hand the state should take into consideration the opposite: through the offer increase of import economic goods, the national producers can have difficulties, as a consequence of unloyal price competition. In this situation, the state, through its competence policy will establish measures for supporting national producers with a view to determining the efficiency of the production methods, and of sustaining the occupation degree as components of its social policy.

Under the conditions of a non-functional economy, the state levers are minimal. Consequently, the insurance of a minimal income for all members of the society is endangered, especially ensuring incomes of the employees in the public fields, which should be at a level of a maximum satisfaction, encouraging motivation and eliminating corruptible acts. These incomes depend on the efficiency of real economy, which should not forget. It is clear that only a functional and a productive economy can ensure a level of wages for maximizing the need of its members.

The state in a modern view

After the fall of communism the state had an even lower influence. In reply to this, the international financial institutions lay stress on measures for reducing the intervention degree of the state in economy, known Washington Consensus [3]. These macroeconomic policies were viewing at implementation of liberal measures aiming at privatisation, restructuring and liberalisation of the market, of trade, measures which are criticised further to the growth of the economies in transition as to the developed

economies, the deficit of the trade balance and external balance of payments, especially a growth in poverty.

The construction of state was at least important of the same way as the share of states reduction, fact which was sometimes wrongly interpreted, as an effort to restrict the state capacity [4]. The result was the economic liberalisation which failed to create welfare for all members of the society, an effect of the market functionalities.

The development of the many companies and the maximisation of the profit obtained took place. The result was a great number of disfunctionalities in most of the national economies and in the international economic relations, which contributed to the present economic crises [5].

3. Conclusion

In the circumstances, there is a mix between the market role and the state role in the functioning of the economy as to the importance of the state. This is a result of not understanding the failures of the market mechanism. The solution for coming out of the crisis is viewing at growing the state influence in economy regarding the process of allocation and the orientation to the economic branches which have high influence over the internal demand with a view to increasing the production process and a growth of the labor productivity. The state involvement does not influence the market mechanism, on the contrary it sustains it through the budget and monetary policies.

This mix of macroeconomic policies should encourage production and the development, the infrastructure, the orientation of investment to economic fields on long terms, having a positive influence on the economic and social development. In order to achieve these targets, the image of the state should be reshaped and remade so that, phenomena such as corruption, excessive bureaucracy, moral hazard may not change market functionality, market flexibility and the behavior of the economic agents.

The Impact of Freight Tax Regime on European Fleet

Bătrîna Ghiorghe

Raicu Gabriel

Maritime University of Constanta, Faculty of Navigation and Maritime Transport

gbatrinca@imc.ro

Abstract

Shipping in a truly international business and for many years, owners were tempted by financial incentives to move ships from national flags to flags of convenience. Many countries in Europe recognised that it is impossible to stop this process unless similar conditions are offered and they started to introduce tonnage tax systems. This paper is written in the context of Romania exploring the possibility of introducing a tonnage tax scheme in an effort to revive its fleet and presents the situation in Europe today together with advantages and disadvantages of such a system.

Key words: tonnage tax, shipping, freight, fleet

J.E.L. classification: H25, G32

1. Introduction

For many years the number of vessels registered under the flag of convenience has increased and we have today over 50% of the world fleet registered. The reasons for choosing an open register are varied and include protection from taxes, the avoidance of national regulations, labour wage scales or political boycotts. Advantages offered by open registries were a real incentive for many European shipowners to move their ships from national registries to open registries.

The lack of competitiveness of European-flagged vessels was recognised at the end of the 1980s and, in the absence of harmonised European measures, several EEA States adopted different arrangements for aiding maritime transport. The strategies adopted and the budgets allocated to support measures were different from one EEA State

to the other in reflection of the attitude of those States to public aid or the importance they attach to the maritime sector.

In addition, to encourage the re-registering of vessels, EEA States have relaxed rules concerning crews, notably through the creation of second registers. Second registers comprised, firstly, "offshore registers" belonging to territories which have a greater or lesser autonomy in relation to the EEA State, and secondly, "international registers", attached directly to the State which created them. In spite of the efforts made, a large part of the EEA fleet continues to be registered under the flags of third countries. This is because the registers of third countries which apply open registration policies - some of which are called "flags of convenience" - have continued and are still continuing to enjoy a significant competitive edge over the registers of EEA States.

In the light of the differences between the aid systems adopted by EC Member States faced with more intense competition from non-Community flagged vessels, in 1989 the EC Commission defined its first guidelines on this subject to ensure a certain convergence between the actions of the EC Member States. This method nevertheless proved to be ineffective and the decline of Community fleets continued. The guidelines were accordingly reviewed, leading to a 1997 communication defining new Guidelines on State aid to maritime transport.

The major development in recent years concerning support measures from the EEA States for maritime transport is the widespread extension in Europe of flat rate tonnage taxation systems ("tonnage tax"). Tonnage tax entered into force very early in Greece and was progressively extended to the Netherlands (1996), to Norway (1996), to Germany (1999), to the United Kingdom (2000), to Denmark, to Spain, to Ireland, to

Belgium, to France, to Finland (2002) to Poland (2007).

2. Short Comparative Analysis of Tonnage Tax Implementation

In Europe basically three different tonnage tax models can be distinguished:

- the Dutch model, introduced in 1996 in advance of the EU guidelines;
- the Norwegian model, introduced by Norway in 1996 and also based on the EU guidelines in spite of the fact that Norway is not a member of the European Union;
- the Greek model, introduced in 1957.

2.1 The Dutch Model

The Dutch model, introduced in 1996 in advance of the EU guidelines, is implemented by Belgium, Denmark, France, Germany, Ireland, Italy, The Netherlands, Poland, Spain and the UK.

The taxable operating profit of a vessel is based on the tonnage of the vessel, and not on the actual operating results. The amount of deemed taxable profit is subject to ordinary (corporate) income tax rates. The main difference between the Dutch model and the ordinary taxation method is the calculation of the profit related to the shipping activities. Apart from that, the shipping company and its non-qualifying shipping income is subject to regular taxation rules.

Calculating the tonnage tax:

- Fixed/deemed profit calculated using 4 tonnage size groups.
- Based on net tonnage.
- The calculated profit is taxed against the statutory CIT (corporate income tax) rate, or in case of individual entrepreneurs, with individual income tax. Belgium has 5 tonnage size groups including a special low rate for qualifying large vessels (above 40,000 ton) subject to age conditions.

Since 2009 Dutch authorities proposed to reduce the tonnage tax rate for larger vessels substantially. From a tonnage of 50,000 net ton, the tonnage rate will be lowered to €0.50 (\$0.71) per 1,000 net ton per day.

Who qualifies

- Entrepreneurs, e.g. individual entrepreneurs, foundations, legal entities, partnerships, permanent establishments.

- Denmark: only legal entities can opt for the tonnage tax system.

Qualifying activities

- Operating vessels in international traffic; also dredging and towing activities can qualify under most systems, under condition that more than 50% of these activities take place at sea.

- The vessel owner/bareboat charterer must exercise certain management activities with respect to the vessel.

Qualifying vessels/ownership

- Owned vessels (not bareboat chartered out).

- Vessels in bareboat charter.

- Vessels in time charter (only applicable if additional ownership requirements are met):

- Denmark: max 80% of the fleet's tonnage on time chartered vessels without purchase options (if a time charter vessel has a purchase option it is regarded as an owned vessel).

- Belgium and the UK: max 75% of the fleet's tonnage on time charter.

Lock up period

A choice must be made in year one and is fixed for 10 years, whether opted for the tonnage tax regime or not. Exceptions are:

- Belgium: opt at any time; choice fixed for 10 year period.

- Poland: choice to be made until 20 January of the first year of the tonnage taxation period or, in the case of a shipping company commencing the activities subject to tonnage taxation in the course of the tax year, until the day preceding the day of commencing these activities; the choice is fixed for 5 consecutive years.

Capital gains

- Capital gains are not subject to additional tax.

- Deferred tax liabilities: valuation at fair market value upon entry into system and claw back rules on hidden reserves realized during lock up period.

- Deferred tax liabilities disappear after the lock up period: usually 10 years, Poland 5 years.

- Capital gains derived during the lock up period are part of the tonnage tax tax base (not subject to tax).

Exceptions are:

- France: capital gains are subject to regular statutory tax rate.
- Poland: capital gains on sale of vessels will be taxed against a flat rate of 15%; a case tax exemption applies when reinvested in a purchase, co-ownership, modernization, renovation or rebuilding of the shipping fleet within 3 years from the moment of sale of that vessel.
- UK: no deferred tax liabilities.

Flag requirement

EU/EEA flag requirement (Germany: register requirement instead of flag requirement).

Ship management companies

From 2006 on, the tonnage tax regime has also been available for entrepreneurs conducting ship management activities. Since the fixed tonnage tax rates have shown to be higher than the actual profits, it is now proposed to introduce a 75% discount on the tonnage tax base for ship managers.

2.2 The Norwegian Model

The Norwegian model, introduced in 1996, is based on the EU guidelines and implemented by Norway (EEA member, not EU member) and Finland. The EEA is also bound by these guidelines. In the Norwegian model the taxation of the operating profits is deferred until profits are distributed, the company exits the tonnage tax system or the company is liquidated. A company subject to this tonnage tax system must pay a tonnage tax based on the net tonnage of the vessels.

Calculating the tonnage tax

- Tax calculated at a degressive tax rate. Finland has 4 degressive size groups, Norway 3.
 - Based on net tonnage.
 - Tonnage tax is not part of the taxable income.
 - Norway applies environment deduction for qualifying environmental friendly vessels.
 - In Finland tonnage tax is calculated and paid on a yearly basis; dividends distributed by the tonnage taxed company are fully taxable for the receiving company.

Who qualifies

Legal entities; in Finland legal entities and permanent establishments, in Norway only Norwegian Limited Liability Companies.

Qualifying activities

Operating vessels in international traffic. Entrepreneurial activities on non-Norwegian continental shelf, leasing out in bareboat, some domestic supply, seismic, anchor handling, tugs and stand-by vessels also qualify.

Qualifying vessels/ownership

- Owned vessels.
- Vessels in bareboat charter.
- Vessels in time charter (Finland: max 50% time charter, only EU flagged chartered vessels and only applicable if additional ownership requirements are met).

Lock up period

- Norway: opt every year (exit from the model will result in exit taxation as if all assets were realized at fair market value).

- Finland: fixed 10 year period.

Capital Gains

- No capital gains taxes need to be paid as long as profits are not distributed. In Norway a participation exemption applies to shareholdings in companies residing in the EEA. This also applies to shareholdings in companies outside the EEA provided that the company is not regarded as resident in a low-tax jurisdiction and certain ownership conditions are met.

Gains derived from realisation of shares in companies which do not meet the conditions for the participation exemption are exempt from tax if they constitute a qualifying asset under the tonnage tax model.

However, such gains will be taxed upon distribution or upon exit from the tonnage tax model.

Other capital gains and financial income are also taxable at a rate of 28% when the company is subject to tonnage tax.

- Norway: no deferred tax liabilities. Finland: tax deferral. Valuation of fixed assets at fair market value upon entry into the system. Taxation of capital gains at normal tax rate under regular taxation rules through indirect gain recognition method. This may be realised during tonnage taxation period, but the fair market value at the time of the entry limits the taxable amount. Taxes are paid on a yearly basis (if any); tax deferral does not disappear after the lock up period.

- Profits that were taxed under the tonnage tax regime are subject to 28% tax if distributed.

Flag requirement
EU/EEA flag requirement.
Ship management companies
No possibilities.

2.3 The Greek Model

The Greek model was introduced in 1957 and implemented by Greece, Cyprus and Malta. The calculation methods applied by Cyprus and Malta differs slightly from the Greek one. The Greek model is mandatory for vessel owners who derive income from shipping. First the taxable gross tonnage must be calculated by multiplying coefficient rates by each scale of gross registered tonnage. This taxable tonnage is multiplied by an age corrected rate.

Basically, in this model the shipping activity is taxed. In addition to that, all distributions are exempt from taxation up to the beneficial owner no matter how many intermediate holding companies are imposed. The Greek tonnage tax covers all vessels and all shipping activities.

In terms of Maltese law, the tonnage tax regime is mandatory for vessel owners only in the sense that the registration fee and the annual tonnage tax are payable irrespective of whether or not the vessel owner or charterer makes use of the benefits and concessions contained in the Maltese tonnage tax regime.

Calculating the tonnage tax

- Taxable tonnage of the vessel calculated based on coefficients using 6 tonnage size groups.

- Coefficients multiplied by taxable gross tonnage.

- Tax calculated by using a tax rate that corresponds with the age of the vessel. Cyprus uses 4 size groups and applies 25% deduction for vessels younger than 10 years; an additional 30% deduction can be obtained if the vessel management is performed in Cyprus.

- No CIT or dividend tax is levied on shipping profits.

Malta uses 8 size groups and applies a fixed amount of tax per group + amount of tax for exceeding tonnage.

Lock up period

- Greece/Malta: mandatory system.

- Cyprus: optional system (mandatory for vessels flying the Cypriot flag).

Capital Gains

- Capital gains on vessels are not taxed.

- No deferred tax liabilities.

Flag requirement

- Greece/Malta: Greek/Maltese flagged vessels qualify.

- Cyprus: EU/EEA flag requirement.

Ship management companies

- Greece: not taxed if put under special regime.

- Only possible in Cyprus. Vessel management companies may choose on an annual basis to either be taxed under the tonnage tax system or have their net profits subjected to Cyprus corporate tax at the flat rate of 4.25% under certain conditions.

In Greece tonnage tax extinguishes the tax liability of the owner and if the owner is a company this extends to shareholders. Tonnage tax also extinguishes tax liability in relation to operating profits, capital gains arising out of the vessel sale as well as liquidation proceeds.

Who qualifies

- Greece/Cyprus: entrepreneurs, e.g. individual entrepreneurs, foundations, legal entities, partnerships, permanent establishments.

- Malta: a legal entity, qualified as a ‘licensed shipping organisation’: a limited liability company, a partnership, whether ‘en nom collectif’ or ‘en commandite’, a trust or a foundation, any foreign body corporate or other entity enjoying legal personality, which has established a place of business in Malta.

Qualifying activities

- Greece: ownership qualifies, not activities (the location of the management is of no significance).

- Cyprus: same as the Dutch model.

- Malta: a ‘shipping organisation’ as a whole must qualify by carrying out shipping activities with own or charter vessels in international traffic.

Qualifying vessels/ownership

- Greece/Cyprus: vessels registered here. For non Greek flagged vessels, a special regime applies to the operator.

- Malta: Malta registered, qualifying tonnage tax vessels (>1000 ton; smaller vessels cannot qualify, unless the Minister of Finance declares such vessels to be ‘tonnage tax vessels’).

3. Benefits and drawbacks of tonnage tax regimes

The key objective of the tonnage tax regime is to create a business environment which will deliver a number of real advantages for all shipping companies entering the regime. The related domestic business activities, supporting a vibrant shipping industry effectively managed and operated from within the jurisdiction, will constitute further growth in tax base (employment and business income) along with the additional or new tonnage tax income.

Key benefits include:

- *Simplicity* - Straightforward and clear-cut tax calculations are the hallmarks of the system. In case of pure shipping companies, it will minimise administrative and compliance effort regarding the computation of annual tax returns with accompanying cost savings;
- *Increased cash-flow for vessel operators* - Low effective tax rate will make shipping companies internationally more competitive;
- *Certainty* - The level of tax will be known, thereby decreasing the need for the company to make provisions in its accounts for deferred taxation;
- *Flexibility* - Companies will have more freedom to make decisions that are commercially driven and are not primarily informed by taxation considerations;
- *Clarity* - A company's tax position will be more easily understood, making the company more attractive to investors and potential business partners;
- *Compatibility and competitiveness* - It levels the playing fields between domestic and international counterparts in cases where at least 15 other important maritime nations have introduced similar notional income tax systems;
- *Employment and training* - It creates opportunities for local cadets and seafarers;
- If jurisdictions impose some sort of *training requirement* - It will be accompanied by an increase in the availability of trained seafarers to the shipping industry; and
- *Economic activity not ownership* is rewarded - Ship management companies must qualify.

A tonnage tax regime could have adverse economic consequences for operators if there would be a cyclical downturn in the international shipping industry. Similarly, a start-up firm investing in new vessels may find the standard corporate tax system more attractive due to the available accelerated tax depreciation provisions. Key drawbacks of a tonnage tax are as follows:

- The incidence of tax could be high - In cases of an economic downturn in the shipping business with declining turnovers with subsequent declines of freight rates, high operating cost, especially if the operator owns a significant net registered tonnage;
- The notional income tax is payable even if operators turn in a loss situation;
- Once a company has opted for a tonnage tax election, most jurisdictions stipulate a lock-in period of ten years, as constant switching in and out of the preferential tax treatment is accompanied by complex transition rules which are difficult to administer. For example, in times of declining world trade companies may suffer in terms of the tonnage tax an excessive tax burden and would be forced to opt out of the tonnage tax dispensation. In such situation, the shipping firm will be in terms of the standard tonnage tax dispensation be debarred from re-entry for ten years; and
- Since most jurisdictions regard a tonnage tax system as a preferential taxation regime, it commonly comes with a host of other government conditions such as the creation of reserves or training requirements for domestic cadet officers and crews.

Consequently, any shipping company before opting for the preferential tonnage tax system must judiciously assess its complete financial position before such election can be exercised.

From Viral Marketing to Social CRM

Berța Dora-Anca

Abstract

The expansion of social networks begins to put their stamp of increasingly powerful over all economic activities. Traditional client translates himself into center of social networks and thus becomes a social client, resulting in chain reactions; marketing campaigns taking place in its environment, called generic viral campaigns are ones that wake them interest against traditional. Social CRM is not just promotion and useful information about brands and products, it means establishing a relationship between client and organization with viral marketing and social networks implicitly.

Kez words: viral marketing, social networking, social client, Social CRM

J.E.L. classification: M15, M31.

1. Introduction

Nowadays, is no longer enough the quality of merchandise to achieve a lasting competitive advantage; a good product must be promoted through a well-developed marketing and a policy consonant with the new market's technologies. The secret of success comes down to understanding the market rules and recognition of market's opportunities used effectively once its were identified.

The new informational technologies have raised the ball to the net in marketing domain, too: traditional marketing's area is not successful anymore, its place being taken by viral marketing. The time of flyers and leaflets from mailboxes is gone, their place being attributed to those who are using the internet, advertisements are being sent not only by e-mails, websites, blogs, forums, messenger but also by sms, games, funny commercials, word-of-mouth and word-of-

mouse.

The theme's actuality is ensured by the fact that nowadays viral marketing attains culmination and I tend to believe trend will not change for the few next years, the importance of studying this phenomenon it's justified through the fact that internet users interact, consciously or not, with this phenomenon. More than this, the users are choosing to play this “game”, sharing the commercial because they consider it original, funny and worthy to send to friends and other connections.

2. The actual stage of knowledge

According to renowned experts P. Druker and Ph. Kotler even though the first practical marketing activities date in Japan since eighteen century and in USA [1] since middle's nineteen century, marketing is officially recognized like science barely in 1935 when National Association of Marketing Teachers, predecessor of American Marketing Association, define it for the first time[2].

Over time, the marketing has suffered various transformations; most significant was noted in the last ten years due to the unprecedented influence of modern informational and communicational technologies upon this phenomenon.

The name “viral marketing” was given to this new marketing generation by

Tim Draper and Steve Jurvetson [3] in 1997 observing a new fact: the Hotmail website reaches the performance to convince in a year twelve million people to register on its website by inserting at the end of each email the message "You can open a free e-mail to <<www.hotmail.com>>".

Once the start was given, marketers from big companies began to use this new type of advertising. Currently, viral marketing has covered the whole Internet being ubiquitous

in one form or another in every corner. Only who doesn't use the Internet don't interact directly with him.

CRM (Customer Relationship Management) is a concept that brings together under one umbrella the methodology, applications and the ability of companies to manage customer relationships in an organized and efficient way. Through a CRM companies obtain, record and filter effectively in real time important information about partners and potential business partners. These applications became vital tools for the efficient running of business companies because provide valuable information about market operating company, information underlying the strategies by which a company seeks to impose.

In the last period a new trend has been observed on CRM: going from a well done in terms of technology CRM and adding a social component for studying the customer in its ecosystem to establish an effective relationship with him, it has been obtained the Social CRM.

Currently in the literature there are only two definitions for this new type of CRM. According to Michael Fauschette, Social CRM is a mix of tools and processes to ensure a stronger interaction with customers through collective intelligence in order to better understand customer needs [4].

In his book, “CRM at the Speed of Light: Essential Customer Strategies for the 21st Century”, Paul Greenberg believes that Social CRM is different from that traditional by the fact that has the role to engage the customer in conversation in order to obtain information about what he wants and his needs and expectations [5].

3. From Viral Marketing to Social CRM

Viral marketing wins his supremacy in front of his older brother, traditional marketing, because it gains the consumers' trust, who are in the spotlight more than the advertised product. Moreover, the consumer feels comfortable interacting with this type of marketing because it has no feeling that something is sold and he helps further the propagation campaigns starting from the premise that the recommendations come

from people who like and trust each other. Another important aspect, this time for marketers, refers to costs, viral marketing being much cheaper than one traditional, with much a larger customer coverage rate.

Opposed to traditional advertising campaigns, the purpose of viral marketing campaigns is not only to post regular online ads, but also to create an interesting message, which will be the guarantee that the product promoted is as interesting.

Also, the philosophy that viral marketing is guiding is particularly interesting: it creates buzz that is being identified with a "noise", its purpose being spoken of as a brand to be a permanent and continuous presence in the lives of consumers.

Sustained by viral campaigns on social networking sites like Facebook and MySpace [6], companies can reach millions of potential customers with minimal cost and effort. By creating a company profile in any social networks, organizations can quickly disseminate information, such as discounts and offers. When someone from one of these networks gives "like" or recommended to his friends the company's page, all friends that is in contact with will be notified of events that organization. Thus, the information is spread exactly on the same principle of spreading a computer virus.

The name “viral “ comes precisely from the way of propagation of the ads that mimics virus, the difference being that instead of virus is a marketing message that is produced and sent by the company which launches a viral campaign, and people are those who agree to willingly transmit this message to friends and acquaintances.

Viral campaigns have an amazing force of conviction because with their help the public internalize its message and it assimilates its own convictions. The target of these campaigns is the customer who uses the internet in a day to day basis called generic social client.

The prestigious company, Forrester Research, after a big study, groups the types of social client in seven categories [7]:

✓ creators (24%) – are those customers who write articles or comments, post them on their own account or blog / website, create images or videos with their favorite product, etc;

✓ conversationalists (33%) – they just update status on their social network account about products;

✓ critics (37%) – this type of customers participate actively by posting comments or reviews on other blogs, forums, websites;

✓ collectors (20%) – are using information about products or companies from the internet for their purpose

✓ joiners (59%) – they just visit the social networks

✓ spectators (70%) - are those clients which read information that is posted on forums, blogs, social network, reviews from websites;

✓ inactives (17%)

The main categories of products, services and information which are seek by social client and are strongly promoted by viral marketing campaigns can be grouped in the following classification:

- ✓ discount coupons
- ✓ information about nutrition and diets
- ✓ recipes
- ✓ demonstrations of the product in action
- ✓ tips and fashion trends

Regardless of the above mentioned category of the fall, social customer profile can be drafted by some specific features [8]:

use online social channels like Twitter, Facebook, MySpace, Yahoo 360 to inform and to discover new brands

grant confidence to community's recommendations by set a high value on its feedback about brands

doesn't respond to spam or promotional offers, but gives attention to relevant information that satisfies specific needs

expect that product to be present and active in his social sphere and ask him for feedback even though whether it is favorable or not

pretend to be listened to and involved when he needs the company's services, not when company needs customers

can interact with a brand through multiple channels simultaneously and is expected to receive a reply where he is currently

controlling the relationship with the brand, because it must win his trust not vice versa.

Since 2000, customer and his business behavior were analyzed using traditional CRM's. However, from 2007-2008, the concept of CRM began to change through the "assimilation" of a social component, namely the phenomenon of online social networking of customers who have become social clients and arose as Social CRM.

Social CRM does not replace the classic one, but it wants to be an extension of its[9], the difference consisting in social centering on customer in the middle of all processes. The search engines, social networks, sites of recommendations, forums and blogs have brought a major change in customer's mentality, buying decisions being influenced more than opinions and views of people with identical or similar interests.

The classic, transactional and operational model of CRM is guided by the "360-degree view of customer", the role of this vision being to obtain an overview regarding the real value of the client for company. In contrast, Social CRM goes on a different principle, "a company like me", which means that each client has the opportunity to create a personal and interactive relationship with a company, product or service that respond as fully as his expectations, but also to company. The purpose of this special relationship is to create a client as loyal and good and turn it into a supporter. There is a fundamental change in the relationship between the client and the company now being in the same position, the partnership [3].

The principle that describes how does a Social CRM works is LARA, which means [10]:

Listen -> Analyze -> Relate -> Act

Increased global use of social media presented a huge opportunity for companies seeking to win new customers and to retain existing ones. Today it is much easier for companies to identify new prospects and customers and determine their needs and concerns with Social CRM systems[12].

Surprising is that major producers of CRM from marketplace as SAP, Microsoft, Epicor, etc. have not yet released Social CRM solutions, in this niche appearing new companies hoping to conquer the market with their products. According to Gartner analysis, the figure no. 1 presents the main producers of Social CRM worldwide.

Figure nr. 1 The major producers of Social CRM

Source: <http://www.liventerprise.com/news/3652/>

But it must admit that the Social CRM has limitations: into audience cannot be included than those who use the internet, and here most often are disadvantaged elderly and the in rural areas. The solution for them that cannot be touched by a viral campaign is the call to traditional marketing. However, the conventional and viral marketing not mutually exclusive. Instead, they can work well in teams: through conventional marketing create an identity of the product which is completed by a viral campaign to generate buzz and constant media exposure[8].

Another important aspect that needs attention is paid to social network related. Both, producers of Social CRM and the market research analysts must be sure that Social CRM adjusts social network that is used to the geographical area in which CRM is implemented. For example into China, Japan and Korea is not use Facebook or Tweeter, but exist there another social network [11].

If we shall anticipate Social CRM evolution one thing is certain: from being a strategy of a company will reach an ecosystem strategy, by ecosystem understanding a blend of different companies, clients and social networks working together in order to obtain each added value.

4. Conclusion

Viral or traditional, the marketing remains the same, regardless of environment it is practiced or type of activity performed. Giving to Caesar what is Caesar's, the unprecedented influence of modern informational and communicational technologies, especially social networks, must be assessed over the marketing phenomenon.

Through the Social CRM is created a healthy symbiosis between company and social customer, beneficial for both sides: the companies can find out what client really wants from their products, this fact helping companies making them better and the customer receives what he wants: the product made by his self-will.

However, the role of traditional CRM should not be despised because it manages to get where the internet and Social CRM fail to make their presence felt, that's why is strongly recommended for a highly efficiency using both of them. The slogan "our customer, our master" is still current and will be as long as companies will exist to offer their products.

5. Research Methodology

As regards methodology, the approach is intended to be abduction. This means that from a series of concepts, articles, case studies about viral marketing evolution it explain the emergence of some consequences, into this case the appearance of Social CRM . Research strategy is non-experimental, type of case study, transversal and qualitative.

For searching and data collection were used techniques for collecting mediated but also direct investigation by used bibliographic achieved through: studying the most important books published in the field, articles and consulting sites that promote ideas, concepts, materials or solutions of interest in related themes.

To analyze the data collected are used in theoretical triangulation, the theme being addressed from several perspectives: being case of social networking software and computer is imperative approach, looking from another angle software that handles the marketing and be seen also in terms of

marketing. Another method used is that of scientific observation.

Crisis – Achilles’ heel

Bicăjanu Vasile
Popescu (Spârchez) Nicoleta
The Bucharest Academy of Economic Studies
vbical1969@gmail.com
sparcheznicoleta@yahoo.com

Abstract

The world is in a state of uncertainty; it may be an economic, social, political, moral, military, cultural, religious crisis... The international entities such as the International Monetary Fund, the European Financial Stability Facility, United Nations Organization, etc. collaborate for enforcing anti-crisis measures and Greece tries to pull out the arrow from Achilles’ heel. The ethics and economics principles sometimes seem insufficient for more flowers than weeds to grow in a planetary garden. In this context, this study emphasizes the importance of reconsidering human values, especially the cultural and religious ones in order for the society to deal with permanent changes and pressures to which it is submitted.

Key words: globalization, crisis, new world order, surveillance practices, responsibility.

J.E.L. classification: F02

1. Introduction

According to the Romanian language explanatory dictionary the crisis represents the violent manifestation of contradictions: (economical, ideological, political, military, etc.) [1] Appealing to Greek etymology, we identify the expression “kerisis” which means judgment or decision. The conjuncture factors made this word evolve in time. In 16th century Latin it was “crisis” and in nowadays Romanian it is “criză”. But what kind of crisis? Economical, social, political, moral, military, cultural, religious...? It is hard to say.

2. Etymology of the word crisis

If we refer to the Greek etymology of the word crisis, having as significance the meaning of “judgment” and if think that this new crisis wave began in Greece we may say that the crisis is at home.

Greece may be Achilles’ heel in European Union. If this vulnerable area of the community is to be revived in time, through the loans granted by the European Financial Stability Facility or by ceasing payments to creditors, it shall certainly be submitted to very strong pressures to apply austerity measures and thus the poison shall not penetrate the entire body.

The most recent austerity measures of October 20th 2011 for the approval of a new loan instalment of 8 billion Euros from the International Monetary Fund imply the diminution of wages, pensions and the increase of taxes and duties. These measures led to the increase of population grievances and outbreak of social tensions.

“Therefore and consequently the Greeks were trading on the sea. Therefore and consequently they were trading with Greeks.”

But how generous is or will be Greece with other countries regarding this crisis. “There are enough fears regarding a possible domino of breakdowns, involving other PIIGS states as well (expression used for the states with problems in financing the public debt – Portugal, Ireland, Italy, Greece and Spain). Furthermore, for the first time since the beginning of the crises IMF warned France (second economy in the Union). The reason was the dangerous mixture given by exposing French banks on debentures issued by the states with problems (especially Greece).” [2]

The crisis affected all economic branches and tourism was not an exception, still we must observe that “Europe remained the most

visited destination in the world and in 2009 with a share of 52.5% in the total world arrivals. The region’s tourism upsurge results mainly from the strong expansion of tourist flows in the countries of Central and Eastern Europe, mainly Czech republic, as well as traditional Mediterranean destinations such as Spain, Greece, Italy.”[3]

According to World Travel and Tourism Council publications, in Greece a direct contribution of 5.6% is foreseen in Greece for 2011 for the travelling and tourism sector for GDP achievement and a total contribution of 15.8% of travelling and tourism sector in GDP, representing a high enough level in comparison with other countries. In Germany for example, a direct contribution of 1.7% is foreseen for the travelling and tourism sector for GDP achievement and a total contribution of 4.6% of the travelling and tourism sector to GDP. A deeper analysis in this respect whose source was “The 2003 Travel and Tourism Economic Research” stipulated that “we shall ascertain that the first ten countries with the highest dependency degree regarding tourism export, that is the ones presenting the most accentuated specialization in this field, are countries with poorly developed economy or developing countries.”[4]

The countries that went through crisis moments: Great Crisis of 1928, Cameron Crisis 1980 – 2001, Russian Crisis of 1998, Mexico Crisis in 1994, Asian crisis of 1997, Argentina Crisis of 1999 – 2002, Romanian Crisis of 1999, ERBM Exchange Crisis in EU (1992 – 1993) have to think in a “profoundly deficient system”. As long as capitalism triumphs, money earning prevails above all other social reasons.”[5] or they shall be more reserved and remember the old saying “Beware of Greeks bearing gifts”. Shall the strong countries open their city gates or shall they be more prudent thinking of a possible Trojan horse?

The first globalization period, marked by theoreticians: Ricardo with “Competitive Advantage” and Say with “General Law of balance”, is the liberalization period. In this stage gold represents the economic standard.[6] In that period tariffs were considered very important in an efficient trade but the imbalance between request and offer could be automatically corrected. Pax Britanica (the period when the British Empire

dominated world’s oceans) and the exchange of goods in cash were representative for that period.

In the second period, 20th century, after the Great Crisis of 1928 and the Second World War, the term of *new world order* is used more and more frequently.[7] The promoters of this expression, Woodrow Wilson and Winston Churchill, used it to refer to a new period of history attesting the dramatic change in world political thinking and shifting the power balance. The idealist and liberal proposals regarding the necessity of a world government contributed to creating international organizations: United Nations Organization and NATO as well as certain international agreements, such as Bretton Woods system and General Agreement for Tariffs and Trade.

3. International cooperation

UNO has five permanent members, respectively the five victorious powers of the Second World War (China, France, Russian Federation, United Kingdom, United States of America) concerned with insuring world peace, observance of human rights, international cooperation and observance of international law.

Among the issues representing important preoccupations of UNO are the demographic and economic development ones.

In a communiqué of May 3rd 2011, this organization specified: “World population may reach seven billion this year, respectively 9.3 in 2050 and 10.1 billions in 2100.”[8]

Also, in this report called “World Demographic Perspectives” it was performed a classification of world states by birth rate. Thus, three states categories were ascertained: with high birth rate (39 countries in Africa, 9 in Asia, 6 in Oceania and four in Latin America) representing 18% of the world population; with a medium birth rate (countries such as India, United States, Mexico and Egypt) representing 40% of world population and the rest of 42% have a low birth rate under population replacement threshold (all European countries, China, Brazil and Russian Federation).

Analyzing GDP/inhabitant (in USD – current prices) of the five great powers that are permanent members of UNO in the

period 2008 – 2010, we ascertain the following situation: in 2008 China registered 6,250 USD, France 34,550 USD, Russian Federation 19,680 USD, Great Britain 37,490 USD, USA 47,100 USD; in 2009 China’s level was 6,860 USD, France 33,940 USD, Russian Federation 18,260 USD, United Kingdom 35,640 USD, USA 45,640 USD; in 2010 China’s level was 7,570 USD, France 34,440 USD, Russian Federation 19,190 USD, United Kingdom 36,590 USD, USA 47,120 USD[9].

Thus, we can deduct that USA is the host.

The first financial order example with complete negotiations intended for regulation of financial relations between independent national states was the Bretton Woods System. The agreement signed at Bretton Woods totaled 20 articles representing the I.M.F. statute.

In IMF statute modified in 2007, in article IV, the supervision function is stipulated. The supervision environment that must ensure best practices was updated in June 2007, for the first time after 1970, by adopting the Decision regarding the Supervision of Economic Policies of Member Countries. The consolidation of supervision practices began in the financial sector through the Financial Sector Assessment Programme (FSAP).[10]

In the third period after 1970, globalization met new dimensions due to the development of organizational technique and development.[11] If we think about Mecca and the role this city had in Pre-Islam we can say that after this year, this role shall be taken by the United States for European investors. The greatest investors in the United States of America are not the ones from Middle Orient but the Europeans represented by countries such as: Holland, England, Canada, Germany, Switzerland, Japan and France.[12]

Over time, great efforts were made to draw attention over severe problems of mankind. Thus, Brandt report expresses the concern of deepening the gap between north and south; Brudtland report succeeded in launching a new formula: durable development meaning the capacity of preserving the environment and chances of future generations.”[13]

In the last 50 years a series of pleasant or unpleasant, desired or undesired events

succeeded, “which mined the great ideological systems wanting to be based on reasoning and which developed the idea of natural progress of man and the ideal of collective happiness: Shoah, the failure of student revolution in the 60s-70s, the economic crisis, the disillusion regarding communist ideologies, fall of Berlin wall and regimes in the East, the ever increasing poverty in the third world.”[14]

It is not difficult to think that “God generously gives us all that we need more than money, such as: air, water, fire, sun and others as such. As one cannot say that the rich man feasts more abundantly from sun than the poor; one cannot say that the rich man breaths more air than the poor, but all was given equally to all. Therefore, why God shares equally to us all the most important things, the most needed things, with which we live, and the small ordinary things, such as money for example, He does not share equally? So that our lives are kept and we have more arenas for virtue.”[15]

In this crisis period an analysis of the state of affairs must be made. “In order to understand this, think of a garden with flowers and weeds.”[16], that must end with a decision on global level for the entire mankind and “If the weeds are cultivated, they would grow, and the flowers will be overwhelmed. If the flowers are cultivated, they would grow and the weeds will be overwhelmed.”[17]

4. Conclusions

Regardless if we speak of flowers or weeds, currently “we notice the coexistence of increase of wealth and inequalities. (Actually, by calmly analyzing the statistics, it appears that not the absolute poverty is increasing but the relative one.

“Today’s economy is limited to competition and it forgets that the ultimate purpose of economic activities is not to win or defeat the others but to ameliorate each one’s living conditions.”[19]

The amelioration of the state of affairs can be performed considering “The dynamic reciprocity between world rationality and human rationality...”[20] analyzed as “profound connection between man and world, as well as man’s special responsibility.”[21]

Everybody is better than before, but the fracture between the poor and the rich deepens incredibly).”[18]

Complementarities between the Internal and External Audit – Base for Increasing the Efficiency of the Financial and Economical Activity of the Public Entities

Bobeş Florina Maria

“Lucian Blaga” University of Sibiu, Faculty of Economic Sciences

florina11@yahoo.com

Abstract

Starting from the fact that both the external and internal public audit have as common purposes to improve the economic and financial activity of the public entities and also to contribute to the proper management of creating and using public funds, it is necessary that the two activities complement each other.

The basic concern in this paper is that starting from the role and importance of the two forms of audit, to be able to identify areas where these complete each other in an effort to optimize the activity audited.

Key words: internal audit, external audit, public entity.

J.E.L. classification: G29, O52.

1. Introduction

At this stage, when the public entities are promoting the efficiency criterion, any public entity leader is interested to operatively know how the available funds are being managed so as to achieve maximum results with lowest costs. This knowledge can not be achieved without the contribution of the internal audit, an activity that provides important information regarding the financial management and the heritage state, thereby contributing to achieving the objectives of the institution. The contribution of the internal public audit to the effort of streamlining the activity of the governmental entities is made through assurance and counseling missions provided to the leadership people for a better management of the revenue and of the public expenditure, through a continuous evaluation and

improvement of the internal control and through the analysis and management of the risks.

The external public audit work done by the Court of Accounts, as the supreme audit institution in our country, is essential for ensuring accountability on the management of public funds. The responsibility for using the public money under legal and performance conditions is, of course, entitled to the officers of public budgets, but the public audit is the one that assesses the financial management of the entities and that issues recommendations that stay behind taking managerial decisions aimed at a better use of the funds. By auditing the execution accounts of the budgetary funds and of other public funds it is intended to see if all the financial resources of the state and of the public sector have been used in an efficient and appropriate way in the purposes and according to the destination established through the budgetary laws.

2. The need for collaboration between internal and external audit

The need for collaboration between internal and external audit should have as cornerstone at least the following arguments [1]:

- management awareness regarding the need to implement the internal audit function within their own entities;
- additional assurance that internal audit is independent;
- assuming the implementation of internal audit;
- a more complete awareness of risks, both by the management and by the auditors;
- minimize duplications;
- professional exchanges of problems;

- common professional training;
- personnel mobility between the two structures;
- corroboration of audit plans and programs;
- sharing relevant information and ensuring an effective communication;
- understanding one's role by each party;
- a more attentive clarification of the two activities;
- eliminating the institutional rivalries or even the competence between the two activities;
- exerting a smaller pressure over the audited entities;
- creating a common culture of the audit in the public sector;
- achieving real compatibilities with similar structures in Europe.

The purpose of the Court of Accounts of Romania, as a public external audit structure, is to examine the existence and functionality of the internal control system, which means that it will evaluate the internal audit activity and thus provide the feed-back for this entity function.

To this extent, the external public auditors should mainly analyze:

- the organizational status, respectively whether the activities of financial control and internal audit are organized and function according to legal regulations;
- if the internal audit activity is carried out based on a plan, if it is supervised, reviewed and properly documented;
- if the internal audit included the high-risk activities and whether it is based on audit procedures applied to specific activities of the public entity;
- compliance with legal provisions and methodologies regarding making specific paperwork, obtaining results and formulate opinions;
- the manner of implementing the recommendations formulated in the audit reports;
- if there are any constraints or restrictions from the management involving the organization and pursuit of the internal control and internal audit activity.

According to the International Auditing Standard no. 610, "the external auditor should analyze the specific activities of the internal audit and their effects, if any, over

the external audit procedures." [2] An effective internal audit allows modification in the nature and duration of procedures performed by the external auditor.

In my opinion, the collaboration between the structures performing internal audit and those performing external audit involves a number of advantages for both parties, as well as entities such as:

- first of all, the internal audit has a better understanding of the risks from the entities in which operates and can provide useful information in some areas of the external audit;
- second of all, the internal audit is more involved in knowing the entity, having access to information that can not be reached by the external audit and from these reasons the collaboration is imperatively necessary.

In turn, the internal audit, by working with the external audit, can improve its field intervention methodologies, can develop its testing programs and can make use of the insurance given by the external audit to the audited entity.

Where there are internal audit committees, these should encourage this cooperation based on the principle of profession complementarities, given that there are real advantages to working together. Also, they should not only consider sharing the knowledge on the audit missions completed, but also a possible alignment of behavior standards of the two professions.

Making a quality audit involves a proper communication from both parties and contributes to strengthening the collaboration relationships and in time to achieving mutual trust.

I believe that the external audit should be the one to take the lead in this partnership, taking into consideration the need for annual assessments of the public entities and the logic to start, in this evaluation from the findings and recommendations of the internal audit.

The collaboration possibilities are numerous and always require to be rethought in light of developing audit techniques and tools, but also a good practice in the field.

3. Ensuring the complementarities between the internal and external audit

Complementarity represents the quality to present a complementary character, to be composed of complementary parts (that complete each other).

Starting from the fact that both the internal and external audits have the same goal, namely to improve the financial and economical activities of public entities, it is natural that between the two activities exist complementary relations, rejecting exclusivity of any kind. The basic motto of the two types of audit should be: collaboration and communication.

The internal audit is a complement of the external audit, because where there is the internal audit function, the external auditor is normally inclined to differently appreciate the quality of regularity, sincerity and the true and fair view of the submitted accounts. In practice, it may even get to use some internal audit work to formulate its opinion or to support its demonstration.

At the same time, the external audit is a complement to the internal audit, given that where a professional has exercised its job, we have a better control and a professional element of comparison. The internal auditor may come to benefit from the external audit's works in order to formulate his recommendations and to support his conclusions. Moreover, the external audit must operate from the evaluation of the internal audit, thereby closing the feedback of the internal auditing. [3]

In Romania it is found that the relationship between the Court of Accounts, as the external public audit institution and the internal audit structures occurs, to some extent, based on distrust and lack of mutual understanding of one's activity. The result is that the external auditors do not trust and do not use the work of internal auditors and the internal auditors do not properly confirm and implement the recommendations of the Court. So, by taking into account these activities, the Romanian Court of Accounts as the supreme external audit institution and the Ministry of Public Finances, through the Central Harmonization Unit for the Public Internal Audit, as a specialized body of central public administration which develops, manages and implements a unitary strategy in

the field of the internal audit unit in the public sector can work together closely to ensure the stability and complementarities of the two audit systems and their components.

4. Complementarily determining factors in achieving internal and external audit work

In the evolution of the internal and external audit activity, not infrequently the intersection of the audit missions was beneficial for both parties, these complementing each other at informational level, but also because the results of one's activity was the initiator and / or shutter for the activities of the other one . Also, as an appreciation of the work of the auditors engaged in a system or another, they have contributed to implementing recommendations for others, although these functions were not determined in advance as required.

4.1. Common methodological coordination in the public audit

Methodological coordination is an important activity so that, by using specific techniques and instruments, the conclusions and recommendations of auditors to be compatible.

This coordination will lead on the one hand, to increasing the confidence of the Romanian Court of Accounts, as external public audit structure, which can rely on the reports of the internal auditors at the same time can use them as starting points in their own activity.

On the other hand, the internal audit structures can redirect their activities according to the findings and opinions of the external audit, thus ensuring an avoidance of effort and resource duplication allocated by the two audit institutions.

4.2. Coordinating the activity plans of the internal audit structures of public entities with the external audit structures

The purpose of this coordination of the two activities is to prevent duplication of audit work but also to complement each other, through identifying and assessing the

resulted risks, so that extensive areas from the public sector systems can be audited.

In the activity of coordinating the plans is necessary to respect certain general principles, such as:

- avoid overlapping audit periods;
- the external audit missions should be usually subsequent to the internal audit missions;
- establishing audit missions of common interest, their targets and deadlines.

There should be also established a common timetable for completing the projects of the internal audit plans for the coming year, coupled with the activity plan of the Romanian Court of Accounts.

4.3. Ensuring the information exchange in the auditing process

The parties realize the importance of exchanging information in the auditing process, which involves mutual information exchange over the development method of the audit missions and over the outstanding audit findings from the content of the audit reports.

For these reasons, in the event that during the course of audit missions there are serious doubts regarding the existence of a poor management or fraud cases, it is required that the internal audit structures and the external audit structures to inform each other, but respecting the principle of independence. Also, in order to practically achieve information exchange, the parties will proceed to the mutual transmission of important findings from audit reports, with the manager's consent.

In the spirit of the above, the parties shall invite each other to participate in meetings of audit closure in cases where they consider necessary the presence of the other party and will inform each other about how to implement the recommendations and conclusions formulated during the audit missions.

In order to exchange information, the parties will have to do the followings:

- sharing information on important findings from the audit reports with the consent of the managers;
- mutual invitations to participate in meetings of audit closure, if applicable;

- mutual information about the method of implementation of the recommendations and conclusions formulated during the audit missions.

4.4. Providing unitary professional training for internal and external auditors

Achieving unitary professional training of internal and external auditors is required to be carried out systematically in order to effectively use the results of the other entity, to achieve predetermined objectives.

In order to achieve specific goals, we consider necessary to establish a collaboration system regarding at least:

- mutual inviting of the auditors from the two structures to the courses organized under their auspices, including to those initiatives from the European Union which refer to controlling and protecting its financial interests;
- organizing debates, seminars on common topics of interest on risk analysis, the method of using the audit techniques and tools, systems for implementing the recommendations and conclusions;
- mutual transmission of information materials and novelty of the audit scope.

In order to ensure the achievement of these objectives, we appreciate the need to permanently implement the activity of a workgroup that also has the initiative of realizing this collaborative action.

5. Conclusions

Given that both the internal audit and the external one are on the same "front", take the same "battle", regardless of their different methodologies used for auditing, mutual support is required as a condition making effective the public audit activity. At the same time, we must admit that the developing relations between the two main activities are based on national tradition and culture and the lack of collaboration between the two systems is considered historic.

Therefore, the internal and external audit must begin an effective collaboration to bring that expected value from both areas and to escape from the existential fear that affects them today.

Factors which Influence the Management Accounting Organization Way within the Framework of the Economic Entities from the Coal Mining Industry

Boca (Rakos) Ileana – Sorina
“Valahia” University of Târgoviște
ileana.rakos@yahoo.com

Abstract

This paper is aiming at headlighting the fact that the management accounting organization within the economic entities from the coal mining industry is based on few singularizing factors, particularly important in this activity field of our national economy.

Key words: factors, management accounting, mining, coal mining industry

J.E.L. classification: M 41

1. Preamble

The coal mining industry is an industry branch whose main purpose is the electricity production. The coal, mineral fuel, form together with other natural resources of the country, the energy primary sources, by means of which the electricity is produced, considered a basic branch of the national economy.

The industry territorial distribution depends on a series of **factors**, such as: economic factors, social and political factors and natural factors.

Economic factors, referring to the economic infrastructure of the territories, transports development level, proximity degree of the consumership areas, land price, capital and taxes regime, proximity of the raw materials and energy sources, such factors determined the industry development in the respective territories.

Social and political factors, from which more important are: manpower qualification level, traditions existence, strategic and ecologic reasons.

Natural factors – the natural factors of the industry location must be analyzed in terms of economic efficiency, technology specific

and raw materials nature (geographical position, relief, water availability, winds dominant direction, s.o.).

Within any economic entity, the management accounting organization so to meet the managers and their employees information requirements, needs the previous analyse of all the influence factors (which interact, coalesce or, contrariwisely, they act controversely), their consequences, and then, taking into account all these, the selection of the most adequate form of the management accounting.

The management accounting organization is differentially done within an economic entity framework, depending on the activity carrying on conditions, specific features and characteristics identified in the organization factors.

According to the Romanian language explanatory dictionary, *factor*, means “element, condition, circumstance which cause the occurrence of a process, action or phenomenon”.

2. The factors which influence the management accounting organization within the mining areas

According to some specialists in the field, the management accounting and costs calculation organization ways absolutely depends on a series of factors, such as: production technology, production type and its organization way, organization structure (production, conception and operational) of the unit, company size, production process continuity (permanent or seasonal), production automation degree and mechanization, etc.

The management accounting organization within the economic entities from the coal mining industry depends on a series of factors, which are mentioned hereunder, after their importance order:

✓ *technological process specific*, one of the most important factors regarding the management accounting and costs calculation organization within the economic entities from the coal mining industry refer to some particulars specific to the mining field, that is: the coal mining is “a simple and homogeneous production, that is an uniform production, which does not involve the existence of an unfinished or half-finished production (for the simple and homogeneous production, the number of the production stages is more reduced than for the complex production, and this has as result a simplified thinking and posting of the price costs, in regard to other industry branches, as well as a classical method for the costs calculation); it is an unitary production including a multitude of partial processes united in a single great production process.

The coal production cycle includes two important types of processes : a main process, technological one, directed related to the coal mining (the face) using the mine equipment and tools; many auxiliary and service processes required for the main process support. The number of the auxiliary and service processes within the coal mining is determined, on one hand, by the mining size, and, on the other hand, by the mining organization level. In the framework of the coal mining site, each of the mentioned processes includes, in its turn, a series of operations done at the working place by one or more executors (teams or crews) which generate costs for materials, wages, fixed means depreciation, etc. For each operation or group of operations, an independent time norm is established. In such a way, the operation represents the start point for the labour division in a mining site, being the labour norming analyse object.

The partial processes types determination within the coal mining, based on their characteristics, smoothes in a great measure the accounting organization work, because it shows the way to be followed in the primary documentation drawing up and in a as rational as possible documents circuit

establishment. This factor influences the management accounting and costs calculation organization as regards the selection of the calculation form depending on which, afterwards, the costs carrier, calculation unit, calculation period and time, as well as the related documentation are established.

The cost carrier represents the product, order, work or service to which the expenses are related, and the calculation unit represents the production measure unit. So, in the mass production framework, we meet the homogeneous product unit cost, in this case, the pit coal, mined within a month, case in which the calculation period does not coincide with the production period.

The influence of the *technological process specific* interact also with the establishment technics of the finished product – the pit coal. Another influence of this factor on the management accounting and costs calculation organization is related to the selection of the calculation unit which must correspond as much as possible to the physical features, as well as on the foreground order of the calculation works execution (posting/registration of the expenses with the materials consumption, wages expenses, fixed means writing-off expenses, etc. caused by each production sector activity; distribution of the auxiliary activities expenses, of the overhead expenses and of those ones generated by the administration over the basic activity expenses; registration of the realized coal production at the preset price; settling up of the realized coal production actual cost; registration of the possible price differences, etc.). Practically, the production technology represents a factor of great influence for the management accounting organization, this factor representing the operations through which the resources are transformed into products, works or services.

✓ *production process organisation* represents another factor which influences in an important measure the management accounting and costs calculation organization.

This factor influences especially the organization way of the documentation for the data gathering from the places/areas generating expenditures for the production cost establishment and calculation method

selection. Thus, within the coal mining sites whose production is simple, having a mass character, within which the production processes have as a main feature the fact that the finished product is got by a processing series of the raw materials and other materials in succeeding stages or phases, the mining phases calculation method is used.

Within the economic entities from the coal mining industry, the following mining stages/phases are executed: *works preparation*, that is preparation coal drifting, preparation blank drifting necessary to the preparation of the coal mining area, water discharge and preparation works ventilation, introduction of the materials necessary to the underground coal production; *coal effective mining*, which includes operations as: coal mining through faces, mounting of the beams for the roof supporting in the coal mining and ways area, in order to assure the optimum transport of the mined coal through the ways, building of the loading holes, wood and other materials transport, etc. Other phases of the coal mining are: *the underground transport in the head ways*, (phase when the mine whole underground transport is carried out – excepted the sectorial transport – by electric engine, conveyors, cables or manually); *the ways maintenance and repair* (includes the maintenance works and the current repairs ones done to the transport ways, air heads, cross-cuts, shafts, pits, platforms, handrails, etc.); *the mine overall ventilation*, which includes exfoliation, spashing, whitening, fire devices maintenance, etc. operations; *coal surface lifting*, through vertical or inclined shafts, men and coal mining necessary materials lifting and lowering, these shafts and loading – unloading installations maintenance; *surface transport*, which supposes the unloading of the coal and blank boxes arrived from the mine, transport from the shaft to the coal storage or to the dump, transport equipment and respective machinery, boxes maintenance; maintenance and repair of the lamps range specific to the underground lighting, etc.; *transport of the materials from the storage place to the mine and shafts* (includes the transport of different materials and equipment from the storage place to the shaft, their lowering in the mine, unloading, materials storing and security, materials and

equipment delivery from the mine, etc.); coal loading in boxes (includes: coal storage maintenance works and boxes coal loading works); other works necessary to the production process (they are related to: some specific works executed acc. to the higher hierarchical organism decision, lamps and underground lighting network maintenance and repair, materials transport from the shaft to the sector, etc.).

For this type of production, the phases and products description has a stable/fix character, so, the analyticals, once built up, do not change from a period to another one. During each coal mining phase, it is found out that there is a usage of manpower and materials, which is included in the production costs per coal ton. It is very important the correct delimitation of the coal production phases, in order to perform an optimal organization of the management accounting, mainly regarding the costs calculation. In the framework of the economic entities from the coal mining industry, the calculation phases, can or cannot, coincide with the activity sectors. In the same way as the *technological process specific* factor, the factor: *production process organization* influences the cyclic character for the mass production, as well as the number and structure of the documents related to the production launching and the price costs survey; this factor determines the way of data gathering, processing and turning into account, being in direct conformity with the management accounting requirements.

The most difficult matter, but essential, for the management accounting and costs calculation organization is represented by the correct determination and separation of the production phases, which can include many operations, can coincide or not with the production section, etc. Not always the separated/delimited phases from technical point of view can be taken into consideration from accounting point of view, as expenditure places, where the respective phase expenses to be gathered and established. In a coal mining, the calculation phases do not correspond to the production sections (sectors), there is possible to have more or less calculation phases within a sector, depending on the activity volume and economic management requirements.

The mining production process organization influences also the calculation way, that is for the flux organized production, there is a cyclic character of the price cost calculation, usually it is monthly, since for the singular product production, for example, the calculation has a non-cyclic character.

✓ *organization structure* of the economic entity from the coal mining industry is another important factor which has a great influence on the economic entities organization in this field, having two components: *the managerial structure*, which includes the organizational sub-divisions with the higher level directors/managers, assuring the managerial, economic, technical and human resources conditions necessary for the production activity carrying on, and *the production structure*, including the organizational sub-divisions where the operational activities are carried on (especially the production ones).

Within the coal mining industry, the production structure is nothing much branched, that is all the raw material processing operations are carried on in a single unit, where there are screening, washing, mechanical treatment, etc. equipment, in continuous flux, without needing the separation in distinct sectors. If the production activity needs as relevant as possible detailing, for the administrative and management sector the organization of a single costs centre is adequate, where the expenses are registered by their nature, not for each department or office, organized as distinct cost centres. In such a way, the respective centres directors/managers responsibility is strengthened, the production expenses information flux is rationalized, all these determine the diminishing of the labour volume necessary to the respective expenditures registration and control. At the same time, the number of the document related to the production expenses is reduced, as well as the number of analytical accounts opened for the posting of the production expenses per costs centres.

Taking into account this criterium, the economic entities from the coal mining industry, more exactly from the pit coal mining industry, include production sectors, auxiliary sectors and operational departments. Within the basic production

sectors of a pit coal mine the coal mining is carried out, this one being the activity object of the mining. *The pit coal mining* supposes the execution of many types of works: *blank preparation works, coal preparation works (faces), mine filling, underground transport, shafts or inclined planes transport, ventilation, water discharge, underground equipment and installations maintenance, ways, box-hole raises and shafts maintenance, etc.* *The auxiliary sectors* (they are secondary production places) serve the basic/primary sectors, supplying different products (electricity from the power unit, water from the water unit, steam from the thermal power station), some works execution (done by the carpentry shop, mechanical shop), services supply. The auxiliary sectors also include: storing houses, lamp room, compressors station, pumps station, road transport, vulcanization shop, own centre for the personnel training, etc. The operational structure includes the technical&production department, the financial&accounting department, human resources (organization – normalization - salaries) department, environment protection department, mechanical & energetical department, labour security department, procurement department, legal office, etc.

The activities sector separation within the pit coal mining is important as regards the registration/posting way of the production expenses and costs calculation, as well as for the consumption amount establishment per responsibility centres. So, the calculation accounts specific to the economic entities from the coal mining industry are developed in analytical accounts, in production sectors, shops, mining area administration, etc. and in these ones framework, the accounts are developed in expenditures categories. In this way, through the analytical, budgetary accounting, the accounting and costs calculation can go in depth up to the level of the working places and of other departments (services, offices, etc.) in order to gain a great interest of the personnel in cooperating for the own labour results. A well-balanced organization of the costs calculation needs to establish an optimum number of expenditures places, on the basis of thorough analyses of the coal mining structure, in order to use the most adequate technics imposed for the production expenses gathering per

expenditure places and their distribution per carriers, as well as for the establishment, for each expenditure place, of their consumer's responsibility.

The factor *organization structure* influences directly the analytical accounting organization. Thus, through the production activity, the analytical accounting is organized/structured per production sectors, and in these ones framework, per works phases (blank preparation works, coal preparation works, front face, horizontal transport, vertical transport, etc.) and further on, in their framework, per expenses nature, among which the most important weight is for the direct materials expenses/costs, direct wages expenses, related contributions to the social security and to the unemployment fund and the expenses with the electricity.

For the auxiliary activity, the analytical accounting is organized/structured per type of shops (mechanical, carpentry, pumps, joinery), and, in their framework, per type of expenditures (expenses with the materials, expenses with the wages, contribution to the social security and protection, writing-off, expenses with different repairs, etc.).

The production overhead expenses (common) are surveyed per production sectors, expenses items (equipment maintenance and operation expenses, transport means writing-off, buildings writing-off, TESA personnel wages, etc.) The management expenses accounting is organized at the coal mining level, per type of expenses (books-magazines subscriptions, travels, coal grants, posting expenses, TESA personnel wages, computer centre expenses, etc.). We can say therefore that the mining production activity structure and the operational one influence the organization way of the expenses analytical accounting because, depending on them, the expenses and the realized production are sectorized.

✓ *coal mining dimension* – determines, firstly, the volume of the economic and financial operations, being a factor which influences the organization and execution way of the works the realized production costs calculation. Correlating its influence with other factors action, for example with: *technological process specific, unit organization structure*, as well as *the professional level of the personnel from the financial-accounting departments and the*

works computer supporting level, the management accounting in the framework of the economic entities from the coal mining industry is organized in a centralized way, at the financial and accounting offices level, organized as distinct sub-divisions inside the coal mining, which execute all the calculation works. An advantage of this type of organization is the fact that the speciality personnel required number is enough reduced, and a disadvantage is the fact that the efficiency of the labour with the expenses amount control and analyse activity is difficult and weak, because of the complicated circuit of the documents and their processing process up to the moment of the costs level establishment.

✓ *the adopted management methods and technics* in a mining area can also influence the management accounting and costs calculation organization, particularly as regards the option for the classical type of calculation method, the phase method, which requires two series of calculation (the provisional calculation and the historical costing) afterwards establishing the possible deviations from the costs or for a modern costs calculation method, for example the standard method, which can assure the insistence upon the forecasting character and the growth of the information efficiency, as well as the costs control. Switching from the phase calculation method to the standard costs calculation method is a process needing the management accounting and costs calculation organization depending on this method requirements, from which we cite: *the three calculation items specific* to the method: *direct materials, direct manpower and overheads*; utilization of some specific accounts, such as: „Deviations from the standard materials consumption”, „Deviations from the standard wage rates”, „Standard balancing account”, „Analytical results”, etc. Adopting of some special forms: „Report regarding the deviations from standard costs for materials”, „Report regarding the deviations from standard costs for manpower”, „The budget of the manufacturing expenses”, Report regarding the deviations of the overheads from the budget”, etc. All the described factors have important influences on the organization way of the budgeting and management accounting in the framework of the economic entities

from the coal mining industry. At the same time, for a certain period of time, some factors can be considered foreground against other ones, and also it is necessary to underline the fact that their influences can be conflicting sometimes. But, having in view the goal of the management accounting and calculation costs efficient organization, we consider that the actions of all the factors must be analysed and corellated so that the manager accountant to do, learnedly, a good selection in the way of the costs establishment. There are, of course, other factors too, objective and subjective ones, which determine the organization way of the management accounting and costs calculation organization within the economic entities in this field. Knowing and taking into account their particulars must have as goal to create the conditions for establishing as accurate and as efficient as possible the unit costs;

✓ the production process permanent character for the coal mining represents also another factor which influences the management accounting organization. Characterisitic of the economic entities from the coal mining industry is the fact that, at the end of the management/activity period, the actual unit cost for the complete description list of the calculation items is calculated.

3. Conclusions

From all these above described, we can conclude that the management accounting and costs calculation organization within the economic entities from the coal mining industry is determined by a series of factors which are related to the technical & organizational and economic particular features of the minig areas.

For a better organization of the management accounting of the production expenses in order to calculate as accurate as possible the realised production cost, it is required to take into account the described factor influence, regardless their importance.

From the Financial Crisis to the Sovereign Debt Crisis

doru.cîrnu@yahoo.com

Abstract

In the last 200 years financial crises have succeeded themselves at more or less equal time intervals. The 25 years after the second world war have been one the least affected periods by crises because of intense state control in banking activities through regulations in this area.

A single exception was recorded in the period 1945-1971, which was marked by the Brazilian financial crisis. It is presumed this is because of intense state involvement in the control of banking activities through regulations. From 1971 approximately 120 financial crises have been recorded in the world. The manifestation means of the Eastern Asia (1997), Brazil (1999), Argentina (2001), Russia (1998) crises have determined their expansion aspect in the context of globalization.

Unfortunately, virtually all politicians and some specialists in this area have not drawn the right conclusions from these crisis, this can be seen in their occurrence frequency. This made possible both the devastating financial crisis, with its epicenter in the USA and the premises of a new crisis that revolves around sovereign debt, the responsibility being positioned this time in the euro zone.

Key words: banking crisis, sovereign debt crisis, deregulation, real-estate bubble

J.E.L. classification: G01, G02

1. Introduction

Economic crises are determined by financial, social or political causes. Therefore, a financial crisis represents a manifestation of an economic crisis, triggered by a lack of trust in the financial system at a

certain moment. Three versions of financial crises have been identified (banking, currency and external debt). There have been situations when two versions have coexisted, as in the case of Russia (currency crisis and banking crisis) or Argentina (currency crisis and external debt crisis).

2. Banking crisis

The robust economic growth without major perturbation which has characterized the USA after the second world war was based on the fact that the financial sector was sufficiently regulated. Imbalances regarding the fall of banks were seriously limited. Commercial banks which usually were local, could not involve themselves in speculative activities, the money of the population deposited at the banks were covered from significant risks. Investment banks, who held the money of the rich, were the ones who could perform speculative activities.

Supporters of electoral campaigns and users of experience lobbyists, bankers managed to impose their point of view over the deregulation of the financial system.

The process of deregulation started in 1982 and was heavily sustained by President Ronald Reagan. The success obtained by Paul Volker in substantially reducing inflation in the USA should have determined his reappointment as the president of the Federal Reserve in 1987. Ronald Reagan named Alan Greenspan, known as a fervent supporter financial deregulation for this position. The end of the deregulation process took place in the year 1999 through the Glass-Steagall law which allowed the access of small operators on the credit market, the so called “low-cost” brokers which facilitated credits to people without a stable workplace and a suitable income and that did not have

as collateral other assets. Through this law the difference between investment banks and corporate banks faded. The immediate result was the fusion of several financial entities with the result of extremely important financial institutions that were often characterized by the expression “too big to fall”.

The fall of the American “real-estate bubble” was the phenomenon that led to the last global financial crisis.

In the period 1996-2006, the price for American homes grew by 100%. This phenomenon was possible due to a large number of mortgages, most of them only on the basis on “ID” to use a famous phrase in Romania. Using slogans such as “born eligible”, banks started giving mortgages to people who did not fulfill even minimal requirements. Monthly mortgages were usually smaller in the first years of credit reimbursement, bank employees promised debtors that in the moment in which monthly mortgages will increase, according to the reimbursement program, they will have the possibility of more permissive mortgages due to the increase in value of the property. This mechanism proved to be completely flawed. When housing prices started to fall and interest rates slightly increased, many holders of the so called “subprime mortgages” couldn’t cover their payments so the banks became the owners of the houses. On the background of the decrease in prices, banks realized that their values only partly covered the mortgages. The behavior of banks, which we can elegantly call “reckless”, was driven by the desire of higher personal gains of the banking decision-makers. The size of the financial packages of these managers was directly proportionate with profits and respectively with the number of credits. In this way, quantity was emphasized over quantity and short term performance over long term.

On the other hand, on the background of deregulation, banks managed to create extremely profitable innovative products, but also extremely risky. These products were the derivatives. The financial instrument based on mortgage was sold by the financial institutions that gave the credit to other financial entities such as investment banks. We can say that these banks lend the debtor money for the mortgaged home. In this

moment the financial institution that initially loaned the money will minimize its risk. Investment banks moved one step forward by integrating mortgages under tradable titles. These tradable titles were thus sold to financial institutions and people from around the world. This was possible also due to the fact that they were rated as AAA by renowned rating agencies. We can say that the renowned rating agencies were accomplices as they were paid significant sums of money to evaluate the risks of these titles.

The trade of more derivative products meant the increase of the sum of money entering the pockets of bankers. Their greed was excessive. As long as home owners paid their mortgages on time, the money reached investors all over the world and everything was fine. The involution of the real estate market and the relative increase of interest rates made a larger number of home owners unable to pay their monthly mortgages. The consequences of this mechanism provided evidence of the recklessness of the tradable titles appreciated by rating agencies as having a minimal risk. In this way banks, investment funds, almost all investors in the world and investment banks that held this type of toxic products were affected. The complex character of derivatives made the mechanism of loss evaluation very difficult.

In 2006 the investment bank Goldman Sachs sold collateralized debt obligations (CDOs) in value of 3.1 billion dollars while claiming their reliability. These statements were made while Goldman Sachs was aware of the low reliability that characterized these obligations. Goldman Sachs initiated this process at the request of the president of an investment fund that bet that the price of these titles would collapse, phenomenon that took place.

In this situation, the important banks, mostly American ones, found themselves on the brink of bankruptcy. Usually, in capitalism, companies that reach such a state are declared as being bankrupt, shareholders lose everything, and their place is taken over by creditors. Through the process of reorganization, companies continue with their activity. Moreover, companies also have the advantage of not having to pay interest to creditors.

This mechanism could not be applied to American banks which were considered as being too big to fail. It was appreciated that the fall of these institutions would stop the financing of the American economy. The Bush administration and partially the Obama administration worked towards saving them. Hundreds of millions of dollars were transferred towards the American banks while the losses fell on the shoulders of the population. Practically, gains were privatized while losses were socialized. (J.Stiglitz, *În cădere liberă*, 2010:332) The banks which were the most reckless were the ones who received the biggest sums of money. After receiving financing from the state treasury with an interest close to 0%, the big American banks didn't even initiated a significant crediting process in order to stimulate the American economy. Moreover, the managers of banks kept their jobs and took advantage of the state's money through multiple million dollars bonuses as a reward for their “performance”. The political influence of American bankers makes banks too big to fall on one hand and on the other, enabled them not respect the capitalist rules of bankruptcy and damages brought to society.

Moreover the treatment to which players in the American economy were treated was extremely discriminating. Some American banks were saved, others – such as Lehman Brothers – were not. The criteria of choosing which banks to save were not well drawn. If banks generally took advantage of financial help from the American administration without taking any responsibility for the losses caused, the same did not happen to the automobile giants as they were forced to declare bankruptcy and their shareholders lost everything, while the new owners became the creditors, among which also state institutions. The managers of the two auto companies were “guilty” of occupying these jobs under extremely bad circumstances and they were fired while normal employees found their salaries substantially diminished.

In comparison, as mentioned above, the managers of banks kept their jobs and even gained substantial bonuses even though they were at the origin of the global financial cataclysm.

We have to state that the USA was the main supporter of the deregulation of the financial system on a global scale. After the state intervention in many countries became limited, the American banks exported toxic derivative products towards institutions from different geographical areas. After deregulation, Great Britain saw many of its banks in a difficult position. Unlike the American administration, the British government proceeded in a more rational way as they financed banks and also made them take crediting activities more seriously. The managers of these banks did not receive bonuses but were laid off. Spain was seriously marked by the fell of the real-estate bubble which had substantial dimensions. The 20 years of strict regulation in the financial sector, made Spain go through the hardships of the crises in an acceptable way.

The intervention of the American administration was not only immoral but also didn't reach its goal of reigniting the engines of the American economy through credits.

With all the efforts made by governments – approximately 1000 billion dollars- to save banks in order to assure a more or less normality in the financial sector, the credit activities are not satisfying. We can see a slower economic growth at least in the near future. Thus, according to UN estimations, for the year of 2012 we will see a global growth of 3.5%, number revised in a reduction to 1.5% in the summer of this year, optimist forecast.

3. A new crisis in the horizon

The financial effort especially in the year 2008 managed to push mankind from the verge of collapse, but hasn't resolved the problem. Moreover, the budget deficits have accentuated causing the increase in state debts.

We can identify some arguments that allow us to state that society is on the brink of a new financial crisis.

First, the decrease of the US rating generated panic on stock markets, where major losses were recorded, followed by minor recoveries. Like the fall of Lehman Brothers triggered the global financial crisis, some analysts appreciate the debut of a new financial crisis the depreciation of the US rating.

Second, we can discuss about an accentuation of the problems in the euro zone. The big European banks presently hold an important number of obligations emitted by Italy, Spain, Portugal, Greece and Ireland. The states just mentioned have significant state debts fact which makes the risk associated with these obligations increase and generating the fragility of the European banks. The lack of faith in the EU financial market, on one hand made the Central European Bank buy obligations emitted by the mentioned states at prices above the market in order to avoid their payment incapacity while on the other hand it generated an unusual behavior of EU member state banks which deposit their money at the European Central Bank against a small interest instead of assuring a normal circulation of financial resources.

Third, it is appreciated that more than a quarter of credits given by Chinese banks are low performing, fact that may determine a financial crisis in this country. Taking into consideration the economic situation of China and its major involvement in commercial trade and foreign direct investment flows, the imbalances of this country will be felt on a global scale.

Fourth, countries in 2008, especially developing ones, did not manage to find the efficient means to stimulate their economies. Tax increase and expense reduction policies adopted by many countries determined a reduction of incomes. Taking also into account the increase of unemployment in the US and Europe has reached 10%. Evidently the ones affected were mainly the ones who lacked resources. This population segment seeing its incomes significantly reduced spent less money and therefore diminished consumption in their countries.

Nouriel Roubini, winner of the Nobel Prize for Economics, considers a new global financial crisis as being very probable, on the background of the accentuation of the problems generated by the state debts. It is believed that the climax of this crisis will take in 2013, the alternative of state bankruptcy is, according to Roubini, the introduction of powerful inflationist phenomena. The solution is disputable taking into account the economic imbalances that it would bring and also the impoverishment of masses. We also have to take into account

that both in the USA and in the EU member countries elections are closing in and the vote of the masses is highly important.

The meeting of EU leaders at the end of October has had as consequence extremely important decisions for the future of EU and especially the euro zone. The following measures are emphasized: the supplementation to a thousand billion euros of the EU fund in order to sustain EU member countries with an urgent need of financing, the establishment of a fiscal program, the decrease with 100 million euros of Greece's debt and the recapitalization of banks in order for them to go through the euro zone state debt crisis.

4. Conclusion

The primordial element both in 2008 and in 2011 is lack of faith. Currently, private investors with small exceptions are adopting an expectative attitude. Governments must urgently find the resorts to determine private economic agents to invest taking into account the multiplication effect that investments have in the economy. Also, state investments should not be neglected. States should also act in the view of tax reduction of the poor citizens; with more money at their disposal they could stimulate consumption.

From the experience of the last three years, we can state that deregulation has allowed the financial system to make risky bets with major economic effects over the world economy and over the world population. This fact, doubled by the way in which banks were helped and their later uninvolved attitude in assuring an acceptable credit flow allows us to state that the reform of the world financial system is an urgent necessity.

Algerian Economic Structure: Opportunities or Threats in a Crisis Situation

Boualem Chebira
University of Annaba
cheb_bou@yahoo.fr

Abstract

According to the theory of Joseph Schumpeter, a business cycle is characterized by an expansion phase followed by a depression phase in the production process. This cyclical crises has attracted interest from various researchers in the example of Clement Juglar, in an attempt to explain the phenomenon in order to prevent future crises. The main causes of these crises are either endogenous or exogenous.

But every crisis did not have the same effects and similar impacts on the country. It is true that the nature of the crisis determines the impact. But it also seems that the economic structure of a country is a factor that could determine the extent of the impact of the crisis on the country. Indeed, the volume of international trade in a nation and the diversity of products traded are crucial in the impact of crises on its economy.

As such, Algeria known for its particular structure of its trade, characterized by export-oriented oil almost suffered the same way as many other countries in development, more or less serious effects on its economy. However, Algerian officials announced, following the example of the last global financial crisis, the country remains safe even if oil prices fell and thanks to large foreign exchange reserves combined. Indeed, the Algerian state argues the fact that its economy is weakly inserted in financial globalization.

The economic structure of Algeria, is characterized, among other things, by a quasi "mono-export", may "be regarded as an opportunity for the country to avoid the impact of an international crisis, or is it a threat that can lead the country into an economic and social crisis?

It is to this main question that this work will attempt to provide some thoughts based on the analysis of the impact of crises on the

economy of this country while referring to its economic structure.

Key words: Economic structure, crisis, oil, globalization, development.

J.E.L. classification: O16 – P45

1. Introduction

No nation in this world, regardless of its wealth, can live in complete autarky. The volume of international trade, growing year by year, is there to confirm it. It is however clear that the volume of trade of a nation is unevenly distributed among the various trading partners.

Besides, the technologies of information and the communication, like Internet, allowed an unprecedented development of these exchanges in the sense that the notion of space and of time has been completely transformed. The speed with which the contacts can be established with any point of the globe, developed in a considerable way the relations between the diverse nations, by widening markets and so by accelerating the rhythm of the exchanges. The World, became a large village.

But if the circulation of goods accelerated, in view of the development of the ICT, but also of the population growth in the world, it had no only advantages. Indeed, the tangle of complex relationships established, can also be a factor of transmission of crises which could arise in a nation.

The impact of a crisis is even more important if it is generated by a developed country where the number of important economic, commercial and financial relations with other countries, is high. The saying of Nomaan Jamal, "As America catches cold, the whole world sneezes," or the title of an article written by "Le Messager" in Douala

"Crisis: Dubai coughs, Cameroon sneezes" are very significant.

It seems logical to think that the consequences of a crisis are all the more important as the number of relations with the diverse partners is important. However all the crises have no same effects and the same impacts on countries. It is true that the nature of the crisis determines the impacts.

But it seems besides that the economic structure of a country is also a factor which could determine the importance of the repercussion of this crisis on the country. Accordingly, two key factors can be at the origin of impacts on the economy of a nation following a crisis in another nation, namely the nature of the existing relationships between the two countries and the economic structure of this country.

As an example, the last international financial crisis called also crisis of "subprimes", born in the United States, blew the cold on the quasi-totality of countries to the world and had impacts of different intensity according to States. As such, Algeria known for its particular structure of its exchanges, characterized by exports oriented to hydrocarbons underwent in the same way that several other developing countries, more or less important effects on its economy. However, it would seem, according to certain Algerian officials but also certain analysts, as the country was widely spared, thanks to its economic structure.

This work will try to analyze the case Algeria during this crisis to understand the real impacts on this country by considering its economic structure. For that purpose, the first part will deal with the current economic structure in Algeria further to the diverse stages of its development. The second part will analyze the consequences of this crisis and their importance.

2. The economic structure in Algeria

To understand indeed the current economic structure of Algeria, an analysis of its development model, since its independence in 1962, is required. Indeed, just after its independence, Algeria was a not structured country where there remained an unstructured conservative society based mainly on a rural way of life, living mainly

products of the land. It was a subsistence farming using traditional methods. It is only from 1965, that the model is transformed, opting for a socialist approach, based politically on the fight(wrestling) against the imperialism and the bourgeoisie, and start revolutions in agricultural, industrial and cultural.

The industrial revolution, preached the installation of a "heavy" industry, based on the existing raw materials in the country, and which would have, upstream, to transform these raw materials, and downstream, to allow the development of a "light" industry. It was to be also, the engine of the agricultural development with in particular the production of mechanized machines intended for agriculture. Some notable results were recorded, with the example of the factory of El Hadjar in the suburbs of Annaba east of country, exploiting the iron ore of Ouenza, and other development poles on the Algerian coast and relating to hydrocarbons, such as the poles of Arzew-Bethioua in western country and that of Skikda in the east.

On the whole, at the end of the decade of the Seventies and according to G. Mutin, there would be more than 75 industrial zones and more than 200 municipalities that have at least one industrial establishment. It should be noted however that the financing of this effort of industrialization of the country was done mainly with the oil revenue without notable recourse to the foreign investments.

The agrarian revolution was as for it a total failure. Initially it should be noted that the agricultural lands is only about 3.3% of the national territory [Terranti, 2003], and that the agrarian revolution had put the land available to those who work and not those who possess it. A great operation of expropriation was committed and the new owners enjoyed the use of land through agricultural cooperatives. The development of the industrial sector and more precisely that relating to the mechanization of the agricultural sector was to help the new owners to ensure of better outputs. Large investments have been made, still funded by the revenue of oil.

All this policy, based on significant investments gave at the beginning of the Seventies some encouraging results. The growth rate of the GDP during this decade

was always overall positive varying from 4% to 9%.

However the end of eighties was the beginning of disillusion. The industrial sector did not give the expected results in view of the invested amounts. The social policy initiated by the State, was not in adequacy with the objectives of economic efficiency. Most public industrial companies suffered from serious financial imbalances, due to the mismanagement and that the State covered by subsidies.

Graph 1: Evolution of the growth rate of the GDP in Algeria of 1962 to 1980

Source : World Perspective Monde

As for the agricultural sector, the cooperative system was a failure. The “fellahs” (farmers) were not accustomed to collective work. Moreover several co-operators ended up sharing the lands which were allotted to them, in small batches, which each one exploited according to its suitability. It’s a return thus to the small-scale subsistence. The production, instead of growing, merely stagnates and even regresses. The population growth is increasing. The resultant of this situation is that Algeria was obliged from the 1980s, to resort to massive imports of food products. [B.CHEBIRA, 2010]

"In 1970 purchases of food products accounted for 6% of total imports but 41% in 1980. Cereal imports pass over the same period from 0.6 to 2.5 million tonnes. "G. MUTIN

Moreover, the crisis of 1986 marked the collapse of oil prices plunge the country into a very delicate situation, which made him become aware of its brittleness, in the absence of the oil revenue. The reforms undertaken by the government Hamrouche aimed to the opening of the country towards

a market economy. Unfortunately, this policy requires, at least initially, significant investments that oil revenues could no longer cover. The subsidies to unprofitable firms were not granted and it was the beginning of a new social crisis that had dramatic consequences for the country and whose consequences are still visible today.

The country have recourse to the debt that eventually reached alarming levels. The crisis also forced the country to accept a plan to reschedule its debts, which was negotiated in 1994 and 1995. The amount of the debt exceeded during the years 1995 and 1996, the 30 billion dollars

The analysts of the situation at the time, explained this economic stability which was transformed gradually into political stability attenuating the social crisis, by the political change occurred in the country. However, this situation was only circumstantial and a good part of the explanation returned to the improvement experienced by the oil prices by 13 dollars per barrel of Brent in 1998 blithely exceeded the threshold of 140 Dollars in 2008 (see graph 2). The price has increased more than tenfold, tenfold by the same revenues in the country (see graph 3).

Graph 2: The evolution of oil prices, 1970-2009, in current dollars.

Source: extrait wtrg Economics, www.wtrg.com

Graph 3: Evolution of the receipts hydrocarbons in Algeria (of Billion dollars)

Source: G. Mutin (1997) and various

Oil revenues has changed significantly, although there is a marked decrease in 1986 and subsequent years, and a second decrease in 2008 and 2009. These two crises have led to the sharp fall and consequent oil prices which reduces the income of the country. The economy is essentially based on the rentier oil which represent some 98% of total exports.

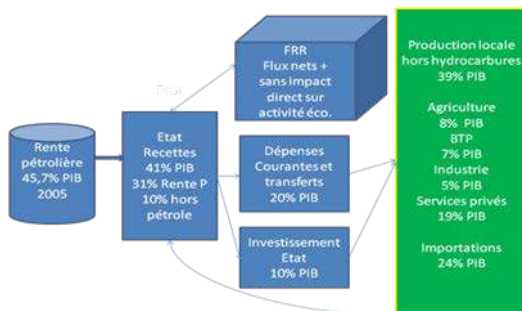

Graph 4: Evolution of the share of exports of oil, 1970-2008, in percent.

Source: Based on data from the Algerian Office of Statistics (ONS)

The oil revenue accounted for 45.7% of the GDP in 2005 and on the public revenue which amounts to 41% of the GDP, 31% come from the oil revenue. The production except hydrocarbons of the country including agriculture, construction, industry and the private services, accounts for only 39% of the GDP (cf diagram 1). Thus all the efforts authorized by the State for the development of the industrial and agricultural sectors do not seem to have reached the posted ambitions and represented in 2005, only respectively 5% and 8% of the GDP.

Diagram 1: Structure of the Algerian economy

Source: Christophe Cordonnier

Graph 5 below relating to the evolution on behalf of hydrocarbons in the GDP is very illustrative of the situation. Indeed, the share of hydrocarbons in the GDP did not cease growing particularly of 1986 to date. This graph explains the strong economic dependence of the country to hydrocarbons. The economy of Algeria became a sack-economy.

Graph 5: Evolution of share of added value of hydrocarbons 1970-2008, as % of GDP

Source: Based on data from the Algerian Office of Statistics (ONS)

The country has become aware of its economic structure and its dire consequences in case of lower hydrocarbon prices in the world. Reflections have been conducted on what called the post-oil to the example of the Symposium dedicated to the knowledge-based economy and where Pr Abdelmadjid BOUZIDI did not hesitate to assert that "the post-oil, is the new economy." So to overcome this situation of incomes only based on hydrocarbons, Algeria and other countries in the same situation, have the opportunity to seek competitiveness through the acquisition of knowledge. [B. CHEBIRA, 2009] But this is yet another problem.

Moreover, it is important to know the major trading partners of Algeria. A crisis which affects a country with which exist important trade relations would have more significant impacts. The most important trade partners are the OECD countries, the United States and some other countries in Asia, North Africa and the Arab world. In its edition of April 29th, 2010, the daily newspaper Maghreb claimed that the OECD Countries accounted for 69.24% of imports from Algeria and 85.21% of exports including 52.86% of imports and 51.30% of exports return to the countries of the European Union.

The following graph shows the evolution of foreign trade in Algeria from 1999 to 2006, highlighting the share of hydrocarbons. This increase is explained more by higher oil prices than by changes in trade volumes.

Graph 6: Evolution of foreign trade and trade balance in Algeria (1999-2006)

3. The consequences of the crisis on Algeria

This particular economic structure characteristic of rentier states combined with certain political decisions aimed at preserving national sovereignty, explains the impact of the recent crisis on the country. The various analyses carried out have come to the following conclusion. Algeria is disconnected from the global financial crisis in view of the component of its economic structure. However, it was very sensitive to the economic slowdown caused by the same crisis.

Why Algeria did not suffer the direct consequences of the crisis?

In fact, Algeria had suffered greatly from the crisis of 1986 which saw the collapse of oil prices to record levels falling below \$ 10 a barrel. The country had in this moment less than \$ 3 billion monetary reserve and had an external debt of over \$ 20 billion. This situation had led the country to review its entire policy and was forced to accept a painful structural adjustment following the rescheduling of its external debt.

After the favorable evolution of the courses of oil during the following years, Algeria learned the lesson and did not want to know this kind of problems any more in the future. Also a series of measures were

taken which seem in a certain direction to have given some results.

Thus the remarks made in 2008 by Mr. Ouyahia, Prime Minister, on the impacts of the last financial crisis on the country agree on some points with various analyses carried out by national and foreign experts. They agree to say that the crisis did not have direct effects on the economy of the country and this for the following reasons:

- The non-convertibility of the national currency: the Dinar.

Algeria has always denied the convertibility of its currency, even after its passage to the market economy, and despite several calls from international financial institutions such as the IMF. Convertibility would have led analysts said a strong outflow of currency to the example of other nations who have followed this path. The economy is not considered strong enough to cope with a full convertibility of its currency.

"The process of convertibility of the dinar should be based, a priori, on a diversified economy, a prerequisite for any convertibility of a currency. This situation would be impossible for the case of Algeria, whose economy remains dependent exclusively hydrocarbons."

Synthesis of Mourad, algerie-dz.com. According to the Expression

The convertibility actually occurs, however informally, and the "parallel exchange" was gradually set up as an "authorized activity"

And in international financial markets, speculations were not performed on the Algerian Dinar. The country remained indifferent to the financial game and avoided any disruption caused to that level by the crisis.

- The sovereign fund is released.

Following the financial upturn recorded in Algeria and the accumulated foreign exchange reserves that have reached a considerable amount of over \$ 140 billion in 2008, some experts recommended to the country invests in sovereign funds or state funds . The advantage of these financial investments is to generate investment income, but have some risks associated with investment choices to make. In the event of major financial crisis, as the subprime crisis, many SWFs have suffered significant losses in the world.

The refusal of the Central Bank of Algeria to choose those investments, likely saved the country significant financial losses.

- Algeria refunded its debt

Following the fall of oil prices during the crisis of 1986, Algeria has been obliged to opt for a strong debt, followed in 1994 of a rescheduling. Foreign debt had reached in 2000, \$ 40 billion, while service revenue was 30% of our exports [Z. MEBARKI, 2009]. Also according to the same source, the debt has been reduced to \$ 19 billion in 2004. The debt services between 1985 and 2005 were estimated at \$ 34 billion. This was considered as a form of infringement of national sovereignty to the extent that some international institutions concerned with their funds dictated their political and economic decisions in the country.

Prepayment agreements, signed with the Paris Club and the Rome Club allowed to return to a debt level of around \$ 4 billion, which significantly reduces the burden of servicing the debt on the balance of external payments.

"The crisis did not lead to the collapse of the global financial system, caused a recession and has had a contagion effect in the different countries of the world, recognizing however, that the Arab Maghreb region has been spared by the crisis through proper debt management in particular, remains vulnerable because of the restriction of financial activity in the world" (Strauss Khan. D, 2008)

- Lack of local financial market

The Algerian financial system as a whole is an internal system, disconnected from the global financial system.

First, the banking sector today is characterized by a strong dominance of public banks. The privatization of banks was the order of the day in 2007, but the country has decided to postpone the privatization. Indeed, on the recommendation of the IMF, Algeria was committed to modernize its financial system which was seen as ineffective. It is true that the country has allowed private banks to settle in the country following the example of Société Générale, BNP, Citibank, Golf Bank... Fifteen private banks were created. However the public banks occupy a big part of the activity of the banking environment. The international transactions and in particular the transfers of

funds in currencies are controlled and governed by strict regulations. Thus the disturbances of the external financial system will not have many incidences on the country. The insurance market in turn is organized, regulated and controlled by the Ministry of Finance. As the capital market, it remains embryonic, with a lack of financial capital inflows.

- Other factors

Moreover, the cleansing of the national money market sanctioning the nonviable financial institutions, the prohibition made at the companies and public banks, since 2004, to resort to the foreign loan and the prudence with which the Bank of Algeria places monetary reserves preferring safety at the strong profitability, were as many protective factors vis-a-vis the upheavals of the international money markets.

Why Algeria underwent the indirect consequences of the crisis?

At the beginning of 2009, the optimism posted by the Algerian State on the impact of the world-wide crisis started to be re-examined downwards. The reduction in the oil revenues started to be felt.

Indeed, this crisis had the following consequences:

1 - A consequent fall of the price of hydrocarbons

On July 11th, 2008 the price of the barrel of oil had reached a historical record with more than 147 dollars, to find itself at the end of 2008 less and at the beginning of 2009 with less than 40 dollars the barrel. The crisis had a brutal and severe impact on the price of hydrocarbons.

2- A reduction in the hydrocarbon world demand (caution).

The United States and Asian countries hit hard by the crisis because of the complex web of existing trade have begun to take a series of measures to address them. It was clear that caution and a more drastic policy were recommended. Thus, these countries, according to the energy reserves available to them, showed less interest in buying oil, which resulted in a decrease in global demand. The offer was higher than demand and prices suffered further declines.

Meeting of oil producing countries to the example of OPEC tried to adapt supply to demand in order to avoid the price to reach unsustainable levels for the economy of some countries following the example of Algeria.

The oil price took again its rise well and of less than 40 dollars at the beginning of 2009, it finds today with more than 80 dollars the barrel.

3 - The fall of half the growth rate in 2009.

These rates are expected to reach 2.7% on average for the Maghreb, or 2.1% in Algeria. GDP growth would be limited to 2.6% in the region against a projection of more than 6% for 2009.

Consequently, it is clear that the fluctuations in energy prices in particular to the decline, have a direct impact on the rentier states. The mattress of foreign exchange reserves accumulated can only temporarily buffer the fluctuations in the expectation of better days.

"Based on all this, our country has 138 billion dollars in foreign reserves at the end of last November, will be able to meet all its external commitments for five years, without recourse to foreign borrowing, even with a barrel to 30 dollars for five years. In such a virtual situation, Algeria still retain in 2014, foreign reserves of almost \$ 50 billion dollars. "Source Ouyahia".

4. Conclusion

During the crisis of 1986, Algeria became aware of the danger of a rentier economy dependent on oil price fluctuations. It was about, at this moment, to reflect on the diversification of the economy by initiating an appropriate strategy.

The rise of the oil courses the following years, slowed down the reflection, prioritizing that which consists in developing new mechanisms to be better armed in the event of a new crisis without to make a notable modification to the existing economic structure.

This new crisis has generated in turn a lot of questions about the current strategy and the head of the IMF mission Joel Bernaté Toujas did not hesitate to affirm "a durable crisis would underline the requirement of diversification of the economy, which supposes the continuation of the structural

reforms remained quite timid. This is the major challenge of Algeria".

The former Algerian Prime Minister Ahmed Benbitour has on his side qualified of curse the resources of the country. The hydrocarbons which were to be a factor of development pose in fact much more problems than they solve.

The History teaches us that the crises succeed the periods record. Teaching to be drawn for Algeria, as for the whole of the countries shareholders, it is to use this wealth to set up infrastructures able to diversify the incomes of the country. With such a strategy, if oil prices cough, Algeria will not have to sneeze.

The National Strategy and the National Action Plan on Climatic Change

Braşoveanu Florica

“Ovidius” University of Constanta, Faculty of Law and Administrative Sciences
floriordache@yahoo.com

Abstract

The environment is a component of human life, being indispensable to their life, as they perform their activities in the environment. It is the vital element of human life.

This article tries to analyze the evolution of the environment, the global heating and the most important changes known by the environment.

The reason we chose this subject is to present the evolution and the level of global warming and the impact it has on human life.

Key words: Sustainable Development, Global warming, Environmental Permit, Climate change

J.E.L. classification: K 32

1. Introduction

Climate change has a huge impact, negative impact on people, animals, flora, fauna, atmosphere. To the climate change that occurred over time, but increased in the last decade of the twenty-first century people have contributed greatly.

Through their desire for progress, development, modernization of their life through the fact that they have facilitated the process of satisfying daily needs with factories, new manufacturing technologies.

2. The Matter Seat

Global warming is the phenomenon of the growth of recorded average temperatures of the atmosphere near the soil, oceans, measured in the last two centuries, especially in recent decades.

Warming is due to human activity, especially by developing carbon dioxide into the atmosphere by burning fossil fuels. Global warming has profound effects in

different areas.

It causes sea level rise, extreme weather, melting glaciers, extinction of many species of plants and animals and changes in terms of human health, the immune system becomes weaker, people are more prone to disease, thereby increasing the number of deaths in the world, at global level.

To achieve my purpose I used a bibliographic material as rich as possible so that results contain more information as to render the reader living reality, nowadays, hoping that one will feel and take action by protecting the environment, thus protecting life at the same time.

A number of Romanian researchers have conceived works that include environmental information, how much authorities worldwide were involved and the measures proposed by them.

We begin with the work done by Mircea Dutu (training and development needs international environmental law), published in 2010, then the study by N. Josan (global environmental systems), published in Oradea in 2002 and Stefan Tarca, (Environmental Law), Ernest Lupan, (Environmental Law). We chose to analyze this issue because it affects people's lives in a negative way and to also draw a warning on the destruction of our planet whom we should love, considering that it is our house, by destroying the planet we destroy “our house”, our environment.

Until recently the Earth's renewable natural resources were sufficient for the needs of humanity. Currently, due to population explosion and unprecedented development of all sectors of industry, raw material and energy requirements for production of goods grew long and intense exploitation of earth resources reveal more obvious ecological imbalance.

As a result of industrialization and increased production of goods increased more environmentally friendly materials.

The notion of environment includes in fact all human activities in relation to man and nature, on planet Earth.

With increasing world population, which went along with the improvement of social organization and in particular with the development of industry and mechanized transport in the last two centuries, human attempt to dominate the fight harsh nature, to snatch the hidden wealth of the planet begins to be increasingly successful.

Any human activity and therefore the individual existence is unthinkable outside the environment. Therefore, its overall quality makes a mark on the level of existence and development of individuals.

The word environment(Umwelt, milieu) has been used since the nineteenth century in the biological sense and thereafter in geography (K. Rifler, P.V. de la Blanche, S. Mehedinti) is defined as living space of and influenced by man.

The word "environment" expresses a comprehensive and fundamental concept by which we understand the world living and inanimate, in principle almost all around man.

Without environmental protection one can not ensure sustainable development. Sustainable development includes environmental protection and sustainable environmental condition.

Natural environment ie air, oceans, seas, lakes, rivers, soil and subsoil and forms of life that these ecosystems create and support is the most common image that the average person makes when he talks about the environment.

Environmental damage is caused by: the existence of too many cars, jets and heavy ships, too many factories operated by old technology, polluting, consuming raw materials, water and energy, phenomena which are determined ultimately by the growing needs of a population in a state of demographic explosion and especially the existence of large urban agglomerations.

The environment is an essential element of human existence and is the result of interference of natural elements - earth, air, water, climate, biosphere - the elements created by human activity.

The environment must be adapted and organized to meet the needs of individuals, which means choosing the right kind of

resources and processing them to serve people (to satisfy their needs).

Sustainability is based on the idea that human activities are dependent on the environment and resources. Health, social and economic stability of society is essential in defining quality of life.

Sustainable development means assuming (economic principle), respect the ecological balance (ecological principle) and consideration of inter-and intra-generational equity (the principle of solidarity).

Man is the focus regarding sustainable development, having the right to a healthy and productive life in harmony with

Sustainable development requires,, according to Gheorghe Zaman, compatibility and a dynamic balance between resources and consumption, between organic, technological and economic systems, between utilization rate and the rate of regeneration of natural resources between the amount of pollutants and the endurance capacity (assimilation) of the environment

Agenda 21 is an extremely comprehensive program of sustainable development in XXI century, treating almost all relevant aspects in terms of development: poverty alleviation, gender equality, the interests of indigenous peoples, social groups participating in the political process, climate protection, protecting species , protecting drinking water supplies, etc.

One of the major documents adopted at the meeting in Rio de Janeiro is the action plan entitled "Agenda 21". The Action Plan brings as innovation the establishment of global responsibilities for the UN and its system bodies to addressing and solving environmental problems.

Sustainable development answers to the needs of present humanity without compromising the ability of future generations to satisfy themselves, their own needs.

In other words, it's about seeing that resources of this planet are limited and that excessive and irresponsible consumption is detrimental to those who come after us.

Environmental policy has got the following objectives: environmental protection, improving its quality, protection of public health and the prudent use of natural resources, promoting measures at international level on environmental

problems of regional and global dimensions.

At present EU policy regarding environmental protection is based on the idea that high environmental standards stimulate innovation and create new business opportunities. Economic, social and environmental protection are closely related to each other.

All environmental policy is based on the principle of "polluter pays". Thus, the pollutant source can "pay" or through investments in raising the standards of protection, either by paying a fee that covers use of polluting products, either by industry or by ordinary consumers. Payment made may also include the obligation to recover, recycle or dispose of the goods used.

Romania has signed, at the 1992 Rio Summit, the United Nations Framework Convention on Climate Change (UNFCCC), ratified by Law no. 24/1994. The main objective of this Convention is to stabilize greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic interference with the climate system.

Climate change affects us all both globally and nationally.

Global warming began to worry after 1960, following massive industrial development and increasing greenhouse gas concentrations that are considered largely responsible for this phenomenon.

In addition to industrial development, another important issue is the massive deforestation of forests. This results in an increased concentration of pollutants, which causes the effect of global warming and ozone depletion. To stop the negative effects caused by this deforestation, experts say that afforestation would need a total of 20% compared to the forest existing world-wide.

One of the effects of global warming is the rising of sea levels, an effect that has two causes: the growth of water by expansion following heating and the addition of melt water ice of polar caps and glaciers on land.

Global warming is the phenomenon of the growth of recorded average temperatures of the atmosphere near the ground and ocean water, found in the last two centuries, especially in recent decades.

Global warming is caused by human activity, especially by releasing carbon dioxide into the atmosphere by burning fossil

fuels.

The main cause of global warming is the increase of CO₂ in the atmosphere over the past centuries.

The average air temperature near Earth's surface has risen in the last century by about 0.7 degrees Celsius. The main elements that produce the greenhouse effect are water vapor, carbon dioxide, methane and ozone.

The effects on the atmosphere are the increasing of evaporation, rainfall and number of storms.

3. Conclusions

Global warming causes soil temperature to rise, leading to dryness, favoring forest fires.

EU report on the consequences of global warming on the security environment notes that melting Arctic ice could provide exploitable natural resources such as fisheries or natural gas and oil deposits that are currently locked under ice continental shelf.

Sea level rise leads to aggravation of flooding problems, especially in very low areas, such as those in the Netherlands, Bangladesh and Venice. Communities living in flooded areas are often very poor, because it is the only fertile ground they have access to.

Reducing Global warming is practically to limit CO₂ concentrations to 400-500 ppm by volume. The proposed path is to reduce emissions of greenhouse gases by reducing energy consumption and use renewable energy.

In order to reduce CO₂ emissions the use of energies that are not based on combustion technology such as solar, hydro and wind energy is recommended.

The Development of Cultures in Accordance with the Ecological Demands of the European Union

Braşoveanu Florica

Brezeanu Lisievici Alexandru Petru

“Ovidius” University of Constanta, Faculty of Law and Administrative Sciences

floriordache@yahoo.com

Abstract

Ecological agriculture has grown within several countries and the European Union sets quality standards that satisfy both the buyer's needs and the need to protect environment.

Beginning 1980, biologists and ecologists dealing with the protection of wild nature signed the alarm, stating that without a change of mentality and the way of dealing with natural resources, they will disappear and the entire civilisation along with them.

Following the scientists, agricultors have shown grown interest towards agricultural techniques better integrated in the cycles of nature.

Key words: Environment, Ecological culture
Ecological agriculture, Protection

J.E.L. classification: K32

1. Introduction

The year 2007, when Romania joins the European Union marks a new era in agriculture and rural economy of our country. Joining the EU is probably the most powerful factor of pressure to fastly reform the agriculture and rural economy in Romania, given the need for successful integration in the European rural economy.

The latest EU policy on organic agriculture is the European Action Plan for Organic Agriculture and Food adopted in June 2004 the European Commission. Romania's integration, including agriculture, in the Community of Europe structures, imposed acutely to adapt food production to existing quality standards, meeting the requirements of the buyer of organic products. In terms of agricultural policy objectives, Romania has a very favorable

position. The fact that the Romanian agriculture fertilizer and pesticide consumption is 10-11 times lower than the European average, makes possible an emphasis on quality agriculture and quality means, first of all organic products. Without a real agricultural reform to regulate the land market and the agricultural credit and to encourage private holdings, however small they may be, our country will not be able to seize the current favorable moment when the world is looking more and more for organic products..

2. The Matter Seat

Romania has favorable conditions for promoting organic farming ie fertile and productive soils, chemical treatment and tech have not yet reached the levels of industrialized countries, traditional Romanian agriculture is based on the use of clean technologies, it is possible to define perimeters green clean where to apply organic farming practices, the demand for organic products is growing, organic farming can become a source of employment to the rural population. Since Romania has favorable agro-ecological potential of organic farming practice and that at least 15% of agricultural land can be converted easily to this type of farming as chemical treatment and even technologically developed countries have not reached, there is still a possibility to delineate areas where ecological farming practices apply.

The European model of agriculture is based on a competitive sector, market-oriented, meeting, also, and other public functions, such as environmental protection, offering residential villages more convenient for people in rural areas, and integration with the environment and agriculture forestry. Common Agricultural Policy is moving its

focus from direct subsidies to integrated development of rural agriculture economy and to protect the environment.

Organic farming (also called organic or biological) appeared in Europe as an expression of the distrust of people towards food safety measures caused by the occurrence of disease through consumption of products bearing pollutants (dioxins, trichinae, Salmonella, E. coli, influenza, prions, etc.). As more episodes of illness have been generated by technology for intensive industrial production by over-focusing based on agricultural land, the use of stimulators (antibiotics, hormones, etc.) in food, shaped a new requirement, strong enough, which turned into a real European movement to obtain food products with clean technologies, clean, without undesirable substances.

The basis of organic production is the idea that the main cause of degradation of the biological quality of products is poor man's intervention at different structural levels of the biosphere, and the worst effects on humans resulting from the cumulation of errors on soil, plants and animals. Organic farming has a particular focus on natural quality products, quantitative aspects and productivity is on a peripheral level.

Organic farming promotes the sustainable production systems, diversified and balanced to prevent pollution and environmental yield. Organic crop production without the use of harmful traditional products, is experiencing a particular concern for several decades in economically developed countries. Interest in products and organic production is increasing in our country. Unfortunately, the areas under the ecological conditions in our country are still very low.

Organic farming is the kind of agriculture that relies on minimizing the use of foreign materials, by prohibiting the use of synthetic chemicals as fertilizers and soil conditioners, pesticides, ingredients for feed preparation, ingredients and processing aids for food preparation.

GMOs and their derivatives are prohibited in organic agriculture.

Organic farming is based on compliance with strict production rules and principles, regulated by legislation. All stages of production, including storage, processing, packaging and labeling are controlled by an

inspection and certification body, established for this purpose.

Organic farming involves production management systems that promote health and improve agro-ecosystems, including biodiversity, biological cycles and soil biological activity. The emphasis is to the application of management practices, preferred non-farm inputs, taking into account that regional conditions require locally adapted systems. Where possible, apply cultural methods, biological and mechanical free synthetic materials, to fulfill any specific function within the system.

An organic production system is designed so that:

- To improve the biological diversity of the whole system;
- Increase soil biological activity;
- To maintain long-term soil fertility;
- To recycle plant and animal waste, soil nutrients to play, so minimizing the non-renewable resources;
- Be based on renewable resources that can be organized in local farming systems;
- To promote healthy use of soil, water and air and minimize all forms of pollution from agricultural activities;
- To handle agricultural products with an emphasis on careful processing methods to maintain organic integrity and vital qualities of the products at all stages;
- To be stable in any firm in a period of transformation, the corresponding duration of which is determined by specific local factors as history of land, crops and livestock type product.

In conclusion, the development of ecological agriculture in line with European Community Council regulations, may be one of Romania's "passports" for the integration into EU structures.

Romania has the appropriate conditions to promote organic farming, such as:

- soil fertile and productive;
- Romanian agriculture is based on traditional approaches that are environmentally friendly and environmentally friendly ways to identify areas where organic unpolluted agriculture could be developed; The aim is to position organic agriculture in the national center as a pivot for long-term development in rural areas.

The main objective of EU agricultural policy on rural development is to promote and develop a relationship between agriculture and environment. The presence of pesticides in drinking water has become an increasingly larger issue, conventional agriculture being the main source of water contamination by nitrates, nitrites, bacteria, pesticides.

Not using pesticides results in a lower risk of contamination of agricultural products. Agricultural products are healthy, safe for human and animal consumption.

Farmers practicing organic farming are less exposed to risk of contamination by pesticides. It is known that many farmers die annually and present various serious conditions, which are caused by pesticides. Decreased biodiversity in conventional farming systems has the following causes: specialization, intensification, lack of mixed farms, lack of land uncultivated, pesticides (insecticides, herbicides, fungicides).

Use of pesticides is a threat to plants, animals and humans. Pesticides threaten the existence of certain wild species of plants and animals, with important implications throughout the food chain. By using pesticides we reduce the food sources for birds. Organic farms show an increase in the number and species of birds.

Crop rotation practiced on organic farms maintains soil sustainability, causes fewer problems caused by diseases, pests and weeds. Organic farming contributes to a more varied landscape and ensures greater biodiversity.

Conventional agriculture has decreased soil organic matter content and caused the accumulation of toxic compounds. In organic practice, soil fertility and health are maintained by biological methods such as crop rotation, hand work, weeding, composting, mulching using organic fertilizers is increased and maintains the percentage of soil organic matter.

Not using chemical fertilizers and organic fertilizers intake reduce the risk of washing nutrients, a problem in many countries and a threat to drinking water.

Organic farming aims to preserve unaltered the environment by using organic fertilizers and the less soluble minerals, the compost, green fertilizer, vegetable preparations. Use of pesticides is prohibited,

only products that do not harm plants, based on simple mineral salts and plant extracts are allowed.

Organic agriculture minimizes global environmental problems such as acid rain, global warming, biodiversity loss, desertification.

Organic farming is based on intensive manual labor practices.

Organic food market is booming, especially in industrialized countries. Growing demand for organic agricultural products from consumers makes many farmers switch to organic practices. Organic farming can be a source of income for small farmers, family farms. In organic farming productions per unit area are lower than conventional farming systems. Decreased yields were recorded especially during conversion from conventional agriculture to organic farming, requiring some time before the agricultural ecosystem restored an ecological balance, after which the production is stabilized. Price recovery of organic agricultural products is higher than that of conventional products.

Specific techniques of production used in farming systems plus some smaller productions than in conventional systems of production are causing the prices to be slightly higher.

Even in developed countries where organic agriculture has a higher profile, it was and still is supported by various economic levers (subsidies, tax exemptions, etc.). Currently, when these forms of supporting the organic farming are eliminated for various reasons, a return of farmers to conventional agriculture system is visible.

The need to support organic farming is particularly important as it is in the early stages of development in certain countries. For organic products to be marketed as such, they must be controlled and checked by approved laboratories. These laboratories should be available to agricultural producers, both in time and space, as well as in financial terms. For example, organic products obtained in Romania are sent to laboratories in other countries to control

3. Conclusions

To mitigate the effects of pollution, one has started large projects and actions to raise awareness, especially large industrial concerns, to take measures to eliminate the effects of pollution. In this context, contemporary society advocates for healthy eating and a healthy lifestyle. The starting point of a healthy diet is the food source, namely agriculture. The idea of a biological food excludes chemical fertilizers. Thus, increasingly one insists on the idea of developing an organic farming in which to completely eliminate use of chemicals that do nothing but diminish the quality of fruit and vegetables, and harm the health of those who consume them.

EU emphasises on the production of animal and vegetable organic goods and encourages those who practice such agriculture.

Organic farming is a dynamic sector in Romania in recent years which has seen an upward trend, both in the vegetable and animal production sector.

Organic crops are (now) smaller and sometimes more expensive by 10-30% compared with the conventional. Decreased yield and economic efficiency is compensated by increasing the quality and stability of organic production

Manpower requirements is greater than in conventional agriculture which, in practical terms, it means jobs, and additional expenses.

Organic farming has greatly contributed to lasting economic development and play an important role in improving environmental conditions, soil preservation, water quality improvement, biodiversification and nature protection.

Organic farming can go forward in the rural economy and make it viable by expanding economic activities with high added value and generating employment in rural areas

The Structure of Financial Regulation

Bratu Renate Doina

renate.tanase@ulbsibiu.ro

nic_petria@yahoo.co.uk

Abstract

During the current global financial crisis has called into question the role and objectives of the regulation of financial markets and its scope of action. Liberalization of financial services under the impact of globalization and strong innovative character of the financial system, architecture of regulation has generated a change. In this sense, this paper aims to present and evaluate the structure of financial system regulation in the current international context.

Key words: financial regulation, financial system

J.E.L. classification: G18, G21, G22, G23

1. Introduction

In today's world in which we operate pay particular attention to financial matters as a consumer of real goods and financial institutions as well as financial and non-financial, financial market participant. This is due to functions that meet the financial system in the global economic system, into the overall social welfare of the individual. It is known that the action of the financial system ensure the interaction of buyers and sellers in a financial market that determines the prices of the traded financial assets (like loans, bonds, equities, deposits, etc). By financial systems it also provides liquidity, an attractive feature when circumstances create a mechanism for investors to sell financial assets. Another function of financial system is that it reduces the cost of transacting, costs mostly knows like search costs and information costs. [8].

Due to its functions, the financial system is central to overall economic system which requires the creation of optimal operating rules and efficient financial market. It requires the exercise of financial regulation. General philosophy as a whole presents financial regulation rules and conventions accepted by the financial community at two levels. At the basic level of financial regulation aims to fulfill the specific role assigned to financial sector regulation. High-level financial regulation takes into account the role of ideologies and economic markets in general operations and financial markets in particular. The primary objective of financial regulation is to establish a high level of financial market efficiency and consumer protection in the economy. More specifically, financial regulation seeks: ensure the stability of financial system • ensure the institutional safety, • to promote consumer protection.

Historically, financial regulatory activity was generated by the first appearance of modern central banks - Bank of England - in 1694, which culminated in the adoption of The Glass Stegall Act in the U.S. in 1933. For a period of almost 40 years of monetary and economic transformations, had generated a increased international financial regulatory process. In the 1970s, 1980s and 1990s and then was held to reduce financial regulatory activities and financial deregulation phenomenon. The main factors influencing this were on the one hand the ongoing process of liberalization of financial services in a globalized context coupled with a process of innovation and sophistication permanent financial markets worldwide. [10]. Here we could add other factors such as increased competition in the field, enhancing trade flows and international financial, enhancing the interdependence of financial institutions and almost exponential development of information technologies.

2. The structure of financial regulation

As we will address, the structure of financial regulation, understood as its architecture. In this architecture are implemented tools and methods that contribute to the monitoring of financial institutions to induce, in the end, financial system stability. In past and current international environment, easily recognize different financial regulatory architecture across countries with different features of their own financial markets. In addition, there are differences in political and ideological-philosophical administration which are found in every country.

The known structure of financial regulation is the *national regulation and international regulations*. National regulation is a set of rules and constraints imposed on financial institutions that operate in the economy. This type of legislation is exercised by the authorities mandated to do so. The international regulation aims to establish international norms and constraints applicable to financial institutions acting especially internationally. We can also think in terms of international regulations at regulations that imposed action area, ie the effect aimed at efficiency and stability of the entire international financial system. In terms of performance accountability international regulation noted that currently there is no institution or group of institutions that are mandated with this responsibility. There are only a few entities and international forums regularly or certain applications (eg the G20) made some recommendations regarding the structure, content and tools would be used for the international financial regulation, and thus a stable international financial system. Further, is up to the national regulatory authorities to implement these recommendations in their laws as rules and principles of financial regulation. From another point of view we can consider international regulation as all national and regional regulations.

Depending on the level to which the exercise, we know *financial regulation macro-prudential and micro-prudential financial regulation*. Macro-prudential financial regulation requires that the institution responsible for it should have

authority macroeconomic aggregate the entire economic system, and have systemic importance. Usually macro-prudential oversight holds responsibility for central banks. Micro-prudential financial regulation is responsible for supervision of individual financial institutions in each hand and must be characterized by individuality, prudential, legal and valuation. In practice savings, micro-prudential regulation is exerted by the Financial Services Supervisory institutions. Macro and micro prudential regulations is based largely on the principle of direct relationship with the largest systemically important financial institutions in the financial market. Although the two types of financial regulators have the basic points of view different, they coexist and are valid.

Based on macro-prudential regulation and micro-prudential regulation and regulation can also highlight *public and private regulation*. Public regulation is exercised by the authorities with responsibility for macro. We consider the regulation of, that type of regulation that is achieved within the financial institution, a kind of self-regulation. For example, Basel II Drinking fountains decision to let banks create some internal models for capital adequacy in order to prevent systemic risk. However, we must mention that regulating private, understood in this sense, has a strong degree of subjectivity and can only be beneficial to individual financial institution concerned. But it must be borne in mind that these institutions operate in interconnectivity with other financial institutions, nationally and internationally. This may induce additional global systemic risk. Therefore we believe that these regulations should be monitored and somewhat limited.

In terms of the area, financial regulation can be considered exercise *regulatory sector*. Depending on the main sectors of the financial system is bank regulation, regulation of insurance and securities. At national level, the central bank can exercise fully regulate all financial sectors in the economy. But often there is mandated entity responsible for regulating one or more sectors of the financial system, as for example in the United States or in China (Table 1). At the international level, there are created three entities responsible, to some extent by sector such as: the Basel

Committee on Banking Supervision - BCBS (banking), the International Association of Insurance Supervision - IAIS (insurance), the International Organization of Securities Commission - IOSCO (securities), International Accounting Standards Board - IASB (accounting). Of the three sectors it seems that the most powerful and fully regulated is banking. The insurance sector is less regulated and securities sector is the least regulated in some of its parts not at all regulated. Sector regulation deficiencies have emerged from the crisis started in autumn 2007. Some of these deficiencies have been visible from the East Asian crisis of 1997-1998. And then, prior to the leaders of G20, and other specialists in the field, brought into focus sector fragmentation and difference of these regulations (banking, insurance, securities), which involve negative effects on efficiency and financial stability in the long run. Specialists in the Basel Banking Supervision recommended reducing committal on key differences between the financial regulators three main sectors (banking, insurance and securities). Capital adequacy measures in all sectors of the aforementioned regulation and surveillance of systemically important financial holding international and cross-border action. There are also recommends closer cooperation and transparency between the main institutions governing the financial activities sector at national, regional and international levels.

Instrumental regulation is considering regulation of financial instruments or products traded on financial markets. Here we consider the specific instruments of regulation, those involving financial products or generate systemic risk and credit risk transfer products (credit default swaps, warrants financial insurance products, etc.). These products have the characteristic of risk transfer in and out of regulatory sectors. It is therefore recommended that more specific regulation, transparent and flexible of these types of financial instruments.

Institutional regulation is the generic name for the main authority responsible for regulatory activity and can be represented by government or by another independent entity some or all of the government of that country. Due to differences in the governance of the financial system in each economy is different practice patterns and supervisory

methods in terms of consumer protection rules, the capitalization level of risk assumed by banks, various control systems, audit or enforcement of financial institutions. [6]. Therefore, in a financial system can operate one or more entities engaged in financial regulatory activities (Table 1). They are responsible for the regulation of one or more sectors of the financial system.

Table 1. The short list of regulators authorities by country

Country	Authority (s)
United States	U.S. Securities and Exchange Commission (SEC) Financial Industry Regulatory Authority (FINRA) Commodity Futures Trading Commission (CFTC) Federal Reserve System ("Fed") Federal Deposit Insurance Corporation (FDIC) Office of the Comptroller of the Currency (OCC) National Credit Union Administration (NCUA) Office of Thrift Supervision (OTS)
United Kindom	Financial Services Authority (FSA)
Japan	Financial Services Agency (FSA)
Germany	Federal Financial Supervisory Authority (BaFin)
France	Autorité des marchés financiers (France) (AFM)
Singapore	Monetary Authority of Singapore (MAS)
Switzerland	Swiss Financial Market Supervisory Authority (FINMA),
Italy	Commissione Nazionale per le Società e la Borsa (CONSOB)
Netherlands	Netherlands Authority for the Financial Markets (Autoriteit Financiële Markten, AFM)
Republic of China	China Securities Regulatory Commission (CSRC) China Insurance Regulatory Commission (CIRC) China Banking Regulatory Commission (CBRC)
Brazil	Securities and Exchange Commission (Comissão de Valores Mobiliários, CVM)
Canada	Canada is one of the few countries that does not have a country wide securities regulator. Canadian securities

	<p>regulation is instead done at province level by separate agencies coordinated through the Canadian Securities Administrators.</p> <p>Investment Industry Regulatory Organization of Canada (IIROC) (French: Organisme canadien de réglementation du commerce des valeurs mobilières, OCRCVM)</p> <p>Office of the Superintendent of Financial Institutions (OSFI)</p>

In accordance with the opinion of the Working Group on Financial Lake Squamata Regulation, in each country should be created a supervisory authority that follows systemic efficiency and stability of financial system. The role of systemic regulator should include: gathering, analyzing, and reporting information about significant interaction between and risks among financial institutions. The same institution also should establish and implement regulations flexible systems, including capital requirements, to cooperate with tax authorities and other government agencies with risk management activities. The institution with the role of systemic regulator should be the central bank. In this way, central bank become the systemic financial regulation that should not to be involved in consumer protection and business-practices regulation, should have adequate resources and should have an explicit mandate for stability of the financial system. As we see from Table 1 in most developed countries the central bank is not one of the authorities responsible for financial regulation only in very few cases. In developing countries and less developed financial system with a less sophisticated, the central bank is the primary regulatory authority of the financial system. But this does not confer the role of systemic regulator.

Formal regulation and regulation of evolutionary. Formal regulation is the body of laws and regulations issued and performed by competent authorities. History reveals that formal regulation is rigid and limited in relation to innovative and complex nature of the financial system. In the long term this

gave rise to financial crises. Evolutionary regulation is one that transforms and reinvents Depending on the financial system under time evolution and cyclical economic phenomenon.

Procyclical and countercyclical regulation regulation. Up to now most practices have shown the use of financial regulation that disadvantage procyclical type already shown to induce and increase systemic risks and therefore financial crises. With few exceptions (eg financial regulatory practices used by the authorities in Spain and Portugal) using financial regulations "against the wind" or countercyclical regulation, which proved to be more effective in creation of a more stable financial system, on a long-term. Price of countercyclical regulation practice is constraining the financial institutions to make certain types of activities and high profits. Moreover, in these situations, financial groups may choose to pass by such markets and choice the markets that are involving compliance procyclical regulation. Therefore, we agree with the idea of closer cooperation between supervisory authorities of the whole international financial system, to create uniform standards and regulatory practices, transparency and reinvented according to the financial context.

3. Conclusion

G-20 leaders recommend to be used the opportunity created by recent financial crisis to rethink and reform the structure and content of financial regulatory system, nationally and internationally. They recommend learning lessons and failures from turning crisis, to create a mechanism of resistance to the provision and future financial crises. We believe that this mechanism should be based on several key principles: coordination, collaboration, transparency, flexibility - adaptability and accountability. In this respect, we consider that to concert all these structures of financial regulation to create a truly efficient and stable global financial system.

Mathematic Modeling Within Economics – a Critical Approach

Brătian Vasile

Țăran Moroșan Adrian

"Lucian Blaga" University of Sibiu, Faculty of Economics

bratianvasile@yahoo.com

adimorosan@yahoo.com

Abstract

In this paper we try to evaluate, through critical analysis, the process of mathematic modeling used within economics. The paper aims to underline the importance of mathematic modeling within economics, but also to point out that the current modeling of the economic process is not one of the most adequate, due to the fact that orthodox economic science is still entrapped within the paradigm of mechanical economics.

Key words: mathematic knowledge, economic knowledge, rational knowledge

J.E.L. classification: B41

1. Introduction

Roy Weintraub, in his paper "How Economics Became a Mathematical Science" [2002], presented several fascinating theories on the development of mathematics within economics. This paper is considered by many to be a very important one and an extremely provocative paper, due to the fact that it was written by someone with considerable experience in the application of mathematics for formulating and solving problems within economics and which concieved with great depth to use mathematics within this area of study.

An impressive essay on this paper is written by Barkley [2003] and is the object of several other articles, like, for example, Katzner [2003].

From Weintraub's perspective, the sense of truth in economics was modified during the 20th century. This modification was inspired by the sense of change within the truth in mathematics, meaning the attitude of mathematicians concerning the importance of

axioms which state something to be true from head on, without appealing to facts.

Also, one notices the fact that mathematics spread within economics during the time that positivism paved the path through the verification and false making of middle theories in order to determine the truth.

Weintraub's attention in his book is mostly oriented on the history of mathematics in economics, and more specifically of the way in which, through aut history, mathematics influenced economics, the latter becoming, in time, a science of mathematics.

An approach through the reasons for which economics has become a mathematical science is given by Donald W. Katzner [2003]. According to him, mathematics became important to economics because of four main reasons:

1. to make use of existing human capital;
2. to attain scientific respectability;
3. to help assure security with respect to claims of truth;
4. because economics was created primarily by Western economists to understand Western economic behaviour

Concerning the first aspect, he states that the fact that many mathematicians left their field of interest and researched economics, seeing here an opportunity to apply their accumulated capital of mathematical knowledge in a new and different fashion.

Concerning the second aspect, one states that a science is respected if it has the ability to explain and to predict phenomena. In this fashion, a whole series of methodological imports was made within economics, from nature sciences, specifically, mechanical physics.

Concerning the third aspect, one states the fact that many economists appealed to mathematical modeling of economic processes in order to obtain epistemological security or for the feeling of safety concerning the intentions of truth. In other words, the import of mathematics into economics was thought to allow for argumentation and justification.

Concerning the fourth aspect, it is a known fact that most contributions to economics were made by Western economists. These have tried to catch the economic behavior of individuals by using the mathematical instrument.

From the four reasons mentioned above, we retain, according to our study, two of these, meaning the need to use mathematics within economics in order for it to be considered a science (to offer an explanation and prediction) and the need to use mathematics within economics to ensure the requisites of truth while also trying, as follows, to see to what extent one can satisfy such a desire for the economic science.

2. Mathematical knowledge and economical knowledge

In the following, we will try to approach mathematical knowledge and economic knowledge from two main analysis guidelines:

1. relationships established within the interrogative subject and the questioned object;
2. the main principles which are the foundation for rational knowledge;

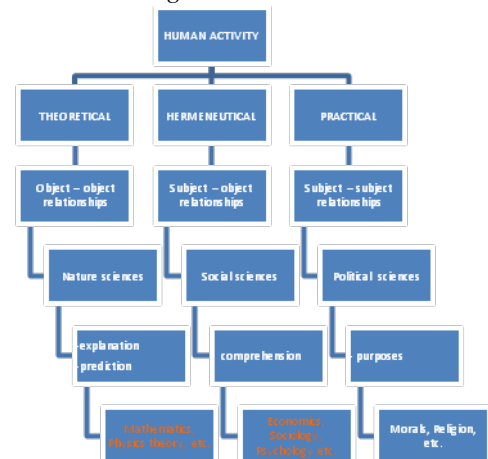

The main purpose of the analysis directions is to notice the possible resemblances within the mathematical knowledge and economical knowledge.

The need for such an approach derives from the fact that economic science desires to have scientific respectability (to bring explanations and to realize forecasts) and for epistemological security, the same as mathematical science.

According to Prof. Emil Dinga, Ph.D., human activity is in a relationship with the real world (whether it is exterior or interior to the interrogative subject) is divided into three categories (Figure 1 – The general scheme of human activity):

1. theoretical activity – which is specific to nature sciences, and has as an objective of knowledge relationships between object and object; this is adressed to fields such as mathematics, theory in physics, theoretical biology, etc., within this activity, we fiind that both explanations and predictions are possible;
2. hermeneutic activity – which is specific to social sciences, and has as objective of knowledge relationships between subject and object, it tackles fields such as economics, sociology, psychology, logic, etc. and makes comprehension available;
3. the practical activity – specific to political sciences, and it has as object the knowledge of subject – subject relationships; it adresses fields such as politics, morals, religion, etc. within these activities purposes are available.

Figure no. 1

Source: Emil Dinga, SpDAE, Academia Română, 2011

As a result of this classification, human activity presents several particularities concerning the interrogator subject and the questioned object, as follows:

- *within the human activity of theoretical kind*, the interrogator subject is considered exterior to the object of the theoretical activity. The action of the interrogator subject in the process of interrogation of the subject does not influence (disturbs, modify, etc.) the object.
- *within the human activity of hermeneutical kind*, the interrogative subject is not different, in a decisive

manner, from the questioned subject. The action of the interrogator subject within the questioning process of the object influences (disturbs, modifies, etc.) the object.

- *Within the political activity kind*, the interrogative subject and the questioned object are inoperable: the interrogative subject and the questioned objective are, at the same time, interrogator and questioned.

Considering the relationships that are established within the knowledge process between the interrogative subject and the questioned object, on the three categories of human activities, we can make the following affirmations:

1. *Concerning mathematical knowledge* [Dinga Emil, 2010]:

- Mathematical knowledge is a knowledge of *theoretical kind*. This means that, methodologically, there are many axioms from which a series of theories can derive which have as an object of knowledge the *relationships between object and object*;
- Mathematical knowledge is of a *dynamic kind*. This means that, once the identity conditions were established (quantitative, structural or evolutionist conditions) for a class of abstract mathematical objects, these identity conditions are verified for every individual;
- Mathematical knowledge is, mostly, of a *tautological kind*. This means that, except for a restricted number of axioms (which are synthetical type sentences), the rest of the mathematical sentences are of an analytical type. Analytical sentences only describe, in other words, pre-existing contents;
- Mathematical knowledge is *acontextual*. This means that mathematical results objects are valid at any time and at any space;
- Mathematical knowledge is *intrinsic to human thought*. This happens due to the fact that the structure of human thought is isomorphic with the functional structure of our Universe (we perceive the causality at an identical level with real causality, inherent to our Universe).

2. *Concerning economic knowledge*

- Economic knowledge has as object of knowledge the *subject-object relationships*. In this case, it means that the interrogative subject is not a distinctive part of the interrogated object;
- Economic knowledge is *not of a dynamic type*, in an absolute manner, because the conditions of identity are not checked for every individual. In economics, we have non-individual or aggregate individuals.
- Economic knowledge is *not tautological*, because, due to the possibility of the modification of initial conditions, analytical sentences can no longer describe pre-existing contents;
- Economic knowledge is *contextual*, this means that economic objects of results are not valid in any time or space;
- Economic knowledge is *not intrinsic to human thought*, meaning that the perception of causality at the current level of thought can differ from real causality.

We would also like to mention the fact that rational knowledge must be based on two fundamental principles:

1. *The principle of intelligibility* – this principle assures us that the real world (exterior or interior in relation with the interrogative subject) can be ordered in a rational way, this means that it is possible to identify an explanatory model of a logical kind, which is coherent, consistent and complete, concerning the phenomenology which represents the object of knowledge;
2. *The principle of objectivity* – this principle assures us that the interrogative subject is not a part of the reality which includes the knowledge process, and the interrogation is done in a von Neumann regime.

Considering (Figure 1) these two principles of rational knowledge, we notice the fact that mathematical knowledge respects them completely, but we still have our doubts whether they are respected within the economic knowledge or not. In other

words, in economic, the second principle of rational knowledge is not respected, meaning that the interrogative subject is no longer completely and decisively different from the questioned object.

Thus, within knowledge in economics, there is a situation where an interrogative subject questiones an object which is not part of the object-object unit, rather from the subject – object unit. The effect is, that in this situation, the interrogative subject is not percivable as different from the questioned object and the logical conclusion is that, as a whole, economic knowledge can not ensure knowledge of what is real, meaning on truth and must limit itself with a likely knowledge of the interrogated object.

3. Mathematic modeling of economics

Considering what we said before, we believe that mathematical modeling in economics is a modeling based on, as, actually, in mathematics, on dynamic ecuations, and this fact makes for the description of the economic process, but even more so, of the predictions made on the basis of the current modeling to present several considerable uncertainties and unacceptable imprecisions.

In his paper „*Studii de economie – contribuții de analiză logică, epistemologică și metodologică*” [Economic studies – logical, epistemological and methodological analysis contributions] of Professor Emil Dinga [1], Ph.D., there are several statements concerning the economic process and its modeling in orthodox economic science:

1. *The economic process is considered a mechanical process:*

- It is a completely causal process;
- The causality of the economic process is of an eutaxiological kind (the noticeable order has an efficient cause – in the sense of Aristotle); we must notice the fact that, in the theleological causality, the noticeable order has a purpose (the final cause – in Aristotle`s sense);
- Time and space which localizes the economic process are considered absolute (independant from the economic process itself);
- The economic subject is considered a sui-generis machine for the optimization of

decisions; it is situated on the outside compared to the economic process (different in a decisive manner);

- The values which guide a society and which determine its vision on the world (religion, scientific and technological initiative, the political and economic order, etc.) are not considered variables of the economic process (the main values presented in actual economic models are those which can be quantified by attributing equivalent monetary values);
 - Non-linear, bifurcation points, attractors, are not attributes of the orthodox process;
2. *As a result, orthodox modeling of the economic process has the following attributes:*
- Is based on optimization processes;
 - Is based on dynamic ecuations (even if a certain relaxation of the dynamic characteristic is noticed, via the introduction of statistic alleatory variables);
 - Is based on the variability of initial conditions (or final, according to case) of the economic process;
 - Is based on the exogenous nature of the human process (as a decider and participant), which ignores the Oedipus effect (the Oedipus effect is the one which modifies the initial conditions).

Moreover, we can also mention the fact that, in mathematic modeling, one takes into account three methodological premises which are extremely debatable:

1. The rationality of the individual;
2. The idea that the economic process tends towards equilibrium;
3. The minimization of the opportunity cost.

Concerning these methodological principles, one notices that:

- Firstly, the fact that economic modeling is considered identical with mathematical modeling, meaning the fact that they start from the premise that both principles of rational knowledge are satisfied, which is extremely debatable, due to previous reasons;
- Secondly, the fact that the individual which models the economic process is not treated like a historic individual, rather like a generic, non-contextual individual, rather an optimization machine, which represents a gross and

unacceptable simplification from a praxiological perspective;

- Thirdly, the fact that, in economic theory, the economic processes are considered self-regulatory and not through the means of normative-type impulses.

Having said this, in our opinion, the most important causes which are the origin of the orthodox economic process modeling and which are not found in reality are:

✚ The economic order is an eutaxiologically generated order in economic modeling, meaning:

1. It is based on four methodological invariances:
 - The invariance of the law linked to initial conditions;
 - The invariance of the law linked to the time arrow;
 - The invariance of the law linked with the quantitative accumulations;
 - The invariance of the law linked to final causes;
2. The rejection of the idea according to which the efficient causes of the economic process are effects of the final causes;
3. It is believed that the future can not be normatively built, only casually forecasted;
4. Possible worlds are already given, via probabilities;

✚ Man is placed outside the modeled economic process and for this reason it is believed that he:

1. Does not influence initial conditions;
2. Does not influence the movement law;
3. Does not continuously evaluate the context;
4. Is not considered one of the independent variables only under the sign of the production factor.

In conclusion, the modeling of the current economic process has, as basis, the principles of rational knowledge, specific to nature sciences (of mathematics is a part of), using efficient causalities and not purpose causalities, and which does not integrate the interrogative subject within the questioned object.

The Development of a Multi-Item Scale to Measure Brand Equity

Brunello Adrian

“Alexandru Ioan Cuza” University of Iași, Doctoral School of Economics
adrian_brunello@yahoo.com

Abstract

This paper seeks to explore the way in which a multi-item scale for measuring brand equity can be developed. Nowadays brand equity has become a very complex and significant construct and it is the subject of much research. The article presents a brief introduction into the concept of brand equity and a short piece of theory about the development of multi-item scales. It also includes a valid and reliable measurement instrument for this complex construct which can be successfully applied to the Romanian market.

Key words: brand equity, multi-item scales, brand equity constructs, proposed questionnaire, exploratory factor analysis.

J.E.L. classification: M310

1. The concept of brand equity

The concept of brand equity has lately been the subject of much debate. Researchers started asking themselves whether brand equity should be analyzed from a consumer-oriented or a market performance-oriented perspective. Motomeni and Shahrokhi (1998) presented this disagreement and they identified two opposing viewpoints: the marketing perspective and the financial accounting perspective [1].

The two major theories when we speak about brand equity from a marketing perspective belong to Aaker and Keller. Aaker (1991) defined brand equity as “a set of five categories of brand assets (liabilities) linked to a brand’s name or symbol that add to (subtract from) the value provided by a product or service”. He specified the five dimensions of brand equity: a) brand awareness; b) brand perceived quality; c) brand associations; d) brand loyalty; and e) other proprietary brand assets, such as

patents, trademarks and channel relationships. Aaker considers these dimensions the main bases for brand equity measurement [2].

Keller defined “Customer-Based Brand Equity” as “the differential effect of brand knowledge on consumer response to the marketing of the brand”. There are three key ingredients to this definition: 1) differential effect, 2) brand knowledge, and 3) consumer response to marketing [3].

2. Developing multi-item scales

One of the main values of a scale is its ability to measure a concept by using multiple indicators rather than one, which facilitated the complexity of concepts. A single observation may be misleading and lacking in context thus multi-item measurement scales help overcome these distortions. Scales also allow for greater precision, specifically in relation to ranking or classifying groups and identifying subsequent differences or similarities. Lastly, by summarizing the information presented by a number of questions into one variable the analysis is simplified.

The characteristic to be measured is called a construct. Scale development begins with an underlying theory of the construct being measured. A theory is necessary not only for constructing the scale but also for interpreting the resulting score. The next step is to generate an initial pool of scale items. Typically, this is based on theory, analysis of secondary data, and qualitative research. From this pool, a reduced set of potential scale items is generated by the judgment of the researcher. Some qualitative criterion is adopted to aid the judgment. The reduced set of items is still too large to constitute a scale. Thus, further reduction is achieved in a quantitative manner.

Data are collected on the reduced set of potential scale items from a large pretest sample of respondents. The data are analyzed using techniques such as correlations, factor analysis, cluster analysis, discriminant analysis, and statistical tests. As a result of these statistical analyses, several more items are eliminated, resulting in a purified scale. This purified scale is evaluated for reliability and validity by collecting more data from a different sample. On the basis of these assessments, a final set of scale items is selected.

3. Constructs of the consumer brand equity model

One of the most recent models that links brand equity and purchase decision in the automobile industry is the model proposed by Ahmed Tolba [4].

In this model Tolba uses the following constructs:

1. Knowledge Equity – divided into two sub-constructs: Awareness and Familiarity;
2. Attitudinal Equity - divided into four sub-constructs: Affect, Prestige, Perceived Quality and Perceived Value;
3. Relationship Equity - divided into two sub-constructs: Customer Satisfaction and Attitudinal Loyalty;
4. Behavioral Constructs: Brand Preference, Purchase Intention and Behavioral Loyalty.

The dimensions of brand equity identified by Aaker and Keller are also included in Tolba’s model.

4. Initial pool of items

Marketing literature includes many scales and items which help measuring the constructs presented above.

The Knowledge Equity construct can be measured using different scales and items:

I. Familiarity of the Object scale developed by Oliver and Bearden (1985) [5].

1. In general, would you consider yourself familiar or unfamiliar with.....? (*very familiar / very unfamiliar*)

2. Would you consider yourself informed or uninformed about? (*not at all informed / highly informed*)
3. Would you consider yourself knowledgeable about? (*know a great deal / know nothing at all*)

II. Knowledge of the brand scale developed by Algesheimer, Dholakia and Herrman [6]

1. When compared to other people I know a lot about this brand.
2. My friends consider me an expert regarding this brand.
3. I consider myself very experienced with this brand.

The Perceived Quality construct can be measure using the following scales and items:

I. Quality of the Brand scale developed by Keller and Aaker (1992) [3].

1. low quality / high quality
2. not at all likely to try / very likely to try
3. inferior / superior
4. bad / good
5. worse than most brands / better than most brands
6. negative / positive
7. not likely to buy / very likely to buy

II. Quality of the product scale developed by Adaval and Monroe (2002) [7].

1. extremely low quality / extremely high quality
2. very little durability / very high durability
3. very unreliable / very reliable

The Perceived Value construct can be measured using different scales and items:

I. Value of the Product scale developed by Oliver and Bearden (1985) [5].

1. not at all expensive / very expensive
2. poor value for the money / good value for the money
3. a bad bargain / an excellent bargain

II. Value of the product scale developed by Adaval and Monroe (2002) [7].

1. extremely bad buy / extremely good buy
2. not worth the money / well worth the money
3. very bad bargain / very good bargain.

The Prestige construct can be measured using the following scale and items:

1. This brand is prestigious (*strongly disagree / strongly agree*)
2. This brand is exclusive (*strongly disagree / strongly agree*)
3. This brand is high status (*strongly disagree / strongly agree*)

The Satisfaction construct can be measured using the following scales and items:

I. General Satisfaction scale developed by Oliver and Bearden (1981) [5].

1. This is one of the best..... I could have bought.
2. This is exactly what I need.
3. Thishasn't worked out as well as I thought it would.
4. I am satisfied with my decision to buy this.....
5. Sometimes I have mixed feeling about keeping it. (r)
6. My choice to buy this was a wise one.
7. If I could do it over again, I'd buy a different make / model. (r)
8. I have truly enjoyed this.....
9. I feel bad about my decision to buy this (r)
10. I am not happy that I bought this
11. Owning this has been a good experience.
12. I am sure it was the right thing to buy this

The Attitudinal Loyalty construct can be measured using the following scale and items:

I. Loyalty scale developed by Yoo, Donthu and Lee (2000) [8].

1. I consider myself to be loyal to the brand. (*strongly disagree / strongly agree*)
2. The brand would be my first choice. (*strongly disagree / strongly agree*)
3. I would not buy other brands if the brand is not available. (*strongly disagree / strongly agree*)

The Brand preference construct can be measured using the following scale and items:

I. Brand preference scale developed by Sirgy et al. (1997) [9].

1. I like better than other car brands. (*strongly disagree / strongly agree*)
2. I would consider buying before other car brands. (*strongly disagree / strongly agree*)
3. I would prefer to other car brands. (*strongly disagree / strongly agree*)

The Behavioral Loyalty construct can be measured using the following scales and items:

I. Brand Loyalty scale developed by Algesheimer, Dholakia and Herrmann [6].

1. I intend to buy this brand in the near future
2. I would actively search for this brand in order to buy it.
3. I intend to buy other products of this brand.

II. Loyalty scale developed by Cronin, Brady and Hult (2000).

1. The likelihood that I will buy a brand again is. (*very low / very high*)
2. The likelihood that I would recommend a brand to a friend is. (*very low / very high*)
3. If I had to do it again, I would make the same choice and buy a brand. (*strongly disagree / strongly agree*)

The Intention to Buy construct can be measured using the following scales and items:

I. Purchase Intention scale developed by Rodgers (2004) [11].

1. I'm likely to make a purchase / I'm unlikely to make a purchase
2. I would like to have more information / I would not like to have more information
3. I'm interested in / I'm not interested in

II. Intention to buy scale developed by Pettevu and Lord (1994) [12].

1. It is very likely that I will buy this brand. (*strongly disagree / strongly agree*)

2. I will definitely try the brand in the near future. (*strongly disagree / strongly agree*)
3. I will probably purchase this brand in my next car purchase. (*strongly disagree / strongly agree*)

5. Qualitative research

The qualitative research is important because the above presented items are specific to the North American cultural context. It is therefore necessary to adapt the items to the Romanian cultural context. The final outcome will be a valid and reliable questionnaire.

The research problem referred to the investigation of the influence of the brand on the purchase decision in the automobile industry. The top three most sold car brands in Iasi have been analysed: Renault, Opel and Skoda.

Four focus groups have been organized and the participants were divided into two age groups: 25-34 and 35-44. They were selected from the dealers of the three car brands and also from rent-a-car companies. The focus groups had five major discussion topics: ways of establishing a hierarchy among car brands in terms of perceived quality; the description of a valuable car; the description of a prestigious car; the description of the preferred car; loyalty towards a car brand

6. Proposed questionnaire

According to the items found in the marketing literature and the ones resulted after the four focus groups the following questionnaire has been developed:

1. Have you heard of the brand Renault/Skoda/Opel? (yes / no)
2. Can you identify / recognize it if you meet it on the street? (definitely yes / definitely no)
3. To what extent do you consider yourself informed about this car brand? (very informed / not at all informed)
4. Renault/Skoda/Opel is part of the car category that you consider: inferior, medium towards inferior, medium, medium towards superior, superior.

5. Renault/Skoda/Opel has: low quality, medium towards low quality, medium, medium towards high quality, high quality
6. Renault/Skoda/Opel is cheap, rather cheap, so and so, rather expensive, expensive
7. The relationship between quality and price for Renault/Skoda/Opel is: low, rather low, so and so, rather high, high.
8. The purchase of a Renault/Skoda/Opel is a: bad business, rather bad business, so and so, rather good business, good business.
9. Renault/Skoda/Opel is a prestigious brand: strongly disagree, disagree, neither agree nor disagree, agree, strongly agree
10. Renault/Skoda/Opel is an exclusive brand: strongly disagree, disagree, neither agree nor disagree, agree, strongly agree.
11. Renault/Skoda/Opel offers a social status: much below the average, below average, medium, above average, much above average
12. Renault/Skoda/Opel is a car brand: disagreeable, rather disagreeable, neither agreeable nor disagreeable, rather agreeable, agreeable.
13. As a brand Renault/Skoda/Opel: I simply dislike it, I rather dislike it, It doesn't matter for me, I rather like it, I simply like it.
14. On the whole Renault/Skoda/Opel gives me a feeling: negative, rather negative, neutral, rather positive, positive.
15. I like Renault/Skoda/Opel more than other car brands: strongly disagree, disagree, neither agree nor disagree, agree, strongly agree.
16. If I were to buy a car I would take Renault/Skoda/Opel into consideration before other brands: strongly disagree, disagree, neither agree nor disagree, agree, strongly agree.
17. On the whole I can say that I prefer Renault/Skoda/Opel to other brands: strongly disagree, disagree, neither agree nor disagree, agree, strongly agree.
18. Did you possess a Renault/Skoda/Opel? (yes / no)
19. Did you rent a Renault/Skoda/Opel? (yes / no)

20. Did you drive (without owning or renting) a Renault/Skoda/Opel? (yes / no)
21. To what extent are you satisfied with the characteristics of the Renault/Skoda/Opel brand?: very small, small, neither small nor large, large, very large.
22. I am disappointed with the performances of the Renault/Skoda/Opel brand: strongly disagree, disagree, neither agree nor disagree, agree, strongly agree.
23. Renault/Skoda/Opel is my first choice when it comes to buying a car: strongly disagree, disagree, neither agree nor disagree, agree, strongly agree.
24. If Renault/Skoda/Opel were temporarily off the market I would not buy another brand: strongly disagree, disagree, neither agree nor disagree, agree, strongly agree.
25. On the whole, I consider myself loyal to the Renault/Skoda/Opel brand: strongly disagree, disagree, neither agree nor disagree, agree, strongly agree.
26. The probability of repurchasing a Renault/Skoda/Opel is: very low, low, neither low nor high, high, very high.
27. The probability of recommending a Renault/Skoda/Opel to a friend is: very low, low, neither low nor high, high, very high.
28. It is very likely to buy a Renault/Skoda/Opel: strongly disagree, disagree, neither agree nor disagree, agree, strongly agree.
29. I will definitely try a Renault/Skoda/Opel: strongly disagree, disagree, neither agree nor disagree, agree, strongly agree.

7. Testing the initial questionnaire

The intelligibility of the questionnaire was verified by applying it to 15 people who took part in the focus groups. Therefore it was shown that people understood the items and could give an answer to each question.

The next step was the exploratory factor analysis. The purpose of conducting an exploratory factor analysis is to identify the factor structure underlying a set of variables, responsible for the co-variation in the dataset. In exploratory factor analysis, factors are extracted to account to the common variance,

while the remaining unique variance is unanalyzed.

There are 18 items that cover the following constructs: Knowledge Equity (2 items), Quality (2 items), Value (3 items), Prestige (3 items), Affect (3 items), Satisfaction (2 items) and Attitudinal Loyalty (3 items). These items have been analyzed, hoping to generate factors that are conceptually interpretable.

Two exploratory factor analyses have been conducted for the three models (Never Tried, Tried and Owned) for each of the three car brands Renault/Skoda/Opel. The first test involves the Knowledge Equity construct as well as Attitudinal Equity constructs (Quality, Prestige, Affect and Value). The second test involves Relationship Equity constructs (Satisfaction and Attitudinal Loyalty).

Test I: Knowledge Equity and Attitudinal Equity

This test has been performed for all the three models: Never Tried, Tried and Owned.

Never Tried

There are 13 items here: Knowledge Equity (2 items), Quality (2 items), Value (3 items), Prestige (3 items) and Affect (3 items). For each of the three sub-models (Renault, Skoda and Opel), a number of 80 observations has been performed, higher than 65 observations - the minimum size of the sample ($5 * 13 = 65$). Therefore the sample size is adequate for the exploratory factor analysis.

The decision regarding the number of factors that are going to be kept in the model can be taken following a number of criteria: **Kaiser's criterion** - refers to choosing the number of factorial axes whose eigenvalues are greater than one; **Cattell's criterion** - means the graphical representation of the eigenvalues (Scree Plot); **Benzecri's criterion** - speaks about choosing the number of axes which explain over 70% of the total variance. Using the first criterion all the item charge more than 60% on one factor and therefore they will all be retained. The KMO statistic has a 0.859 value (for Renault), 0.816 (for Skoda) and 0.881 (for Opel) showing that the solution is more than adequate.

The first Factor consists of an item belonging to the Quality construct, one item belonging to the Value construct, one item belonging to the Prestige construct and three items belonging to the Affect construct. The first factor will be named IMAGE

The second factor is made of an item belonging to the Value construct and two items belonging to the Prestige construct. Item number 10 will be eliminated from the model because it charges less than 60%. The second factor will be termed VALUE.

The third factor is made of item 2 and item 3 and will be termed KNOWLEDGE.

The same 3 factors IMAGE, VALUE and KNOWLEDGE apply for all three car brands Renault, Skoda and Opel.

Owned

The values of the KMO statistic are 0.887 (for Renault), 0.802 (for Skoda) and 0.829 (for Opel) and we have the same three factors: IMAGE, VALUE and KNOWLEDGE. Item 10 will be again eliminated from the model.

Tried

The values of the KMO statistics are 0.887 (for Renault), 0.836 (for Skoda) and 0.834 (for Opel) and we have the same three factors: IMAGE, VALUE and KNOWLEDGE. Item 10 will be again eliminated from the model.

Test II: Relationship Equity (Satisfaction and Attitudinal Loyalty)

Using the Kaiser Criterion two factors will be retained. The first factor contains two items belonging to the Satisfaction construct. The second factor contains one factor belonging to the Satisfaction construct and one factor belonging to the Loyalty construct. The two factors will be termed SATISFACTION AND LOYALTY. The situation is similar for all three analysis: Never Tried, Owned and Tried. The KMO statistic is greater than 0.8 for all the models analyzed Never Tried, Owned and Tried and for all car brands: Renault Opel and Skoda.

Reliability analyses

The exploratory factor analyses offered five factors: IMAGE, VALUE, KNOWLEDGE, SATISFACTION and LOYALTY. For a construct to be reliable the Alfa Cronbach statistic has to be higher than 0.7. This situation happens for all the

constructs except the SATISFACTION construct. Therefore item 22 can be dropped because it either refers to something else or it was not perceived correctly by the Romanian market.

8. Conclusions

After conducting an exploratory factor analysis two items from the initial proposed questionnaire were dropped: item 10 because the charging on the second factor is less than 60% and item 22 because the Alfa Cronbach statistic for the Satisfaction construct is less than 0.7 and therefore the satisfaction scale is not reliable. After studying this paper, readers come across a theory of how to develop a multi-item scale and they also have a valid and reliable instrument to measure the very complex construct named brand equity.

The Quantitative-Qualitative Controversy in Marketing Research

Brunello Adrian
Petrușcă Claudia-Ioana
„Alexandru Ioan Cuza” University of Iași
adrian_brunello@yahoo.com
petrusca_claudia@yahoo.com

Abstract

A critical point in the process of establishing a research methodology is represented by the choice related to the type of analysis that should be used: quantitative or qualitative. The arguments in favor of quantitative or qualitative research have been the subject of a large number of scientific articles. The difference that can be made between the two research methods refers to each article's technical specificity and style. In a marketing research, in order to respond to the requirements of validity and reliability, the quantitative and qualitative methodologies should be correlated so that the problem is resolved in a logical way.

Key words: quantitative research, qualitative research, validity, reliability, trustworthiness
J.E.L. classification: M310

1. Primary concepts

According to the selection method and the nature of the information, the marketing research can be [1]:

- Quantitative research – leads to quantitative results (statistics), using a series of specific techniques: surveys based on questionnaire, market investigations or panels;
- Qualitative research – identifies consumer's attitudes, perceptions and motivations, offering precise explanations pertaining to their behavior and decisions (the results cannot be directly measured from a statistical point of view and also cannot be extrapolated for the entire population. It is an exploratory research or one that regularly precedes a quantitative study adding new information. The techniques employed in

a qualitative study are: free or individual dialogues; focus groups; projective tests (the exposure of the subjects to stimuli that make them project their needs, motivations, preferences or intentions); associative tests (word association or filling in a phrase, a story or a drawing); experimental tests (allow the measurement of the interest manifested by a person towards a product, advertising or subject).

The origin of the qualitative approach comes from the historian Grambattista Vito in the second half of the XVIII century. He considered that through “intuitive understanding” people can only understand each other. Sociologists claim that the intuitive experiment and the use of empathy have been the basis of major discoveries in this field [2].

Qualitative research allows a better understanding of the investigated marketing phenomenon, without the use of quantitative research or quantifications. For example, a quantitative research study can identify the statistically significant differences among the people who use a certain product in comparison to the ones who don't use it or uses it less. On the other hand, a qualitative research study offers information about the consumer's attitudes towards a product or related to the motives that make a client buy a certain product [3].

Quantitative research uses numbers and statistical methods for testing research hypothesis. The results of this kind of study can be easily generalized.

According to the type of information generated by a certain study, the specialists make a difference between quantitative and qualitative research.

Taking into account the nature and content of the information, these can either be quantitative or qualitative [4]:

- Quantitative information refers to observing the consumer’s general behavior in the marketplace. The important aspects speak about the awareness of the products and brands, the bought quantities, purchase locations and the ways of informing about the products. This information is the answer to the “how?” and “how much?” questions and can be considered relative, objective and controllable.
- Qualitative information refers to the individual’s behavior and is usually obtained by answering the “why?” question. Opposed to quantitative information the qualitative one has a strong subjective nature. In this category one can include motivations, perceptions and arguments.

The results of a quantitative research can be enriched using the instruments of a qualitative research. Dubois and Jolibert, (1993) consider that the two types of studies are correlated and not opposed.

Emilio Bartezzaghi (2007) states that the problem doesn’t consist in establishing which type of research is the best but to determine which is the most suitable method in a certain decisional situation taking into account the purpose of the research. The quality of a research project and its results don’t depend on the proportion of the quantitative or qualitative methods used, but on the coherence of their implementation.

The difference between the two types of research can be, however, made for theoretical purposes [5]. Therefore the objective of a qualitative research is to understand a certain market phenomenon in order to identify the consumer’s motivation. In the case of the quantitative research the goal is to quantify the information and to generalize the results for the entire target population.

The analyzed sample in a qualitative research is made out of a small number of cases whereas in a quantitative research one can process the data obtained from a large number of subjects [6].

The data analysis in a qualitative research is a content, subjective and interpretative one, while the quantitative research uses statistical

methods.

The results of a qualitative research means understanding a marketing phenomenon, while by using qualitative methods one can recommend a way of acting [7].

The qualitative research is an exploratory study and the quantitative research uses descriptive and causal methods.

2. Quantitative versus qualitative - literature review

The relevant aspects identified using qualitative methods are defined and characterized exactly by means of quantitative research. Groucut (2006) states that quantitative research becomes absolutely necessary when we want to know and quantify the market segments for goods and services that are in the growth or maturity stage and the way in which consumers define the position of goods and services in the marketplace.

Dubois and Aroujo (2007) consider that qualitative research methods are not better than the quantitative ones. They emphasize that the way in which researchers highlight the theoretical aspects of every subject is very important in choosing the proper research method.

Damien McLoughlin (2007) has a different point of view related to the controversy between quantitative and qualitative. The arguments of this debate represent a starting point in making a “very interesting” research with the purpose of enriching the state of knowledge in a certain field. The author analyses the opinions of some Purchasing Supply Management specialists and considers that the studies which use quantitative methods thoroughly statistically tested are more difficult to implement and not always used as references for other studies [8]. On the other hand qualitative studies contain ideas and concepts that raise our interest, invite us to dialogues and can influence the reader’s way of thinking [9]. The author considers that qualitative studies are used more as references and are more often cited in other articles.

Wilson and Natale (2007) think that the distinction between the two methods is so evident that any attempt to separate the two

can become useless in certain cases. The methodology that stands for the research comes from the research question. According to the author’s opinion the so called distinction between qualitative and quantitative has only the purpose of prejudging the work models and procedures which should be left “opened”.

Authors support their opinion according to which the distinction between quantitative and qualitative has no sense using an example: if you want to find out if A loves B, you can count how many times he calls her honey (even if he had done this when he was angry) or you can count how many times they walked or danced together (quantitative research). This statistical information can be relevant when it helps identify the link between “true love” and these three activities (qualitative research). Therefore the quantitative information is useless without being interpreted.

The qualitative-quantitative research paradigm dates back to the philosophical thinking of the XX century [10].

Qualitative empirical studies are part of a positivist traditional research frame. This frame focuses on the development of valid theories for the studied population.

Quantitative studies use constructivist and naturalist approaches (Lincon and Gruba 1985), interpretative (Smith 1983) or post-modern perspectives (Quitiz, 1992) [11].

3. Validity and reliability in quantitative and qualitative research

There are certain differences in estimating the quality of a quantitative study in opposition to a qualitative one.

In the case of qualitative studies Guba and Lincon (1985) used the notion of “trustworthiness” in order to evaluate the quality of the research. This concept has four attributes: credibility, transferability, dependency and certainty.

In the last two decades the concepts of validity and reliability in a qualitative research have been replaced with evaluation and criteria standards for the impact of the significant relevance and the utility of marketing research [12].

Validity refers to the accuracy of the representations and generalizations made by the researcher and to the authenticity of his statements written in the research report [13].

In the results of a research study, reliability appears when these results are the same as in the case in which the analyzed situation repeats itself [14].

The “validity and reliability” terminology is used for the studies conducted in Great Britain and Europe [15]. In North America there are a few authors who agree that this terminology should be extended to quantitative studies because the ultimate goal of research is to generate credible and plausible results [16].

When appreciating the quality of a qualitative study we use the concepts of “internal validity”, “external validity” and “objectivity” [17].

4. Conclusions

Both the quantitative and the qualitative research should be correlated in a study and they must contribute to generating valid and reliable results. The differences between the two research methods are theoretical and refer to the objective, sample, data analysis, research results and the type of research.

In the marketing literature authors have almost the same opinion regarding the theoretical differentiation criteria. When choosing the analyzed method, the type of qualitative or quantitative information that the researcher has at his disposal is very important.

Apparently the qualitative research is more often cited because it is easier to read. At the same time the quantitative research is offering a greater amount of information and is more strictly structured [18].

At the basis of the qualitative-quantitative controversy lie totally different philosophies. The essence of qualitative research is to present life as it is lived [19]. The qualitative researchers watch people in their environment and interact with them in certain conditions. They consider that the best way to understand a phenomenon is to get into it [20]. They state that the quantitative research is limited and it analyses people in an artificial environment, seeing only a part of the reality. They argue that human

experience cannot be described by using numbers or explained by controlling, measuring and manipulating variables.

Qualitative researchers demand flexibility. Instead of doing a structured study which contains fixed questions and answer categories, they allow questions to appear and to be modified as they become more and more familiar with the subject [21].

On the other hand, the base principal of the quantitative philosophy is represented by the objectivity obtained by enumerating, adding and causality. Kerlinger states that “there is no quantitative information. Everything is either 1 or 0”. Knowledge means measuring, cause and effect and reduction.

The design of a quantitative research is a detailed plan using predetermined hypothesis. The use of sampling statistic techniques for questioning representative samples allows the extrapolation of the results for the entire population.

Quantitative researchers pride themselves that they are not bias, analyzing the subject objectively. They criticize the qualitative researches, accusing them of being bias and influenced by the prejudged opinions of the researchers and of the study participants. The excessive particularity and the analysis of a certain questioned subject without establishing connections with broader situations are also criticized by the quantitative researchers.

Does Migration Influence Regional Growth in Romania?

Bunea Daniela

The Bucharest Academy of Economic Studies

daniela.bunea@yahoo.com

Abstract

In the European framework, regional convergence is crucial in ensuring European integration. “Sigma-convergence” deals with how the distribution of national output across economies evolves over time whereas “beta-convergence” deals with the mobility of this output within the same distribution. Migration is one important mechanism in generating convergence.

In Romania, during the last few years, the main results point out at an income divergence trend with no migration influence. This irrelevancy of migration can be explained by the very low levels of net migration rates.

Key words: income convergence, non-linear model, internal migration.

J.E.L. classification: J61, R11, R15.

1. Introduction

Usually, migrants move from regions with low incomes and high unemployment to regions with higher incomes and better employment opportunities. This contributes to the adjustment to asymmetric shocks. But if labour is rigid, the regional disequilibria will persist unless other mechanisms (e.g., fiscal) intervene (Fidrmuc [11], 2004).

Labour mobility is high in the US (Blanchard & Katz [5], 1992) and low in Europe (Decressin & Fatas [8], 1995). Moreover, in Central and Eastern Europe, the transition from central planning to market economy caused a series of regional disparities; here, labour mobility is even more crucial to help diminish them (Repkine & Walsh [21], 1999). These disparities are not important only internally, but also externally, for example, to enter the Economic and Monetary Union.

In European practice, regions with high wages tend to have high in-migration as well as high out-migration, rather than high in-migration and low out-migration. Similarly, unemployment seems to discourage both in-migration and out-migration, although its significance is, usually, lower than wages'. This is how regional disparities persist, because developed regions display high migration (and persistent high wages and low unemployment) while depressed regions display low migration (and persistent high unemployment and low wages) (Fidrmuc [11], 2004). This is where the concepts of convergence (diminishing disparities) and divergence (increasing disparities) intervene.

2. Economic growth: controversial approaches

Economic growth has always been the controversial subject between the **neoclassical (exogenous) theory of growth** and the **new (endogenous) growth theory**. The former argues that the long-run growth rate is exogenously determined by either the saving rate (the Harrod-Domar model) or the rate of technological progress (the Solow-Swan model), whereas the latter is partisan to an endogenous growth due to the production of new technologies and human capital accumulation. The exogenous growth model has been developed by Solow and Swan in 1956, whilst the endogenous growth model is due to Romer (1986) and Lucas Jr. (1988).

In the neoclassical theory, a higher level of per capita human capital leads to higher productivity and GDP per capita. Convergence is due to diminishing returns to capital and constant returns to scale. Diminishing return to capital implies that the rate of return is negatively related to the stock of capital per head so that, caeteris paribus, regions with low amount of capital per head are expected to grow faster (Marques & Soukiazis [16], 1998). Instead,

the new growth theory allows to human capital stock to accumulate in order to affect positively the per capita output growth. It allows for consumption and saving decisions of households, investment decisions of firms and public policy to determine endogenously the long-run growth (Lucas Jr. [14], 1988).

3. Sigma- and beta-convergence

Convergence can be explained by lower-income regions growing faster than higher-income regions, this is poorer regions catching up richer regions, and, as a consequence, regional disparities decreasing. On the contrary, divergence favors regional disparities (Barro et al. [1], 1991, Rey & Montouri [22], 1998, etc.).

In the classical literature, there are two main concepts of convergence:

- ◆ **sigma-convergence**: when the dispersion of real GDP per capita tends to decrease over time; this convergence can be computed using three main coefficients of inequality (variation, Gini, Theil);
- ◆ **absolute beta-convergence**: when poor economies grow faster than rich ones, all should converge to one steady state;
- ◆ **conditional beta-convergence**: when different economies reach their own steady states.

It is possible that two economies converge in the conditional sense (the growth rate of each economy declines as it approaches its own steady state) but not in the absolute sense (the rich economy can grow faster than the poor one if the former is further below its own steady state). The two concepts are the same if a group of economies tend to converge to the same steady state (Barro & Sala-I-Martin [3], 2004).

Although differences in technology, preferences, and institutions exist across regions, these differences are likely to be smaller than those across countries. Firms and households of different regions within a single country tend to have access to similar technologies and have roughly similar tastes and cultures. Furthermore, regions share a common central government and therefore have similar institutional setups and legal systems. This relative homogeneity means that regions are more likely to converge to

similar steady states. Hence, absolute convergence is more likely to apply across regions within countries than across countries (Barro & Sala-I-Martin [2], 1992).

Beta-convergence is a necessary but not a sufficient condition for sigma-convergence, or a negative/positive beta-convergence parameter does not necessarily imply a declining/ascending cross-sectional variance in GDP per capita levels (sigma-convergence) (Martin, 2000). We do not have always both types of convergence because sigma-convergence displays whether the regional distribution of national income shrinks over time or not and beta-convergence displays the mobility of the different regions with the given distribution of national income. Nevertheless, when working with real data, whenever we observe sigma-convergence, we also observe beta-convergence (Sala-I-Martin [23], 1995).

A data series is convergent if σ -convergence decreases and β -convergence turns negative, otherwise the series is divergent.

4. Migration and convergence

Migration is one mechanism that can contribute to convergence. In a neoclassical model that allows for labour mobility, migration of labour with low human capital from poor to rich economies tends to increase the capital-labour ratios and wages in the source economies and to decrease the capital-labour ratios and wages in the economies of destination (Persson [20], 1997).

Introducing migration in the convergence equation raises the problem of labour human capital content, i.e. homogenous labour or heterogeneous labour.

If **labour is homogenous**, *migration enhances convergence* by boosting the capital intensity in regions with net out-migration and reducing it in regions with net in-migration. Instead, if **labour is heterogeneous**, *the impact of migration on convergence is unclear*. In this last case, the final impact of migration depends on which of the following two opposite effects dominates (Friedberg & Hunt [12], 1995):

- ◆ **quantity effect** (negative impact): if migrants have the same human capital content, migration is a channel for growth;

- ◆ **composition effect** (positive impact): if migrants do not have the same human capital content, the migration effect on growth could be positive if the average human capital content of migrants is higher than the average human capital of non-migrants.

Exogenous growth theory predicts a negative impact of migration on economic growth because a net gain of migrants increases the labour force and reduces the labour marginal product. This holds when migrants are homogenous in their human capital content. (Proxies for human capital content are the educational attainment, the occupational status or the work experience.) But if migrants are heterogeneous in their human capital content, they can increase the human capital stock in the destination (origin) economies as long as their human capital is higher (lower) than non-migrants' (Etzo [9], 2008).

In the case that migration changes the regional distribution of human capital (labour is heterogeneous), we have the following two cases (Østbye & Westerlung [19], 2007):

- ◆ if migration increases human capital in the depressed regions and decreases it in the developed regions, we call this a **brain gain**;
- ◆ if migration decreases human capital in the depressed regions and increases it in the developed regions, we call this a **brain drain**.

If the brain-drain effect is stronger than migration will impact negatively on economic growth, whilst if the brain-gain effect dominates then migration will impact positively.

Mountfort ([18], 1996) considers that the brain drain could be good for the sending regions because of the possibility to migrate and earn more in another region could be an incentive to acquire human capital and thus strengthen growth. Moreover, Beine et al. ([4], 2001) make the distinction between a first gain effect, due to the increased investment in education in the perspective of a future more, and a second drain effect, when this move becomes effective.

If migrants are more productive than non-migrants, the loss in human capital per head may exceed the gain in physical capital per head and slow down growth. Moreover, if migrants are even more productive than

workers in the destination region, the increase in human capital per head at the destination may dominate the decrease in physical capital per head, thus boosting growth here and generating economic divergence (Østbye & Westerlung [19], 2007).

5. Econometrical testing of convergence

In order to study the economic growth, Barro & Sala-i-Martin (1991, 1992, 2004) followed by many others employed the following two methodologies:

1. A long-run non-linear modelling:

$$\log\left(\frac{gdp_{iT}}{gdp_{it}}\right) \Big/ T = \alpha + \frac{(1-e^{-\beta T})}{T} * \log gdp_{it} + \varepsilon_i \quad (1)$$

where gdp_T, gdp_t = real per capita income (in 2004 prices) in final (T) and initial year (t), gdp_T / gdp_t = the growth rate of real GDP between years t and T, i = individual country/region, T = period of time for which the growth of per capita income is calculated, α = constant term (autonomous or steady-state growth), β = speed of convergence (time invariant).

2. A panel data non-linear modelling:

$$\log\left(\frac{gdp_{it}}{gdp_{i,t-1}}\right) \Big/ T = \alpha + \frac{(1-e^{-\beta T})}{T} * \log gdp_{i,t-1} + \varepsilon_{it} \quad (2)$$

Both models can be estimated using non-linear least squares (NLS) although for the latter we can also apply a dynamic approach (GMM). Long-run NLS regression is useful to study the speed of convergence for a group of economies if the whole group is considered as a single representative economy with a unique steady state. But if economies are heterogeneous the NLS becomes a weak and irrelevant tool to analyse conditional convergence. But we still have the possibility of including “conditioning variables” such as the population growth rate, the saving rate, the level of technology, the rate of capital depreciation or the rate of productivity growth, according to the neoclassical approach. Mankiw et al. ([15], 1992), as well as Barro & Sala-I-Martin ([2], 1992) consider

that introducing these conditioning variables, one controls for different steady states. However, when using regional data, the neoclassical approach suggests not including conditional variables or control for fixed effects. For instance, if β is negative and significant with no conditional variables or fixed effects, we call this absolute beta-convergence. Net migration should speed up the convergence process and β should be smaller when including migration, or in the absence of migration the effect of migration is taken by β (Østbye & Westerlung [19], 2007).

But, even after controlling for steady states, one continues to assume the same production function and, heterogeneity bias can affect the estimates even in presence of the conditioning variables (Islam [13], 1995; Caselli et al. [7], 1996). This is why the former authors consider the panel data methodology as the most appropriate for studying convergence. Its main advantage is the possibility to control for fixed effect of economies, i.e. unobserved structural differences between economies that are time invariant.

6. Migration and income convergence in Romania at county level

During the interval 2004-2008, Romania witnessed a constant increase in migration from 2006 to 2008, despite a fall in 2005. Therefore, the following absolute (and relative) values were registered: 367 th. (17‰) - 2004, 272 th. (12.6‰) - 2005, 334 th. (15.45‰) - 2006, 374 th. (17.35‰) - 2007, and respectively, 389 th. (18.1‰) - 2008. See figure 1.

Migration rate (gross and/or net) is computed as the ratio of (a) gross/net migration for an area during a specific period to (b) its population in the previous period, multiplied by 1,000.

In the same period, net migration rates by county were within the small range [-3‰, +3‰], except for 5 counties with higher rates.

Figure 1. Gross migration
(no. of migrants and rates)

Source: Personal elaboration based on Romanian Statistical Yearbooks data (eds. 2005-2010)

Can this upward trend be explained by increasing differentials in county GDP per capita? According to the ascending evolution of the inequality indexes represented in figure 2 (or sigma-convergence), per capita output at county level did experience a divergence process.

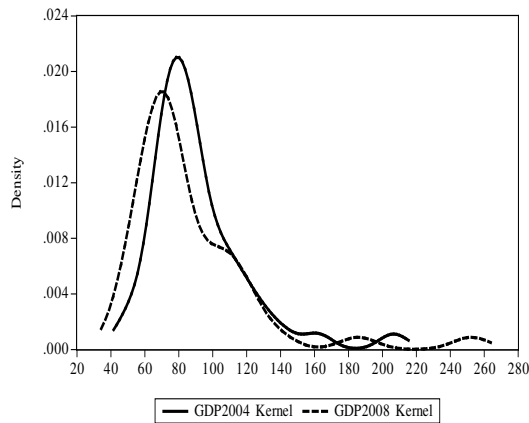

Figure 2. Indexes of inequality

Source: Personal elaboration based on Romanian Statistical Yearbooks data (eds. 2005-2010)

In order to strengthen the conclusion above, I have also computed the **kernel density distribution**, following the rule of Silverman ([24], 1986). The kernel density depicts the changes in per capita income occurred during the period 2004-2008. First, I had to transform GDP values in relative terms (national mean = 100) in order to facilitate comparisons and eliminate the impact of absolute changes over time (Ezcurra & Pascual [10], 2006).

Figure 3. Kernel density for GDP per capita 2004, 2008

Source: Personal elaboration using Eviews 7

We should interpret figure 3 as follows:

- ◆ the dotted line of GDP2008 is below the continuous line of GDP2004, which means that there are less counties concentrated around the national mean (=100) in 2008 than in 2004, i.e. divergence;
- ◆ the ratio of extreme values increased in 2008, i.e. divergence.

Before presenting the results of the regressions, the next scatter plot depicts an upward line of regression between the growth rate of county income 2004-2008 and its 2004 initial level. Therefore, we should expect a positive beta-convergence.

Figure 4. Scatter plot of divergence

Source: Personal elaboration using Eviews 7

Results of non-linear regressions with migration excluded (all coefficients are robust):

Table 1. Non-linear estimations with no migration

Coefficients	Long-run NLS (1)	Panel NLS (2)	Panel GMM (2)
α	-0.29	-0.083	-0.18
β	0.046	0.011	0.023
R^2	0.16	0.03	-
DW	1.96	1.97	-
AR(1)	-	-	0.00
AR(2)	-	-	0.38
Hansen test	-	-	0.12

Source: Personal elaboration using STATA 9

NB: The Hansen test verifies the validity of the instruments used under the null hypothesis of “instruments as a group are exogenous”. Values of AR terms and Hansen test in table 1 are p-values.

When excluding migration, the annual speed of income convergence is within the range [1.1% - 4.6%], although the best value is 2.3%. (GMM technique is suitable when considering models with predetermined or endogenous covariates based on “small time, large cross-section” panels (Blundell & Bond, 1998)).

Results of non-linear regressions with migration included are reported in table 2.

Table 2. Non-linear estimations with migration included

Coefficients	Panel NLS (2)	Panel GMM (2)
α	-0.10	-0.17
β	0.014	0.021
δ (p-value)	-0.0004 (43%)	-0.001 (8%)
R^2	0.03	-
DW	1.99	-
AR(1)	-	0.00
AR(2)	-	0.38
Hansen test	-	0.17

Source: Personal elaboration using STATA 9

After controlling for net migration, which turns out to be insignificant, we obtain convergence speeds of 1.4% and 2.1%, somewhat similar to the previous ones.

7. Conclusions

The main purpose of this paperwork was to determine whether income at county level underwent a convergence or divergence process in Romania during the time period 2004-2008 and, furthermore, to see if net migration had any impact on it. As a consequence, using various methods of estimation, the results have pointed out at a divergence tendency in which migration (ascending but very low) hadn't any contribution.

Application of Actuarial Modelling in Insurance Industry

Abstract

In insurance industry, the financial stability of insurance companies represents an issue of vital importance. In order to maintain the financial stability and meet minimum regulatory requirements, actuaries apply actuarial modeling.

Modeling has been at the center of actuarial science and of all the sciences from the beginning of their journey. In insurance industry, actuarial modeling creates a framework that allows actuaries to identify, understand, quantify and manage a wide range of risks, especially actuarial risks.

Actuarial modeling uses as key instruments actuarial models which represent a simplification of a real system, facilitating understanding and prediction of the real system. Therefore, these models are designed to be appropriate with the essential principles of actuarial science. In actuarial modeling progress is marked by breaking existent barriers and developing and incorporating new types of actuarial models.

Key words: actuarial science, actuarial modeling, models, financial risk, insurance companies

J.E.L. classification: C58, G22

1. Introduction

The development of actuarial science in last decades, in combination with fuzzy mathematics used as a robust approach for estimation problems under uncertainty, created a new framework for solving real problems on the basis of integrated, flexible and realistic methodological approaches. At the same time, the range of problems which can be solved effectively was extended, the

nature of these problems being much diversified in terms of their complexity.

Nowadays an important accent is put on the necessity of maintaining the financial stability of insurance companies. Nobody knows exactly if and when an insured risk takes place or which is the certain size of claims the insurer must pay. Nevertheless these unknown variables can be assessed by actuarial modeling, allowing us to make sure that there will be adequate financial resources in order to meet liabilities.

Actuarial modeling has a major importance in insurance industry, currently being expanded in other areas because its core is represented by risk assessment – which is an inherent element of any activity.

2. The evolution of actuarial science

Actuarial science is the discipline that applies mathematical and statistical methods to assess risk in the insurance and finance industries. Actuarial modeling deals with the modeling techniques used by actuaries when trying to assess uncertainty and risk and it is based on core principles. The models used in actuarial modeling are composed of equations that represent the functioning of insurance companies, accounting for the probabilities of the events covered by policies and the costs each event presents to the company. They help companies decide which policies to take and to set premiums based on the projected claims that they will have to pay. These models predict the funds that insurance companies will have to pay out, allowing them to know how much money they have to take in to cover their costs. Therefore they are very important for keeping the companies solvent.

Actuarial science includes a number of interrelating subjects, including probability, mathematics, statistics, finance, economics, financial economics and computer programming. In actuarial modeling, actuaries use behavioral assumptions derived from these subjects to create systems of equations that represent the events that happen in the real world.

Actuarial science became a formal mathematic discipline in the late 17th century with the increased demand for long-term insurance coverage such as burial, life insurance and annuities and with the extraordinary advances in mathematics in Germany, France and England. At the same time, there was a rapidly growing desire and need to place the valuation of risk on a more scientific basis. Initially, actuarial modeling was applied in life insurance, then being successfully extended in general insurance in the early twentieth century.

In the 18th and 19th centuries, computational complexity was limited to manual calculations. The actuaries of that time developed methods to construct easily-used tables, using sophisticated approximations called commutation functions, to facilitate timely, accurate, manual calculations of premiums[1]. Over time, actuarial organizations were founded to support and further both actuaries and actuarial science, and to protect the public interest by ensuring competency and ethical standards[2].

Historically, actuarial science used deterministic models in the construction of tables and premiums. But, as a consequence of the proliferation of high speed computers and the union of stochastic actuarial models with modern financial theory, the actuarial science has gone through revolutionary changes during the last 50 years. Computers made more practical the building of stochastic models explored using simulation, served as real time databases and permitted faster calculations, with less chance of error. Therefore actuaries began to forecast losses and premiums using a framework of random events, instead of the deterministic methods they had been constrained to in the past.

Historically, much of the foundation of actuarial theory predated modern financial theory. In the early twentieth century, actuaries were developing many techniques

that can be found in modern financial theory, but for various historical reasons, these developments did not achieve much recognition[3]. The main issue was that actuarial science concentrated on formulating solutions to insurance problems, without explaining their general nature. Consequently, actuarial science developed along a different path, becoming more reliant on assumptions, as opposed to the arbitrage-free risk-neutral valuation concepts used in modern financial theory. The divergence is not related to the use of historical data and statistical forecasts of losses, but is instead caused by the manner in which traditional actuarial modeling apply market data with those numbers.

Nowadays ideas from financial economics became increasingly influential in actuarial thinking, and actuarial science has started to embrace more sophisticated mathematical modeling of finance.

3. The importance of actuarial modeling

Modeling has been at the center of actuarial science and of all the sciences from the beginning of their journey. Actuarial modeling has evolved from traditional reserving activities in insurance and employee benefits practice to asset management, product and plan design, enterprise risk management and other derived practices.

Actuarial modeling is based on the theory of compound interest that allows the comparison of financial values at different moments in time. The essential concern of actuarial modeling is to find practical solutions with a high level of accuracy, using historical data in order to solve problems regarding uncertain future events. In order to achieve this, actuarial modeling relies on models which represent a simplification of a real system, facilitating understanding and prediction of the real system. Models do not faithfully reflect reality, but highlight how key influences determine the state of the system. Obviously, a good actuarial modeling requires a complete understanding of the system modeled. Not always the best model corresponds with the most accurate model because there is a need to put in

balance cost with benefits; in actuarial modeling cost usually is the key constraint.

The importance of actuarial modeling is highlighted by the fact that the essence and determination principles of technical reserves in insurance are different from other areas of national economy. In insurance companies, technical reserves are created in order to meet liabilities regarding the payment of claims when the insured risk takes place. Therefore these funds, in correlation with other financial indicators, have a great impact on the financial result of the insurer. Furthermore, the insurer's solvency and liquidity ratios depend upon the amount of technical reserves[4].

In insurance industry, actuarial modeling is used by actuaries to identify, understand, quantify and manage a wide range of risks, especially actuarial risks that are inherently contingent in nature and usually have financial implications. The information used to fulfill these tasks includes a variety of recorded observations on many kinds of risks and also the theoretical and practical understanding of how these risks behave. Usually, the actual experience represents the actuary's primary facts which are then processed through a series of hypotheses and assumptions that form together an actuarial model. In the modeling process, various elements are being used, some of them of critical importance such as the choice of assumption and the availability of valid data. In some cases it is possible that proper data it is not available or that the actuary has to apply a specific pre-defined set of assumptions. Thus users of model should evaluate the model outcomes taking into consideration the assumptions applied and the original purpose of the model. In insurance industry, actuaries understand the probabilistic nature of actuarial modeling and take this consequence into account in the decisions they make.

Actuarial modeling's goal is to provide key elements that are useful to the entity in minimizing financial risk, but ultimately the company management is responsible for the final decisions and results.

In actuarial modeling progress is marked by breaking existent barriers and developing and incorporating new types of actuarial models. The actuary needs to be able to model the financial behavior of the company,

estimate the effects of various factors on the overall financial condition and support the company's ability to meet minimum regulatory requirements.

4. Key instruments of actuarial modeling

Actuarial modeling uses as key instruments deterministic or stochastic models which are simplified representations of possible outcomes relative to future contingent events. A contingent event is an event whose occurrence, timing or severity is uncertain. Even though a deterministic model generates an outcome that seems to be predicted with certainty, this certainty is based upon assumptions that are themselves uncertain. Therefore, this type of model has an if-then particularity: if the assumptions made in the model are realized in the real world and if the real world reacts exactly as predicted by the model, then the outcome of a deterministic model will appear.

In actuarial modeling, Bayesian methods are frequently used because they provide a framework which allows the incorporation of prior experience and knowledge of the actuary into the model formulation and estimation. It has been argued that the Bayesian pattern represents the most natural and convenient one to adopt for the implementation and assessment of various models applied in actuarial science, insurance and risk management.

Actuarial models are usually expressed in mathematical terms and are designed to be appropriate with the essential principles of actuarial science. They may contain many elements and frequently are based upon multiple interrelated assumptions regarding various aspects of risks associated with an insurance company. Actuarial models are periodically refined by comparing their results with actual results and making changes in the assumptions or the simulation techniques used. These adjustments are made to improve the model's output in terms of the model's capacity to accurately represent the real world. Nevertheless, actuarial models do not and cannot predict the future with certainty. Different models may be created to simulate the same or future events. Also it is likely that two different models applied with

the same input assumptions will generate outcomes that differ. This kind of different results can only be explained in relation to the specific model that produced them, but it should not be concluded that one model was incorrect and the other more accurate.

In insurance industry, actuaries apply actuarial models for every task performed and may use actuarial modeling differently depending on the circumstances. Actuarial modeling is aimed at managing or mitigating risk, because the elimination of all of the possible risks would involve a major financial cost that becomes restrictive. The selection of an actuarial model is always a matter of professional judgment and actuaries have preferences regarding the manner used to accomplish specific analyses. Thus in some instances, two actuaries could select two different models to perform the same or a similar task. Once the actuarial model is selected, the analysis is conducted and the results are validated and, in addition, sensitivity testing is performed, highlighting to what extent financial results generated by the model will change with modifications in the assumptions employed. Finally, the model's output is compared against emerging experience in order to confirm or adjust the model design. In some instances, actuaries may apply the model to forecast experience for a past period of time in order to assess if the financial results of the model closely reflect reality. Also, an actuary might apply a different model using the same assumptions and data in order to compare the new outcome against the results generated by the first analysis.

Any model used in actuarial modeling needs to be validated. Models derived using classic techniques are usually validated by using a static validation and a dynamic validation. In the case of small sized models more testing may be appropriate in contrast with large models which give assurance that the model will not diverge considerably.

Actuarial models are sensitive to the assumptions used which are based on historical experience. Due to changes in the legal, social and economic environment, historical experience becomes a potentially poor base for previsions of the future events and, even if these changes are taken into account, the modifications made by an actuary represent only a subjective

approximation of the future effect on the experience data. Further, many actuarial models take into consideration factors and influences in the business environment that cannot be easily quantified such as competitive strategies in risk management. These models are usually designed to take into account events that are more likely to occur on average and, therefore do not necessarily model very infrequent catastrophic events for which historical experience has little or no predictable value [5].

As key instruments of actuarial modeling, models are not necessarily different by nature from those applied in other disciplines due to the inter-disciplinary nature of the actuarial science. In theory and practice there are several classifications of models used in actuarial science that enable actuaries to discuss the general principles which should be applied to each category of model.

Between the real system represented and the actuarial model there is a process that reveals how the model is developed from information, theory and the judgment of the actuary involved in the development of the model. The nature of a model may be categorized either by the process by which is developed or by the process of application. Avoiding the specification of the mathematical form, Thompson categorizes models used in actuarial practice as: descriptive models, predictive models, fund models, control models, normative models and decision-making models.

A descriptive model describes historical relationships between the variables modeled while a predictive model predicts future relationships between the variables modeled. A fund model is one that formulates fund values in terms of fund data, the output variables of predictive models and the rules of the fund. In this type of model, a fund incorporates the financial system relating to an individual contract, a set of contracts, an individual agent or a financial institution. A control model is a fund model that formulates an objective variable in terms of predictive models and control variables specified by the decision-maker, revealing the effects of alternative values of the control variables. A normative model expresses the choices of a decision-maker between financially risky expectations in terms of data relating to the

attitude of the decision-maker to wealth and risk. A decision-making model generates the advice to be given by the actuary to the decision-maker corresponding to the decision that would be made by an idealized decision-maker, resulting a decision which is not necessarily prudent, but it is rational[6].

Abstract

Entrepreneurship constitutes a key element for ensuring the dynamism of the modern market economy. The entrepreneurial activity has the potential to respond the challenges of a changing environment in the global context. The aims of our paper are to present in short the impact of the economic and financial crisis on the Romanian enterprises and to analyse its effects at the regional development level. A set of two hypotheses were tested and validated during our research by using the information provided by the National Trade Register Office. Our research has shown that the crisis has led to the decrease both of the entrepreneurial activity in Romania and of the total turnover of the enterprises in the period 2008-2009.

Key words: entrepreneurship, entrepreneurial activity, economic and financial crisis, Romania

J.E.L. classification: M1, M19

1. Introduction

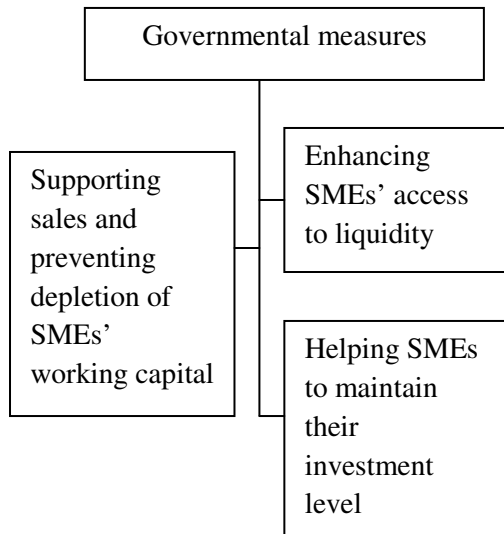

Since the end of 2007 and the beginning of 2008 the world has faced the economic and financial crisis at a rapid pace. After a decade of good global growth the crisis occurred and both advanced economies, and developing and emerging economies have been affected.

The problems appeared when mortgage defaults started rising, foreclosures on houses spread rapidly, and short-term interest rates increased [4]. In the first trimester of 2007, the New Century Financial Corporation

located in the United States of America (USA) ceased to issue subprime mortgages. In September 2008, the US Treasury nationalized Fannie Mae and Freddie Mac, two of the biggest mortgage lenders, and the famous Lehman Brothers bank declared bankruptcy. In the same time the oil price significantly increased and consequently the food prices did the same. Declining stock markets, deflation of the house price bubble, losses in consumer confidence, and global trade contraction were among the main issues that contributed to the propagation of the crisis all over the world. Therefore all geographical regions of the world were more or less affected by the economic and financial crisis which became a global phenomenon.

In the last decades the entrepreneurial orientation has emerged as a major theme in the business literature [9]. Entrepreneurship constitutes a key element for ensuring the dynamism of the modern market economy. The entrepreneurial activity has the potential to respond the challenges of a changing environment in the global context [8]. As credit matter for entrepreneurship, the overall contraction of financial markets led not only to a reduction in new firm start-ups and of the growth rate, but also to the increase of the firm failure. The higher credit costs made more difficult the access of companies, especially small and medium-sized enterprises (SMEs), to the international markets [1]. The tightening in credit terms has been accompanied by a drastic drop in demand for goods and services. In order to support the entrepreneurial activity during the crisis governments have responded generally by a mix of measures (Figure 1).

Figure 1. Governmental measures for supporting the SMEs

Source: [6]

In spite of the fact that many governments around the world are faced with the challenges of reviving their economies, they can consider entrepreneurship as an important economic stimulus [2]. Policy makers and international organisations are recognising the importance of entrepreneurial activity and are making general statements about their commitment to improving the entrepreneurial environment [5]. This is why policy makers of many countries took steps in the past years to make it easier for local entrepreneurs to start up and operate on the market [11].

In Romania entrepreneurship has become a key element both of the development of a market economy and of the revitalisation process of a lagging geographical area after 1989 [3]. The effects of the economic and financial crisis on the Romanian entrepreneurship have been negative, but they were not felt the same throughout the country [10].

Starting from the above discussion, two interconnected questions arise for which we do not have yet an exact situation of the effects of the economic and financial crisis on entrepreneurship in Romania. These are as follows:

- (1) How did the first year of economic crisis reflect on the Romanian entrepreneurship?
- (2) What was the impact on the turnover of companies in Romania in terms of

geographical layout of the company headquarters?

In order to obtain information on these questions, a methodological approach was used based on the statistical data existent within the National Trade Register Office (NTRO) in 2008 and 2009 [7]. Starting with 2010 companies have submitted their audit to Ministry of Public Finance (MPF). However, MPF does not have a specialized department for providing statistical data on the economic activity of companies and only exact information is possible and not some statistical aggregation at municipal level, county, development region.

The aims of our paper are to present in short the impact of the economic and financial crisis on the Romanian companies and to analyse its effects at the regional development level. A set of two hypotheses were tested during our research by using the information provided by the NTRO. The second chapter of the paper deals with the research methodology. The results of our research are analysed and explained in the third chapter. This is followed by the final conclusions.

2. Research Methodology

On the above mentioned objectives of the paper the authors developed a set of two hypotheses as follows:

- a. The lower is the development level of a country the higher are the effects of the crisis on the entrepreneurship in that country.
- b. The lower is the development level of a region within a country the higher are the effects of the crisis on the decrease in the relative size of the turnover.

In carrying out the research we performed a statistical analysis of data on the dynamics of entrepreneurship in recent years from the major international economic publications and we processed the existing information in NTRO. The second level of analysis on the situation in Romania was the turnover reported by the Romanian companies at the end of the year.

For the general situation of the business environment in Romania a request has been submitted to NTRO in reference to the turnover of the local companies. Subsequently the data were aggregated at the

level of the development region. Information obtained was processed using Excel.

3. Entrepreneurial activity at national and regional level

For the first question on the impact of the first year of crisis on Romanian entrepreneurship, we shall answer by analysing the NTRO data on the situation of companies that have filed their audit for 2008 and 2009. We noticed from the general overview the impact of the crisis on entrepreneurship and the data we are about to analyse will seek to test the hypothesis advanced on the situation in Romania. In 2008, 661702 companies were registered at NTRO at the national level and in 2009 only 626557 companies remained. Thus, there was a 5.3% decrease of the number of companies and of the entrepreneurial activity within the national economy (Table 1).

One of the explanations for reducing the number of companies is represented by the implementation from the second quarter of 2009 of the flat tax which led to suspension of a significant number of micro and small companies.

Table 1. Number of companies in Romania and their weight per 1000 inhabitants in 2008 and 2009

Year	Number of companies at the national level	Number of companies per 1000 inhabitants
2008	661702	30.8
2009	626557	29.2
2009/2008	94.7	94.7

Source: [7]

On the number of business indicator per 1000 inhabitants we are reserved in reference to the population in 2009; the size of external migration is measured quite imprecise in Romania and it continued in 2009 which could affect the reporting of the number of business indicator per 1,000 inhabitants.

The second plan of testing the first hypothesis aims at the turnover reported by the Romanian companies (Table 2).

Table 2. Dynamics of turnover per year at national level (RON)

Year	Total turnover of companies at national level
2008	1064284399369
2009	1009663334197
2009/2008	94.9

Source: [7]

These percentage weights should be considered also in the context in which the Harmonised Index of Consumer Prices (HICP) which in January 2009 compared to January 2008 was 7.9% and in January 2010 compared to January 2009 was 5.4%. Also in 2008 the inflation rate was 6.3% and in 2009 was 4.74% (the largest in the European Union).

Therefore, we conclude that the first year of economic crisis in Romania has led to reducing the number of companies that have submitted their audit by 5.3% and their turnover by 5.1%, which confirms the advanced hypothesis on the reduced effect of the economic crisis on the Romanian entrepreneurship in 2009.

In order to test the second hypothesis we present data on the regional entrepreneurship dynamics in the Romanian economic field. The analysis was performed both from the point of view of the number of companies that have submitted their audit, as well as their reported turnover.

From the point of view of the weights occupied by each development region and the number of registered companies, we ascertain changes in 2009 compared to 2008. Thus, by the total number of companies, the Bucharest-Ilfov region increased its percentage weight by 0.9% in the total companies nationwide and the South Muntenia, South-West Oltenia and West remained with the same weight in 2009 compared to 2008 (Table 3).

Table 3. Relative distribution of the total number of companies by year and development regions

Development region	Percentage of national number of companies in 2008 (%)	Percentage of national number of companies in 2009 (%)
Bucharest - Ilfov	23.6	24.5
Centre	12.4	12.2
North-East	10.9	10.6
North -West	14.3	14.1
South Muntenia	12.3	12.3
South-East	9.8	9.8
South-West Oltenia	7.3	7.2
West	9.4	9.4
Total companies (%)	100	100
Total companies in Romania	661702	626557

Source: [7]

Significant differences emerging to validate our second hypothesis are observed in the dynamics of turnover. Regional differences have been registered in terms of turnover dynamics in 2008 and 2009. Thus, Bucharest-Ilfov region has increased its economic weight at the national level- almost half of the turnover- and South Muntenia region has owned the tenth part of the total turnover.

The explanation of the special weight of the Bucharest-Ilfov region lies in the fact that all big companies have their headquarters in the capital or Ilfov County. The two regions of the Carpathian arc (Centre and North-West) have each about 9.2% of all businesses nationwide. Centre region seems to record a consolidation of the economic position during the current crisis (Table 4).

Table 4. Relative distribution of the volume of turnover on development regions

Development region	Percentage of national turnover in 2008 (%)	Percentage of national turnover in 2009 (%)
Bucharest - Ilfov	46.7	49.2
Centre	9.2	10.2
North-East	5.8	5.4
North -West	9.1	8.5
South Muntenia	10.5	10.0
South-East	7.5	6.6
South-West Oltenia	4.8	4.3
West	6.4	5.9
Total turnover (%)	100.0	100.0
Total turnover (RON)	1064284399 369	1009663334 197

Source: [7]

4. Conclusions

In today's turbulent economic environment, one of the most important issue governments, business associations, and civic organizations have to deal with is to encourage the entrepreneurial activity. Promoting and stimulating entrepreneurship constitutes a valuable tool in order to face the challenges of the economic and financial crisis.

As in other countries, the crisis has produced negative effects on businesses and entrepreneurship in Romania. Our research has validated the set of two hypotheses. Firstly, the number of enterprises has decreased in the period 2008-2009. Secondly, as a consequence, the total turnover of the companies decreased in the same period. However, from of the point of view of the entrepreneurial activity there are significant differences among the Romanian development region and the effects of the crisis were not the same in these regions.

Corruption - between Myth and Reality

Burlacu Valentin

Police Inspectorate of Constanta County

Abstract

In the actual context of Romanian society's development, the prevention and fighting against corruption represent a priority for all responsible forces, being them a part of state's, institutional framework or of the civil society.

Without any doubts, the adhesion to NATO and integration to EU have meant sustained efforts done in the matter, and the adhesion to Schengen Space together with the real necessity of consolidating our country's communitary status must be continued and identified.

Key words: state, organized crime, control, prevention, corruption.

J.E.L. classification: K42

1. Introduction

The evolution progress of the criminal phenomenon over the previous years and the sustained efforts done by the institutions and civil society to deal with in a coherent and effective manner impose the accomplishment of a new national strategy of preventing criminality.

This fact is fully possible due to a rich theoretical basis within this field: Romanian laws, programmes and European Council and UNO's recommendations, strategies recently elaborated in other countries.

2. Corruption. Analysis and tendencies

New contemporary evolutions demonstrate criminality's threat for social development, citizens' right for a secure living and, as a consequence, the elaboration of a long term strategy to avoid going towards a terrorized society.

Everywhere in the world, the official statistics show important increase of criminality as well as greater efforts to deal with, both at national and communitar layer. Although police is an essential force in preventing and fighting against criminality, citizens and communities are becoming more and more visible in the complex field of social order and increase of life's quality. Reveling criminal phenomenon's causes can be achieved only through a research which analyzes all aspects of this particular phenomenon.

Some investigations of social, psychological, legal, psychiatric, biological, anthropological character are necessary.

Organized criminality as well as corruption are omnipresent phenomena that can be found in different countries from the economic and social development's point of view.

Although certain societies are more vulnerable than others, and can suffer more from the devastating effects of organized criminality and corruption, still, no country in the world is immune to its destructive influence. The spread and rapid evolution of organized criminality and corruption are connected to the evolution progress of the entire economic and social framework, being an indirect reflection of its malfunctioning and shortcoming.

Programmes against organized criminality and corruption are mainly based on two elements. The first element refers to the accomplishment of economic, social, financial and administrative reform which can obviously reduce the conditions that encourage organized criminality as well as corruption. The second element consists of reinforcing the institutions which inform public opinion on corrupt behavior and its costs, such as media, Parliament, monitoring agencies and judicial institutions. On economic layer, the reforms impose economic reorganization and the acceleration of privatization process, balancing costs and

stability of our national coin, reducing inflation and unemployment, raising living standard and improving technological industry.

The fight against organized criminality and corruption can't be successful without public help. If common citizens and firms are accustomed to bribe and pay for public services, considering bribe a “necessary evil”, a change in mentality is somehow essential before any systematic reform of fighting against corruption.

The civil society's role is an important element within a system of reinforcing national integrity. The state cannot perform its activities unless there is some citizens' support. Civil society provides necessary network for dealing with common interest issues, amongst which, corruption. It is, therefore, in the benefit of citizens to get involved, as most of fraud and corruption cases take place within the Government and private sector. Civil society is the main victim. Civil society can get involved in fighting against organized criminality and corruption, based on ONG, accountants, lawyers, professors, private field and common people. All these elements must lead to a strengthened link between people and police, prosecutors and justice. Strategic analyses, both tactical and relational maps concerning groups and national networks, together with the transnational ones, given at the prosecutors' disposal, allow them to turn the data and information into evidence in order to be administrated in the criminal trial.

The Public Ministry's specialized departments cooperate with similar structures from foreign countries as well as with international bodies holding responsibility in organized criminality fields, such as Eurojust, Europol, SECI Centre and Interpol. The main tendencies in the criminal phenomenon- in its components which represent the biggest threat for society- are: organization, modernization and internationalization.

At present, the majority of the solved files by prosecutors and judges involve oil business, forest industry, wood material, alcohol, tobacco, illegal privatization, financial engineering, bankrupt, money laundering, human trafficking, drug dealing and precursor.

If in the transition period, low corruption cases have been analyzed, in the past three years the accent was set on high corruption met at the highest level of political and economic life. The truth is that it hasn't been an internal initiative but an imposed obligation to become a member of the UE.

The control over corruption demands a series of measures meant to punish the crimes against corruption so that it can limit or even prevent their spread.

The essential condition for the elaboration and implementation the measures of preventing and control on corruption represent a political will which points at this aim, together with creating a specialized structure in the fight against corruption. Therefore, the most important measure to be taken for control on corruption is modifying and completing the legislation so that it includes a real definition of corruption, all forms of corruption and, nevertheless, more severe punishments for corruption crimes.

Due to the incomplete legislation, few from the accused of corruption deeds are finally convicted, and, anyway, the convicted get a minor conviction.

Moreover, the opportunities of committing corruption deeds must be limited: politicians mustn't be businessmen; birocracy must be lowered, public services quality and promptitude should be improved, positive examples of important social personalities must be promoted.

Another measure for control on corruption is adopting a more severe attitude of public opinion and media as well as public judgment of corruption deeds, so that the entire society could have a real representation on the consequences of the phenomenon. A political measure is to suspend parliamentary immunity in corruption cases, so that political rulers should submit to the exactly same laws and receive the same punishment as common people.

The standard of living should be raised by salary raise, lowering the unemployment so that people's need of raising wages should not exist any longer. Unfortunately, in Romania, there is no appropriate education on morality and it favors illegal acts which lead to corruption. This is the reason why special programmes must be included in schools and media in order to teach and inform the public on the specificity, forms

and consequences of corruption. The public administration staff might respect their professional deontology, politicians might declare their incomes correctly, people might stop offering gifts to doctors, and even the Romanian society’s morality might improve.

3. Conclusions

Paying attention to the criminal policy in the analyzed field, the setting off general and particular aspects of national and international criminality, we consider it important to take into consideration the following measures which can play an important role in improving the actions against national criminality.

- Immediate framing of international standards in punishing corruption, organized crime and money laundering. On its behalf, attention must be paid on hardened punishments, on aligning national legislation to the European one.
- Creating a powerful interdepartmental body, including police officers, financial specialists, prosecutors with an unlimited controlling right and possibilities of establishing order in the matter.
- Perfecting the judicial system of preventing, discovering and fighting against international acts.
- Making a tough financial legislation able to stop different phenomena as: fraud and money laundering,
- Creating and re-enforcing anti-mob units within Police.
- Selecting and training police and justice to fight against criminal organizations.
- Enacting, by Romanian Government, an efficient policy in social, economic and environmental field.

It would, however, represent a naivety to believe that these measures might eradicate or stop corruption. They can only keep them under control and prevent the so-called dangerous phenomenon.

Corruption has always been and it always be present; it’s up to us to limit and adopt the necessary measures to keep it under real control.

Bank Capital and the Functions Performed by It

Busuioc Witowski Irina Raluca

„Alexandru Ioan Cuza” University of Iasi, Doctoral School of Economics
iwitowski@yahoo.com

Abstract

The current economic circumstances bring in discussion the question of financial stability through the recapitalisation of banks. The capital is the most important concept in banking matters. To determine the level of capitalization of the banks must first define bank capital. The present paper therefore focuses on understanding the concept of banking capital and of the functions performed by it.

Key words: bank capital, function of bank capital

J.E.L. classification: G21

1. The concept of bank capital

The concept of bank capital has received special attention in the economic literature being addressed in a variety of ways. Therefore, taking as example the theoretical point of view, the specialized literature distinguishes between regulatory capital and economic capital, offering a range of analyses with the prospect of implementing the Basel II Accord.

The regulatory capital is determined according to the rules and methodology of the banking regulatory authority and regards the structure of the bank capital, its minimum value and issuing means and also its adequacy. On the other hand, the concept of economic capital has known several definitions. Thus, the economic capital can be defined as the amount of capital that a bank believes is necessary to have in order to cover various risks arising from banking activity.

According to Burns – the head of the Office of Analysis and Support within the Division of Supervision and Consumer Protection of the FDIC - U.S., the economic

capital is based on a probabilistic assessment of future potential losses and is therefore a potentially more forward-looking measure of capital adequacy than the traditional accounting measures [2]. Saita defines economic capital as an internal assessment of capital necessary for carrying out the activities developed by the bank [9]. In another approach, the economic capital is defined as the level of capital that shareholders would choose in the absence of capital regulation [5].

All these definitions try to capture the essence of the economic capital.

In practice, the economic capital required differs from the regulatory one, because every bank constitutes its own level of economic capital based on its risk profile but also on its experience in risk management.

While the regulatory capital covers only credit risk, the market risk and the operational risk, the banks include in the economic capital all the risk factors which a bank could be facing during its activity, and which are not to be found in the regulatory capital (liquidity risk, bank strategy risk, etc.).

For example, the levels of protection capitalized on by a banking institution during its activity can be graphically represented as chart number 1.

According to this representation, the first level of protection to cover losses arising from banking activities is usually provided by the profits made during that year and the by the risk provisions that were developed. If these are insufficient, the bank will also fall back on the funds constituted for this purpose (based on general risk reserves). They represent envisioned and expected losses, and form an assumed cost to ensure the safety of the depositors.

Chart number 1. Economic capital

Source: Burns, R., (2004), Economic Capital and the Assessment of Capital Adequacy, page 6.

The next level of protection is provided by the volume of capital that the bank has at its disposal. In consequence, when unexpected losses occur above the normal average level registered, they are borne by the capital representing the shareholders' intake. Therefore, the economic capital is used only to cover unexpected losses, up to a certain level of trust, being estimated as the difference between the capital adequate to the chosen confidence interval and the estimated expected loss.

The maximum loss limit incurred by the bank is given by the variable VaR (Value at Risk) which measures the maximum loss likely to be obtained on a portfolio, in a given period of time, for a given confidence level. Thus, the losses that normally cannot be provided by the bank and for which no level of protection has been established are the losses which exceed the VaR limit. In this case, the bank becomes insolvent, the capital level being insufficient to pay its debts.

In an attempt to define bank capital we also meet the following concepts: capital defined from the viewpoint of accounting as well as the notion of market capitalization. From an accounting perspective, the capital represents the shareholders' right to the assets of a legal person, after deducting all liabilities.

On the other hand, the market capitalization represents the value of the bank on the stock market at current market prices.

In other words, the market capitalization is an estimation of the value of the bank on the market, determined by many factors such as the perception of the business developed, the position on the market, business prospects, etc.

Understanding the two concepts is of particular importance. Thus, the market value expressed through the price of the shares depends on the amount of dividends paid by the bank, i.e., the profitability of the bank's own capital. If it is considerable, the banks gain trust and therefore can collect funds, which means that they can increase the capital by attracting new shareholders. If the market value of the shares is low or declining, the bank's actions do not present interest even if the book value of capital is high.

Thus the market value of the capital is independent of the book value irrespective of whether this value is large or small.

In practice, a bank operates with all these different notions of capital as well as with different constraints on it, which must be met simultaneously.

2. Function of bank capital

In a banking institution, every aspect of its activity is closely correlated with the availability of the bank capital. This is because the bank capital plays an especially important protective role, both in terms of the depositors, the shareholders of financial institutions and their creditors.

The depositors and creditors of the bank must be convinced that their bank deposits and assets are safe. As the chart number 1 shows, the capital acts as a support to absorb loan losses as well as other unforeseen operational losses, protecting them against the risk of insolvency and bankruptcy of the bank.

In order to guarantee repayment of deposits in banks, the Deposit Guarantee Fund in the Banking System has been established. This occurred as a result of the shock felt by the banking system following the difficulties faced by some banks when they had to face massive withdrawals of deposits.

In Romania, the Deposit Guarantee Fund in the Banking System was established in 1996. It is financed through an administrative

fee of 1% of the banks' capital, annual contributions from banks and assets of insolvent credit [10] institutions, in order to protect depositors in case of bankruptcy of banks.

Through the Directive 2009/14/EC of the European Parliament and of the Council from 11 March 2009 on the granting of compensations to victims through the measures implemented in the course of special administration of credit institutions, it was decided to set the coverage level to EUR 100,000. The same level of the coverage is being applied in Romania as well from 1 January 2011.

On the other hand, some studies have shown that in banks shareholders expect a certain productivity of their own capitals having strong interests in the risks taken by the bank, while the depositors depend on the bank's risk strategy [7]. Thus, different parts, with special interest in the functioning of the bank, may hold contradictory opinions as to the size, the importance and the functions of social capital [3].

In this context, the nature and structure of the bank shareholders gains importance. It must be able to ensure the integral capital as well as to provide a higher level of capital when necessary. During its activity, the bank generates capital from the undistributed profits allocated to shareholders in this regard, the capital increase being an additional source of financing of the asset. In the case in which it needs more capital than it can generate through its activity, the bank may issue new shares or take a subordinated loan. This highlights the role played by the bank shareholders.

Even if the adequate level of capital raises conflicts between the bank's shareholders and its clients, all parties have a common goal, namely to see the bank as a stable and profitable institution. This is ensured by confidence in the bank. Without this trust, the market would sanction the bank, the latter not being able to attract deposits from savers.

Thus, the balance of the banking resources in the bank's resources reflects both the confidence of the depositors in the institution, and the degree of safety of the deposited funds, as well as the appropriate level of remuneration, under the form of the discounted interest rate [4].

On the other hand, on the interbank market, other banks could reduce or close their lines of funding. In this context, the capital market also perceives the behavior of highly indebted banks by minimizing the rate of shares of banking companies [1]. Thus, confidence is important for shareholders; it represents an incentive to increase the bank's share price and therefore to obtain additional capital.

Another obvious function of the bank capital is the source of funds necessary to create conditions for conducting business. Thus, it consists in allocating resources in view of purchasing the assets necessary at the establishment of the bank, which is being used subsequently to ensure its functioning. Basically, it is not the depositors who must be the suppliers of funds to open a banking institution and to ensure the equipment associated with its functioning.

Furthermore, the capital fulfills a regulatory function, referring to the ability of authorities to set requirements concerning the size of the bank's capital, serving as a limit imposed in view of the growth of assets in connection with the assumed risks.

This function is designed to limit the bank's exposure by limiting the growth of its debts and improving the quality of the bank's assets. Consequently, the availability of the bank capital determines the maximum level of assets, which is determined by the capital adequacy index.

In some studies with regard to the capital level, a number of analysts attribute the failures to poor management, claiming that well-managed banks should be allowed to operate with lower capital in relation to assets, showing that they do not present a greater tendency to insolvency for the banks with a higher capital in relation to assets. In contrast, other researchers attribute failures to liquidity problems, ignoring the capital [8].

However, the essential function of the capital remains that of ensuring the partners of the stability of the bank. The capital serves as a "safety net" for the risks that a bank is exposed to and for this reason, its size and structure are essential elements in determining the risk profile of the banking company.

Therefore, a bank's capital must have three important characteristics; it

- must be permanent;
- must not generate mandatory fixed charges;
- must allow legal subordination in regard to the rights of the depositors and of other creditors [6].

3. Conclusion

The importance of capital has become one of the key concepts of the banking system. This is why I think understanding the concept of bank capital required and the functions performed by him. These fundamental changes going on in the future will be made regarding bank capital as a result of future developments required by the current economic climate and the provisions of the new Basel 3.

The Crisis Situations in the Forestry Domain - Beyond the Appearances

Călean Ioana

„1 Decembrie 1918” University of Alba Iulia

ioana_c20@yahoo.com

Abstract

The problematic situations in the forestry domain become an important preoccupation for a bigger and bigger number of persons and have a significant impact on the accountant job and on the activity of the internal audit. In this case, the difficulty stands in the difficulty and in the particularization of the of the essence of the forestry activities and finding some possible solutions for fighting against the dangerous moments which can be in this domain. For the beginning, we underlined the possible contribution of the accountancy in the settlement of these contexts, continuing with the identification of the value plus added by the internal audit for the over passing and even avoiding some situations of this type. Another reminded aspect is that one concerning the showing of the way in which the internal auditors can involve in the managing of the forestry resources so that it should not reach in difficult situations.

Key words: crisis, forestry area, internal audit, the accountant job.

J.E.L. classification: M 40, M41.

1. Introduction

The aspects connected to forestry area become important for a bigger and bigger number of entities, researchers and can have a significant impact on the economical operations developed in this area. Any entity must develop its activities following an easy way decipherable and the efficient management of the resources, places a tension on the accountancy which through its specify, must point out at least a part of the hypostasis of the entities activity.

Thus, we have to mention that at the level of the autonomous administrations from the forestry area there are some accountancy leakage which causes meaningful problems

to the professionals accountants. The result of the financial decisions concerning the management of the forestry resources taken by the different persons which have at its base the precision of the accountancy information face the situation in which certain information proved to be not according with the economical events at its base being generated by the situation in which they are misunderstood. In these negative surroundings, the result of the applied decisions will be in most of the cases away of the wanted level.

Because of this reason, appeared the necessity of introducing the compartment of the internal audit which should add the value of the entity by the effectuated recommendations. In this way, the adopted decisions will be better fundamental, analysed, studied and thus it cannot be reached but to results closer to the aim and the autonomous administrations from the forestry domain.

2. The motivation of the researched theme

The motivation of this theme finds itself in the desire of finding certain solutions in solving some practical problems with which the forestry domain faces itself, a research domain little exploited and debated in the specialty literature, but with an incomparable importance for the society. The research starts from some aspects of conceptual and methodological nature from the forestry area continuing with the reflection at the modalities of passing from the theoretical views to the practical accomplishments. On the other hand, the motivation of studying the forestry domain starts from the realizing of a cruel reality concerning the great deforestations of wood comparing with the accomplishment of investments for the forestation and the protection of the forestry elements. Without having the pretension of a complete research of the forestry domain

from the economical- financial point of view, the effectuated research try to bring into discussion some of the problems or difficulties found in the development of the activity in this domain.

The scientifically approach fundamentals it self on the chosen information from the specialty literature, using research methods as documentation, comparison, analysis, synthesis, specific methods to the framing in the positivism from the epistemological positioning point of view.

3. The correlation of the key concepts

According to the explicative dictionary of the Romanian language, the word- crisis is taken in Romanian language from Latin, by the French *crise*, having the following significations: 1) The manifesting of some difficulties (economical, political, social etc.); a period of tension, torment, attempts(often decisive) which manifest in society. The acute lake of...2. A critical, rising moment in the evolution which precedes the healing or aggravation of a disease; the sudden appearance of a disease or the appearance of a sudden access in a chronically disease...b) The dangerous and deciding phase in the social life, consisting in a violent manifestation of the economical, political and social contradiction. 2) A critical moment in the evolution of a disease, after which it follows the change in good or bad.

This complex concept is a lot debated in the specialty literature by diverse authors, each of them treating different aspects from different domains.

The crisis situations find themselves at almost any level, any area of activity, during the time. These moments of tension are inherent to the social existence, the existence of the entities etc. because of the perfect development of some activities is an ideal, and, besides this, the past shows that ‘During a crisis period the inventions, discoveries and the great strategies are born.’ ”(A. Einstein).

If we refer to the economical- financial crisis at the worldly level, it is concluded that there is a component on the way of „the integrisim of the markets, and the crisis of the worldly capitalism, which the author George Soros foresaw, ten years ago” (Mășu Ștefan et.al.) Pierre Leconte, the fonder of the

„Monetary Forum at Geneva for peace and development”, an expert in the monetary theory and practice, remarks himself through the special radicalism of his conclusion, which only the future, even on short terms, will confirm or deny it: „the monetary politics are those which create crisis...”

Robert Mundell, the Nobel prize for economy, accomplished „the triangle of the incompatibility” according to which a monetary international system cannot gather, simultenously, the three features: the autonomy of the international monetary politics, changing fixed rates and the international liberty of the capitals, but only two of them, till present having tried without result the combining of the first and the last features.

Thus, all these characteristics and events on the worldly level, did not avoid the forestry domain, which besides the counteraction of the worldly crisis still has to overcome another so- called internal crisis of the area, manifested through the loss of control of the great deforestations of wood what dues to the lack of rapidity in taking some measures in this way.

According to the law no.46/2008, concerning the forestry area, it represents the assembly of preoccupations and actions concerning the knowing of the forest, the creation and taking care of this, the getting and rational valuing of its products, the primary working of wood, as the organizing and the leading of the entire process of management.

The term „wood” includes: the forests from the forestry management plans at 1st January 1990, as those included previously in these according to the laws; the wooden curtain of protection, juniper trees, the wooden pastures with a bigger or equal consistency with 0,4 ha, calculated only for the surface occupied effectively by the forestry vegetation.

In these contexts, the accountant professionals through their developed activities may bring a valuable contribution for the anticipation, fighting and improving the crisis situations from the forestry domain. This happens more in the situations in which the professional accountants may signal wrong directions in the exploring of the woods (and other

elements concerning the forestry fund) as concerning the best management of the available resources during the worldly economical- financial crisis, and not only.

The professionalism of the internal audit is art and the manner of emitting a value judgment on the used instruments and techniques, as: rules, procedures, instructions, informatics systems, organizing types etc., which represent the assembly of the control activities used by the manager of the institution or the responsible for a job, recognized by the specialists as the internal control.

4. The contribution of the accountancy and of the internal audit at the counteraction of the crisis situations.

The problems of the forestry domains should be seen as being a part of the essence of the lasting development of a country. That is why one of the problems of the national development is the interrelation of the forestry domain and of the medium in general with the economical situation of the country, found in the connection of the necessities at the investments „possibilities from each country. Thus, we have to notice that there is a close correlation between the poor and its destructive effects on the medium. To this aspect it is added the strong impact of the financial crisis” (A. Popa, L.G. Vasilescu).

In this way a fundamental preoccupation of the third millennium would concretise in three directions: deforestations, poverty and water. A significant contribution to the dissemination of its causes could be a better management of the resources by a lively collaboration between the accountancy activity and that of the internal audit. (Fig.1).

As a consequence, just as it is underlined through his affirmation A. Einstein, in these difficult situations should be significantly improved the modalities of collaboration between the two compartments so that the value added to the entity, sector, domain and the economy in an assembly to be one which tends to efficiency and progress .

In 2009, the most often met way of exertion of the internal audit activity was that one accomplished through the contracts of

the carrying out services.(at 493 local public entities). In the same time, to 127 public local entities, the internal audit exerted itself through labour contracts of partial duration, without existing a distinct compartment of the internal audit.

Figure 1 The influence of the economical crisis on the internal audit sector and accountancy

According to the methodological norms specific to the RNP-ROMSILVA and the unities from its structure concerning the internal audit activity elaborated during 2011, the internal audit represents in the National Administration of the Wood- ROMSILVA (RNP- ROMSILVA), as in all the forestry directions PNN/ICAS/ other sub unities, an activity functional independent and objective, which gives assurances and counselling to the leading staff for the good administration of the incomes and public and private costs of the administration, as of the allocated funds for the specific activities, no matter the financing source, making at the same time recommends concerning the perfection of the RNP – ROMSILVA activities.

It also helps RNP- ROMSILVA to fulfil its objectives through a systematic and methodical approach, evaluating and improving the efficiency and effectiveness of the leading system based on the management of the risk, of the control and of the administration processes.

The recommendations of the internal auditors will try to improve firstly the way of managing of the resources extremely limited

and searched in the forestry domain, succeeding in reflecting the good or bad management of the forestry fund, the causes of the abusive deforestation, the ones which are against the forestry domain, to reflect the deficiency of the management of the activity in the forestry domain and to present optimising solutions of the resources management.

On the second place, the internal audit follows the good functioning of the activities in the districts' compartments, of the districts belonging to the RNP-ROMSILVA.

On the other hand, a dilemma will be the establishment of a value of an information given by the internal audit and the accountancy, which in some authors' opinion can be defined through the difference resulted from the net benefit, generated by the taking of a solution after the getting of an information, not being affected by the information. (Dutescu, 2000).

Debates on the economical information will be a problem because this represents the main source used by the decisive factors from the autonomous administrations from the forestry domain, which offers the possibility of the „critical examination of the way of human and natural goods' use, concerning the taking of decisions which impose themselves” (Pop, 2002).

The forestry entities no matter of the developed activities „must frame in the general rules of an open democratic entity. Or, one of the most important rules of democracy is transparency. Transparency concerns the development of an activity „at the day light” or openly. The forestry entity has to furnish financial- accountancy information concerning the way of development with the aim of permitting the control in the forestry entities on the actives, debts, incomes, costs etc. (N.Todea, I. Călean).

The distinction between the valuable information and the useless ones is crucial, the accountant job has to deal with the furnishing of the adequate information so as not to become an area of vain research. (S.C. Deaconu).

A common difficulty of the autonomous administrations from the forestry domain concerning the informational system which stand sat the basis of the taking of decisions towards an economy in which the market

relations must function.

In this way, there are to be mentioned: the limited capacities of the public and private institutions from the forestry sector, deficiencies of the low and fiscal system which do not facilitate the activities from this sector, the imposed limitations by an unperformed economical medium, the lake of the public financing for the investment projects. Other difficulties are connected to: the lack of uniformity of the national network of forestry roads; the advanced degradation of some big surfaces from lacking forests areas; the negative effects which appeared as a consequence of the reconstituting the right of property on woods, because the action was not prepared in a corresponding way.

Concerning the removal of the mentioned difficulties, besides the effectuation and continuous improvement of the strategy concerning the lasting management of the woods, some improvement measures of the forestry Code were taken, the base law of the woods administration, as of the other law documents concerning the forestry sector. It is taken into account that in the future, the public sector will have, mostly, attributions concerning the formulation and implementation of the forestry politics/ strategies, as the control/ supervision of the lasting management activity of the woods at the national level (The National Forestry Programme).

The analysis of the forestry domain participation to the PIB underlines an important diminuation of this participation, from 0.8% in 1980 to 0.28% at present. The privatisation of some related activities from the forestry domain and from the exploitation and pre- working of wood domain, as the reconstitution of the property right on a big part from the forestry areas which makes difficult the evaluation of the real participation of the entire forestry sector to PIB.

The majority of the small and medium enterprises, newly created, accomplished in the functioning authorisations mixed activities, and the statistical raport of the buisness score is not done by an honest reflection of the activities weight with forestry character, thus concerning the consequence of the economical crisis at the PIB formation for 2010, the most important decreases were registered by the buildings

sector (- 13,3%), agriculture, the forestry domain and fish domain (- 5,4%) and the services' sector (- 2.2 %).

The decreasing of the added gross value of the activities from the services is an important one because this branch has a percentage of almost 50% from PIB. Consequently, in 2010, Romania remained in the recession, industry increasing, alleviating something from the decreasing from the other sectors. The main generator of the increasing of the industrial activities is the exportation, as on the internal market the consumption and the investments continue the negative trend.

Figure 2. The share in PIB of the main categories of resources

Source:

<http://www.cogitus.ro/economie/executia-bugetara-pe-2010-si-sinteza-pib>

The relation of the forest and of the forestry sector in its assembly with other sectors of the national economy are of a special importance. The forest, with multiple ecological, economical and social functions which are fulfilled, is a good of national interest which interests and conditions different activity domains, from the medium protection to the ones connected to the valuing of the natural resources.

The harmonious combination of such preoccupations, apparently contradictory, is of maximum importance.

5. Conclusions and perspectives of the research

The effects of the financial international crisis are multiple and affects differently the domains of the economy's activity.

Recently, Romania has got a macro-economical instability, being affected by the worldly economical crisis. One possible cause would be the lack of competition which stops the economical development of Romania. This can be explained by: the low productivity due to the use of an old technology, a low entrepreneurial level and a weak level of the management capacity, an unfriendly business medium, an insufficient investment in research, development and innovation, a low correlation between the employment and the necessary of qualification in a modern economy. (R. Andreica, M. Jaradat).

In almost all the states, the medium and natural resources ministries are traditionally weaker from the point of view of the allocated annually budgeted, as personal and resources. (A. Popa, L.G. Vasilescu).

Thus, the financial activities are very important, because it is necessary the adherent capacity for assuring that the investments for the protection of the medium simultaneously with the lowering of the poverty can be financed from the external resources, but also by the mobilization of some own resources. It is also necessary a sustainable effort to underline the importance of the correlation poverty- medium in the taking of some future decisions of the government and for the implementation of the solutions, with the involvement of the ministers with the planning and the financing according to the objectives of the medium agents.

The perspectives concerning the effectuated research consist in the showing of some images on the role, objectives, procedures, and of the correlations between the activity of the internal audit and the one of the internal control manifested in the autonomous administrations from the forestry domain, with the emphasising of the implications which these activities have in the efficient management of the resources from the forestry domain and of the added value, which these compartments can bring the entities, in correlation with the

management of the resources, having at its base only the information given by the financial situations

The motivation of continuing the research is especially of the practical order, having in consideration the poor way in which the resources from the forestry domain have been managed during the last years.

Analysing in an optimist way the situation from the forestry, I believe that in the future the role of the internal audit from the autonomous administrations will manage to be more successful, and from the assumption of the mistakes and irregularities, will pass to the underlining of the priorities of the private Forestry or from the National Administration of the Forest.

The promising recommendations found in the reports of the internal audit, recently introduced in the forestry directions, constitute a starting point in the observations that the internal audits from the forestry domain can support the entire Planet through their activity, besides their help in the autonomous administrations from the forestry domain, trying to frame rigorously the negative effects of different economical operations.

Evolution of Large Retailers in Terms of Crisis

Călin Mariana Floricica
"Tomis" University of Constanta
mariana_bentea@yahoo.com

Abstract

In a difficult economic context and a more fastidious consumer, retailers can not pass evenly in the shelf price of more expensive raw materials. One important thing this year for companies is to remain anchored in macroeconomic market realities and "maintain about consumers and employees."

The stake will be the amount that any product. Consumers are more careful about what they buy. Must every producer (brand) won in their consumer wallet. The challenge is even greater as most traders already have used traditional lever heavy discounts during the recession. Are in a nearly hopeless situation, they have now found new ways to mitigate the inflationary pressure.

Key words: consumer, retailer, behavior, marketing strategies

J.E.L. classification: D12

1. Introduction

No less money from the pockets of buyers, no increase in TVA, no economic crisis not in the balance sheets of the largest retailers on the Romanian market. Accumulated profits of the fifteen largest network approached last year by half a billion lei, a figure more than twice higher than in 2009, according to calculations BUSINESS Magazine. And sales have increased by (only) four percent. The crisis did not affect the Romanian consumer appetite for food. Continue to buy as much as during the boom. The difference is that rather than give up quantity, Romanians give up quality. As a result, products are sold mostly cheap and very cheap.

It focuses almost exclusively on meeting basic needs, and frequency of purchases, which fell to four visits per month, affecting more modern retail. In Romania shopping cart is 175 euros monthly and consists of fresh produce at a rate of 65%, while in Europe the basket is 320 euros monthly. Average basket per visit hypermarkets fell in January-September from 170 lei to 158 lei, though in words hypermarket shopping remains the first choice for 93% of cases, according to a recent study.

Proximity remains an important criterion in choosing the store to shop, but is very important distinction, and the ease with which customers find products on the shelves.

In terms of retail market development, we appreciate the fact that "the market will not increase, but no longer decreases." Traditional trade will maintain its current market share of around 50%, major retailers will continue to lead a fierce battle on price, but will improve and services. However, it will make the transition from large format to smaller ones, and traders will seek to conclude strong partnerships with various manufacturers in the market.

While retailers can hope to offset higher input costs through price increases, inflation will have a significant impact on consumer ability to spend. Its purchasing habits will reflect a shopping list adjusted in several ways, including fewer visits to the store, an accelerated migration to the Internet and move towards nearby shopping locations (convenience stores).

As the price range, consumers will turn to economic solutions such as private brand products and those in promotion. The new consumer internet user intelligently, is more ready to make purchases. This avoid misleading prices and buy more with fewer resources, which will limit the ability of retailers to ignore price increases and will force them to be more precise in approach.

Trade continues to show attractive. In the last decade local retail market increased by 123%, by far the most active in the region. Between 2000-2010 Romania has the highest rate of growth of the retail market (about 8.5% annually) in Central and Eastern Europe, other markets in the region with lower rates: 54% in Poland and the Czech Republic, 26 % in Hungary.

Data from the Registry of Commerce and the Ministry of Finance shows that the most profitable business is that of the Germans from Kaufland, which operates discount stores large. Over 172 million RON in 2010, more than double compared to 2009 (78 million) is net gain of Kaufland, while the discounters strategy is to rely on low prices. While last year Kaufland had the largest gains from trade in Romanian, the other unit of Lidl, recorded the biggest loss: 247 million RON in 2010, about three times higher than the previous year.

In the last two and a half years the largest food companies, DIY and clothing have invested about 1 billion euros in opening new stores despite the economic crisis and declining consumption.

Players such as Kaufland, Lidl or Dedeman, either Romanian or foreign, still relied on the local market despite the downward trend of consumption continues.

However, according to consultants, there is growth potential for retail market valued at 30 billion euros. Unless modern retail consultants rely on an increase of about 60% by 2020, while the Romanians spend at present only 1,100 euros per year in this type of shops, four times less than EU average according to a study by Oxford Economics company. Thus, the next ten years, only food retail dominance could earn 10 billion to 16 billion today.

Another reason retailers have relied on expansion in a difficult period for the economy and trade is that the difficult economic situation of cheaper rents and land prices.

However, the crisis has left its mark on some market players, who failed to pass this time. For many of the Romanian business insolvency trade became the watchword.

Examples are Pic, business owned by brothers Penescu, Univers'all (Razvan Petrovici) and Ethos (Ion Soloman). This situation benefited large foreign companies

that made acquisitions among "sick". They continued to come up with money in anticipation of increased consumption in Romania. Some sharks are Mega Image trade and Profi trade.

Modern retailers were the most active and are still interested in opening stores. This market segment has managed in less than two decades to catch up with traditional retail, and half have come to trade. What will happen to the traditional trade in this situation remains to be seen. Network Dedeman DIY stores, occupies leading position in several chapters on last year's results - rapid expansion, sales growth (46%), the largest margin of profitability (around 10%). In terms of profitability, is also placed on top and Carrefour (140 million), Metro (139 million), Selgros (100 million) and Cora (66 million).

Figure 1. Dynamic sales growth in key economic agents

Source: National Institute of Statistics

In fact, discounters have been champions of the crisis in segment trade: the last three years have opened over 220 stores and cumulative sales reached 1.2 billion. To attract shoppers, discounters now gulping in segment sales over 430 spaces called Lidl, Penny, Profi, Minimax Discount Market, or Red Market.

Figure 2. Profit analysis of key economic agents in the years 2009-2010

Source: Ministry of Finance

This year we saw an abundance of remodeling processes, rebranding, repositioning, after the reinvention, the Romanian retail. At first glance we should enjoy such a finding because, in fact, investments in such processes is a mature market. On the other hand, we can not notice a blurring of lines between convenience stores, supermarkets and discounters, which are not nearly as clear as 5-10 years ago.

Start remodeling processes in modern commerce gave him cash & carry stores in a few years ago, but now already talk of a general phenomenon, doubled and other movements, such as repositioning or rebranding. Profi, for example, in the last 2-3 years trying to find a position in the market more "relaxed", bringing the concept of trade above the discount. Bill Germans also have great plans for remodeling the old supermarket network by rethinking space sales and a greater focus on services for buyers and assortment of fresh produce.

Add to the equation and aggressive expansion Lidl has already rebranded 107 stores from Tengelmann Plus taken and is preparing for the inauguration of the first units raised from zero, estimated at around 30 in the first phase. Concomitant with the announcement of the opening of 11 stores, Lidl launched its first image campaign focused on highlighting regional peculiarities in its portfolio of articles, which runs under the name "All the best in Romania. All the best in Europe ". Image campaign will be conducted in all media, both in Romania and in Poland, the Czech Republic and Slovakia.

Monica Davidescu image campaign is Romanian.

So far, Lidl has communicated only through the store magazines distributed in the surrounding areas. In addition, Lidl can interact with Web pages and through social media, where a community of over 91,000 fans, far more than any other local retailer now on Facebook. Since the beginning of September, all clients have weekly Lidl stores two days nonfood articles promotions: Mondays and Thursdays.

May we count miniMAX in Macro stores and rebranding. In fact, the last minute changed Mercadante management strategy, realizing that the two concepts are addressed to different segments of the population.

After a year and a half since the launch Mic.ro concept, the network of about 720 grocery outlets include fixed and mobile units around 110. The novelty really important in terms of company Mercadante is a decision not to give up miniMAX Discount brand. Because miniMAX and Macro are two different markets. miniMAX is a discounter and Macro store is more than proximity. Another strategy applied by large retailers is based on advanced analysis of prices, promotions practiced in the store, the better management of inventories and product diversification depending on the specific needs of the area where the store is located.

Price will receive the most attention, as inflationary pressures will intensify. Ability of retailers to increase prices not passed on to consumers varies with the company's market position and price policy. Retail industry leaders, those who benefit from a consistent traffic in the area of sale, are reasonably well positioned to keep prices relatively unchanged.

Their smaller competitors, however, more concerned with current rates probably maintain profitability, will have to increase the final prices and use other levers to drive traffic in store. Store formats targeted toward quality will be under price pressure as low-income buyers, sensitive to price, will be forced to make shopping more selective and much less value. On the other hand, the ability to inform consumers about offers price charged by retailers will follow reduce their appetite to increase prices for substitutable items.

These factors influence the market with a high will cause retailers to be more strategic and precise to validate prices, but also more flexible in adapting to market changes. Retailers will need to closely monitor the dynamics of prices of competitors and adapt to these changes in a short time. Similarly, should be given special importance and effectiveness of promotions. The fact that retailers looking to generate traffic even among people who do not tend to do more shopping, knowing what kind of offers will motivate consumers to buy, is of critical importance. Retailers may seek to introduce or expand a campaign of high-low price segment (the line between economic and environmental) using promotional discounts to generate significant traffic in the store, but also to mask some price increases.

By carrying out analysis on finding the most relevant product attributes to consumer buying habits or tolerance regarding the price increases, retailers can identify the right combination of products to run promotions, in order to motivate various consumer segments. Introducing this level of sophistication in the decisions about prices and promotions will ensure that retailers and their actions promotional prices will generate results.

With the expansion, retailers will begin to develop commercial projects based on market characteristics that are found, and the range of products tailored to the needs of a highly fragmented audience. Although this approach is widely used today by many retailers in the past adapted to the local strategy was considered too difficult to implement.

Advanced analysis techniques to change the appearance of the game. Great retailers apply detailed research to effectively maximize the assortment of products.

Research on product quality but also of selling space provide more superior knowledge compared with traditional reporting on top of a category of products preferred by merchants. New research methods allow traders to determine with greater precision local consumption habits

and optimize assortment properly. In addition, there are software companies specialized in providing sustainable solutions designed to analyze transactional data both consumers and local model of consumption and thus to help retailers determine which items should be included in the assortment.

Factors which underscores the importance of good management of stocks:

- Increased transportation costs could result in decisions on stocks rise for a better management of logistics costs;
- The prospect of rising prices of raw materials and utilities, in general, can cause retailers to buy more than needs, especially by imports, to avoid future price increases;
- Most retailers store and manage inventory for online commerce stores built separately from those submitted. As online commerce continues to become a growing business division, retailers will have to adopt a multi-channel inventory management.

2. Conclusions

No less money from the pockets of buyers, no increase in TVA, no economic crisis not in the balance sheets of the largest retailers on the Romanian market. Economists warn that the biggest inflationary pressures coming from food and fuel prices. As the price range, consumers will turn to economic solutions such as private brand products and those in promotion. The new consumer internet user intelligently, is more ready to make purchases.

The Effects of the Global Crisis on Services

Căruntu Andreea Laura

„Constantin Brancuși” University of Targu-Jiu
Faculty of Economics and Business Administration
Andreea.caruntu@yahoo.com

Abstract

Challenges appear day by day and selling more services than products has become an exciting challenge. In the last years the number of services sold has overcome the number of products sold.

The purpose of this paper is to show how the world crisis has effected confidence in services in the European Union. Services are a part of our lives and due to their intangibility the decision of buying them becomes even more important because we can fail in choosing a service that does not accomplish what we need from it.

After reading this we shall see that in services it is very important the relationship created between the company and the client. Unfortunately, the financial crisis has had a serious impact on the sale of services.

Key words: services, crisis, marketing, confidence

J.E.L. classification: M3, N7

1. Introduction

Throughout the last years, the economies of most countries have had the tendency to evolve in service economies having at the center services like education, health care, financial one and the list can continue. It is though for a business to compete in the services area due to the fact that services are not tangible products and marketers must take into consideration all of the marketing mix elements and offer consumer the value they desire.

Some scientists consider marketing services more difficult mainly because:

- services are intangible so they can not be touched, being difficult to actually now what they are buying;

- services are variable, they differ as people are different and each can have a different answer to the same problem,

- services can be manufactured while the consumer is waiting to receive it and this usually happens in the online area.

Companies from the service area try pass difficulties by making sure that consumers recognize the quality of the service through its physical manifestation and this can be done through the business representatives, the way the building looks and so on. If you want to travel and see photos with a hotel looking great than you will be satisfied before actually staying there. This is the good part because there is the case when a coffee shop looks obsolete and you may not want to enter to see what it offers so even if the coffee shop offers great services it will be more difficult to convince people of the services quality.

It is said that relationships are the key in services marketing because if marketers understand consumers needs it will be easy for them to have a long term relationship, build on loyalty and such a relationship can only lead to the increase of sale and to an effective buzz marketing. As we have seen, interacting with the customer is important so companies try to have different touchpoints. Companies also take into consideration feedback from customers in order to improve the quality of their services and basically to fulfill consumer needs.

In such a competitive world, customers have the possibility to choose among different services so there is a huge challenge for the marketer so that its services will be known by everybody. Knowing how to communicate the benefits offered by services is only due to the fact the services marketing is so prolific.

We must also mention that the new technological discoveries have a huge impact on the service economies of all developed

countries. Living in a world dominated by Internet services can be a good thing because it allows companies to stay competitive and customers can take part in the marketing process.

2. Notions related to services

Kotler defined services as “any activity or benefit that one party can offer to another that is essentially intangible and does not result in the ownership of any thing”.

The services marketing concept has appeared in the moment when the world economy of services has started its development. After the years 1940, 1950 the society developed so it was necessary that new techniques and methods were used to know the market, anticipate its behavior and taking measures to respond to the competition.

In the year 1963 it has been published by William J. Regan the book “Services revolution’ and from that moment on the number of authors writing in this area has increased so that in the 90’ there were over 3000 specialty paper. An important moment is represented by the year 1981 when the conference of AMA (American Marketing Association) has been dedicated exclusively to services marketing.

According to the French school the services system represents the systematic and coherent management of the physical and human elements of the interface client- firm.

This system contains four elements: physical support, contact personnel, the client and the service. Between the elements we find different relationships.

Regarding the physical support we can state that it represents tangible part being used not only by the contact personnel but also by the client. It consists of the instruments used in performing the services and here we find equipments, machines and other objects.

Some say this part is divided in material elements used in performing services and elements specific to the contact personnel.

The contact personnel refers to the people that are in touch with the customers. There are case when a service does not need such a personnel. Some services use equipments, machines so the presence of contact personnel is no longer necessary.

The client is the one who has a certain need that is being fulfilled by a service. Client is the person who uses several times the services of a company. There are cases when its involvement is necessary and cases when it is not. The participation happens when a client takes a ride with the car that has just been repaired.

The service is the most important part of this system being the result of the interaction between client, physical support and contact personnel.

According to the Nordic School of Marketing the services marketing is divided in :

- a. External marketing – referring to the usual activity of the company consisting in preparing services, charging tariffs, distributing and promoting them;
- b. Internal marketing refers to the activities of preparing, motivating and stimulating the personnel in order to provide services;
- c. Interactive marketing regards the staff capacity of providing services.

3. The effects of the global crisis on services

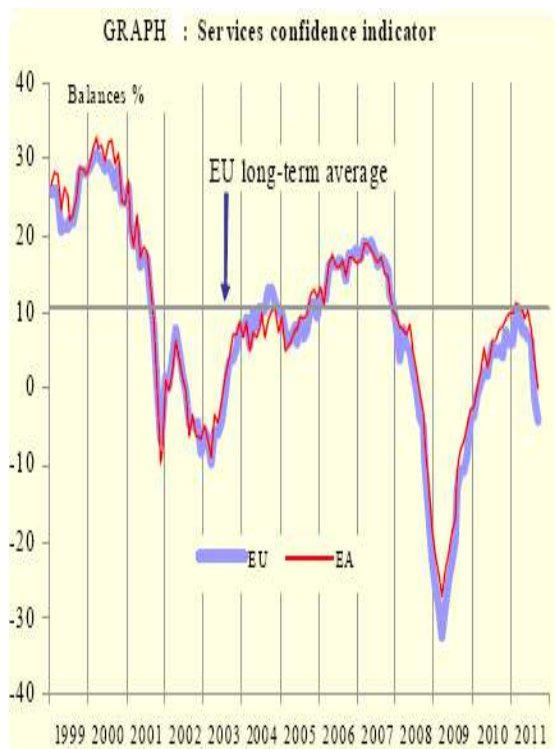

It is said that the world economic crisis has started in the middle of the year 2007, the beginning of the year 2008. The crisis started in U.S. and continued around the globe. In that period governments realized there was a need for rescue packages due to the fact that important financial institutions collapsed and day by day the crisis was getting worse and stock markets continued to fall.

Some say that this crisis could have been avoided but during the boom period nobody could have thought that things could go that bad.

Professor Joseph Stiglitz, winner of the Nobel Prize, that financial markets should be evaluated in relation to how they serve citizen, if their services respect clients needs and by doing so the economic could only grow.

According to the surveys realized by the European Commission, Directorate – General for Economic and Financial Affairs, the Economic Sentiment Indicator (ESI) declined by 3.4 points in the EU and the euro area. This decrease shows losses in confidence in industry and services.

Figure 1. Graphical representation of ESI

Source: European Commission Services

In what regards the sentiment in services we see that it decreased in European Union with -2.8 and in the euro area with -3.7. This difference is caused by a small increase in sentiment in the United Kingdom. Apparently, past and expected demand from both regions has been evaluated as worse. Regarding employment expectation in services it can be noted that they decreased in the euro area but it can be seen an improvement in the union.

Also, confidence in financial services also decreased with -3.5 in the union and -1.2 in the euro area.

The lowest level of the ESI started to be recorded in 2008 when the services confidence indicator has had the lowest value since the appearance of this indicator. It was reported a decrease in all countries of the European Union.

4. Conclusions

Experts say that the global financial crisis will reach its peak in 2012 so there is still to come. As we have seen, services have been affected considerably, existing a serious decline in the consumer confidence leading to decreases in the sales. Such a thing can only affect companies in a negative way because by decreasing their profit companies find it harder to survive in the competitive economic environment.

The only way to continue to perform an economic activity is for all companies to try to innovate their services, always discover what are their customer needs and try to fulfill them before the competition.

Fortunately, the members of the European Union do their best in keeping the unity of the Union and in trying to help countries to overpass this crisis by recording a growth in the economy.

Synthetic Analysis of the Effects and Impact of Financial Crisis in the National Context

Căruntu Constantin
Lăpăduși Mihaela Loredana
„Constantin Brâncuși” University of Tg-Jiu
caruntu_ctin@yahoo.com
loredana@utgjiu.ro

Abstract

„Creativity is born out of necessity, and the day is born of the night. In times of crisis are born inventions, discoveries and great strategies. Who is exceeded beyond the crisis itself and not remain exceeded.” Albert Einstein

In this paper we intend to present a series of reference points on the implications and impact of the financial crisis on the micro and macro environment in Romania. This analysis is focused on summarizing the effects of global economic and financial impact on our country.

In this, the state involvement in the economic and financial life should be to act as representative of all citizens and representatives of national economic and financial interests. The economic and financial crisis has been and continues to represent the negative effect of a multitude of interconnected factors, namely: economic factors, financial factors and institutional factors. Under these extraordinary conditions of crisis it is necessary to be taken a number of measures, both at international and national level to counter the negative effects of the internal and external financial crisis.

The research will allow us to identify significant changes both in economic life and in the financial life of our country.

Key words: economic and financial crisis, recession, crisis effects, anti-crisis measures, the economic recovery.

J.E.L classification: H11, O11, O12

1. Introduction

The triggering of the economic and financial crisis by breaking the U.S. housing bubble and its global expansion has broadened the horizon of research in this area, generating numerous topics of discussion today and tomorrow.

In our view, this global crisis is and will be the catalyst of many mutations and changes we will face in coming years. We believe that the uncertainty of economic and financial crisis of the state must adapt to these changes in order to perceive, understand and analyze the business environment as a major opportunity for the future.

Specialists in the field believe that the economic crisis began in October 2008 in the U.S., mainly but not exclusively. The most important causes identified by experts for this phenomenon are: pre-crisis boom in lending, excessive growth of asset prices, granting loans and uncontrolled massive economic entities that do not provide sufficient guarantees of repayment. Root causes of economic and financial crisis are deep, such as macroeconomic and microeconomic in nature. The current financial crisis is spreading worldwide and no sector has remained untouched.

The crisis was largely the result of an exacerbated optimism that led to an excessive degree of risk in business, combined with mismanagement of financial market uncertainty management. Amid inconsistent macroeconomic policies, generating internal and external imbalances and deficiencies in financial regulation and supervision, the financial crisis turned into a global economic recession. The economic situation overlaps many other negative phenomena become chronic: environmental crisis, the crisis

deepening economic disparities between states, poverty, deficits, education, healthcare, etc., affecting the world as a whole and each individual, which makes improving the social problems of mankind to be postponed due to lack of financial resources.

Although the starting point of the crisis is in developed countries, the most affected seem to be the developing countries, as is the case of Romania, who has to cope with the increased number of people suffering from malnutrition, hunger and chronic diseases, unemployment, reducing access to education and health. Effects of the crisis materialized in the collapse of stock markets, disrupting the balance of payments and trade balance, large swings in exchange rates, budget deficits increase, decrease world trade, reduced access to financing through loans, are felt to varying degrees throughout the world. Developing countries such as Romania, are most affected because they depend more foreign investment, and people have fewer resources to cope with the crisis (through consumption and thus encourage the development of growth companies). [7]

2. Economic and financial crisis in the national context

2.1. The impact and effects of financial crisis over the microeconomic environment in Romania

None of the companies operating in the Romanian or international economic space can not avoid reality and minimize the effects of global crisis.

During the periods of recession, companies tend to reduce investment in research, development and innovation, which is why young firms whose entrepreneurs come up with new ideas are more vulnerable to financial constraints than companies developed. However creativity entrepreneurs can reduce the effects a crisis more effectively than traditional businesses. [5]

Many experts consider that, to meet the difficult economic situation, enterprises, especially SMEs, must provide quality services, build a trusted name in the market, develop lasting relationships with business partners.

More than half of the top companies in Romania believe that the peak of the economic crisis will be reached in 2012, the year will be marked by new bankruptcy of Romanian SMEs, said the director of the Association of Chartered Certified Accountants (ACCA) South East, Andreea Stanciu, at a conference on SME sector development. As the studies show in this area, Romania did not yet reach the maximum level of the financial crisis. The peak will be attained in 2012. It is good that we can know this before and that firms have such opportunity to rethink their business, to shift. Will continue, certainly bankruptcies, companies make do not have profit because of the falling demand and SMEs access to financing is more difficult, said Andreea Stanciu. [1]

The principal measures taken by the managers of Romanian companies as a result of the crisis have been materialized in:

- reducing the number of productive and administrative staff;
- adjustment of the investment plans;
- adjusting prices by reducing wages;
- renegotiating with banks on credit expansion and extension;
- sending employees in technical unemployment;
- reducing all categories of expenditure;
- increase loan payment deadlines credit/leasing;
- expansion of marketing;
- reduce the costs of collection;
- sale of assets;
- maintenance of wages or even reduce them;
- accessing European funds where possible;
- grant not paid of leaves;
- reducing or eliminating other material benefits to employees.

Each company has had a manifestation and a different approach on the financial crisis impact on its activities, depending on the activity profile, company size and reputation before the occurrence of the crisis, the market context that works, etc

The main factor affecting the business environment in Romania has been the falling demand seen as a complex and interdependent system of factors, among which the important ones are: availability of credit, exchange rate volatility, the

emergence of arrears and liquidity problems, etc.

The most affected companies were those in the metallurgical industry, metal constructions and metal products and transport industry, building materials, chemical industry.

2.2. The impact and effects of financial crisis on the macroeconomic environment in Romania

Deepening financial and economic crisis to turn around the trend over the state's role will be higher, and the private sector will be lower.

The European economy slowly emerges from the worst recession for decades faced. The economic crisis has caused a significant decline in economic activity in the U.E., accompanied by the loss of millions of jobs and a high human cost. Pre-crisis structural deficiencies were not corrected properly became visible. [8]

The crisis had a high degree of synchronization is affected both developed and emerging countries, demonstrating a significant increase interdependence of world economies. Since the last quarter of 2008, the financial crisis spread rapidly in Romania, in the context of an increasingly globalized world economy, and specifically, the Romanian economy highly integrated into the U.E. economy, so any negative external shock to spread rapidly and internally.

The international financial crisis on the Romanian economy expanded at least the following areas:

- commercial sector crisis led to a slowdown in export growth or even reduce them;
- in the financial sector the crisis has limited access to external financing, and thus led to restrict the volume of lending, generating difficulties in the external private debt; the developments in international financial markets and in the domestic financial market dynamics have led to a reassessment of risks influencing the capital market;
- national currency depreciation by reducing external financing;
- withdraw from Eastern European investors;

- net asset deterioration of the population and companies due to the large share of loans in foreign currency (depreciation related) and lower asset prices and real estate securities from speculative values.

Monetary policy pursued during the crisis has led to an increase in the monetary base. However, in early 2010, it did not cause an acceleration of monetary aggregates faster than at the beginning of the economic increases that followed the economic output of the worst recessions of the past. But as soon as the cyclical conditions will become normal, there is a real possibility that this risk of liquidity to inflate the price of certain assets, creating a new speculative bubble. The problem which will then come into discussion is that of the strategies of receiving liquidity. In other words, the crisis spiral continues, because not only after the crisis of the risky mortgage derivatives, we find ourselves in the same point as after the crisis of new technologies from 2000, but more than that, the dynamics has grown because “the global saving glut” (global excess liquidity) Bernanke was talking about in 2005 has only served to increase, following the monetary policy pursued during the crisis. [9]

The effects of the financial crisis on the macroeconomic environment can be grouped into: economic effects, effects of financial and social effects.

Major economic effects can be:

- reduce economic growth (GDP);
- reducing the volume of foreign direct investment;
- increasing unemployment;
- market exit of a large number of SMEs;
- tend to reduce competition.

Major financial effects may include:

- decreasing liquidities in the banking system;
- reducing current transfers from abroad;
- damage disinflation;
- increasing bank interest rates;
- increasing the public budget deficit;
- increasing the cost of private sector funding;
- increasing the cost of financing the budget deficit.

Major social effects are:

- difficulty or impossibility of returning to long-term bank loans to individuals;
- decreasing the safety of the workplace;
- the fear of increasing social insecurity.

The strategic options that the state could take to facilitate overcoming the negative effects of the economic crisis are:

- reducing fees would be really useful especially for private companies, but also to redress the economic environment;
- unlocking investment and expansion;
- intervention on the banking market in reducing interest;
- providing financial incentives;
- strengthening state banking sector;
- exchange market intervention on exchange rate stabilization purposes;
- extension of time limits for payment of taxes;
- reducing budgetary expenses.

In the short term, government priority has been and still remains linked to economic recovery, creating jobs and ensuring sustainable public finances. Despite the reduced budget fiscal space as a result of expansionary macroeconomic policies pursued in previous years, the government reacted promptly in 2009, and implemented an anti-crisis program resulted in a substantial number of measures to stabilize the economy and resume growth process, as follows: [9]

- measures to stimulate demand by increasing the purchasing power of households (The first house), cars (scrapage program), support for exports (Eximbank capitalization);
- investment incentives (tax exemption for reinvested profit, investments in thermal rehabilitation of dwellings);
- incentives to agriculture (the “first crop”);
- social measures (providing social pension for pensioners with low incomes in two installments);
- measures to protect the labor market (unemployment Technical Program “for employees more money, more competent, more healthy”, extension of unemployment aid for three months).

3. Conclusions

Conclusions of the most important Romanian experts are clear: not only the crisis is not over, but entered a difficult phase and that will affect the financial system and economic fundamentals, the phase of economic decline will continue until 2015 at the earliest and a recovery cycle in 2020.

This decade will be the lost decade of Romania, and if are not taken rapidly action to restore even a controlled collapse of the economy then we risk that Romania will not recover even after 2020.

The crisis continues to affect the Romanian companies. Two thirds of Romanian managers is expected to be affected by the crisis by the end of 2011 and a third are in gibberish so the level of uncertainty that can not act on the moment when the crisis will stop them affect business. From about mid last year until now, almost all companies in Romania have started implementing actions of keeping costs under control, but also to reduce them, but in the exchange of structural changes of business, most measures have been limited to staff reductions , freezing salaries and hiring and freezing new investments.

Regarding economic and financial crisis at the microeconomic level we suggest a series of general measures which may somewhat counteract the effects and impact on our country:

- measures to mitigate the effects and impact of the crisis taken at national level should be correlated with those taken at E.U. level in order to improve their effects;
- control measures established in the short term crisis, should be classified in the medium and long term strategy;
- in the manifestation of the economic and financial crisis must be protected the economic interests of the population (purchasing power, repayment capacity, jobs) and social security support;
- maintaining and developing investment attractiveness of Romania;
- measures of countering the effects and impact of the crisis must be taken and applied logically, so that a measure taken to become a resource or support follow-up.

In the line with the Government Program and U.E. objectives provided under the Lisbon Strategy (relaunched), the Broad Economic Policy Guidelines and the Stability and Growth Pact of the E.U. medium-term economic strategy of the Government the following objectives: [9]

- Resumption of the process of economic growth and job creation;
- Adjusting public deficit and current account deficit to levels that make possible their funding and continuation of the disinflation;
- Protecting the population categories are most affected by the economic crisis;
- Improving the predictability and performance of medium-term fiscal policy and maximize the efficient use of funds from the European Union;
- Ensuring long term sustainability of public finance;
- Restructuring and streamlining public administration;
- The firm implementation of the commitments assumed under the multilateral external financial agreement with the IMF, European Commission, World Bank and other international financial institutions.

The European Commission's new strategy for 2020 seen as an exit strategy requires that each head of state and government „sets a few generic objectives and policies to define appropriate action, to be pursued at EU level and Member States, in partnership”. The document defines four priorities for 2020: Innovation and knowledge, the fight against exclusion, green growth and digital Europe.

Profitability – Economic and Financial Performance of the Efficient Usage of Production Costs

Căruntu Roxana Corina
Căruntu Andreea Laura

“Constantin Brâncuși” University of Targu-Jiu,
Faculty of Economics and Business Administration
r_căruntu_28@yahoo.com

Abstract

Every company has to be concerned with its profitability due to the fact that an activity with a negative rate of return has to stop developing or to improve its malfunctions.

Managers have to perform a financial analysis in order to observe the effectiveness of current economic measures and to assess the degree to which the strategic objectives are achieved.

The financial analysis of a company's activity includes a profitability analysis that reflects the economic efficiency of the activity. The performance of it has an impact on the owners and clients of the company because it will show if the activity has the necessary characteristics to be continued

The article presents the importance of the profitability analysis and what indicators should be used in order to perform it. The indicators considered to be relevant in this case are included in two categories: indicators expressed in relative size and indicators expressed in absolute size.

The indicators expressed in relative size are composed of the profit and margin while those expressed in absolute size refer to the profitability ratios.

The profit is the indicator that characterizes the activity of the company from the qualitative and quantitative point of view. The profitability ratios show how efficient the company uses its resources.

Key words: profitability, rates of return, economic performance

J.E.L. classification: G14, L11

1. Introduction

In the conduct of a company, experts appointed by it are required to periodically evaluate the performance registered in order to prevent and improve possible malfunctions.

Diagnosis on company performance is achieved by:

- management of the company;
- external experts
- joint teams of domestic and foreign specialists.

The notion of performance of an enterprise lies in how it achieves its objectives. This is dependent on company's objectives, on their achievement.

The complexity of performance lies in the diversity of definitions that appear in the literature about this notion. Thus, in the economy appear to be three types of performance calculated according to the level of achievement of strategic objectives, the value creation and the productivity and efficiency of the company.

Economic efficiency occurs due to the existence of a trader and is closely related to the evolution of prices, supply and demand ratio and costs.

The process developed for measuring the economic and financial performance starts from the two approaches of performance measurement. The first approach is a technique one and focuses on the study of results, networks of management units and the second approach, human psycho-sociological approach, is centered on the person and leader behavior.

Thus, the two approaches are based on the system of objectives that have to be clearly defined and quantified within the limits but also in the staff motivational system.

Reflection of a company's performance depends on the method of calculating it that the managers choose. Thus, the performance measurement of the company's activity during a period of time can be calculated by difference between revenue and expenditure for that period.

If it is wished to assess the economic enrichment of the company, managers have to analyze the difference between net assets at the end and beginning of the period.

2. Profitability content as an economic and financial performance

The notion of profitability appears due to the development of an economic activity and it defines its ability to make profit by using inputs and capital. Profitability comes from the difference that occurs between the proceeds from the activity and the expenditures from manufacturing, marketing and the transaction itself.

This means that after the sale and collection of manufactured products, the revenues have to be higher than the expenses. Profitability is included in the system for disclosing financial and economic potential of the company, being essential information for banks, creditors and business partners. [1]

Profitability is a synthetic form of expressing the economic efficiency of the activity undertaken by a company considering both the inputs and labor.

Measuring profitability is achieved by using two categories of indicators: profit, reflecting the sheer size of return, and rates of return which show the degree to which financial resources of the company produce a profit.

Profit is the indicator of whose role involves characterizing the company's activity in terms of quantity and quality. It provides shareholders and entrepreneurs information on the saving activity of production factor, stimulation of innovation, improved manufacturing technologies, increase of the quality of their products. [2]

Legal regulations mention the fact that profit consists of two components:

- legal or legitimate profit – represents the monetary surplus registered by the company by keeping the law;

- illegal or illegitimate profit – amount of money obtained by violation of law.

The main objective of strategic nature of an economic entity is to achieve higher returns to capital invested by shareholders.

Achieving this objective is synonymous with the pursuit of profit - generating activities, since it represents the base for the allocation of dividends to shareholders of the company. [3]

Obtaining profit by the company proves to be a risky process because of the difficulties appearing regarding the correct assessment of market trends, prices, demand size, etc.

Economic and financial practice show that in case of some companies it can be met the over profit notion that includes over profit due to inflation, speculation; over profit generated by imitative innovation; the monopoly profit that occurs when a company has a monopoly position on the market.

The profitability rate represents one of the most important indicators to compute the efficiency of the company's activity as it shows the results obtained by following the economic circuit steps: supply, production and sales. [4]

3. Basic indicators of profitability

Measuring the return can be made by using two size categories: absolute and relative. [5]

The indicators expressed in absolute size include: the profit and the margins.

Indicators expressed in relative size refer to the economic, financial, commercial and resources consumed return.

3.1 Indicators expressed in absolute size

In the case of *profit*, according to the revenues and expenses structure from the Profit & Loss Account, for the profitability analysis we have to consider the following indicators: [6]

a) the operating income:

$$\text{Operating income} = \sum q\bar{p} - \sum qc$$

where:

$$\sum q\bar{p} - \text{operating revenues;}$$

$$\sum qc - \text{operating expenses.}$$

The operating revenues include the turnover, revenues from the stored production, revenues associated with assets production and other operating revenues.

The operating expenses include all expenses related to the operating cycle (production and marketing of goods)

b) the current income:

$$\text{Current income} = (\sum q\bar{p} + R_f) - (\sum qc + E_f)$$

where:

R_f - financial revenue

E_f - financial expenses

c) the extraordinary result is computed as the difference between the extraordinary revenues and expenses;

This type of result is a random one, it does not have a regular character as in the case of current result.

d) The gross income before tax is computed by summing up the current result with the extraordinary one or by making the difference between total revenues and total expense;

e) The taxable profit represents the gross profit before tax to which is added the overruns to legal levels for some categories of expenses and deducted some tax deductions;

f) The net income (profit or loss): represents the taxable profit corrected with the income tax.

Margin can be expressed in the following forms:

a) The margin of production costs: is computed as the difference between the selling price and the production cost of goods;

b) the commercial margin: appears in the case of companies that activate in the distribution field and is computed as the difference between the selling price and the purchase cost of the goods;

c) variable cost margin: shows the difference between the selling price and the variable cost of the good;

d) direct cost margin: shows the difference between the selling price and direct costs.

3.2 Indicators expressed in relative size

This type of indicators includes:

a) the economic rate of return: shows the relationship between an economic result and

the economic means employed to achieve it; this rate expresses the efficiency of the commercial activity of the company:

$$R_e = \frac{I_c}{A_t} \cdot 100; \quad R_e = \frac{I_o}{A_o} \cdot 100;$$

$$R_e = \frac{I_c}{C_p} \cdot 100$$

where:

I_c - current income;

A_t - total assets

I_o - operating income;

C_p - permanent capital

b) the financial rate of return: shows to investors how profitable is their investment and it reflects the correlation between the net income and the company's equity:

$$R_f = \frac{I_n}{\sum_{i=1}^n qvi \cdot \bar{p}i} \cdot 100$$

where:

I_n - net income

qvi - production sold

$\bar{p}i$ - average selling price

c) commercial rate of return: expresses the efficiency of the commercial activity of the company maintaining the connection between the income the net turnover:

$$\bar{R}_c = \frac{I}{T} \cdot 100 \text{ where:}$$

I – income associated with turnover;

T - turnover

d) resources consumed rate of return associated with the turnover: shows the correlation between the profit corresponding to the turnover and total costs associated to sales; the specialists consider that its value should lie between 9% and 15%.

$$\bar{R}_c = \frac{I}{\sum_{i=1}^n qvi \cdot ci} \cdot 100$$

where:

ci - cost for product i.

The presented indicators are considered useful tools in the financial analysis of the company because their computation helps characterize the production policy, trade policy and investment policy.

4. Conclusions

In order to continue in performing its activity the company has to analyze the performance of it registered over a period of time. This involves a detailed study of the profitability of the enterprise being necessary the results that are obtained from the calculation of rates of return in order to make a comparison between national companies with the same domain.

The notion of profitability is strongly correlated with the profit, representing a company's ability to achieve profit.

The concept of return reflects the company's ability to use its resources at its disposal in an efficient manner that will lead to obtaining monetary units. It is important that the inputs that the company has to be used at full capacity.

From this article we observe that in order a relevant analysis on profitability requires two types of sizes: absolute sizes, the profit and margins, and relative sizes, rates of return.

Determining the profitability of the activity carried out by a company is important information for economic agents and customers, creditors, suppliers and banks.

Thus, the approach on this theme, profitability, is a complex and deeply in need of further deepening.

geangupetronela@yahoo.com

Abstract

In the actual context, marketing in the dental care services field is confronting with more and more challenging demands. Among them one of the most important one is referring to the need to integrate consumers motivation in the field of marketing strategy. The present research aims to investigate the content and the different corelations of consumer habits regarding dental hygiene. The results are intended to be used in developing new promotional campaigns build on motivational techniques for dental offices.

Key words: dental hygiene, consumers habits, dental care marketing

J.E.L. classification: M31, I11

1. Introduction

Complexity of services is greater relative to tangible goods makes a matching of product offering with customer expectations more challenging in the case of services marketing. Among different types of common services, health care products may be even less amenable to a matching of services offered with customer expectations, because health care product offerings are often characterized by complexity, inseparability, variability and customization.[6]

Land after some research has shown the urgency with which the profession dentistry needs to grasp the challenge of becoming more consumer-focused. Elements of the practice of dentistry are now highly

anomalous with the characteristics of successful modern services. [4]

The health of individuals in particular and of the population in general reflects the quality of the society's life and unrelentingly represents a chief factor in its development, and the health management is not a luxury but, on the contrary, a necessity. The population evaluates the dental medical services by making a comparison with other similar units and, if those services meet their expectations, the consumers define the service as attractive. The cost of patient dissatisfaction is high, since it creates an unfavourable publicity on the competitive market, with consequences upon the efficiency of the dental medical service. [1]

Authors have been conducted a national research aimed to identify romanian consumers habits regarding dental hygiene, taking into consideration the following dimensios: temporal, modal, and spatial.

Dental hygiene represents a set of rules and norms that people respect in order to mantain and the health status of the bucal cavity. Consumers actions that are meant to preserve a hygiene state in time can be quantified as habits.

Habits regarding dental hygiene can be defined as manifestations of the human behaviour with a high degree of repetitivity and a powerfull cristalization after long periods of time.

Consumption habits are interrelatinged with the buying skills representing those modalities that achieved constancy regarding some goods or services.[2] Habits have a big amount of stability through time beeing the direct result of learning and sedimenting process of some adaptations. Beeing very intercorelated with the learning process, and

consumption experience, habits usually have a certain dynamics.

Changing of habits can be achieved through a long process of education and consumer self-education, in the same time through a constant evaluation of the consumer satisfaction state and self expectations.

In the context of efforts related to dental hygiene it can be distinguished a number of analysis area relevant to the complexity of this approach. Thus, we may speak about activities characteristic to the prevention of dental disease, activities to maintain dental health and activities circumscribed to the treatment of dental disease. All of these three dimensions gives us the overall view of the complexity of contemporary dental hygiene as referring to the contemporary consumer.

2. Methodology of the research

In order to identify romanian consumers dental hygiene habits authors conducted an online survey type research. This approach was trying to identify answers of people from all over the country, from both urban and rural area.

The authors were aware of the restriction provided by this method because of the need to get access to the e-mail technology. However, this method was chosen for practical reasons related to costs and speed in obtaining the desired informations.

The active period for the questionare as a tool for collecting the informations was between september and october months.

Authors had a respondents database spread almost uniform in all counties, then beeing used the method of snowball for creating the sample (each person that was receiving the link was transmitting to all his acquaintances).

The primary requirement that was comunicated to the respondents was that they already have to be over eighteen years of age, this beeing the only filter applied to the respondents. The total number of selected respondents was 732.

The research was based on a number of key objectives such as: identifying consumer awareness towards their own state of dental hygiene, characterization of used dental hygiene methods habits, detrmination of food

habits, characterization of dental health care habits.

The key objectives were completed with a series of secondary objectives and hypotheses from which we can emphasize:

H1: awareness of dental hygiene is high,

H2: attention granted to dental hygiene is important in more than 80% of cases

H3: 30% of respondents identified a dental problem in the last 6 months

H4: main sources of information about the nature of dental disease are: the dentist, family, friends

H5: 40% of the respondents brush their teeth once a day

H6: Most respondents use dental brushing after meals

H7: there is no clear preference for drinks or food acid

H8: 40% of respondents have an irregular frequency of dining

H9: in most cases the visits motivation to dental offices was the dental treatment visit

H10: over 60% of respondents attending a dentist 2 times a year

H11: over 70% of respondents go to the dental office alone

H12: at least 40% of respondents prefer a dentist in the neighborhood where they live (for Bucharest), in place of residence (for the province).

3. Research results

Initially was performed a univariate analysis of the responses received and subsequently it will be made a bivariate and multivariate analysis of correlations between different questions

Along the present article it will be presented a part of the research results, especially those that confirm or refute the hypotheses advanced in the methodology of creating the research questionnaire.

Thus one can see that on the first hypothesis (awareness of dental hygiene is high), answers are nuanced and offers a fully structured information.

A total of over 90% of respondents said they use to inspect their teeth in the mirror, habit that is corelated with other activities that can be asimilated with awareness of the hygiene status (concerning about regular

brushing, approved dental exam, use of auxiliary oral hygiene brushing means).

The conclusion that is imposing itself is that, romanian consumers in general have a dental hygiene state degree of awareness pretty raised thus being verified the first hypothesis.

Also the second hypothesis is verified, the percent of 90 % respondents who are interested in dental health is relevant for the concern regarding dental hygiene.

Answers indicating the time interval necessary for identifying a dental hygiene problem reveals that the cumulative percentage of respondents which have been identifying a problem in the last 6 months exceeds the figure corresponding to the hypothesis. The actual figure is around 70 % of total respondents.

The imposed conclusion is that the dental health status is poor for most respondents and in the same time the awareness of the disease is high.

Fig no1: The time interval necessary for identifying a dental hygiene problem

Source: Own survey

In terms of how the dental disease was notified, by correlating answers it became clear that respondents have been associated the pain with color change modification or decay manifestation (after the pain manifestation).

Fig no2: The element of identification for the dental disease

Source: Own survey

Hypothesis referring to the information sources is partially verified, on the first place as a information source being placed as the same as the case of the enounced hypothesis - the dentist advice, followed by the communication with family members. Communicating with friends is still surpassed by source of information represented by the sites of cabinets and specialty clinics.

Hypothesis on the fact that there is manifested a clear preference for drinks or acidic foods, is disproved by research results that reveal a rate of about 57% of consumers said they like to consume acidic foods or drinks.

Also a significant percentage of about 69% said it does not matter when buying a food if it has potential damage to teeth

Thus it can be observed that romanian consumers doesn't correlate care for dental hygiene with care for consumed food

In terms of the regular schedule of meals the research reveals that approximately 69% of consumers do not have a regular schedule of meals (3 meals per day, at appropriate times), which refute the hypothesis advanced, the number in question is substantially above the projected (40%).

On tooth brushing, most people said they used dental brush twice a day (67 % of respondents), while the percentage of those who brush their teeth several hours after eating is also substantial (44%), being immediately followed by that of those who brush immediately after eating (39%).

Regarding the type of toothpaste used it is obvious the use of fluoride toothpaste being still sugestive for the consumers culture the result of 28% of those who did not know how to specify the type of toothpaste used.

This can be explained either by a lack of consumer interest or by lack of basic knowledge about these products.

In this regard, the percentage of 65% from the number of respondents that are aware about other hygiene methods besides tooth brushing represents a surprising element in the context of the lack of informations revealed by the previous answers.

The methods used for the dental hygiene can be grouped on a scale from 1 to 5 depending by the weighted scores at the level of the entire sample as follows:

- tooth brushing – 4,432
- chewing gums – 3,208
- mouthwash – 2,844
- dental floss – 2,199
- regular professional scaling – 2,066
- dental toothpicks – 1,909
- pression mouth washing – 1,369

One can observe a pretty high popularity of chewing gum, which is relatively easy to explain if we see that 63 % of the sample ranged in age groups under 35 years.

Because of the extremely intense promotion, these products have been widely accepted as a possible method of keeping the health specific to the youth consumer culture.

In terms of the hypothesis on the visit to a dentist, it is confirmed by the fact that the main reason (for 76% of the cases), was a dental treatment.

In terms of frequency of consumption of dental health services, it reveals that 35% of respondents go once a year at a dental office, followed by 32% attending a cabinet twice a year.

Fig no3: Frequency of consumption of dental health services

Source: Own survey

Habit on dental health care consumption with family or acquaintances reveals that most go to a dental surgery alone (68%) or usually do not have a specific (13%).

Regarding the opinion about the problems which in turn can produce a state of poor dental hygiene can be seen as a significant number of respondents are aware of a number of diseases may occur is - infectious, digestive and heart that even in following a poor dental hygiene.

Habit that refers to dental health care services consumption with family or acquaintances reveals that most go to a dental surgery alone (68%) or usually do not have a specific habit (13%).

4. Conclusions and final considerations

Research has revealed a series of sometimes conflicting issues relating to perception and consumer habits in the context of maintaining and promoting an adequate dental hygiene.

It can be observed a true mix of factors both exogenous and endogenous that determine nowadays romanian consumer behaviour regarding to the issue of dental hygiene

There is a general concern directed to health and hygiene, but we can not see a strong motivation for consumers to follow a model of their own dental health approach effectively and consistently over time.

As we stated in the preamble of the present article, habits could be seen as individual's acquisitions that crystallize themselves in time, whose influence require a sustained educational effort.

Romanian consumer of dental care services needs to be educated. Acceptance of a set of rules in developing consumer habits and dental hygiene maintenance implies the existence of a strong motivations of individuals.

In this respect especially dentists but also the rest of medical staff from a dental office must try different methods for motivation of the clients in order to obtain a correct dental hygiene. Thus they can use a rational motivation (presenting other diseases caused by a poor dental hygiene, higher costs for dental treatment than in case of dental hygiene, etc) or a motivation built on

affective elements (the status gained within social groups of interests through a proper hygiene and a healthy teeth, self – assessment as individuals, the pleasure of having fresh breath, etc).

Choosing the proper ways to motivate patients related with oral hygiene must be carefully established. Thus Janis Irving și Feshbach Seymour issued a hypothesis that the audience of a certain individual that communicates becomes highly motivated to accept his allegations if it is used a default level of fear (an introduction of a emotional tension).[3]

Through their experiment specialists have shown that the overall effectiveness of a persuasive communication will tend to be reduced by using a strong fear appeal, if evoking a high degree of emotional tension without adequately meet the need for reinsurance.

Same authors, Irving and Seymour, conducted an experiment for recommend a good hygiene of the teeth. There were three situations, each of the messages containing some informations about the causes of tooth destruction and recommendations on hygiene practices in this regard.[5]

The message which was intended to induce fear at high levels was reporting to the subjects that dental infections can cause secondary infections, leading latter to paralysis, arthritis or even complete blindness.

The moderate message was focused on describing the current dangers of poor hygiene of the teeth.

The third message, which induces a low level of fear was focused on basic information about the growth and functions of teeth. The two researchers have found that the most efficient way to induce a proper dental hygiene at the level of the subjects belongs to the message of fear at a reduced rate. They argued that the message which induced a high level of fear produced anger to the subjects and a state of defensive avoidance (they become so frightened by this message that prefer to avoid thinking about the whole issue).

So this is why, in order to develop proper communication and relationship strategies for dental offices we recommend the construction of messages that are inducing

an optimum level of emotional implication on behalf of the consumers.

Also we have to remember of the extrinsic and intrinsic level of motivation.

Intrinsic motivation refers to internal rewards obtained by the individual, in terms of personal satisfaction that motivates him to act in a certain way because of his own interests and pleasures.[5]

In the case of dental hygiene, promoting pleasure asociated with a fresh breath, perfect teeth, etc, it may represent an example of emotional motivations, while communicating idea that it has to preserve a perfect health state may represent a possible cognitive type motivation.

Creating a proper marketing strategy at the level of dental offices requires an effective framework build on complete consumers profile.

The behaviour of dental care services consumers is dynamic and it has at his core the emotional bounds between consumers and their self image. In order to examine this type of interactions, a multiple effort of marketing research has to be done.

From this respect the present research has it's own limits on one hand because of the limitations imposed by online technology and on the other hand because is the first attempt to investigate the complexity of dental care services consumer habits regarding dental hygiene.

The results of the research has to be validated on a larger scale both at the level of a bigger national sample (around 3500 respondents) and also from the temporal perspective.

After a series of repeated research, the agregate conclusions may describe efficiently the dynamics of consumer habits.

Still at this level, the conclusions of research are valuable for designing promotional programmes for dental offices in order to reach different level of consumer motivation.

Corporate Social Responsibility within Credit Institution in Romania

Chirleşan Dan

Apostoaie Marius Constantin

“Alexandru Ioan Cuza” University of Iasi,

Faculty of Economics and Business Administration

danch@uaic.ro

apostoaie_marius@yahoo.com

Abstract

Corporate Social Responsibility (CSR) was long viewed as a costly or charitable measure on the short-run but now it is considered an asset worth having on the long-run. Credit institutions take on a significant role in the process of financial intermediation in the Romanian economy (a bank-based system). For this reason, CSR within these credit institutions is of great concern not only for the individuals but for the whole financial system (an important element to ensure financial stability and avoid systemic risk). In order to evaluate the level of involvement of Romanians' credit institutions in CSR areas, this study used the content analysis method on the annual reports for a panel of five representative banks.

Key words: corporate social responsibility, credit institution, social awareness, report

J.E.L. classification: G20, G21

1. Introduction

Corporate Social Responsibility (CSR) was a virtually unknown concept for many policymakers more than a decade ago. Nowadays it is a subject of debate not only for the insiders of a company but also for the outsiders. Although the concept is found under different names (like Sustainable Responsible Business, Corporate Citizenship, Corporate Conscience, Social Performance,) what is of great importance is the core meaning of it.

The occurrence of the recent economic and financial crisis has opened numerous debates concerning the responsibility of the financial institutions and the transformations required to guarantee the stability of the global financial system. This is especially the

case of the Euro Area where banks are the primary source of financing for the real economy. For this reason, defining and enforcing CSR within their strategic structure is of great importance. In elaborating their strategies, financial actors must consider and measure the impact of their different actions in order to achieve not only a good market position but also to preserve social welfare for all partners involved.

In this context, the main purpose of our paper is to set out a framework for analyzing and thinking about the core meaning, the advantages and the direction of specific practices regarding CSR in a company in general, and more specific in credit institutions. The paper focuses on some specific cases in Romania.

The remainder of the paper is organized as follows: in section two, the paper realizes a brief survey of the literature regarding CSR and focuses on the common ground, previous conceptions and theoretical approaches. In section three we highlight several CSR practices of some credit institutions in Romania. The final section of the paper is reserved for summary and conclusions which draw attention on the most important aspects of the paper and some lessons to be learned.

2. Brief survey of the literature on corporate social responsibility

Research undertaken in the field of corporate social responsibility abounds but the results and conclusions differ and are sometimes contradictory from one author to another, depending on the approach. The methodological approach, the countries analyzed or the length of the research have a big influence on the results. Nevertheless, trying to establish a clear and strong definition of the concept may in turn lead to a failure in

its clarification; ironically, over time, the approaches and interpretations of the concept multiplied instead of simplifying making the task of determining a single definition of CSR a real challenge. For this reason, we will address only some of the definitions that we have encountered in our research and that offer a wider and more comprehensive view on the CSR phenomenon.

From an **evolutionary approach**, the concept CSR appears for the first time in the economic literature in the early 1950' in the writings of Howard R. Bowen. Bowen, also known as the ‘the father’ of CSR, when speaking about *social responsibility* referred to it as the ethical obligations that the companies have towards the society and the environment [3]. There has been some debate as to whether CSR is such a novel phenomenon at all. From a historic point of view, the concept of CSR had already known considerable interest in the 60s and 70s thanks to a broad range of papers (among them, the most cited are [4], [1]). Although the topic almost vanished from the literature in the 1980s [5] it seemed that it resurfaced forcefully over the past 15 years as a response to the public concern regarding the process of globalization and economic restructuring.

Figure 1. Developments in CSR related concepts

Source: [12], Authors' illustration

The 1990s were marked not only by the rising importance of CSR but also by the “birth” of a new concept, *corporate governance* (CG). Given the fact that CG deals with the entire network of relationships between management, board, shareholders and the other stakeholders, CSR is just a piece in a puzzle (but no less important, nevertheless). Other concept often debated is

corporate citizenship (CC). CC is the contribution a company makes to society and the environment through its core business activities, its social investment and philanthropy programs, and its engagement in public policy. A more comprehensive evolution of the terminology can be viewed in Figure 1.

If we were to take an **explanatory approach**, in the literature regarding CSR we often encountered ourselves with a variety of definitions, which often are in contradiction to each other. Donaldson [6] considers CSR as a contractual obligation that the companies have towards the society. Because the companies are in the spotlight of the society (given the fact that they employ human and natural resources), the latter has implicit *social rights*, i.e. for the society has the right to demand compensation from the companies that exploit their resources for productive purposes.

Wood [17] describes three levels of analysis of the concept: *institutional*, *individual* and *organizational*. We can add to this analysis a fourth level proposed by Hockerts and Morsingwhich [11], which they characterized it as *global*.

Another important opinion is that of Elkington [7] for whom the social responsibility of a business entity is three-fold: to create *economic value* by being profitable; to create *ecological value*, by engaging in activities that are beneficial for the (natural) environment; and to create *social value* by engaging in activities that are beneficial to life and the society/community (also known as the ‘triple bottom line’ of ‘people, planet, profit’).

After a thorough examination of the economic literature one can distinguish two important approaches that are, to a certain point, opposite: the “stakeholders approach” and the “shareholders approach”. The “shareholders’ approach” disregards CSR activities because the sole purpose of a company is to obtain profit, thus maximizing the wealth for the shareholders. As to the “stakeholders’ approach”, CSR initiatives are welcome and encouraged given the fact that not only the shareholders are involved in the activity of the company but also other parties too. In the 1970’, Milton Friedman was an important promoter of the “shareholders’ approach”. In the words of the economist

“the responsibility of firms and their management is singularly defined by reference to the need to make choices that maintain and enhance shareholder value within the framework of the law” [10]. Nevertheless, after 1980’ the “stakeholders’ approach” changed Friedman’s point of view converting him into a sympathizer of this theory.

There are **institutional approaches** too. A UK report on CSR aimed essentially at businesses, states that: “We see CSR as the business contribution to sustainable development. There are many definitions but we are all talking about how business takes account of its economic, social and environmental impacts in the way it operates – maximizing the benefits and minimizing the downsides. But we are not talking about altruism – CSR should be good for long-term business success as well as good for wider society” [18: 3].

In 2001, the European Commission published in the Green Paper [9: 8] the following: “Being socially responsible means not only fulfilling legal expectations, but also going beyond compliance and investing ‘more’ into human capital, the environment and the relations with stakeholders”. Thus, this legal document became a common European framework for CSR with the main objective of facilitating the implementation of the strategic objectives expressed in the Lisbon Strategy. On October 25, 2011, the European Commission has published a new document on CSR that attracted a lot of attention first of all through the new definition and secondly for the fact that CSR it’s not just voluntary and the interests of stakeholders and shareholders are issues which have to be considered in equal measure. The new and simpler definition that EC has put forward treats CSR as “the responsibility of enterprises for their impacts on society” [8]. Thus, through the new approach EU aims to create “conditions favourable to sustainable growth and employment generation in the medium and long term”.

In **Romania**, as in many transition countries, the concept CSR appeared only after 1990’s when many NGOs were set up. Because international public or private institutions were involved, one can say that Romania ‘imported’ *social responsibility* from the outside. The Romanian economic literature regarding the concept CSR is scarce

(e.g., [13], [14], [2]) and this aspect reflects itself in the business environment. Thomson Reuters registers just one ISI article on the subject of CSR in Romania [15]. A major role in the process of information dissemination of the concept of CSR through events, actions and seminars played the American-Romanian Chamber of Commerce (AmCham). Not only that, but AmCham developed several sound projects in the field of social responsibility [16].

From our point of view CSR can be defined as the company’s contribution, active and voluntarily, to the well being and the social, economical and environmental improvement of the society, as its objectives are focused upon competitiveness and obtaining added value.

3. Credit institutions and CSR actions in Romania

Because financial institutions take on a significant role in the process of financial intermediation they are considered to be important players in the financial system, especially in the Euro Area (where banks are the primary source of financing for the real economy). Episodes of financial turbulences that occurred in history like the credit institutions’ crisis in USA at the end of the ’80, the crisis in East Asia at the end of the ’90 and the fall of Enron and WorldCom have shown us the importance of a sound CG and CSR. The lessons draw then must not be forgotten.

Regarding the technique used in this study, we considered a content analysis to identify and describe patterns in the annual reports, on the web sites and other media sources regarding a specific sample of credit institutions in Romania. Content analysis is a research tool focused especially on the actual content and internal features of media.

The *Romanian Commercial Bank* (BCR) is one of the most important credit institution in Romania managing assets worth over EUR 16 billion and with activities ranging from universal banking operations (retail, corporate and investment banking, treasury and capital market operations) to activities regarding leasing, housing bank and private pensions. According to the banks’ CSR policy, social activities are considered to be important investments on the long run because they

contribute directly to the sustainable development of the community. For this reason, BCR’s strategic directions regarding social or community projects are oriented in the following specific areas:

- **Education**, with the two sub-components: *financial education* and the *access to education* of children from disadvantaged families;
- **Entrepreneurship**, focused on two sub-components: *entrepreneurship education* and *encouraging the entrepreneurship initiatives of NGOs* so they could achieve financial independence and accomplish their goals;
- **Social solidarity** within matching campaigns, where employees of the bank donate money for a social cause and BCR doubles the sum.

Figure 3. CSR related expenses made by BCR in 2009 and 2010

Source: BCR, 2011, Authors illustration

In May 2011, BCR published the first extended report on corporate social responsibility according to the guidelines of the most important standard in the field, the Global Reporting Initiative, GRI-G3, level B. As reported by BCR, starting with 2009 a budget of RON 4,8 millions was directed especially to areas such as education, entrepreneurship and social solidarity but also to activities in the fields of art, culture

and conservation of the patrimony (see Figure 3). In 2010, the strategy for CSR actions was revised and the budget of almost RON 3,6 millions was directed to the three main areas mentioned above.

The *Romanian Bank for Development - Groupe Société Générale* (BRD) is the second bank in Romania in size with an average market share of 20% and capitalization of over EUR 5 billion. As stated by BRD in the Annual Report for 2010, *social and environmental responsibility* is accomplished at the internal level through responsible human resource policies, and at the external level through the minimization of the impact that the banks’ activities have on the environment and through projects of involvement in the community.

In order to contribute to the sustainable development of the Romanian economy as well as to sustainable performance, BRD has decided to adopt specific CSR strategies, namely:

- **Responsibility towards the community**, with three sub-components: *education*, *fighting school abandonment* and *professional insertion* of people excluded from the labour market;
- **Cultural patronage**, with activities focused on *modern and contemporaneous art*, *conservation of the Romanian patrimony and classical music*;
- **Sports partnerships**;
- **Environmental concerns**, with special attention to the optimization of consumption and professional travelling, energetic efficiency of the buildings and lowering the negative impact of IT activities.

The BRD’s budget for CSR actions in 2010 was mainly focused on partnerships in the areas of **sports** (rugby, tennis and cycling) and **culture** (national and international festivals, traditional events, classic music concerts etc.). Other important areas, but with lower budgets than the previous, are **education** (for children without material possibilities, abandoned children and children with physical or mental handicap) and humanitarian projects.

Raiffeisen Bank is the third bank in Romanian in top five in terms of assets held. According to the banks’ CSR policy at the foundation of social involvement (in individual projects of partnerships) lays the

community. In its activities, the bank encourages its employees to get involved in team projects and voluntary actions. The main focus of the bank regarding CSR activities is oriented towards: Romanian art and culture, education (financial and non-financial), environment protection, promoting sport as a healthy way of life and supporting the disadvantaged social class.

In 2010, the bank has published its first report on CSR where one can find an evaluation (performed using the LBG methodology) of the projects with impact on the community.

Figure 4. CSR related expenses made by Raiffeisen Bank in 2009

Source: Raiffeisen Bank, 2011, Authors illustration

As reported by Raiffeisen Bank in the 2010 CSR Report, the budget for 2010 was RON 5,15 million (aprox. EUR 1,23 millions) and was directed towards to areas such as mentioned earlier (see Figure 4). If in 2009 the social projects attracted more than half of the banks' budget for CSR actions (56%), in 2010 the distribution of resources to the community is more equilibrated, highlighting the five main interest areas of the bank: environment, art and culture, education and youth, social support and sport.

Transilvania Bank (BT) is the nucleus of the Financial Group Banca Transilvania, group which offers various integrated

financial services like leasing, transactions with securities, investment funds, factoring etc. According to the CSR policy, BT gets involved in social activities because it wishes to build a long term relationship between the company and the community characterized by involvement, dialogue, transparency and ethical behaviour. In 2007, BT was engaged in over 160 projects in areas such as culture, education, environment and sport with a budget of approximately EUR 0,55 millions.

UniCredit Tiriatic Bank is among the first five Romanian banks with financial products addressed to individuals and authorized individuals, small and medium enterprises and big corporations. In agreement with the CSR policy, the bank undertakes its business while carrying on investments with long term results and contributes to sustainable development in a manner which is in line with the stakeholders' expectation. The main strategic elements which the bank takes into consideration in its CSR policy are: involvement in the community, social activities, art and culture, protection of the environment and education.

4. Conclusions

Regarding the theoretical approach of CSR, we can conclude that there are sides that tend to emphasize the avoidance of harm and the achievement of sustainability. On the other hand, for others, CSR necessarily entails actively seeking to achieve positive change. Nevertheless, the CSR concept generally refers to transparent business practices not only in compliance with legal requirements but also based on ethical values, and respect for the people – both the individual and the community – and for the environment in which the company activates.

Credit institutions take on a significant role in the process of financial intermediation in the Romanian economy (*bank-based system*). For this reason, CSR within these credit institutions is of great concern not only for the individuals but for the whole financial system (an important element to ensure financial stability and avoid systemic risk). In order to appreciate the level of involvement of Romanians' credit institutions in CSR activities a panel of five banks were analyzed focusing our attention on the reporting activities of these banks and media

information. The results show that there is a high involvement of these banks in CSR activities (some banks with considerable budgets) and the impact on the community was positive and well appreciated by the media. Nevertheless, there is much more to be done if we were to compare the involvement of Romanian credit institutions in CSR related activities to European institutions. The results also reveal the fact that the Romanian credit institutions focus their financial resources towards the following main areas: education, culture, environment, social, sport. One credit institution which differentiates itself in terms of budget allocation and the CSR portfolio is BCR. It is also the bank who in May 2011, published the first extended report on CSR according to the GRI-G3 guidelines.

This paper represents an ongoing research. Because in our analysis we investigated the data from only five credit institutions the results are scarce and we cannot generalize them to Romania. Nevertheless, we consider this pilot research a launching platform for a more comprehensive investigation in the field of CSR in Romania.

Epistemological Considerations on Complexity Economics

Ciote Cristina Steliana
„Spiru Haret” University of Bucharest
Faculty of Financial Management and Accounting Constanta
cristinaciote@yahoo.com

Abstract

Subject of numerous recent debates among economist researchers, complexity economics takes a whole new approach regarding economics, namely a holistic one. Although the phrase ‘complexity economics’ is recent, the holistic approach is however not a new subject, the ideas referring to economic systems being continuously sculptured for hundreds of years. Undergoing an incursion in time, we find a series of ideas which precede the complexity paradigm in economics. Leaving it up to the experts in management and marketing to describe the concrete aspects regarding the organization and markets mechanisms in the new era of ‘turbulence’, our attention is brought to the general economic theory, an unlimited source of fundamental ideas on any subject regarding economics. From here on in, one could easily transgress to new functional economic sciences, such as management, which has been listing among its latest preoccupations the identification of alternative management models, based on chaos theory.

Key words: complexity economics, complexity theory, holistic view.

J.E.L. classification: B25, B41, B53, Z13.

1. Introduction

Complex systems are naturally formed in an economy. They are composed of multiple elements, adaptive and reactive to the patterns which they create within the system^[1]: economic agents continuously adapt their market behaviour, their buying decisions and the prices on the market. Also, they continuously adapt their expectations regarding the new situations which all their individual behaviours have conjunctly

determined by their aggregate action over the ensemble. This is how the economic agents play roles of key elements of a system as complex as the economic one.

The systemic view which suggests deducing the properties of the components by conducting a qualitative analysis of the whole has ‘caught on’ with renowned economists, such as Nicholas Georgescu-Roegen. He destroys the myth of the neoclassical economic model, based on the paradigm of Newtonian mechanics and the one of homo-oeconomicus via perpetuum mobile. The rational analytic undertaking which the standard economic theory presumes mutilates the image of the whole. The uncertain character of reality enables us to consider complexity and knowledge two major challenges of our times. In an era in which acting in uncertainty becomes the only certitude, instability and change make the efforts of orienting towards stability and equilibrium pointless.

The neo-liberal ‘normality’ erroneously considered economic activity to be a circular movement dominated by equilibrium. Self-regulation seemed to occur independently and the market was seen as a mechanism dominated by perfectly rational agents, capable of processing complex mathematical calculations in order to precisely establish the utility of a certain good. Not few were the voices which considered that the ‘classical’ homo-oeconomicus completely lacked the concreteness of the complex environment in which he shallowly lived, dehumanized, as an empty abstract entity^[2]. A more realistic view presents the individual not so much as a selfish being, as that rational machine which only acts in its own interest, but highlights its human side. The man is a social being who interacts with its neighbours, a being capable of feelings such as altruism, good will and empathy.

The first law of thermodynamics: ‘nothing is lost, nothing is created, everything is transformed’ was the one which nourished the standard economist’s obstinacy to present the economy as a pendulum movement which, from unlimited resources and through a reasonable price, can self-regulate and ‘conciliate’ the demand and supply. The equilibrium is nothing but a temporary state of the economy at a given moment. The economy is seen as a continuous flow, a complex system in which multiple equilibria are established at certain points in time. Thus the neoclassical equilibrium proves to be an erroneous conception. From the simple acknowledgement that the economy is complex, Holt, Rosser and Colander claim that the neoclassical era of the economic theory has sunk; a new era is arising: the era of complexity economics^[3].

2. The economic system - a complex system

A system can be considered complex ‘at the point in which it presents a certain type of order as a result of the interactions of numerous heterogeneous objects’^[4].

In describing the complexity view, Arthur, Durlauf and Lane^[5] emphasize six characteristics^[6] of the economy, the coexistence of which makes it difficult to use traditional mathematics in the attempt to find explanations to socio-economic phenomena. These are:

- *Dispersed interactions* – the phenomena which occur within the economy are determined by the interactions between dispersed heterogeneous agents who act parallel to one another. The action of every agent depends on the anticipated actions of a limited number of other agents and also on the aggregate state which these agents conjunctly create;

- *The absence of an universal regulator* – no global entity controls the interactions. Instead, the activities of control are ensured by the mechanisms of competition and coordination between the agents. At the same time, there is no universal competitor, a singular agent who has the possibility to profit from all the advantages existing in the economy at a certain moment;

- *Cross-functional hierarchical organisation* – the economy embeds numerous levels of organisation and interaction. The elements within any level (behaviours, actions, strategies, products) serve as ‘bricks’ which help build the elements on the next higher level. And the organisation in its entire structure is more than just hierarchical, integrating various types of transversal interactions between levels;

- *Permanent adaptive character* – the behaviours, actions, strategies and products are corrected as the individual agents interact and gather experience, the system adapting itself constantly to new changes;

- *Perpetual innovation* – niches are continuously created by new markets, new technologies, behaviours, institutions, even the activity of filling up a niche being able to provide for new niches. The result is undisrupted, perpetual innovation;

- *Dynamics outside equilibria* – because new niches, new potentials and possibilities are continuously created, the economy operates far from a state of optimum or of general equilibrium. At the same time, improvements are always possible and occur regularly;

Authors call the systems characterized by these features *nonlinear adaptive networks* and give examples such as the nervous system, the immune system, ecosystems and also the economies of states worldwide. These systems do not act by the stimulus-response principle, but they anticipate. The economic agents ‘form expectations, build models of the economy and act based on the predictions generated by these models’^[7], the mechanism running on the fact that its elements mutually generate themselves.

Also, they bring into attention the obsolescence of linear reasoning and of the system of differential equations, choosing to outline instead the increasing importance and necessity of ‘new categories of mathematical combinatory and stochastic processes at the level of the population, in combination with computational modelling’^[8] which can capture the processes from which structures at different levels of organisation emerge.

3. An incursion in time

Given the methods it uses, the standard economic theory is a conventional science^[9]. It captures a phenomenon as complex as the human action, simplifying its complexity by identifying analytical structure models; it appeals to reductionism, abstracting the economic reality with mathematical equations. The models are tested by comparing the predictions with empirical data, using statistic tools and techniques. The models are generally static and linear, with unique, determinist solutions. The way reality is simplified with these formal mathematical models produces countless errors and omits essential elements which only informal knowledge can capture.

In order to understand highly complex phenomena alternative methodologies need to be found, methodologies based less on the analysis of the structural elements and more on the identification of iterative processes and patterns which are formed within complex systems. Human action – complex phenomenon – constitutes the object of the economic science, whereas the individual – autonomous agent – is the subject of the economics. The components of these complex systems – the individuals – have unpredictable behaviours but interact with one another determining large scale changes of the whole. These changes take the form of nonlinear processes which repeat themselves at certain periods of time, forming patterns or behaviour models which can be predictable. The models used are nonlinear dynamic mathematical models which generate multiple possible solutions. These open models do not have a unique deterministic solution as the model based on the neoclassical general equilibrium does. Every solution depends on the initial conditions, but also on the path which the model follows (path dependency).

Starting from two concrete examples: the theory of endogenous economic growth based on increasing scale returns and the Schumpeterian multiple equilibria, David Colander^[10] considers that numerous economists have understood the implications of the complexity view in the economics from the very beginning of its materialization as a science, but have concurrently accepted their limits regarding the lack of the

necessary tools to scientifically formalize and validate their conclusions.

Constantly having objections to the orthodox economic theory, the heterodox schools of economic thought present numerous affinities with the modern school of thought based on the complexity view in economics and can be considered, from this point of view, the predecessors of the Santa Fe School. Although they have countless points in common, the new school does not have its origins in the heterodox schools of economic thought, but represents a development of the orthodox economic theory. It is being perceived as a natural evolution of the latter, a reaction of the economic theory to technological changes^[11].

In the attempt to identify the origins of the complexity view in economics, we consider it a stop to the first liberals to be inevitably. Cantillon is the pioneer, opening the path which many liberals more or less consciously follow. Among its most honourable followers are Adam Smith and William Stanley Jevons. However, we do not want to leave the impression that we place Cantillon as the predecessor of the Smithian theories, in all their complexity.

In *Essai sur la Nature du Commerce en Général*, book considered by William Stanley Jevons to be the starting point of political economy, Cantillon characterizes the economy as a system of circular flows of production, distribution, consumption and of reciprocally interdependencies between these factors, less under the influence of the visible hand of property and more under the influence of the invisible hand of the market. The market itself is driven by consumers whose choices are directly reflected in the market prices, which send signals to the entrepreneurs. The entrepreneurs are in turn motivated by their own interests of gaining profits, markets shares and maximizing production^[12].

By emphasizing the added value and the scale increasing returns, the author of *The Wealth of Nations* has shown affinities with the complexity theory long before the new scientific discoveries enabled a development of this view. The metaphor ‘invisible hand’, used only three times in the entire work of the great theorist considered to be the father of economics, refers to that social mechanism through which the individual ambitions and

interests are driven towards the satisfaction of the needs of the entire society, even if the individual actions were not consciously benevolent.

Advocate of the thesis of spontaneous economic development, Adam Smith states that ‘any individual, as long as he is not breaking the law, is completely free to pursue his own interests and to put his activity, as well as his capital in competition with the activity and capital of other individuals’^[13]. The question here is if the market does not somehow restrict the freedom of the individuals, if it is not a factor of cancellation rather than one of affirmation of the individual liberties. In the view of the liberal line of thought, the laws of the market are objective relations, very much alike the laws of nature and the forces of the market are alike the forces of nature. Although the forces and laws of the market can exclude certain possibilities for the individuals to satisfy their needs, this does not mean that the market is a barrier to human freedom, but that the individuals are confronted with their own incapacity to obtain what they want. In the liberal view, the market mechanisms are objective mechanisms of coordination and evaluation, impartial and extremely useful to the economic activity^[14].

Representative figure of the classical school of economics in its maturity period, John Stuart Mill has brought numerous contributions to the economic theory through his humanistic view, but especially through the clear distinction line which he made between the social laws of the distribution of revenues and the technical laws of production. The great economist has the merit of having distracted the attention from the theory of value based on labour. Regarding the affinities with the complexity theory, his theories based on the law of distribution of revenues and path dependency prove that this theorist had a view of complexity economics.

Although generally presented as a classical economist, Karl Marx^[15] did not share the ideology of the orthodox economic theory. Although he has the merit of having emphasized the influence which the state of society in its entire structure has upon the individual’s rationality, Marx can not be considered amongst the predecessors of the complexity theory for the mere fact that

because of his theories regarding social exploitation, he did not recognize that the social relationships evolve with the purpose of maintaining the stability within the economic system.

The phrases ‘spontaneous order’ and ‘natural order’ give a certain pleasant tune to the liberal speech. This, along with the security feeling given by the understanding that everything is embedded in a divine project – the nature – make the legacy of classical liberals and their followers, namely the economic science, an optimistic one. Bridges to and from physics, biology or maths relating to economics prove durability. We apprehend, on the one hand, the opening of the liberal speech towards an interdisciplinary view, but above all we have to underline the interdisciplinary opening towards schools of different periods of times.

Exponent of the second generation of the Austrian school of economic thought, Friedrich Hayek introduces the expression ‘spontaneous order’; he understands the nature of complex phenomena and correctly associates them with the economy^[16]. By emphasizing on spontaneous order and by seeing prices as systems of storing information, the representative mind of the Austrian school can be considered a predecessor of the complexity theory in economics. The author explains the ‘organised complexity’ as being ‘dependent not only on the properties of the elements which compose it but also on the relative frequency with which they occur and especially on the way in which they interact with each other’.

Evolutionism, as a theoretical approach in economics forms the basis of the dynamic analysis based on biological concepts. The principle the advocates of the evolutionist theory embrace is opposed to the standard economic view of static equilibrium and reveals the idea of ‘living organism’, of ‘living moving force’, concepts particular to the complexity theory. According to the laissez-faire principles, a competitive market guarantees that the natural mechanism of selection from the Darwinian theory leads to an efficient allocation of resources, because the firms with a reduced profitability are forced to leave the marketplace, while the more productive ones survive on the same market.

Getting closer to the present time, we are being unveiled the relevance of the natural laws and of the ‘laissez-faire’ principle to neo-institutionalism, the modern school of economic thought which analyzes the processes based on which institutions evolve. Amongst the ideas of neo-institutionalism and the complexity theory a series of common points can be found, especially in terms of methodology: both schools of thought concentrate on the economic processes and not on the analysis of equilibrium, on the formation of behavioural models and patterns and on the study of human society in its whole, seen as an institution. For neo-institutionalist theorists the organization, the institution, the rule represents the unit of analysis in the absence of which the individual human action does not make sense.

In the end of our summarizing periplus, we must not forget to mention the contributions made by Philip Kotler in the application of *chaos theory* in the micro and macroeconomic environment. Witnessing the current changes which occur on the stage of international commerce, the founder of the modern ‘management of marketing’ conducts an analysis of the new economic stage. The countries worldwide are in a tighter interdependency, and the commerce is carried out based on flows of information which circulate with the speed of light. Beyond the undoubted advantages translated in terms of decreasing costs, accelerating production and the delivery of goods and services, this new stage has its downsides: any unpleasant event can spread itself on the same paths extremely fast, in a ‘huge wave of turbulence’^[17]. In order to apprehend the turbulence of the market and its effect on the economic activity, concepts of this natural phenomenon have been revised from mathematics and physics. Turbulence is a difficult phenomenon to model and predict, despite the existence of new sophisticated computers with huge capacity of processing^[18]. Turbulence is a concept which made the object of preoccupations of physicists from the earliest times up until nowadays researches. Extrapolating, we can state that economic turbulence is defined as consisting of rapid, impossible to predict changes in the external or internal environment of the firm, which affect its

performance. The recent depression served as an example to help us better apprehend the magnitude of the impact of turbulence and the devastating chaos which it leaves behind.

In a world characterized by technological progress and revolution of computer science, disruptive innovations, the rise of ‘the rest of the world’, clients’ abilities, the necessity of protecting the environment and the selection process of the market become all the more tough, and those who do not adapt to the coming hypercompetition^[19] are immediately eliminated.

Globalisation, the appearance of more appealing substitute products, the deeper fragmentation of consumers’ tastes, deregulation and invention of new business models – all these contribute to the elimination of barriers to free access on the marketplace and to the dethronement of branch leaders^[20]. The author of the book *Hypercompetition: Managing the Dynamics of Strategic Manoeuvring*, Richard D’Aveni^[21], claims that the competitive advantage can no longer maintain itself on a long term, it creates itself and it erodes away, then it destroys and recreates itself permanently with the aid of strategic manoeuvres of the firms which disrupt the established order of the markets. In the era of turbulence the competitive environment changes its balance of forces in a spectacular way, from market leaders who wish to maintain their position to rapid assaulters who have the purpose of dethroning the formers.

4. Conclusions

From the summarizing periplus of the preceding ideas of complexity economics we understand that this subject has been long debated throughout time by numerous economic theorists. However, their hypotheses could not have been validated with the tools and methodology they had back then. However, with the passing of time, the abstract sciences have recorded remarkable advancements by the appearance of mathematical tools on computers, developed with the purpose of capturing, analyzing, outlining and developing predictions regarding the behaviour of different elements (called agents) which compose complex systems. Nevertheless,

these tools will be adopted in economics too and used in order to validate the hypotheses assumed by the economist researchers; an adequate framework will then be developed in order to help embrace and nourish this new theory in economics.

Complexity economics preserves what has been soundly proved from the orthodox and heterodox theories. We are witnessing the establishing of a new view upon economy and at the same time a progressive improvement, in terms of methodology. This new paradigm enriched the heritage of economics without abandoning the classical theories.

The Economy as a Whole Living

Abstract

Neoclassical economics, governed by the first principle of thermodynamics, based on Newtonian mechanics and centred on the rational individual, reifies the human actions and preferences in unites of measure for calculating marginal utility, determining the indifference curve and the ‘equilibrium point’. But it is exactly this wish of the neoclassic economists to formalize and abstract which will later prove to be the main deficiency of the mainstream orthodox theory. Instead, we are being proposed to adopt an organic view upon the economy and to orientate towards identifying the quality of human actions and not their quantitative coordinates.

The optics is changed under the influence of the second principle of thermodynamics, which emphasizes the fact that the economic process is irreversible and eminently characterized by entropy. Within human activities massive amounts of materials are engaged. These materials dry the planet of resources and exhaust the reserves supply for the future generations.

In the light of this new view, the purpose of economic activity slightly shifts from the maximization of production and revenues to the minimization of the entropy of personal actions and to laying the foundations of sustainable development.

Key words: bioeconomy, law of entropy, whole living, sustainable development

J.E.L. classification: B25, B52, Q57.

1. Introduction

The propensity towards reduction which characterizes neoclassic economists, tries to ‘fit’ agents’ behaviour within the market in abstract formula type stimulus-response

which describes individuals who always act objectively, based on the most rational decision and in their own interest (which is always the optimum state).

Thus, static models are designed, with the purpose to determine the *equilibrium point*, models which ‘while elegant cabinet specimens of applied mathematics, largely ignore human behaviour, as understood by contemporary psychology and biology. Lacking such a foundation, they often describe abstract worlds that do not exist.’^[1]

The excessive abstracting of neoclassic economics is repeatedly criticised even by Hayek in *Individualism and Economic Order*, the economist reasoning that these methods and approaches are of use ‘only when confined to the analysis of the action of a single person’^[2] and that they do not correspond to the real market in which a large number of heterogeneous agents interact.

As a reaction to this hindrance of the standard economic theory, new paradigms and currents have arisen, which propose, in principle, an interdisciplinary view upon economic problems. Amongst them are *evolutionary economics* and *bioeconomics*.

2. Evolutionary Economics

Inspired from and based on Darwinism^[3], evolutionary theory has influenced numerous fields of research, from biology and medicine to sociology and economics. It represents the conception according to which all things in the universe are seen through their evolution in time. In relation with this idea, the notion of *path dependency* emerges in complexity theory, expressing the strong bond which exists between current events and the prior evolution of the phenomena which led to the present state. The importance of history is defined with reference to the light which it can shed upon current phenomena, as well as

to the fact that it stores previous experiences and decisions. And depending on the comprehension and interpretation of these experiences, people can base their decisions and strategies in the present.

Some authors identify two sources of path dependencies: generated by structure and generated by rules. The dependency on past structure is considered to directly influence the future structure and the dependency on rules applied in the past directly generates alterations in the property system and indirectly influences the present structure.

Darwinism emphasizes on the struggle for survival which is constantly fought in nature, the strongest individuals being those who, by natural selection, triumph and continue their existence, at the expense of the weak ones who burden the ecosystem.

On numerous occasions economists manifested an attraction to evolutionary ideas, often emphasizing parallels between capitalism and the evolutionary struggle for survival^[4].

With reference to the resemblance between the ecosystems within nature and the complex social system within the economy, some authors have even stated that ‘Darwin’s theory of natural selection was an economic theory, not a biological one’^[5].

The opening towards natural sciences which the social sciences and humanity show is based on the fact that human actions comprise events with physical causation, and this alliance can bring nothing but benefits which reside in a better comprehension of economic phenomena and their causes^[6].

Thorstein Veblen uses for the first time the phrase ‘evolutionary economics’ and produces a true revolution in the economic theory, generating numerous debates and decisively influencing the ideas of the next generations of economic researchers with his essay ‘Why is Economics not an Evolutionary Science’. Rejecting biological reductionism and also methodological individualism, Thorstein Veblen highlights in his papers the influence which the whole social structure has upon the individual. He emphasizes the danger to which theorists are exposed. They can easily fall in the trap of biological, individual, structural or any other form of reductionism.^[7]

The evolutionary economic theory has developed parallel with the institutional economic one, both of them sharing the endogenous view in which the beliefs, customs and rules of the society lead to the appearance of institutions. An organic idea is hence being outlined in economics, of an economy belonging to the ‘living world’, with the mission to draw attention to the researchers in the field that the subject of analysis here are individuals who, although consume resources which can be quantitatively measured, essentially behave subjectively. And the interactions between these individuals determine structures similar to ecosystems, which tend not towards an optimized life, but towards a better living (in every sense).

Evolution cannot be recorded in a pure quantitative manner, it is necessary to use qualitative parameters in order to properly measure individuals’ development. And these parameters should also include aspects regarding the environment.

This flaw of the mainstream theory has determined some economists to introduce new concepts with the aid of which to more properly describe the economic state at a given moment. Thus, the French professor Serge Latouche places in the centre of his analysis the concept of *economic decrease*, stating at the same time that ‘in a world with limited natural resources, the dominant paradigm so far has been that of infinite growth’^[8]. A planet which is generous with its inhabitants, but equally abused, will not hinder to unveil its limits and will sanction the irresponsible behaviour of the individual guided by a sole religion: complete satisfaction of his unlimited needs. In a world in which natural resources are limited, an infinite growth cannot be accomplished.

People are invited to transform their destructive creativity in creative destruction in the Schumpeterian sense of the word. Innovation must be achieved by adopting a long term view upon reality and by manifesting consideration for the generations to come. At the same time, people have to unanimously accept the idea that the action of a sole individual has effects which propagate themselves on the market and affect the entire structure of the system, not just the immediate reality of the agent who generated the change in the first place. In this

respect biology would offer a number of introspective perspectives for the economic process.

3. Georgescu-Roegen's legacy

Sustainable development started to count itself among the main objectives of humanity with the intensification of technological development. More and more resources are being used to meet the same needs, causing at the same time the appearance of other new ones, namely that of wisely using the earth's resources so that the future generations can have access to them too.

In the attempt to theorise this perpetual consumption of resources and to explain the economic process with reference to it, economists have transgressed the limits of their field of research, entering the depths of physics. Here, many authors observed correlations between the flow of resources from the economy and the one of energy from thermodynamics, reaching the conclusion that 'the ideas and methods of analysis from thermodynamics mirror the energetic transformations which occur within society', and especially the second law of thermodynamics (or The Entropy Law, as it is mentioned by Georgescu-Roegen).

If the first principle of thermodynamics was a predecessor of the law of conservation of energy in the field of thermic processes, *the second principle of thermodynamics* was formulated as a law particular to thermic processes.

The second law of thermodynamics specifies the conditions in which the transformation of thermic energy in mechanic energy takes place; it is a customization of the general principle of energy exchange and it has a qualitative character, indicating the direction in which the spontaneous transformations take place, without referring to the quantities of energy exchanged.

A process^[9] passes from an initial state in a final one; it is *reversible* if the return to the initial state is possible so that this state of the considered system and the state of the surrounding systems are identical with their initial state. If when returning to the initial state, the state of the surrounding systems differs from its initial state, then the process is *irreversible*.

The laws and concepts of thermodynamics form the basis of the operations within the energetic systems; these 'heat' and 'power' human development^[10].

Thermodynamic laws have been and still are considered to be ones of the most lasting and comprising theories in physics^[11]. Their heuristic influence in economics have been highlighted when neoclassic economists based their reasoning under the aegis of the first law of thermodynamics, using it in order to abstract and model the behaviours of actors within the market. But the Romanian American *bioeconomist* Nicholas Georgescu-Roegen was the one who signalled the inadvertence of this law in relation to the economic reality. He sustained that exergy^[12] cannot reflect the entire complexity of the human behaviour and of the whole economic process, but that entropy^[13] (namely the second law of thermodynamics) can more appropriately reflect the reality of dissipative systems. Thus, 'the economic process is, by its nature, entropic, and the entropy law governs not only this process but also its evolution'. In other words: 'the economic process is not reversible'^[14].

Georgescu-Roegen did not make the same calculations and tautologies which his contemporaries did; he oriented towards the tools of physics and biology in order to free the individual from the rigors of mathematical models and in order to give life to the economic process, conferring veracity to it. He saw beyond the equilibrium between supply and demand and stopped upon the equilibrium of the environment in which the individual carries out his activity. Noticing that the resources which the individual extracts and exploits from nature for and in his activity exhaust the planet from the reserves destined for the future generations and affect the equilibrium of the environment, the economist proposes a holistic approach, centred on the qualitative and interdependent aspect of human actions rather than on the quantitative and singular one. Moreover, he invites us to think about a living organism which, if not nourished, but permanently drained of nutrients, gets ill, causing damage afterwards both to itself and to the individuals with whom it interacts.

The new paradigm which Georgescu-Roegen outlines is based on the premises of sustainable development, on relating to

reality and on the view upon the whole ensemble.

His ideas opened the path for research in the field of bioeconomics and signalled the primordial problem of humankind in times to come: ‘the economic criterion should be in a dynamic compatibility with the social-human and ecological one when we think, analyze and interpret the economic system in its whole’^[15].

4. Conclusions

In all his actions, man uses natural resources which he introduces in the economic process, first characterized by low entropy, and produces outcomes characterized by high entropy. Throughout this process, the natural equilibrium of the environment is affected, this having repercussions on the future generations.

In these conditions, the need of a smarter sustainable development is outlined, taking into consideration the qualitative parameters of humankind and having more respect for nature and its capacities.

Nicholas Georgescu-Roegen was the first one to realize the incompatibility between the environment created by man and the natural one, thus founding *bioeconomics*. His contributions to the economic science have led to the appearance of a new paradigm, which animates the economy through a holistic optics. It approaches the individual embedded in the environment in which he lives and carries out his activity.

The Pension – a Substitution Income?

Ciuraru-Andrica Cristina
„Vasile Alecsandri” University of Bacau
cristinaciuraru@yahoo.com

Abstract

The deficient state of the public pension system in Romania nowadays is the result of a combination between a more or less distant “yesterday” which was spotted by abuses and maybe injustice, which has been hotly debated and the present crisis. Anyway, time cannot be turned around so as to avoid them, and even if this miracle could be performed, it seems almost certain that the same mistakes will be made again. Daily life proves this to us.

As a consequence, we can only find pertinent solutions to eradicate or amend these mistakes, and institute a sort of “Salvation Arc” for the Public Pension System.

Nevertheless, in this paper we do not aim at such a grand project; on the other hand, we will focus on the “substance” of the most controversial income nowadays: the pension.

Key words: pension, equity, replacement average ratio

J.E.L. classification: H55

1. Introduction

What is the pension? Here is a question which might, at a simple glance, seem simple for many, with a simple answer but which, oftentimes, leads to what the pension *should be*. So, is the pension what it should be?

According to the definition offered by Law 263/2010 regarding the unitary public pension system [3], the pension, as a social insurance benefit, represents a replacement income granted when insured risks occur (invalidity, old age, decease), for the total or partial loss of insured incomes.

As a result, the pension must replace an income which was obtained previous to the occurrence of the above mentioned risks. To what extent should this replacement be

operated? This is a question whose answer is still not formulated in an official manner. Indeed, there are pension calculation rules, but they do not guarantee a certain percentage from the insured income.

2. An overview on pension income

However, from a logical point of view, if the occurred risks determine the total or partial loss of insured incomes, then their replacement should also be total, or partial.

The reality does not seem to respond to the same type of logic. The replacement is, oftentimes, too generous with some and too scarce with others. These two extremes outrun (as value, respectively as number) even the replacement at a medium level (see Table 1).

This inequity has been supported, for a long time, by the existence of special pensions whose beneficiaries sometimes were, paradoxically, even the deciding factors, who visibly favoured these types of pensions, and also by the “pettiness” of the population.

By virtue of the equality principle, on the basis of which the public pension system functions and is organized, this inequity should be eliminated by all means from a governing institution which claims to serve the citizen. The law 119/2010 [4] and the new pensions’ law (263/2010) [3] made a first step in this direction, by eliminating and recalculating special pensions and by including certain categories of pensions (which previously had a special status) in the unitary public pension system (public clerks and those with a special status, military men, police officers, etc.)

And yet, what could “equity” signify in the public pension system?

From the perspective of the pension’s quantum, equity involves that this quantum should be strictly connected and directly proportional to the contributions paid during

the subscription period, for all pensioners. Therefore, this obliges that contributions have been previously paid (according to the contributivity principle). It is true that the cumulated value of contributions depends on the amount of taxable income which corresponds to the active period and, accordingly, for many employees with low salaries this ensures the right to equally low pensions, but whose fault is it? Still, granting huge pensions only to some professional categories was a clear sign of discrimination, especially having in mind that they did not rely on realistic motives for any justification.

Despite all this, the relationship pension level = accumulated contributions is more particular to the private pension system based on definite contributions. In a public system based on the redistribution of contributions accumulated in the present for the payment of current pensions, this equality is practically impossible, and this is valid all the more when the amount of the pension also depends on other factors rather than on the cumulated value of paid contributions.

As far as the conditions or criteria to receive the pension are concerned, they must take into account certain particularities of the domain of activity in which the insured incomes were obtained (normal conditions, special or particular conditions, or other work conditions). They must be pertinent and they

should justify, in a real and moral manner, the difference of treatment. For instance, work in underground conditions, in a mining environment, for at least 50% of the normal work time in a month cannot be equivalent to (in terms of risks) the position of administrator in a commercial unit. Nonetheless, many criteria used before have favoured certain professional categories on rather subjective grounds.

Concerning the other rights and obligations, they must be granted or imposed without discrimination to all persons which are part of the same judicial condition (contributors and retired persons).

Equity in the public pension system is therefore indispensable in order to guarantee its sustainability and efficiency. But these two targets also necessitate an average ratio for replacing the salary by means of the pension which will ensure, after retirement, at least a living standard comparable to the one before retirement.

In Romania, between 2001-2006, the average ratio gradually decreased, and starting with 2007 up to the present it has oscillated around 50% (see Table 1). In the future, another decrease is foreseen, as a result of the increasing deficit of the public social insurance budget, but also as a result of the problems of the public pension system in general.

Table 1. Replacement average ratio pension-salary

No.	Year	Average pension of state social insurance	National net average salary	Replacement average ratio
1.	2001	131	302	43,38%
2.	2002	163	379	43%
3.	2003	187	484	38,64%
4.	2004	232	599	38,73%
5.	2005	267	746	35,79%
6.	2006	311	866	35,91%
7.	2007	399	1.042	38,29%
8.	2008	593	1.309	45,3%
9.	2009	711	1.361	52,24%
10.	2010	739	1.407	52,52%
11.	2011*	775	1.461	53,05%

Source: Own processing based on given database by Ministry of Labor, Family and Social Protection

*The average is based on first 7 months of the year

Mention should be made that from the total number of pensioners within the state social insurance system, for instance 4.745.716, on June 30, 2011, only 5,48% benefited from the average pension, while 40,68% received a pension which was above average, and the rest of 53,84% had the right to a pension below 700 RON [6]. Consequently, we deduce that for almost 60% of the pensioners the rate for replacing the salary by means of the pension has reached a maximum level of 53,05%. More than that, this inconsistency related to the evolution of the average ratio reveals an intergenerational inequity which tends to get worse at the expense of the future groups of pensioners.

Another problem which raises doubts about the fact that pensions are a replacement income is related to its calculation manner.

According to the law [3], the level of the pension is determined by multiplying the average point accumulated by the insured person by the pension point-value, which is also regulated by law. Considering that the yearly average point accumulated by contributors did not even reach the first level (excepting 2009), and the value of a pension point has reached lately only 36,4% of the average gross salary (see Table 2), it is absurd to believe that the pension is a replacement income. This is all the more valid considering that approximately 75% of the employees earn incomes below the average gross salary, while only 5% benefit from it [5].

Table 2. The weight of pension point-value in national average gross salary

No.	Pension registration year	Average point	Point value	Average gross salary	Point-value/average gross salary ratio
1.	2001	0,78405	173,5	422	41,11%
2.	2002	0,84657	212,8	532	40%
3.	2003	0,91081	240,8	664	36,27%
4.	2004	0,94322	274,6	818	33,57%
5.	2005	0,98119	295,6	968	30,54%
6.	2006	0,99505	352,8	1.146	30,79%
7.	2007	0,95884	478,5	1.396	34,28%
8.	2008	0,96392	639,4	1.761	36,31%
9.	2009	1,00244	725,6	1.845	39,33%
10.	2010	0,97575	732,8	1.937	37,83%
11.	2011*	0,96868	732,8	2.013	36,4%

Source: Own processing based on given database by Ministry of Labor, Family and Social Protection

*The average is based on first 7 months of the year

From among the group of insured persons who have retired in 2011, only 11% could accumulate the average point, while 42% accumulated a below-average point, and the rest of 47% managed to collect an above-average number of points [6]. In conclusion, more than 53% of the number of pensioners benefit from a pension which rarely reaches the value of one pension point (currently 732,8).

Therefore, is the pension nowadays a replacement income or is it just a guaranteed right at a certain age, whose quantum is uncertain?

And yet, what solutions could be taken to increase the replacement ratio and, implicitly, the pension's adjustment degree, according to the conditions of the current calculation of pensions?

One solution – equally simple and risky – could be the alternative of supplementary saving methods, such as private pension funds.

Contributions to compulsory private pension funds are estimated to supplement the pension income with approximately 10-15%, while contributions to optional pension funds will increase the replacement ratio to

80% of the average salary which corresponds to the active period [2].

Willingly or unwillingly, the uncertainty related to compulsory private pension funds had to be accepted especially by contributors to the public pension system under the age of 35. Time will tell if this “debt” will bring the expected effects.

The promotion of “active ageing” [1] could also be a solution for the accumulation of an increased score which is necessary for the calculation of pensions. Thus, from the total number of active population aged above 60, in the first semester of 2011 (729.257 people), approximately 99% included people involved in some kind of job, which is extremely favourable [5].

Moreover, the increase of the pension point could also augment the ratio for replacing the salary with the pension. Yet, once law no. 263/2010 entered into force, the value of the pension point could no longer vary arbitrarily as governing parties sometimes wished. It is increased annually by 100% from the inflation rate, to which 50% of the real increase of the average gross salary is added (until 2020), and in 2021 it will decrease by 5% a year until 2029, so that in 2030, for the increase of the pension-point value only the inflation rate realized in the previous year will contribute, with 100%. These rules no longer allow “juggling” with the pension level according to diverse electoral interests or some other types of interests.

3. Conclusions

Certainly, other factors can also positively influence the replacement ratio, but all these solutions do not guarantee an increase of the

replacement ratio, but only a hope that this thing could happen.

Therefore, the pension remains only a right guaranteed by law whose quantum is uncertain. Is this satisfactory? After a considerable number of years spent working, in which contributions are paid, is it normal that future pensioners must live in uncertainty?

The Temptation to Exit the Eurozone in the Context of the Current Sovereign Debt Crisis

Cîndea Iuliana Marina

Abstract

When a fire breaks out, we learn very quickly who is prepared to enter into that building in order to save lives and who runs away to avoid danger. The current sovereign debt crisis is precisely the kind of crisis that reveals true characters, that shows which states are prepared to enter the Eurozone and which are willing to give up the monetary union.

This paper explores the possibility that some Member States of the Economic and Monetary Union (EMU) to leave the European monetary arrangement, as well as the potential consequences, both for those countries and for the EMU.

Key words: Eurozone, European single currency, national currency, sovereign debt crisis, default.

J.E.L. classification: F15, F33, F34, F50.

1. Introduction

The Economic and Monetary Union is being tested beyond limits. The governments, particularly those of Greece, Portugal and Spain, face pressures from the markets in reducing deficits and reforming the economies. Politicians, in turn, consider rewriting the rules for joining the Euro area in order to prevent further crises.

The main vulnerability of the Eurozone, relieved by the current sovereign debt crisis, is found precisely in the institutional framework of EMU - namely, the fact that no financial support mechanism that could be activated in times of crisis was included in the EMU project. There is, of course, a strong motivation for this "negligence" - avoiding moral hazard, the risk that the

governments to exploit the existence of such a mechanism, creating debt and excessive budget deficits.

Neither had the governments proposed saving the banks during the banking crisis, nor did the Member States of the Euro area decide to save their "neighbors" during the sovereign debt crisis. However, circumstances forced them to do so, not out of solidarity, but for pursuing their own interests. Self-interest coincided with the common interest, in that most Member States (even Germany) understood that the survival of the Euro area is vital for the further development of individual countries.

2. Exiting Eurozone

The crisis which broke out in 2007 is exactly the kind of asymmetric shock which the euro-skeptics warned us against and emphasized by the theory of optimum currency areas. The level of house prices fell down throughout the entire Euro area. The crisis meant big losses for the banks around the area. It also caused the increase in the rate of unemployment. The result was deflationary and inflationary pressures. This meant a greater pressure on the public finance in some Euro area Member States, reflected in increased sovereign bond spreads or increased credit default swaps (CDS).

In this context, some Euro area countries would probably prefer another response from the monetary policy. But EMU members are bound by a single policy, which characterizes, in fact, the monetary union. This tension brought on the agenda the debates regarding the appropriateness of creating the monetary union in the first place. It also generated speculations on the possibility that some Member States to abandon the Eurozone.

The temptation undoubtedly exists. Policymakers in the countries with the lowest domestic demand can imagine how, if they still had a national currency, they could depreciate it in order to encourage exports. Also, the countries that face problems regarding government bonds can imagine how, if an independent national central bank still existed, it could ultimately buy the sovereign bonds.

But for each of these arguments supporting the reintroduction of the national currency, there is a counterargument. Currency depreciation would create tensions in the European Union. The partners of the country using this monetary policy instrument would feel that the country is not only exporting its goods and services, but also its problems. This assertion can be proved by the reaction of the other EU countries to the depreciation of the sterling pound against the euro. The economic crisis, like all recessions, has increased the pressure on the governments to support domestic producers through concessional loans and subsidies. Handling the exchange rate and devaluing the currency could risk Europe's economic objective, which is creating a real single market in which EU producers to compete on an equal footing.

In addition, a country that unilaterally abandons the euro for a competitive advantage could jeopardize its EU membership. That country would no longer be welcome within the negotiations on EU policies. The Lisbon Treaty contains a clause according to which Member States can leave the European Union, but there is no clause governing the exit from the Euro area. Thus, in order to exit the Eurozone, Member States would have to give up the EU, thus repealing the full range of obligations stated in the Treaty. Although nothing prevents this, given the importance that the Europeans attach to the union, it is a decision that any Member State would give a lot of thought.

In 2000, Romano Prodi, at that time president of the European Commission, explained the possibilities for an EMU member country to return to its own currency. According to the young official, abandoning the euro would be possible in exceptional circumstances, provided it does not adversely affect the European Union. "Exiting the EMU and thus returning to their

own currency would not necessarily mean leaving the EU. It may, therefore, infer that the EMU would prove a degree of flexibility and reversibility, which, in reality, is still difficult to represent in terms of expected costs and benefits and the procedures to follow, given the long and complex period of preparations for setting up the EMU" [1].

On the other hand, Jonathan Faull, spokesman of Romano Prodi, emphasized that "there are no legal clauses for leaving the Euro area" [1], which shows exactly the irrevocable and irreversible nature of the agreement regarding the monetary union. Faull also noted that "the commitment to the economic and monetary union is a significant one, which can not be treated superficially" [1]. However, this position does not exclude the theoretical possibility of a country's withdrawal from the union in special, unforeseen circumstances, which now, after more than 10 years since the statements cited above, turn out to be real.

Although the reintroduction of the national currency and the separation of the national central bank from the European System of Central Banks and the European Central Bank (ECB) may facilitate the short-term financing of the budget deficit, on the long run the financing costs would go up. Indeed, if a highly indebted country of the Eurozone is unable to pay its debts as a result of the economic crisis, it could leave the arrangement in order to resort to financing. But given that, at least so far, governments' aim has not only been that of financing immediate expenses, but also of stabilizing financial and credit relations, abandoning the Eurozone would only aggravate the problems.

The most important cases in which participants have left the monetary unions are those of countries with relatively closed economies and characterized by an underdeveloped or strictly regulated banking and financial system. The collapse of the Czech-Slovak monetary union and that of the ruble area are good examples in this respect. The fact that it did not affect the financial well-being, that the exchange rate could still be controlled and that the economies were not as open as nowadays made the decision making process possible without triggering an economic disaster. In this respect, it has been shown that open economies are less

likely to abandon monetary unions. Clearly, the vast openness of the EU Member States to trade and financial transactions of all kinds places them in this category.

Is it, however, inconceivable that a Member State to abandon the Euro area? The global financial crisis has taught us that the economic events that we once considered to be inconceivable, in fact are not. Even if it is not inconceivable, leaving the Euro area is highly unlikely. Some voices in the financial world have pointed out the fact that Germany's indignation against the current situation could determine Berlin to give up the Euro area. In turn, German Chancellor Angela Merkel launched the idea of establishing an international mechanism through which Greece or the un-competitive economies of other countries in the Euro area can be removed from this alliance, if they do not give up their irresponsible spending habits.

Stratfor Global Intelligence suggests another possibility for exiting the Eurozone, namely recreating the European Union with a different membership and establishing a new Eurozone within the new structure. According to Statfor, "such a manipulation would not destroy the existence of the European Union; its members would simply recreate the institutions without that member" [2]. In the case of such a scenario, with a smaller Euro area, Germany's influence would, however, be even greater and the remaining members might not accept this. Thus, according to Stratfor, if France and Benelux would reconstruct the Eurozone together with Germany, the German economy would have a 45.6% share in the new structure, compared to 26.8% today. The analysts of the American think tank believe, however, that the states which will be excluded from the new structure might do something unexpected when they leave: namely, they might not pay their debts to the members of the new union.

We shall further analyze two extensively debated cases on the political European scene: Greece and Germany.

3. Greece – the irresponsible

The European authorities found themselves in the unfortunate position of choosing between two "evils": the Greek

bailout and the Greek default. Bailing out Greece was seen as an inappropriate alternative in the sense that it would have meant leaving an irresponsible behavior unpunished and, thus, favoring moral hazard. Spain, Portugal or Ireland could also become a second Greece as long as an immoral behavior is rewarded with a bailout.

Why did Greece's default have to be avoided? For at least three reasons. Firstly, because of the risk of contagion spreading to other government bond markets in the Eurozone. Secondly, the Euro area banking system would have been affected. The solution that many banks chose in order to overcome the credit crisis was to borrow on short-term from central banks at very low interest rates and invest in long-term government bonds. A government bond market crisis would have meant significant losses for the banks, which would have caused a new banking crisis in the Euro area. Thirdly, if it had not been stopped, the Greek crisis would have led to the increase in the government bond yields in a large number of countries, which would have created pressure on the governments to reduce government spending, threatening to throw the Euro area into a recession twice as strong. At the same time, the unemployment rate would have increased, which would have created difficulties regarding the struggle to reduce budget deficits and public debt.

It was in the Eurozone countries' interest to save Greece (especially because of the risk of triggering a new crisis of the banking system), not necessarily out of solidarity, but for defending their own interests. We shall further see what leaving the Eurozone would mean for Greece.

American economist Nouriel Roubini, who predicted the US economic crisis a year before it broke out, said that, despite the rescue program provided by the EU and IMF, Greece and other states from the Euro area could be forced to abandon the single currency in the coming years, in order to save their economies [3].

Greece's exit from the Eurozone would ease the country's financing problems by depreciating the domestic currency and by the central bank purchasing bonds. However, the introduction of the drachma would be almost impossible because no one would accept to receive a currency which is being

introduced precisely in order to be devaluated. Capital will flow immediately out of the country, without any support, at least temporarily, from the EU, the ECB or the IMF.

What happens, therefore, if Greece abandons the euro? Suppose the drachma replaces the euro. Given that investors have very little confidence in Greece, a significant devaluation of the new currency, possibly by 100%, will take place. Many companies will withdraw their money from the country and people will start buying foreign currencies massively. Thus, the pressure on the drachma will be huge and the Central Bank of Greece will not be able to do anything about that as its foreign exchange reserve is extremely little.

How can a country pay its debts? It can print money or borrow money. The Americans can print dollars as their debt is in dollars. The Japanese can print yens as most of their public debt is internal, thus in their national currency. But Greece does not solve much by printing drachma since over 70% of its public debt is external and in Euros (and US dollars). And Euros and US dollars can only be obtained on the international market. Who and at what price would credit a country which is virtually bankrupt? In addition, the more money will the Greek print, the more will the national currency depreciate.

On the other hand, the Greek government can significantly reduce the share of public spending in GDP through inflation, thus restructuring the public sector. Basically, if the authorities print money and the drachma is devalued, prices will rise, the nominal GDP will increase and, provided that pensions and budgetary wages remain unchanged, their share in the GDP will decrease. Of course, this means that the purchasing power of the population will fall dramatically.

Greece's exit from the Eurozone may be a solution for dragging the country out of crisis, but such a measure will have disastrous effects for both the population and the current creditors, who will lose most of their money when the Greek will restructure their external debt, which is an inevitable measure.

4. Germany – the indignant

A large share of the government securities issued by Greece, Portugal and Spain are held by German and French banks; in other words, these countries were in a thankless position, whether they accepted to devise a rescue plan for Greece and the other countries that needed help or not.

Although reluctant to aiding Greece, even threatening to exclude the less virtuous member countries from the Eurozone, the first economy of the continent has no interest in the collapse of the single currency. Indeed, without the euro, Germany would face an unprecedented crisis.

Unlike the case of Greece, the reason why Germany could leave the Euro area is not to have to pay the debts of the Southern European countries, the so-called "Club Med". Technically, the German mark could be reintroduced without negative reactions from the financial markets and no outflow of capital from the country. Especially since the "European banknotes are not issued by the ECB, but the national banks of issue", such technical and practical obstacles would be minimal [4]. However, in the event of exiting the Euro area, Germany would suffer double loss: the current exposure on Club Med and, on the long run, the loss of labor competitiveness.

Before using the mark again, Germany should first withdraw its reserves from the ECB, print its own currency and then move to the redenomination of the country's assets and liabilities. Although it would not necessarily be a simple process, Germany could reintroduce its national currency more easily than the other Eurozone members. Given the reputation of the mark before the creation of the Euro area, the credibility of the Bundesbank and the German currency would be restored in no time.

Therefore, the re-evaluation of the mark would place the German currency at least 30% above the euro. These 30% would be a great competitive advantage for the French and Italian industries, but also Belgian, Dutch and Slovak. Taking advantage of the boom in their exports, the other European countries will be able to finally develop without Germany. More pragmatic than the German regarding the rebalancing of their financial sector, the French, who believe that it is

better to return to growth than to reduce costs, will ensure Europe a few years of prosperity.

What will the German do with their new mark in the meanwhile? They will find themselves in a catastrophic situation. The return of the mark will make the "made in Germany" too expensive and exports will fall. All the extra exports of France and the rest of Europe will mean lost profits for the German companies. Unemployment will rise, as well as debt, dug by the increase in the allocations that need to be paid. German growth, which relies exclusively on exports, will slow down. As the cost of labor force will rise, wages will inevitably be frozen.

The return of the mark will also raise a wind of panic among banks and insurers. The decrease of 30% in the value of all their European assets (due to the 30% appreciation of the mark against the euro) could represent a loss of nearly 200 billion euro for this sector, given that, since the introduction of the euro, Germany has raised foreign assets valuing almost 600 billion euro (due to the large export surpluses). This will happen only in the lucky perspective that these states do not default and pay their debts to Germany. Otherwise, a second wave of bank rescue plans will have to be set up, which will further aggravate the public debt situation.

On the other hand, if Berlin returned to the German mark, the debt-burdened states such as Spain, Portugal, Greece or Ireland would record an increase in the competitiveness. Exports would rise, thus allowing them to raise money in order to pay their debts and support the social systems. In return, Germany, an exporting country, would be forced to reduce its exports towards the Euro area (the single currency being weaker than the German mark). Indeed, Germany's liabilities are in Euros, which makes them much cheaper to pay; but the problem of the banking system will not be solved. In conclusion, at least in the near future, Germany will not opt for exiting the Eurozone, because at this point the costs would exceed the benefits.

5. Conclusions

Regardless of how the situation of the Euro area will be solved on the long run, the monetary union will follow its course, and the states that meet the real and nominal convergence criteria and are willing to adopt the single currency, will be accepted in the EMU. Regarding the Member States, although the temptation exists, none of the participants will leave the Euro area in the near future because the costs would be much greater than the benefits at this stage.

Greece's exit from the Eurozone would ease the country's financing problems by depreciating the domestic currency and by the central bank purchasing bonds. However, the introduction of the drachma would be almost impossible because no one would accept to receive a currency which is being introduced precisely in order to be devaluated. Capital will flow immediately out of the country, without any support, at least temporarily, from the EU, the ECB or the IMF.

Although reluctant to aiding Greece, even threatening to exclude the less virtuous member countries from the Eurozone, Germany has no interest in the collapse of the single currency. Indeed, without the euro, Germany would face an unprecedented crisis. Given the reputation of the mark before the creation of the Euro area, the credibility of the Bundesbank and the German currency would be restored in no time. The appreciation of the mark against the euro would mean the reduction in the exports towards the Euro area, which would entail an increase in unemployment and public debt, and, on long-term, lower competitiveness. German banks with exposure to government bonds issued by the Euro area Member States would be subject to two risks: the decrease in the value of their European assets (the single currency being weaker than the mark) and the risk that some countries to default and no longer be able to pay their debts if Germany exits the Eurozone. In such a context, a second wave of bank rescue plans will have to be set up, which will further aggravate the public debt situation.

gciurariu@yahoo.com

Abstract

Given the importance of accounting profession and the key role of its European body, the European Commission invited the FEE to play a key role in mobilizing European accounting professionals for providing European business advisers on the changes of the single currency. One objective is to represent the European accountancy profession internationally. FEE maintain close links with International Federation of Accountants - IFAC and the International Accounting Standards Board - IASB. FEE is involved in the work of the Organisation for Economic Cooperation and Development - OECD World Trade Organization - WTO and International Forum for Accounting Development - IFAD. Permanent contacts are maintained with a wide range of professional bodies and other organizations on common interests accounting profession, both at European and international.

Key words: accounting standards, statutory audit, accounting normalization.

J.E.L. classification: M 40, M 41.

1. Introduction

Representative organization of the accounting profession in Western Europe is European Accountants Federation (Federation des Experts Comptables Européens: FEE). It groups together 44 professional bodies from 32 countries. Currently FEE member bodies are present in all European Union member states and EU candidate countries. These organizations include over 500,000 individual members, of which about 94% are from EU countries.

Typically, 45% of accountants are represented in FEE freelancers, providing a wide network of services to their customers. The other 55% work in various positions in industry, government or education.

2. Regional body of professional accountants

FEE is the governing body of the General Assembly, which meets in ordinary session every two years. Federation Council is the responsibility of management fee. Responsible for implementing decisions of the Executive Council is composed of President, Vice President and Delegate. FEE is an international association established in accordance with legal and recognized by the Belgian Royal Decree dated 30 December 1986. It also is an "non-profit". FEE has the following objectives:

- to work in the public interest for harmonization and liberalization of the exercise profession in Europe and to support the regulation of accounting in both public and private sectors, taking account of developments globally;
- promote awareness and cooperation between professional bodies in Europe about the common problems in public and private sectors;
- to represent the European accountancy profession internationally;
- be the leading representative and consultative body for the accountancy profession in dealing with European Union institutions;
- identify issues that impact performance and accounting profession and, above all, to advise member bodies on these issues and, secondly, to work together with the States in search of ways to solve them;

- to promote global awareness of business professionals in all fields of profession.

FEE activities cover a broad spectrum of topics that impact the European profession, including accounting, auditing, ethics, taxation, public sector accounting, company law, banking, insurance, capital markets, accounting management, environmental issues, regulation and liberalization of the profession the euro. Most of the technical responsibilities are delegated to the FEE working groups, while special projects dealing with task forces.

In accounting, FEE play a leading role in Europe, especially in the European Union. Being an actor with a strategic role in the harmonization of accounting standards, is regularly consulted by FEE European Commission and other international or national. In addition to the work program, develop FEE studies various problems, such as comparing the conceptual framework of accounting in Europe, the European perspective of the accounting treatment of financial instruments accounting impact on the environment, comparison of European Directives and International Accounting Standards, International Accounting Standards for analysis of environmental issues, financial reporting strategy in Europe, accounting standardization process in Europe. FEE also publishes a number of advisory statements designed to assist public sector organizations and a number of documents related directly or indirectly in terms of taxation. The audit, FEE has published numerous studies on statutory audit quality, setting professional standards, independence and objectivity of the statutory auditor and the wording of audit reports in Europe.

FEE also promotes a broad liberalization of the profession at European level. It monitors the mutual recognition of professional qualifications in the Union and organized a number of seminars on this subject, with the management representative bodies. European accounting profession has certain fundamental characteristics, systematic way:

- *It is a profession regulated access and practice*

Profession of chartered accountant is one of the professions regulated in all EU Member States. To gain access to the

necessary approval of the competent authorities of these countries. Authorize a professional accountant is reflected in its inclusion in the list of those entitled to exercise the activity or activities reserved to the profession.

For authorization is necessary to obtain the professional title granted by the competent authority of the Member State designated in accordance with legal provisions, regulations and statutes of that state and meeting any other conditions relating to licensing, such as incompatibilities in the absence of good repute and legally, the usual conditions for this type of profession. For legal entities, the requirements for most capital and management definer, must also be met for them to be licensed.

- *It is a profession with a wide and diverse range of activities*

The scope of activity includes accountants a broad range of missions such as statutory audits, accounting expertise on mergers, acquisitions, contributions in kind, reorganization and liquidation of enterprises, legal accounting expertise, tax advice, tax representation, advice investments, legal advice and drafting legal documents, and other types of consulting, more general, such as consulting in organization, strategy, management, information technology, etc. These activities are, of course, regulated in all Member States, and is not mandatory everywhere having a specific professional title to practice. Some of these may be reserved exclusively for the accounting profession, but can also be set and the competence of other professions, there are situations where some activities are not part of the accounting profession missions.

Despite the differences in historical, economic, legal and cultural core of the accounting profession reserved activities include at least the following tasks: statutory audit (legal); auditing; expertise in mergers and acquisitions; expertise in in-kind contributions.

In addition to these activities which are usually reserved for the accounting profession, certain activities, such as tax consulting and liquidation of companies, are part of the traditional sphere of profession, even if they are made and other professions.

If we examine the differences between states on the activities of the accounting

profession is empowered to engage, we see that a large number of restrictions (for example, tax consulting) does not result from a lack of competence of the accounting profession, but the result monopoly protection and other professions. These differences have a direct impact on the exercise of accounting profession in Europe, as professional accountants wishing to provide cross-border professional services not to practice than those permitted by the home missions.

In order to maintain high quality and professional services is essential to develop those professional firms which are able to exert a wide range of missions and to form professionals with a high degree of competence. In this situation, in an environment that is not undermined by protectionism and unfair competition is made to the accounting profession, meet each client's interest and public interest in general. Therefore, in order to maintain a high quality of the activities of the accounting profession for EU business and to ensure that the EU can be competitive profession, in light of changes to total liberalization of the services offered by accounting profession worldwide, “FEE recommends that all the limitations of the scope of professional services that can not be objectively justified on grounds of competence, integrity, independence and objectivity, to be removed” [1].

- *Accounting profession and the public interest*

Professional accountants tasks are performed in order to satisfy the public interest. For example, if the statutory audit, the auditor's opinion reinforces the credibility of audited company accounts. Thus, increasing the value of audited accounts based on their decisions and, thus, help protect the public interest. Audit of mergers and contributions in kind, in connection with shares issued, ensure protection of the interests of all shareholders and thereby contribute to the protection of public interest.

The professional accountant is interposed as a guarantor of the information provided by economic entities. As guarantor of the quality of information, the accounting profession must meet the requirements imposed by the national ethical and professional accountants to behave in accordance with the rules of ethics of the profession.

Impact on public interest missions undertaken by the accounting profession may be perceived more or less depending on the activity in question. To the extent that the statutory audit is important, it is subject to regulation at EU level, indicating the role of the auditor on the reliability of financial information. However, “there are different regulations on statutory audit requirement in the EU Member States, depending on company size, number of transactions or labor, lead us to the idea that different national authorities interpret the role that accounting plays in providing professional credibility of financial information”[2].

The implementation of the directive's 4th annual accounts and Directive on consolidated accounts 7th, Member States shall audit different thresholds, situated between the limits in the Directive, for companies that require statutory audits of accounts. Some countries have maintained national criteria for statutory audit requirement, even if they were below those stipulated in the Directive. Other exempted from statutory audit companies and groups îndepiinesc not criteria in the Directive.

The criteria for statutory audit requirement defines the number of companies that become subject to it. In countries where the number of companies required to have audited accounts is high, the criteria set below the minimum guidelines. These two cases demonstrate the importance of the different EU Member States' authorities attach to the production of financial information by professional accountants. Therefore, each state, the public interest that it covers the activities of professional accountants recognized the public demand and authorities on the nature of the activities they require, as well as professionalism and accountability posed by their work.

Professional accountants of specific missions, only one became subject to EU regulation. Directives 4th and 7th provide that the annual and consolidated accounts which meet the criteria must be audited by an authorized professional. The regulations require companies to use an external independent audit of their accounts in accordance with Articles 51 of Directive of 4 and 37 of Directive 7, which reflects the desire of states to apply the provisions laid down in the Union on the protection of

investors and other users (creditors, staff, public authorities etc.).

Moreover, since public financial information are provided to users under the conditions laid down in Directives audited 4th and 7th, a provision has become necessary to establish common European training permit conditions and statutory auditors. This common regulation was obtained under the directive of 8, which defines the conditions on which individuals and businesses must meet to carry out statutory audits in each EU country. It should be noted that the 8th Directive is a directive for liberalization, which is clearly stated in the penultimate paragraph of the preamble.

But in the draft amending Directive contained provisions on international issues that apply when an auditor of a Member State wishes to exercise its audit work in other EU Member States.

3. Anglo Saxon European Pole

The origins of British accounting profession should be sought by the auditors before creating the first professional associations in Edinburgh in Glasgow in 1854 or 1855. To maintain its reputation with customers, the association should not contain only competent auditors. It also needs to develop a conduct and present accounting techniques. This means that associations have tried from the beginning, the accounting profession to give an image of organization and coherence.

Access was very difficult association. By the '60s to become a member of an association, the candidate must follow a five-year apprenticeship, after which, under professional success in exams, who went through all these joined gauntlet. These requirements have brought about a reverse of the medal, the creation of associations, excluded ". Therefore, in the second half of the nineteenth century and early twentieth century, there was a double trend: on the one hand, small group associations to create national organizations, on the other hand, the proliferation of associations whose interests and rules were different. Today, the UK operates six professional organizations include over 200,000 members. The first three organizations have been recognized by

royal charter and national vocation. Among these include:

- Institute of Chartered Accountants in England and Wales (Institute of Chartered Accountants in England and Wales ICAEW);
- Institute of Chartered Accountants in Scotland (Institute of Chartered Accountants of Scotland ICAS);
- Institute of Chartered Accountants in Ireland (Institute of Chartered Accountants of Ireland ICAI). In parallel, he developed an accountant profession, which was held in the structure of the organization, the Association of Chartered Certified Accountants' (ACCA Chartered Association of Certified Accountants).

Functions performed by members of the three national institutes of accountants and those of ACCA is similar to a large extent. Accounting profession plays an important role in economic life: a consultative role to the government, in terms of legislation and accounting and tax rules, a major in accounting normalization, a normalizing role of the profession (training, ethics, exercise).

Professional organizations in Romania are body bringing together professional accountants Chartered Accountants and Chartered Accountants (CECCAR) and the Chamber of Financial Auditors of Romania (CAFR). CAFR that work is supervised by a state authority (Ministry of Finance) leads us to the idea that at least one of the fundamental principles of independence, the accounting profession, can not be met.

Independence, impartiality, neutrality can not affect the activity of accountant, even if, notwithstanding the status of members' nonactivi "category may be part of professional auditors and employees of public bodies.

4. Conclusions

In order to achieve its mission to support the development of accounting profession with harmonized standards and providing a high quality of services to meet the public interest, the International Federation of Accountants has reconsidered its development activities to support the international accounting profession and its

role in the service of interest public key activities are structured into four categories: developing quality standards; increase transparency standards development process; achieving a high responsibility to the public; facilitating dialogue and relations between members.

The success of the accounting profession is, inter alia, in conjunction with the public trust by the user to whom it is addressed. The successful conduct of the business concern monitored by professional accountants in terms of the efficiency of business, development of capital markets and ultimately the economic stability worldwide.

parpandeldenisa@yahoo.com

Abstract

Current economic context marked by economic crisis, has the effect of reducing costs and greater control over costs. It is a problem faced by all managers and a solution to anti-crisis measures such as using data mining techniques.

Data mining or "knowledge discovery in large databases" is a set of techniques used to discover valuable information from large volumes of data unknown

.Data mining techniques are used in many fields, one which lends itself particularly well to the economy. Uncertainty facing the economy makes use of data mining techniques are more important now as it assumes that there are many advantages, brings both knowledge and management level in their area of activity.

Key words: data mining, economic crisis, information, knowledge extraction

J.E.L. classification: M15, G01

1. Introduction

Since ancient times people needed to operate information, information that was processed manually at first, but now, due to economic circumstances, increase the amount of information, managers can not operate studying reports showing a lot of data, volumes of data that are detailed and without the existence of correlations, because the evolution of an organization in times of economic crisis can be decided in fractions of time. Thus, it requires that managers have access to accurate and timely information to make better decisions, information that can

be obtained performed because of a system by which data is presented quickly, synthetic, but revealed while providing the opportunity and especially an analysis of forecasts.

Due to the progress of information technology, access to data and information is more easily achieved in the current context marked by crisis, the question is to know more and more, and know how to use the maximum information that you have at a time.

Economic downturn experienced in full by the vast majority of enterprises makes them feel somewhat of a fear of the future that awaits them. Many of the managers of these organizations chose to reduce their activity or have preferred to freeze the business hoping to better times. But the future is for companies who work in a more efficient business processes and improve control and analysis tools.

Citizen-oriented application development is a necessity in a knowledge-based society [7].

The economy is going through a period of economic imbalances and putting their mark on all business activity. Management level decisions be taken in a timely manner to ensure survival of a business or smooth. To substantiate these decisions, managers need information. Data mining techniques will assist managers because they are a modern and powerful set of tools with a great potential in helping companies find the most important information hidden in the data collected and stored in databases or data warehouses.

Gray and Watson argue that "data mining allows analysts and managers to find the answers to the problems of data warehouse company, which they have not even put". [4]

Data mining is "a lot of techniques that can be used to extract valuable information and knowledge from massive volumes of data" [5].

Data mining in relation to economic resource planning, is the statistical analysis and logical volumes of transaction data, looking for patterns that can help decision-making process [2].

2. Data mining techniques

Data mining techniques allow users to extract information and making predictions based on historical data. For this, they use methods from various fields in which they are rooted (as shown earlier in this chapter), namely: statistics, databases, machine learning, recognition of shapes and visualization.

Are used to apply a data mining strategy. Data mining techniques are defined by an algorithm of data mining and knowledge associated structure. In turn, the structure of knowledge is represented using a decision tree or a set of production rules.

1. Decision trees and classification

Classification trees are used to predict membership of objects / instances to distinct categories, based on their action in relation to one or more predictor variables [3]. Analysis of decision trees is an important technique in data mining.

A decision tree is a disjunction of conjunctions of constraints on attribute-value pairs of the courts. Each path from tree root to a leaf corresponds to a conjunction of attribute tests and the shaft is a disjunction of all these conjunctions [1].

This technique of decision tree is used to build a tree necessary to model a process of classification. After the tree was built, it will be applied to each item of the database and classification results of that tree. Technique is based on two steps: tree building and tree database application.

Classification and decision trees technique presents some advantages and some disadvantages. The main advantages of decision trees is that they build models useful and effective in terms of users are easy to understand and use and are not influenced by the absence of data values. They also can be used in real problems such as trade rules.

Decision trees folds large databases, tree size is independent of database size.

As we mention disadvantage that they restrict the data analyzed in that it allows only a single dependent variable. Also, a significant part of algorithms for decision trees require that data continue to be divided or converted into data type enumeration.

Neuronal networks (NN), the computers have been used since the 1980s. These neural networks were built after the model of biological neural networks (using the working model of the human mind). Thus, to make a stark difference between the two types of networks, those computers are also known as artificial neural network (ANN).

2. Neural networks are some of the most complex classification and regression, often considered as true black boxes [6]. Even if a neural network uses a lot of data for training, needing time, however it has the ability to make predictions for new cases fairly quickly, in real time. Basic feature of neural networks is given by the fact that they work directly only on numbers. Therefore, any type of data located in columns independent or dependent (output) which corresponds to a numeric type conversion process is subject to the number (as an example we give the values of type Yes / No variables belonging to be replaced with digits 0 / 1). As classification and decision trees technique and the technique has certain advantages and some disadvantages.

Neural networks operate on the principle of black box (black-box) have no ability to explain the finding dependencies between nodes. Neural network uses only numerical data, the nonnumeric to be undergoing a process of conversion.

Using a neural network, if they have a well defined structure, you can easily specify a new case. The disadvantage of a neural network is that it can never be exact.

3. A rule of association is an expression of commitment by the way, where X and Y are items (item's) separate X and Y are the consequence of the rule antecedent rule [3].

Technical association rules is part of strategies unsupervised data mining technology. Its role is to discover links between records for a data set.

This method of association rule, association analysis, is known in literature as the consumer basket analysis, the most common practical application of it. The main purpose of this analysis is to identify which goods are often purchased together to assist retailers in making decisions about the arrangement of goods in the store, making promotional offers.

The classic example, the use of association rule "beer - diapers", based on the behavior of many buyers in a supermarket. Thus, it was found that people who buy beer, buy often.

The main technical advantages of association rules are: ease of use ensures users in generating the opportunity to achieve fast classification of new instances. Clustering techniques to data, as well as association rules, are part of the unsupervised classification. Clustering is the process by which a data set is divided into several groups (clusters) of data from a certain similarity (grouping set of data subsets that share certain characteristics). Cluster groups are known from the beginning, they have also invented the process of learning. A cluster is a set of similar data items. Within each group should be a big similarity, but groups should be as different from one another.

4. Clustering techniques are divided into several categories depending on the type of algorithm:

- Ascending (grouping, summary): path is achieved by successive aggregation of elements, and obtain a partition hierarchy of classes;
- Descendants (the division): the set of objects is divided successively into subsets of objects;
- Partitioning: the starting point is a class structure that supports changes to maximize the homogeneity of each class.

Clustering methodology has two approaches:

- Hierarchical clustering (Hierarchical clustering)
- Neierarhic clustering (non-Hierarchical clustering)

Clustering involves grouping objects in a hierarchical iterative, leading to a hierarchy of clusters, the occurrence of dendograme (tree diagram). It uses a method of merging / joints (linkage), such as:

- Single linkage - the distance between clusters is determined by the distance between the closest object (Nearest neighbor);
- Complete linkage - the distance between clusters is determined by the distance between the most distant objects (furthest neighbor);
- Average linkage - the distance between clusters is given by the average distances in any two pairs of objects in different clusters;
- Centroid method - the distance between clusters is determined by the distance between the centers of gravity;
- Ward's method - this method differs from the above that is used for analysis of variances (dispersions) in the evaluation of distances between clusters.

There are several types of hierarchical clustering of which I will present only three:

- crowd (bootom-up) are connected pairs of clusters leading to the emergence of successively larger clusters. This method assumes that each object is placed in its own cluster and then is joined at each step the most similar two clusters until only one is obtained, alternatively, the stop condition is met.
- Division (top-down): At first all objects are placed in one cluster and will then, they divided into separate groups. At first we have one cluster then the cluster division to occur in smaller clusters, containing these procedures until obtaining a number of pliers or stop condition has been satisfied.
- Conceptually: consists of a root node empty, objects are added one by one, using the existing classes, creating new classes, combining and dividing existing classes [3].

Non-hierarchical clustering (partition) is also known as the k-Means clustering type. As is different from the hierarchical model, such method involves partitioning the original crowd of objects in non-overlapping clusters, each object to be part of one cluster and a priori knowledge of the number of clusters. The problem is to create an algorithm with which the number of clusters to be formed initially.

K-means algorithm requires random selection of K clusters, the arrangement of objects in the K clustre having to meet two objectives: to minimize intra-cluster variance and maximize inter-cluster variability.

3. Conclusions

The economic crisis affects almost all businesses and among the economic crisis are cutting costs, but costs such effects should not put their mark on reasonable investor and future.

Data mining helps us to discover hidden information in your company information, information that could not be effectively achieved only with the query reports. For businesses, data mining is used to discover patterns and relationships between data, in order to help management to take the best decisions in a timely manner.

Because data mining techniques benefits of particular importance be given to implementation and exploitation of its full potential. Including data mining process in the organization have to be gradual, realistic goals are set. The ultimate objective is to integrate data mining techniques Complete with other existing activities within the firm are used as decision support for the company. Data mining is the process by which they are identified and selected (especially in a time of crisis) information in the volume of data they work in an organization. True masters are those who have information, strategic resource of an organization.

Tax Evasion - the Main Component of the Underground Economy Matrix in Romania

Condrea Elena

„Ovidius” University of Constanta, Faculty of Economic Sciences

elenacondrea2003@yahoo.com

Abstract

According to financial analyzes conducted by the facilitated institutions, tax evasion is the main component of the underground economy matrix and one of the major crimes which generates "dirty money".

The assessment of tax evasion is quite difficult. We may, in fact, talk about estimating the discovered or identified tax evasion (either as a share of GDP or as a share of tax revenues of the Consolidated national public budget - BGC); actually, the registered tax evasion is much higher.

In this paper we have tried to highlight some of the causes and factors that determine and influence both tax evasion and some particularities of the registered Romanian tax evasion. Moreover, we presented the values determined for tax evasion identified during 2000-2010.

Quality, long time considered like a mean, especially an industrial one, changed.

Key words: tax evasion, fiscal fraud, underground economy

J.E.L. classification: E26, E62, M40, M41

1. Introduction

The tax evasion and fiscal fraud phenomena are widely spread across the world, in countries with a high level of poverty as well as developing countries or the world's great economic powers.

The tax evasion phenomenon has always been condemned, without having its perspectives changed by social arrangements; it will permanently be in the sights of the world's governments, as long as they are unable to find a means of eradicating it.

It can be said that tax evasion is an important means of underground economy's manifestation on a global level and, of course, in Romania.

In conformity with the *Romanian Explanatory Dictionary*, **tax evasion** is defined as being a **withdrawal from fiscal obligations**.

The Law 87/1994, **tax evasion** is defined as being the *total or partial withdrawal, by any means possible, from the payment of taxes and other sums owed to the state budget, local budgets, state social insurance budget and special extra budgetary funds, by the physical or juridical persons, Romanian or foreign, named taxpayers*.

Throughout time many other tax evasion definitions have been formulated; by synthesis, we can say that tax evasion consists of the taxpayers' total or partial withdrawal by any means possible, from the payment of taxes and/or any other sums owed to the general consolidated budget [Iacob 2008].

2. Tax evasion manifestation forms

Based on the field of activity and specific legislation, tax evasion can have different shapes, manifesting itself in a much stronger and more offensive manner in the fields where taxes are high (in these fields, by avoiding the payment of fiscal obligations, very large profits are achieved and the competition, created by the economic agents who respect the acting laws, is eliminated).

The most common means of classifying the tax evasion's manifestation forms refer to *licit tax evasion* (also known as *tolerated* or *intra-legem*) and *illicit tax evasion* (also known as *extra-legem* or *fiscal fraud*) [Pătroi, 2007].

Licit tax evasion is not conceptually defined by the normative referential, although the term is accepted by the fiscal

practice, being based on “intra-*legem*” operational procedures, which escape, from a legislative point of view, the sanction regime’s statements.

Legal/licit tax evasion should be considered as being that tax evasion which succeeds in avoiding the payment of budgetary obligations (partially or totally), by exploiting certain law “gateways”; that tax evasion which does not aim towards damaging the state’s financial interests, but towards the potency of such damage [Dinga, 2008].

The licit tax evasion is assimilated by some economists as being a form of duality of the official economy [Pătroi, 2007], which manifests itself especially when the regulation policies promoted by the public authority are not properly structured.

Among the tax evasion’s manifestation forms we can recall [Pătroi, 2007]:

- Most expenses, which can be fiscally deducted through the recording of expenses which were never real, but, which are based of justifying documents obtained by legal means, properly written and correct from an accounting point of view, as well as from the field’s legal regulations’ point of view.

- The use, in international economic transactions, of intermediate purchase/selling prices for the transfer of the taxable base towards a more malleable fiscal jurisdiction (usually, through the off-shore societies, which are situated in fiscal paradises).

- The fiscal deductibility of the interests granted based on a “loan” contract made between the commercial society and a physical person (associates or shareholders, depending on the organizing manner chosen in the moment of constitution).

- The “compensation” of the advanced payments granted throughout the year with the dividends distributed after the financial exercise’s finalization, based on certain, permanent financial situations.

- The unjustified increase of expenses regarding the merchandise which has left the management through the incorrect repartition of their price differences (the incorrect calculation of the “K coefficient” regarding the management unloading).

- The accounting recording within the exploitation expenses of expenses regarding effectuated investments;

- The ignoring of the whole patrimony’s stockpiling results;

- The lack of recording and disclosure of the accounting evidence of the cashed in advance payments’ collected VAT;

- Failure to record and failure to register as a tax deductible expense, the VAT on goods or tangible nature of inventory recorded as missing or damaged, attributable, for which insurance contracts were concluded in accordance with the provisions of Tax Code.

The illicit/illegal tax evasion [Dinga, 2008] is the result of any fiscal norm breaking, capable of bringing prejudices to the state’s financial interests. In the opinion of some authors, it is the only species of tax evasion (because it takes place through the breaking of fiscal laws). Starting from those presented, it can be said that the *illegal tax evasion* phrase represents a pleonasm, the tax evasion being illegal by definition.

Another means of classifying tax evasion refers to *anomic tax evasion* and *subsistence tax evasion* [Pătroi, 2007].

The *anomic tax evasion* is based on the conscious motivation of the taxpayer for “non-action”, being stimulated by the nonexistence of the normative frame, not by its imperfection; despite the fact that it does not generate additional material expenses, it can determine unbalances through the taxpayers’ deviationist desires’ prism.

The Romanian does not explicitly recognize this form of tax evasion manifestation, although it does not deny prioritizing some fiscal regulations with the purpose of discouraging certain taxpayer actions and activities.

The *subsistence tax evasion* is structured on the methods and means of avoiding the fiscal tasks by the taxpayers, through the avoiding of certain normative passages, thus, practically, denying the taxable act.

3. The causes and factors which have led to the apparition and development of the tax evasion

Among the causes that may lead to an escapist type behavior, we find [Dinga, 2008]:

♣ Fiscal pressure - an appreciation of how the tax evasion varies as a result of fiscal pressure can be done with the Laffer curve (Laffer model), which models the dynamics of tax revenues of the state budget according to the average fiscal pressure in the economy (it may be considered that as tax revenues decrease, tax evasion extends).

♣ The weakness of tax administration - has the effect of diminishing the degree of budgetary obligations collecting, whether objective or subjective (may be the effect of tax corruption or its logistical or professional incapacity).

♣ Fiscal facilities / moral hazard - fiscal facilities have the effect of reducing the tax burden either through exemptions or budget debt cancellations or by providing other forms of fiscal support; moral hazard occurs as a result of the existence or promise of tax incentives. The granting of tax incentives produces harm to the financial interests of the state by the state itself (and therefore the tax evasion produced in this case is a special tax evasion - the granting of tax incentives by itself does not generate tax evasion on the taxpayers' level, even though it creates damage to the state budget).

♣ Contagion / imitation - the force of the contagion within the generation and expansion of the tax evasion phenomenon is especially consistent, as it depends on institutional and cultural factors. It may be noted that the strength of the tax administration and contagion's force are inversely proportional in the process of generating the overall tax evasion (a state with a strong economic policy may lead to the weakening of the escapist contagion).

Following the analysis of the tax evasion's aforementioned causes, experts in the field have concluded that between these causes there are certain interconditioning relations, namely:

• Increasing the fiscal pressure can lead to the necessity of giving new tax breaks to stop the Laffer curve effect, leading to increased moral hazard;

• Increased tax administration weakness can attract increasing of the fiscal pressure to counteract the lower tax revenues;

• The weaker the fiscal administration, the wider the contagion.

Tax evasion, in its many forms, is a complex, multidimensional and multicausal problem; thus we can classify the main favouring factors of tax evasion in the following categories:

• Legislative, administrative and political factors

○ The legislation that is evasive, contradictory, often with many gaps and that has not adapted to the current economical-social realities;

○ The lack of a strategy to counteract the tax evasion phenomenon;

○ The vulnerability and corruption of the control organs;

○ The political interests to protect certain profitable economical fields;

○ The lack of protection for the internal market through the signing of treaties and conventions through which the customs and import incentives are accepted, thus injuring the Romanian products;

○ The absence of a strategy for the creation of a fiscal system which has adapted to a supposedly competitive and stable market economy.

• Economical factors

○ an excessive taxation - in Romania there are recorded over 550 taxes which, although insignificant in terms of contribution to the state budget, still generate some additional administrative costs, contributing to increased bureaucracy and distress to the taxpayer;

○ an excessive rescheduling of obligations to the state;

○ The lack of a stimulating economic framework for entrepreneurs;

○ a defective regulation of the main indirect taxes (VAT, excise duties);

○ The putting in practice of flawed economic programs focused on privatization, restructuring of the economy (mining, chemical and petrochemical industry, etc.).

• Psycho-social factors

○ the social insecurity generated by the extent of poverty and the decrease in living standards, coupled with rising unemployment;

- corruption, trading in influence;
- religion (there are religions, sects who commit crimes such evasion, human trafficking, drug trafficking, money laundering through donations, grants, investment funds etc.)...

4. The tax evasion’s particularities in post-Decembrist Romania

According to reports drawn up by the Financial Guard as a result of the carried out investigations it has been deduced that the main areas of tax evasion manifestation are the food industry (the largest share of milling and bakery sector has), respectively trade and intra-Community transactions.

One of the main factors favouring tax evasion in the food industry is the high level of VAT on commodities, given that in most EU countries it does not exceed 5% (which discourages speculation and the black market, the sums of money obtained being too small and too much risk).

Entrepreneurs of the baking industry believe that the actual bread market is estimated at over one billion Euros (under normal household consumer demand), but the taxed market is about 250 million Euros, which means that other products are sold without the issuing of tax documents, the entire profit returning to the producers and respectively the traders by avoiding the payment of various taxes.

According to statistics, the most common manifestation of tax evasion is found in intra-Community acquisitions, especially in the trading of: vegetables, fruits and cereals, meat and meat products, construction materials, especially cement and sanitary products for individual buildings; nonexcisable energy products (these products are preferred rather than the Romanian ones due to the difficulty in identifying the suppliers, the collecting of the value of goods is usually done with cash on delivery or in a relatively small period of time).

Along with the EU membership, transactions carried out with partners from EU countries are made with the reverse charging of the VAT; thus, many illicit economic agents exploit this European feature and escape from VAT in various ways, such as: avoidance of VAT, short-term

use of phantom companies (3 months), the use of offshore companies.

Other identified methods of committing tax fraud in intra-Community transactions are:

- The exploitation of the lack of European standardization documents accompanying the transport of goods supplementing them with , by deliberately designed to prevent omissions or errors the identifying of beneficiaries;

- Signing the documents accompanying purchases of some fictitious beneficiaries.

In the field of import, production and marketing of petroleum products, increased tax evasion occurs because it is a "rich market", absolutely every field of activity is related to oil (the Romanian fuel market ranges at about \$ 4 billion annually).

The main methods used for avoiding the payment of tax in this sector of the economy are:

- Substitution of gasoline / diesel normal with various substitutes (ex. airplane gasoline, heating fuel), products that are not subject to excises; these products are initially sold to phantom companies in order to finally reach the real company, the "clean" one which sells them, in turn, to the PECO type filling stations (this circuit aims the transformation of nonexcisable products into excisable goods, payment of these tax obligations actually returning to the ghost companies, leading to tax evasion);

- Preparation of production reports with falsified data, designed to support or to cover up fraudulent operations;

- Use common tax documents in order to circumvent the auto fuel supplies' monitoring, taking into account that such transactions are checked by the tax authorities primarily through the inventorying of special tax bills issued in this sense;

- Fictional Export (on export, fuel do not bear taxes). Apparently, the goods leave the country; in reality, only the trade documents cross the border and the fuels enter the market at lower prices (they are free of charge);

- Imports of oil products in order to be processed and then sold for export (so the finished product is not excised, as it is exported). It was found that the obtained

finished products (gasoline, diesel) remain in the country, where they are sold by the trader.

Other evasion methods which are quite common in this sector are:

- the compensation method;
- the method of transferring shares;
- the method of avoiding fictitious operations.

According to studies conducted by a group of teachers from ASE Bucharest [6] based on data collected from institutions of financial control (Ministry of Finance, NAFA, the Financial Guard and National Customs Authority, the Court of Auditors, the National Anticorruption Direction, National Institute of Statistics), using a simplified model of calculation (estimates based on models used by the INS and by Professor Friedrich Schneider) the following values of identified tax evasion were obtained:

1. GDP Share of identified tax evasion

	2000	2001	2002	2003
GDP Share of identified tax evasion	0,4	0,5	1,45	1,8

	2004	2005	2006	2007
GDP Share of identified tax evasion	1,71	1,76	1,77	2,80

	2008	2009	2010
GDP Share of identified tax evasion	2,30	2,87	2,34

2. Identified tax evasion Share of the BGC income

	2000	2001	2002	2003
identified tax evasion Share of the BGC income	1,32	1,75	5,16	6,51

	2004	2005	2006	2007
identified tax evasion Share of the BGC income	6,26	6,33	6,19	9,66

	2008	2009	2010
identified tax evasion Share of the BGC income	9,82	10,07	8,36

5. Conclusions

According to financial analyzes conducted by the facilitated institutions, tax evasion is the main component of the underground economy matrix and one of the major crimes which generates "dirty money".

One can say that the tax burden registered in our country is very high, but, however, the degree of budgetary revenue collection is one of the lowest in the European Union.

Excessive taxation in Romania increases the tax evasion; more and more companies passing from the transparent business environment to the underground economy.

The effects of tax evasion are directly felt on the level of public financial resources, leading to distortions in the market's competition mechanism and can contribute to the creation of social inequities.

The lack of strong actions by public authorities to punish and deter escapist practices will lead to distrusting of state institutions and loss of public confidence in the effectiveness and the determination of the fight against this phenomenon.

Natural Non-Renewable Resources in Economic Theory

Constantin Alexandra Mihaela
“Alexandru Ioan Cuza” University of Iasi,
Faculty of Economics and Business Administration
alexandra_c88@yahoo.com

Abstract

Non-renewable resources can doubtlessly be regarded as the backbone of our modern society. However, most of economists have ignored the impact of non-renewable resources on the environment by dissociating the economy from the ecological network it is fundamentally linked to. The aim of this paper is, therefore, to highlight a literature overview of the most important opinions regarding non-renewable natural resources.

Key words: renewable/non-renewable resources, technical and scientific progress, market mechanism.

J.E.L. classifications: Q01, Q32.

1. Introduction

Natural resources have always played an important role in the development of society, but for a long time economists understood and assimilated their importance only from the perspective of the revenues they could provide. Nonetheless, the ecological crisis that mankind is currently faced with, together with the energy crisis and the raw materials crisis in the 70s, has led to increased awareness from the economists regarding the danger of irrational exploitation of natural resources.

By their nature, natural resources are renewable through natural or artificial processes (solar and wind power, tidal power and that of agricultural fields and forests), while others are non-renewable (ores and fossil fuels). Although for the time being geological exploitations are able to replenish the stocks for a given resource, in time we may not be able to enjoy such generosity from our environment. Thus, because of the problematic present situation and the

uncertain future, many „sensitive” questions were raised regarding the universe of natural resources [1]:

- for how long and under what conditions can life go on on Earth with diminishing resources, with a population that consumes too much and limited natural resources?
- another major problem refers to the location (accessibility of exploitation) of the known stocks. The oil stocks are huge and new oil fields are discovered every year, but these resources are not located in the main oil-consuming countries in the Western hemisphere;
- another problem refers to our increasing dependence on resource stocks that are getting more and more low quality. In other words, the quality of the stocks of ore and fossil fuels used today is way below that of the stocks exploited in the past;
- or the role given to the market mechanism in determining the way resources are managed in the future, and this because throughout the years the market played an important role in determining the degree of exploitation and the rates of consumption.

2. Different opinions on non-renewable resources

Non-renewable resources can doubtlessly be regarded as the backbone of our modern society, only that in the time of the early economists, there was no concern over the deficit of natural resources, which was directly reflected in the planning of the economies.

Classical British economists. According to Adam Smith, in „The Wealth of Nations”, the “impersonal” market mechanism will look after society best, “if allowed to function unhindered, so that the laws of evolution lead society to its promised reward”. Therefore, the “invisible hand”

regulates, with the help of competition, real prices and allocates thus the resources and ensures the distribution of production factors.

Unlike his successors - Thomas Malthus and David Ricardo - Adam Smith was not overly preoccupied with the effects of the consumption of natural resources as a limit to the wealth of nations. His main message being that wealth could increase indefinitely due to the division of labour and the accumulation of capital, which are regulated by the „invisible hand” of the market and free commerce and fueled by specific interests. However, this "bright optimism" [2] was toned down by future considerations regarding the provision of foods and the increase of population.

In 1798, Thomas Malthus, leading representative of classical liberalism, adopting a different point of view regarding the analysis of the economical and social reality of the time, published the work „An essay on the principle of population”, which produced a real shock to those who held optimistic views on the future. Malthus was the first „apocalyptic voice” [3], who noticed the limitations of our world, represented at that time by the ability of the arable land to feed an ever growing population, honestly believing that humanity will eventually reach a low point in its existence from which it will not be possible to escape. What intrigues the mind is that, despite the controversial ideas, currently, Malthus is seen as „the most accurate thinker of the 21st century” [4] if we are to look at the rate the population increases in China and India.

A contemporary of Malthus, David Ricardo, also had a pessimistic view on natural resources, believing that a balanced state between natural resources and the tendencies of the environment cannot last for too long [4]. In his model, Ricardo looks at economic growth as directly linked to the scarcity of natural resources, outlining in a precise manner the tendency of economic growth which will decrease with the reduction of the availability of fertile (rich) fields.

Looking at the times highlighted by the 18th century, we notice that other classical economists were not so pessimistic. For example, John Stuart Mill (1862) emphasised the fact that, while the limited amounts of

natural resources could be a hindrance in the way of increased productivity, this limitation has not yet been reached, and will not be reached by a country for a considerable time to come. Mill based his theory on the future development in the field of agriculture and on the fact that the social institutions and the increase of economic welfare could slow down the increase of population. An interesting characteristic of the thinking of John Stuart Mill is the argument according to which the quality of the environment is an important aspect of economic welfare. According to Mill, a world in which the environment is used only for industrial and agricultural purposes is not an ideal world.

These pessimistic or realistic opinions prevailed in the thinking of 19th century economists, albeit not without heated debate, until in time many of them were regarded as outdated, as the economic environment moved towards different values and tendencies.

The studies of Hotelling (1931) and Barnett & Morse (1963). Partly as a reaction to the Conservation movement – according to which economic growth has clear physical limitations, which cannot be avoided through technological progress - economist Harold Hotelling published a study called „The Economics of Exhaustible Resources”, in 1931. In this study he built a theoretical model which targeted the maximisation of social welfare, by examining the possibilities of optimal extraction of non-renewable resources. Hence the conclusion – of belief in an everlasting exponential growth – widely accepted among economists, is rather problematic, as competition and the economic market will always lead to a maximisation of revenues on the short run and the quick exhaustion of non-renewable resources.

Thirty years later, there were empirical data available to study the problem of the deficit of natural resources. Thus, two economists from the USA- Harold J. Barnett and Chandler Morse, in the study „Scarcity and Growth” (1963), studied the implications of the scarcity of natural resources on the extraction costs, as well as on the prices on the global market of natural resources, by first looking at the period between 1870 and 1957, and then drafting an extensive analysis for another 13 years. Their purpose was to

test the hypothesis according to which the increase of the deficit of non-renewable resources has real support.

In general, the authors strongly question many of the basic premises of the conservation movement, as well as the pessimistic point of view of Malthus.

Upholding the same comforting ideas such as those of Barnett&Morse are the studies done by N. Potter and F.T. Christy (1962), W.D. Nordhaus and J. Tobin (1972), whose results stated that *natural resources will not become a severe hindrance in the way of economic growth*. However, there were still questions among the specialists of the time which referred to the neofactors of production, such as the technological developments, the substitution technologies, studying their positive influence on the offer of resources.

Many researchers, as well as governmental officials, were concerned about drafting the estimates of resource stocks on data that was as reliable as possible. Thus, a realistic estimation should include not only known stocks, but also a „probable estimation” of the quantities that are not fully known at present but will probably be discovered in the future [4]. Some analysts, such as J. Zwatendyk (1972), thought that we will never run out of natural resources, because the stocks are much greater than the known technological and economical limitations.

The report „Limits to Growth” for The Club of Rome. For many analysts, The Club of Rome is seen as neo-malthusian in its views, because of the conclusions launched in its first report „Limits to growth” (1972), presenting the warning signals that the world was becoming ever more poor in the resources that are necessary to support our lifestyle. The study presented a new model, whose purpose was to anticipate the evolution of the following five global variables: population, agricultural production, non-renewable natural resources, industrial production and pollution. The predictions of the study were extremely pessimistic: the future level of world population, of agricultural production and industry will grow exponentially at first, and during the next century will collapse. The collapse will follow because the economic world will reach its physical limits regarding the use of non-renewable resources,

agricultural production and excessive pollution. Likewise, the study predicted the depletion of eleven vital ores before the end of the 20th century, among which there were copper, mercury, natural gas, oil, tin and zinc. Under these circumstances, the authors suggested promoting deliberate restrictions on the processes of demographic and economic growth, and thus achieving a gradual and slow transition from growth to complete balance [4].

However, these scenarios did not come true, and many researchers around the world criticised them. The main academical criticism came from the economists, who claimed that the study did not take into consideration the mechanism of prices, and from the scientists, who pointed out that they had neglected the ability of science and technology to solve the problems of the world.

With regard to the problem of the depletion of non-renewable resources, the Report of the Club of Rome played an essential role in generating a vigorous debate regarding the availability of these resources in the future, debate that is still valid today.

Economic researches on „durability”. One year after the publication of the report „Limits to Growth”, the price of oil almost tripled in a very short period of time, which led to the first energy crisis. Few people questioned the vision according to which the future of the world is that in which the deficit of energy and of natural resources is increasing. Maybe the most known work at the time was the model of non-renewable resources and of economic growth suggested by Dasgupta Partha and Greffrey Heal [5]. These economists were wondering whether an economy can maintain a positive level of consumption for an indefinite period of time in the absence of technological development, and in which the production of goods is possible only by using the limited non-renewable resources such as oil. This thing clearly reflects a matter of durability. According to their annalysis, maintaining a positive level of consumption indefinitely is possible only if the capital can be replaced by non-renewable resources without technical difficulties. If the substitution possibilities are limited, the future consumption per capita should eventually decrease to zero. Many environmental economists (eco-economists)

believe that only the second case fits the laws of physics. In this respect, it is considered that not even permanent technical innovation (which does not violate the laws of physics) couldn't change this pessimistic scenario [6].

From the study of Dasgupta and Heal, as well as other similar studies regarding the scarcity of natural resources - R.M. Solow (1974) [7], J. E. Stiglitz (1974) [8], the research in this field has evolved in several directions. One direction of research seriously considered the possibility that the market economies might not lead to durable results, even if this thing were technologically possible. Another direction of research includes renewable resources such as solar and wind power in models of long-term economic growth. This is meant to change the above-mentioned pessimistic result. At the beginning the economy uses its non-renewable resources and simultaneously invests in some revolutionary technologies which lower the costs of using renewable energy [9]. Thus, non-renewable resources are used up to a point, after which there is a transition to using renewable sources of energy.

A third direction of research continues to study the deficit of natural resources in a pragmatic way. Now that the first and second energy crisis have ended, it has become clear that they weren't dealing with the long-term deficit of natural resources. When the oil prices went up, the companies were willing to take the risk of exploring new regions. Thus, new deposits were found in the North Sea, Mexico and Venezuela.

It thus appears that the efficiency of the market mechanism is one of the reasons why non-renewable resources were not completely depleted, to this being added the opinion of many geologists who believe that the physical exhaustion of the resources is impossible, as long as the decrease of the availability of resources will always trigger their substitution.

3. Conclusions

In conclusion, the points of view regarding the problem of non-renewable natural resources can be divided into two categories: *a pessimist* one, according to which the stocks of resources are finite, and the future is somber; and *an optimistic one* which is

confident in the unlimited abilities of the human being to always find new solutions, in which the great „thinkers” are the product of the schools and the environment they were raised in.

In an era of extremes, we believe that the middle way is the best way and at the same time the most feasible way to deal with such a problem. Thus, the rational use of natural resources is the main way to efficiently increase production, which can be obtained by decreasing the production factors in the process of extracting and processing them. In this respect, *technological and economical progress (the informational resource) and the use of the human potential (the only plentiful resource)* become the main instruments in solving the contradictions between the increasing demand for resources and the limited possibilities offered by the environment.

Economic Growth under the Impact of the Depletion of Non-Renewable Resources

Constantin Alexandra Mihaela

alexandra_c88@yahoo.com

Abstract

In recent years, the events which have unfolded on a local or global level have affected us with an ever-growing frequency. A new vision on economic growth is needed, which raises the problem of ending the “career” of the model used so far to produce obsessively, wasting the limited resources, putting a strain not only on the link between needs and resources, but also on life itself, both for today’s generation and for the future ones. In this context, this paper wishes to highlight the effects of the growth that brings poverty, as well as those of the relationship between growth and non-renewable resources.

Key words: economic growth/decline, depletion of non-renewable resources.

J.E.L. classifications: Q01, Q32, Q41.

1. Introduction

“The current crisis that dominates mankind is due to the addiction to the industrial comfort presented as being the conquest people are very proud of”[1]. It is thus necessary to wake from the dogmatic slumber of the economists who upheld unlimited growth. The roots of the phenomenon can be traced back three centuries, when A. Smith (1776) wrote: “Progress is, in reality, a good thing, even the best and most important for all the different orders in society. Stagnation is interesting; it is a melancholy in decline”. And thus this opinion became an economic rule, economic growth becoming “the great objective of the whole economic policy”.

The crisis of the limited resources, although acutely felt after the embargo on oil during 1973-1974, did not receive anything from the economic community except ignorance, the economic effect of the deficit of resources being rejected. Perhaps only a sociological analysis could explain why, as the energy crisis worsened over the years, the standard economists continued to claim that there are absolutely no reasons for concern. Such statements follow two directions: one which considered that “come what may, we will find a way to keep growing” just as it has always happened; and a second position, highly popularized by the theorists of standard economy, according to which the market mechanism can solve any ecological crisis. Through the market prices, the deficient resources would always be protected from becoming exhausted, and “the resources are measured in economic, not physical terms”. Natural resources are no different from other commodities, maintained Solow and Stiglitz. Therefore, if resources become less and less available, there will appear other factors to substitute them [2].

We thus have the paradoxical tendency of economists to arbitrarily freeze the economy in its current institutional structure, instead of regarding it as a system that is continually changing and evolving, connected to the change in the ecological and social systems it is part of.

If we take into account the whole world, it becomes evident that an increase in population and human savings has led to an ever-increasing level of consumption of natural resources in order to support the ever-growing standard of production and consumption (the first law of thermodynamics).

Nonetheless, apart from the growing ecological limitations, there are indications that the era of growth, as it has been understood so far, is coming to an end. The way in which economic growth was approached led to increased inequality, both on a global level and on the domestic markets, for most nations.

2. Economic growth and the depletion of the non-renewable resources

The attitude of the economy of human society has always been to develop its own mechanism to adapt to the permanent conditions of limitation, waste and uncertainty imposed by the environment, in order to support a real growth at the level of the production of goods and services.

From economic growth to economic decline. A retrospective analysis highlights two types of economic growth: one that enriches development and fulfills human individual and collective development, also maintaining the ecological balance; and another one which moves away from development and diminishes welfare.

The growth that brings poverty is actually the growth that wastes the limited economic resources, irrationally polarising the boundaries of production possibilities [3].

By concentrating our efforts to identify the causes we can more easily understand and control the uncertainty of the factors outlying our actions. Thus, for a long time the theory and practice of economic growth and development have subordinated the environment to the human society, neglecting the conditions for life in the natural environment to regenerate itself. Among the essential causes of the current natural-human crisis we can identify *the evolution in the wrong lane* of human society, due to the lack of awareness from the individual, who, by satisfying the needs for a normal life, has led to an increased „debt” towards the other forms of non-human life.

An analysis of the economic and social activity on a global scale points out the fact that the theories of economic growth have not brought about a balanced evolution on the whole, consciously transforming some into developed and others into undeveloped (as if the development of some cannot happen unless other fall into poverty). We

understand therefore that the purpose of humanity has not been stability and preservation, but evolution and expansion at all cost, in all possible meanings and directions.

In this respect, specialist studies identify on the one hand, up to the present moment, countries whose population is less than 1/3 of the total world population, that have recorded economic growth and the improvement of the quality of life of individuals on the whole; and on the other hand countries whose population is over 2/3 of the total population in which no economic growth was registered and, as a result, the individual and collective welfare of this area declined.

Both the growth that brought wealth and the one that brought poverty co-exist on the scale of the world demographic system, producing negative results from the social, human, ecological, military and behavioral points of view [3].

Based on the above-mentioned things, we identify as natural the orientation towards economic decrease as a natural expression of the increased responsibility towards the limited natural environment. The decrease must not be seen as a ceasing of evolution, but as a more efficient use of natural resources, especially the non-renewable ones.

For this to happen, we need to understand what inefficient use of the natural resources means, under what circumstances the world economy, which is under the rule of limiting its means, foolishly wastes the most precious things for human development and welfare. The major forms of inefficient use of the limited natural resources are as follows [3]:

- their use where they are not needed, with two consequences: useless things are produced, and, at the same time, there are needs which are not met in certain fields of life;
- their use to produce utilities for necessities, but with great consumption in relation to the dominant (top) technology of that time;
- the use of resources to produce military goods, which should not even be used, because they threaten life on a global scale;
- not using existing resources to produce goods that are useful for the society which, for various reasons, lie in the natural environment (unused agricultural

land, water that is not used for fishing, to produce energy etc.);

- waste of limited natural resources also occurs when their attraction in the circuit of economic life is done at a faster pace than it is possible for them to be regenerated, with a negative effect on the future generations;
- another form of wasting the limited resources is the partial or total lack of processes to reintroduce all the waste from the production processes in the economic and social circuit.

The industrial revolution, which has passed, the informational revolution, in which we are now, as well as questioning the whole pattern of evolution we have been through so far, together with the emergence of a need for a new economic direction, are the direct expression of the consequences of wasting limited natural resources. The fight against waste in its various versions, has always led to technological revolutions, which have always led humanity to a different level, but, unfortunately, their vision has always been incomplete, based on the principle „gain-loss” and not on that of „gain-gain” that is needed for a harmonious development both of the human society and of the limited natural environment.

The decline which preceded the fall of human economy is, in fact, the final expression of the collapse of the growth which brings poverty and wastes its vital resources [3].

Relationship between economic growth – non-renewable resources. The relationship between economic growth and the increasing consumption of energy has been under a lot of scrutiny, because in its way to development, modern society remains dependent on ensuring energy resources. If we want to know what the position of a great power will be in the future, we should look at its present-day energy resources.

The relationship between the consumption of energy and economic growth remains well defined in specialised documents, the only controversy being that of the causal direction of this relationship: whether economic growth leads to the consumption of energy, or the consumption of energy is the engine of economic growth. At the same time, there are significant political implications in this causal direction. Empirical attempts have

been made to establish the direction of the relationship between the consumption of energy and the economic activity in developing and developed countries. Nonetheless, the results are mixed. For example, if the relationship moves from the consumption of energy to economic growth, then the energy-conservation policies, whose aim is to reduce the consumption of energy, can have a negative impact on the growth of an economy.

The uneven distribution and exhaustible character of non-renewable resources, resources which remain for the time being *the engine of world economy* have led to an escalation of the „games” regarding them and have allowed the appearance of certain „monopolies” as regards the control of sources and routes, of markets and prices.

Now we can notice that the whole attention and strategic activity of political forums is aimed at attracting and increasing the resources of limited energy resources. Thus, the non-renewable resources have become instruments of political, economic and military pressure in order to obtain certain strategic advantages on the ever-increasingly dynamic and complex arena of international relations.

There used to be three classic importers of energy resources: the United States, Europe and Japan, which accustomed us to large consumption of resources, coupled with spectacular economic growth. Nowadays the growth „moved” elsewhere as well, more precisely in China, India, Brazil and the Gulf states, in what we call emerging markets. „Between 2000 and 2007, the world demand for oil grew by about 9,4 million barrels. Almost 80% of this growth took place in the emergent markets” [4]. On the whole, the rise of these states will continue, and so will the need of developing countries, access to resources in general becoming a vital problem [5].

Each great power has linked its existence and rise to a specific resource which ensured its independence and power in relation to other countries or powers. For example, Europe has based its power on coal, a plentiful resource on the old continent. When the transition was made to a different source of energy – oil – Europe became dependent on that particular resource of which it only had limited amounts. And the power that

emerged across the ocean – the USA – had plenty of oil [5]. There followed decades of exceptional economic growth ending with the threatening present situation of limited resources.

According to the statistics of British Petroleum (2011), the states that have the richest stocks of non-renewable resources are not the biggest consumers, but they are the main producers. Thus, countries in the Middle East have the richest stocks of *oil*, followed by Venezuela and the Russian Federation. Rich stocks of *natural gas* can be found in the Russian Federation, the Middle East countries and the USA. As regards the resources of *coal*, the USA is in top position, followed by the Russian Federation and China.

Generally speaking, the states that consumed most resources used to be at the same time great producers, only in time a certain dependency was created of the developed world to the countries rich in resources. Thus, Europe and Japan illustrate the case of more profound dependency, because neither of them have significant energy resources in relation to their real needs. That is why, for example, their need for oil has gone up towards as much as 80% [6]. One exception is France, who ensures 80% of its energy needs from the powerplants that exist in this country [5].

On the whole, the energy map of Europe has certain unique features, but it is not very different from that of other important economic actors. However, the EU, due to the fact that it does not have rich energy resources, and its increased consumption has increased its dependency on imports, has set out to increase the percentage of energy produced from alternative sources.

Likewise, a concentration of the energy resources only in certain areas (the Middle East, the former Soviet Union) only complicates the broad energy map. The fundamental problem will remain the offer that is surpassed by demand, which will lead to a sort of economic suffocation of some states.

3. Conclusions

The research done so far shows the fact that non-renewable resources remain the engine of world economic growth, and the tendency of modern society to waste natural resources is, in fact, the price for every step ahead in the technological progress, reaced by discovering ways to use new types of accessible energy. Therefore, no great technological progress can have effects unless the innovation is followed by a great mineralogical expansion. In conclusion, we understand that „waste” seems to be a by-product of economical and social processes of our age, only that in order to progress more, society needs to overcome the perspective of linear progress and tend to focus on development without growth.

The global economic recession brings back into question problems that have been ignored by the economic community and the political forums, guided by a limited perspective that is detached from the universal context and which can only maintain its continuity and integrity by maintaining a constant balance. The global hysteria remains paradoxical, which is presented as insurmountable in order to justify the need for punishments recommended by international forums.

Perspectives on the Worldwide Oil Market

Constantin Liana – Laura

Faculty of Economics and Business Administration
lee_constantin@yahoo.com

Abstract

Oil is the main motor of the world's economy. Until the scientists will breakthrough new and competitive energy technologies, for the proxy future, it is mandatory identify new ways of balancing the superior increase of the demand, in correlation with the offer.

Key words: oil, market, global reality, Energy strategy.

J.E.L. classification: Q40

1. Facts in oil market

Even if there are active searches carried out in finding alternative sources of oil, an essential source hasn't been yet found. It is unlikely that in the first half of the recent century will be invented any new source of energy that can replace the existing ones. That means that oil, along with natural gas, will remain the basic elements in energy balance.

Long-term forecasts argue the possibility that the big companies will keep their positions in world oil market. Moreover, the increase of revenues and profits of oil companies will be influenced by a number of factors. Starting with nowadays situation, we have to describe the structural outline of this sector's development together with the problems that it may encounter in the years to come. These are:

- developing new and more efficient technologies of extraction and production of oil and gas, orientated towards the increase of efficiency in oil layers, a larger use of additional methods of extraction;

- establishing new worldwide oil extraction centres, especially in the Caspian region, North Sea region, Kazakhstan, constant development of energy consumption in the Asian region;

- an active research and implementation of energy saving technologies, intense competition between energy agents in order to dominate the energy balance of states, increasing the production and extraction volume, the role of natural gas;

- mass investments in developing scientific researches and structural experimental, creating new types of petrochemicals products;

- tightening the environmental requirements not only in the industrialized countries but also in the developing ones;

- using the latest technologies and information systems, establishing long-term business relationships between producers and consumers and in this way, achieving deeper expectations, stability and balance in the oil sector development;

- increasing the competition in all business oil sectors as a result of creating large and powerful structures in Asia, Eastern European states, Russia, the former USSR and other regions, increasing the general privatization of oil companies, increasing the number of small and medium independent oil companies;

- particularly, it should be emphasized the emergence of new approaches of the major oil companies in issuing the perspective strategies, this being conditioned by changes of form and method of entrepreneurial activity, including the following:

- reducing the control over the company's external environment under the influence of socio-political sources, the increase of state company's influence being in developing;

- transition to a new technological foundation, based on different kinds of voluminous scientific ways of changing the positions report of sectors in global economy;

- the system of relationships within the company, the corporate and cultural ethics, become difficult.

In this way, in the years and decades to come, all major oil companies will have to live a more severe competitive struggle for financial, human and material resources, not only among themselves, but especially a struggle for investment with the new companies from the major sectors of economy, the production of electronic equipment for providing telecommunication services, information and others.

2. Future perspectives

The global oil market should detent at the end of 2011, due to a comfortable level of surplus production capacity, the International Energy Agency (IEA) estimated. According to IEA, the surplus production capacities, followed carefully by the global markets because it provides a safety margin in case of a problem in an important producing country, it is likely to increase up to 4-6 million barrels per day in 2011, compared with 2010 levels.

Much of this increase will come from the investments recently announced by the Organization of Petroleum Exporting Countries (OPEC) with the purpose of increasing the production of oil and liquefied natural gas. IEA considers that the last seven years of increased rate of oil, have visibly affected the oil market. By the end of 2011 and 2012, the oil demand will increase compared to the oil offer, as a result of global economical recovery, after the global financial crisis in 2008.

Thus, IEA estimates that the global oil demand will increase by the end of 2011 up to 89, 13 million barrels per day and by the end of 2012 up to 90, 21 million barrels per day. It should also be added the increase of refining capacities that will be initiated in next period. Nowadays, the insufficient refining capacities are a reason that the markets are being afraid of possible insufficiencies in providing refined products. However, IEA warns that according to his estimates, the increase of states oil production not members of OPEC will be much slower than the demand, also repeating that massive investments and increasing the energy efficiency are needed in order to solve the problem.

Energy Reality

Constantin Liana – Laura
“Alexandru Ioan Cuza” University of Iasi,
Faculty of Economics and Business Administration
lee_constantin@yahoo.com

Abstract

Oil industry has always been affected by interdisciplinary factors that can change the trend of this market.

Main reality of this global resource is that the most powerful states don't have the largest share of oil resources. Thus, these are using the financial and political power, are struggling to gain the energy supremacy.

Even if it was one of the pioneer states in oil industry of XIX century, Romania has passed over a series of events which led her in an actual position of refiner and consumer on the oil, initially from the position of a player directly involved in the regional market share.

Key words: oil, influence factors, oil dependency, OPEC, OECD, Romania.

J.E.L. classification: Q40

1. Major factors of influence

The recent history of the oil market fluctuations allows identifying factors that have been and will be affecting for a long time.

The main oil-producing countries, economic growth and oil prices are closely correlated. In these countries, higher prices encourage increased imports, and this, along with population growth, increased consumption requires energy in the domestic sector. A higher domestic consumption means less available for export and therefore increase the price of oil offered external clients. If they are not willing to pay, the provider will waive delivery will reduce the price or will cause a crisis. Thus appears when demand causes a shortage of energy in oil-producing countries and, even during 2011, is expected

to decrease exports and a rebalancing of prices.

Second, there is interdependence between oil prices and diversity of derivatives required. The oil price increases, especially heavy on derivatives. When oil prices reach a certain level, derivatives producers are moving towards other raw materials and other products, abandoning dependence on oil. With global demand will increase as oil, it will decrease the demand from manufacturers derivatives, be willing to switch to other activities or to other technology solutions. On the other hand, there are countries that can ensure their own oil needs. The danger is that they are not important. Manufacturers develop their early cautious consumer sectors, to take, at least partially redundant consumption. Thus, producers are producers of oil derivatives and their market launches: petrochemicals, plastics, aluminum. They know the alternative industry to build faster than the speed with which former beneficiaries manage to put up their own sources. If successful, they decrease the supply of oil to export and behold, there again the shortage of oil; prices raise again and again thriving trade.

Thirdly, the oil trade is hit by a vicious circle between oil prices and dollar value. High prices in the U.S., generates financial deficits, which weaken the dollar. On the other hand, a weak dollar increases the value of oil, which immediately presses towards weakening the dollar and further price increase. Basically, a barrel of oil price increases and only uncontrolled market can stop by her laws.

Finally, the price is influenced by fiscal or monetary policies of consuming countries. To combat the impact of rising oil prices, consumers often adopt expansionary economic policy, reducing the interest rate

and increasing public spending. Policy also allows maintaining economic growth, even under high oil price. But in this case, there is unwanted vicious circle as a price support artificially high, indicates an even more exuberant.

The best alternative to monetary and fiscal expansion remains still the unwanted economical recession, only able to have a real impact and efficient on controlling the prices to increase indefinitely. Given the current crisis in the Middle East and hydrocarbon losses in Yemen and Libya, energy demand is growing, but it will not be achieved in the Middle East by increasing extraction in Saudi Arabia, which plans to keep constant the volume of exports, within OPEC. As a result, Middle will not have a significant impact on price growth.

2. Global oil reality

The global energy reality is as it follows: the most powerful states don't have the largest share of oil resources. Thus, these states, using the financial and political power, are struggling to gain the energy supremacy.

In this matter, the tactics used as a control method and deeper entrance in the oil zone, are:

- Owning the world's largest oil companies, in this way, refining and distributing the refined products towards the intern and international consumption.

- Another tactic is the political, military or financial sustainment by other countries that hold important oil resources.

These two approaches have a placid effect.

- There is also a third tactic, with invasive and destructive effects, as all forms of violent events: wars, terrorist attacks, conflicts, terrorism, etc. From afar, in terms of oil, the US clearly emerges as the major competitor in oil game, the effects of its actions being very profound.

The highest quality and oil reserves are in the Middles East, with a substantial number from areal, all members of OPEC. On the other hand, USA is on the top of OCDE. From this perspective, it may cross the barrier of the state individuality. So, the oil energy analysis, in order to see things as a whole, is based on the following assumptions:

- Global demand for oil is representative through OCDE, the organization that represents the interests of the most powerful states in the world. It is easy to understand that its actions or position effects on a global level. Any other state, which is not member of this organization, hopes to join in, as its interests are intensive represented at a regional level and at a global lever as well. The chance of a state that doesn't holds important reserves of oil, so that it could be in the “other side”, is to improve its national economy, so that it could get closer to the minimum standards approved by OCDE and by the economical rules. Thus, as the member states are more economical developed, the organization becomes stronger and its targets more powerful.

- The global oil offer which is represented through OPEC, and which holds states not so well developed. As I already specified, from the “barricade” demand it has been offered any kind of support to the one that offers, against benefits such as oil. On the other hand, at the level of global offer, all states that are not affiliated to any organization are divided and they have a customary presence on the oil market. The best example, is Russia which leans towards the interests of OPEC or remains solitary, regardless his position, it protects its own interests.

Gathering the global demand, consisting OECD and non-OECD with global offer OPEC and non-OPEC, leads to reference prices, also followed by creating the energy balance and profile markets. Specialized statistics have shown that no matter which would be the technological industrial progress or any other policies adopted and applied, the energy balance will always be tilted by the disproportion between the demand that exceeds the abundant oil offer, regardless of time taking in consideration or the analyzed quantity. The analysis of oil market is made in terms of the four groups, two of which have organizational representation and are in a constant interdependence with mutual effects.

Oil market has valences of fundamental vector of the current global economy and that can change at any time the direction of a national economy.

3. Case Study: Romania

Even if it was one of the pioneer states in oil industry of XIX century, Romania has passed over a series of events which led her in an actual position of refiner and consumer on the oil, initially from the position of a player directly involved in the regional market share. Thus, making a parallel with the global reality, the following aspects to be considered in his case, are:

- Romania had no partners or similar associates around its area in to support mutual interest in oil.

- It hasn't meet and it still doesn't meet the necessary conditions to be admitted in OPEC or OCDE.

- The only notable advantages held in oil industry were the refining capacities, which, after 1990 have been affected by the privatization process, so that the most of the profit margin being dispersed to other areas.

Currently, oil production in Romania is over exceeded by demand, the trend of dependence of extern oil resource being in ascendant trend. Assuming that Romania would have had the necessary support of maintaining state owned refinery and being able to apply extensive development and modernization programs, would have resulted another economical European position for the Romania's economy. However, giving the distinct reality from the assumption mentioned above, being that oil resources are exhausted and the dependence on imports is not a solution to sustainable economic development, Romania has to retrain towards other sources of energy.

A fair evaluation of the possibilities of covering energy needs in future has to be based on the current situation of the proven reserves, combined with realistic estimation of the potential resources in close relation with consumption forecasts determined by the final energy demand.

Table 1 – Romanian oil reserves exhaustion prediction

Graph representation of the database from the National Agency for Mineral Resources

It is concluded that the oil production in Romania will not increase from the utilization of national reserves. Coverage of energy demand increase will be possible by increasing the use of local sources of renewable energy and oil imports. The level of dependence will depend on discovering new exploitable internal sources, the degree of integration of renewable energy sources and the success of energy efficiency measures.

Table 2 – Romanian energy dependency evolution

Graph representation of the database from the National Agency for Mineral Resources

According to the statistics oil the national reserves oil reality, it is clearly seen that Romania has the case of reorient to other national potential energy sources.

Romanian Ministry of Industry and Resources embraces a strategy that is appropriate "integrated" oil industry through a systemic approach to activities and flows of all economic components (exploration, production, refining and petrochemicals, infrastructure and distribution).

The strategy was developed in accordance with the objectives and priorities of Government, with the National Strategy for Romania's economic development on medium term. The overall objective of the strategy is to ensure conditions of the energy sector to meet energy needs in the medium and long term, affordable, appropriate to a modern market economy and a civilized standard of living, in terms of quality, food safety, with respect principles of sustainable development.

Given the role of energy for society and for all economic sectors, the development of this sector is done under the supervision of the State, through the development and enforcement of a sector strategy and short term by implementing a strategic document related policies.

Strategy's role is to define the main directions of development of the energy system in Romania between 2011 - 2035, considering the economic, social and demographic development, the status in the electricity sector and correlation of the energy policy.

In a context of increasing globalization, Romania's energy policies changes and develop at national and European level. In this context Romania's energy policies must be correlated with similar documents at European level to ensure our country's policy convergence with EU policy in this area.

Energy Strategy will pursue the main objectives of the new energy policy - EU environmental, objectives assumed by Romania.

Abstract

The global economic crisis started in 2008 shook the global order we were used to in the last two decades and a crisis of such a span seriously tests the ability of each country to implement anti-crisis programs meant to provide an economic re-launch, and not all the countries can show the same efficiency in fighting against its effects and in implementing such programs that could restart the engines of the national economies.

The crisis expanded rapidly at global level, the national economies incurred difficulties of different degrees.

In conceiving of this paper we started with the idea that by emphasizing the situation of the credit institutions of Romania it can actually a real barometer of the actual state of our national economy. By this reason we did an analysis of the banking system performances that provide the sustainable development of the Romanian economy by the future.

Key words : macrostability indicators of Romania, financial policies, international financial crisis, International Monetary Fund, Romanian credit institutions.

J.E.L. classification: E00; E22; L10; L89.

1. Introduction

The expansionist monetary policies in the countries with developed economy generated global imbalances manifested by a substantial growth of the current account deficit in the U.S.A., simultaneously with the growth of the Asian countries over plus (especially in China), in the countries

exporting oil in the Middle East and in Russia where reserves were constituted, available for investments, including in financial tools that proved difficult to perceive by certain investors.

Despite these financial *imbalances*, the macroeconomic stability was kept; the economic growth and a reduced inflation were recorded in most developed states, thus encouraging a sub-evaluation of the risk and a relaxation of crediting conditions.

During the recent years, when the international financial crisis took effect in the economy of the most countries of the world, the countries have intensified the demands for obtaining the credit from the International Monetary Fund (IMF), as result of the financial crisis impact in the economy of these countries. The IMF financial assistance has as beneficiaries the Member States, which are faced with the balance of the payments difficulties and granted the right to buy the foreign currency with the national currency and the obligation to repurchase the national currency in a given time, at a higher price, the price difference is the operation cost.

Among the *microeconomic causes* of the current economic - financial crisis one can list: the deregulation of the financial institutions, the financial innovation and an easy offer of high ratings by the competent agencies.

For the European countries, the crisis was and continues to be an alarming signal, which severely hit the banks in the European countries in series of ways similar to the impact it had on the American banks.

Among these effects, its can list the following [1]:

- *asset loss*, due to the devaluation of the estates (especially residential estates);
- *major loss on the American supreme assets* (they represent, at the same time, one of the triggering causes for the current crisis);
- *allowed cash-flows*, the financing difficulty being a result of freezing the inter-banking global markets of money. Thus, many banks are forced to refinance each semester great parts of the accounting balance.

Particularizing at national level of the Romanian economy, the causes of the economic-financial crisis were:

- an unsustainable economic growth, based on internal and external economic - financial imbalances;
- transfer and external impact (banks, insurances);
- the volatility of the foreign capital;
- the exacerbation of the speculative character on the capital market (an inadequate relation between the primary and the secondary capital market);
- a loss of synchronism between the real and nominal economy (lack of correlation between profit, interest and economic growth);
- the real state sector expansion.

In 2009, the economic crisis increasing was made at a more strongly rate than expected, leading to a major contraction of the cash incomes. Starting from the collapse of credit, when the person indebted beyond the personal power, could not pay their loans, the crisis quickly spread to other sectors of the global economy with increased effects of the lower consumption and business confidence. Throughout the period of 2009, the IMF has mobilized all the resources towards covering the money needs of the Member States provided to adopt the suitable macroeconomic policies. Consequently, the IMF has adopted emergency some structural policies, applicable to both international and national level for the IMF member [2]:

- restoring the balance sheets of the affected financial sectors - refers to those actions taken to recapitalize banks and restore their balance sheets for the credit recovery in the economy, aiming to the economy revitalizing at the end; until

this to happen, the restoration attempts have been numerous;

- recognise the importance of the monetary policy - as a component of the domestic demand;
- transmission of the overall fiscal stimulus in 2009 and 2010 through the fiscal measures permission to exit from the crisis;
- substantial increasing of the international financial reserves to alleviate the pressure on the low-income country markets.

In April 2009, G20 members decided to triple the Fund capacity to lend up to \$ 750 billion, to double the resources for the underdeveloped countries and to expand the global liquidity with \$ 250 billion through an allocation of SDR. Consequently, during 2009 the IMF directives followed:

- the financial regulation and supervision to increase the regulation perimeter in order to avoid the new events that generate risks and imbalances. IMF does not want to establish its dominance, but to ensure that the adopted policies are respected. This oversight should extend to all sectors of activity; from the individual economies to the world markets (the commercial discipline must be recast). Also, the central banks should review its operating mode to increase the liquid reserves of the system;
- adaptation of the financial arrangements to prevent the Member States needs. IMF arrangements should be improved to a better suit to the circumstances of each country and to encourage states to approach the Fund in a manner close;
- improving the bilateral supervision focused on the cash flow to avoid the systemic risk in the economy and a better macroeconomic and financial integration of the work sector;
- improving of the international cooperation and multilateral surveillance.

IMF welcomes the oversight reforms proposed as the most important reforms to avoid the burden of the weak countries / underdeveloped with new restrictions and commitments. Also, optimizing the actions of the Member States in the policy adopted international cooperation plan is another field of action of the Fund. Like other affected

countries by crisis and Romania needed the resources of the Fund, and in May, 2009 the IMF Board approved a new stand-by agreement for 24 months, amounting to SDR 11.44 billion (12.95 billion euros). IMF welcomes the oversight reforms proposed as the most important reforms to avoid the burden of the weak countries / underdeveloped with new restrictions and commitments. Like other affected countries by crisis and Romania needed the resources of the Fund, and in May, 2009 the IMF Board approved a new stand-by agreement for 24 months, amounting to SDR 11.44 billion (12.95 billion euros) [2].

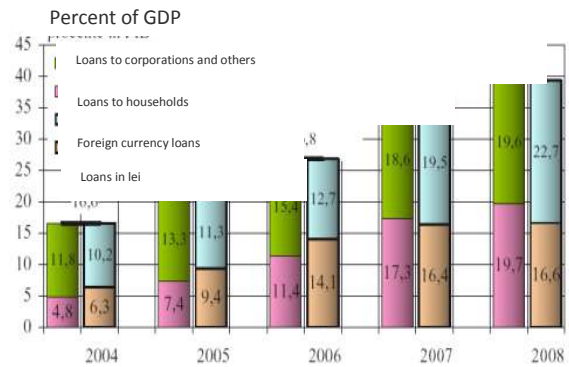

2. The Romanian capacity of economic and financial development during the international financial crisis

Average GDP growth in Romania, in the period 2003-2008, stood at over 6.1% per year, the foreign direct investment and the capital inflows are factors with the significant contribution to increase the consumption and investment.

The fiscal policy has played a strong procycle role and the budget deficit increase from less than 1% of GDP (2005) to almost 5% of GDP until 2008.

The credit rapid growth that fuelled this boom has produced a large exposure of Romania to the global financial difficulties and the volatility of the exchange rate. The foreign borrowing of the Romanian banking system led to a rapid increase of the domestic credit, which reached an annual average of 50% in the last four years. Over 50% of the domestic private loans were in the foreign currency and most belongs to the population or to the companies exposure at the risk, which generated an substantial indirect exposure of the banks to the currency risks, even if, in the bank balance sheets there weren't large disparities currency (graph.1).

Graphic 1. The credit structure of the private sector between 2004-2008 years

Source: Isărescu M., 2009, p. 34

The credit rapid growth that fuelled this boom has produced a large exposure of Romania to the global financial difficulties and the volatility of the exchange rate [3].

The foreign borrowing of the Romanian banking system led to a rapid increase of the domestic credit, which reached an annual average of 50% in the last four years. Over 50% of the domestic private loans were in the foreign currency and most belongs to the population or to the companies exposure at the risk, which generated an substantial indirect exposure of the banks to the currency risks, even if, in the bank balance sheets there weren't large disparities currency.

During 2004-2008 years, by the actions implemented of the central bank have resulted:

- increase the monetary policy rate (10.25%) and the minimum reserves required (18% for liabilities in the national currency and 40% for liabilities in the foreign currency);
- measures to limit the exposure of the population debt, especially in terms of the mortgage debt;
- strengthened the prudential regulations to limit the foreign currency lending to the households and to the companies exposed to the currency risk and tightened the restrictions on the public debt limit. All these measures have helped to a later braking of the household credit growth, however, the pressure induced by the expansionary fiscal policy and by the capital inflows could not pass the inflation target proposed by the National Bank of Romania for 2007 and 2008 (graph. 2).

Graphic 2. Inflation rate of Romania

Source: Annual Report of the National Bank of Romania, 2008, p. 24

The tax policies on the tax and income contributed to the overheating of the economy and supported its current vulnerabilities. The excessive growth of the expenditures, especially with the wages and pensions was the main problem and helped to supply the domestic demand growth [3].

The Romanian industrial production continued its downward trend in 2009 and the inflation remained relatively high.

The international country rating for Romania at the end of 2008 was reduced (to below the investment grade for the Fitch agency) with a margin greater than that of other countries in the region, reflecting the concerns of the international market for the sustainability of the Romania's current account large deficit, the uncertainties surrounding the prospects for the fiscal policy, the incomes policy and the financial health of banks with branches/subsidiaries in Romania. The impact has translated into significantly higher costs on the foreign loans contracted by the banks and the companies in Romania [3].

Although the banks are well capitalized into this crisis, the bad loans started to accumulate, especially, those granted in the foreign currency and the economic recession certainly deteriorated the quality of assets.

3. The effects of the current financial crisis the development of the credit institutions in Romania

The importance of the banking system in an economy is reflected in rendering efficient the process of capital mobilization and allocation, globally in the economy of a country, and in particular, purpose for which the banks must mobilize the internal

economies, allocate funds for the investments that would contribute to the structural changes in the economy and to the growth of productivity, to facilitate payments, thus as to be able to operate at low costs and to find more concrete correlations between efforts and effects, meaning between efficiency and effectiveness.

In the Romanian economy, the banking system remains one of the most profitable departments of the economy that tends towards development and towards challenges coming from the external environment. The transition to market economy imposed the development and implementation of a banking system similar to that of the European countries, one that could satisfy the demand of products and services in the economy. This process started from the current needs which imposed an **expansion of the banking network, thus reaching a number of 42 credit institutions nowadays**: 2 institutions have major or entirely state capital, 4 with major domestic private capital, 26 banks with major foreign private capital, 9 branches of the foreign banks and Creditcoop (see graph. 3).

Graphic 3. The Romanian banking components system by forms of property

Source: www.bnr.ro

Within 2009 - 2010 the banking market was marked by a moderation of the banking activity and a change of the banks orientation from a rapid expansion and quantitative objectives towards a mainly qualitative orientation regarding strategy, branches network, products portfolio/cost control. Among the 42 credit institutions in Romania, only RCB and DRB have a market rate of aprox. 37%, while the rest of the banks do

not exceed the limit of 9%. [3]

Keeping in mind the aspects I presented, we can state that the impact of the current crisis on the credit institutions in Romania is delivered through two different channels:

- **directly** by means of the transmission channel for shocks, measuring the changes of incomes realized by banks as a consequence of adversary conditions;
- **indirectly** by means of which one can approximate the possible reduction of their own funds as a consequence of expenses increase for provisions afferent to credit risk, within the context of accumulating a larger volume of unprofitable credits.

The Romanian banking system development and its entry on the Unique European market once with Romania’s adherence to the European Union, a market dominated by competition, imposed the implementation of the agreement Basel II, involving a series of measures both for the banking companies and for the NBR. The implementation of Basel II in Romania starting with 2007 provided the compatibility of the Romanian banking system with those of the other member states of the E.U., but it also produced significant mutations in the architecture of the Romanian banking sector (graph. 4)

Graphic 4. Aggregated Indicators regarding the credit institutions

Source: www.bnr.ro

The reduction of foreign branches isn’t exactly profitable because it reduces the competition in the banking system, with a possible impact on the rate of interest for credits, as banks can loan at a bigger rate of interest. At the same time, the reduction of foreign branches can have a profitable effect, because the credits in foreign currency granted by NBR will be reduced and its

monetary policy can be promoted on much more efficient segments.

The exposure to risk of the banking system can also be emphasized by the evolution of the main financial indicators and of banking prudence. The two indicators of banking prudence, that is ROE and ROA recorded a decrease, the biggest value recorded was in 2008, after which the profitability of the assets and of the capital was very low, reaching negative values at the end of 2010. This decrease occurred on the background of the NBR intervention rate of interest. The banks profitability was also blocked by the impossibility of extending the business segments.

The solvency rate recorded a slow growth from one year to another, the biggest value being recorded at the beginning of this year. This situation could point our attention to the fact that the banks were more careful in the crediting process, but the rate of unprofitable credits is still growing, currently recording the biggest value of the three years analyzed. The crediting activity is also decreasing, as Romania fights a high crediting risk at the level of the banking system, as a consequence of the difficulties that the Romanian economy encounters at present, such as: increase of unemployment, wage decrease, and more.

The rate of unprofitable credits is increasing continuously, reaching 12,71% in the first half of this year, fact which represents a reason for anxiety for the country’s financial stability. This increase of unprofitable credits is the cause of several aspects occurred in the economy in the last three years, such as: the deterioration of the customers’ economic-financial activity, as they can no longer fulfill the obligations of the crediting agreement; the bank’s incorrect assessment of the credit risk which led to the explosive increase of credits within 2006-2007; the increase in the number of dismissals; wage decrease; prices increase; a large number of credits without warranties.

The National Bank of Romania (NBR) makes efforts to reduce the exposure to risk of credit institutions by a prudential survey, but we must notice the fact that it cannot eliminate risk but only reduce it. To provide the necessary resources in the economy, the NBR acted in the following ways: the flexibility of crediting the household sector;

measures of improving the bank liquidity indicator as well as regulations in the matter of solvency.

3. Conclusions

The financial and economical crisis strongly affected Romania's real and financial sector. The real sector was strongly affected by the increase in the rate of unemployment, a decrease of interest for investments, of the population available incomes, of productivity and of international trade. But the issue of the financial sector occurred as a consequence of the action of some macroeconomic and microeconomic factors. Macro-economically speaking, a reduction of the degree of financial intermediation took place, with a strong impact on the stability and efficiency of the entire banking system and on the entire economy. At microeconomic level, the more and more acerb competition, as a consequence of having foreign banks, forced the NBR to take harsher measures in the matter of prudential regulation and survey. The current Romanian banking system, despite the changes and imbalances recorded at the level of the Romanian economy proved to be stable, both from the point of its liquidity and of its solvency, but the depression of the crediting activity led to the deterioration of the assets and to a modest profit. One must emphasize the fact that the financial instability occurred in Romania from the outside and that most countries fight an economic crisis, fact which imposes the need to take some warning measures regarding the macroeconomic imbalances, both at the country level and at regional level.

The authorities also discuss the implementation of Basel III proposals, concerning the demands of capital in order to complete the current framework for indebtedness observation. The purpose of this Agreement is to develop a macro-prudential framework and to insure the financial stability. The conclusions that can be determined from the analysis we realized are that external resources of the credit institutions credit slowly compressed starting 2009 in line with the regional trend, reducing the dependence of banks towards external financing.

The mother-banks promoted the increase of the branches efforts in collecting deposits from the local markets. As a consequence, a slow increasing trend is recorded in reserves and deposits attracted from resident physical persons. The predominance of short term deposits maintains a lack of correlation by maturities of liabilities and assets, the banks their long term assets with short term resources. The credit institutions own resources gradually increased based on the new capital growth, on contracting new loans subordinated from the mother-banks, as well as on the distribution of a consistent amount of money with the destination of the reserves from the profit afferent to the year 2008. The placements of the credit institutions were directed towards the internal market, predominant under the form of securities; collateral, after a contraction tendency of the credit granted to the nongovernmental sector during the main part of the analyzed period, in June 2010 was recorded a real increase of this one. The extension of the uncertainties on the international financial market as well as the strategically corrective reaction of banks could emphasize the mutations in the structure of the Romanian banking sector balance.

Abstract

*This article analyses, in the unitary conception, the forming and the evolution of the most important elements of infrastructure which laid the base of **Economy of the Romanian Naval Transports, in the period 1900 – 1914.***

Also, this article attempts to determine the total value of assets on the main components of the system infrastructure, following the next issues:

- *Ways of Communication on the Water;*
- *Fluvial and Maritime Ports;*
- *Naval Industry;*
- *the National Civilian Fleet- fluvial, maritime and fishing fleet.*

Key words: naval transport, fluvial and maritime fleet, ports, naval industry.

J.E.L. classification: B15, L92.

During the period **1900-1914**, the evolution of **Romanian Naval Transports** was established by the general economic conditions, by the existent financial availabilities for the acquirement from the external market of naval transport means, and by the technical possibilities of issuance of the main works in the port infrastructure and water communication ways.[1]

During this period, the Romanian economy registers the highest increase rate, compared to the previous periods. Despite of the economic crisis triggered by the dryness from 1904, shaken by the peasant rebellions from 1907, during the period we refer to, the agrarian production increases by about 47.61% from 4.2 millions of tones, the average of 1896-1900 years to 6.2 million tones the average of 1911-1915 years, and

the production of big enterprises adjusts from 230 million lei to 584 millions.

Table 1. Economy of Romanian Naval Transports, per components in the period 1900 – 1914

Item	Components	Millions of dollars
		1900-1914
1	Fluvial Ports and Navigable Roots, including Navigable Channels	23,17
2	Maritime Ports and Navigable Roots	13,47
3	Naval Industry	2,90
4	Fluvial Fleet	4,29
5	Maritime Fleet	5,35
6	Fishing Fleet	-
7	Naval Radio-Communication System	-
TOTAL ASSET		49,17

Source: PhD. eng. Dumitru Corduneanu, *The System of the Naval Transport from Romania in the XX century*, CTEA Publishing House, Bucharest 2010, p. 269.

Accordingly, during the period 1900-1913, the volume of external trade increases 2.5 times, from 497 million lei to 1261 million lei, the ponder of commodity export for the ends of the range being 56.33%, respectively 53.21%[2].

In this context, the establishment of a modern naval transport system, which has to be liable for the national economy requirements becomes an objective need. During the period we refer to, the naval transport means are the active ones in their evolution. For the development of infrastructure of *the Fluvial Navigable Ports and Routes, the Hydraulic Service* performs works of about **120 million lei gold**, from which 90 million lei gold were only used for the arrangement of navigation on Sulina arm and of the navigable channel between Varciorova and Tulcea, on a distance of about 830 Km, the rest of 30 million lei gold, were invested by the *Direction of Docks Galati and Braila* into modernization works of the port superstructure.

For the development of Constanta port and the arrangement of access ways, by the state initiative, *the Maritime Port Service*, performs important works for the construction of embankments, dams, basins, port territories, by the construction of platforms, warehouses, administrative buildings and the endowment with installations and plants necessary for the operation of commodities, the value of which is estimated at about **69.78 million lei gold**. Only until 1910, the investments made by the state for the development of Constanta port were listed at about 49.130 million lei gold[3] of which, for the construction of the first two warehouse-silos, of 30 thousand tones each one, there have been invested about 14.388 mil. Lei, the electrical factory and bloom cost the Romanian state about 6.056 mil. lei, the installations for the export of oil valued about 4.761 mil. lei, and the investments made for dams, embankments and technical, port vessels were numbered at about 4.5666 mil. lei gold. Consequently, the capital invested only in development works of the infrastructure of *Navigable Ports and Routes*, raise during this period at **189.78 mil. lei gold**, representing about **36.64 mil. dollars gold**.[4]

In the domain of *Naval Industry*, the investments made by the state did not have the same dynamics like in the case of port infrastructure, this fact being mainly due to the decal of about 50-100 years, with which the *Industrial Revolution* reaches in Romania, too. The most important naval site being in the state patrimony during this period is that from Turnu Severin, bought from the Austrians in 1893, by the amount of about 240 thousand lei gold, and until the end of the studied period, one more private network of naval workshops is developed, where it is noticed the Naval Site G. Fernic and the one from Giurgiu, the total value of investments in the *Naval Industry*, for this period, being established at about **15 mil. lei gold**, about **3 mil. dollars**.[5]

After the establishment, at the end of XIX century, of the two regular navigation services, the state makes important efforts for the development of *National Civil Fleet*, of increasing the number of ships and increasing of the transport capacity. From a capital of **8.696 million lei gold**[6], as the *Romanian Fluvial Navigation* benefitted from at the beginning of XX century, until the end of the period we refer to, it almost doubles, reaching to about **15 million lei gold**, and the investments made for the development of *Romanian Maritime Service* were numbered for the same date at about **19.27 million lei gold**.

For the same period, the value of investments made for the acquirement of ships, by the private field raises to at least 15.63 million lei gold, per assembly *the National Civil Fleet* benefitting of water transport means in amount of about **49.90 million lei gold**, meaning **9.63 million dollars**.

Cumulating, the previously mentioned data, we may conclude that until the burst of the First World War, the value of the total invested capital within the *Naval Transport System of Romania* raises to about **254.68 million lei gold**, which exchanged into forte currency represent about **49.17 million dollars**, being structured as *Figure 1*.

The biggest ponder within the *System* is held by the *Navigable Ports and Routes*, with about **75%**, the income of which, before the burst of the First World War was numbered at about 9 million lei gold at a value of expenses of 8 million lei gold,

registering a gross profit of about 1 million lei gold.

Source: PhD. eng. Dumitru Corduneanu, *The System of the Naval Transport from Romania in the XX century*, CTEA Publishing House, Bucharest 2010, p. 271.

At the opposite pole, as one may notice from the above graphic representation, the lowest ponder within the system is held by the *Naval Industry*, with about **5.89%**, which confirms the weak development of *Industry* during this period. Compared to the states of the Eastern Europe, the technical endowment degree is low, the movement force, expressed in C.P., our country benefitted of, was 10-15 times smaller than the England's one, 5-8 times smaller than the France's one and about 2-3 times smaller than the Austria's one.[7]

Needing an industry of metal and no branch of the construction of machines and plants, almost all the machines and plants were imported, so that until 1914, in Romania, the industrial revolution and the industrialization produced based on the technique and technology, our country being entirely dependent on the external suppliers, the capital invested in the Romanian economy resulting in rate of 81% from the external market, too, together with 42% from the engineering and technical staff, and over 30% from the administrative one[8].

Consequently, the endowment process of the *Transport National Fleet – Fluvial and Maritime* – could not be issued but by acquisitions of ships from industrialized countries like England, Germany, France, Italy, Austria and Denmark, and the formation of navigating staff was issued by external support, too, with great capital investments, the Romanian economy did not benefit of.[9]

This will make that the ship park of the Transport Naval Fleet, to be quite restrained, not being able to satisfy optimum the transport request, given the fact that over 80% from the external trade of the country was issued on the water way, and the agrarian predominant character of Romanian economy determined a typical structure of external trade, greatly made of raw materials and agrarian products, with low unit values and a big volume – needing big transport capacities.

On the other hand, the development of the *Transport National Fleet* was balked by the competition of foreign companies too, belonging to certain foreign pavilions, like the English, the French, the Austrian, the Greek one, etc., which took over the biggest part of the volume of commodities, developed on the water way within our external trade, over 90%, cashing about 12-15% of the dispatch value of products, diminishing accordingly the sold of commercial balance and of payments.

However, until the burst of the First World War, by the supported action of the state, within the *Naval Transport System*, there are put the bases of a new infrastructure, of Occidental type, partially mechanized. Therefore, for the operation of commodities, there are introduced over 60 elevators, (26 at Sulina, 3 at Galati, 20 at Braila and 11 at Constanta), the two naval transport services – fluvial and maritime – within a quite short period of time – of only one decade and a half from the establishment – made important efforts for the endowment and modernization of the ship park.

During the analyzed period, *The Fluvial Fleet* has transported over 1,088 tones commodity and about 1,169 thousand travelers, issuing a total income of about **41.57 thousand lei gold**, and the *Maritime Fleet* has transported over 892 thousand tones commodity and about 156 thousand passengers, issuing a total income of about **44.62 million lei gold**, at a total of expenses of 59.22 million lei gold.[10]

As noticed from the presentation, the trading activity of SMR during the analyzed period resulted in a loss of about **14.5 million lei gold**. This fact, continued in the inter-war period, too, will be mainly endowed to the foreign competition, to which the company could not face, because

the ship park it benefitted to was made of old ships, of low capacities and speeds, and the maritime ships, compared to the fluvial ones need much bigger investments, taking into account the destination for which they are designed, the conditions they navigate in, and the high technique degree. Our maritime fleet only benefitted of 0.05 mil. trb., meanwhile England had a fleet of over 21 mil. trb., Germany about 5.45 mil. trb., France – 2.32 mil. trb., and Norway about 2.5 mil. trb. At this date, Greece owned only 0.84 mil. trb.[11] But citing the writer Jean Bart (the commander Eugeniu Botez in *Caile Levantului*) – “it would be a political and economical myopia to see only the direct deficit of the trading activity of SMR, without analyzing further the indirect benefits brought to the development of naval transports, our external trade, and formation and occupation of the labor force”.

Under the given conditions, the external trade of the main capitalist countries, being centered on the export of finite products, machines, plants, transport facilities, textile products, etc. and on the import of raw materials, determined the pavilion of these states to develop an important traffic of commodities by the Romanian ports, where from three articles were mainly charged: gross wood, cereals and oil products. By the structure of its external trade, Romania appeared like a supplying country of raw materials, dispatch market for the finite products of the developed countries and a placement country for the external capital; as an agrarian country, insuring the development, dependent to the market of industrial states, the negotiation of maritime transport contracts, the sale conditions, the prices of Romanian products, as well as those of acquirement of the foreign commodities were not established by our country, but by the foreign markets, sometimes with big disadvantages for the Romanian economy.

Between 1900-1913 years, the value volume of the international trade had increased by about 95% (from 323.1 mld dollars to 64.6 mld. Dollars), the ponder of the main capitalist countries at the end of this range being as follows: England with about 15.2% followed by Germany with 13.1%, France – 7.8%, Holland – 3.1%, USA and Japan with 11.2 and 1.6%, respectively.[12]

Compared to the beginning of the century, although England continues to hold the first place in the hierarchy, its ponder within the international trade decreases by 4.3%, the decal had before compared to Germany and USA greatly diminishing, the latter ones passing from the policy of free exchange to an aggressive protectionism. Despite these countries, England continue to practice the policy of free exchange, this being explained by the fact that, although it had lost a part from the supremacy of industrial production, first for USA, then in the Germany’s one, it owned the supremacy regarding the colonial empire, the external trade, *the trading fleet* and the capital export. The practicing of free exchange corresponded to the interests of London, as worldwide trade and financial center.

Offshore Financial Centers – A Recent and Debatable Reality in World Finance

Cosma Sorinel

„Ovidius” University of Constanta, Faculty of Economic Sciences
sorinelcosma@yahoo.fr

Abstract

Offshore Financial Centers (OFCs) have emerged as a rather recent and quite debatable reality in the world of international finance. So debatable is the issue that it does not even have a precise generally-accepted definition. Moreover, quite often confusion arises from the use of the more obscure term tax haven instead of OFC. Taxation, regulation, confidentiality, effects on international trade are some of the main aspects that give birth to debates on whether OFCs pose risks to the overall financial system or whether they are an incentive for investment into emerging markets and a beneficial competition that contributes to innovation in financial instruments and products and lowers costs of financial services worldwide.

Key words: offshore financial center, tax haven, jurisdiction, non-residents, bank secrecy.

J.E.L. classification: G15.

1. What is an Offshore Financial Center (OFC)?

There is no internationally agreed definition of what constitutes an offshore financial centre (OFC). Over the years, there have been many attempts to define the concept but there has been no real consensus. The term itself is a relatively modern neologism, first coined in the 1980s.

The various definitions given since then tend to be centered on the concept that an OFC provides financial services (usually in currencies other than that used domestically) primarily to non-residents (the majority of financial transactions conducted by institutions located in an OFC are conducted

on behalf of clients who reside in other jurisdictions), for whom it offers a favorable tax regime.

An OFC is a jurisdiction whose financial sector accounts for a significant—and disproportionate—share of its domestic economy. It is usually perceived as a small, low-tax jurisdiction specializing in providing corporate and commercial services to non-residents in the form of offshore companies and the investment of offshore funds.

By comparison, onshore centers may have rules that are considered by service providers and their customers as too demanding, tax policies that are too restrictive, disclosure requirements that are too extensive, or overall costs that are simply too high. Successful OFCs will generally have legal, regulatory and tax structures that avoid these "problems", although it should be stressed that the standards to which they operate are not necessarily out of line with international expectations of a jurisdiction which wishes to offer appropriate incentives.

OFCs, despite their name, are not necessarily islands, although many island jurisdictions have established OFCs.

Offshore does not describe geography. It most certainly does not refer to island locations, even though some OFCs are hosted within palm-beach lined domains. The term ‘offshore’ refers to the location of the customers of the OFC who are elsewhere. What this means is this: in the offshore world transactions are recorded in one place on behalf of parties who are actually elsewhere in the world (offshore). The transactions have the legal form of taking place where they are recorded, but their substance and benefit, occur elsewhere. By contrast, what onshore should, but does not always, mean is that the substance of the transaction takes place in the location where it is recorded and regulated.

Geographical features are not that important, but rather the characteristics that

an ideal offshore financial center must possess, such as a high degree of political stability, close geographical proximity to wealthy countries, communication infrastructure, well educated workforce, tourist potential.

Business conducted in OFCs covers a wide range of financial sectors, such as banking, insurance, and securities, and some nonfinancial activities, such as shipping registries. However, most offshore centers specialize in specific types of financial services.

Many offshore jurisdictions specialize in the formation of collective investment vehicles, or mutual funds.

But the greater appeal of offshore jurisdictions to form mutual funds is usually in the regulatory considerations. Offshore jurisdictions tend to impose few if any restrictions on what investment strategy the mutual funds may pursue and no limitations on the amount of leverage which mutual funds can employ in their investment strategy.

2. How Did OFCs Come About?

The first tax havens were created in the USA when Delaware and other states offered lower taxes and a relaxed regulatory environment to entice the relocation of business out of New York State in the late nineteenth century.

After the First World War things changed at global scale: cross-border trade increased and problems of double taxation of income between states began to be an issue.

In 1929 the House of Lords in Britain decided that if the directors of a UK registered company met in another country then the centre of that companies control was outside the UK and, so long as it did not trade in the UK it was not subject to UK tax on its profits. This decision had a profound impact on the development of offshore financial centers.

The Second World War put a halt to further offshore development.

It was the Bank of England to treat certain type of financial transaction between non-resident parties undertaken in foreign currency as if they did not take place in London and hence not under the regulatory and supervisory arm of the Bank of England

that created the offshore reality. Therefore, the offshore market emerged in September, 1957.

Since UK resident banks were excluded by the Bank of England from operating in this offshore market, they rapidly got round this by creating branch operations to achieve the same result in the Channel Islands.

From there, the offshore world grew exponentially, stimulated by financial deregulation and improvements in communications and information technology including fax machines and the internet.

The growth of offshore centers can be traced back to the restrictive regulatory regimes in many advanced countries in the 1960s and 1970s. These regimes blocked the flow of capital to and from other countries (excluding trade financing), or imposed restrictions on the interest rates banks could offer, or raised banks' funding costs in domestic markets (for example, through the imposition of high non-interest-bearing reserve requirements). These restrictions, which, in many cases, were intended to provide governments with more control over monetary policy, encouraged a shift of deposits and borrowing to less regulated institutions, including banks in jurisdictions not subject to such restrictions.

3. OFCs and Tax Havens

Quite often, the more obscure term tax haven is applied to OFCs, leading to confusion. The concept of tax haven has straightforward connotations of secrecy and tax avoidance policies, which is not the case for all OFCs, many of which have no statutory banking secrecy, and most of which have adopted tax information exchange protocols to allow foreign countries to investigate suspected tax evasion.

The central feature of a haven is that its laws and other measures can be used to evade or avoid the tax laws or regulations of other jurisdictions.

The main element of their attractiveness is secrecy, which includes strong bank secrecy and secrecy of legal entities. In other words, information is not available and cannot be obtained from banks (for tax collection purposes) or about companies and beneficial owners of trusts, assets, etc.

It is a mistake to confuse the term Offshore Financial Centre with tax haven. These two are quite separate and distinguishable if intimately related phenomena that jointly make up the offshore economy. Tax havens and OFCs together make up the ‘offshore world’.

Offshore financial centers are not the same as tax havens. OFCs are the commercial communities hosted by tax havens which exploit the structures that can be created using the tax haven’s legislation for the benefit of residents elsewhere. In other words, the offshore financial centre is made up of the accountants, lawyers, bankers, plus their associated trust companies and financial intermediaries who sell services to those who wish to exploit the mechanisms the tax haven has created.

Every tax haven aspires to be an OFC. Despite this it must be stressed that some tax havens have not really achieved the objective of being OFCs.

Until now all attempts to regulate the offshore economy have been focused on tax havens. As a prime solution to the turmoil that tax havens create, it has been recommended that the focus of regulation must shift onto limiting the impact of OFC operators within the global economy.

OFCs are made up almost entirely of firms with no strong economic ties to the tax haven they are using and are, secondly, staffed by people with, if anything, even lower commitment to that place. They are clearly highly mobile, which creates the real possibility that they will have relatively limited regard for the law of one jurisdiction, knowing how easily they can relocate if problems arise.

4. OFCs Assessment

Concerns about the potential risk posed by offshore centers to other financial systems have been raised in several international forums, including the Financial Stability Forum (FSF), the Financial Action Task Force on Money Laundering (FATF), and the Organization for Economic Cooperation and Development (OECD).

Many OFCs upgraded their supervisory and regulatory systems (for example, they enacted new legislation and established financial intelligence units to counter money

laundering activities), while others learned how to better supervise their institutions.

The OECD 1998 report identified four features of harmful preferential tax regimes: no or low effective tax rate; “Ring fencing” of regimes (preferential tax regimes are partly or fully insulated from the domestic markets to protect own economy); lack of transparency; and lack of effective exchange of information.

Offshore finance has been the subject of increased attention since 2000 and even more so since the April 2009 G20 meeting, when heads of state resolved to “take action” against non-cooperative jurisdictions. Initiatives spearheaded by the OECD, the FATF and the IMF have had a significant effect on the offshore finance industry. Most of the principal offshore centers considerably strengthened their internal regulations relating to money laundering and other key regulated activities. Indeed, Jersey is now rated as the most compliant jurisdiction internationally, complying with 44 of the “40+9” recommendations.

In 2007 *The Economist* published a survey of offshore financial centers; although the magazine had historically been very hostile towards OFCs, the report represented a shift towards a very much more benign view of the role of offshore finance, concluding that although international initiatives aimed at reducing financial crime are welcome, the broader concern over OFCs is overblown. Well-run jurisdictions of all sorts, whether nominally on- or offshore, are good for the global financial system.

5. Detractors’ Views

The offshore world is designed to make things appear other than they are, and that is exactly what they do, this, in a nutshell, being the threat that they pose to the economic world.

These centers have been presented using numerous names and phrase, such as drug dealers of modern finance and pushers of instability.

OFCs are typically seen to foster a significant imbalance of scale between the external business and the domestic financing needs of the local economy. It is generally accepted that an OFC is a country or jurisdiction that provides financial services to

nonresidents. But the scale at which that happens is inadequate when related to the size and the financing of its domestic economy. There are authors who consider OFCs economies with financial sectors disproportionate to their resident population.

Critics argue that they drain tax from higher-tax countries and developing nations that are insufficiently regulated, and facilitate illegal activities such as tax evasion and money laundering while avoiding legal risk.

Critics of offshore jurisdictions point to excessive secrecy, particularly in relation to the ownership of offshore companies, and in relation to offshore bank accounts. However, banks in most jurisdictions will preserve the confidentiality of their customers, and all of the major offshore jurisdictions have appropriate procedures for law enforcement agencies to obtain information regarding suspicious bank accounts.

Statutory banking secrecy is a feature of several financial centers, notably Switzerland and Singapore. However, many offshore financial centers have no such statutory right. Many offshore jurisdictions have signed tax information exchange agreements based on the OECD model, which commits them to sharing financial information about foreign residents suspected of evading home-country tax.

International initiatives have largely stopped this practice of offering banking licenses to institutions with relatively little scrutiny. Very few offshore financial centers will now issue licenses to offshore banks that do not already hold a banking license in a major onshore jurisdiction.

There is increasing concern that, with the growing integration of financial markets worldwide, problems in a financial institution located in an OFC can be transferred rapidly to markets elsewhere.

There are at least three ways in which the current attack on off-shore financial centers is illegitimate. First, it flies against the notion of tax sovereignty. Second, the idea of off-shore financial centers is that they offer low tax because taxes are paid before money reaches them and after it leaves them. The off-shore centre acts as a "way station" that facilitates complex international trade and investment flows. There are no taxes or low taxes in the "way station" because the money is in transit. Taxes are paid at the beginning

and at the end of the journey, just not along the way. Third, responsible off-shore financial centers do have information agreements that allow tax authorities to share information.

6. Proponents' Views

Proponents suggest that reputable offshore financial centers play a legitimate and integral role in international finance and trade, and that their zero-tax structure allows financial planning and risk management and makes possible some of the cross-border vehicles necessary for global trade, including financing for aircraft and shipping or reinsurance of medical facilities. Proponents point to the tacit support of offshore centers by the governments of the United and United Kingdom.

Although most offshore financial centers originally rose to prominence by facilitating structures which helped to minimize exposure to tax, tax avoidance has played a decreasing role in the success of offshore financial centers in recent years. Most professional practitioners in offshore jurisdictions refer to themselves as "tax neutral" since, whatever tax burdens the proposed transaction or structure will have in its primary operating market, having the structure based in an offshore jurisdiction will not create any additional tax burdens.

A number of pressure groups suggest that offshore financial centers engage in "unfair tax competition" by having no, or very low tax burdens, and have argued that such jurisdictions should be forced to tax both economic activity and their own citizens at a higher level. Another criticism leveled against offshore financial centers is that whilst sophisticated jurisdictions usually have developed tax codes which prevent tax revenues leaking from the use of offshore jurisdictions, less developed nations, who can least afford to lose tax revenue, are unable to keep pace with the rapid development of the use of offshore financial structures. Offshore centers have often been seen as venues for money laundering of illicit activity. However, following a move towards transparency during the 2000s, some now argue that offshore jurisdictions are in many cases better regulated than many onshore financial centers.

Offshore centers act as conduits for global trade and ease international capital flows. International joint ventures are often structured as companies in an offshore jurisdiction when neither party in the venture party wishes to form the company in the other party's home jurisdiction for fear of unwanted tax consequences. Although most offshore financial centers still charge little or no tax, the increasing sophistication of onshore tax codes has meant that there is often little tax benefit relative to the cost of moving a transaction structure offshore.

Recently, several studies have examined the impact of offshore financial centers on the world economy more broadly, finding the high degree of competition between banks in such jurisdictions to increase liquidity in nearby onshore markets. Proximity to small offshore centers has been found to reduce credit spreads and interest rates, credit being more freely available in countries which have close relationships with offshore centers.

Low-tax financial centers are becoming increasingly important as conduits for investment into emerging markets. Since the livelihood of OFCs depends on their ability to attract global financial business, competition is strong. Such competition is beneficial when it contributes to innovation in financial instruments and products and lowers costs of financial services worldwide.

Utilitarianism – Origins and Evolution

Cosma Sorinel

„Ovidius” University of Constanta, Faculty of Economic Sciences
sorinelcosma@yahoo.fr

Abstract

*The history of ethics is an essential part of the history of philosophy. Utilitarianism is an abstract ethical doctrine at the core of which lie the concepts of pleasure and pain. This approach to normative ethics may be regarded as England's most prominent contribution to the development of the ethical theory, since two English philosophers, **Jeremy Bentham** (1748-1832) and **John Stuart Mill** (1806-1873) are considered to be classical utilitarians. Bentham described utilitarianism as the greatest happiness principle. The principle of utility, forms the cornerstone of all his thought. Mill's famous formulation of utilitarianism holds that one must always act so as to produce the greatest aggregate happiness among all sentient beings, within reason. Mill's major contribution to utilitarianism is his argument for the qualitative separation of pleasures.*

Key words: utility, utilitarianism, ethics, hedonism, consequentialism.

J.E.L. classification: B12.

1. Utilitarianism – An Ethical Theory

One of the most powerful and persuasive approaches to normative ethics in the history of philosophy, utilitarianism is generally held to be the view that the morally right action is the action that produces the most good. The man ought to act so as to produce the best consequences possible.

The essence of this abstract ethical doctrine is in its concept of pleasure and pain. Utilitarian philosophy sees “good” as anything that increases pleasure and reduces pain. It is a philosophy of outcomes. If the outcome of an action serves to increase pleasure and reduce pain, then the action is considered good. At its heart, Utilitarianism is a hedonistic philosophy.

An action is right if it tends to promote happiness and wrong if it tends to produce the reverse of happiness—not just the happiness of the performer of the action but also that of everyone affected by it.

According to the Utilitarian, it is possible for the right thing to be done from a bad motive.

On the utilitarian view one ought to maximize the overall good — that is, consider the good of others as well as one's own good.

The basic principle of utilitarianism is: actions are right to the degree that they tend to promote the greatest good for the greatest number.

Utilitarianism is also distinguished by impartiality and agent-neutrality.

This theory defines morality in terms of the maximization of net expectable utility for all parties affected by a decision or action.

Utilitarianism is a simple theory and its results are easy to apply. It also allows for degrees of right and wrong, and for every situation the choice between actions is clear-cut: always choose that which has the greatest utility.

Utilitarianism is maximizing the value (utility) of the universe - which makes utilitarianism a *consequentialist* (goal-based) theory of ethics, as opposed to a *deontological* (rule-based) theory.

Utilitarianism is a well-known example of a branch of ethics known as consequentialism, which states that actions are morally judged by the impartially reckoned value of the consequences.

2. Types of Utilitarianism

Act Utilitarianism (or Case Utilitarianism) states that, when faced with a choice, we must first consider the likely consequences of potential actions in that particular case and, from that, choose to do

what we believe will generate the most overall happiness.

Rule Utilitarianism states that, when faced with a choice, we must look at potential rules of action to determine whether the generalized rule produces more happiness than otherwise, if it were to be constantly followed. Thus, an action should only be carried out if it follows a rule that morally should be followed at all times.

Two-Level Utilitarianism states that normally we should use "intuitive" moral thinking, in the form of Rule Utilitarianism, because it usually maximizes happiness. However, there are some times when we must ascend to a higher "critical" level of reflection in order to decide what to do, and must think as an Act Utilitarian would.

Motive Utilitarianism states that our initial moral task is to inculcate motives within ourselves (by means of teaching and repetition) that will be generally useful across the spectrum of the actual situations we are likely to encounter, rather than hypothetical examples which are unlikely to occur. It can be thought of as a hybrid between Act and Rule Utilitarianism, but it also attempts to take into account how human beings actually function psychologically.

Total Utilitarianism advocates measuring the utility of a population based on the total utility of its members. *Average Utilitarianism* advocates measuring the utility of a population based on the average utility of that population.

Negative Utilitarianism requires us to promote the least amount of evil or harm, or to prevent the greatest amount of suffering, for the greatest number (as opposed to the general, or positive, Utilitarian rule of the greatest amount of good for the greatest number).

Sentient Utilitarianism states that the well-being of all sentient beings (i.e. conscious beings who feel pain, including therefore some non-human animals) deserve equal consideration with that given to human beings, when making moral decisions in a Utilitarian context.

Ideal utilitarianism involves tallying any consequence that we intuitively recognize as good or bad (and not simply as pleasurable or painful).

Preference utilitarianism involves tallying any consequence that fulfills our preferences.

3. Precursors to Classical Utilitarianism

The origins of utilitarianism are often traced as far back as the Greek philosophers (**Aristippus of Cyrene, Epicurus, Parmenides**).

A hedonistic theory of the value of life is found in the early 5th century BC in the ethics of Aristippus of Cyrene, founder of the Cyrenaic school, and 100 years later in that of Epicurus, founder of an ethic of retirement, and their followers in ancient Greece.

Early precursors to the Classical Utilitarians include the British Moralists, **Richard Cumberland** (a 17th-century moral philosopher), **Shaftesbury, Francis Hutcheson** (a British “moral sense” theorist), **George Berkley, John Gay** (a biblical scholar and philosopher), **John Brown**, and **David Hume** (a Skeptic, Scotland's foremost philosopher and historian).

Some of these earliest utilitarian thinkers were ‘theological’ utilitarians. They believed that promoting human happiness was incumbent on us since it was approved by God.

The early utilitarians were democratic (social policy ought to work for the good of all persons, not just the upper class; where interests conflicted, the best choice was to aim at satisfying the interests of the majority), progressive (they questioned the status quo; if a program was not working well, it was time to change it), empiricist (observation would determine whether a policy was successful or not; we only know what is good by observation or by appeal to experience) and optimistic (human wisdom and science could improve “the lot of humanity”).

4. Classical Utilitarians

The Classical Utilitarians, **Jeremy Bentham** (1748-1832) and **John Stuart Mill** (1806-1873) (Bentham’s godson and student), were concerned with legal and social reform.

Bentham's major philosophical work, published in 1789 is titled *An Introduction to the Principles of Morals and Legislation*. It can be divided into 3 parts: views on what

motivated human beings, the principle of utility, the *Felicific calculus*.

Bentham famously held that humans were ruled by two sovereign masters — pleasure and pain. He found pain and pleasure to be the only intrinsic values in the world. From this, he derived the rule of utility: the good is whatever brings the greatest happiness to the greatest number of people.

Bentham begins the ethical part of his book with a blunt statement of total human subordination to pleasure and pain: "Nature has placed mankind under the governance of two sovereign masters, pain and pleasure."

John Stuart Mill wrote a famous (and short) book called *Utilitarianism*. Mill differs from many current utilitarians in that he considered cultural and spiritual happiness to be of greater value than mere physical pleasure.

In his famous 1861 short work, *Utilitarianism*, John Stuart Mill both named the movement and refined Bentham's original principles.

John Stuart Mill maintains that some *kinds* of pleasure are more desirable and more valuable than others, thereby making differences in the qualities of pleasures as well as in the quantities of pleasure relevant to moral deliberations. The standard reading of Mill's test for pleasures of higher quality is as follows: One pleasure is of higher quality than another if and only if most people who have experienced both pleasures always prefer the first to the second regardless of their respective quantities. The standard reading suffers from two problems

Mill argued that cultural, intellectual and spiritual pleasures are of greater value than mere physical pleasure as valued by a competent judge (which, according to Mill, is anyone who has experienced both the lower pleasures and the higher).

In his essay *On Liberty* and other works, Mill argued that Utilitarianism requires that any political arrangements satisfy the liberty principle (or harm principle), according to which the only purpose for which power can be rightfully exercised over any member of a civilized community against his will, is to prevent harm to others, a cornerstone of the principles of Liberalism and Libertarianism. Some Marxist philosophers have also used these principles as arguments for Socialism.

The main difference between the two of them is that Bentham wants us to consider only the quantity of pleasure, While Mill wishes that we consider also the quality. Intellectual pleasure is, to Mill, of greater value than sensual pleasures (sensual here, intending pleasures of the senses).

The classic utilitarianism of Bentham and Mill influenced many other philosophers and the development of the broader concept of consequentialism. As a result, the correct definitions of utilitarianism and consequentialism and the exact difference between these two schools are not always entirely clear, even among philosophers.

5. 19th and 20th Century Utilitarians

One of the leading Utilitarians of the late 19th century, a Cambridge philosopher and economist, **Henry Sidgwick** (1838 – 1900), author of *Methods of Ethics* (1874), rejected the theories of motivation as well as Bentham's theory of the meaning of moral terms and sought to support Utilitarianism by showing that it follows from systematic reflection on the morality of “common sense.” Most of the requirements of commonsense morality, he argued, could be based upon Utilitarian considerations. In addition, he reasoned that Utilitarianism could solve the difficulties and perplexities that arise from the vagueness and inconsistencies of commonsense doctrines.

In political economy he was a utilitarian on the lines of John Stuart Mill and Jeremy Bentham. His work was characterized by its careful investigation of first principles, as in his distinction of positive and normative reasoning, and by critical analysis, not always constructive.

In philosophy he devoted himself to ethics, and especially to the examination of the ultimate intuitive principles of conduct and the problem of free will. He adopted a position which may be described as ethical hedonism, according to which the criterion of goodness in any given action is that it produces the greatest possible amount of pleasure. This hedonism, however, is not confined to the self (egoistic), but involves a due regard to the pleasure of others, and is, therefore, distinguished further as universalistic. Lastly, Sidgwick returns to the

principle that no man should act so as to destroy his own happiness.

A British philosopher, **G.E. Moore** (1873-1958), a pioneer of 20th-century Analysis, regarded many kinds of consciousness—including love, knowledge, and the experience of beauty—as intrinsically valuable independently of pleasure, a position labeled “ideal” Utilitarianism. Even in limiting the recognition of intrinsic value and disvalue to happiness and unhappiness, some philosophers have argued that those feelings cannot adequately be further broken down into terms of pleasure and pain and have thus preferred to defend the theory in terms of maximizing happiness and minimizing unhappiness. It is important to note, however, that even for the hedonistic Utilitarians, pleasure and pain are not thought of in purely sensual terms; pleasure and pain for them can be components of experiences of all sorts. Their claim is that, if an experience is neither pleasurable nor painful, then it is a matter of indifference and has no intrinsic value.

G. E. Moore suggested that we should strive to maximize ideal values such as freedom, knowledge, justice, and beauty.

The world may not be a better place with more pleasure in it, but it certainly will be a better place with more freedom, more knowledge, more justice, and more beauty.

In *Principia Ethica*, Moore contended that goodness cannot be analyzed in terms of any other property. Therefore, we cannot define “good” by explaining it in other words. We can only point to an *action* or a *thing* and say “That is good.” Similarly, we cannot describe to a blind person exactly what yellow is. We can only show a sighted person a piece of yellow paper or a yellow scrap of cloth and say “That is yellow.”

Moore’s candidates for intrinsic good remain difficult to quantify. In addition to categorizing “good” as indefinable, Moore also emphasized that it is a non-natural property. This means that it cannot be empirically or scientifically tested or verified - it is not within the bounds of “natural science”.

Abstract

Management can provide tools for the transfer of knowing, but its power to get people to use it is strictly limited. Gross imposition, without the knowledge management activities often leads to symptomatic line. It is vital to take into account the views of staff in the implementation and detailed design of knowledge tools and processes. Staff motivation is the enthusiasm of a new management tool, a new technology and new possibilities, not least by the benefits the organization, their success is a persuasive example. Excitement and opportunities may arise at any time, it is important that they are actively sought and fully exploited to take advantage of knowledge systems.

Key words: Management, tool management systems, knowledge

J.E.L. classification: I 25, M 12, O 10

There are various professional services to the activities carried out by companies in many ways, even though these are subject to similar pressures from increasing market competition.

Expectations and knowledge management approach must relate differently in accordance with market requirements. An important premise of the last 10-15 years is whether the basic principles of organizational learning and knowledge sharing can apply everywhere, and if many of the techniques can be used as the basis for success, on the implementation details instruments that must be designed in practice given the organizational context.

The famous saying "God is in details", it is equally suitable for knowledge management. In this paper we will consider the implications of this, but also revised some differences worth of professional organizations and their consequences.

Most industrial organizations develop and reproduce identical products on a large scale - cars, TVs, PCs, socks, steel bars, barrels of oil, tons of concrete, insurance policies, operations, retail, travel by train etc. - while professional services organizations (if consulting companies), deals with unique transactions such as buildings, medical treatments, consulting projects.

The most important consequence of these differences is that the "multiplication" increases the value, especially in operational efficiency and product quality, and creates the possibility of large gains. The transfer of good ideas, even if it is new company can cover the annual cost of a knowledge management program, these benefits can justify the investment in testing and improving the transfer process.

A structured program of training and knowledge transfer, management focused on improving processes based on project results such as the reduction of direct costs, reducing implementation time that involved cutting costs as a consequence, they are multiplied by the number of projects over a certain time. These programs are a powerful advantage for knowledge management and "study cases" can convince both skeptical and indifferent people

Because of indirect benefits, sometimes diffuse and difficult to quantify, it is more difficult to justify generous investment in knowledge management and to motivate staff to do everything to work in this regard.

In the context of consulting services, overlapping roles within the organization between ownership, management and employees is another factor that makes progress in knowledge management more difficult than in industry, these functions are separate. This overlap of functions make decisions in the hands of people whose incomes are directly affected by short-term profitability and make the investment company level depend on the interdependence between several people.

For consulting companies this is a negative trait for activities such as knowledge management, providing significant benefits, even if they are hard and can take years to bring achievements, in exchange for immediate, however small, costs.

One of the principles of behavioral economics is based on the idea that most people are against losses, thus abandoning the possibility of obtaining substantial earnings to avoid losses and put more effort to avoid a loss than to secure a win.

Another principle is to define strategic decisions influenced consisting of too much short-term repercussions and too little of the long term from a lack of well structured. The decrease in revenues from each project completed and personal motivation to try something new even when repetition could be more economical, leading to an aversion to looking for projects completed in order to learn from them, and to transfer other knowledge obtained. Looking back costs money, a personal sacrifice of time and the information may not be relevant for the next project.

This is different from consulting services to a typical production situation, where there is a conscious effort to make each new product to improve its predecessor, reducing production costs by identifying weaknesses and inefficiencies of the product, finding ways to eliminate them and counter competitive products.

Even in the context of a decision to invest in knowledge management, entrepreneurial culture Romanian companies operate more like a collection of "independent" barons than a well structured organization, which is not uncommon in such consulting, a Key accounting not convinced of knowledge management can completely block progress. In this constellation, the appointment of a

CKO (Chief Knowledge Officer) is unlikely to differentiate between a discretionary activity without gain, which was derived from the business without professional status, his position will be too weak.

There are character and professional obstacles are less subject to managerial decisions. Architects, engineers and doctors are trained to have autonomy, they are often reluctant to believe that anyone else knows them better than what they do and resist anything that interferes with their professional independence or their creative freedom. The consequence is that many professionals seeking information and advice only when forced, and often tend to look at the resources of knowledge as a last resort.

Learning and knowledge sharing in an environment like this requires deep cultural change is a major challenge for leaders who want their companies to use in practical knowledge management.

These obstacles can be overcome by leaders and managers ready to take difficult decisions:

- defining company strategy that incorporates knowledge management;
- to accept the possibility of a small, short-term reduction in income;
- make any necessary financial investment;
- delegate staff time, consciously for knowledge management;
- provide budgets for staff activities related to knowledge management;
- creation of tools (information management, communication platforms, etc.).

There is an important reason to make knowledge management a strategic priority:

- short and medium term to improve competitiveness;
- long term and as a prerequisite for survival.

There are many features that can be learned from how the industry used them in the last 10-15 years, but the consulting services industry differs from this area, so copying their approaches, tools and techniques leading unlikely to to make it successful and to be adapted. Implementing knowledge management in consulting will be supported or not, depending on clear thinking, motivation and determination of managers.

Consulting companies have knowledge management as a strategic element in the strategic management can benefit from:

- motivated staff;
- develop superior service;
- A better Customer Relationship
- Management;
- Innovation and performance;
- Increased profit.

If the aspirations of consulting companies are considering knowledge management as a basic element of business strategy (modeling strategy, processes and tools), the role of knowledge in the context of organizational work to enable investment in this respect is the human psychology and combination of human resources in knowledge management process that can be, among others:

- Create the vision impaired
- Transmission of poor vision;
- Inconsistency between the considerations expressed and felt;
- Lack of time required to use knowledge organization members;
- Managing the organization's failure to acknowledge the members of knowledge.

These deficiencies have roots at a high level of management organization it as "locomotive" or main engine in practice and highlight the organization's strategy, but if the "engine" creates an organizational culture conducive to the inspiration, tenacity and support, successful implementation is sure.

The degree of success of implementing knowledge management is the decision in consideration it as a bureaucratic function without a clear relationship with the organization's results, so that the relationship with the basic strategy should only one resonance in all departments to ensure positive results.

Professional practices are generous members of an organization at both the functional and intellectual, which are typically managed by persons who are owners of the organization and remain involved in all their daily activities.

To raise issues that can be interposed in the successful implementation of knowledge management must be detailed following:

- Practice requires us to consider the disparity between expression and feeling as a manager can be expressed directly in the adoption of knowledge management,

but not consistently apply its implementation. (For example: people who leave the lamp lit in unused rooms or leave the water run continuously without using it).

- Defining the vision is a decisive factor, it should be simple to have a complete character, transparent and easy to follow, you must create an image in the minds of staff, to carry a load to evoke emotional and mental images. Knowledge management should be guided by generating ideas, framed in a vision that shows how it can contribute to the future success of the organization. Without a strong vision, initiatives tend to lose focus, coherence and disappear.
- Communicating the vision is usually due to the leader. The vision of the company shall be interpreted and transformed into concrete and practical action plans, in this context, other subordinates (managers) have to reinterpret the vision, subjective, progressively adding details in a concrete manner, creative and transparent, stand close from the definition of the vision. In this sense, the entire governing body of an organization to implement the vision and strategy to access the vision is implemented through their daily decisions.
- Qualified personnel. In a organization it is essential that first adopted to be prepared to struggle with unfamiliar tools and techniques and make them work. Project organization and analysis of practical community events, writing articles in the knowledge that their management requires professionalism and transparency to be viewed with interest and motivation by employees in the implementation of projects. Fortunately, only a few tools, platforms and IT & C, need a large number of contributors to become useful.
- Delaying or delayed "Timing" of adoption of the strategic decision to implement knowledge management is a factor which gives them fade it benefits an organization. There are indeed major corporate activities and less urgent than knowledge management, but knowledge itself is the key to future business success, not being able to be a delay

penalty quantification in a clear knowledge management.

- Time allocation is also a major factor in implementing knowledge management. When an organization has built awareness activities in entrepreneurial culture, they do not require of staff time. Takes time but save even more by allowing people to work more efficient and creative means of accessing knowledge transfer to become automatism, and at the same time pressures that prevent people to play key role must be identified and reduced.
- Persistence. Marginalization of knowledge management is exposed to a constant risk to its integration in knowledge-based thinking in the mentality of employees, entrepreneurial culture that, at the corporate level. Managing the implementation of the knowledge may prove to be a success when it ceases to be a conscious effort to become a habit. This requirement continues after encouragement, support and sometimes pressure along the management chain in a long time. Integration can not be delegated, as was also stated by the management of an organization's environment.
- Systematic review of the experience can be useful even in the smallest practices, but the organizational level requires a critical mass of users to become profitable. The more active the users (critical mass) is higher, the more potential benefits increase the number of possible connections between people and the value of qualitative and quantitative knowledge base increases proportionally. Interdependence between knowledge management and other corporate activities can provide valuable data and material criteria for the composition of project teams and activities of the department of human resources, and personnel evaluation.
- Strategic alignment needs to be driven by business needs and priorities of high-level corporate through vision, aspirations, objectives and targets so that the direction and priorities of major initiatives and investments that have the knowledge. In the context of knowledge

management it may mean giving priority to activities that can support a valuable discipline, and creative design or analysis looking at retrospective analysis to improve the quality and operational efficiency.

- Misperception. The insurance company's future organization may be based on the importance of knowledge, but it does not matter core staff, they will not work in the office than to be slightly easier or more rewarding.

Conclusions

The manager is required to be directly involved in the development, namely defining the vision to be able to communicate with confidence, to win hearts and minds of organization members. To capture the full attention of the transmission of vision, communication must be done "face-to-face" and the comprehension and commitment towards it must be made consciously.

The failure of managers to predict and fit the user's point of view often cause atrophy of knowledge initiatives. This deadlock is not specific knowledge activities, automatically lead to loss of enthusiasm. User's vision in every aspect of knowledge management is crucial, and is not considered enough in the early stages of development of vision or strategy, or creating tools and processes, yet it must have a permanent influence.

Consequently, management at all levels must ensure that staff knowledge is involved in activities so that they become habits. This requires sustainable promoting and encouraging, also ensuring that the employees ignorance towards knowledge management is eliminated.

Abstract

Learning is a very diverse activity: learning a PIN number, a poem, recognition of one's American Civil War, understanding the electrodynamics equations, driving a car, design a building and managing a project are very different experiences. And since most of us can learn to recognize a face without conscious effort, the memory of four random numbers requires some conscious attention, usually learning how to drive takes 30-40 hours of practice, and it takes 10 years to qualify as a neurosurgeon (in Britain). Despite the variations of time learning the same memory processes are involved in all activities, they are also essential to use knowledge.

Key words: leadership, motivation, learning, knowledge management, reward.

J.E.L. classification: I 25, M 12, O 10

Research has shown that infants develop an extremely sophisticated understanding of causality and mechanics before they can talk about them. For example, they learn quickly that, for a brick to push another brick it has to be in contact with her, and begin to use objects as tools to achieve their goal. They are surprised when an experimenter make something happen, which seems to violate causality. They are almost unique human abilities, even chimps fail to learn that a stick can be used to draw things for them.

We acquire fundamental knowledge such as this by interacting with the world, observing and thinking about what we saw, by learning from experience and it continues to be one of our most valuable sources of knowledge throughout life, which is the basis of all science and technology.

Causality forms the way we understand the world, and how we structure the knowledge.

We start asking “why” questions, questions and need to find causal explanations continue to be strong throughout life. When we do not help observing, often invented, and we can even invent entirely false memories to support explanations (all made entirely unconscious).

Memory is nothing but mental video appearance that we tend to imagine, research has shown that anytime we recreate the past whenever we remember, we often remember it a little different. And our behavior is controlled not so much as it is said, by the conscious, rational brain. Our unconscious determines our behavior much more of than we would like to believe, approx 90% of our thinking, according to a recent study the unconscious strengthens the conscious and the it sometimes overlaps it.

Also create insights that research shows, are often highly accurate, providing expert skills to explain and we can not make most of us avoid things that we should not do.

American Psychologist Jonathan Haidt has a beautiful metaphor: the conscious mind sees it as a rider on an elephant, a strong volunteer animal who often decides not to undergo the rider's character trying to lead it.

Managers need to understand something so in terms of rider, as well as that of an elephant in order to create conditions, tools and processes that lead organizations to learn more of what they do, to share knowledge more widely and to be more creative.

Learning is a very diverse activity: learning a PIN number, a poem, recognition of one's American Civil War, understanding the electrodynamics equations, driving a car, design a building and managing a project are very different experiences. And since most of

us can learn to recognize a face without conscious effort, the memory of four random numbers requires some conscious attention, usually learning how to drive takes 30-40 hours of practice, and it takes 10 years to qualify as a neurosurgeon (in Britain).

Despite the variations of time learning the same memory processes are involved in all activities, they are also essential to use knowledge.

All learning is based ultimately on sensory inputs of sight, hearing, touch, smell, taste and awareness of your body position and movement. They are stored primarily in sensory memory, which is quite extensive, but concise - less than one second for memory and visual memory sounds only a few seconds.

Images and sounds are processed locally to some extent, and then an interpretation of the parties interested us is transmitted lucrative memory. Auditory system, for example, has clarified one flow through voice input sound from the phone, office background chatter, traffic and so on.

Qualities of "Interpretation" and "who we are careful" are important, remember only a small part of what we see and hear and memory of an event can be quite different from the others, and even wrong.

The visual system builds many interpretations of "instant", the eye stops on a single point briefly at a time before suddenly moving to the next, and eye movement studies show that it depends on what we pay attention of. People have seen a different picture to estimate the economic situation of people in the image, or to find those ages were different movements of the eyes, they subconsciously seek different types of evidence. It seems that even the most basic level - the data are still largely sensory, and before carrying different meanings - how we perceive the world depends on what makes sense for us or what we expect to see (and hear), and who pays attention, almost as much as on what is actually in front of us. No wonder that the first explorers returned with strange reports of what they saw, those who learn to manage crowded cities are so confused, and witnesses can give different accounts of the crimes. Effects like these are combined by lucrative memory characteristics which work closely to sensory memory.

Neuroscientists make a difference between episodic memory, procedural and declarative, respectively, memories of events, motor skills, such as driving a vehicle, and speaking, information such as numbers and mathematics. These are all important in life, but the most important is the declarative memory, and conscious use in learning.

Research suggests that the memory key is to recognize patterns in what we see, their interpretation in light of prior knowledge and connecting them to prior knowledge. A random number generator for a number of new figures, generates 777888999 rather than 593684728, but both numbers are meaningless, but the first model, groups composed of short, simple one, two or three, arranged in an order familiar - much easier to remember. Familiarity can be just as useful.

Many of us use numbers with personal significance, because they are easier to remember.

Management practice

There are many practical steps that leaders can make for a company to give its best possible chance of success.

Use discussions to select your beliefs and to develop your understanding.

It is impossible to change one's beliefs through intense effort of will, or change other people in management training. The brain can be reconnected only by serious thought, by testing new ideas - especially in this context, the idea that knowledge management is really vital in continuing corporate success -against established beliefs, personal experience and external evidence, and thought by some the personal implications of new ideas.

Brainstorming

Brainstorming is a suitable approach, adding a small group of colleagues with similar thinking to a series of informal discussions, ideally including someone (outside, if necessary) who is familiar with the concepts and practice of knowledge management. The need to articulate thoughts helps greatly to clarify and development.

Exposure to other people's thinking equals the value of different perspectives can contribute to valuable ideas may indicate

additional traps, and can help develop strong enough arguments to convince those of us enthusiasts and neutralize active opposition. Such debate helps to clarify a new understanding and connection to existing assumptions and beliefs at a level that is difficult to achieve by "Brainstorming" Solitary. Active use of knowledge is a unique mind development and anchoring.

The debates also serve another purpose, they provide the foundation for a clear vision, preparing communication wider and help build a coalition of guidance.

Compression time

A final advantage of the debates is that they compress time, scheduling a meeting is one of the best ways to avoid disruptions. Higher Management should continue to fall during the knowledge management activities until it becomes a habit for everyone.

As we have seen, commitment to principles is only the first step in a long way. Senior staff should take time and create the conditions for mental commitment and leadership, even if delegates design and implementation tools and techniques of knowledge to others, at the same time, confronting personal beliefs, developing a vision, communicate it, building alliances, creating an example, tracking progress, and occasional intervention all the time, are essential.

Less important work must be delegated, if necessary, to free up enough time. Any difficulty in identifying activities that are less important than creating a learning organization is an indication that those beliefs expressed and felt did not match.

Internal or auxiliary aid

Shareholders often combine personal involvement in daily management, marketing and ongoing earnings with responsibilities.

This can be particularly difficult for them to find the right time to lead knowledge management initiatives, and the result is often delay after delay. It is always tempting to believe that when the current crisis will pass and there will be time available for knowledge management, but this happens very rarely, another takes its place out of time.

The solution is to identify basic management responsibilities to be personally discharged, and to seek help from other staff resources.

Knowledge management poses unusual problems of personal, structural complexity related to the organization. In a true learning organization based on strategic elements of knowledge management, taking responsibility for learning activities is rapidly implemented and transferred throughout the company.

The function of a manager plays a key role, responsibilities and management communities of practice normally delegated by experts in the field, to be implemented at the corporate level, through the organization's interdependent departments, namely the transfer of knowledge gained successor more people spreading the tasks of those departments.

In an organization in which learning and knowledge transfer plays an important role in the basic strategy is necessary to create a post of "chief executive in knowledge" or "Chief Knowledge Officer" (CKO) to help managers, leaders and others by experience providing specialized, practical help, encourage, coordination and supervision of knowledge management activities.

However, in practical and pragmatic, but most organizations are likely to be able to recruit an experienced specialist and advanced enough to guide initial creation of the system. The same symbol is rarely sufficient to provide an existing member of staff responsibility to create a knowledge system or a full time or part time.

Outsourcing is an alternative help, which often turn to an outside consultant. Consultants can help with experience, analysis, deployment, focused attention and time are unlikely to be available in any other way. They may correlate with the Board and staff on all levels without the baggage of an insider or inhibitions complicate a company's formal status.

They can reduce misunderstandings, helping to clarify thinking, and can ensure that key issues are being overlooked, and is more likely to ask challenging questions to be addressed always. Independence and detachment consultants are better equipped than its internal staff to conduct inspections of knowledge and I know really how staff

perceive culture and leadership style of the company, how well the systems of knowledge, and what customers really think about the practical work.

In the early stages of the initiative of knowledge they can provide valuable assistance in developing and communicating a vision, developing a global strategy, creating tools and processes, the practical implementation guidance, monitor progress and training internal staff knowledge roles.

Later - as in other areas where high-level specialist expertise is desirable, but can not create a full-time post is not appropriate to continue access to external expertise through a Non-executive directors or a similar arrangement.

Leadership by example

The most persuasive evidence that can give senior management confidence in the importance of knowledge is visible through the exchange of practice knowledge transfer and perpetual learning. For this reason, top management must first complete personal pages, contributing to the knowledge, participating in retrospective and forward-looking analysis and make presentations of the knowledge base.

Practical engagement as contributor and the user has a benefit, namely, that no personal experience on knowledge systems and activities, managers are equipped to guide future development and ensure that they are used in the best advantage. Senior management may also provide a lead in that show that knowledge systems routinely used to support their own work, which is considered as the standard for an organization's staff.

Knowledge bases retrospectively, looking, and guidance in particular can serve business management and professional ends. Retrospective analysis can help in learning lessons from a major activity such as an offer or opening a new office. Mentoring is a form ideal for managers who have retired or changed their role in order to transmit knowledge to success. The knowledge base is as important to good management and marketing knowledge as well as in technical knowledge.

Continuous motivation and obstacle elimination

The success of knowledge management depends largely on the people involved in the knowledge base discretionary in the sense that they do things they do not have to do.

Knowledge transfer and learning can occur only to a limited extent, the manager's duty is to create an environment leading only by ensuring that the enabled system is working and by motivating the personnel.

Performance over time and habit of using knowledge management tools make these mainframe systems to be so valuable in nature that users would focus on them.

Motivation is crucial, because people will not act without it. And belief in the strategic value of knowledge itself is sufficient to justify only a small crowd of people auditioning, most staff have more concerns and they need something more tangible.

One of the key challenges in creating a learning organization is that a number of activities to immediate knowledge in their specific compensators, which is harder to quantify.

In the context of a knowledge platform, complete personal pages, it is usual for beginners because its contributors are too "novice" in terms of system use, familiarity takes time, and in this phase the system provides only basic information. When getting to know the situations, employees continue to accumulate, to learn and use knowledge platform tools, gradually becoming more useful, and the slope reaches a point where it can reward new users with useful contacts. Eventually, they will provide the most lazy motivation they need to add knowledge. One of the main tasks for a champion in knowledge, therefore, is to create a sufficient incentive to keep their commitment to knowledge activities until the items go tilt.

Conclusions

Personal motivation can be provided in many ways, based on advertising to a minimum and gentle coercion. Simple practical measures such as highlighting interesting analysis of project company newsletter encouraging contributions to the knowledge base by nominating a topic of the

week, and insisting on procedural disciplines and complete database and analysis project can all be useful.

Motivation can be easily denied by no motivation factors and obstacles, so it is important to identify and eliminate them. Managers can begin the process by self-analysis, wondering why things are not that supposed to do.

The study and subsequent analysis of a project is useful, but rare, the most often mentioned obstacle is time pressure, which is ironic, given that saving time by reducing touches and "reinventing the wheel" is one of the main goals of knowledge activities.

Pressure occurs when specific requirements are in conflict with knowledge management, such as targets, subject to time pressure, the solution is legalization and creating space for the activities of knowledge by offering a personal budget time, but you can find other ways can be equivalent found to eliminate most of the no motivation factors and obstacles.

Corporate Social Responsibility – New Challenges for Strategy Romanian Companies

Cristache Nicoleta

Susanu Irina

Micu Adrian

"Dunărea de Jos" University of Galați

Abstract

At a time when the world is interested in phenomena such as, ecology, environment, food safety, ozone layer depletion, famine and their effects on social responsibility initiatives are becoming increasingly well received. Even if you can not give a real dimension of the concept of social responsibility-taking as any guarantee of success, an organization must be aware that there is only a tool for maximizing the value of image design, but an essential element of long-term success in direct connection with social and environmental performance of the community. The success of corporate social responsibility strategy is to find a balance between awareness problems of society, and capacity needs of various target groups material, financial and managerial organizations.

Key words: CSR, strategy, tools, programs

J.E.L. classification: M 14

1. Introduction

The incorporation of CSR principles into every operational level of an organization as well as its daily compliance has become a global tendency. Nevertheless, the Romanian business environment is still familiarizing with this business ethics. In this context, CSR is not perceived in the business community as a core value which is part of corporate development strategies. However, many CSR elements are acknowledged and applied, frequently with a "specific national character".

Obviously, there should be also mentioned the extreme case in which many companies with foreign capital approach the concept of

social responsibility in a more complex manner. These organizations define and integrate CSR into corporate strategies and their shareholders approve expenditures for social responsibility activities in the annual budget of these companies. In their activity these companies pursue three complementary objectives:

1. profit increase;
2. diminishing the negative impact on the environment;
3. investing in local community.

Most Romanian managers are concerned primarily with the company's survival or with their own interests and the social responsibility issues are among their least important concerns, if there are any at all. This attitude is explained by a number of micro and macro level factors, but mainly by the uncertainty under which their companies run their business. Regarding the local organizations which do care about society, *most of them understand social responsibility as donating money for charity and sponsoring public events.*

As expected, multinational companies were those which initiated social responsibility events, moving gradually from corporate philanthropy to community development projects and educational or training activities. Thus, several major companies distinguished even since the early 90's such as Coca-Cola, Vodafone, Orange, Henkel due to extensive projects designed to help victims of natural disasters, to protect the environment and support training programs for students and other educational projects.

After 2000, many other companies, both large and SMEs, started to be involved in actions of social responsibility, especially restructuring their technologies for improving environment, adopting social measures for employees, developing good relations with

local authorities. The research about the state of corporate social responsibility in the Carpathian region (counties in Slovakia, Poland, Hungary and Bihor, Botosani, Harghita and Maramures counties in Romania) conducted by Carpathian Foundation in 2007 concluded about the situation in Romania: “At a national level, CSR practice follows a clear positive trend. Companies and NGOs are the main actors. Romanian accession to EU and Romanian Fiscal Code influence, both with incentives and challenges, the corporate attitude towards the CSR domain. The development of CSR practices is influenced by factors from outside of the community (national or international models), as well as by local factors, which can encourage or inhibit the process. Elements affecting the development of CSR practices in Romania mentioned include: peoples’ perception of their capacity to change the community, companies’ need for qualified and motivated employees, the perception of local leaders in the community by businesses, etc. Romania country report underlines the fact that, in the regions of the country studied, companies preferred getting involved in shorter-term projects (event based or 30–60 days), where as the Poland and Slovakia country reports point out a different approach by identifying CSR projects with longer time frames. The reports from Romania, Slovakia and Poland show that a common characteristic of CSR in the Carpathian region is the difficulty in differentiating whether the decisions are based on the beliefs and values of one individual (usually a manager or owner) or form a part of an overall corporate strategy [5]. “

But for most organizations, social responsibility of is something which is considered occasionally, which has nothing to do with their main business and this is due to the fact that frequently it means corporate philanthropy. Most often organizations do not report on their social responsibility simply because they ignore the public in general.

The reasons for which organizations assume social responsibility are the following:

- economic interests namely: efficiency increase and profit increase;

- attracting and maintaining the qualified workforce;
- company’s reputation and tradition;
- business ethics and moral objectives.

According to the new orientations, due to the increased competitiveness of markets CSR has become an important element in product differentiation and reputation increase.

An analysis of the main aspects of corporate social responsibility nowadays reveals that it tends to become the key to the development of a country economically, socially, environmentally and politically speaking.

However beyond this noble objective, the following issues have been identified for Romania: social responsibility programs find no echo in the specialized press, their degree of popularization to the general public is not very high, there is a lack of published reports of social responsibility and the tendency to make them mandatory in the coming years, similar to organizations in Britain and Japan, reduced visibility of corporate social responsibility projects, lack of information campaigns of business environment representatives regarding the community problems, lack of communication between the business environment and community to solve the existing problems, lack of information centres to ensure the link between business and community, lack of business environment awareness and of the link between trust and consumer loyalty, the existence of an imbalance between the support of society’s various causes; lack of legislation to encourage companies to initiate projects of social responsibility, imbalance between proactive and reactive management in solving image and trust issues to the public’s benefit.

Community members’ trust and respect may influence the entire activity of a company and therefore it should contribute actively to the society development. The achieved benefits are represented primarily by recognition, reputation and appreciation. To summarize, we can say that the effects of company involvement in the community are the following:

- improving community relations (customers, suppliers, authorities);
- influencing the target audience, opinion leaders, press etc;

- placing the company on a higher level of the society;
- better image /better visibility for the company;
- consumer loyalty to the company and its products;
- employees motivation;
- significant contribution to achieving business excellence;

Starting from this framework of benefits provided by the integration of CSR principles into the organization policy, D. Wood identifies three principles that determine the social responsibility[6]:

- companies are also “social institutions” and this status forces them to use responsibly their power;
- companies are responsible, first of all for the impact they have on the environment in which they run their business;
- managers are “moral agents”, representing role models on the community level, thus determining them to exercise responsible decision-making powers.

The economic environment complexity and organizational complexity determine new requirements in organizations management and communication level to ensure the strengths and advantages against the competitive forces. Within this context several areas of interest can be marked, namely sustaining areas where there is poverty, areas where economic activities affect the environment. CSR can be also seen as an expression of the business environment dynamics, of ethical spirit and of care for resources in accordance with the sustainable development principles.

Although we speak about an acute necessity, CSR can only thrive when the proper legal conditions are created and certain policies that consolidate public trust are implemented. However this aspect is still critical for Romania. Thus private sector business is formally state independent but in reality many sectors are over-regulated whereas others, on the contrary are facing the lack of proper regulation. These drawbacks are also explained by the lack of communication between government, economic entities and civil society. This policy uncertainty is also triggered by the selective application of the regulations for political and economic purposes. Business

environment representatives consider that the legal system does not stimulate them to get involved in social activities.

According to the foreign analysts, corruption has still remained a problem which requires urgent solutions and it is probably the most worrying aspect of the social irresponsibility of companies that run their business in Romania. By monitoring the current Romanian business environment several defining elements have been identified regarding the meaning of CSR. Thus, the positive aspects refer to the following:

- yearly increase of CSR initiatives among Romanian companies (for instance multinational companies Vodafone, Orange followed by Petrom, BCR, Automobile-Dacia, Carpatcement); According to the statistics studies (<http://www.responsabilitatesociala.ro/dialog-uri/bilantul-responsabilitatii-sociale.html>) the most responsible companies from the Romanian business environment are the following:

- Vodafone
- Petrom
- Tuborg
- Orange
- Unicredit Tiriac Bank

- organizing conferences, symposiums on CSR in Romania;
- increase in number of companies that publish information on CSR policy, projects they carry out, achieved results as part of their annual reports (e.g. Siveco, Orange, Vodafone);
- expanding the public-private partnerships.

Nevertheless we should also mention the list of less comfortable aspects of what is intended to be a distinct and full-fledged field:

- inconsistency of programs, initiatives, strategic guidelines in Romanian CSR, many companies offering the financial crisis as a real excuse;
- reduced number of real CSR programs, many of them being simple sponsorship or donation events;
- lack of research, of some complex analysis which would be used to avoid intuitive decision-making in CSR;
- advertising tendency of some CSR reports;

- most SMEs managers mistake CSR with donations and sponsorships which indicates their lack of information, education to be responsible;
- insufficient awareness of the need for CSR activities and their benefits;
- lack of a common language and perception on what CSR is;
- CSR programmes are not always designed to meet a real social requirement;
- Involvement in CSR activities not as a strategic approach but only for a short-term image benefit;
- High degree of the general public's distrust concerning the business environment and especially the political one;
- Tendency in recession period to reduce the budget intended for CSR activities;
- Social responsibility programmes are not a priority for the Romanian business environment;
- The challenges described by the company range from the difficulty of selecting the most relevant causes and their prioritizing to the difficulty of finding a common language with other community actors (organizations, public institutions) and to the public opinion concerning companies that promote their community programs;
- Reduced number employee volunteer programmes of Romanian companies.

Despite the fact that the scales are tipped in the negative position, there are however real opportunities to increase the degree of CSR favourable perception among the Romanian companies. Basically we can identify certain opportunities that provide the business environment the chance to support corporate social responsibility through real policies.

Thus, the adhesion to standards and local and international reporting guidelines provides the possibility to ensure common framework which would further allow the setting of some CSR performance indicators. The transparency level increase, without turning CSR into PR or into a marketing tool, generates more credibility regarding all initiatives regardless of their extent. Among the opportunities concerning CSR expansion programs at the Romanian firms level we can mention the following:

- Companies sets a coherent CSR in accordance with the company's specific character;
- The organization management makes public the company's CSR obligations;
- Developing certain criteria and benchmarks against which the CSR activities can be assessed;
- Reporting social performance and making these reports public;
- Stakeholders consultations;
- Involvement in social and environmental programmes in accordance with company's interests;
- More efficient risk and crisis management;
- Attracting and motivating valuable employees;
- Stakeholders involvement in reporting process;
- Unfortunately great variety of issues that require company's involvement (environment, corruption, education, workplace conditions, resources, etc.);
- Publishing sustainability reports which approach all relevant issues in CSR field to improve organisations transparency;
- Implementing a more efficient environmental management system in organizations with high level of pollution;
- Company's development of its own internal and/or external audit system;
- Adopting G3 standards – triple reporting to assess companies' performance both in financial and economic terms and according to their environmental and social policies – in accordance with the sustainability principles.

However it may be noticed that although we are talking about a complex business environment, CSR has still remained a marginal issue for most organizations, especially the SME sector. At the same time it should be mentioned that CSR is a matter of internal conviction and business ethics and not of coercion.

Nevertheless, the most significant effort should be made by companies which can identify the most relevant and influential social actors with whom a dialogue may be further developed. For an organization, the result of this dialogue will provide a complex image on public expectations, a comprehensive understanding of how social reports should be structured as well as the set

of indicators that should be used to show the company's progress in areas where the public is most interested. Moreover these indicators must be compatible with the international standards of public information.

These indicators may be used as tools and benchmarks for assessing the social impact of activities that are included in the social responsibility sphere. The impact should be properly assessed and the public should be informed about this impact. Thus, the public should be given opportunity to express their opinion and this opinion should be taken into account by the company. Such assessments will help the company improve its CSR policies.

Moreover, each company should understand that social responsibility also includes basic human rights, moral integrity, concern for the environment and promoting responsibility throughout its entire network. Investing in community sustainable development can also prove to be economically lucrative since it strengthens the company's image in society and provides long-term increase opportunities. In this context, companies should understand that CSR can turn into even a strategic advantage which in its turn will further strengthen the company's reputation.

In order to broaden the framework and to enhance the acceptance of CSR concept in Romanian business environment, the Ministry of Labour, Family and Equal Opportunities will encourage *good practices* on CSR by:

- Companies' adherence to internationally accepted standards, such as OECD guidelines for multinational companies;
- Active engagement to identify and approach hindrances in compliance with the national legal requirements;
- Sustainable development and dissemination of good practices, including in the creation of aptitudes and abilities and approaching hindrances in their implementation;
- Partnership and active engagement between the public sector, civil society organizations and their representatives, local and national authorities;
- Transparency and effective information flow.

Within the new economic context and the social commitment of the Ministry of Labour, Family and Equal Opportunities to integrate CSR into public policy development is vital for the improvement of the decision-making process at all levels in order to improve competitiveness in a sustainable way.

The study “Developing the concept of Corporate Social Responsibility in Romania, within a European context “ concludes that [7]:

- In Romania, the definition of CSR as well as the practices in the field generate still a variety of interpretations and different understandings by companies.

- So far, in Romania many of the multinationals, used to run such programs in most of the countries where they operate have applied the CSRs principles as in their country of origin.

- Public-private partnership is not a mechanism that can support development of CSR programs.

- CSR is still perceived by companies in Romania as charitable giving, while companies show little awareness of understanding of the broad concept and its multiple facets and roles.

- 2/3 of companies surveyed believed that integrating CSR in company's management has a positive impact and make it more profitable, but only 17% believe that this has a large impact, while 34% believe that it has a small influence.

Many companies tend, at least until recently, “to choose spectacular, easily communicable and well presentable roles rather than charity and CSR action that would logically follow from their core business activities. Particularly for subsidiaries of multinationals, CSR was typically rooted in the PR or communication divisions, placed under great pressure from the executive management to deliver spectacular and communicable acts, targeting mostly the *consumers of all the possible stakeholders*, “*a fast returning investment*” .[7]

Things begin to move step by step in Romania, too. Some specialists consider that CSR in this moment represents a global phenomenon, not only a trend in rich countries. In some years our people will start to take decision to buy not only because of

quality and price, but also based on the social involvement of the provider companies. There is not enough information at this moment about the real thinking of Romanians about social responsibilities of companies.

Some positive aspects regarding the development of CSR among SMEs[8]:

- Importance given by governmental bodies and agencies in order to support CSR for SMEs:

- change of laws, new legal provisions in this respect, creating special departments for this topic.

- Financing programmes supported by Government or civil society in order to implement CSR for SMEs.

- EU funded programmes for awareness and support the implementation of CSR by the SME sector.

- More and more articles in newspapers, special dedicated web-sites, more and more events, seminars, conferences, in order to make known the concept of CSR and real advantages for companies.

- All involved parts: companies, clients, suppliers, local authorities, mass media, began to understand the importance of CSR and step by step to choose companies and the products and services of companies which introduced CSR strategies in their activities.

2. Conclusions

Thus, we can have a real process, by means of which we create a responsible society in which the companies try to cultivate a sense of responsibility and a better capacity to understand the economic, social and environment problems the society is confronted with, and the consumers are equally exigent and responsible.

The organizations' actions success is insured by the permanent dialogue with the consumer in order to satisfy him by means of the goods and services offered. In front of a polyvalent consumer, the companies' marketing specialists are challenged to find new references to understand the mechanisms that guide the consumer's behavior and profile emphasis. Referring to the respect that must be given to the consumer, it starts with some real knowledge and understanding of the elements that are the basis of his decisions, respectively the creation of his behavior. The today consumer is permanently seeking for a meaning that is not always compatible with the rationality or utility notion.

Abstract

Tourism has an important place within the world economy and represents a basic branch in many countries with touristic vocation. In the context of the current world crisis, religious tourism is a complex phenomenon in a continuous transformation and diversification, though keeping the basis element which established it: religion. The contribution of religious tourism to the world economy development is accomplished directly by the registered incomes from the specific activities, through the regional development functions of the destinations, through the function of education and development of the culture and development horizon in general. Unlike other economic fields, it has been statistically proven that in the current crisis situation, religious tourism registers a constant growth.

Key words: economic crisis, religious tourism, trends, specialization

J.E.L. classification: D21, L21, M14

The economic world crisis has affected all areas of social and economic life. In the '80^s of the XXth century people have become aware that resources are limited and that new forms of energy and of saving natural resources must be searched. Here it is that after 30 years humankind is facing a new crisis this time as a result of the consumption growth and of the investments destined especially to it. The preservation and rationalization of consumptions of any kind require first of all the education in the spirit of economy and of the higher valorization of all resources.

Tourism has an important place in the world economy and it represents a basic branch in numerous countries with touristic vocation. Natural touristic and anthropic resources are as well subject to economic laws and are the object of protection and preservation measurements in order to be valorized as rationally as possible through touristic programs by as many generations as possible.

Generally, to tourism are associated several functions through which we mention: remaking of work capacity, relaxation, entertainment, maintaining the health state, education, development of knowledge horizon, knowing other peoples lifestyle, cultural exchange. Thus, in the current situation of the crisis we consider that the education function should be developed under several aspects: education in the spirit of traditional cultures, of authentic cultural values, the return to moral and spiritual old ancient values, knowing of universal values and of life principals in communion with nature.

Religious tourism through its forms especially pilgrimage is one of the oldest tourism forms, knowing small changes in time. Old pilgrimage destinations know ever since ancient times are just as wanted today, tourists don't always have spiritual motivations, but rather of curiosity.

Religious tourism is a complex phenomenon in continuous transformation and diversification, keeping its basic element which established it: religion. Although there are many religions, cults, religious sects, when we are talking about pilgrimage, tourists pertaining to different religions, practitioners or not, atheists or adepts of syncretism, they all travel to traditional destinations motivated by the desire to follow

the steps of those who represented pillars, the ground stone on which a certain church has been built, wanting to know the cultural relics of the past which marked history and which represent real treasures of humanity.

Until the early and medium Middle Ages and also all through the Age of Renaissance, religious tourism meant mostly religious pilgrimage developed on traditional destinations in accordance to great religions. Thus, Christians were headed to Rome and Jerusalem, Muslims were travelling to Mecca and Medina in Saudi Arabia, Buddhists were headed to Lhasa and sanctuaries in India and Indochina, while Japanese were going to Mount Fuji [4]. The reasons why these processions were made, have been determined by worshipping different gods in the specific days or by searching answers by the pilgrims to their different problems. The implications were mainly spiritual and emotional, certain rituals were followed, there was a big fear from God's anger which could strike at any moment, if the sacrifice were to be brought too late.

Religious tourism is that type of tourism which has the purpose to visit constructions and holy places with spiritual implications, with a hint to the aspects situated on the boundaries between magic and religion [5]. Since pilgrimage is closely connected to religion, it is necessary to show that through history many forms of manifestation of believe have appeared, although with a high degree of extension in time and in the human kind's history, when given a closer look, we find that they simultaneously manifest in different cultural spaces. Thus we are contemporary to communities where rudimentary religions manifest, primary to society, a big part of the globe population belongs to Judaism, Christianity or Islam on one side, while others practice Buddhism, Hinduism, Taoism, Shintoism etc. In the XIXth century religious sects have appeared as Jehovah's witnesses or Mormons [2].

Analysis of religious tourism

In time, the concept of religious tourism has acquired more approaches as a result of diversifying the motivations determining practicing this form of tourism and the selected destinations.

The manifestation forms of religious tourism are just as various as the reasons determining the trip. It is travelled from pure curiosity, or with the purpose of knowledge under a cultural perspective. Many pilgrims worship divinity and its representations, others want to see and touch sacred in order to heal, to communicate directly with divinity or to experience the manifestation of miracle. Many pilgrims walk kilometers to free from the daily problems burden and to gain strength and reinforce the belief. Some pilgrims are pushed by needs and inabilities, others come to the holy places for the simple reason of making peace with oneself and to bring thanks [5]. For certain people the visited sites have a significance for others they don't have any religious significance. That is why it is no wonder that in such religious places, contrary to the strict clothing rules one can meet people wearing shorts and deep cleavage shirts [7]. Depending on the religious behavior, individuals can be divided into the following categories: negativist atheist, indifferent atheist, conformist, common Christian, traditionalist, real believer, practitioner believer [3], each adopting a certain attitude in respect to the pilgrimage place.

Ever since 2003 the European Association for Education in Tourism and Entertainment (ATLAS 2003) by the reunion of experts from Fatima in Portugal, have taken into debated the need to accomplish the research of motivations and specific needs for visitors of religious sited and the analysis how the administrators of these sites accomplish such requests. On this occasion also a group of experts wanted to globally recognize the significance of term “religious space” to this being associated: a closed space, an altar, a sanctuary, a cathedral etc.[5].

The specialists' concerns in the field of religious tourism were headed also on the relationship between the terms tourist and pilgrim being extended the pilgrim statute to the tourists travelling into organized groups by tourism agencies, which determined from a statistic point of view a growth in the number of tourists on a world scale being registered as practicing religious tourism specifically pilgrimage.

Unlike last centuries, today those who practice religious tourism have a higher education degree allowing them a higher appreciation of the cultural, historical and religious value of religious spaces.

As a result of pilgrimage tourism development the phenomenon has awakened the interest of researchers who started studying the phenomenon and explain its causes which generated a higher growth rhythm in relation to the world touristic flows in general.

The globalization of the touristic phenomenon has determined an increase in the travelers' mobility degree, the introduction in the world circuit of some religious destinations representatives to the universal culture and civilization. For example in Western Europe pilgrimage is an event frequently taking place, being registered approximately 6.150 pilgrimage centers, by them 4.075 are dedicated to Virgin Mary [1].

Among the main religious tourism destinations we mention: the pilgrimage to El Camino Frances to Santiago de Compostela with a lengths of 709 km, where in 2009 a number of 145.000 pilgrims obtaining the diploma have been registered [8]; secret sites of Islam, Judaism and Christianity from the Anatolia Peninsula –Turkey; Vrindavan in Northern Italy, a location visited every year by more than 3,5 million people; Fatima-Portugal, the Holy Fortress from Mecca-Saudi Arabia visited by 2,1 million people in December 2010, the pilgrimage to the Gange river-India, where it an estimated over 70 million Hindu come for the spiritual purification in the months of January and February; the religious sites in Western Ireland; the Western Wall, also, known as the Wall of Tears, in Jerusalem where 6 million people were registered last year; Medjugorje-Bosnia, which has over 15000 accommodation places [11];

Katherine Monastery, Mount Sinai-Egypt; the Vatican-Italy, visited annually by more than 4 million pilgrims and tourists [15]; the great Efes theater from Turkey; Jerusalem-Israel, Olives Mountain, Ghetsimani Garden, Via Dolorosa and the Grave; Apocalypse Cave, Patmos Island-Greece; Massabielle grotto, Lourde, France, where more than 6 million people come annually; the Church of All Saints Castle Wittenberg-Germany;

Basilica of the Guadalupe Virgin, Ciudad de Mexico etc. [14].

Tourism has lead to the creation of new behavior habits, to a new life style. This has generated a cultural move encouraging travelers to see and to understand social, cultural and environment differences. Homo turisticus has become a symbol of a society which opened and has evolved. Today, old pilgrimage sites have started again to attract masses of pilgrims, these not being any different from the tourists arrived in vacation. This mass movement means a search for redemption or a comeback to the roots in the past as a form of resistance in relation to the rationality of modern times. Without a doubt, tourism industry and mass-media offer pilgrimage as consumerism. Taking into account that tourists share the same attitudes as pilgrims, in other word the search for authenticity, on different depth and implications levels, one might say that pilgrims are partially tourists and that tourists are partially pilgrims.

Rediscovering pilgrimage, also, shows that religious values, doctrines and institutions have lost nothing from their statute and influence on the day to day behavior.

The modern individual is looking for transcendental values to surpass fragments, discontinuities of the contemporary society representing “the pilgrim tourist” from modern times [16].

As a result of an increase in the number of demands for this form of tourism, tourism agencies have developed their specific services offer [6]. The pilgrimage tourism development has awakened the researchers' interest, who started studying the phenomenon and to explain the causes generating a bigger growth rhythm in relation to the world touristic flows in general. On a global scale tourism has been affected by the crisis stronger in 2008 and 2009 then, a slight increase in the number of tourists has been registered in 2010.

In that year on an international scale the tourists arrivals have increased in relation to the previous year by 6,6%, arriving to 940 million, while the incomes from the world tourism has increased by 4,7% arriving to 919 000 million dollars, that is 693 000 million Euros. For the first semester of 2011 the World Organization of Tourism estimates

an increase of approximately 4% in relation to 2010, a growth which will be maintained, it seems for the entire year [12].

In November 2006 the World Religious Travel Association (WRTA) was born, an association who has aimed to promote religious destinations from all over the world. It was then considered that there were approximately 300 million tourists practicing the religious tourism. Representatives of tour-operators, and of cruising companies, organizers of religious events from 30 countries were reunited to analyze the phenomenon and to elaborate a development strategy of this form of tourism. Unfortunately at the WRTA meeting in 2010, which took place in Turkey, it has been concluded that the functioning of this society is an expensive action, thus ending the first association of this profile in the world [17].

Numerous tourism agencies from all over the world make and sell cultural-religious products and pilgrimages. The request for these types of tourism can be filed both by individual tourists who, choose to travel on their own or in organized groups, and by the representatives of different religious cults or sects for the groups they represent. Regarding the chosen destinations it is found that under the aspect of providing accommodation spaces for big flows of tourists such services providers have adapted as well their offer. Pilgrims can choose to be lodged by monasteries, guest houses or in hotel structures [13].

For the first time in the world, in India is born the idea of making trademark hotels for pilgrimage tourism. This is due to the increased requests number in pilgrimage place for quality hotel services. An example is Starwood by setting up a 180 rooms hotel under Sheraton trademark. This unexploited potential of the market has awakened the interest of other trademark hotels as well such as: Four Points, Hotel Aloft, which will make via local developers a national system of such hotels. These will be opened I Tirupati, ShirdiDevi and Vaishno, Nasik, Ajmer and Mathura. The interest for creating such hotels is determined by the large number of pilgrims arriving, for example only in Tirupati some 23 million pilgrims are registered every year. Leela Ventures hotel is also flirting with the idea of making three

stars hotels in Nalanda, Haridwar, Rishikesh.

All these preoccupations have as a purpose to meeting the specific demand on Indian tourists who are numerous and in continuous growth, not being taken into account the tourists flows from other countries. In 2010 a 740 million religious travels has been estimated, the Ministry of Tourism intends to increase by 2013 the capacity of internal accommodation by more than 100.000 rooms [18].

Pilgrimage in Romania

When things go bad from an economic point of view, the Romanian guides his thoughts to the divinity. Even in the surveys made up during the last years, the church is rated with the higher level of trust among the state institutions. The most important pilgrimage places in Romania are Mănăstirea Nicula, which received from Papa Pius XIth, in 1928, the statute of Marian sanctuary; the pilgrimage to the relics of Saint Parascheva from the Metropolitan Church in Iasi; and the pilgrimage to the relics of Saint Dimitrie Basarabov from the Romania Patriarchy in Bucharest.

Pilgrimage tourism in the above centers and in many other sacred places in Romania produces positive economic effects on the entire destination zone by a higher valorization of accommodation spaces, by the incomes registered from rent and specific trade activities. From these events taking place in occasion of the pilgrimage to Saint Parascheva, for example, in 2009 Iasi City hall also had to gain, by cashing important amounts coming from renting the public space. Thus, the more than 400 traders paid to the local budget for 6 days some 1,5 million lei [9].

Although there are no statistic data regarding the dimensions of pilgrimage tourism in Romania, it is estimated that year by year the number of pilgrims in the above centers has grown. They travel individually or in organized groups through programs made by initiators from within the church especially. Services of touristic packages are requested for travels outside the borders for pilgrimages organized by tourism agencies and by the Romanian Patriarchy. The only tourism segment not affected by the crisis is

the religious one, the number of Romanian making internal pilgrimage tourism being constant in the last years.

Moreover, external travels with a religious theme are in continuous growth, in accordance to the tourism agencies representatives and to the Patriarchate. For this year approximately 40 000 Romanian are estimated to have left or to leave in such a journey, with 10% more than in 2010. The average price for an external pilgrimage is 600 Euros per person, which means an estimated revenue of some 24 million Euros per year from which 25% goes to tourism agencies and 75% to the Patriarchate as program organizers [19].

Conclusions

Religious tourism is a complex tourism form combining today elements of culture, tradition, civilization, history and religion in a harmonious way, giving the products a higher degree of attractiveness. The magic blend between sacred and secular, urge and accomplishment of desires, determines that pilgrimage keeps awaking the interest of numerous dwellers of the planet. The manifested requests are valorized by the tourism organizers, but new needs are generated by products and original destinations. It seems that the crisis not only succeeded in negatively influencing the tourists' flows but also generated new preoccupations in the field of increasing the accommodation capacity. By the benefic implications upon the individual and the economy, religious tourism is one of the activities which deserve an increasing attention to its continuous development on a national scale by showing to advantage the wonderful treasure that Romania has.

The Migration of the Romanian Citizens „Defies” the Economic Crisis

Cristian Elena Raluca
Enache (Darzan) Mihaela
Romanian American University of Bucharest
cristianraluca@yahoo.com
emrau2003@yahoo.com

Abstract

Migration affects the active population of a country, entrepreneurs, companies and political class equally; there are both negative and positive effects for both origin and host country.

The factors that influence the migrationist phenomenon are social, psychological, cultural factors, having a significant impact on the „economic life” of a country.

The effects of the economic crisis did not discourage too much the migration of Romanian citizens, though that lately the phenomenon had a much lower intensity than in 2008, even if the latest forecasts and statistics considered that this phenomenon would be completely stopped under the current circumstances.

Romanian citizens, though that lately the phenomenon had a much lower intensity than in 2008, even if the latest forecasts and statistics considered that this phenomenon would be completely stopped under the current circumstances.

Key words: migration, globalization, economic crisis, remittances.

J.E.L. classification: F22, F24

1. Introduction

Spreading of the global economic crisis was felt especially on the labor market, affecting also the migration phenomenon. Another phenomenon emphasized by the economic crisis is the drop of the income (salaries) in Romania, as well as the altering of income distribution (of the remitters) of the immigrant flows from the host country to the origin country.

Until 2008, the central and South Easter European countries had a positive growth mostly because the remitters (incomes obtained from the transfers between countries); in our country, these led to a significant grow of investments and private consumption; unfortunately, we cannot say the same thing about 2011.

The Romanian economic situation, poverty, uncertainty regarding the future, the current global context and the new monetary economic crisis which hit severely the EU crisis, have had a direct and definite impact on migration.

2. The significance of the remitters for the origin country during economic crisis

Beside the known negative effects of migration for the origin country, there are also positive effects for the economy: grow of income flows (remitters), income from the host country to the immigrant’s origin country, in our case, Romania.

Gabriela Prelipean in „Migration and the thrill of the remitters. Implications of the current economic crisis”, said that the motivational factors of the remitters can be endogenous (referring strictly to their own situation and the context the immigrant is living, the altruist relation with the family and the close ones) as well as endogenous (referring to the external environment, psychological, cultural factors, affecting especially the „economic life” of a country) that is the significant differences between the GDP of the origin country and the GDP of the host country, security of the monetary transfer, decrease of some bank fees, can lead to nothing but the increase of the migration phenomenon. [1]

The amounts of money (remitters) sent in the country by immigrants improve significantly the living standard of the recipients, these money going mostly to family private consumption, to investments in human capital (health, education) as well as to small investments (purchasing housing, land, cars) or to paying certain loans to banks in the country.

The positive effects of the remitters are felt at macroeconomics level also, leading to an increase of personal consumption and investments, that is the increase of income for a certain part of the population.

According to the data issued by World Bank, the remitters entered a decreasing flow starting with the second half of 2008, after a significant grow in 2007-2008 [2].

For the destination preferred by Romanians (Italy and Spain) we notice a 9% decrease, and also for Spain, between June and September 2009, compared to the same period of the previous year.

For Italy, the decrease is 7.4% in the first three months of 2009 compared to the same period of 2008. The amounts of money sent into the country by the Romanian citizens working abroad during the first trimester of 2011 was 758 mil euro, being the lowest value recorded in the last six years.

3. The impact of the crisis on the migration phenomenon

The economic crisis hit not only Romania, but also the most developed countries in the European Union: Germany, UK, France, Italy and even Spain, Portugal, Greece and Ireland, countries that not long before the big global changes, were, for many Romanian immigrants, a source of jobs that the local population was not willing to perform.

The latest EC statistics for the second quarter of 2011 showed that at least 2,1 mil Romanians work in EU Member States. The destinations preferred by Romanians remain, as before: Italy, Spain, Germany, UK and France.

In 2010, statistics show that there were approx. 2.5 mil Romanians and Bulgarians working in 15 EU Member States. According to statistics, there were 890.000 Romanians working in Italy, 825.000 in Spain and 110.000 in Germany, the rest of 275.000

Romanians being registered in Austria, Denmark, Finland, France, Greece, Ireland, Luxembourg, The Netherland, Portugal, Sweden and UK.

According to the data for the labor market at EU level, the number of Romanians living in EU-15 grew in 2009 at a much slower pace than before the crisis, becoming negative in the first trimester of 2010 (a negative net migration), and growing again in the next two trimesters.

Leaving aside the pros and cons of migration, the Romanians were, unfortunately, constrained to leave for work abroad, after losing their jobs, this adding to the significant decrease of budgetary salaries. The pros of the Romanian migrant are social, psychological are rational; they do nothing but support and emphasize the already strong motivation of the Romanian citizens working abroad.

The statistics and studies conducted on Romanian migrants after the beginning of the crisis show a significant down trend of the migration phenomenon.

Other factors that influence the migration behavior are: the cultural model (both family and community), education: foreign languages the immigrant knows, the profession the immigrant trained for in the home country, abilities acquired throughout the life, social and especially financial status, the way that population of various countries understand poverty (in our case, the Romanians), the economic crisis or even the “poor man status” – which for many gives an exclusion feeling, at least in our country in the last 20 years after the communism[3]

In the middle of a new economic crisis or in strong recession, the Romanian citizen is still willing to leave for work abroad, willing to leave home the „Romanian dream” and to embrace the „European dream”.

The Romanian citizen is willing to „reluctantly” leave home the family, the relatives, the children, and at the same time, a much uglier side: poverty, unemployment, corruption, bureaucracy and his own incapacity; these things do nothing but seal the fate of the Romanian emigrant.

Romanian citizen is trained well enough to enter a new host country, capable of offering him and his family a decent living and a better salary.

Romania remains, unfortunately, for most of the immigrants working abroad, a „ poor, corrupted, without perspectives country”, now more than ever because the effects of the economic crisis and the austerity measures.

The figures released by the Italian National Statistics Institute for 2011 show that there were at least 997.000 Romanians living there, most of the women, compared to 2009, when this figure was approx 887.763 Romanians.

The decisions of the migration are mainly dictated by the economic context, by the income (salaries, social and political protection) as well as the demand for foreign work force for various domains: construction, transportation, agriculture, household services – children or adult caretaking.

Unfortunately, for our citizens working abroad, the economic crisis had a certain impact on all the economic sectors. Italy and Spain, two of the main destinations, are no longer very attractive for our citizens in 2011, because of the economic crisis. The construction sector, which until 2009 attracted hundreds of thousands of Romanian men in Italy and Spain, proved to be one of the most affected by crisis.

The deep economic crisis in Spain made the construction sector, that for a long time was thought to be „the engine of the Spanish economy”, sink into a deep decline, leading to the collapse of the real estate sector and to high unemployment, including Romanians. Unemployment in Spain has reached alarming proportions: besides the Spanish unemployed population, there are also unemployed Romanian citizens.

For Spain, the migrant women, compared to the men, were much less affected by unemployment, mainly because the fact that they have jobs in sectors very little or not at all affected by the crisis.

We must note the campaign started in France against roma Romanians, but also the events that happened in Italy against Romanian immigrants, especially the ones at the end of 2010 (the Romanian woman killed in Rome, in a metro stations, by a xenophobe young Italian) [4]

Another strong argument in favor of migration is the work force deficit in Romania, generated by massive migration from various domains: construction, health, education, textiles, shoes manufacturing and commerce.

Even if we consider the above mentioned arguments, we may emphasize the fact that Romanians are not discouraged and are not yet willing to leave for good Spain for Romania, preferring to live on unemployment allowance from the Spanish state, with is bigger than the one in Romania. In a world where the Spanish or Italian citizen becomes unemployed, the Romanian citizen accepts any kind of job, or changes domain, without big expectations from the foreign employer.

Another example would be Italy, where despite the latest pessimistic economic forecasts, the demand for jobs in home social care or for household services continues to grow, Romanians being preferred for them [5].

Statistics in Italy show that from 1.6 mil Romanian women working as caretakers, only 700.000 ale employed legally, with work contract, while 900.000 Romanian women work without contract.[6]

The Romanian women usually sign a contract with the families in Italy, mentioning a small amount of money, the Italians trying to avoid as much as possible taxes, and, at the end of the month, the Romanian women receive a significant amount of money.

According to a study by Friedrich Ebert Stiftung Romanian Foundation men, unlike the women chose more easily to leave for working abroad even if they don't have a work contract. More than half of the male Romanian emigrants leave abroad without being waited there by family and friends.

Economic crisis divided Europe in two: for some migrants coming from the South East European countries (relatively poor ones, such as Romania, Bulgaria or Moldavia) the crisis did not discourage them; on the other hand, citizens of countries like Spain, Italy, France, UK and Germany feel that their jobs are threatened, and some of them, unemployed at this time, accept those jobs that they wouldn't have accepted before. For Romania, the deepening of the economic crisis does nothing else for the poor population of the country than intensify the migration phenomenon, thus defying the forecasts and opinions of the economy and politics specialists.

Romanians see their own migration as a way to save them and their families, helps them understand, by opening new horizons, how it is to really live in a more developed country, although long term migration leads, in time, to the destruction of the family.

Studies conducted by the Romanian National Statistics Institute prove that for 2011, more than 70% of the Romanian migrants chose to go to Italy and Spain. But there are also Romanians that chose to come back because of the new, worse salaries and interdictions on the labor market.

Romanians that returned to Romania for good had the chance to experiment migration, mentioning a series of negative effects: family problems, not being able to integrate in a community, racism and extreme materialism.

Unfortunately for the Romanians working abroad, only a small percentage of them succeed in finding a better job than the one in the country and maybe according to their studies.

The Romanian emigrant usually chooses the destination country based on the existence of certain close relatives (brothers, sisters), which would lead to an easy adapting, to finding a better paid job, or to persons that would help them unconditionally, the entire migration being based on the „walked path” principle.

The studies on migrants in EU show that despite losing their jobs, they would be more entitled to go back to their origin countries, unlike the migrants coming from non EU poor countries that prefer to remain in the destination countries, even if they lose their jobs. [7]

Migration in the present economic, political and social context in Romania, becomes, for the common unemployed Romanian in his country, a real „life boat”. If by 2008, the migration decision for the Romanian citizens was based on social grounds (family, close relatives working abroad), now people of almost all generations migrate, regardless their studies (middle school, high school, trade school, university), regardless their ethnicity, culture and age. The question is what makes Romanians leave for work abroad?

The answer would be: most of the Romanians leave for money or higher income, because of the lack of jobs, in order

to guarantee a decent living, because of the poverty in the country, of corruption, bureaucracy and austerity measures, or for investing inhuman capital (children or close relatives).

Their choice to remain in the Western countries or to come back home and join the unemployment represents a real dilemma for the now hopeless Romanian immigrant. [8] Under these circumstances, the Romanians that chose to remain in the host country, changed domains to forestry, sheep raising or various services: (barber shops, restaurants, hospitality industry, and tourism).

Working abroad is usually a temporary strategy, most of the Romanians choosing to come back in the origin country.

An extremely worrying situation is represented by the continuous grow of the highly qualified population.[9]

Romania faces more and more the so called „brain migration” phenomenon. Eurostat studies show that more than one quarter of the emigrants is formed by university graduates.

The most representatives emigrant categories are: workers, medical nurses, doctors, economists, professors, engineers, architects, IT specialists, which are qualifications also requested in Romania, but much less paid compared to any EU country.

4. Conclusions

The effects of migration on economic growth have a series of benefits for the origin country (Romania), the ones that come home benefit from leadership knowledge and other competences in various professions.

The migrants leave for work abroad for money, for substantial gains and come back to be near the families or because they made enough money to reach their targets in Romania.

Regardless the motivation, leaving for work abroad does not make one rich, but for sure, for the poor Romanian, it offers a more decent living than in the country.

Most of the immigrants returning home with the deepening of the crisis abroad declare themselves to be quite pleased to have the possibility to join their families, but they live a worse life in Romania than abroad, from their savings

Usually, the Romanian migrant returned in the country does not have very good chances to get a job here; most of these chose to start their own business, with their savings.

Generally speaking, we may say that the economic crisis had, and continues to have a series of negative effects for the Romanian migrant, choosing to return home, but also for every citizen of Romania.

The Knowledge Based Society and Economy. Literature Review

Cușu Dorinela

“Ovidius” University of Constanta, Faculty of Economic Sciences
cusudorinela@yahoo.com

Abstract

In recent decades, humanity has become extremely concerned with finding plausible explanations about the post-industrial society and its sense of evolution. The literature in the field has been enriched with several terms, such as post-industrial society, information society, knowledge society, new economy, information economy, the new way of creating wealth, etc.. Meanwhile the world economy has entered a process of irreversible changes that have foreshadowed the new type of economy – the knowledge based economy.

Key words: knowledge based-economy, knowledge based-society, knowledge revolution, globalization

J.E.L. classification: D 83

1. Introduction

In the early 1990s, two major phenomena began to revolutionize the economy and the daily life all over the world, including Europe. On the one hand, the economic globalization, economies around the world becoming increasingly interdependent, and on the other hand, the knowledge revolution.

"In essence the knowledge revolution represents a fundamental change in the economy based predominantly on natural resources in the economy based predominantly on knowledge". The result of the knowledge revolution is the new knowledge-based economy.

"In essence, the knowledge-based economy is characterized by transforming knowledge into raw materials, capital, products, key factors of the economic production and is also characterized in economic processes in which the generation, sale, purchase, learning, storage,

development, knowledge sharing and protection become predominant and decisive condition in ensuring the sustainability of the both firms and economy" [1].

With the current knowledge revolution, obtaining the economic performances are conditioned by the existence and use of knowledge, of course calling also the other forms of capital that are and will always remain necessary in certain proportions.

The concept of globalization means from the economic and organizational point of view the integration or merging of national markets and, therefore, the development of new competitive labor and capital sources.

2. The knowledge based society

The phrase "economia bazata pe cunostinte" is used worldwide today. This name comes from the phrase "knowledge based society" or "knowledge based economy". The knowledge-based society or the information society is a post-industrial form of social organization in which the main activities and sources of incomes are related to the knowledge management.

The knowledge-based society ensures the dissemination of the knowledge to all citizens using mainly new methods like the Internet and methods of learning by electronic ways (e-learning)

3. The knowledge based economy

"The Knowledge-based economy is a highly personalized economy. In this economy, the overall success in the management of the organizations is based on the existence of an environment oriented on the production of new knowledge [...]”[2].

According to O. Nicolescu "the knowledge-based economy is characterized by transforming knowledge into raw material, capital, products, key factors of

economic production and economic processes in which the generation, selling, buying, learning, storage, development, sharing and protection of knowledge become predominant and decisive condition for the long-term economic sustainability.” [3]

Romania must take into account the contribution of knowledge and innovation in the development process now more than ever, knowledge is the main sustainable and renewable resource of Romania

Milestones in shaping the new economy are:

- the years 1984-1988 when many transnational companies were no longer able to keep pace with the growth of the complexity of the problems faced;
- 1992 when investments in intangible assets have exceeded in the U.S.A the investment intangible goods.

In Europe a crucial element in promoting the knowledge-based economy is the European Union's strategy of establishing a knowledge-based economy adopted at the Lisbon summit in 2000 which aims to transform the EU economy in a competitive and dynamic knowledge based economy .[5]

In Romania the promotion of the knowledge based economy started with the "Knowledge Economy Project" initiated by the Romanian government through the Ministry of Communications and Information Technology which requires the implementation of electronic networks in a total of 200 local communities disadvantaged regarding the access to knowledge.[4]

The overall objective of the project is facilitating the participation of disadvantaged communities to the knowledge-based society in line with the Government strategy for EU integration.

The objectives of this project are to reduce disparities across Information and Communication Technology populations education, public access to information in digital format via electronic networks of local communities, providing electronic government services to rural communities, providing mechanisms to encourage entrepreneurial initiatives in Romania .

In addition between the first priorities of the Romania's National Development Plan 2007-2013 is: "Increase of the economic competitiveness and the development of the knowledge economy."

The development of the knowledge-based economy offers a new vision in which the informatics, economic, managerial, social and technological aspects are intertwined.

4. Characteristic of the knowledge based economy

O. Nicolescu and L. Nicolescu identifies a number of characteristics of the knowledge-based economy [1]:

- The primacy of knowledge in all spheres of the economic activity; knowledge is often an input more important to obtain performances than land, money or labor.
- In the knowledge-based economy the intellectual property will be majority (intellectual property is a form of a legal title that allows the owner to control the use of certain intangibles, such ideas or expressions, common forms of intellectual property include patents, copyrights, trademarks).
- Concentration of economic activities not on the production of goods but on the production and accumulation of knowledge goods. Knowledge and knowledge assets, tend to become the most popular and cherished goods for agents.
- The knowledge isn't based primarily on tangible resources (land, buildings, equipment), but on intangible resources represented by the knowledge of competent people.
- Using mostly symbolic products to the detriment of natural products (symbolic products are based on information whose value is independent of the physical characteristics of these goods, for example, cards, software, electronic commerce, electronic banking site).
- Increasing the intellectualization of work processes in general and especially of the economic ones. In some developed countries the intellectual work became predominant in the whole society to the detriment of traditional industries such as textiles and agriculture.
- Eliminating the need to concentrate large amounts of physical and human resources in an organization, in order to generate sustainable economic performances concomitantly with the

integration of computers, expansion of the home-work.

- Gradual disappearance of borders between the activities of the company by focusing on the gradual abolition of the hierarchical organization and replacing it with teamwork.
- Organizational performances are mainly based on exploiting and improving technologies.
- Majority share in the growing service sector, the whole economy at the expense of the manufacturing sector while the service generally incorporates a higher volume of knowledge, compared with the products.
- The development and growth of exports in general and the exports of knowledge in particular because of the blurring of differences between national markets.
- Rapid multiplication of the SME's while reducing the number of large firms because the former are more flexible and can adapt quickly to changes of the external environment. SMEs represents the main promoters of the knowledge economy as it have three essential features: flexibility , dynamism and innovativeness.
- Diversifying economic association forms between organizations in order to capitalize on higher level the knowledge and other resources available (eg. of forms of economic association between organizations: strategic alliances, networks of firms, clusters, industrial parks).
- Against the background of globalization and with available information and communication technology, companies can improve their cooperation.
- Obtaining competitive advantages in all forms of organization: firms, groups of firms, clusters, networks of firms, industries and economic regions, national economies and world economy based on the knowledge possessed and used.

5. Conclusions

The process of building on organizational environment favorable to knowledge is a complex, difficult process which requires a considerable period for the preparation and

performance of all great changes, with emphasis on the human nature and involves a number of specialists based on knowledge.

To benefit from the knowledge revolution concrete strategies are required to help countries in the transition process to the knowledge economy such as: educated and properly equipped population in order to generate and use knowledge, an effective system of innovation in firms and research centers.

Accepting the fact that the company represents all relations of cooperation between individuals and not a separate entity to which individuals are subordinate, allows understanding the role of education as the basis for the existence of the individual and society. The education influences how the individual acts.

“As the market become more competitive, less predictable, organizations have realized that their main values which are known and the ability to use this knowledge to achieve competitive advantage. [...] Transitioning to a knowledge-based economy and in particular the construction and operation of knowledge-based companies, cannot be achieved without an efficient management of knowledge” [7].

Knowledge Based Company– a Theoretical Approach

Cușu Dorinela

“Ovidius” University of Constanta, Faculty of Economic Sciences
cusudorinela@yahoo.com

Abstract

In a stable economic environment, the change may be slow, and the organization would have time to react and maintain its competitive advantages. In contrast in a knowledge-based economy, the economic environment changes rapidly and the response is not the best alternative; in order to succeed, the organizations must be proactive, to anticipate, to be directed towards learning and permanently development.

The main resource of a knowledge-based company is the knowledge. This company is focused on knowledge creation, acquisition, learning, use, sharing, integration, exploitation and protection in order to achieve economic and social performance. From these considerations it is clear that the knowledge-based company is the learning organization that develops over time as the result of commitment and management processes applied and constantly pursued. Resources within the organization are directed toward learning. In the knowledge-based organizations are thus new opportunities for motivating employees to learn, by leaders, ways that in the traditional economy weren't an option.

Key words: knowledge based organization, learning organization, new types of organizations according to the knowledge based economy

J.E.L. classification: D 83

1. Introduction

The transition to the knowledge-based economy changes substantially the way the enterprises are established and operate.. At the foundation of any business is the tap of on opportunity.

“Knowledge-based companies are created, from this perspective, in two ways: valuing the new opportunities associated with the knowledge-based economy and valuing the opportunities of the classical economy, but in a new manner focused on knowledge [1].

The new types of technical and economic opportunities include new technologies, the Internet, the electronic commerce, teleservices.

2. The knowledge based organization

The development of the information society as a knowledge society is decisively conditioned in Romania and internationally, by the presence of intelligent organizations with advanced capabilities for managing their collective skills as sources of performance. Thus we can say that the main actors of the knowledge-based society are the knowledge based organizations.

Knowingly concept based organization has its origins around the years 1984-1988 when many transnational companies do not manage to keep pace with the growing complexity of the problems it faces. Knowledge-based organization is known as an organization focused on memory, intellectual-intensive company, organization, intelligence.

For Romania, the relevance of the concept of knowledge-based organization derives from the engagement of the country to the development to the information society - knowledge society, a condition for the sustainable development of the country and its European and Euro-Atlantic integration.

In the reality of the Romanian business environment, the firms of the old economy coexist and interact with those of the new economy and in their characteristics can develop gradually allowing them to fall in the second category.

Indispensable attributes of the learning organizations are: to establish a strategic vision, to expand continuously their creative

and innovative capacity, to motivate the learning process within the organization, to find in the learning process both an acquisition of new knowledge but also on improvement of the existing knowledge.

In the knowledge-based organization, rigid pyramid structures are replaced by non-hierarchical structural forms, the team consists of specialists, being outlined in this sense new management roles (chief knowledge officer, chief information officer), coordination is ensured by non-authoritarian means (standards, norms).

"The functioning of such organizations determining are the processes generic designated with the phrase "three I" respectively: "innovare" - innovation (creating new knowledge), "invatare" - learning (assimilation of new knowledge) and "interactivitate" - interactive partnership for knowledge. Engaging stakeholders in this process can be achieved only by creating an enabling and transparent organizational framework, the use of incentives and appropriate value systems, promoting active learning and dissemination of knowledge."^[2]

3. Characteristics of the knowledge company

The Knowledge-based company has several characteristics ^[1]:

- The reduction of the company in terms of the physical assets, employees used, work performed, concomitantly with the development of knowledge and expansion of the domestic linkages with customers, suppliers and external human resources.
- Outsourcing the activities not essential for the company, in parallel with the internalization of those who are, or are strongly complementary to the essential knowledge's of the organization.
- The development of the company will be based on increasing in depth and / or width of firm knowledge's.
- The internal organization of the knowledge based company will be characterized by less structured networks, semiautomatic teams made up of individuals possessing the knowledge,

availability for learning that lead to maxim effectiveness and efficiency.

- The integration in the company of "knowledge managers" who often begin their work as consultants of the organization.
- Targeting the investments in training in the foreign labor used, in order to replace the staff who doesn't not progress efficiently.
- Restructuring of the motivation system, enhancing the rewards taking into account the performances and merits.
- Developing an open culture, inviting customers and suppliers as well as other categories of stakeholders to watch how the decisions that affect them become operational.
- The practice of multiple forms of collaboration with other firms, such as strategic partnerships.
- The barriers between the individual and organization are reduced.
- A major attention is paid to obtain, use, protect the intellectual capital.
- The approach to build a effective, dynamic and competitive knowledge based organization begins with the satisfaction of the employees requiring constant and rapid processes of individual and organizational learning, the harmonization of the individual objectives with the organizational objectives, visionary and intellectual leadership.
- The Knowledge-based company will be simple with fewer levels, more flexible and intelligent.

Therefore in the context of the knowledge-based economy, it is necessary to shape a new type of organization - one based on knowledge and a new type of management - knowledge management. In practice, the knowledge management consists of approaches, methods, techniques of companies focused on the production and use of knowledge.

In most existing companies in transition to the knowledge-based company, it is necessary reengineering the organizational system in all its components. The main features of the organizational system of knowledge based company are: ^[1]

- extensive use of delegation;
- diminish the importance of hierarchical relationships and enhance the cooperation relationships;
- develop relationships with the external stakeholders of the company.

4. Learning organizations. Characteristics

A learning organization consists on workers who learn. For most organizations, the ability to create a sustainable future is directly proportional to how they are encouraged to develop their intellectual abilities of employees.

a) Transforming a company into a learning organization is a process that includes a series of steps:

- establish a strategic goal: achieving the stage of a learning company;
- determining the set of actions necessary to achieve that objective;
- awareness by employees of the need to transform knowledge in the company's main resource.

b) The use of the gained knowledge in developing business activities and thus to generate new knowledge.

c) The use of all forms of organizational learning: classical methods (lectures, discussions), modern methods (case studies, games, simulations), and other ways: mentoring, extensive use of participatory management methods, the delegation;

d) A learning organization means first of all employees who learn: employees must have a behavior focused on learning, acquired through intensive communication between all employees and on intense involvement of the managers in learning.

e) Learning occurs not only at individual level but also at the organization and in this direction is necessary to know and always take into account the major factors influencing the organizational learning (business environment, organizational structure, organizational culture, company strategy).

f) Shaping in the knowledge based company of a new type of employees named: knowledge-based employees.

The knowledge based company is based on knowledge-based strategies. These strategies based on knowledge present new elements such as:

- knowledge's are the most important strategic resource company;
- learning is the most important capability of the organization;
- business activity is materialized in knowledge products and services;
- the innovation activity influences the performance and even the existence of the organization

5. Conclusions

The transition to the new economy means changes in all spheres of activity. The main reasons for the change in an enterprise are:

- the work becomes more complex, manifesting the need to deliver higher quality products and more competitive;
- the nature of businesses has changed and the competitive environment has become more demanding as a result of changes caused by:
- the increased reliance on the intellectual capital (in the past businesses were based on physical and financial capital);
- the globalization process (competitors from around the world can provide high quality products);
- consumers become better informed and may have refined demands; today's consumers have the possibility to choose among a greater number of suppliers, compared with the past.
- employers demand more involvement in work.

The individuals from the organization of the enterprise, come with ideas and have access to knowledge and information, which are disseminated at all levels and applied in everybody's work for higher performance [11].

Abstract

In the absence of appropriate remedial measures, financial instability can cause the collapse of even more financial institutions, problems in the financial system infrastructure and it can ultimately affect all the financial markets. The contagion effect threatens to spread internationally and it produces the destabilization of the financial system as well as of the global economy. The global financial crisis has been felt all over, in our country. The National Bank had to take a series of measures in order to eliminate the risk of contagion. The present paper aims at approaching the topic of the role that the Romanian National Bank has in the supervision of the Romanian financial system, whose main purpose is to ensure financial stability.

Key words: banking supervision, the National Bank of Romania, financial stability, financial crisis, financial sector.

J.E.L. classification: E 58, G21.

1. Introduction

The current financial crisis, characterized by the pursuit of profit and increased risk taking, requires a prompt and concerted action on the side of central banks and governments for the affected countries. The measures taken for this cause are designed to restore confidence in the international financial system and they are conceived with the purpose of mitigating the risk management deficiencies as well as other

weaknesses which hamper the performance of financial markets. Hence, in terms of regulatory framework, a profound reform is mandatory. The last should be supported by a radical change in the entire architecture of the international as well as of the regional supervision so that the new formula can ensure the revival, strengthening and improvement of the international system as a whole.

The global efforts must be strengthened through EU and national efforts in order to improve the quality of prudential supervision at both the microeconomic and the macroeconomic levels.

The basic international standards for effective banking, revised in 2006 by the Basel Committee, represent an authentic tool in the assessment of the institutional as well as of the organizing capacities which a national supervisory authority may have. The progress of its activity should be in accordance with the best practices of regulated surveillance. These principles formed the basis for FSAP (The Financial Services Action Plan), being used by the IMF and World Bank within assessment programs of the financial Sector of a state from the perspective of its financial stability, its developments and the degree of compliance with the financial standards and codes of conduct. Starting from this point, this paper aims at analyzing the case of National Bank of Romania, as main supervisor of the national banking system and its role in maintaining the health and viability of the last, having as ultimate goal the status of financial stability.

It is considered however that there are some functions of the Central Bank which can contribute to financial stability (Cerna Silviu, 2008). These functions are: banking regulation and supervision, the management in oversights of payment systems, deposit insurance and lender-of-last-resort function. These traditional features have emerged through the gradual involvement of the institution in ensuring financial stability. There are various definitions of the economic concept of financial stability, both in literature and in practice. It is worthy of consideration that the economic literature and practice haven't reached a common view regarding the content of the concept of "financial stability", its features being revealed rather by the opposite notion of "financial instability". Authors such as J Chant believe that "the financial instability refers to those conditions of financial markets that affect or threaten to affect economic performance through the impact they have on the financial system" (Chant, 2003). Crockett also defines "financial stability" as the absence of instability and even more specifically as the "situation in which economic performance is not affected by potential asset price fluctuation or by the failure of the financial institutions in fulfilling their obligations" (Crockett, 1997). F Mishkin also believes that "financial instability occurs when shocks in the financial system interfere with information flow in a way that the financial system is no longer able to perform functions and resources so that it can analyze the most productive destinations" (Mishkin, 1999). Cerna S believes that "financial stability is the state in which the economics of pricing, valuation and financial risk management division work well enough to contribute to an increased economic performance"

As far as the National Bank of Romania is concerned, its first "Financial Stability Report" defines "the financial stability" as "that feature of the financial system to cope with systemic shocks on a sustainable basis and without major disruption, to efficiently allocate financial resources in the economy and to identify and manage risks effectively" (NBR, 2006). Moreover, Mugur Isarescu, the governor of the National Bank of Romania, explains that "financial stability is when the financial system is able to attract

funds and to place money in an efficient and able way so that it can withstand shocks without hurting the real economy" (M. Isarescu, 2006).

In conclusion, the financial system is likely to hinder the normal development of business processes and achievements desired performance in an endogenous way, even in the absence of exogenous shocks. Financial stability does not necessarily mean the absence of seizures but rather the prevention of those imbalances which could affect the integrity of the financial system, and block the real economic processes.

2. The structure of the financial system in Romania

In 2010, the degree of financial intermediation was narrowed slightly because of the tensions existent on international financial markets and because of the decreased economic activity. The credit institutions represent the main component of the financial sector. Their exposure to the other financial institutions in Romania as well as their attracted resources from the last, are not at risk of direct contagion, within the financial system. The high level of concentration of financial changes indicates the credit institutions as the only ones exposed at systemic risk. The share of financial assets in GDP is an indicator for assessing the degree of financial intermediation in the economy and it shows a slight decrease, in 2010, compared to the situation of the financial intermediation sector, in 2009. The structure of the financial intermediation sector indicates a local financial literacy oriented mainly towards the banking sector, while investment capital market, growing, yet has a low share (Figure 1). Thus, only in a limited extent can the capital market take over the role in financing the real economy. Even though it has a good absorption capacity as it was tested in the underwriting of public offerings, this usually happens whenever the banking sector imbalances. Financial investment companies have a key role in brokering the stock market, but the assets held by these entities are very low. In regards to the structure of the banking system, table number 2 displays the decrease in the share of financial institutions during 2008-2010. This was caused by the

high risk of default of their portfolio and it has led to restrictions in lending and thus it reduced balance sheet assets

Figure 1. Structure of the financial system (as a percentage of net assets in GDP)

Source : National Bank of Romania

Figure 2. The evolution of financial system components during 2008-2010 (local shares in system)

Source : National Bank of Romania

The analysis of evolution of the financial system (during 2008-2010- Figure 2) reveals that credit institutions recorded the largest increases, being followed by the open-end investment funds and by the private pension funds. Small increases were recorded among the financial investment and insurance companies.

3. The organization of the financial sector's supervision and financial stability in Romania

Apart from the developments which take place on the structure of the financial system, the surveillance of the Romanian financial sector continues to pursue the traditional pattern, in which there is a supervisory and regulatory authority for each segment of the financial sector component. The institutions involved in the supervision of the financial sector and regulation are the following: The Ministry of Economy and Finance, the National Securities Commission, Insurance Supervisory Commission of the Private Pension System Supervision and the National Bank of Romania.

The National Bank of Romania has responsibilities which are provided in detail in Law No. 312/2004, on the Statute of the NBR and the Government Ordinance no.28/2006 regulating certain financial and fiscal measures. According to law, the Central Bank contributes at supporting financial stability as well as it contributes in the management of potential financial crises by doing the following:

- Ensuring and maintaining price stability;
- Licensing, regulation and prudential supervision of credit institutions;
- Promote and oversee the smooth operation of payment systems;
- Providing temporary liquidity for credit institutions in order to prevent systemic risk events: only exceptionally can NBR borrow to credit institutions, loans (unsecured or secured by assets others than those provided for in the Article no. 19 of Law no. 312/2004);
- By supervising the financial institutions which are listed in the General Register and by prudential supervision of financial institutions registered in the Special Register and which operate on Romanian territory.

Due to its status of monetary and prudential authority, the National Bank of Romania has a role in maintaining financial stability intrinsically. Its tasks are subsumed to financial stability objectives. They are pursued by: the regulation and prudential supervision of institutions under its authority, the formulation and effective transmission of

monetary policy, assuring an optimal functioning in the payment and settlement systems of systemic importance.

The transformations which occurred, over time, in the Romanian financial system, led to an increased cooperation between the NBR and other regulatory and supervisory authorities in various sectors of the Romanian financial system. Thus, a cooperation agreement was established having as main purpose to ensure the effectiveness of the conditions for growth in normal and in crisis situations. This was conducted by the four supervisors previously mentioned, who activate in the four sectors of the financial market in Romania and it had the Ministry of Finance among the signers.

The agreement between the Ministry of Finance, the National Bank of Romania, the National Securities Commission and the Insurance Supervisory Commission of the Private Pension System for Cooperation on financial stability and crisis management, signed on July 31, 2007 led to the founding of the National Committee for Financial Stability. The principles governing the cooperation between the four financial supervisory authorities of the Romanian financial market and the Ministry of Economy and Finance are: a clear delineation of responsibilities, transparency, efficiency and exchange of information under conditions of professional secrecy.

According to the Government Emergency Ordinance No. 99/2006, in terms of credit institutions and capital adequacy, which was approved with amendments by Law 227/2007, in order to protect depositors and the stability and viability of the entire banking system, the National Bank of Romania provides prudential supervision for credit institutions, Romanian legal entities, including their branches established in other Member States or in third countries, by setting standards and prudential indicators and monitoring their compliance and other requirements prescribed by law and regulations, both individually and on a consolidated or sub if necessary, to prevent and limit the risks specific to banking. This ordinance has brought substantial changes regarding the way banking surveillance assures the transition from a compliance-based approach to a risk assessment approach.

Also, it requires the existence and operation of a risk management system comprising:

- Identifying, monitoring and reporting risks by bank management and by internal control mechanisms;
- Determining capital requirements for covering credit risk, market risk and operational risk ;
- The exercise of prudential supervision of credit institutions by the National Bank Supervision Department and collaboration with other competent surveillance authorities;
- The principles of consolidated supervision-setting competent authority in Romania or in Member States of the European Union.

In order to ensure effective supervision, NBR establishes written agreements of coordination and cooperation with the competent foreign authorities.

In this respect, the following agreements are worthy of consideration:

1. The Cooperation Agreement between the authorities responsible for monitoring the payment systems and banking supervisors, in Stage Three of EMU (2001). The National Bank of Romania joined it on the 1st of August, 2007;
2. The agreement of cooperation between banking supervisors and central banks of EU, in the field of crisis management (2003).The National Bank of Romania joined it on the 1st of August 2007;
3. The Multilateral Agreement of Cooperation between banking supervisory authorities and central banks, and the finance ministries of EU countries, focused on situations of financial crisis. It initially entered the EU in 2005, just that, later on, it was replaced by a new agreement which entered into force on the 1st of June, 2008.

The new agreement promotes cross-border cooperation between the aforementioned authorities, both in normal situations, by strengthening their preparation for management of potential crises and in situations of the financial crisis. The document introduces several new elements. The National Bank became a signatory of the agreement on the 4th of April, 2008, in the ECOFIN Council meeting.

The importance given to the cross-border banking groups has led to a more careful monitoring of these entities, at a consolidated as well as at an individual level. Taking as a starting point the agreement developed by CEBS / EBA, the surveillance authorities have to complete, by the end of 2009, cooperation agreements with all the authorities from the host country, for a list of cross-border banking groups established by it, with the purpose of supervising any of the groups in question. The list was extended to the end of 2010. Hence, the banking groups identified that a number of 18 colleges of supervisors are present in Romania.

Also, the National Bank carries out a monitoring program for the non-banking financial institutions subscribed in the General Register as well as the prudential supervision of those activating on Romanian territory.

Another concern of the NBR is related to its design and its management in regards to the payment and settlement system, in national currency. In the statute of the central bank, it's stipulated its attribution, as central bank and as a member of the European System of Central Banks, concerning the promoting of a smooth functioning of the payment systems.

The measures taken in this regard are the following:

- provision of means of payment and settlement for financial instruments. The Central Bank operates with high-value payments in lei (REGIS), depository and settlement systems for financial instruments (SAFIR) and a system of compensation, payments by debit instruments such as checks, bills of exchange and promissory order;
- promoting efficiency in payment systems and infrastructure in order to adapt to the requirements of the Single Euro Payments Area (SEPA).
- supervising the payment and settlements systems which operate by financial tools;
- cooperation with national and European authorities to ensure a regulatory and supervisory framework harmonized with international standards.

4. Conclusions

The recent turmoil, existent in financial markets, has laid emphasis on the importance of ensuring a stable and sound financial system, but it also highlighted the importance of the role which authorities have in proper and prompt risk management. The National Bank of Romania has contributed significantly to the strengthening, supervision and regulation of the financial sector.

In the context of the financial crisis, the National Bank has intensified its actions which prove to be similar to those carried out by European authorities, in terms of reducing vulnerability by ensure liquidity and capital adequacy.

Finally, it can be acknowledged that the Central Bank's role in ensuring financial stability is of main importance. Crucial arguments in this regard are related to the existence of informational synergies between the supervision of the financial sector and central bank functions, its orientation and to monitor systemic risk as well as between its independence and technical expertise.

Analysis of the Recent Evolutions of the Romanian Motor Insurance Market

Dănuleşiu Adina Elena
Dănuleşiu Dan Constantin
„1 Decembrie 1918” University of Alba Iulia
adina.danuletii@gmail.com
dan.danuletii@gmail.com

Abstract

This paper aims to be an analysis of the Romanian motor insurance market for the period 2006-2010. Motor insurances with those two component parts, motor own damage insurance (Casco) and motor third party liability insurance (MTPL), represent the greatest percentage of the general insurances, fact that highlights the importance these types of insurances have. The motor insurance market analysis has been done from both quantitative and qualitative perspectives, on the basis of some indicators such as: the penetration degree of motor insurances, the density of motor insurances, the subscribed raw premiums and the paid raw wages, the degree of concentration of motor market for CASCO and MTPL insurances. There are emphasized also factors affecting the future evolution of motor insurance.

Key words: motor insurance, third party liability insurance, own damage insurance
J.E.L. classification: G22

1. Introduction

The Romanian motor insurance market is highly dominated by the motor insurance sector, with its two basic categories: Casco insurance and MTPL insurance.

The Casco insurance type is designated to cover the damage and the theft of the owned automobile, and at another extent the accidents of the car occupants, meanwhile the MTPL insurance type aims to cover the prejudices the insured person causes to a third party, according to his own claims. In addition, motor insurance has evolved to

incorporate other forms of cover such as breakdown and emergency protection, legal expenses, and other add-ons. These are more normally incorporated into comprehensive product types. The implication is that MTPL is a more homogenous product (at least when considered within an individual national market) and - all else being equal - one would expect a greater focus on price competition in MTPL [9]. This aspect is the most important for companies when it set up the strategy on this market segment.

Due to the importance on the insurance market, the evolutions of the two components of motor insurances will have a profound influence on the entire insurance market, and the share market these insurance companies get in the case of motor insurances can lead the mentioned company to a top position on the market. Therefore, the analysis of this market highlights the major influence channels of the entire Romanian insurance market.

2. Analysis of the Romanian Motor Insurance Market

Firstly, the motor insurance market analysis has to take into account aspects related to its importance for the whole economic situation of a country. From this point of view we will emphasize the evolution of penetration degree of motor insurances into economy, which reflects the weight of the subscribed gross premiums into the GDP, and the density of motor insurances representing the value of subscribed premiums/ inhabitant, as well.

The analyses of the evolution of the penetration degree for the motor insurances will definitively sustain the greater importance this sector has in the national

economy. In this way, one can see the increase of this indicator for the period 2006-2009, which means that the weight of motor insurance sector into the GDP value has registered an increasing tendency, getting to 1,13% in 2009. Moreover, this indicator value is still reduced compared to the most developed countries, fact that reveals the great potential of insurances in the Romanian economy.

Table 1. Penetration degree and the density of motor insurances for 2006-2010

Year	Penetration degree	Insurance density lei/inhabitant	Insurance density lei/inhabitant in real terms
2006	0,90%	143,99	143,99
2007	0,99%	191,64	168,71
2008	1,05%	251,20	196,34
2009	1,13%	259,68	193,57
2010	0,96%	231,20	157,22

Source: the author’s data processing after the CSA Reports for 2006-2010

It is also the density of motor insurances which registered the same increasing tendency up to 2009; and this shows the idea that motor insurances have been developing in Romania, the value of the subscribed premiums for inhabitant in 2009 being with 50% higher than the value in 2006. And this will show either the increase of insurance premiums paid for a period of time, or the increased number of insurances closed. The explanations of these evolutions are the growth of the car fleet, introduction of the CEDAM database, which permits to identify more accurately the cars without MTPL insurance, the growth of the revenues in the period 2006-2008.

In what the importance of motor insurances on the Romanian market is concerned, it is reflected by the average rate of the subscribed premiums in the total amount of the subscribed premiums from general insurances, as shown in Figure 1.

As Figure 1 shows, the rate of motor insurances within the general insurance market represents more than 70% for 2007-2010, while in 2006 this represented only 67,43%. The tendency proved to be an increasing one up to 2009, but in 2010, due to the economic and financial crisis effects, the average rate of motor insurances has been

significantly reduced on the general insurance market; and that has been determined by the continuous decline of Casco insurances.

As the importance of those two components is concerned, we can state that the market promoter has been represented by the Casco insurance up to 2008. Starting with 2009, the Casco insurance rate has been significantly reduced, so, at the level of 2010 the MTPL has become the most important component of the general insurances market. As was highlighted by others authors, income is an important driver for non-life sector [3]. This is visible on the Romanian motor insurance market, where the diminishing of the revenues generated renunciation to the Casco insurance by some of the car owners. As a way to counteract this tendency, the insurance companies issued new insurance products, covering a small range of risks, but cheaper.

Figure 1. Evolution of the subscribed premiums rate for motor insurances in general insurances in Romania

Source: the author’s data processing after the CSA Reports for 2006-2010

Another indicator that mark the motor insurance importance on the general insurance sector is represented by the gross paid claims, respectively by the paid claims for motor insurances from the total paid claims for general insurances. Graphically this rate detailed on those two components of motor insurance is presented in Figure 2.

Figure 2 – Evolution of gross paid claims for motor insurances and their structure

Source: the author’s data processing after the CSA Reports for 2006-2010

So, one can state that the gross paid claims for motor insurances represented more than 80% from the gross paid claims for general insurances for each year of the mentioned period, the highest rate being of 88,62% in 2008. As a structure, more than 50% of the paid claims for general insurances represent gross paid claims for Casco insurance, as those paid for MTPL insurance represent around 30% from the total amount of the paid claims. In what the tendency is concerned, there can be seen an increase of the claims rate for the MTPL insurances during the whole period of 2006-2010, while in the case of Casco insurance the claims tendency has been similar to the subscribed gross premiums. Moreover we have to take into account that the depreciation of the national currency also affects the business of the insurance companies because the prices of spare parts and the costs of damages are calculated in euros. Actually all the costs that contribute to damages are more or less related to the euro currency.

The analysis of the motor insurance market has to aim the structure on different motor insurances, and that can allow us to bring into play other aspects, as well.

Table 2. Subscribed gross premiums from Casco insurances for 2006-2010

Year	Subscribed gross premiums Casco insurance			
	lei	$\Delta\pm$ (%)	Euro	$\Delta\pm$ (%)
2006	1864567015	-	529030221	-
2007	2619859216	40,51	785023587	48,39

Source: the author’s data processing after the CSA Reports for 2006-2010

According to the data shown in Table 2, one can see that, from the Casco perspective, after a sustainable increasing period registered in 2006-2008, when the rise had the value of 40, 51% (in lei) or of 48, 39% (in euro), it followed a period of decreasing the subscribed gross premiums, first a reduced one (6, 35% in lei or 18, 61% in euro), but later much higher (over 20%). The analysis of the subscribed gross premiums in euro is essential because the premiums value concerning the insurance companies is calculated in European currency for most cases, even if later on its payment is done in lei; so, from this point of view the market evolution is significantly influenced by the exchange rate [4].

The crisis effects on the Casco insurances market can be primarily seen through the slowing process of the increase of the subscribed premiums volume in 2008; later on, the subscribed premiums value registered important losses, and at the end of 2010 their value highly decreased getting a much lower value than in 2007.

An important cause of such an evolution of the Casco insurance is determined by decreasing volume of car sales, especially by the sales financed by leasing or bank loans for which the concluding a motor own damage insurance is a contractual condition. This is why the massive drop in car sales had a major influence in the non-life business volume [5].

Figure 3 Financial Leasing Market evolution (annual growth rates) 2005-2010

Source: Association of financial companies – ALB Romania

As one can see in Figure 3, the financial leasing market in Romania has followed the same decreasing evolution for the period 2008-2009, which obviously generated the income decline of the car insurances.

The high importance of Casco insurance for the insurance market can be viewed as a warning factor as the lack of the leasing contracts can generate the decline of CASCO insurance. This was the case in 2010, when the insurance market had to get used with the economic crisis effects. The relaunching of the leasing market in the case of car sales will directly lead to increasing the CASCO insurance types, but the maintenance of the crisis will generate new decreases on the insurance market and a need for insurers to restructure their activities.

More than that, another concerning factor is represented by the evolution of the report between the subscribed gross premiums and the paid claims, as it could be seen in Figure 4.

Figure 4 – Evolution of the gross paid claims vs. the subscribed gross premiums for Casco insurances

Source: the author’s data processing after the CSA Reports for 2006-2010

Taking into consideration this comparison, there can be seen a concern in the case of Casco insurance system. So, simultaneously with the decrease of the subscribed gross premiums in 2009 there can be seen the fact that the paid claims has registered an important increase compared to the previous year, and in 2010, despite the lower value of the paid claims than in 2009, these exceeded the subscribed gross premiums. Such a situation can be solved by a much more adequate way of establishing premiums for motor insurances – higher premiums for the insured persons presenting a high risk. This is quite difficult to be put in practice, due to the lack of a unique base concerning the damages paid for this type of insurance. Solving this aspect can be done by taking into account general elements as it follows: the insured person’s age and experience, the car roller capacity, statistics concerning the car accidents and storms, the automobile type and its brand, the insured risks, technical performance, easy repair works, the exchange pieces accessibility and availability, attraction in favour of thieves, the account of solicitor’s damages, the roads condition, street-traffic control lights, road scraper. A solution adopted by the vast majority of the insurance companies referred to introducing the possibility (in many cases the obligation) of signing casco insurance contracts with deductible franchise for each particular event, together with appropriate reducing of the insurance premiums as set by insurance tariff. According to data in Figure 4 these measures proved to be insufficient and new solutions are to be imposed in this area.

In what the MTPL insurance type is concerned, the analysis of the subscribed gross premiums highlights their constant increase (both in lei and in euro), which is due to its compulsory characteristic, and which allowed it to exceed the Casco insurance average rate on the total insurance market in 2010.

Table 3. MTPL insurances for 2006-2010

Year	Subscribed gross premiums from MTPL			
	lei	$\Delta\pm$ (%)	euro	$\Delta\pm$ (%)
2006	997630000	-	283.055.753	-
2007	1397595000	40,09	418.780.152	47,95
2008	1794599000	28,41	487.305.238	16,36
2009	2159584000	20,34	509.660.397	4,59
2010	2464451000	14,12	585.394.190	14,86

Source: the author’s data processing after the CSA Reports for 2006-2010

One can see that the subscribed gross premiums from MTPL insurances have had an increasing evolution for the analysed period. This increase is due to both the growth of MTPL average premium on the market, premium which has risen from 598 lei in 2009 to 646 lei in 2010, and to the growth of contracts of insurances signed, from 5845000 in 2006 to 6555000 in 2010, as well. In 2010 it was introduced “bonus-malus” system, which gives the insurance company the opportunity of allowing certain discounts to the insured who did not cause car accidents or who did not ask for compensations during the insured period; on the contrary, for those who did cause car accidents which caused claims payment, there are additional premiums to be paid. Although the great majority of the insured benefited by the bonus clause, the value of the total subscribed premiums has increased.

The evolution of the value for the MTPL paid claims for the period 2006 – 2009 has constantly increased, but we should also stress the idea that from the perspective of their rate into the subscribed premiums, they had a sinusoidal curve. It has to be noticed that the highest report between the paid claims and the subscribed gross premiums was registered in 2009 (70, 92%), but in 2010 this diminished, especially on the basis of the premiums growth, because the claims paid was almost identical.

Figure 5 – Evolution of gross paid claims compared to the subscribed premiums for MTPL insurances

Source: the author’s data processing after the CSA Reports for 2006-2010

Nevertheless the year 2011 lead to the fact that certain insurance companies adopted more risky subscribing policies, and this way a decrease of average bonus appeared in the case of MTPL insurances. This obviously

will create negative effects on the insurance company’s financial results and on the market, as well.

Another analytical element of the motor insurance market is represented by the degree of market concentration, indicator which is more relevant for the area of Casco insurance type, and less for MTPL insurances, system in which the number of companies supplying this product is highly reduced.

Table 4. Concentration degree of the car insurance market

Anul	Casco insurance		MTPL insurance	
	top 10	top 5	top 10	top 5
2006	95,28%	72,29%	94,44%	63,72%
2007	86,90%	67,06%	93,08%	52,69%
2008	94,07%	67,06%	92,20%	61,57%
2009	94,26%	66,41%	91,83%	56,04%
2010	96,57%	71,85%	97,02%	64,36%

Source: the author’s data processing after the CSA Reports for 2006-2010

The data from table 4 demonstrate that the motor insurance market is very concentrated. So, in the case of Casco insurance, one can easily state that from more 40 of insurance companies the first five ones represent 70% of the market, and if we are going to refer to the first ten companies their average rate is around 95% for 4 years from those 5 analyzed. Such a situation reveals that the other 30 insurance companies are slightly present on the market. As regards MTPL, the number of companies which had the opportunity to sign insurance contracts is relatively reduced (13 companies in 2010), so we can say that the real number of significant companies is much more reduced in comparison to the total number of insurance companies. Even if a small insurance company bring new products of casco insurance or establishes low premiums for MTPL insurance, the access and maintaining into the package of relevant ones is quite difficult, especially due to the significantly high report between the gross claims and the subscribed premiums, which does not allow the less solid companies to succeed in supporting the claims, and to the lack of the potential clients trust in its financial capacity.

3. Conclusions

The analysis of the Romanian car insurance market highlights a few important aspects of the economic- financial crisis. Firstly the negative evolution of Casco insurances is to be mentioned. This decrease is caused by the economic crisis effects: increased unemployment diminished domestic consume, salaries cuts, due to which more and more Romanian car owners either renounce to sign a Casco insurance policy or to use their cars, without withdrawing them from traffic. To all of these there can be added the cars returning to the leasing companies because their owners could not pay off the debts anymore and the leasing companies could not find other potential clients in real time.

We have also to take into account that the national currency depreciation affects directly the activity of car insurance companies, under the circumstances in which the price for the exchange component parts is calculated in euro. Under these terms any rise or any influence has a negative impact, since the subscription has been realized at a historic rate and the compensation at a depreciated level.

Other elements influencing the efficiency of car insurances refer to the high degree of damages, the major factors having a great impact over them such as: the road infrastructure, the great number of cars and the disrespect for law, and the relationship between the insurance companies and the car service station.

The data provided for the first semester of 2011 reveal a substantial reduction of both components, especially significant in the case of MTPL, due to the policies of low premiums established by a large number of insurance companies. Among the elements to influence the Casco insurance market there is the implementation of the bonus-malus system on the entire market, by the time when Casco component should function as part of CEDAM database.

The direct effect of such a measure will be to stop the insured's solution materialized by changing the insurance company next year after they had damage. Additionally, this fact will lead to the correctness of the drivers involved into car accidents with material losses, so that the temptation to use the Casco insurance should disappear in favour of the MTPL insurance usage.

The Reform of the Romanian Banking System

Deca Claudiu

“Ovidius” University of Constanta, Faculty of Law and Administrative Sciences
claudiudeca@yahoo.com

Abstract

Anyone who has been familiar with one of the most rigid banking systems in former socialist countries would now be surprised of the relative transformations that have occurred within the Romanian banking system and within the financial sectors, and of the progress which has been realized. The promotion has not been related only to the development of several institutions and to the implementation of the transaction from a unique bank to a double stratified system. Laws and governmental decisions have led to the rapid development of millions of new economic agents and to the transfer of their financing task from the state budget to the banking system.

In order to understand these changes, it is necessary to present the structure of the banking system before the year of 1990, a system which was similar to that of all centralized economies.

Key words: banking system, reform, international systems

J.E.L. classification: E5

1. Introduction

The National Bank of Romania combines the functions of a central bank with several functions of a commercial bank. Together with other state institutions, it was elaborating the crediting and currency projects for economy and it was monitoring their implementation. It was organizing the warranty of short term credits on basis of the approved plans and the extension of credits towards enterprises and economic organizations which have had there an account.

The four specialized banks (for investments- renamed the Romanian Bank for Development, for international commerce- renamed Bancorex, for agriculture- the Agricultural Bank, and for savings- the CEC) have had accounts at the National Bank of Romania and they could receive credits, when in need for supplementing their resources, with the exception of CEC which was re-depositing the population's money at the National Bank of Romania.

The main objectives of the monetary and credit policy were:

- to provide the required credits for enterprises, so that these enterprises could carry out their tasks;
- to provide enough ready money in economy, in conformity with the planned amount of available goods.

The introduction of the two steps banking system and the legislation in 1991, concerning the National Bank of Romania and the commercial banks, are at the basis of the transformations of the banking system. This system is still substantially dominated by the old specialised banks, although there is an erosion of those specialisations on activities. The new banks try to gradually enter the “universal” banking activity or to build up a niche on the market. Most of the banks have witnessed the rapid increase of services demand through the fast development of branches and personnel; they have entered the market of important foreign banks, but most of them are focused on services for commercial companies (corporate banking).

Without minimising the relative progress, the transformation of the banking system is still into an incipient stage. A fast rhythm of the substantial transformations and performance improvement is a permanent premise for a more efficient mobilisation of resources and for the allocation of funds for the long term increase in economy.

2. The Legal Background

The reform of the banking system actually starts in December 1990, with the concentration of the commercial banking operations of the National Bank into the new founded Romanian Commercial Bank. A double stratified system has become operational in April 1991, after the promulgation of the Banking Activity Law (Law nr. 33/1991) and of the Organisation of National Bank of Romania Law (Law nr. 34/1991). Starting from November 1991, supplementary reforms have included the transfer of the administration of foreign currency reserves and the transfer of the control of the exchange system at the National Bank.

The banks with public capital have been reorganised as stock companies, through the State Enterprises Reorganisation Law (Law nr. 15/1990). Their title to property has been defined through Commercial Companies Privatization Law (Law nr. 58/1991). Through this Law, 70% of the banking capital has been transferred to the State Property Fund (STP) and 30%- to the five Private Property Funds (PPF) (more exactly 6% for each Fund).

Moreover, in what concerns the above mentioned Laws, the National Bank of Romania issues and brings up to date regulations regarding *the exchange system, prudence regulations, the reform of payment systems*, and regarding other banking operations. Starting with 1st January 1998, it has also been applied a new system of banking accounts, regulated by the Law nr. 50/1998.

Other decisions made by the Government and by the National Bank have also had an impact on the operations and on the financial health of public banks.

These decisions concern the non-performing credits granted before 1990 and, more recently, the non-performing credits for the financial reorganisation of state enterprises (towards which banks were required not to levy interest and to reschedule the debts) and the extension of tax deduction on the commissions for non-performing credits.

3. The Evolution after 1989

Within the legal background, all commercial banks are allowed to function as “*universal banks*”. In fact, certain functions of the universal banking activity are not allowed, such as stock-broking activities, which require distinct firms with this basic activity. Moreover, the system is still very much characterised by a substantial fragmentation and by market specialisation, by virtue of the large network of branches held by state banks and by virtue of the traditional contracts with enterprises. The Agricultural Bank dominates the crediting of agriculture and of food industry; the Commercial Bank attends the large enterprises. The House for Economies has suffered a considerable depreciation of its monopole position in attracting the deposits of population, but it still holds an important part of these deposits.

Initially, the strategy of the National Bank of Romania was to include the development of the system, and to consolidate the performance of several banks, especially of state banks. During the past years an important emergence of new banks has taken place, and some of these new banks are among the most well-known in the world. Their competitive banking service pack would profoundly affect the standards and the performances of the other banks.

The increase in the number of banks was less explosive than that in other countries in Central and Eastern Europe, due to the prudent authorisation policy of the Central Bank. Looking a posteriori, it can be estimated that this policy has allowed, roughly speaking, the avoidance of major financial crises, the banking system remaining thus relatively solid, in spite of the problems which cannot be neglected.

Thus, in 1996, the situation was as it follows (in 1998 the number of banks has grown to 40):

Table 1.1

Capital type	Nr of Banks	Percent share:		
		Total credits	Total deposits	Total capital
State	5	29	46,4	33,2
Autochthonous state and private	3	48,5	28,2	19,9
Foreign state and private	4	11,3	8	20,3
Autochthonous private	1	5,3	6,1	1,2
Autochthonous and foreign private	9	4,4	6,0	18,6
Foreign private	8	1,3	4,6	1,1
Total	31	100	100	100

The entrance of new banks into the system has led to the increase of competition and has generated the modernisation of the public banks; this modernisation was achieved by introducing both several client-centred policies and the marketing of financial departments. A substantial diversification of the assets and liabilities of public banks has taken place, new banking services have been introduced in order to raise the efficiency of operations (the utilisation of SWIFT network for electronic transfers of payments and returns) and in order to meet with different client demands (payment cards used in Romania and abroad by physical and legal persons, automaton payment, certificates of deposit with different short-term dates of maturity, factoring services, corporate banking services).

Simultaneously, a behaviour reform has also taken place; this reform was materialized through the education of the banking community in what concerns the administration of risks, the crediting culture, the code of ethics etc., and through the

education of the third party (authorities, stockholders, clients, journalists etc.).

The involvement of international institutions and of other bodies has contributed to the development of the banking sector. The important technical assistance obtained from F.M.I, the World Bank and PHARE has been extended or financed for building new headquarters, for professional forming, for audit made by the international accountancy firm etc; many central banks have assisted the National Bank of Romania in perfecting its activity. The international assistance has also had a financial character: B.E.R.D. has supported the sector through its participation at the capital (“Ion Tiriac” and “Bucuresti” banks). It has also extended a stand-by loan for “Ion Tiriac” bank, meant to grant long term reliable credits. The World Bank and B.E.R.D have extended the crediting funds (over 150 millions USD) in order to enforce the local ability of banks in satisfying client demands for foreign currency loan.

The intermediating function of commercial banks has been profoundly affected until 1994 due to an inflationist environment and to negative real interests. After 1994, a real development of the banking system is to be noticed.

Starting from 1990, the relation between external assets and external liabilities was favourable to external placements. This relation has changed after 1995 due to the preferences of commercial banks for granting internal credits in foreign currency, which have assured a better fructification than the placement in deposits abroad did.

The deposits of non-banking clients have recorded significant increases, each year, and starting with the year of 1994, they have surpassed the growth rate of prices in economy. This positive evolution represents an important signal concerning the maintenance of confidence in national currency, and, in the same time, a non-inflationist financing resource for the economic growth.

Each year, the size of their funds has increased in absolute figures, being in general superior to the inflation instalment. This comes to confirm the development of the banking system in Romania, reflecting both the foundation of new banking companies and the preoccupation of the

existing banks in improving their capital basis.

It is to be mentioned that, with few exceptions, the maintenance of the high inflation between 1990 and 1998 has had an important influence on the evolution of Romanian banking system. The effect of this situation on the monetary aggregates and on the credit in economy was significant; as it was expected, both the monetary mass in real terms and the credit in economy have compressed themselves. The financial disintermediation and the “dollarization” (payment, cashing and financial deposit in dollars) of the economy have been two phenomenons which normally appeared within this context.

4. Perspectives

Seeing that the greatest part of the flow related to the financial intermediating process is taking place in Romania through commercial banks, the banking system represents the main element of the Romanian financial system. Taking into account its importance, the future Romanian banking system has to meet with the conditions of efficiency and competition in order to fulfil its basic functions, i.e. the mobilisation and the allocation of internal economies towards the most profitable equipments, the insurance of transmission mechanisms of monetary policy and the optimal functioning of the payment system.

It is estimated that the achievement of these objectives may be ensured by starting and finalising the following processes, at shortest notice:

- reorganisation of banking portfolios;
- banks recapitalisation;
- privatisation of banks;
- consolidation of the banking system.

Clearing the portfolios from credits is a necessary step, which represents only the beginning of the reorganisation process of these portfolios. The losses are generated by serious structural problems which affect both the economic and the financial systems:

- the high moral risk and the adverse selection manifested by public banks;
- the insufficiency of a legal background which imposes the forced sale of debtors;

- the use of the banking system by the Government in order to achieve several objectives of economic-social order.

The reorganisation of banking portfolios has as consequence the increase of budgetary costs, but once the authorities assume this role, it remains to find the most suitable strategy. In Romania a combination of the decentralised approach has been realised, and this process has to be continued.

Recapitalisation imposes itself in order to cover the risks generated by the active operations, with an adequate capital, guaranteeing the corresponding functioning of banks.

Banks privatisation is the most rapid modality of introducing behavioural and strategic modifications, ensuring thus the independence of banks towards the Government and the public sector. The main condition for initialising privatisation is represented by the improvement of the balance sheet of banks; this requires the reorganisation or the bankruptcy of a certain number of clients. The second condition is represented by the existence of a firm political will.

There are several privatisation strategies which are applicable within the banking system; however, none of them is generally valuable.

The choice of the privatisation strategy and its implementation depend on governmental objectives and on market realities. If the speed is the main objective, then banks have to be included into the mass privatisation programme (Czech Republic, Slovakia). If there are other main objectives (obtaining revenues for the budget, gathering experience and capital, improving managerial culture), then other possibilities are taken into account (selling shares, capital increases through stock issues).

Within this context, the partial privatisation of banks is a very popular concept in Eastern Europe, during the past years. However, a series of technical details may seriously affect the nature of the process and its finality: the nature of investments and the influence of the state.

The Stock Market

Deca Claudiu

“Ovidius” University of Constanta, Faculty of Law and Administrative Sciences
claudiudeca@yahoo.com

Abstract

The foundation and the establishment of the stock market express the emergence of the exchange relationships, and of the market as a defining structure of modern economy. The well-known French historian Fernand Braudel states that “the stock market is the last floor of a market, but that of a market which never ends”, of a market which includes and dominates the entire economic reality. Once with the acknowledgement of the stock market, the exchange relationships have reached the complete expansion and maturation, and “the market forces” have got the main role in regulating the economic mechanism; the economy has become a market-driven type of economy.

Nevertheless, it was necessary for a long evolutionary process in order to reach this situation, a process in which the material and institutional premises of the stock market have been gradually created.

Key words: stock market, function and role of the stock market, modern economy

J.E.L. classification: H5

1. General meanings

In common Romanian language, the word “bursa”, translated into English as “stock market” has two different meanings. The first one, strictly delimited, refers to the scholarship which is granted to pupils and students by the state, institutions or firms; this meaning etymologically originates from the term “purse” (an object in which people were keeping their money during Middle Ages). The second meaning includes a series of semantic variants such as:

• **The market in general**, as the location where trade exchanges are carried out or, more exactly, the aggregate of all transactions regarding goods and stocks. This

meaning is also reflected by the English corresponding term “stock market”; it designs any kind of market, irrespective of the object of the transaction or of its means of functioning;

• **Transactions** of certain categories of goods, services, or stocks and/or the price levels of the respective exchange transactions. From this point of view, there are, for instance, the gold stock market, the foreign currency stock market, the stock market of works of art, and the professional sportsmen stock market;

• **The market**, with a different type existence and functioning means. The syntagm **black market**, for instance, refers to an illicit and “savage” type of market, representing exchange relationships which are against the legal regulations regarding trade actions and deeds.

However, most frequently, the concept designates a market-driven economy institution - the stock market – as an organized form of exchanging goods, stocks, and even several services.

Essentially, the notion refers to the meeting place of merchants and businessmen, i.e. a space where demand and supply are concentrated. This results from the definitions used in economics. Therefore, the Romanian law on exchanges which was passed in 1929 (the well-known Madgearu law) states that: “stock markets are public institutions established for the purpose of reuniting merchants, industrialists, manufacturers, owners and insurers in order to negotiate public and private stocks, currency, foreign currency, goods, manufactured goods, ship renting and different types of risks coverage.”

Therefore, the stock market is a market which distinguishes itself from other types of market by means of the objective of its transactions, and by means of its way of organization and functioning.

In a work within the domain of Law, the authors comment that “stock markets are institutions where transferable securities or goods are being negotiated according to a certain procedure, only by certain intermediary agents, and under the supervision of certain authorities”.

According to a specialist in financial-monetary issues, the stock market is defined as “one of the typical markets of the market-driven economy countries, where goods, merchandises and fungibles values are being offered and sold according to a special procedure”. Here there are several recent dictionary definitions regarding the stock market:

- The Romanian word “bursa”, translated in English as “stock market”, is derived from the French word “bourse”; this term refers to the periodical reunion where persons carry out financial operations with transferable securities and goods; the term also indicates the place where these persons are reuniting (Robert);

- The stock market (eng. Exchange) is an organised market or a centre for transactions with financial titles or goods (Webster’s);

- The stock market is an institution where securities and foreign currency are being negotiated or where goods transactions are taking place (DEX).

2. Historical premises

The historical development of sale-purchase relations has imposed the concentration of exchanges in a well-established location. This means that merchants, bankers, industrialists, intermediary agents, and all persons who were interested in business were being reunited in the same place. At the beginning, this function was being performed by regular markets; however, they have been gradually replaced by the stock market institution.

The first stock markets have been documentarily attested during Middle Ages. The Romanian word “bursa”, translated in English as “stock market”, originates from the name of the Venetian family “Della Borsa”. This family has created at Bruges (Belgium), at the end of the XIVth century, an establishment where different stocks and merchandises were being negotiated: goods

including gold, silver, platinum and also securities.

The stock market from Anvers, founded in 1531, is considered to be the first stock market in terms of the contemporary meaning. The Italian cities (Venice, Genoa, and Florence) have witnessed an early development of stock markets; in fact, these Italian stock markets have been the promoters of the commercial spirit at international scale. However, the real affirmation of the stock market within the trading and the financial world is achieved once with the foundation of stock markets in London (1554, Royal Exchange- founded by one of the pioneers of economic sciences, Thomas Gresham), Amsterdam (1608), Paris (1639) and New York (1817).

The main stock markets are to be found in Europe in cities such as London (Stock Exchange), Paris, Milan, Frankfurt, Munich, in USA- at New York (the two stock markets on Wall Street), and in Japan- in Tokyo.

The beginnings of the commodity exchanges and of stock markets in Romania date from the half of the XIXth century. The first attempts, which have been made in 1839, had no result. A free market for stocks, effects and foreign currency existed in 1860, and bankers and merchants were performing transactions at the “Hanul cu Tei” Inn, using exchange rates based on information from Constantinople and from great western centres.

Starting with “the Law on stock markets, and on goods and exchange intermediaries” (the 1st of June 1881), one can speak about a mare solid and serious stock market organisation within the old Romanian kingdom. Thus, on the 1st of December 1882, the Bucharest Stock Market was being opened and, in province, there were functioning stock markets at Iasi, Galati and Braila. Nevertheless, the stock market activity has been influenced by the social and political events of the time: during the 1907 Riot, the currency rate has been marked by regression; the Balcanic War (1912-1913) has led to massive rate losses, which have been recovered afterwards; during the First World War the Stock Market has been closed.

In October 1918, the Stock Market has been reopened and it has witnessed a very intense activity; nevertheless during the Second World War, it has been closed again.

The authoritative and hyper-centralised policy did not allow the development of a capital market; however, after December 1989, the governmental financial policy was focused towards establishing a stock market. Thus, on March 1995, the Bucharest Stock Market has been founded. The activity of the Stock Market runs according to the provisions of the Law nr.52/1994; it aims at creating an organized market for negotiating quota admitted movable assets and public insurance, through the activity of authorized intermediary agents of several systems, mechanisms and adequate procedures for the continuous, ordered, well-balanced, performing transactions with transferable securities.

Bucharest Stock Market represents a very important institution to the Romanian economy, to the businessmen activity and to the public opinion. There is only one certainty: to our country, as well as to the other European countries, the stock market represents the most accurate progress measure which leads towards transition.

3. The Functions and Role of the Stock Market within the Modern Economy

The secondary markets for financial titles (stock markets) can be organized in two main ways:

- ◆ As stock markets (“Bursa de valori” in Romanian, “Bourses” in French)
- ◆ As OTC (“over the counter”) markets, also called negotiation markets

The stock market defines itself through the existence of an institution which disposes of transaction spaces, where the demand and the supply for financial titles are being concentrated and, moreover, where the negotiation, the contracting and the open execution of contracts are taking place according to a familiar regulation. This means of organizing the stock market presupposes the centralization of transactions with financial titles through the agency of a mechanism which provides to the customers the direct and continuous access to market information - in this case, to the market

exchange rate- and which allows the effectuation of stock transactions, exclusively by the means of this mechanism.

Within the tradition of different countries, the two ways – the classical and the modern ones – merge or are used only in electronic transactions. Nevertheless, in all cases, the permanent feature of stock markets is that, essentially, all market information regarding prices and financial operations is centralized in only one location (the negotiation room).

A feature belonging to the last two decades is that the stock market tends to expand itself. Companies have to meet more restrictive requirements if they want to be operated at the quotation; therefore, new stock markets have been created (the market of unquoted shares), where the access is allowed in less limitative conditions. At the same time, the so-called “third markets” have also developed; the shares of young companies can be operated within these markets; these shares are usually established on high profit potential fields but also with high investment risks.

Interdealer or OTC markets have witnessed an important expansion (for instance in USA and Japan); these stock markets allow the access at transactions to a great number of stocks which do not meet the requirements for the quotation at the “proper” stock markets. OTC market is essentially made of connections which are established between dealers, and as well as of connections which are established between these dealers and their clients; thus this type of market has the abstract meaning of an aggregate of transactions. Nowadays, these relations are made by using IT means of processing and transmitting information.

The following table (table 2.1) comparatively presents the traits of the “proper” stock markets and those of the interdealer markets (OTC).

Table 2.1

STOCK MARKETS	OTC MARKETS
1. Localization of transactions, i.e. the existence of a defined space, of a building which should have a negotiation room, exclusively destined to running financial titles transactions	1. Lack of localization, lack of building; transactions are carried out in the offices of financial companies, which thus act “over the counter” (OTC)
2. The direct access on the market is basically allowed to the members of the stock market and to the accepted shares	2. The access is wider, both to customers and shares; there is a great number of market makers
3. The negotiation and the contract execution is made by specialized staff – through different transaction systems based on public auction	3. Transactions are carried out through the negotiation between seller and purchaser; within the transaction, the dealer has the role of an intermediary agent
4. When caring out transactions one has to observe the stock market regulation and also several legally established strict rules; exchange brokers have to respect certain obligations	4. Transactions regulation is less firm and comprehensive; usually it is made by associations of dealers
5. A unique exchange quotation for the negotiated shares is developing owing to the concentration of orders and to the mechanism of transactions	5. Prices can vary from a company to another because they are established by means of isolated negotiations

The stock market, which has the structure of the so-called stock market, of the interdealer markets or of the electronic market, is a constituent of the market of financial titles. Its aims are to concentrate the demand and supply for securities and to carry out transactions in an effective, fair and transparent manner. During the past years, the stock market has entered a new stage of evolution: important measures of modernisation have been taken in the acknowledged stock centres; these measures aim at the increase in transactional efficiency and security. In several third world countries, and, recently, in several central and eastern European countries, the process of creating and enforcing the stock market capital is in full progress.

The stock market, in the broadest sense, acts as a “relay” between the surplus of unused funds and the economic needs, transforming thus the savings into capital. Through this function, the stock market is involved on the primary market, where company shares are being issued, and where compulsory loans are being launched etc, supplying thus the necessary funds for the economic agents.

Nevertheless, its defining role is that of secondary market, allowing the wide public to access the securities which have been already issued. Thus, the stock market ensures the necessary support for the primary market; it also allows the functioning of the mechanism for the economy funding. The dynamism of the economy is directly related to the adequate functioning of the primary market, and consequently, to the possibility of funding the activity of economic agents. Nevertheless, a functioning primary market (a credible and a viable one for the stock holders) requires that the stock holders have the ability to liquidate at any time their shares and to regain the invested sums.

Thus the stock market ensures *the liquidation* of financial assets, offering the possibility of selling the purchased shares, i.e. changing them into currency. The investor disposes of a market on which he is able to change the purchased sales into cash; this is considered a warranty because the cash paid in advanced will be recuperated at their market value.

Therefore, as a financial market, the stock market fulfils the function of a market controller in economy; it operates as a mechanism through which funds are passing from those who dispose of them to those who need these resources in order to finance certain economic activities. Thus the stock market ensures the running in general of the economic circuit and it also fulfils the role of a regulating mechanism for the real economy. In the same time, it is “an engine” of the economic life: it stimulates the business activity and allows the achievement of certain important investment projects, which could not be carried out only by means of the funds of a small group of undertakers.

The stock market has an important role in **the reorientation and the reorganisation** of economic activities. The stock market carries out a redistribution of the funding means in economy, stimulating the branches, the industries and the societies which are in full development.

The stock market activity leads to the development of competition, to the stimulation of **the transactions between corporations**. When considering the stock market a landmark of the business world, one has to take into consideration its imperfections, as economic guidelines. In certain situations, the stock market may reflect an unfounded optimism, a fake promise of income, leading thus to the separation of the stock market trend from the real economic situation, or even to the clear opposition between the financial and the real economy (reflected by the stock market crash). This happens because the tendency of the stock market is influenced not only by rational anticipations, which are fundamental from an economic point of view, but also by subjective factors and reactions. At the same time, when judging the role of the stock market in the financial-economic life, one cannot ignore the importance of the consequences of a very intense stock market activity, and the risk of certain uncontrollable speculations, which can lead to stock market panic and even to crash.

4. The Organisation and the Functioning of the Stock Market

The financial transactions on the stock market are running according to a very well established system of organisation, both regarding the place and the role of participants and the manner in which transactions are being carried out.

The exchange brokers are responsible for the quotations which are running on the stock market; they also ensure the financial administration of the portfolios of transferable securities, in the account of their clients. From the point of view of his professional statute, the exchange broker is a dealer. At the same time, he is a civil servant; he is solidary with his colleagues, and responsible together with them in case of failure on the stock market. Like any other dealer, the exchange broker has to be subscribed to the register of companies.

Security purchasers and sellers, such as companies, banks and natural persons, do not have direct access on the stock market, although they are generating the demand and the supply for shares; they can access the stock market only through the exchange brokers. The exchange brokers are of two types:

- **Agent brokers** are those exchange brokers who act in the name of their clients. They have the role of intermediaries because they receive the sale-purchase order from their clients and they transmit these orders to “specialist” brokers. Agent brokers permanently communicate to their clients the exchange rate of the securities which are being negotiated and they also inform them about the order execution.

- **“Specialist” brokers** are those exchange brokers who are centralising the sale-purchase orders and negotiate the orders which are received from the agent brokers. Although they have different names, such as “jobbers” in Great Britain, “courtiers” in France or “dealers” in USA, their role is the same within all stock markets. They participate at the establishment of the exchange rates, execute the sale-purchase orders, and administrate their own portfolio of securities. As a dealer, the “specialist” broker has to ensure stability and continuity to transactions. Therefore, he has his own

portfolio of shares and bonds, and his own currency funds, which he uses only in order to maintain the stability of the shares which he negotiates.

The exchange brokers can be reunited in a Society of Brokers, whose activity is coordinated and administrated by the Syndical Chamber of Stock-Brokers. The Syndical Chamber, who is responsible for the organisation and the functioning of the stock market, collectively represents all the members of the Society of Brokers; it controls the exchange activity of transferable securities, the regularity of the financial operations, and their solvability degree; it establishes the rules according to which each exchange broker is setting up the results account, and it also establishes the precaution measures which it considers to be necessary; it interdicts the access on the stock market, it suspends or revokes the quality of exchange broker.

The activity of the Syndical Chamber is coordinated by a Chairman (the stock market syndic) and by a vice-chairman, who are elected by the general assembly of the Society of Brokers, on a limited period.

The Syndical Chamber disposes of functional services and of its own budget. As an authority of the Society of Brokers, it has at its disposition a service of foreign relations and a staff service, a juridical and fiscal service, a treasury and accountancy service, and an electronic centre of information processing.

As a distinct body within the Syndical Chamber, there is the Commission of Stock Transactions (in Romanian COB) which regulates the way in which transactions are running, and which informs the public over the stock market mechanisms. For this reason COB publishes a The Stock Official Bulletin.

COB supervises the observance of laws and regulations established by the public authority; it informs the holders of transferable securities on the societies which put deeds into circulation, on the transferable securities which are issued by these companies, and on their negotiation on the stock market; it controls the means of respecting the bonds which have been made by the participants at these transactions; it gives its verdict on the insertion or on the erasing of certain transferable securities from the official quotation; it has the role of a

court, next to the public and to the government, and it has the duty of solving certain demands and complaints related to stock market transactions; it makes an annual report on the stock market activity and it publishes it in the Official Gazette of Romania.

Within the organisational structure of the stock market, the clearing house (of compensation) has an extremely important role; it guarantees the execution of the bonds which have been assumed by the partners. Through the clearing house all transactions which have been concluded during a stock market day being are balanced. The purchasers have the warranty that they will receive their shares and the sellers have the certainty that they will receive the exchange value of the sold shares.

Tourism Development Activities in the European Economy and the Influences of the Actual Crises

Dionisie Cristina
“Petre Andrei” University of Iași
cris_dion@yahoo.com

Abstract

This approach has amply analyses the influence of the current crisis in development of the tourism sector.

The study was justified by the fact that this field has greatly expanded over the past 50 years in the EU country. Tourism is a sector noted that an important contribution to GDP and employment.

In the study are highlighted issues relating to the way of tourism development in the sub-branches in recent decades. Special emphasis is placed on the analysis of international tourism, which was affected most by the current crisis.

The study examines the evolution of some important indicators of tourist activity and identifying the main causes that contributed to the trends outlined manifestation. Although, the nature of risk factors in tourism has received little attention restricted to collateral and unilateral treatment.

Key words: anti-crisis measures, tourism development, sustainable recovery

J.E.L. classification: M16, P5

1. Introduction

With the intensification of the globalization process had emphasized the concerns of all countries to ensure a more favorable position in the European and international tourist market. In the scientific research in the field of tourism economy, expanding phenomenon of globalization in tourism has occurred with the development of the doctrine of the new economy. According to Hans van der Loo this development meant moving away from the primacy of development services (included in the product package tour) to that of feelings,

and experiences. Therefore the value of tourism products is no longer seen as being exclusively linked to the efforts of the manufacturer, of the offertory to the consumer but also to the tourist. This value to the consumer or depends on how to manage his feelings, sensations felt in the defined by time and after travel consumption, entertainment actions. For developed countries, the model experience is extended by including as ingredients and feelings, relationships established with the tourist economy, the authenticity and the degree of customization of tourist products [2]. This approach stresses that tourism development is less affected by cyclical economic fluctuations than other areas.

2. The influence of the current crisis on the contribution of tourism to the P.I.B and employment at European level

In economic practice in the field of tourism, the European countries efforts were focused on both the growth indicators which reflect the economic performance and on the implementation of a modern tourist management.

More than human resources and the technique itself, the strategy by which a company decides to organize themselves, constitute a decisive factor in securing a dominant position on a particular market.

In the last two decades, the development of tourist activities had a sinus, mostly ascending trend until the 2000s followed by a downward trend. Thus, the growth rates they recorded the largest values in the 2000s, as part of the main developed countries E u. (Austria, France, Germany, Italy, Spain) and then have had a mostly downward, culminating in the 2005-2007, which were at the time of crisis [3]. An exception to this evolution of Greece, in which registered the

highest growth rate was recorded in 1995. (table 1)

*Table 1. The evolution of the real growth rate of the contribution of tourism to the P.I.B **

Country	2000	2005	2010	2011**
Austria	15,6	-2.5	-2.3	2.4
Bulgaria	29,6	3.9	0.2	2.0
France	9,0	-3.6	-1,7	0,5
Germany	12,1	-2,0	0.0	0.5
Greece	8,8	7,2	0,0	2.6
Italy	16,7	-2,1	0,5	3.0
Romania	3,8	5,8	-1,9	6,1
Spain	13,4	5,2	-3,5	1,1
U.K	7,1	0,2	-0,3	0,9

http://www.wttc.org/eng/Tourism_Research/Economic_Data_Search_Tool/

In Romania, real growth rates have been in a decline in the first decade, and the second recorded small fluctuations amid a general downward trend. As late as 2011 it is estimated that there will be a recovery, the real growth rates have been estimated at 6.1%. The last five years recorded negative rates, amid the economic crisis and the fall in population incomes. Although the process of globalization has opened new possibilities for accessing European funds for development and access to European markets, strategies and measures applied were not appropriate and consequently not culminated with the achievement of growth rates similar to those achieved by developed European countries.

In the period 1990-2000, an ascending evolution has occurred in relation to the direct contribution of tourism to the P.I.B, the highest rate of direct contribution to the P.I.B passed in 2000. In the last decade, the direct contribution to the P.I.B had the lowest rate of real growth in 2005. (table 2)

*Table 2. The evolution of the real rate of growth of the direct contribution of tourism to the P.I.B **

Country	1990	2000	2005	2010
Austria	2,0	11,9	0,6	-2,0
Bulgaria	26,5	29,4	-1,7	4,7
France	0,7	8,7	-1,5	1,0
Germany	-4,9	14,1	0,3	1,5
Greece	-3,5	7,2	10,9	1,0
Italy	-3,6	16,8	-1,5	1,3
Romania	-16,4	10,4	37,8	2,1
Spain	-6,0	12,1	3,2	0,7

http://www.wttc.org/eng/Tourism_Research/Economic_Data_Search_Tool/

Can be seen from the table that was being established in the year 2010 for the development of a sustainable recovery in most of the countries of the European tourism. In Romania under the impact of the current crisis being established a huge gap between the years 2005 and 2010, which marks a dramatic shrinking of the direct contribution of tourism to G.D.P.

In most European countries, tourism has had an important contribution to employment. The direct contribution of tourism on employment estimated by means of real growth rates was more significant in 2000 developed in most European countries. (table 3)

*Table 3. Real growth rate of the contribution of tourism to employment **

Country	1990	2000	2005	2010
Austria	-0,6	9,0	2,2	-4,2
Bulgaria	55,9	8,9	-6,1	1,0
France	-1,0	7,5	-2,3	-1,9
Germany	-2,9	10,7	0,6	-2,1
Greece	-0,6	1,3	8,6	1,2
Italy	-1,9	16,0	0,2	-0,9
Romania	-9,4	7,0	28,3	2,3
Spain	-7,6	11,1	6,7	-1,7
UK	2,2	5,2	-1,6	1,4

*1989=100

http://www.wttc.org/eng/Tourism_Research/Economic_Data_Search_Tool/

Labor productivity in the tourism industry has been differentiated in terms of trends, increasing peak attained in most European countries developed. The highest labor productivity index values have been reached in Belgium (497,2 in 2004), France (335,5), Austria (273), UK (244,1). This trend is the result of an increased contribution of tourism to the GDP of these countries and the growth of employment in the tourism sector to a lesser extent than the rise of wages [4]. Labor productivity growth is the result of the intensive, thus encouraging factors in European countries it has occurred and thanks to measures taken for the purposes of replacement technologies used, a change in legislation and promoting the social component in the direction of implementation strategies, issues that should be taken into account by decision-makers and managers of our country. All these actions were conducted within the framework of an efficient strategy, therefore a differentiated process of specialization within the tourism industry. Thanks to these measures in the developed European countries, the branches of the tourism industry were less influenced by the negative effects of the current crisis

3. Improvement of the negative effects of the crisis in countries specializing in the tourism industry on the branches based on infrastructure and communications, equipped with a highly technical and technological

Developed within the framework of the European countries have outlined a series of favorable development trend of tourist business intensive:

a. Specializing in branches based on infrastructure and communications, equipped with highly technical and technological developments. Compared with the industrial concentration of capital in international tourism in the tourist infrastructure has been very rapid. Hotel chains, cruise companies have experienced a sharp development Transport logistics itself had organized by global and development structures. The practice of tourism destinations has appeared which offered chance escape from daily life, demarcating increasingly more road construction business destinations, equipped

with a special utility infrastructure. Even if the destination is at a great distance by the issuing it is added to the many forms of incentive, by integrating the tourist in studies specific to the local population and local events. With the emergence of this feature over the past decade included the hospitality industry. 4000000 hotels and 8 million restaurants, on which millions of employees 67,4 producing 1280 billion of the world's GDP, which is about. 9% of employment and about. 12% of world GDP.

b. Growth of the business sector contribution and rentals. This development was carried out in line with the strategic development of the service industry. The development of services sector in E.U countries did not follow a chaotic evolution, by extending the process of globalization. It must be noted in this process of specialization tendency of developed countries in certain branches of business and professional services, and in some tourist industry's business. Branches of services are the most important stakes of the battle which goes to gain a dominant position in the division of labor in the world, due to the dominant share of services in world trade, the P.I.B and employed population. Development of business and professional services is the result of intensified global competition and a "process of outsourcing the production of services" [5].

c. Labour productivity growth in the hospitality sector branches. The trend has been due to intensive measures to modernize the hotel, while respecting the traditional style, or promoting the avant-garde style. The provision of quality services, the customer tourist to feel "King" is the result of the application of marketing strategies and rigorous quality but also of a policy of specific staff. Maintaining optimal staff rules serving not meant a reduction in productivity but rather, performing a service that allowed the winning of a growing market share in the long term. Branch "hospitality have about 68 million employees i.e. 2,6% of the total employees generating a positive multiplier effect directly to c. 195 million jobs (7.6% of the total).

4. Decrease in investments in the tourism sector during the current crisis

The actual rates of increase in capital employed, compared with 1989 there have been positive, in particular, between the years 1990-2000. The scope of the crisis triggered in 2007, the rate of growth of capital invested in 2010 are mostly negative, but in the future a recovery and so by default it will return to trend growth of the capital invested in this sector. [6]

Globalization and actual crisis marked a differentiation of countries in terms of arrivals of tourists. Countries that recorded the highest number of arrivals had and the greatest revenue. Money with leaving a tourist are an import for the country of origin, representing an expenditure and therefore the export to the country of destination. In the incoming component trips is higher than that of outgoing.

One of the positive trends and our country has lined up refers to increasing the number of nights spent by tourist destination countries. The trend has occurred as a result of the increase in tourism of stay, number of visitors who have turned to the services of travel agents being considerably larger than tourists in transit.

W.T.T estimates for 2020 outlines several major trends within the globalization in tourism:

- The passage of China's first places in terms of the "arrivals";
- Reviving Russia, Poland, Hungary, the Czech Republic and Asians country.
- The incoming component remain higher than that of outgoing in developed countries.
- In developing countries, domestic exports, made of arrivals of tourists coming from the developed countries will be lower than the outgoing component.[6]

Estimates give the continuation of the trend of the domination of the capitalist countries the tourism developed with great potential.

5. Conclusions

Accordingly, in the current configuration of the European tourist activities with developed countries dominate the contents in the value added, investing in infrastructure, telecommunications, business services, while some countries are still lagging behind oriented tasks with the lowest value added, which occupies roughly cut in global tourism. In this way tourism to the developed countries was less exposed to the adverse effects of the crisis. The increasing benefits of globalization are possible only through the shaping of such structures in the tourist sector has focused on the activities of the most competitive and for which Romania has a good potential. Issues considered should constitute at the same time the fundamental points of reflection for the development in the future of appropriate strategies for tourism in our country.

The Benefits of Industrial Agglomerations in a Prolonged Economic Crisis

Dirzu Mădălina-Stefania
„Alexandru Ioan Cuza” University of Iasi,
Doctoral School of Economics, Centre for European Studies
dirzu_madalina@yahoo.com

Abstract

The international economic crisis that started in late 2007 and perpetuated until 2011, has conducted to new interests in the connection between the impact of worldwide recession and the possible remedies offered by industrial agglomerations for contrasting this powerful virus that global economy is copying with. To shed a light on this question, industrial agglomerations permit companies to become more innovative and consequently more productive by developing unique knowledge and abilities difficult to be replicated. In this way, the agglomerations contribute to the competitive advantage of the areas where they are located, and this value chain seems to be similar even in the case of a prolonged economic recession.

Therefore, the purpose of this paper is to explore the behavior of the firms inside industrial agglomerations in the context of an extended financial crisis, focusing on several cases from Europe and finally to examine in what proportion the benefits of agglomerations are crucial for a prompt recovery from this worldwide economic collapse.

Key words: industrial agglomerations, economic crisis, coping solutions.

J.E.L. classifications: R10, R11

1. Introduction

The actual prolonged recession the world economy is traversing since the end of 2007 has mainly generated a profound lack of trust which appears to have contaminated practically all sectors of global economy. As long as, in general, economic crises install a high degree of instability and uncertainty that

might determine companies to collapse, industrial agglomerations seem without question to be “happy islands” [1]. Thus, if we look back to the nucleus of agglomeration, it includes various antidotes for confronting this acute illness the worldwide economy is forced to endure, offering a real hope for a quick and solid rehabilitation. The fact that a lot of industries are geographically clustered in a certain region gives the essential evidence for the existence of external economies of scale that stimulate companies to locate in the proximity of others and function as an unified organism. Agglomeration economies appear when pools of specialized skills, intense interactions among local suppliers and customers, shared infrastructure and many other localized externalities reduce the costs and major the returns of the firms involved in the local exchange and thus generate growth and other benefits. Additionally, besides these scale economies, synergies of cooperation may also be enjoyed by agglomerations members through the medium of three important elements: access to developed labor market, solid supplier background and finally the favorable circumstances of quick knowledge and information transfer among companies [2].

Considering these, the main goal of this paper is to point out the fact that the present extended recession might signifies a fertile environment for new opportunities and solutions advanced by industrial agglomerations through adaptation to the new economic context. Thus, the structure of this work is organised as follows. Section 2 disentangles the relevance of industrial agglomerations for coping with a prolonged economic crisis. Section 3 focuses on benefits of agglomerations during a recession. Section 4 presents several cases of European industrial agglomerations to

observe their behaviour in this critical period. Finally, section 5 draws conclusions and highlights the potential of these agglomerations to contrast the negative effects of the economic crisis.

2. The relevance of industrial agglomerations for coping with economic crisis

Without any doubt, every economic recession creates chaos, confusion, panic and eventually an environmental instability. For this reason, national governments are profoundly preoccupied with discovering solutions to avoid collapse of economies and global financial systems. At the same time, there is also high awareness of the importance of a collaborative behavior among firms. In this sense, the next section aims to reveal the significance of the interaction and closely cooperation that characterize an industrial agglomeration, all these interrelationships being vital for facing a major economic downturn.

First of all, industrial agglomerations are defined as spatial concentrations of interrelated enterprises, specialized suppliers and other institutions, that establishing and maintaining intense connections, generates growth in the regions in which they operate [3]. Generally speaking, firms cooperate to handle turbulent environments, to get access to new resources and markets, to diminish risks and control costs [4]. Collaboration among firms is frequently seen as an intentional response by enterprises to cope with insecure and changeable environments. For this particular reason, the principal motivation for alliance formation is convulsions in environmental conditions that point out company internal resource inadverencies. High economic uncertainty and rapid technological modifications tend to appear at the same time and become jointly strong drivers for cooperative behavior of firms. Resource dependence, new information, risk limitation and access to market serve as company-internal motivations for establishing partnerships with other firms. Especially in cases of environmental uncertainty (due to economic collapse, for instance) enterprises are notably disposed to cooperate as a modality to

manage uncertainty. Moreover, a broad framework that enlighten why firms build collaborative relationships is interdependence. Thus, “interdependence exists whenever one actor does not entirely control all of the conditions necessary for the achievement of an action or for obtaining the outcome desired from the action” [5]. As long as companies are not self-sufficient, they are consequently obliged to rely on the environment to procure support and involve in exchanges with other groups of firms for needed resources. By forming linkages with other enterprises in the environment, in this way they are able to provide required resources and diminish uncertainty. Creating ties among companies represents a solid way for firms to try to handle this uncertainty by assuring needed resources, conceive stability in supply and become more competitive. Moreover, it must be stressed out that vital resources such as specific competences and specialized vendors are obtainable through forming connections with others, these ties being created only inside industrial agglomerations.

Considering these, it is expected agglomerations to be relevant for coping with this economic crisis because cooperation among members reduces uncertainty and ensures access to scarce resources.

3. The advantages of industrial agglomerations during an economic recession

Industrial agglomerations are not certainly the central figures of the actual financial crisis, but they seem to constitute by far secure shelters. Even if we are referring to industrial activities or not, agglomerations are also touched by the negative repercussions of this economic recession. This aspect is particularly visible if we take a closer look at the general decline in consumption at world level and at the deficit of trust that appears to influence almost all sectors of global economy. Nevertheless, if we return to the essence of industrial agglomerations, it exposes several valid arguments why spatial concentrations of firms are favored in times of economic collapse.

Primarily, industrial agglomerations allow inside firms to become more productive and more innovative compared to the case when they activate isolated. In this manner, they can develop new knowledge and skills mixture which can hardly be replicated. Therefore, firms enter into informal and formal networks of knowledge share and create complex modes of collaboration among them. Hence, agglomerations permit the companies, states and regions in which they function to create sustainable competitive advantages and even to develop in spite of the overall recession.

Moreover, as we have already said before, this prolonged crisis has generated a powerful lack of trust that seems to be extremely destructed for almost all the economic actors. But this is not the case when we are referring to industrial agglomerations environment because inside these alliances trust is vital. However, it does not signifies that every member undoubtedly trust one each other, this would be a too perfect world. Still, in a such partnership, information and knowledge share, including also the tacit knowledge, circulate in a more efficace way which permits all agglomerations agents to respond quicker and, finally, to correct those who violated certain business rules. This represents an alternative modality of putting trust into practice.

Furthermore, industrial agglomerations represent a powerful potential for regeneration. Since the creation of new business is much easier than for those firms operating in isolation, agglomerations can better react to the crisis and recover faster offering regeneration and fresh ideas to old business models. In this sense, an economic crisis marks the „begginig of the end” of an ancient techno-industrial paradigm [6]. Eventually, the economic recession symbolizes both destruction of an established paradigm and new opportunies and new solutions through readaptation to novel contexts. To be more precisely, the entire world is confronting with a so called creative destruction [7].

Additionally, crisis frequently generates opportunities inside: “wej-ji”, the chinese term referring to this concept is formed out of two ideograms representing “danger” and “challenge/opportunity”. For instance,

automobile manufacturers specialized in small size cars, often neglected in the past because they were evaluated with lower added value, are nowadays considered the most dynamic actors of this industry strongly touched by the actual crisis. Thus, within an industrial agglomeration, small businesses tranform their principal disadvantage – the fact of being small, into a source of competiveness, giving their flexibility and faster response to the new market demands.

In a nutshell, it is essential to understand that all these benefits of industrial agglomerations presented above do not serve as magic formulas for succeeding this prolonged crisis but focusing on agglomeration basic strenghts represents a step forward in overcoming this major economic downturn.

4. European experience

Despite this extended economic crisis which has strongly affected a lot of European countries, many of these states have been able to show hopeful signs of recovery based also on increasing competitiveness of certain industries clustered into agglomerations. In Europe, industrial agglomerations capitalized traditional activities of all regions and hence manage to preserve and improve ancestral knowledge and skills: stainless steel in Solingen, fashion industry in Milano, financial services in London, Danish cheese, Dutch glass and so on. Generally, these advantages emanate from the abounding natural resources of the regions, like in the case of Spanish and French wineries, the Polish coal industry, the Slovenian spa resorts and the rest.

European industrial agglomerations differ in intensity of the interactions among the businesses. In this sense, it is important to understand that only spatial proximity is not sufficient [3]. It turns into competitive advantage only if it covers the specialized suppliers, developed work force and if the process requires profound linkages among the firms. In European countries, the regional competitiveness is build upon the creativity of the agents in the agglomerations, the capacity for innovativeness and strong collaborative relations between these alliances.

In recent years, a lot of observers have speculated on the evolution of industrial agglomerations in Europe. First of all, these spatial concentrations are dominated by small or medium-sized companies. Secondly, most of the agglomerations serve global markets, not just Europe. Also, it is important to emphasize that in an increasing numbers of agglomerations, multinational companies are present, unquestionably using these European locations as export platforms. Thirdly, advanced activities are available in many of these concentrations of firms while standard production activities are increasingly being outsourced to different locations [8]. This position as innovation centers is in line with the role of European agglomerations to overcome this global economic crisis. In this sense, the Global Competitiveness Report provides annually comparative data on overall agglomeration strength for 140 countries including all European countries. This survey presents also the state of agglomeration development. Thus, in the graphic below it can be noticed the development trend of some European agglomerations in this period of economic recession.

Graphic 1: State of agglomeration development

Note: 1-nonexistent;7-widespread in many fields

Source: Global Competitiveness Report 2008-2009 and 2009-2010

As we can easily observe, the majority of these European countries have continued to develop their industrial agglomerations even when the crisis got its climax in 2009. This aspect confirms that these spatial concentrations dispose of powerful assets that help them to succeed the recession.

Clearly, special cases are Italy, Sweden, Germany and United Kingdom which have been able to obtain very high scores on agglomeration development, values that have ascended during 2008-2010 from 4,9 to 5,0 in United Kingdom and, pleasingly, from 5,4 to 5,5 in Italy. Countries that on the contrary have obtained descending scores are Greece, Romania and France, here the recession's effects being more serious compared to other states.

To sum up, analyzing the structure and the development of some European industrial agglomerations, it seems very clear that these concentrations dispose of unique features that allow them to grow and contribute to the competitive advantage of the regions where they operate even in times of a prolonged crisis.

5. Conclusions

In this paper, we have explored the virtues of industrial agglomerations in general and the evolution of several European industrial agglomerations in particular with the final goal to observe the behavior of the members of these conglomerations during this extended crisis the worldwide is going through. After a careful analysis, it seems that the benefits of being part of an agglomeration are vital not only for survival but even for a further relative growth despite the prolonged crisis, all these due to the complex and strong interrelationships among companies. In this way, industrial agglomerations conduct to higher efficiency and effectiveness through the availability of specialized skills, agile vendors and most of all a concentration of key customers. Also, the prompt dissemination of both formal and informal knowledge and the permanent interactions with the customers create constantly new ideas and pressure for more innovation, since the agglomeration environment lowers the costs of business experimentation, in the end taking advantage of the economies of scale.

Considering these, in general, the conclusion drawn from this analysis is that industrial agglomerations seem to diminish risk and stimulate the innovative spirit during situations of environmental turbulence such as this extended crisis. Nevertheless, to perceive industrial agglomerations as a

panacea for the attainment of overcoming this recession is relatively risky. As always, there are not shortcuts or abracadabra tricks for succeeding this major economic downturn but focusing on agglomeration basic assets and applying them to other distinctive skills of agglomerations, is definitely a big step in the right direction.

The Mutations of Public Utilities Provided by Public Indebtedness in the Economic Downturn

Dobranschi Marian

“Alexandru Ioan Cuza” University of Iasi

dobrica_3@yahoo.com

Abstract

In this paper we try to draw a possible trajectory of the public utilities supply, taking in consideration actual economic recession correlate with the evolution of public indebtedness which is intended to finance public expenditures. We assume that in order to provide competitive and high quality public goods and services, governments need to change the policy regarding public provision of utilities in order to ensure efficiency and avoid public financial resources waste. One of viable solution is the transfer the provision from state-owned companies to private-owned ones, of course correlated with a simultaneously process of regulation to create a precise legal framework to ensure a broad access to public goods and services offered to citizens.

Key words: Public debt, public utilities, economic recession, public indebtedness.

J.E.L. classification: H4, H50, H68.

1. Introduction

Government in most of the developing countries cannot sustain economic growth without borrowing in order to finance the technology gains and capital deepening that will ensure economic growth in long term. With this choice to finance public spending comes high levels of debt which are increasingly accused of deleterious effects on economic development, in what appears to be an revival of a 20-year old debate on the virtues of debt relief.

In this paper we take in consideration the notion of debt accumulation that are debated in two different categories of theories. First categories of theories are based on multiple equilibrium, where investment endogenously

collapses beyond a certain level of indebtedness in preparation for default and in order to minimize penalty payments, exogenously assumed to equal a fixed proportion of output.

Second categories of theories are assuming where the nature and terms of optimal debt contract are affected by the level of existing indebtedness. As debt level rise, it becomes increasingly difficult and eventually impossible, for a creditor with imperfect monitoring technology to illicit effort on the part of the debtor. The borrowing economy then loses all incentives to implement policies that are painful in the short-term but beneficial in the long run.

Modigliani in his debate over public debt sustain that public spending financed through public indebtedness can affect economic growth into the future (long term) if public spending affect at least one of the above conditions: if this spending affect the natural resources available to the future; second condition is that public spending improve technological knowledge and the third if these spending affect the stock of man-made means of production, or capital, available to future generations.

In order to ensure the sustainability of public debt, public debt policy has to be a tight one. In case of a slow and modest economic growth combined with a deteriorated fiscal situation, and after a deep and prolonged period of recession the results can be seen firstly on the national income evolution, which in most cases is an negative one, and implicitly tax revenues do not increase comparing with continuously rising government spending due to social pressures like: unemployment, social funds, other welfare expenditures, that are causing every time large budget deficits.

The concern for sustainability of fiscal deficits and public debt sustainability should be a key problem that would lead public

spending policy and the supply of public utilities.

The main question is about: Can large deficit be sustained? How much public debt can a government afford in order to maintain the sustainability threshold? Is there a possibility that in the long run the system will be paralyzed if public finance collapses under the weight of massive deficit?

If the Ponzi gamble is not respected, and the mechanism became an unsustainable one, the government will eventually go to default, in other words it will be unable to collect enough tax revenues to finance public spending and debt repayment. In situation when public loans crowd-out private capital, the economy will go bankrupt if the mechanism of financing public deficits through public loans fails.

From this statement we can emphasize the importance and the long run effects of government austerity. For the example of situation when government is forced to go default. In such situation of public sector bankruptcy, austerity measures are required and fiscal policy has to be responsive. The use and efficiency of austerity measures can be operated only if the private sector can sustain and can respond proper to the budget constraints. The application of the austerity program proposed by the government depends critically by the response of private sector and the accumulation of capital.

In situation of default, government have two main solution to act, either they cut spending or either they increase taxation.

The effect of public spending in the production of market goods can be exemplified by the services provided by the judicial and police systems that enforce laws and contracts and have an external effect on the market transactions. Public spending as an input in the human capital production function consists of the supply of services (such as public education) that directly contribute to the accumulation of the human capital.

2. Public indebtedness and the provision of public utilities

In time of economic recession, when consumption decreases, and production falls, implicitly the unemployment rise and the pressures on the public budget are higher,

public spending need to increase in situation where tax revenues are shrinking, the optimal provision of public utilities becomes a basic requirement in order to ensure public finance sustainability and long-term growth.

The rationale of the optimal supply of public utilities can be placed in a simple classic framework where if the benefits of productive efficiency outweighs the cost of allocation inefficiency, then the society will have a welfare gain from maintaining the natural monopoly organization of a public utility.

In other words, we can say that if the benefits or the advantages obtained from the supply of public utilities is greater than the public spending incurred in their financing, we can assume in this case that are efficiently provided and public spending are productive in the sense that they produce added value.

Supposing that an important part of the public spending are financed through public loans, the efficiency of the public utilities is the basic condition in order to sustain public debt burden and fully repayment at maturity.

Reinhart and Rogoff (2010) sustain that in a period of depression even in countries that have not experienced major financial crisis, debt rose an average of about 20 percent in real terms between 2007-2009. This general rise in public indebtedness stand in contrast with 2003-2006 period of public deleveraging in many countries and owes to direct bail-out costs in some countries, the adoption of stimulus packages to deal with the global recession in many countries, and market declines in government revenues that have hit advanced and emerging markets economies alike.

Their's main findings are that across both advanced and emerging countries, high debt to GDP levels (90%) are associated with notably lower growth outcomes. In addition for the emerging markets there are an even smaller threshold for external public debt to GDP (60%), this is also associated with adverse out comes for growth. Seldom do countries simply “grow” the way out of deep debt burdens.

J.M. Buchanan in his paper “Public Principles of Public Debt” sustain that public debt issue has normally been conceived as appropriate only for the financing of genuine public investment. The classic consider that access to debt issue might lead to

irresponsible spending decisions on the part of legislative assemblies and executions.

The main reason why public expenditures must be financed through taxation is because from the public expenditures benefit current generations, the benefit principle suggest that they should be financed wholly from tax revenues. But if public spending are anticipated to yield income in future time periods, future generations will receive the a significant part of these benefits. Therefore, a part of this real costs should be placed on future taxpayers, and this is accomplished through the financing of the spending by debt rather than taxation.

The answer given by James Buchanan for the question: When should the government borrow? – is that is should borrow only to finance long-term or capital investment projects which are expected to yield benefits over future time periods.

An very important statement made by the author is that “it becomes essential that some method of financing the debt service and amortization be adopted at the time of the initial decision. It is the height of folly to allow individuals to choose a bond issue to finance a long-term project with in corresponding means of paying the service charges”.

A future tax obligations can be impressed upon the individual behavior pattern only if it is institutionalized in a specific tax schedule. The sustainability of public debt and fiscal policy lies in the earmarking of some revenue source for debt service at the time in which debt is created.

Another situation of the insurance of public debt is that public loans should be used to finance self-liquidating projects, meaning by this projects which will directly yield to the government a money return sufficient to service and to amortize the debt. If a project is self-liquidating, then sufficient funds are earmarked for debt service from the start.

Greiner (2004) sustain that the decline of public investment as a result of rising public debt is not too surprising. The government collect revenues in order to finance public spending. Public spending can be separated in two important categories: productive spending (investment, subventions seen as incentives to economic recovery which will produce added value in future) and final or

unproductive public spending (wages, bills). When a economy experience a period of recession, characterized through massive decline of revenues collected at the public budget, implicitly governments must decrease public spending. Regarding the two categories, productive spending like investment tend to decrease more than unproductive public spending mostly because of their current and immediate need.

In these condition characterized by lack of financial resources, governments are forced to borrow either from domestic or foreign markets in order to cover urgent expenses like: salaries, maintenance bills, pensions, scholarships, allowances, social benefits, etc., and to lesser extent in covering public investment expenditure in social infrastructure.

Hence the opposite effect of public public indebtedness, once governments caught inside this vicious cycle of continuous borrowing to cover final public spending (unproductive), against to public investment expenditures which are repeatedly reduced and ultimately excluded, as a consequence of public debt accumulation and continuous spending this time with debt burden: interest, fees and repayments required to be paid at maturity.

Greiner affirmation can be proven when governments face economic downturn and enter in the first year of first installment due to be reimbursed. In this case occurs the transfer or deviation effect allocation of public budget resources, where a large part of financial resources is intended to cover public debt expenditures, leading it increasingly less and less room for productive expenditures, in cases of excessive public indebtedness to removal of public investment and to even sensible cuts in terms of health, education public, social protection expenditures due to massive appeal to uncontrolled public loans.

For the example taking in consideration actual economic downturn that started in 2008, if we analyze the economic evolution of Romania, as a developing country, against a characterization as a “low indebted country”, the evolution of public indebtedness has reached a level that threatening the debt sustainability in condition when economic growth is negative.

If we compare the changes in economic growth level and the public indebtedness, we can observe a negative increase comparing with a growing level of public debt. In this case of growing public debt, decreasing economic growth, even if Romania is characterized as a low indebted country, the actual trend is fiscal unsustainable one. Implicitly if this trend of continuously indebtedness is maintained, the risks of excessive indebtedness are inevitable.

*Table 1. Public debt burden and budget deficit evolution in Romania 2005-2010
(% of GDP)*

Public budget	2005	2006
Public revenues	29,2	29,3
Public spendings	32,2	32,3
Public debt interest	2,2	2,1
Budget deficit	3,0	3,0

Source: NBR.

Excessive public indebtedness correlated with unsustainable fiscal policy open two simultaneous actions: first one of public budget austerity, where government needs to cut spending in order to finance public debt interest and public debt repayment at maturity and second action is given by the lack of financial resources, where governments usually choose to debt rollover, in other words governments borrow to finance the repayment of already existent stock of debt and not to finance public investment expenditures. From here, the supply of public utilities becomes shortened and insufficiently financed, lacking of financial resources the public goods and services provided by the government are less competitive and low quality. In table below we can see that the expenditures with public debt interest have an important percentage of total public expenditures, in 2010 4,7% of GDP represents interest paid by romanian government in comparing with 2006 where public debt interest were only 2,1 % of GDP.

Table 2. Evolution of macroeconomic indicators in Romania between 2007-2008

U.M.	2007		2008	
	Milioane Lei (RON)	% GDP	Mil. Lei	% GDP
GDP Evolution	366422.8	6.3	446578.3	7.3

Change in public debt	48444.6	9.7	40711.1	7.9
Interest	7636.4	1.5	7994.0	1.6

Source: Eurostat.

As can be seen in third table, in context of economic downturn, the rate of public indebtedness is increasing in comparing with economic growth which is an negative one. This means that the sustainability of public debt is threatened in terms of revenues that are collected in order to fulfill public loans payments. As long this Ponzi gamble is not respected, where ratio of economic growth is not bigger than the indebtedness one, government must apply a different policy of public spending financing.

In some cases government decide to cut spending, this means that some public spending must be reduced. Implicitly, the provision of the public goods and services has to be reduced. However, we propose a different kind of public spending cuts, seen from the perspective of efficiency, meaning

to obtain more benefits from the same amount of financial public resources used to provide public utilities.

3. One efficient solution - privatization

The privatisation of the provision of public utilities has to come as a reaction to budget constrains as consequence of actual economic recession.

Another condition into moving public utility provision from public to private sector is determined especially by the need for their modernization and improvement and the need to permanently raise the quality of public services that are offered to citizens.

privatization can be seen as a effective solution which can increase public utilities efficiency, guaranteeing in the same time a broad access to public services.

A major problem debated by Tarola (2011), is the necessity right from the beginning in correlating the privatisation process with the regulations. In other words these public goods and services, offered by the private sector need to comply with clear requirements of competence and quality, which are determinate by a well developed legal framework.

These transitions from state-owned companies to private ones, where the basic principle in their activity is to maximize profit, public utilities provision must be determined by a precise legal framework, thus excluding through privatization the waste of financial resources and free-rider access, which is possible by applying market economy mechanisms, where demand and consumption are affected by pricing policy.

The main reason for the transfer of ownership o public utilities supply to private sector is given by the principles that govern this sector: first of all profit maximize; provision of high quality goods and services to retain and attract “customers” (n.n. citizens); incentive to invest, innovate and improve social infrastructure in order to increase revenues.

In some cases, a private company that produces public goods and services, may adopt a pricing policy to stimulate or inhibits the demand, depending on production capacity which is correlated with investment policy.

4. Conclusion

Analyzing the evolution of principal macroeconomic indicators in a developing country as it is Romania, and taking in consideration the actual economic recession, we assume that the actual trend of public indebtedness is a unsustainable one, and in order to ensure a sustainable economic growth and avoid risks associated with excessive public debt, governments need to change public spending policy. Worldwide, the main line is about public spending cuts, seen as the reduction of the amount of public financial resources allocated to provision of public goods and services. Implicitly, that means that the supply of public utilities has to be reduced in order to cut public spending. But, public spending reduction can be seen not only as a physical reduction on paper but also as a change of public money allocation. To be more specific, a public spending reduction can be obtained if the government decide to prevatizate some of the public utility provision but also if the government decide to allocate money to efficient public spending, where benefits are greater than the amount of resources allocated.

This means, that public spending can be reduced not only through cuts but also through a better allocation of financial resources where the results are exceeding the costs or the public financial resources produce added value in the future.

In order to ensure public debt sustainability, government should contract public loans only to finance productive spending that will produce added value in future necessary to repay the debt. Actual economic recession can be seen as a lesson to improve and change public policies that are due actual economic crisis.

The consequence of irresponsible public spending and excessive public indebtedness is the economic downturn and other risks which can be seen in the long-run, affecting economic growth and development in the future.

Market Concentration and Economic Theory

Dobre I. Claudia

"Ovidius" University of Constanta, Faculty of Economic Sciences
dobre_claudia@yahoo.com

Abstract

The economics of market concentration and antitrust law have a long-lasting tradition of fruitful interaction. In static neoclassical theory, market concentration - irrespective of the reasons of it - was considered harmful. Later, adherents of the Harvard School correctly observed a relationship between industry concentration and profits, but erroneously inferred that those profits were the result of artificial market power. In contrast, researchers working in the tradition of the Chicago school maintain that high profitability in a concentrated industry has to be interpreted as a reflection of superior efficiency of larger firms over smaller ones, not as a reflection of market power. Post-Chicago economists developed new game theoretic models and stated that the efficiency explanations of the Chicago School were insufficient and inadequate explanations of firm conduct or market structure. More recent, proponents of innovation school believe that there can be many instances where the losses in allocation inefficiency will be small and dwarfed by the gains in productivity and innovation.

Key words: market concentration, schools of thought: Harvard, Chicago, Post-Chicago and Innovation

J.E.L. classification: K21 K00 N4

1. Traditional concentration concerns

In static neoclassical theory, market concentration - irrespective of the reasons of it - was considered harmful. Edgeworth (1925) and Cournot ([1838], 1971) introduced pioneering contributions which until today remain at the heart of daily antitrust practice: models of imperfect competition. The neoclassical economists viewed competition as a state of affairs rather

than as a process as depicted by classical economists. It is built around the notion that the market is characterised by a state of equilibrium that is dependent on forces of demand and cost structure that determine who survives and who fails, and is formally presented in the idea of perfect competition. Despite the purely static framework in which this model is built, where time is not taken into account, the market structure (concentration sellers) dictate market outcomes (prices and profits) with a clearly defined behavior.

Resting on the ideal of static competition norm of perfect competition, oligopoly as a monopoly-type competition, indicate harmful situation in which the possession market power results in loss in (static) efficiency and welfare (two types of inefficiency can occur in a Cournot equilibrium: the equilibrium price exceeds the marginal cost of production, and aggregate output is inefficiently distributed over the firms). Neoclassical theory clearly indicates a case for competition policy. In essence, strong scepticism towards market power should guide competition policy. [1]

In '30, the concept of workable competition emerged from the literature as a concept to counteract the view that perfect competition is not a reliable basis for making normative appraisals of the working of actual markets (J. Clark).

In '40, an ordoliberal policy was developed based on the work of W. Eucken - "Fundamentals of the national economy" which has established a "theory of order" as the foundations of a "ordering policy." For the author, economic liberalism that is found in the market economy is the economic system that made the best possible allocation of resources. Ordoliberal policy is based on building a full order of competition. Ludwig Erhard has been revealed between ordoliberals, considering the social market economy as a specific form of economic

order and rules. He is considered the "father" of the law in Europe against restraints of competition, struggling to enforce competition law against all opposition. Erhard knew well that it would be naïve to trust market forces alone. The rules of supply and demand allow the market to maximise individual freedom *only* when one market player, or several market participants jointly, are prevented from achieving a position of market dominance [2]. Therefore, the state is responsible for creating a functioning competition framework. Simultaneously, it should increase the desire and the human capacity for action in the spirit of personal responsibility.

2. The Harvard School and the Structure-Conduct-Performance Paradigm

After the emergence of neoclassical price theory, a fundamental step forward in competition theory dates back to the Harvard School's Structure – Conduct – Performance paradigm somewhere around the 1940's. The S-C-P paradigm was developed by Edward S. Mason (1949a) at Harvard University. The original empirical applications of the new theory were by Mason's colleagues and students, the most famous of whom was Joe S. Bain. "*Market structure is a term used to define the characteristics within which firms operate in a given product market. The principal characteristics are the number of firms and their size. Also relevant is the market power of the firms' customers, the ease with which new firms can enter the market and old ones can exit it*" [3]. Adherents of the Harvard School correctly observed a relationship between industry concentration and profits, but erroneously inferred that those profits were the result of artificial market power. Bain aggravated the mistake suggesting that entry barriers were pervasive, and found that necessary up-front capital expenditures, incumbent efficiency, and other difficulties frustrated entry into concentrated markets and perpetuated market power [4].

According to Piraino, the Harvard School approach had many advantages. If antitrust analysis under the Harvard School was not perfect, at least it was certain. The courts were able to indulge in a presumption of

illegality for many types of conduct without engaging in a complicated analysis of the economic circumstances in the relevant market. Since the outcomes of trials were so predictable, business executives understood the type of conduct they should avoid. Firms in concentrated industries were effectively deterred from transactions that increased concentration levels in the relevant market. The Harvard School approach, however, also had serious disadvantages. Harvard School jurists were too quick to find fault with aggressive competition. The courts and agencies prevented large firms from engaging in competitive conduct that could have benefited consumers and would have been perfectly permissible for firms with lower market shares.

3. Efficiency and the Chicago School

The theoretical weaknesses of the structuralist approach and the lack of empirical support for the SCP led in the late 1960s and early 1970s to extensive criticism of antitrust policy and the Harvard School by a number of influential economic and legal scholars at the University of Chicago (A. Director, R. Bork, R. Posner, F. Easterbrook and G. Stigler). Chicago scholars launched three central challenges to the SCP approach [3]:

1. They refuted the connection between industry concentration and anticompetitive effects. For example, they stressed that coordination is costly so that one cannot presume coordinated anti-competitive behavior in all concentrated industries. Furthermore, the statistical correlation between high concentration and high profit rates was not necessarily caused by anticompetitive behavior, but could be the result of economic efficiency. Finally, economies of scale did justify high levels of concentration.

2. They pointed out that the relationship between structure and conduct is twosided. While the SCP-paradigm implies that market structure affects firms' conduct, the Chicago School stresses that firms' conduct may also affect the structure of the market. Therefore, a firm with a large market share may behave anti-competitively by cutting output. However, this will invite new entrants, which will improve competition.

3. Chicago's criticism of the SCP definition of entry barriers is that the latter saw entry barriers whenever entry was more difficult (e.g., in the presence of economies of scale, product differentiation, and cost advantages). The question for the Chicago paradigm is whether entry is more costly for the new entrant. For Chicagoans the only entry barriers are property rights conferred by the government (e.g., if the incumbent owns the patent to a product necessary for entry).

The books of Bork gives a complete and orthodox overview of the doctrine of the Chicago School. He argued that “*the antitrust laws were designed simply to increase the efficiency of the American economy*” [5]. Bork defined economic efficiency in terms of conditions that maximized wealth, and he equated wealth enhancement with “consumer welfare,” meaning lower costs, reduced prices, and increased output of products and services desired by customers. Bork believed that “[*t*]he only legitimate goal of American antitrust is the maximization of consumer welfare.” All other possible goals of the antitrust laws, including the protection of small business from the power of large firms, were irrelevant.

In Chicago approach, merger control is partially denied, although the school did not argue in favour of total abolition of competition policy. Only very large horizontal mergers leading to monopoly are seen “worthy of serious concern” [6]. The control of vertical or conglomerate mergers is as such rejected.

Researchers working in the tradition of the Chicago school of industrial economics maintain that high profitability in a concentrated industry has to be interpreted as a reflection of superior efficiency of larger firms over smaller ones, not as a reflection of market power. In addition, Posner argued that there was no basis for automatic judicial intervention against a merger where the combined market share of the four largest firms in the market was less than sixty percent. One of the most influential researchers in this tradition is Demsetz (1973) who argued that if a high concentration industry enjoys high profitability then the profitability of large firms in that industry should not be different from the profitability of small firms. He found that that the profitability of larger

firms was in fact higher than smaller firms which he regarded as proof that larger firms were more efficient than smaller firms.

The transaction cost theory has a longstanding tradition in the law and economics of antitrust and the central idea in transaction cost economics is that the market is not entirely free in the sense that certain operations (transactions) are not entirely costless [7]. In Williamson's analysis the transaction is an exchange between two or more individuals whereby they transfer ‘property rights’ (that is, rights to dispose of scarce resources, which may be limited not only by other individuals' ownership rights but also by rules of legal liability and the provisions of competition law). Transactions differ perceptibly so far as costs are concerned and these differences in transaction costs influence the choice of the right organisational form or ‘governance structure’. The transaction cost approach is thus concerned with the costs which are necessary to maintain the economic system. To put it briefly: markets and firms are regarded as alternative instruments for implementing transactions.

But the origins of transaction cost economics go back at least to Coase (1937), who in his classic essay laid the foundations for the new institutional economics. Markets and firms are indeed institutional forms, and their existence and survival are explained out of economic efficiency. The use of one mode or the other for a particular type of transaction directly follows from the relative costs of operating over one system or the other. As such, the laws which regulate and interfere with these institutions will also be judged in the long run by economic efficiency.

The transaction cost economics has been used to explain the horizontal and vertical boundaries of firms, the structure of hybrid organisations such as joint ventures and strategic alliances, the reasons for mergers and the motivations for non-standard contractual arrangements between firms.

The contestable market theory also had implications for merger control. Developed by Baumol (1982), stresses that a concentrated industry can behave competitively if the barriers for new entrants to the market are nonexistent or low. Baumol emphasizes that incumbent firms are always

vulnerable to hit-and-run entry when they try to exercise their potential market power. A market is said to be contestable if there is freedom of entry and exit into the industry. If this occurs incumbent firms will be forced to keep prices competitive and profits low, otherwise this will encourage other firms to enter into the market. Therefore, if the market is contestable then an increase in the concentration ratio will not necessarily cause an increase in economic inefficiency.

According to the Harvard School, fixed costs were seen to lead to scale economies on the one hand, but also to barriers to entry on the other. An exponent of the Chicago School, Stigler defines a barrier to entry as “*a cost of producing (at some or every rate of output) that must be borne by a firm which seeks to enter the industry but is not borne by firms already in the industry*” [8]. Barriers to entry are present only if the costs for firms entering the market turn out to be higher than the costs for the existing firms. In fact, what turns out to be important for understanding market structure are not fixed but sunk costs. The latter are defined as non-recoupable costs, or outlays one has to make in order to get in business, but which are without value if one exits. Entrants will not be stopped if the fixed cost - the factory in the example above - can get a new destination or can be sold on a second-hand market. In this respect, Kessides in his article, concluded that the sunk costs account for a substantial portion of the sample variance of concentration even after technological factors are controlled for. More recent work, belonging to the same author, indicate that increased market contestability, as signified by low sunk costs, tends to reduce the dispersion of firm sizes. These findings provide support for one of the key predictions of the theory of contestable markets: that market forces under contestability would tend to render any inefficient organization of the industry unsustainable and, consequently, tighten the distribution of firms around the optimum [9].

4. Post - Chicago School and “More Economic Approche”

The Post-Chicago School relies on complex (quantitative and econometric) tools to determine whether there is a market failure and the specific features of an industry are

crucial to determining market failures. Beginning in the 1980s economists developed new game theoretic models of imperfect competition and industrial organisation which supported concerns by an increasing number of antitrust scholars and practitioners that the efficiency explanations of the Chicago School, while valid in certain cases and circumstances, were insufficient and inadequate explanations of firm conduct or market structure and generally led to a too lenient interpretation of antitrust law. Largely derived from an analysis of competition in oligopolistic markets, many of these new game theoretic models by “Post-Chicago School” economists identified both the ability and incentives of firms to act anti-competitively through strategies designed to exploit unilateral or collective market power. Contributions to the literature include horizontal mergers (Farrell and Shapiro 1990); vertical mergers facilitating collusion (Nocke and White 2007); and anti-competitive vertical mergers (Riordan and Salop 1995).

Regarding the horizontal mergers, Stigler had already argued that mergers for a market power motive would not be formed as it is more profitable to stay out such a merger than to join it. Paradoxically, Salant, Switzer and Reynolds (1983) show that with a linear demand curve, constant marginal costs and firms competing in quantities, at least 80 percent of the firms in an industry have to be included in the merger in order for it to be profitable [10]. Clearly, these are not the mergers that will show up, for antitrust authorities would quickly rule them out on the basis of the creation of dominant positions. This would imply that mergers are not likely to form, unless some important efficiency gains in terms of, for instance, production or distribution costs are made. But these are the mergers that need to be approved from a welfare point of view, hence antitrust authorities only have to bother with clearly dominant positions.

But the result depends on one critical assumption: the competition is in quantities rather than in prices. It was shown by Deneckere and Davidson (1984) that all mergers are profitable even if they do not yield efficiency improvements in the latter case. Hence the conclusions are turned upside down by merely the change of one

assumption. This has led those critical of game theory to claim that any conclusion or its reverse can be proved, while the defenders of game theory claim that the advantages definitely outweigh this disadvantage (see, for instance, the discussion between Fisher, 1989 and Shapiro, 1989). The latter includes the fact that game theory requires one to explicate all the assumptions made also on behalf of the rival players (which was not always done by price theory), as well as the richness in terms of institutional detail and hence the realism game theory has added to economic models.

Sutton (1991), provides an alternative method of estimating competition using game-theory to explain firms' profit maximizing behaviour when there are sunk costs associated with production [11]. He distinguished two types of sunk costs: the exogenous sunk costs needed to set up a plant of minimum efficient scale and the endogenous sunk costs which cover the cost of advertising and R&D. He showed that when entry and exit are assumed to be free, the equilibrium number of firms, and thus market concentration, depends on the market size, the magnitude of sunk costs, and the intensity of price competition. Given the intensity of price competition, the model predicts that there is a lower bound to concentration which decline to zero as the market size increase towards infinity. The model also predicts that an increase in the intensity of price competition will lead some firms to exit and others to merge so that the level of concentration tends to increase. The lower bound concentration model has been successfully used to explain the competitive effect of market expansion and of changes in policy regimes. [12].

The new empirical industrial organisation has tried to resolve the problem of indeterminacy in the new industrial economics, by leaving it open as to what kind of conduct prevails in an industry. The general idea is that industry structural elements can be measured and modelled, hence one starts from theoretical models of a sector. As such, conduct which is much harder to know *ex ante* is left open to be determined empirically. The divergence of industries necessarily calls for sector-specific models. Usually the fundamental ingredients are specifications of supply and demand,

modified and augmented with industry-specific features. Estimation based on time series analysis allows the identification of market power, that is to separate the effects of cost changes from mark ups. The new empirical industrial organisation is a great leap forward for antitrust practitioners, as it allows the simulation of the effects of mergers.

5. The Innovation School

A new economics doctrine — innovation economics — has emerged in the last decade through the work of a wide range of scholars and postulates that innovation (the development and adoption of new products, processes, and business models) drives growth. As a result, it makes an explicit effort to understand and model those forces and factors conducive to innovative activity, seeing such advances as a result of intentional activities by economic actors, including government.

The innovation doctrine places more emphasis on productive and dynamic efficiency. Most economists and antitrust scholars focus on static competition in the equilibrium-based market not because they are biased against dynamic competition. Rather, conventional economics largely ignores dynamic factors because of its almost exclusive focus on mathematical models. This is in part because “*the mathematics of dynamic models is far more challenging and the likelihood that an economist who invests efforts in such models will achieve a publishable result is lower*”.... “*When realism and relevance butt heads with analytical tractability, tractability almost always wins out in economics*” [13]. In short, a major reason why innovation is often ignored by conventional doctrines is because it “cannot be expressed in blackboard economics” [14].

The “innovation school” critique is based on several factors, according to R.D. Atkinson and D.B. Audretsch [15]. First, proponents believe that the focus of competition policy should be much more on the side of spurring firm productivity and innovation with less worrying about either allocation efficiency or distributional effects. Second, they see the neoclassical Chicago and post-Chicago doctrines as too focused on

static, short-term allocation efficiency and as not recognizing the importance of dynamic markets and innovation. In this sense, the neo-Austrian School defines real world competition as a dynamic process, “as a discovery procedure”. They reject the neoclassical equilibrium model and instead argue in favor of “the market process view” [16]. Third, the innovation school is more prone to see inter-firm cooperation as positive. Finally, it sees different industries as having different dynamics and therefore requiring different antitrust approaches.

6. Conclusion

Economists are interested in explaining what causes the market to deviate from its competitive level as it entails welfare loss to society. The methodology that is commonly used to explain the intensity of competition is the structure-conduct-performance. The SCP approach has been subject to much scrutiny. Researchers working in the tradition of the Chicago school of industrial economics maintain that high profitability in a concentrated industry has to be interpreted as a reflection of superior efficiency of larger firms over smaller ones, not as a reflection of market power. A more recent approach to industry analysis provides an alternative method of estimating competition, by using game-theory and innovation doctrine.

The Influence of Economics on Antitrust Law

Abstract

Since the very beginning of antitrust legislation, microeconomics has influenced the context as well as the implementation of the law. Because economic development is in nature very cyclical, merger policy can not be static, being influenced also by the development of economic theory. There are remarkable differences between American and European law with respect to the treatment of some hot issues in antitrust, such as merger control. While in the U.S., the policy principles have been modified to incorporate recent theoretical developments in Industrial Organization, such as the analysis of oligopoly behavior and the role of efficiencies, in European competition policy only recently have moved to embrace a post-Chicago approach with an emphasis on efficiency (particularly as it applies to European firms), but the officials still hold on to a populist approach, with a greater focus on defending the interests of producers (firms and workers) and to an “ordoliberal” approach.

Key words: merger policy, schools of thought, EU competition policy, US antitrust
J.E.L. classification: K21 K00 N4

1. Developments in economic theory that affect merger policy

In static **neoclassical theory**, market concentration - irrespective of the reasons of it - was considered harmful. At that time, when the Supreme Court confronted cases involving market power measurement, it tended to accept broad market definitions that made a finding of dominance less likely. In *Standard Oil Co. v. United States*, the Court upheld a patent pool by which several major refiners set the royalties to be paid for exploiting catalytic cracking technology. Key

to the decision was the definition of the relevant market. If cracking technology were the relevant product, the refiners’ market share would exceed 60 percent. Alternatively, if the relevant product encompassed all refining capacity, including older distillation technology, the defendants’ share would be only 26 percent. The Court embraced the second alternative and concluded that the refiners probably lacked power to raise prices [1].

The authors of the Treaty of Rome used the concept of **workable competition**, moreover, many of the distinguishing features of European competition policy seem to fit into this theoretical framework. It is noteworthy that the European Court of Justice, in its leading *Metro* judgement, referred to the concept of *workable competition* as being the type of competition that was necessary to achieve the economic objectives of the EC Treaty.

In the especially striking example of competition policy, Katja Seidel (2008) has shown how the entrepreneurial leadership of Commissioner Hans von der Groeben and Director-General Pieter VerLoren van Themaat helped to unite their civil servants behind a broadly **ordoliberal** conceptualization of a ‘competition society’ which has guided Directorate-General (DG) IV policy to the present day.

From the end of the Second World War to the early 1970s antitrust enforcement was interventionist with its economic foundations based on the structure-conduct-performance paradigm (SCP) of the “**Harvard School**”. Harvard School scholars believed that mergers and joint ventures will substantially increased concentration levels in the relevant market made it easier for the remaining firms to engage in anticompetitive conduct. At that time, Harvard professors applied the structural approach to antitrust theory. When America’s merger law was re-written in 1950, the Senate report recommending this

change in policy put the concern about concentration of economic decision making power at the forefront of its deliberations, declaring : *“The purpose of the proposed bill ... is to limit future increases in the level of economic concentration resulting from corporate mergers and acquisitions”*. The Supreme Court recognized that by enacting this new merger law, Congress resolved *“competing considerations in favor of decentralization,”* and sought to block *“what Congress saw was the rising tide of economic concentration...”*. Judge Wyzanski later underscored this direct concern about market power in his United Shoe Machinery decision: *“Concentrations of power, no matter how beneficently they appear to have acted, nor what advantages they seem to possess, are inherently dangerous. Their good behavior in the past may not be continued; and if their strength were hereafter grasped by presumptuous hands, there would be no automatic check and balance from equal forces in the industrial market”*.

In European policy, the Harvard ideas that the structure of the market has an impact on the ultimate performance of the market is clearly reflects in the field of merger control. This result form the emphasis of the inquiry on whether the concentration ‘creates or strengthens a dominant position’ (Reg. 4064/89). There is no explicit efficiency defence. Efficiencies are often seen as evidence of market power, rather than as benefits which may outweigh the anti-competitive consequences of mergers [2].

“The implications of the SCP paradigm for competition policy is that we can identify which market structures lead to anticompetitive results and devise a competition law that is designed to modify or prevent market structures that are linked with poor economic performance.” [3].

The theoretical weaknesses of the structuralist approach and the lack of empirical support for the SCP led in the late 1960s and early 1970s to extensive criticism of antitrust policy and the Harvard School by a number of influential economic and legal scholars at the University of Chicago. In **Chicago approach**, merger control is partially denied, although the school did not argue in favour of total abolition of competition policy. Only very large

horizontal mergers leading to monopoly are seen “worthy of serious concern”. The control of vertical or conglomerate mergers is as such rejected.

According to P. Van Cayseele and R. Van den Bergh, [4] **transaction cost economics** has important implications for antitrust policy. Certain market structures might be the result of transaction cost efficiencies, not the strive for market power. A welfare-maximising anti-trust law then must take into account these efficiency aspects. In the context of the control of concentrations it is necessary to consider what transaction cost savings will be prevented by a merger prohibition and whether these (possible substantial) costs are compensated by the anticipated advantages of more intensive competition.

Joskow (2002) support of the application of transaction cost economics to competition policy: *“At the present time Transaction Cost Economics and Post-Chicago school of antitrust law and economics are like ships passing in the night. The development of sound antitrust legal rules and remedies would benefit from integrating these approaches and recognizing that they are compliments (sic) rather than substitutes”* [5]. According to Holland, *“transaction cost analysis enhances and complements neoclassical and industrial organisation theories to provide more accurate assessments of competitive behaviour and market structures. The greater use of transaction cost economics to competition analysis is likely to result in improved decision-making by competition authorities and better legal rules and remedies for competition policy.”* [14]

The **contestable market theory** also had implications for merger control. In principle, the message of contestability theory is that policy intervention in market processes is unnecessary, if entry and exit are free and easy. In this case, potential competition as well as actual competition will influence market performance. In practice, the prescriptions of contestability theory seem often to have been applied in a free and easy manner, without the kind of detailed analysis necessary before it would be safe to conclude that a particular market could be treated as “workably contestable.” S. Martin stated in his article “The Theory of Contestable

Markets” that “a simple way to summarize the insights that contestability offers to policymakers is to say that public authorities should make markets as contestable as possible, given the constraints imposed by other (and possibly noneconomic) goals” [6].

As Van Cayseele and Van den Bergh argued, a real danger of the Chicago price theory tradition comes from the exaggeration of some theoretical concepts that do not apply to the real world very often. A such an example was contestability theory that has been mistakenly applied in US in the airline mergers (see Utton, 1995). The result has been that it has been somewhat discredited. While in general thrust and effects, the major difference with mainstream Chicago concepts seems to lie in the lack of a positive inclination: the contestable market model serves a normative purpose in that it merely shows that there exists a yardstick market structure in which antitrust policies are useless even in the presence of monopoly. The assumptions needed to obtain this conclusion are so restrictive that the contestable market model cannot make claims to be descriptive or positive theory. In the theory of contestable markets, the fact that the market structure is concentrated says nothing, of itself, about the degree of efficiency. Even with a high degree of concentration, allocative efficiency is not excluded because potential entrants exercise a controlling discipline. Perfect contestability produces a similar outcome to perfect competition: prices are equal to marginal costs, as required by the welfare theorems, but without having a substantial number of competitors in the industry. The players necessary to guarantee this result are found outside the industry.

Nonetheless, the Chicago School influences American antitrust policy. A more permissive climate developed for mergers. Responding to the concerns of the Chicago School, the Supreme Court, in 70's, began to open up merger and joint venture analysis to a consideration of factors other than market share concentration statistics. In *United States v. General Dynamics Corp.* the government suffered its first Supreme Court defeat concerning a case brought under the Celler-Kefauver Act. *General Dynamics* showed that the rebuttal possibilities recognized in *Philadelphia National Bank*

(1963) were not illusory. Several influential lower court cases used evidence concerning ease of entry to permit mergers that yielded high market shares, as in *United States v. Waste Management, Inc.* and *United States v. Syufy Enterprises*. Other decisions recognized at least the conceptual validity of efficiency justifications, even if they rejected the efficiency arguments of merging parties in the case at hand, as in *Federal Trade Commission v. University Health, Inc.* Perhaps most important, the court of appeals in *United States v. Baker Hughes, Inc.*, with a panel including future Supreme Court justices Clarence Thomas and Ruth Ginsburg, ruled that the defendant's burden of proof in a merger case depends on whether the plaintiff relies solely on market share data or provides further evidence of likely anti-competitive effects. These decisions parallel similar developments in the federal merger guidelines, which disavowed the most extreme enforcement possibilities created by Supreme Court merger decisions in the 1960s.

By the early 1990's, the Chicago School had completed a revolution in antitrust analysis. In US the Merger Guidelines were revised several times (in 1982, 1984 and 1992) to take account of developments in economic thinking concerning the competitive effects of mergers. In the 1992 Guidelines there is no longer an explicit reference to the S-C-P paradigm; there is also explicit scope for an 'efficiency defense', which clearly reflects the influence of the Chicago School.

In Europe, the fact that the economic doctrine of the Chicago School has not influenced European competition law at that time is clearly apparent from the decisions in *AKZO* and *Tetra Pak II*. The Court of Justice accepted a price-cost comparison as the yardstick by which to establish predatory pricing. Abuse of dominant position must be deemed to be present once prices fall below the level of average variable costs.

Beginning in the 1980s economists developed new game theoretic models of imperfect competition and industrial organisation which supported concerns by an increasing number of antitrust scholars and practitioners (**Post –Chicago Scholars**) that the efficiency explanations of the Chicago School, while valid in certain cases and

circumstances, were insufficient and inadequate explanations of firm conduct or market structure and generally led to a too lenient interpretation of antitrust law. A general introduction of the achievements **game theory** was able to accomplish for competition policy is provided by Philips (1988, 1995). Jacquemin (1997) provides examples of the links that game theory has regarding both the goals of competition policies and the anti-competitive practices that are unconceivable with such policies. Revisions of the U. S. Guidelines during the 1990s reflect the increasing importance of game theory in antitrust economics. The newer editions extensively discuss how a merger might lead to anticompetitive outcomes by either increasing the likelihood of coordinated interaction or giving the merging parties unilateral ability to raise price. The discussion of entry extensively assesses the ability of new firms to be able to operate at a scale sufficient to recover any sunk costs of operations. A belief that a general disposition viewing concentration as bad does not suffice. One has to tell stories regarding strategic opportunities and entry barriers consistently, at least broadly, with a plausible game-theoretic equilibrium model.

The **new empirical industrial organisation** is a great leap forward for antitrust practitioners, as it allows the simulation of the effects of mergers.

A less direct but also important influence of these modeling techniques is in the specific prediction of a merger's effects. Some of this work has been purely theoretical, looking at the effects of mergers in models where merger is an equilibrium outcome and not merely an assumption (Farrell and Shapiro, 1990). Some applications have been in the development of simulation techniques to predict the effects of mergers, that rely on demand models calibrated to match current industry data regarding price, market shares, elasticity of demand for the product as a whole, and cross-elasticities of demand between products (Werden and Froeb, 1994). These demand models have also led to econometric techniques for estimating brand-specific demands, particularly as they may be affected by the prices of other brands (Baker and Bresnahan, 1985; Bresnahan, 1989) and thus provide estimates of the effects of

mergers that eliminate independent pricing. As Brennan stated, these techniques are the result of theoretical advances and increases in computing power, but a major contributor has been the vast quantities of retail purchase data from bar-code scanners at checkout counters [7].

In general, merger analysis became more heavily economic in the 1990s. Economic concepts now pervade the federal merger guidelines, and merger analysis, whether performed by prospective merger partners or antitrust agencies, routinely involves close collaboration between economists and attorneys. Although the Supreme Court has said nothing about substantive merger rules since 1975, in *United States v. Citizens and Southern National Bank* (422 U.S. 86), lower court decisions and government enforcement guidelines continue to deviate from standards the Court endorsed in the 1960s. These developments have both toughened and loosened antitrust enforcement. Some cases, such as the rejection of the Staples/Office Depot merger in *Federal Trade Commission v. Staples, Inc.* (970 F. Supp. 1066 [D.D.C. 1997]) have analyzed competitive effects in seemingly narrow submarkets and have used electronic data from cash registers to measure market power directly by analyzing how the business at one chain affected the other. However, in 1997, the federal agencies amended their merger guidelines to account more generously for merger synergies in analyzing competitive effects. This approach could make the law more friendly to mergers in some cases.

Adherents of the **innovation doctrine** argue that antitrust policy — and merger policy specifically — need to incorporate analysis of longer-term dynamic effects. As Atkinson and Audretsc stated, the innovation doctrine makes it clear that the focus of antitrust thinking should be on the long-term trajectory of product value and price, not just current consumer welfare measured by short-run prices. Again, as Porter argues: Since the role of competition is to increase a nation's standard of living and long-term consumer welfare via rising productivity growth, *the new standard for antitrust should be productivity growth*, rather than price/cost margins or profitability. All combinations or practices scrutinized in antitrust should be subjected to the following question: how will

they affect productivity growth? If a merger, joint venture, or other arrangement will significantly enhance productivity growth, it is probably good for society and for consumers (as well as the firms involved). Transactions with dubious benefits for productivity growth, or those that offer only a one-time productivity benefit, are likely to be net negatives for society if they pose any risk to the overall health of competition. Following the same logic, Alberto Pera writes, “*it could be argued that a proper application of the efficiency framework would be the examination of practices not in terms of their effects on consumer welfare, but rather in terms of their effects on total welfare and wealth* [8]”. Thus, the Chicago school and the innovation school have similar, but not exactly the same goals. Both would place more value on efficiency gains than net income transfers from consumers to producers, since the latter is a transfer payment in which society as a whole is no worse off. In this sense both the Chicago school and the innovation school would value the loss from transfer payments due to higher prices less than the gains from more efficient production or innovation.

The second area of difference concerns time and change, according to R.D. Atkinson and D.B. Audretsch. The innovation school argues that the analysis of growth impacts cannot be static (as it is with the Chicago school, for example with respect to more efficient production). For the innovation school, the focus is more dynamic, involving both productivity and innovation. In the other three approaches, the losses to consumer welfare are included in the model, but the dynamic gains (for example, the introduction of a new product or service) usually are not. As Hart notes, innovation has historically been only one of many objectives of antitrust policy, and not necessarily the most important one. Rather, the focus has been more about short-term impacts on prices. Indeed, as Michael Porter notes, “*The effect of mergers or competitive practices on the overall rate of innovation is usually only paid lip service* [9].”

In addition, Shapiro notes: “*If appropriability is low, e.g. due to weak intellectual property rights and significant spillovers to rival firms who engage in imitation, then increased concentration can*

improve appropriability and promote innovation, weakening the link between concentration and competition. [10]”

This is one reason why the conventional doctrines provide little guidance to policy makers and the courts in deciding cases based on an understanding of dynamic processes. As Evans and Hylton argue: “*If a judge wanted to know whether any particular business practice should fall on one side or the other of the boundaries for the game of competition she would not find the answer — or even much of what she would need to know to make an informed judgment — in the modern industrial organization literature* [11].” This is in part because the conventional antitrust approaches are based on a notion of markets in equilibrium where market power is sustaining and the allocation mechanism leads to predictable outcomes. Thus, the goal is to enable competition that will lead to clearly determined outcomes (selling a bit more barley and a bit less wheat, for example). In contrast, the innovation school argues that markets and positions in markets are constantly shifting. As Mantavinos states, “*competition thus leads to a permanent forming, shifting and erosion of market power* [12]”

Finally, the innovation school suggests that industries should be treated differently. And indeed, some industries, particularly high-tech industries, have very different characteristics than others. As Richard Posner states, high-tech industries “are characterized”... “*by falling average costs (on product, not firm, basis) over a broad range of output, modest capital requirements relative to what is available for new enterprises from the modern capital market, very high rates of innovation, quick and frequent entry and exit, and economies of scale and consumption (also known as ‘network externalities.’)* [13]” One defining feature of these industries is that firms are more likely to engage in dynamic competition for the market (for example, in a process of “creative destruction”) whereby drastic innovation makes market leadership highly contestable. In other words, innovation is pursued not just to gain a small share of a stable market, but to fundamentally disrupt the market. As Farrell and Katz argue, “*in network markets subject to technological progress, competition may take*

the form of a succession of “temporary monopolists” who displace one another through innovation. Such competition is often called Schumpeterian rivalry. [14]”

The innovation school approach also more explicitly recognizes that differences among industries require different approaches to antitrust. As Geradin (one analyst of EU competition law) states: *“Because these industries [technology industries] have increasing returns or significant economies of scale on the production side, the markets will tend to be concentrated. In many cases marginal costs are close to zero. And combined with substantial economies of scale on the demand size (e.g., network effects); there is real benefit from concentration.[15]”*

2. Conclusion

In recent years, antitrust enforcement has increasingly focused on innovation issues. In September 2009, for example, the FTC and the Antitrust Division asked whether the Merger Guidelines should *“be updated to address more explicitly . . . the effects of mergers on innovation.”*

EU competition policy can rightfully be said to have been influenced by many different views and philosophies. The most influential schools in the US – Harvard, Chicago and post-Chicago – have most likely left prints in the application of merger control. Likewise, Austria and the German city Freiburg were important outposts for competition law thinking in Europe.

Euro Zone between Recent Evolutions and Perspectives

Dobre Elena

Abstract

Global economy was significantly affected by the global financial crisis and especially the budget balance of all countries. Sovereign debts cause the lack of stability and the shift of monetary policy.

This paper is about the recent evolutions in euro zone and its perspectives. The Euro break –up scenario should give unexpected consequences. Under the current structure and with the current membership, the Euro does not work. Either the current structure will have to change, or the current membership will have to change. On the other hand, the Euro break –up means economic and political costs which are not agree at the moment. The cost of a weak country leaving the Euro is significant. Consequences include sovereign default, corporate default, collapse of the banking system and collapse of international trade. The risk case, of break-up, is considerably more costly and close to zero probability. Countries cannot be expelled, but sovereign states could choose to secede. So, the perspectives of Euro Zone are fiscal confederation and fiscal discipline, not break-up.

Key words: euro zone, break –up scenario, economic costs, monetary policy, fiscal policy

J.E.L. classification: E 52

1. Introduction

The global economy has been affected by global financial crisis and particularly the countries budget balance. Sovereign debt is causing serious shortage today financial stability. Hence, to change monetary policy is needed. This paper addresses recent developments and new challenges and prospective of the euro area. The serious

concern for the future of the Euro area and the single currency is natural in the context of the current financial fluctuations which affect financial stability. In the same time, financial stability is the main objective to catch by monetary authorities in euro area. Thus, we have considered a topic complementary and goal oriented work, namely: (1) current issues for monetary policy in Romania; (2) the technical conditions for euro adoption by Romania; (3) recent developments of national currency against the euro; (4) analyst’s opinion signals and survey results on the financial crisis effects; (5) Euro area scenarios and financial stability perspectives and solutions. Setting these all items is based on the analysis of published studies in this field and we capitalize them to the purpose of the work.

2. Current issues for monetary policy in Romania

National Bank of Romania (NBR) as the central bank and monetary authority has responsibilities for monetary policy, securities operations, and management of international reserves. Monetary policy instruments used are related to open market operations (at the initiative of the central bank), standing facilities (at the initiative of the commercial banks) and the minimum reserve requirements. The actual directives of NBR are anchored to the actual European evolutions, namely: (i) maintain solvency and liquidity provision to banks all levels appropriate; (ii) identify new ways to resume lending more balances categories of currencies, while ensuring a degree of indebtedness of borrowers more sustainable; (iii) develop and improve solutions applicable to credit institutions in difficulty; (iiii) respect international agreements with made commitments at the national programs anchored to strengthen the economic results

achieved and financial stability and structural reforms.

3. The technical conditions for euro adoption by Romania

Romania's situation as part of the European Union should be, by default a new member of European Monetary Union. This approach, however, is conditioned primarily by nominal convergence. The fulfilling of Romania's convergence with the Maastricht criteria at the final of 2010 is reflected below: a) Inflation (percent, annual average) < 1.5 percentage points above the average of three best performing EU members (2, 2%) is 5,5% with 3,3 % deviation; b) Long-term interest rates (percent per year) <2 percentage points above the average of three best performing EU members (6, 3%) is 7.6% with 1.3% deviation; c) Exchange rate against the euro –maximum percentage +/- 15% is fulfilled at +1, 71 /- 14, 3. d) Consolidated budget deficit (percentage of GDP) less than 3% is 7.2% with 4.2% deviation; e) Public debt (percent of GDP) below 60% is fulfilled at 30.4%. In this context, preparing for euro adoption involves a series of measures aimed to political governance, institutional governance and preparation of the changeover: setting a target date for adopting the single currency, forming the National Committee for the changeover and development of the National Program for changeover.

4. Recent developments of national currency against the euro

At the end of September 2011, new Euro scores a maximum of 4.3218 lei/1 euro to 1 July 4.3537/1 euro. This exchange rate is the highest level in over three years. Also in this period depreciation against the euro pushed BET-FI index, calculated in euro, at a minimum in last several years, to 3942.37 points in 2011 September 30 from 6531.94 points in April 1. In the same trend, quoting the currency pair EUR/RON by NRB in 2011 September 30 to 4.3533 RON for 1 euro is one of the lowest levels for national currency.

Analyst's opinion signals and survey results on the financial crisis effects

More and more financial analysts are subject to opinion polls on the debt crisis in Europe. Bloomberg recently published studies show that analysts interviewed believe that the current sovereign debt crisis will bring economic and financial collapse and social turmoil. This conclusion is based on interpreting the results survey: 72% anticipate that a member of euro zone gives up the fiat currency in next 5 years; 75% indicate that the euro zone economy will enter in recession in next 12 months; 53% believe that the turmoil in the banking sector will worsen; 40% think that monetary union consists of 17 countries will lose at least one member in 2012; 35% believe that Europe's worsening debt will negatively affect the world economy next year. After this prediction, seems useful to find the perspectives and solutions for European Monetary Union.

5. Euro area scenarios and financial stability perspectives and solutions

Under the current structure and with the current membership, the Euro does not work. Either the current structure will have to change, or the current membership will have to change. Many studies show that the Euro moves slowly and painfully, towards some kind of fiscal integration. The risk case, of break-up, is considerably more costly and close to zero probability. Countries cannot be expelled, but sovereign states could choose to secede. However, popular discussion of the break-up option considerably underestimates the consequences of such a move. **The economic cost** of a weak country leaving the Euro is significant. Consequences include sovereign default, corporate default, collapse of the banking system and collapse of international trade. There is little prospect of devaluation offering much assistance. Specialists in this field estimate that a weak Euro country leaving the Euro would incur a cost of around EUR9,500 to EUR11,500 per person in the exiting country during the first year. That cost would then probably amount to EUR3,000 to EUR4,000 per person per year over subsequent years. That equates to a range of 40% to 50% of GDP in the first year.

Were a stronger country such as Germany to leave the Euro, the consequences would include corporate default, recapitalisation of the banking system and collapse of international trade. If Germany were to leave, we believe the cost to be around EUR 6,000 to EUR8,000 for every German adult and child in the first year, and a range of EUR3,500 to EUR 4,500 per person per year thereafter. That is the equivalent of 20% to 25% of GDP in the first year.

In comparison, the cost of bailing out Greece, Ireland and Portugal entirely in the wake of the default of those countries would be a little over EUR 1,000 per person, in a single hit. **The political cost** is, in many ways, the least of the concerns investors should have about a break-up.

Fragmentation of the Euro would incur political costs. Europe’s “soft power” influence internationally would cease (as the concept of “Europe” as an integrated polity becomes meaningless). Breaking up the Euro scenario was anticipated by Romano Prodi, EU Commission President, who in December 2001 said: *“I am sure the Euro will oblige us to introduce a new set of economic policy instruments. It is politically impossible to propose that now. But some day there will be a crisis and new instruments will be created.”* The problem with the Euro is why considering break-up at all? Break-up occurs because the Euro does not work. Member states would be economically better off if they had never joined. European monetary union was generally miss-sold to the population of the Europe.

In the 1990s the Euro was often characterized as an instance of foreign exchange rate integration – the Exchange Rate Mechanism without the crises. The advantages of no foreign exchange rate uncertainties or costs for trade and tourists were emphasized. Of course the exchange rate integration was probably the least of the consequences of the Euro. The most important consequence was the integration of monetary policy. The hint was in the name “European Monetary Union”. However, politicians sought to ignore that hint.

A Euro that had been promoted on the idea of monetary union rather than exchange rate integration would have been far more difficult to sell to the electorate. A monetary union is, economically speaking, a “good”

idea if the membership constitutes an optimal currency area. This occurs under one of two conditions. Either the area is so homogenous that the component economies all move in the same direction at roughly the same speed, at the same time. Alternatively, the economies are sufficiently flexible that any differences in economic performance can be relatively swiftly corrected. The homogeneity is necessary because there is only one nominal monetary policy for the monetary union.

If different economies are moving in different directions, or at different speeds, monetary policy cannot be set optimally for the whole union. Some part of the monetary union will have an inappropriate monetary policy. If there is no homogeneity (and homogeneity is rare in anything other than a very small economy) then flexibility is required. If nominal economic activity in one part of the union deviates from the monetary union norm, then some adjustment must happen to correct that and force normalisation. This adjustment can be through labour migration, nominal wage adjustments, price adjustments or (as is the preferred solution for the Euro given its circumstances) though fiscal automatic stabilisers.

In the absence of such adjustments, some areas of the monetary union will suffer a persistently inappropriate monetary policy. It was the great misfortune of the Euro that the early years of its life saw a monetary policy that was biased towards being too accommodative for some of its members. Politicians generally will only recognize the existence of economic threats when they come garbed with immediate negative consequences – this is why politicians are so eager to ban the short selling of assets. Politicians generally fail to appreciate that economic threats can also wear a (temporarily) positive appearance, in the form of bubbles.

These are just as damaging as negative price moves – yet for some reason “rising asset markets” that misprice assets are politically perceived as good, while “falling asset markets” that misprice assets are politically perceived as bad. Even today, politicians who rush to ban naked short positions would not dream of banning naked long positions. As a result, the Euro spent the

first decade of its existence largely oblivious to the serious economic threats posed by its dysfunctional nature. The crisis predicted by Romano Prodi was therefore even more real than his words.

The legal position and factual findings -

In theory the break-up of a monetary union like that of the Euro could be the result of one of two actions: the first would be a Member State or a group of States deciding to leave (secession); the second act would be the expulsion of a Member State or group of Member States by the majority of the union. As things stand, secession is highly costly and very difficult, and expulsion is impossible. There are three reasons why the founders of the Euro chose not to include an opt-out clause in the governing treaties:

a) the existence of an opt-out would have been seen as a lack of commitment from Member States;

b) the existence of an opt-out – however structured – would have raised the possibility of a country exiting; c) by failing to specify a technical mechanism for an exit, the costs of exit are significantly raised.

The result seems to be like famous song *Hotel California*: “You can check out ... but you can never leave”. Some voices said more important, there are no details provided as to the actual mechanism of exit. The Member State has to negotiate its exit; there is no solution nor even a facilitation of the process proposed, just the option to embark on negotiations. Most important, there are legal arguments for a country to leave the EU, but not one to leave the EMU. What about expelling a country?

Here again there is no legal basis for doing so. There is an option to leave the EU but not one to expel a country from either the EU or the Euro. Because the expulsion is not an option under current law, to expel a Member State requires an amendment of the Maastricht Treaty.

Amending the Treaty requires unanimous consent – from all 27 countries of the EU. The country that is to be expelled would first need to vote in support of the expulsion mechanism. The country is effectively agreeing to its own expulsion – which makes expulsion secession. A Member State (even one that has agreed to an expulsion amendment) could argue against the expulsion before the European Court of

Justice, and on the basis of the inconsistency the European Court of Justice could declare the expulsion invalid. On the other hand, leaving legally does not seem to be a viable option.

At the moment, the Treaties governing the Euro were designed so as not to have an exit option. The Euro is made up of sovereign states. As such, these states could choose to repudiate the Treaties that they have signed, and unilaterally declare independence from the Euro and the EU. Another case is unilaterally leaving for the weak countries. Rationally, an economy would choose to leave monetary union if the costs of staying in exceed the costs of departure.

Once a country has voluntarily surrendered its currency and its monetary policy independence to a common currency area, the costs of leaving that monetary union and establishing a new national currency (NNC) are huge. If one country left, then speculation about other weak economies choosing to leave could then generate costs that are very similar to these. This means that it is very unlikely that a single country leaves the Euro.

Default on domestic debt- In the case of a country chooses to leave the Euro it has essentially two choices with regards to its domestic sovereign debt. One is to leave the sovereign debt as it is – that is to say, Euro denominated. The problem with this approach is that the entire debt is then denominated in a foreign currency, over which the NNC country has no power of taxation. The only way of earning Euros would be through trade, which is likely to be significantly disrupted – and so default on the Euro denominated national debt is almost certain. The other and more probable option is the forced conversion of Euro denominated debt into NNC debt. This would constitute a default in the eyes of most investors.

Default on sovereign debt – in either case – would generate lasting economic costs as the long-term cost of capital for the government would increase. However, inside or outside the Euro, some countries are likely to default.

The increase in sovereign debt costs associated with a default could perfectly easily happen with the Euro in circulation (bond markets already price Greek debt as if it were about to default, for instance). What

makes Euro exit more costly is the fact that as well as the sovereign default, there is also likely to be a corporate default. If the government is changing the currency of the country, it will force the change on the domestic corporate sector, which will thus share the government's default. In all likelihood, even if there is no force, a domestic company earning revenues in the NNC will have problems settling any debts that have been incurred with overseas banks. Exiting the Euro is not going to take place with a small depreciation of the NNC.

Collapse of the domestic banking system - If the NNC is to function properly, the seceding government would have forcibly redenominated domestic bank deposits into the NNC, otherwise the NNC is an entirely abstract concept. The reality of implementing this becomes highly arbitrary. For instance, should only Euro accounts be forcibly redenominated, or should sterling and dollar accounts also be converted into the NNC? Post the NNC being established, the Euro is a foreign currency.

If one foreign currency is to be converted into the NNC, why not convert all foreign currencies in the domestic banking system? Should the conversion apply only to domestic citizens or to foreigners with accounts in the domestic banking system? What about foreigners with Euro accounts in an overseas branch of a domestic bank? In this situation, confronted with the obvious uncertainties surrounding the establishment of a NNC, the obvious response of anyone with exposure to the secessionist banking system is to withdraw money from the bank as quickly as possible. T

his could be done electronically – unless the government puts in place stringent capital controls. In that event, the wise depositor anticipating the creation of a NNC would withdraw their money in physical Euro form, pack it into a suitcase and head over the nearest international border – unless the government seals their borders to the movement of people. In such scenario, the sensible depositor would withdraw their money in physical Euro form.

The only way that can be prevented is to shut the banking system entirely, or perhaps place a limit on the amount of withdrawals that can be made over the transition period.

This is the collapse history of the US monetary union in 1932-33.

The banking system is also likely to be the most immediate transmission mechanism for the crisis beyond the borders of the seceding state. If bank runs and enforced conversions in the seceding state are witnessed elsewhere in the Euro, citizens of any Euro member state that is considered to be a possible candidate for secession would start to withdraw their bank deposits from their domestic bank system out of fear. Bank runs could spread before the actual act of secession, therefore, and become a catalyst for a more widespread crisis in the Euro financial system.

Departure from the EU is difficult - It seems highly unlikely that a government could leave the Euro and expect to remain a fully functioning member of the European Union itself. The process of introducing a NNC is clearly against the guiding principles of the European project. By leaving the Euro, the seceding country is breaching the constitution of the European Union (the Treaty of Maastricht forming part of the body of European constitutional treaties).

A country could leave the Euro and then negotiate to stay in the European Union.

Trade and tariff problems - It is also important to note that exiting the EMU means exiting the EU. This would leave the country departing with no trade agreement with Europe. The ideal idea that a seceding state would immediately have a competitive advantage through devaluing the NNC against the Euro is not likely to hold in reality. In the event that a NNC were to depreciate 60% against the Euro, it seems highly plausible that the Euro area would impose a 60% tariff (or even higher) against the exports of the seceding country.

So what to do? – Economic modelling is not good at dealing with something as extreme as the break-up of a monetary event. It is not really what models are designed for. However, with some basic assumptions we can attempt to quantify the cost for a weak country that chooses to leave the Euro. We have assumed that a weak country leaving the Euro will see its currency fall by around 60% against the rump Euro bloc. The mass sovereign and corporate default would generate an increased risk premium for the cost of capital – assuming that the domestic

banking system is in any way capable of providing capital. If the banking system is completely paralyzed then the cost of capital de facto increases an infinite amount. In the extreme paralysis of finance, capital is not available at any price.

Banking analysts assume a decline in the volume of trade of 50%. This is based off secession from the EU, and an assumption that there will be some attempt on the part of the rump EU to impose tariffs to offset the currency depreciation of the seceding state. Finally, there is assumption that there is a cost arising from the banking system failure. In this case, with 60% depreciation the central case, we would assume a cost equivalent to 60% of bank deposits in the system. Of course, we are also assuming a run on the banks before secession takes place.

If 50% of current deposits are withdrawn from the system before secession (or before the banking system is shut down in anticipation of secession) we can therefore impose a cost equivalent to 60% of 50% of current deposits. Using the southern European countries as our benchmark, we can therefore come up with a very rough estimate of the cost of departure from the Euro. Taking all these factors into account, a seceding country would have to expect a cost of EUR9,500 to EUR11,500 per person when seceding from the Euro area. It should be borne in mind that while bank recapitalisation could be considered a one-off cost, the cost of higher risk premium and trade stagnation would be borne year after year. So the *initial* economic cost would be EUR9,500 to EUR11,500 per person, and then a cost of around EUR3,000 to EUR4,000 per person would be felt each year thereafter.

The economic argument if a strong country leaves - The cost of a weak country leaving the Euro would seem to be horrified. The base assumption is that if a strong country were to leave, there would be an appreciation of its currency – on the assumption that the strong NNC would be desired (at least by other Euro area inhabitants) as a reserve currency. Certainly if a strong country leaves, we would assume an appreciation of the NNC relative to the rump Euro. Whether the NNC of a strong country also appreciates against non-Euro

countries depends on the extent to which there is capital flight from the rump Euro into the NNC, the degree to which capital controls are imposed, etc.

If we then examine the five consequences of leaving the Euro for a strong currency, we find a slightly different structure emerging: default on domestic debt, collapse of the domestic banking system, departure from the EU, trade and tariffs problems and so what to do? The same problems with modelling apply to a strong country departing as a weak country – this is such an abnormal event as to be all but impossible to simulate with any great certainty.

An exit from the EMU of a stronger country would create severe tensions in rump Euro financial markets, encouraging a flight to quality. This capital flow would trigger a very rapid appreciation of the new currency. Not only would the currency move have a large adverse impact on the country's exports (loss of competitiveness, but also because of the jump in volatility), but also the central bank would lose part of the control it has on the monetary base. If the banking system did not convert Euro loans into NNC, it would be left with Euro assets and NNC liabilities across its entire balance sheet, which would require substantial recapitalisation.

The banking system must convert to the NNC if the NNC is to become the *lex monetariae* of the seceding country. Otherwise Gresham's Law would apply – *bad money drives out good*. Everyone would hoard the NNC and try to pass on Euros to settle all liabilities. Thus, any strong country seeking to secede would have to assume that the majority of its export sector is wiped out in the process. So what is the cost of a “stronger” country leaving?

The same problems with modelling apply to a strong country departing as a weak country – this is such an abnormal event as to be all but impossible to simulate with any great certainty. However, we can make some assumptions about the basic costs. The seceding strong currency is likely to have an appreciation of 40%. This is a conservative assumption, as there would be attempts at capital flight into the strong currency in advance, but presumably in the disorderly circumstances of secession there would be some attempt at capital controls or regulation of the flows.

The domestic banking system would be in urgent need of recapitalisation. This impacts the cost in two ways. First there is an increase in the risk premium. Second, there is the cost of recapitalising banks. In this point everybody are interested in the marginal cost of recapitalising banks – which basically means looking at offsetting the impact on bank balance sheets of the consequences of the appreciation of the NNC. Finally there is the trade impact. Some of the trade effect is captured with the appreciation of the currency of course, and so we are keen to avoid double counting.

However, if a strong economy like Germany leaves the Euro there are non-currency trade consequences. The exit from the European Union raises potential trade barriers and border disruption. Further, the exit causes a growth shock to the rump Euro, which undermines the export potential.

A very conservative assumption says about a 20% reduction in trade. If we take Germany as an example of a stronger country, the combination of these costs works out at between EUR6,000 and EUR8,000 per person if Germany were to leave the Euro. As with a weak country leaving, the recapitalisation of the banking system can be considered to be a one-off event.

However, the legacy of the risk premium and the problems of trade would entail a cost of between EUR3,500 and EUR4,500 per person per year after the initial shock. We can put into this context, if Greece, Ireland and Portugal all defaulted on their debt with a 50% haircut, and the remainder of the Euro area bought all outstanding government debt in the market (including IMF debt), that would generate a cost of a little over EUR1,000 per person in Germany.

The banking system would have sold its debt (at market) to the remainder of the Euro area, which might entail some recapitalization requirements in addition to that, where banks have failed to mark to market existing holdings of bonds. However, the idea that the Euro area purchases all outstanding debt of the three countries and then accepts a 50% haircut can be thought to be a fairly extreme bail-out scenario.

6. Instead of conclusions

Can we invest in a break-up scenario? It is also worth reflecting that the break-up of the Euro and fragmentation of the EU would be a negative shock to Europe’s international position. The EU is the largest or the second-largest economy in the world. The separate components of the EU – particularly those from the former Euro area – would be effectively neutered. The economic costs of breaking up the Euro are high, and extremely damaging. The political costs of breaking up the Euro, even in part are too great to quantify in bald cash terms. The analyst’s base case for the Euro is that the monetary union will hold together, with some kind of fiscal confederation.

Everybody hope and think how the UK monetary union, and indeed the German monetary union, have held together. But what if the disaster scenario happens? How can investors invest if they believe in a break-up, however low the probability? The simple answer is that they cannot. Investing for a break-up scenario has not guaranteed winners within the Euro area. The growth consequences are awful in any break-up scenario. The risk of civil disorder questions the rule of law, and as such basic issues such as property rights.

Final conclusions

Euro dismantling scenario could lead to unexpected consequences. The Euro area in current structure does not work with current members. Countries cannot be expelled from the euro area, but sovereign states could voluntarily choose to leave the monetary union. It is estimated that the dismantling is not a solution. Instead, a confederation based by common fiscal policy aimed to build a new fiscal discipline is considering. Working tools and techniques should be: (1) economic and monetary integration to ensure financial stability; (2) monetary and fiscal cooperation to ensure improved institutional governance and common fiscal policy.

Faculty of Economic Sciences and Business Management

gabi.dobrota70@yahoo.com

chirculescu_felicia@yahoo.com

Abstract

Fiscal policy of a state must allow to achieve important goals, embodied in economic growth, reduce the unemployment, competitiveness, stimulating the investment climate. An important tool in achieving the objectives set remains the profit tax. This workpaper concerns an analysis of the most important changes incurred by profit/return tax regulation and its contribution in the income budget. The period under review mainly relates to the period 1995-2010, achieving and comparisons between the Romania and the EU case.

Key words: profit tax, tax revenues, economical growth

J.E.L. classification: A 11, H12, H21, H62

1. Introduction

The terms of registration a decline in all economies after 2008, the issue of ensuring financial stability appears to be one of the thorniest. Moreover, public finances have been since evolving an important component of social and economic life of each country and their impact on the national economy is mainly reflected by the distribution of GDP size.

Establishment of public funds on account of taxes and mandatory contributions remains the main solution to the authorities, however, a decline in economic activity inevitably attracts and reduce revenue. Obviously, this leads to an imbalance recording financial recovery, and the solutions are reducing costs and identifying solutions to increase revenue. Unfortunately, in our country, the fiscal measures adopted during the crisis did not

correspond to the phase, effects are often contrary. VAT increase, setting minimum tax (given up after a short period of time) are just two of the negative tax measures in recent years. Moreover, the tax system in Romania has suffered many changes since 1990, which seriously affected the business and discouraged investment. Income tax is an important tool used not only to the State for tax purposes but also economic. In this paper we aim to achieve a brief analysis of changes in corporate tax system and to highlight the correlation between income and tax revenue generated by it.

2. Analysis of profit tax contribution to the formation of budget revenues in Romania

During the legislative regulations regarding profit tax was a sinus one. Implementation of income tax payments broke same time with replacement of the tax benefits payments with benefit realized by economic units.

Very quickly the profit tax was established, but in a form that has created serious difficulties in implementation (there are 67 installments for each one is established a tax rate). Waiver of this has led to the establishment of two tranches and two tax rates (30% and 45%). Since 2005 they started to flat tax of 16% currently used.

But corporate tax reform has not the same objectives over time, often they are not realized (for example, granting a tax exemption from taxation as income in different periods of stimulation of private sector concerned, but the effect was stealing, legally "from taxation for such intervals; abolition applied through the 67 shares of small and medium enterprises aiming at

stimulating effect, they have gone from a tax of 5% to 30% each in while large firms fell within 45% minimum tax aimed at cleaning up introduction economy companies which were running any business and economy decrease, resulting in bankruptcy of many small business entities, increasing unemployment and public expenditure in question implicitly the registration of obvious inequities when the same level of profit tax is paid differently, and the examples can continue).

Although the most common measure was adopted to reduce tax rates, there are disparities from one period to another between the levels of these shares.

Supporting economic growth in 2005-2008 was achieved mainly through taxes decreasing on labor quiescence, on the capital, by reducing social security contribution rates in order to eliminate the underground economy.

Based on these considerations was adopted also the proportional share of 16% for tax on most individuals income and for profit tax in the hope that such a quota level will increase the tax base by developing existing businesses by increasing foreign investment so direct.

On a recent time, tax law changes have regard to the continuous reduction of exemptions and exemptions granted to pay taxes and duties, in order tension easing businesses, stimulate private initiative, encouraging the unregistered economy to surface, improving competition and broaden the tax base.

3. Evolution of income tax determined by applying tax profit in Romania

The evolution of the state budget revenues from profit tax of Romania, as its share in total revenues are reflected in the table. No.1.

Table no. 1 The share of total corporate tax revenue collected to the state budget, during 1995-2010

Year	Tax profit mil. lei	Total revenue mil. lei	The share of tax profit in total revenue **
1995	279,13	1.288,83	21,66
1996	351,73	1.837,28	19,14
1997	1.063,89	4.383,45	24,27
1998	1.084,56	6.721,55	16,14
1999	1.664,56	9.323,98	17,85
2000	1.992,70	12.034,20	16,56
2001	2.199,10	14.820,90	14,84
2002	2.997,90	17.920,60	16,73
2003	4.368,10	25.244,70	17,30
2004	6.441,60	32.195,40	20,01
2005	6.495,30	36.599,50	17,75
2006	7.905,47	40.698,11	19,42
2007	10.528,80	48.984,60	21,49
2008	13.528,80	61.151,00	22,12
2009	10.617,10	56.434,80	18,81
2010	10.090,90	68.050,70	14,83

Source: www.insse.ro, mfinante.ro

** Own calculations

Analyzing the data in Table. 1, we can say that fluctuations in the share of total corporate tax revenue growth is due to frontload the size of profit tax by increasing the total revenue collected to the state budget, which shows the orientation of the state to indirect taxes despite of direct taxes, while being and the result of fiscal measures adopted. On average, in the period studied, this ratio is 18%. Although since 2005 the profit tax rate was reduced by 9% (from 25% to 16%) the the state budget revenues collected under this head increased by 53,7 million lei, while total revenues increased by 4404,1 million lei, which led to lower share of total corporate tax revenues by 2,26% over the previous year, when there was a level of 20,01%.

Evolution of revenues from income tax collection shows an increasing trend over the interval 1995-2004, when there is a stagnation (growth is insignificant in 2005 compared to 2004, ie 0,83%), followed by a sharp increase until 2008, embodying the period immediately following a significant decrease (figure no. 1).

Figure no. 1 The incomes evolution of tax revenue during 1995-2010

Graphical representation of developments in tax revenues caused by tax profit and the total revenues collected to the state budget in the period 1995-2010, shows the trend of decreasing mentioned above. It is observed that tax revenues have experienced a decrease in the period 2008-2010 to 4,96% while tax revenue fell by 12,66% in 2009 compared to 2008 but increased by about 2 percent in 2010 compared to same period (figure no. 2).

Figure no. 2 Evolution of total income and incomes from tax profit

An relevant analysis implies also monitoring of development involved by the ratio of tax revenue due to tax revenues and revenues resulting from direct taxes, but also the revenues from direct taxes in total tax revenue (table no. 2, figure no. 3).

Table no. 2 Share of direct taxes and profit taxes during 1995-2010

Year	The share of direct taxes in fiscal revenues	The share of tax profit in fiscal revenues	The share of tax profit in direct taxes
1995	50,91	22,41	44,02
1996	48,69	20,07	41,22
1997	51,22	26,56	51,85
1998	37,43	17,87	47,75
1999	31,24	19,58	62,67
2000	27,51	17,42	63,32
2001	29,97	16,02	53,45
2002	24,94	17,87	71,63
2003	21,27	18,51	87,03
2004	25,07	21,29	84,92
2005	25,95	18,81	72,47
2006	30,99	20,68	66,72
2007	33,31	23,48	70,51
2008	34,49	23,65	68,57
2009	34,83	22,05	66,55
2010	26,38	17,92	67,93

As regarding the share of direct taxes in tax revenue, after studies made, we found that, unlike the first period of time under review, when the share of direct taxes in tax revenue amounted to about 50%, time 2000-2005, direct taxes accounted for on average 25% of tax revenue in 2010 reached a level of 26,38%. Moreover, the direct taxes have been surpassed by indirect taxes both as a share of GDP and as a share of revenues collected in the general consolidated government budget. This trend can be explained due to diminishing tax base due to economic fluctuations and reduce tax rates for direct taxes. Moreover, the strong correlation between direct taxes and the economic situation determine the orientation of the state to a reliable source of income, consumption tax, respectively, which is more accessible in terms of convenience and relatively low cost of collection.

Figure no. 3 The share of direct taxes and profit taxes in tax revenues

These developments occurred due to changes caused by legislative changes, Romania reaching a quota of a 6th place position in the EU 27 in order of increasing tax rates (table no. 3).

Table no 3. Three statutory corporate tax rates of companies in EU Member States, 2011 vs. 1995

Years	1995	2011
Belgia	40,2	34
Bulgaria	40	10
Cehia	41	19
Danemarca	34	25
Germania	56,8	29,8
Estonia	26	21
Irlanda	40	12,5
Grecia	40	20
Spania	35	30
Franța	36,7	34,4
Italia	52,2	31,4
Cipru	25	10
Letonia	25	15
Lituania	29	15
Luxemburg	40,9	28,8
Ungaria	19,6	20,6
Malta	35	35
Olanda	35	25
Austria	34	25
Polonia	40	19
Portugalia	39,6	29
România	38	16
Slovenia	25	20
Slovacia	40	19
Finlanda	25	26
Suedia	28	26,3
Regatul Unit	33	27

The share of profit tax in total tax revenues in the EU27 in 2009 was on average 7.8%, by 1.4 percentage points less than in 2008. In the same year the highest level was

registered in Malta (19,6%), while the opposite was Germany (1,7%). In the EU, compared with 1995 the most significant development of this indicator was registered in Malta, where the gap was 9,8 percentage points (from 9,8% in 1995 to 19,6% in 2009) and the opposite was Slovakia, where the difference was -6.3% (from 15,0% in 1995 to 8,7% in 2009).

Among countries with a high share of profit taxes in tax revenue last year from the time of analysis it is included Malta (19,6%), Luxembourg (14,7%), Cyprus (18,4%) and Czech Republic (10,5%). One of the reasons for these differences is the application of reduced rates for profit tax in most states which joined the EU in 2004. Among the countries that joined in 2004 and 2007 and have basically a low corporate tax rates of profit fall: Cyprus (10,0%), Latvia (15,0%), Lithuania (15,0%), Poland (19,0%), Czech Republic (19,0%), Slovakia (19,0%), Bulgaria (10,0%), Romania (16,0%). In 2011 the average statutory corporate profit tax rate in the EU27 was 23,1%.

It is clear that the policy of reducing the statutory corporate tax rates are not the only way to reduce the high tax burden on economic operators. During the transition, most countries that joined the EU in 2004 have introduced numerous exemptions, the most significant being the exemption from profit tax to attract foreign direct investment and set up within these special economic zones, which offered financial incentives to iforeign investors.

4. Analysis of profit tax impact on economic development in Romania

Economic growth is an important objective of any government, because it is focused on improvement the degree to satisfy human needs and the whole human society. In Romania, growth fluctuated from period to period, 2009 and 2010 embodying significant negative values (Table no. 4).

Table no. 4 Economic growth and tax burden in the period 1995-2010

Year	Real GDP	The fiscal pressure related to compulsory levies
1995	7,1	22,61
1996	3,9	21,21
1997	-6,1	20,29
1998	-4,8	21,67
1999	-1,2	21,54
2000	2,1	20,07
2001	5,7	17,61
2002	5,1	17,06
2003	5,2	18,34
2004	8,3	17,99
2005	4,2	17,97
2006	7,9	16,85
2007	6,3	16,63
2008	7,9	16,82
2009	-8	19,65
2010	-1,3	19,88

The correlation between income tax and GDP can be evidenced by a regression equation. A first step in the regression analysis is the construction and interpretation of the graph (Figure 5) using the SPSS statistical program processing.

Figure no. 5 The bound between PIB and tax profit

It is noted that the two variables are directly related, as demonstrated by the value of correlation coefficient and the value of determinative ratio:

Model	R	R Square	Adjusted R Square	Std Error of the estimate
1	.994	.987	.986	1,9047E

3. Conclusions

In this paper we have focused on statistical analysis of the structure and dynamics of direct taxation in Romania with direct reporting to tax, making a comparison with other European Union member states for the period 1995 to 2010. From the analysis made we can identify the trend of tax revenue generated by our country, which can be explained by the many tax breaks granted during the 90's, economic decline, reduced tax rate and tax measures adopted by the effects caused negative.

The problem of contradiction between the growing need for budgetary revenues, on the one hand, which entails a continuous amplification of taxation, and on the other hand, the need to stimulate the development of economic activities, which however can not be achieved without them have more substantial resources to thrive in an environment increasingly competitive, is one of the thorniest points of the fiscal-budgetary policy of any state. The State must consider the fact that direct taxation produce a variety of effects, particularly on administrative and organizational structure of companies and the results achieved by them, and that their stimulation, especially in difficult times of economic can not only lead to economic development.

We believe that the role of taxes in Romania are still major based on taxation (in order to cover public expenditure) without being given the role of intervention and regulation in the economy. The relatively high number of implicit taxes generate higher fiscal pressure, their collection is difficult, and regulations are lengthy, cumbersome and especially unstable.

The Reflections of Risks and Uncertainties within the Enterprise’s Performance –Provisions, Contingent Assets / Debts in Public Institutions

Dragu Gabi Georgiana
“1 Decembrie 1918” University of Alba Iulia
georgiana.dragu@yahoo.com

Abstract

The qualitative characteristics of financial data also entail the limitations of presenting the accounting information, limitations regarding the appropriate presentation that would not result in neither losing the relevance of the information by delaying the presentations nor losing the credibility due to a too expeditious presentation, a cost effectiveness ratio and finding a balance among the qualitative characteristics. Financial reports are not limited to a narrow presentation of the current/previous year data, but they constitute the foundation of the processes and phenomenon analysis that occurred, of the way causes and effects are highlighted, the way measures of controlling the activity are taken, programmes are elaborated and decisions are made.

The present paper is based on the legal framework analysis, highlighting the transgression of specific legal norms of recognizing presumptive debts in practice. This action aims at completing the legal framework by bringing the notions of contingent assets/debts to foreground.

Key words: Predictive value, confirmation value, opportunity, provision, contingent asset, contingent debt.

J.E.L. classification: M41

1. General background

Respect for the principle of prudence is perfectly adapted to the principle involved in taking risks: better less rich today than very poor tomorrow [1].

Unlike depreciations that correspond to impairments regarding certain assets, provisions correspond (in principle) to

liabilities whose deadlines are not precisely set.

By means of prudence, which is a principle cherished by the Accountant, these inaccurate liabilities are covered in advance by current revenues; the Accountant thus avoids having them involved in the accrued expenses and the present uncertainties being transferred in the future [2]

„In financial theory, the risk represents the variability of the result under the pressure of the environment „,[3]

The insufficient knowledge and consequently a defective evaluation of risks directly affects the final result of the activity undergone, possibly leading to errors.

It is necessary to make a distinction between error and inaccuracy.

The risk must be separated from inaccuracy, but the existence of inaccuracy does not justify the formation of provisions.

Thus an important preventer that the management disposes of, the evaluation being subjective, may lead to the inadequate use of provisions for recording losses the year they are formed and revenues the year they are re-engaged.

The basic concepts in financial accounting, the continuity of activity and the accrual accounting allow making forecasting under risk and uncertainty conditions.

The elements that create a connection between the accrual accounting and cash accounting (provisions, adjustments, depreciations, equalization operations, expenses to be allocated), generally known by the term of *accruals*, reflect the managers policy and can be a two edged sword: on one hand it reflects the opportunistic administration of the result and on the other hand it integrates the possible effects of this uncertainty within this policy [4]

Taking into consideration the management or the professional accountant reasoning, the evaluation of the provisions is submitted to

risks and uncertainty that inevitably affects a series of events and circumstances.

In practice there is a tendency to treat provisions only in terms of fiscal facilities, as long as they are tax-deductible, a procedure not included in public accounting, which led to their

In the present context, everything is reduced to the professional accountant's capacity of correctly evaluating and presenting these risks within financial statements.

2. The accounting treatment of provisions according to the international accounting standards for public sector

According to international accounting norms for public sector:

The provisions represent undetermined debts regarding their deadline and value.

A provision will be registered in accounting if the following conditions are met:

-a current implicit liability generated by a previous event;

-there is a possibility that a resource disposal incorporating economical benefits or presumable services to be necessary for the discount of that certain liability;

-a credible estimation of the liability's value can be made.

The value recognized as a provision represents the best estimation of the necessary expense for the discount of the current liability, which is the same value the enterprise would rationally pay for the discount of the liability at the end of the reporting period or for its transference to a third party at that time.

The objective of the IPSAS standard 19 *Provisions, contingent debts and contingent assets* is to ensure that the evaluation baseline and the accreditation criteria are adequately applied to contingent provisions, debts and assets.

The way of reflecting the risks regarding payments derived from litigations (IPSAS 19 *Provisions, contingent debts and contingent assets*, Annex C)

I. At an official lunch from 2004, ten deaths were reported, possibly due to intoxication with food sold by a restaurant in

a public museum (the reporting entity). Legal procedures were initiated against the entity to claim for damages, but the entity denies its responsibility. The entity's lawyers believe that the entity might no longer be found responsible by the time the annual financial statements are to be approved for issuance at 31st December 2004. However, the lawyers believe that it is possible that the entity would be declared responsible by the time the annual financial statements are issued in 31st December 2005 due to process evolution.

Analysis

a) At 31st December 2004:

The current liability generated by a previous event obliges to:

Based on the available proof at the time the financial statements are approved, there are no liabilities generated by a previous event.

Conclusion

The museum does not recognize any provision. A contingent debt is recognized, except the situation in which the probability of an issuance is very low.

The provisions are to be re-analyzed at the end of each reporting period, since it is necessary that they are adjusted to reflect the best current estimation.

b) At 31st December 2005

The current liability generated by a previous event obliges to:

Based on the available proof, there is a current liability.

It is possible that there are resource disposals incorporating economical benefits or presumable services, necessary for the liability discount

Conclusion

The provision that has the best estimation of the necessary amount to honor the liability is recognized.

II. The legislation imposes the introduction of smoke filters

According to a new law, starting with 30th June 2005, the local state entity is compelled to equip its public office buildings with smoke filters. The entity did not introduce the smoke filters.

a) At 31st December 2004 reporting date

The current liability generated by a previous event obliges to:

There is no liability since, according to law, there is no event that entails filter equipment costs or penalties.

In conclusion there is no provision to be recognized for the costs of introducing smoke filters

b) At 31st December 2005 reporting date

The current liability generated by a previous event obliges to:

There is no liability associated with the costs of the smoke filter equipment since there is no compelling event (for the filters equipment)

However, according to law, the obligation to pay a penalty may appear due to the occurrence of a compelling event (refusal of conforming to dispositions regarding public buildings).

The resource disposal incorporating future economical benefits or presumable services, necessary for the liability discount.

Evaluating the probability of receiving penalties and fines due to refusal of conformation depends on the law stipulations and on the promptitude of its application.

Conclusion

There is no provision to be recognized for the filter equipment costs.

However, a provision is recognized for the best estimation of the costs associated to each presumable fine and penalty.

If we were to speak about the European framework in France, the law from 2002 regarding the new economic regulations compels the marketable enterprises to include in their annual report information concerning the way in which the enterprise takes into consideration the social and environmental consequences of its activity.

At European level, the consolidated statements included in the annual report must present a description of the main risks and uncertainties (Directive 2003/51/EC of European Parliament and of the European Union Council of June 18 2003, that modifies Directives 78/660EEC and 91/674 EEC, <file:///GI/EUR-Lex-Recherche/simplebgvv.htm>); by comparison, IASB economic agents does not compel, but recommend enterprises to present this kind of financial statement.

Although a resources disposal incorporating economic benefits is not necessary for the liability discount, the provision must be continued in revenues.

A provision that no longer has an object cannot be used for any other event, even though it involves the same value.

An important issue is the case in which it is estimated that a part or total provisions expenses will be reimbursed by a third party.

We can talk about reimbursement only the moment we can be assured that the sum will be received, it will be treated as an asset and cannot exceed the provision's value.

IPSAS 19 *Provisions, contingent debts and contingent assets* also defines the terms of contingent debt and contingent asset/

The contingent debt is presented to be

-either a possible liability, which appeared due to past events and whose actual existence will be confirmed only by the occurrence or non-occurrence of one or more uncertain future events, that cannot be fully controlled by the enterprise;

-or as a current liability, which appeared due to past events but is not recognized because there is a presumable necessity of resource disposal incorporating economic benefits or services for the discount of this liability or because the liability's value cannot be sufficiently credibly evaluated.

A contingent asset is defined to be that possible asset that appears due to previous events whose existence will be confirmed only by the occurrence or non-occurrence of one or more uncertain future events that the entity can fully control.

3. The accounting treatment of provisions according to national reference framework

The national accounting framework regarding commissions is close related to the international accounting norms.

The provisions are designed to cover the debts whose nature is clearly defined and are expected or will certainly appear in the balance sheet, but which are uncertain in terms of value and placement in time.

The provisions' value cannot exceed the sums that are necessary for the payment of the current liability on the date the balance sheet is issued. Provisions cannot be used for the adjustment of the assets' value.

The most recent national accounting regulations regarding provisions

Based on the principle of prudence, the elaboration of financial statements must include an evaluation made prudently, taking into account all the predictable debts and

potential losses that occurred in the current or previous financial year (even though they become apparent only between the balance sheet date and its drafting).

The three conditions for recognizing a provision according to international norms have been also assumed by the national accounting norms:

- an institution has a current liability generated by a previous event;
- a resource disposal is probable for the payment of that certain liability; and
- a credible estimation of the liability's value is made.

Provisions are constituted for elements such as (Order of the Ministry of Public Finance 1917/2005):

- litigations, fines and penalties, damages and other uncertain debts;
- expenses associated with service activity within the guarantee period and other expenses associated with guarantees granted to clients;
- other provisions.

A provision is registered the following way:

$$6812 = 1511$$

“Operational expenses regarding provisions” = “Litigations provisions”

In case the payment of a liability is no longer probable, a disposal of resources or the disposal of resources has been made, the provision must be cancelled by its re-inclusion in the revenues the following way:

$$1511 = 7812$$

“Provisions for litigations” = “Revenues on provisions”

Recommendations

Our advice is that the financial statements' annexes be completed by the provisions statement that clearly highlights

- the value of new provisions
- the re-inclusion in the revenues, the cancellation of provisions
- the adjustment of provisions
- the value of the paid provisions.

The provisions are different from trade credits, engaged but unpaid expenses, due to their uncertain nature regarding the execution or the value of the future expenses necessary for their payment.

The legal framework thus needs to include articles regarding the constituency of provisions in case of restructuring the public institutions.

4. Accounting treatment of contingent assets and debts according to national framework

The registration into account 8067 Legal accruals is made within the limit of the approved budgetary credit.

Therefore salaries and other legally earned personnel rights are registered both in financial and accrual accounting within the financial year they are due to be paid in the limit of the approved budgetary credit on this purpose; since they are not registered as debts, we recommend that the normative framework states their constituency as compulsory.

Litigations provisions will be reported in the “Balance sheet” (code 01) under non-current debts, at raw 55 “Provisions”, representing the best estimation of the necessary costs to pay the current liability at the date the balance is issued.

The registration of provisions will be made under account 1518 “Other provisions” for the “environmental tax” expenses that will be cleared according to the Government Act no. 448/2005 regarding the waste from electrical and electronic equipment with subsequent completions, for the assets that are going to reach their end of life in the near future, these sums being correlated with the registrations under account 151 “Provisions”.

Currently the green stamp tax included in the purchase of working inventory, purchased fixed assets, representing a irrecoverable tax is embedded in their cost.

Similarly, we recommend that creating provisions for penalties of sums that the state owes to third parties and did not pay in time becomes compulsory.

But in case it is not a sure thing that processes will be lost an the conditions for recognizing a provision are not met, public institutions do not present this kind of information.

Therefore we consider that the completion of special accounts with 2 such accounts – one reflecting contingent debts and the other one reflecting contingent assets – would be a pertinent decision.

5. Conclusions

The national accounting framework has picked up some of the principles of the international accounting norms concerning the accounting policies.

One of the necessary conditions is the insurance of financial data comparability by means of making the accounting policies and their changes available for the information users.

The accounting result is, fundamentally, an “uncertain” number (Casta, 2000). Always precise, calculated to the last euro cent, it is often uncertain.

We also want to remind that according to Auguste Comte (*Cours de philosophie positive*, 2e L., I., p. 56), “Precision and certainty are two qualities intrinsically different. A totally absurd sentence can be extremely precise, so to say, for example the sum of a triangle’s angles equals three right angles; and a very certain sentence may only contain a very mediocre precision: for example, the affirmation that every human being will die” [5]

We cannot certainly claim that a result is more objective than other as long as we can apply several solutions for the same situation, leading to different consequences regarding financial statements and accounting result.

If we choose a solution we implicitly abandon another one. Different accounting options used in the case of re-evaluation, of depreciations and provisions lead to different financial results even though the management conditions are identical.

We can no longer analyze accurately an entity’s performance based on its financial statements if we do not know in detail the adopted accounting policies.

The Role of Leisure Activities in the Revival of Romanian Tourism Industry

Dridea Catrinel Raluca

Romanian American University of Bucharest

dridea.catrinel.raluca@profesor.rau.ro

Abstract

This paper is trying to identify the importance of leisure activities in revival of Romanian tourism industry. Many important destinations have understood the role of the leisure industry as a dynamic factor in tourism circulation.

As a main component of the tourism economy, the leisure activities have determined a boost in the tourism circulation, by offering a variety of enjoyment opportunities. Taking into account the experience of famous destinations, Romanian tourism can learn from this by developing and diversifying the different leisure segment.

Key words: tourism, leisure, development, circulation, opportunities

J.E.L. classification: L83

1. Introduction

The role of tourism industry nowadays is undeniable, as a major sector of world economy. The fast development and the initiative taken have increased, in a large proportion, the activity of countries. The influence and contribution of tourism to GDP, the growing number of employments in tourism segment, the improvement of education, culture, and many others are underlining the importance of tourism as one of the principal methods to increase every country's general economic benefits.

In the globalization era, tourism becomes an alternative to many economic sectors, which has deeply suffered from the world crisis. Adapting to a variety of costumers has generated the creation of niche markets usually with the particularization of the leisure services offered. As a result, the specialization has been integrated in the

services offered and therefore the destinations are fructified as a whole *tourism experience*. In this context, some of the famous destinations have reinvented their leisure activities and others have created the framework for tourism development and after crisis solution. In this category, it can be included most recent tourism initiatives from Dubai, Macao, Singapore, Hong Kong, and so on.

2. International leisure tourism trends

The perspectives of tourism and travel activities have influenced people around the world, being oriented to enjoyable activities and recreation. The political and economical aspects of society have had a specific influence over the past years, as every country has tried with big efforts to maintain a positive image on the global tourism. The components of the tourism industry are changing dramatically, with more and more new ingredients, with new concepts, or classical ones, but adapted to other sectors, for instance, the *boutique hotel*, and the influence, the *boutique cruise*, or the *theme parks*, and the result the *theme cruise*, etc.

The context of globalization can be identified in tourism as a sum of different trends [2]: easy access to information; the degradation of environment; the increase of travel and tourism; the aging of population; the change of tourist's mentality toward consumption; the appeal of new forms of tourism; the intensified trips such as *short breaks*, and *long haul* destinations, and of course many more tendencies. This has turned into a worldwide race for the best destination, and the most competitive one.

An overview of world tourism industry has brought a series of surprises in the case of tourism arrivals and also the tourism receipts. [5] In the following table are presented a list

of touristic regions and their evolution regarding these factors.

Table 1: The International tourism arrivals mil pers.

	2008	2009	2010
Total	917	88	940
Europe	485,2	46	476,6
Asia	184,1	18	203,8
America	147,8	14	149,8
Africa	44,4	46	49,4
Middle East	55,2	52	60,3

Source: www.unwto.com

As it can be seen, the evolution of tourists' arrivals has a positive trend in all the presented regions, with different proportion that determine the future tourism initiatives and actions. *Europe* is maintaining the first place, being the most visited destination, followed by the *Asia-Pacific region*, *Americas*, *Middle East*, and final *Africa*.

It is interesting to notice, the fact that all of these has recover from the 2009 crises, with values that overcome the peak points obtained in 2008, with the exception of Europe, that has registered a smaller value in 2010 in comparison to 2008.

Table 2: International Tourism Receipts billion euro

	2008	2009	2010
Total	640	610	693
Europe	322	294,	306,4
Asia	142,	145,	187,6
Americas	127,	119,	137,4
Africa	20,5	20,6	23,9
Middle East	27	30,1	37,9

Source: www.unwto.com

The receipts are following the same ascendant trend, with increased results for each region. It can also be seen, that Europe is the only one that has, in 2010 receipts with minor numbers than in 2008.

One of the most spectacular revivals in tourism activity is represented by Asia Pacific region, with destinations that

constantly improving the tourism infrastructure, and especially the leisure one.

Table.3: The arrivals in Asia-Pacific mil pers.

	2008	2009	2010
China	53,04	50,87	55,6
Malaysia	22,05	23,64	24,5
Hong	17,32	16,92	20,0
Thailand	14,58	14,15	15,8
Macao	10,61	10,40	11,9

Source: www.unwto.com

These destinations are becoming more attractive by implementing a large spectrum of leisure activities, as a consequence of consumers' demand. The new tourist is an active one that has more free time and wants to manage it properly. Tourists, nowadays, are interested in experiencing tourism rather than be a spectator to different touristic activities.

They are searching for *tailor made* services, for a multitude of leisure services, transforming the concept of *relaxation* to an *entertainment* one. Therefore, the new customer must be attracted by the particularly settings of the destinations and it implicates a special concern of tourism administrations units. To answer these demands, the offers have increase their opportunities for entertainment, by developing types of leisure into types of tourism, such as: *sport tourism*, *event tourism*, *theme park tourism*, *cruise tourism*, *shopping tourism* and so on.

For example, **Macao** has reinvented itself by catering for gambling customers. The new born resorts hotels and casinos have overcome the image of Las Vegas, as many of the costumers of the latest were Asian, and the proximity of Macao to the Asian market is obvious (the major percent of tourist are coming from the mainland China-80% [1].)

Another example is the **Hong Kong** that has invested in creating the *Hong Kong Disneyland* following the success registered by Tokyo Disneyland, representing itself a motivation for travel, especially for the Asian market. Hong Kong is also known for the cruising activity, representing a significant port of call for numerous cruises.

China is also an example of leisure development, with two new improved

destinations, as Shanghai and Beijing. The famous *Shanghai Disneyland*, *Shanghai National Holiday Resort*, *Shanghai Happy Valley* (a theme park that incorporates restaurants, gardens, shopping facilities, etc.) and of course, other opportunities for fun are changing the way this is positioned in the eyes of the consumers - a new type of offer for new and experienced clients.

These few examples present a perspective for tourism trends and therefore a more compressive idea about the successful infrastructure for tourism- the leisure one. More and more the leisure industry has intersected with the tourism one and destinations are now known for the leisure services offered, for instance:

- Las Vegas (USA), Monte Carlo (Monaco), Singapore – gambling
- Milan (Italy), Dubai (UAE), New York (USA), Hong Kong, Bangkok (Thailand) – shopping
- Chamonix (France), Innsbruck (Austria), Cortina (Italy), Aspen (USA) – skiing
- Caribbean region – cruises, etc

Over the years, tourism has become the most important economic activity, with *contributions of tourism to GDP*, for some destinations, which overcome the percent of 50, such as [6]: Antigua and Barbuda (57%), Aruba (71, 7%), Bahamas (74, 7%) - Caribbean Sea. Regardless of the tourism success, or the natural potential any country can reposition it's imagine being more conscious in addressing the new costumers with special services based on a variety o leisure opportunities.

In conclusion, the international experience can provide to the Romanian tourism with the scenery for economical development and crisis solutions. The concerns involved are in regarding to the lower number of arrivals, but also the lack of implication of the public and private sectors.

3. Opportunities for Romanian Tourism Revitalization

Romanian tourism is well-known for the rich traditions and culture, unique destinations that provide an interesting travel experience. Its main interest points are the *Danube Delta* – home for the multitude of bird species, *Black Sea Resorts*, *Medieval*

Towns, *Carpathian Mountain Resorts*, *Monasteries*, etc. The famous objectives are a permanent attraction for foreign tourists, but the deficiencies in the tourism infrastructure, tend to undermine the effort of tourism promotion and more than that, the tourism circulation. This is a typical example of an imperfect valorizing of a large tourism potential, taking into consideration the opportunities for tourism development in Romania. To illustrate this purpose, there are presented the main indicators for tourism activity:

The number of tourists' arrivals in Romania (mil pers.)

Romania	2010		
	All	Romanian	Foreigners
	6,08	4,7	1,3
Seaside	0,7	0,67	0,31
Spas	0,57	0,55	0,02
Mountains	0,81	0,72	0,09
Danube Delta	0,06	0,05	0,01
Bucharest and important cities	3	1,9	1,1
Other localities	0,9	0,76	0,14

Source: www.innse.ro

The picture underlines the necessity for raising tourism awareness in report to other destinations and the strategies which have transformed their tourism potential. The most important action must consider the development of the major tourism services and equipments - the accommodation, the food and beverage, the transport and the leisure.

The enhancement of tourism industry in Romania is strictly conditioned to the adaptation of services to the international markets. In response to the international context of tourism, but also the intentions to proper recovery from the economic crisis, some strategies can be undertaken:

- In the beginning, it is impetuous to create and modernize the tourism infrastructure and especially the leisure one;

- The diversifying of leisure services offered for the general public and for niche segments;
- The usage of unexploited other leisure resources in order to create new forms of tourism;
- The involvement of specific Romanian leisure practices in the services offered;
- The adaptation of leisure equipment for the indoor as well as the outdoor, for a permanent tourism circulation;
- The integration of more seaside resorts in the *blue flag* program, with the responsibilities and consequences involved;
- The increase of water sports programs for all types of ages;
- The rearrangement and redefinition of the touristic routes marks;
- The improvement of the ski areas, and the lift endowments, and the accessibility to the mountain areas;
- The creation and consolidation of non ski leisure activities, for the tourists that are not skiers, but are looking for fun and excitement in the mountain resorts;
- The variation possibilities for winter sports by using artificial snow and also promoting the grass ski practice and the investments in this type of activity;
- The adjustments of the accommodation units with the leisure activities offered by resorts;
- The exploitation of the spa resort, not only for treatment, but more important for maintaining the physical condition, the anti ageing prophylaxis, the quality of life, etc.;
- The development of spa hotels or resorts that caters for a luxury segment of clients in regarding to the well being, and rejuvenating techniques, based on the high potential of the mineral and sulfurous waters existing in Romania;
- The promotion of the unique destinations such as Danube Delta, by offering a variety of leisure attractions;
- The initiation of cruising itineraries from Romanian seaside and Danube to international circulation;
- The creation and promotion of new mega leisure opportunities such as theme parks, revitalization of casinos;
- Organizing a variety of events with global appeal such as festival, concerts, races, etc.;

- The development of human resources and in consequence the animators;
 - The enhancement of tourism information centers, and the implication of public and private sectors;
 - The intensification of the promoting activities for the domestic and the international tourism;
 - Promoting and consolidating the Romanian tourism brand in valid connection with the specific of traditions and customs;
 - Creating tourism packaging that are focusing on the leisure services;
- All of these are small initiatives to develop the leisure services because they determine a growth of tourism circulation, offering a multitude of fun and enjoyable ways. Destinations worldwide have understood the necessity of leisure services and the role they play in the development and revitalization of the tourism industry, being a successful example for the Romanian market.

On the Competitiveness, between Inputs and Outputs. Romania’s Case in the EU

Drumea Cristina

“Transilvania” University of Brasov

cristinadrumea@yahoo.fr

Spatariu Elena Cerasela

“Ovidius” University of Constanta, Faculty of Economic Sciences

Abstract

This paper is observing the effectiveness of the amounts spent by the Romanian Government in supporting and promoting Romanian economy's competitiveness, through the evolution of specific indicators.

While the efforts in terms of expenditures for increasing the competitiveness can be possibly measured by the afore mentioned indicators, the economy's posture is not evident thus some proxy measurements must be formulated.

We then calculate the correlation between spending (in Education, R&D, Innovation) and ranking on competitiveness in the EU and even worldwide.

We find that there is a weak correlation between the two terms, indicating that the funds could be better employed elsewhere.

Key words: competitiveness indicators, Innovation, R&D

J.E.L. classification: H50

1. Definitions

Defining competitiveness: we begin with an obvious definition of the competitiveness at the national economy level, as the capacity to compete in the global market or to manage to improve the wellbeing of the citizens compared with other countries.

It is a RELATIVE indicator because the competition is a relation with others, the competitors. Naturally, the competitiveness cannot exist in a vacuum so we need to check results against the performance of others.

2. Measuring efforts in increasing competitiveness in Romania

In order to find what were the amounts spent to increase Romanian economy competitiveness; we start with data from the Management Authority for the Sectorial Operational Program for Increasing Economic Competitiveness (abbreviated POS CCE). Its activity has five branches grouping various aspects of the ventures it chooses to support. There is a guide for applicants and, purportedly, any Romanian company can apply in order to obtain funds from an EU programme source. Approved in July 2007 by the European Commission, the Operational Program for Romania in view to increase competitiveness has had a budget of 3 bln Euro, out of which 2.5 bln European funds.

The beneficiaries are listed on the public website; data is displayed for 2008, 2009, and 2010 up to April 2011. The total assessments granted is 1,908,619,527EUR, with 339,695,277 EUR actually handed over between 2008 and 2011. The average exchange rate between EUR and national currency is considered at 4.1035lei/1Eur. Both the approved and the effectively drawn amount are listed. As seen in the table 1, significant funds were not drawn in 2011, showing an effective success rate of 38.28 in attracting EU funds and a rate of 17.80% paid out. This is compounded by the very short time series that could be derived. With only 2008 to 2011 reported, it seems difficult to believe that these funds, that can be viewed as subventions have had any time to show effects and the program will stop in 2013. As an addendum, we mention that the rate of success funds effectively drawn/funds allotted is 13.30% only.

Table 1 EU funds absorption for increasing competitiveness program, 2008-2011

Allotments of EU funds 2007-2013, POS CCE		Number of projects 2008-2011					Value (lei)					Value (EUR)		Rate of success(%)			
EUR	LEI	In competition	Engaged	Output evaluation	Approved	Emergency financing	EU financing	National Budget	Non-eligible value	Own contribution of the beneficiary	Total value (lei)	Effectively paid (lei)	Total value approved for financing (EUR)	Effectively paid (EUR)	Rate of absorbed EU funds, out of all/works	Rate of approved grants	Rate of approved financing
2.204.222.183	10.481.258.424	8.496	3.315	1.949	2.337	1.788	4.012.388.019	888.067.183	1.396.568.458	1.106.557.315	7.832.026.230	1.335.833.578	1.393.619.527	338.695.277	38,28	13,30	17,86

Source: POS CCE [7]

The Romanian Institute of Statistics (INSSE) publishes several indicators clustered under the heading of competitiveness. We consider those indicators as being quite indirect numbers

that start suggesting the real picture and that they are to be taken with caution and paying heed to the caveats.

Table 2 Romanian R&D and public Education expenditures 2000-2010

Year	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010
GDP (billion Lei)	80,3	116,7	151,4	189,1	238,7	287,2	342,4	404,7	513,0	499,5	504,2
R&D expenditures (billion Lei)	0,2971	0,4551	0,5753	0,7375	0,9309	1,1775	1,5408	2,1044	2,9756	2,3475	2,3697
R&D expenditures, as % of GDP	0,37	0,39	0,38	0,39	0,39	0,41	0,45	0,52	0,58	0,47	0,47
Public education expenditures (billion Lei)	2,5696	4,4346	6,3588	6,8076	8,8319	10,3392	14,7232	17,4021	22,5735	21,4774	23,1929
Education expenditures, as % of the GDP	3,2	3,8	4,2	3,6	3,7	3,6	4,3	4,3	4,4	4,3*	4,6**

Sources: INSEE, CNP and *Romanian Ministry of Education, Ministry of Finance, 2000-2010

It is also mentionable that only some limited aspects of the competitiveness are taken into consideration, that is four indicators (Innovation, public Education expenditures, R&D expenditures and continuous education), while structural aspects (such as infrastructure, macro stability, policy coherence) are virtually not integrated into the methodology of the INSSE to measure competitiveness. The indicators and their evolution for the Romanian economy are shown in Table 2.

We find this evolution of the two quantitative indicators (public Education and R&D expenditures, as percentage of the GDP), with a peak in 2008 (4.4% out of the GDP) for the Public education expenditures, following a plateau of 3.6%-3.37%, up to an estimate of 4.6% in 2010, while the R&D expenditures tend to an almost constant increase between 2000 and 2008, while 2009 comes with a decline (0.48%, as compared to 0.58% in 2008) and steady for 2010.

This evolution of the two categories of expenditures intervenes on a constant and consistent increase of the GDP (up to 2008), which increases by 627.5% between 2000 and 2008, in nominal terms (Table 4); while in 2009 we find the first important correction of the GDP, which decreases by 7.05%, shaping up the beginning of the recession.

The third indicator (continuous education) is presented separately, as it measures the percentage of the population aged between 25 and 64 years that is enrolled in a form of

education, in the total population of the same age. We observe an increase in the percentage of active population that decides to continue education after the normal scholar, with a peak of 1.6% in 2005, followed by a similar percent (1.5%) in both 2006 and 2007.

As for the last indicator, the Revenue from innovation as part of the total income, due to lack of data, we can only observe an ascending trend between 2002 and 2006, with a maximum of 38.8% form the turnover due to innovation in 2006 and a peak of 41.1% in industry only, same year.

A study issued by the Romanian National Commission for Prognosis (CNP) shows scenarios comparison of the influence of EU funds on the Romanian economy. Elaborated on a HERMIN method [8] adjusted to the Romanian variables and context (Herom model), the study estimates that, if the entire amount of European Funds (see Table 1) were to be absorbed into the Romanian economy, the latter should show an increase of the GDP by 15% in 2013 as compared to 2007, the beginning of the implementation. The increase is calculated as differential between scenarios: with and without use of Funds. As we have seen, the absorption of funds (at least for increasing competitiveness, but numbers are similar into the other major areas of intervention) is far from being complete, attaining for now less than 15% of the available amounts. Are the effects on the economy to be taken to the same rate? Certainly not, as injection of funds, such as

structural ones, has multiplying effects once mechanisms are put in place, generating effects on large scales, meaning that projects have to be completely developed in order to produce the expected results. With small amounts placed here and there in different areas of the economy, the declared objective of setting up the EU fund injection in Romania (e.g. for the competitiveness the goal is for Romania to attain 55% of the European average) will continue to be just a target.

Evidently, we refer to a study based on a model, with limits and constraints. It is still interesting to take into consideration its results as a benchmark to what well administered funds can produce.

3. Measuring competitiveness in the EU and worldwide

When scrutinizing other ways to reach the relevant competitiveness indicators, we find sources of information into the reports of the World Economic Forum (WEF), World Intellectual Property Organization (WIPO) and EUROSTAT.

The World Economic Forum issues annual reports on competitiveness. The report for 2010–2011 states on the topic of measuring competitiveness: “We define competitiveness as the set of institutions, policies, and factors that determine the level of productivity of a country. The level of productivity, in turn, sets the sustainable level of prosperity that can be earned by an economy. In other words, more-competitive economies tend to be able to produce higher levels of income for their citizens. The productivity level also determines the rates of return obtained by investments in an economy”[6].

Because the rates of return are the fundamental drivers of the growth rates of the economy, a more-competitive economy is one that is likely to grow faster than average in the medium to long run.

The concept of competitiveness thus involves static and dynamic components: although the productivity of a country clearly determines its ability to sustain its *level* of income, it is also one of the central determinants of the returns to investment, which is one of the key factors explaining an economy’s *growth potential*.

While the definition is clear and workable, we consider it less than satisfactory as it does not address the relationships and comparisons between economies.

In 2001, the researcher Sanjaya Lall publishes the paper “Comparing National Competitive Performance: An Economic Analysis of World Economic Forum’s Competitiveness Index” [2] in which he criticizes the WEF methodology and results. Specifically, the author arguments: “[...] developing country policymakers worry about national competitiveness and closely watch indices ranking international competitive performance. The WEF definitions are too broad, the approach biased, the methodology flawed and inconsistent, and many measures vague, redundant or wrongly calculated. [...] It concludes that competitiveness indices have weak theoretical and empirical foundations and may be misleading for analytical and policy purposes.”

We tend to consider those allegations, at least to the point of analysis but this is to be continued in a broader perspective in another paper.

The competitiveness is measured, according to the methodology employed by the WEF [6], based on twelve pillars that form a composite indicator, the Global Competitiveness Index (GCI); the pillars refer to: Institutions, Infrastructure, Macroeconomic stability, Health and primary education, Higher education and training, Goods market efficiency, Labor market efficiency, Financial market sophistication, Technological readiness, Market size, Business sophistication and Innovation.

As we find in the 2010-2011 Report, the top 10 countries in the world, in terms of competitiveness, based on the aggregated indicator (GCI) contains five of the EU countries (Sweden, Denmark, Finland, Germany, Netherlands). The interesting aspect is that for at least three years in a row, the same 10 countries (the five EU countries cited before plus Switzerland, United States, Singapore, Japan and Canada) compete on the top 10 overall, exchanging places amongst them.

On the 2009 Report [5], Romania scores best, at the 64th rank out of 133 (that is top 48.12%), four ranks higher than the 2008 quotation (68 out of 134, top 50.74%), then

in 2010, we score similarly as compared to last year (67th out of 139, meaning top 48,9) (Fig. 1). As a late estimate, on 2011 Romania scores 77 out 142 countries, which is top 54.22%, worse result since 2008.

On the 27 EU countries, Sweden scores best (2nd overall, after Switzerland in 2010, respectively 4th rank in 2009) and Bulgaria scores worse on both intervals (76th in 2009, up to 71st in 2010).

Fig.1 European countries rank as per 2011-2010, 2009-2010 and 2008-2009 Competitiveness Reports

Source: [WEF, 2008, 2009, 2010]

The World Intellectual Property Organization (WIPO) is counting, among many other functions, the patent applications from the member countries (Table 3). An argument can be interpreted where we say that the expenditures with innovation should influence directly the creation of the patents. One logical consequence is that some of those patents are improving the national competitiveness by increasing the productivity (in WEF terms) and by opening new venues for profitable activities.

Table 3 Romanian R&D and patent applications 2000-2010

Year	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010
R&D expenditures (bn Lei)	0,2971	0,4651	0,5753	0,7375	0,9309	1,1775	1,5408	2,1044	2,9756	2,3475	2,3697
Inflation corrected R&D exp	0,2971	0,2981	0,2920	0,3171	0,3526	0,4054	0,4955	0,6436	0,8527	0,6408	0,5958
Patent applications	287	277	363	293	200	68	62	59	36	37	53

Sources: INSSE and World Bank

We then correlate the two data series through the Pearson correlation, calculated as:

$$Correl(X, Y) = \frac{\sum (x - \bar{x})(y - \bar{y})}{\sqrt{\sum (x - \bar{x})^2 \sum (y - \bar{y})^2}}$$

where x and y are the simple means averages of the two data series.

The resultant Pearson correlation is -0.835. It is surprisingly low showing a negative correlation between the R&D expenditure corrected with the inflation rate and the

number of patent application, that decreases dramatically (to less than 1/5 between 2000 and 2010), while R&D expenditures double in the same time frame.

We then consider this correlation as a fairly good indication of the decrease of Romanian economic posture in terms of one component of the competitiveness indicator, while perception of the investors (as we will see in Table 5) is rather positive starting with 2006, due less to the competitiveness increase, but more to a promising economic environment[1].

4. Data correlation

Finally, we decide to concentrate on two complex indicators, organized in time series in order to determine whether the Romanian efforts are actually improving the national competitiveness.

The first is the total expenditure for R&D and education (E) as detailed by INSSE. According to the Romanian National Bank, the GDP in nominal terms is presented in Table 4, values that will be corrected for inflation while choosing 2000 as the reference year, as follows:

Table 4 Romanian GDP and inflation rate 2000-2010

Year	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010
GDP (billion Lei)	80,3	116,7	151,4	189,1	238,7	287,2	342,4	404,7	513,0	488,5	504,2
Inflation rate	0,467	0,345	0,225	0,153	0,119	0,091	0,096	0,049	0,063	0,0474	0,079
Corrected GDP (bn Lei)	80,3	86,786	91,89	99,54	112,29	123,3	138,49	156,05	186,1	172,98	161,83

Sources: INSSE, Romanian National Bank (BNR)

We use then this information to calculate the “absolute” R&D and Education (E) expenditure and then use the Moody’s Romanian Bonds Ratings as reported between 2000 and 2010 (Table 5).

Table 5 Correlation between R&D, Education and Bonds yields rating by Moody's 2000-2010

Year	R&D expendit % from GDP	Educati on % from GDP	Total	GDP corrected (billion Lei)	Absolute expenditure (E) billion Lei	Romanian Bond rating (Moody's)	Score
2000	0,37	3,2	3,57	80,3	2,96671	CAA1	60
2001	0,39	3,8	4,19	86,7658	3,635486989	B2	110
2002	0,38	4,2	4,58	91,88984	4,208554738	B1	140
2003	0,39	3,6	3,99	99,54142	3,97170281	BA3	180
2004	0,39	3,7	4,09	112,2883	4,592593007	BA3	180
2005	0,41	3,6	4,01	123,8346	4,985786459	BA1	230
2006	0,45	4,3	4,75	138,495	6,57851158	BAA3	280
2007	0,5	4,3	4,82	156,0479	7,521509914	BAA3	280
2008	0,58	4,4	4,98	186,0985	9,287808986	BAA3	280
2009	0,47	4,30	4,77	172,9788	8,251090508	BAA3	280
2010	0,47	4,6	5,07	161,8287	8,204714774	BAA3	280

Sources: INSSE, Moody's

We consider this indicator as being the better proxy for measuring Romanian competitiveness because it is formed in the competition between the governments on the open bonds market and each market participant or investor is making its own mind and risk assessment for its money without too much official interference.

The “r” factor (Pearson correlation) between the indicator E (R&D and education expenditure), and the bond rating synthetic score is 0.905739. It is a positive correlation, suggesting a rather good impact of increasing the two types of expenditures onto the perception of competitiveness shown in the the Bond rating by Moody's.

There is to be also taking into consideration that a lag may appear between then time expenditure (in R&D or public Education) is made and the time results in terms of competitiveness occur. We find that authors [3] contemplate on a minimum of two years lag between input and output; this introduces a caveat in the correlation. The gap in time can also vary from a country to another, as well from a moment in time to another. It depends also on the stage of the economy, on the conjuncture conditions, as well as the evolution of the competitors.

Back to the correlation we have shown, due to the rather uneven nature of some estimations as well as the artificiality of converting the ratings into numerical format, we will only keep one position after the decimal point so we consider $r = 0,90$.

This shows that the expenditure and the ratings are somewhat locked in step but some caveats as earlier could be applied:

- The time series might be too short, thus not warranting a robust correlation;
- The numerical scale is arbitrary and could introduce unauthentic signal;
- The ratings are most likely influenced by political factors as well, which is the most serious nuisance to the correctness of the reported data.

It remains to be seen what the future holds and if the conclusion will be upheld or falsified.

5. Conclusion

The conclusion we draw is that we find a predictable good correlation between the expenditure on research, development and education and the country's financial market rating, as expression of the investor's perception on the Romanian economy and competitiveness.

Nevertheless, the policy makers should find clearer ways to support the Romanian economy competitiveness, as in terms of the participation at the European market, for example through exports, Romania has a relatively modest participation, thus showing some gap maintained in terms of competitiveness of our products and services.

CV Writing for Young Graduate

Dumitrașcu Elena

“Ovidius” University of Constanta, Faculty of Letters
dumitrascu.lena_2006@yahoo.com

Abstract

Crucial in order to insure economic independence, source of social recognition and individual and collective development, the working place becomes essential for every being in constructing one self. For the young graduate entering the active life is more and more problematic due to the fact governmental politics don't bear any positive messages where they're concerned, and because they fill confined between leaving their formation and their first steady job for a long time. Between 2008 and 2009 youngsters' unemployment rate has increased as well in developed countries as in central and south-eastern European countries. Nowadays even a free formation in a renowned institution is not an anti-crisis shield and the insertion numbers of last statistics state this fact. The financial crisis and its economic repercussions emphasised on the importance of making the resume worthy in order to obtain a job and make a difference for recruiters.

Key words: crisis, young graduate, apply, job, unemployment;

J.E.L. classifications : E24 ; J23 ; J24

1. Introduction

In nowadays social and economic background one of the most difficult issues for graduate is finding a job. Having your graduate diploma in your pocket you think of finding an immediate job, but the confrontation with the working market is often brutal because you're facing numerous competitors with several years of experience and professional knowledge.

In this circumstance before their eyes lies the challenge of a life time: their successful insertion in the professional life. Times are

tough and pessimism gets a hold of this generation that no longer fills protected by obtaining a diploma that will later one allow them to have access to a job.

In the global economy and hyper-technological thinking of the XXIst century, a good initial professional formation is more and more crucial, but it's less to guarantee an easy entrance to the working market.

Even recognised institutions' diploma isn't always the key that opens by charm every enterprise door. With the inflation of diplomas these lost a great part of their value; it's always great to have a diploma, but it will never be enough in order to have a job.

In the search for their first job these youngsters find themselves more and more confronted with extra requests regarding professional experience or continuous formation almost impossible to fulfil when applying for the first time after leaving the system of education.

More so, another fact that seems to have a major impact adds to this phenomenon: on an educational and working market more and more global, recruitment also becomes global and young diplomats become competitors with their homologues from all European countries and from around the world.

In their pursuit, young diplomats must convince the employer that it is in his advantage to employ them. Therefore it is very important to promote their competences through a well-written CV indicating your studies and work experience. The financial crisis and its economic repercussions emphasised on the importance of making the resume worthy in order to obtain a job and make a difference for recruiters. For a young graduate, writing the CV and Cover Letter bears the secrets of a good candidateship.

2. CV's general principles

First victims of the economic crisis more youngsters find themselves without a job. At the ending of 2010 there were 75 millions all around the world "*fighting to find a job*", after the latest study of International Work Organisation (OIT).[3]

Sadly this accentuated the doubts and pursuits that youngsters go through in order to find or not a job, to access or not to the working market, to professionally insert themselves more easily. This struggle makes them participate to a real social construction. It is our job (the teachers) to not make this construction a chaotic one and a desperation source for those demanding a first job.

The purpose of this article is that to accompany the young diplomat without too much working experience in all the phases of his working pursuit. That goes from elaborating and effective and pertinent CV that will draw recruiters' attention to preparing the famous recruitment interview. The suggested solution consists in focusing on abilities, knowledge and acquired competence developed thanks to their studies and collateral activities other than work.

CV is firstly a promoting instrument allowing the graduate to communicate effectively about his projects and expectations from future employer, it's life summarised in one page ... the first step in the professional life. The CV must supply a sum of useful information for recruiters, under all aspects: professional experience, formation (academic and professional), but also each element allowing to emphasise on different interesting abilities necessary to the practice of the requested job. It has to contain only the essential, nothing superfluous: *saying a lot with little words*.

It has to detail his itinerary where studies are concerned, also revealing important experiences for his personality. It has to know how to draw attention, stating its value, making a difference and proving its merits.

Recruiters are unanimous: CV's content and presentation make the difference. A CV is put together in three distinctive blocks: experiences, formation, interest centres.

• Formation

In a competitor world and a more difficult economic context, recruiters become more and more exigent on choosing the profile. Young diplomat must be good at what they do and also know how to sell themselves. In the opinion of specialists on the field, before launching themselves in the pursuit of a job, it is very important to organise oneself, taking the time to make the sum of your personal itinerary, even if you are only a young diplomat. The objective is that of receiving a feedback on your strong points; fable ones and those of improvement. CV writing requires a certain rigour especially on describing ones itinerary. The first thing to do is consulting all the employment offers in the press or online enterprise portals or on other sites specialised in job announcements.

The *formation* part is the chapter relating on diplomas and other acquired certificates. The date of obtaining these last ones must also be present. But indicate the probation period and followed training to various employers. (5, pp. 70-71) For a diplomat or those that just finished school, this section sates their schooling. They have to be clear on their following up in school, including programme names and institutions, accomplishments and received awards. Professional acquirements and competence domains like informatics and languages don't have to be dead ends.

Regarding *foreign languages* they have to indicate the studied languages as well as the journeys abroad that signal to employers a personality opened to change, ready to adjust more easily. Recruiters search more and more "international profiles" because leaving abroad offers a cultural and linguistic experience peerless that enriches the personal itinerary, and also the future collective one, stimulating knowledge diffusion and improving mutual comprehension. A study of the European Commission stated that 60% of Erasmus students appreciated that their abroad experience has been a major help in their being employed. [3]

You don't have lie on the level of the indicated languages; it's very possible that the recruiter pursuits a conversation in the language indicated in the CV. It is also best to admit the true. Example: Italian: « able to keep a conversation, » « *describe a technical*

documentation » ; « I speak three languages but not equally » « I try from time to time to read books and magazines in order to keep up wit my German » ; « I also have knowledge of Spanish and German that I understand but that I don't yet speak currently ».

Ophélie Colas des Francs in her article « What you can say to a recruiter (Que l'on peutdire à un recruteur) » advises to « Avoid formulas present in all CV's : *courant English/ reading, speaking, writing. Go for "excellent level of English, professional purposes" or "English frequently used, for professional purpose* » [1, pp.46-48]

To emphasise on knowledge regarding foreign languages the person demanding the job must specify that he reads the British/French press, given the fact that this formulation doesn't give any indication on the real level or on the regularity of the language practice. For certain positions, it is necessary to specify that he expresses himself in technical language. Like for instance if he masters commercial French/German.

• Professional experience

Work experience is highly appreciated by employers and its absence it's a major obstacle for those demanding a job. Many youngsters fill trapped in a vicious circle being incapable of acquiring working experience due to the fact that they can't find a first job, and can't find a job because they don't have working experience [4].

In the « *experience* » block, the diplomat without professional experience will detail different probation periods made within his studies, listing them from the most recent to the oldest. Considered by recruiters as real professional experiences, they all have to be indicated and detailed: filled activities (organising, client receiving, handling raw materials or also merchandise reception) and obtained results. In two lines it can describe main responsibilities and contributions
Example: « *Z new clients brought to the enterprise* », « *creating a specific folder* ». Even the concluding probation report may interest recruiters and in a very synthetic way, given that results of the work done can be reminded.

If the probation period at the end of the studies is not concluded with a job offer, than the sum of professional experiences acquired during your formation is the best card of young diplomats. Therefore, everybody agrees that the probation time is the chance to discover different fields, to polish the professional project and acquire operational abilities. « Multiplying professional experiences has two advantages, appreciates Françoise Rey. Students are more prepared once they enter the enterprise and can easily justify their orientation. » [3]

This is also the best time to give proof of their work related abilities, or of their initiative in finding a job or better yet the way they manage their time between work and studies. These abilities are the one that make the difference between them and those who didn't have a job during their studying period. The quality, diversity and length of the probation period play an important role in being employed, it is therefore in the best interest of diplomats to focus on that during their interview. Mobility and professional probation time are two major advantages in order to score points and start a carrier.

• Abilities

Finally you don't have to hesitate to include your abilities acquired elsewhere than in school or at work. The formation and experiences are very important references giving the recruiter information on the person demanding a job's background to develop abilities. For each candidate, recruiters seek firstly their abilities because diplomas and experiences help create these ones.

In order to make a difference from the crowd the postulants must identify one single thing that it's unique in them, like for instance, *a special communication talent* or any other quality that goes beyond the requested abilities, but something that it's work related: a sum of professional qualities and abilities that the candidate possesses. For instance: *organised, sociable, good memory, research oriented* ...

In case there's not any professional experience they should go for a thematically CV that focuses on abilities and personal accomplishments. When writing such a CV you can create certain categories called „*Administrative abilities*” „*Informatics*

knowledge,, “*Academic and professional experience*”, that can list all activities developed from the first year of the university. Attending classes or sports competitions can give the employer valuable information on the candidate: that he is a competitive person, who likes challenges, with a strong will able to do the job, because every employer faced once their first job and knows better than anyone that youngsters are really willing to succeed in their professional life and therefore deserve a chance. Here are some examples of abilities: «*Mastering logistic phone*», «*Excellent writing skills*, or «*Very aware of clients needs*», *ability to negotiate*, *ability to solve conflict situations*, *works well under stress* etc. « Reading these first words, the recruiter must think «*Well! Interesting!* »

This is also the category where you are supposed to list the jobs you’ve had during holidays. Summer jobs are rarely related with the chosen one (ex : hotel, restaurant, harvest or maintenance); but you don’t have to despise these experiences that shows that the person is able to handle oneself, and that is willing to make an effort in order to reach his objectives. Recruiters are often sensitive to that and in their eyes that proves a lot of *dynamism* and a *strong will*. On the other hand this type of job may prove team spirit or even more excellent contact with clients. Attending the institution’s football team or students’ association means that he is able to put his abilities in practice.

All these information is attached to the CV after pertinent analysis. Once facing his recruiter the young diplomat mustn’t forget that he competes with other candidates in possess of the same qualification, but that also possess more than just a simple academic formation.

- **Interests**

The paragraph « *interests* » concludes the page and allows the examining recruiter to appreciate the candidate’s traits of personality. In this section, one or several personal points that you mention allow to identify the personality, which helps the recruiter to better know the candidate.

At the top of the page to the left we have to find the « *card* » of the postulant (name, surname, and coordinates: mobile phone number, e-mail address, birth date).

- **Seriousness and legibility**

The resume is a synthesis aiming to make the personal itinerary be worthy, striking on your strong points. Its first role is that of seducing the recruiter as much as to offer you the chance of an interview and the second role is that to prepare an interview.

In order to fully respect its functions, a resume must be clear, give information and be coherent and personal. Therefore you have to focus on its presentation and writing. You also have to know that it is not the same resume for all positions, therefore it must be written a second to the requests of each offer.

The golden rule of a good CV is that it is imperative to respect as much the content as the shape. It has to be unique, clear and open, honest and according to the reality.

For a student or a diplomat it has to be no longer than a page, in very distinctive parts and a good structure that can be easily spotted at a first gleams. It has to be brief structuring short sentences, without using the first person too much or without being too familiar, but completely aware that sureness in writing can be a plus.

The CV’s layout isn’t neutral but reveals to the recruiter parts of the candidate’s personality: a classic layout can reveal a strict and organised character and a more original layout with colour will show a creative and playful spirit. In order to be more effective you should use: one single colour (black for instance), a neutral and very legible writing (Time New Roman or Arial) and big letters for titles.

3. Conclusions

In the middle of the crisis or not, diplomats of the year 2011 must have the chance or make a difference in order to get a job. They landed on a very degrading work market where they found themselves competing with the graduates of 2010 and of 2009, already suffering the disadvantage of the fact that they are debutants. Finding a job is one of most important wishes that every being has that will guarantee their wellbeing

and that of others! Having a diploma is not the only condition in order to get a job. Strong working habits, having a positive attitude towards others, being serious ... are other requirements necessary to be recruited. More so, in order to easily find a place on the working market that it's more and more selective: each candidate must invest his best assets and try to satisfy the requests of the working market. This means proving that he can adjust, that he is effective and extremely willing to communicate.

Only those who fully understand the problems of nowadays society, that can perceive its needs in continuous change, can be the right person that recruiters need for their opening position. It is no longer a question of formation and study, it is more about continuously practice of improving oneself and its abilities, its about acquiring as much experience as you can possible, and preferably in more than your field. Only than you can be sure that your personal accomplishment and professional one can make a difference for the company offering you a job, and that's what recruiters search, *the right candidate with the right CV!*

Accounting, Institution of the Economic Liberal System, and the Great Religions of the World. Prolegomena

Dură Nicolae V.

"Ovidius" University of Constantza, Faculty of Law
nicolaedidimos@yahoo.com

Abstract

The evolutionary Process of Accounting – a basic institution of the economic liberal system - belongs to the area of the general history of economic thought, which originated in the ancient East, where we also find a first conception about work, "presented as a collaboration in a religious sense, as a sacrifice", and in ancient Greece, where the economic doctrine of Plato was formulated.

From the economic doctrine of Plato to the theory of capitalism launched by the protestant Adam Smith (1723-1790) – which culminated with the global theories and models of economic growth and of economic crisis of our days – was of course an evolutionary process, emphasized by the specialized Schools, in which their main representatives have defined the content of economic thought of one age or another. But, this economic thinking left aside not only the "system of the market" and "the planned system" – as Kenneth Galbraith understood and explained them – but also the preception of the values of private or state economy by the great Religions of the world, among which the Christian one, the Parents of which have evaluated them from the angle of the teachings of the Holy Script of the Old and New Testament.

Key words: the great religions, the history of bookkeeping, the management accounting, the economic liberal system

J.E.L. classification: B00

1. Introduction

If the first primitive manifestations of Bookkeeping appeared once "homo sapiens" became „homo oeconomicus", in turn, the first elements of bookkeeping discovered

date from the age when the old civilizations emerged. The oldest archaeological testimonies date back to the period 8000-3000 B.C., being made up of small pieces of clay discovered in the area of Near East[1], where the great Religions of the world appeared and where they cohabitate, among them the monotheistic ones (the Mosaic, Christian and Islamic one).

In their treaties of management or financial accounting, the competent researchers let us know that "the origins of bookkeeping take us back many thousands of years to a time when people used to represent *something*, pertaining to their reality, by carving it on bones or even by writing on clay tables or on papyrus"[2]. However, the history of bookkeeping in its present meaning – as a form of theoretical and practical knowledge – starts "in the Middle Ages, once with the development of the monetary economy and with the emergence of the seeds of capitalism"[2].

In the XV-th century, we already witness a "refinement" of the bookkeeping practices, that imposed "the first work of accounting literature", namely that "Tractatus de computis et scripturis" (Treaty of double-entry accounting), published in Venice in the year 1494, "which presents for the first time, in a coherent manner, the double entry, the element most typical of bookkeeping in technical terms"[2].

At last, we must say about bookkeeping – defined as a "procedure of inventory" – becomes one of enterprise only starting with the XX-th century.

2. The management accounting and the financial accounting

Regarded as a social science, accounting is linked to other social-humanistic sciences as, for example, the juridical Sciences, the economic Sciences, the political Sciences,

the management Sciences, History, Theology, Philosophy, Sociology etc.

As regards the management accounting and the financial accounting, the specialized literature – also emerging in the last years in our Country – could not avoid to specify that, "until 1989, the two accountancies had worked together in an integrated accounting system", but the accounting reform after the events of December `89 "has generated the separation of financial accounting from the management one"[3]. However, the same specialized literature informs us that "the former has a binding character, being regulated and determined by norms", whereas the latter "is optional for most of the Enterprise, the organization manner being the option of every unit"[3].

But, apart from the two accountancies, the management and financial one, there is also a fiscal management and, ipso facto, a fiscal system, which must be emphasized taking into account, above all, "the important role that accounting plays, be it financial or public, in the establishment of the fiscal management as a result of the citizens` contribution and of the fiscal administration"[4].

The evolutionary Process of Accounting - a basic institution of the economic liberal system - belongs to the area of the general history of economic thought, which originated in the ancient East, where we also find a first conception about work, "presented as a collaboration in a religious sense, as a sacrifice"[5], and in ancient Greece, where the economic doctrine of Plato was formulated.

From the economic doctrine of Plato to the theory of capitalism launched by the protestant Adam Smith (1723-1790) – which culminated with the global theories and models of economic growth and of economic crisis of our days – was of course an evolutionary process, emphasized by the specialized Schools, in which their main representatives have defined the content of economic thought of one age or another. But, this economic thinking left aside not only the "system of the market" and "the planned system" – as Kenneth Galbraith[5] understood and explained them – but also the perception of the values of private or state economy by the great Religions of the world, among which the Christian one, the Parents

of which have evaluated them from the angle of the teachings of the Holy Script of the Old and New Testament.

In the Antiquity, the peoples who disseminated notions and concepts specific to a philosophical thinking were also the ones who have created systems of thinking and of spiritual-religious living. In this respect, one could notice that the same peoples also created and experienced the most developed accounting systems of the world of those days, hence the conclusion that the Religions of the world have also contributed to the genesis and the evolution of the Accounting. That this is the historical reality is also confirmed by the fact that in China, for example, the putting into practice within the administrative system of the State of the religious doctrine of Confucius – a philosophy of life with a programmatic character, which has guided the administration of China for two millenia [6] - also led to the development of the accounting system.

In the old Rome and in the cities of ancient Greece, the treasury of the City-State was kept inside the temples, hence the necessity of accounts books. In fact, at the ancient peoples, the system for the collection, record and control of private or public goods, including the goods belonging to the Temples or that were in their area, also needed the creation of an accounting system which, at that time, did not require sophisticated accounting techniques, but limited itself to an accounting record that we could call "single-entry".

3. The role played by the servants of the temples and of the Christian Church

The experts in the „Economical Sciences” unanimously recognize that, as the genesis and the evolutionary process of accounting is concerned, a decisive role was played by the servants of the temples[7], that is by the priests of the respective religions, who had a very high level of knowledge both in the field of accounting and in the economic-financial one. Indeed, the priests of these Temples were also the ones who kept a quite complex record of the incomes and expenses of the respective religious places. Actually, the

experts could notice that the entire public and private life of those times manifested around and under the protection of the temples, which were themselves real accounting[8] centres.

Ever since the Antiquity the Temples and, in general, the religious places were also the first institutions to make operations of a banking nature. „The first evidence of a banking activity can be found in the Near East (Babilon) and in the Ancient Egypt, where the temples were both a place of prayer and for keeping the money and the treasures”, based on the existence of some written testimonies regarding the deposits and loans made by the temples. In fact, the temples had a system of registers for the record of the operations made, if not even a system for accounting those operations. Thus, the treasury in the temples, both the public and the „divine” one, was quite well controlled from an accounting point of view. Apart from the record of creditors and debtors (the city being the main creditor and debtor of the treasury of the temples) there was an accounting mechanism for the record of transfers from one fund to another. Apart from these aspects, annual inventories took place the purpose of which was the discharge of inventory, both for the public treasurers and for the „sacred” ones.

The Christian Church has also kept a record of goods ever since the apostolic age. After the edict of Milan (313), and, above all, after the Decree of Theodosius of 380 we can also notice a raise in the material resources of the Church, which implicitly led to the necessity to administer, manage, preserve and keep the record of the church patrimonial goods. Thus, the first church inventory took place and, ipso facto, a primary record of the transfer of these goods from the property of Christians to the property of the Church. However, in the beginning there was just a simple enumeration of goods which were transferred to the Church, because the necessity of keeping a record was reduced to the level of the simple necessity of administering and preserving these goods. So that we can say that the development of the capacity to count was the first instrument of bookkeeping for the sacred institutions and Places of that first period.

In its primary form, this type of bookkeeping appeared in the moment when the administrators of the Church counted the goods and animals which became part of its patrimony[9]. Therefore, we could say that was also the first inventory of the assets of these sacred institutions and Places, no matter the motivation which determined this. The instruments of this bookkeeping have multiplied and diversified once with the increase in resources in relation to the needs of the believers, that is of their members.

At the moment when the administrators of the Churches could no longer afford to waste their goods, the use of an instrument was imposed in order to help them register and keep the record of these or at least of the available resources. This is how the institution of the "oikonom" (the administrator) of the assets of the church (cf. the canon 25 of the IV-th ecumenical council and the canon 11 of the VII-th ecumenical Council) was established, which, initially, has existed in the life of the Church in the person of the Bishop, the only one who had the canonical obligation to administer the affairs of the Church. Indeed, the apostolic canon 38 – written by the middle of the IV-th century – specifies in an "expressis verbis" manner that the Bishops were the only legal administrators of the assets of the church.

The same competent researchers of the institution of accounting let us know that the accounting system of Rome has influenced the accounting techniques to a significant extent for at least one thousand years. In fact, the system most similar to the one used by the Romans was discovered in the accounts of takings and payments kept by the western Church, which, during the existence of the pontifical State, has imposed and collected taxes throughout the European geographical space. Indeed, since the VI-th century, the deacons have been appointed to administer the properties of the church and to report the incomes accomplished. In the context of every ecclesiastical province (diocese) there were agents of the Papal treasury and people in charge of the collection and the payments of the amounts due to the Papacy.

Within the Western Church – which was under the canonical jurisdiction of the Roman Pontiff – the ecclesiastical bookkeeping has taken up a new form of development once with the establishment of some knightly

orders, with a real influence both in the political and ecclesiastical world and in the economic field, which managed to gain not only mobile and non-mobile goods, but also financial funds, the natural consequence being also the development of the methods of management of the latter. Step by step the double-entry technique emerged, the first elements of which appeared in the registers of the Knights Templar, which were said to be the „initiators” of double-entry bookkeeping. However, the principle of the double entry has appeared as a consequence of the practical necessities, as it was with good reason considered the product of the progressive evolution of the daily practice of business, following in a natural way from the single-entry.

4. The role played by the Order of the Knights Templar

That the Order of the Knights Templar was very strong and occupied an extremely large territory, encompassing heterogenous cultures and civilizations remains an undoubtable reality. Actually, they had access to the libraries of the ancient and medieval worlds, as many as there were left.[10] We do not exclude the hypothesis that they had taken over this technique from a Christian monastery from the East with which they came in contact. Anyhow, it is certain that some religious Orders, such as the Knights of the Teutonic Order and the Order of the Knights Templar also knew how to handle the bookkeeping, not only the sword.

The Order of the Knights Templar was established in Paris, in the year 1118 by Hugues de Paynes. As defenders of Christianity in Jerusalem, they have benefitted from a palace on the place where the ancient temple of king Solomon was once built and from many donations along the time. Due to their ability to handle the money, this knightly order became the banker of the Popes, of kings, but also of many ordinary persons.

The bookkeeping of the Templars seems to have been quite detailed, "being more developed than the one used by the French merchants and ordinary persons or by the Italian bankers of the same period"[10],

hence the overtly hostile attitude of the latter towards the former.

This development of the accounting technique was possible due to the fact that, during the several hundreds of years when they were a strong political and economical force in Europe and in its border regions, "the accounts of the clients were kept in an identical manner as the present-day bank accounts, as they used to close the accounts periodically, three times a year, in the moment that the payment date of the leases arrived and to report at every payment date the credit from the previous closing of account. We are talking here about an authentic current account: the debit section included the amounts owed by the client, the credit section the payments made, the balance representing the debt. The amounts were recorded in a journal on a daily basis, than copied into the great accounts books".[8]

As regards the keeping of the accounts by the clients, this accounting system "has not only been probably one of the most efficient instruments for keeping the accounts of the Templar Knights, but it is possible that it represented the seeds from which the double-entry had later evolved".[11]

Given that they had managed the patrimony through this system in a fair and efficient manner, the Templars were also asked by some of the kings of France to administer the treasury of their French state. This way, the society paid special attention to the accounts of the French royal house, for which a double-entry accounting was kept.

According to this accounting system, the respective amounts of money were identified according to the sources of their provenience, that is where the money came from, a fact which reveals the technique of the use of a double-entry accounting. In fact, "the records were not made in a descriptive manner, but in a manner pertaining to accounting. On every page of the journal appeared the name of the Templar who was on duty on the respective day at the payment counter, as well as the date, the amount of the payment or transfer, the name of the person to the debt or credit of whom the amount was recorded, the indication of the accounts book the „Great Book” in which the operation was reported"[8].

In the opinion of some economists, the Templars would have developed and optimized the accounting technique if they had not been dominated by accumulating very high wealth and power, a reason for which the Order was actually dissolved by the order of Philip the Handsome, the king of France, in the year 1314.

5. Conclusions

The evolution of bookkeeping after the fall of the Western Roman Empire, in the year 476, with an evolution cycle due to the Knights Templars, is not accidental, since, as one could notice, the templars were the first ones to act on a large scale with the financial funds of others. Afterwards, taking over the experience of the Pontifical State and of the Knights Templars, the Arabs established the business societies with joint operations, and the Italians, of Roman-Catholic confession, were the ones who multiplied these types of societies and developed the commerce to an unprecedented scale, combining the best business practices they have had access to.

At last, a final major contribution in the evolutive process of the institution of Accounting was also due to a clergyman, that is to the pastor Jean Calvin (+ 1564), who, in the city of Geneve, laid the foundation of the economical, liberal, institutional system from the countries of a Protestant confession from Europe and, later on, from the United States of America.

Finally, we can say that the great religions of the world have also brought – through their people – a meritorious contribution to the genesis and the development of Bookkeeping, basic institution of the economic liberal system.

Abstract

Identification of optimal allocation of resources to maximize the health of the population will be a key challenge of the health system in the next decade. Consequently, medical research should continue to expect an increased number of alternatives to detect, prevent and treat various diseases. However, budgetary constraints will restrict access to these solutions, or at least by some. Economic evaluation of the results of an entire health system (such as in Romania) is possible but not practical. This deficiency can be explained by lack of appropriate indicators and the difficulties of quantification. Through this paper we propose an inventory of the main methods of applying cost-benefit analysis of health system in Romania and in particular, oro-dental health system in order to identify new costs involved in carrying out such services.

Key words: Multifactor productivity; Organizational behavior; Distribution.

J.E.L. classification.: D24; D23; D3; I15; I12.

1. Introduction

One of the OMS wishes and demands expected to practice medicine for human health throughout - taking account of physical, mental and social life, a little modern medicine to support and strengthen the natural physiological mechanisms by which the human body fight disease, trying to

draw attention on the value of a positive healthy lifestyle.

In this context, the likelihood of major changes in the organization's systems is significant, being influenced decisively functions such as maintenance, inventory management, organization of material flows, financial and human resources, logistics and distribution.

2. Basic types of economic evaluation of health programs

There are four basic types of economic evaluation of health programs (MFDrummond 1980; KEWarner, BRLuce 1982, Drummond MF, GLStoddart, GWTorrance 1987):

- cost analysis,
- cost-effectiveness analysis (EEA),
- the cost-utility (AEU),
- cost-benefit analysis (AEB).

Cost analysis in health compare costs / expenses included in insurance services, supplies or alternative health programs. Difficult problems in cost analysis generated marginal costs (proportional allocation techniques for marginal costs of individual projects) and admission to the various costs of programming time (and cancellation technique to reduce capital expenditures).

Cost-effectiveness (ACE) in net benefit health care health measures or the reduction of disease by applying targeted services directly related to cost. Can be expressed in monetary units per years of life lost. ACE is a full economic evaluation that examines the costs and results / consequences of health programs. The term "effective" (Cochrane, AL., 1972) applied the system and health policies can be understood as to maximize the

results of health services and / or minimize the effort and resources used.

Cost-utility (ACU) is similar to ACE, but focuses on the quality of results due to health programs. A description of methods to measure health services is available in Torrance (Torrance, GW, 1982). There are three known methods for measuring the health services: assessment scales, standard risk and time-trade off.

Cost-benefit analysis (CBA) is trying to convert all costs and benefits of health programs in the same monetary unit. CBA is potentially the most complete form of economic evaluation, but practical use is limited by difficulties in measurement.

Benefits programs and services are the effects of improving the health of the population and indirect social and economic development of the country. To achieve the desired benefits, available resources should be used as well. Failure optimal use of resources is a loss for the community (opportunity cost). Clear definition of costs and benefits need to assure those who make decisions that no alternative would not provide better results.

Management accounting has an important role in funding decisions, namely the establishment of income, determine the unit value price per treatment / therapeutic maneuver and workload (number of patients, number of maneuvers, etc.). Therefore we analyze the two activities with major implications in dental office management, dental treatments that determine the different costs and economic substantiation of the prices / tariffs of these treatments / therapeutic maneuvers.

3. New models for the analysis of "cost effectiveness"

A number of countries (Australia, Canada, Sweden and the UK) have implemented, implicitly or explicitly, strategies to guide resource allocation decisions based on economic analysis of health, the most popular type used today, the cost-effectiveness (cost-Effectiveness Analysis). In other countries, the cost-effectiveness or other economic analysis are key inputs in decision making in health systems. However there is a growing concern about the fact that

resource allocation should be done systematically and in a manner not intuitive. As cost-effectiveness analysis is widely used in decision support in the health system, decision makers will become more consistent.

It is therefore reasonable to expect an increase in interest and use to substantiate the cost-effectiveness analysis and decisions in this area. Inevitably this will lead to more transparency and consistency in decision-making process.

The concept of "threshold" was originally proposed by Weinstein and Zeckhauser in 1973 (Weinstein, Milton & Zeckhauser, Richard, 1973) and refers to the costs and effects of an intervention must touch it to be accepted by a given health system. This "threshold" is the ratio between the cost of money, usually expressed in national currency, the numerator and increase the health assessment, the denominator. The decision to use cost-effectiveness result from optimization of resource allocation constraints in achieving health. Controversy about this method and its ability to provide relevant comparisons circumscribed mainly practical difficulty of determining a single assessment, universally accepted "health growth".

Another sensitive point of application of cost-effectiveness analysis and the concept of "threshold" is the types of costs that must be included in this context. There are opinions that should be considered not only the costs (direct and indirect) arising from that condition, but the costs of photography or hedging (technical deficiencies, reruns of some therapeutic maneuvers during the warranty period, etc.), and forecasting of future costs. Johannesson and other researchers have recently demonstrated how the inclusion or exclusion of future costs affect the cost-effectiveness indicator and, in particular, on those interventions that improve life expectancy and improve quality of life.

Following the recommendations of proper application of economic valuation methods defined therapeutic strategies under French economist College of Health during the presidency of Emile Levi, called direct cost amount of resources consumed in relation to treatment of diseases (medical costs: hospitalization, medical consultations, drugs , non-medical costs: transport patients home help etc) indirect cost of productivity losses related to value the patient's illness and his

entourage (eg treatment of chronic apical periodontitis long-standing whose treatment is paid by the number of sessions involved) cost and intangible value losses caused by unmet patient desires completely, which will be reflected in private practice dental image as the most effective way to promote it is satisfied that the patient even in the family and entourage will recommend dental services he received.

Managing costs is very important because it expresses the general method of assessment of quality management business, as the indicator of efficiency:

The value of products / services obtained

The value of resources consumed

Business decisions are vital knowledge about cost structure and their characteristics. For this reason we can say that the classification of costs, those costs can quickly choose to meet specific information needs. There are a variety of criteria for the classification of costs, of which we will address only a few:

1. depending on the relationship of dependency with variation output:

1.1. variable costs that fluctuate in direct proportion to the volume of production (consumption of raw materials, direct labor, etc.) unit variable cost is constant, ie the ratio of variable cost and number of units produced;

1.2. fixed costs remain constant regardless of changes in production volume, is the cost of capacity (building depreciation, administrative expenses, maintenance costs of buildings) unit fixed cost is variable;

1.3. joint costs where a part varies according to production volume and the other part remains fixed (common expenses of the department, maintenance of equipment in the main production sections, etc.).

In principle the calculation of the cost relationship (Y), depending on fixed costs (b) and unit variable costs (a) is as follows:

$$Y = aX + b, \text{ where } X \text{ is the activity}$$

This relationship is valid when the correlation between resources consumed and products is constant, the purchase price of

raw materials is stable and available resources are used. In terms of inflation or recession linearity relationship is no longer maintained.

2. depending on how are the expenses allocated in costs:

2.1. direct costs- that directly affected products / services manufactured or phases, workshops etc. (Raw materials and consumable materials, direct labor, etc.);

2.2. indirect costs can not be directly attributable to products / services produced, they are collected and distributed globally on product / service manufactured using keys distribution (expenses lighting, heating, plant depreciation, factory director salary etc).

Between costs "variable - fixed" costs "direct-indirect" interference numerous, many expenses from many categories, but each classification meet specific information needs. For example expenses are included in the direct variable cost (direct materials and wages) and direct fixed costs (depreciation manufacturing lines). There is also an indirect cost variable corresponding costs for lighting, heating, inventory, supplies to help with the activities of production, but may not be identified on a specific product. Indirect fixed costs relate to salaries of administrative staff or depreciation of buildings / premises of the company.

3. depending on the connection with the product/ service obtained (evaluation of resources consumed in each stage of production and realization, evaluation of the product phase, the stage of manufacture):

3.1. product cost includes all associated costs (settled) the calculation of an object (product, service, workshop, etc.);

3.2. period cost calculation includes all expenses recognized in profit or loss, without being necessarily related to the product / services provided (administrative costs, distribution).

4. depending on the influence on managerial decisions:

4.1. indifferent costs refer to the "legacy of the past" but have no influence on the decision, as the cost remains unchanged, even though there is about the future (eg France and England have abandoned the "Concord" after making the 14 devices in Despite huge

investments, because they took into account future costs);

- 4.2. relevant costs are future costs that can be modified according to a plan of action, in this category and opportunity costs which is the difference between the margin generated by an action plan and higher margins generated by a better plan;
- 4.3. failure costs relate to absenteeism, accidents, poor productivity, poor quality of products / services. These events involve either increased costs involved (increased material consumption, increase working hours and additional activities without economic justification for increasing salaries) or reducing the quantities of finished products available for sale or reduction of production potential (staff is busy with the dysfunction remedy).

Interest calculation costs "hidden" is twofold: on the one hand refers to accountability and on the other hand affect future decisions. Direct costs of private medical offices easily identifiable are those costs directly associated with dental treatments. These costs must be registered in the entity's records system and may include the following categories: salaries (gross level, plus employer contributions); raw materials, other supplies, general expenses, malpractice insurance, maintenance expenses.

Indirect costs of private medical offices are those which can not be classified as direct costs but are indispensable treatments and therapeutic maneuvers or proper conduct of business in general and may include: depreciation of work equipment, space and other tangible assets involved in the activity ; pay maintenance and support personnel, costs of maintenance and operational costs (eg utilities costs, costs of current repairs etc).

Other general and administrative expenses of the dental office without being directly related to specific therapeutic maneuvers: interest expenses on loans for financing the business / investment (under certain conditions *) Operating expenses: General maintenance costs (cleaning, waste transport etc.), administrative costs (personnel costs, costs of the departments of accounting, finance, IT, HR etc).

Indirect costs are allocated to the patient or cost centers, according to the established allocation.

Intangible costs are the costs associated with patient dissatisfaction, which can translate into additional resources to be allocated for cost recovery or therapeutic maneuver to address an additional therapeutic maneuvers or patient loss costs (which will give to those Services in). These intangible costs must be impaired, depending on the history of previous cases of dissatisfaction and included in determining the total cost of treatment and therapeutic maneuvers.

The most important and difficult action in the generation of relevant costs, indirect costs and intangible is allocated each therapeutic handling, patient, physician, etc.. Therefore costing methods applicable to dental offices, have as main objective of a more judicious (realistic) allocation of indirect operating costs and general and administrative costs so completely thus obtained represent a coherent and relevant basis for determining the prices / fees incurred by patients.

4. Conclusions

In our country the pace of dissemination of information to those interested is very slow. Information system is not adequate and does not provide sufficient accuracy and high quality dental care and the context, especially on private dental office management. At this time using information on the website with various institutions and associations such concerns or content of the various publications, information not guarantee reflection of reality in the field. The calculation of indicators whose value can be identified using various information sources is not unique and often remains unknown practitioner, leading to erroneous decisions, many with disastrous effects. Accuracy of information is affected and by the absence of a viable, rapid data collection, so collecting them late, especially since there late processing center specializing in data analysis or a national database.

Sources of information does not cover the whole field of them, most offering information obsolete or without fully valid in the dental care.

The idea of construction and activation of such a calculation base and information on the management of private dental office that was generated in economically advanced countries the existence of such bases facilitates the

decision making of those interested. Therefore a key objective of this scientific research will target information:

1. Private clinics and dental offices to identify development opportunities;
2. Romanian and foreign potential investors in order to initiate business;
3. Organisms of public power in order to draw statistical statements;
4. Research institutes and universities to give presentations to current activity specific methodologies for the calculation of cost categories;
5. Dentists who performs an efficiency improvement and dental office management;
6. Consulting companies, stock or insurance, in order to elaborate, and support a private system of insurance of dental clinics that meet the European standard ISO.

Abstract

A country in global competition for markets of any kind certainly has chances of economic success if it is based on the specialization of the offer and the focus of its development efforts on certain elements and key areas that have competitive advantages, resources and skills.

In this context, innovation and competitiveness become essential. Since the European Commission's concerns for the next financial period make the two concepts become priorities, it is understood that our country also must consider them as priorities.

Romania is a modest innovator characterized as such by the results so far, in comparison with other European Union member states. Occupying the 24th place in the European Innovation Scoreboard, Romania does not have enough consistency and continuity, although it recorded innovation growth rates above 5% per year.

Key words: innovation, competitiveness, European Innovation Scoreboard, productivity

J.E.L. classification: O32, Q55

1. Introduction

A country in global competition for markets of any kind certainly has chances of economic success if it is based on the specialization of the offer and the focus of its development efforts on certain elements and key areas that have competitive advantages, resources and skills. In this context, innovation and competitiveness become essential. Since the European Commission's

concerns for the next financial period makes the two concepts become priorities, it is understood that our country also must consider them as priorities.

The very recent signal, transmitted by the Commission's spokesman Vice-President Antonio Tajani at the Conference entitled "The challenges of the European industry competitiveness and the role of the firm investments" held in September 2011 at the National Bank, is "Quality before quantity" ([www.fonduri-structurale.ro/detaliu.aspx?eID=98358 & t = news](http://www.fonduri-structurale.ro/detaliu.aspx?eID=98358&t=news)).

In its turn, the Government of Romania proves a concern expressed by the Minister of Education, Youth and Sports, Daniel Funeriu, who states that "without innovation, competitiveness is not possible" and he sustains an "innovation ecosystem" through actions such as:

- Supporting the scientific research connected to an international level;
- Creating a modern and efficient telecommunications infrastructure;
- Supporting the entrepreneurial culture and education in schools;
- Ensuring the fair legal and financial services;
- Creating industrial clusters, even competitiveness poles, in which education should have a role as important as the industry itself.

In order to not situate himself at the level of statement, but at the one of concrete actions, the Minister introduced new mechanisms which are taken into account for the near future, such as: the **inovouchers**, meaning that system of innovation checks for the environmental entrepreneurship, along with the industrial research grants, made possible by means of the National Plan of Research, Development, Innovation, **the**

service patent law, intended to clarify, simplify and make the relations between employers and employees less bureaucratic, in terms of intellectual assets, **entrepreneurship education plans** for students and the supporting of the business incubators in universities, **partnerships with other countries in the research field** along with the innovation and entrepreneurship policies interconnection with Poland, Bulgaria and Croatia.

The action modalities listed above are intended to connect the research in Romania to the European reforms and the role of liaison between the Executive, business and academics becomes the responsibility of bodies such as the National Council for Competitiveness responsible for the National Competitiveness Strategy - Romania 2020, the Advisory Board for Research Development and Innovation, the Executive Unit for Financing the Higher Education, the Research, the Development and the Innovation (EUFHERDI) etc.

There are both positive and negative feedback against this first-rate approach on the issue of research. Some believe that only through strong links between research and education, as well as between these two and the business it can be hoped that the economy would become more competitive, some others do not deny it, but they criticize the fact that, this way, education seems more inclined in the direction of research rather than in the one of training, and the rest of them, the more pessimistic ones, state that the goal wanted will not be achieved.

Without doing, in our turn, assessments on this controversy and referring strictly to innovation and competitiveness, we believe that the innovative thinking is required by all. Innovation joins and overlaps with the organizational strategy, the attitude to the brand and customers, whoever they are, whatever the product or service is and wherever they perform as an area of interest. Innovation can only exist in partnership with creativity, with thinking about hypostasis, things and situations that no one thought about before.

The innovative vision and innovation itself lead to the appearance of some products and services, which are superior from all points of view, more friendly with the highly polluted environment, and of some more efficient management systems. The dynamism of the economic and social life turns innovation into an

opportunity, often the only one, for an organization to evolve, although the experience in this field has shown that innovation is not accepted from the very beginning and without opposition by the consumer. It happens that valuable ideas do not reach the goal of turning themselves into mass products. Therefore, the organization is motivated, almost forced, to think innovatively on a regular basis, being known that innovation is the main rank in the nowadays global economic gears, and also to have a marketing to "renew the market not only at the strategic level, but also at the tactical level - creating the proper context, the appropriate attitudes, the adequate infrastructure and the appropriate appetite for the competitive and commercial success of the best ideas to be assured." For this reason, a significant proportion of the income is directed towards the research and creation, and for marketing as well.

2. Concepts

The definitions are many and there is not one universally accepted. Important sources of documentation can be considered the dictionaries and the encyclopedias (DEX online, Merriam - Webster online, Wikipedia, etc.), specialized manuals, etc.

In the Legislatie.3pedia.ro Dictionary it can be found a limiting definition, in our opinion, showing that "innovation is a technical achievement that shows novelty at a national level, progress and economic and social advantages, solving a problem in the industry or any other field of economy, science, culture, protection".

Comprehensively, the OSLO Manual, version 3 (2005) shows that "innovation is the implementation of a new or significantly improved product (good or service), or of a process, a method of marketing, or a new organizational method in the practice of the business in the employment organization or the external relations" OSLO Manual (Guidelines for collecting and interpreting innovation data, 3rd ed. OECD / European Communities, 2005).

Another source is the Marketing Explanatory Dictionary (2003) where, in a broad sense, **innovation** is "the work of a specialist or a team and its result, which provides the improvement of the technics, of a production process, of the products (material goods) and services, of some organizational means showing an aspect of

novelty. “In the narrow sense, innovation "is reflected in a new solution (constructive, technological, organizational), usually an improvement, claiming no uniqueness or priority, etc...”

But what is widely accepted in all approaches is the word "new" (significantly improved).

In principle, innovation ensures the transfer of knowledge, the technology commercialization, the receptivity to new ideas and the entrepreneurial sense, meaning that it determines competitiveness, by including the new ideas that generate value. Being **competitive** means having the necessary capacity to cope with the competition on every market.

2. Moments of reference

The creation of the European Union is an innovation itself by means of which the founders had hoped and still hope to cope with the competition with the U.S.A. and the Asian countries, namely China, Japan, South Korea and India.

By the Lisbon Strategy in 2000 innovation became a strategic element, being made clear reference to it in two chapters, namely "Creating a European research and innovation area" and "Creating a proper environment for starting and developing innovative businesses, especially SMEs".

In 2003, by means of the Communication entitled "Innovation policy: Updating the Union's approach in the context of the Lisbon Strategy" - COM (2003) 112 of the European Commission to the European Council, the European Parliament and other institutions, an update of the concept and the multimensionale nature of the phenomenon and its implications has been done. The speed with which innovation spreads in the economy became crucial to the competitiveness, productivity and the economic growth. And even if there were significant results and progress, however, improvements have been proposed periodically since in the Lisbon Strategy there have been identified a number of weaknesses or items not taken into account at the time of its elaboration.

The Europe 2020 Strategy brings a new major initiative: an "Innovation Union" launched by Antonio Tajani on October 6, 2010 (www.europa.eu/commission_2010-2014/Tajani/hot-topics/innovation-union/index_en.htm).

The major objectives of this strategy are related to:

- Strengthening the knowledge base of Europe and reducing the fragmentation, in which a special role is to promote excellence in education;
- Turning good ideas into marketable products;

- Removing social and geographical disparities;
- Putting the resources in common in order to achieve major breakthroughs in directions such as the access to finance, the public sector innovation, the social innovation and the focusing on design. In the support of achieving these objectives there will come the Framework Programme 8 as well.

3. European Innovation Scoreboard - EIS

It is an instrument created to enable a comparative analysis on innovation performance in the activity of the 27 European Union countries, to which there are added some other non-European countries: Croatia, Serbia, Macedonia, Iceland, Turkey, Norway and Switzerland. Also, the scoreboard makes the comparison with the U.S.A., Japan, China, India, Brazil and Russia as the European target is to reach and exceed the extraordinary results achieved by the latter ones.

In 2010, the 10th EIS used a list of 25 indicators, different than in the year 2009, when there were used a number of 29 indicators expressing the national performance of the research and innovation as a system. The scoreboard is public (www.proinno-europe.eu), the results being able to be compared with the ones from the year 2001 onwards.

An analysis on this scoreboard at the year 2010 level led us to the following results:

- By comparison, the EU27 is ahead of countries like China, Brazil or India, and which yet advances in sustained rhythms, but behind the U.S.A. and Japan, which remain the undisputed leaders of the global innovation;
- There are identified four categories of performance: **Innovation Leaders**, including Denmark, Finland, Germany and Sweden, with a rate of innovation with more than 20% above the EU27 average, **Innovation Followers**, with Austria, Belgium, Cyprus, Estonia, France, Ireland, Luxembourg, Netherlands, Slovenia and the United Kingdom, which have 10-20% over the same average, **Moderate Innovators**, which include Czech Republic, Greece, Hungary, Italy, Malta, Poland, Slovakia and Spain, under the EU27 average, but still over half of it; **Modest Innovators**, which include Latvia, Lithuania, Romania and Bulgaria, with less than half of the EU27 average;

- The performance of the four groups of European countries is compared according to the following eight dimensions: human resources,

research systems, finance and support, firm investments, linkages and entrepreneurship, intellectual assets, innovators, economic effects.

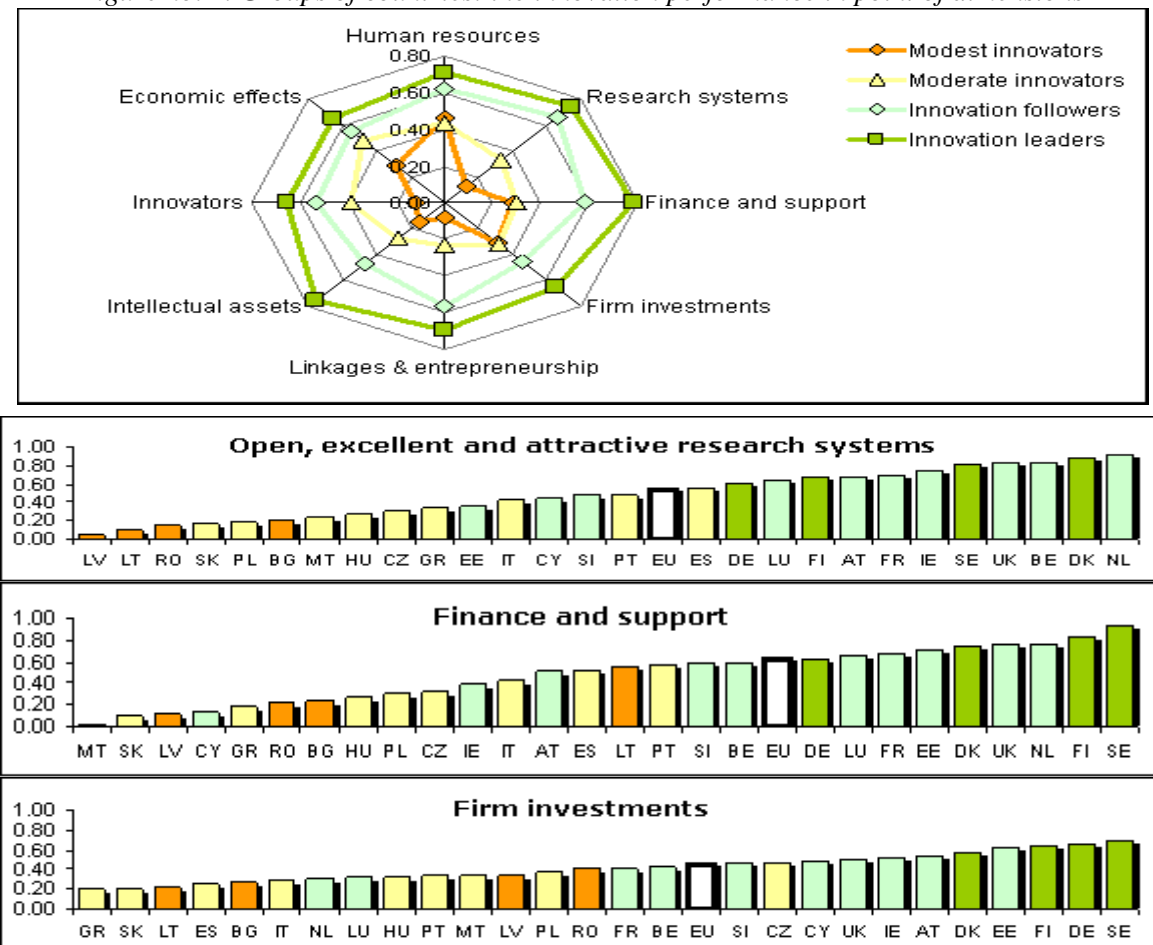

Figure no. 1. The innovation performance in the EU Member States

Note: The average performance is measured by using a composite indicator built on the basis of the 24 indicators having values that go from a lowest possible performance of 0 to a maximum possible performance of 1. The average performance in 2010 reflects the performance in 2008/2009 due to a lag in the data availability.

Source: <http://www.proinno-europe.eu/inno-metrics/page/innovation-union-scoreboard-2010>

Figure no. 2. Groups of countries: the innovation performance in point of dimensions

Source: <http://www.proinno-europe.eu/inno-metrics/page/innovation-union-scoreboard-2010>

4. Romania – a modest innovator

Thus it is characterized by the results so far in comparison with the other Member States. Occupying the 24th place in the EIS, Romania has no consistency, continuity, although it recorded innovation growth rates

above 5% per year. It would have been needed more than the double of this value in order to avoid what the charts below present. Of the 24 indicators, only three are above the average and only one is to be mentioned: expenses that generate innovation - other than the ones of research and development.

Figure no. 3. The innovation performance in Romania

Source: <http://www.proinno-europe.eu/inno-metrics/page/innovation-union-scoreboard-2010>

Aware of the fact that the countries that do not innovate in a rapid pace develop slowly and have only to lose, Romania begins to change things. The research as a distinct field was forgotten or even abolished in the last 20 years, former research centers with significant results entirely, or mostly disappeared. Authentic researchers were not as talented in achieving an efficient management to ensure their financial support, to sell what they

produced. Education was focused mainly on education, enterprises were concerned especially about their own care rather than about the entire economy, having no overview. The picture is filled with many laggard positions, such as the educational outcomes, the number of young employees in higher education ascribed to the whole population, the level of innovation in the private companies, etc... This whole complex

of factors brought to our country positions envied by no one in charts that really matter. A significant effort is required and the invitation, from the part of the European countries with high ambitions determined by the lagging behind the non-European competitors, must be honored.

There is also the necessary finance, if we take into consideration only the allocation for the Increasing of the Economic Competitiveness SOP – IEC SOP, which is of 2284675277 euros. The program's overall aim is to reduce the gap in comparison with the Union, namely the achieving of an average annual growth of GDP per employee by 5.5%, which will lead to the achieving of 55% from the annual productivity of the EU by the year 2015. The specific objectives are included in the five priority axes, the first two being directed towards innovation: A1 - An innovative and eco-efficient production system and A2 - Research, development and innovation for competitiveness.

Preoccupations in the Field of Integrated Reporting

Enachi Mihaela

“Vasile Alecsandri” University of Bacău, Faculty of Economic Sciences
enachi_mihaela@yahoo.com

Abstract

A growing number of organizations offer through the reports prepared at the end of the financial year, in addition to financial information, more and more non-financial information.

In this paper we try to clarify what makes the difference between these two categories of information, why is necessary to provide non-financial information and how is it reported.

We also bring into discussion some references existing in the international accounting regulations, European directives and Romanian accounting regulations on the provision of non-financial information and we present some aspects concerning the requirements for recognition in the financial statements of certain categories of non-financial elements and some regulations existing or applicable in the field of certification of non-financial information.

Key words: financial information, non-financial information, integrated reporting, integrated audit.

J.E.L. classification: M41

The transition from financial reporting to integrated reporting aims to ensure a greater transparency of the organizations' activities by reflecting the connections between financial and non-financial factors which influence the registered performance.

Opinions on distinction between financial and non-financial information are varied and sometimes contradictory. In what follows, we present only some of them we considered representative.

Thus, the International Corporate Governance Network uses the term *non-financial* to refer to *information relevant to the assessment of economic value, but which does not fit easily into the traditional*

accounting framework [9, p. 4], considering that, when reported, this information allow the disclosure in both quantitative and qualitative terms of those drivers that increasingly shape company performance.

Koninklijk Nederlands Instituut Van Registeraccountants understand through non-financial information *all quantitative and qualitative data on the policy pursued, the business operations and the results of this policy [...] without a direct link with a financial registration system* [10, p. 5].

According to other sources, non-financial information is *all information reported to shareholders and other stakeholders that is not defined by an accounting standard or a calculation of a measure based on an accounting standard* [2, p. 83], *qualitative information included in company annual reports, but outside of the four financial statements and related footnotes* [13, p. 72], being sometimes identified with contextual information provided in narrative form to users, information on intangible assets or information on sustainable development.

Generally, through integrated reporting there are offered three types of information: *economic* (especially, of accounting nature); *social* (about the safety of product in use, the quality-value relationship for the products offered, the satisfaction of customers, the knowledge and experience of the employees, the development of human resources, the health and safety at work, the facilities offered to staff or members of their family, the humanitarian initiatives materialized in supporting the creation of hospitals etc.); *environmental* (about the climate changes, the land contamination, the water pollution, the genetic modifications of the organisms, the positive impact on the environment, the use of natural resources etc.).

A special category of social information which presentation in financial reports becomes, in certain circumstances, absolutely necessary, is that relating to prosum

activities. The term *prosum* refers both to the creation of goods or provision of other types of services for own use or own satisfaction and to unrolling activities for others without waiting for a consideration [4, p. 142].

Among the *prosum* activities which can be unrolled by employees or persons outside the entity, we mention: offering unpaid assistance for short-term problems; freely giving valuable information; carrying out voluntary activities without receiving a monetary rewards for the time spent, skill shown and, eventually, risk assumed; free repairing goods without the existence of some contractual obligations etc.

A broader approach encompasses, in addition to economic, social and environmental information, issues concerning: the corporate governance (mission, objectives, strategies, policies, risks, opportunities, innovations etc.), the ethics (codes of conduct, anti-fraud measures etc.), various key performance indicators (on the progress of the organization, industry-specific aspects, indicators used in internal decision-making process and other indicators) etc.

If for financial reporting there are international standards, in terms of providing non-financial information we can't talk about globally accepted regulations, but a series of attempts of some renowned bodies to support the identification, measurement or quantification and reporting of such information by developing guidelines or frameworks: *Connected Reporting - A Practical Guide with Worked Examples* (Accounting for Sustainability), *Key Performance Indicators for Environmental, Social & Governance Issues: A Guideline for the Integration of ESG into Financial Analysis and Corporate Valuation* (European Federation of Financial Analysts Societies), *Sustainability Reporting Guidelines* (Global Reporting Initiative), *ICGN Statement and Guidance on Non-Financial Business Reporting* (International Corporate Governance Network), *Non-Financial Information in Progress - A Guide to the Reporting and Assurance of Non-Financial Information in the Public Sector* (Koninklijk Nederlands Instituut Van Registeraccountants), *Guidelines for Multinational Enterprises* (Organisation for Economic Co-operation and Development).

We also mention that, through the collaboration of several internationally recognized bodies, including Accounting for Sustainability and Global Reporting Initiative, was established IIRC (International Integrated Reporting Committee), an entity whose purpose is to create a globally accepted integrated reporting framework.

References to the disclosure of certain non-financial information we already find in the content of international financial reporting standards, European directives and Romanian accounting regulations for economic agents.

Thus, IAS 1 *Presentation of Financial Statements* requires that entities include in the notes to the financial statements, together with financial information, non-financial information of the kind indicated by IFRS 7 *Financial Instruments: Disclosures*, such as, for example, information on exposures to risks arising from financial instruments, methods used to measure these risks, objectives and policies for managing the risks etc.

In addition, IASB has recently developed a framework for narrative presentation, in a separate report, called *Management Commentary*, of some additional information of that included in the financial statements which enables the interpretation of financial position, performance and cash flows of the entity in an appropriate context. Thus, according to *IFRS Practice Statement Management Commentary*, the report mentioned above, whose preparation is optional, should contain information that is essential in understanding: the nature of the business; management's objectives and strategies for meeting those objectives; the entity's most important resources, risks and relationships; the results of operations and their future trends; the indicators used to evaluate performance against stated objectives etc.

When presenting *the annual report* (document which is published together with the annual accounts or, if permitted by the laws of a Member State, may be made available to the public free of charge at the company's registered office), the Fourth Directive (after subsequent amendments made by Directive 2003/51/EC) requires, under Article 46, paragraph 1, letters a and b, that it include *at least a fair review of the*

development and performance of the company's business and of its position, together with a description of the principal risks and uncertainties that it faces, and, to the extent necessary, the analysis include both financial and, where appropriate, non-financial key performance indicators relevant to the particular business, including information relating to environmental and employee matters (regarding the obligation to provide non-financial information, Member States may choose to exempt entities that do not exceed certain size criteria).

Also, according to the same article, paragraph 2, letters a, b and c, the report will indicate *any important events that have occurred since the end of the financial year, the company's likely future development, activities in the field of research and development*, and according to the letter f (added by Directive 2001/65/EC) *the company's financial risk management objectives and policies, including its policy for hedging each major type of forecasted transaction for which hedge accounting is used, and the company's exposure to price risk, credit risk, liquidity risk and cash flow risk*, if this information is material for the assessment of assets, liabilities, financial position and profit or loss.

The same Directive, Article 46a (added by Directive 2006/46/EC), requires companies whose securities are admitted to trading on a regulated market to include in a specific section of the annual report *a corporate governance statement*. Among the information that this statement shall include are mentioned: a reference to the corporate governance code to which the company is subject and/or the code which the company may voluntarily decide to apply and/or all relevant information about the corporate governance practices applied beyond the requirements under national law, a description of the main features of the internal control and risk management systems in relation to the financial reporting process, the composition and operation of the administrative, management and supervisory bodies and their committees etc. With the authorization of Member States, this information may appear in a separate report published together with the annual report or as a reference in the annual report indicating the company's website where such document

is posted.

The requirements of the Seventh Directive, with subsequent amendments, on the content of *consolidated annual report* are similar to those of the Fourth Directive, an important difference consisting in the absence of the obligation of providing a statement on corporate governance. However, entities whose securities are admitted to trading on a regulated market will also include in the report mentioned above information on internal control and risk management systems in relation to the process for preparing consolidated accounts.

The Order of the Public Finances Ministry no. 3055/2009, with subsequent amendments, requires that the economic agents prepare for each financial year *the managers' report* or *the managers' consolidated report* which contains information similar to that included in the annual report and consolidated annual report, respectively. We also find here a special attention given to the internal control, one of the sections of the order extensively referring to it. Besides, Sarbanes-Oxley Act, Section 404 *Management Assessment of Internal Controls*, also requires that entities provide information on internal control, even through a separate report.

Moreover, some non-financial information, if we understand by this contextual information, information on intangible assets or indicators that use accounting information, are already provided by the financial statements of the economic agents.

Organizations from different countries of the world provide non-financial information in some sections of the annual reports (Management's Discussion & Analysis - mandatory in U.S.; Operating and Financial Review - once mandatory in UK; Business Review; Management's Report; Sustainability Report etc.), in the financial statements or a separate report (Corporate Social Responsibility Report; Corporate Citizenship Report; Environmental, Social and Governance Report etc.).

In what follows, we'll reflect on the possibility of recognizing in the balance sheet or income statement of certain intangible assets and free offered services to/by the entity, without going into details about other non-financial information extensively discussed in literature, being known so-called

social accounting or so-called *green accounting*.

How the physical form or the existence of a property right is not essential for determining the existence of an asset, we ask ourselves under what conditions certain intangible elements, namely, the additional knowledge of employees, both scientific and common, with a significant contribution in the process oriented towards obtaining economic benefits, could be included in the balance sheet. Even if the entity may expect that the employees will continue to make these means available to it, usually, the entity can not exercise sufficient control over the expected economic benefits, having no power to restrict the access of others to the same means than, where applicable, by copyrights, confidentiality clauses and other legal rights. Thus, the presentation in the balance sheet is allowed only if the knowledge is protected by legal rights to use it and to obtain the future economic benefits expected from it and the other conditions for recognition these means available to the entity are met.

Regarding the prosum activities, when these are revenue-generating services, the difficulty of their recording in the accounting of the Romanian entities is caused, inter alia, by the lack of information in this respect in the regulations. Moreover, neither the European directives nor the international accounting standards provide information on the recording of such services in accounting. However, FASB, through SFAS 116 *Accounting for Contributions Received and Contributions Made*, refers to the services received by donation, arguing that these shall be recognized in the financial statements when: 1) create or enhance a non-financial asset or 2) require specialized skills, are provided by individuals possessing such skills and would typically need to be purchased if not provided by donation. Nevertheless, it remains opened the following question: what we'll place in the counterpart of the revenues from donations that meet the criteria for recognition in accounting?

Integrated reporting requires integrated audit. This involves the provision of additional services by the auditor who must have knowledge of the examination of the non-financial information. Among the regulations already existing or applicable in

the field of certification of non-financial information, we mention: AA1000 *Assurance Standard* (AccountAbility), COS 3410N *Assurance Engagements Relating to Sustainability Reports* (Koninklijk Nederlands Instituut Van Registeraccountants), IAPS 1010 *The Consideration of Environmental Matters in the Audit of Financial Statements* and ISAE *Assurance Engagements Other than Audits or Reviews of Historical Financial Information* (International Auditing and Assurance Standards Board).

The inclusion in the financial reports of some non-financial information, along with financial ones, which could explain or justify, to some extent, the changes produced in the structure of various patrimonial elements, supports the decision-making process by increasing the transparency of the activities unrolled and the results obtained by organizations.

Acknowledgement

The paper was accomplished with financial support under the project POSDRU/88/1.5/S/47646, co-financed by the European Social Fund, through the Sectoral Operational Programme Human Resources Development 2007-2013.

The European Commission Forecast on the Global Economy under the Economic Crisis

Epure Dănuț Tiberius

“Ovidius” University of Constanta, Faculty of Economic Sciences

epure_dan@yahoo.com

Brăiloiu Liviu

“Dunărea de Jos” University of Galați

Abstract

This paper illustrates the role of a relevant and balanced analysis on the development of the sustainable economy, by means of global economic forecasts under the contemporary crisis. The forecasts of the European Commission and World Bank are short-termed, since the dynamics of the global economy is emphasized and adversarial, which makes it impossible to predict on medium or long term. A distinct part of the multinational corporations' analysis aims at their impact on national economy and the global economy, the GDP evolution and the decrease of the EURIBOR interest rate.

Key words: interbank market, capital flows, interest rate reduction, corporate income.

J.E.L. classification: F23

1. Introduction

Following the bankruptcy of Lehman Brothers in September 2008, the wholesale credit markets have become completely dysfunctional, and the trust among the participants in the financial market has dissipated completely.

In an effort to avoid a collapse of the global financial system, the Governments and central banks intervened, at first instance, by granting access to banks for short-term financing. Shortly afterwards, some major banks have been forced to go out of the business. Also in Europe, the Governments have adopted drastic measures to strengthen the banks' capital. In this way, they have ensured the solvency of banks and their ability to continue providing credit to the non-financial private sector.

2. The Adopted Measures

In the euro area, the Central European Bank has stepped up efforts to support bank liquidity, by simplifying its monetary policy, extending the due to refinancing operations and the adjustment of its guarantee policy. In the last seven months, the CEB has lowered the reference interest rate in several stages, with 300 basic points (bps), from 4.75 percent on October 8, 2008 to 1.25 percent in late April 2009.

E.U. also acted decisively, by announcing, on 16 October 2008, a package of financial support measures, including new schemes of insurance, the recapitalisation of banks with the help of public funds, Government guarantees for bank loans and asset conversion/acquisition of banks in order to increase access to liquidity. So far, the Member States have undertaken 270 billion euro in the recapitalisation of banks and about 3,200 billion for improving the banks access to financing (through securities, the exchange of assets, etc.). [1]

In order to avoid creating undue distortion of competition between the Member States, the European Community, the Commission and the CEB have provided guidance to the Member States relating to the different types of public intervention. Moreover, an impressive set of legislative initiatives has been or is being adopted by the E.U. and the Member States in the areas of financial services policy and regulatory structures. The European Union has campaigned to persuade the G20 to adopt a set of principles for reforming the global financial sector.

Actions carried out by the Governments and Central Banks around the world seem to have managed to bring a degree of stabilization of the financial system, even if

the markets and financial institutions remain under considerable stress. Moreover, the large-scale political interventions have

involved the Governments in assuming considerable financial risks, which led to the

Table 1. The EURIBOR evolution (%)

Year	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
2006	2,67	2,76	2,96	2,99	3,06	3,24	3,32	3,44	3,55	3,70	3,72	3,85
2007	3,92	3,97	4,02	4,12	4,24	4,30	4,37	4,72	4,75	4,59	4,71	4,76
2008	4,39	4,39	4,73	4,88	4,92	5,12	5,15	5,15	5,29	4,89	3,95	3,03

Source: www.euribor.org

deterioration of the situation of the public finances, which were anyway affected because of the economic activity decline. Indeed, the problems in the banking system have increasingly expanded more on the real economy, with the sudden entry of the major economies in recession, thereby creating a negative feedback loop for the financial sector.

The CEB interest rate reductions and adjustments to the lending regulations have helped to mitigate the progressive movement of loans and risk associated with their peak reached in October 2008 (this interest rate is used as the reference rate for financial products worth trillions of Euros).[2]

2.1. The EURIBOR Evolution

The EURIBOR was about 60 bps in the late April 2009, well below the peak of nearly 200 bps. in the autumn of 2008, but still with more than 10 bps. higher than in normal periods (see Table 1). [3]

The three-month EURIBOR interest rate, the main indicator of interbank crediting uncovered in Euro and banks expectations regarding the appetite for borrowing and interest, has climbed in October 2010 at 1,025% from 1,016%, reaching a new maximum of the last 15 months.

The interest rate has exceeded the CEB's monetary policy, of 1%, for the first time since July 2009. [4]

The three-month interbank interest rates are normally higher than the CEB'S key rate, but the Central European Bank's strategy to provide to the markets unlimited funds, at a reduced interest rate, during the crisis, have toppled this trend.

Other indicators of the interbank market have improved their level, when they have reached the same peak in October 2008. This situation results from the decreasing number of banks participating weekly to the CEB's refinancing operations. Moreover, the banks have reduced the amounts placed in the CEB.

Even though these trends are encouraging, they are not necessarily an evidence of normalization of the situation on the interbank market, but rather a direct response to the interest rate reduction on deposits with the CEB to 0.25%.

Figure 1: The EURIBOR Trend 2006 – 2010 (%)

Source: Personal analysis

2.2 Other Financial Measures

Despite the extensive support measures implemented by the Member States, the E.U. banking system remains under considerable stress. The investors' confidence in banks has been undermined by the gradual disclosure of losses related to the depreciation of assets. The E.U. banks have already announced such losses of nearly 290 billion Euros from the beginning of the crisis.

However, the concern about the depreciation of the assets of the banks has extended beyond the so-called "toxic" securities, to a much wider range of assets, including commercial mortgage loans-backed securities and loans for the purchase of cars.

Because the real economy situation has deteriorated sharply, issues of insufficiency of assets are likely to expand more, including now corporate loans and a wider range of consumer credits.

The consolidated and aggregate capital and the reserves of E.U. banks have improved modestly, since October 2008. This improvement reflects a substantial injection of capital from the Governments of the Member States, without which the economy may have significantly deteriorated. Only a few large banks in the E.U. have managed to raise private capital, since October 2008.

The geographical exposure of the banks has also become a source of uncertainty for investors. Banks in the "old" Member States have approximately 950 billion Euros foreign debt in the "new" Member States and in other emerging European markets, in total about 82% of the total foreign claims. In absolute terms, the most exposure has the banks from Austria, Germany, Italy and France. In terms of GDP, the cross-border bank exposure to the region reaches 68% of Austrian GDP, 27% for Belgium, 23% for Sweden, 17% for Greece and 14% for the Netherlands.

Challenges for the banking sector in Central and Eastern Europe may arise both from the funding process and of the assets. Given the high proportion of short-term debt and long-term assets in their balance sheets, many banks face asymmetric maturity risks. The strong dependence on short-term external financing could make some countries (notably Bulgaria, Hungary, Romania and the Baltic States) vulnerable to a sudden stop of capital flows. Therefore, close monitoring and prudent management of nonperforming loans should be performed.

Due to the uncertainty about the quality of the balance sheet of banks, investors began to focus more on economic affairs than on capital. On this basis, the rate required by capital markets as an evidence of solvency of banks, appears to have increased well above lows regulated, which could have significant implications for banks' lending activity.

In February 2009, the annual growth rate

of outstanding bank loans still remained positive, but declined by 0.7 percentage points from the previous month. The general decline of the stock of bank credit to the private sector in the euro area began to manifest in 2008 and is caused by factors related to both supply and demand. Problems in the banking sector involve constraints on the supply of credit, because banks try to strengthen the balance sheet situation, becoming increasingly more opponents of the risk in a bad economy. However, the slowdown of credit is due, largely, also to the demand reduction as a result of the economic downturn.

The bank credit to households began to decline in the first of all, a process that will continue for more than two years. In February 2009, the annual rate of change decreased by 0.7%, which is the effect of lending with reduced mortgage.

The bank loans to corporations initially seemed to be less affected by the financial crisis. However, the credit cycle has turned. The yearly decline of loans to non-financial corporations reached 7.6% in February 2009, which represents a notable deceleration sequence.

Figure 2: The Loans Trend in the Euro Area (%)

Source: Personal analysis

The financial situation of households sector was adversely affected by the financial crisis by financial losses (of wealth) and loss of housing. The sudden price drop of a wide range of financial assets had a significant impact on wealth households, directly or indirectly, through pension funds.

Meanwhile, the housing prices are either declining or growing slowly across the E.U. The inflation rate in the euro area house prices fluctuated between 5.5% and 7.5% in 2002-2006, but slowed to 2.7% in the first

half of 2008. The housing prices fell and sales volume decreased significantly. In some Member States, was even recorded a significant decline in levels of these prices (Ireland, Spain, United Kingdom).

Amid high levels of debt, the loans to households began to decline. This reflects the toughest conditions on the credit supply and credit conditions.

On the other hand, the overall financial costs for households have declined steadily from the end of 2008, reflecting, in particular, reduce interest rates for short-term loans (even if the rate is still at a high level). Furthermore, in response to the negative effects of the income, the consumers are encouraged to increase their savings in the next 12 months.

The non-financial corporate sector's financial situation in the E.U. deteriorated from mid-2008. As the financial crisis has advanced in the real economy, the corporate earnings have come under increasing pressure and incentive for business development collapsed. Despite the positive developments in March and April 2009, reflected in the higher revenues than expected earnings reports from several major banks and the most recent measures adopted by monetary and fiscal authorities, DJ Euro Stoxx 50 index ranges about half of its maximum quotation in June 2007. (see Figure 3).

A tightening of the external financing conditions would put additional pressure on the corporate sector. The companies in E.U. now keep substantial cash balances, but the internal financing capacity is still low due to the decline in corporate earnings. As a result, the access to external financing will be crucial to avoid liquidity constraints.

Figure 3: The Current Evolution of DJ Euro Stoxx 50

3. Conclusions

While banks have tightened the lending standards, almost from the beginning of the crisis, the non-financial corporate sector lending has been relatively unaffected by the end of 2008. Since then, this process has undergone a slowdown.

The value of the corporate bonds in euro declined in the recent months, the change being more pronounced for the bonds rated BBB, riskier than the AAA rated ones.

Abstract

This paper highlights the historical trajectory of the global economic forecasting models of type GEM (Global Economic Model) and a comparative analysis of advantages and limitations offered by each model. The GEM 2004 is based on the correlation that exists between the academic scientific research and the existing economic policy models, which after its application, resulted that real GDP in the euro area will increase as a result of higher capital stock and number of hours worked. Consumption will increase as a result of increased investment and depreciation of the euro, while investments will be influenced by the economic reforms implemented. The GEM 2007 is a multiregional model covering the global economy that allows the analysis of the bilateral trade flows and the relative prices for each region.

Key words: evolution of the work, government consumption, government investment, public procurement, GDP growth.

J.E.L. classification: F23

1. Introduction

In the context of deepening globalization, the policy makers, the international organizations, the multinational corporations and even the individual experts showed the overall need for dynamic models, able to quantify and predict the human socio-economic evolution.

The global models have evolved, both in terms of quality and number of restrictions taken into account. Moreover, the restrictions global models must take into account the

international constantly changing situation, so that they can be used to quantify the economic development in crisis conditions, for example.

The global economic models can be analyzed in terms of quality, during three general stages.

2. The GEM 2004 Model Analysis

The first stage is related to the GEM 2004 model. This model provided a non-technical approach to the development, based on microeconomic connections developed in the IMF Research Department. The GEM 2004 has as predecessor the MULTIMOD model, which was focused on the analysis of the interdependencies between the countries of the world. [1]

The evolution of the macroeconomic models can be divided into the following steps:

The Keynesian approach of adaptive expectations: this approach has allowed researchers to assess the impact of economic policies and other cyclical shocks in a uniform manner. The main shortcoming of this approach is that it allows the politicians to mislead the public opinion by creating a bias related to the expansionary macroeconomic policies. This approach was reflected in the growth models made by Flemming and Mundell. [2] [3]

The Keynesian approach of rational expectations: it allowed generating a more realistic response to the cyclical economic malfunctions. On the other hand, this approach does not seem to be strongly grounded in the theory, which is a challenge for the analysis of the effects of economic policy on the aggregate supply. The most known model of this type is MULTIMOD. [4]

The real business cycle approach: it has a strong theoretical foundation, which improves the approach in terms of supply and allows the direct determination of economic welfare. The use of price flexibility premise limits the macroeconomic policy analysis. Such a model is the Mendoza model. [5]

Dynamic stochastic general equilibrium approach: it integrates the supply and aggregate demand responses by the microeconomic theory. Models in this class are in an early stage of development and they are characterized by construction and implementation - related difficulties. The GEM is a part of this class of models, with its different variants.

3. The GEM 2007 Model

The GEM 2007 model was implemented by specialists of the National Bank of Canada. They extended the standard GEM model by introducing the analysis of sold and unsold goods traded sectors, including petroleum products, namely those nonpetroleum [6]. In addition, the oil sector was split into oil production and petroleum products for retail consumption.

The GEM 2007 is a multiregional model, covering the global economy that allows the analysis of bilateral trade flows and their relative prices (including exchange rates) for each region.

The model splits the world economy into five regional blocs: Canada (CA), USA (U.S.), the emerging countries of Asia (AS), the goods exporting countries (CX) and the remaining countries (RC) (see Table 1)

Table 1: Regions Analyzed by GEM 2007 Model

Region	Component states
CA	Canada
US	U.S.A.
CX	OPEC countries (Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, Venezuela), Algeria, Argentina, Australia, Azerbaijan, Bahrain, Brazil, Chile, Indonesia, Mexico, New Zealand, Norway, Oman, Russia and South Africa
AS	China, Hong Kong, India, South Korea, Malaysia, Philippines, Singapore and Thailand
RC	The U.E.25 Member States and Japan

Source: Lalonde R., Muir D

Each of these five regional blocks consists of:

- the companies (monopolistic type), which produces raw materials, intermediate and final goods;
- two categories of households (to differentiate their limited liquidity of consumer perspectives), which is consuming final goods and constitutes the labor supply factor for companies;
- the government, which consists of a tax authority that consume goods and services financed by taxes and loans, and a monetary authority that influence short-term interest rates through the monetary policy.

In the GEM 2007, the companies cover the goods offer for domestic and foreign consumers and they cover their own work factor necessities from the country analyzed. The firms also need intermediate goods, which they purchases from other domestic or foreign production companies.

The consumers, in turn, size the demand for domestic and foreign companies' goods and provide the employment factor for national companies.

The model in its nonlinear form can be regarded as a system characterized by functions of demand, supply and prices and uses the elasticity constant of substitution of function type ESC.

The practical use of the GEM 2007 is based on the following assumptions:

- for areas affected by the impact of the foreign countries (rest of world), the regional indices are explicitly incorporated into the notation;
- the productivity trend is the same for the world economy. All the quantitative variables in the model are expressed in terms of the trend. But increasing the productivity is only one component of economic growth. Another component is population growth, but the model assumed that this increase is zero during the forecast. In addition, all prices are considered relative;
- the non-explicitly indexed variables are expressed in average terms of capital;
- the forecasting periods are quarters and the variables have annual values.

After the simulation of the GEM 2007, the result is a different economic development in regional blocks (see Figures 1 - 4). The largest quarterly growth rates will continue to have the emerging countries in Asia.

Figure 3: Quarterly evolution of GDP, consumption and investment in Asia emergent states (%)

Source: Personal analysis

Figure 4: Quarterly evolution of GDP, consumption and investment in EU and Japan (%)

Source: Personal analysis

4. The GEM 2008 Model

The latest version of the GEM model was made in 2008, in the U.S. [7] According to this model, the economy is analyzed in the following sectors:

- households: they consume final goods and provides employment factor to all national companies. Some of these households have no access to capital markets. They finance their consumption exclusively with income from work. Other households benefit from the national companies and the national capital stock, which they rent to these companies. In addition, they buy and sell two types of titles: national, denominated in the national currency and international.

When households sell or buy international debt, they pay a prize (commission) to the financial intermediaries, whose size depends on the situation of the country's total net assets.

Labor and capital factors are considered property internationally. The capital market is competitive, and the capital accumulation is influenced by the adjustment costs. On the factor work market, the wage contracts are relatively rigid.

- companies: they produce final goods and offer brokerage services. In each country, there are two categories of final goods: the consumption goods and the investment goods, which are produced by firms in a market with perfect competition.

The consumer goods are purchased by households or government. The demand for the investment goods is supported by the private and public sector agencies. The final

goods are produced by using all available inputs of intermediate goods.

There are a variety of intermediate goods, each one being produced by a single company, which operates on a monopolistic market. The intermediate goods are produced using domestic labor and domestic capital factor. The intermediate goods can be non-marketable or tradable on the international market.

The non-marketable intermediate goods can be purchased by the government or used to produce final goods.

- government: it acquires the two categories of the final national goods and non-marketable services. Due to the Treasury, the government finances its net expenditure tax imposed on the private sector nationwide. Through the central bank, the government handles the nominal interest rate on short-term. The monetary policy is considered as a credible commitment of the government to ensure price stability by influencing the nominal interest rate on short-term.

5. Conclusions

The GEM models provide a microeconomic construction, which allows an integrated analysis of the positive elements and the economic welfare.

These results were the motivation to achieve a new forecast for the global economy. In developing our forecast, we started from the global economy evolution during 2005-2010. Data series structure aimed at satisfying the GEM model in order to achieve a unified approach to the global economic development issues.

The Influence of the Fiscal Policy in Perpetuating the World Crisis

Fădur Cristina-Ionela

Ciotină Daniela

“Alexandru Ioan Cuza” University of Iasi,
Faculty of Economics and Business Administration

cristina.fadur@yahoo.com

ciotina_daniela@yahoo.com

Abstract

This paper aims to stress the impact of the fiscal measures in the perpetuation of the current economic and financial crisis. In our approach, we have studied the set of companies with debts towards the state in the category of large companies in Romania. The database published by ANAF includes 558 large companies classified in eight activity branches. Also, we applied a questionnaire concerning the measures adopted by the micro-companies in order to fight against the effects of the economic crisis. An alarming conclusion is the fact that the penalties for the non-payment of the amounts due to the state budget dramatically weaken the strength of large companies, and the compliance with the principle of the continuity of the activity is seriously questioned. The liquidity of companies can be improved by changing the VAT legislation.

Key words: budget overdue debts, economic crisis, descriptive analysis, VAT.

J.E.L. classification: M48

1. Introduction

The economic-financial crisis, which started in 2007 and whose end is uncertain, is a worrisome subject for many people.

As an antidote to the economic and financial crisis in Romania, which has affected the business environment, generating a decrease in liquidity, an increase in the unemployment rate, as well as in the risk concerning the impossibility to ensure the liquidity level necessary for the economic agents to perform their current activity, and

in the context in which the Member States of the European Union have taken measures to support the economic operators in order to diminish the effects of the world economic crisis, Romania's Government has adopted the Emergency Order no. 92/2009 for delaying the payment of the overdue debts as a result of the effects of the economic and financial crisis.

Besides the measures adopted by the Government, we have attempted to identify the practices adopted by companies in order to ensure their survival in the new economic conditions. To this purpose, between February and March 2011 we applied a questionnaire made up of 20 questions concerning the measures adopted by the micro-companies in three activity fields (services, commerce, and industry), with the purpose of ensuring the continuity of their activity in the economic “chaos”.

We have also been concerned with performing a radiography of the budgetary overdue debts for 2009: we have analyzed all the big companies with debts towards the state, according to the data published by the National Agency of Fiscal Administration, identifying the peculiarities of each activity field: agriculture, processing industry, production and supply of electrical and thermal energy, gas, hot water and air conditioning, water distribution, sanitation, waste management, decontamination activities, constructions, commerce, transport and storage, brokerage and insurance.

As a result, our article is structured on two fundamental axes: a descriptive one, of the debts of the large Romanian companies towards the state budget for 2009, and an analytical one, minutely drawn, of the measures adopted by micro-companies in order to counter the negative effects of the financial crash.

Following our approach, we have obtained the coordinates of the commercial credit policy, of the financial policy, and of the investment policy of the micro-companies of Iași, and we have performed a comparative analysis of the field distribution of Romanian companies indebted towards the state budget at the end of 2010, in spite of the legal measures adopted by the government.

2. Measures and compromises...

As a result of globalization, the economic-financial crisis has been transmitted in waves of various amplitudes, sweeping all continents one after another [1]. The current crisis is unique in that it is based on the superposition of three crisis types, which started in different moments and which have distinct characteristics: a liquidity crisis, a financial crisis, and a crisis of capitalism as a model. This extremely rare combination explains its scope and deep effects, incomparable with those of the recession period between 1929 and 1932 [2].

At a world level, the most important topic under debate in the last three years has been connected to searching solutions for eliminating the crisis. The economic crisis is still under way. Its effects are visible, but the measures taken to fight these effects are tightly connected with the specificity of the business environment, of culture and of society values, of the existing resources, of the fiscal policy, etc.

In our approach, we have studied a sample of 42 companies in the region of Iași, classified into the following activity branches: services, commerce, and industry. The purpose of our research is to determine the impact and the effects of the economic crisis on the analyzed companies, as well as the measures adopted by the management in order to overcome the difficulties generated by the new economic context. A percentage of 26.2% of the sample is represented by micro-companies, 71.4% by SMEs, while large companies represent 2.4% of the companies included in the analysis [3].

After processing the received answers, we have noticed that, in general, the economic-financial crisis has led to the suspension of activity for 14.6% of the companies and to a decrease of the accounting-financial results for 73.2% of the cases. In this recession

period, 4.9% of the companies have managed, however, to achieve better results.

The delay between the term for paying the debts to the providers and the average term for collecting the commercial debts can have a significant influence on the liquidity of a company. Therefore, in our research, we have been concerned with identifying the commercial policy measures, considering that it is vital for insuring the success in an unstable economic environment. In this context, for the activity fields of *Services* and *Industry*, we can notice a negative evolution of the commercial credit policy, as only 2.70% of the companies have succeeded in delaying the payment of their debts after a renegotiation of their contracts with the suppliers, while 5.41% of the same category of companies recover their debts in a longer delay. For the *Commerce* field, the situation is much more favorable. 10.81% of the companies have obtained longer payment deadlines, and 8.11% of the companies have reduced the deadlines for cashing in the granted commercial credits after renegotiating their contracts with the customers. Only 2.70% of the companies have been more permissive in what concerns the deadline for debt collection from their customers in order to keep the contracts that had already been closed.

In what concerns the **funding policy**, the companies have avoided contracting new bank credits. The SPSS output reveals that 40.54% of the companies in *Services*, 18.92% of the companies in *Commerce*, and 10.81% of the companies in *Industry* have not resorted to bank credits.

The flat-rate tax has generated many controversies. Criticized or considered beneficial, the flat-rate tax remains a reality that meant the suspension of activity for many micro-companies. At the level of the analyzed sample, for 29.73% of the companies in *Services*, the introduction of the minimum compulsory tax has meant a heavy fiscal burden, and 13.51% consider that this measure has had an extremely negative effect on their financial performance. In *Industry*, 8.11% of the companies have not been affected by the introduction of the flat-rate tax, while 5.41% of the managers stated that the minimum tax has had a very negative impact on the economic and financial results.

A solution to the financial block caused by the lack of cash is to compensate credits with debts, and the regulation that allows compensating the reciprocal obligations between legal entities is H.G. no. 685/1999 for the approval of the methodological Norms concerning the monitoring of unpaid debts of the tax payers (legal persons) on time, in the view of diminishing the financial block and the economy losses, and of the Regulation for compensating the unpaid debts of the tax payers (legal persons) on time. The object of the compensation regulation is to successively compensate the reciprocal payment obligations between legal persons, based on compensation orders.

The beginning of the economic crisis has actually meant opening “Pandora’s box” for most companies, which suffered significant losses in their economic results or had to suspend their activity.

3. A radiography of budget overdue debts

The analysis of the budget overdue debts is the first step in the direction of adopting efficient measures that would stop the economic collapse. At the same time, although the Fiscal Council strongly recommends paying the existing debts to the private environment as fast as possible, even before other expenses, practice proves the opposite.

The period of economic crisis has rewritten the history of the beginning of the 1990s, when a sudden transfer towards a new economic mechanism occurred. Surprised completely unprepared, the existence of numerous Romanian companies has been conditioned by the non-payment of their debts and by accumulating overdue. At the same time, we cannot deny the influence of subjective factors in the evolution of the overdue debts, such as the poor quality of management, the fluctuations of the decision makers in applying appropriate economic policies, etc.

The results of the dynamics analysis of the debts towards the state budget may lie at the basis of the evolution of the efficiency of the governmental measures aimed at fighting the economic crisis. In order to collect the overdue debts, financial administration bodies may apply all the collection methods

mentioned in the Fiscal Procedure Code, which are: summons, attachments on bank accounts, attachments on the incomes of third parties, distraint on fixed and mobile goods, attracting the joint responsibility of the administrators, associations, or shareholders. Companies that are entitled to request VAT refunds have however the obligation to wait for an exaggerated period of time, so that deadlines are exceeded by entire months. Therefore, since companies must pay a VAT for any issued bill, although it has not been collected yet, plus accessories for delays, but they cannot force the state to refund their value-added tax, their liquidity, including the premise of the continuity of activity, become weak points.

In figure 1 we present the structure of the indebted companies according to their situation at the end of 2010. For most companies (66% of them), the enforcement procedure has started, and for 33% of the overdue companies, there are compensation petitions under way. Only 1% of the companies are under special administration, according to Law no. 137/2002, which establishes the legal frame for accelerating the privatization process.

Figure 1. Ratio of large companies indebted to the state budget at the end of 2010, on the three activity fields

Source: output SPSS

As an extended effect of the economic crisis, an increase occurs in the amounts due to the state budget compared to 2009, as well as in the number of indebted companies. Most debts come from the value-added tax and from interests and penalties, which have a different weight for each activity field.

Figure 2. Evolution of the number of indebted companies and of the value of the debts towards the state budget during 2009-2010

Source: output SPSS

It is also important to remember that the first 10 companies in the top have the highest ratio of the total debts to the state budget: in 2009, they had a weight of 78.69% of the total debt. In 2010, the weight decreased by 10.22%, reaching 68.47%.

Figure 3. Top 10 companies indebted to the state budget at the end of 2009 and 2010

Source: output SPSS

Besides the overdue penalties that the indebted economic agent has to pay, and which often imply an important effort from the latter, in some cases, they will also have to pay for the enforcement procedures, which are often quite high. We mainly refer to the expenses related to the evaluation of the distraint goods and those involved by the publicity of the tender announcement in the local and national newspapers, which can amount to 1600-2000 dollars and even more, if the press announcements are repeated.

Contracting a bank credit in order to pay for the possible overdue debts has higher advantages. It would imply paying an interest of at most 15-16% per annum, compared to an annual interest of 36% payable in case of non-payment penalties, within the legal deadline, of the due fiscal obligations.

4. Conclusions

Economists may demonstrate, based on graphic analyses, that the current economic and financial crisis was to be expected. The cyclic nature of economy will always lead to the same result. However, the solutions to diminish the effects of the crisis are in our hands, as a result of the acquired experience of the lessons provided by history [4].

In periods of economic crisis, managers have to be more cautious and make more efforts to save their business. After processing the answers obtained from the application of the questionnaire to the managers of the 42 companies in Iași, we have noticed a channeling of their efforts to

stay on the market. By changing the object of their activity or resorting to selling assets for covering their bank credits, renegotiating the contracts with their business partners or reducing the operational expenses, their purpose was the same: surviving in crisis conditions.

The perpetuation of budget overdue debts has a negative impact on the actual economy and delays economic recovery. The non-collection of the VAT from the state budget can paralyze the activity of a company and, as a result of the domino effect, of several other economic agents.

The solutions to the economic crisis should not be searched in monitoring the companies indebted to the state, but in paying the state's debts to the private environment and in the privatization of the state companies, which are great consumers of resources, especially if we consider that the debts of the state company account for 5% of the GDP, according to the conclusions of the seventh evaluation of the stand-by agreement.

Coming back to the title of the paper and analyzing the measures adopted by the Government, are we entitled to state that, for Romania, the fiscal policy was and still is a factor for perpetuating the economic crisis? Without the intention to convince, we consider that some legal measures, beyond their objective, have represented inhibiting factors for micro-companies. It is enough to mention the introduction of the flat-rate tax, the payment delay of the due VAT and the value of the interests and penalties calculated for not paying the debts to the state budget on time. On the other balance pan, we should nevertheless place the decisions of the Government that have allowed delaying the payment of the debts to the state budget and compensating commercial debts and credits.

Efficient Optimization Methods of all Technological Process by Development the Production Transfer Process

Filip Florina-Cristina
Marascu-Klein Vladimir
“Transilvania” University of Brasov
cristinaflorinafilip@yahoo.com
klein@unitbv.ro

Abstract

Since the economic crisis affected the industrial companies, to maintain the products quality and number of orders received, some companies had to implement efficient optimization methods of all technological process by development the production transfer process. The main objective of this paper is to analyze and describe the process of quality assurance in case of production transfers within a supplier's organization. The production transfer from one supplier to another supplier has to be handled as a complete component release. The aim of this process is to ensure that the supplier agrees changes to products, processes, tooling or production site (transfer), or deviations from drawings or specifications, with the customer at an early stage. The relevant lead buyer is responsible for monitoring the implementation of the transfer process at the supplier and the affected supplier is responsible for implementing the process at his company.

Key words: production transfer, product, supplier, risk, plant.

J.E.L. classification: L60

1. Introduction

The economic crisis is a present and controversial subject at this time. As a result of globalization, the economic-financial crisis has propagated in waves of various amplitudes, sweeping all continents one by one [1]. In the current economic context, managers must rethink the entire business and any decision made has a boomerang

effect, having the potential to make the difference between the continuation of activity and its termination [2].

The challenges facing manufacturing firms in many developing countries include adopting the right technology, using it efficiently and continuously reviewing production processes in order to stay abreast [3]. Technology is recognized as one of the most important factors for remaining competitive in the global business environment [4].

When the production of a certain grade is transferred to a second process or another plant, it is very important to achieve identical-grade quality from both production sites. This ensures that customers who receive the product will not notice any difference between the grades from different plants [5]. Technology transfer, being a manifestation of knowledge transfer, is the transmission of knowledge that enables the recipient firm to manufacture a certain product or provide a particular service [6].

The product life cycle can be divided into three stages: new product stage, mature product stage and standardized product stage. In the new product stage, the product is manufactured in the home country and introduced into foreign markets through exports. In the mature product stage, as technology becomes sufficiently routine a firm's export position becomes threatened, the firm is induced to produce abroad, generally in other advanced countries. Finally, as the product becomes completely standardized, production will be shifted to low-cost locations in developing countries [7].

2. Product and production transfers

Industrial companies continually face the challenge of reducing costs while maintaining quality [8]. Effective technology transfer helps to provide process efficiency and control and maintain product quality. Technology transfer contributes quality-by-design principles by identifying critical quality attributes, the key manufacturing parameters that affect those attributes and ways to control those manufacturing parameters. In several ways, technology transfer enables continuous improvement of the manufacturing process. When technology transfer is performed correctly, it benefits all stages of a product's life cycle. Effective technology transfer is particularly important when conveying manufacturing process knowledge about current products to contract manufacturers [9].

A product transfer is a change of the production location within the company or a change from in-house to external production (purchase) or vice versa, if only the tooling, devices and documents for production of the affected products are transferred. When transferring within the company, information must be exchanged between planning of manufacturing locations, product line and central data management.

A production transfer is defined as a change or localization in the production location for existing products within the company, where all necessary production resources are transferred or sourced as new (e.g. machinery, plant facilities, assembly and measurement equipment etc.). The personnel required at the receiving plant are trained in advance as necessary. The risk level assessment assesses the risk of a transfer project at the start of the project.

Transfer conditions: change in the production location for existing products within the company, technology in the receiving plant not available, training required, machinery/facilities are being transferred.

Transfer restriction: if the risk level assessment for the production transfer indicates a significantly reduced training requirement in conjunction with the movement of machinery for identical or strongly related processes, the particular case can be processed in low-risk cases as a

product transfer.

Addition: even if the conditions for a production transfer are not fulfilled, the particular case can be processed with project management and planning of manufacturing locations.

3. Activities relating to the production transfer

This chapter presents an internal procedure for transfer notes from suppliers. This study was conducted to an automotive industrial company from Brasov.

For approval of modification request from the supplier, the supplier is obliged to request the customer's approval prior to a transfer and to send the completed transfer checklist for production transfers to the lead buyer at the same time. The lead buyer receives this application and the completed checklist and takes the responsibility for processing and internal coordination. After checking the modification approval document and the checklist, the lead buyer will give the internal release, or he will send the written rejection of the modification approval to the supplier. The basic pre-condition for the supplier is that the receiving plant is approved in accordance with the company's regulations. In case it is not an approved plant, approval must be granted by means of a potential analysis. An unsuccessful potential analysis will cause a rejection of the transfer.

For transfer planning the supplier presents at the customer, the points project management, changes between receiving and delivering plant, training concept, planning of preproduction and traceability of batches. The invitation is issued by the lead buyer. The participants on company's side are lead buyer, application engineering, receiving plant and supplier development. Further activities may be required on the basis of the points presented by the supplier and previous experiences with the supplier.

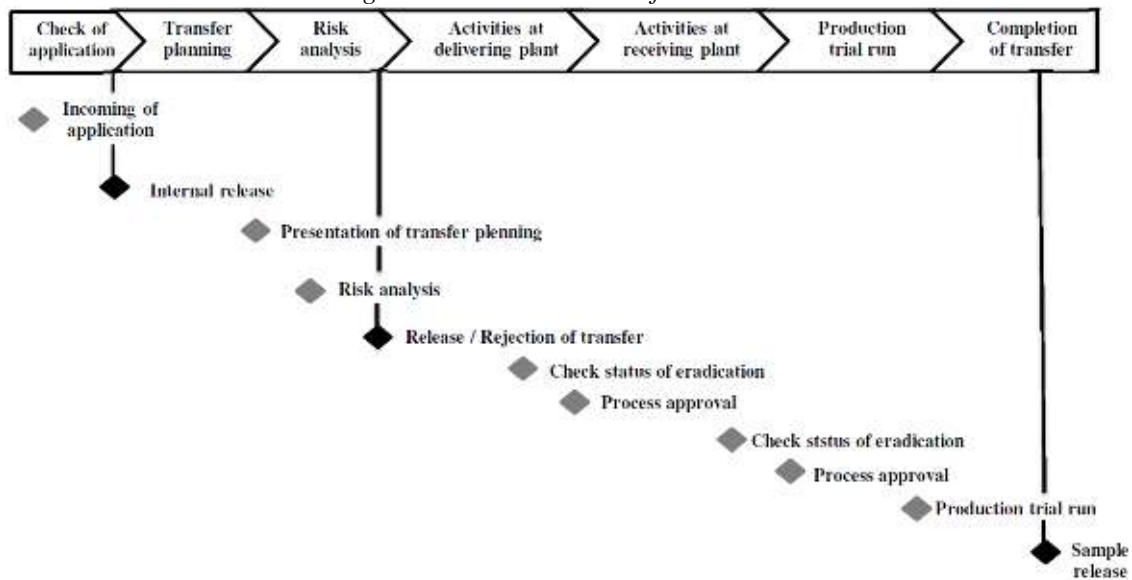

On the basis of the presented planning of the transfer and previous experiences with the supplier, is performed the risk analysis. It is also necessary to coordinate the extent to which customers of the company have to be notified of the transfer by application engineering. The result of the risk analysis is a release with or without additional requirements and the definition of the

necessary expenditure for assistance or the rejection of the transfer request.

In case of a release of the transfer request, a classification in low, medium and high risk has to be done. The classification is the basis for the necessary expenditure for assistance: low risk (evaluation of the supplier’s presented transfer planning documents),

medium risk (evaluation of the supplier’s presented transfer planning documents) and high risk (evaluation of the supplier’s presented transfer planning documents). The lead buyer is responsible for the definition of the company team and for overall control (in coordination with the relevant technical departments).

Figure 1. Production transfer activities

Regarding the activities at supplier’s delivering plant, the supplier presents at the customer the point’s project planning, buffer stock, process capabilities and planning of training. Corporate supplier development is responsible on the customer’s side. The lead buyer, application engineering, receiving plant and supplier development are participants on customer’s side. Further activities may be required on the basis of the points presented by the supplier and previous experiences with the supplier.

Regarding the activities on supplier’s receiving plant, at start of production, the supplier presents at the customer the points project management, safe relocation, documentation and logistics. According to the necessary expenditures for assistance the process approval is granted on the basis of the initial samples, an on-site initial sample approval, an on-site inspection of the processes at the receiving plant and/or process release at the supplier’s receiving plant using process audit resp. Corporate supplier development is responsible on the customer’s side. The lead buyer, application engineering, receiving plant and supplier

development are participants on customer’s side. Further activities may be required on the basis of the points presented by the supplier and previous experiences with the supplier.

For production trial run at receiving plant, the team member of the receiving plant assures that for a defined quantity of parts a production trial run will be performed and for a fixed period specific quality assuring activities will be implemented. For this a serial order will be started, with specific coverage by the team member of the receiving plant.

After a successful production trial run and the successful initial sample release of all affected part numbers by the receiving plant, the production transfer process will be closed by the release of the initial samples and this means completion of the transfer.

4. Conclusions

Transfers in the sense of production transfers are carried out by means of project management and the decision on a possible

product transfer is made in consultation with the product line and planning of manufacturing locations and documented.

The project manager with main responsibility prepares a project plan with support from the general project coordinator and the project manager at the receiving plant. This project plan contains the most important milestones and transfer steps, the summarized sub-projects, the degree of completion, the persons responsible and the start and end dates. Continuous monitoring of activities should help to improve the consistent realization of planning.

The responsible project managers at the delivering plant and receiving plant are equally responsible for the success of a project (tandem concept). The overall responsibility for the transfer and start up production of the transferred products lies with the project manager at the delivering plant, except for when the receiving plant is technologically more advanced than the delivering plant.

Transfers extending over a longer period can be divided into several transfer stages. The process of production transfer from site one of a supplier to site two of the same supplier is divided into three phases: transfer planning and classification of risk, activities delivering plant and activities receiving plant. At the end of each phase the supplier has to present the status of implementation at his company. In the case of transfers, an audit is to be planned at the delivering plant prior to moving machinery and at the receiving plant once the move is complete.

In production transfers, employees of the receiving plants are to be trained usually before machinery is moved. The training serves to communicate theoretical and practical knowledge of products, machinery and processes. The delivering plant notifies the receiving plant of the training times and the required qualifications at an early stage in the transfer planning phase so that personnel selection or the appointment strategy can be defined.

The risk potential for the activities is identified from a structured, overall assessment viewed from four different perspectives and based on defined criteria, data and processes. A further course of action is decided on and documented within the team on the basis of the identified risks. The

aim is to identify the risk potential associated with implementing a transfer and the subsequent definition and documentation of the decision on the appropriate process, as well as the definition of measures with the persons responsible in order to reduce the risks.

Abstract

Tourism has taken another step in responding to requests for more and more demanding markets: a complex, sophisticated product (well done or well organized) and at reasonable cost. MICE is now regarded as a contemporary form of tourism, something "fashionable" to diversify tourism products of a country or region. MICE is an acronym used for international Meetings, Incentives, Conventions, Exhibitions. The international industry is one of the largest in the organization of fairs and congresses, but also a tourist segment that will be developed in the future. MICE is the sector that is growing most rapidly in the travel industry. It is estimated at 300 billion euros.

Key words: MICE industry, tourism, global trends, economic crisis.

J.E.L. classifications: L83

1. Introduction

MICE (meetings, incentives, conferences and exhibitions) segment represents one of the fastest growing sectors within the travel and tourism industry generating important revenues for all the cities and countries which became MICE destinations. Europe and United States are the major markets in respect of the number of meetings, conferences and exhibitions.

Nowadays, we face-off a non-standardization terminology for MICE tourism. The acronym MICE is still in widespread use around the world, despite its somewhat unfortunate connotations. In

Canada this is adjusted to MC&IT: meetings, conventions and incentive travel.[1] Even in Europe, after some authors, is preferred term of “business tourism”, and, in the meantime, in Australia is used the term “business events”. But the dispute on the terminology of MICE or business tourism or events will continue, so we will refer to MICE as the best term for meetings, incentives, conferences and exhibitions.

MICE tourism is fundamentally different from general business tourism as it has everything to do with tourism industry infrastructure, marketing and perception and several crucial levers that exist within the City's ability to expand demand in this sub-sector. [2] Tourism is a staple industry for many country's economy. It is a service industry providing a generous distribution of income to all sectors of the economy, including those directly related to tourism such as resorts, restaurants, transport and activity providers and souvenir shops as well as those that are indirectly involved such as communications, advertising, public relations, and produce suppliers. In addition to revenue, the tourism industry, and more specifically the MICE industry, creates jobs and the potential for knowledge exchange between people of the same professions leading to national human resource development.

Within the tourism industry, the MICE sector is singled out as an alternative component, a must for numerous destinations, especially due to the significant advantages involved by the development of this type of tourism. The key characteristic of the MICE tourism is the fact that it can be incorporated into any type of offering, no matter the resources available at the

destination, as long as a wide range of services targeted at the business customers are available.

Within the development strategies of certain regions, MICE is listed as a top priority, not only because it leads to the creation of important social-economic benefits, but also because it might prove to be the most appropriate solution for reducing the seasonality faced by those destinations. For example, numerous resorts in areas with high seasonality consider the development of the MICE sector as a key objective, investing significantly in the infrastructure required for such events, in order to be able to yield economic benefits during the off-peak season, when the demand for tourism services is limited. Among the benefits of organizing such events we can list the boost in the demand for tourism services during the peak season from clients who otherwise would have opted for a different destination, as well as the extension in the length of their stay by clients attending events (such as fairs, expos, sport events) not initially part of their travel plans. In other respects, this kind of tourism also plays a major part in generating a positive image of the destination, having the potential of becoming a key factor in the marketing of a specific destination

2. About MICE Industry

The Meetings, Incentives, Conferences and Exhibitions sector consist, at the beginning, of activities including conventions, trade shows, seminars, events, exhibitions and incentive travel, then extends the number of activities included in the MICE sector to include workshops, press conferences, symposiums, forums, panels, lectures, and colloquiums. [3]

A *meeting* is defined as an event designed to bring people together for the purpose of exchanging information, either from within one company or organization or from a broader spectrum of people: cocktail functions, product launches, lunch dinner and breakfast meetings, as well as special occasions such as weddings would constitute a meeting as defined by the WTO. Meetings held by corporations and other businesses are classified as corporate meetings, while those held by associations are referred to as association meetings. [4]

Figure 1. The International Meetings market from ICCA Report

Incentives are the second category of this market segment and include travel to a foreign country or domestically as part of a motivational incentive scheme to increase or reward employee effort. The definition of *conferences* is highly contentious but is generally accepted as being a multi day event having at least 100 delegates attending the event for the purpose of exchanging information.

Exhibitions involve the bringing together of people for the purposes of viewing products and services.

The Meetings and Events Industry encompasses all facets related to the planning, staging and evaluation of meetings and events, including: customer, in-house organiser, Professional Conference Organiser (PCO) now commonly termed “Meetings Manager”, venues including convention centres, hotels and attractions, airlines, tour companies, special events organisers, suppliers (everything from satchels to names badges), audio-visual production houses, staging, themeing. [5]

Figure 2. MICE Components

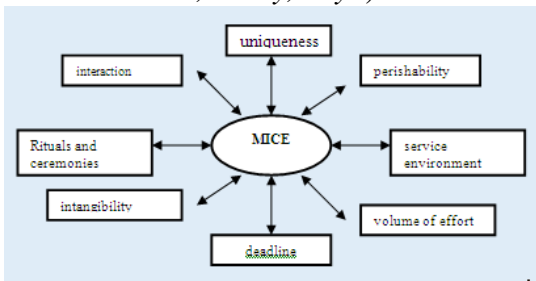

There are three types of MICE benefits:

- Primary benefits: direct gains in case of MICE locations, PCOs, PEOs, DMCs organizers and hotels;
- Secondary benefits are obtained indirectly from sectors such as food, and entertainment attractions, travel agencies and tour operators, shopping, transportation, communications, banking, labor employed temporarily, importers of goods, etc.
- Tertiary benefits represent amounts that can not be calculated and measured precisely, it is beneficial for the country / region / destination translating the overall gain in technology transfer, international trade, positive image.

Although the MICE features have a lot in common with the services sector in general and with the hospitality and travel industry, the main characteristic of these consist in the uniqueness of a certain event. Each event differs from another taking into consideration variables such as: the number of participants, service environment, audience, etc.

Figure 3. MICE characteristics(after Shone, A., Parry, Bryn)

Perishability derives from the first feature mentioned and is caused by the customization of the services for every individual business event. At the same time, services offered cannot be stored and are consumed only if the event is taking place.

Service environment—of all characteristics of a meeting, the service offering and environment play a major role both for the organizer and for the client. A business event placed in an appropriate environment can be hugely successful, while an unsuitable environment can lead to the failure of an otherwise well-organized one. Besides the environment, the role of the organizer is to decide the number and the type of the services needed to guarantee the success of

the event, based on the requests made and the available budget.

The more complex a meeting, the higher the *volume of effort* required from the organizers, and the higher the number of personnel required. Organizing issues, the huge number of processes required to set-up and run a business event, the need of permanent communication with the beneficiaries, all these require intense human efforts, as well as significant time and material resources.

At the same time, business events are organized based on specific *deadlines* that must be met to guarantee the success of an event.

Intangibility, a typical feature of the services, means that it is impossible for somebody to actually “touch” an event. The only tangible aspect is the overall experience: being part of the event, the enjoyment of the experience and one’s later memories about the event.

Rituals and ceremonies, such as staging traditional ceremonials or remembrances of significant historical events can be parts of an event. Numerous events are inherently based on people’s desire to celebrate dates, historic events and other important moments in the life of their communities. [6]

The success of the event becomes also a function of the participants’ involvement and reaction to the event itself (for example, the real participation of the individuals in the attendance of a workshop).

3. The impact of MICE over the tourism and travel industries

The MICE sector is a valuable producer of tourism income, investment, foreign exchange earnings and jobs. The meetings incentives conferences and exhibitions sector of the tourism industry has experienced important growth all over the world, with many destinations and venues having already invested in major MICE facilities. The first conference cited was held in 1896 in Detroit, Michigan when a group of businessmen first realised the economic value of hosting meetings. [7]

In 1998, UIA identified over 184 countries, which have held MICE events. [8] According ICCA, the most rapid growth has

occurred in Asia. Africa and Eastern Europe have recently entered the MICE market, the USA has the maturest MICE market. The USA has lost part of its market to newly developing MICE destinations such as Asia.

Table 1. Numbers of MICE events between 2000-2010

AN	Number of MICE events
2000	5186
2001	5262
2002	6090
2003	6294
2004	7524
2005	7825
2006	8549
2007	9036
2008	9610
2009	9255
2010	9120

Source: ICCA, 2000-2010

Statistically it was demonstrated upon many marketing studies, being an important source of incomes for the local economy and for the community, the MICE Industry is nowadays sustained in all developed countries by the resort organisms who seek the strategic development, creating a suitable ambit at a legislative level and investments in order to achieve dinamic opportunities of growth in this sector.

Table 2. Distribution of meeting by continets, 2010

Europe	54.1%
Asia	23.1%
America (North & South)	15.7%
Africa	4.9%
Australasia / Pacific	2.4%

Source: ICCA 2011

The ICCA stats display a total amount of 400.000 annual conferences, exhibits and fairs organized all over the world, with a total income of 280 billions USD.

The most important international MICE markets are USA and Europe, while a continental rank shows Europe as a leader in the top preferences of the MICE clientele, Western Europe holding 60% of the total events of this kind.

As a present tendency, new East European competitors like Russia, Hungary, Bulgaria and Romania appear on the market having as advantage the possibility of cheaper offers than the traditional European destinations, upon the development of the turistic infrastructure with an orientation on this sector.

Table 3. Top 10 meetings organizers

	Country	2008	2009	2010
1	USA	637	595	623
2	Germany	450	458	542
3	Spain	385	360	451
4	Italy	350	350	341
5	UK	381	345	399
6	France	397	341	371
7	Brasil	255	293	275
8	Japan	281	257	305
9	China	262	245	282
10	Switzerland	217	227	244
48	Romania	46	42	39

Source: ICCA, 2010

The whole range of the MICE components have a great impact on the tourism industry, being extremely benefic taking into consideration the advantages that result from their organization: the sales growth of the transportation services, the increase of the hotel occupation range, additional incomings obtained through the commercialization of the service offers, real profits obtained by the economic agents who sustain the operations(hotel, catering service, travel

agency, etc), incomings for the connective industries(from technic and equipment dealers, alimentary dealers and even the companies specialized in floral decorations, taxes and fees from the state budget, creating new jobs, the development of the general and specific infrastructure) represent certain advantages for the event organi organizers and for the community.

4. Trends in the meetings, incentives, conventions and exhibitions industry

The Meetings, Incentives, Conferences and Events market is a rapidly expanding market for destinations offering the key components important to these segments of the tourism industry.

The MICE industry is characterized by the “*Three Highs*—high growth potential, high added-values, and highly beneficial innovations”; the “*Three Larges*—large output, large opportunities for employment, and large industry associations”; and the “*Three Advantages*—advantage over other industries in human resources, technological know-how, and the efficient utilization of assets.” [9]

In an increasing competitive global marketplace, the conference and meetings industry will have to adapt to change and respond to external influences for survival. In order to remain competitive, this sector needs to respond to a number of challenges that will face the industry in the near future.

These responses are:

- to upgrade conference venue infrastructure and to develop new products.

- to invest in human resource development for the industry in order to become an attractive career option, and to improve employee motivation.

- to implement and utilise new technologies that facilitate the successful organisation and delivery of conferences and meetings.

- to continue to invest in marketing strategies in order to stimulate the growt .

- to lobby government for support in terms of funding and investments. [10]

MPI (Meetings Professional International) considers that the number of meetings, suggestions for activities, as well as the

number of participants and level of spending per event/meeting will increase in 2012. At the same time, clients interested in such events expect to receive a higher slice of their organizations’ budgets to support this anticipated increase in their needs. However, everybody is suspicious about the accuracy of such predictions, especially because of the state of the worldwide economies and the boost of oil prices that will result in higher travel costs.

In a world in which terror attacks and economic crises are a current occurrence, more and companies use e-conferences as a solution that saves them both money and time. Small and medium-sized companies in the US and Europe use phone conferences and virtual meeting more and more often, resulting in significant savings in their travel budgets. Virtual meetings become more and more widespread as companies’ top and middle management tend to keep themselves updated on the latest development in this area. While this trend is obvious to all observers, lack of available statistical data makes the efforts of quantifying it ineffective.

On the other hand though, the technological developments play a vital role in the MICE sector not as a replacement for the face-to-face interactions, but as a tool that facilitates the efforts of the organizers of meetings, incentives, conferences and events. New technological tools on display at MICE fairs all across the world show ways for organizers and buyers of such technologies to improve the efficiency of their work.

Climate changes (and carbon emissions in particular) are a top priority on the agenda of MICE associations. Most of these associations work together from a desire to educate their members on adopting “green” policies. This new tendency is becoming more and more visible in the policies of the organizations that promote conference centers, hotels, and airlines that adopt environmental-friendly practices as part of their daily business practices. Statistics show that companies adopting “green” policies wind up with cost savings, while also reducing the carbon emissions.

Among the other factors affecting MICE demand are:

-Domestic and international economic stability and all economic crises that affected the different continents in the last 20 years had as result for MICE industry the tendency to cancel important meetings and smaller budgets dedicated to organizing business meetings by: reducing the number of delegates; reducing the budgets for catering and food services; the use of less expensive locations (like 3-star hotel instead of a 4 stars - compromising quality).

-Exchange fluctuations can have positive or negative effects on the MICE industry events by relocating to countries that offer the exchange rate advantage, becoming good value for money destinations.

Even though at this moment Europe and the US hold the supremacy in the MICE sector, Middle East and Asia are quickly closing the gap. Due to consistent and significant investments in infrastructure, the endorsement of the respective governments, and the involvement of powerful organizations that support the development of this sector as a way to attract new clients and, implicitly, create new sources of revenue for organizers and the countries involved, the afore-mentioned areas witness a considerable increase in the number of events.

Innovativeness and Adoption of Innovation under Crisis Conditions

Florea Dorian-Laurențiu

The Bucharest Academy of Economic Studies, Faculty of Marketing
floreadorian@yahoo.com

Abstract

Innovativeness is the engine of human progress and wealthness, and thus, our way out of this economic crisis. However, economic crises can drive different trends to the innovation propensity of both firms and consumers. This article focuses on the factors that influence innovativeness and on the assess of innovativeness trend during the current economic crisis. The article sets that global innovativeness has a positive trend under crisis circumstances and that consumers kept propensity for adopting innovations.

Key words: innovativeness, adoption of innovation, economic crisis, R&D, consumer's behavior

J.E.L. classification: D91, D92, M 31

1. Introduction

Innovativeness is considered one of the key factors in overcoming the current economic crisis. Although innovativeness is required in any economic circumstances, during a crisis period it becomes imperative for a firm's survival. Therefore, firms are forced to innovate in order to maintain their positions on the market, or, at least, avoid bankruptcy.

Such strategy has to take into account the changing consumer behavior, negatively influenced by his financial constraints. As a general feature of a crisis period, consumers become less willing to try new products, as their risk aversion rises.

Thus, firms have to face two opposite forces: the competition that forces them to innovate, and the consumers that, theoretically, suppress their innovative side. Under this circumstances, only the best

marketing strategies can shirk from both dangers.

On the other hand, the use of crisis to leverage innovation is a wide topic in the management literature [1][5]. Doyle and Krauskopf acknowledge that „crisis can be a powerful agent for introducing and rapidly adopting innovation.”[3]

2. Literature review

According to Rogers, „the innovation process consists of a sequence of five stages”: agenda-setting, matching, redefining/ restructuring, clarifying and routinizing. As well, Rogers suggests five characteristics of innovations that influence the adoption: relative advantage, compatibility, complexity, triability and observability [9].

Technology acceptance model suggests that perceived usefulness and perceived ease of use are the major factors in the adoption of innovation [2].

If we consider the individual, adoption of innovation depends on the consumer innovativeness, which is defined as „a consumer's propensity to adopt new products” [13]. Usually, in the marketing literature, consumer innovativeness is measured on the ground of trait theory, which states that consumer behavior is influenced by personality traits. For instance, Rogers proposes three types of personal characteristics which influence the consumer innovativeness: socioeconomic characteristics, personality variables and communication behavior [9].

Schumpeter splits innovations into several categories: introduction of a new product or a qualitative change in an existing product, process innovation new to an industry, the opening of a new market, development of new sources of supply for raw material and other inputs, and changes in industrial organization [12].

However, the most used classification of innovations is given by OECD in the Oslo Manual [8]:

- Product innovation – the introduction of products that are new or highly improved in terms of features, utility or performance;
- Process innovation – the introduction of new or highly improved manufacturing methods. Usually, process innovations aim to reduce costs, to increase productivity or to sustain forthcoming product innovations.
- Marketing innovation – the introduction of new marketing tools that changes profoundly the marketing policies of the company;
- Organisational innovation – the introduction of new organisational activities, methods and tools that changes the organisation structural and functional mechanism.

As can be seen, these categories consists two fundamental types of innovations: technological and non-technological. Some narrow views of the innovation process considers just the technological side of the innovation, neglecting the non-technological paths. Nowadays, it's clear that research and development (R&D) is just a part of the innovation process, and a company can be appointed as innovative without having a performant R&D department. Nevertheless, there are many firms that combine technological and non-technological innovations, adopting a complementary innovation strategy.

3. Objectives, Hypothesis and Method

This paper consists of an exploratory research of the innovativeness issue, integrated in a larger research project, which aims to explain and to assess the brand influence on the adoption of the product innovations.

The objectives of this paper are:

O1: To analyze the conflicting factors that influence the innovativeness during an economic crisis period.

O2: To state a general orientation of firms towards innovation during an economic crisis period.

O3: To determine how consumers innovativeness is influenced by the economic crisis.

O4: To assess the global innovativeness trend under the economic crisis circumstances.

We adopt the following hypothesis that are to be verified or invalidate by the current paper:

H1: Generally, companies restrict their R&D budgets and try to neutralize the leader as much as possible.

On many markets, there are few companies that invest great amount of many in R&D activities, and many other companies that try to copy, as well and as fast as possible the innovators.

H2: Consumers have the same propensity to adopt innovations as they had before the current economic crisis.

H3: Global innovativeness keeps a stabile trend under the economic crisis period.

Despite the negative effect of the economic crisis on the population incomes, we presume a constant predilection for innovations.

The main methods used in this research are the empirical analysis, statistical analysis and the case study.

Millot proposes trademarks as indicator for product and marketing innovations. Several studies show a positive correlation between trademark counts and other indicators of innovation diffusion. [6]

One of the most meaningful indicators of innovativeness is the number of new patents. Thus, this research is based on the statistical figures of new patents applied to the United States Patent and Trademark Office (USPTO) from 10 of the largest economies in the world by GDP from 2000 to 2010: United States, China, Japan, Germany, France, United Kingdom, Brazil, Italy, India and Canada.

4. Analysis and Results

First of all, we consider relevant to take a look at the conflicting factors that influence the population's propensity for innovations under economic crisis circumstances. As negative elements can be mentioned:

- The decrease of the population's incomes that restrict the expensive innovations adoption;

- The increasing risk aversion perceived by individuals under economic crisis conditions;
- The pessimistic expectations of the population, drawn by the negative provisions given by the media or other influential factors.

The most important positive arguments for adoption of innovation are:

- A more careful assessment of the products before buying, that can strengthen the consumers' trust on the new products;
- The need of finding more efficient products in order to save money on a long term (i. e. low consumption cars);
- Many of the personal characteristics that influence the consumers' innovativeness are not sensible to an economic crisis, as it is stated below.

As well, the economic crisis brings contrary arguments for the companies innovativeness. These means that any change that occurs in the companies behavior towards innovation can be explain by one of the following arguments. The reasons of a company's innovativeness decrease under crisis conditions are:

- The lack of financial resources (own or borrowed) to support the expensive R&D activities;
- Every innovation contains the risk of failure, so the risk management becomes a sensible aspect as many other risks rise during an economic crisis;
- The decline of salaries, that usually occurs under crisis conditions, drive to less motivated employees, less eager to implement innovations.

On the other hand, crisis inconveniences can have positive influence on the companies innovativeness, such as:

- The fall of some products' sales needs to be covered by new products' sales to exploit completely the production capacity;
- The need of finding more efficient production processes drives to the adoption of process or organisational innovations;
- The need to gain a better position on a more and more competitive market drives to the adoption of marketing si product innovations;

- The specific income designs offered to the employees, that pays more for performance, encourages the employees to struggle for adopting and implementing innovations of all kinds.

As it was mentioned, there are enough arguments for companies to adopt all kind of innovations: product, process, marketing and organisational. While regarding product innovations companies have different orientations, almost all companies adopted some process or organisational innovations such as: cost reductions managed by a better control of the technological losses, cost reductions managed by a better use of time, innovations regarding the organisational communication and labor relations.

The pace of innovativeness can negatively affect the consumers' adoption. „A firm may be unwilling to introduce a new technology if it seems highly probable that future technological improvements will shortly be forthcoming” [10]. The same reasoning is displayed by the technophiles who delay the buying of the new gadgets, such as e-book readers [4]. As the adopter anticipates further improvements or innovations on the field, he usually prefers to expect those ones. Basically, that's why many companies don't market their innovation immediatly after it's ready, looking for the best moment when can be more successful.

This analysis help us understand how the innovativeness can be influenced at the level of a producer or a consumer, but doesn't allow us to distinguish which have the conclusive impact on the consumer's behavior towards new products. Therefore, the next step of this research is to have a look at the consumer. Having in mind the three types of personal characteristics that influence the consumer innovativeness, proposed by Rogers, we can analyse how an economic crisis may affect the adoption of innovations.

The socioeconomic characteristics suggested by Rogers are: formal education, literacy, social status and degree of upward social mobility [9]. Of all these, only social status may be sensitive to economic crisis, as the social hierarchy changes under economic turbulences. The observation that wealth and innovativeness go hand in hand drive us to the conclusion that if the crisis affect wealth, can affect personal innovativeness also.

Personality variables that Rogers consider important in the consumer innovativeness are: empathy, dogmatism, ability to deal with abstractions, rationality, intelligence, risk aversion, fatalism and higher aspirations. The most obvious causality is the one between economic crisis and risk aversion. A high risk aversion inhibits consumer in trying new products. Although risk aversion is granted to consumers, we can talk also about the risk aversion of the companies. Moore proposes three outcomes of all innovation efforts of a firm: neutralization, differentiation, productivity and waste [7]. The first three outcomes are desirable for the firm, but the last one represents in many cases the larger part. Wasted innovation may be unsuccessful attempts of innovation or innovations that don't generate profit. Thus, if a firm's management anticipate a high probability of waste in the innovation process, it confines the innovation inside the firm.

According to Rogers, the communication behavior variables that influence the consumer innovativeness are: social participation, interpersonal networks, cosmopolitaness, change agents and opinion leadership [9]. None of this variables can be notably affected by economic crisis.

To enforce the conclusions of this research, we will briefly analyse a case study which we consider relevant: smartphones adoption. The first smartphone was the IBM Simon, designed in 1992 and shown as a concept product [11]. It took 15 years for smartphone to obtain large acceptance and adoption. After the first iPhone release in 2007, smartphones have had a great adoption growth, as can be seen in Figure 1.

Figure 1. Adoption rate of smartphones

Source: www.infotrends.com

It's obvious that iPhone success encouraged many phone manufacturers to copy the functional characteristics in a struggle to neutralize some of its advantages at a lower price. This manufacturers turned their R&D efforts into a quest for the most direct technologies to implement the functions of their competitors' products.

Finally, we analysed the numbers of new patents applied to USPTO between 2000 and 2010, by companies, institutes and other entities from the 10 countries mentioned above. As it was mentioned before, this figures are precise indicators of global innovativeness.

In order to evaluate the annual evolution of the new utility patents we calculated the chain-based indexes and the and the relative modification. In order to verify the hypothesis H3, we calculated the average relative annual modification for the period 2000-2007 and the same indicator for the period 2008-2010 (see Tabel 1).

Tabel 1. Relative annual modification average of the number of utility patents

Country	Relative annual modification 2000-2007 (average)	Relative annual modification 2008-2010 (average)
United States	-0.479%	11.5319%
China	37.9683%	51.4415%
Japan	1.4659%	10.8723%
Germany	-1.296%	12.2726%
France	-2.194%	14.0156%
UK	-1.194%	10.7099%
Brazil	2.9482%	28.0351%
Italy	-3.359%	12.3315%
India	23.661%	28.3078%
Canada	0.1463%	14.2439%

Source: Author's calculations

Tabel 1 leads quite clearly to the conclusion that the largest economies have enhanced their innovation struggles in the three last years, under crisis pressure. China and India were leading on the innovativeness growth between 2000 and 2007, while 5 countries had negative trends. The innovativeness burst in the 10 largest economies in the world, but we have to remark China's incredible performance of

more than 50 percent per year during the last three years taken into consideration.

Taking a look on the Figure 2, there can be seen the evolution of the aggregate patents number of the 10 largest economies. The conclusion that can be drawn is that under welfare conditions, the number of new patents has little variations, while under economic crisis conditions, the innovation activity has a significantly growth (about 5% in 2009 and more than 30% in 2010).

Figure 2. The evolution of the aggregate patents number of the 10 largest economies between 2000-2010

Source: Author's calculations

5. Limitations and future research

We can nominate at least two limitations of this research. The first one is related with the lack of statistical data for a relevant and representative model that can explain the changes appeared in the adoption of different kind of innovation during the economic crisis. This data should reflect the evolution (yearly or even monthly) of adoption rates. The second limitation refers to local culture and particular aspects that might affect the adoption pattern of innovation in different countries. This is a source of variability that explain the noticeable differences that exist on the globe concerning adoption of new technologies. As an effect, any conclusion drawn at global level might result invalid in specific places.

As a sequel, we propose for future research:

- To verify, qualitatively and quantitatively, on different innovations, if any influence of the economic crisis on adoption of innovation exists;

- To investigate any positive synergy effects of different kinds of innovation, especially between product innovation and marketing innovation with focus on brand;
- To set what kind of innovations are the most used by companies under economic crisis conditions and why.

6. Conclusions

This paper tries to analyse innovativeness under crisis conditions, having under view both consumers and companies.

As the statistical research revealed, the companies innovativeness significantly improved since 2008, having a burst in 2010. Thus, hypothesis H3 is rejected. Indeed, global innovativeness haven't decrease, as we presumed, but it hasn't a stable evolution either.

Against some theoretical and logical arguments, consumers adoption of innovations doesn't seem to be negatively influenced by the economic crisis. However, a better view to different kind of product innovation is necessarily in order to admit or reject hypothesis H2.

Companies innovativeness becomes more and more related with the competitors' moves. Exception few companies that assume the role of market setters, the other companies choose to touch the utility, to approach the perceived value and to beat the price of the leader. In conclusion, we admit hypothesis H1 until future research.

Risk and Performance – Purposes of Banking Supervision and Stability

Florea Dragoş
„Valahia” University of Târgovişte
floreamdragos73@yahoo.com

Abstract

No organisation is immune to risk. Moreover, each organisation’s risks change constantly. Every organisation must learn to anticipate and prevent risk by identifying, measures, and controlling business. In this article we will show that banking risk management is an ever-changing process shaped by general factors, such as the institution objectives, financial trends, government regulation, internal structure, the maturity structure of assets and liabilities, and the size and source of the risk. Obviously banks make money by taking risks and lose money by not managing risks effectively. In order to obtain performance, banks must take on higher levels of risks than in the past (E.E. Furash, 1999 cited by H. van Greuning, S. Brajovic Bratanovic).

Key words: credit risk, banking risk management, performance

J.E.L. classification: G 21, G 32

1. Intrduction

In general, the objective of managing the risk by any financial institution is the possible profits. Banks carry out their main activity, the credit activity in conditions of uncertainty and for this it takes a certain risk. For some risk managers the global approach of risk is a way to stop the myopia of various classical features of the modern organizations. Every organisation must learn to anticipate and prevent by implementing effective processes throughout the company so that it proactively identifies, measures, and controls business risk [1].

2. The risk and the banking performance

Managing uncertainty and obtaining performance, said Adrien Bedard is the responsibility of all employees within an organization and for this we need to follow all the systems and phenomena taking place in that organization and all decision tracking next to the psychology and the behavior of each employee [2].

Performance is an ongoing concern for all economic actors. Its perception is different, depending on the specific interests. Interest in measuring performance, selected references, and measuring instruments are closely related to the objectives sought by the organization and its partners. Measuring performance is a necessary condition to ensure the progress of an entity, but is not enough [6].

Performance measurement it is also a priority direction for normalization of international accounting. In a general accept, the performance expresses:

- Be the result of actions: in most cases, the word “performance” is associated with outcome of an action, good results obtained in a field of activity;
- Or simply success: the performance is associated with success, the success in a particular field;
- Be an action that leads to success.

In other words, success is not appreciated only in terms of subsequent results, it is built all along the process of defining the action plan until completion, and achievement of strategic objectives. Performance does not exist in itself. It is always the product of a comparison. The problem is with what is the comparison? This is either an internal variable (an objective of progress or result of a past period) or an external variable.

Lavalete G. and Niculescu M. define the performance of being a level of an unstable potentiality of an organization, made by the optimized torque value and the cost, and make that the organization to be competitive on its strategic segments. In this sense, the performance is synonymous with competitiveness, a competitive bank (performance) being an efficient bank (able) to improve the relationship between the results and the resources allocated) and effective (able to satisfy the expectations of all social partners), at the same time. Performance is a state of competitiveness of the bank reached by a level of efficiency and productivity (efficiency) that ensure sustainable market presence [6].

Performance is perceived in a different manner by the bank partners, depending on specific interests: shareholders are concerned about ROI, employees of bank stability, the

creditors of solvency, the suppliers of sustainability activities and markets [6].

3. Performance measurement

The interest in performance measurement, no matter the chosen level, results from this:

- a) allows those interested to know the stage of advancement in operations;
- b) allows assessment of the results obtained in relation to their efforts;
- c) serves to justify the investment of additional resources;
- d) determines priority actions and implementing plans;

Specific purpose of performance measurement and measurement devices are in closed correlation with the objectives of each partner and are shown in Table1:[6]

Table 1. Indicators of performance measurement

Partner	Objective of performance measurement	Indicators of performance measurement
Shareholders	Estimate in a reliable manner the value of the organization and the ability to pay the capital	-Net income and its rates which can be built on its basis, -Indicators that express value creation (EVA, MVA, CVA)
Members of Board Directors	Assessment of quality management and capacity development. Establishing the form and level of remuneration of managers	-Indicators of using resources -Indicators of management activity -Indicators of results -Efficiency indicators -Development-specific indicators
Managers	Estimation of tactical and strategic objectives and their achievement	-Indicators of using resources -Indicators of management activity -Indicators of results -Efficiency indicators -Development-specific indicators
Creditors	Estimation of enterprise capacity to generate cash inflows or cash equivalents in order to be able to pay its debts when due	-Liquidity ratios -Indicators of Solvency -Cash-flow-indicators
Employees	Establishing the form and level of remuneration Assessing bank stability	-Activity indicators -Efficiency indicators -Specific indicators on staff motivation
Clients	Estimation of production quality Assessing bank stability	-Production-quality indicators -Total Quality Indicators
Civil society	assessing development	-Development-specific indicators

Source: Niculescu M, „Diagnostic Financiar” Vol. II, Editura Economica, 2003

Currently, the banks adopt prudential norms, which are based on two main types: deposit insurance and the obligation to comply with a minimum capital ratio, often called Cooke's report. These two types are intended to cover two key risks that are derived from conventional banking system, credit risk and default risk of deposits. The role of money creation, which is the responsibility of banks sometimes lead to situation where customer deposits exceeds their capital reserves. The risk occurs when the bank is unable to convert the money that depositors are the property of liquidity contagion effect can occur as the entire banking system. [4].

In general it is better to define an organization's overall performance as a subtle balance between stakeholder satisfaction of the organization (employees, investors, financial partners, clients, social environment) and the risk it faces.

Finding this balance is a very delicate exercise because the organization stakeholder concerns are different and sometimes contradictory. It is currently accepted that the fine balance of performance and viability depends on the organization to adapt to risk [5].

To prevent and mitigate credit risk in order to obtain bank performance, banks need to adopt certain measures to protect against risks in general and especially credit risk, credit being the main activity of banks. The overall performance of a bank's overall results show it, being on the banking company's capital profitability, it correlated with variation depending on resources made by the bank. In other words, a bank's performance is given by profit-risk bank.[7] Outlets at each regular determine different types of assessment indicators that give insight into the evolution of the bank's position and at some point, their establishment is correlated with the bank on the organization's strategic decision banking units as profit centers based on the assessment so performance criteria to help analyze the results. In banking practice using a variety of indicators for analysis and evaluation of bank performance, but depending on the main objectives of bank management is mentioned [8].

1. Indicators for assessing the overall efficiency of the bank's activity;
2. Indicators of asset quality;
3. Indicators for assessing profitability and profitability and the correlation between them;
4. Indicators of income analysis and bank charges;
5. Indicators of banking ratings.

For an indicator to be relevant and useful decision-making at every level of construction should be done by following strict rules. This is the premise of respecting quality requirements imposed on any indicator and materialized in: utility, accessibility, reliability, simplicity, reliability, neutrality, responsiveness, consistency. In this regard must be taken into account the characteristics of indicators, specifying for each: name, the center of decision formula, frequency of calculation, the reason for the choice of indicators, the contribution of information, sources of data necessary to calculate, the normal evolution of the indicator, possible interactions, the range of decisions may be taken based on the indicator, presentation indicator (rate, absolute size).[6]

Performance always depends on the quality of bank' management, quality is assessed by the results based on management decisions that were taken.

Assessing the economic environment (market banking products), risk is actually anticipating the future and change the pace of economic phenomena, in order to develop realistic strategies to achieve performance and advance the banking market to potential competitors. To get better performance from the banking system top management should consider the following elements[3]:

- A system of competitive information;
- Rewarding staff performance based bank;
- Knowledge of techniques and financial instruments;
- Sound financial management;
- Strategies.

A performance assessment system used in the banking system is the system used in the U.S. CAMEL. This name comes from CAMEL main elements of the review of bank performance, safety and soundness of banks, namely:

- Capital Adequacy Requirement;
- Asset quality, asset quality;
- Management-Management;
- Income-Earnings;
- Liquidity-Liquidity.

The award consists of grades 1 through 5 for each component of the system, with 5 being the highest level of concern of the banking authorities. The banks with ratings at least equal to 3 are examinations at least once a year. Other banks are examined every 24 months. The analysis of these criteria can see that performance appraisal is viewed mainly as a strength. Profitability is a priority of each bank and not banking authority. Income and bank management are addressed in this context only as ways to minimize risk and exposure coverage. CAMEL rating is a weighted average of a banking authority periodically recalculated. The significance of this qualification is as follows: [9]

- CAMEL rating 1: The banks in this group are in sound financial situation of almost all points of view considered. - CAMEL rating 2: banks in this group are also fundamentally sound institutions but may show modest weakness that can be corrected through the normal course of operations;

- CAMEL rating 3: banks in this group exhibit a combination of weaknesses that reflects conditions ranging from "moderately severe" to "unsatisfactory". These banks are vulnerable and require more than normal supervision. - CAMEL rating 4: banks in this group have a large volume of doubtful assets or a combination of other conditions that are less than "satisfactory". This situation is present but not pronounced, a potential bankruptcy.

- CAMEL rating 5: banks in this group have a nature and scale weaknesses requiring urgent support from shareholders or from other sources. The probability is high for these banks. Banks that have a grade 4 or 5 are called problem banks. The activity of these banks can not be seen as prudent and are exposed to bankruptcy, are closely supervised and banking authorities usually are forced to change financial management. The overall performance of a bank is given by profit-risk.[10]

4. Return on equity

Return on equity (ROE= Return on Equity) and its variation are the key element of this approach. Decomposition of the two elements provides images in the internal structure of the Bank's risks and benefits. Return on equity (ROE) is divided into:

- Return on assets (ROA) = Return on Assets)

- Capital structure (EM = Equity Multiplier or Leverage, or degree of indebtedness or capital adequacy).

From this scheme is seen as controlled and uncontrolled factors are determined for the assets (ROA). Supply and demand conditions that banks face are generally uncontrollable factors (eg interest rate risk is an uncontrollable factor).

Factors on which banks have some degree of control are: types of businesses, income from operations, credit quality, timing of maturities in the management of assets and liabilities.

The diagram above shows the risks a bank faces and determines the level variation of return on equity (ROE):

1. balance or portfolio risk;
2. risk of regulatory
3. risk associated with technology;
4. risk of operating efficiency;
5. strategic risks in the corporate lending;
6. affiliate risk (subordination).

5. Conclusions

Portfolio risk and operational risk have the greatest effect on a bank earnings variation. Risks in bank portfolios are based on credit risk, interest rate risk and liquidity risk. Based on these risks would be to determine how much liquid capital a bank should hold.

Any organization even banks that fail to adapt to environmental conditions on technology and competition regulations face sooner or later with extreme risk of extinction. In order to obtain performance of banking institutions will have topay attention to:

- Price, considering how much to pay to cover various risks.
- Probability of occurrence of these risks.
- Monitoring and risk control, which begins with the formulation of objectives, policies and guidelines are at risk as determined by approach to risk. Risk management normally involves several steps for each type of financial risk and for the risk profile overall. These steps include identifying the risk management objective, risk management targets, and measures of performance.

The Contribution of the „Alexandru Ioan Cuza” University of Iași to the Generation of Human Capital in North-Eastern Region and in Romania in the Context of the Current Economic Crisis

Fotea Alexandru Cristian
„Alexandru Ioan Cuza” University of Iași
alexandru.fotea@uaic.ro

Abstract

The current economic and financial crisis, triggered in July 2007 in the United States, has hit the world economy with an unprecedented force since the Great Depression in the '30's. Romania, a country with few years of experience in the functioning of the market economy could not avoid the negative effects of the crisis. One important element of resilience is the higher education system necessary for quickly restoring the economy and adapting the human capital to these critical conditions. In this context, the generation of human capital throughout its graduates represents the most direct contribution that a university can provide to regional and national economic development. Under these circumstances, the objective of this paper is to quantify the contribution of Alexandru Ioan Cuza University of Iași, the oldest and one of the most prestigious universities in Romania, to the generation of human capital in the North-Eastern Region and in Romania in the context of the current economic crisis.

Key words: university, economic crisis, economic development, human capital

J.E.L. classification: O15

1. Introduction

The current economic and financial crisis that the world economy has been officially facing since July 2007, even though its origins can be found in the United States in 2001, it is definitely considered to be one of the great dangers of the new millenium. In the context of the growing interdependencies between world economies that globalisation has been promoting over the last decades, the

gravity and the extension of its effects can be devastating. Moreover, since the initial shock took place in the United States, the most powerful economy of the world, no economy has remained unaffected.

The current economic crisis also revealed the vulnerability of the European Union (EU), regarded prior to the crisis as one of the most stable economic poles in the world, immune to external shocks. The negative effects of the crisis felt their presence not just in the domains directly responsible for its outburst, such as financial and real estate, but also at social, commercial, cultural and even at psychological level.

Romania, a young member of the EU and a country with few years of experience in the functioning of the market economy has been seriously affected by the crisis starting with the fourth quarter of 2008 through a series of direct and indirect effects at all levels like: worsening of risk perception of Romania, reduction of foreign capital inflows, external financing problems, depreciation and high volatility of RON, reduction of import and export, reduction in household consumption, lower utilisation of production capacity and closure of companies (direct effects), reduction in the overall wealth of population, rising unemployment rate, lower revenues in the state budget, exposure of firms to currency risks (indirect effects).[1]

2. The importance of human capital in the context of the current economic crisis

The economic crisis has urged an immediate response by governments to avoid financial collapse and to limit its proportions. Such policies must not just limit the negative effects, they must also initiate a quick and efficient recovery based on a sustainable

long-term growth process. Even though the Lisbon Strategy has not been by far a success, EU leaders are convinced that the economic reforms must continue. Therefore, they have developed a new and better version of the Lisbon Strategy, called Europe 2020, that aims at generating sustainable long-term growth through innovation, education and improved enterprise environment, setting three priorities: smart growth – developing an economy based on knowledge and innovation; sustainable growth – promoting a more resource-efficient, greener and more competitive economy; inclusive growth – fostering a high employment economy delivering social and territorial cohesion.[2]

Some of the directions that the new strategy recommends, in order to increase economic growth and employment, acknowledge once again the value of the human capital. We mention here: to ensure that innovative ideas turn into products and services that can create growth and jobs, to enhance the performance of education systems and to set an agenda for the development of new skills and jobs.

OECD states that „the crisis also presents an opportunity to raise investment in human capital. Support for education and training can accelerate the healthy transition to new jobs and emerging opportunities”.[3] United Nations has been long considering investments in human capital as „investment investments made to increase the productivity of the labor factor”.[4]

Human capital has become one of the most important pillars on which the anti-crisis policies are based and the investment in education and in the development of improved skills one of the top priority. If we take into consideration the fact that the majority of the knowledge, skills and competencies are acquired throughout the educational process, higher education institutions, especially universities, have gained all over the world, including in our country, a significant role in the economic development at both regional and national level.

Next, we intend to quantify the contribution of Alexandru Ioan Cuza University of Iași (UAIC), the oldest and one of the biggest and prestigious universities in Romania, to the generation of human capital throughout the formation of its graduates in

the North-Eastern Region and in Romania in the context of the current economic crisis.

Even though the quantification of human capital represents a complex and difficult task, the methodology is usually based on educational data. We subscribe to the idea that a superior level of education implies more knowledge, and subsequently more human capital. Therefore, inspired by the studies of the Valencian Institute of Economic Investigations (IVIE), [5] we will choose the synthetic indicator that measures the years of study as our method of calculation.

3. The contribution of the Alexandru Ioan Cuza University of Iași to the generation of human capital in the North-Eastern Region of Romania

Technically, the contribution of UAIC to the generation of the human capital throughout its graduate students, it is calculated based on a hypothetical scenario, as the difference between the average years of study in the North Eastern Region and the hypothetical average years (according to the hypothetical scenario) that the population of the North Eastern Region would have achieved if UAIC wouldn't have existed and therefore wouldn't have formed any graduate.

The average years of study of a population pertaining to the society r (AS_r) it is calculated as the coefficient between the average years of study attained by the total individuals that make up the society and total number of individuals that make up the society, according to the formula:

$$AS_r = A^i \times POP_r^i / \sum POP_r^i$$

Where: A^i – years of study necessary to complete the level of study i

POP_r^i – the total number of the individuals of the society r (in our case North Eastern Region/Romania) that have completed the level of study i .

The hypothetical average years of study, that is the average years that the population of the North Eastern Region of Romania would have attained if the UAIC hadn't formed any graduates, it is calculated based on the premise that the students that did graduate UAIC would have attained, in the most fortunate case, the immediately inferior level of education, that is short post-high-

school studies, as the last level of education that can be attained before superior education, according to the structure of the education system of the Ministry of Education, Research, Youth and Sports in Romania.[6] Of course, we must take into consideration that UAIC is not the only university in the North Eastern Region of Romania. Thus, the difference between the real average years of study and the hypothetical ones, can not be attributed exclusively to UAIC, but to all the universities in the North Eastern Region, out of which we will extract and show just the contribution of UAIC.

Before actually calculating the contribution of UAIC to the generation of the human capital in the North Eastern Region with the help of the statistical data, we mention that due to the lack of available information, we can not know the exact number of person that have completed university studies and no longer have the residency in the North Eastern Region, nor the exact number of persons who have graduated outside the North Eastern Region and live in the Region. Therefore, in order not to affect the objectivity of our calculations, we will assume that these categories compensate.

In order to calculate the average years of study, we will use the information provided by the National Institute of Statistics (INS) regarding the structure of the occupied population by age and level of education attained in the North Eastern Region of Romania in 2010 as shown in Figure 1.

Figure 1. Structure of the occupied population by age and levels of education attained in the North-Eastern Region of Romania in 2010.

Level of education attained	Nr. of occupied population
Superior	195.284
Medium	880.010
Post-high-school	49.134
High-school	419.678
Professional-oriented	411.198
Lower	613.063
Secondary	487.714
Primary & no education	125.349
TOTAL	1.688.357

Source: Adapted by www.insse.ro

As we can notice, Figure 1 only provides us with the number of occupied persons by levels of education. The other variable required by the formula, that is the necessary number of years to complete each of the levels of education, it is obtained from the same official information source, the Romanian Ministry of Education, Research, Youth and Sports. Thus, the primary level requires four years to complete, the secondary level eight years, the professional-oriented level ten years, the high-school level twelve years and the post-high-school level fourteen years. The lack of available information forces us to make two assumptions. The first one is related to the group of population that completed the primary level. Due to the fact that Figure 1 does not indicate the precise number of people that completed the primary level of education or the number of those who haven't completed any level of education, we will attribute to this category an average number of three years of study. The second one is related to the higher education group of people. Due to the fact that we can not know precisely how many people completed bachelor, master or PhD levels, we will attribute to this group an average number of 16,5 years of education.

The calculation shows us that the average real years of study of the occupied population in the North-Eastern Region of Romania in 2010, that is 3 years after the current economic crisis has erupted, is 10,2 years. The average hypothetical years of study that the occupied persons would have attained if none of the universities in the region, including UAIC, had existed, would have been, in the most fortunate scenario, 9,9 years of study. Therefore, the human capital generated in the aulas of the universities in the North-Eastern Region, including UAIC, before and during the present economic crisis represents 0,3 years of study per occupied person.

In absolute terms, if we multiply the average years of study with the total number of the occupied persons registered in 2010 we will obtain an approximately number of 17,3 million years of study out of which 3%, that is 517.000 years of study have been generated in the aulas of the regional universities, including UAIC.

The total number of graduates of the approved universities in the North-Eastern Region of Romania and UAIC graduates (with or without diploma) for all three levels of study (bachleor, master, PhD) between 2006 and 2010 allows us to calculate only the contribution of UAIC.

According to information that the universities provide to the Romanian Ministry of Education, Research, Youth and Sports [6], in the North-Eastern Region of Romania, in 2010, function a total number of 11 approved universities, 7 public (including UAIC) and 4 private. The majority of 8 are located in the city of Iași, the most important academic centre, which annually hosts over 75.000 students. As we have previously demonstrated, all these 11 universities contribute with 3% to the average dotation with human capital for the occupied persons in the region. In order to extract only the contribution of UAIC, we will look at the number of the total number of graduates that UAIC has produced from 2006 till 2010, that is two years before the crisis and three years after, in comparison with the rest of the universities in the North-Eastern Region.[7] The evolution of the total number of graduates has registered a constat growth during academic years before the crisis (17.881 graduates in 2005/06 and 19.542 graduates in 2006/07), recording the maximum number of 27.782 graduates in academic year 2007/08 when the crisis hit our country. After that, the total number of graduates steadily declined (25.936 graduates in 2008/09 and 23.227 graduates in 2009/10).

The official data allows us to estimate that from 2006 till 2010, UAIC has generated in average 38,8% of the graduates in the North Eastern Region. That would imply that out of the total contribution of 3% atributed to all the universities for the dotation with human capital of the occupied persons in the North-Eastern Region of Romania, 1,2% belongs exclusively to UAIC. In absolut terms that would mean 200.500 years of study generated by UAIC out of a total of 517.000 years.

4. The contribution of the Alexandru Ioan Cuza University of Iași to the generation of human capital in Romania

At national level, the contribution of Alexandru Ioan Cuza University of Iași to the generation of human capital in the context of the current economic crisis is naturally smaller. In order to calculate it, we will once again use the information provided by the Romanian National Institute of Statistics as shown in Figure 2.

Figure 2: Structure of the occupied population by age and levels of education attained in Romania in the fourth semester of 2010

Level of education attained	Nr. of occupied population
Superior	1.558.644
Medium	5.319.935
Post-high-school	363.359
High-school	2.701.879
Professional-oriented	1.999.346
Lower	2.173.877
Secondary	1.714.294
Primary	419.144
No education	40.439
TOTAL	1.688.357

Source: Adapted by www.insse.ro

Figure 2 shows us the total occupied population by age and level of education in Romania in the last trimester of 2010. The aplication of the same methodology, indicates that the average real years of study per occupied person in Romania in the last trimester of 2010 is 11,4 while the average hypothetical years of study if none of the universities in Romania (including UAIC) hadn't existed, would have been 10,7. Thus, the human capital generated in the aulas of all the universities in Romania represents 0,7 years of study per occupied person. Or better said, 6,14% of the average human capital dotation in Romania per occupied person have been generated in the aulas of the Romanian universities.

In absolut terms, that would mean that if we multiply the average years of study with the total number of occupied people in the last trimester of 2010, one of the taughtest years in terms of economic performance in Romania, we will obtain a total number of

103,2 millions years of study, out of which 6,14%, approximately 6,34 million years of study have been generated by the Romanian higher education system, including UAIC.

The total number of graduates of the approved universities in Romania and UAIC graduates (with or without diploma) for all three levels of study (bachelor, master, PhD) between 2006 and 2010 allows us to calculate only the contribution of UAIC.[8]

The evolution of total number of graduates at national level follows the same trend as the evolution at regional level, recording a constant growth during the academic years before the crisis (112.244 graduates in 2005/06 and 125.499 graduates in 2006/2007), reaches its peak of 232.885 graduates at the end of academic year 2007/08 when the crisis reaches our country, and steadily decreases in the following years (214.826 graduates in 2008/09 and 191.291 graduates in 2009/10), due to the effects of the economic crisis.

As we can see, beginning with the academic year 2005/06 and ending with academic year 2009/10, UAIC has generated an estimated 5,24% of the total number of graduates in Romania. That is, out of the total contribution of the Romanian higher education system of 6,14% of the average years of study, 0,32% is attributed exclusively to UAIC. In absolute terms that would mean that out of the total 6,34 million years of study, approximately 332.000 years of study have been generated in the auldas of UAIC.

5. Conclusions

As part of their strategic response to the economic crisis, governments all over the world, including EU leaders, have made human capital one of the most valuable resources in the long-term growth and universities key players throughout the process.

The results of our work demonstrate that Alexandru Ioan Cuza University of Iași is one of the universities that contributes to this long-term process throughout the generation of human capital both at regional and national level. Even so, we consider that this contribution underestimates the real impact that the dotation with human capital generates. This, due to the medium and long time induced effects that an additional human

capital produces. One of these effects refers to the decision to complete academic studies that a higher income has. Thus, if a higher dotation with human capital that UAIC generates enables its graduates to earn more money and this has a positive influence on the decision to complete academic studies, this means the higher dotation with human capital will generate a higher dotation with human capital in the future. The second effect takes into consideration the influence that the level of education of parents has on their children's decision to complete academic studies, that is to invest in human capital. Taking into consideration these induced effects, we are entitled to conclude that the human capital generated by UAIC will produce more human capital in the future. Although these effects are from the economical point of view extremely difficult to quantify they shouldn't be ignored.

6. Acknowledgement

This work was supported by the the European Social Fund in Romania, under the responsibility of the Managing Authority for the Sectoral Operational Programme for Human Resources Development 2007-2013 [grant POSDRU/88/1.5/S/47646].

Traditional and Modern Techniques of Transferring the Benefit of the Credit Insurance Contract in International Trade

Gavrilă Simona Petrina

„Dunărea de Jos” University Galați, Faculty of Legal, Social and Political Sciences
gavrilasimonapetrina@yahoo.com

Abstract

Credit, the key word in today's society, considered as a control element of the market economy has its reverse: the risk. The risk is itself diverse: the risk of non-payment, the risk of late payment due either to bankruptcy to the debtor or natural, political, etc. events. If, in general, banks have at hand means pertaining to bank management or the use of complex financial techniques to prevent internal risks, to prevent the risk of non-payment and the risk of late payment, one of the most effective tools is to provide loans.

Key words: credit insurance, international trade, securitization.

J.E.L. classification: K12, K33, G21, G22

1. Introduction

We define the export credit insurance contract as a contract whereby a creditor, as insured, undertakes to pay to the other party, the export credit insurer, a sum of money called a premium, and the insurer undertakes, in the case of occurrence of the insured event, consisting of the non-payment of claims resulting from the granting of an export credit (debt owed to foreign persons, usually identified previously), to pay to the insured or to the third-party beneficiary the insurance compensation, as determined in the contract.

Although the definition given shows that the parties of a credit insurance operation are in number of three, that is, the insured, the insurer and the debtor, the export financing practice tends to introduce third party insurance matters. Most times, the insurer agrees to pay any compensation in the hands of another person and not to the insured. It is worth mentioning that the third person will not acquire more rights than the insured himself.

The introduction of third parties may be performed by way of an assignment accessory to the discount, via the debt assignment and on the way of the delegation of the right of compensation.

2. The assignment accessory to the discount

In case of a provider credit, wishing to raise the claims it has on its foreign debtor, the insured seller will discount the effects of trade (bills of exchange drawn upon the debtor or promissory notes issued by it) and based on the translative effect of the endorsement it will send to the bank all accessory rights.

The principle is that the insurance, unlike the interest, is not ancillary to the right of claim, having an independent existence. However, some credit insurers such as COFACE, concerning medium-term funding, are willing to make derogation from this principle only for the refunds made for French banks, arguing that the secured credit itself is transferred to the bank.

This technique, the easier from the practical point of view is, at the same time, the least costly because performance does not require any formalities. It cannot be used, however, until after the receipt of the goods and after the buyer issues a promissory note or after the acceptance of a bill of exchange on it. Another shortcoming is that if the insurer is not notified of the transfer occurred, he will not know about the transfer of rights arising from insurance contract made in favor of the bank and he/she will not be able to notify it of the termination occurred because of the insured's failure to perform the obligations or, by mistake, he/she will pay the insured the compensation he/she refused.

For these reasons the most commonly used mechanism to transfer the export credit insurance internal contract benefit in favor of banks is the pledge or the assignment of the right to compensation.

3. The Security Interest in Movable Property

It is constituted through an accessory contract whereby the debtor, or another person for him/her, consents to affect a property of his/hers, in order to ensure the performance of the obligation assumed[1] in this case, the repayment of the credit by the supplier or the banker.

Guaranteeing an obligation with an insurance policy is a practice often used in international trade. As the security is made on the right to compensation resulting from the credit insurance contract, on a tangible incorporated asset, we shall refer to security interests used for the transfer of the export credit insurance domestic contract benefit.

In our case, the insured makes in favor of the bank a pledge of his right to compensation arising from the contract of credit insurance. Outside formalities such as handing the insurance policy, as under Belgian law or its introduction in an archive of security interests, as it is the case in the current Romanian legislation, imposed by the law in force in the State of the insurer, in all cases, this act must be notified to the insurer.

However, some observations must be made on the economic opportunity to ask (and receive) such security[2]:

Unlike the assignment ancillary to the discount or the debt, in case of the establishment of a security interest in movable property, the third party in whose favor this guarantee was constituted may not claim the insurer to be notified of the insurance indemnity payment and, if the risk included in the insurance occurs, but the guaranteed debt (the refinancing loan) is not yet due, the third party will lose the right to compensation.

The real value of such security is highly dependent on both external factors and the actions of the insured debtor (the payment of the insurance premium, the performance of the obligations related to the notification of the risk or the obligation to notify the insured case).

If for the transfer of rights deriving from the export credit insurance contract, the insurer shall have the possibility to notify the third party to pay the installment for the due premium or shall notify him about the insured's failure to perform the obligations, in case of a security interest in movable property, the insurer shall not have this, the security recipient being unable to know the fate of the insurance contract and being at risk to lose the right to compensation.

4. The credit insurance policy endorsement

In international trade relationships, the insurance policy[3] (the document acknowledging the international insurance contract), is equivalent to a credit title, being, where appropriate, nominative, at the holder or through a note and it is sent or given as collateral under the general rules laid down for each of these titles.

As credit title, the insurance policy for the export credit is transferred in full property through the endorsement governed by the provisions of Art 13 and following of Law no. 58/1934. The pledge of credit titles has a practical utility and the purpose of law is to provide traders a simple drill for the formation of the pledge, the common law being considered[4] difficult.

The endorsement of an insurance policy through a note is actually made under the provisions on the endorsement form contained in Art 21 of Law No. 58/1934 on the bill and the promissory note, introducing the clause of “value as security”, “currency as pledge” or other equivalent clause.

The endorsement with the clause of “value as security” or “currency as pledge” correspondent to the pignorative endorsement is regulated by Art 22 of the Convention U.N.C.I.T.R.A.L. for bills of exchange and international promissory notes, adopted in New York in 1988[5], as well as by Art 19 of the Uniform law adopted by the 1930 Geneva Convention on bills of exchange and promissory notes.

The endorsement institution for pledge has no counterpart in common law, but the owner – the endorsed of such endorsement can be likened to “holder for value” (section 27 of the Bills of Exchange Act, adopted in England in 1882 and section 3-303a of the

U.C.C.), or to the owner of a restrictive endorsement (section 3-416 of the U.C.C.)[6].

The pignorative endorsement of an insurance policy for export credit creates a legitimizing effect, and not a translative one. The guarantor will not revoke the endorsement of the pledge, nor could he claim the credit insurance policy in case of insolvency of the endorsee, resulting in its practical safety.

5. Securitization of the claim rights arising from the insurance policies

In the international relations, a practice that emphasizes the quality of negotiable title of the insurance contract has developed on export, or by using the technique of yielding the insurance indemnity benefit with the circulation of the title incorporating the insured debt[7].

It is a technique originally used in the U.S. and taken in industrialized countries consisting in yielding a set of claims of financial bodies to individuals generally willing to invest their savings. This giving up is made not by discounting or rediscounting debt securities but through a transfer of a portfolio of receivables.

Typically, the management of these debts is entrusted to an “ad-hoc body” whose mission is their collection and the management of payment incidents. The manager of the portfolio will issue debt securities representing fractions of that portfolio.

It goes without saying that without bank securities (which they do not want to give to control the commitments by signature), other guarantees have to be provided (other than those ancillary claims such as suretyships, tangible securities or mortgages).

In this sense, credit insurers may grant a coverage through a credit insurance contract with the respective mentioned “management body”.

The premium will be paid indirectly by the assignees (beneficiaries) by including it in the management fee required by the body constituted for this purpose. In this way, the insurer will consider the insured claims, will oversee the risk, having to be informed by the management body of the development of the risk, he will be involved in the recovery

of the unpaid claims and, especially, will be consulted on the establishment of each package.

If the checks will result in a single package, too much “risky” debts have been included and he will be able to refuse to ensure that package.

The bearer securities representing fractions of the claim portfolio will be traded on the securities market and will run with the benefit of the credit insurance policy “attached”.

Relatively recently, this technique has been regulated by the Romanian legislature by Law No. 31/2006 on receivables securitization and subsequent acts, such as the Regulation of NBR and NSC no. 21/26/14.12.2006 on the treatment of credit risk related to securitized exposures and the securitization positions, which transposes the provisions of the European Directive 2006/48/EC specifies the approach for securitizations containing an early repayment clause triggered by a level of net margin or a quantitative limit, another than the net margin or the Regulation of NBR and NSC no. 18 of 30 September 2010 on the treatment of credit risk related to securitization exposures and securitization positions, which transposes the provisions of Directive 2009/83/EC of the Commission of July 27, 2009 amending certain annexes to the Directive 2006/48/EC of the European Parliament and of the European Council as regards the technical provisions concerning risk management.

The securitization is a financial transaction for the recovery of claims by a special purpose vehicle (with or without legal entity, whose the sole object of issuing securitized financial instruments, securities or participatory type bonds issued in dematerialized form, based on a portfolio of claims), which buys, groups and affects them for the guarantee of an issue of real assets.

According to the provisions of Article 2 Para 2 of law, both claims arising from credit agreements or contracts of sale – purchase paid on time may be subject to securitization, i.e. also receivables arising from an acheteur credit or a supplier credit and receivables arising from leasing contracts, for which a contract for the export credit insurance was concluded.

Sending claims from holders to the investment vehicle is performed by claim assignment, only onerously, it is notified by the transferor to the assigned debtors, the creditors of the transferor are notified and it is recorded in the Electronic Archive for Security Interests in Movable Property.

However, unlike the assignment of debt covered by the Romanian Civil Code by which, with the debt claim the debt accessories are transmitted, such as the security, the privilege and the mortgage (contracts, by definition, ancillary), the assignment made for securitization sends all real or personal rights to assets, including security interest rights and *claim rights arising from the insurance policies concluded by the assigned debtor* (Art 3 point 7 of Law).

Even if the legislature used the phrase “ancillary rights”, we consider that this is an error in his expression and that, in case of the insured export credit provided for the transfer to an investment vehicle, the character of the main contract of insurance credit of the credit for export does not change.

To ensure the legal certainty for the securitized financial instruments, the legislature established a limitation period for the exercise, by the transferor's creditors of the action to cancel the debt assignment in very short time, of only 45 days from the cumulative meeting of the disclosure requirements for the registration in the archive and the notification of the transferor's creditors. Also, this action cannot be promoted if the transferor is in legal reorganization or bankruptcy proceedings opened in accordance with law 85/2006 of insolvency or the G.O. No. 10/2004 on the judicial reorganization and bankruptcy of credit institutions.

We appreciate that, after creating the general framework by regulating the securitization of claims, nothing precludes the Romanian credit insurers to support the insurance of a debt portfolio for which securitized equity are issued.

6. Conclusions

Compared to the principle of celerity and that of credit protection, specific to commercial law, and given the many benefits of the pignorative endorsement of the export

credit insurance policy compared to the transfer of the right to insurance indemnity, we believe that it would require the amendment of Law no. 136/1995 for the purposes of consecration of the export credit insurance policy.

In the current regulation, the proof of the insurance contract is made by issuing the insurance policy or the insurance certificate[8], and the insurance document can be, where appropriate, nominative, through a note or at the bearer (Art 12 of Law No. 136/1995).

Although the legislation does not show the difference between the insurance policy and the insurance certificate, the doctrine has established that the first is a negotiable title, while the second does not have this feature.

The doctrine critics has been formulated of the character of the insurance policy with nominative title[9], although considering that the insurance policy can be through a note or at the bearer, there is insufficient evidence to support the nature of the negotiable title of the insurance policy whereas it has no formal character, but rather a declaratory character, (the law does not prescribe the form in which that document should be drafted) nor gives rise to a right autonomous to the one born from the insurance contract.

We appreciate that, if the legislature would require the written form as an *ad validitatem* requirement, thus defending the right embedded in the title these critics would not withstand a detailed research.

Thus, in terms of the formal nature of the insurance policy, it should be noted that Art 10, Para 3 of Law No. 136/1995 lists the items to be covered by the insurance contract and, of course, which must appear in the policy[10].

Regarding the fact that the insurance policy does not create a right autonomous to the one that is born from the insurance contract, it appears that, despite the existence of an autonomous right, is a feature specific to debt securities, there are enough causal securities (company shares, bills of lading[11]) and the lack of autonomy of the rights of the holder of the rights compared to the rights of the insured title is an exception provided by law (Art 23 of Law No. 136/1995).

Even if in the Rules of conduct, in the account of and on behalf of the state, for the short-term insurance activity of the risk of external non-payment reference is made to the “insurance policy” (Art 3 Para 2, Art18 Para 2), the conditioning of the transfer of the insurance policy benefit by the agreement of the insurer opposes to the qualification of these “policies” as negotiable securities.

Especially in the case of the provider credit, the insured creditor or beneficiary of the insurance will want to make a refinance, by transferring the rights to the debtor or by guaranteeing with him the refinancing loan.

If the export credit insurance policy form was adopted by the legislative, its movement would be facilitated, which is desirable given the need of traders to access credit refinancing.

International and Community Issues on Bankruptcy Regulation of Credit Institutions

Gavrilă Simona Petrina

Abstract

Despite the international efforts on the development of a special surveillance regime, banks may become insolvent. The poor management, the excessive risk, the adverse conditions in the market or fraudulent practices can cause serious or even fatal financial problems. Therefore, the rules of “ex ante” are not enough, but there must be an adequate legislative framework for bank insolvency situations.

The need for special rules relating to bankruptcy for these companies is mainly due to considerable economic repercussions of the failures that affect them.

Key words: insolvency, credit institutions, international law, Community law.

J.E.L. classification: K12, K33, G21, G22, F34.

1. Introduction

The principles of law applicable for bankruptcy are, generally, in some countries, applicable for bankruptcy of credit institutions. However, many jurisdictions have opted for the exclusion of bankruptcy proceedings of credit institutions under the rules from the law applicable for bankruptcy in general and the drawing up of special rules in this area.

Recent financial crises around the world have demonstrated the close link between the financial stability and the health of a viable economy. Economists consider financial stability as a “public good”, which requires the attention of national laws. This public “good” or “interest” is better served by reducing the probability of bank insolvency situations.

The main purpose of these special rules is to maintain public confidence in the banking system. This goal translates into a series of objectives that the legislation in the area must pursue, namely: the establishment of appropriate accounting standards, transparency, prevention of corruption, creation of a favorable international investment.

2. International and community regulation of bankruptcy of credit institutions

Internationally, the documents recently adopted in cross-border insolvency showed the same trend, excluding credit institutions in their field of application, along with insurance companies, securities companies and collective investment.

Thus, according to Art 1 of the European Convention on certain international aspects of bankruptcy, this international document does not apply to insurance companies or credit institutions such as banks, subject to procedures that may come into its field of application.

The Explanatory Report accompanying this document shows that, in fact, these institutions, which are generally subject to administrative arrangements, are governed by specific insolvency procedures, which in some states, are administrative by nature and may, at least in the period preceding the bankruptcy, to derogate from the general rules applicable to collective proceedings to avoid bankruptcy.[1]

The scope of the EU Council Regulation no. 1346/2000 on insolvency proceedings are excluded from bankruptcy proceedings concerning insurance undertakings, credit institutions, securities and collective investment companies. As shown in the

Preamble of the Regulation (section 9), as they are not covered because they are subject to a particular national control authority that has very extensive powers of intervention.

The UNCITRAL Model Law on cross-border insolvency[2] does not contain provisions concerning the conditions to be met by borrowers who have applied the procedure, since the objective of the law was to avoid restricting its scope so that it covers a wide range of insolvency proceedings that may be recognized, whether reorganization or liquidation, regardless of the debtors, legal entities or individuals, traders or consumers, thus respecting the differences between national legal systems.

However, commercial banks or insurance companies are cited as examples of entities for which the model is able to adopt law exclusion of subjects included in its scope. The guidelines for applying the Model Law[3] explain this exclusion especially as the opening procedure against such debtors is necessary to protect the vital interests of individuals and generally require special regulations for quick and cautious action.

Since, now, banking operations necessarily go beyond national borders, commercial insolvency generates international effects that require appropriate legal solutions.

Banks make their subsidiaries and branches outside the state in which the head office is located and they grant loans to foreign companies or they issue autonomous securities for banks from other countries. Therefore, they may have foreign debtors, foreign creditors, secondary establishments abroad, foreign shareholders or foreign counterparties.

The difficulties of approach of such insolvencies are multiple: the difference in the conception of treatment of bankruptcy in different jurisdictions (for example, some are more favorable to the debtor than others, some opt for a mainly administrative procedure, others for a jurisdiction), the differences in the procedure, the conflict of laws, and the different treatment of property or compensation etc.[4]

The opening of the insolvency proceedings in any State in which the bank has an office, primary or secondary, or business relationships, raises practical problems which must find an appropriate

response in the national and international legislation.

Some of the most important issues are: the question of whether for the same debtor credit institution, more concomitant procedures can be open or only one procedure can be open, which will be the decision of a competent court or of such procedures and its or their applicable law, which will be the effects of the decision given by the court of a foreign state in bankruptcy of credit institutions, which will be the treatment for foreign creditors in comparison to the local ones and if the proportional reduction of claims could be applied for the first, etc.

Some reports consecutive to famous bankruptcies have stressed the need for special rules in banking bankruptcy with cross-border issues. Following the bankruptcy of B.C.C.I. in 1991, Basel Committee on Banking Supervision issued the document entitled “Insolvency of international banks”[5], and in 1995, following the bankruptcy of Barings Bank, the Group of the 30 (G30), in cooperation with the International Federation of Insolvency Practitioners (INSOL) has developed a study on how to approach this type of insolvency.[6]

An issue of utmost importance in bankruptcy of credit institutions is whether bank insolvency should be treated as a single entity or the entities of which it is composed should be considered separately. In the first case, there will be a single insolvency procedure, in which the credit institution shall be treated as a single entity, which means that all its assets, wherever they were located, will be included in this procedure, and the lenders, regardless of their nationality, will be entitled to register their claim in this procedure and will receive equal treatment.

In the second case, different parts of the credit institution, located in different jurisdictions, will be treated as separate legal entities. For example, a branch of a foreign bank located in a particular jurisdiction will be disposed of separately from the central bank located abroad.

The universality is, in the bankruptcy of credit institutions, related to the concept of “home country” of a bank, having unique jurisdiction over insolvency proceedings.

The territoriality involves separate procedures in each jurisdiction. The open procedure in the “home country” has no cross-border effects.

At Community level, it was decided first to act primarily in a preventive manner[7] putting into place a series of rules called “prudential”, such as, for example, the Directive 89/299 of April 17, 1989 and Directive 89/647 of December, 18 1989 on the own funds and the solvency ratio.

They came to complete the coordination Directives no. 77/780 of December 12, 1977, no. 83/350 of June 13, 1983 and no. 89/646 of December 15, 1989.

The European Community Commission took steps to establish guidelines for insurance companies, credit institutions, securities companies and collective investment bodies.

Thus, credit institutions formed in 1985 the subject of a proposal for a directive on the stabilization and liquidation of credit institutions (Directive proposal no. 85/C356/10 of the Council, OJEC C 356 of 31.12.1985). The work on this project, however, were suspended upon the implementation of the Second Coordination Directive of 1989 and were not resumed until after the bankruptcy B.C.C.I. The disputes between Spain and the UK to include Gibraltar in the Annexes of the project have delayed much the work, so that, only on July 17, 2000, the European Community Commission adopted the Common Position No. 43/2000.

With the approval of the Economic and Social Committee and the European Monetary Institute on April 4, 2001, Directive no. 2001/24/EC of the European Parliament and the Council on the reorganization and Liquidation of Credit Institutions was adopted.

The Introduction of Directive no. 2001/24/EC is generally regarded as a significant advance in the legal framework of the European Union which will provide, fortunately, a high degree of efficiency and certainty in bank insolvency proceedings with cross-border issues.[8] This progress would have not been possible however without an existing framework, being based on the principle of consolidated supervision established by Directive 2000/12/EC. It is expected that this directive to be the starting

point in the process leading to the eventual harmonization of bank insolvency laws of the Member States of the European Union and the international efforts to go beyond its borders. Until then, it is however necessary to strict monitor the level of effective implementation of the provisions of the Directive by all Member States, the process for which the deadline is May 2004.

3. Romanian legislation in the field of private international law relations in the area of insolvency of credit institutions

In Romania, this procedure is regulated by Law 83/1998 separately, in force since May 23, 1998, to be completed with the provisions of Law 64/1995, on the insolvency procedure and the Code of Civil Procedure. This law was intended to be more stringent, clear and specific, for which the Government has adopted Ordinance No. 10/2004.

The need for a law for bankruptcy of credit institutions was determined by considerations relating to the harmonization of the Romanian legislation with the European Union, on the one hand and, on the other hand, the harmonization of the bankruptcy of credit institutions with the general laws on banking and reorganization and bankruptcy.

Title II of the Ordinance is governing the cases of insolvency of credit institutions with cross-border issues and is consistent in the aspects of harmonization in this area with the European Union. From this point of view, the takeover, by G.O. 10/2004 of the provisions of Directive No. 2001/24/EC which appears as a natural complement approach, started by Law 637/2002, concerning the regulation of the private international law on insolvency, to take over the *acquis communautaire* in cross-border insolvency.

This title contains both the rules for determining the law applicable to judicial reorganization and bankruptcy, concerning credit institutions, Romanian legal entities, including foreign-based branches and subsidiaries in Romania of foreign credit institutions in the state of insolvency and rules concerning the conditions under which the authorities concerned shall mutually inform and consult on measures of reorganization and liquidation procedures of credit institutions.

4. The procedure of judicial reorganization and bankruptcy of credit institutions, Romanian legal entities, and their branches established in other Member States

Chapter 2, regulating the procedure of judicial reorganization and bankruptcy of credit institutions, Romanian legal entities, and their branches established in other Member States, enshrines the principle of unity and universality of bankruptcy.

Art 47, which incorporates the provisions of Directive no. 2001/24/EC, governing the conflicts of jurisdiction in an opposite way as Law 637/2002 does, which, taking the provisions of Regulation No. 1346/2000 of the EU Council on insolvency proceedings, abandoned the principle of absolute unity and universality of bankruptcy for a compromise solution that combines the elements of the two classical theories: the theory of unity and universality and the theory of plurality bankruptcy territoriality.

Therefore, the competent court is the court in whose jurisdiction the registered office of the debtor credit institution is registered, as it appears in the commercial register, which is the only authority, empowered to decide on the procedure of judicial reorganization and bankruptcy of the credit institution, Romanian legal person, including its branches in other Member States.

In bankruptcy, including bankruptcy of credit institutions, the conflict of jurisdiction determines the solution in conflict of laws, as the competent court will apply its own law, the *lex fori*.

Therefore, the opening of bankruptcy proceedings on a credit institution in Romania, including its branches established in other Member States is governed by the Romanian law both in terms of rules and procedure of judicial reorganization and regime and bankruptcy procedure.

The field of bankruptcy law and the exceptions to the principle of application of *lex fori* are defined by the Ordinance similarly to the provisions of Directive no. 2001/24/EC.

It expressly excludes legal provisions, rights and procedures provided in Art 37-40, 42, 43 and 45-47 of Law No. 637/2002 on the regulation of private international insolvency law, the right of property or other

rights in financial instruments whose existence or transfer is subject to the registration in a register, an account or in a centralized storage, held or located in a Member State, which will be governed by the law of that Member State, repurchase agreements and contracts underlying the transactions conducted on a regulated market, which will be governed by the law of contracts and compensation contract, in which case the law governing such contracts.

It also regulates the obligations of information and publicity on the decision to open a procedure of judicial reorganization and bankruptcy. In this respect, the competent Romanian court assigned to three categories of obligations in order to bring to the attention the decision to open a procedure of judicial reorganization and bankruptcy to the competent authorities of the host Member States, of making disclosure, registration in public registers of the Member States and informing the known creditors who have their habitual residence, domicile or head office in other Member States.

The competent Romanian court will inform the National Bank through the competent authorities of the host Member States, before the adoption, and if this is not possible, immediately after, of the decision to open a procedure of judicial reorganization and bankruptcy, including the practical effects that such a procedure may have.

The competent Romanian court will take immediately the necessary steps for the publication in the official language or one of the official languages of the Member States concerned, an extract from the decision to initiate judicial reorganization and bankruptcy proceedings, stating from the subject and the legal basis of the decision taken, the time of appeal, including the date of expiry of this term and the competent Court, in the Official Journal of the European Communities and in two newspapers circulated in each host Member State (Art 49 paragraph 1 and 2).

Bankruptcy procedure applies regardless of the performance of this publicity and has full effects on creditors (Art 49 paragraph 3). However, the person who performs an obligation in a state for the benefit of a credit institution without legal subject of insolvency proceedings opened in another state, rather than run for the benefit of the liquidator

appointed in those proceedings, is released if aware of the opening of the proceedings.

Also, for performing the advertising obligation, the competent court is entitled to request the registration in the real estate book, the trade register and any other public register kept in the other Member States of the decision to initiate a procedure of judicial reorganization and bankruptcy to a credit institution. If the registration is compulsory under the law of that Member State, the court must take the necessary measures to ensure that registration. The registration costs will be considered costs of the procedure.

After opening the bankruptcy proceedings of a credit institution, Romanian legal person, with branches in other Member States, the administrative or judicial authority or the administrator or liquidator, as appropriate, will promptly inform the individual and the known creditors who have their habitual residence, domicile or head office in other Member States in the form of a written notice indicating in particular, with time limits, the penalties provided for the failure to comply with these terms, the legal requirements for consideration by the competent court of the approval of such claims or comments about these claims, whether the preferential claims or those that were security interests are subject or not to verification and any other measures or procedures provided by law. (Art 53).

All these information procedures however will have to observe the professional secrecy. Art 58 of the Ordinance takes the provisions of Art 30 of the Directive 2000/12/EC of the European Parliament and of the Council of March 20, 2000, on the access to credit institutions and its exercise. According to art 58, the persons required to receive or divulge information in connection with the information or consultation provided for in this Ordinance are bound to professional secrecy, except any judicial authority to which the national provisions in force apply.

The treatment of foreign creditors (with the domicile / residence or, where appropriate, incorporated in a Member State other than Romania) is governed by the Ordinance starting from the principle of non-discrimination based on nationality or nature of the claim.

This non-discriminatory treatment is defined by three fundamental rights of foreign creditors, namely: the right to be informed of the initiation of the judicial reorganization and bankruptcy of credit institutions and the conduct throughout the proceedings, the right to lodge claims and written comments about their claims on the institution credit and the right to be treated equally and have the same preference ranking as claims of creditors of the same kind as of the national creditors.

The liquidator appointed under Romanian law can act without further formality within the host Member States under a certified copy of the decision of the competent court appointed or under a certificate issued by it and may exercise upon all the territory of the host Member States its powers under Romanian law. He may also appoint persons to assist or represent him in the proceedings in the territory of these states, especially in order to overcome any difficulties encountered by creditors in these countries.

In exercising his powers, the liquidator shall comply with the law of the Member State in whose territory he acts, particularly with regard to procedures for the realization of assets and the provision of information to employees of the credit institution of the Member State. The powers may not include the use of force or the right to settle litigations or disputes.

5. Reorganization and bankruptcy procedure applicable to branches of credit institutions in Romania from other Member States

The reorganization and bankruptcy procedure applicable to branches of credit institutions in Romania from other Member States is governed by Chapter 3 similarly as for the reverse situation, the judicial reorganization and bankruptcy of credit institutions, Romanian legal entities, and their branches established in other Member States, subject to Chapter 2.

The ordinance explicitly enshrines the principle of automatic recognition of the judicial reorganization procedure or opening of the bankruptcy procedure on a credit institution in a Member State which operates on the Romanian territory.

Thus, according to Art 56, if the credit institution in a Member State which operates on the Romanian territory was ordered to commence the reorganization or bankruptcy proceedings, they shall be applied without further formalities in Romania and they will take effect under the conditions and the date specified in the legislation of that Member State, the principle of reciprocity becoming valid when Romania joins the European Union.

The information obligation for the opening of proceedings for credit institutions with branches in Romania, located in a State other than a Member State is covered by Title III, “General Provisions”. If the decision of opening the proceedings was taken for a branch in Romania of a credit institution established in a State other than a Member State, but which has opened branches in other Member States, the competent court shall inform the Romanian law without delay, if possible before the adoption of the decision, and if not, immediately afterwards, through the National Bank, the competent authorities of the host Member States on this decision, including the practical effects that such a procedure may have.

6. Conclusions

In many ways, no matter how “successful” the solution adopted by a state would be in a crisis situation of a given bank, any bank crisis is a costly and unpleasant situation, with potential negative effects of the financial system of the state, region and even the financial system as a whole. That is why the need for cooperation and coordination in cross-border insolvency knows particular aspects that require specific regulation where the debtor subject to the proceedings is a credit institution.

Directive no. 2001/24/EC of the European Parliament and the European Council on the reorganization and liquidation of credit institutions approach is most notable in this area.

Comparative Study on Male Vs Feminine Leadership in Public Administration in Maramures County, Romania

Gavrilescu Liviu

Postdoctoral Grant Recipient, Romanian Academy, Iasi Branch

North University of Baia Mare, Faculty of Sciences

liviu.gavrilescu@yahoo.com

Abstract

Leadership in the Romanian public administration is an exciting research area and also of current interest, while the success of public organizations depends now more on the human factor than on the funds becoming less accessible. Another item of interest is given by the low representation of women in managerial positions in administration. This paper presents a study on two mayors, a woman and a man of Maramures County, Romania, in order to identify and compare the leadership styles practiced. Belbin and Kilmann tests have revealed significant differences between leadership styles, which seem to favor women. Without claims of generalization, the study shows that female leadership in the administration is likely to produce success in achieving the objectives of the organization, which is an important argument against gender discrimination.

Key words: leadership, typology, gender, public administration

J.E.L. classification: J16, J79, R59

1. Introduction

Leadership in public administration is a challenging issue, for both the administrative and the political systems. As a leader is supposed to do the “right things” [3], such a person must be a most wanted professional now-a-days, marked by a severe financial crisis, where those “right things” are above all cost saving.

In times of un-discrimination and equal opportunities, it would be a great mistake to neglect the women, a large human resource for top positions in the public administration, where, at present, they represent less than

10%.

Making a comparison between the characteristics of two leaders in the Romanian local public administration, our research is meant to highlight the pros and cons for giving women such responsibilities and more.

2. Leadership, types and qualities

Leadership is an extremely complex phenomenon that has in view a range of aspects, from decision making, to human relations issues. Thus, leadership is defined as a process in which an individual influences a group to achieve common goals [7].

Leaders are visionary characters, they become models, standards for their subordinates, they satisfy the need for change of people, motivate them to overcome their limits and interests, mobilizing them to achieve the organizational goals.

What are the types of leaders and what distinctive features characterize a successful leader, are very relevant questions and which have determined extended and deepened studies on the typology of leaders.

Leadership styles according Kurt Lewin [5]:

- The democratic style, where the leader involves the subordinates in decision making, in setting objectives and strategies. The leader listens actively and uses the feedback for the benefit of his subordinates, encourages initiative and individual contributions.
- Autocratic style that involves the centralization of authority, so decisions are taken by the leader. The leader set tasks and methods of work, the opportunity of the employees to get involved is limited.

- The "laissez-faire" style in which the leader can bring a number of explanations, clarifications, but decision-making and setting the working methods rest on the employees.

An innovation in the domain of leadership style is the appearance of the dichotomy transformational - transactional, similar to that between management by objectives (MBO), and, respectively, management by exception (MBE) [1]. It is important to note that in essence, according to some authors, transformational leadership is opposed to the transactional. Regarding the latter, rewards are contingent to the effort and the level of performance achieved, while concerning the transformational leadership, the subordinates are inspired, motivated by the image of the leader, they channel their energy on achieving high standards, following the example of the leader. Transformational leadership encourages commitment to the organization and its objectives, insists less on mechanistic, forced work, only to reach the required standard. And yet there is a common denominator, namely that they are linked to achieving a goal.

Transformational leader traits have a feminine touch. Women-leaders are people-oriented, rather than to tasks, they communicate effectively with the team, get involved, count on the team-spirit, practice a reduced managerial control, are more sensitive to nuances and conflict solving, without being irrational.

To practice an effective leadership, the leader must possess certain qualities, skills. It is noted that these skills can be acquired or learned, in addition to the innate ones. The most important quality of a leader is self-control. According to John Maxwell [5], one of the most important qualities of a leader is communication, i.e. the ability to communicate correctly, but especially effectively. In organizations, communication is the cornerstone behind all operations and processes.

Competence is also an indispensable quality of a leader, as assesses Maxwell: "The competence goes beyond words. It is the leader's ability to transmit, to plan and to act so that others can intuit that you know how it's done - and know that they want to follow you" [6].

Two other important qualities provided by Maxwell to be a perfect leader are generosity and passion.

3. Presentation of the case study

This paper presents a comparative research on the male-female leadership in the Romanian administration.

It is well-known the situation of the Romanian administrative system, characterized by excessive bureaucracy, which makes difficult not only the administrative process, but also harms the public sector image in general. The overcome of these drawbacks can be achieved by humanizing the style of leadership, by the personalization of the leader-subordinate and leader-citizen relationships.

The main objective of the research is to identify the differences between the female and male leadership, by identifying the typologies of the two leaders and the impact on the organizational environment both internally and externally, from the leadership practiced by each of two subjects.

In addition to exploring gender differences on leadership theory, an area less approached, the study may provide support for the formation of authentic leader in the Romanian administration.

There were conducted two case studies on two mayors belonging to neighboring local government units, and having an approximately equal number of inhabitants, one of them having as mayor, a man, and, the second a woman. The cases studied are: Mrs. Ioana Trifoi, Mayor of Botiza and Mr. Vasile Dunka, Mayor of Poienile Izei, both of Maramures County.

In this regard, it was chosen as a research method the case study and the tools were applied as follows:

- The interview guide
- The Belbin test
- The Killman test

4. The Belbin test

The Belbin test [2] [12] aims to assess seven important aspects of the work done by a leader resulting in the same number of questions, each with eight answers which refer to the ability to achieve organizational

objectives tested and to relate with people. By applying this test is intended to identify the typology of the leader and the capacity to inter-relate within the group. The topics are:

1. How do I think I can bring my contribution to the team?
2. If I have a deficiency regarding the teamwork, it could be...
3. When participating in a project with other people...
4. In group relations, my typical approach is manifested in this way:
5. I achieve successes and job satisfaction because...
6. If a difficult task is assigned to me, which has a deadline, and means to work with people with whom I've never worked before...
7. Thinking of the difficulties that I have working in a team, I can realize that...

The two leaders have selected the same answers 26 times, but the responses were rated differently, depending on the importance they give to such statements. Differences in rating are significant, for example, at item 6, Ioana Trifoi evaluate article B (“I would be willing to collaborate with the person who shows the most optimistic attitude regarding the problem”) with 3 points, while the same article was rated by Vasile Dunka with 1 point. Another case of great differential rating is registered with the item 7, article B (“I could be criticized by others because I am too analytical and insufficiently intuitive”). In this case the man gives four points, while the woman gives only one point.

In the case of the woman-leader, the best scored articles were those that promote team spirit, interpersonal relationships and communication. The woman-leader encourages initiative, considers all points of view (even those inappropriate presented), and focuses on building solid, empathic relationships with the team. As a leader, she is aware of both her qualities and flaws.

Regarding the man-leader, the best scored articles were those concerning the fulfillment of tasks correctly and on time. Also noted is an orientation of the leader towards power, and less towards people and interpersonal relationships. Moreover, the articles concerning the relations with the team were the least rated by the man-leader. He influences the course of action more through

sanctions, rather than by reasoning. As he states in the interview, as response to the question “In relations with colleagues, what do you think are their attitudes and perceptions towards you and the work you are doing?” his actions are based on the principle that “it is very important that the subordinates 'know the fear’”.

Following the interpretation of total scores, it was established that Ioana Trifoi fits into the Co-ordinator category, showing good skills of group organizer, manifesting active listening and encouraging initiative by the extrapolation of talents and qualities of team members. Regarding Vasile Dunka, he fits into the typology of Monitor-Evaluator, at an extremely small difference of that of Shaper. According to these roles, the leader focuses mainly on the rational, prudent dimension of the activities he undertakes, being characterized by the constancy with which he criticizes and gives negative remarks, as well as by the tendency to compete with other team members.

Ioana Trifoi, as shown by the articles she selected and their ratings, appears mainly as a Democratic leader. According to literature, these behaviors are characteristic for a transformational. And all these aspects can be found in the articles selected and generously rated by the woman-leader.

Vasile Dunka fits into the typology of the Autocratic leader, according to the same classification, not by 100%, but certainly in a higher proportion than the woman-leader. The autocratic style implies decision centralization, as the leader set tasks and work-procedures.

5. The Kilmann test

The conflict resolution self-diagnosis – Thomas-Kilmann conflict test [4] - allows the classification of the leader personality into five types of solving conflict situations: confrontation, resolution, compromise, avoidance and adaptation.

After analyzing the chosen response alternatives, it was shown that Ioana Trifoi is an adept of the resolution-compromise style (36.66% - 30%). In other words, the woman-leader relies on a logical, democratic process of conflict settlement, which becomes the only purpose, conflicts are discussed openly and directly, and all interested parties

participate to negotiations, so that the chosen resolution alternative will be unanimous known and accepted (a “win-win” situation). This approach is specific to the transformational leader. These issues come to sustain the democratic style of the women-leader, as demonstrated by the Belbin test.

Figure 1. Percentage on styles - Ioana Trifoi

Source: author’s research data

Figure 2. Percentage on styles - Vasile Dunka

Source: author’s research data

On the other hand, the man-leader has been shown to adopt a confrontation-resolution style (33.33% - 30%). The percentages highlight an assertive and slightly uncooperative behavior. The leader consults with subordinates to identify a solution fair to any party, but the final response and decision belongs to him. As in the case of the women-leader, the typology established through this survey confirms the Belbin test results, that fit Vasile Dunka into the autocratic leader category, but not fully. Because it is not 100% confrontation style, combined with the 30% resolution style, a number of specific features of the autocratic leader are canceled. According to this test, in case of conflict, this leader is only slightly uncooperative, and not entirely

uncooperative.

Thus, the man-leader fits into a 33.33% - 30% confrontation-resolution style, and the women-leader fits into a 36.66% - 30% resolution-compromise. Differences between the confrontation and compromise styles are significant; the specific features of each of them are diametrically opposed.

Ioana Trifoi has an assertive and cooperative behavior, collaborates with others, and attempts to identify several alternatives of which will be chosen the one that meets best the interests of all the parties. The woman-leader opts for a solution reached through negotiations with the interested parties, so that no one is neglected.

On the other hand, Vasile Dunka, cares very much that his point of view is taken into account. Although, according to percentages he is taking into account the views of others, he has the final word.

6. Conclusions and recommendations

The phenomenon of leadership has a major importance in ensuring the efficient and effective functioning of an institution, whether public or private. Private institutions have an extra efficiency, because the innovative changes are allowed, and are not limited by the rich legislation governing the functioning of public institutions. Leaders are, currently, the visionaires that will achieve the much needed reform. Leaders are perceived as having masculine features and the women's access to power or to the managerial structures of the public institutions is difficult. The perspective of female leadership is viewed with skepticism and this causes a gap in the maximum exploitation of managerial capacity in this labor sector.

The research presented in this paper has some limitations on the possibility of generalizing the results. Gender difference is a necessary topic to be studied in the present circumstances in which equality and undiscrimination are more than ever in the attention of society. The issues discussed in this paper can be a starting point for future research, more extensive, in a representative sample, whose results are generally valid.

The Mechanism of Corporate Governance in Romania

Georgescu Cristina Elena

„Ovidius” University of Constanta, Faculty of Economic Sciences
cristina_georgescu95@yahoo.com

Abstract

The corporate governance is one of the key elements for improving economic efficiency, particularly in the current context of financial global crises. Corporate governance regulations are not uniform across the world. Considering these circumstances, our paper examines the main characteristics of the corporate governance in Romania. Then, we include a review of the methodological framework for corporate governance legislation.

Key words: corporate governance, principles, models, firm, performance

J.E.L. classification: D23

1. Definitions of Corporate Governance

In this era of globalization, competitiveness growth and salience of financial flow mobility, corporate governance has become one of the key elements that have a high impact on companies' performance and implicitly on national companies. Due to its implications with the efficient allocation of resources on a national scale and economical performances growth, corporate governance has proven to be an essential factor economies.

Corporate Governance is an increasingly complex concept ranging over many fields from business administration, economics, accounting, law and more recently ethics and social sciences.

Corporate governance is, according to the Organization for Economic Cooperation and Development (hereafter OECD) tenets:

- A set of relations between the company management, the managing board, its shareholders and other interest groups within the company;

- The structure by which company objectives are set as well as the means for achieving these objectives and monitoring performances;

- The stimuli system granted to the management board and administration in order to increase the objectives that are in the company's and shareholders' best interest and to facilitate monitoring, thus encouraging companies to use their resources more efficiently.

This definition is the most consistent definition, because it specifically integrates a company's relations to its internal environment, i.e. the shareholders and employees, as well as the outer environment, such as suppliers, creditors and, last but not least, the interaction between the two environments and management frames: management board, company management.

Due to the factors that influence a company's activity and, implicitly, corporate governance, it is safe to say that the latter is relevant only within the scope of large companies, where there is a clear separation between the structure of ownership and the actual management of the company. Legally, these companies are organized as joint-stock companies, where shareholders participate only as investors, generally don't know each other and cannot contribute to the current management of the business, which is entrusted to professional managers.

In what small businesses are concerned, we may say that corporate governance is relevant only in regarding the relations to employees, creditors, suppliers; as investors are directly involved in the decision making process.

2. The main types of Corporate Governance

The analysis of governance structures within enterprises, in developed countries, allows for certain specific characteristics to be identified in Anglo-Saxon, European and

Asian countries. Specialized literature identifies three main types of corporate governance (Onofrei, M., 2007):

a) The traditional model is characteristic to the North American system and operates on three hierarchic levels: shareholders, executives and managers. According to American legislation, the rights of the shareholders, to influence the ongoing activity of the corporation, are limited to the election of the members of the board of directors. The shareholders do not have the right to make direct decisions regarding the business governance (e.g. Payment of the dividends), but can only act indirectly, that is to say through the board of directors, in order to modify the attitudes and decisions of the managers. Operators, however, can decide to cease financing, by refusing to raise equity. In extreme cases, in the absence of the shareholders' financial support, the board of directors can proceed to replacing the general manager or the other components of the top management teams (Hart, O., 1995).

b) The co-determination model is characteristic to Western European countries, the participants being classified on four hierarchic levels: shareholders, executives, managers and employees. The model is representative for Germany, whose economical system is based on social co-determination, in the sense that various social categories are making efforts in order to raise social welfare (Onofrei, M., 2007). As opposed to the traditional model, this model introduces a participative management system, starting from the premise that the business risk is lower for shareholders than it is for employees; the latter cannot diversify their investment portfolio, but can elaborate recommendations for the board of directors in order to reduce risk, giving the decision making process a democratic feel.

c) The stakeholder model is characteristic for countries in South-east Asia and is also classified on four hierarchic levels. It can be differentiated from the co-determination model by means of the complexity of the relations it establishes. The model gives proper attention to each stakeholder and does not clarify the extension of rights and liabilities. Thus, a balance is kept between the decision making process and the levels based on which it is structured (Brezeanu, P., Stănculescu, A., 2008).

Although these corporate governance models are characteristic for large companies, they are also applicable to smaller, publicly traded enterprises. In Romania, just as in other Central and Eastern European countries, companies are characterized by a corporate governance model, based on the internal regulation of employees and of the management (Robu, V., 2004). These aspects are presently being developed.

Regularly, the *internal regulation* is not an outcome in itself, but just a means by which the corporate management tries to ensure of reaching the organizational objectives. The responsibility of ensuring internal regulation lies on the executives. The principle of the separation of duties is one of the foundations of organizing the internal regulation system. It allows avoiding the plurality of any two incompatible functions. The incompatible functions are: the operational function, the asset protection function and the accounting function (Bunea, Ș., 2011).

In the case of SME's in our country, the rule for the separation of duties, one of the foundations of internal regulation, is often disregarded. The confusion of these functions entrains that the error and fraud risk are a necessity. Nevertheless, in many SME's, the manager exerts genuine administrative control, which is an essential element of the internal regulation. Statistics show that fraud is no longer recurrent in a small or medium sized enterprise, as it would be in a larger company, which, elaborates its procedures better and has a higher level of respect for the principle of separation of duties, and the cause for this is administrative control which is proven to be more efficient in smaller enterprises.

In our countries, the rights of the employees, as stakeholders, are regulated by the constitution, work and unions legislations (Onofrei, M., 2007). Beside the rights guaranteed by law, such as minimum wage or basic welfare, the employees have the right to information and to express their opinion to the board of directors, on matters such as the reorganization of their activity or cutbacks in personnel. At the same time, employees are entitled to collective representation, whether or not they belong to a union. This right is generally respected and unions have plenty of political power, especially in state owned

companies. Strikes and union actions were frequent in Romania, one characteristic trait being their protest toward privatization and reorganization.

In respect to employer transparency, the cases in which employees are systematically informed on the financial performances of their company, or taken counsel with regarding important decisions, are considered exceptions. Nevertheless, there are cases in which union leaders were appointed on the board of directors.

Romanian law for trade companies offers solutions for appointing the board of directors, according to the default European law. On the other hand, the separation of duties between executive and non-executive members has not been institutionalized and, except for isolated cases, neither has the appointing of independent members on the board (Onofrei, M., 2007). Even so, with its efforts to adapt to the community acquis, Romania adopted regulations that imply the election of some administrators with the votes of ordinary shareholders.

Adapting to the proper corporate governance demands, as well as assuming an efficient model, similar to that of developed countries, represents an important activity for our country, thus reflecting a full ongoing process.

3. The corporate governance model in Romania

The implementation of corporate governance norms in our country, entails respecting the principles established in 1999 (amended in 2004) by the OECD (Organization for Economic Cooperation and Development), applied to each European country in turn, in accordance to its legislative system. The principles refer to: ensuring a basis for an effective corporate governance system, the shareholders' rights and the key duties of the participants, the proper treatment of all shareholders, the stakeholders' role in the corporate governance, information and transparency, and in the responsibilities of the board of directors.

In Romania, the principles were mainly kept unchanged, with the exception of concentrating the second and third principle, from the previous recital, into one larger

principle (Onofrei, M., 2007). The principles of corporate governance and the regulations of the capital market are designed to offer insurance to the investor that the funds he invested in securities, issued by traded companies, are used for the declared purpose of obtaining profit. This way, the investor is ensured for unfair, abusive and fraudulent practices, which may arise on the market.

The main corporate governance issues in Romania may be synthesized by the following observations:

- ✓ The frail institutional framework constitutes a significant obstacle for the consolidation of a solid investment climate;
- ✓ The implementation enforcement and rigorous execution of the already existent legal terms should represent a priority;
- ✓ The private sector should take over the initiative for the development of implementation instruments, as well as for the promotion of public debates on corporate governance issues;
- ✓ Concentrating on remedying the system's greatest weakness, namely invading the rights of ordinary shareholders.

According to some analysts, the issue of corporate governance has gained importance over the last few decades, as the role of the private sector has grown on a global level. To that effect, the analysis of the Romanian companies' sector represents a valid point in the implementation of the necessary norms for the corporate governance mechanism.

The Romanian companies' sector recorded a positive evolution after 1990, especially in regard to the number of enterprises, as a result of the private initiative that was launched during the first few months of 1990 and then on the background of privatizations, separations and establishment of new companies. Consequently, by the end of 2005, there were 928255 economical operators registered in our country, of which 450666 were companies, 381468 were private entrepreneurs and the rest were public and private administrations. Even so, a large number of economical operators are inactive. If we exclude the inactive operators and the public/private administrations, then the majority (95,6%) of the number of active operators in the industry, constructions, trade business and other services, are, legally speaking, limited liability companies; only 10923 of the total (2,5%) are joint-stock

companies. Thus, we can see from the analysis, that the majority of the companies are closed companies. This is highly relevant in what corporate governance is concerned, especially in relation to the stage in which governing standards are being adopted in our country, as closed companies offer insufficient information to its investors (Bădulescu, A., 2008).

The importance of good corporate governance was even more so emphasized by our country's opening its economy, in the context of European integration, as it represented an element of economical and social convergence with developed countries. The concept in question has become more and more important over the last few years, for Romania, which has an economical and social system in progress, as well as for member countries of the OECD, where a series of aspects concerning “financial scandals” drew attention to the delicacy of the companies' governing system and, as a consequence, the need to rethink the system was born.

In many emerging countries, the issue of corporate governance was also emphasized by the financial crises on the issuing markets, as well as by the prolonged process of transition from statist economy to a planned market economy. Thus the functioning condition of the corporate governance mechanisms is seen as a key to the institutional structure of a functional market economy.

The OECD and the World Bank have combined their efforts in order to create and support round tables on the issue of administration for corporations in Russia, Asia, Eurasia, Latin America and South-Eastern Europe. The round tables were organized in cooperation with local partners and hosts, whose support was vital to guaranteeing the success of these meetings. Each round table elaborated White papers for the corporate administration, characteristic for the respective region. The exception was made by the round table in Eurasia, which elaborated a comparative paper on the corporate administration in Eurasia. The National securities Commission and the Bucharest Stock Exchange have together organized the first round table in September 2001, in Bucharest. The conclusions drawn during this meeting were to be materialized

the following year (2002) in our country, by elaborating a perfectible code, regarding the structure and organization of the companies, based on the conformation with OECD principles regarding the harmonization of the interests between owners, the management and the companies' executive.

The current corporate legislation system in Romania is rooted in the continental European civil rights tradition. The harsh nucleus of the regulations in this field can be found in Law No. 31/1990 concerning trade companies. Law 31/1990 is based on the Romanian Trade Code of 1938, which although not enacted, constituted an attempt to modernize and update the old Trade Code of 1887. The latter was inspired in a significant percent from French traditional law – although, the project for the trade code of 1938 was also based on the Italian Trade Code, considered, at the time, to be the most advanced in the entire legislation (OECD Report, 2001).

In regard to the law for trade companies, the OECD considers that it must include: strict limitation of the responsibilities between internal and external regulation bodies, classification of the attributions of financial auditors and details on the obligations and liabilities of the members of the board of directors.

A significant fragment in the evolution of the corporate legislation was Law 52/1994 concerning securities and stock exchanges, nullified in 2002. In regard to “open companies” (economical bodies that build their capital by public subscription or whose securities were subject to other public offers), this law contains special dispositions that are more restrictive than law 31/1990. Inspired from European or Romanian law traditions but also from present day Canadian and American legislation, Law 52/1994 was issued in the context of preparing the opening of a stock market in Romania, after more than 50 years of suppressing securities transactions (OECD Report, 2001).

In the process of adhering to the corporate governance structures recommended by the trade companies' law, trade companies have, unfortunately, only managed to imitate a regular governance structure, showing a strong artificial nature. Thus, instead of appropriating the objective of maximizing the company value, the board of directors

was sensitive to political influences and adopted a bureaucratic behavior.

The privatization of state owned companies represented the sole solution for the alignment of the administrators' and managers' interests in order to maximize the value of the companies. The privatization had a slow progress and the economical performances of the state owned companies deteriorated rapidly. On the level of the community, it was continuously considered that privatizations must not constitute a pretext for indirectly helping the respective companies. For example, measures such as erasing the debt or tax exemptions were qualified as helping, even when these measures were taken in order to improve the context of the privatization – e.g. the cases of great magnitude like SC Dacia Pitesti and Sidex Galati (Onofrei, M., 2007). Romania did not follow this criterion to the full extent of its valence.

The Romanian companies listed on the capital market emerged subsequent to the privatization process, which, on the one hand determined the development of highly dispersed shareholders, inactive in the operation of the companies and, on the other hand, groups of high power shareholders. These companies created a form of governing, dominated by management and employees or by the regulation of the shareholders, which does not take into consideration the interests of the stakeholders or other social partners. The most important issue is the infringement of the rights of ordinary shareholders, by reducing their income (Giurcă Vasilescu, L., 2008).

Due to the privatization methods that allowed for a wide access of the managers and employees to the company capital, in Romania, external shareholders do not wish to be involved in financing the investment projects, because of the inefficiency in the means of regulation. To that end, the privatization process has lead to the creation of detached shareholders in the company's activity and no efficient means of regulation. On the other hand, privatization has lead to the emersion of powerful groups of major shareholders. With the lack of an efficient governing within these companies, the conflict of interests between major and ordinary shareholders is inevitable. This conflict degenerates into other conflicts:

between the management, the board of directors and the major shareholders as well as between major shareholders and the company's business partners.

In regard to the activity of the board of directors, Romanian regulations on the matter do not make any specifications concerning the structure of the board, its components, the mode of operation or legal requirements regarding the presence of independent members. As a consequence, several Romanian companies elected members of the executive within the board of directors. This is a breach of trade company laws, which forbid managers (except for the general manager, who can assume the position of board director) from being elected as administrators. This state of things determines the growth of the management's influence.

The European Committee recently published a Green paper, entitled *The EU framework for corporate governance*, by which it launches a public inquiry regarding the optimum means of improving the current corporate governance mechanism.

The public inquiry is set in a long term analysis of the framework for companies' corporate governance. The need for this inquiry is justified by the fact that the recent financial crisis signaled the inefficiency in the operation of corporate governance mechanisms. To this extent, a more effective management of the companies may reduce the probability of a future crisis.

According to the European Committee, the Green paper has the purpose of launching a comprehensive debate, focused on three points:

- ***The boards of directors***, respectively their effective operation and the measures to be taken in order to achieve a mixed structure of components;
- ***Shareholders' involvement***, respectively, solutions for increasing their role in the management of certain issues concerning corporate governance and for motivating them to be interested in achieving long term results and a longer term performance, as well as solutions to increase the protection of ordinary shareholders;
- ***National codes for corporate governance*** in effect, respectively, ways of improving their monitoring and applicability,

in order to offer useful information to investors and the public.

On the subject of corporate governance within public bodies in Romania, studies show the need for a more effective model of governance for local public institutions, externalized by a clear means of regulation and evaluation of the efficiency in using public funds. The model in question must apply the principles of corporate governance with the purpose of improving the activities of these bodies.

4. Conclusions

In the context of globalization and integration of national economies, corporate governance is considered as an important comparative advantage of companies and countries, because it increases foreign investors' confidence in the private sector. Besides, as a result of the reducing the public sector that occurred during the last two decades, the private sector has become an increasingly important provider of public assets. Therefore, corporate governance is a tool of oversight that provides information about the functioning and performance of private firms but also about the economies.

The corporate governance of Romanian enterprises have to be analyzed taking into consideration the evolution of the transition and reform process, which determined many changes in the economic framework.

Romanian companies listed on the capital market have merged from the privatization process, which determined the formation on one side, of extremely dispersed shareholders, inactive in administrating firms, and on the other side, the appearance of a very strong group of shareholders. These companies have a form of governance dominated by management and employees or shareholders control, despite the interests of stakeholders and other social partners. The most important problem is the violation of the rights of shareholders and minimizing their incomes. The managing board and censors have just a formal role of approving manger's or shareholder's decisions.

In conclusion, corporate governance creates safeguards against mismanagement and corruption and can promote fundamental values of a market economy in a democratic society.

The Accounting Normalisation in Romania: Past, Present and Future

Georgescu Cristina Elena

„Ovidius” University of Constanta, Faculty of Economic Sciences
cristina_georgescu95@yahoo.com

Abstract

Achievement of the deed of the accounting normalisation at a national level might be provided by the public power, accountant as profession or a mix mechanism. Within the present context trends increase of the international accounting regulation and accounting non regulation at the national level are perceived. In this paper we present some reference points regarding evolution of the accounting system in Romania and influences of the assimilation of European Directives and International Financial Reporting Standards on the Romanian accounting system. In Romania once with IAS/IFRS assumption it was tried improvement of financial reporting, publication process and individual financial statements remittance.

Key words: accounting normalisation, European Directives, International Financial Reporting Standards

J.E.L. classification: M48

1. The reform of the accounting system in Romania

The Romanian accounting system commanded the creation of a new accounting culture, which would keep with the spirit of relevant European and international regulations, as it was, on the one hand, influenced by the political, legal, economical and cultural environment and, on the other, by the evolution, trends and mutations of the international accounting field.

The transition towards the market economy generated a series of reforms in our country, out of which, the reform of the accounting system, represented and still represents an important position.

A thorough accounting reform in Romania could not ignore the high impact international doctrines and accounting regulations, oriented toward accounting systems characterized by the primariness of financial statements that would supply intelligible, relevant, credible and comparable accounting information for as many users outside the enterprise as possible.

Realizing the accounting system reform after 1990 was done gradually, by covering the following steps (Ionaşcu, I., 2003):

- The first step, begun after 1990, when a reform was made to create *Romanian accountancy law*;
- The second step began in the year 2000, during which it was intended to *ensure the accounting compatibility of Romanian companies with the evolution of the international accountancy law*.

The first step of the accounting reform was focused on the development of a Romanian accountancy law that will encompass concepts and accounting practices, specific to enterprises operating under the conditions of the market economy, which helped set the starting point of the harmonization with European accounting norms.

Within this step we can identify three periods:

- 1) **The period between 1990 and 1993** This period could be characterized by the adaptation of the former soviet accounting system to the new economical conditions and the application of a French-inspired accounting system, referred to in specialized literature as *The new accounting system*. During this period it was attempted to align the accounting regulations and practices to the European standards. With the new Accountancy law no. 82/1991, which enacted the General Accounting Plan, Romania adopted a new continental accounting system, namely the French one. On January 1st 1993, the new system entered into an experimental stage, using 70 various

economical agents, means of capital exploitation and different types of developed activities, as test subjects.

2) ***The period between 1994 and 1996*** The new accounting regulations, *Accountancy law no. 82/1991* and *its Enforcement regulations*, were applied starting with January 1st 1994, guaranteeing a certain compatibility with the accounting practices established in the European accounting directives. These regulations were elaborated under the guidance of French and Belgian experts, thus explaining the fact that the newly implemented accounting system is of French inspiration, a finding reflected in several dimensions:

- The taxation-accountancy link, attested through the use of provisions;
- The General Accounting Plan is a replica of the French accounting plan of 1982;
- The structure of the Balance and the Profit and loss account is a copy of the French structure.

The accounting system adopted in 1994 is a dual system, where financial accounting is normalized and management accounting becomes optional. The two types of accounting have different functions: financial accounting has an external financial communication function and management accounting has a provision function. The introduction of a dual accounting plan marked the entrance of a type of accounting oriented toward internal as well as external financial information users. The French accounting system proved to be a good choice. The French model was a system, which was adapted to Romanian traditions, to the existing conditions of those years and easily adaptable to the Romanian economy, which was actually demonstrated.

3) ***The period between 1997 and 1999*** In the year 1997 *the program for the development of the Romanian accounting system* was initiated, whose objective was that to harmonize accounting in Romania with the European accounting directives and international accounting standards. At that moment there were arguments and counter-arguments to the implementation of the IASC conceptual accounting framework and the international accounting standards, whose elaboration was predominantly of Anglo-Saxon influence, arguments which may contradict the European accounting

directives. Thus, in order to achieve the accounting harmonization of the national legislation with the European and international demands, two solutions were born: one was the restatement of the national financial statements based on international standards, and the second was to edit, from the beginning, the national financial statements based on the international standards for enterprises listed on specialized financial markets.

The second step took place in the beginning of the 21st century, when Romania adopted a program for developing its accounting system born out of the necessity for globalization of the economies and financial markets.

Within this step we can identify three periods:

1) ***The period between 2000 and 2002*** this period marked a turning point in the development of accounting in Romania. Romanian normalizers decided to reorient the accounting doctrine towards an accounting system where the Anglo-Saxon elements are predominant. The objective of the program for the development of the accounting system is to implement a system shaped on international regulations and practices, which can be found in the international accounting standards.

The premises of applying the international accounting standards to large enterprises were created by the *Ordinance of the Minister for Public Finances no. 403/22.04.1999* for the approval of the *Accounting regulations harmonized with the 5th Directive of the European Economical Communities and the International Accounting Standards*, which was subsequently replaced by OMPF no. 94/29.01.2001, with the same denomination.

According to OMPF 94/2001, the application of the *Accounting regulations harmonized with the 5th Directive of the European Economical Communities and the International Accounting Standards* during 1999-2005, is provisioned to take place gradually, within large and medium-sized enterprises. In order for that to happen, the application of the standards must be realized in full, with no allowance for modifications, adaptations or omissions.

The novelties introduced by these regulations into the national accounting system are new concepts and objectives, based on which the reports for the financial statements will be made. The set of financial statements includes two new financial statements: the modification of the ownership equity and the cash flow statement. The annexes were replaced by *Accounting policies and annotations*, which can be differentiated from the former not only by the change of title but also by the contents: annotations offer details and comments to the information given in the set of financial statements in order to enhance the relevance of the financial information supplied; accounting policies offer methods and accounting principles adopted by an enterprise in the process of working out the financial statements.

2) ***The period between 2003 and 2005*** starting with January 1st 2003, the enterprises that did not fulfill the size criteria set out in OMPF no.94/2001, elaborated financial statements according to the *Simplified accounting regulations, harmonized with the European directives*, approved in OMPF no.306/2002. At this time, the Regulation for applying the Accountancy law, approved by G.O. no.704.1993, ceased its validity. These regulations were, basically, a simplified version of the standards for accounting in large-sized companies.

3) ***The period between 2006 and the present day*** from the comparative analysis of the European directives (the 5th and 6th) and the national accounting regulations there resulted some inconsistencies. In order to eliminate these unconformities, the Ministry for Public Finance elaborated an accounting regulation consistent with the European directives, which replaced, starting with the 1st of January 2006, the OMPF no. 94/2001 and OMPF no. 306/2002, respectively OMPF no. 1752/2005.

The main novelty brought by OMPF no.1752/2005 was the unification of the accounting regulations, so that the economical agents who applied the regulations approved by OMPF no.94/2001 and OMPF no.306/2002, by the end of 2005, applied, starting with the 1st of January 2006, unitary accounting regulations, respectively OMPF no.1752/2005.

At the moment, in Romania, the **normalization apparatus** of the economical agents' accounting is made up of:

- Accountancy law no. 82/1991, republished;
- Accounting regulations for economical agents and public institutions;
- Methodological standards and accounting definitions acting as regulations;
- Methodological instrumentations acting as professional guides;
- General framework for hatching out and presenting financial statements, elaborated by the International Accounting Standards Board (IASB);
- The accounting standards or norms network defined by the International Financial Reporting Standards (IFRS), known until 2003 as International Accounting Standards (IAS); European accounting directives; National Accounting Standards as developments made, according to the EU Accounting directives, the framework for IASB and in convergence with IFRS; additional National Accounting Standards for the areas not covered under IFRS/IAS;;
- General Chart of Accounts;
- Recommendations and practical guide;
- Financial auditing law.

2. The implementation of IFRS in Romania

Romania covered between 200 and 2005 a program for the implementation of Accounting regulations harmonized with European directives and International Accounting Standards.

Adopting and implementing IFRS in Romania started as a request included in the European Parliament regulation no. 1606/2002.

Therefore, ***OMPF no.907/2005*** was adopted, regarding the approval of those categories of legal persons who apply accounting regulations according to IFRS, respectively to the European Directives. This ordinance referred only to the fiscal year of 2006 and anticipated that all legal persons mentioned in art. 1 of the Accountancy law will apply accounting regulations, according to European directives, for the year 2006. (OMPF no.1752/2005).

During the fiscal year of 2006, the loan institutions, also elaborated a distinct set of financial statements, conforming with IFRS, only for self information necessities, with the parenthesis that such accounting statements, which are in conformity with IFRS, are only met by the restatement of the financial statements according to European directives.

By taking into consideration the objectives of the national action plan for the improvement of the financial reporting, the process of preparing the strategy for the implementation of IFRS was continued, and was materialized in the elaboration of the General Framework for the IFRS strategy implementation in Romania, along with the World Bank, which was approved by the Accounting and Financial Reporting Council. This general framework was adopted as a work product and shall be continuously revised with the evolution recorded in adopting and passing IFRS.

OMFP no.907/2005 was replenished by **OMPF no.1121/2006** on the application of the *Financial Reporting International Standards*, which states that, in order to ensure the conformity national regulations with European Union regulations on accounting, during the fiscal year of 2007, Romania will continue to gradually implement the International Financial Reporting Standards (IFRS).

Under this ordinance, by International Financial Reporting Standards we understand:

- International Financial Reporting Standards (IFRS);
- International Accounting Standards (IAS); and
- Associated interpretations (SIC-IFRIC Interpretations), subsequent amendments to those standards and the associated interpretations and future associated standards and interpretations as approved by the European Union translated and published the Romanian language.

Starting with the financial year of 2007, the trade companies whose securities, at the date of the audit, are accepted for trade on a regulated market and that elaborate consolidated financial statements, were obligated to apply the International Financial Reporting Standards.

For 2007, the other public interest entities could apply the International Financial Reporting Standards upon elaboration of individual or consolidated financial statements, for self informing necessities.

All bodies that must, or opted to, apply the IFRS must ensure the continuity of said application. They may also elaborate a distinctive set of annual financial statements obtained by applying the International Financial Reporting Standards, destined for information users, other than state owned institutions.

This regulation stipulates that all bodies, including the ones applying the International Financial Reporting Standards, must elaborate financial statements in conformity with European directives (OMPF no. 1752/2005).

The adoption of the IFRS standards, starting with January 1st, 2006, determined significant incidents, for some enterprises, when presenting their financial position and performances.

3. Conclusions

The IASB conceptual framework contradicts the Romanian accounting tradition, which is why a series of **problems** may occur. From here on, we will refer to certain aspects we consider as relevant.

By applying the new regulations, the general framework becomes compulsory, in the detriment of the General accounting plan, even if that entails changing the Romanian mentality on professional accounting. If this challenge is not carried out immediately, the modification of the chart of accounts in effect will become compulsory.

Special importance will be given to financial statements, in the detriment of the financial records procedures. These must answer to the users' need for information on the financial position, of the enterprise, the performance and modifications in the financial position of said enterprise.

The fundamental objective of accounting is obtaining real, accurate and credible information for the users, which must be generated with lower costs than the users' benefits and be transparent and comparable in time and space. Thus, through the adopted policy, the administration of the enterprise

must seek a balance between relevance and credibility.

Accounting professionals will be faced with a dilemma of whether or not to elaborate provisions, which, on the one hand, artificially diminish profit and dividends and, on the other hand, are requested in order to obtain a precise figure.

The vertical format of the profit account, where expenses are classified by their quality (predominantly fiscal orientation), will be discarded as will the adoption of the model where the classification is done by functions (international accounting orientation).

The precise figure is impacted because Romanian accounting is strongly linked to taxation. In order to obtain the precise figure demanded by IFRS's, the accounting specialist must apply a professional reasoning to solve the issue of the accounting truth conforming to tax regulations, because in Romania, the tax results are calculated starting with the accounting results, which is adjusted with the expenses that are considered to be ineducible and tax deduction. All the discrepancies between accounting and tax policies will be settled off-balance. In this context the need to revise the tax policies in Romania will arise, in order to create the premises for developing businesses, capitalizing such businesses, profit growth and the supervision of the tax parameters by the administration of the companies.

The cross over to IFRS is a complex process that will determine significant modifications in the accounting policies currently in effect.

For the development of standards, the IASB intends to limit the number of options regarding accounting treatment and re-examine the current options of the IAS in order to restrict the number of allowed treatments.

All standards are connected to IFRS 1, because this standard states the manner in which each of these must be implemented by the applicant for the first time. By this we understand an entity that adopts the IFRS standards for the first time, as reference for elaborating its financial statements

In Romania the IFRS standards were adopted on January 1st, 2006. By applying the IFRS standards in Romania we should witness a growth of trust on the capital markets and trade companies. The International Financial Reporting Standards will give Romanian companies the perspective of obtaining capital at a lower cost.

Crisis Normality in the European Union Structure

Abstract

During the European Union development there have been some actions marked by failure, situations in which the achievement of objectives was not possible due to the difficulties related to their actual implementation, and because of the backdrop or disapproval of some members. Also, several crisis periods and moments of impasse followed.

The correlation between the terms of crisis, failure, impasse and compromise is determined by the common element - the European Union. Each of them has been and will be further mentioned, as long as this mechanism of creating a new legal order is in an ongoing process of evolution, transformation and development.

However, the registered crisis periods must be analyzed for a specific point of view, in accordance to the Union features.

Key words: crisis, failure, impasse, euroscepticism, eurosclerosis.

J.E.L. classification: K3

1. Introduction

Established as an economic entity, the European Union has evolved from a functional point of view to a legal order based on a constitutional structure, in which the political character determines the statutory rights and obligations belonging to members of participating states, citizens, in this case. In this way, among the highlights of its existence - the establishment, operation, future existence – the EU is defined as a crisis system. The notion of crisis corresponds to the economic situation

resulted in the postwar period, of the Cold War, of strained relations between East and West., but also due to faster evolution of European law towards the European Constitutional Law.

2. Crisis categories in EU

We will analyze the notion of crisis as it takes different forms in relation to the EU system.

2.1. Crisis from the chronological point of view

Starting from the historical perspective and using the chronology of events as a criterion, taken out of the historical context - only for analysis - we can include between the moments of crisis of this absolutely original system, which is the EU, the following:

- 1952 - 1953 - E.D.C. and E.P.C projects;
- 1960 - A.E.L.S establishment;
- 1965 - 1966- the “empty chair” policy;
- 1973 - The first enlargement of the Communities;
- 1975 - The renegotiation of the accession conditions of Great Britain;
- 1984 - The financial crises
- 1994 - The problem of minority blocking in the EU Council
- 2001 - 2005 - Constitution for Europe

There has not been any integration project doomed to failure since the first phase of Communities existence. The treaty signed on 27 May 1952 by the six member states of the ECSC was considering a European Defense Community (EDC), debating the ideas from the "Pleven" plan which was expected to create a European army under the control of a European Ministry of Defense, small armed

units being part of the NATO army. France has not ratified the treaty, given the tools abandonment par excellence of national sovereignty.

Moreover, no draft statute of a European Political Community (EPC) has succeeded since March 1953. The project aimed at achieving an institutional structure similar to ECSC and EDC, providing independent institutions with an important role of policy-making and parliamentary element, but also coordination of foreign policy.

The success of the European Communities in the first years after 1958 is reflected in developments such as: an increase of almost 30% percent of trade between the six Member States, the achievement of customs union a year and a half earlier, designed to be completed by the end of 1969.

However, the implementation of the common agricultural policy (CAP), one of the objectives of the Treaty of Rome, proved to be difficult, leading to contradictory discussions within the European Community up to date.

The spectacular growth from the 60s and 70s in agricultural production in the European Community, far exceeding the consumer needs of Member States and the drastic decrease in the number of people working in agriculture, were the causes which led to difficulties in achieving the CAP. Community institutions have wanted to stop this phenomenon by adopting a plan for providing incentives to increase farm size, mechanization of agriculture and abandonment of less fertile land to cultivate.

As a reaction to the economic progress of "The Six", the Great Britain, for fear of being left outside the European trade, initiated the creation of the European Free Trade Association, along with Austria, Denmark, Switzerland, Norway, Portugal and Sweden in 1960 in Stockholm. The United Kingdom ceased to be a member of EFTA in 1973, during its entry into the European Community together with Denmark and Ireland.

According to the Treaty of Rome, during the transition period scheduled to end in 1965, the European Communities Council, consisted of foreign ministers of the Member States, must take most decisions with unanimously votes. At the end of this transitional period, following the decisions to

be taken with qualified majority votes, a major crisis broke out between France and the other members of the European Communities.

De Gaulle, the French president, was not willing to accept that the vote of France was ignored in major issues, opposing the introduction of voting by qualified majority. Thus, in 1965, the suggestions of the European Commission's President, Walter Hallstein, on the financing of the CAP, the creation of the European Communities' own financial resources and expanding European Parliament's budgetary powers faced the opposition of France, which had boycotted the work of the European Communities Council for six months by adopting the so called policy- the "empty chair".

In order to solve this crisis and due to the essential presence of France in the European Communities, the other states gave up and the completion of the Compromise from Luxembourg took place. It states, in essence, that any of the six states has voting rights when their important interests are affected, rule that is in force until the Single European Act from 1986.

The crisis caused disruptions to the European Communities Council activity, had negative impact on the common agricultural policy and strengthened the relation between governments at the expense of developing the integration process and a community approach. During this period of decision stagnation, the Court of Justice has played a major role, advancing the European integration and stabilizing the European construction by its daring jurisprudence.

The year 1973 marks the first expansion of the European Communities. On January 1, the United Kingdom, Ireland and Denmark became members.

Britain and Denmark showed a skeptical attitude regarding membership, especially when they had been part of the European Free Trade Association, together with other five associated countries, which aimed to counteract the economic effects of eliminating the internal taxes between ECC countries. Moreover, the Danes had no choice, once Britain joined the Treaties, because their exports went to Britain and Germany. Because of its relationship too close to Britain, Ireland needed the opening towards the continent and the funds

distributed by the Common Agricultural Policy.

The increased number of the Member States was a challenge for communities, especially in the economic crisis which started in 1973. If by that time the United States had not prevented the European construction, it started a harsh economic and commercial war against EEC. The absorption of new member states and community development were hampered by rising inflation, rising unemployment, worsening oil crisis, different foreign policies, especially toward the Middle East. In addition, some states did not agree to contribute to the construction of Europe, unless they received in return substantial benefits. It was the case of Great Britain, whose ideal had always been transforming Europe into a free trade area in which each state can pursue their best interests.

To all these aspects, there was also the law-making paralysis caused by the Agreement from Luxembourg, the Community budget further facing with a major deficit.

Joining the United Kingdom would not put to an end the differences of opinion between this and the other Member States, especially in budgetary matters. The United Kingdom contributed with very large amounts to the Community budget, while budget expenditures were allocated most of the time to agricultural support, which brought no gains to British, who were large importers of agricultural products.

A temporary solution was found in 1975, through a complex "correcting mechanism", having the main purpose the resettlement of community tasks due by UK, thus it was broken the principle of community solidarity. Finally, in 1984, at Fointainebleau, under the French presidency of the EC Council, the budget problem was put to an end by reducing the United Kingdom's financial contributions, reducing funds for agriculture and increasing European Community's own resources.

From 1982-1983, the European institutions had found in Europe the internal market shortages. In 1982, the European Parliament entrusted the task of studying the economic crisis to experts in terms of Europe and the finding means of growth. The report published in 1983 showed that, despite the

final suppression of customs duties in 1968, in reality, Europe was witnessing the closing of markets which prevented from overcoming the crisis and enjoying the economic advantages of a large common market. One can observe the limits of the common market regarding persons and goods circulation.

In 1984, the European Community faced a difficult financial situation and the existence of a substantial deficit, with multiple causes.

Firstly, in 1984 the Agriculture Council adopted a decision which caused costs that were difficult to cover by resources perceived by the Community, especially from VAT.

The Commission was also planning to launch a loan to states that should have been subject to repayments spread over eight half-yearly installments, from 30 June 1986. This solution was not adopted, the situation was saved by the appealing to a feed from the states.

Secondly, the budgeting caused permanent conflicts between the budget authorities; the budget was twice rejected by the European Parliament in 1979 and 1984. The crisis was rooted in the community resource depletion and in the Parliament's attitude of contempt towards the Council. Moreover, in 1985, the Parliament finally passed and decided a budget that exceeded the amount of costs from the project set by the Council. The Council appealed to the Court of Justice, obtaining the cancelation of the European Parliament President's final decision. The Court also stated that the budgetary procedure could not be completed but for the institutions' agreement.

Clearly, these difficulties in the budgetary procedure had negatively influenced the development of European construction, requiring recovery efforts.

Before the accession of Austria, Finland and Sweden, the European Communities Council had taken decisions by qualified majority of 54 votes out of 76 possible. The blocking minority was of 23 votes.

The institutional deadlock was caused by the prospect of change in the number of votes to obtain the blocking minority from 23 to 25, the votes being 87 at the present, along with the entry into the Community of the three states. The United Kingdom and Spain triggered an institutional crisis to get the maintenance of the blocking minority of 23 votes.

To solve this situation, by the compromise from Ioannina in 1994, it was decided that the blocking minority could be 23 votes, if "some members of the EU, representing 23 votes showed their interest in disapproving the adoption of the Community Act. In this case, the Council would do everything to reach within a reasonable term and without prejudice the Community interests at a satisfactory solution, that could be adopted with 64 votes", not 62, according to the rule.

However, the compromise has never been implemented so far.

The doctrine holds two contradictory views regarding the constitutional nature of Community legal order, a constitutionalist thesis that denies constitutionalist argument.

The constitutionalist thesis is based essentially on the idea of progressive constitutionalisation of the European Union, keeping in mind the following arguments: the Community legal order has evolved from the legal status formed by relationships and in particular the obligations established between States to that of integral legal order, whose main characteristic is that it gives rise to rights and obligations in favor of and help of individuals in those states. The control operation over the implementation of public power is held by the static model.

Furthermore, the authors highlight the fact that the institution treaties contain provisions having a constitutional nature, as the theme of these treaties is the establishment of both political authority and its legal powers limitation. The organization, the outcome and the procedures of the European Union are established by treaties with the rank of supreme rules, and the application of political power can not take place outside the Treaties.

It is also important the role of the Court of Justice of European Communities in the process of constitutionalisation. This was empowered to draw up the European law, but also to impose its prevalence on national legal systems, setting its "supreme", constitutional value. This was achieved by developing the concepts of direct effect and prevalence of community law over national law, imposed as fundamental concepts.

Regarding the second thesis, the arguments which deny the constitutionalist thesis consider only the constitutionality features of institution treaties, omitting the innovative work of the Court of Justice. In

essence, it is said about treaties, ignoring their clear characteristics towards classical international law treaties, that there is no indication that parties that have ratified them, sought to establish a legal system different from that of international law, the less of one constitutional type. In addition, the standards of democratic legitimacy are not met, as the European citizens should be not only the addressee of the norms, but also their authors.

The characteristic of the European Union Systems makes some of the consequences of classical constitutionalism to be inapplicable, even if it is accepted that the European law order has become a constitutional one.

2.2. Crisis from the perspective of expressed opposing position to the European construction

2.2.1. The Euroscepticism

The Euroscepticism is a political ideology related to scepticism over the European Union and European integration in general. Sometimes, this scepticism is accompanied by the desire to preserve the sovereignty and identity of the European nations instead of creating a European federal state. Eurosceptic movements exist in all European Union member states, although in some countries, especially in Northern Europe, these ideologies are more developed. For example, Norway has not joined the European Union because of the widespread Euroscepticism, while Sweden, Denmark and the UK are not in the euro area. In Sweden and the UK, less than 30% of citizens believe that their country benefited from EU membership. Among the countries that joined the Union in 2004, the Czech Republic is the most eurosceptic, although these countries are generally less Eurosceptic. Euroscepticism is generally associated with the idea of nation state and sovereignty, expressing the concern about the increasing integration and federalization projects of EU. Euroscepticism is usually used as a generic term for a variety of exclusive ideologies and visions towards European political project. The most important distinction is between "hard" and "soft" Euroscepticism.

Hard Euroscepticism implies open opposition of national parties with a platform that opposes the whole European project as

now constituted. Such parties want the withdrawal of nation states from the European Union or its dissolution and the inversion of integration process.

Soft Euroscepticism primarily involves lack of extremist parties and means, rather, a critical and rational vision about the Union, considered bureaucratic and undemocratic. The soft ideology does not promote the idea of dissolution, but that of reform in sectors or policies considered dysfunctional. For example, Norway has not joined the European Union because of the widespread Euroscepticism or the opposition from fishing policy (considered strategic), while Sweden, Denmark and the United Kingdom are not part of euro area, disagreeing the monetary policy. In Sweden and the UK, less than 30% of citizens believe that their country benefited from EU membership. Statistically speaking, Romanian people have the highest level of trust in EU institutions. The concept that opposes the Euroscepticism is that of Europeanism or Euro-optimism, and here are distinctions between "functional" Europeanism, less focused on the idea of integration, rather oriented towards the idea of sectoral benefits and the "identity" Europeanism, the supporter of political integration and federal evolution of the Union.

Based or not on prejudice, scepticism about present and future actions of the Union, and its transformation into a federal state and the loss of national sovereignty, has taken a movement consistency. The rejection of EU policies was felt more strongly in the northern continent countries, Sweden and Denmark and the UK. Norway, Iceland and Switzerland are also major countries who have refused to strengthen relations with the Union or acceptance of membership. It is estimated that Euroscepticism was a major factor in several European failures. Of these the most important are: the rejection by the UK of EU and Monetary Union and Schengen visa, the fact that Iceland has never made any application for membership, Sweden's rejection of euro, the Norway's denial of membership, the rejection of the Constitutional Treaty in referendums from France and the Netherlands, in 2005.

Euroscepticism is generally based on the dissatisfaction present in areas where its presence is felt, but has some common

themes. A large part of those who oppose the Union, bases its argument on the fact that the Union is not perceived as a natural product, designed and developed like a state based on national foundations. They believe that the EU is a bureaucratic invention, designed to evolve into a bureaucratic and undemocratic state, a dictatorship of the officials.

Another key issue is related to centralization and the idea of creating a super state, United States of Europe, a copy of the United States of America. Many of the eurosceptics considered the present integral tendency can only have this result. As such, the adopted or proposed measures by the Union jeopardize the sovereignty of each state. Of these, the most disputed are related to the European Constitution, the harmonization of taxes and health insurance system, increasing the powers of Europol.

The eurosceptics also oppose the idea of harmonizing the system of justice and home affairs which they consider unnecessary, considering that national justice operates satisfactorily. In Britain, the dispute came up in Parliament. The main counter-arguments targeted incompatibilities between civil legal systems and the impossibility of providing citizens some basic rights, such as presumption of innocence.

2.2.2. Eurosclerosis

The stagnation of the European integration process, due to problems the national economic systems faced with in the 1970s, was called eurosclerosis, an ancient form of aging stable long-term economic systems. The European integration process, seen as a process of legal integration, should have a stimulating effect on the economy, not just in terms of dynamic and static effects of integration but also by weakening interest pressures. The customs union was achieved relatively smoothly. Gradually, since 1958, taxes were reduced and in 1968 the customs union was broadly completed. Some European countries, that did not want to join the EEC and thus to introduce a common external tax and to use the political model of the group, established EFTA.

Consequently, in the early 1980s, the "eurosclerosis" had two different meanings: described the European countries difficulty to meet their internal economic problems during

the period of stagflation, but also described the European countries difficulty to overcome the challenges of European integration. Two cases have resulted in overcoming the difficulties of European integration. In 1974, the European Court of Justice in the decision "Dassonville" established that any regulations that act as non-tax trade barriers should be removed. By this decision, the Court allowed the competition between different national regulations, pointing out also the way the Member States can overcome future barriers from the flow of production factors by mutual recognition of standards.

Subsequently, the standards in education were recognized, where diplomas began to be mutually recognized and thus allowed EU citizens to work after graduation, in any other Member State. The second situation to overcome the "eurosclerosis" was the schedule to achieve the common market in 1985, in order to overcome economic and political problems of the integration. There were adopted 279 proposals of non-tariff barriers abandonment, of national protection and of border control.

The mutual recognition of standards, based on the minimum level of the Single Market Plan, aiming at reducing at the same time hundreds of protectionist regulations from all Member States, was a success. In the following years, C.E.E. regained its optimism and in the late 1980s went from "eurosclerosis" to "Euro-hysteria" an overflowing optimism regarding the dynamics of integration.

3. Conclusion

In conclusion, the European Union is characterized by a structural crisis, as the systems theory and the application of the traditional concept of sovereignty to the Union structure are not possible. By its nature, the Union requires the simultaneous existence of several systems on the same territory, a situation considered impossible in terms of classical theories of constitutional sovereignty. Consequently, the European Union can be conceived as an entity whose existence is a normal crisis, emphasizing the identity, thus eliminating the notion of "failure", but strengthened it by that of "compromise".

Some Considerations on Internal Alignment in the Field of Energetic Efficiency of Buildings in European Legislation

Gheorghe Lucian

“Ovidius” University of Constanta,
Faculty of Mechanical, Industrial and Maritime Engineering

Abstract

Increased energy efficiency constitutes an important component of the package of policies and measures necessary to comply with the Kyoto Protocol and should be a part of any policy package aiming at further undertaken commitments' accomplishment.

Key words: energy, certificate, energetic performance

J.E.L. classification : K49

1. Introduction

Council Directive 93/76/EEC of 13 September 1993 of limiting carbon dioxide emissions by improving energy efficiency (SAVE), which requires Member States to develop and implement energetic efficiency programs in the construction sector and to report on taken measures, started to produce important benefits which have already been felt. However, a complementary legal instrument to establish more concrete actions to achieve more concrete actions for exploiting the great potential still unrealized energy savings and reducing the large differences between Member States in terms of results in this sector is more than appropriate.

2. Analysis of the subject

Council Directive 89/106/EEC of 21 December 1988 on the approximation of laws, regulations and administrative provisions of Member States relating to construction products requires the construction works and their heating, cooling and ventilation to be designed and constructed so that the amount of energy

required in use will be reduced, taking into account local climatic conditions and the occupants' comfort. Energetic performance of buildings should be based on a methodology that can be differentiated from one region to another, and should include, in addition to thermal insulation other factors that play an increasingly important role such as heating and air conditioning, use of renewable energy sources and design of the building.

Romania's domestic legislation provides that a building's energy performance certificate is valid for 10 years from the date of issue, and it shall be developed in compliance with legislation for buildings in the categories prescribed by law and which are constructed, sold or rented.

The certificate is issued to the owner and the owner puts it, if necessary, at the buyer or tenant's disposal. For the categories of buildings that are built (new buildings), the certificate shall be developed by investor / owner's care and be includes documentation for the reception at the end of the work. Specifically, the owner of the property (investor /owner, etc.) must apply, at the end of reception for the energetics performance certificate. For the categories of buildings to be sold or rented (existing buildings), the certificate shall be developed by owner's care and be submitted to the contract of sale, respectively.

With the adoption of Law no. 372/2005, Directive 2002/91/EC implementation was done by national law but not the actual implementation which is to be achieved by legally inferior laws. Law no. 372/2005 is not, however, a simple ordinary law, but an act of transposing an European Directive.

It aims at protecting a public interest, public order, with medium and long term effects, namely the improvement of energy performance for real estate fund as a whole, reducing costs, protecting the environment, preserving natural resources, influencing global energy market, etc.. The Parliament and EU Council which drew up the Directive (EU legal act binding on Member States) were not the least bit concerned about protecting the individual buyer's interest, but providing greater energy efficiency worldwide, as part of package measures and policies to be drawn in order to achieve the obligations under international protocols, as it is clearly stated in the preamble to the Directive.

European Directive 2002/91/EC was amended and adopted by the European Parliament called 2010/31/EC and the 12th article of the Directive requires Member States to provide a certificate of performance required for buildings or building units which are constructed, sold or rented to a new tenant.

Article 2 of Decision nr.335/2010 recommends notary signing the contract of sale or rental of a building energy performance certificate without request of the property which is subject to transaction, but insert the following clause: "The buyer or tenant, as applicable, agree to acquire or use such real estate property, at their own risk, assuming any responsibility regarding the effects produced by withheld information contained in the content of the building energy performance certificate."

National Union of Public Notaries from Romania misinterpreted the content of Law no. 372/2005, as being a concern for private interest (the buyer / tenant), in which case the penalty that comes to the conclusion of the legal act in the absence of competence certificate is relative invalid by energy that could be covered by the clause cited above.

It is clear that notaries can not decide on a building's energy efficiency, as they have no training in the field.

3. Conclusions

To fulfill obligations under the Treaty of Accession, it is compulsory for the directives not only to be transposed, but to be

also implemented, which requires that national authorities should take all necessary and appropriate set of measures for the regulation to apply effectively.

In this case, this measure is that of absolute nullity sanction provision within the Law, in order to enable public notaries not simply interpret provisions of a bill so important to qualify as a relative nullity.

This sanction could not be foreseen in the Directive as EU institutions establish in this act only result needed to be achieved.

Binding force of directives aim at Member States fulfilling the objective set. How Member States adopt the measures prescribed by the directives, the legal instruments they use, are left to each Member State to establish specific sanctions of its own system of law.

In terms of non-compliance with Law no. 372/2005, which establishes penalties for violation of its provisions, I also mention that provision of law which establishes the requirement for existing public buildings to have energy performance certificates for new buildings to have this certificate in case of acceptance of works submitted to the City Halls, does not apply at all across the country.

Law no. 372/2005 has not provided any penalties or consequences for failure to comply with this legislation, the legislature and this gap must be removed to ensure the implementation of Directive 2002/91/EC. Energy certificates are virtually a guarantee for those who are in fear that winter maintenance can cost more.

These are given, among others, over year when the property was built, to materials used to raise his or supply the heat source (central heating or district).

Given the above considerations, I appreciate that it is necessary to "de jure" as in all situations in which buildings are sold/ rented there, must be invariably presented building energy performance certificate when signing that contract, otherwise the sanction must be absolute nullity.

Determinants of Climate Pyramidal Organizations

Gheorghe Lucian
"Ovidius" University of Constanta,
Faculty of Mechanical Engineering, Industrial and Maritime

Abstract

An organization or pyramidal institution can be described as a system in which exceptions are often rules and general developments occur in the particular. The essence of public pyramidal institutions is given by the set of precise rules and regulations, where person formally operates. The existence of a narrowly define framework does not make it easier, as one might think, the work of organization members, on the contrary they sometimes have to show more imagination in solving professional problems, overcoming the formal and therefore manifesting social developments.

Key words: organization, climate, determinants, group

J.E.L. classification: L14

1. Introduction

From here, a polarity between the old and new, rises which can be described as an axis on which each member of his organization has its place. Consequently, some will range throughout the profession only at one at pole, but others will migrate depending on what instinct dictates personal or professional needs occupying successively different positions on the axis described above.

In this context, the necessity of studying the influences on internal and external factors can have on organizational climate, studied in the case of a section in a pyramidal institution.

2. Organizational climate and its components

Organizational climate is difficult to define although many authors have performed this task.

According to some authors it means "all social characteristics of the interaction of different work groups" within the organization, organizational social environment in which each of these groups lead their business.

Climate refers to those characteristics or attributes that distinguish an organization from others. Because organizational climate is perceived primarily by members of groups, it will determine a certain behavior, it appears that people do not behave identically in different organizational climates.

Organizational climate components acts and are defined organization personality, experienced stress at work, inter and intra-group cohesion. Organizational climate perception is internalized through the individual, so the question of defining a "good" climate rises. Therefore there must be taken into account several factors that support the achievement of a detailed picture of it, depending on which it may be determined the optimal climate, specific to each organization, as "good" for some members of the organization can mean "bad" for others. Having to do with concepts primarily characterized by dynamism, organization, climate, group, conclusions that can be drawn on them are always partial and subject to changes taking place within them.

3. Determinants of organizational climate

- Age and size of the organization

Age organization, seen as remote in time from the time of establishment, may have different influences on the climate. A young organization is characterized by limited formalization, while a long organization with stated rules requires, including the environment because the years often play an important role as far as aging and formalization of organizational climate is concerned.

The organization, age, however, can be regarded also from another perspective, namely the biological and psychological age of its members. There are institutions where the age limit which allows you to perform work is not very advanced (for example, pyramidal institutions stand at 55 years), from this point of view we can conclude that these organizations are "young", but the way the organization works does not support this hypothesis. There are also organizations where their members are past the legal limit of retirement but by the specific professional activity, the psychological age still stands among the organization young. The size of the organization prints a human behavior in a small organization which is different from that shown in a large organization. Personal, quick established human relations, subject an informal structure fosters a pleasant climate a competitive one in comparison with the stiffness of large organization.

- Profile of activity and nature of work

The specific activity of an organization helps defining the climate as a lot of important issues are involved like the branch of activity which includes organization, dedication to innovation, research capacity, the technical equipment, predominantly staff some training. Nature of work conditions the climate by its impact on humans, the central dimensions of work:

- variety (different job),

- identity (resumption of operations) and the meaning of tasks (which is important in the eyes of workers),
- autonomy (selfcontrol tasks) and
- feed back (information about performance).

The activity's profile and nature of work activity are responsible, in most cases, for the occurrence of stress at work, so there are classifications of the most stressful jobs and job tasks, involving occupational hazard. This is the situation of operative functions in pyramidal institution, requiring a high level of professional stress, which occurs almost constantly.

- Characteristics of the human factor

It is what is called "personality" of the organization. Organizational climate is affected by age, sex, training, communication, satisfaction, turnover, conflicts, stress. An organization with a high number of elderly or less educated is blatantly different from one with younger people trained in the field. The climate supports some influence women on men ratio or the time spent outside work, social activities likely to create an atmosphere based on friendship. Organizations that correspond to its members' needs provides performance in terms of low staff turnover, fewer conflicts and low stress. At the opposite pole there lie organizations with unfavorable climate, where dissatisfaction, absenteeism, and interpersonal disputes are commonly inter collective and conducted under high tension and mental strain.

- Economic and financial situation and organization efficiency

The climate designates an existing state at some point in the organization. It varies together with the time changes of parameters that determine.

It economic conditions are one of the climate's determinants as economic and financial results achieved in the organization make the working atmosphere and the mood. The disappearance of, material and moral support removes confidence within the organization, contributing to progressive deterioration of the climate.

4. Role in organization

Another determinant of organizational climate, with human implications nature and features that require finesse in the group's approach, is considered by the people entering its composition.

About the way it is organized, etohes and subsists we have already discussed, so only the issues that define the influence, will be delated together with the role that the group holds within the organization. In the individual isse group's functions can be found in the personal reason for which a person wants to be part of a team "and" cover issues such as social needs relating to complex needs such as need for affiliation(affiliation to the group), the need for affection, the need for security (support by colleagues in case of conflict with employers, dilution of responsibility), the need for recognition (appreciation of personal values, personality, creativity gives evidence of that team), stimulating mental activity: the team is the most appropriate environment to stimulate mental activity (reasoning, memory, creativity). Group allows quick and minimum efforts learning, using specific techniques: role play, simulation, demonstration, group discussions. "

All these functions determine the role the group plays in the organization as by assembling them we can see how different roles are in each group and how they may affect the organizational climate. (Bogathy Zoltan and employees - manual techniques and methods in psychology and organizational work, Iasi Polirom, 2007,p.187)

5. Composition and structure of the group

To present a group means to do so in terms of perception, motivation, organization, interdependencies and interactions in such a way as to highlight the influence of each person or on another.

To capture the dynamics of the experimental group in terms of relations between its members, Moreno's test was used, taken into consideration 28 members of a compartment in a pyramidal organization. In applying the sociometric test (expressed preferences vis-à-vis the provision of training and work teams) out only 25 people participated the subject choice (lists) being the whole team, including those absent.

Of these 22 belong to male and 3 female individuals.

Functional organization of the department assumes the existence of two divisions (offices) one office consisting of 13 members and 2 consisting of 15 members, where members routinely interact and other 5 people who although have the same type of activity, do not carry Current work in the same space with other members.

6. Conclusions

a. The first stage consisted of applying the sociometric questionnaire, containing the following items:

1. "Name out of the group you do business in, three people you think are the best in a professional manner and three you think they are the least trained."
2. "Name out of the group you do business in, three people with whom you prefer forming a team for a very important activity and three people with whom you wish to form such a team."

Responses were valued, the list of preferences and rejections for the two items are the following:

ITEM 1			ITEM 2		
	elections	rejection		elections	rejection
1	6,16,2	15,7,4	1	6,2,21	15,7,4
2	25,27,3	24,12,8	2	6,1	26,28,12

c. Calculation of first sociometric indices :
Since the number of elections has been limited to 3, within present group there can not be calculated the index for emotional expansiveness. Calculation of preferential status index (PSI) reveals the following structure of the compartment for each of the items applies:

Item 1:
Informal leader (ISP max - 0.45) - subject 2 is preferred not only by the subjects in his group but almost equally by those in group 2. To determine popular subjects those subjects accepted and rejected at medium level, and those very unsuccessful, we calculated the distance between the informal leader and score 0.
Popular subjects (ISP large) - 1,3,4,16 subjects - among them the formal leader of the group, subject 1.
Subjects accepted (ISP min) - subjects 19,21,27,10,9,6,22 Isolated (ISPO)

7,11,20,25 subjects, the percentage of isolates is 50% in each group
Subjects rejected (ISP neg) - 5,8,12,14,15,17,18,23,26,28 subjects - among subjects rejected the medium level and those highly rejected, there are the females in the group, which denotes group to "homophile".

Item 2:
Informal leader (ISP max - 0.46) - subject 21 is particularly preferred not only by members of the group he is a part of by the other group members, indicating the possibility that he provides cohesion group.
Popular subjects (ISP large) - 22,19,6,27
Subjects accepted (ISP min) - 2,16,20,4,10,1,9,11,23,25 out of them the formal leader is part of group , a subject Isolated (ISPO) - subject 14, who is seconded to the service and is a part of group 2
Subjects rejected (ISP neg) - 3,18,5,8,15,12,13,24,7,26,17,27 and as far as subject 2 is concerned, female subjects are a part of the medium rejected.

Scientific version of calculation and disclosure of psychosocial type preference

categories are presented below:

A-R (gross)	Nr. subject with the same value a difference	Isp	Categories
11	2	0,45	very popular subjects
9	1,3	0,37	
7	16	0,29	
6	4	0,25	
5	19	0,2	
4	27	0,16	popular
3	21	0,12	accept
2	6,22	0,08	
1	9,1	0,04	isolated
0	7,11,20,25	0	rejected
-1	5,12,14,	-0,04	
-2	23,28,26	-0,08	rejected on average
-4	8	-0,16	
-5	13,15,18,	-0,2	very unsuccessful
-7	17,24	-0,29	

A-R (gross)	Nr. subject with the same value a difference	Isp	Categories
11	21	0,46	very popular subjects
10	22	0,42	
9	19	0,38	
6	6	0,25	
5	27	0,21	
4	2	0,17	popular
3	16,2	0,13	accept
2	4,10	0,08	
1	1,9,11,23,25	0,04	isolated
0	14	0	rejected
-1	3,18	-0,04	
-2	5,8,15	-0,08	rejected on average
-3	12,13,24	-0,13	
-6	7,26	-0,25	very unsuccessful
-9	17,28	-0,38	

d. Information obtained on previous steps are, based on sociogram building for the two items (Appendix 1 and Appendix 2). Sociogram construction allows group analysis on the perspective of 3 levels of manifestation.

1. Personal individual level :

At this level in addition to information obtained by calculating the ISP, the number of positive, negative and neutral statuses for each item can be counted:

Item 1 Positive status -12 Negative status - 12 Neutral states - 4	As seen half of the compartment, including formal leader, enjoys positive status, in terms of training, but counting negative statuses with the neutral ones, involving no preference, we believe that the group is emotionally unbalanced and we deal with conflict all environment.
---	---

Item 2 Positive status - 15 Negative status-12 Neutral states - 1	Regarding the establishment of joint teams for the number of statutes positive statutes exceeds that of the negative and neutral ones. Also on this level you can see the status of gender from an affective group perspective.
--	---

Item 1

	+	0	-
F	0	0	3
B	12	4	9

A special case presents subject 17, which is the most rejected if both items, getting no choice, totaling seven rejections for item 1 and 9 rejections for item 2.

Item 2

	+	0	-
F	0	0	3
B	15	1	9

2. Interpersonal level

In item 1 case we have three positive and one negative dyads, a small number of choices and rejections, taking into account the large number of members in the group, which eventually cause inconsistency of interpersonal relationships.

In item 2 case we have 4 positive and negative dyads. Regarding present group for item 1, 3 people have acquired the status of "isolated" as a lack of positive or negative choice, which emphasizes emotional indifference tendency to group and 1 from the calculation of ISP. In item 2 case the isolated person also comes from the lack of elections of any kind.

3. Group level

Item 1

In the first case we deal with an informal leader, preferred by the formal leader, the situation is not, anyway, the other way around.

Item 2

The informal leader differs from the one in

<p>IpG item 1 = 0,33 group power is low, dissipated IpG gr 1 = 0,41 – less power than the large group IpG gr 2 = 0,16 – very low power</p>	<p>IpG item 2 = 0,16 - very low power IpG gr1 = 0,25 - low power IpGgr 2 = 0,50 - medium to low power</p>
--	---

As it can be seen from the lack of sub-group relationships and intra-group power is low or very low.

the first item and it is favored by the formal leader and, again, the situation is not mutual. In this item the formal leader's position is de-structured, being in the situation of the accepted ones. I mentioned the situation of females, and subject 17, which although does not reject any of the items, is rejected if self, in both items, especially group 2 members, he is a part of reject both items is rejected if the members of the group 2.

e. Calculation of other sociometric indices

Preferential power index, ie the intensity of preferential attraction force of the group members shows power is distributed within the group:

Stability index reflects preferential interpersonal balance achieved in the group, between group members who enter into mutual relationship.

<p>ISP item 1 = 0,12 the group has a low stability ISP gr 1 = 0,04 the group isn't stable ISP gr2 = 0,04</p>	<p>ISP item 2 = 0,16 ISP gr1 = 0,04 ISPgr2 = 0,08</p>
--	---

Given the values obtained by calculating the ISP, it can be concluded that the relationship is almost of non-existent group,

group members have not established relationships between them.

Cohesion Item

<p>C item 1 = 0,01 Cgr1 = 0,003 Cgr2 = 0,003</p>	<p>C item 2 = 0,013 Cgr1 = 0,003 Cgr2 = 0,006</p>
--	---

And in terms of group cohesion, the situation has a negative aspect, which can be interpreted as the existence of tensions within the group, which can lead to its collapse. In investigating the nature of organizational

climate reality, regardless of the perspectives and tools, used for its evaluation, it would be utopian to think that all the issues and ways of expression of this "phenomenon" where covered.

Abstract

Whether they operate in a real or simulated business environment, the success of economic activity undertaken by producers/traders depends on understanding the behavior of current and potential customers, by studying the mechanism by which they take consumer decisions under the influence of internal and external factors whose divergence or convergence may affect the quality of their satisfaction.

Orthodox vision on the consumer looked upon as a rational economic agent, often criticized for its limits, has been repeatedly improved, demonstrating the attraction force induced by its validity in the individuals' daily life.

Key words: rationality, rational consumer, demand, efficiency

J.E.L. classification: D11

1. Introduction

The starting point of the traditional approach concerning consumer behavior is represented by the *postulate of rationality*. Thus, considering that goods offered on the market generate utility, by virtue of this postulate it is estimated that, in the consumption act, the person is capable of solving simultaneously two problems, namely: one of decision, with regard to the choice among several consumer goods that can respond to his needs and one of maximizing the satisfaction felt after the undertaken choice, respectively of maximizing the utility. Within this context rational consumer equilibrium is built forward, taking into account, on one hand, the needs he feels at a certain moment, and on the other hand, the budget constraints

imposed both by the prices of those goods, and by the income which is effectively at his disposal.

In a bid to improve the traditional approach concerning the rational consumer behavior and especially to answer the critics related to the boundaries involved by it, new theories have emerged in economic thinking, which rapidly imposed in the field through logic elements, coherence and especially the attraction force induced by the inciting spirit and their applicability in the individuals' daily life, even beyond the sphere of so-called consumption.

2. Theory of “characteristics”

An alternative approach to the traditional one concerning rational consumer behavior is offered by *the new theory of “characteristics”*, starting from the prerequisite that the utility of an economic good is generated by the characteristics or properties it has within the market. Consequently, the consumer behavior is the result of choosing the maximization of the satisfaction in terms of the quantity of characteristics it has; goods will be differentiated according to the combination of characteristics they have, and the demand for a certain good will be derived from the demand for its characteristics.

A first version of the model of characteristics is elaborated by **Hendrik S. Houthakker**, by introducing a new function of utility which, together with the traditional variables related to the physical quantities of goods that the consumer wants to purchase also contains their qualities, as variables that are separated from the first ones.[1] In fact, Houthakker starts from the idea that a good can be described by two different variables, respectively the physical quantity and its quality. Accordingly, it can be motivated that the goods which possess different

characteristics can be treated as one and the same good, but having a variable quality. Consumers could choose explicitly the quality of a good, and by their choice the determination of its sale price would be possible.

The second version of the model of characteristics, and also the most evolved one, is developed by **Kelvin Lancaster**, by initiating the suggestion of constructing a new demand theory based on the idea according to which “goods possess or give rise to multiple characteristics in fixed proportions and that it is these characteristics, not goods themselves, on which the consumer’s preferences are exercised”[2]. Accordingly, a good will have more than one characteristic, and some characteristics will be able to be shared by several goods.

The relation between goods and their corresponding characteristics is resumed in a *matrix of consumption technology* - as Lancaster denominates the assembly of all consumption possibilities[3] - by which the consumer will target the utility maximization of the characteristics acquired under certain budget restraint conditions, graphically presented with the help of *consumption efficiency frontier*, which replaces the budget restraint from the traditional model.

In principle, the hypotheses from which Lancaster starts in the construction of his variation concerning the consumer’s theory can be presented by a synthetic manner as follows. Firstly, the characteristics represent objective and intrinsic properties of consumption activities. Secondly, doubling the production of goods involves doubling the characteristics – which supposes a linear homogeneity. Thirdly, the characteristics possessed by goods or by their combination can be presented under the form of some vectors of characteristics arranged by the consumers. Fourthly, not the goods themselves, but their characteristics generate utility. Not lastly, a combination among several goods can possess characteristics which are different to those which belong to one of the respective goods treated separately. Accordingly, the psychological effects, such as the consumer’s relative interest in different characteristics, can be assumed to be felt in the preferential ordering manner of the vectors of characteristics and

not in the relation between goods and characteristics.

The problem of maximizing the utility, as presented by Lancaster, is similar to the traditional analysis. As a matter of fact, if the number of goods and of the characteristics are equal, the traditional approach and the method suggested by Lancaster only lead to the retrieval of the same solution. But in all the other cases, important differences appear. On one hand, the maximization of utility can be obtained by using some non-linear programming techniques, unlike the simple method of optimization used in the traditional model. On the other hand, a sole consumer cannot be considered as representative, so that the aggregated behavior of the bearers of demand within the market is able to be determined by the multiplication of the representative consumer’s demand with the number of present consumers. Consequently, in deriving the aggregated demand for a certain good both the distribution of preferences for its characteristics, and the distribution of consumers’ income must be considered.

From the theoretical point of view, this approach offers certain advantages, such as the more concrete explanation of the fact that a consumer can be indifferent between two goods which, although they seem quite different, can be approached as possessing similar sets of characteristics. Moreover, the lancasterian hypothesis concerning consumer behavior allows the explanation of introducing some new products or the disappearance of some old ones, and also the motivation of distinction in consumption between the commutable goods (which have the same characteristics) and complementary (which are used together in the production of the same characteristic).

Lancaster’s theory served as a starting point for research activity and from other fields through which the explanation of consumer behavior was tried, and also the researches in the marketing field, which regarded the understanding of consumer’s loyalty for certain brands of products.[4] Thus, his model explains the role played by prices in determining the demand for the products that differentiate among each other by the way of combining different characteristics, fact which allows the effectuation of an analysis with regard to the

optimum product variety[5], and also the estimation of demand sensitivity towards the modifications produced in the relative price of a certain brand. Loyalty towards a certain brand will be able to be explained, in this context, by the fact that it provides to the consumer the exact combination of characteristics that maximizes its utility.

Because of the fact that Lancaster’s model concerning consumer behavior is however based on the hypothesis of infinite divisibility of economic goods, this can not be applied, for example, in the case of purchasing goods of long-term use, impossible to divide. Starting from this lack of Lancaster’s theory, **Sherwin Rosen** constructed a model in which he defines the utility function in terms of prices and quantities of characteristics which define the goods.[6] As a matter of fact, the same as the lancasterian model, the one advanced by Rosen implies a consumption efficiency frontier, defined by the combinations of characteristics available for a certain given level of expenses, and also the choice of the combination which will allow him the maximization of utility by the consumer.

Other critics to the hypotheses from which Lancaster starts in elaborating his theory were formulated with regard to: positive marginal utility of each characteristic; the independence of utility towards the distribution of characteristics among goods; the linear character of consumption technology[7].

Thus, it was shown that, in the situation of infringing the first hypothesis, judging the efficiency of consumer’s choice without knowing his preferences, becomes impossible. If the marginal utility of a characteristic was negative, as, for example, in the case of nicotine in cigarettes, the indifference curves would imply a slope upward to the right.

Also, if the second hypothesis is violated, Lancaster’s analysis is not available any more and each point from the space of the characteristics will no longer represent a unique level of utility, but only two or more levels, each of these being relevant for a different distribution of characteristics among goods. Moreover, in order to evaluate the efficiency of consumer’s choice, the relation between its utility and the way of distributing

the consumed characteristics among the acquired goods must be known.

In relation to the hypothesis of the linear character of consumption technology, if this is not verified, it is impossible to judge the efficiency of the consumer’s choice without knowing in detail the respective technology.

Not lastly, the most invoked objection to Lancaster’s theory regards the generation of utility as being influenced rather by the services brought to the consumer by the acquired good, so that this would finally be dependent on the characteristics of the good (such services may be: food, shelter, social status etc.).[8] The consumer himself will determine the services brought by the acquired good, while the producer cannot control them, the latter having the possibility of acting only on the characteristics of the offered good, and by their variation influence directly the services obtained after the consumption.

But without reference to the controversial hypotheses of the lancasterian theory, **George W. Ladd, Veraphol Suvannunt** and **Martin Zober** developed a similar variant of it, starting from two hypotheses: on one hand, the function of consumer demand for a certain good is affected by the characteristics of the respective good, and on the other hand, for each consumed good, the price paid by the consumer is equal to the sum of implicit marginal monetary values of the characteristics of the respective good, where the marginal monetary value of each characteristic is obtained by multiplying the characteristic quantity obtained from the marginal unit of the consumed good with its implicit marginal price.[9] The presented model allows the appearance of a unique characteristic for each good.

A variant of the mentioned theory excludes the term of unique characteristic, starting from the hypothesis that all the relevant characteristics are commune to consumed goods, a useful model especially in the case of demand analysis for a group of goods like food products.[10]

3. Theory of “household production”

One of the critics brought to the traditional theory concerning consumer behavior is represented by the approach of his preferences and tastes as exogenous,

stable variables, on which it is not insisted in explaining human behavior in consumption, the economists leaving the explanation of formation and evolution way to sociologists. The modification of people's tastes and preferences however begins to gain more and more importance, as a consequence of the fact that the explanation of demand variation only to the influence exercised by the modification of prices and income, in many cases, is inconclusive, often being necessary to appeal to psychological explanations, to assumptions concerning the modification of tastes and preferences, approach which transcends the perimeter of economic science.

Moreover, the traditional approach of consumer behavior cannot be applied to the analysis of the way in which non-merchandise choices are made, such as: decisions concerning the choice of a religion, of life partner, of the dimension of family or even of the lifestyle – situations in which the individual-consumer can not proceed to quantifications and comparisons by the agency of prices, in the monetary expression.

In this context, which mark an irreversible rupture related to the traditional approach concerning consumer economy are undertaken, by initiating the hypothesis according to which consumption is not a final act, but a mediate one, the consumer – individually and especially the household – being also a “producer” of his own satisfactions, by using, to this effect, as “inputs” - goods and services bought from the market, and also another rare resource - free time. Thus, consumer's demand for market goods and services appears under the form of a derived demand similar to the derived demand of a company for any production factor.

Similar to any rational economic agent, the consumer exercises this function of “household” production daily, by making a multitude of decisions concerning the allotment of the available resources by which he tries to obtain the optimal combination, respectively the one which, taking account of the relative prices of the “inputs” he uses in his household activity - including the value he allows to his time - allows him to obtain the highest level of satisfaction. In this new approach, the explanation of consumer behavior assumes the identification and

measurement of the relative importance of the factors that enter in the decision-making process.

The introduction of *time* in the analysis of individual's activity represents the key-element of a new theory, for at least three main reasons.[11]

Firstly, time factor allows the explanation of apparent irrational passion for amassing goods, so that the value of this rare resource is provided by its opportunity cost, respectively by salary income sacrificed on the consumed time unit. Accordingly, at the consumer-producer level, the increase of time value produces a substitution effect, based on which the consumer is incited to become more economical with his own time, so that, in order to maximize his global utility volume, he will look for satisfying his needs by appealing to means that need less time. This way the development of fast transport, mail and communication, home sanitary assistance can be explained. As a matter of fact, in nowadays society, characterized by the increase of tertiary sector importance, consumers accumulate more and more goods, whose price decreases in proportion to the price of time, reaching to use an increased quantity of goods per time unit. In conclusion, time becomes more and more valuable in proportion as goods become more abundant.

Secondly, the introduction of time in the analysis of consumer behavior offers a new vision on the modification in time of shopping and consumption ways, bringing forward the hypothesis of the stability of preferences. Traditionally it is considered that the mutations produced in consumption ways purely and simply accrue from the appearance of new needs, that the producers endeavor to satisfy, but without being possible to explain the dynamics of their formation, fact which allows the development of theses concerning consumers' manipulation by means of publicity and artificial creation of false needs. In order to confute them, it is sufficient to accept that the only element which evolves is the price of time.

Besides, the continuous increase of the price of time is the one which places the consumer in a situation similar to that of the producer situated in the permanent essay of modifying the relative prices of production

factors, proceeding to their various combinations. In the same manner, the consumer, in order to satisfy the same preferences, has to substitute new shopping against the old ones, based on the reasoning according to which the new acquired products, considering the new value of time factor, will be more efficient for satisfying his needs at the lowest possible cost. What changes, as a matter of fact, is not the structure of consumer's needs, but their satisfying way, as Lancaster estimated.

In this connection, behavior differences among different economic agents do not reflect different tastes, but they will be the result of different productive efficiencies which lead to the satisfaction of the same demands with the help of some distinct techniques, in which these specialize depending on personal abilities.

Not lastly, time factor allows us to identify the consumer's freedom of action within the market with each individual's freedom concerning the choice of those consumption combinations which allow him to obtain the highest satisfaction volume possible, within the limit of the restrictions imposed by the volume and structure of available resources.

The introduction of time factor in the function of household production allows **Gary S. Becker** - the first representative of this new thinking current - to transform the consumption theory from a barren area of economy in one of the most attractive areas, starting from an economic reasoning, as simple as convincing from the analytical point of view and with almost unlimited practical advantages.

Resumed by a simplistic manner, the utility function of household submitted by Becker is the following[12]:

$$U = f(x, t, M),$$

in which:

U – represents the utility, the satisfaction felt by household;

x – the assembly of consumption goods and services acquired from the market;

t – time at the disposal of household;

M – the assembly of factors representing the environment in which the household develops its activity.

This new approach of utility function serves Becker to the formulation of some explanations concerning some tendencies put

forth in modern consumption, but especially to the extension of the applicability of consumer's new theory and to activities outside the economic sphere, as family and fertility. Further, it becomes impossible to generalize the economic approach to the assembly of activities and social relations, both those with freight character (a regular act of sales), but also those with non-freight character (charity or public activities), Becker managing to prove the fact that rational arbitrations any individual makes economically, in the search of obtaining the maximum advantage, can be extended to the dimensions of human activity. Consequently, the economic approach becomes applicable to the entire human behavior, whether a behavior which implies prices in monetary terms or assigned shadow prices, repeated or rare decisions, important or minor decisions, emotional or mechanical purposes, rich or poor persons, men or women, intelligent or ignorant persons, patients or doctors, businessmen or politicians, teachers or students.

Although his approach is sometimes estimated as a too general one for covering the delicacy of many factors which affect human behavior, Becker has the merit of comprising, for the first time, in a formal analytic framework those abstract and incommensurable factors, but unanimously considered as being extremely important.

4. Conclusions

Regardless of approaching the consumer as a rational or irrational human being, the economic theories wove around offer different explanations, sometimes contradictory, on his behavior principally within the market and subsidiary in other action environments (social, familiar), which allow the construction of an image with regard to the way in which he can satisfy his needs under the influence of various endogenous and exogenous factors that influence consumption.

Like this, analyzed in dynamics, quantitative, qualitative and structural, the consumption looks different from one period of time to another, mutations explained by the concerted action of various psychological, economical, geographical, demographic, technical, social, political etc.

factors, which, either modify indirectly the balance between price and income, or operate directly on consumers’ tastes, preferences and demands. All these factors, considered separately, exercise a distinct influence, whose sense and direction are frequently divergent.

Irrational Consumer Behavior and Its Importance for Real and Simulated Business Environment

Gheorghiu Gabriela

“Ovidius” University of Constanta, Faculty of Economic Sciences

gabriela3110@yahoo.com

Abstract

Whether they operate in real or simulated business environment, the success of economic activity undertaken by producers/traders depends on understanding the behavior of current and potential customers, by studying the mechanism by which they take consumer decisions under the influence of internal and external factors whose divergence or convergence may affect the quality of their satisfaction.

The heterodox theoretical systems of consumer behavior born out of the desideratum of emphasizing the limits of traditional approach and of offering alternative considerations, especially by embracing the belief on manifestation of an irrational behavior of the consumer.

From this perspective, the consumer, especially in modern society, is exposed to challenges in front of which, due to the production rhythm and their complexity, he becomes vulnerable, and finding a solution for assuring his proper protection is imposed.

Key words: irrationality, irrational consumer, consumption, demand

J.E.L. classification: D11

1. Introduction

Both the traditional approach, and the new theories regarding consumer behavior start from the supposition according to which human nature is elementarily homogeneous in behavior and that this behavior is dominated by the principle of rationality. Although it enjoyed an extended recognition among the economists, especially from the theoretical point of view, this image of the individual regarded as *homo oeconomicus* was not divested of the attacks from those who mistrusted its practical validity.

Thus, its opponents - starting from the hypothesis of the impossibility of predicting and understanding human behavior beyond man's habitual way of thinking and the institutional field in which it activates – support that individuals tend to change their preferences, they do not take into account the transitivity principle in their choices and especially they are not computers in order to be able to process with the speed of light all the relevant information for their ulterior decisions. The hypothesis of deliberative hedonistic calculations being rejected, the idea according to which human behavior in general and consumer behavior in particular would be the result of an unstable and irrational complex of actions, impulses, instincts, habits etc., pushes through.

2. Main theories supporting irrational consumer behavior

The main objections brought to the theory referring to individuals' rational choices regard the influence exercised on their behavior by the social environment in which they develop their activity and from which they cannot be excluded by their isolation in space, in order to allow them to become immune from any pressure exercised from the outside.

One of the most fervent supporters of this idea, **Thorstein Veblen**, constructs his theory starting from a critical analysis of capitalist society from the end of last century, dominated by the existence of “predator class”, respectively the capitalists, whose income was gained from the property held on the resources, and not from work, reason for which he names them “leisure class”. “Leisure” concept, in the sense used by Veblen, does not connote indolence or quiescence, but it refers to non-productive consumption of time from a sense of the unworthiness of productive work, and

especially as an evidence of pecuniary ability to afford a life of idleness.[1]

The members of this class, retired from the production scene and whose success is less obvious, eager for affirmation and recognition, are under the necessity of finding a different modality in order to incite the admiration of those around them, to which effect they appeal to “*conspicuous consumption*”. Thus, the more useless is a certain good, the more it is valorized as an article that can be wasted for show, in order to allow the distinction from the richest social classes, based on the envy generated by the measure in which this affords the waste of its own financial resources, and the tendency of the rest of the population to imitate this consumption. “Pecuniary culture”, as denominated by Veblen, is based on “the emulation of consumption” at an extended scale, the imitation becoming the standard by the agency of which common people feed their self esteem, simultaneously with the improvement of social status. In this interpretation, consumers engage in a competition whose purpose is to position the individual at a superior level on the consumption distribution scale for a certain good.[2]

Next to Veblen, another major attack on “the orthodox theory” of rational consumer behavior is initiated by **James S. Duesenberry**, who transposes in macroeconomic plan the hypothesis of the influence of social environment on the individuals’ decisions, proceeding to a reformulation of saving theory, as a counter-share to the keynesist approach on the function of consumption. The main thesis of his theory consists in the fact that generally the current consumption is significantly determined by the relation between the current income and the highest past income. The conclusion reached by Duesenberry regards the fact that, as long as the unequal distribution of incomes persists, the increase of income and consumption not only will not stop, but it will not moderate the competition among consumers, and the increase of expenses will continue.[3]

According to the “demonstration effect” (reasoning found also in Veblen’s approach with regard to “conspicuous consumption”) and to the hypothesis of relative income introduced by Duesenberry, if the rich ones

get richer and richer in proportion to the poor ones, then the latter will feel even poorer, even if their real income increases, so that, no matter how much they consume or gain, they will not be happier in relation to other people’s welfare.

From the perspective of demand theory, these hypotheses would allow the explanation of “non-additive” characteristic of individual curves of consumers demand[4], considered by **Harry Leibenstein** as “non-functional” from the point of view of their motivation. Unlike “functional” demand, respectively that part of demand for a certain economic good due to the inherent qualities of the good itself, “non-functional” demand represents that part of demand due to other factors. On its turn, this “non-functional” demand is due to external effects on utility, respectively: the “bandwagon” effect, “snob” effect and “Veblen” effect.[5]

In its simplest form, the “*bandwagon*” effect comes to the fore when an individual will ask more or less of a good at a certain price, as a consequence of the fact that certain individuals within the market, to which it relates generally or at a certain moment, require on their turn, more or less of the respective good. This effect is the result of people’s demand of imitating the consumption of those with whom they want to be associated, of being considered “in fashion” or of proving their affiliation to a certain social group.

The effect that is symmetrical to the “bandwagon” one, but to the contrary, is represented by the “*snob*” effect, assuming an evolution of demand which is contrary to that of the market, so that an individual will require more or less of a certain good at a certain price, as the market demand for the respective good is lower, respectively higher. In this case, we deal with people’s demand of being exclusive, unique in their way, in order to “stand out in the crowd”.

To these two effects “*Veblen*” effect of “*conspicuous consumption*” is added, characterized by the fact that consumer demand for a specific good is all the greater as its price is higher, so that the price of a good can be divided into two components, respectively: real price of the good, expressed by the actual payment the consumer bears for acquiring it, and the ostentatious price, namely the price estimated by the consumer

as being considered by the others as the price paid by him for that good. However, the distinction between this effect and the snob one must be made, so that the first one is a function of price, and the last one is a function of the consumption of others.

Starting from the external mentioned effects which determine the individual demand, **Richard A. Easterlin** dares to challenge the idea according to which the increase of income and consumption improve human condition. The paradox identified by him, also denominated as “Easterlin’s paradox”, is a consequence of the fact that, in any given country, at any given time, rich people are happier than poor people, but in spite of that, in proportion as they get richer, rich people do not become happier. The solution of this paradox consists in the approaching manner of happiness, which would not be dependent on what each individual consumes separately, but on what each one consumes in comparison with others, so that, although the consumption increases in absolute value, as long as it does not happen the same with its relative value, the individuals are nowhere near being happier.[6]

All these consumer behaviors can be appreciated as irrational only in terms of the fact that they represent a derivation from the hypothesis according to which, in allotting his limited budget, in order to maximize his individual utility function, each individual reacts independently to market prices, without letting himself affected by the behavior of the other participants on market.

Accepting the fact that consumer’s choices and preferences are influenced not only by his own tastes, but also by those of other consumers with whom he comes in direct contact, therefore assumes the infringement of the hypothesis of consumer’s rationality. This derivation has its origin in the belief that people live in a world of permanent interconnectivity, where information is shared, recommendations are made, and social acceptance is extremely important. To this effect, the main sources of influence of social nature on the individuals’ consumption behavior are considered as coming from the social groups in which they integrate[7] and can be divided into three categories, respectively: internalization, identification and conformance.

Internalization is produced when people adopt their fellow humans’ behavior, assessing that inherently leads to the maximization of own satisfaction. In other words, people are willing to learn from each other because they assess that this would help them in adopting a better decision, which optimizes the results. *Identification* is produced when fellow humans’ behavior is adopted because this is associated with a satisfactory relation of consumer’s self-definition in relation to these. Not lastly, *conformation* intervenes when the individual reacts positively to another individual’s expectations in order to receive compensation or to avoid a punishment mediated by the latter.[8]

The analysis of consumer behavior from the perspective of his reaction to external stimuli is the study object of marketing researchers who, out of the need to understand and better anticipate his consumption decisions, appeal even to the study of endogenous influence factors, respectively the psychological ones, considered by the supporters of rationality thesis of economic activity as deviations from the application of objective market laws. In fact, psychological elements, such as reasons, attitudes or expectations - represent variables which intervene among the stimuli coming from market conditions and the answers to these under the form of economic decisions. Psychological factors are not exclusively the determiners of the final decision, but, under certain conditions, they become strong enough to alter consumer behavior.

These ideas are rooted in the study of psychological aspects of human behavior, as those undertaken by **Herbert Simon** who suggested replacing the optimization postulate of the decisions adopted by rational individuals with that of *meeting the expectations*.

Simon’s entire theory gravitate round the concept of *limited rationality*, constructed by starting from the idea that the choices individuals make are determined not only by reaching a certain goal and the particularities of external world, but also by the knowledge policymakers over the world have or do not have, by their ability or inability of invoking such knowledge when relevant, of anticipating the consequences of their own

actions, of imagining possible action ways in order to cope with uncertainty (including the uncertainty accruing from the possible answers of the other actors) and of juggling among the multitude of their own current needs.[9] Individuals’ rationality is limited precisely because these abilities are severely limited not only under cognitive ratio, but also under temporal and informational ratio.[10]

In this situation the consumer is left only to regulate a strategy to meet their own expectations, because even if he cannot attain the suggested goals, he continues to look for, and sometimes even modifies these goals, being content, in real world, with a satisfactory level and not a maximizing one in pursuing them.

Thence, as **George Katona** assesses, at any moment the psychological field of our decisions comprises a part of previous consumption experiences, the perceptions on the present and the expectations relating to the future[11], so that, similar to all human beings, consumers learn to adapt their behavior depending on the changing character of consumption circumstances. Under these conditions, Katona suggests the replacement of the approach of rigidly planned behavior as an expression of a rational behavior with the approach according to which adaptability represents the prototype of an intelligent behavior[12], so that the consumer, in order to be rational, moulds his behavior in the action of satisfying his personal interest depending on the circumstances.

Regarded from the perspective of the influences that can be exercised upon it, consumer behavior can be defined, in a marketing specific approach belonging to **Iacob Cătoiu and Nicolae Teodorescu**, as “the specific resultant of a dynamic relations system between the perception, information, attitude, motivation and effective appearance processes, which characterize the integration of the group or individual in the space described by the assembly of consumer goods and services existent at a certain moment in the society, by individual or group decisional actions in reference to these”. [13] The enunciated definition covers the effects impressed on consumer behavior both by exogenous variables, which act outside

human being, and by endogenous ones, related to human mentality.

Given this complex of previously presented situation, we consider as profoundly grounded and representative for the analysis undertaken by us **Ruth P. Mack**’s assertion, according to which consumer demand represents a function of what he is, what he possesses, recent history of his shopping, what others possess or buy, what they expect, what they hope for, the habits which he formed, so that, in present society, consumption dynamics is co-extensive in proportion to personality dynamics.[14]

However, in the widest acceptance the rational character of consumer behavior does not necessarily regard the exclusive elimination of external influences, so that the decision-making be done absolutely independently, but it refers to those considered in a mental economic plan before being effectively adopted, by which the maximization of predefined satisfaction function is intended (respectively a utility function to the consumer and a profit one to the producer). Accordingly, any decision made by virtue of the spur of the moment, without assuming the march of a period of time between the deliberation moment and that of execution or any action undertaken by virtue of inertness, of the habitualness impressed by the formation of certain consumption skills in time, could be catalogued as irrational.

But even under these conditions in which they are not rational in their effort, consumers can be treated as being thus. This hypothesis, developed by **Gary S. Becker**, starts from the pre-requisite according to which the eventual behavior mistakes or errors can be entered into the calculation on the basis of a probability mechanism by which it is assumed that any opportunity has an equal chance of being chosen, so that the consumer will be “forced” by the modifications produced in the distribution manner of the respective opportunities to respond rationally.[15] For example, consumer behavior acting on the spur of the moment will tend to be characterized by decreasing demand curves, because an increase of the price of a certain good will determine the change of opportunities in favor of another good, thus existing less

chances of buying a more expensive good even only on the spur of the moment.

Likewise, **Milton Friedman and Leonard J. Savage** proved the fact that even an important class of reactions of individuals towards risk can be rationalized by means of a simple extension of the principle of utility maximization, starting from the idea according to which, standing in the situation of having to choose between several alternatives which differ, among others, from the point of view of the risk involved (the best example to this effect being gambling), the consumer behaves as if he attributed some common quantitative characteristic – designated utility – to various goods and then selected the combination of goods that yielded the largest amount of this common characteristic.[16] Consequently, when he has to choose between several alternatives which do not imply a specific risk, the consumer will choose the one which will assure him the highest utility, and when he has to choose between alternatives which assume a certain degree of risk, he will choose the one for which the expected utility is the highest.

Starting also from the restraint imposed by risk and uncertainty **Armen A. Alchian** constructs his theory intended for “saving” the appearances of the principle of necessary rationality by replacing it with the methodological principle “AS IF”. [17] By virtue of the respective theory, being surrounded by the unknown quantities and concerns that are present in the environment in which he must actuate, the economic agent finds his support in the market forces themselves, which come to operate a “natural” selection of the participants, validating, in order to remain active, only those who, although they do not know effectively the principle of rationality and its marginal way of calculation, however behave as if they knew everything of almost everything about it. Consequently, by exposing themselves to the competitive environment of the market, economic agents, and implicitly the consumers, are guided by rational actions, as if they knew them.

Moreover, the principle of rationality, interpreted from the perspective of satisfaction within the limit of budget restraint and present capital stock, can be considered as generally applicable to any

action undertaken by the consumer, even without imposing the classic condition of “tastes remaining the same”. What **George J. Stigler** actually sustains together with **Gary S. Becker** consists in the fact that, in relation to the choices consumers have to make, “*de gustibus non est disputandum*” or, in other words, “there is no arguing about tastes” [18]. The two economists do not nearly state that individuals’ tastes would not exist at all or that those would be identical for all consumers, but, on the contrary, differences in taste do exist, whether across time or across individuals, but, in spite of that, the economic analysis can generate empirically verifiable theories explaining human behavior that do not depend in individuality that has its genesis outside the economic model.

The offered solution is the endogenization of tastes by translating them in variables of the production function of a household, together with the other restraints (budget, time) to which it is submitted, approach which presents the advantage of allowing the explanation of any change in consumer behavior only in terms of the modifications intervened in the level of prices and incomes. Regarded from this perspective, human behaviors widely accepted as inconsistent in proportion to the stability hypothesis of tastes, such as dependency (of alcohol, tobacco, heroine etc.), habits, fashion or advertising, do not affect the tastes themselves, but the prices and incomes, being submitted, on their turn, for example, to the restraints imposed by the theorem referring to negatively inclined demand curves, and also other concurrent hypotheses.

Although criticized for the fact that, once specified the preferences and restraints of the production function of a household, consumer’s place could be taken by a computer which should initiate the effectuation of all necessary choices, thus leading to the elimination of any possibility of appealing to individual’s “free will” [19], the economic model developed by the two economists actually manages to partially relax some of the usual constraints to which the consumer is exposed and to offer, on the contrary, more degrees of individual freedom.

3. Conclusions

Regardless of approaching the consumer as a rational or irrational human being, the economic theories wove around him offer different explanations, sometimes contradictory, on his behavior principally within the market and subsidiary in other action environments (social, familiar), which allow the construction of an image with regard to the way in which he can satisfy his needs under the influence of various endogenous and exogenous factors that influence consumption.

Like this, analyzed in dynamics, quantitative, qualitative and structural, the consumption looks different from one period of time to another, mutations explained by the concerted action of various psychological, economical, geographical, demographic, technical, social, political etc. factors, which, either modify indirectly the balance between price and income, or operate directly on consumers' tastes, preferences and demands. All these factors, considered separately, exercise a distinct influence, whose sense and direction are frequently divergent. The resultant of their action however discloses a series of tendencies and correlations generally valid in practice, namely: according as price-income balance allows an increase of consumer's living standard, the share of food expenses have a decreasing tendency, against their increase in absolute value and the structural-qualitative improvement of food products offered on the market; concurrently, the share of clothes and personal comfort expenses is maintained relatively constant; in exchange, an increase of the share of service consumption and durable goods takes place.

Abstract

The crisis have left their mark on the equality of chances at European and National level. The equality of chances between man and women represent a fundamental right, a common value of the European Union and essential condition for the achievement of the EU objectives. The access of health, culture and information should be non – discriminatory too.

Key words: crisis, equality of chances, disabilities, discrimination, equity.

J.E.L. classification: O15

1. Introduction

The recent major changes, amplified by the present crisis have left their mark on the equality of chances at national level and at European and international level as well. The key objectives and the directives of the European Union for 2020 prove that these should answer the fundamental priorities of Romania in order to correct the weak points of our country as they are perceived by the European Union.

2. The equality of chances between men and women during Crisis

During Crisis, the equality of chances between men and women represent a fundamental right, a common value of the European Union and an essential condition for the achievement of the EU objectives: the economic growth, the rate of employment

and the social cohesion. Even if the inequalities still exist, in the last decades the EU has made significant progress regarding the equality between men and women, the legislation concerning the matter, the integration of the gender equality dimension and the specific measures in favour of promoting the women in important positions. These aspects focus upon the rate of employment, the job equality, the maternity protection, the maternity leave, the social insurance and professional leave, the social security etc.

Thus, the equality between men and women on the labour market has had a crucial significance in the community space placing the problematics of the equality of chances at the core of the European Strategy for Recruitment.

An equal treatment is necessary regardless of:

- age
- ethnic origin
- religion and faith
- disabilities

The legislation in force is meant to ensure the equality of treatment with respect to many aspects related to daily life and its implications at work covering educational problems, medical assistance and access to goods and services.

Disabled people have equal rights and the right to dignity, equality of treatment and complete integration into society. Making sure that the disabled people will benefit from these rights is the main aim actively included in the EU long term strategy. The European Commission wishes to see the improvement of the employment perspectives,

the raise of the degree of accessibility and independent life.

The EU promotes the active inclusion and full participation of the disabled people into society in accordance with the European approach to human rights regarding the handicap problems.

The European Social Fund (ESF) is an important financing resource for the activities destined to the development of the rate of employment and the development of human resources. This fund is used in addition to the policies introduced to achieve the objective of promoting the employment opportunities for all the citizens belonging to an inclusive society.

The main aim of the ESF is to support the measures which prevent and fight against unemployment, which contribute to the development of human resources and foresee the social integration on the labour market in order to promote a high rate of employment, the equality of chances between men and women, constant development and economic and social cohesion.

3. The evolution of the equality of chances principles

In the early antiquity, women held a privileged position within society as we find out from Herodotus or Plutarch who used to envisage the women's rights. With the growing number of wars the woman's role was restricted mainly to household activities.

The victories on the battlefield have brought important economic advantages, an intensification of the commercial exchanges and an unprecedented cultural effervescence conferring a privileged position to man. This situation has become the common law and has been transposed in different normative acts on the basis of the principle according to which long practice becomes the norm.

Thus, the Roman law mentions “pater familias” (the head of the family) who exerts his influence upon all the persons (wife, children, grandchildren) and goods in a family. At first, the Roman marriage meant the woman's submission to man's power with her dowry and all her other assets being taken over by her husband. Once they were married, the woman was lawfully considered the daughter of pater familias, an aspect with consequences upon the inheritance rights. Only when the man died,

his wife and children had the right to emancipation acquiring full legal rights and being able to sign legal papers in their name. The law has also induced the idea of inequity assigning the right to ascend to the throne only to the male descendents. Later, the feminist activism began to spread and the French revolution laid the foundation for the recognition of the individual rights and the principle of equality among individuals. In 1908 the first Woman's Day was organized and it was accompanied by large manifestations asking for the recognition of the women's economic and political rights.

One of the protagonists of the emancipation movement, the American sociologist Lena Lewis declared that there was no reason to celebrate, it was in fact the moment announcing the fights to come. In Romania, the Elective Law of 1918 gave the women the right to vote for the first time and its provisions were later included in the Constitution in 1923. On a worldwide scale, the last Conference dedicated to the women's problems took place in 1995 in Beijing under aegis of ONU. The main objectives included in the final document of the fourth Conference have been included by our country in a National Plan of Action and tackle the following problematics: the creation and development of certain mechanisms meant to coordinate the policies of promoting the woman; the improvement of the economic situation of women through non-discriminatory access on the labour market; the prevention and rebutment of the violent manifestations against women and children; the establishment of the principle of equality between men and women in all

domains; the coherent and substantial contribution of women to the decisional process. The measures promoting the women's rights have been applied by means of the normative act bringing under regulation the equality of chances between men and women. This is Law no. 202/2002 which stipulates the modification of the penal code introducing the infringement of sexual harassment and aggravating variants of already stipulated infringements, physical injury and any other kind of injuries. The stipulations of this law are meant to discourage the phenomenon of domestic violence.

According to Law no. 202/2002, in the domain of the working relationships the employers have the obligation of mentioning the equality of chances and treatment between the employees in their Rules of

Procedure. Getting a job should not be conditioned by a maternity test with the exception of those activities necessitating special working conditions. Sexual harassment is a frequently encountered problem and this is the reason why punishing this kind of behaviour is notable. The victim of the harassment can formulate intimations and complaints addressed to the employer or against the employer if this is involved.

Being in this situation, the employee will benefit from assistance from the part of the syndicate and if there is no syndicate, from the representatives of the employees. If the initial mediation within the firm was not in the fair way of doing it, the respective person will apprise the law court in order to have his/her complaint settled. Such a complaint can not be the reason to change the individual labour contract or to fire the respective person due to his/her inadequate behaviour. According to article no.13 from Law no.201/2002, at the negotiation of the collective labour contract at the national level or at the firm level, the parties involved (the employers and the syndicates) will include clauses of non-discrimination. In the educational field, the women have the same rights as men regarding the access to all levels of instruction, professional training and development.

4. The equality of chances in UE and Romania

The equality between men and women is one of the fundamental values of the European Union. Its history starts as early as 1957 when the principle of equal payment was incorporated into the Treaty of Rome.

The accomplishments of the European Union regarding the support of the equality between men and women have contributed to the change of the lives of many European citizens.

Even if there are still some inequalities, the European Union has made significant progress in the last decades. The main factors contributing to this progress are: the legislation regarding the equal treatment; the integrating approach to gender equality (the integration of the gender perspective into all the other policies); the specific measures used to promote women.

Among the encouraging tendencies we can mention the raise of the number of women on the labour market and their contribution to ensuring a high standard of education and training.

Nevertheless, the gender differences are still present and on the labour market the number of women is usually higher in the case of low paid jobs and lower in the case of managerial positions.

The strategy concerning the equality between men and women represents the working agenda of the European Commission regarding the gender equality for the interval 2010-2015. This strategy ensures the general framework the Commission needs in order to promote the gender equality as part of its policies. It also establishes the following thematic priorities:

- the equal economic independence for men and women;
- equal payment for equal type of work;
- decisional equality;
- dignity, integrity and the eradication of violence on gender criteria;
- the promotion of gender equality beyond the EU borders;
- equality aspects regarding gender roles, legislation and government instruments).

The equality of chances and non-discrimination represent key elements of society under the present circumstances on a community level and at an international scale.

The equality between men and women is a fundamental right, a common value of the European Union and of Romania and an essential condition for the achievement of the European and national objectives: the economic growth, the rate of employment and the social cohesion. The legislation has a major role in the case of non-discrimination and the integration of the gender equality. Measures are taken with respect to the rate of employment, equality of payment, maternity protection and maternity leave as well as social insurance, social security and the assessment task in the cases of discrimination and self-employment.

The financial remuneration could contribute essentially to increasing work performance and maintaining personnel but **for many people, the most important aspect regarding the payment system is represented by equity** [1]. Research studies have shown that satisfaction at work determined by payment is highly influenced by the employees' feeling of fair payment in comparison with other persons working inside or outside the organisation.

By means of equity payment the employees benefit from a fair treatment regarding the correlation between wages and work.

The equity of payment presupposes a number of conditions [2]:

1. **The internal job equity** which includes the means of payment for the employees having different positions in the same organization;

2. **The individual internal equity** which includes the means of payment of the employees having similar positions in the firm;

3. **The external equity** which represents the means of payment of a firm's own employees in comparison with the employees in other organizations in the case of similar positions.

A fair payment system is based on very important decisions concerning the following domains: the type of rewards, the payment level and the administration of the payment system.

In a competitive economy, every enterprise conceives its payment system in a particular manner respecting the minimum wages and the following principle [3]: “Equal work, equal payment” - a principle mentioned in the Universal Declaration of the Human Rights.

The present Romanian context enhances the fact that the discrimination problem on sexual criteria is still a challenge for the society as a whole with a series of visible differences regarding the access, participation and involvement of men and women in the social, political, economic and cultural life on the labour market.

The access to health, culture and information should be non-discriminatory too. As far as the participation of women to the process of making decisions is concerned, the law rather evasively stipulates the obligation of the local and central public authorities to arrive at a balanced and equitable representation of men and women. The lack of punishments and of an authority to monitor the presence of women in the process of making decisions devoid the legal obligation of any content and transform it into a simple recommendation. More than ten institutions or authorities apply the law regarding the equality of chances. In order to rectify this deficiency, the government founded the National Agency for the Equality of Chances on 1st January 2004.

The National Agency for the Equality of Chances has developed the National Strategy for the equality of chances between men and women in the interval 2010-2012 [4].

The activity of the agency as part of the central public administration under the subordination of the Ministry of Labour, Family and Social Protection is meant to promote the policies of the equality of chances between men and women at all the levels of social, political, economic and cultural life and to introduce the gender perspective upon the national policies and programs [5].

The national legislation stipulates the equality among its citizens, regardless of their gender and does not contain discriminatory norms.

The problematics of the inequalities between men and women has become evident in all areas of social, political, economic and cultural life and has also become one of the main issues on the social and political agenda at the community and international level. Due to the fact that the gender disparities are present at the national level as well, the Romanian Government aimed at answering to this challenge by establishing a set of priorities meant to facilitate the equality between men and women.

A brief analysis of the situation of the gender equality in Romania leads to the identification of a series of weak points and threats.

Thus, among the weak points we can mention the following:

- the low degree of awareness regarding the equality policies inside the public administration and mass-media;
- the lack of coherent stipulations concerning the settlement of complaints and charges regarding gender discrimination.

As threats we can mention:

- the crisis;
- the dynamics of the labour market;
- the incondite promotion of the social campaigns in mass-media;
- the communication deficiencies between the public institutions and the civil society and the social partners.

The inhabitants of the rural area represent a social category with a high degree of vulnerability, most of them without a job and earning their living from agriculture. The majority of the children, adolescents and youngsters in the rural area work together with their parents in their own household or in the field otherwise having low chances of going to college or university.

Even if a high percentage of the total number of students come from the rural area, these students do not have equal

opportunities with those coming from the urban area mainly because of the precarious material facilities, the lack of authorised personnel, isolation and communication difficulties. This aspect represents one of the weak points of each and every county and annually deepens the inequality of chances between the rural and the urban areas especially because of the lack of training programs for an entire population living on sustenance agriculture and government assistance.

5. Conclusion

We can affirm that the principle of the equality of chances between men and women has acquired recognition throughout time together with the other principles and rights regarding the regulation of the human rights at both the international level and the community and national level. Under the circumstances, the Romanian legislation regulates and at the same time guarantees the equality of all persons in front of the law and the equality concerning job opportunities, promotion, education, continuous training, social protection and clear access to all levels of economic, political and social life.

The insecure organizational media are specific to the crisis and presuppose the use of new instruments ensuring a raise of effectiveness and efficiency of the activities in any domain and at the same time having as an objective the equality of chances between men and women.

Applying Programmed Changes Management – a Condition of Applying Post-Crisis Reforms

Golea Pompiliu
Balogh Petru

"Dimitrie Cantemir" Christian University

golea_p@yahoo.com

petru_balogh@yahoo.com

Abstract

In compliance with the imperatives of the transition to a new post-crisis production industry, the paper aims to address the issues of programmed changes management. In this sense, after the submission of the general coordinates, a methodology for implementing its requirements based on a case study is proposed.

Key words: crisis, forces of change, programmed changes management; global village; the balance of the change forces.

J.E.L. classification: M14

1. Introduction to specific problems

The analysis of phenomenal and processes of the contemporary era demonstrates that the reforms needed to overcome the crisis permanently create a need for change in the organization.

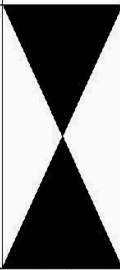

Certain changes have a smaller scale affecting only an individual or a small group of people, while other changes have a greater influence affecting large companies as a whole.

In the current context, crisis – recession – crisis, Romanian companies pass through dramatic changes towards efficiency, frequently wasting the creative energies of human resources and the available capital. These resources, when used with skill, could lead to increased marginal efficiency and furthermore to beneficial macroeconomics effects.

Kurt Lewin, a known expert in management, supports in his theory known as “force field analysis” that the conduct of business or an individual or group of

individuals is the result of a balance between the forces that lead to change and the forces that resist change.

Fig. no. 1. Forces of change

Elements that determine change	Balance	Elements that slows change
Pressures for change <ul style="list-style-type: none"> • Technology changing; • Know-how boom; • Products obsolescence; • Improving work conditions; • Changing the structure of the labor force. 		Resistance to change <ul style="list-style-type: none"> • Labor force structure; • Mental block; • Fear of new; • Fear of failure; • Low level of professionalism.
The balance of the change forces (after K. Lewin)		

Source: Golea Pompiliu, *Management – procedural approach*, Ex Ponto Publishing, Constanta, 2003

Specialized literature reveals that changes may be caused by the following causes:

a) *The trend towards a globalized competition*

According to some experts, globalization is the expansion of capitalism in general and the Western one in particular.

Sociologist Mc. Luhan talks about the possibility of transforming the world into a “global village” where the states, borders and language disappear, unifying the entire planet and headed by a “planetary government”.

While it may seem imaginative, it reflects a major trend: the pronounced possibility of integration and radical transformation of the world during the current millennium. From an economic perspective, some experts consider that creating a single global market will generate an increased possibility to integrate the national savings.

Under these circumstances, the participation of countries and implicitly that of companies is amplified in the global economic network. In order to achieve this goal, companies must change their culture, modify their structures and upgrade their products and technologies.

The current imbalances involve greater changes in companies' physiognomy, which brings in the spotlight the programmed changes management issues.

b) Major changes in technology

Scientific and technical progress determines the acceleration of product innovation, know-how and technologies of companies which have to carry out their activity in a technical, technological, economical and dynamic organizational environment.

c) The moral depreciation of products

Scientific and technical progress also causes the amplification of product wear process, through the appearance of new products in increasingly shorter periods.

Rapid product wear is another important factor which requires scheduled changes within companies.

d) Major changes concerning manpower

The most significant changes in this field are:

- Increased aging of the population and therefore the manpower;
- Amplified worldwide mobility of the workforce, caused by a globalized economy
- decreased loyalty towards the company;
- several profession changes during the productive life;
- women will still hold a significant share of total manpower.

In parallel with the forces that determine the change, a series of opposite forces occur.

Individual resistance to change is determined by at least six factors:

a) Selective perception – is constituted in such a force because people tend to perceive from the surrounding world only those matters within their sphere of understanding and interest. Major changes may affect the interests of company personnel and therefore they are not perceived positively by them.

b) Habitudes – are a source of satisfaction for the individual because it allows adaption to the environment in safe and comfortable manners. If changes are a source of stress, people manifest resistance towards the implementation of the proposed changes.

c) Reliance on others – is also a force that opposes the change. If the head of an organizational structure will manifest resistance to change, if they are dependent on the head of the department others will also reject change.

d) Fear of the unknown – make people insecure, because major changes bring elements of doubt which generate resistance to change.

e) Economic reasons - can be a force that resists change, because major changes bring elements of doubt which generate resistance to change.

f) Rules and group cohesion – are a potential force that opposes the change, because the group will put pressure on each of its members who will try to deviate from rules, which will generate a state of conformity which may block change.

Companies resistance to change is determined by at least five factors:

a) Fear of power and influence change – is determined at its turn that within the company, individuals and groups of people will strive to make changes only if they are in their favor, while others will resist because they do not want to lose their power and influence.

b) Rigid organizational structure – consists of a clearly defined chain of command, of tasks and authorities of each position, representing a road block to change.

c) Corporate culture– can generate resistance to change, because within the company prevail certain customs and values which impose a de facto state.

d) The limited resources of the company – also constitutes a force that opposes the profound changes that require huge material and financial resources. The large share of fixed assets constitutes a force that opposes the change due to technological restructuring difficulties.

e) Inter-organizational agreements – can constitute into a force that opposes change, because it may affect the interests

of other cooperative companies. They join together and resist against change.

Therefore, the identification and analysis of these forces is required, because it is desired to break the balance between the forces that resist change.

2. Operationalization of programmed changes management methodology

From our point of view, a methodology that formalizes the process of change involves the following steps:

- a) Identification and analysis of critical issues that require change
- b) Develop a program for implementing planned changes;
- c) Identification of individuals and the firm attitudes towards change;
- d) Value staff’s creativity and ideas implementation;
- e) Consolidation of new values and conduct.

We will briefly review each one in a case study.

a) Identification and analysis of critical issues that require change

To achieve this approach, we will draw the following table:

Table no. 1. Identification and analysis of critical issues in companies

Crt. nr.	Critical issue name	Reference data	Main causes
1	Failure to achieve planned turnover	Planned level	Market share drop (sale-wise) on market X
2	Market share drop (sale-wise) on market X	Planned level Level achieved by the main competitors	Obsolete products

Source: author’s efforts

Remarks:

1. In the last three years the planned level of profit hasn’t been achieved;

2. In the last 5 years the company has not upgraded nor assimilate new products

Identification of critical issues should be linked with the analysis of the forces that press for major changes in the company.

Based on the critical issues identified, the firm’s external environment factors shall be examined:

- Market X where the company sells their goods;
- Existing and potential competitors in this market;
- Consumer requirements;
- Raw material suppliers;
- Manufacturing technologies; etc.

b) Develop a program for implementing planned changes

Table no. 2. Implementation of programmed change management program

Cr t. nr.	Name of organizational change and the stages of making	Responsible	Terms
The assimilation of product “A”			
1	Constructive design;	Constructive design workshop;	1.05. 2012
2	Technological design;	Technological design workshop;	1.07. 2012
3	Material and organizational design	Supply Management; Marketing;	1.08. 2012
4	Prototype manufacturing;	Production departments;	1.10. 2012
5	Making constructive changes in the draft;	Workshop and technological design;	1.12. 2012
6	Manufacture series 0.	Production departments.	1.02. 2013

Source: author’s efforts

Notes: A team project shall constitute, consisting of specialists from departments involved in the uptake of the product “X”

This stage ends with a meeting attended by both managers and top managers and specialists from all departments involved in the process of change. The role of this meeting is to raise awareness for the need of change for the individuals, groups and organizations as a whole.

c) Identification of individuals and the firm attitudes towards change

The foundation of this stage is represented by the appreciation of general attitude of employees towards change and the various factors of individual and organizational resistance to change.

For this approach we shall use the following questionnaire adapted from Hellriegel D., and others, Organizational Behavior, West Publishing Company, 1992.

This questionnaire is in our opinion a tool that allows to appreciate the employees’ attitude towards the planned changes and to identify various factors of individual and organizational resistance to change.

Based on the answers, the evaluating coefficient can be determined using the following relation:

$$Eval\ coeff = \frac{score\ value}{no.of\ questions}$$

The results of the questionnaire applied to the firm’s staff are inserted in the table below:

Table no. 3. Evaluation of individuals’ attitude towards change

Questi on no.	The question content	Evaluation coefficient
0	1	2
1	I intensely want changes to occur at my job.	5,70
2	Usually I resist new ideas.	5,20
3	Most employees benefit from change	5,26
4	I do not like changes, because managers usually don’t support them.	6,13
5	Usually changes are for the benefit of the company.	5,45
6	Most changes are useless	5,90
7	Change is necessary	5,90
8	I use my power to resist change.	6,05
9	I often suggest new ways of solving problems.	5,06
10	Often, I feel less secure towards change.	4,90
11	Usually change insignificantly improves work.	5,78
12	I agree with a change only if all agree.	6,20
13	I try to acknowledge new ideas about the job I have.	5,90
14	Usually change reduces my ability to control work.	5,10
15	Group to which I belong agrees with change.	5,35
16	Some components of organizational culture block the change.	4,80
17	Departments involved in a major change, usually cooperate with each other.	4,80
18	Your superiors tend to block some changes that reduce their power and influence.	4,86
Average		5,46

Source: Golea Pompiliu, *Management – Procedural approach*, Ex Ponto Publishing, Constanta, 2003.

Rating:

- Very positive attitude towards change: 9-10;
- Positive attitude: 7-8;
- Neutral attitude: 5-7;
- Negative attitude: 3-5;
- Very negative attitude: 0-3.

The results can be represented in the following histogram:

Fig. no. 2. Evaluation of individual attitudes towards change

Source: author's efforts

Using the table and the histogram, we can appreciate the general attitude of employees and the various factors of individual and organizational resistance to change. Analyzing the evaluation coefficients in table no.3 and the histogram fig. no. 2, we can formulate the following remarks:

- Insecurity caused by fear of the unknown, because the major change brings elements of doubt (4.90);
- The organizational culture determined by the existence of values and habits that impose the status quo. Therefore, this factor constitutes a force that opposes the change (4,80);
- The cooperation between the departments involved in a major change is not adequate. The reasons behind this behavior should be examined deeper, because this factor is a barrier for change (4,80);
- Fear of losing power by some managers is also a force that block change (4,86);

Overall we notice a generalized state of apathy on behalf of the interviewed staff. Because of this we should seek ways to encourage the latent part of the company's workforce (5,46).

d) Value staff's creativity and ideas implementation

At this stage we seek solutions for solving problems regarding the programmed operational changes and to mitigate or eliminate the forces that resist change.

In our specific case, solutions are sought on:

- Designing new products and upgrading existing technologies;
- Upgrading the existing technologies;
- Improving the organizational structure;
- Changes in company culture; etc.

To stimulate creativity there are some methods that can be used such as: brainstorming, collective book (carnet colectiv), etc.

e) Consolidation of new values and conduct

At this stage the new state of the system is strengthened in a technical, economic, organizational and cultural way. A series of measures are undertaken such as:

- Bringing improvements to new products;
- Intensification of promotional policies;
- Improvement of manufacturing technologies;
- Improvement of organizational structures;
- The application of incentives to increase employee interest in maintaining the changes made;
- Consolidation of new cultural values.

3. Conclusions

Romanian companies find themselves in need of major changes determined by the transition to a new type of economic performance. We believe that from this perspective, the issue of programmed changes management should be approached with great responsibility.

Economic Crisis - a Result of Globalization?

Gradea Cristina Rodica

"Gheorghe Cristea" Romanian University of Sciences and Arts
Faculty of Economic, Legal and Administrative Studies, Bucharest
cristina_gradea@yahoo.com

Abstract

As we analyze the current economic crisis, which we can consider first ever global crisis that started with banking problems, we are asking if this crisis was strictly a financial one or a crisis due to the phenomenon called globalization.

What caused the global financial crisis was the lack of information. Best parameters to operate in markets need information, but no market player did not know who and what is holding or how much is worthing. Thus, we believe that the main point of the world economy before the recession and the weak factor, directly responsible for the current economic crisis, was trade. Moreover, since 2008, officials talked about establishing a new framework for world trade, but this desire met difficulties in order to be capitalized as political segment and as a starting point.

The conclusion we can draw is that the current economic crisis requires reconsideration of globalization.

Key words: globalization, crisis, credit, trade
J.E.L. classification: E32

1. Introduction

We note that the concept of globalization is very common, especially in recent decades. Were amplified various aspects and connections of this concept, which continues to develop in a fast particularly. The idea of globalization is present everywhere: in science, communication, technology, military affairs, the environment, etc. Although in theory the process of globalization was "invented" in the 1980s (the concept existed long before), we can say that today international trade attracts hundreds of

countries and registered an enormous range of finished products of all categories. Thus, globalization is marked by an integration of the economies of various countries, which make the final, qualitative structure of national economies to be changed. Many national economies have become common part of a global economy with many advantages and disadvantages. One can speak of many triggers that marked the emergence of globalization, being socio-economic or policy factors. Among them are: development of means of production, consumer goods, demand and supply of goods and services, improving communication and transport means, moving labor force, capital migration.

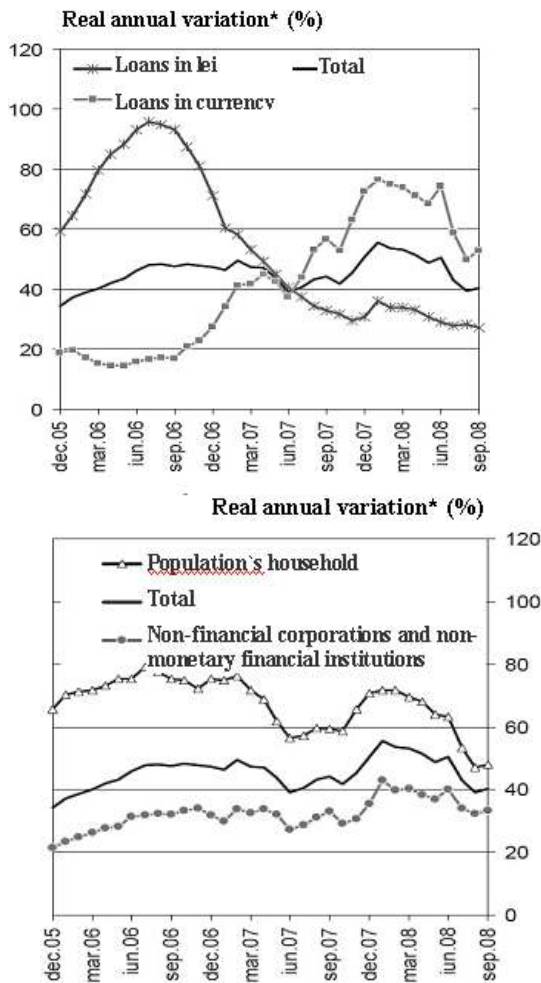

2. Credit situation in Romania

The economic crisis we are in and which humanity itself has created, is a consequence of insufficient supervision on bank loans, based on quantity and not quality.

The graphs below, taken from the National Institute of Statistics, shows the situation in private sector credit and the types of customers, until September 2008:

Figure no. 1. The situation in private sector credit and the types of customers, until September 2008

The loan granted to the private sector

Source: National Bank of Romania; National Institute of Statistics

Loans in lei had a period of strong growth during the end of 2005 until the mid of 2006, and after the adhesion of Romania to European Union, had strong downward trend, and downward trend is maintained until now. Loans in foreign currency situation experienced a reverse evolution in domestic credit, with a trend of stagnation in late of 2008, when the crisis began, and now is a downward trend.

The dynamics of lending economical agents and individuals experienced a slight decrease during 2005 - 2008 with vague tendencies, at some times, of growing, due to cyclical market conditions, particularly to the Real Estate market, the overall trend still being a downwards one. In the chart

presented can be seen that the real annual variation for economic agents is below the level of individuals.

Figure no. 2. The dynamics of lending economic agents and individuals

Source: National Bank of Romania

Loans situation granted by credit institutions on the types of customers shows that non-financial corporate loans trend versus the trend of loans granted to households of population during December 2004 - September 2008, had a reverse trend and tended to equalization at the end of year 2008.

What is needed on the market today, is a new economical and financial order at global level. It must that each country should have an anti-crisis program, established under the appropriate economic parameters of each nation, a program to increase public

confidence and produce visible and immediate effects.

3. The beginnings and evolution of the global economic crisis in recent years

Global economic and financial crisis which started in 2008 has produced a hole of distrust in financial institutions and has had negative effects on economic growth globally. However, the crisis has consequences both in political and social level. Recession triggered chaos in the financial system, which has made governments in Western Europe and U.S. to nationalize some of the domestic financial system. Although the crisis was triggered in the United States, has expanded rapidly in Western Europe, making "havoc" among all the countries where it has spread, due to globalization.

The financial crisis has had as its starting point the U.S. whereas the American administration has reduced the authority of bodies which were responsible with the regulation of financial investment and has allowed to some banks and insurance companies or investment funds, which had not the necessary cover, to be required to lend to some beneficiaries that had not the ability to pay the rates. Thus, there have been created attractive "packages" that were sold to investors, excessive availability of credit funds, spreading globally.

Such financial events have grown to encompass regional and local administrations, have entered the market exchanges or of shares or natural assets, leading to capital losses from banks and losses from unpaid loans. The financial crisis being established, the result was a lower income and economies of citizens, real estate impairment and the amount of traded shares was significantly reduced. All these effects were done significant losses in the United States, which was in its worst economic recession in the last 75 years and worldwide. American financial and economic crisis has spread extremely rapidly in the rest of the world, Europe entering into recession.

Crisis effects in Europe were: lower industrial production, unemployment, lack of consumer confidence or a feeling of insecurity of citizens. Thus, in some

European countries like Germany, England, France or Italy or Spain, industrial production decreased greatly.

Currently, global debt increased by about 45% compared with 2007, is reflecting the massive recovery programs implemented by governments to overcome the financial crisis. It is estimated that global debt will be 80% of global GDP in 2011, compared with 63% in 2008.

4. Effects of economic crisis in Romania

As seen in this moment Romania, returning money received from the IMF, and certain rights won in court, whose payment was delayed, make 2012 an impossible budget year.

Romania has been severely affected by world economic crisis that has spread with amazing rapidity and revealed, unfortunately, serious vulnerabilities of the Romanian economy.

Thus the first and biggest problem is the current account deficit, more difficult to be financed, and the second major problem is resulting from excessive dependence on foreign capital.

Romania is not in a situation to deal with this type of crisis because in a consumer market, unemployment has increased and will still increase alarmingly, the income will fall further, the currency will depreciate, and poverty will conquer more and more people. Another vulnerability to combat the economic crisis is the inability to absorb EU funds. What is even worse in these conditions is to ensure social peace, as the population is increasingly unhappy and suffer because of increasingly drastic measures which are to be taken by the Romanian state.

Here is in the charts below, how inflation moved up from December 2005 until December 2009:

Figure no. 3. Inflation in December 2005 to 2009, December

Figure no. 4. Inflation rate

On 31 May 2010, the last report of the Ministry of Finance show that public debt in GDP was 34.94%, but growth is extremely alarming, so on February 28, 2010, the Ministry of Finance reported a level of 28,

77% of GDP. Probability of Romania to pass on growth in 2012 is low which obviously will lead to a further increase in public debt in GDP.

5. Conclusions

Currently, in Romania, to counter the economic crisis there have been taken some of the most drastic measures: increasing the VAT rate from 19% to 24%, decreased with 25% the budgetary salaries, unemployment benefits were reduced by 15%, were introduced new taxes for small producers like authorized persons, individual companies, family companies, and for any independent income, obtained outside wages, as GEO no. 58/2010, it was introduced the flat tax, which balanced the whole economy and have changed, in a very short time, the laws governing the business world which still existed. Thus, there have been changed laws by extreme importance for the smooth running of companies and authorized persons, such as: tax code (several times in a very short time, without any rules for the application in due time), Law no. 31/1990 of Companies, Law no. 85/2006 of insolvency, and the list goes negative.

Abstract

The managerial functions are used for leading the organizations to their final targets. The managerial decisions have to be implemented by the conveyance of the working tasks from the top to the bottom of the company structure. At the same time, the reporting of the acquired results is delivered in the opposite direction. It is obvious that the communication system is substantially linked with the managerial functions. The role and the importance of the managers are in accordance with the level of the action(s). To be efficient and effective the communication between the levels and horizontally has to reach a proper format. The case study presented in the paper is an opening for a larger research on the effects of communication on the process of management.

Key words: communication, management functions, effectiveness

J.E.L. classification: M10, M30

1. Introduction

Managers are persons with the role of leading the organizations - by means of personnel and resources - to the expected results. Certainly, they should have several skills and abilities to be capable to enforce the managerial strategies. One of them is the communication ability, which is the potential to transmit the tasks to the subordinates and to receive the reports and feedbacks.

That is why between the management and the communication inside the organization is a strong link. Good communication between

managers and with the regular staff is a premise for a proper (business) environment able to conduct to expected results.

Types of communication systems used by the managers are according with the style of the manager, as well as with his profile. For example, an authoritarian manager will have a different communication style from a “democratic” manager.

There is also a link between communication and the managerial functions according with the managerial level. It is obvious that communication will be influenced by the duties the manager has to fulfil.

2. Management levels

Management functions are different within an organization, as well as between organizations. In a traditional hierarchical organization (pyramidal structure) there are employees with non-managerial role, “first line” managers, middle managers and top managers.

The basic functions of managers at different levels of an organization can be described as follows: *first-line* managers (*line manager*) or team leaders who are supervising non-managerial staff, category directly involved in the production and the creation of company products or services. *Middle managers*, as the name suggests, report to the top management and are supervising the line managers. They are responsible for running functional areas such as: sales, customer support/service, marketing, logistics, finance, human resources etc. Top managers are expected to plan, to prepare and “to sell” the strategic objectives of the organisation and to take

decisions at the level of the organisation that will determine “the path” to be followed by the company.

Management positions within an organization of the kind require some basic skills, originating from the type and level of managers within the company and from the impact of their decisions. Leadership roles for various types of managers will be different depending on the nature of activities designed for each of the management levels. So, the role of a line manager would be different from the one of a top manager.

A manager is the person that works with and through the others; he is planning and coordinating their activities in order to achieve organizational goals with required efficiency and effectiveness. Efficiency is the component that helps to achieving the best results with minimum resource consumption. Effectiveness is about the way to ensure the work to achieving organizational objectives. There are several types of organizational structures used by companies such as “*the traditional hierarchy*” in which there are several (different) levels of managers and where communication is performed just one level above or below. Another type of structure is the type of “*block matrix*”, where people from different levels of the organization can directly communicate with each other regardless of the position occupied.

The organizational structure will depend on the size, type and culture of organization.

3. Specificity of the managerial function

To better understand if the roles of the management are the same or not at different levels of the company, we need to analyze in depth the activities of the managers, the skills and the capabilities of each and every manager.

The management can be described by four basic functions: "planning, organization/regulation, leadership and control" (Fayol, 1916).

Planning involves defining goals, establishing strategies for achieving targets and developing plans in order to coordinate the integration activities. Organization/regulation determine what to do, how to do,

and who to perform. It also entails the resources allocation, the grouping of established tasks and the reporting structure. Leadership is to involve and motivate the subordinates, to influence individuals and/or work teams to engage in the achievement of the tasks. This function requires a selection of the most effective communication channels in order to address employees' behaviour problems. Control is the final function of a manager which allows the verification of tasks performance and objectives achievement.

Once goals are set (the planning function), the structures arranged in order to carry out the tasks (the regulatory function) and the staff employed, trained and motivated (the leading function), a process to monitor and evaluate the progresses achieved, as well as to compare with the initially set goals must be put in place. If there is a deviation from the established objectives and business could be turned to more effective, the manager should adapt the process in order to get the best results for the organization (the control function). Henri Fayol a businessman in the early twentieth Century used the functional approach to describe the roles of all managers. Functional theories were based on personal experiences as general manager of a coal mining French company..

Recent results obtained on a significant sample with managers on the three levels of the organization might suggest that all of them have to meet four basic functions, described by Henri Fayol, but in different manners. The results show the following: in terms of time for leadership, the ratio for the line managers is 51% of their total time of work, compared to 36% for middle managers and 22% for top managers. In terms of time spent for regulatory/organizing purposes, the line managers are spending 24% of their total time of work, compared to 33% for the middle managers and 36% for the top managers. The time spent for planning purposes by the line managers is 15% of their total time of work compared to 18% for middle managers and 28% for the top managers. For the control function the line managers are spending 10% of their total time of work compared to 13% for the middle managers and 14% for the top managers.

It can be perceived that upper management levels need to spend more time on organising and planning than on direct leadership. The top management is concerned with the overall organization, while line managers are focused on operational management (for individuals and working teams).

4. Competences and abilities

Lawrence F. Katz (Harvard Business School and Stanford University) ascertained that there are three basic skills (abilities to carry out duties in various jobs) a manager should possess, but do not define him as good manager (features and characteristics). “Competency involves a skill that can be developed, not necessarily inborn, and which is reflected in performance, not only in potential. Competencies are: technical, human and conceptual “ (Katz, 2008).

Technical skills that require specialized knowledge, ability for, analysis, easiness in using the tools and techniques in specific fields are often required, being important for many of the line and middle managers, because they are more interested in leadership issues. LF Katz suggested that when managers reach higher levels, the technical skills become less important, but they still need some skills tailored to the specifics of the company.

Human or interpersonal skills represent the capabilities of the manager to work effectively as a team member, to build up with the team, in order to motivate or even to de-escalate conflicts. This notion was known as emotional intelligence or EQ. LF Katz suggests that this "qualification is important at all management levels, competencies allowing managers to communicate effectively, to motivate, to lead, to delegate and to negotiate within the organization in order to achieve its objectives efficiently and effectively " (Katz, 1995).

The conceptual skills describe the ability of the manager to observe the company as a whole, to identify the relationships between departments and how the company fits its place in the market. This capability allows managers to conceptualize and to think in abstract situations. Conceptual skills are needed at all management levels for the decision - making process.

LF Katz suggests that these skills are more important in top management because they often have to deal with abstract ideas, unlike lower-level managers, who spend more time and efforts with more observable and tangible objects and processes.

The responsibility and the role of a manager could depend on the level and position within the organization. The differences appear in the degree and the emphasis on skills and competencies, not in the process of conduct. All managers, regardless of their level within the organization will perform the managerial functions of planning, organizing, leading and control by use of communication procedures.

5. Managerial communication

To implement executive processes, managers need to communicate with subordinate structures, as well as with higher managerial entities..

Taking into account the elements of the communication process – sender, message, environment,, receiver and the context – one could find out that this process fluctuates in accordance with the nature and the position in the hierarchy of the organization.

In the process of managerial communication it is important to achieve the communication objectives: (1) correct reception of the message, (2) understanding of the message, (3) acceptance of the content of the message and (4) initiating an action.

Communication functions within an organization are: information, transmission of the decisions, influencing the receptor, training of the employees, creating of image, motivation, promotion of culture, integration.

In terms of process and functions of communication it is very important to have ensured the accuracy of the message. To achieve effective communication it is necessary to follow the (communication) principles: transparency, simplicity, speed, realism. In other words, one has to establish: (1) *Who* should be informed?, (2) *What type* of information should he/they receive?, (3) *How much* should he/they be informed (how much information)?, *How* to be informed (how often)?

The manager is definitely the most important person in determining the flow of communications and its general features.

Sending tasks and obtaining information are achieved by the management through the following techniques: (1) establishment of multiple channels of formal communication (2) the use, whenever possible, of direct communication, (3) determining the susceptibility / sensitivity of the receiver towards the messages of the project manager, (4) choosing proper timelines for optimal communication, (5) enforcing words by deeds, actions, (6) using a simple, clear and concise language, (7) recalling messages whenever possible, (8) obtaining feedback in as many forms as possible.

Through the use of various techniques, managers are able to avoid and overcome possible barriers for internal and external communication.

At the same time, several aspects must be taken into account such as: the real desire to communicate, the favorable environment, the adjustment/the adaptation of the message, the attractiveness of the the message, the commitment to communication.

6. Case study

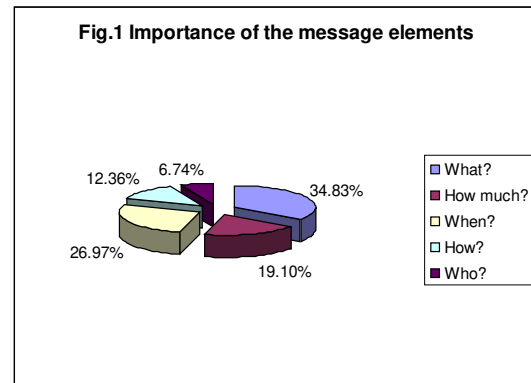

To estimate the perception of links between management and communication a survey was conducted on a randomly sample of 89 managers from different levels, in 37 companies from Târgoviste, Dâmbovița County.

The sample considered 19 line managers, 47 mid level managers and 23 top managers. The questionnaire used 8 questions closed, with scale for responses and only one response option. The interviewing was performed directly by the operator or by telephone, so that all questionnaires were complete and correct.

The results were centralized and processed as fractions in the total responses.

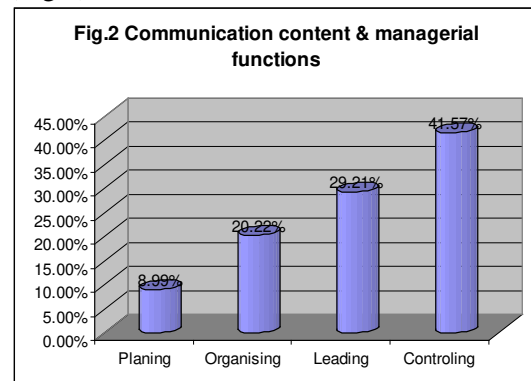

Question 1 - How important do you consider the communication for management activities? Over 60% of the interviewed indicated communication as important, while only 12% considered it as very important. The share of those in a “neutral” position is 13%, and of those who think it is totally unimportant or less important totals about 14%.

By referring to the core elements of the message communicated (this being the essence of the communication process), an attempt to detect the perception of the managers from this perspective was undertaken by *Question 2* - What do you consider the most important matter in communication?

It can be observed that the highest percentage is recorded for the content of the communication, followed by its timing (Fig.1).

Question 3 - What managerial function is mainly detected in communication? This reveals that among managers the largest share is being held by communication with respect to control and coordination, these encompassing about 70% of the options, compared to planning with only 8.99% (Fig.2).

It can be observed that if international studies (mentioned above) show that the orientation of different management levels is towards organizing at the top management, towards leadership at mid and line management, while the control function registers no more than 15%. In the case of the Romanian managers the propensity for communication in the area of controlling is to be noted, as well as the secondary share for communication in the spheres of organizing and leading. The planning is practically

missing, the parameter recording a very low rate compared to the others.

By *Question 4* - How do you communicate with your manager? and *Question 5* - How do you communicate with your subordinates? it was expected to highlight possible differences in perceptions (Fig.3).

Most of the respondents were placed, in both cases, within the range between “acceptable – good”. Most of them are considering that they have a good communication with their supervisor and acceptable communication with their subordinates. Same swap can be seen for the couple “weak-very good” which leads to the conclusion that many supervisors think they have a feeble communication with their subordinates, while many subordinates believe they have a very good communication with the superior.

Question 6 - How do you communicate with other managers in the company? - intends to highlight possible differences between the vertical communication and the horizontal one.

The results acquired show that almost 90% of the managers believe they have an acceptable, a good or a very good communication with “fellow managers”, while only 10% think the communication suffers (Fig.4).

While the situation is almost similar in terms of communication with the upper management level, in the communication with subordinates appears a significant difference, the dysfunctional communication registering a ratio of about 24% (more than double).

Question 7 - What element of communication do you think is lacking? The respondents believe that the weakest element of the managerial communication is the content (at a rate of 29.21%), followed by the timing of the communication, with a percentage of 23.80% (Fig.5). At the same time, the least weak elements seem to be the form and the (message) transmission channel.

Question 8 - What kind of manager do you prefer? - aims to highlighting the types of managers preferred in the studied companies, typology also reflected in their style of communication.

The outcomes show that most respondents (32.58%) do not consider this issue as important. On the top of the preferences ranks the “democratic” type, followed by the “delegation” type. Only 14.61% of the respondents are pleased with an authoritarian style.

It can be noted that although not desirable, from the data regarding communication in relation with the managerial function of control, they seem to be present within the studied sample.

7. Conclusions

The survey aimed at assessing a first evaluation on the perception of managers with respect to communication within the studied organizations. The data collected show that managers consider communication important in the management process, but there are discrepancies between the functions of management and the content of the communication. At the same time, subjects find it very important the message and the timing of the transmission, and almost totally unimportant the sender, which - in our opinion - also pinpoints some dysfunctions. However, this result might have been influenced by the requirement to mark only one option. A deeper analysis is required, possibly using hierarchy-based systems.

Discrepancies were observed also in terms of the representation of the managerial functions with respect to the content of the communication. The analysis on categories/types of managers was not performed for comparison with relevant data in international scientific literature but to provide a “first impression” report.

The fact that most of the responders consider themselves as having a good communication with superiors and subordinates is a good starting point for a more complex analysis of the relationship between management and communication, on how the performances of the managers can be influenced by their style in communication.

It is noteworthy that almost all managers believe they have proper communication with other managers in the firm.

Subsequent directions for the development of the study could be:

- carrying out a survey on a representative sample with greater in-depth;
- studying the management environment in the business sector, as well as in the public sector;
- identification of correlations between management functions and components of the communication;
- displaying the differences between the two studied environments.

Abstract

At present, trade marks, brands and service marks are used widely in all countries - whether developing or industrialized, market or planned economy - and play an important economic role in the marketing trade.

Trademarks serve the interests of the market offering goods and services - such as industrialists, manufacturers, distributors, retailers and wholesalers - and the interests of consumers, public authorities and the wider economy.

Key words: Trademarks, brand, competition

J.E.L. classification: K11

1. Introducing the Main Concepts

In a market economy, the use of trademarks is subject to legal and financial constraints, which reflects the increasing importance that is assigned by the contemporaneous society.

In essence, the trade policy aims at targets dictated by the need of individualizing and differentiating the products and services from those of competitors, depending on the specific of market segments, in relation to the technical benefits and qualities, of the performance whose valorization is sought.

Nowadays, trademarks play a very important role in the industrialization era; they became an essential factor in the modern world of international trade and market economy.

In a competitive economy, manufacturers and retailers can provide consumers with different products in the same category. Although, at first glance, these products do not appear to be different in the eyes of consumers, however, they may differ in terms of quality, price or other features.

Brands or trade marks serve different purposes. From the standpoint of the person interested in buying a commodity, the mark aims to:

- Influence the buying decision.

This decision is based on the product properties and traits (size, weight, colour, smell, taste, durability, efficiency degree etc.), i.e. the potential buyer looks for a certain product quality or feature [1]. The mark thus serves to personalize the product or the service, it raises awareness and stimulates the product buyer or the service beneficiary, and, not least, it offers the guarantee of quality.

The mark highlights the particularities of the product, being considered a potential for a future sale, made in the subconscious of thousands of individuals; the mark is a sign for the recognition of an item, which serves to distinguish it from another, to indicate one of its functions.

The mark is also a distinctive sign used within companies in order to distinguish and identify their products, items and services from those items identical or similar, belonging to other companies; it is used by traders and intended to differentiate their products, works and services, from identical or similar products, works or services which belong to other traders.

The second function of the factory or trade mark is to allow the manufacturer to identify the goods previously produced and which are no longer in its possession but, for example, in stores that sell them.

The third function of the factory or trade mark is to enable the authorities responsible for quality control or for the control of other features of the products sold under a particular brand to exercise their responsibilities.

Entrepreneurs have in view the production of goods but they also provide services. Services may be of almost any category:

tourism, advertising, transportation, insurance, materials handling, etc.

The service mark is therefore a sign used by entrepreneurs offering services (hotels, restaurants, airlines, travel agencies, car rental agencies, laundry and drying) to identify services on the market.

According to Professor Ioan Macovei [2], in business strategy, the mark is a key element.

The objective and subjective distinction made in the global supply of goods and services, the mark is used to extend the market.

In this context, the mark functions are configured for economic and social conditions. The main functions performed by the brand are: the function of product differentiation, competitive position, market organization function and the monopoly function.

Analyzing the various functions of the mark, a study of the AIP-IP (International Association for Industrial Property Protection) shows that the mark has primarily an identification function; then, it has the function of indicating the source of origin [3].

The mark has additional economic functions, which vary depending on the specific use and the type of brand; among the economic functions there are:

- The quality function;
- The function of advertising;
- The competition Function.

3. The Function of Competition

The function of brand competition is based on the system to attract customers.

Following the development of production, the offer increase considerably augmented business volume, and, thus, the productive capacity[4].

Competitiveness necessarily implies the promotion of new items on the market [5].

Through its influence on demand, the brand allows the manufacture in large series, which favors the reducing of the cost and increase the competitive power of products.

The brand quality is directly related to firm size, the competitive position is a productivity factor, an element of technical progress.

The competition function is achieved through differentiation and brand advertising.

The diversification and multiplication of models, types and colors made not only a differentiation of products but also of brands.

The same brand is used for a variety of models. For example, car or detergent brands.

The differentiated brand advertising increases the sales.

Due to technical progress, advertising has evolved from persuasive forms, with the character of information, to invasive or obsessive or violent methods.

Due to the abuse in advertising, the objective differentiation becomes subjective differentiation.

The funds allotted to differentiated brand advertising involve the increasing of production costs.

In terms of force of attraction, the brand is an independent good, with its own value and it is part of the balance sheet asset.

The quality or presentation differentiation is completed with the subjective preferences of buyers.

For the consumer, the brand has the role to guarantee product quality.

It helps the buyer to identify a product and it determines, by maintaining a constant quality, a certain preference.

If the real quality of the product is altered, the buyer will choose the products of a different manufacturer.

4. Function of market organization

By matching supply and demand, the brand is a means of organizing the market [6]. The organizing function of the brand exercises its influence on distribution forms [7]. The mark ensures sales and cost savings.

Since the brand sells by itself, traders use their own distinctive marks. By means of this use of their own trade and service marks, traders have the tendency to ensure their exclusivity of their brand in the process of product distribution organization.

In this context, the brand is a primary tool of marketing.

5. The position of monopoly

Mark differentiation and distribution exclusivity lead to the transformation of competition into an instrument of monopoly [8].

Due to this phenomenon, the function of guaranteeing the product quality is replaced by a consumer protection function [9].

The brand diversification within the same company is an artificial phenomenon that prevents production progress.

With an increasing number of variants, the effectiveness of large series is limited and the differentiation becomes exclusively subjective.

Corporate Social Responsibility in Romania. Case Study

Grosu Maria

„Alexandru Ioan Cuza” University of Iasi
maria_lia24@yahoo.com

Abstract

CSR starting premise that aims to harmonize economic, social and environmental. In Romania, CSR is a relatively new field, but now more and more business in the Romanian society, being promoted, especially through multinational companies. A sensitive issue, at least for companies doing business in Romania, is to ensure communication and transparency of information on socially responsible investment as they are involved. In this article we try to present the current situation regarding the practical implementation of CSR in Romania, but not before taking into account the dimensions of corporate social responsibility and issues of recognition or non-recognition investments in the accounts of social. The study concerns a sample of 40 companies (multi)national, which are considered matters such as: areas of interest are involved, different budgets for socially responsible actions, the main CSR projects, and most philanthropic companies past five years carrying out their business activities (and) in Romania.

Key words: Corporate Social Responsibility, social actions, corporate sustainability, sustainable development, CSR reporting, charitable companies.

J.E.L. classification: M14, M38, M41, M42.

1. Introduction

In recent years, a new category of companies responsibilities generating interest in general and multinational companies, especially. It's about *Corporate Social Responsibility (CSR)* viewed as the sum of liabilities of companies that contribute to the development of the modern society. In this regard, to contribute to public good, more

companies (multi) national socially responsible takes action considered strategic CSR objectives, which could have positive effects on financial performance and reinforce the company's image in general medium and long term. Literature [5] highlights the theory supporters, which CSR help to strengthen the financial performance of companies and deniers, who believe that investing in social actions, not directly related to the company's business strategy, and could help to adversely affect the financial performance.

We can not agree with the idea of opposing positive contribution of CSR on the profitability of the company, knowing that *image of investment*, even if in principle can not be recognized accounting term that will enhance company performance, measured by indicators „outside accounting”, such as: *Economic Value Added (EVA) or Market Value Added (MVA)*.

However, we must note that the positive effects of CSR can not be sustained than in normal conditions of business companies, where threats are of macro (see the current economic crisis), CSR no longer can be effective, because the imbalances exceed corporate and manifests a higher level.

To understand issues concerning CSR reporting in Romania, we present the dimensions of corporate social responsibility, focusing on *discretionary responsibility*, corporate social pyramid at the top [2]. In fact, the balance community-company may be provided by optimizing the economic, social and environmental - strategic approach to CSR.

2. Dimensions of CSR

Using the concept of CSR has become current since the 70s of last century, claiming that *a new form of governance in the business, to benefit, mutually, company-society relationship*. Supporting the

conceptual development and practical implementation of CSR takes place both *internationally*, through: standards issued by the United Nations Organization (UNO), the lines of conduct developed by the Organization for Economic Cooperation and Development (OECD) and International Labour Organization conventions (ILO) and *the European Union* by the Lisbon Strategy objectives in 2000. These institutions were involved in developing the overall framework of CSR together with the principles and recommendations to support the issuance of national policies to support CSR initiatives and to ensure transparency in their reporting.

So for a company to prove that is socially responsible, it must understand the principles of CSR internationally promoted and, moreover, should report regularly shares "socially responsible" to demonstrate the integration of CSR principles into its activities. CSR in terms of size since the 90s [2] demonstrated that CSR concerns four types of responsibilities that companies have to society as a whole: *economic responsibility, legal, ethical and discretionary (philanthropic)*.

Economic responsibility is synonymous with the term "*Profit!*" and is the basis the other three categories of responsibilities. Economic components that characterize this type of responsibility shall include: the company must act to maximize the return on shares, to profit consistently and as high and to maintain a competitive position in the market. *Legal responsibility* falls imperative: "*Respect the law!*" and its components are: to act according to legal requirements, comply with national and international regulations, to conduct business subject to compliance with legal requirements. In accounting, this responsibility might translate as respect for regularity and sincerity. *Ethical responsibility* is associated with the motto: "*Be ethical!*", and is considering fairness for all stakeholders. Among the ethical components of CSR, we find: to act in accordance with moral norms, to recognize that corporate integrity and ethical behavior assuming duties involve high compliance with the rules. On top of the pyramid of corporate social responsibility is *the discretionary or philanthropic responsibility*, characterized by the expression: "*Be a good*

corporate citizen!" Obligations taken by companies in this area are purely voluntary and the decision is guided by the desire to assume their companies to engage in social action, involvement is proved to be a win-win solution for both the company and for society as a whole. Components that define discretionary responsibility considering the contribution those companies can have it in areas of interest such as: *education, culture, environment, social, human rights and sport*. More specifically, for "being a good corporate citizen", every company must act in accordance with the order philanthropic expectations that society has to address, must involve managers and employees in voluntary and charitable activities in communities where operates, to assist public and private educational institutions. In other words, companies should voluntarily contribute to the development of projects leading to improved quality of life in the community in which they operate.

Organizational theory shows that over time, the focus was especially on the first two types of responsibilities (economic and legal), they were placed, moreover, at the bottom CSR. Later, he felt the need for ethical and discretionary obligations that complements CSR area in response to changes in the value systems of all categories of stakeholders and to meet the demands of increasingly competitive business environment.

Therefore, if you make a comparison between Maslow's Pyramid and CSR Pyramid, we can see that the ethical responsibility the same position as the "*need for esteem, status, respect*" in Maslow's Pyramid. So, within a company, economic and legal responsibilities can be assumed (as are considered "physiological needs, security and belonging" in Maslow's Pyramid), and socially responsible corporate practices, certainly should be directed and to philanthropy, equivalent to "Self" in Maslow's Pyramid.

A delicate issue is the recognition or non-recognition of the assets of a company's investment in various social activities. We ask that when increasing the asset value is the company as a result of the costs for some socially responsible actions?

3. (Non)Recognition in accounting of investments in the social actions

Currently, while measuring the economic and financial performance of companies can be made easily, quantify social performance is difficult to determine, and recognition of intangible assets requires consideration of the conditions very “delicate” in terms of accountant.

Under IFRS, recognition of an intangible asset shall consider first the definition of an active compliance, generally presented in the Conceptual Framework. *An asset is a resource controlled by a firm as a result of past events and from which is expected to generate economic benefits for the enterprise in future periods.* Specifically, the key criteria to determine whether an intangible asset be recognized are: can be *identified separately* from other assets of the entity; the entity to have *control* over the asset as a result of past events; *future economic benefits associated activities are expected to flow to the entity*; can be measured reliably intangible asset *costs*.

If any of these conditions is not met, the intangible asset is non-recognized in the balance sheet. Given that the costs are shown *as expenses in the period*, also many remain unregistered in the balance sheet assets by purchasing entity to another entity. If an item does not meet the definition of intangible nature of their failure to comply with conditions set, then it can not be recognized as an asset and will be highlighted *in the category of expenses* (for example: marks, titles of publications, internally generated customer lists, *because they can not be reliably measured*, the costs of training, *because it can control the future economic benefits*, costs of changing the location and the reorganization because they can *not be estimated future economic benefits* etc).

This is the case for *expenses incurred for various social activities*. Because they can not be estimated and quantified future economic benefits associated expenditure for various social actions, it certainly can not be recognized as intangible assets in the balance sheet. However, it is noted that while investment in the image and reputation can not be recognized (is internally generated goodwill and IAS 38 “Intangible Assets” prohibits the recognition of it), however,

beneficial effects will be felt in the long run, according “virtuous” circle theory [6], which claims that between social performance and financial performance is not only a relationship of co-determination, but also one of self-determination.

To analyze the current (reported) on CSR in Romania, we used an empirical study of the 40 companies listed on the website CSR [3]. he methodology and results are presented below.

4. CSR projects in Romania

In terms of conceptual development and practical implementation of CSR in Romania, we notice that in the last five years have held various conferences, projects and studies, on the one hand, promoted the need for CSR in developing communities in which they operate companies, on the other hand, have analyzed the results of their involvement in various social activities.

To analyze what the situation is currently in Romania, we conducted a survey of companies that, in principle, made public their CSR actions. Said the study was made possible by collecting information on www.responsabilitateasociala.ro site where are listed at present a total of 40 national and multinational companies operating in Romania and shall make public and socially responsible practices, providing information such as: *areas of interest which involves different budgets for social responsible actions*, and *the types of projects*.

The information collected and processed on actions undertaken in the 2006-2010 social responsibility by companies listed on the site, to which we added information on the turnover of the financial reports public companies in the same idea relationship analysis: social performance-financial performance. As I mentioned in the introduction, this relationship can be demonstrated only if the companies face reputational risks. n terms of systemic risk is difficult to analyze social performance-financial performance relationship, so in this study we confine ourselves to finding more CSR situation manifested in recent years at national level and we do less than to demonstrate the relationship of co-determination or self-determination between

financial performance and social performance.

With regard to areas of interest involving (multi)national companies analyzed, it is noted that in the last five years, approximately 93% of companies have initiated *actions in education*, as can be seen from the chart below.

Chart no. 1 Areas of interest of (multi)national companies

Source: processing by data from sites: <http://www.responsabilitatesociala.ro>

In hierarchical order, by area of interest concerned the percentages recorded by companies are: *social (82%), environmental (73%), cultural (52%), sports (40%), and the last ranks of corporate initiatives human rights (13%)*. We see, therefore, that most companies were involved in educational activities with programs such as: "*We care about education*" (Apa Nova Bucharest), "*Student of the Year*" (Carpatcement Holding), "*School of Andrew*" (OMV Petrom), "*Vodafone scholarships for high school*" (Vodafone Romania), but can not motivating enough, given the current state of secondary education in Romania. And the social and ecological hold important places, supported by actions such as: "*Wall of indifference*" (A&D Pharma), "*Your child is safe?*" (BGS), "*Color a Smile*" (Praktiker Romania), "*Together for nature*" (Romstal), "*Green umbrella*" (Tuborg Romania), and "*Think. Recycle*" (Alexandriion Group). Last place is held by the field of human rights, the companies involved: A&D Pharma, Avon Romania, OTP Bank Romania, Vodafone Romania, Wester Union Romania. *Main forms of corporate involvement* were: donations in cash or in the form of equipment, construction materials, teaching materials, educational programs, trainings, and various voluntary actions that have involved employees of companies.

If we analyze the distribution companies involved in social action on the fields, we find that the highest percentage is owned by *services companies*, among which are distinguished communications and telecommunications services (UPC Romania, Vodafone Romania, Orange Romania) and financial services and utilities (RBS Romania, Transgaz, Apa Nova Bucharest). In second place are ranked *financial institutions*, especially banks and *companies in the production or the distribution*, as can be seen from the chart no. 2.

Chart no. 2 Breakdown fields of CSR projects

Source: processing by data from sites: <http://www.responsabilitatesociala.ro>

A critical aspect is related to the study: *lack of transparency in corporate social initiatives declare budget*. This is quite difficult to interpret results, and analysis of the relationship: social performance-financial performance. More specifically, only ten companies (25%) said budget actions on CSR in each of the five years taken into account (*A&D Pharma, BCR, BGS, Carpatcement, Coca-Cola HBC, Provident Financial, Romstal Transgaz Tuborg, Western Union*), 70% state budget only partially, and two companies listed on the website CSR (5%) said no budget for social action (*Dacia Groupe Renault, UPC Romania*). However, even if not stated budget, the two companies were involved in various social projects such as: "*The construction of homes for children with disabilities*", "*Planting the platform in Mioveni*" (Dacia Groupe Renault), and "*Provita project*" (UPC Romania).

For the period considered, over half of companies say their budget analysis in each of the first four years; the presented situation for the year 2010 is not necessarily relevant, because many companies have not yet declared their expenditure on various social

actions, which is presented only in a provisional.

Chart no. 3 Transparency and lack of transparency in budget declaration CSR in Romania

Source: processing by data from sites:
<http://www.responsabilitatesociala.ro>

Among companies that declare their budget, we noted that some allocated budget for CSR campaigns of several thousand Euros and several million others. A ranking of the companies analyzed (Top 5) depending on the budgets for the period studied can be seen in the table below.

Table no. 1 Most socially responsible companies in the period 2006-2010

The first five companies in 2006		
No.	Company	Budget (Euro)
1.	OMV Petrom	2.600.000
2.	BCR	2.000.000
3.	Vodafone România	1.600.000
4.	BRD-GSG	1.300.000
5.	Transgaz	890.000
Total amount invested		8.390.000
The first five companies in 2007		
1.	OMV Petrom	2.623.436
2.	BCR	2.000.000
3.	Vodafone România	1.992.654
4.	Coca-Cola HBC	1.000.000
5.	Transgaz	932.000
Total amount invested		8.548.090
The first five companies in 2008		
1.	OMV Petrom	2.700.000
2.	Vodafone România	2.500.000
3.	BCR	2.000.000
4.	Coca-Cola HBC	1.000.000
5.	Transgaz	964.000

Total amount invested		9.164.000
The first five companies in 2009		
1.	OMV Petrom	4.000.000
2.	Vodafone România	3.800.000
3.	BCR	2.000.000
4.	Banca Transilvania	1.280.000
5.	Raiffeisen	1.209.000
Total amount invested		12.289.000
The first five companies in 2010 (provisionally)		
1.	Transgaz	2.000.000
2.	UniCredit Tiriac Bank	800.000
3.	Tuborg România	780.000
4.	A&D Pharma	470.000
5.	Carpatcement	300.000
Total amount invested		4.350.000

Source: processing by data from sites:
<http://www.responsabilitatesociala.ro>;
<http://www.forumuldonatorilor.ro/proiecte>

From the table above we can see that the total amount allocated to social campaigns registered an upward trend during 2006-2009, despite the financial crisis that characterized the second half of the range considered. 2010 is presented only in a provisional manner, because many companies have not yet said the budget for this financial year.

5. Instead of conclusions ... limitations of the study on CSR in Romanian

Companies (multi)national, including social elements in their business strategy can help increase the welfare of society as a whole and at the same time, can gain in terms of corporate image, which will undoubtedly increase the financial performance their theory of the circle as "virtuous". However, in Romania often confuse CSR with philanthropy, corporate involvement is based in particular on occasional donations and sponsorships, without a strategic dimension, in line with corporate long-term objectives. Then, some areas are neglected, as can be seen from the study undertaken, namely: *human rights, cultural projects, medical and scientific research, drug use* etc. Thus, CSR should be considered in Romania to turn its attention especially on environmental issues,

the programs dedicated employees and the implementation of quality standards and less on charity.

Another problem we face when we want a more comprehensive analysis of the situation of CSR in Romania is the lack of transparency regarding the information provided. In this regard, the main limitations of the study undertaken can be summarized as:

- Lack of transparency of all relevant information to analyze the current situation of CSR in Romania;
- Difficulty in verifying the accuracy of information provided by the companies studied;
- Not publication or partial publication of budgets for social actions;
- Not publication budgets by type of social actions;
- Many companies, especially, national make no statement on the CSR issue that hampers the analysis and comparability of national.

In addition, the event analyzed the financial crisis distort the relationship between social performance-financial performance, as manifested in a higher level of corporate and then can not be tested in a relevant way relationship: social performance-financial performance.

Beyond these shortcomings, we find, however, that in Romania CSR is perceived more as a tool to promote company image and not as a long term commitment to contribute to the development of the modern society. In these circumstances, even if CSR is promoted in Romania, especially by multinational companies, however the main problem is the realization that CSR is not just a tool to promote the company image, but an essential element of long-term success, knowing because a company is sustainable if it is economically efficient, socially responsible and environmentally committed.

Abstract

Without taking into account their nature, risks have consequences for the financial bill which are often very important.

For this reason, the attention given to the problem of protection against risks by the management has grown tremendously.

Risk management consists of all concepts, measures and actions taken by the management entities to identify, capture, monitoring, analysis and management of exposures to risk and uncertainty of their work.

Key words: knowledge, consulting, capital management, market

J.E.L. classification: M 41

1. Introduction

The disclosures focus on the risks arising from financial instruments and on how they were managed. These risks typically include, but are not limited to, credit risk, liquidity risk and market risk.

For each type of risk that comes from financial instruments, an entity shall:

- Exposure to risk and how they occurred;
- Objectives, policies and processes for managing risk and the methods used to assess risk, and
- Any adjustments in the above information from the previous period.

For any type of risk arising from financial instruments, an entity must submit summaries of quantitative data on its exposure to that risk at the reporting date. This presentation should be based on information provided internally to key management personnel of the unit (for

example, the entity's board or executive director).

If the quantitative data presented at the reporting date are not representative of an entity's exposure to risk during the period, an entity will provide additional information to be representative. Derivatives are used to cover the main elements of risk. They are measured at fair value and its changes are recognized in the income statement. There are few cases where derivatives do not qualify for hedge instruments.

2. Risks associated with financial instruments

Derivatives have emerged from the need to protect companies against various risks that characterize business today. Of these posts, due to their implications for financial risks. They reflect the failure of an entity's cash flows in comparison with financial obligations. Shows the degree of financial risk protection amounts of money involved in financial markets in the form of deposits in the banking sector or capital market investment, or of the insurance.

Consequences of occurrence of this type of risk are:

- obtaining resources at high prices;
- the obligation to abandon or delay certain investments provided;
- the obligation to transfer assets at inappropriate times and in bad conditions;
- failure of one or more undertakings, which puts the company in difficult situations affecting their credibility;
- unable to return to a decision to alter a previous strategy.

Cash flow risk, which is that the value of future cash flows associated with a monetary financial instrument will fluctuate.

2.1. Credit risk

An entity shall disclose for each class of financial instruments:

- The value that best represents its maximum exposure to credit risk at the reporting date without taking into account any collateral held or any improvement in credit rating;
- The amount shown under the preceding paragraph, a description of collateral held as insurance or other credit rating improvements;
- Information on credit ratings for financial assets that are neither past due nor impaired, and
- Book value of financial assets that would in any other case, arrears or impaired whose terms have been renegotiated.

Activities that generate maximum exposure to credit risk and credit risk associated include, but are not limited to:

- Loans and receivables to customers and placing deposits with other entities (in this case, the maximum exposure to credit risk is the carrying amount of related financial assets).
- Concluding contracts in derivatives - foreign exchange contracts, interest rate swaps and credit derivatives. If the assessment result is given asset at fair value, the maximum exposure to credit risk at reporting date is equal to book value.
- Providing financial guarantees, the maximum exposure to credit risk is the maximum amount that the entity may be required to pay if the guarantee is executed, a value could be significantly higher than the amount recognized as a liability.
- Completion of a credit commitment is irrevocable over the life of the facility or is revocable only in response to a significant adverse change.

If the issuer can not settle the loan commitment net in cash or another financial instrument, the maximum exposure to credit risk is equal to the full amount of commitment. This is because it is uncertain

whether the amount of any unused payments can be used in the future. This may be significantly greater than the amount recorded as a liability.

2.2. Liquidity risk

An entity shall disclose:

- Maturity analysis for financial liabilities showing the remaining contractual maturities, and
- A description of how it manages the liquidity risk inherent in the foregoing.

In preparing the contractual maturity analysis for financial liabilities, an entity uses its professional reasoning to determine an appropriate number of intervals, so that an entity can be established that are appropriate for the following intervals:

- Intervals of less than one month;
- Intervals between one month and three months;
- Every three months to one year, and
- Ranges from one to five years.

When the time of year can choose a partner who pays an amount, the debt is included using the first day that the entity may be required to pay. For example, financial liabilities such an entity may be required to pay in advance, upon request, are included in the first period.

When an entity is obligated to pay certain sums in installments, each installment is allocated to the first period in which such entity may be required to pay.

For example, an unused loan commitment is included in the period covering the first day on which it can be used.

The amounts disclosed in the maturity analysis are the contractual undiscounted cash flows, for example:

- Gross liabilities arising from finance leases - before deduction of financial charges
- Prices specified in forward contracts to acquire financial assets in cash;
- Net amount of interest rate swaps with floating rate payment and fixed rate charged for exchanges that are net cash flows;
- Contractual amounts to be transferred to a derivative which are gross trade flows, and
- Gross loan commitments.

Such undiscounted cash flows differ from the amount included in the balance sheet because the amount is based on discounted cash flows.

Where appropriate, an entity shall analyze separately the derivatives of the derivative financial instruments in the analysis of contractual maturities of financial liabilities.

It would be fair to distinguish between cash flows from derivative financial instruments and derivative financial instruments if the cash flows arising from derivative financial instruments are settled gross.

This is applicable because the gross cash outflow may be accompanied by a corresponding entry.

When the amount that has to be paid has not been fixed, the amount presented is calculated by reference to conditions that existed at the reporting date., namely when the amount payable varies with changes in the index, the amount shown is based on the index at the reporting date.

2.3. Market risk

An entity shall disclose:

- A sensitivity analysis for each type of market risk to which the entity is exposed at the reporting date, showing how profit or loss and equity would have been affected by the changes, reasonably possible after that date, the relevant variable risk;
- Methods and analysis used in drawing up proposals for sensitivity to, and
- Changes compared to previous methods and assumptions used and the reasons for such changes.

If an entity prepares a sensitivity analysis, such as value at risk, that reflects interdependencies between risk variables - interest rates and exchange rates - and uses this analysis to manage financial risks, the entity may use that sensitivity analysis .

The entity also must disclose:

- an explanation of the methodology used in preparing such a sensitivity analysis and key parameters and main assumptions underlying the data provided, and
- an explanation of the objective method used and limits that could arise because

the information is not fully reflect the fair value of assets and liabilities involved.

When the sensitivity analysis are not representative of a risk inherent in a financial instrument, it shall disclose that fact and why it believes the sensitivity analysis are not representative.

Entity should perform sensitivity analysis for each type of risk to which it is, so it should compile information to be presented in the overall picture without combining information with different characteristics about exposures to risks of economic environments that are very different. For example:

- An entity that sells financial instruments could present this information separately for financial instruments held for trading to those who are not held for trading.
- An entity would not aggregate its exposure to market risks from areas of hyperinflation with its exposure to the same market risks from areas with very low inflation.

If an entity is exposed to only one type of market risk and only in an economic environment will not disclose disaggregated.

Sensitivity analysis must show the likely effect of changes in the relevant risk variable (eg main market interest rates, exchange rates, equity prices or commodity prices) on the profit or loss and equity.

To this end:

- entities are not required to determine the profit or loss, if the risk variables were different it would have been relevant. Instead of this, entities have the effect on profit or loss and equity on the balance sheet date assuming that a change was likely relevant risk variable at the balance sheet and that it had been applied to the exposures that existed at that time. If an entity has a variable rate debt at the end, the entity would have the effect on profit or loss - ie interest costs - for the current year if interest rates have varied amounts likely.
- entities are not required to disclose the effect on the profit or loss and equity if any change is likely within a range of relevant risk variable changes. Introducing the effects of changes in extremes of range would probably be sufficient.

When determining a modification is likely relevant risk variable, an entity should consider:

- economic environments in which they operate. A change would be likely to include "the worst expectations" or "strength tests. Moreover, if changes in the underlying variable rate risk is stable, the entity must not change the probable change in risk variable.
- the time the assessment is made. Sensitivity analysis will show the effects of changes that are very likely in the period which lasts until the new entity will present this information, a period which is usually the next annual reporting period.

2.4. Interest rate risk

Interest rate risk arises from interest bearing financial instruments recognized on the balance sheet (eg loans, debts and debt instruments issued) and certain financial instruments are recognized not.

2.5. Currency risk

Exchange rate risk or exchange rate risk arises from financial instruments that are denominated in foreign currency, ie in a currency other than functional currency are measured. In the context of IFRS 7, no currency risk arises from financial instruments that are elements of the monetary or financial instruments denominated in the functional currency.

2.6. Other price risks

Other price risks arising from financial instruments due to changes in commodity prices or equity prices. An entity could have the effect of a fall in a specified stock index, commodity prices and other risk variables. If an entity gives residual value guarantees, warranties, which are financial instruments, the entity shows an increase or decrease in value of assets to which the guarantee.

There are two cases of financial instruments which may give rise to equity price risk:

- if they have equity in another entity and
- where investments are made in a fund, which in turn holds investments in equity instruments.

These cases include forward contracts and options to buy or sell specified quantities of an equity instrument and swaps that are indexed to equity prices. The fair values of such financial instruments are affected by changes in market prices of equity instruments based.

Financial instruments that an entity has classified as equity instruments are not revalued. No profit or loss nor equity will not be affected by equity price risk of those instruments. Therefore, there is no analysis of the sensitivity required.

3. Conclusions

An entity will provide information through which the users of financial situations can evaluate the nature and size of the risks that came from financial instruments and where the entity is exposed at the reporting date. In addition, disclosures may be provided either in the financial statements or incorporated in the financial statements by cross-reference to other situations, such as comments on risk management or risk report is available for users of financial statements under the same conditions as financial statements and at the same time.

Without the information incorporated by cross-references, financial statements are incomplete.

The first stage of an effective risk management and risk assessment is to identify sources of risk and related business entity, by careful analysis of the external environment and internal organization.

The next step is the monitoring of risks by implementing appropriate mechanisms. This step must be doubled by the performance assessment of the risk control process carried out by managers at all levels aware of the importance of this activity and appointing staff to ensure its proper deployment.

Accounting Hedge Operations of a Fair Value

Gudan Paulina

“Valahia” University of Targoviste

paulina_gudan@yahoo.com

Oprea Oana-Ruxandra

University of Bucharest

oprea.ruxandra@ymail.com

Abstract

Accounting hedge operations of a fair value against risks aims to protect the assets, liabilities, unrecognized firm commitments or part of the risk against the amendment because the fair value of interest rate fluctuations, exchange rates or prices of goods.

Key words: financial instruments, risks, financial performance knowledge, capital management

J.E.L. classification: M 41

Users of financial statements need information about an entity's exposure to risks and how those risks and managed. Such information can influence a user's assessment of the financial position and financial performance of an entity or the amount, timing, and uncertainty of its future cash flows. Greater transparency regarding those risks allows users to make more informed judgments about risk and return. Entities should describe the nature and extent of risks arising from financial instruments.

The International Accountability Standards referring to the financial assets and debts have been drafted out of the desire to reflect in accountability some of the most spectacular evolutions that have taken place on the global financial markets during the last decades.

By the agency of these norms, the accountability practice has been brought up to day in order to reflect undeniable economic and financial realities, like the very frequent use of the products of the financial market with the goal to obtain the necessary resources to develop the activity, make

investments or protect the business against the different risks of a financial nature.

In the perspective of a necessary and expected development of the Romanian capital market the Romanian companies will appeal more and more to the financial instruments.

As a consequence, their accountancy and presentation and the description of the information concerning the individual or consolidated accounts and the analysis of the impact of using it on the performances and financial position of the entities become very actual subjects for the Romanian professional accountants, for whom the aspects described in the paper proposed to be elaborated get more and more utility.

Accounting hedge operations of a fair value against risks aims to protect the assets, liabilities, unrecognized firm commitments or part of the risk against the amendment because the fair value of interest rate fluctuations, exchange rates or prices of goods.

An operation to cover the fair value will be charged as the followings:

- gain or loss resulted from revaluation of hedging instruments at fair value or the value of its currency accounting assessed in accordance with IAS 21 for a tool to hedge against risks nederivat will be recognized immediately in the profit and loss.
- gain or loss related to a covered item that can be attributed to the risk cover will be adjusted at the value of the item covered and will be recognized in the profit and loss.

This principle applies if an item is covered in other conditions evaluated at cost. Recognition in profit and loss of earnings or loss attributable to the risk covered is

covered if the item is available for sale financial asset.

For a fair value hedge of the exposure of a portion of a portfolio of financial assets or financial liabilities at the risk of interest rate, method of counting presented above can be achieved by presenting earnings or losses that may be presented to the covered item risk:

- in a single element - the active line, for those periods in which the revaluation of the item covered against risk is an asset, either
- in a single element - separate line in debt, for those periods in which the revaluation of the item covered against risk is a duty

Separate line-items referred to in previous paragraphs will be presented along with financial assets or financial liabilities. Values included in these elements - line will be removed from the balance sheet when the assets or liabilities that are related are derecognized.

Only if certain risks that can be attributed to an item covered against risks are covered against risk, recognized changes in the fair value of assets covered against risks that are not related to the risk is already covered in the profit and loss when the entity entitled to receive payment is established.

An entity will discontinue hedge accounting prospectively specified above if:

- hedge against the risk expires or is sold, completed or exercised;
- coverage no longer meets the criteria to use hedge accounting or
- revoke the appointment by the entity.

When an unrecognized firm commitment is designated as a covered against risk, the amendment in the aggregate fair value of the firm commitment that is attributable to the risk covered is recognized as active duty or in the corresponding gain or loss recognized in the profit and loss. Changes in the fair value of hedging instruments against the risk are also recognized in the profit and loss.

If an entity enters into a firm commitment to acquire an asset or to assume a debt that is a covered against risk in a fair value hedging against risks, the initial value of the asset or debt arising from that entity and a firm commitment is honored adjusted to include changing the aggregate fair value of the firm commitment that is attributable to the

covered risk was recognized in the balance sheet.

In category low coverage operations included those hedging links through which it aims to cover the risks of individual items.

Covering against the interest rate risk is performed for items such as:

- loans and receivables generated by the entity or assets available for sale, bearing fixed rates;
- debt bearing fixed rates and are not held for trading.

Some examples of relationships of the fair value of hedging against such risk are presented in Table 1.1.

Table 1.1. Covering against the interest rate risk

The covered element	The covering instrument	The covered risk
Decreased rate	Interest rate swap that pays a floating rate and receives a fixed.	Variability of the value of a fixed-rate debt.
Growth rate	Interest rate swap that pays a fixed rate and receives a floating.	Variability asset value of a fixed rate.
Decreased rate	Buying a futures contract or a forward contract to purchase, with the active support of a fixed-rate debt.	Variability of the value of a fixed-rate debt.
Growth rate	Selling a futures contract or a forward contract of sale, with the support activ a debt with a fixed rate.	Variability asset value of a fixed rate.
Growth rate	Buying a "cap".	Change the value of a fixed-rate assets resulting from fluctuations in interest rates over the limit set in the "head".
Decreased rate	Buying a "floor".	Change the value of a fixed-rate debt resulting from interest rate fluctuations under the level set to "floor".

Source: KPMG, IAS – *Financial Instruments Accounting*, KPMG International, September 2000, p. 128.

Suppose that a company bonds on 01.01.2006 with maturity over 3 years, at nominal value of 50000 USD, with an interest rate of 7%, payable annually. The company would prefer to pay a variable rate. To do this, it contracts an interest-rate swaps with notional value of 50000 USD , which pays LIBOR and receives a fixed rate of 7%.

Evolution of the LIBOR contract period is as follows: 7% in the first year, 5% in the second year and 9% last year. Derivative coincides with the maturity of the loan bond. Initial fair value of swap is zero, which is why contract not generate any accounting entries.

Management entity to designate a relationship derived from a fair value hedge against interest rate risk. Operation is considered very effective. Issuance of bonds is recorded as following:

Accounts at banks from issuing loans=Bond 50000 \$

Net flows of Treasury related derivatives during the three periods are calculated in Table 1.2.

Table 1.2.

Year	Variable interest rate LIBOR	Fixed interest rate	Cash flows estimated at exit	Cash flows estimated in entering	Net flows of Treasury
1	7%	7%	(3.500)	3.500	0
2	5%	7%	(2.500)	3.500	1000
3	9%	7%	(4.500)	3.500	(1000)

In year 1, determine the fair value of swap by updating the estimated net flows of Treasury year 2 using LIBOR (5%).

$$1000 / (1 + 0.05) + 1000 / (1 + 0.05) (1 + 0.05) = 1859 \text{ USD}$$

Therefore, change the fair value of derivatives has not been a gain of U.S. \$ 1859.

Swap (financial debt) =Unachieved gain from covering operations 1859 \$

Change fair value of debt, calculated by updating the flow coming in the form of a loss recorded in the results (50000 USD - 51859 USD).

$$3500 / (1 + 0.05) + 53500 / (1 + 0.05) (1 + 0.05) = 51859 \text{ USD}$$

3500 where the flow is the annual interest due, and the 53500 USD and is considering the loan repayment period to end.

Article accounting is appropriate:

Unrealized loss of loans=Operations cover the issue of bonds 1859\$

Interest paid in the first financial year for bonds issued are as follows:

Interest expenses=Bank accounts 3500 \$

The following year, the entity recorded a net settlement of swap in which the receiving 1000 USD, which they distributed among the related interest income from financial debt

previously recognized (1859 USD x 5%) and the claim itself. Registration will be related accounts:

Accounts at banks=% 1000 \$
Income 93 \$
Swap (financial debt) 907 \$

Also, the flows were estimated at -1000 USD for three of the century through the interest rate of 9% [$1,000 / (1 + 0.09) = (917)$] is an conversion of swap of debt financial debt and a loss of unrealized fair value changes. Article accounting is appropriate:

Unrealized loss of = % 1869 \$
Swap operations coverage (financial debt) 917 \$

Swap (financial debt) 952 \$

Interest expense recorded by the entity issuing the bonds is U.S. \$ 51859 x 5% = 2593 USD. Therefore, payment cash flows of U.S. \$ 3500 generates the following accounting:

% = Accounts at banks 3500 \$
Interest expense 2593 \$
Loans with issued bonds 907 \$

Present value of debt in the second year is $53500 / (1 + 0.09) = 49083$. It is noted that the debt is reduced from 51859 to 49083, which generates a gain unfulfilled.

Loans from the issue=Bond operations coverage of unfulfilled gain 1859 \$

In the last year of the contract, the entity record swap settlement and payment of 1000 USD expense to distribute the interest on financial debt represented swap ($917 \times 9\%$) and debt balance.

% = Accounts at banks 1000 \$
Interest expenses 83 \$
Swap (financial debt) 917 \$

Interest expense on the debt this year is $49083 \text{ USD} \times 9\% = 4417 \text{ USD}$. Accounting for relevant are:

Interest expense = % 4417 \$
Accounts at banks 3500 \$
Loans of programs bond 917 \$

At the end of the debt is repaid.

Borrowing programs = Accounts at banks 50000 \$

In all three periods of the relationship of coverage, efficiency is 100%, any change to the fair value of the loan is perfectly offset by the hedging derivative instrument. For this reason, changes in market interest rate do not affect any duty not its results.

Hedge accounting recognizes the offsetting effects on the symmetric profit or net loss for the fair value changes of hedging instrument and related events that are covered.

When a company booked a financial instrument as an instrument for hedging risks associated with anticipated future transactions, then the company will present the:

- description of anticipated transactions, including the time period until the emergence of risk is assessed;
- description of the instruments for hedging risks;
- value of any gains or losses deferred or unrecognized and when the expected recognition as income or expense.

An enterprise should present all gains or losses occurred in the financial risk to cover anticipated future transactions, whether those gains or losses have occurred or not in the financial statements.

Conclusions

An entity will provide information through which the users of financial situations can evaluate the nature and size of the risks that came from financial instruments and where the entity is exposed at the reporting date. In addition, disclosures may be provided either in the financial statements or incorporated in the financial statements by cross-reference to other situations, such as comments on risk management or risk report is available for users of financial statements under the same conditions as financial statements and at the same time. Without the information incorporated by cross-references, financial statements are incomplete.

The Dashboard and Performance Improvement of the Company

Guni Claudia Nicoleta

“Spiru Haret” University, Faculty of Financial and Accounting Management
borsanclaudia@yahoo.com

Abstract

The dashboard is a way of framing, selecting, arranging and presenting of the indicators that allow for an overview of the general trends in the evolution kept under scrutiny. Depending on the objectives that it sets and monitors, an enterprise can build its own representation of the required dashboards.

The performances for each activity are assessed by means of indicators whose levels and trends will be compared with the previous objectives, rules or results. At each of these levels, the activity can be retained as representative.

Key words: efficiency, frequency, balance indicators, indicators of anticipation.

J.E.L. classification: G3; G32; G34

1. Introduction

The enterprise as a complex, adaptive system, with a specific purpose and open towards the environment, can be considered as a set of subsystems. In terms of management, the enterprise includes the leading subsystem, the led subsystem and the informational subsystem, which guarantees the relationship between the former two.

The purpose of the enterprise system which includes meeting the objectives set by strategy requires a system of performance analysis within the decision-making system. Building such a performance analysis system mainly requires solving the following problems:

- Establishing the organizational subdivisions required to receive information regarding the achieved performance;
- Specifying how the decision centers of the means of disclosure concerning the activities conducted;

- Coordination of organizational subdivisions which receive information concerning the performance achieved in the operational subsystem.

2. Performance improvement of the company

The dashboard consists of a set of indicators presented in a synthetic manner and with a correlated periodicity, which should allow the responsible person to react quickly, should any problem arise.

The metaphorical use of this term, which originated in the automotive and aviation fields, properly translates the range of business management responsibilities. It is important to understand that such an instrument is not effective unless it provides information "in due time."

The dashboard has the following four important functions:

- the function of informing the manager regarding the state of the managed field;
- the function of warning regarding certain unfavorable situation or certain deviations from the norm;
- the function of assessing the obtained results as far as objective achievement is concerned and, implicitly, of the quality of the decisions and of the actions taken in order to implement said decisions;
- the decisional function, meaning that the pertinent information, sent to the managers in various hierarchic positions, allow founding and making the adequate decisions.

Regardless of the version it chooses to manifest itself - the restricted dashboard, with a relatively low level of information, or the complex dashboard, destined for broader information, with reference to all aspects of the queried activities, it must simultaneously be:

- consistent, i.e. to comprise relevant, synthetic and exact information regarding the managed fields;
- rigorous, i.e. to comprise rigorous information, based upon the real emphasis on economic phenomena and real-time transmission of the information needed to get it completed;
- synthetic, i.e. to comprise information with different degrees of aggregation, according to the hierarchy of the beneficiary of these pieces of information;
- accessible, i.e. to facilitate the understanding and operative and complete use of the information, clearly and explicitly presented;
- balanced, i.e. to emphasize the information regarding the economic, social, managerial etc. phenomena and processes, in proportions able of reflecting their importance in the scrutinized field;
- expressive, i.e. to use adequate visualizing forms (value tables, graphics etc.);
- adaptable, i.e. the dashboard can be modified according to the modifications brought to the enterprise's activities or management;
- economic, situation given by the superiority of the effects comparable to the efforts reclaimed by completing, transmitting and using it.

Regardless of the type of dashboard chosen, the important element is its content. According to experts, a dashboard includes information regarding the results obtained in the operational area, as evidenced by means of:

- the value tables, which have inserted the expected level of the objectives, the level of the results obtained in the period to which they relate, the spread, the achievement index for the objective and the causes which led to positive or negative deviations. The most important part of the values table is the indicator.

First, the indicator is a numeric expression of the quantitative aspect of economic phenomena and processes, in concrete circumstances of time and place.

A second problem concerns the system of indicators to be chosen to define as accurately and relevantly as possible the

objectives, results and - wherever necessary - the mission of the company or its components that the dashboard is based upon. In this area there are several constructive variants of the system of indicators, but we cannot talk about a recipe for any type of company.

Although we cannot highlight a coherent, representative system of indicators, enterprises use several types:

- quantitative and volume indicators: 1) of efforts, for example, production costs, fixed capital, number of employees, 2) of effects, such as profit, turnover, production of manufactured goods, physical production, etc.
- qualitative or efficiency indicators: work productivity, average wages, rates of return, liquidity and solvency, cash rate, rotation speed of current assets, etc.
- the graphs, with the help of which it is best to illustrate the trend of indicators or indices in a given time interval;
- the mixt forms, value tables - graphs.

The basic principles of designing the dashboard are:

- Consistency is monitored in two ways:
- Consistency of the dashboard with the enterprise chart;
- Transverse consistency.

The information provided by the dashboard must respect the hierarchical line of business. The dashboard is not identical for all components of the hierarchical chain. To allow an aggregation to a higher level, the dashboards of compartments with identical functions in the same hierarchical level must have the following elements in common: the same performance indicators, the same definition of indicators, the same data source.

- Relevance, i.e. the dashboard should contain essential information that adequately highlight the center objectives achievement. The indicators chosen should be focused on key points of the centers' performance. From the dashboard we must retain few indicators, but those indicators are essential. Synthesized information is adapted to the hierarchical level. There is no dashboard pattern, each responsible person needs to define their own information in a new manner.

- Frequency refers both to the deadline for achieving the dashboard, and to the rapidity of their distribution. The later the results are obtained, the later can one take action. Frequency of the dashboard depends on the life cycle of the decision and action of the monitored center. As we descend the hierarchy, the frequency of the dashboard is lower. Thus, at the base level, we can design daily or weekly dashboards.
 - Efficiency refers to the ability of the dashboard to lead to action and to implement corrective actions. To this respect, after completing the dashboard we must proceed to the analysis of deviations, the interpretation of deviations, the formulation of corrective actions and the implementation of said actions.
 - Standards, covering the objectives, previous results and assumptions. Based on these standards we calculate and interpret the results.
- Dashboard design is a preliminary stage, but fundamental to the success of using the dashboard as a management tool. The main issues regarding the design concern:
- Establishing the management organizational chart- the management organizational chart is a formalized representation of the responsibilities exercised effectively and of the communication between different hierarchical levels and sectors of the enterprise. The dashboard must adapt itself to the existing organization. On the other hand, it plays the role of revealing the failures of the enterprise.
 - Establishing the department or team of specialists responsible for (a) designing and ensuring the logistics required for the dashboard. Usually, given the special management importance it has in founding and taking decisions based on quality information, we recommend that the management organizing department be made accountable, and within it a group of management tools and management methods and methodologies. Should such a section not be available, a person in any other economic department or even one of advisers of the general manager may be appointed in this function.
 - Setting the company's objective and its components, as well as the objectives relating to the design, completion, transfer and use of the dashboard. The company objectives are highlighted by quantitative and / or qualitative indicators that express a systemic approach, the purpose for which the enterprise and its procedural and structural components were established and operated. The purpose of determining the key points of the decision is the choice of missions and of the main objectives.
 - Design of an attributions, competencies and specific responsibilities schedule which would allow to achieve the objectives.
 - The in detail specification of the attributions, competencies and responsibilities of each functional and operational department involved in providing information, making up models, transmission of information or models and use of information specific to the dashboard. Basically, for a complex dashboard, all departments are involved in one form or another in carrying out the main steps required for its use.
 - Determining the information needs of the information "beneficiaries" found at different hierarchical instances. The starting point is, naturally, the elements defining the position - individual goals, tasks, competencies and responsibilities. Achieving objectives and performing tasks requires a certain amount of information with a certain structure to be precisely established in advance in order to ensure a complete, accurate and timely information. It is the most difficult and at the same time, the most complex phase of the stage of design of the dashboard, since the accuracy of information requirements depends mainly on the typology and contents of specific models.
 - Specifying the indicators and other methods of measuring the objectives and achievements - the choice of indicators allows awareness of the responsible persons and orienting action in the short term by controlling key points. For this purpose we analyse the indicators that seem best adapted to assess key points. The indicators used should provide a coherent system that represents the entire

business operation of the company. As the informational needs of managers situated on the vertical of the management system are different, the indicators of objectives commensuration and of the expected achievements are also different. The indicators must satisfy multiple requirements.

First, they must be capable to report an abnormal condition in the managed field - warning indicators.

Secondly, to highlight the normal state, the direction in which the managed system evolves - balance indicators.

Thirdly, the indicators used to predict and anticipate some changes and their operationalization decisions - anticipation indicators.

In addition to the indicators, an important role is played by indices, i.e. the relative sizes of the relations between the two indicators, quantitative or qualitative, in the current period and in one reference timeframe. It better highlights the tendencies manifested in a given timeframe.

- Collecting information – guarantees that there is data at the due terms and the desired frequency, calculates the indicators and measures the importance of actions to be taken. Based on the retained indicators, determine those for which there is information already available in the enterprise. For the indicators for which there is no source immediately usable, the existing data is studied and converted to the form required by the indicator.
- Adequate writing of the dashboard information use- involve the presentation of indicators in the form and on the deadlines decided upon, in order to allow for rapid and effective action. For this the final form must be established, as well as the operating rules of the dashboard.

3. Conclusions

In preparing and using the dashboard the priority is often placed on information quantity and precision, when in fact the focus should be on efficiency, that is the relevant information and action.

The finality of the dashboard is not establishing a document that shows the reached level for each defined indicator. The purpose of management control is reaching the goals and not setting the goals or analyzing the deviations. The finality of the dashboard is reaching the defined objectives, therefore it must be clearly directed towards action.

Abstract

With the passing of time and as a result of progress in information technology, trading mechanisms of derivate financial instruments have evolved from the “open outcry auction” system to “electronic trading”. Currently, almost all stock markets in the world use performant electronic platforms, the trading floors thus becoming a part of the modern history of stock markets.

The stock markets trade derivate financial instruments having a standard in terms of feature elements, called “contract specifications”. Participants which are authorized for the stock market are the intermediaries who have the right to conclude transactions on their own behalf or on behalf of clients such as institutional investors (commercial banks, mutual funds or pension funds, insurance companies, corporations) or retail investors (individuals).

Key words: net investment, fair value, embedded derivative product, hedging operations.

J.E.L. classification: G3; G32; G34

1. Introduction

In recent years, investment opportunities encompass a wide range of financial instruments, from the classic bank deposits, shares, bonds to more sophisticated instruments such as futures, options, swaps. Consequently, it is necessary to analyze the risk-return of the financial instruments, which helps an investor make a rational investment decision. In this chapter we consider the risk and cost of a financial asset, the asset allocation decision and the optimal risk-return relationship of a portfolio of financial instruments.

The decision to invest of an investor is directly influenced by the profitability of the financial instruments. This profitability may be judged from a point of view of past (historical) performance of the title and / or from that of the expected performance (anticipated for the future).

2. Risk of the financial instruments

Risks are defined as losses associated with adverse developments in the results. Risk management is nothing but the complex of the tools, techniques and devices necessary for the bank organization to succeed. Although aimed at a future time horizon as far as the functioning of banks are concerned, bank risks can be managed, this being the novelty of risk management approaches.

The importance of risk management as a business lies in being able to predict, to a certain degree, the occurrence of the risk event and to take timely decisions to reduce the risk of possible adverse consequences. The essence of risk, which can be expressed by the possibility of a quantitative evaluation of the probabilities of occurrence of adverse situations, conditions the need for methods and mechanisms to mitigate the negative effect of the anticipated events. Knowing the potential danger and the risk impact level allows for a more effective management of said elements.

A hedged item is an asset, liability, firm commitment or transaction that is expected in the future which:

- exposes the enterprise to the risk of a change in the fair value or in the future cash flows;
- in terms of hedging accounting is designated as being hedged.

A hedging instrument, in accounting terms, is a designated derivative or another financial asset or financial liability whose fair value or cash flows are expected to compensate changes in fair value or cash

flows of a designated element defined as a hedged element. However, according to IAS 39 Financial Instruments, recognition and measurement of a financial asset or of a non-derivate financial liability may be designated as a hedging instrument for hedge accounting only if they hedge the risk of exchange rate changes.

Hedging efficiency is the extent to which fair value compensation or cash flows attributable to a hedged risk are achieved by the hedging instrument.

A hedged item can be a recognized asset or liability, an unrecognized firm commitment, highly probable forecasted future transaction or net investment in a foreign operation. The hedged element can be:

- a single asset, liability, firm commitment, highly probable forecast transaction or net investment in foreign operations;
- a group of assets, liabilities, firm commitments or highly probable forecast transaction or net investment in foreign operations with similar risk characteristics;
- the cover portfolio against interest rate risk only, a portion of the portfolio of financial assets or financial liabilities that share the risk that was hedged.

A firm commitment to purchase in a business combination can not be a hedged item, except for the exchange risk, as the other risks meant to be hedged can not be identified or measured reliably. These other risks are general business risks.

Unlike loans and receivables, an investment held-to-maturity can not be a hedged item in terms of interest rate risk or advance payment risk because designation of an investment as being held to maturity requires the intention to maintain investment until the due date regardless of changes in fair value or cash flows of such investments attributable to changes in interest rates. However, an investment held to maturity may be seen as a hedged item in terms of risks and fluctuations in exchange rates credit risk.

An investment accounted for under the equity method can not be a hedged item in a fair value hedge against risks as the equity method recognizes in either profit or loss the investor's part of the profit or loss of the

associated entity rather than changes in fair value investment.

For a similar reason, an investment in a consolidated subsidiary can not be a hedged item because consolidation recognizes in either profit or loss the profit or loss of the subsidiary rather than changes in fair value of the investment. A hedge of a net investment in a foreign operation is different because it is a hedging of an exposure to currency risk, not a hedging of the fair value against changes in the value of investment risks.

In the context of hedge accounting, only assets, liabilities, firm commitments or highly probable forecast transactions that involve a party outside the entity can be designated as a hedged item. Therefore, hedge accounting can be applied to transactions between entities or segments in the same group only in the financial or individual statements of those entities or of their segments, and not the group's consolidated financial statements.

As an exception, foreign exchange risk for a financial item within the group - for example, a claim or an amount due for payment between two subsidiaries - may qualify as a hedged item in the consolidated financial statements if it results in exposure to losses or gains from exchange rate differences that are not fully eliminated upon consolidation under IAS 21 "Effects of Changes in Foreign Exchange Rates". Under IAS 21, gains and losses from exchange rate intra-group monetary items are not fully eliminated upon consolidation when the intra-group monetary item is transacted between two group entities that have different functional currencies.

Also, the currency risk of an intra-group transaction that has a great likelihood of occurring may qualify as a hedged item in consolidated financial statements, provided that the transaction is denominated in currencies other than the functional currency of the entity that initiates the transaction and the currency risk will affect consolidated profit and loss account.

All of the above state that in consolidated financial statements the currency risk in a intra-group transaction that is very likely to occur may qualify as an item hedged against cash flow risks, provided that the transaction is denominated in another currency than the functional currency of the entity that initiates the transaction and the currency risk will

affect the consolidated profit and loss account. For this purpose, an entity may be a parent, a subsidiary, an associate, a joint venture or a branch.
