Asserting Intellectual Property Rights

Anechitoae Constantin

alina_buzarna84@yahoo.com

Abstract

Intellectual property law has received a final and official dedication along with the conclusion of the Convention which led to the establishment of the World Intellectual Property Organization (WIPO) signed on 14th July 1967, in Stockholm [1].

According to WIPO, Intellectual Property covers four main areas:

a) Copyrights for literary and artistic works;

b) Rights related to copyright – there are protected (as related rights): the performances or interpretations of artists – performers or interpreters –, producers' sound recordings or phonograms, radio and television broadcasts;

c) Industrial Property Rights;

d) Other intellectual property rights not included in the previous categories.

Key words: WIPO, breeder, patent, industrial property,

J.E.L. classification: K11

1. Introduction

Intellectual property law has received a final and official dedication along with the conclusion of the Convention which led to the establishment of the World Intellectual Property Organization (WIPO) [1], signed on July 14, 1967 in Stockholm.

Professor Ioan Macovei, in his work *Tratat de drept al proprietății intelectuale* ("Treatise of intellectual property law"), from the very beginning, in his the "Foreword", argues that, within the strategy of economic, social and cultural development, the intellectual property is an essential part, ensuring the protection of human intelligence

works and guaranteeing the capitalization of the free-market [2].

At the international level, Romania is a founding member of the World Intellectual Property Organization and of the World Trade Organization.

Generally, intellectual property includes all legal rights arising from intellectual activities in the literary or artistic, scientific and industrial fields [3]. In a more technical sense, intellectual property is also defined as a domain (a subset in a mathematical sense of the legal concept of ownership), under a patrimonial aspect, which refers to the property resulting from a work of intellectual creation process of any kind: literature, science, didactics, method, fine arts etc. [4].

2. Intellectual property law

Intellectual property is inextricably linked to the legal concept of law because it involves both moral, as well as patrimonial attributes [5].

There is, thus, a system of interference of unwritten moral issues with the legal ones which have a sovereign nature (belonging to any law in force at a time) and which are contained in a system of legal acts constituting the intellectual property law.

Professor Constantin Turcanu states that intellectual property is an intangible property, stemming from human intelligence and creativity, so it requires adequate protection, specific and specialized for this type of property [6]. Intellectual property protection is provided for the inventions in all fields of human activity: economic, industrial, agricultural; transportation, construction, tourism, services, commerce, administration; scientific, literary, artistic, audio-visual and media [7].

Professor Viorel Roş says that the discipline of "intellectual property law" studies the protection of the intellectual creation of the authors of works of the mind and the results of these creative activities in various forms, but also the protection of the most important distinguishing signs of trading activities [8].

In another sense, the "Intellectual property law" refers to all the rights related to the protection of the intellectual creation of the authors of spiritual works and of the results of creation activities in their most varied forms, and the protection of the most important distinguishing signs of trade activities [9].

3. The protection of the right to intellectual creation

The idea of protecting these rights was unanimously endorsed by almost all countries, for reasons related both to the interests of authors and to the policy of each State. Thus, we may clearly draw two main reasons:

a) The assertion of legality, of the moral and economic rights of creators on their creations and the rights of the public to have unrestricted access to these works, on a voluntary basis;

b) The promotion of creativity by adapting legislation in order to encourage a fair trade through the application and use of these rights, with direct effects on the development of economy and society.

4. The recognition of intellectual property rights

Intellectual property rights are property rights as all the other rights defined by the civil law - they allow the creator or owner of a patent, of a trademark or of work protected by a copyright to benefit from his/her work or investment[10].

These rights are outlined in Article 27, paragraph 2, of the Universal Declaration of Human Rights which states that "Everyone has the right to the protection of the moral and material interests resulting from any scientific, literary or artistic production of which he is the author". This dimension of intellectual property rights protection finds a new larger and more complex approach in

article 15, paragraph (1) of the *International Covenant on Economic, Social and Cultural Rights*, by means of which the States Parties undertake to recognize that every person has the right to:

a) take part in the cultural life;

b) benefit from the scientific progress and its applications;

c) benefit from the protection of moral and material interests from any scientific, literary or artistic production of which he/she is the author.

For this right, the States Parties to the Covenant undertake also to ensure the full exercise of those rights and to adopt the appropriate measures in order to ensure the maintenance, development and diffusion of science and culture (paragraph 2) and to respect the freedom indispensable to scientific research and creative activities (paragraph 3).

5. Conclusions

The importance of intellectual property was first recognized by *the Paris Convention for the Protection of Industrial Property* of March 20, 1883, published in the Official Gazette no. 77/1998 and *the Berne Convention for the Protection of Literary and Artistic Works* of September 9, 1886. Both treaties are administered by the World Intellectual Property Organization (WIPO).

According to article 3, paragraph (1), section 1 of Law no. 344 of 29.11.2005 on the measures to enforce intellectual property rights in customs formalities clearance, intellectual property rights include: copyright, related rights, the right on protected product or service marks, the right on industrial drawings and designs, the right on geographical indications, the right on patents, the right on supplementary protection certificates, the right on plant breeds.

Practical Difficulties Generated by Cargo Description in Contracts for International Sale of Goods and Bills of Lading

Bătrîna Ghiorghe

Constanta Maritime University, Faculty of Navigation and Maritime Transport
gbatrinca@imc.ro

Abstract

It is estimated that over 80 percent of the goods sold on international market are carried by sea [1] and many times a bill of lading is required for cashing the letter of credit. The parties to the sale contract require that cargo is described as clear as possible and a certificate of quality is very often required, while the shipowner will many times insist that the cargo is described as generic as possible in the Bill of Lading, and no references to cargo quality are accepted.

This paper will explain the reasons behind such a strict requirement from the shipowners point of view and based on recent legal case will provide practical solutions for overcoming the potential disputes arising between shippers, charterers and shipowners.

Key words: bill of lading, cargo condition, cargo quality, UCP 600, letter of credit

J.E.L. classification: K33, L91, G10

1. Introduction

According to art. 35 (1) of the United Nations Convention on Contracts for the International Sale of Goods the seller must deliver goods which are of the quantity, quality and description required by the contract and which are contained or packaged in the manner required by the contract”.

The parties to a contract for the international sale of goods will prefer a complete and very clear description of the goods in order to avoid possible claims that may appear at a latter stage. They will also include very clear clauses related to quantity and quality issues, including required certificates. If the payment is done using a documentary credit method the parties to the contract will obviously discover that in

accordance with UCP 600 the description in the Letter of Credit should be brief and should not include excessive detail. An acceptable description would be "Hardware items as per buyer's purchase order no. 2334." An unacceptable description would be a listing of all the various items covered in the purchase order. Excessive detail does not add to the protection of the applicant, and could detract from the beneficiary(ies) ability to collect.

The commercial invoice is the only document where the goods description must correspond exactly with that indicated in the Letter of Credit. Even the slightest deviation can be cause for rejection.

Art 15 (1) (a) of The Hamburg Rules requires the carrier to include in the Bill of Lading ” the general nature of the goods” while Art 36 (1) (a) of Rotterdam Rules requires ”description of the goods as appropriate for the transport”. The phrase ”as appropriate for the transport” is intended to give the carrier some flexibility to condense overly long and detailed technical descriptions. [2] Even if computers have made fairly easy the reproduction of detailed technical description the introduction of such particulars overburdens carriers, custom authorities, security authorities and banks.

As we have seen above cargo description may differ between the contract and the letter of credit and it may also differ between the Letter of Credit and the Bill of Lading or other transport document.

According with The Business Dictionary the quality is a measure of excellence or a state of being free from defects, deficiencies, and significant variations, brought about by the strict and consistent adherence to measurable and verifiable standards to achieve uniformity of output that satisfies specific customer or user requirements. ISO 8402-1986 standard defines quality as "the totality of features and characteristics of a

product or service that bears its ability to satisfy stated or implied needs." [3]

The quality of a product has to be differentiated from its condition. Quality is the inherent nature of a product and may or may not be influenced by its condition. Condition is related to the external inspection of the cargo and to the packing [4]. A reasonable external inspection is not necessarily limited to visual inspection, sounds or smell could also reveal information that could be included in the Bill of Lading.

Statements as to quality are unusual in bills of lading [4]. In *Cox v. Bruce* (1886) it was stated that the master has no apparent authority to represent the quality of goods in the bill of lading.

2. Cargo condition under maritime international conventions

When the carrier takes charge of the goods, he must, on demand of the shippers, issue to them a Bill of Lading. The Bill of Lading would normally include statements as to the quantity and description of the goods shipped together with condition of the cargo at the time of receipt. Such representation of facts has three important commercial effects:

1. The buyer or the bank is entitled to reject the documents if the description of the goods in the Bill of Lading do not correspond with their description in the sales invoice;
2. They form the basis of any cargo claim by the receivers if the goods are short delivered or in a damaged condition at discharge;
3. Such statements may seriously affect the negotiability of the bills in the hands of a consignee, since the goods would not be sealable in transit if the bill of lading disclose that they have been shipped in a damaged condition.

At common law the shipowner is allowed to exclude liability for the truth of the statements related to apparent order or condition of the cargo or to include a clause to the effect "condition unknown".[6] However a clear statement made by the

shipowner that the goods were shipped in good order and condition will override any standard printed clause in the body of the bill of lading indicating that state of the goods on shipment was unknown.

In accordance with Article III rule 3 of Hague Rules the shippers is entitled to demand a bill of lading incorporating a statement as to the apparent order and condition of the goods when received by the carrier. The carrier can not rely on expression "condition unknown" as this is a tentative to reduce the obligations of the carrier below the minimum obligations set out by Hague Rules and it will be considered null and void. It is true the most bills of lading contain a printed clause such as "weight, measure, quality, quantity, condition, contents, and value unknown". Such statements related to cargo condition may protect the carriers only when the cargo details cannot be verified by reasonable shipping practices.

According to article 16 (2) of Hamburg Rules "if the carrier or other person issuing the bill of lading on his behalf fails to note on the bill of lading the apparent condition of the goods, he is deemed to have noted on the bill of lading that the goods were in apparent good condition". This means that in case the carrier wants to avoid liability he should include in the bill of lading a statement as to the cargo condition at the time of receipt.

According with article 36(2)(a) of the Rotterdam Rules the carrier has to include in the transport documents a "statement of the apparent order and condition of the goods" at the time they are received for carriage. Although the carrier has no duty to conduct anything beyond a "reasonable external inspection of the goods as packed at the time the shippers deliver them" The Rotterdam rules are the first international rules that are making reference to "any additional inspection that the carrier ...actually performs before issuing the transport document". This means that when in doubt the carrier has the right to perform additional inspection. Is the carrier under an obligation to perform

additional inspection when in doubt? It appears that for the time being he is not, but there is no guarantee that he will not be in the future.

3. Relevant cases related to cargo condition

The following two legal cases have been selected to illustrate how difficult is sometimes to draw a borderline between the cargo quality and cargo condition. The first case concerned a shipment in May 1995 of urea in bulk loaded on board the DAVID AGMASHENBELI at Kotka for carriage to Beihai in China. A dispute arose about the condition of the cargo as the master protested about its moisture, its colour and contamination. According to shippers' surveyors (who carried out a random inspection plus analysis), the cargo's condition was normal and had the correct colour.

The dispute was not resolved before the vessel sailed, and the master claused the Mate's receipt with following wording: "Cargo discoloured, also foreign materials (e.g.) plastic, rust, rubber, stone, black particles found in cargo". This remark was worded in very broad terms without saying anything about the extent of the contamination or discolouration.

When the vessel arrived at Beihai in China the Bs/L had still not been issued, but on the day of arrival the Bs/L were signed claused with the same, similar wording. The clausing of the bills caused rejection of the Bs/L by the buyers' bank and the market prices fell. Buyers eventually agreed to buy but at a reduced price, and cargo interests sued the carrier.

The question then was argued before the court where the basic question came to be whether it is the master's duty to either objectively and accurately describe the actual apparent order and condition of the cargo or describe the apparent order and condition of the goods as an ordinary and reasonably

skilled master reasonably and honestly believe it to be.

The court held that it was the carrier's duty to record the apparent order and condition of the cargo according to the reasonable assessment of the master (or other agent of the carrier). There is no absolute guarantee of accuracy. The master is required to exercise his own judgement on the appearance of the cargo being loaded (and there is no separate obligation to call in expert help e.g. a surveyor or other "expert" with specific knowledge of the cargo in question). The actual wording of the clausing is also a matter for the master's judgement. [7]

In this specific case, the court also held that, on the evidence, the cargo had in fact not been contaminated and that the master had been wrong to clause the bills with respect to contamination. The court, however, also concluded that, on the evidence, a smaller portion of the cargo had been discoloured. The correct clausing would therefore have mentioned the extent (e.g. by percentage) of cargo being discoloured and the clausing employed in this case was likely to cause any third party to believe that a major part (or all) of the cargo was discoloured.

The decision is therefore a reminder that, when clausing a B/L, the master must not only use his reasonable judgement in deciding whether to clause, but he must also be sufficiently specific and precise in his clausing, failing which the owner may be held liable in damages.

The second case concerned a shipment in November 1999 of wheat in bulk loaded on board the ALIAKMON RIVER at Constanta for carriage to Hodeidah in Yemen. A dispute arose about the condition of the cargo as the master protested about its contamination with sun flower seeds and other impurities. According to shippers' surveyors (who carried out analysis), the percent of impurities was 0.6% (out of which 0.2% sun

flower seeds) while according with sale contract the allowed percentage was 2%. [8]

After the numerous discussions and negotiations the parties did not reach any agreement and the master claused the Mate's Receipts with the following remark: "sun flower seeds / barley / maize / corn cockle are mixed with wheat at loading" and he gave to the agent a letter of authorisation for signing on his behalf Bills of Lading that are in strict conformity with the Mate's Receipt. There were some other remarks, but they are not considered relevant for this paper.

The shippers have not accepted a claused Bill of Lading due to the fact that according with the Letter of Credit only a clean on board bill of Lading was acceptable. The shippers have consequently obtained a court order and the cargo was eventually discharged and the vessel arrested. After the P&I Club has lodged a bank guarantee the vessel was released and the case was referred to Maritime section of Constanta Court.

The main question under investigation was if the master was entitled to include such remarks when it was obvious that the cargo was in accordance with the sale contract quality requirements. The court has correctly reached the conclusion that the master is not a party to the sale contract and can not be bound by its terms and conditions. Also the court held that the master was entitled to clause the Bills of Lading to reflect the true condition of the cargo at the time of shipment. However the court has not went into details and has not analysed if the remark was too general and a more precise qualification was required.

This second case is in many ways similar with the first one and it is now clear that the master is entitled and is even unde an obligation to reflect the apparent condition of the cargo at the time of shipment. If in the first case it is not very common to find urea mixed with plastic and other impurities it is hard to find wheat without any impurities and therefore much more care in clausing whet cargoes is required. The shipowner and the

master should always remember that they are expected to deliver the cargo in the same good order and condition it was received and their clausing should always take this into consideration. In the second case if the bills of lading were signed clean on board and at the discharging port the receivers would have lodged a claim then is was the duty of the owner to prove that cargo was not contaminated by sun flower seeds and other impurities during the voyage and this should have been quite easy to demonstrate.

4. Conclusion

As has been seen in this paper there are significant differences between the various documents used in international trade and particular attention is required from all parties involved in a business transaction. Quality and condition of the cargo are very different terms and even if a cargo is in accordance with sale contract from quality point of view there are significant risks that the carrier include remarks about the cargo condition at the time of shipment and Letters of Credit can not be cashed without aproval of the buyer. If the price on market is stable or is increasing the riskes are limited, but if the price is significantly decreasing then the buyer will either reject the cargo or ask for a significant price reduction.

The Features of the Romanian External Commercial Trades

Botescu Ion

Ovidius University of Constanza
ion_botescu@yahoo.com

Abstract

The events of December 1989 represented the trigger which determined the future evolution of Romania from an economic and political point of view. Among the first reform measures, adopted after the fall of communism, were also those regarding Romania's commercial policy. Being aware of the global economy's globalization trend, Romania liberalized its external trade, fact appreciated by the EU. Actually, Romania's main objective at that time was joining the EU. In this paper I have tried to present aspects regarding the evolution of Romania's exports and imports in two time intervals. The first interval refers to the pre-adherence period, being marked by the country's mistakes during the transition towards a market economy and the second interval refers to the post-adherence period, marked by the rules imposed by the EU and the effects of the global financial crisis.

Key words: export, import, trade balance, commercial policy, EU adherence

J.E.L. classification: F15, F41

1.Introduction

The sensible reduction of the level of customs taxes of the majority of the world's countries and the reduction of the quantitative limitations of international goods and services trade represent phenomena which have determined an accentuation of the liberalization of trade on a global scale in the last decades.

In this context it was possible a growth in importance of the role which developing countries play in the global trade. We should emphasize in this direction the successes obtained by the countries which compose the

BRIC structure. The apparition of new forces on the global economic scene such as China and India has made necessary the redefinition of economic and commercial relations. The triad USA, EU and Japan which has dominated the international economy and trade since the second world war is aware of the fact that countries such as China and India should have the opportunity to support their interests within global institutions, in this case there exists also the possibility of them generating their own system of international economic relations.

The unprecedented rhythm of the international economic relations development in the last decades has made on one side possible the powerful development of some countries and on the other has led to the increase of the interdependence between states, with a direct impact on the diminishing of their sovereignty.

Romania must also take into consideration all these aspects as after the fall of communism, it has been going on the path of global development.

2.Aspects regarding Romania's economic trade in the pre-adherence EU period

In the period before 1990, Romania's external commercial trade has been influenced by the belonging to the Council for Mutual Economic Assistance and by the necessities imposed by the planned development of the economy.

During the majority of the years between the end of the second world war and until 1980, the trade balance of Romania was in deficit. The objective was to pay the external debt determined a surplus in the trade balance between 1981-1989 with negative

consequences on the living level of the population and on the long term development of Romania.

The option of the transition towards a market economy which started in 1990 initially determined a reduction of the GDP and powerful disequilibria on the internal market. This phenomenon was characteristic more or less in all former socialist countries. We should also state that apart from that of all the other countries at the fall of communism, the external debt of Romania was practically zero.

The fall of the Soviet Union and the events which marked the Balkans at the beginning the 90's determined the end of the COMECON's activity, thus significantly affecting the commercial flows in the area. The fast liberalization of the external trade promoted by Romania, but unsupported by the reforms of the other national economic domains negatively affected the economic progress of our country. Losing an important part of the so called traditional markets the Romanian merchandise producing companies which were less competitive internationally recorded massive increases in inventory, fact which determined a blockage of the Romanian economy. Practice the depreciation of the Romanian lion became the main policy of export stimulation promoted by the Romanian decision makers.

Regarding the structure of Romanian exports in 1990, the biggest weights in the total exports of our country were detained by the following products: products of the car building industry (30,3%), mineral products (19,6%), metals and metal articles (16,4%), textiles and leather products (12,7%), products of the wood industry (10,1%), etc. We can notice that the big weight detained by the products of the manufacturing industry in the total Romanian exports, with the mention that the majority of the products meant for exporting came from work intensive fields or field which a big energy consumption per product unit.

Regarding imports, the product categories which were the best represented in 1980 were mineral products and the products of the car building industry. This group of products belonging to the car building industry is found well placed both in the structure of exports and imports, with the mention that the trade balance of the group was negative generating aspects regarding the low competitiveness of Romanian products and of the procurement of financial resources destined to the payment of imports.

Regarding the geographical orientation of the Romanian external trade we need to remark the relative small weight of the trade with the EU. Thus in 1990, out of the total of Romanian exports almost 34% had the EU as a destination, and out of the total imports less than 10% came from the EU.

The first years of the ninth decade of the last century were marked by Romania's wish to join the EU. We should note that in this regard the negotiations regarding the Agreement of Association between Romania and the EU entered into action on the 1st of February 1995, this ending the Agreement of Trade and Economic and Commercial Cooperation with the European Communities signed in October 1990. The consequence of this agreement was the elimination by the EU of tariff and non-tariff barriers to Romanian products on the 1st of January 1997, following their step by step reduction by our country until zero, process which ended on the 1st of January 2002.

Romania's adherence in the middle 1997 at the Central European Free Trade Agreement (CEFTA) represented a step to the access in the EU. Unfortunately the impact of joining CEFTA to Romania's trade balance was a negative one, the exports done by the countries in the organization diminished in the following years, while imports grew.

Specific to the pre-adherence period, respectively the 1990-2005 interval, is the fact that both exports and imports were multiplied just a bit more than 5 times, the

level of multiplication of imports being just slightly larger than that of exports. If we link this evolution with the fact that the beginning basis were completely different, in 1990 Romania's exports and imports recording values of 5,7 billion dollars and 9,1 billion dollars respectively, show that our country has been net importer, and thus the trade balance's deficit accentuates.

During the analyzed period we can see a significative growth of the commercial trade between Romania and the EU. The weight of exports done by Romania in the EU out of the country's total exports reached 67,6% in 2006 and the weight of imports in the same relation was 57,4%. This evolution shows that Romania did not succeed to take advantage of the asymmetric reduction of the custom tariff decrease in its relation with the EU.

3.The evolution of Romania's external trade after obtaining the status of an EU member country

Romania's adherence to the EU on the 1st of January 2007 meant among other things the application of mutual commercial policies, our country giving up on all international agreements in this field. Starting with the adherence date, Romania has applied in the commercial relations with the member countries the Mutual Custom Tariff whose custom tariffs are in average lower than the ones applied by our country in the previous period. In the same time Romania was forced to apply preferential customs tariffs in conformity with the Generalist Preference System of the EU, system which has the aim to stimulate the economic growth of less developed countries. We should mention that before its adherence, as a developing country, Romania was a beneficiary of commercial preferentials. The moment of adherence marked an entry on a powerful competition both within the EU community and on an international level of Romanian companies.

The years 2007 and 2008 touched the maximum levels both for Romania's exports and imports, with the mention that the later grew on a greater average annual rate than the first. This phenomenon was possible due to the stimulation the population's consumption, consumption largely satisfied with imported products. The stimulation of consumption was determined by credits which were easily given to the population and to Romanian companies by a Romanian banking system controlled an approximate 90% of foreign capital. The Romanian balance of trade deficit in the period immediately after the EU adherence grew alarmingly reaching in 2008 the level of 27,9 billion dollars.

With a large degree of economic openness, approximate 76%, Romania is strongly dependent on foreign markets. The propagation of the financial crisis at a global level had a powerful negative impact on Romania external trade in 2009. The demand reduction on external markets determined a reduction in Romanian exports from 33,6 billion euros in 2008 to 29,1 billion euros in 2009. For the same period imports also substantially decreased from 52,0 billion euros to 35,9 billion euros due to the austerity measures adopted by the Romanian government and the harshening of credit conditions. The positive element of these turbulences, if we can call it so, was represented by the reduction of the balance of trade with 62,3% in 2009 in comparison with the previous year. The Romanian exports and imports are expressed in FOB prices and their levels can be found in the reports of Romania's National Bank.

In the years 2010 and 2011 both Romania's exports and imports recorded growth. If in the case of imports, the level touched in 2011 was approximately equal with the level before the financial crisis (2008) in the case of exports, their growth was 33,9% higher in 2011 than in 2008. This evolution was reflected in the deficit of the balance of trade which was maintained at

reasonable quotas comparative with the pre-crisis period.

In comparison with the previous periods, in 2011 we can find an improvement in the structure of products of Romania’s external trade. According to the information offered by the National Institute of Statistics, the exports structure contains: cars and transport equipment 41,2%, other manufactured products 33,4%, raw materials 7,2%, food, beverages and tobacco 6,4%, chemical and annexed products 6,3%, mineral fuels and lubricants etc. 5,5% and the situation of the imports is the following: cars and transport equipment 34,6%, other manufactured products 30,6%, chemical and annexed products 13,2%, mineral fuels and lubricants etc.11,3%, food, beverages and tobacco 6,8%, raw materials 3,5%..

The geographic orientation of the Romanian external tradewith goods in the period since the beginning of the crisis has been characterized by a slight reduction in the weight of trade with EU countries. This weight decreased from 74,2% in 2009 to 71,1% in 2011 for exports and from 73,1% to 72,6% for imports. In the last period we have seen an increase in the commercial trade with the USA, Brazil, Mexico, Norway, etc and other countries from Asia, Latin America and Africa. This has been done with the view of increasing the geographic dispersion Romania’s external trade.

Romania’s efforts to join the EU generated an entire series of effects also in the external trade of our country. The evolution of the main indexes can be seen in the following table.

Table no. 1

Indexes regarding the external trade

		Romania			Czech Republic			Ukraine		
		1994	2006	2011	1994	2006	2011	1994	2006	2011
Exports	bll. \$	6,1	32,5	62,7	15,9	85,4	138,5	13,8	38,9	69,4
Imports	bll.\$	6,5	47,3	73,2	17,3	82,8	133,2	16,4	44,1	83,2
Trade balance	bll.\$	-0,4	-14,8	-10,5	-1,4	2,6	5,3	-2,5	-5,1	-13,8
The weight of the balance of trade in the GDP	%	-1,2	-12,0	-5,6	-3,0	+1,4	+2,4	-4,6	-4,7	-8,2
Coverage level of imports by exports	%	93,8	68,7	85,6	91,9	103,1	103,9	84,1	88,2	83,4
Exports/capita	\$	267	1511	2929	1543	8372	13190	269	836	1538

Source: <http://unctadstat.unctad.org/>

In order to present the accuracy of the measures taken by our country, I have made a comparative analysis of the indexes which characterize the external trade. In this regard we have chosen two countries, each representing a relatively opposed set of

countries. The Czech Republic, as a member of the Visegrad group, was part of the former socialist countries which took radical measures towards a market economy and therefore joined the EU in 2004. From the opposed group I have chosen Ukraine, former socialist country which hesitated applying economic reforms and is presently

outside the EU. The analysis started with the year 1994, because for previous years there is no available data for Ukraine.

We can observe that if initially Romania's GDP was lower than that of Ukraine, in 2011 the situation was inversed. The differences between the Czech Republic and Romania have more or less stayed the same during the studied interval. Regarding the GDP/capita the discrepancies between the two countries are much more accentuated.

The exports and imports of the three countries have known growth, fact that signifies a good participation to the world economic circuit, with the mention that during the entire period the external trade balance of Romania and Ukraine was permanently in deficit, while for the Czech Republic it was in surplus for the last two analyzed. Regarding the level of coverage of imports by exports, Romania is closer more to Ukraine than to the Czech Republic. The situation is net favorable to Romania in comparison to Ukraine regarding the value of exports/capita and imports/capita.

4. Conclusion:

In the last two decades, Romania tried and partially accomplished adapting its commercial policy to the main events which marked the global economy. After a fall in the beginning years of the transition, both Romania's exports and imports grew year by year until they were marked by the effects of the global financial crisis in 2009. Unfortunately, the exports recorded annual average growth levels inferior to the ones recorded by imports, resulting in a negative trade balance throughout the entire analyzed time interval. If we take into consideration the evolution of the former socialist countries which have stayed outside the EU, in our case Ukraine, we can see that Romania, through joining the EU chose the correct solution. When referring to the Czech Republic, one of the former socialist countries which adopted very quickly

economic reforms, we can say that the economic evolution of Romania was under its possibilities and under the goals of the population.

Causes and Consequences of the Current Economic Crisis

Chindriș-Văsioiu Oana

Abstract

Current economic and financial crisis is considered to be the deepest crisis to date. Some experts believe that the current crisis began following publications in the press about U.S. banks instability, which led to loss of credibility banks, and others believe that bankers are responsible for the crisis because they had cash reserves of state interest. These are just opinions, but in fact the causes are more complex as both macroeconomic and microeconomic.

Economic effects were felt worldwide, but different from state to state depending on the regulations and its level of development. Crisis governments have taken steps to protect the national economy both individually and collectively (at EU level).

Keywords: financial crisis, economic crisis, leverage, bubble, gross domestic product.

J.E.L. classification: F62, F65, F68

1. Introduction

Current economic and financial crisis is unprecedented in the last half century. The economic downturn extends to USA, Europe and Japan and is shaping up to be more painful than the 1981-1982 economic downturns. Beginning of the crisis led to a massive loss of confidence both in the business sector and the consumers, both responding by restricting spending. The global financial crisis became apparent in July 2007, when the loss of investor confidence in mortgages secured U.S. led to a liquidity crisis caused a substantial injection of capital into financial markets by the U.S. Federal, Bank of England and European Central Bank. The crisis worsened in 2008 as the world's stock markets

collapsed and went into a period of acute instability. A large number of banks, lenders and insurance companies went bankrupt in the aftermath. A large number of banks, lenders and insurance companies went bankrupt in the aftermath.

Federal Administration U.S. housing collapse is often held responsible for the production crisis. But the vulnerability of the financial system was caused by complicated financial contracts and operations and leverage subject (borrowing a joint effect on the profitability of own funds, which may improve if borrowed capital brings more income than the interest due), U.S. monetary policy setting a negligible price for credit and thus favoring a very high leverage effect and, as John Bellamy Foster American economist, a "hypertrophy of the financial sector".

Beginning with failures of large financial institutions of the United States crisis rapidly evolved into credit crisis, deflation and sharp reductions in shipping, causing several European banks to fall in various stock indexes, and large reductions in the market value of stocks and commodities worldwide.

Initially triggered in the United States, the crisis has spread to Western Europe and against the background of globalization, rapidly spread worldwide.

2. Causes of economic crisis - financial crisis

Root causes of the current global financial crisis are so macroeconomic and microeconomic in nature. The two types of cases were interdependent in the production crisis.

One cause deep economic crisis macroeconomic and financial was ample liquidity created by major central banks of the world and a desire for oil and gas exporting countries to limit currency

appreciation. Also, there was a saturation of savings generated by increasing integration into the global economy of countries (China, Southeast Asia generally), with high rates of accumulation and the global redistribution of wealth and income country exporters of goods (oil, natural gas and so on). Supersaturated with ample liquidity and savings available for investments have created resources, including sophisticated financial instruments, hardly understood by some investors. [5]

Consequences of the existence of abundant liquidity were very low interest rates and their low volatility. Risk margins were also very low. Together, these effects lead to increased appetite for assets with high returns. In addition, reduced market volatility has created a tendency to underestimate the true risk of complacency and investors.

Together, low interest rates, the appetite for assets with high returns, low vigilance towards risk and price signals masked small margins on financial markets and led to insufficient understanding of the risks involved.

Against this backdrop operated as aggravating, and a series of microeconomic causes. The first question is securitization frenzy that led to becoming opaque financial market. Cracks in the business model of rating agencies, outsourcing rational in terms of private but socially inefficient for deregulation and increased international competition may be considered in turn causes micro.

Finally, the demand for liquidity, combined with the loss of trust between banks, resulting in the pursuit of cash and the effective interest rate began to rise.

In the U.S. and some European countries, governments and central banks responded by improving liquidity, providing government guarantees for loans, recapitalize financial institutions; ensure the latest issued by insured banks, preventing disorderly collapse of large interconnected firms, buying shares in banks, coordinated interest rate cuts. Although such measures have been implemented after 17 months from the onset of turbulence, the market remained opaque, which amplified the financial crisis and facilitating its passage in the real sector, first in the U.S., and in other developed countries.

3. Consequences of economic - financial crisis

International economic and financial crisis are multiple and varying degrees affect the countries involved are unfavorable global economic growth.

The most important effect, so far, is the failure of banks and credit of the U.S. and EU member states following the entry of default and asset recovery impossible especially in real estate. [2]

The economic downturn caused by the chaos in the financial system weakness profound public, business groups and political leaders. Trying to prevent mass bankruptcy of banks and insurance funds, governments in America and Western Europe nationalized much of the domestic financial system which is contrary to the principles of modern capitalism and empowers the state to the detriment of private sector depreciates the validity of "values" associated with "free" market and erode economic model image promoted by the United States in the world.

Unprecedented government intervention through massive infusions of funds "borrowed" the financial system by purchasing shares in bankrupt institutions and reducing taxes, does not guarantee restoration of public confidence in the banking system and investment in real estate funds and ability of authorities to regulate credit markets to prevent toxic speculation, abuse and corruption.

In 2008, the shares offered in international markets have lost between 20 and 70% of the value taken in 2006 and 2007. Political leaders in many countries, afraid of the drastic consequences of the crisis, I agree that the priority must be to prevent the collapse of the international financial system. They are aware that States, individually, can not restore confidence in banks and investment than if they coordinate crisis. However, under pressure from local political leaders of many countries are inclined to act strictly national interest and to use protectionist measures to defend their own institutions of crisis and to prevent their acquisition by foreign interests.

Other effects of the financial crisis concerns on rising inflation, interest rates and unemployment, devaluation of national currencies and increasing current account deficits and public debt. [1]

The financial crisis was initially triggered in the United States. Administration led by President George W. Bush dominated by preachers "free market economy" degraded authority bodies responsible for regulation of financial institutions and gave free hand "trick" financial.

In the absence of limits imposed and enforced by state authorities, some banks, investment funds and insurance companies without the necessary coverage have lent considerable for "customers" who had no ability to pay rates. These loans, with considerable interest, were "repackaged" in foreign complex and seemingly attractive toxic, which then were sold profitably as legitimate financial products many local and foreign investors.

Creditor's excess spread globally. Excessive availability of credit funds created many "bubbles" (stock trading is a group at high volumes which differ considerably from the intrinsic value or real them) hyper inflated credit market for single-family houses, buildings, cars, student and credit cards. Ingenious financial manipulations were extended to loans made by regional and local governments, the industrial and commercial loans to grants of shares and markets for natural resources. During the banking crisis, increasingly more loans remained unpaid, the property has declined and many companies went bankrupt. Losing capital, banks can not grant credit. In America, unpaid loan losses could amount to over \$ 2 trillion.

Lack of regulatory rules and attitude "laissez faire" (an environment where private parties are free to trade without being constrained by state intervention, including regulations, taxes, tariffs and monopolies applied.) of the American government and contributed to the formation of hedge funds, where investors could participate only very rich and wealthy institutions. Transparent and manipulative managers of these funds were involved in all kinds of dubious transactions that helped precipitate the financial crisis.

In 2007 and 2008, American citizens have lost a third of their personal property. Values of houses and buildings, estimated at 13 trillion dollars in 2006 fell below 8 trillion in 2009. During the same period, private pension funds have been devalued from 11 to 8 trillion. These enormous losses shocked

American population. To avoid worsening of panic, the U.S. Federal Reserve made promptly to the pension fund an amount of 540 billion and 700 trillion allocated for use by banks and insurance companies failing.

In January 2009, the share of U.S. stock markets fell by 50% from the value it had in the first half of 2007. These losses have reported that the United States is in the worst recession of the past 75 years. In recent years, government deficit spending in Washington has created huge debts.

In September 2007, the federal government owed 5.8 trillion, equivalent to 41% of gross domestic product. Because of the worsening economic situation and the measures additional government debt crisis still grow with 3 trillion U.S. dollars, while the GDP and state tax revenues have declined substantially. Present value of debt, interest on borrowed funds only requires the U.S. government to pay \$ 12 billion annually.

Over half of the loans of the American government were made abroad, especially in China, Japan and oil-exporting countries in the Gulf region. If these countries were to decide to get rid of accumulated foreign currency, the U.S. dollar would collapse, which would have adverse consequences for both the U.S. and global economy.

Financial and economic crisis in America has expanded rapidly in the world. Europe went into recession. Trying to stabilize domestic financial entities and to revive the economy, governments in Western Europe have invested huge amounts in domestic financial structures, nationalized a large part of banks and cut taxes to stimulate the economy. [1]

Industrial production in developed European countries such as Germany, France, England, Italy and Spain fell in 2009 by 20-25%. Unemployment, lack of consumer confidence and feeling insecure people increased in most EU states. The German government has allocated 100 billion to guarantee loans granted by banks. Because the effect was insufficient, the government ordered that another 60 billion would be allocated to stimulate the economy.

Great Britain's GDP declined alarmingly in recent years. Trying to survive, British companies have turned to the state. In January 2009, the British government has allocated 20 billion pounds as collateral for

loans made by banks to small and medium enterprises, which is far too little to cover domestic debt of British firms worth over 500 billion pounds. [5]

So far, China has resisted the best current crisis. Although exports fell, imports fell even more; so that China's foreign trade balance remained positive, amounting to 460 billion dollars. The huge foreign exchange reserves, with great capacity to stimulate domestic consumption and strong trade surplus, China's economic rise will continue.

In Russia, the financial crisis has ravaged spectacular. Since last year the international market price of crude oil fell by two-thirds, oil export revenues have deteriorated substantially. Reacting to the ruble devaluation, foreign and domestic capital flight resumed abroad. In 2009, the stock market fell by 70%. Instead of taking measures of monetary policy, the Russian government decided to tackle the economic crisis and political repression control information. As "not to scare people," he allowed the media to discuss the financial and economic crisis. [4]

During the international financial crisis, the requirements for natural resources, products and services decline, which negatively affects countries with export-based economy. Exports from Taiwan, Japan and South Korea have deteriorated from 25 to 50%. Global economic growth, which was 5% in 2007, fell to 3.1% in 2011. Many developing countries survive the export process raw materials and agricultural products. IMF has enough funds to save the most underdeveloped states hit by the recession.

From a geopolitical perspective, the financial crash of 2007-2008 diminished influence, prestige and credibility of America in world economic. The economic recession that started in the U.S. and the nationalization of financial institutions has compromised, at least temporarily, effective overall promotion of American capitalist economic model, considered in the past as the most capable of creating economic progress and prosperity.

In the past, the United States and Western Europe were the main sources of private capital to the rest of humanity, which gives the Euro-Atlantic democracies great influence abroad. Budget deficits and deterioration of financial institutions, this

influence will diminish. In the future Euro-Atlantic community governments will be reluctant to engage in costly actions abroad.

Despite government efforts, Western capital markets will not recover for several years' previous vitality. Banks hit by losses from devaluation unpaid loans and investments will be required to restructure and reduce their number of employees. More cautious in future, they will only lend to customers who can prove that they will pay those rates.

Unprecedented financial interventions by governments of countries affected by the crisis, with the intent to restore vitality financial institutions and stimulate economic activity, drastic as it is, does not guarantee restore public confidence in the banking system, investment funds and in the capacity to regulate credit markets to prevent excessive speculation, abuse and corruption sanctioned.

Inevitably, people will have to pay considerable taxes, to cover the debts incurred by governments intended to stem the damage global economic recession. Member considerable financial interventions could ensure not only the survival of viable businesses and other entities or inefficient parasitic actually deserves to be removed or to fail. [2]

Economics are still "science" true, in the sense capability to explain what happens to predict events and to provide valid solutions. Specialists in the economy had not anticipated the onset and evolution of the current crisis. Their conflicting recommendations on measures to be taken to restore confidence in the financial system and to settle current economic depression reflects ignorance embarrassing.

4. The economic-financial crisis in Romania

International financial crisis were extended to the Romanian economy..

However, in terms of direct impact, the banking system was less affected by not being exposed to toxic assets and because prudential and administrative measures adopted over time by the National Bank of Romania.

Indirectly, however, the international financial crisis and especially its obvious

consequence - the recession in developed countries - Romanian economy extends across multiple channels. Commercial channel, slowing export growth or even reduce them. Financial channel, limited access to external financing and thus restrict lending volume, and creates difficulties in private external debt. Exchange rate channel, reducing external financing reflected in national currency depreciation. This had the effect of monetary and currency market manifestation of moments of panic and speculative attacks, like the one in October 2009 in Romania, which necessitated central bank intervention. Finally, channel wealth and balance sheet effects, damage occurs to the net assets of people and companies, due to the large share of loans in foreign currency (leu depreciation related) and falling asset prices and capital from speculative values, unsustainable (type "bubble").

Propagation of these effects is the degree of uncertainty about economic developments variables to be extremely high. This contributes, in turn, increase the negative effects of the crisis has on expectations and argumentation degree of caution for consumers and businesses.

In Romania, the adverse effects of the crisis response may be similar to that made by some European countries and the U.S. There are some differences between the Romanian economy and the economy, not simply allow copying package of measures developed there. In essence, it is about the fact that the Romanian economy has a large current account deficit, indicating dependence on external financing. We have to choose between reducing the deficit or the orderly reduction of the market in the current voltage and mistrust, with dramatic consequences for the exchange rate and economic growth.

Even if the economic adjustment process performance can not be accurately planned, however, to promote coherent and credible economic policies could avoid a disorderly adjustment. The government should avoid emotional approach to crisis under pressure from trade unions and employers, which would lead to measures to stimulate domestic demand, complicating bringing the current account deficit to a sustainable level. Only a concentration of macroeconomic policy mix adjustment process external imbalance

(current account deficit) and domestic (budget deficit) may lead to support a soft landing of the economy and improving investor sentiment.

If all these steps are followed, there is a high probability that investors improve their perception concerning Romania and prefer to invest here than in other countries in Eastern and Central Europe. High probability but not with certainty equals: it is conceivable scenario in which, although the Romanian authorities do everything you need, foreign investors may not react positively and treat its neighbors Romania undifferentiated. High probability but not with certainty equals: it is conceivable scenario in which, although the Romanian authorities do everything you need, foreign investors may not react positively and treat its neighbors Romania undifferentiated. Awareness of this possibility, however, should not lead to defeatism and abandonment so necessary adjustment measures. A coherent risk for such an orderly adjustment of external imbalances is the weather becoming more pessimistic developed by different institutions economic growth in Romania and going to anticipate negative growth. The danger is that political factor, giving credence to these forecasts could treat emotional problems, adopting and pay the tax cuts, which would only aggravate the crisis.

In conclusion, the private sector has already reduced its external deficit in past years, but it remains relatively high. At the same time, fiscal policy has been cyclical and contributed to increased external deficit of the Romanian economy. The analysis of the stance of national fiscal policies finds evidence that the quality of fiscal policies has improved in two ways: they are more clearly countercyclical – or less procyclical – and they are more readily used to restore competitiveness than to attempt to boost demand when competitiveness is eroded. [3]

Also be better prepared for EU funds absorption and adoption of financing agreements with international organizations from the European Commission and European Central Bank. The private sector must restore the correlation between wages and labor productivity to ensure external competitiveness. These policies would reduce uncertainty and restore confidence in future economic developments.

5. Conclusions - Output measures of economic crisis

One of the first steps taken by financial institutions (the Federal Reserve and U.S. Treasury) was addressing the TARP (Troubled Assets Relief Program), that sought to take over toxic assets from banks' balance sheets "weak" and then auctioning them on the open market for their real price discovery and to establish a market for these assets. Another measure was to provide state guarantees for debts of poor quality. To prevent abuse, providing security has a price: either in the form of special taxes or accepting as stricter regulations, or setting a franchise to which losses had been incurred as of that financial institution.

Institute of International Finance suggested reconsidering risk management practices, compensation policies, evaluation of credit, ratings and transparency of activities, both at the level of financial instruments and financial institutions.

Stimulus packages, ad hoc measures or accelerate the implementation of planned measures before, but tax cuts are among the main anti-crisis solutions recommended worldwide.

Financial advisory company Deloitte has put together all these measures, making a catalog of tax solutions used worldwide.

According to the report, several EU countries have already implemented a series of anti-crisis measures:

- The most popular measure (effective in 89% of the EU) is the exemption from capital gains. Often, this fee will be applied for a certain period of time for homes used for personal use.
- In 11 states operate a mortgage guarantee fund to support individuals who face mortgage payment problems. Several states, including Poland, Hungary, Slovenia and the UK such funds launched in 2009 as part of a package of anti-crisis measures.
- Bulgaria introduced tax exemption for a period of five years for investment in disadvantaged regions and reductions or exemptions from taxes on income for young families who pay interest on housing loans.
- The Czech tax rate was reduced from 21% to 20%, and social health contribution rate for employees and employers has been reduced.

- In Hungary proposed a series of tax measures aimed at taxing consumption, not income.
- UK reduced VAT rate for a period of one year from 17.5% to 15% and allowed to postpone paying taxes for companies that have been affected by the crisis.
- Both Holland and Spain, have introduced incentives related to accelerated depreciation for investments made in 2009.
- The Belgian Government has reduced VAT rate for new housing construction, from 21% to 6%.
- In France and Germany have been taken to support SME. Thus, from January 1, 2013, French companies such may take into account the losses incurred by foreign subsidiaries in determining income tax. On the other hand, Germany has raised the economic indicators by which a firm can enter the SME.
- Lithuania introduced a 20% flat tax, income and profits and all VAT of 20%.

Abstract

In the lights of the recent crisis, the monetary policy became the most important weapon that an economy must rely upon, considering that the banking system was the first one to be affected by the crisis and then the effects had spread upon the entire economy. In order to avoid lack of liquidity and therefore a major crisis of the banking system, China adopted a stimulus package through which inserted large amounts of money into the economy in order to stimulate loans. As previous crisis proved, a “credit boom” is dangerous because it eventually leads to a high number of nonperforming loans. Although its effects are visible after a period of time, precautionary measures have to be taken by the monetary authorities to avoid spreading an unhealthy financial system.

Key words: Banking system, monetary policy, nonperforming loans, crisis

J.E.L. classification: G15, G21, H81

Introduction

There are a lot of lessons that have to be learned from this recent economic crisis. One of them is the importance of credit boom and moreover the highest attention that has to be addressed to nonperforming loans. Due to the fact that banks are the reason that a lot of governments had to use large amounts of money in order to assure liquidity it is clear that nonperforming loans are a reflection of how useful the measures against the crisis

proved to be. And this indicator it is also in the end a reflection of how efficient was the monetary strategy used. It is difficult in this days to avoid that a loan becomes nonperforming because the general uncertainty. Mainly for the householders the threat of unemployment is real and an important incentive to avoid contracting loans. Taking into account the general unfavourable economic conditions it is also the case of firms and enterprises. In general, nonperforming loans are a reflection of how commercial banks learn to manage the losses that arise from nonperforming loans. If the ratio of nonperforming loans from the total loans is growing, it means that the problem is of the bank and it can be solved by helping this certain bank through tightening regulatory details. If the problem is generated at an entire group of banks, then it is a warning signal that the entire system is in need for a reform. The Central bank has to elaborate the best possible laws relating crediting in order to avoid nonperforming loans to become a national problem and a reflection of poor monetary policy tools implementation.

Overall, the main objective of China's monetary policy is, according to its Central

Bank “to maintain the stability of the currency value to advance economic growth” [1]

Even since 1953 China adopted a long time plan for achieving economic growth through a series of 5 year plans. Through this, the Central Government would elaborate the

economic strategies, plan investments and set the tool through which to gain economic

power. So it was obvious that the Central Bank had to

elaborate the monetary strategy in order to facilitate this economic growth

Only the last plan adopted in 2011 was created taking in mind the people, social consensus and consider solutions to reduce social inequality. But in the end it is safe to say that the ultimate plan still remains maintaining the impressive two figures growth in the years of 2000. Regarding the monetary policy, this plan aims at total liberalization of the interest rate and improving the transmission mechanism of the monetary policy. Through the years, since 1984 when Central Bank of China became solely responsible for the monetary policy, the monetary policy evolved considerably.

An analysis of nonperforming loans it is crucial because a high ratio of this loans will eventually threaten monetary expansion. And monetary expansion was the main weapon that China used in order to achieve the true goal of the monetary policy: economic growth. Although the monetary expansion was based on increasing money supply it was achieved by credit liberalization and granting loans indirectly through the Central Bank. It supplied liquidities through the state owned banks, many of the times at negative interest rate. More recently, we saw a jump from money supply to credit rationalization.[2]

A lot of voices state that this control strategy of monetary policy through monetary mass is not very efficient considering that most of the powerful countries use interest rate as the most important instrument of controlling monetary policy. Also, there are several other voices that state that the impact of the interest rate in China is not very useful, due to a lot of factors. First, we can state the lack of total liberalization of interest rate system, the interest rate on deposits and loans is dictated by the Central Bank. China's financial system is controlled by four commercial state owned bank that own 80% of the entire banking system assets. Moreover, they absorb 70% of the deposits and 80% of the total loans.[3]

It is obvious that this four banks form an oligopol and due to the different market segments they are addressed to, do not compete against each other. Due to this high rate of deposits they gain gives a high profit

rate so they are less sensitive to interest rate movements [4].

Another reason are consumption habits. This because the population of China is well known for their high savings rate, thus consumption is not sensitive to changes in investment rate. The lack of materialism, patriotism and the regime dictated this high savings trend. The economic theory suggest that a high consumption rate is directly connected with the increase in incomes. Consumption is expected to grow once the incomes are growing this is not the case of China.

There are a lot of voices that link this monetary policy that China conducted in the recent years with the crisis in 2007. The economists O'Brien and Brown (1992) stated that one of the crucial factors that led to a drop in monetary transactions is drop in the number of loans granted. This would eventually affect also the offer and the demand. Demand because the population will be self-effacing in acquiring new loans due to drop in purchasing power and the economic uncertainty in general. According to them, the offer will be affected by deteriorating price assets and the new regulations in granting the loans.

It is obvious that due to unfavorable economic conditions there will be an increase in non-performing loans. And this indicator reflects directly on the health of the financial and banking system. Another study was made by Maggi and Giuda in 2009. They tested the effects of nonperforming loans on the structure of costs of commercial banks. The study proved, by an econometric analysis that the threat that some loans could become nonperforming is highly dangerous and it is a reflection of the financial system in a country. And the effects will be on the entire banking system not only upon the bank that generated the loan itself. Another series of economists demonstrated this connections like Kwan and Eisenbeis (1994), Hughes and Moon (1995), Resti (1995), Barr and Sems (1994).

This threat that the increase in NPL will affect the entire banking system is proved by Hou and Dickinson in 2007. They called this phenomenon "credit crunch"- lending becomes more expensive and harder to get. Therefore, all these effects will be seen in a restrictive monetary policy and further on in a drop in economic growth.

Other studies were concentrated on proving a very real connection between macroeconomic uncertainty and bank loans. Baum Etal (2001) and then Calza Etal in the same year demonstrated a cointegration relation between GDP, interest rate and bank loans. This studies showed that in the long run there is a positive connection between the number of loans granted and GDP and also a negative relation between GDP and the interest rate on the short and long run.

Source: IMF, 2012

This crisis was not a typical one, if we consider this trend of nonperforming loans. As we can see above, before nonperforming loans rose sharply. This recent crisis overall has a different effect. We can see that NPL rose gradually and lower than in the past. There are several reasons for this. the inability to repay the loans started only when the crisis affected the real economy and households.

Another significant reason could be that, compared with other crisis, the expansionary monetary policy adopted by a lot of countries, including China supported banks and the interest rate was kept at a low level. In other crisis, the interest rate was the first to rise in case of risk of default.

In USA, the country that started the crisis, NPL increased from 1.8% to 2.6% in 2007 and 4.9% in 2008. According to Mwansa Nkusu in 2011, there are some relevant links and causes of a NPL increase shock such as[5]:

- If house prices increase by 6.1%, NPL increases by 0.3%, and after 4 years it is 1.5% higher than before the increase in house prices

- If inflation increases by 1.6%, NPL will increase by 0.3% and by 1.6% after 4 years

- If the credit ratio to GDP decreases by 1%, NPL will increase by 0.3% and with 1% after the fourth year

Moreover, the study proves that any deterioration in the macroeconomic environment that turns out into a lower economic growth or even a negative one, is usually associated to with debt problems that directly translates into higher nonperforming loans. The crisis are the best way to analyze the overall effects of this indicator. There are several phases that past crises responded to[6]: first, containment, to deal with acute liquidity stress and to stabilize financial liabilities; second, resolution and balance sheet restructuring, which involves removing insolvent financial institutions from the system and recapitalizing viable ones; and, finally, operational restructuring to restore the financial soundness and profitability of viable institutions and asset management to rehabilitate nonperforming loans. The recent crises followed this pattern through the first phase, but subsequent policy responses have been less forceful, at least for the major countries.

It is difficult to make a proper analysis on China's real level on NPL because as the Central Bank president said, the number are not quite accurate and do not reveal the real number of NPL. This because some banks manage to restructure or roll-over bad loans before the 3 months period after which are classified as "non-performing"

According to Central Bank of China, nonperforming loans are[7]:

- Loans which repayment of principal or interest have been overdue for more than 3 months

- Any loan of which the principal debtors and surety have been sued for non-payment or the underlying collateral has been disposed, although the repayment of principal or interest have not been overdue for more than 3 months

The most important year to look upon when performing an analysis on Chinese banking system and loans is 2009. This was the year when monetary mass increased tremendously. The economic stimulus package was a reaction to the global crisis

through which the government pumped huge amount of money in the economy- 4 trillion yuans. It was a measure of implementing trust in a global imbalance financial sistem. It was the most important tool that the government used as an anticrisis tool. The most important targets of the package were: infrastructure, science and technology and social security.

Considering that most of the money were granted through state owned banks its sufficient to say that this banks were in fact the end beneficiary of the money. The state council increased the credit quota for the Development Bank, Import – ecport Bank and Agricultural Bank as a measure of stimulating consumption. But there other state owned banks involved like the Construction Bank, Industrial and Commercial Bank for Development so it quickly became unclear which bank founded which program. In the end the constribution of the Central Bank to the entire stimulus package was in fact 1.18 trillion RMB.[8]

The difference was covered by bank. The state guarantees, the collaboration between this banks in order to found a big infrastructure project for instance became the most important tools in what quickly became an alarm system regarding the number of NPL thta could appear in the future. Below there is an evolution of bank loans in China from 2005:

Evolution of bank loans in China april 2005- april 2012

Source: Tainted Aalpha, global macro perspectives

As it was expected, in the period just after the economic stimulus the number of bank loans exploded. So, in the first trimester of 2009 the entire value of the loans was 4.58 trillion yuan (more than 1 trillion a months- as a comparison in april 2012 trilion was 682 millions yuan). The threat of nonperforming loans started to appear. This fears were amplified because the majority of those who contracted the loans were state owned companies, the private ones could not get access that easily. For example, the respresentative of one the biggest private companies in China New Hope Grup, stated that state companies are priviledged in public auctions, allthough the overall costs proved to be higher. There were a lot of debates regarding the auction for building a new railway. For its construction they imported technology form Japan and Germany at very high cost, so naturally huge amount of loans were contracted.

Evolution of NPL % of total loans granted

Source: China central bank

Allthough we see a drop in the evolution of nonperforming loans in China, looking at the overall number of loans that increased significantly, we might say that this drop is insignificant. Overall, there is a 2.27% ratio between the percentage of NPL and the percentage of total loans. The year of 2012 could be the first that will announce a significat increase in NPL. This year, 16 of the chinese banks reported an increase in non-performing loans ratio. Overdue loans

increased by 81.6 %, 63.2 %, and 62 % in the first six months of 2012, according to the interim reports.

NPL of commercial banks at the end of 2009

Source: China banking regulatory commission

Note: The commercial banks include the state-owned commercial banks, joint-stock commercial banks, city commercial banks, rural commercial banks and foreign banks. The major commercial banks include the state-owned commercial banks (SOCBs) and the joint stock commercial banks (JSCBs). The SOCBs include the Industrial and Commercial Bank of China (ICBC), the Agricultural Bank of China (ABC), the Bank of China (BOC), the China Construction Bank (CCB) and Bank of Communications (BOCOM). The JSCBs include CITIC Industrial Bank, Everbright Bank of China, Huaxia Bank, Guangdong Development Bank, Shenzhen Development Bank, China Merchants Bank, Shanghai Pudong Development Bank, Industrial Bank, China Minsheng Banking Co., Evergrowing Bank, China Zheshang Bank and China Bohai Bank[9].

We see a major role played by city commercial banks in the context of nonperforming loans. Due to a some kind privileges that the state owned banks appear to benefit from the state, it is safe to say that this banks face greater risks. According to a report of China Economic Weekly this banks face high non-performing loan ratios, poor capital adequacy ratio and limited market penetration. A significant amount of NPL are also accounted for by the four state owned banks, thus proving that this indicator could

threaten in the future China’s banking health and also the entire financial stability.

Conclusion

It is yet to see in the case of China how nonperforming the loans granted through the economic stimulus will turn out to be and what will the effects be on the monetary policy. To burden the economy with huge amount of money to avoid lack of liquidity for the banks was the main objective of the authorities in order to maintain the appearance of a safe financial environment and to create the illusion of a country with good economic growth in the overall economic instability around the globe.

In 2008, Laeven and Valencia analyzed 42 crisis episodes and the result was that average annual credit growth to GDP prior to the crisis was about 8.3%. Between 2009 and 2010, this ratio for China reached 27.8% and 20%.

Non-performing loans ratios in recent crisis

Source: Deutch Bank

According to this analysis, after a period of credit boom there are always, sooner or later a high number of nonperforming loans. The effects of NPL on the economy is quite real and poses a real threat. A lot of countries sufferend from it, maybe the most relevant example would be Japan. They started to suffer from the NPL in the early

1990. And the NPL ration started to peak only in 2002, after the damage to the banking system was already done. And the best example is Thailand that never quite recover after this huge NPL ratio.

The real effects of the nonperforming loans after the recent crisis in USA is yet to be seen, although some effects were obvious just after the lending. In this conditions, it is safe to say that China will see the downsize of the economic stimulus only when it will already be too late. By pumping money into the economy the monetary mass increased and so the Central Bank had to adopt measures of attracting liquidity into the financial system in order to prevent further accumulation of monetary mass due to massive foreign exchange acquisition.

Non-performing loans will directly reflect on Central Banks monetary policy strategy. This because the Central Bank sets the interest rate on deposits, on loans and by setting the reserve ratio it indirectly dictates the loans that commercial banks can give. And with all the voices that criticise monetary policy in China, this anticipated boom of nonperforming loans can do a lot of damages.

Globalization and Mondialisation - A Conceptual Analysis

Cosma Sorinel

„Ovidius” University Constanta
sorinelcosma@yahoo.fr

Abstract

Definitely one of the most controversial terms in recent history, globalization (also spelt globalisation) was called “the most abused word of the 21st century” by The Economist. Many authors fear that it is bound to become the cliché of our times. The concept behind the word radiates such a multiplicity of phenomena that in time it has received a tremendous number of definitions given by various people in various contexts having various purposes in mind. The concept of globalization is relatively new compared to the process or historical trend of globalization which dates a long time back in the history of mankind. Thomas Friedman, author and New York Times columnist, perceives globalization as the chief force shaping and moulding the world today. Globalization is a word used in Anglo-Saxon literature. The Francophone literature uses another term – mondialisation. Though often treated as synonyms, in French, globalization is seen as a stage following mondialisation, a stage that implies the dissolution of national identities and the abolishment of borders inside the world network of economic exchanges.

Key words: globalization, mondialisation, market, multinational corporations.

J.E.L. classification: F60

1. Introduction

Human interaction and world commercial relationships over long distances have existed since forever. The earliest form of *globalization* began with the rise of trade links between different parts of the world in the third millennium BC, later continued during the time of Ancient Greece, the Roman Empire in Europe, the Persian Empire, the Han dynasty and the Mongol

Empire in Asia, the Muslim traders. The Silk Road is a marvelous example. The Silk Road or Silk Route is a modern term referring to a historical network of interlinking trade routes across the Afro-Eurasian landmass that connected East, South, and Western Asia with the Mediterranean and European world, as well as parts of North and East Africa. Extending 6,500 km) the Silk Road gets its name from the lucrative Chinese silk trade along it, which began during the Han Dynasty.

Later on came the rise of maritime European empires, in the 16th and 17th centuries, first the Portuguese and Spanish Empires, and later the Dutch and British Empires. The Age of Discovery, the two World Wars, the Great Depression, the Bretton Woods Conference, GATT and WTO are only several of the many landmarks in the long history of globalization.

International business, international trade, trade agreements, economic blocks and special trade zones, tax havens, global information system, the internet, international tourism, multilingualism, anti-globalization movement, international migration and global work-force are only some of the numerous aspects generated by globalization.

Globalization has many dimensions and many nuances once it ceases to be conceived as a single entity. We can, for example, speak of the globalization of education, of technology, of science, of medicine, of politics and culture, (that is why some authors prefer to talk about globalizations and not about globalization, or even about global system) and of world economic governing systems like liberalism and socialism.

2. Globalization and mondialisation – etymological differences

Globalization, mondialisation, mundialisaton, worldwide – out of these

four terms, *globalization* is the one you hear most often.

Globalization is a word that constructs itself naturally in the English language by combining the word “global” with the standard suffix “ization”. It obviously must mean “to become global” or “to make global”. A brief examination of the etymology of the word “global” establishes its root in the Latin word *globus* or “ball”, thus suggesting inclusiveness and completion, conveying a sense of the earth as an all-encompassing whole. Global as an adjective has a geometrical and geographical sense. Globalization refers to the globe, to the shape of globe and hence, with regard to the earth, to the shape of the earth. Even though the term globe was coined as early as in 15th century, common usage of term such as globalization did not begin until about 1960.

Theodore Levitt, American economist, professor at Harvard Business School and editor of the Harvard Business Review, is widely credited with having coined the term globalization in one of his articles titled “Globalization of Markets” which was published in 1983.

However, the term was in use well before that. The word *globalization* entered the Oxford dictionary in the 1930s and the Merriam-Webster dictionary in the 1950s. “Undertaken entirely”, this is the meaning attributed to the word global by Western languages. Besides, the term means “homogeneity” in French. Hence the term implies both “entirety” and “homogeneity”. Derrida pointed out that the word globalization is itself becoming global to the point of imposing itself more and more, even in France, in the rhetoric of politicians and the media.

In the 1960s, the Canadian philosopher Herbert Marshall McLuhan coined the term “global village” to refer to the collective identity of humankind in the new age of electronic technology and instantaneous movement of information. Today the term is mostly used as a metaphor to describe the Internet and World Wide Web. Later on McLuhan started to use the term “global theater” to point out the shift from consumer to producer, from acquisition to involvement, from job holding to role playing.

But there are voices who raised the question (a tautological one at first sight) whether *globalization* is indeed global. Nobody can deny that there are regions of the world which are not touched and influenced by *globalization*. They are totally isolated and therefore excluded from today’s global changes. So the world falls into one of the following two categories: players and passive observers in the game of *globalization*.

As a term, *mundialization* is often used in the same manner as *globalization* but it has different roots and so carries different connotations and denotations.

Mondialisation and *mundialization* take us back etymologically to the Latin *mundus* or “world”, a word dense with social and religious meanings but lacking the geometric totality imparted by “globe” or “global”. They refer to far more than spatial dimensions or geographic confines. They imply social and historical sense.

When we speak of “our world,” we usually mean the manners and customs, ideas, language and the like which are in our particular community or communities of reference. It is not geographic at all, though place may be a part of it. When we speak of the world at large, we are referring to the peoples and cultures around the globe. With these connotations in mind, we can see that *mundialization* thus would mean that some aspect of some part of the world at large has been globalized, that is, has undergone some sort of transfer, and, most would agree, some sort of transformation in the process.

Mondialisation breaks down frontiers and brings forth harmony. It started as an attempt to widen industrial markets and to stretch them to the geo-political blocks, a process to extend capitalism to the rest of the world. It creates a web of connections between participants – countries, companies, individuals – to such an extent that decisions made in one part of the world echo to many other parts of this system. It is like a law which applies to all four corners of the world.

In conclusion, *mondialisation* can only imperfectly be translated as *globalization*. *Mondialisation* has richer connotations and a broader scope of meaning, implying an infinite process encompassing the whole world – micro- and macro-cosmos, the Earth and humanity. *Globalization* is a process that by comparison takes place at a smaller scale.

But they both revolve around the concept of world interdependence.

3. Globalization and mondialisation – conceptual differences

Whether we speak of *globalization* or of *mondialisation*, we speak in fact of a very natural process belonging to the societal nature of human beings. It is common wisdom to present *globalization* and *mondialisation* as something positive and closely associated with human progress. Though often imprecisely used to describe a set of complex processes and realities, they are nonetheless perceived as unavoidable or ineluctable and irreversible. Also, both indicate something in motion and development, in other words, a process.

The distinction between *globalization* and *mondialisation* is the way in which the latter may be said to provide the conditions of possibility for the former. *Mondialisation* refers to putting mankind in close contact and it is a natural phenomenon and *globalization* is a modern form of the somehow ancient *mondialisation*.

Planetary space does not result from the historical past but from new factors (energy, techniques, strategies, productive forces). *Globalisation* names a process which universalises technology, economy, politics, and even civilization and culture. But it remains somewhat empty. It is a kind of *mondialisation* without the world.

Globalization leads to a whole governed by the same rules. *Mondialisation* entails that when certain events happen and certain decisions are taken in one corner of the world, the consequences will be felt in another corner of the world. They refer to all those processes by which the peoples of the world are incorporated into a single world society, *globalization* retaining a mainly economic sense and *mondialisation* a mainly social one.

Globalization is about maintaining the logic of the local markets, while *mondialisation* implies the brutal inter-connection of the markets.

Globalization as ongoing process by which regional economies, societies, and cultures have become integrated, is first and foremost a process of bringing world economies closer to one another leading to

the emergence of an international network of social and economic systems. The term is used to describe a whole set of complex processes, such as the mutation of industrial functions, market growth, and the synchronism of financial centers.

Ultimately, anything can be globalized. The word most usually refers to different national economies becoming integrated through flows of goods and services, capital and labor – in other words, it depicts a global market. But the word *globalization* can also apply to global culture, global society, global community, global ideas, global beliefs, and so on. The number of possible definitions for *globalization* is virtually limitless.

Globalization is a consequence and a condition of the capitalist system. It makes *mondialisation* come under the influence of economics. *Globalization* is world economy, economic liberalism, modern capitalism, in other words a modern capitalist society which has a global scale. It goes along modernism and capitalism. It translates into economic liberalism being spread from developed countries to undeveloped or developing ones.

Already in 1848, Marx predicted that the mechanisms of the capitalist society would penetrate everyday life. Instead of a liberal focus on the local or the national, he foresaw the capitalist discourse weaving universal interdependence between nations. As such, the world market stands as a popular example for what we today call *globalization*. Marx viewed globalization as the exponential growth of the global market and an increase in interdependence, his view still being very much valid nowadays.

Globalization has also been defined through the perspective of multinational corporations. It has been said that it is nothing more than the product of these companies. In their quest for profit, these super-companies try to maximize profits by looking for cheaper labor, for example. For them, *globalization* can be defined as the freedom to invest where and when they please, to produce what they please, by getting supplies and selling where they please, and by having to put up with as few constraints as possible with regard to working rights and social conventions.

4. Conclusion

Globalization is beyond any doubt an extremely successful catchword to use when referring to the new development of contemporary societies all over the world. And a hot topic to write about.

Globalization is largely thought of as an intrinsic characteristic of the human evolution, in which geographical areas that are miles apart and different from many points of view are indissolubly intertwined.

After its heyday in 2000 and 2001, *globalization* started to take on positive meanings. Thus it lost its polemical status. And, as a consequence, it lost its appeal as a concept in such a way that many believe it is on its way out.

Globalization is seen as a stage following *mondialisation*, a stage that implies the dissolution of national identities and the abolishment of borders inside the world network of economic exchanges.

Furthermore, there are visible differences in terms of the connotations applied to these two words and the concepts behind them: generally speaking, more negative connotations are applied to *globalization* which is generally seen through a business lens (large multinational companies outsourcing labor where it is cheaper and where there are not as many regulations, or global warming, for example), rather than *mondialisation* seen through a government lens (government aid and international

cooperation between governments, for instance).

The fact is that, when analyzing the process of globalization, we conclude that the world is ever changing – the world is gradually becoming the only world and globalization begins to refer to agglomeration and has significant consequences on everyday life. There are authors who believe that the *globalization* model is cracking up at the moment and there is no new model to replace it in the future.

Financial Stability in the Aftermath of the World Crisis – Looking for a New Framework

Halep Maria

Doctoral School ASE Bucarest – International Business

mariahalep@yahoo.com

Abstract

Effects of the worst crisis since the Great Depression are still being felt throughout the world. While emerging economies have found their way out, due to sound economic fundamentals, developed economies are still struggling. The crisis unfortunately proved the damages caused to real economy by a non-regulated global, interconnected financial system. This article aims assessing the performance of recent regulation measures and provides additional regulation paths enabling financial stability.

The first section briefly summarizes the factors having allowed the development of the current financial and economic crisis. The second section analyses the links between financial markets and real economy, both in developing countries and in advanced economies.

The third section addresses the necessity to regulate the financial system.

The fourth section assesses the effectiveness of existing regulation policies, particularly the Basel III Recommendations and the Dodd-Frank Act, in the US.

The fifth section proposes different regulation solutions and concludes.

Key Words: financial crisis, regulation, liberalization, shadow banking

JEL Classification: G01, G38, E44, E32

Introduction

We are now reaching the end of the deregulation era that started more than thirty years ago in the United States. After the Second World War, souvenirs of the Great Depression started to fade, preparing a perfect playing field for debt accumulation. In the 1980s, with the election of Ronald Reagan at the White House, starts a

progressive retreat of the State Intervention in the economy. The movement had already been started by its predecessor, Jimmy Carter, who had deregulated sectors such as aviation, road transport, as well as oil and gas distribution. Ronald Reagan continued in this path with finance deregulation. The first law in this direction was the Monetary Control Act, adopted in 1980, lifting the ban on deposit remuneration by commercial banks. It was followed in 1982 by a new law, Garn St. Germain Act, relaxing restrictions on the types of credits that banks may consent, opening the path to increased competition, concentration and high risk taking among commercial banks. The final step was made under the Clinton presidency, when, in 1999, the Glass-Steagal Act, separating commercial from investment banks, was aborted [4]. Meanwhile, remaining rules were not updated to cope with new developments in finance and especially the soar of the “shadow banking”, which had become, by 2008, more important than the traditional banking system (20 trillion against 11 trillion dollars) [7]. The same deregulation processes took place in other developed economies in Europe, though somehow later (excepting for the U.K.) and at a different pace.

Considering the impacts that the financial system has on governments, real economy and society in general, it is vital to reconsider the financial system’s functioning and try to imagine the best ways to ensure global financial stability, a necessary condition for attaining long-term sustainable growth.

Section 1. Factors leading to the Financial Crisis

As mentioned in the Introduction, a deregulation process was deployed in developed countries starting with the 1980’s. This movement was supported by politics,

but also by mainstream economics, which embraced the “market efficiency and auto-regulation” theory. Combined with some other factors, such as technological progress, very low inflation and loose monetary policies, the souvenirs of the Great Depression faded away and so did the aversion to risk-taking, both of banks, investors and private consumers.

Soon after the deregulation process started, the concentration of very large financial institution has reinforced. A BIS report shows that bank concentration, while having remained constant for almost 50 years, between 1930 and 1980, has since more than three folded [2].

Low risk aversion and moral hazard made financial institutions take more and more risks. At the down of the crisis, these highly concentrated and interlinked institutions had increased significantly their financial leverage. Between 2004 and 2007, the leverage ratio (total assets divided by common equity) increased from 27 to 33 in Europe and from 15 to 18 in the United States. Liquidity ratios were at historical levels (which make sense considering the abundance and low cost of liquidity in those years). Too big to fail financial institutions would now take huge risks as they know their impact on the rest of financial institutions and the real economy is so huge that governments will not afford no to come to their rescue.

However, when crisis do occur and governments are forced to intervene, bills tend to be very spicy, putting a strain on governments finances, particularly in those countries where financial institutions represent a large part of the country GDP. This is a vital issue, as the repeated government support to these institutions raises the question over the fairness of the system and the distribution of costs: while benefits go to stockholders and well paid traders, losses are socialized and paid by the taxpayers.

An economist that has finely developed a theory on debt accumulation and the subsequent crisis was Hermann Minsky. In the “financial instability hypothesis”, he explained that long periods of economic stability favor debt accumulation, as agents are less risk-averse: investors embark in more risky projects and banks pay less attention to credit allocation. However, the excessive

debt ratio of the economy may become a vulnerability factor when things start going bad, because collective efforts to pay debts created a downward movement on assets prices and increases the debt value. Irving Fisher once said: “the more the debtor pays, the more he owes”. If the process continues, impact may be felt in the real economy, as consumers cut their expenses to repay debt, economic activity declines, and unemployment rate raises, and deflation may gain the economy, increasing de facto the real debt value [4].

Section 2. Links between the financial system and the real economy

In order to apprehend the increased “role and impact of the financial system on macroeconomic decisions and on financial stability, it is useful to study the links through which financial crises may have negative impacts to the real economy.

In the advanced countries, the crisis started in the financial markets and gradually spread in the real economy. Banks’ ill balanced sheets needed government rescue, thus increasing public deficits and public debt. Banks’ troubles and increased risk aversion brought with them the “credit squeeze”, spreading the financial crisis to the real economy (despite central banks efforts to provide banks with liquidity in order to support credit to the real economy). Firms started having financing problems, bankruptcies followed, as well as a depressed economic environment. Declining economic activity started raising unemployment and activating automatic stabilizers. Public deficits widened as the amount of fiscal taxes fell and unemployment and social benefits climbed. For developing countries, financial crisis usually takes the form of retreating capital flows from these markets, due to investors’ risk aversion (this is what actually happened after the crisis burst in the developed world) or because of deteriorating fundamentals in the receiving country (Asian Crisis, Brazil, Argentina).

This distinction between financial channels in developed and developing countries is crucial in defining future regulation: while advanced economies should focus on regulating the “arm’s length” part of

finance”, developing and emerging countries might pay more attention to capital controls.

Section 3. The need for regulation

Considering what we already know on the effects of the crisis on the world economy, the answer might seem obvious, and it actually is. But I think it is important, given the fact that less than five years ago, the world and economic thinking included was embracing the “efficient market theory”, to address the problem and deduct the logical solution. The Stiglitz Report (page 115 – French Edition) offers a simple solution to the problem.

Table 1. Regulators’ dilemma

	Bail-out	No bail-out
Regulation	A	B
No regulation	C	D

Source: [9] Rapport Stiglitz “Pour une vraie réforme du système monétaire et financier international après la crise mondiale”, 2012

Considering a big complex financial institution in difficulty, its bankruptcy would create important damages to the financial system and to the real economy. Two alternatives are possible before the crisis bursts: regulation or no regulation. Two alternatives are available after the crisis burst: bail-out or let die the institution.

A free market fundamentalist would choose the “D” option, no regulation and no “saving”. In real life, however, the “D” option is not a realistic one, as in almost every country there is a financial institution so big and complex that its disappearing will negatively affect the economy, so, de facto, government will come to its rescue. The remaining options are “A” and “C”. As the State cannot afford not to save these institutions, economic efficiency requires the choice of the “A” option, “regulate” and “save”.

This judgment is applicable for big complex institutions, but also for smaller ones, but interconnected, as their negative effect on the economy might prove important as well.

The Stiglitz Report raises another interesting point about regulation. It is true that regulation attracts innovation, as the financial system tries to counteract regulation. It makes an association with the fiscal

measures, which have the same functioning, as firms and private tax-payers do their most to counter these rules (usually called “fiscal optimization”). In fiscal matters, the State has not decided to stop taxing; instead, it deploys dynamic measures, which progress in the same time as the “innovation” in fiscal optimization.

That being said, regulation measures already exist and updates have recently been made, as we shall analyze in the next section, but succeeding the regulation process is a very difficult task because of the large perimeter and the rapid evolution in financial innovation.

Section 4. Recent regulation measures

The most notorious set of regulation measures are the Basel recommendations. The word “recommendation” has all its place, as the Basel Committee does not impose, but suggests sets of regulation measures, it is then up to each country to adopt, or not, the proposed rules. Historically, Basel rules imposed a capital adequacy on the engagements taken by banks, that is, blocking capital according to risk weighted assets.

Various critiques were addressed to these rules. Firstly, it only concerns the assets published in the balanced sheets. The securitization process escapes completely (it is true that securitization developed mostly after the first Basel rules adoption, nonetheless, these rules failed to rapidly adapt to the financial innovation). Next, Basel rules are criticized for their pro-cyclical bias, though Basel III has absorbed this critic and established counter-cyclical buffers. Indeed, these regulations put an emphasis on risk-sensitive models in which risk estimates are supposed to be based as much as possible on market developments [6].

Last but not least, Basel rules often came too late, not to mention the laps of time for their adoption and implementation by national regulatory bodies, when the implementation is decided. In the mean time, finance instruments evolved rapidly and regulation lagged behind.

Basel III rules did innovate with the two liquidity ratios proposal, the Liquidity Coverage Ratio (LCR) and the Net Stable Funding Ratio (NSFR), asking banks to

increase their liquidity in order to resist to stress-test conditions. Banks will have until 2015 and 2018 respectively to adapt and fulfill these new obligations, if their national regulators adopt the recommendations.

However, regardless of the quality and efficiency of the Basel rules, supposing that the most advanced economies will all adopt them, which is far from being accomplished, the slowness of the process makes the implementation already inefficient. The crisis burst in 2008, first Basel rules updates came in 2010, Europe decided to implement the recommendations, here we are, end of 2012, 5 years after the first signs of financial crisis, with Basel texts waiting to be voted by the European Parliament and with no step made towards the implementation process. Basel III rules will become obsolete by the time they are actually implemented.

Supposing they will be implemented, the Basel III recommendations may have significant impact of banks' profitability and balance sheet structure. Undeniably, implementation will increase their resources cost, lowering profitability. In order to respect these ratios, banks will have to either recapitalize (difficult in a context of deceiving results and weakened market confidence), either restructure their activity portfolio, focusing on those activities that consume the least common equity possible. This strategic change of portfolio activities may take the form of asset selling (ex. Leasing activity sell-out), as well as a reduction of the trading activities and a slowing down in new projects development (from credit lines to external growth). These changes will most probably have very negative effects of small and medium enterprises, which already don't have access to market funding and will find themselves in a critical situation when banks will stop lending them as well.

The United States chose their own regulation process and, in 2010, The Dodd-Frank Act was signed, aiming at improving market transparency and reducing the risk of systemic default. It encompasses regulation beyond futures exchanges by including swaps, which become subject to clearing and exchange like trading. Furthermore, dealers and major participants to swap deals are subject to capital and margin requirements. Among the most important measures, is the

requirement for financial institutions to produce their own “living-wills” when there is no sensible procedure for shrinking them or reducing their complexity. The second idea is the introduction of a special resolution authority, in order to avoid too slow banking procedures or not taking into account externalities. This authority could intervene prior to a declaration of insolvency.

However, for the time being, the Dodd-Frank Act has encountered problems in implementation and discussions are still being held on various items.

The problem with these solutions is that they are local and aimed at strengthening existing rules or including some missing elements and pay no attention to the restructuring of the financial system.

Section 5. Additional propositions to re-regulate the financial system.

This section analyses some other solutions available to re-regulate but also argues for a stronger restructuring of the financial system in order to ensure financial stability and a solid playing field for sustainable economic growth.

Increasing capital requirements and liquidity standards, as realized in the Basel recommendations, are useful but very insufficient, especially for systemically important financial institutions. For the latter, accrued surveillance and a specific set of policy instruments are needed: the creation by financial institutions of living wills (to be used in case of a crisis blow up, update it and keep regulators informed about it), the creation of authorities entitled to intervene when liquidation procedures are considered too slow, in order to prevent contagion risks. Some other measures could include the automatic conversion of the “bail-in” debt into capital, the interdiction, when the institution goes bankrupt, to be bought by an even large institution and, of course, introduction of size caps, in absolute value or as a per cent of the GDP.

Some other studies focus on more macro prudential policies. Among the propositions made by the Stiglitz Report, the UNCTAD (Trade Development Report, 2011) but also some economists such as Allen (2011), the following ones seem appropriate and have a reasonable chance of being implemented.

For instance, a first suggestion is the diversification of the institutional framework, giving a larger role to public, regional and community banks [10]. Public banks have long been criticized for many years, as they had access to public resources, by opposition to private financial institutions. With the recent rescues of big private banks, the criticism is no longer true, and it may even be reversed, in the sense that private banks, while receiving aid from governments, have retained control over profits and management. Therefore, contrary to public ones, where government invest resources but also gets benefits, private banks proved to be a net loss for the public system. Allen has recently conducted an analysis that highlights three important advantages of having, in a diverse financial system, some public banks. The first one relates to the proven resilience in a context of crisis and their role in compensating for credit crunch. It is well known that small and medium firms suffered the most from this crisis, as banks cut their lending and this category was the first one to be touched, especially in Europe, where private equity is less developed. Even if efforts were made, notably by the European Central Bank, who lend billions of euros to the most important banks in the Euro Zone in order to stimulate credit in the economy, banks preferred to invest in government bonds or to place the liquidity in the deposit facilities with the ECB. The idea of public banks is gaining field, for instance, in France the “Banque Publique d’Investissement” is now being created. A second favourable aspect of publicly owned banks is that they support activities that bring much better social welfare than the private banks and provide wider access to financial services. Finally, they may also help promote competition in situations of oligopolistic private banking structures [1].

Shin, on the other hand, suggests limits on the liabilities side, especially on those resources that do not come from deposits, in order to prevent excessive credit growth [8].

Restructuring private banks is a very strong proposition, sustained both by the Stiglitz Report and some economists such as Reddy and De Grawe, but it presents more obstacles for real implementation, because of political pressures, conflicts of interest and powerful lobbying. Separating activities of

investment and commercial banks could be the next important step towards the restructuring the financial system, after the creation of public banks. The logic behind this idea is that financial institutions nowadays resemble a lot in their structure. Universal banks, which used to collect deposits and allocate credit to the economy and also ensure the payment system, became more and more involved in investment banking activities, becoming therefore, more fragile and more exposed to contagion. Two solutions are thus possible, impeding commercial banks to embark in trading activities, for its clients or on its own and, in order to overcome the too big to fail problem, dismantling very large financial institutions. Empirical evidence shows that, beyond 100 billion of assets, there are no economies of scale [3].

Last but not least, it is important that regulation be focused on activities and instruments rather than institutions. This way, including in the regulation framework the “shadow banking system” should be conceivable: money market mutual funds, asset backed securities markets financed with repos, they all function as banks, they all borrow short and lend long, assuring a transformation process.

Conclusions

The ongoing financial crisis has proved the powerful impacts that the current financial system, through its size and interconnectedness, has on the world economy. The crisis put on the table the need to restructure the financial system, in order to ensure financial stability. While some timid efforts have been made to re-regulate, no fundamental step has yet been taken in the way of restructuring the system. However, some broad conclusions can already be made.

First of all, in order to be efficient, the regulation perimeter must cover all institutions and instruments. Without an articulated and global regulation, regulation arbitrage will certainly emerge: activity will be progressively transferred towards the “shadow banking”, markets with fewer or without regulation systems. These policies must be concentrated on activities, and instruments, on one hand, and on institutions of systemic importance, on the other hand.

Nevertheless, no one can guaranty the exhaustiveness of regulation measures and their force to reach the entire financial system. That is the reason why regulation must focus as well on transmitting the good incentives, aiming at restricting risky activities and limit the damaging consequences playing [8].

At the international level, a universal coverage of the regulation should enable limiting national financial systems' exposition to risks coming from countries that would fail to implement an efficient regulation policy. Additionally, attention should be paid to detect anti-loyal stratagems of developed financial centers to preserve their privileged positions.

In the second place, it is important, for succeeding in the financial stability objective, to reach international cooperation. A global integrated financial system cannot be regulated on a national basis. All countries are concerned by financial stability and regulation measures are only a part of it. Attention should also be provided to the flow of short term capital to developing and emerging countries, for their potential destabilizing effect on macroeconomic variables [5].

Until the problem won't be addressed globally and there is no real political willingness to tackle the problem, reforms, already timid, will stay local and a new financial crisis may hit again. It will maybe be the slap that will wake us up.

Developing Countries in the Aftermath of the Financial Crisis – Constraints and Possible Outcomes

Halep Maria

Doctoral School ASE Bucharest – International Business

mariahalep@yahoo.com

Abstract

The on-going financial crisis, resulted from increased financial deregulation, easing monetary policy and a blind belief in financial markets’ efficiency and auto-regulation, is still haunting the world economies. While the developed ones are still struggling to find growth, the impact on developing countries is mitigated. The purpose of this paper is to assess the economic and social impacts of the financial crisis fall-out on the developing countries.

The first section briefly summarizes the factors having allowed the burst of the crisis and its contagion to the real economy. The second one analyzes the transmission channels of the crisis: terms of trade, volatility in commodity prices, poverty climb and income inequality. The third section gives some insights on the capacities of developing economies to respond to such an adverse external shock and the outstanding pressure. Forth section suggests possible solutions while acknowledging the limits of a theoretical exercise. The fifth section concludes.

Key Words: financial crisis, developing countries, interconnectedness, capital flows

JEL Classification: E44, F32, F33, F43

Introduction

In guise for the Introduction, I would like to explain the reasons for choosing to study the impact of the financial crisis on developing economies.

The first one is the increasing contribution of developing countries to world GDP growth. During the last 6 years, 74% of the world growth was due to developing countries, against 22% to the developed ones. This feature is in sharp contrast with their

respective contribution to global growth in previous decades, attesting for their increasing role on the world scene (these calculations include the BRICs):

Graphic 1. Regional contributions to world GDP growth (1970 – 2012)

Source: [8]. UNCTAD Trade and Development Report, p. 4

Secondly, developing economies suffered from an exogenous adverse shock, by contagion from advanced economies. Having specific macroeconomic features, different from the developed world, the channels through which developed countries’ crisis affects them are specific, and so are their subsequent responses.

Last but not least, assessing the facets of the interconnection between advanced and developing economies provides a useful insight in identifying solutions to support global financial stability and growth.

Section 1 – Financial Crisis genesis

The financial crisis that started on the US housing market carried the developed world into the worst recession since the Great Depression. Advanced economies’ recession weakened global demand and influenced the

world terms of trade, thus spreading the initially local crisis throughout the world.

The last forty years were marked by a significant deregulation process, product innovation and technological revolution; all comprehended in the general belief in the “market efficiency theory”. Low inflation, abundant and cheap liquidity and blunt confidence into the efficient and auto-regulated financial markets, all competed in the emergence of a general perception of low risk, thus pushing investors and speculators to more and more risk-taking [6]. The crisis’ burst wiped-out well accepted fundamentals, calling into question economic theories, financial institutions, governments and macroeconomic thinking in general.

Despite irrefutable benefits of the financial system – principally the improved access to borrowing, available to more far-away markets, at competitive costs – the risks carried by the systemic nature of the financial sector have proved pitiless. Through its interconnectedness with the real economy, financial distress may have long lasting effects on economic performance [6].

The common sense suggests that financial stability should be a continuous concern for the developed economies and international institutions, such as the IMF. This concern could translate into a better incorporation of the linkages between financial system and the real economy, as well as of the impacts that policies and developments in other economies may have on the domestic and financial sectors [1].

Section 2 – From the financial to the economic crisis, from local to global: transmission channels

In advanced economies, the crisis started in financial markets and gradually attained the real economy. Banks’ ill balanced sheets needed government rescue, thus increasing national public deficits and exploding public debt. Banks’ difficulties and increased risk aversion translated into a “credit squeeze”, spreading the financial crisis to the real economy. Firms started having financing problems, bankruptcies followed, as well as the emergence of a gloomy economic environment. Declining economic activity caused raising unemployment and activated automatic stabilizers. Public deficits widened

as fiscal taxes dropped and unemployment and social benefits amplified.

In most developing countries, the crisis was initially felt in the real economic sector and then spread to the financial sector, except for those which benefitted from significant capital flows from foreign investors.

The main channels through which the crisis spread throughout the world were the following:

- **Direct Financial Channels:** while very important for developed economies, with widely developed financial markets and a high degree of financial integration, this channel was less powerful for developing countries.

- **Indirect financial channels:** most of the developing countries, excepting a few emerging economies, have limited borrowing capacity on international financial markets. In the aftermath of the crisis, in a context of squeezing market liquidity and high risk aversion, developing countries access to international markets, if available, was accompanied by high interest rates, damaging to the macroeconomic fundamentals such as fiscal balance and public debt. Another important indirect financial channel, especially for emerging markets, is the sudden switch in foreign capital flows, as well as foreign banks’ willingness to continue financing credit in these markets, while they suffer pressure from their own domestic markets.

- **Economic channels:** the advanced economies’ recession weakened global demand, which had negative impacts on developing countries, especially exporting ones. The following chart illustrates the crisis effects on the world economy GDP in the aftermath of the crisis fall-out.

Graphic 2. GDP trend, international comparison

Source: Author calculations, UNCTAD database

Indeed, the last twenty years have witnessed an increased liberalization of trade, making developing countries more interconnected with the world economy. Trade openness, calculated as the ratio of the sum of exports and imports to GDP, has increased substantially since 1991 and has been accompanied by an acceleration of growth.

Graphic 3. Growth and trade openness – developing countries

Source : WEO database

Commodity exporters are generally twofold affected, through a lowering global demand and falling commodity prices, triggering an important reduction in their revenues and GDP.

Graphic 4. Commodities price 2002 - 2012

Source :Unctad

World Development Report 2012

The strong volatility observed in commodity prices is striking. In the aftermath of the global crisis, the decline in commodity

prices had negative effects on export countries, both through the terms of trade deterioration and the fall in external demand.

Furthermore, while export developing countries are sometimes equipped with fiscal redistributive policies aimed at helping the poorest, commodity-importing countries suffer from rising import bills, particularly for food and fuel, thus limiting their development capacity but, most of all, inducing damaging effects on household budgets. It is well known that food and fuel represent more than 80% in certain developing countries households' budget. This feature makes them dependant on commodity price evolution and aggravates the already large income inequality.

Not the least, recession in advanced economies may generate a drop in remittances and in financial aid, especially those intended to low income countries.

Section 3 – Developing countries responses, threatens and opportunities

Compared to advanced economies, developing countries, except for some emerging economies, cannot afford to implement policy instruments necessary to counteract an adverse external shock, for various reasons.

Firstly, people have fewer resources to face crisis, income inequality is more stringent, and poverty touches important parts of the population, so the poorest are immediately touched in the case of an adverse negative shock. Secondly, automatic stabilizers are weak or inexistent, as social protection systems are embryonic, which intensifies the already negative impact outlined in the first point [4]. Thirdly, the weak borrowing capacity on international financial markets limits their capacity of implementation of counter cyclical policies. Therefore, various countries are constrained, for instance, to adopt cyclical fiscal policies as their fiscal revenues diminish during recession time and they cannot benefit from adequate financing for maintaining existing public expenses, not to mention expanding them. Meanwhile, entrepreneurs and private investors are confronted with credit constraints and a climb in borrowing costs. [7]

Fourthly, financial interconnectedness plays a crucial role in exacerbating already existing risks. Countries having totally liberalized their capital accounts and borrowing on international financial markets are the ones the most touched by external shocks. [7]

Capital account liberalization is a thorn-bush issue, as many developing countries have been constrained by international institutions, IMF included, to liberalize their capital account in exchange for support programs [3]. While capital account liberalization may have significant benefits for the receiving country, such as enforced access to capital and capital investment endorsement, it also poses some risks, such as pressures on currency appreciation (eroding the economy’s competitiveness at exports), asset bubbles and capital inflows volatility, i.e. drastic reverse when a switch in international investors’ risk appetite occurs.

Graphic 5. Net private capital flows towards developing and transition economies, 1980-2010 (\$ millions and as percentage of recipient countries' GDP)

Author calculations, World Economic Outlook 2011 database

As we can observe in the figure above, the financial crisis caused an abrupt shift in net flows towards developing countries. However, once the turmoil calmed down, sound fundamentals (notably in emerging markets), health sovereign and balance sheets and low US real interest rates contributed to drawing inflows to developing countries again. While inflows are recovering at a fast pace, their volatility and composition (portfolio inflows gain place against foreign

direct investment and bank lending [5]) requires increased consideration and fine-tuning macro-economic management. These developments in the inflows trend make a point in adopting capital account controls, even if IMF historically prohibited capital account controls and recently shifted towards a softer view [1,5], issuing a set of capital account measures applicable under special circumstances and for a limited period. (That being said, its work was not well received by emerging markets, which plead for independent macroeconomic policies implementations).

Another feature of the developing countries, most specifically emerging economies, is a significant current account surplus position, as they are net exporters on world markets. This allows them to either reduce foreign debt or accumulate foreign assets, including international reserves. After having gradually reduced their foreign debt ratio, emerging economies used their current account positions to accumulate huge amounts of international reserves. While concentrated in China, the unprecedented rise in international reserves has been a widespread phenomenon in the developing world, especially after the asian crises in the 1990s, aimed at preventing currency appreciation, especially in the case of volatile capital flows.

Graphic 6. Reserves of developing developed and transition economies and China

Source :World Economic Outlook 2011 database

Despite widely improved external positions, emerging countries proved vulnerable in the global crisis because of greater integration and interconnectedness in unconstrained global finance. They were definitely less impacted than developed countries, due to their sound economic fundamentals, low debt ratios and important foreign reserves, but still, the GDP and trade slowdown in the aftermath of the crisis testify for the increasing interconnectedness of the world's economies.

Conclusions

The current crisis has highlighted the increasing interconnectedness between finance and real economy, as well as between different economies around the world.

While the negative effects of the Western Crisis to the Developing Countries are rather obvious, the solutions are less obvious, for various reasons.

Firstly, developed countries, while having officially escaped from recession, are still facing difficulties to return to economic growth. Europe's case is even more worrying; caught out in a political and economic crisis, growth is weak, economic climate is gloomy and unemployment has reached historical peaks. Countercyclical policies have worked rather well in the aftermath of the crisis, but left behind important public deficits and debt ratios. This actually made politicians embark into austerity policies, hindering the already weak signs of recovery and aggregate demand. Notwithstanding, Europe also faces structural deficit problems: health and retirement expenses should hike by 2030 as the “baby boom” generation grows old, thus requiring important and painful reforms.

Today's Europe has its hands tied up, at least until a political consensus is reached. At the moment, Europe is not talking with one voice, so it is rather utopian to think that Europe will embark in discussions on world economic development, while it's hard for it even to look after its own problems.

We talk about the nonsense of the pro cyclical policies imposed to developing countries. The Euro Zone actually applies the same treatment to its suffering members, conditioning help packages on governments' engagement to apply restrictive policies in

order to reduce public deficits and debt ratios. But everyone knows that the debt ratio is dependant on two factors: the public deficit accumulation and the GDP growth. Cutting expenses in a moribund economy will only worsen the situation, as aggregate demand falls and brings with it GDP losses. While governments must implement optimal expenses and avert waste, it has to be very careful not to further depress an already suffering economy.

Given the degree of globalization of the economy, the strong links between most of the economies in the world and the increasing role of international finance, the only solution to ensure global financial stability and sound growth is a world-wide negotiation of a financial reform. It seems maybe unrealistic, but, for the moment, no other solution has proved useful.

This leads us to the obvious conclusion that financial stability should be a continuous concern to developed, developing and least developed economies, as well as international institutions, because, in an integrated world economy, one's actions may have important spillovers on the rest of the world. This concern should translate into a better incorporation of the linkages between the real economy and the financial system, as well as the impacts that policies and developments in other economies may have on the domestic and financial sectors.

While developed countries will probably try to make progress financial activities and financial markets regulation – though, for the moment, the starting block is rather disappointing –, developing countries should support initiatives in that direction, because they are indirectly impacted, but they should also push for an agenda that helps them deal with problems specific to developing countries and for which advanced economies are not completely irresponsible. Among these problems, let us note the exchange rate policy, the management of the balance of payments and the stock of foreign exchange reserves, management of capital flows in order not to shatter its financial and real sectors when capital flows abruptly fly off, resulting from a change in the investors' risk perception.

Global cooperation should enable address developed world's problems – vast interconnected, non-regulated financial

system, less prospects for high growth and aging population –, those of emerging economies – capital flows management, exchange rate policies, reserves accumulation and not to forget the least developed countries, the most vulnerable in the economic process, for which supporting programs must be provided as well as specific aid, especially when they suffer from exogenous adverse shocks[2].

Foreign Direct Investments and Human Capital Accumulation. The Case of Romania

Halmi Mirela

Carpathica Commercial Bank Satu Mare

mirelahalmi@yahoo.com

Abstract

The paper explores the effects of foreign direct investments on the human capital accumulation in the case of the Romanian economy. Using data for 1995-2010, the study shows that it is strong relation between FDI flow and the share of the tertiary educated people in the population aged 20-24. This is suggesting that there is a beneficial effect of the FDI flow in the economy, stimulating the demand for a high quality human capital.

Key words: foreign direct investments, human capital, education demand

J.E.L. classification: E 22, J24, I25.

1. Introduction

The flows of foreign direct investments (FDI) are the largest and the most stable sources of private capital for developing countries and economies in transition.

It is very well recognised among the economists the beneficial effects for the economic growth, employment, national productivity.

There are several channels through which the flows of FDI into developing countries may increase economic growth. An example is via technology transfer [10], [9]. Another is the raise of the plant productivity in the host countries [1], [6]. Furthermore, FDI may increase the relative demand for skilled labor and lead to a rise in the skilled labor share of total wages, as multinational firms are often more skilled-labor-intensive than the rest of the economy [18].

The above considerations are suggesting that there is possible a causal relationship between FDI and human capital accumulation. From the perspective of host countries, especially in the developing world,

FDI is typically considered by several authors as an essential deliverable package of capital, technology, management skill, and know-how.

The present study aims to explore the impact of the foreign direct investments on the human capital accumulation in the Romanian economy.

The paper is organised as follows: after a short literature review on the relation between FDI and accumulation of human capital, the methodology and data are described and the main findings are exposed. The final section is dedicated to conclusions.

2. FDI and human capital accumulation: a short literature review

There are several aspects of the FDI impact on the host countries analysed in the empirical studies.

First of all, FDI has a favourable impact on the rate of growth [7],[8],[12],[13],[15],[22],[16].

Positive effects of FDI on growth or productivity spillovers are attributed to De Gregorio (1992) Blomström et al. (1992, 1994), Bende-Nabende and Ford (1998) Zhang (2001) for the majority of East-Asian economies and Latin America and Baldwin et al. (2005) for nine OECD countries.

Furthermore, the inflows of FDI add to total capital stock in host countries and raise the marginal product of skilled labor relative to unskilled labor. As foreign affiliates are typically more skill intensive than domestic firms in developing countries, the increase in foreign investment may enhance the demand for skilled labor. Furthermore, if foreign firms introduce new products or processes to the domestic market, domestic firms may benefit from the accelerated diffusion of new

technology [21] and the resulting rise in labor productivity further enhances the need for skilled labor. Due to the lack of well-educated workers in developing countries, the higher demand for skilled labor accompanied with the inflows of FDI leads to higher wages of skilled versus unskilled labor that raises a worker's incentive to acquire more education.

The relation between education and FDI is studied by several authors. Hoffman (2003) constructs a general equilibrium model and theoretically shows that an education subsidy under investment liberalization can lead to equilibrium with a much higher level of skilled labor in the economy.

Egger et al (2005) uses cross-sectional data of 79 countries and finds that net inflows of foreign direct investment raise participation in higher education.

As analysing method, a cross-sectional time-series analysis is more likely to fully characterize the effect of FDI on human capital accumulation, because it takes time for FDI to affect the return to education and labor earnings and therefore the individual's educational choice. It follows that data including time series variation in FDI and education are likely to be able to show the relationship between them.

Furthermore, the causal relation may go from education attainment to foreign investment, because regions with better educated population maybe more attractive to multinational companies. There is an array of works that stress the positive role of FDI conditioned on adequate local factors especially human capital. For example, Borenztein et al. (1998) in their study of 69 developing economies for 1970–1989 concluded that the effect of FDI is dependent on the human capital stock. Bengoa and Sanchez-Robles (2003) reached the same conclusion for Latin America based on economic stability and liberalized financial markets. We can conclude that human capital is a factor of the "absorptive capacity" of FDI in the economy.

We can conclude so far that when we discuss the relationship between human capital and FDI flow in the host economies, human capital plays a dual role: as determinant of the FDI flow (a factor of attractivity for FDI) and as effect of the FDI flow, through the mechanism of economic growth. It is demonstrated by several empirical studies that economic growth stimulates the demand for education which leads to accumulation of human capital and increase of the human capital stock in the economy [5].

There are some empirical studies demonstrating that the proportion of higher educated people is influencing significantly the economic output in Romania. The composition of human capital in the economy is important for growth, meaning that the tertiary education as a measure of the quality of human capital is an determinant of the economic output and its dynamic [20].

Summarising the above considerations, the paper aims to demonstrate that FDI flow has a positive influence on the human capital accumulation and the economic growth is determined by FDI flow and human capital stock in Romania.

3. Theoretical approach, methodology and data

We explore the effects of FDI on the human capital accumulation in the Romanian economy, using the following variables: FDI flow, GDP per capita and human capital. Human capital is expressed by the percentage of tertiary educated people (ISCED levels 5-6), data for 1995-2010, from EUROSTAT data base. The values for FDI flow and GDP per capita are collected from UNCTAD data.

We assume that the human capital is positively influenced by the flow of ISD.

$$EDU_SUP = f(ISD) \quad (1)$$

Assuming that (1) is a linear dependence, all other factors being constant, the regression equation use could be:

$$EDU_SUP = \beta_0 + \beta_1 ISD + \varepsilon \quad (2)$$

where: β_0 is a constant, β_1 is the regression coefficient and ε is the standard error.

Assuming that there is a time lag when the educational stock increases as a consequence of a increased level of FDI flow, the equation (2) is re-written as follows:

$$EDU_SUP_t = \beta_0 + \beta_1 ISD_{t-1} + \varepsilon \quad (3)$$

where t is time.

If we check the joint effects of FDI flow and human capital on the economic growth, we use the following regression equation:

$$PIBC = \beta_0 + \beta_1 ISD + \beta_2 EDU_SUP + \varepsilon \quad (4)$$

where PIBC is GDP per capita.

4. Main findings

As we can see in the Table 1 there is strong correlation between the share of the tertiary educated people in the population aged 20-24 and the flow of ISD. The model is statistically validated due to the fact that the p-value is lower than 0,05(the significance treshold).

Total	14	222,94			

	Coefficients	Standard Error	t Stat	P-value	Lower 95%	Upper 95%
Intercept	4,0787	0,7595	5,37	1E-04	2,44	5,72
ISD	0,0008	0,0001	6,16	3E-05	5E-04	0,001

Source: authors calculations using Excel Data Analysis Application

The econometric model can be validated, as the SignF is lower than 0,05(the significance threshold).

When FDI flow increases with 1 dolar, the share of higher educated people increases next year with 0,0007 percentage points. It is not a spectacular increasement, but is a positive effect, statistically validated (p-value is lower than 0,05 (the significance threshold)).

If we check the joint effects of the FDI flow and the human capital on the economic growth, the findings show (Table 3) that they are beneficial to the evolution of GDP per capita in the case of Romania.

The econometric model is statistically

validated, due to the fact that sign F is lower than 0,05 (the significance threshold).

Based on the above findings, the main conclusion is that in virtuous circle of growth, the FDI flow induce economic growth, wich stimulates the demand for high quality human capital and this lead to the accumulation of human capital in the economy. Further, an increased level of human capital in the economy is leading to a higher level of the absorptive capacity of FDI in that economy:

5. Conclusions

Human capital, expressed by the percentage of the higher educated people in the population aged 20-24, is positively influenced by the FDI flow, the relationship being statistically validated. This influence is transmitted through the mechanism of economic growth.

As determinant of economic growth, the FDI flow stimulates the demand for tertiary education and accumulation of high quality human capital.

The findings of the study confirm the general results regarding the positive effect of FDI flow on human capital accumulation.

We have to mention the limits of the study, especially the low number of observations and the omission of other factors that can influence the results (economic, absorptive capacity of the economy, economic recession and wider time lags in the technology transfer).

RUSSIA – The Clay Feet Giant in World Economy. A Forerunner Image of the Economic Crisis

Mihai Ioana-Iulica
Constantin Brancoveanu University from Pitesti
iuliamihai72@yahoo.com

Abstract

Until recently the Russian economy was one of the fastest growing economies in the world. The economic growth brought an improvement in the standard of living of the average Russian citizen and also brought an economic stability that Russia had not experienced in at least a decade. This strong economic performance had been a major factor in the popular support that the Russian leadership enjoyed and was also arguably a factor in the boldness with which that leadership reasserted Russia's status as a world power, challenging the United States, Europe, the neighboring former Soviet states in economic and national security areas. However, as it has been the case with most of the world's economies, the Russian economy has been hit hard by the global financial crisis and the recession.

Cuvinte cheie: Economic Development; Foreign Trade; Inflation; Weaknesses.
Clasificare J.E.L.F5; O1; O4;

1. Introduction

Considering the situation ‘on surface’ we see that Russia has some of the world's largest reserves of oil, natural gas and other raw materials, many of which are critical to industrialized countries. Many European countries and former Soviet states are highly dependent on Russian natural gas. Russia is a significant player in a number of issues critical to the United States, such as nuclear proliferation by Iran and North Korea.[1]

Russia is also a member of the G-8, group of highly developed economies and has been a member of World Trade Organization - WTO since 22 August 2012, becomes the 156th WTO member. [2]

While the U.S. exports to Russia are still relatively small, Russia is an important market to the U.S. exporters of poultry, energy equipment, and technology. Russia is also an important supplier of a number of raw materials that are critical to the U.S. manufacturers.

Despite all these facts, the crisis has deeply affected the Russian economy. To better understand the internal mechanisms of the crisis processes[3] it is important to look more closely at the model of growth that evolved in Russia in 1998-2007 and on fundamental problems of the Russian economy, given that at present, growth is based on increasing the amount of knowledge and the number of innovations per adapt them rapidly and widely available.[4]

2. Economic Development: 2001-2008

The Russian economy bounced back quickly from the 1998 crisis and enjoyed over 9 years of sustained growth averaging about 7% due to a devalued ruble, implementation of key economic reforms (tax, banking, labor and land codes), tight fiscal policy, and favorable commodities prices. Real GDP has increased 6.9% on average per year in contrast to an average annual decline in GDP of 6.8% during the previous seven years (1992-1998). The positive GDP trends are reflected in other measurements that point to an improved Russian standard of living throughout the period.

Table 1. Selected indicators of the Russian economic development 2000-2008

Average real wages in Russia increased 10.5% per year from 1999-2008. In addition, real disposable income (the income that the average Russian resident has available from all sources after taxes) grew 7.9% from 1999 to 2008. The Russian unemployment rate also declined during the 1999-2008 period, from 12.6% to 6.3%.

Household consumption and fixed capital investments both grew by about 10% per year during this period and replaced net exports as the main drivers of demand. Inflation and exchange rates stabilized due to a prudent fiscal policy (Russia ran a budget surplus from 2001-2008).

Graphic1. Exports driven by oil price 2000-2008

Source: Constructed according to Russian Statistics Agency data [7]

Russia’s foreign trade has increased sharply in the last ten years (1999-2008). During that period Russian exports grew close to 525%, from \$75.5 billion to \$471.6 billion and Russian imports rose close to 640%, from \$39.5 billion to \$291.6 billion. As a result, Russia has experienced rapidly increasing trade surpluses. Its merchandise trade surplus rose from \$36.0 billion in 1999

to \$179.7 billion in 2008. Russia’s current account balance (which includes balances on merchandise trade, trade in services, investment income and unilateral transfers) increased substantially, from \$24.6 billion in 1999 to \$102.3 billion in 2008. As a result, Russia accumulated one of the world’s largest foreign reserve holdings that have skyrocketed from \$12.5 billion in 1999 to \$427.1 billion at the end of 2008.

3. Weaknesses of the Russian Economy

Unfortunately, the Russian achievements of the recent years were based on weak foundations. Russia was unable to properly cope with the growing stream of petrodollars.

Despite the favorable picture, Russia has been plagued by continuing problems. The dramatic improvements in the performance of the Russian economy initially occurred not because of the right policy, but despite the lack of it. Inflation, while down from the sky-high rates of the 1990s, inflation rates remained high. From 2006 to 2008, the consumer price index rose by 9.0%, 11.9% and 13.3%, respectively. The life expectancy of the average Russian citizen, particularly males, remains low for a developed country. In 2006, it was 73.2 years for a Russian woman and 60.4 years for a Russian male. Increases in alcoholism and other diseases, such as tuberculosis and others which have been nearly eradicated in developed countries, have contributed to the relatively low life span, especially for males. It is also explained by the poor and deteriorating health system which has been slow to adjust to the transition from central planning.

It must be noted that Russia’s economic growth was largely concentrated in a few sectors. Nor were the benefits of growth widely distributed throughout the society. More than one-third of the population of the Russian Federation continued to live below the poverty line. The Russian economy faced several weaknesses:

3.1. An overvalued exchange rate.

In recent years Russia has suffered from the “Dutch disease” – a dramatic appreciation of the real exchange rate of the ruble that undermined the growth of all industries except for those in the resource sector. The

Russian Central Bank was doing the right thing by going against the grain and accumulating foreign exchange reserves to prevent the appreciation of the ruble, but it did not do it fast enough, which resulted in the growing ratio of Russian prices to foreign prices. As a result, the Russian non-fuel industries could not compete with the foreign producers, so imports in real terms grew faster than anything else in the national economy. The growing trade surplus of recent years is mostly due to constantly increasing fuel prices, whereas the growth of the physical volume of imports (fivefold in real terms in 1999–2008) greatly outpaced the growth of exports in real terms.

3.2. Poorly diversified economy and export structure.

The Russian economy is too dependent on the oil and gas exports that account for one-half to two-thirds (depending on world fuel prices) of total Russian exports. The prosperity of recent years was mostly based on growing world fuel prices. A simple calculation shows the importance of the windfall oil revenues for Russia: the Russian GDP at the official exchange rate was about \$1 trillion in 2007, whereas the production of the oil and gas sector, which employs less than 1 million workers, is valued at about \$500 billion at world oil prices of \$80 per barrel. When oil was priced at \$15 a barrel in 1999, Russian oil and gas output had a value of less than \$100 billion. The difference, \$400 billion, is the fuel windfall profit that literally fell on Russia from the skies.

Graphic 2. Russia’s export structure, mln\$

Source: Constructed according to the Russian Statistics Agency data [8]

3.3. Low spending for investment and public goods.

The government failed to channel the stream of ‘petrodollars’ into repairing the “weakest link” of the national economy – provision of public goods and investment into non-resource industries. Investment and government consumption amounted to about 50% of GDP in the early 1990s, fell to below 30% of GDP in 1999 (right after the 1998 currency crisis), and recovered only partially afterwards – to about 40% of GDP in 2007. Instead of using windfall petrodollars to repair the weakest link – state capacity to provide public goods – the government, on the one hand, decreased tax rates, allowing petrodollars to leak into personal incomes, and, on the other, maintained a budget surplus that expanded to nearly 10% of GDP and was used to finance the accumulation of foreign exchange reserves in the Central Bank and the Stabilization Fund.

3.4. High income inequalities.

Before the collapse of the Soviet Union, the richest 20% of the Russian population accounted for 30.7% of Russian income, while the poorest 20% accounted for 11.9%. In 2006, the richest 20% held 46.8% of the income, while the poorest 20%’s share had declined to 5.4%. The middle 60% of the population’s share had declined from 57.4% in 1992 to 47.8% in 2006. The two sets of income distribution measurements mean that while the Russian standard of living has improved, a small segment of the population is enjoying close to half of the benefits. In 1995 there was no person in Russia worth over \$1 billion, in 2007, according to Forbes, Russia had 53 billionaires, which propelled the country to the second/third place in the world after the US (415) and Germany (55) – Russia had 2 billionaires fewer than Germany, but they were worth \$282 billion (\$37 billion more than Germany’s richest). In 2008 the number of billionaires in Russia increased to 86 with a total worth of over \$500 billion – *one-third of the country’s GDP*.

Conclusions:

These weaknesses – an overvalued exchange rate, poorly diversified economy and export structure, low spending for investment and public goods, and high income inequalities – were partially concealed by high oil and gas prices in 2000–08, but were revealed during the Global economic crisis, as oil prices fall. Foreign exchange reserves of over \$550 billion (as of early October 2008) provide some room for maneuver and a chance for a “soft landing.” At the current rate of depletion (\$20 billion a month), Russia still has some time to adjust to the terms-of-trade shock. But even if oil prices do not fall faster, at the end of the day, there is no way to avoid devaluation and real restructuring in order to tackle the root problems rather than their symptoms. It is a paradox, however, that the need to deal with these weaknesses becomes more acute with the depletion of the required financial resources.

In fact, the right question to ask about the recent performance of the Russian economy is why Russian growth rates lagged behind the growth rates of other countries and were not even higher in 2000–2008 despite a nearly fivefold increase in average annual oil prices. The answer may be disappointing, but is hardly disputable – Russia did not manage to use its growing resource rents in the best possible way.

Russia Under the Impact of the Global Economic Crisis

Mihai Ioana-Iulica

Constantin Brancoveanu University from Pitesti
iuliamihai72@yahoo.com

Abstract

The global financial crisis, brewing for a while, really started to show its effects in the middle of 2007 and in 2008. Around the world stock markets have fallen, large financial institutions have collapsed or been bought out, and governments in even the wealthiest nations have had to come up with rescue packages to bail out their financial systems. Despite official attempts to designate Russia as a safe-haven in the stormy sea of the global financial crisis, the crisis has deeply affected the Russian economy.

Russia's fiscal decline –from an average of 7 percent annual growth before the crisis to a loss of 7.9 percent GDP in 2009 – is the highest figure among G20 countries.

Cuvinte cheie: Global Economic Crisis; Anti-crisis Policy; Business; Inflation.
Clasificare J.E.L.F2; O1; E6;

1. Introduction

As the case with most of the world's economies, the Russian economy has been hit hard by the global economic crisis and resulting recession, the effects of which have been apparent since the

last quarter of 2008. Even before the financial crisis, Russia was showing signs of economic problems when world oil prices plummeted sharply around the middle of 2008, diminishing a critical source of Russian export revenues and government funding.

In 2008, it faced a triple threat with the financial crisis coinciding with a rapid decline in the price of oil and the aftermath of the country's military confrontation in August 2008 with Georgia over the break-away areas of South Ossetia and Abkhazia. These events exposed three fundamental weaknesses in the Russian economy: substantial dependence on oil and gas sales

for export revenues and government revenues; a decline in investor confidence in the Russian economy; and a weak banking system. Europe's decision to temporarily suspend deliveries from Russia – after Moscow's January 2009 dispute with Ukraine – also drove prices down.

2. Effects of the Economic Crisis

The rapid decline in world oil prices discussed earlier has been a major factor in the overall decline in Russia's economy. Russian government revenues are expected to be adversely affected because of the drop in oil revenues, but also because of the decline in income tax revenues, which will cause the Russian government to incur a budget deficit for the first time in ten years, a deficit of perhaps 8% of GDP. Russia has also been adversely affected by the world-wide credit crunch that ostensibly began with the proliferation of subprime mortgages in the United States and the subsequent burst of the real estate bubble. Because low interest credit was not available domestically, many Russian firms and banks depended on foreign loans to finance investments. As credit tightened, foreign loans[1] became harder to obtain.

Table 1. Selected indicators of the Russian economic development 2006-2009 Q1

	2006	2007	2008	2009 Q1

Historical Crude Oil Prices [3]

The economic downturn is showing up in Russia’s performance indicators. Although Russia’s real GDP increased by 5.6% in 2008 as a whole, it increased more slowly than it did in 2007 (8.1%) and grew only by 1.2% in the fourth quarter of 2008.

In 2008, Russia’s real GDP was only 8th among the 15 former Soviet states (Azerbaijan’s GDP increased 10.8%, Armenia 10.0%, Uzbekistan 9.0%, Tajikistan 7.9%; Kyrgyz Republic 7.6%; Moldova 7.2%; and Armenia 6.8%).[4]

The economic slowdown has been reflected in the Russian ruble exchange rate as well. The ruble has been declining in nominal terms because foreign investors have been pulling capital out of the market to shore up domestic reserves, putting downward pressure on the ruble. The ruble had declined as much as 45.6% between July 29, 2008 and April 21, 2009; it has recovered somewhat so, that by June 5, 2009, it had depreciated 31.8% since July 29. Russian official reserves have declined substantially in part because of Russian Central Bank has intervened to defend the ruble and current account surpluses have shrunk. Russian official reserves declined from \$597 billion at the end of July 2008 to \$384 billion at the end of February 2009, although they have increased to \$404 billion by the end of May 2009. Another sign of financial trouble for Russia was a rapid decline in stock prices on the Russian stock exchanges. At the close of business on May 10, 2009, the RTS index [5] had lost 62% of its value from its peak reached on May 19, 2008, although the index has shown signs of rising recently. (The RTS Index is a free-float capitalization-weighted index of 50 Russian stocks traded on the MICEX-RTS Stock Exchange in Moscow, Russia. The list of stocks is reviewed every three months by the RTS Information Committee).

3. Russia’s Anti-crisis Policy

The major peculiarity of the Russian anti-crisis policies was the decision by its leaders to gradually devalue its currency—known as stepwise devaluation—after months of expectation in November of 2008. Such devaluations are rarely recommended. They tend to create expectations of a continuous cycle of currency depreciation, and consequently, a vicious cycle easily arises leading to excessive depreciation of the currency.

Observers believe that the Prime Minister Putin adopted the stepwise devaluation policy over the objections of practically all others involved. He apparently based it on arguments that it would maintain the currency’s stability, whereas a one-off devaluation – usually the preferred alternative – might have led to difficult-to-forecast reactions of the public. At the same time, gradual devaluation gave economic agents ample time to adjust their assets through the privatization of currency reserves. This meant that the authorities did not have to fulfill their initial promises to provide foreign currency support to all companies and banks with foreign debt.

Apart that, the Russian government has responded to the crisis with various measures to prop up the stock market and the banks. The packages, valued at around \$180 billion, are proportionally larger in terms of GDP than the U.S. package that Congress approved in September 2008. In mid September, the government made available \$44 billion in funds to Russia’s three largest stateowned banks to boost lending and another \$16 billion to the next 25 largest banks. It also lowered taxes on oil exports to reduce costs to oil companies and made available \$20 billion for the government to purchase stocks on the stock market. In late September, the government announced that an additional \$50 billion would be available to banks and Russian companies to pay off foreign debts coming due by the end of the year. On October 7, 2008, the government announced another package of \$36.4 billion in credits to banks. In 2009, the government changed strategies by focusing on macroeconomic measures rather than measures to assist specific industries or firms. For example, the government reduced

the corporate tax rate from 24% to 20% and the tax rate on small companies to try to stimulate investment. The government expects to rein in expenditures as it anticipates lower revenues but still anticipates its first budget deficit in 10 years, which the government will be able to finance at least for the time-being from accumulated reserves. While cutting expenditures might be considered fiscally responsible on the one hand, it could retard government investment in obsolete infrastructure and expenditures on pensions and other social income transfers, contributing to a drag on the rest of the economy.

4. Present Situation

4.1. Export.

Economic recovery was primarily export-driven in the second half of 2009. Resumed growth in Russian exports correlated with a recovery of global trade. Yet even though exports grew, they only reached, but did not exceed, the pre-crisis level. While in normal economic conditions a small increase in exports might have triggered economic growth, in the current post-recession economy exports alone are insufficient to support Russia’s recovery.

4.2. Industry.

Industry, a critical component of the Russian economy, is performing below its pre-crisis level as well. The only growth of note has been in those industries that benefited directly from the boost in foreign trade.

4.3. Household Income.

Unemployment remains high, with the official numbers skewed because they fail to include many unregistered foreign workers, who dominate the construction and retail industries. Yet, despite high unemployment rates, household income has grown in the past two years due to increased government spending on wages and pensions. This growth in income contributed to an increased flow of imports into Russia, affecting Russia’s trade balance. The crisis also

changed Russia's position in terms of attracting foreign direct investment (FDI). Surprisingly, Russia is among the top five developing countries in terms of attracting FDI. [6]

Table 2. Selected indicators of the Russian economic development 2009-2011

	2009	2010	2011
GDP, %	-7,8	4,3	4,3

Despite its deficiencies, Russia successfully responded to the global crisis, and as oil prices are rising again, it does not face any serious problems in the immediate future. But the global crisis has exposed the severe structural problems that have been plaguing the Russian economy for decades. For the country to enjoy again the growth it had before the global crisis, it urgently needs a comprehensive reform. The current system is no longer suitable for the challenges ahead and is facing a dead end; it is not sustainable in the long run and must change. But, as it is typical of a country suffering from a resource curse, the Russian leadership will likely delay reforms as long as oil prices stay high. Reliance on energy rents to once again fuel Prosperity while ignoring fundamental reforms will only slow growth in the long run and eventually lead to bankruptcy. How long will the Russian society be willing to live with low growth, which is inevitable without serious reforms? Will the government remain

popular if real disposable income rises at 1 to 2 percent per year rather than 9 to 10 percent?

Among the severe structural problems are poor infrastructure; excessive regulations; energy inefficiency; high public spending, especially on pensions; heavy dependence on commodities, especially oil and gas; and widespread corruption and weak rule of law. Even without the global crisis, these problems would have inevitably led to an economic collapse (or at least a significant slowdown) by the end of the decade. Many economists note that a slowdown in some important sectors began well before the crisis, and the causes were purely domestic, having nothing to do with the global environment. [9]

Russia is an important international power, but it does not have sufficient resources to be a global superpower. Russia's conventional forces, even when they are eventually reformed will have only a limited capacity to act beyond the country's borders. More importantly, the Russian defense-industrial base will have to be fundamentally restructured to support even that capacity.

As the economic crisis has demonstrated, the model Russia's present leaders have chosen – growth without development, capitalism without democracy, and great power foreign policy without international appeal – can run only so far. Unless the country modernizes, Russia will further marginalize its position in global affairs. Russia's foreign policy is as much in need of a fundamental overhaul as are its economy and social and political systems. Instead of pursuing a separate course, Russia should aspire to integrating itself into the world economy.

The Russian leadership has a great opportunity to change things for the better. On the one hand, it is evident that the current economic model cannot deliver sufficient growth in the next several years. On the other, the Russian regime does not face any apparent immediate internal or external problems. Therefore, the Russian government can launch reforms if it so desires. The president of Russia himself has expressed the enormous challenges his country faces in his September 2009 manifesto-article, “Go Russia!” – “Should a primitive economy based on raw materials and endemic corruption accompany us into the future?” he asks.

Only time will tell if this stark analysis of Russia's structural challenges will prompt the leadership to pursue the much-needed reforms.

Conclusions:

Russia rises and falls with oil prices, which have a huge impact on the real, external, fiscal and monetary developments. It is open whether Russia will be able to reduce its vulnerability to oil price fluctuations by generating non-oil growth. Russia's unfavourable business climate remains a serious impediment for non-commodity and commodity sector development alike. In fact, global economic crisis revealed those weaknesses of the Russian economy:

- An overvalued exchange rate;
- Poorly diversified economy and export structure;
- Low spending for investment and public goods;
- High income inequalities.

Keeping in mind that the government did not take any measures and did not held any reforms, the effects of the crisis were quite dramatic. Crisis resulted in:

- Loss of 7.9 percent GDP in 2008;
- Drop in export prices;
- Decline in some export volumes;
- Massive outflows of portfolio investment and capital flight.

In fact, Russia managed to survive and to respond to the global crisis, basic indicators are growing again and even if Russia is not able to develop a healthier model for sustained catch-up growth based on investment, innovation and human capital accumulation, and continues to rely on commodity exports, this would still be a reasonable basis for economic growth, provided commodity prices remain sufficiently high and Russia's natural resources are skillfully managed.

Psychological Effects of Economic and Financial Crises on the Behaviour and Mental Health of Individuals

Mionel Oana

Moraru Alexandra

"Dimitrie Cantemir" Christian University
Faculty of International Economic Relations
panaoana2005@yahoo.com
alexandramoraru2002@yahoo.com

Abstract

The present paper brings forward the psychological effects of the financial and economic crisis upon individuals. Following the empirical research as well as the specific literature, we discovered that the greatest psychological effect of the financial crisis upon individuals is created by the financial stress. Moreover, the study shows that the financial stress, as a psychological effect of the financial crisis, is associated with the fear of not being able to accomplish the financial needs, the impossibility to have a high standard of living, a lower self-respect and the withdrawal from former social groups.

Key words: psychological effects, financial and economic crisis, behaviour, financial stress, mental health.

J.E.L. Classification: F 650

1. Globalisation and financial crises

The moment when globalisation exacerbated, financial crises appeared. These crises reveal the price instability on the financial markets, as well as the "lack of cash", without which the geo-economic system cannot function. Throughout history, examples of economic crises are numerous and unpleasant, but the world economy "memory" has only kept the following: the great stock market crash (The Wall Street Crash) in 1929 which triggered "the great recession" that lasted until 1933; the stock market crash in 1987, which was the greatest crash recorded in a single day, and then there are the emergent markets crises of the 90's

which involved significant geopolitical and economic repercussions.

At the moment we are in the middle of the most serious financial crisis compared to the great 1929-1933 crisis. At a glance, this crisis, which started in the USA, resembles the others very much, but there is also one significant element which makes the difference: it designates the end of an era of credit expansion, which has the dollar as a currency reference [1]. The US government wish for the Americans to be able to buy a house has forced FED to cut the refinancing interest rate of commercial banks by 1% a year since the 90's. Given these facts, banks granted credits with an interest rate of 2-4% a year, which led to an unprecedented "real-estate boom". Since 2000 and until 2005 we assisted at a real-estate frenzy that was supported by a market quota increase of over 50%. This overwhelming increase actually favoured speculations on the value of both the houses and the loans. Thus, when we expect the house value to be higher than the loan, the tendency is to purchase as many estates as possible (in 2005 more than 40% of the real estates were holiday residences or investments). Since 2005, the inflation danger which was threatening the USA, forced FED to increase the interest rate up to 5% a year. Therefore, commercial banks operated an interest rate rise of 6-8% a year. These doubled or even tripled interest rates have led to the impossibility of instalment payments and to foreclosures [2]. Thus, millions of people couldn't cope with FED's new interest rates, and banks suddenly found themselves in the possession of an impressive number of houses, which they tried to auction, thus unbalancing the interbanking relations. The major cause that created the crash in the international banking relations

was the fact that American banks succeeded their refinancing by selling the high risk real estate contracts (the contracts with a low payment capacity of the population) to other worldwide investment banks (UBS-Switzerland, Deutsche Bank - Germany). *What did the other countries hope for regarding the crisis?* The answer is simple. They wished to avoid contagion, which developed during the crises in the 90's. But the story seems to have repeated, and the whole world economy “is catching the American flu”. Contagion, or the domino effect seems to function really well [3]. In the US, the economic crisis started in 2007, while the European and the continental economies were perfectly going on. Now, after five years, the international media announces significant downsizing in many states and on different continents.

2. Psychology and human behaviour

Psychology is a developing science with the goal to understand, discover and explain human nature – the mental process and the behaviour which make us what we are and separates us from other beings. Personality psychology, which is part of social psychology, studies the influences of information, situations and of other individuals on people and tries to understand the changes of personality caused by them. That is, personality psychology investigates the individuals' ideas, feelings and behaviour.

Behaviour is the externally observable response of a person to an environmental stimulus. According to psychology, behaviour presents an intellectual feature, as well as an intentional and an emotional one [4].

Behaviour, which depends both on the individual and on the environment, but mostly on the economic environment, always makes sense. It corresponds to seeking a solution or an object likely to reduce the needs of the individual. In the economic literature, classical and neoclassical theories describe man as rational and able to make the best decision. This “perfect man” was called *Homo economicus* [5]. Meanwhile, research determined *homo economicus* “to change his style”, which led to the dissolution of a rational *Homo Economicus*. The change of

style was supported by the development of the *limited rationality* that considers human beings as unable to make efficient decisions because they cannot have all the data and do not efficiently anticipate the outcome. Thus, if we take limited rationality into account, we may say that the greatest psychological effect of the crisis upon the individuals is the financial stress.

3. Financial stress

According to the *American Psychological Association*, the most common source of stress is money, or the lack of money [6]. Is present in people's life from all social classes and it appears where the individual cannot cope with changes.

Generally, stress may be defined as an unpleasant feeling that appears with the fear of loss or when threatened by something such as economic and financial crises, which are external stress factors to individuals. More precisely, financial stress may be perceived as breach in the daily program of both the individuals and the financial markets [7].

According to Chinese culture, risk has a double meaning, being a combination between danger (crisis) and opportunity. Following this line, we may interpret financial stress in the same dimension.

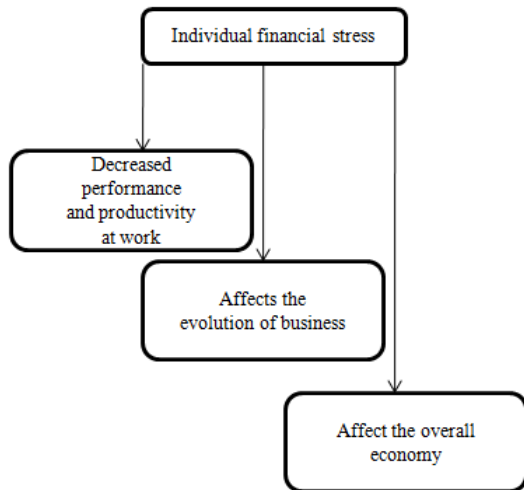

- *Financial stress as danger*. Financial stress is different from one person to another and it may appear under several forms, starting with the threat to lose one's job. Such features are: the fear of being unable to meet one's financial needs, a lower standard of living, a lower self-respect and the withdrawal from former social groups when financial stress appears.
- *Financial stress as opportunity*. Financial stress may also lead to positive changes in one's life: finding a job, or improving the ability to manage personal finances.

The intensity of the financial stress is mostly measured by the lapse of time which postpones the purchase of household appliances, the rhythmic payment of bills (a major stress factor), the decrease of the living standard, the lack of cash flow, the possibility to lose one's job [8].

Generally, it is very difficult to assess the cost of financial stress for both the individual and the society as a whole. However, the cost

may be set according to the effects that financial stress has upon the individual mental health, as well as upon the economy. Within the economy, financial stress may reduce job performance and productivity, thus creating a gap within the business development and the general economic system.

Figure 1. The individual financial stress outcome

Source: Authors' research

4. The impact of the economic crisis upon the individuals' mental health

Sanity is very important as it allows the individuals' personal development in the emotional, psychological, intellectual and social dimensions. Moreover, it is beneficial for the job atmosphere, in order to determine an economic growth and a social development.

It is expected that an economic crisis affect the mental health of the individuals. Sanity problems caused by the economic crises produce chaos in the community, within the country, and at the level of world economy.

Table 1. The significant element of the population's sanity

Protection factors	Risk factors
Social capital and social protection	Poorness and high debts
Children's health before and after birth	Unhealthy food, mental health heredity

Balance at work and at home	Unemployment, job insecurity, stress at work
Healthy life style	Alcohol and drug addiction

Source: World Health Organization, *Impact of economic crisis on mental health, 2011*

The different personality features of individuals make them react differently when facing the economic crisis. Thus, they may experiment a constant search to find solutions to overpass the crisis, they may ask for extra state incentives or social protection, or they may increase consumption and ignore the crisis. On the other hand, they may develop anxiety issues and display nervous breakdowns due to a constant feeling of helplessness.

The world economic situation demonstrates that the crisis started in 2007 affected the population on three different channels:

- *Channel 1 – the stock exchange and the real-estate market* (this level has affected the investors who had resources and invested in securities or over-the-counter derivatives, but also on the estate market);
- *Channel 2 – banks* (this category includes people who have financed their purchases by obtaining bank loans);
- *Channel 3 – pay cuts and layoffs* (it affected people whose salaries decreased and those who lost their jobs due to downsizing or to bankruptcy) [9].

According to World Health Organization studies, the present crisis has significantly affected Europe. Thus, Europeans lost their jobs and the vulnerable groups, such as people with low incomes and very poor people, were socially excluded. World Health Organization includes children, single parent families, unemployed people, ethnic minorities and old people among the vulnerable groups. Poorness affects children in their cognitive, emotional and physical development, as well as their life-long health and wealth [10].

Besides the negative effects of the economic crisis on the individuals' mental health, there is also the opportunity to strengthen economic policies of social support.

The health system cannot assure the individuals' sanity without the help of the

state. Thus, the side effects of the economic crisis may be diminished by economic policy measures:

- creating active programs for the labour market (programs to keep jobs, or requalification programs to reintegrate people on the labour market, special programs for young, unemployed or disabled people);
- family support programs (support for further study, for maternity leave and for the child-raising leave);
- a significant increase of the alcohol price, as well as lower distribution, which determines a decrease of alcohol consumption;
- medical assistance for people with a high risk of mental health problems;
- programs to cut people’s debts to the state.

5. The psychological impact of the economic crisis upon the Romanians

Nowadays, Romania – an emergent economy with severe systemic problems (inflation, unemployment, corruption, education, EU funds absorption, infrastructure, and loan-dependent) which is open to the external market – was deeply affected by the present unfavourable economic situation.

Connecting the Romanian economy to the international economic flows favoured the development of contagion (generated by the US sub-prime crisis) inside Romania. The moment the sub-prime crisis burst continues the *timeline design* of the other economic and financial crises.

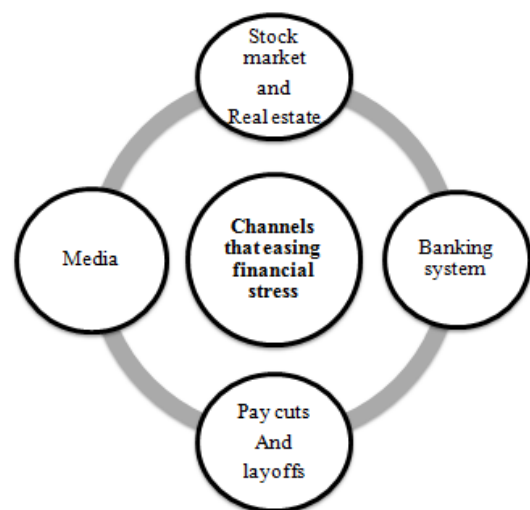

According to the *Oxford Dictionary*, the term “contagion” is defined as the communication of disease from one person to another by close contact. However, the word comes from Latin and is made up of *con* (with) and *tangere* (touch) [11]. *The theory of contagion* which was developed by Mori Kogid și Kok Sook Ching in 2009, demonstrates that no country in the affected region cannot avoid contagion of such an economic crisis... [12].

After 8 years of economic (2000 - 2008) and very sure on itself, Romania is now dealing with the reverse situation which has a major psychological impact upon Romanian consumers and investors. Thus, due to a long

lapse of economic growth, the present economic crisis is psychologically difficult and rather impossible to accept for the Romanians.

The channel that favoured the appearance of the financial stress in the case of Romanian consumers and investors are the same (the stock exchange, the real-estate market, the pay cuts and layoffs). However, we wish to add a fourth level that has a major psychological impact on the Romanian population, and that is *the media*.

Figure 2. The channels that send financial stress

Source: Authors' research

The year 2008 came with the same crisis situation for the Romanian Stock Exchange and determined the decline of the equity market. The equity market faced two important phenomena that had a negative impact on the investors:

- institution investors were out of the market until the emergence of positive signals on the market evolution;
- risk aversion, Romanian investors preferring to protect themselves against any risk which could threaten their investment.

The investments on the real-estate market that were based on *buy cheap, sell expensive* have worked until mid-2009, when investors considered them *a free lunch*. Starting with June 2009 and until June 2010, real estate investments started to record a major decrease, with a 30-40% loss of the investment.

Banks represented the second channel that

had a psychological impact on the population. Actually, this channel is closely connected to the third one, which deals with pay cuts and layoffs. Most Romanians have asked for bank loans in order to purchase real estates or household equipment. Pay cuts and layoffs do nothing but higher the risk of default of borrowers to banks, thus causing losses on both sides: borrowers are left without estates or purchased goods, and banks face foreclosure.

Just as the economic crisis, the media is a constant figure in people's lives and it has a significant psychological effect on the population, because the human brain processes the information according to word utterance, attitude and voice volume. In the article “What are the psychological effects of the financial crisis?” published in Psychologies Magazine, Radu Crăciun, investment manager at Eureka Pensions, considers that: “there is a terrible “noise” in the media regarding the crisis. It is a situation where professional opinions, rational and non-biased voices cannot be heard at all. Unfortunately, people look for the extreme and farcical opinions, as the decent ones are not “spicy” enough for the audience. This media bombardment artificially augments the stress factor and creates misinformation”.

6. Conclusions

The effects of the economic crisis are numerous and omnipresent, thus creating vulnerability within the daily activities. Therefore, we can say the appearance of an economic crisis triggers important changes for the individuals on the one hand, and represents a major challenge for the governments dealing with the crisis. Hence, it is very important to model efficient measures in order to overcome the economic crisis (creating active programs for the labour market, medical assistance for people with a high risk of mental health problems, programs to cut people's debts to the state, reintegrating the unemployed on the labour market). Moreover, there are other important measures that help people to overpass the economic crisis, such as promoting stress management by psychological support as well as professional career guidance systems.

Abstract

In the five years since the accession to the EU in Romania's foreign trade occurred significant changes, particularly complex. The instrument of accession of Romania became part of an economic and customs union, the prospect of European monetary union membership. Opportunities offered by free access to European markets were accompanied by threats of increased competition for foreign domestic products.

Keywords: foreign exchange policy, competitiveness, European Union, Romania's foreign trade, volatile exchange rates

Jel Code: F50, F59

1. Introduction

This paper presents the evolution of foreign exchange policy and its impact upon Romanian trade competitiveness with European Union and is structured into 6 sections. In first section is presented the subject of the paper, section 2 is a review of the relevant literature of international trade and the factors that influenced its evolution. Section 3 presents some characteristics of the Romanian foreign policy, developing VAR model and analyzing the interactions between exchange rate volatility and exports to the Euro zone. In section 4 is presented the analysis of the impact of exchange rate volatility on Romanian exports to the Euro zone and in section 5 the prospects of Euro adoption. The paper ends with some conclusions.

2. Literature review

Factors of a country's foreign trade development have been approached in several theoretical works. Ricardian model, of the nineteenth century, proposed specialization of a country for those goods in which it has comparative advantage. Hecsher-Ohlin model, in the first half the last century, states that a country should export those goods that can be achieved with inputs which are in abundance, instead importing goods which consume rare and expensive inputs. Rybczynski made a few decades later, the theorem which bears his name and which revealed the role that trade plays in performance-intensive inputs. Stolper-Samuelson theorem stated that an increase in the relative price of a good will increase the efficiency of factor used intensively efficiency while decreasing other factors. Krugman and Obstfeld approached the mechanisms through which FDI can help a country's export growth: the transfer of modern technologies, taking advantage of multinational experience in foreign markets. Dornbusch and Fischer explained the role that exchange rates, both nominal and real ones, exercise in analyzing a country's exports. Currency depreciation leads to cheaper exports that become more competitive, while strengthening the national currency make them more expensive and thus causes loss of competitiveness of exports.

3. Characteristics of the Romanian foreign policy

The literature has highlighted the impact that developments in exchange rates may have on trade. A very strong currency reduces the competitiveness of local producers, encouraging imports and discouraging exports. In contrast, a weak currency cheaper domestic products, increasing their competitiveness. Sometimes, states face substantial current account deficits resort to currency devaluation to stimulate net exports. However, this measure has some major drawbacks, the effects of inflation and that impact on competitiveness can be decreased with the increased price of imported raw materials.

Using foreign policy to increase foreign trade competitiveness has some features the exchange rate regime.

In 2005 the central bank formally adopted a new policy on money, based on inflation targeting. In principle, this arrangement requires that the central bank to refrain from massive intervention in the forex market, acting only when the exchange rates reach levels that threaten to jeopardize the macroeconomic balance.

In practice, inflation targeting has brought significant changes in foreign policy, central bank interventions still remain crucial for the formation of exchange rates.

In general, exports and imports Romania reacted substantially to the strengthening or weakening national currency, which would justify consideration of the application of active foreign policy towards current account balance. However, currency depreciation has had significant impact on prices, which could jeopardize the National Bank of Romania (NBR) anti-inflationary policies. In addition, designing foreign policy and other constraints involved:

- major differences between real interest rates prevailing internal and external;
- presence of massive speculative currency market in Romania;
- substantial funds sent the country of foreign nationals working abroad;
- foreign capital inflows.

In developing foreign policy should be considered and the prospects of euro adoption, obligation assumed by Romania's EU accession. This process requires certain

conditions, some of which are difficult to follow for the Romanian economy. However, even where the criteria for joining the euro zone could be met in order for euro adoption issues involved potential effects on trade. It can be assumed that the euro introduction will substantially reduce international transaction costs and bring more stability to exchange rates. However, besides these beneficial effects for exporters, joining the euro zone could encourage imports.

4. Analysis of the impact of exchange rate volatility on Romanian exports to the Euro zone

In recent years Romania's exports to the Euro zone rose steadily, becoming one of the main components of trade balance. In assessing the consequences of joining the euro area is important to analyze how the volatility of exchange rates influenced, so far, exports to the Euro zone.

The literature can be found in particular views about the effects of exchange rate volatility on exports, among which we mention: a model in which managers of export firms, with risk aversion, decide to reduce their production conditions instability in exchange rates or a model where the conditions of volatile exchange rates managers exporting firms will increase production to ensure that they obtain the necessary foreign funds.

Based on a VAR model, we analyze the interactions between exchange rate volatility and exports to the Euro zone. Using the following variables:

- RX = logarithmic value of monthly exports real, seasonally adjusted;
- RSTD = logarithmic least square values of the monthly real exchange rate (based on Baum method);- d_RX = first differences RX;
- d_RSTD = first differences RSTD.

Stationarity of the variables was analyzed based on the ADF test and Lann Saikkonen test. Based on the graphic representation was decided to use as a deterministic trend component and a constant if and only variables to a constant level for the first differences (Figure 1).

In Table 1 ADF test results for level variables. A result that may be considered as stationary RSTD for all four criteria for

choosing the lag number of sites, while in the case of RX non-stationarity null hypothesis can be rejected only the three criteria.

The results of Augmented Dickey Fuller stationarity level values of two variables (with a constant and a variable trend as deterministic terms)

no. 1

Variable	Number of lags	Test value
RSTD	AIC, FPE: 3	- 4.9467***
	HQC, SC: 0	- 7.5405***
RX	AIC, FPE, HQC : 6	- 3.6653**
	SC: 3	- 2.3572

Table

Figure no. 1 Evolution of RX, RSTD, d_RX and d_RSTD

Lanne-Saikkonen test gives an ambiguous image on two variables at stationarity level (Table 2).

The results of Lanne-Saikkonen stationarity test - values level of two variables (with a constant and a variable trend as deterministic terms)

Table no. 2

Variable	Shift Function	Structural change	Number of lags	Test value
RSTD	Impulse	2005 M5	AIC, FPE: 3	- 4.5723***
		2005 M5	HQC, SC: 0	- 7.5164***
	Shift	2005 M7	AIC, FPE: 3	- 2.4721
		2005 M7	HQC, SC: 0	- 4.4259***
RX	Impulse	2008 M3	AIC, FPE, HQC, SC: 6	- 4.0068***
		2008 M12	AIC, FPE: 6	- 3.8158***
	Shift	2008 M12	HQC: 3	- 2.8543*
		2008 M12	SC: 2	- 2.3717

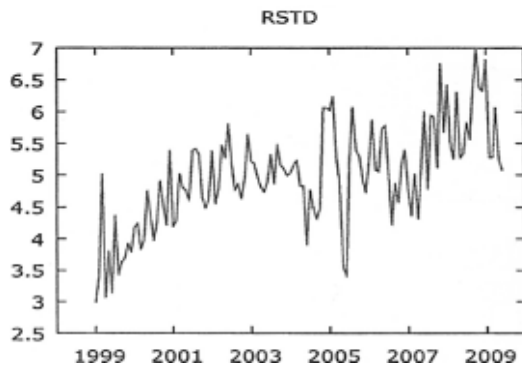

For variables d_RSTD and d_RX, ADF tests showed unequivocally reject of the non-stationarity null hypothesis (Table 3).

The results of Augmented Dickey Fuller stationarity test for the first differences of the two variables (with a constant as deterministic terms)

Table no. 3

Variable	Number of lags	Test value
d_RSTD	AIC, FPE: 8	- 6.1770***
	HQC: 5	- 7.2912***
	SC: 3	- 8.0247***
d_RX	AIC, FPE: 7	- 4.7679***
	HQC, SC: 1	- 12.0347***

The stationarity for the first differences was confirmed by the Lanne-Saikkonen test (Table 4).

The results of Lanne-Saikkonen stationarity test for the first differences of the two variables (with a constant as deterministic terms and with a Impulse Shift Function)

Table no. 4

Variable	Structural change	Number of lags	Test value
d_RSTD	2005 M7	AIC, FPE: 8	- 5.3606***
	2005 M7	HQC: 3	- 6.2018***
	2005 M7	SC: 1	-11.2864***
d_RX	2008 M3	AIC, FPE: 7	- 4.9728***
	2008 M3	HQC: 2	- 6.0692***
	2008 M3	SC: 1	-10.8703***

Stationarity analysis results led to the use of first differences in a VAR model. Equations parameters that model are given in Table 5. Based on correlation coefficients can be appreciated that interactions between the two variables are quite weak.

Interaction between d_RX and d_RSTD determined on a VAR model

Table no. 5

Equation 1: d_RX

Variable	Coefficient	Standard Error	t Test	p Value
const	0.0100491	0.00488363	2.0577	0.04177**
d_RX_1	- 0.441996	0.0763952	- 5.7857	0.00001***
d_RSTD_1	- 0.00401658	0.00623557	- 0.6441	0.52070

Average dependent variable	0.006755	Deviation of dependent variable	0.059106
Total squared residual values	0.339347	Regression standard error	0.052958
R ²	0.210262	Adjusted R ²	0.197209
F(2, 121) Test	16.96924	p Value of F Test	3.19e-07
Rho Coefficient	-	Durbin - Watson Test	2.230205

Equation 2: d_RSTD

Variable	Coefficient	Standard Error	t Test	p Value
const	0.0138883	0.057023	0.2436	0.80799
d_RX_1	0.902171	1.01924	0.8851	0.37784
d_RSTD_1	- 0.367713	0.0972494	- 3.7811	0.00024***

Average dependent variable	0.013699	Deviation of dependent variable	0.677364
Total squared residual values	48.99073	Regression standard error	0.636303
R ²	0.131910	Adjusted R ²	0.117562
F(2, 121) Test	7.149741	p Value of F Test	0.001162
Rho Coefficient	-	Durbin - Watson Test	2.134341

Analysis of "impulse - response" performed on the VAR model showed that

increased exchange rate volatility leads to lower exports, while export growth increases the volatility of exchange rates (Figure 2).

Figure no. 2 Analysis of "impulse - response" between d_RX and d_RSTD

Reduced influence on the volatility of exchange rates has on exports can be largely explained by the fact that they are made by subsidiaries of multinational companies,

which cover foreign currency exposure is relatively easy.

5. Prospects of Euro adoption

The instrument of accession to the European Union and Romania has committed itself to adopt the single currency with the performance of nominal convergence criteria stipulated in the Maastricht Treaty. This process involves a deepening of economic relations between Romania and the Euro zone states.

Dates of accession to the European Monetary Union produced by NBR provide Romania participation in the Exchange Rate Mechanism (ERM II) in 2012 and the Euro adoptions in January 2015. However, the convergence report by the European Commission in May 2008 stipulates that the nominal convergence criteria are met only those on public finances (Table 6).

Maastricht criteria (Nominal convergence indicators)

Table no. 6

Nominal convergence indicators	Maastricht criteria	Romania 2008	Romania 2009
Inflation rate (HICP *) Percent average annual)	<1.5 pp above the average of three best performing EU members	7,9	7,4
Consolidated budget deficit (percent of GDP **)	Below 3 percent	5,4	...
Public debt (percent of GDP **)	Below 60 percent	13,6	...
Exchange rate against the Euro (appreciation/depreciation percentage maximum two years ***)	+/-15 percent	+9,7/-14,6	+7,2/-22,7
Long-term interest rates (percent per year annual average)	<2 pp above the average of three best performing EU members in terms of the inflation criterion	7,7	8,3

Source: EUROSTAT, BCE, CE, INS, BNR

... - missing data;

* HICP–Harmonized Index of Consumer Prices;

** According to SEC95 methodology

Process of adopting the Euro will impact directly on the possibility of influencing foreign trade through foreign policy. By

joining the ERM II Romania will be obliged to keep the Leu/Euro within a fairly narrow range of variation in relation to the official parity. The Euro will mean the transfer from the National Bank to the European Central Bank of all tasks related to foreign policy.

In the specialized literature was found that besides the nominal convergence criteria should be followed and other circumstances generically called real convergence criteria upon which the success of adopting the single European currency:

- actual level of GDP per capita;
- sector structure;
- the openness of the economy;
- EU trade share in total foreign trade.

Recent studies have revealed that large gaps between labor productivity and earnings of a new country joined the other Euro zone countries can cause distortion and imbalance of trade.

From this perspective indicated that decisions on ERM II entry and Euro adoption should be preceded by careful analysis of the performance of real convergence criteria. The process of adopting the Euro would occur and recent developments in the Euro area significantly affected by economic imbalances Greece.

6. Conclusions

Romania's foreign trade passed through a complex period marked by the process of European integration and the ongoing consequences of the global crisis.

The current international conjuncture induced difficulties in penetration of foreign capital. Limited financial resources and declining demand in some markets following the global crisis dropped the whole impetus for investment. However, in the current context could become more attractive investments in countries where labor cost is low. From this perspective, but Romania is competing neighboring countries like Ukraine, Serbia and Moldova. To encourage foreign direct investment can be considered a tax reduction, including reducing salary related contributions. However, implementation of this measure is subject to balanced budget constraints that Romania must observe in the current difficult.

Another measure to balance the trade balance would include applying a policy

evidenced by the depreciation of the Leu currency against the currencies of international partners. Such a measure could increase the competitiveness of discouraging exports, while some imports. However its effectiveness is conditional on several factors: the degree of incorporation in exported goods of imported raw materials, price elasticity of demand from domestic and foreign markets etc. Moreover, in this field are a number of macroeconomic constraints.

In foreign policy approach towards increasing the competitiveness of Romanian products should be considered the prospect of Romania's accession to the Euro zone. Participation in the ERM II will greatly hamper foreign policies while adopting the euro will eliminate the possibility of influencing the Romanian authorities of foreign trade through exchange rates. This is however subject to the fulfillment of the nominal convergence criteria that could be involved in the current context, an effort to burden the national economy.

To move towards foreign markets of non-exporting firms is action needed on the perceptions of managers regarding the benefits and barriers to entering foreign markets. To this end, differentiated policies are necessary features of the firms concerned. The current global crisis would act as a catalyst for many Romanian companies towards entering foreign markets, especially where Romania will come out of recession late compared with other countries.

Determination of the Economic Potential of Patents in the Context of the European Patent Convention

Nițu Valentin Ionuț

The Bucharest University of Economic Studies, Romania

nivalentin@yahoo.com

Abstract

In the context of knowledge economy, the competition for obtaining competitive advantages no longer consists in having access to tangible resources, but a great significance has now the intangible ones. This article aims to reveal in which way the patents with high economic potential can be outlined from a patent portfolio using quantifiable differentiation criteria. Criteria taken into consideration to determine the patents with the highest economic potential are: citations in specialised publications, the protection territory, obtaining the decision of patenting, the protection period and the renewals made, the oppositions brought. From their analysis a placement can be made of how the patents are being perceived by the scientific community through the presence in the specialised literature, by the institutions that grant the patent certificate by analysing the databases and the oppositions brought which form the image of the potential market on which they could be traded.

Key words: *patent, intellectual property, economic potential, oppositions, size of the patent family*

J.E.L. classification: O31, O32, O33, O34

1. Introduction

The current knowledge economy had effects on research results materialised in patenting. The specialised literature imposed certain criteria that show a positive connection that is established between a patent and the economic value brought by its exploitation. There is not a standard algorithm to determine which part of the brevets will bring profit by exploiting it and which would not. The analysis of a patent involves three perspectives: the technical one

– made by specialists when granting the certificate, the juridical one given by the protection obtained and the economic one which determines whether the patent can bring economic benefits. If the first two aspects are clearly regulated, the economic part has certain determinants that support analysis. This work analyses the way in which based on established criteria one can separate from a patent portfolio the those patents with the highest economic benefits and with the lowest exploitation risk.

Criteria considered for the analysis are: citations in specialised publications (Jaffe, A. and Trajtenberg, M. 2002), the protection territory – size of the patent family (Harhoff, D., and alt, 2002), the decision of registration (Guellec, D. and van Pottelsberghe de la Potterie, B., 2000), the protection period and the renewals taken, oppositions against the decision of registration (Potter Pottelsberghe, B. and van Zeebroeck, N. 2008).

2. The way of relating the criteria with the economic potential

2.1. The citation

The citation can be seen from two perspectives: citation in the specialised literature and citation in the following patent filings. Citing in the scientific literature provides clear indications of the patent's importance in the academic sphere. In this case should also be analysed the way the citing was made, the frequency of the quotes and the impact factor of the publications (Jaffe, A. and Trajtenberg, M. 2002). The analysis in this case is scientometric. A big number of citations show the interest of the scientific community for the patent and a potential market for it (Harhoff, D. and alt. 2002).

Citation in subsequent patent filings reveal that the analysed patent was

considered by researchers and it was used to narrow the application area of their results, helping them to place themselves correctly reported to the current state of knowledge. This indicator presents a great importance by providing solid evidence on the economic potential.

2.2.The decision of patent granting

The filings submitted to the European Patent Office are published in a maximum period of 18 months. Art.67 provisions of the EPO guarantee equal treatment of the published filings being examined and the patents already granted. Thus the patent owner has the same rights since the publication of the filing, as if they had obtained the decision of patent granting. This aspect is very important because of two reasons: long duration of the analysis of the filings and the short life of some patents. Obtaining the decision of patent granting increases the patent's value given that it has passed the patentability requirements – but this consideration has a more non-market nature (Guellec, D. and van Pottelsberghe de la Potterie, B., 2000).

In case of new technologies there are some impediments due to the lack of evaluation standards of the patent, which makes the art. 67 from EPO very important, because market opportunities can be lost in the absence of such a period between the publication of the filing and the decision of patent granting.

2.3.The size of the patent family

The size of the patent family measures the number of jurisdictions in which one requested protection and its size. When the territory on which the patent is protected is larger its potential value increases. Low-value patents are protected only in the country of origin, because the owner does not have the interest in extending the protection. When the value increases, the economic interest is in positive correlation and the protection is desired to be more extensive due to the perspective of future gains higher than the fees arising from extending the patent family (Harhoff, D. and alt. 2002). With the maturation of the patent the holder will maintain the protection in the countries

where he has interest. This fact gives economic value to the patent and is the key element in distinguishing all patents with high potential.

2.4. The protection period and the renewals made

The moment when the evaluation is made is critical. To determine the value, a placement in space and time should be made given by the size of the patent family. Keeping protection for a long period of time on a large number of jurisdictions is a sign of strong interest. Taken into account the costs of maintaining, only a value addition could justify the family size. An influence in this case has the industry in which the patent is used. There are sectors where the life of a product is very short, which no longer justify protection renewal or the holder limits the protection only in the countries where he has direct interest. There are also sectors as the pharmaceutical one or that of biotechnology, where due to high costs of research and development is preferred to maintain protection even if the hoped economic potential is not proportional.

2.5.Oppositions

After granting by the European Patent Office EPO, a patent can be contested by interested parties by formulating an oppositions within nine months from the publication of patent granting decision. There is a positive connection between formulating an opposition, how they are resolved and the economic value of the patent. In case of patents with high potential, oppositions are more often because of the interest of the competitors for the market on which they activate not to be affected. Lack of oppositions, not only for a single patent but for a whole patent portfolio is also a signal of low interest in it. A patent that passed successfully through the opposition process can once more be certified to have economic value and a potential market (van Pottelsberghe de la Potterie, B. and van Zeebroeck, N. 2008). The way an opposition influences the economic value is difficult to quantify, but it has as an effect substantial changes in the patent. Clearer is the situation when a patent is withdrawn because of an

opposition. In this situation, the final act of a patent’s existence is signed.

3. Total European patent filings in 2011

To determine and analyze the way in which these criteria lead to optimal solutions to discover patents with economic value and with a potential market, a great relevance has the analysis of patent filings in the year 2011.

Table no. 1.Total European patent filings in 2011- Breakdown by applicant residence

Origin	Filings	%
Germany	33,181	13.6%
France	12,107	5.0%
Switzerland	7,786	3.2%
United Kingdom	6,464	2.6%
Netherlands	6,178	2.5%
other EPO member states	26,119	10.7%
U.S.A	59,688	24.4%
Japan	47,404	19.4%
China, People’s Republic of	16,946	6.9%
Korea, Republic of	13,254	5.4%
Others states	15,310	6.3%
Total	244,437	100%

Source:www.epo.org

In the tabel there is a breakdown of the European patent fillings by the applicant’s residence. From the EPO states, Germany stands out with with 13.6% share which shows the importance given to research in general and for obtaining patents that can be legally protected.

By analysing the table we can observe the economic interests that other countries have in protecting their patents in the European Patent Convention system. U.S. and Japan have the greatest share in total and surpass Germany. This situation presents the importance given at state-level to the intellectual property and in this case to patents. Research results only by obtaining patents can be protected and exploited for the owner’s economically advantage. Romania is very far with 37 patent filling at the level of 2011, compared with Cyprus which has 55. Patents by exploitation bring added value to

the economy. It is clearly distinguishable that the best countries in the European Patent Convention are those with high economic potential. Exploitation of the patents is the source of a part of this capital.

4.Conclusions

Determining the economic potential of a patent is critical in the current economic context. Exploiting new technology, mitigation of excessive consumption, enhancement of strong investment in research would be a realistic solution for the resettlement of the economy. The market on which the patents are traded and licensed is real and can produce added value. Many patents have never been used.

The purpose of this article was precisely to help separate the weak patent from the strong ones. The patent owner is focused in research and obtaining the patent granting and often does not see the prospect of obtaining economic benefits. Making an analysis of criteria which are specific to a patent and have a positive determination on the existence of potential markets one can select those patents with economic perspectives.

The approach taken has its limits. In case of new technologies, the characteristics cannot be taken as benchmarks: complaints could not be made because there are no competitors, specialized literature would not quote too often this type of patents because they cannot be taken as references. In this case a potential market could not be imagined. This is where the intuition of the analyst comes to discover patents that apparently don’t have potential but they bring economic benefits after the product obtained from their exploitation is launched. These are only exceptions. Criteria considered, applied to wide base, such as the European Patent Office leads to clear conclusions regarding the potential market and the future of the patent’s exploitation.

When applied, criteria have different degrees of relevance and accuracy of the information being analyzed. Determining of size of the patent family, the granting decision, the oppositions, the renewals and the terms of protection are easier to quantify through statistical analyses and the analysis of databases. Citations present some

problems because of diversity and the way of citation and its frequency.

Knowledge economy makes the value of many top companies not to be incorporated in tangible assets, but in intangible ones, including intellectual property. Patents occupy the main place along with the trademark in creating value. Developing a culture of intellectual property means the present and for a long time will be the future of a world economy on solid bases. How patents are valued is one of the goals of this purpose.

The Combined Transport of Goods. The European and International Legal Framework

Pandele Adina Laura
Ovidius University of Constanta
The Faculty of Law, Administrative Sciences and Sociology
adinapandele@yahoo.com

Abstract

The development and diversification of world trade has directly influenced the improvement of the international transport of goods. The necessity to identify economically feasible solutions is obvious, given that the international transport is an essential part in promoting international trade, facilitating or, on the contrary, restricting trade.

Keywords: successive transport, combined transport, multimodal transport

J.E.L. Classification: K 10-General

I. Prior definitions

Moving goods by a single mean of transport, from the point of departure to their destination was, for a long time, a common solution.

As it concerns the distance of carriage, the possibility of using a single means of transport or the transport by one carrier at a time has become incompatible with the speed and efficiency of international trade. This is why the improvement of the quality of transport services gradually involved not only the development of each type of transport in part, but also their functional interdependence.

Promoting and supporting the complex transport operations required an appropriate legal framework which should allow the transport of goods by involving several carriers of the same type or different ones.

II. Legal regulation

In accordance with the provisions of the Civil Code, the transport of goods may be provided by one or more carriers. The first hypothesis concerns the situation in which

the transport is performed by a single operator using only one means of transport.

The second hypothesis considered by the legislator is related to the transport performed by several carriers that use either the same or different means of transport. From this point of view, the Civil Code distinguishes between successive and combined transports.

In accordance with the general and special provisions governing the matter, the successive transport involves the activity of transportation and its completion by more carriers of the same kind, using the same means of transport (road, rail, water or air). The successive transport is settled by international regulations for each means of transportation separately (see art. 6.2 of CIM-Appendix B to the Convention concerning the International Carriage by Rail COTIF, adopted in Bern, 1980, ratified by Romania by Decree no. 100/1983 published in B. of. no. 23/1983, as amended, Art. 34-40 of the Convention on the Contract for the International Carriage of Goods by Road CMR, adopted at Geneva, 1956, ratified by decree nr.451/1997 published in the Official Gazette 145/1972 etc.).

In accordance with the provisions of the Civil Code, the combined transport is defined as the type of transport used when the same carrier or successive carriers use multiple types of transport (art.1957, 2nd paragraph). The issue of the combined transport of goods arose mainly from the need to optimize the transport on highways. The constant concerns of the European legislators regarding the solutions that should allow the combination of road transport with other types of transport by land or sea have resulted in the adoption of uniform regulations.

These regulations have aimed first to define a common plan for the development of combined transport.

Rail transport is a competitive alternative

to road transport, which would relieve the European traffic and limit the negative effects of road transport on the environment. In this sense, in order to define the most important international railway networks, whose use could replace road segments and their related facilities, there was adopted, in Geneva, in 1991, the European Agreement on Important International Combined Transport Lines and Related Installations - AGTC (ratified by Romania by Law no. 8/1993, published in the Official Gazette nr.60/1993). In accordance with the AGTC provisions, the international railway lines may be part of the international combined transport network if they meet the specified technical requirements (for railways see Annex 1 to the AGTC Agreement).

The rail network is completed with related facilities, consisting of terminals for combined transport, border crossing, stations and ports or gauge interchange with ferry connections (AGTC Agreement, Article 2).

As it concerns Romania, in Annex 2 of the AGTC Agreement, there are mentioned: the most important terminals (Bucharest, Constanta, Oradea, Craiova), the gauge interchange points that correspond to the crossing of border (Iasi, Ungheni) and the port connections integrated in combined transport networks (Samsun-Constanta (Turkey-Romania).

Not only does the rail transport combination represent an effective solution for combined transport. Covering portions of the route on inland waterways and coastal routes is also an effective and attractive solution. The appropriate legal framework was established by the adoption of the 1997 Protocol to the AGTC Agreement on combined transport and inland waterways (ratified by G.O. nr.74/1998, published in the Official Gazette no. 318/1998). Similarly, there are identified waterways and coastal routes which are consistent with the minimum requirements in order to be considered an integral part of such transports and of the connection terminals in ports.

In Romania there are mentioned two main inland waterways of great importance to the international combined transport, namely the Danube and the Danube - Black Sea Channel and the coastal route from Gibraltar to the south which also includes the coastline of our country (see Annex 1 to the Protocol, 1997).

In the category of Romanian ports equipped with terminals, which, together with the waterway network, play an important part in international combined transport, there are listed the ports on the Danube (Turnu Severin, Giurgiu, Oltenia, Braila, Galati) and the Danube-Black Sea Channel- Constanta port (see Annex 2 to the Protocol of 1997).

The great importance of waterway transport is highlighted by economic, technical and environmental protection advantages. The promotion of inland waterway transport, even when there is an adequate infrastructure, requires additional building and upgrading measures. The legal framework for achieving this goal was established by adopting the European Agreement on Main Inland Waterways of International Importance (AGN) of 1996 (ratified by G.O. nr.68/1998 published in the Official Gazette nr. 314/1998).

The rules on the performance of the combined transport of goods between EU Member States were laid down in Directive 92/106/EEC. The provisions of this act have been transposed into the national law by the G.O. nr.88/1999 on establishing the rules for the combined transport of goods (published in the Official Gazette nr. 423/1999).

The analysis of these legal provisions reveals that the combined transport of goods involves using roads only on the initial and final portions of the route; on the rest of the route there are used the rail, the inland waterway or the sea routes (art. 1, paragraph 1 of Directive 92/106 / EEC, Article 2, paragraph 1 of G.O.nr.88/1999).

The encouragement of the development of combined transport is characterized by the tax incentives granted to businesses, for the investment and development of the necessary infrastructure and equipment specific to this mode of transport (art. 6, G.O. nr.88/1999).

Regarding the actual execution of such transport, it is worth noting that not only does it offer an alternative, even partial, to road transport. At the same time, it enables the possibility to save time when operating the goods because the legal texts reveal that the road vehicle or the container of a certain size will be moved on a certain part of the route by rail or ship transportation.

Under the legal provisions, any road transport operator satisfying the conditions of access to the road transport market may carry

out initial and / or final parts of a combined transport (see Article 4 of G.O. nr.88/1999).

Regarding the combination with rail transportation, the law does not impose limits on the length of the initial and / or of the final road route. However, for the combination with shipping, the road transport can be a part of the combined transport if it does not to exceed 150 km in bee line from the loading or unloading river or sea port.

The combined transport does not involve loading and unloading operations of goods [1]. In this regard, the laws provide that the combined transport is the transport of goods where the charging unit or the road vehicle successively uses several modes of transport. The combined transport thus made, also called intermodal transport, can be considered "a special case of multimodal transport" (in this respect, see Romania's intermodal transport strategy adopted by Order no. 457/2011, published in the Official Gazette no. 506/2011).

The multimodal transport is governed by the provisions of the UN Convention on the International Multimodal Transport of Goods adopted in Geneva in 1980. The rules relating to the multimodal transport were adopted by the International Chamber of Commerce, in Paris, in 1992.

The Civil Code also generally regulates the substituted transport (art.1960, the Civil Code). The substituted transport regards the situation where the initial carrier entrusts to other carriers the overall or the partial execution of its obligation to move the goods at their destination (the rules on the substituted carriers are set out in the international conventions on different modes of transport). The provisions relating to the substituted transport (art.1960 of the Civil Code) can be combined with the situation where the initial carrier undertakes the obligation to carry the entrusted goods also on the operating lines of another carrier (art.1998 of the Civil Code). In this situation, the position of the initial carrier may be assimilated to the one of the multimodal transport operator which undertakes to carry out such transport (article 2, paragraph 2 of the Rules on Multimodal Transport, Paris, 1992).

III. The unique nature of the contract

Transport development has meant combining the modes of transportation in a single transaction, under a single legal instrument "that covers the main aspects of the contract for the international carriage of goods" [2].

Under the national and uniform regulations, the successive transport of goods is done under a single contract of carriage, covering the entire route, regardless of the number of the participating carriers. The conclusion of the contract for the successive transport of goods is proven by issuing and accepting the transport document. Each of the carriers participating in the transportation becomes, by successively receiving the goods and the transport document, a contracting party, under conditions similar to the initial carrier (see Article 34, CMR Convention; Article 36 CIM etc.).

Similar to the successive transport of goods, the combined transport of goods is done, on charge, under a single contract of carriage. The conclusion of the contract of carriage is determined under the transport document. In addition to the usual entries in any transport document, the document of combined transport must indicate the name of the railway station of dispatch and of destination, or, where appropriate, of the loading or unloading river and sea ports. All the entries in the transport document will be confirmed, by signature, by the participating carriers (Article 3 of G.O. nr.88/1999). Also we should add that this transport is part of a combined transport (Article 3 of the Implementing Rules of G.O. nr.88/1999, adopted by G.D. nr.193/2000 published in the Official Gazette nr. 134/2000).

Under the Geneva Convention of 1980, the conclusion of the multimodal contract of carriage is established by the elaboration of the multimodal transport document, which may be negotiable (being a representative title of goods) or non-negotiable.

Also, under the uniform rules adopted by the International Chamber of Commerce in Paris, the multimodal transport document is that document evidencing the contract of multimodal carriage which can be replaced by electronic messages, where they are allowed under the applicable law (art. 2, paragraph 5). These documents are issued by

the multimodal transport operators, whose role is similar to the one of unique carriers [3].

IV. The combined container transport

The transport of goods in containers had a great influence on the development of combined transport. The possibility of loading the goods in a mobile box, resistant to handling and transportation, facilitated their transport from "door to door", directly from producer to consumer [4]. The combined transport does not necessarily imply the use of containers, but the development of containerization has significantly increased their importance.

The legal provisions on combined transport make special reference to this method of packaging of goods. In this regard, special rules make reference to the intermodal transport unit which can be a container, a box or a semi-trailer.

Under the legal aspect, the use of containers in combined transport implies liability issues.

Basically, the container is a package. Like any package, the container must be in good condition, in order not to cause the impairment of goods which it should normally protect. Where appropriate, the improper state of packaging may or may not exempt the carrier's liability.

Usually, when handed over to the carrier, the container is closed and sealed, so it is mainly based on the honesty of the entries specified in the accompanying documents.

According to Article 2 of the rules for implementing the provisions of G.O. nr.88/1999, from the sender to the starting terminal of combined transport, the goods must be accompanied, where appropriate, by the CMR International waybill or by the rail return-receipt document, noting that the respective transport is part of a combined transport. In accordance with the general provisions relating to the issue of transport documents, the duty to report the poor condition of the packaging or the inability to verify the entries in the transport document belongs to the carrier. In the absence of substantiated justifications for the improper packaging or for the lack of verification possibilities, it is assumed that both the goods and the packaging correspond to the entries

in the document (see for example, art. 12 paragraph 3 of the CIM Uniform Rules).

Regardless of the type of transport (successive or combined), problems arise in connection with the establishment of the liability for the loss or damage to the goods loaded in containers. Normally, the liability belongs to that carrier on whose transportation route the loss or damage occurred. The identification of the liable carrier is difficult, as the containers are opened at destination.

In the combined transport of goods, the uniform regulations provide that all the entries, including those relating to the goods (type, weight), in the combined transport document must be confirmed by the participating carriers (rail / maritime or fluvial transport operator) when completing their route (art. 3, paragraph 2, G.O. nr.88/1999). However, from the text we can conclude that this confirmation could not be made in the absence of effective verifications at destination.

The uniform regulations do not contain, however, provisions relating to the time of changing the mode of transport. By applying the general provisions in a particular matter, it may be considered that, in combined transport, the carrier which takes over the goods has the general obligation of verification. Thus, if the container was received sealed, the road, rail or sea or river carrier shall indicate in the combined transport document (railway bill, river waybill or bill of lading) its reservations regarding the impossibility of verifying the entries concerning the goods. In the absence of such indications, under the general rules, it may be considered that the entries in the document are in accordance with reality.

In successive transport, under the general rules, if the liable carrier can not be identified, the rule is that each participating carrier shall contribute to compensation in proportion to the fee charged (art.2000 of the Civil Code, stating that this rule is also provided for in international conventions governing the various modes of transport).

The solution adopted in successive transport on the proportional division of the compensation payable for the loss and damage to the goods transported between the carriers participating in transport, however, does not apply to combined transport. In this

regard, the uniform rules on multimodal transport (in 1992) state that the multimodal transport operator is liable for the acts and omissions of its employees and agents (article 8 section 4). The liability is based on the presumed fault assumed by the multimodal transport operator (see also the provisions of the Geneva Convention of 1980). Therefore, in order to exempt itself from liability, the multimodal transport operator should prove that it took all the reasonable measures to avoid such damage.

V. Conclusions

The possibility of interconnecting different modes of transport in a single operation can not be conceived in the absence of uniform rules. The legal framework necessary for the development of the infrastructure in combined transport was established by adopting and by ratifying the European provisions analyzed in this paper. Regarding the actual pursuance of combined

transport, the uniform provisions concerning the uniqueness of the transport document are noteworthy. The possibility of carrying out the transport under a single transport document provides assurance to transport beneficiaries. Even in this case there are still problems to be solved only if there is a uniform basis for liability.

Transnational Companies and Globalization. Benefits and Costs

Radulescu Magdalena,
University of Pitesti, Romania,
[youmagdar@yahoo.com](mailto:yomagdar@yahoo.com)

Abstract

TNCs have several advantages over local firms in using new technologies for export activity. They have large internal reserves of skill, technical support, experience and finance to design and implement the learning process. They have access to major export markets, established marketing channels and well-known brand names. They can transfer particular components or processes from a production chain to a developing country and integrate it into an international system. Such supply-side upgrading needs government support.

Moreover, a policy to induce TNCs to enter more advanced activities by offering such incentives as specialized infrastructure and skills can accelerate the upgrading process. With a completely passive policy, TNC exports can remain at low, technologically too small, levels. Thus, a TNC dependent export strategy needs a proactive element for dynamic competitiveness. More important, an FDI-dependent strategy is not a substitute for building domestic capabilities.

Keywords: TNCs, benefits, costs, Asian countries, FDIs.

JEL Classification: F21, F23, F43, F62, F63.

1. Introduction

Transnational companies (TNCs) are one of the most visible facets of contemporary globalization. For some authors [16], TNCs have great power. This is because they can use their massive revenues, control over distribution channels, and addictive brands to force countries to open their markets, limit their support for local firms and embrace international accords they might otherwise reject. According to them, globalization only

worsened matters by increasing the mobility of TNCs. TNCs financial resources are a potential source of leverage over host countries, because TNCs can build plants, import advanced manufacturing equipment and develop transport facilities. Large revenues and profits suggest that TNCs may serve as engines of job creation. TNCs have the potential to contribute to tax revenues. They have power because of their possession of managerial and operational expertise and knowledge. They typically employ staff that has special skills in functional areas such as advertising, distribution and production. As well, they know to exploit advanced transnational business arrangements and regarding research and development area, they are at the frontier of inventing new products. The greater the mobility of TNCs is, the greater will be the ability of TNCs to pressure policy makers to comply to the TNCs preferences. Also, the globalization indirectly strengthens the hand of TNCs by unleashing international capital. Globalization dissolves national loyalties.

Others say that states remain quite powerful as a result of their political, military and economic endowments and their influence over international governmental organizations [3]. It may actually weaken them, for example by providing governments with alternative sources of capital and technology [1]. State has the resources needed to subsidize domestic companies or build infrastructure that privileges local enterprises. It provide the public goods, domestic and global institutions that enable TNCs to operate. State can exert control over the markets through producer cartels or other techniques, it has the authority to tax TNCs, regulate their dividend and interest remittances, force technology transfers and require joint ventures. It can deny TNCs access to resources, labor or markets. Moreover, firms with large investments in plant and equipment remain relatively

immobile. TNCs have to operate in certain areas in order to profit from these countries' development or to generate economies of scale [1].

Globalization has “promoted diversity in interests, demands and values” [14]. In the case of multinational companies doing business around the world, this certainly has implications for marketing to and communicating with consumers in different countries. Of course, the issue of culture has long been a factor. “Communication and culture are inseparable” [20], since the way we as human beings communicate is inherently tied to the culture in which we were raised. This has not been lost on those who are involved in international business, in which communicating to business partners, clients and potential customers can be a complicated task. This seems to be especially true for American companies, who tend to assume that their business models, which are highly successful in the U.S., will be equally successful when transferred to another country. Cushman and King, however, suggest that “cultural settings not only determine much of behavior, but also require varying avenues for success within the diverse environments” [12]. Thus, due to cultural differences, one cannot take for granted that practices in one country will bring about the same results in another.

No matter how strong a corporation is, however, if it does not understand the basics of intercultural communication or chooses to ignore them, it can find itself in serious trouble when things go awry and it needs to inform and reassure its various publics.

TNCs and local firms face different markets and have to overcome different market failures in learning. TNCs have several advantages over local firms in using new technologies (“new” to a particular location) for export activity. They have mastered and used the technologies elsewhere; they may have created the technology in the first place. They have large internal reserves of skill, technical support, experience and finance to design and implement the learning process. They have access to major export markets, established marketing channels and well-known brand names. They can transfer particular components or processes from a production chain to a developing country and integrate it

into an international system. This is much more difficult for local firms, not just because they may not have the experience or technological competence – they inevitably face higher transaction and coordination costs in integrating into TNC corporate systems. In addition, TNCs have considerable advantages in product markets: by definition, they have established international markets and brands and so can finance costly learning processes more easily and with less risk [13].

While the TNC-led strategy has many benefits, and can be a highly effective and rapid means of exploiting existing advantages, a passive FDI strategy may not be the best way to dynamize competitiveness. TNCs may not invest in a particular country because of imperfect information or poor image. Thus, effective promotion and targeting of investors can allow a country to attract more and higher-quality FDI. Where TNCs do invest, they initially transfer equipment and technologies suited to existing skills and capabilities. To move on to more advanced activities and functions, they have to upgrade local skills, technological capabilities and supply chains. This is economical only where the education and training base is growing, local suppliers are increasing their capabilities, technology institutions are able to provide more advanced services, and so on. Such supply-side upgrading needs government support.

Moreover, a policy to induce TNCs to enter more advanced activities by offering such incentives as specialized infrastructure and skills can accelerate the upgrading process. With a completely passive policy, TNC exports can remain at low, technologically too small, levels. Thus, a TNC dependent export strategy needs a proactive element for dynamic competitiveness.

More important, an FDI-dependent strategy is not a substitute for building domestic capabilities. There are many activities in which TNCs have no competitive advantage over domestic firms, particularly those served by SMEs. The development of national enterprises may also lead to broader, deeper and more flexible capabilities, since the learning process within foreign affiliates as compared with local firms may be curtailed. It is imperative for developing

countries, as they mature industrially, to undertake these functions locally to support their future comparative advantage. This is why some countries choose to promote technology development in local firms.

Globalization is of two types. The first is called a "forced globalization" initiated by the International Monetary Fund. The second is called a "participative globalization" which occurs through Transnational Corporations. TNCs have been playing a dominant role globally and accordingly, have been integrating the world economy. But their role and contribution to the process of growth and development of less developed regions are of controversial in nature and character [4].

2. TNCs in the Asian Countries

The South Asian region is one of the less developed regions in the world. In the beginning of the decade of 90s, South Asian economies had started adopting or initiating an 'outward looking approach' and had also started opening up their economies to TNCs.

Through the channel of Foreign Direct Investment (FDI), the TNCs have emerged as a driving force behind the process of globalization of South Asian economies. There has been a triangular relationship between globalization, security and sustainable development [18].

There has also been mutual interdependence between TNCs and host nations. TNCs have two options for formulating strategies. The first is the North-South or Vertical strategy. The second is the Outsourcing strategy. Recently, another strategy has emerged - namely the Global strategy [2] which is combination of market-seeking and outsourcing. The underlying impact of the strategies of TNCs is the concentration of FDI inflows into a handful of countries [10].

The South Asia region has long been been an arena for operations of TNCs (Dutch East India Company). In the early 1960s and 1970s, South Asia pursued an inward looking approach for development. Since the advent of the 1980s, however, liberalization got a foothold and accordingly, FDI started to enter into the region. "Significant amounts of FDI are coming in to exploit the low labor cost advantages of South Asia, and to utilize

them as export platforms" as China has done [15].

Prior to the year 1990 in India, TNCs had been a "four-letter word" in most Indian minds and evoked passions of an extreme nationalistic variety across the political spectrum. It was in the middle of the 1980s, that one of the significant MNS investments was made by the Japanese automobile manufacturer Suzuki who set up a joint venture with Government of India [6]. At that point in time, the Indian people became familiar with TNCs. Thereafter, the flow of FDI has become part of India's economic policy. It has been a long journey for India and most other developing countries in South Asia to attract FDI and accelerate the pace of growth and development in the region.

One of the main causes of export success in Asian countries in recent years has been increasing participation in global production networks under the aegis of TNCs. This has been particularly dynamic in HT activities, led by electronics, which has allowed countries (in labor-intensive assembly processes) to enter very fast-growing export activities and then to move up the value chain [19]. All the major exporters from the developing world apart from the Republic of Korea and Taiwan Province of China have depended on such participation [10]. The latter two economies, on the other hand, have tapped into global chains with domestic enterprises, using such mechanisms as original equipment manufacture contracts, licensing and copying. This has entailed a massive development of technological and other capabilities on the part of local firms, sustained by extensive government intervention in all markets, including selective infant industry promotion [7].

The FDI-dependent countries have also used different sub-strategies. Singapore, for instance, has relied heavily on industrial policy to target and attract hi-tech TNCs, build local skills and institutions, and develop specialized infrastructure. As a result, it has moved to the top of the technological ladder, and is now targeting R&D and high-value service activities by TNCs. Malaysia, Thailand, Indonesia and the Philippines in Asia, and Mexico in Latin America, have been less proactive on FDI and the development of local skills and institutions (although they used industrial

policy in other ways). As a result, they are much lower than Singapore on the technology spectrum. However, they are now acutely conscious of the need to upgrade capabilities and supplier networks in order to retain a competitive edge as wages rise and economies with lower wages emerge as competitors. As shown later, their technological capabilities lag well behind those of the Republic of Korea and Taiwan Province of China [17 and 18].

China is unique because of its size, industrial tradition, background and overseas ethnic linkages. It can combine elements from all the other strategies with its own policies to restructure and develop domestic enterprises [11]. While its base of skills and technological effort is low by international standards, it has enough to mount a spectacular surge in exports across the technological spectrum. And it is building its capability base rapidly while bringing its "surplus" human capacity into modern industrial activity, which suggests that the surge still has a considerable way to go.

The experience of these successful economies does not mean that other countries that liberalize FDI will automatically share their success. In fact, few developing countries participate in these emerging TNC systems. While FDI in developing countries is increasing rapidly, flows are highly concentrated. The top 10 developing countries account for nearly 80 per cent, and the top 25 for 95 per cent, of the total.

The leaders in the world in this activity (measured by R&D as a percentage of GDP) are Sweden, Japan and the Republic of Korea. Yet only some 20 years ago, the Republic of Korea was a typical developing country, with 0.2 per cent of gross national product going into R&D and 80 per cent of that coming from the public sector. Taiwan Province of China and Singapore come next in the developing world, with other economies well behind. Of these three mature Tigers, Singapore lags behind the others owing to its dependence on FDI – but such dependence does not prevent it from leading all other developing countries. These data again show the highly differentiated responses to globalization and technical change among developing countries. Among industrializing countries, the three mature Asian Tigers are in the lead, with other

countries in Latin American and Asia lagging behind. The "New Tigers" - Malaysia, the Philippines and Thailand - do well in technology-intensive exports.

Latin American countries come fairly low on the R&D scale in comparison with East Asia, but the latter does much better than other developing regions. At the national level, Brazil is the leader in Latin America, and ranks fourth in the developing world after the Republic of Korea, Taiwan Province of China and Singapore.

In summary, using FDI to insert countries into global value chains is an extremely effective way to build competitiveness in the new globalizing environment, and almost all successful economies apart from the Republic of Korea and Taiwan Province of China have used it. Of course, there are many countries that have not been able to use such strategies, and we draw lessons for FDI promotion and targeting below. However, it is important to note that simply plugging into global chains at the bottom end is not necessarily a sustainable strategy over the long term. As more complex processes are introduced and technologies continue to evolve, it becomes imperative for countries to improve domestic capabilities: skills, supplier bases, R&D capabilities and the physical (particularly the ICT) infrastructure. TNCs contribute to building capabilities, of course. They train employees and diffuse technologies to local suppliers, but there are limits to how far this can improve national capabilities [8].

Ultimately, it is up to the Government to support capability development by creating more skills, strengthening domestic firms and creating strong technology and research institutions. If this is not done, the most complex and value-creating activities may well be located in other countries – this is the strategic challenge facing the new Tigers, as China appears as a giant competitor with lower wages, massive domestic markets and capable suppliers.

The sites that will receive most FDI in the emerging economic and policy setting are those that provide for TNCs to set up competitive facilities able to withstand global competition. This means that the host country has to provide competitive immobile assets – skills, infrastructure, services, supply networks and institutions – to complement

the mobile assets of TNCs. While transport costs and taste differences mean that large markets will continue to attract more investment than small ones, few countries can afford to take a continued inflow of FDI – especially high-quality, export-oriented FDI – for granted. This means that the ultimate draw for FDI is the economic base: FDI incentives and targeting cannot by themselves compensate for the lack of such a base.

The East Asian experience, particularly of the new Tigers such as Malaysia and Philippines, shows that attracting FDI into high-technology activities can happen without any particular government strategy. In their case, it was largely a matter of their economic base, which may have been helped by welcoming FDI policies. High-tech TNCs had already established a base in Singapore [9].

3. Conclusions

What does this analysis suggest for strategies by developing countries to build local technological capabilities for competitiveness? Competitive success in industry depends vitally on the ability of each industrial system to cope effectively with technical change. This ultimately determines how a country's local value chain relates to the international chain: where it is located, how rewarding the insertion is, and the rate at which its position in the chain improves over time. Globalization means that resources such as finance, technologies and high-level skills are far more mobile than before and value chains are more tightly organized and controlled. Clearly, insertion into dynamic value chains is a very good way to build competitiveness, and the lead players are increasingly scouting the world for economical sites in which to locate their production and service activities. New technologies enable this to happen more efficiently and quickly than ever before.

However, all this does not reduce the role of local technological capabilities. On the contrary, it increases it because the efficiency of each location becomes the prime determinant of success. Technical efficiency requires access to new technologies from across the world, but simply exposing local industries to international trade, investment

and information is not enough. It may even devastate them to the point of closure if measures are not undertaken to build up new capabilities and accelerate learning processes.

Abstract

The present study aims to present strategies of improving the competitiveness for corporations operation in the market of precious metals in the context of global economic crisis. This is a difficult period for all the corporations regardless of the sector in which it operates. The increasing prices for the raw material, the bigger cost of the rent paid by all the tenants, purchasing power increasingly lower there are only some fact that are increasingly more difficult to existing companies on the market.

The existence of the companies operating in the market of precious metals is even more difficult taking into consideration the increasing prices of the precious metals.

In order to improve the competitiveness of the corporations operating in the market of precious metals the strategy must take into account the following: always in change price of precious metals, the payment terms of the suppliers, the best quality at the best price products, the best prices for the rent of the selling price.

Key words: competitiveness, corporations operating, strategy, market of precious metals
JEL Classification: F20

1. Introduction

One of the main objectives of the research explores the strategic global trend of the methods to improve the competitiveness of the corporations, as a preliminary stage in the

global economic crisis, which is crucial for the further success on the national and international markets. Taking into account the alertness of change in the socio economic environment worldwide, the analysis of the methods that are improving the competitiveness of the corporations operating in the market of precious metals is necessary both for the academic and business world today. In the same time, considering that the companies acting on the precious metals market are one of the vectors of the globalization process, the empirical research on the investment decision-taking is becoming a strategic aim both for the companies operating within a country, and also for the companies that are expanding their activities outside the country.

2. Monitoring and evaluation system to increase the competitiveness of the corporations

The developing of the a strategy to increase the competitiveness can take many forms ranging from tacit agreements between groups of actors to form value chains, to the financing of important development projects whose aim is to improve one or various chains in a precious metals market. Taking into consideration this variety of variables it is very difficult to design a single system for monitoring and evaluation of the implementing of strategies to increase competitiveness. This study intends rather to present some key parameters at different levels that can be useful for measuring the

changes achieved by these strategies. Before starting the construction of the monitoring and evaluation system which will be the model to increase the competitiveness of the company we must answer some simple questions such as: who are the intended users of the data generated by the proposed monitoring and evaluation system? How will the data be used by different groups? Will the system be design in such a matter that it will respond to the needs and desires of those how will use it? Last but not least: one should draw the objectives of the system. Having clarity about the rational behind the system is important so that this is designed correctly in order to offer to the corporations operating on the precious metals market a correct strategy to improve their competitiveness.

3. Factors that needs to be taking into account when taking about the strategy of improving the competitiveness of corporations operating on precious metals markets

Below are listed the factors that need to be taken into account for monitoring and evaluation system for the strategy of improving the competitiveness of the corporations operating on the precious metals market.

1. *Production costs*

On the precious metals market there are two kinds of corporations: ones that are production the goods and ones that are importing the goods and they sell those goods in their shops. For the ones that are producers in order to improve the competitiveness they should know the evolution of production costs.

2. *Value of final product*

Also for the ones that are producers it is very important the evolution of the commercial value of the final product of the chain.

3. *The price of gold and silver on the market*

Very important when talking about the strategy of improving the competitiveness of corporations operation on precious market is the price of the precious metals. In this period of global economical crisis the price of the metals is always increasing and this is an important fact that influences the competitiveness of the corporations.

4. *Profitability*

The corporations acting in the precious metals market must calculate the profit in the each link because this is the easy way to identify which actors capture a greater percentage of the benefits. Most of the corporations within this market are importing the goods that they sell and it is very important the size of the profit.

5. *Distribution of benefits*

This indicator is of special interest in projects focused towards poverty reduction.

6. *Improvement of products offered to the customers*

All the corporations operation on this market are always looking for the best supplier of the raw material, if the corporation is a producer ones, or if not, it will always try to find the best supplier: the one that have the best quality of the goods at the best prices.

7. *Sales volume*

The corporations operating on precious metals market must every month measure the sales volume by calculation the total grams of gold jewelleries sold.

8. *Sales value*

Because of the always modified price of the gold the corporations operating in the precious metals market must always be carefully with the price that they are selling. If they do not modified always the selling price of the goods they will not have money to buy new goods from the supplier.

4. Strategy of improving the competitiveness for corporations operating on precious metals markets

For the corporations operating in the market of precious metals in the context of global economic crisis it is very important to stay connected to the prices of the precious metals. Nowadays, when prices change any minute: either increasing or decreasing, for those corporations it is a must to adapt the selling prices for the goods that they sell based on the market price. Negligently in regard to this matter can cost bankruptcy of the company? Even if they have bought the goods at a lower price the company must adapt the selling price at a higher price (if the price on the market is higher in the next period) because if not the company will not be able to buy new and fashionable items for

supply the need of the market. In the context of the global economical crisis the higher prices of the precious metals is the most dangerous enemies for the corporations operating on precious metals markets because since the consumers are affected by the crisis and they do not have anymore the same budget for the luxury items they do not afford anymore to buy and with this issue the profit of the corporations is affected. Not having any profit it will be impossible to move forward. We can not tell that the strategy of improving the competitiveness is maintaining lower prices for the precious metals in order to obtain profit because without the correlated price for those it will be impossible for the corporations to move forward. The strategy is to maintain a correct price, a correlated one.

The global economical crisis has already closed a lot of companies operating in the market of precious metals. With the sells at a very low level they did not find the money to move forward: the level of the rent, the salaries and the debt for the suppliers has made many companies to close. A strategy for improving the competitiveness is a good negotiation skill in the negotiations between the company and the locator of the space where the company operates. Most of the spaces where the companies operate are taking for rent and with the actual prices it is very hard to maintain the payment terms that are maintained in the post crisis brush. By reducing the rent one can move forward and resist on the market. To be competitive in this sector (precious metals market) the corporations must take advantage that a lot of companies operating on different markets can not afford anymore to pay the rent in malls for the selling space and they are closing the shops. The corporations operating in the precious metals market must be aware that there are a lot of free spaces in mall at better prices that if they sign lease with mall before their opening. This spaces at those best prices is a real competitive advantage for the corporations because taking into consideration the global economical crisis that exist the customers will better appreciate the corporations that still continues to open shops even the selling period is not the best.

Another strategy of improving the competitiveness of the corporations operating in the market of precious metals in the

context of global economical crisis is to find the suppliers that accept the payment at 60-90 days. Nowadays, taking into consideration the fact that most of the companies do not have the power to pay the debt it is extremely hard to find such suppliers. With the 60-90 days term of payment the company can have the goods in windows and can offer to the customer a wide range of product without making any payment before having the merchandise. In this way the corporations can be competitive offering to the consumers also the best prices. This payment term can be also very dangerous in this crisis period: the price of the precious metals may increase at a level that can not be covered at the end of the period by the corporations operating on the market of precious metals.

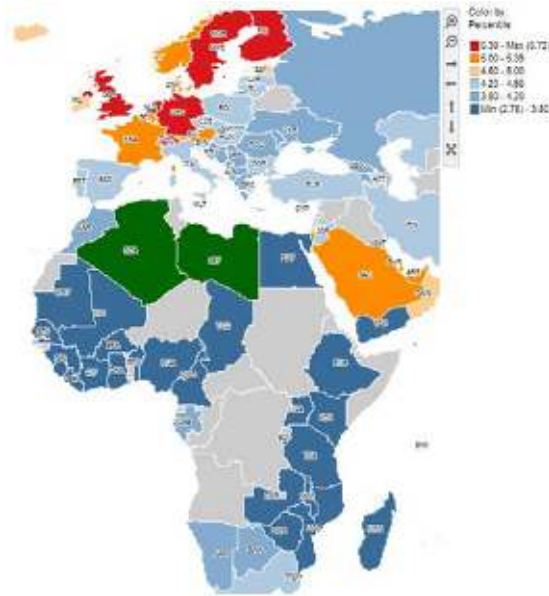

Maybe the most important strategy to improve the competitiveness for the corporations operating in the market of precious metals is finding the suppliers with the lower prices and the best quality. The account managers of the corporations that manage to find this combination of attributes into only one supplier has the key of the method to improve the competitiveness. In this period of crisis it is very difficult to produce the best quality at a lower price because the price of the precious metals is high; the price of the technologies used is also very high.

5. The Global Competitiveness Index 2012 – 2013 Rankings for two of the most representative country with tradition in jewelry

Two of the most important producers and sellers of jewelry in the whole world are Turkey and Italy. They have the tradition in manufacturing the jewelry made of precious metals and they have the technology that you can find only in their countries. Most of the producers and sellers of jewelry made from precious metals are located in Turkey and Italy.

In the Global Competitiveness Report 2012-2013 Turkey and Italy are showed to be on an upward trend as it written below.

Fig. 1 Competitiveness “hotspots” and countries with weak performance according to the GCI

Source: World Economic Forum

In the map below the 10 best-performing countries are shaded dark red and as we can see with six of the ten best-performing countries, Northern and Western Europe is a competitiveness hotspot. In comparison with Northern and Western Europe, when looking at Southern and Eastern Europe one can see a considerably bleaker. On the map there is a patchwork of colors that reveals how the competitiveness is divided within Europe. Indeed, the lack of competitiveness of several European countries is an important cause of the current difficulties in the euro zone. A vast majority of African countries appear in dark blue on the map showing that the Sub-Saharan African countries continues to face the biggest competitiveness challenges of all regions. Despite decades of brisk economic growth in some developing regions, the map reveals that the profound competitiveness gap of these regions with more advanced economies persists. As we can see the map reveals that the hotspots remain concentrated in Europe, and a handful of advanced economies in Asia and the Pacific.

Turkey moves up by 16 places this year to attain the 43rd spot. The country's economy grew by 8.4 percent in 2011 and benefits from considerable progress in a number of areas covered by the GCI – global

Competitiveness Index. Macroeconomic stability has improved and the financial sector is assessed as more trustworthy and finance as more easily accessible for businesses. Improvements to the institutional framework and greater competition in local markets have also been registered; these will further strengthen the country's competitive position. Turkey's vibrant business sector derives important efficiency gains from its large domestic market (ranked 15th), which is characterized by intense local competition (16th). Turkey also benefits from its reasonably developed infrastructure (51st), particularly roads and air transport, although ports and the electricity supply require additional upgrading. In order to further enhance its competitiveness, Turkey must focus on building up its human resources base through better primary education and healthcare (63rd) and higher education and training (74th), increasing the efficiency of its labor market (124th), and reinforcing the efficiency and transparency of its public institutions (67th).

Italy moves up by one place to reach the 42nd position this year. The country continues to do well in some of the more complex areas measured by the GCI, particularly the sophistication of its businesses, where it is ranked 28th, producing goods high on the value chain with one of the world's best business clusters (2nd). Italy also benefits from its large market size—the 10th largest in the world—which allows for significant economies of scale. However, Italy's overall competitiveness performance continues to be hampered by some critical structural weaknesses in its economy. Its labor market remains extremely rigid—it is ranked 127th for its labor market efficiency, hindering employment creation. Italy's financial markets are not sufficiently developed to provide needed finance for business development (111th). Other institutional weaknesses include high levels of corruption and organized crime and a perceived lack of independence within the judicial system, which increase business costs and undermine investor confidence—Italy is ranked 97th overall for its institutional environment. The efforts being undertaken by the present government to address such concerns, if

successful, will be an important boost to the country’s competitiveness.

6. Conclusions

Researching the methods the companies operating in the precious metals market use to improve their competitiveness, we observed the evolutionary nature and also the new typology of risks taken into consideration, for maintaining their competitive advantage. To empirically demonstrate the decision-taking theory, we tried to test the programmed methodologies by pointing out the decision-making process in several case studies we took from international business practice.

Seeing the evolutionary nature in this area, alongside the technological advance, we consider that further research is necessary, to discover new means of global strategy to improve the competitiveness for corporations operating in the market of precious metals in the context of global economic crisis. For future steps of the research, we consider that finding a way to introduce global risks for the price of precious metals as dependent variables in those models used as basis for the strategy of improving the competitiveness of the corporations operating in the market of precious metals, is needed in order to realize an optimal improving strategy.

The Role of Corporate Governance in Risk Management

Săveanu Cristina

Doctoral School of Economics
University “Al.I.Cuza” Iasi
cristinasaveanu@yahoo.com

Abstract

Nowadays, the term corporate governance is more and more associated with risk management objectives. Its importance increases for the main reason that a good governance is a symbol of balance between tactical and strategic decisions.

This paper aims to clarify some issues related to corporate governance, starting from principles, ways of measuring, its level, presenting the influences and interactions between the quality of corporate governance and risk management process.

The paper also emphasizes the practical importance of the concept which comes from the fact that corporate governance is a complex system that facilitates the achievement of business objectives and monitors the economic performance.

Key words: corporate governance, risk, financial performance.

J.E.L. classification: G32, G34, M48.

1. The concept of corporate governance

“Corporate governance” is still a new concept in economics. Corporate governance refers to a correctly established relationship system between the different parties involved in a company’s management process, such as: shareholders, creditors, investors, all of them referred to as stakeholders. This concept of corporate governance has appeared from the need to protect the interests of the stakeholders. As a system it offers the working environment through which the company’s objectives are defined, settling the ways of action and the methods for monitoring the achievement of the objectives [1].

The term refers to the way a company is managed and it was used for the first time in

1992, when the Cadbury Report was issued. Corporate governance means the assembly of rules through which a company is managed and controlled.

According to the World Bank Manual of Corporate Management, corporate governance is a combination of rules, regulations and codes, voluntarily adopted, which gives the possibility to gain the financial and human capital needed for its activity in order to efficiently function and generate value for its stakeholders.

Corporate governance implies the relationship between different players (shareholders, managers, board of directors) and it facilitates the matching process between objectives and results. That is why the corporate governance is considered to be an internal system made up of policies, procedures, processes and human resources.

The economic literature proposes two senses for the term corporate governance [2]. First of all, it reflects all the processes through which the companies are managed and controlled. On the other hand, it represents an economic field which studies issues related with property separation and control.

The corporate governance includes a great area of scientific fields starting from economics and continuing with law, accounting, finance, psychology, management, politics, sociology. Including ethical principles, social responsibility, good business practice, control and supervision, corporate governance can be associated with internal and external audit, internal control, being permanently in a qualitative dependence with all these activities.

The development of corporate governance concept is based on several economic theories, some classical theories, such as the administration theory, the stakeholder theory, the agency theory and a modern theory which is the transaction costs theory. When it comes

to the classical theories the main link is established with the agency theory and that is the reason why almost all the definitions given to the corporate governance focus on the nature of the relationship between managers and shareholders as an agency relationship. The agency theory was issued by Beale and Means in 1932 and it presumes the existence of a conflict between the one who invests his money in a company and the one who manages the company [3]. The essence of this theory is based on the hypothesis that the manager or the agent must act in shareholders' (the principal) favour. The problems agent-principal appear due to their different interests and sometimes the necessary costs for monitoring the management are above the profit margins [4]. The corporate governance aims to minimize the agency costs and conflicts between principals and agents. The efficiency of different systems of corporate governance is evaluated by their capacity to solve the conflict managers versus shareholders.

The transaction costs theory [5] uses in a very clear manner the concept of governance. The main purpose of this theory is to explain the transactions through the efficiency of the corporate governance responsible structures. In this context, the corporate governance problem refers more to the way companies succeed in effectively and efficiently fulfill their activities taking into account their political and cultural environment, than to the protection of shareholders' rights.

The corporate governance represents an amount of "rules of the game" by which the companies are internally managed and supervised by the Board of Directors in order to protect all the shareholders' interests. It clearly specifies the rights and responsibilities of all the parties involved in a company. It defines a structure for establishing the company's objectives and the means to achieve them. All these reasons make corporate governance an important tool for measuring a company's performance.

2. Principles, codes and models of corporate governance

The concept of corporate governance has evolved and even codes have been

established in the economies where it operates.

Corporate governance codes have been issued by different entities, governmental groups, committees or national stock exchange commissions, business or academic associations, board of directors, investors' groups [4].

In the European Union, there have been adopted a number of 35 codes, every country having at least one code of corporate governance. Most of the codes were issued after 1997, after the financial scandals and bankruptcies of some British companies listed on the stock market and in the period of the Asian crisis [4]. The withdrawal of the capital invested by groups from Asia, Russia and South America has generated the focus on the basic principles of corporate governance.

Although they are different by their purpose and degree of details, all the codes approach four important problems [4]: equal treatment of the shareholders, whose interests must be on the first place; clear responsibility of the Board of Directors and management; transparency of information and accuracy of financial and nonfinancial reporting; responsibility for the interests of the minority shareholders and the obedience of rules and regulations.

Starting from different codes and practical models there have been identified some common elements that define an efficient system of corporate governance. They are reflected by the OECD principles of corporate governance. They mention three aspects for a good corporate governance: *integrity*, *responsibility* and *transparency*. Integrity means honesty and completeness and a balanced financial state of the company. Transparency is needed because low performances are hidden sometimes by the stakeholders in order to take some advantages from the public authorities. Responsibility is the most important aspect and in the same time the most difficult to be understood and observed.

Having all these principles as a starting point, there have been identified corporate governance models [4], mainly applied in all the European Union states which present distinct features: *the Anglo-Saxon model* (applied by companies from Great Britain and Hong Kong, Australia and the United

States) and *the german model* (applied by companies from Germany and continental Europe and also from Japan).

The anglo-saxon model represents a system based on external influence (outsider-based system) of the capital market. The capital market exercise a control over the companies and trade the securities under the situation of a dispersed ownership structure. The protection of the investors, when there are not any great shareholders, represents a permanent activity of the regulators of the financial market through corporate governance practices and policies.

The german corporate governance model (similar to Japan) is a system based on internal control and is not centered on the powerful influence exerted by active capital markets, but on the existence of strong shareholders such as banks. Human capital is considered of utmost importance in the German model. In contrast to the anglo-saxon model which is based primarily on the capital market, the german model is centered on the banking system. The main advantage of this model is flexible monitoring and financing and the effective communication between firms and banks. Strong involvement of banks in leading companies gives great stability and orientation towards economic development.

3. Criteria for measuring the level of corporate governance

Corporate governance is not just a theoretical concept. There are real grounds for appreciation of this notion. The best known system for assessing corporate governance is designed by the rating agency Standard & Poor`s. This system has two components [6]: a macroeconomic component - the scores given to a country and a microeconomic component - the score awarded to a company. The country score indicates the support from the state in terms of corporate governance taking into account the legislative framework, national regulations of the capital market, the financial reporting and accounting standards. It is important to take into account the country's score, because external forces at the macroeconomic level may influence the quality of a company's corporate

governance. Two companies with the same score, but from different countries, with contrasting levels of governance, may have different risk profiles. In this respect, the better the score of the country, the more investors will feel more secure. A high score awarded to a country becomes a significant advantage for national companies.

Company score takes into account the effectiveness of interaction between managers, shareholders and other stakeholders. It is based on criteria such as ownership structure (ownership structure transparency, focus and ownership structure influence on the company), stakeholder relationships (regular / access to information regarding the General Shareholders Meeting, the voting process), financial transparency (quality and content deemed public programming and access to knowledge dissemination, auditor independence and position the company), management structure and process (structure and leadership effectiveness, leadership role and composition, role and degree of independence of senior executives, directors and management reward system, methods of assessment and succession). Each of the above is measured on a scale from 1-10 and help set the final score, which is also represented at 1-10. A company can have a low final score, even if they come from a country with a high score, unless they comply with the four criteria defined above. Based on these criteria, a study dated 2000, prepared by SG Emerging Equity Funds Research [6] on the level of corporate governance in emerging markets shows that Romania ranked 7 out of 10. Subsequent research conducted in 2011 revealed that some Romanian managers are still not prepared to make the qualitative leap required by corporate governance principles and still holds on compliance provisions relating to transparency, resulting from this fact that the score has not evolved much.

4. The role of corporate governance in risk management

The concept of corporate governance is closely linked to corporate performance. The concept of overall performance of the company is based on stakeholder theory. Maximizing business value can be realized

only in the context in which managers take into account the interests of their social partners: shareholders, employees, creditors, suppliers, customers, etc.. [4]. Harmonization of interests is actually the risk management process, a process designed to identify potential events that may affect the entity and manage risk to keep it within acceptable limits so as to provide reasonable assurance regarding the achievement of entity objectives. Analysts were concerned in identifying potential correlations between the value of the company and financial management, especially in terms of economies of scale.

Creating financial management departments promotes in fact economic growth [6].

Risk management techniques are a support to maximize the company's value and are essential in the context of capital market integration. An increased level of risk and especially the concentration risk generates vulnerability to the corporate segment. Thus, risk management strategies contribute significantly to value creation.

When evaluating the listed companies, rating agencies and institutional investors such as banks, use as indicators of non-financial performance different criteria: corporate culture, management quality, effectiveness of communication with investors, executive management remuneration policies. Banking practice has shown that institutional investors, especially lenders, often give equally importance to information on corporate governance and financial information, for investment decisions.

It has been tried in various ways to establish a relationship of dependence between the quality of corporate governance and risk management. There is an intuitive link between the two issues and analysts have tried to demonstrate the mathematical correlations. The methodology used was the technique of regression, obtained by the method of least squares. The demonstration [6] started from equations that include financial leverage (calculated as the ratio between total debt and equity), and profitability (calculated as the ratio between net profit and turnover), as the dependent variables and using independent variables that include traditional financial indicators,

such as liquidity, solvency, and indicators of capital structure.

The innovative part of the research involved the integration of variables that reflect features of corporate management strategies such as institutional investors and ownership of the company's CEO, and other variables (blockholders and acquisition activities).

Data were collected both from companies that promote a high level of debt and the companies advocating for the implementation of policies leverage more relaxing. Analysts agree that leverage is the main variable influencing risk management strategies. Along with this indicator has been selected the ratio of debt and working capital as an indicator that reflects the company's capital structure and solvency default.

The results led to the conclusion that the companies focused on internal financing have strong corporate governance mechanisms, while companies with high value of financial leverage have strong corporate governance mechanisms. The reason is that, to get as many resources as possible, such companies must comply with the requirements of credit guarantee, which means that lenders must offer sufficient guarantees, reflected by a high level of equity.

Economic analyst research did not stop there, but have tried to include growth opportunities for variable closely related to corporate management strategies, using for this purpose variables such as research and development expenses and tangible assets (property, plant and equipment), the result being a positive correlation between these variables, profitability and financial leverage. Significant growth opportunities and high leverage contributes positively to profitability and specific risks management. Positive association between risk management strategies and financial leverage depends on the structure of corporate governance.

Meanwhile, coverage of interest expense and indebtedness is a real support for corporate management strategies.

Investment and financing decisions are closely related to risk management strategies, especially in terms of financial resources. Investment projects that are not supported by internal funds generate costs of external financing and this situation means agent

additional costs.

It follows that risk management strategies are correlated with capital structure. Risk management system is built around the company's willingness to attract external resources.

The relationship between the financing and investment process is correlated with the mix of growth perspectives of the company and the stock market / banking system constraints.

Risk management strategies involve a real challenge from the perspective of agent problems, conflicts of interest and informational asymmetries.

Practice has shown that there are different perceptions of risk on the part of managers and shareholders. Managers tend to implement risk strategies in accordance with their preferences, which often are not similar to those raised by shareholders.

The controlling process from shareholders' structure generates monitoring costs which trigger a negative impact on financial performance. At the same time, managers claim remuneration depending on the level of risk. Since risk increases, high reward for managers is required.

Also, a high concentration of shareholders implies a greater cohesion in terms of management strategies, with a positive impact on profitability.

Variables such as institutional investors and ownership of CEOs have a positive impact on financial leverage. Variable of CEO ownership is associated with extremely consistent remuneration policy. Leverage becomes in the context of corporate governance a device, which decreases the degree of information asymmetry. In this context, of a particular importance is the revision of remuneration policy for the executive management body [1] The crisis has shown that motivating executives by paying bonuses should be linked to medium-term business results, not annual ones, which may overestimate actual performance. It was also seen that guaranteed bonuses (fixed) are incompatible with a strict risk management policy. In order to minimize the risk potential compensation should be adjusted in accordance to the cost and the amount of capital required to cover the risks, costs and amount of the liquidity risk.

Temporal structure of remuneration schemes should be correlated with the time horizon for the appearance of the risks and that is why only a small fraction of the amount of compensation should be paid in cash.

5. Conclusions

The intensifying attention to ensure good corporate governance was generated by the sharp volatility and dynamics of the international economic context. Financial scandals and bankruptcies have increased, however, questions about corporate credibility and about the viability of this concept.

However, ensuring good corporate governance remains a goal on the list of international economic convergence[7]. At European Union's level, through economic governance are created equilibrium conditions for interdependence and interaction between different institutions at different levels.

A good corporate governance is a symbol of balance and financial performance. Corporate governance remains, regardless of the pros and cons, a complex system to meet economic goals and to monitor the financial performance.

Abstract

Now humanity is going through hard times, hard times caused by this pandemic, which has strayed over the world namely, the current global crisis. It began as a US subprime crisis in the United State, it was then transformed into a banking crisis, followed by the debt crisis, sovereign credit crisis, crisis in the Euro Area, because in the end to be known as the "global financial crisis". In this article we tried to determine this by looking at a few macroeconomic indicators. So we chose for this analysis the real rate of growth of gross domestic product, indices of global competitiveness and corruption index. All these indicators have been investigated for the 27 Member States of the European Union, the five members of the B.R.I.C., United States of America and Japan. The bottom line is that slowly but surely, the dominant economic logic will be another in the near future.

Keywords: current global crisis, Euro Area, rate of growth of gross domestic product, exports, indices of global competitiveness

JEL: F0, F02

Introduction

Although this new crisis that swept around the world as a pandemic has not yet passed, more and more experts are asking the question whether the end of the crisis will not bring about a new world order, especially on the economic plan. The crisis led to the downfall of "neoliberalism" as he was known until today. He saw clearly that its teachings

about a world with a constant growth and a stable economy have never been put into practice. But until now, at the beginning of the crisis in 2007, all of these things have not been fully reflected in a change of the world order. However, due to the fact that this crisis is not far to be completed in a few years (10 or maybe 20) we think will arise a new world order, since at least economically.

This new world order would include a more accelerated convergence between the old Western powers and new players on the market, the emerging countries. For many decades, people have accepted the idea that the West has dominated the global economic system. From the governance of the multilateral organizations and to form a shared financial service, global infrastructure was seen as being subject to the interests of the West. These Western powers were seen as some forces that acted on the market and, from time to time, extended a hand to help distressed economies. When a signal is coming, however, reform at the global level with respect to this order, and when an economy emerging they earn a place above in the hierarchy, the Western powers filing to the world to remain unchanged. As a result, many emerging economies have lost confidence that "aid" that the global system was it was available when needed urgent help.

This shift was catalyzed by the financial crises in Asia, Eastern Europe and Latin America in the late 1990s and early 2000s, as well as what many of these regions have to be catalogued as an inadequate response from the great powers of the world. Having reduced confidence in bilateral assistance and multilateral institutions (such as the International Monetary Fund), the emerging

economies, led by those in Asia, have tried rallying by own forces. Once you have been successful in overcoming the crisis phase in terms of management, many of these countries have accumulated significant levels of international reserves. They managed to put out major foreign debt and to generate significant current account surpluses.

All of these things mentioned above were in contrast to what was happening in the West. There prevailed the emergence of enormous debt, unprecedented measures to maintain stability through economic levers, etc. Financial excesses were to become the rule rather than the exception, being the financial innovations, borrowing standards and erosion of the prudential regulation.

Thus, it was noticed at once that the world, as we know, turned inside out: rich countries running large deficits and, in some cases, passed quickly from the status of creditors to borrowers, while poor countries were running surpluses and began assembling large stocks of international assets, including bonds of Western economies. But neither rich countries nor poor countries were not aware at the time that their divergent roads will lead to huge global imbalances and, moreover, will lead to a financial crisis that will shake the foundations of the old international economic order.

Research methodology

To see if and how it was affected by the current international economic order of the world manifested in the present crisis, we analyze the evolution of macroeconomic indicators: gross domestic product per capita at purchasing power parity and expressed in millions of dollars, the global competitiveness index and the degree of corruption. The period for which the analysis is 2010-2011 for the first two indicators, analyze and 2008-2011 for the final indicator considered.

The analysis is made up of six entities: United States of America, the European Union, Japan and three B.R.I.C.S. members, respectively Brazil, India and China.

Thus, for the gross domestic product, calculated on purchasing power parity we took as the review period the past two years 2010 and 2011, respectively.

Table 1 – Gross domestic product per capita -PPP (USD) 2010-2011

Country/Region	2010	2011
United States of America	48.147	47.184
European Union	31.676	31.548
China	7.536	8.394
Japan	33.994	34.362
Brazil	11.127	11.845
India	3.586	3.703
Global	11.151	10.992

Source: Table drawn up by the authors on the basis of the data collected on the websites of International Monetary Fund and the World Bank

It is clear from this table that while the two big economic powers of the world have been severely affected by the crisis, i.e. in terms of the United States of America, the gross domestic product per capita fell in 2011 at \$ 47.187 compared to \$ 48.147 in 2010, registering a decrease of \$ 954, while the European Union has seen a drop in per capita gross domestic product of \$ 128 at a value of \$ 31.676 in the year 2010 at a value of \$ 31.548 in 2011, countries with emerging economies have seen an increase in this indicator.

Thus, China has registered an increase of \$ 858, at a value of \$ 7.536 posted in 2010 at \$ 8.394 post in 2011.

Japan, which already had a value far above that of the European Union, recorded an increase of this indicator from 33.994 \$ to \$ 34.362, i.e. + \$ 368. At a first glance this value would not be so impressive, but must take into account the fact that this country has recently passed through a series of events that have had a major negative impact in economic terms. However, the Japanese aspire to a place in the new world economic order.

Another famous country block B.R.I.C.S., Brazil, registered during the analysis period increased to \$ 718 per capita gross domestic product, i.e. the value registered for the year 2010 of \$ 11.127 at a value of \$ 11.845 recorded in the year 2011.

The last country to test this, India has registered and an increase of \$ 117 to \$ 3.586 as he had in 2010, 3.703 \$ in 2011. Can this growth is not very large but India has a very large population, the second largest in the world after China, in the year 2010 with 15 billion residents in 2011 with 1.22 billion

inhabitants; this large population should not be seen as a simple, but must be regarded as a huge human capital, capable to climb in the rankings of the world India.

The following indicator review to see how the global crisis has affected the old dominant economic logic is the global competitiveness index. The construction of the index is to analyze a set of twelve factors, namely: the institutional factor, infrastructure, macroeconomic environment, health and primary education, higher education and vocational training, labor market efficiency, financial market development, the technology, the size of the market, the degree of efficiency of the business environment and the degree of innovation. All of these factors are interrelated and influenced to a lesser or greater extent the global competitiveness index.

In what follows we presented in a table index obtained by a group of countries chosen for analysis during the period 2009-2010 and 2010-2011.

Table 2 – Global competitiveness Index 2010-2011 compared with 2009-2010

Source: Table drawn up by the authors, based on data taken from "The Global Competitiveness Report 2010-2011", p. 15

Legend: Red – Euro Area States

Blue- the other Member States of the European Union

Green – the Member States B.R.I.C.S.

Violet – United States of America and Japan

According to the global competitiveness index, the first country in the world on the 2010-2011 period is Switzerland, which knows about it that it has the status of a neutral country. For the analysis that we realized we have chosen a group of 35 countries: 27 are EU member countries, 5 countries are B.R.I.C.S. and they have especially United States of America and Japan.

We chose all the 27 Member States of the European Union to that of these 17 are members of the Euro Zone, and now this area is undergoing a series of tests, especially due to austerity measures taken in hopes to return after the shock of the crisis. To highlight

States that are part of this area we've assigned the red color.

It is noted that Euro Zone States most affected by the crisis were those whose savings proved to be less effective. Thus, the largest falls in the global competitiveness index for the sample analyzed it was Slovakia, with about 13 seats lost and Greece with 12 seats lost to the period 2009-2010. All these States are those that have lost the most seats and of the European Union States, followed by Spain, Slovenia and Cyprus. At the opposite pole, in spite of this bleak period through which pass all the world economies, European Union member countries that have managed to gain seats in this ranking are in order: Poland + 7, Hungary and Lithuania with + 6 seats each, Bulgaria + 5 seats. The rest of the Member States of the European Union have seen decreases or increases with 1, 2 or 3 places. The only State that has remained at the same level in 2010-2011 to the 2009-2010 season, between the Member States of the European Union was Italy which ranked 48.

In terms of emerging economies in the B.R.I.C.S., the only country that has experienced an increase in ranking is China + 2 seats, the rest of the country have experienced a decrease in the level-2 seats as in the case of India and Brazil, or even worse, 9 seats as in the case of South Africa, be stalled, as happened with Russia which remained at 63.

If it is to add the changes suffered by the UNITED STATES and Japan in this ranking for the period under review, we notice that the result can be null, because while the UNITED STATES dropped 2 places, 2 world in 2009-2010, the 4th World in 2010-2011, Japan made a climb two places in the rankings, from number eight in 2009-2010 to 6th place in 2010-2011 demonstrating once again his exceptional ability to return from different crises.

As can be seen, this ranking is a fairly unstable, changing from one period to another and may, crossing and deepened this crisis, a completely different situation will be for the period 2011-2012, especially that indicate depends on a very large number of influencing factors, as has been seen.

Another indicator that you consider to be relevant in the analysis undertaken to change the global economic order is linked to

corruption. So we made a table for the period 2008-2011, with the same group of countries under review before we presented both on the score obtained in these years, and the place of the world rankings.

Table 3 – Corruption index 2008-2011

Contry	Score				Rank			
	2008	2009	2010	2011	2008	2009	2010	2011
Danemark	9,3	9,3	9,3	9,4	1	1	1	2
Finlandk	9	8,9	9,2	9,4	1	3	4	2
Sweden	9,3	9,2	9,2	9,3	9	8	4	4
Netherlands	8,9	8,9	8,8	8,9	9	8	7	7

Source: Table drawn up by the authors based on the data retrieved from the www.transparency.org/cpi website, accessed at 28.02.2012

We have chosen to analyze this point because with the advent of these asymmetric shocks in the global economy, the whole world has come to the conclusion that it needs greater transparency and accountability on the part of our leaders. No region or in the world economy is not immune to the damage caused by corruption. An analysis of all of the 183 countries of the world which have provided data about this show is that most of them have obtained a score below 5 on a

scale that starts at 0, the most corrupt and 10 the most transparent State.

The group chosen for analysis is used in the above indicator, i.e. the 27 EU Member States and the Member States B.R.I.C.S., USA and Japan.

In the table it can be easily notice that Denmark and remained three years in a row the Supreme position in this ranking, in 2011, remaining on the integrity of this country probably being affected by speculation that with the deepening of the global financial crisis. The second country that occupies a leading place in this hierarchy comes from the European Union, in the case of Finland. If in 2008, it is located on the same place with Denmark, i.e. 1st, in 2009-2010 lost slowly this prestige, arriving in 2010 to occupy the fourth position, because in the last year, 2011, and to climb two places.

Analyzing on the whole of the European Union member countries, we've noticed that only 17 of the 27 States have a score above 5, in the other 10 States corruption index showing us a degree of transparency extremely low.

It is estimated, however, that despite the crisis that has crushed and grinds in the Euro area, of the 17 States with the single currency 14 scores of more than 5, indicating a moderate to low corruption.

The most corrupt countries in the Euro area are Slovakia, Italy and Greece because this time the crisis has turned into a very attractive speculative target.

As regards the Member States B.R.I.C.S. we noticed that they have a high level of corruption, the least corrupt among them being South Africa and most corrupt being Russia with a score of 2.4.

The Japanese does not belie nor this indicator and, after occupying the position of 2008 28 in total, came to climb the 14 positions, until the 14th, 2011 with a score of 8.

United States of America, on the other hand, had a sinusoidal trajectory in terms of corruption index, the alternating downturns from 2008-2009 to the boarding of the 2009-2010 position 25 to 22, because in 2011 to fall back to the 2 position 24. However, throughout the four-year review, the U.S. has won scores of more than 7, which indicates a moderate to low corruption.

As we said, the situation in the world is not at all happy about this, but with the appropriate measures it could improve, especially if these measures aimed at halting the crisis.

Conclusions

From the analysis of the five factors that we could see that there was some attempt to change the old economic logic, the countries that have so far held supremacy is fighting hard to preserve it, in the face of increasingly stiff competition from some developing countries. This change forces worldwide and has made its presence felt ever more prevalent lately, especially since these have hovered and a catalyst of unwanted and the global crisis. A more thorough analysis it was observed that the world powers began to appear increasingly more often countries which until now were free of too much interest but who knew how to suggest the opportunity offered by this crisis and to take full advantage of it, to the detriment of countries considered Favorites to the title of superpower. In the future we will try to show that in addition to this change in world order in terms of power, the crisis has resulted in a change of logic and economic dominance at the global level.

Key Elements for Storage and Maritime Bulk Transport of Edible Fats and Oils in a Global Growing Market

Surugiu Felicia
Constanta Maritime University,
felicia.surugiu@cmu-edu.eu

Abstract

The storage and maritime bulk transport of edible fats and oils as a subject is a very complex matter and there is a real need to capture the evolved practices and international industry requirements now demanded by all international players in a continuous growing global market.

The world-wide edible fats and oils trade has established its own set of quality standards for storage and carriage that are laid down in certain forms issued by the Federation of Oils, Seeds and Fats Associations Ltd. (FOSFA) in London and National Institute of Oilseed Products (NIOP) in Washington.

However, there are few key elements that need always to be observed when dealing with edible fats and oils and it is the purpose of this paper to highlight those elements.

Key words: edible fats and oils, storage, maritime transport, shore tanks, chemical tanker

J.E.L. classification: L91, R40

1. Introduction

It is well known that currently global production of the major fats and oils is led by Asian countries. Indonesia is the world's largest producer, accounting for over 44% of the world's palm oil production, the major type of vegetable oil produced while China produces a nearly equivalent volume of fats and oils, and is a larger producer of soybean and canola oils.

Malaysia ranks third in world production because of its place as the second-largest world palm oil producer. India also produces large volumes of canola and butter. Overall, Asia accounts for over 50% of world fats and oils production.

Similarly, world consumption is driven mainly by Asia, which accounts for 44% of the world total. China and India together make up 32% of the world total. Chinese demand is mainly for soybean oil, followed by canola and palm oils. India is a major consumer of canola oil, as well as palm oil and butter. Both countries expect continued strong growth. Indonesia and Malaysia also contribute to overall consumption, especially in palm oil demand.

Palm, soybean, canola and sunflower oil are the world's most widely used fats and oils, and together account for 72% of total global consumption. Palm oil is the largest-volume oil used, surpassing soybean oil in the mid-2000s. In 1990, these four oils combined accounted for about 55% of global fats and oils consumption, with soybean oil at 20% of the world total, followed by palm oil with 14%.

Palm oil is produced mainly by Indonesia and Malaysia. Demand for palm oil accounts for over 25% of world demand for fats and oils, and is expected to grow at an average annual rate of more than 5%. The main consumers include India, Indonesia and China, and the rest of Asia, Europe and Africa. Palm oil use has grown significantly as a result of its lower cost, edible properties, and supply availability.

Soybean oil is the dominant oil used in the United States, accounting for 45% of total consumption. Biodiesel production will continue to drive U.S. growth. Soybean oil accounts for over 63% of total demand in Central and South America, and over 40% of its use is for biodiesel production, especially in Argentina and Brazil.

In Europe, soybean oil is used as cooking oil but growth has been limited in food use and more recently by biodiesel production. Soybean oil use in Asia is also significant (about 20% of the total) and strong growth of

4–5% annually is expected. China is a large consumer.

Figure 1. World production of major fats and oils in 2011

Source: <http://www.ihs.com/products/chemical/planning/ceh/fats-and-oils-industry.asp>

Overall, world fats and oils consumption is expected to grow at an average annual rate of 3.5–4%, driven mainly by growth in Asia and steady increases in the United States and Europe.

In Asia, China and India will continue to experience a growing population and economy, which will result in an increase in per capita demand for fats and oils. In the United States, Europe, and Central and South America, fats and oils demand for nonfood use, particularly biodiesel production is expected to continue to increase.

2. Storage of edible fats and oils ashore and onboard chemical tankers

For storage tanks ashore the most suitable shape is the vertical, circular cross-section tank with self-supporting fixed roof, preferably conical in shape. Where possible, tall, narrow tanks are preferred to minimize the surface areas of the contents and, therefore, to minimize contact of the oils or fats with air and the oxygen it contains. Tank bottoms should be conical or sloped (with a sump) to facilitate draining. All openings such as manholes, inlets, outlets, draining out points, etc., should be made such that they can be locked and/or effectively sealed.

For each installation, the total storage capacity, size and number of tanks need to be related to the size and frequency of intakes,

rates of turnover and the number of different products handled etc.

The economics of bulk transport requires that a range of cargoes can be carried on one vessel and tank capacities generally vary between 200 to 2500 tons.

Ship's tanks differ from land tanks and complete segregation of tanks is achieved by using individual pumps and line systems, each tank having its own dedicated pump and line system.

Mild steel tanks should preferably be coated to prevent attack or corrosion of the mild steel by the cargo. The coating should be approved for contact with food. The trend towards the use of stainless steel for tank construction will remove the need for tank coatings. Damage to coatings can be caused by abrasion or by using unsuitable cleaning methods leading to local corrosion.

The tanks should always be inspected before a cargo of oil or fat is loaded and, if necessary, repairs to the coatings should be carried out.

Despite of being clasified as edible, due to more and more stringent requirements for pollution prevention, when edible fats and oils have to be carried by sea, certain types of ships (known as chemical tankers) have to be considered.

There are three types of ships designed for sea carriage:

- type 1 ship is a chemical tanker intended to transport products with very severe environmental and safety hazards which require maximum preventive measures to preclude an escape of such cargo;
- type 2 ship is a chemical tanker intended to transport products with appreciably severe environmental and safety hazards which require significant preventive measures to preclude an escape of such cargo;
- type 3 ship is a chemical tanker intended to transport products with sufficiently severe environmental and safety hazards which require a moderate degree of containment to increase survival capability in a damaged condition.

In general, only type 2 and type 3 chemical tankers are used for carriage by sea of edible fats and oils since these cargoes are not so aggressive for marine environment in case of operational overboard discharges.

3. Maritime bulk transport of edible fats and oils

Internationally, the carriage of oils and fats was not regulated until the International Maritime Organization, with their responsibility for the safety of seafarers and the maritime environment, regulated the category of ships which could carry this type of cargo. There is no doubt that this change, in January 2007, has greatly improved the quality of the vessels employed in the trade.

Ships employed in the trade are categorised as follows:

- bulk tankers
- parcel tankers
- coasters
- container vessels

Bulk tankers range from 15,000 to 40,000 tonnes and have a varying number of different sized tanks, usually with inter-connected valves. They are best suited for the carriage of single oils, in large volumes, where they can be loaded with valves open for fast receipt of the cargo and easier trim of the vessel.

Parcel tankers are more sophisticated ships, mainly in the 15,000 to 40,000 tons range, designed to carry a variety of different but fully segregated bulk liquids. Each tank may have one of a number of different coatings to suit a particular kind of cargo and each tank, or small group of tanks, will have its own dedicated pipelines and pumps.

Coasters are ships generally between 750 and 3000 tons that cover short sea voyages. They are also frequently used to handle transshipment from ocean-going vessels.

Container vessels are purpose built to carry containers of uniform dimensions for convenient stowage. They run between container terminals, whilst the containers themselves can be filled and unloaded at whatever other, frequently inland, point/s may best suit the goods and parties concerned.

For all above ships there are specific requirements as regards materials used in the construction of tanks and for ancillary equipment (including heating facilities). Such materials should be inert to oils and fats, and should be suitable for use in contact with food. Stainless steel is the most preferred metal for the construction of tanks. It is

particularly recommended for the storage and transport of fully refined oils and fats.

In addition for all ships, the cargo storage tanks onboard should be installed with heating facilities so that the product is liquid and homogenous when transferred or unloaded. Heating coils should be of stainless steel construction. Heating coils constructed from alloys containing copper are not suitable. Use of means of heating should be by design, construction and procedures, such as to avoid contamination and damage to the oil.

There should be always means of cargo temperature monitoring for each individual cargo storage tank, with temperature sensors and control devices to prevent overheating of oil in the tank and associated lines.

4. Conclusion

As a conclusion to be noted that prior being accepted for carriage of edible fats and oils, chemical tankers have to comply with following mandatory requirements:

- ships shall be fully classed by a classification society in membership of the International Association of Classification Societies.
- copper and its alloys such as brass, bronze or gun metal shall not be used for any part of the system installation and means of transport that has contact with the oils or fats.
- tanks, other than those of stainless steel, shall be coated, with the exception of mild steel tanks as specified in the *FOSFA Operational Procedures*. Only coatings suitable for food grade products and for the carriage of the oils or fats shall be used. Zinc silicate coated tanks shall not be used for crude oil unless the acid value is 1 or under.
- heating coils within tanks, and tubes and internal shell of heat exchangers shall be of stainless steel construction only. Heat transfer medium shall be fully described on the *FOSFA Combined Masters Certificate*.
- cargo lines shall preferably be of stainless steel construction with sufficient drain valves.

Chemical tankers shall comply with the requirements of the *FOSFA Qualifications* for ships engaged in maritime bulk transport

of edible fats and oils and also with *FOSFA Operational Procedures* for ships engaged in this business.

There will be two major documents issued prior vessel's acceptance for commencement of actual loading operations of a chemical tanker:

- certification in the form of a *FOSFA Certificate of Compliance, Cleanliness and Suitability of Ship's Tank* issued by a FOSFA Member Superintendent.
- certification in the form of a *FOSFA Combined Masters Certificate* signed by the Captain/First Officer or an equivalent statement signed by the ship's owners or authorized agent, applicable before any loading or cargo transfer.

In order that a *clean acceptance certificate* to be issued, the immediate previous cargo in the storage tanks shall not have been a product appearing on the *FOSFA List of Banned Immediate Previous Cargoes* or shall have been a product appearing on the *FOSFA List of Acceptable Previous Cargoes* (whichever is appropriate) currently in force at the date of Bill of Lading.

Where the second last cargo is not on the *Acceptable List*, the pumping of an acceptable immediate previous cargo from one tank to another during the voyage will not render the tank as acceptable.

The Restrictions relating to previous cargoes beyond the Immediate Previous Cargo, as set out in the *FOSFA List of Banned Immediate Previous Cargoes* and the *FOSFA List of Acceptable Previous Cargoes*, shall apply.

Prior to receiving cargo ship's tanks and related cargo handling systems should be fully inspected for cleanliness by a FOSFA Member Superintendent in accordance with *the FOSFA Code of Practice for Member Superintendents, Part One*. Inspections shall be certified in the *FOSFA Certificate of Compliance, Cleanliness and Suitability of Ship's Tank*.

Before any loading of, or transshipment to the ocean carrier, a statement in the form of the *FOSFA Combined Masters Certificate* shall be handed to the sellers/shippers or their Superintendent.

In the absence of heating instructions from charterers, *the FOSFA Heating Instructions (A5 - A8)* or the relevant *PORAM Heating Instructions*, whichever are

applicable, shall be followed and the temperature of the oil or fat shall be recorded daily.

Physical operations at loading and discharging shall be conducted in accordance with the *FOSFA Code of Practice for Member Superintendents, Part One*.

Prior to discharge all additional handling systems such as hoses and deck manifolds shall be inspected for cleanliness by a FOSFA Member Superintendent. At the commencement of discharge, line samples shall be taken at the ship's permanent connection for each cargo unloaded.

Particular Warehousing Techniques for Goods Carried by Sea

Surugiu Felicia
Constanta Maritime University,
felicia.surugiu@cmu-edu.eu

Abstract

A warehouse is a commercial building used for storage of goods while warehousing is the process of proper storage and handling of goods and cargo using scientific methods in the warehouse and making them available conveniently when needed. In today's economics, warehousing is considered as one of the most important aspect of trade.

Warehousing techniques are the systematic ways and means of receiving, storing, protecting and issuing materials and commodities for future use.

This article will point out few stages in the process of warehousing goods carried by sea and shows how good techniques can improve the efficiency and economy of a warehousing organization.

Key words: warehouse, storage, techniques, goods, sea ports

J.E.L. Classification: L91, P45

1. Introduction

Warehousing is just one element in the chain of interdependent activities known as materials management. It is the part of materials management concerned with the storage of the kind and quantity of goods that consumers and users require [6].

It is well known that some commodities are produced in a particular season only then, to ensure their off season availability, warehousing is needed.

On the other hand, some products are produced throughout the year but their demand is seasonal so, again warehousing is important and needed in such cases.

For the companies which opt for large scale production and bulk supply, warehouse is an unavoidable factor. Warehousing help

companies ensure quick supply of goods in demand. Production of goods and their movement are important for the companies for continuous production of goods.

Warehousing is also important for price stabilization especially when national political interests dictate a price control. For necessary goods, the Governments store them in the warehouses and control its supply in the market as per the price fluctuations.

Another important need of warehousing is for bulk breaking. Consider a trade agent who imports goods from a country for a large number of buyers in his own country. He first takes the goods to his warehouse and breaks it into small parts for supply to the buyers.

When it comes to cost saving, there is warehousing that helps the traders with cross docking. All the goods are consolidated in the warehouse and then stuffed into containers as per their destination. This is especially beneficial for small traders who export low quantity of goods.

2. Functions, types and characteristics of a warehouse

Major functions of a warehouse are: storage and protection of goods, risk bearing, financing, processing, grading and branding, transportation.

There are three main types of warehouses, each having its own specific characteristics [1]:

Private warehouses: these are owned by the manufacturers or traders/distributors. Private warehouses are used to store exclusively owned goods. These are usually preferred by farmers near their fields, wholesalers/distributors/retailers near their territory, manufacturers near their factories, and exporters/importers near ports. Private warehouses offer better control over movement and storage of goods and less chances of error. Along with this, product specific storage techniques can be opted in

private warehouses. On the other hand, higher operation costs and inflexibility in storing different products are the major disadvantages of private warehouses.

Public warehouses: these warehouses are meant for use by general public. Anyone can store their goods in public warehouses for a nominal rent. These warehouses can be private or state owned. In case a private company wants to start a public warehouse, it has to compulsorily obtain a license from the government. Besides this, the operations of these warehouses are also regulated by government agencies. These warehouses are less expensive and more cost effective. They are flexible enough to store different kinds of products. Public warehouses offer better utilization of money as the user pays only for the space occupied. But public warehouses are not considered goods when it comes to such goods which require special handling techniques. Also the chances of error are more here due to common storage of all goods.

Government warehouses: are owned, managed and governed by a state government. They can be used by both private companies and government agencies for storage of goods. They are thus also considered a form of public warehouses owned by government. Government warehouses offer better security and safety of goods due to high involvement of government. They are very less expensive but require considerable paper work to be done.

An ideal warehouse will present following main characteristics:

- mechanical appliances should be there to lift, load and unload goods;
- should be conveniently located near highways, railway stations, air ports, sea ports etc. for loading and unloading of goods;
- it should be spacious enough;
- food storage warehouses should have enough facilities to prevent food from perishing;
- proper arrangement to save goods from sunlight, dust, rain, moisture and pests should be available;
- sufficient parking space should be there to facilitate quick and easy loading and unloading of goods;

- security arrangements should be strict and round the clock.

3. Warehouse Management System

The main aim of warehouse management system is to fulfill its functions with economy, speed and efficiency [6].

This should be designed to suit the types of goods in store and the patterns in which they are received and issued. Storage location systems should enable orders to be put together and made ready for distribution when they are wanted. Stock has to be maintained in good condition and handled with care.

A warehouse management system, also known as a WMS, facilitates and controls the movement and storage of materials housed within a warehouse. These systems automate transactions and allow stock to be located, quantities of stock to be assessed, and warehouse tasks to be directed.

As a matter of fact, due to the advanced technology of warehouse management systems, all warehousing functions can be optimized. This optimization can include all inventory movements, as well as the provision of all information flowing in between the movement of inventory.

Warehouse management systems are being used by, and are of great use to all types of businesses. While businesses of all sizes use them, small to mid-sized business have been showing a growing interest in these systems.

Even though smaller to mid-sized businesses may have less inventory to keep track of than larger businesses may, the streamlining facilitated by a warehouse management system is still of great usefulness to them. These systems allow for the faster movement of product, which in turn improves the bottom line of any business.

The integration of a WMS within an organization results in improved operating practice overall. It allows space within a warehouse to be maximized, and allows for the more effective use of labour, equipment and inventory.

Once a warehouse management system is implemented, an improvement in the accuracy of inventory, as well as an improvement in flexibility results. Of course

labor costs are reduced, and customer service is enhanced.

The process by which information can be updated in electronic inventory, due to the integration of a WMS results in higher levels of accurate results. The accuracy of WMS results allows for a reduction in the amount of red tape within a business, as well as the altering of inventory information in a streamlined, simple manner.

Captured electronic data can be used for the purpose of monitoring the working practices within a business. This in turn ensures that the merchandise is always replenished when necessary, making the taking of physical inventories unnecessary. Manual data entry can result in errors. However, electronic operations involving warehouse stock through warehouse management systems, results in a greatly reduced rate of error, or even no rate of error at all.

4. Conclusions

Amongst warehouses, those located in maritime ports have a particular interest in respect of goods flow upon beginning or completion of a sea passage.

In an ideal world, warehouses would not be needed at seaports. Consignments would be off-loaded directly onto waiting trucks, railway wagons or barges and taken straight off to their ultimate destinations. This would be particularly true for commodities or goods arriving as full container loads (FCLs).

In the real world things do not always run so smoothly. Goods may have to be accommodated temporarily in the port area for two main reasons [1]:

- the right number or type of trucks or railway wagons are not or cannot be made available for onward transportation at the time a ship is discharging its cargo;
- there may be delays in completing documents or satisfying port or customs formalities. For example, goods may have to wait before they are assessed for import duties. Damaged consignments may have to wait before they are inspected for insurance purposes or the documents themselves may not be in order.

Delays are costly. Holding up a ship in port incurs expensive demurrage charges. Keeping goods "stored" in railway wagons

also runs up charges. In addition to these direct costs are the indirect costs accruing to the importer who is not receiving any return on his goods and who may well be paying interest on the investment.

Delays are even more disastrous for cargoes which can perish or deteriorate.

Fast off-loading and streamlined onward transportation will benefit importers, end users and a country's economy as a whole.

As more and more goods are transported in containers, and particularly of the Roll-on/Roll-off type, portside warehouses are used less and less.

More typically, these port warehouses are used today for storing smaller items or packages *destuffed* from LCL containers until they can be removed to other or final destinations.

Dutiable items for which the levy has to be paid before they can be removed are stored in bonded warehouses. A charge is made for this facility.

Some ports limit the time in which goods can remain in bonded warehouses for the set rental. After the given period, interest may be charged on the outstanding duty. Damaged packages may stay in bonded warehouses until they are inspected by port authorities, customs or insurance assessors.

A great deal of quayside space is often needed for storing containers awaiting their onward journeys or return.

Ports usually have an open area for cargoes which can be stored outside without a great risk of deterioration - steel sheets or metal ingots, for instance. These yards must be kept secured.

Whether to store an item inside the building or in a stockyard will depend on three things: the nature of the product, the climate and the amount of space available.

Storekeepers need to know which materials can and which cannot withstand exposure to the local climate. Plastic pipes may be fine outside in temperate climates, but can distort in extreme heat. Other products may dissolve, rust, rot or crack if they are kept outside.

If goods are normally issued in bulk, they will be repacked and stored in cases or on pallets after checking. If other items are normally issued individually, it will be better to *break bulk* after checking, and store them as individual packages or separate items. It

may be necessary to store a product both ways to cater for the needs of different users.

If delivery of a small quantity from a counting or handling unit of a package becomes unavoidable, only one package should be opened at a time. The contents of this should be accounted for before the next package is opened.

Well-defined commodities of a reasonable and stable range could usefully be arranged in a logical sequence by commodity. Commodities needing special storage facilities, such as fuels, lubricants are often grouped in this way.

So are various kinds of bulk grain or bulk cement. Grouping products of a technical nature is always advisable.

It may suit a multi-purpose warehouse to have a different location system for separate groups of goods or for different buildings. Some flexibility will be inevitable: heavy or very bulky items cannot be placed safely on high shelves, for instance.

All stock received into the warehouse must be marked to identify each lot or consignment. The marked items will then be placed according to the location system selected, and according to size, packing, volume or type of material [4].

Details to be marked should include a description of the contents or a catalogue code number plus the quantity and date (or date code). This information may be written on a label attached to the item or on a bin tag on the place where the item will be stored.

Closed cases should be marked on two adjacent sides. Goods can be marked by manufacturers or suppliers according to the purchaser's instructions.

Given precise instructions, they can print the necessary details on the labels, including an alpha-numeric code or a bar code (or both).

Most of goods and cargoes carried by sea fall into below categories having particular warehousing techniques prior or after a sea passage is completed [5]:

Raw material storage: any material required or used for the production process. Warehouse locations are generally located in the factory building, so the company can save the costs of storage because it does not require a special building for it. Warehouse so called because its function is well stockroom store stock for specific needs.

Storage of semi-finished goods: In the manufacturing industry, we often find that the work piece has to go through some kind of operation in the process. This procedure often had stalled because of a subsequent surgery required processing time is not the same. As a result, goods or materials have to wait until the machine or operator who is doing it.

Finished Product Storage: most of times they are stored at the sea ports before being loaded onboard vessels for the sea passage to final consumer.

In addition to the above three kinds of warehouse, there are several other kinds of warehouse needs to know:

For Suppliers Storage: Warehouses nonproductive goods storage and will be used for the work of packing, maintenance, and storage of office supplies.

Storage components : Warehouse to store the components are ready assembled. Warehouse is commonly placed adjacent to the assembly area or can also be placed separately in the storage of semi-finished goods.

Salvage (rescue): In most of the production process, it is possible some will be wrong workpiece done. As a result, items requiring rework to repair, so the quality of production in the fix. Therefore, companies need an area to store any of the workpiece before reprocessing. Workpieces can not be repaired will be scrap or waste is placed in a separate location.

Waste : Warehouse used to store materials or components wrong way and could not be repaired.

Marine Transport by Container – Moisture and Condensation Damage

Surugiu Gheorghe
Constanta Maritime University,
gheorghe.surugiu@cmu-edu.eu

Abstract

Marine transport by container is the most economical and safe way of shipping for almost any kind of cargo. But putting cargo into a closed steel box also entails a permanent risk of moisture damage for the majority of cargoes carried by sea.

Such damage may result in substantial losses and costs. Certainly not every shipment suffers moisture damage, and most of those that do, suffer only limited damage. However, lots of moisture damage remains unrecognized, because it is considered “normal” and only few shippers have a good system of feedback from the receivers of their goods. There may be lots of things they don’t know and thus no adequate steps are taken to reduce or even eliminate risk of damage.

Although along the years the subject has been covered by extensive literature, due to continuous technological progress and implementation of modern shipping techniques, there is a need to highlight those developments which bring an improvement to the marine transport by containers, and this is main purpose of this paper.

Key words: container, moisture, condensation, marine transport, damage

J.E.L. classification: L91, R40

1. Introduction

While cargo theft on piers or warehouses is generally recognized as a major loss exposure for shippers or consignees, and efforts are made to stem such attacks, still too little attention is paid to loss as a result of excessive moisture in the shipping container. That’s ironic, because the container development was, in part, a response to cargo theft and poor aboard ship stowage [3].

Excessive moisture damage can occur not only in marine shipping, but also to cargo

shipped by rail, truck or air under inland marine coverage.

Temperature changes as well as other natural elements can result in the build-up of moisture and the formation of mold and mildew, rust on metal, discolored or peeling product labels and unwanted product odors.

These destructive results stem from extreme climatic changes which occur along shipping routes and include fluctuations in temperature and humidity.

Condensation develops in the air space inside the shipping container fouling the contents and invisible until uncrated.

In addition, humid air trapped inside containers, or certain hygroscopic (moisture - containing) items within them, such as wooden pallets, can intensify the moisture problem [4].

This type of irreversible damage can lead to millions of dollars in escalated shipping and materials costs, increased claims, higher insurance premiums and, in extreme or repeated cases, cancellation of the insured's marine policy.

Condensation is the result of a recipe of factors: air movement in the hold of a vessel or intermodal container; inherent moisture content of the cargo and/or its packaging, temperature variation between ship/container and cargo; and time period that this difference is maintained [8].

It occurs when there is a temperature difference caused by [5]:

- changes in latitude, as the vessel and cargo travel from one climatic state to another. Something as simple as the cold steel of a vessel’s hull plying through warm waters can trigger it;
- presence of artificially warm air on cold steel hull or container surfaces. This may occur when the vessel or container is exposed to temperature ranges, such as hot, humid days when stored or stowed in the open, followed by cool, dry nights. It can also occur when cargo or container is

placed near the engine room bulkheads or other latent heat source;

- spontaneous heating of the cargo due, among other things, to the growth of microorganisms, insects or oxidation.

The pattern of moisture damage may seem random. The moisture processes are examples of strongly non-linear physics.

That means that very small differences in the cargo and voyage conditions can have a huge effect of the outcome. That is why you may have few consecutive perfectly safe shipments and the next ones may be a disaster.

This means that there is always a risk of moisture damage in the next shipment, even if the last one was ok.

2. Moisture damage can be prevented

All containers contain moisture from the time of loading and in the cargo. No container is airtight. Moisture will move in and out of the container during the course of the voyage – so called “container breathing”. The objective of a moisture protection program is to prevent the buildup of moisture in the air to levels where it may cause damage [1].

Storing pallets inside or outside is often enough to make the difference between no damage and “disaster”. Simply adjusting the temperature of the cargo at loading can prevent damage. Thus it is well worth to make what improvements are at all practical, and the balance will then have to be taken up by the packaging and the absorbers.

A minimum requirement is of course that the container is watertight against rain and spray. That is usually the case, but especially the bottom side and the doors are vulnerable to damage that may not be noticed.

Certainly no container is airtight, but a container in good condition allows air (and moisture) to move in and out of the container only slowly, over hours perhaps. That significantly reduces the amount of moisture moving into the container under common circumstances (container breathing).

For a moist cargo, such as agricultural commodities, it is usually better to leave the vent holes open.

A container that has been washed before loading, brought in from outside into a warm

loading area or stored in a humid place, may contain lots of water. In particular, attention must be paid to the container floor. The humidity of the wood should not be above 18%.

All pallets and other wooden dunnage must be dry. Preferably the moisture content should not be above 18% and certainly not above 20%. It is easy to check the humidity with a small handheld device commonly used in the construction industry and costing a couple of hundred Euros only [1].

Some cargoes are entirely dry and don't contain any moisture, e.g. pure metal products without corrosion protection or surface treatment.

But most cargoes contain moisture, if only in the packaging that usually include wood, cartons, paper etc. Most of this moisture is bound in the material and is not easily released, but even a small percentage can cause problems. Even if the product appears dry at loading is no guarantee against things going wrong in a container where temperatures may later on reach 60-70C [1].

Some cargoes unavoidably contain large amounts of moisture, even after having been made as dry as practical. They require a more sophisticated moisture protection installation.

Particular attention should be given to the storage of containers, pallets and dunnage and certainly not to speak of the cargo. Even under a tarpaulin dry pallets or crates stored outside, can quickly absorb significant moisture.

Wet or snowy tarpaulins, truck wheels or even shoes may introduce a lot of water into the container. Again beware of wood, including the container floor that may look dry but in reality be very moist.

A more subtle consideration is to make the cargo have the same temperature as the container during and after loading. It is especially dangerous to load a cool cargo under warm and moist conditions. Moisture containing warm cargo loaded into a cold container, eg a reefer, is also a problem [6].

As the doors on the container are closed a certain amount of air is enclosed. Under normal conditions the amount of moisture contained in the air is usually insignificant in comparison with that which will be exchanged with the outside and the cargo during the voyage.

But when loading under tropical conditions the amounts of moisture involved may be greater by a factor 10 or more, and special consideration will then need to be taken to quickly absorb the surplus moisture [1].

Even a completely sealed package may suffer moisture problems as a result of temperature variations. Most packaging materials let moisture through and moisture will move both into and out of the packages during the voyage. This can be advantageous in a dry container, where the cargo will dry out into the container air. But it is of course a danger if there are moisture problems in the container.

A properly designed moisture protection considers the entire logistic chain and may involve a combination of absorbers placed within the cargo as well in the container and several layers of barriers with different properties chosen so that the net effect of the moisture migration is positive [8].

It is usually an advantage if the cargo is closely stuffed and there is as little free air as possible in the container. The pallet wrapping should have openings at least on the bottom.

3. Modern techniques for reducing risk of cargo damage by moisture and condensation

The most effective way to reduce the risk of moisture or humidity damage in the shipping container is the use of container desiccants. Specifically developed to combat condensation during long-haul transport via air, sea, or land, container desiccants contain a clay compound capable of absorbing up to half their weight in moisture [3].

These desiccants activate whenever the dew point is reached and condensation starts to form inside the shipping container. The desiccants, which were designed to accommodate cargo containers, are a cost- and labor-efficient solution for moisture prevention.

The lightweight, environmentally-safe bags are simply placed in between packages of cargo as they are being loaded into a container prior to shipment, and removed upon arrival.

According to Hans Ruhlandt, regional vice president for the National Association of Marine Surveyors, Inc. (NAMS), a non-profit

organization dedicated to the enhancement of the marine industry and the marine surveying profession, "Desiccant products can prove to be a priceless commodity to worldwide shippers, whose cargo can travel through different climates and experience extensive lag time in transportation" [3].

Ruhlandt explains that cargo is often held up in non-climate-controlled storage areas or hot, sun-drenched docks for extended periods of time, which can cause or intensify the formation of condensation. Ruhlandt cites desiccant technology as one of the most effective means of addressing moisture problems. "As surveyors, we are called upon by the insurance companies to evaluate packing methods and make suggestions to prevent claims. We recommend desiccants whenever we evaluate a cargo load of high-tech or moisture-sensitive products, such as computers, metal products, or cargo that consists of metal cans," says Ruhlandt. "In many cases, desiccants can prevent claims to insurance companies and thereby reduce premiums" [3].

Marine insurance policies calculate premiums on a per hundred dollar value basis (for example, 50 cents per hundred dollars). In many cases, if the insured can demonstrate to an underwriter that a desiccant product can reduce risk, a lower premium per hundred, such as 40 cents, can be negotiated. This type of reduction, when multiplied over hundreds of cargo containers can mean millions of dollars in savings for a large commercial exporter [3].

Marine insurance policies calculate premiums on a per hundred dollar value basis (for example, 50 cents per hundred dollars). In many cases, if the insured can demonstrate to an underwriter that a desiccant product can reduce risk, a lower premium per hundred, such as 40 cents, can be negotiated. This type of reduction, when multiplied over hundreds of cargo containers can mean millions of dollars in savings for a large commercial exporter.

A company that uses desiccants, however, must first be knowledgeable about their use. "In the absence of engineering, the use of a desiccant is a futile effort," says John Colletti, CMS, of John R Colletti Associates (Pittsburgh, PA), a company that specializes in marine cargo surveying [3].

Colletti describes a recent example in which a cargo container that utilized desiccants was opened, only to find the desiccants soaking wet and excess moisture in the bottom of the container. "The shipper had the right idea, but there was not enough research done to calculate the proper amount of desiccant. As a result, the cargo was destroyed by moisture," he explains.

4. Conclusions

Following ten steps were found as being a good practice checklist needed to be followed for a container shipment preparation [5]:

1. Ensure that the application of preservative or rustcorrosion inhibitor is uniform on exposed metal surfaces.

2. Inspect the container to ensure it is clean, dry and suitable for use. Containers should be as airtight as possible, with no holes, poor door seams or other defects where moisture/water can enter. The best and easiest way to inspect the weather-tight integrity of a container is to stand inside and close the doors, looking for any light entering through roof, sidewalls or floor. Obviously, it is advisable to perform this test in daylight hours and in a somewhat open area, not under the eaves of a loading dock.

3. Ensure that the packaging used, whether wood, plywood or corrugated, does not contain excess moisture. Wood/paper can hold significant moisture. Corrugated cartons should be of high grade. Poor quality, short-fiber material falls short in any shipping environment. If it is exposed to moisture, it tends to rapidly weaken, causing handling/storage problems.

4. Place desiccants throughout the stow during loading and more at the rear after completion of loading. Since desiccants absorb moisture as soon as they are exposed to air, they should be kept in original packaging until ready for use.

5. Select appropriate number of desiccant bags or strips (a rule of thumb = 32 one-pound bags of desiccant for a 20-foot container for a typical 30-40 day overseas voyage) depending on certain parameters.

6. Ensure the product can operate in the likely climatic conditions; e.g., some of the strip-type moisture absorbing products applied with glue to the sidewalls of the container will lose their adherence at extreme

temperatures, and can be damaged during handling.

7. Finish cargo loading as quickly as possible and then close the doors. Cargo loading should be uninterrupted and fast; desiccants can saturate quickly in humid conditions. If they are already saturated, they will not protect the cargo.

8. Schedule shipment so it can go immediately to the port of loading and be loaded onto the ocean vessel as soon as practical.

9. Consider inserting inexpensive temperature and humidity indicators inside the container to ascertain what conditions were experienced during transit.

10. Use the results of the initial shipments to gauge the amount of desiccant/protection needed for future ones.

Abstract

This paper conducts an analysis of the impact of the global economic crisis on the Romanian small and medium enterprises (SMEs) and provides some relevant policy suggestions at the end. First, the paper analyzes the impact of the global economic crisis on the Romanian SMEs, focusing the discussion on the causes and resulting problems from SMEs. Secondly, this paper reviews the impact of the economic crisis on the Romanian SMEs, presenting the evolution of SME sector during the crises. Third, the paper presents the countermeasures taken by the government, focusing on its support policies for SMEs and the problems exhibited in the implementation of those policies. Finally, the author makes policy suggestions for boosting the development of SMEs.

Key words: financial crisis, economic crisis, small and medium enterprises.

J.E.L classification: F62, F65, F68

1. Introduction

Small and medium-sized enterprises have always played an important role in economic and social life of any country. The dynamism, flexibility, adaptability, mobility, innovative potential are some of the features that small and medium-sized enterprises have and which are considered essential for the harmonious development of the economy of any country, ensuring the cohesion of the economic structure, healthy economic growth and creating new jobs.

In Romania, SMEs generate dynamism and profitability, competitiveness, increase the employment rate of the labor force, so we

can say that it works successfully in the direction of reducing the monopolist role of the of the big enterprises. According to the President of the National Fund of Credit Guarantee for Small and Medium-Sized Enterprises (FNGCIMM), Aurel Șaramet, SME sector in Romania contributes with 65% of the gross domestic product of the country and ensures as up to 67% of the employment of the work force.

In the economic-financial crisis situation, the most affected area is by far that of SMEs. The SMEs Sector was the first which "chest with the crisis" and from this sector it is expected the recovery signal.

The impact of the economic crisis on the activity of SMEs in the global economic crisis started in 2008, it was felt, as it is normal also in Romania, as a result of globalization. Knowing the consequences of globalization, many European States acted preemptively to lessening the effects of the crisis. In Romania, the crisis found totally unprepared Romanian officials who declared that the effects of the crisis will not affect very much the Romanian economy. This explains the delay with which the Romanian authorities acted to reduce the effects of the crisis. Thus, the negative effects of the economic crisis were felt most in the SME sector that was depleted by the cost of the economic crisis, especially those in sectors such as trade, construction and real estate. The number of SMEs under bankruptcy increased. This is due to the fact that the pace of lending to SMEs decreased what prevents their development and has the effect of reducing the Bank's solvency.

2. The influence of economic crisis on the romanian SMEs

The global financial crisis has affected the sector of small and medium-sized enterprises in Romania in two ways.

On the one hand the economic crisis affected the business environment, due to the fact that large companies with which the SMEs collaborate were affected.

The second way the economic crisis affected the financial and banking system, which was the most vulnerable and most volatile. The system has limited the availability of credit to SMEs. The crisis began because of the situation on the real estate market and the securities that banks ask for SMEs access to finance are especially real estate guarantees and in this situation the fall in value of the real estate market conducted to difficulties for SMEs to obtain new loans or even able to maintain credit lines for the development of production.

The main difficulty with which the Romanian SMEs were faced, both because of the economic crisis and because of chaotic actions of the Government are:

- ensuring the necessary funding and liquidity due to the blockage of crediting;
- drastic reduction of demand for products and services at the national and international level, reflected in the reduction of exports and domestic sales;
- taxation and extremely high fiscality;
- high increasing of the raw materials, energy and food prices;
- variations of the exchange rate and inflation
- legal framework, the bureaucracy and the numerous administrative barriers for SME activity, insufficient measures to support SMEs in crisis [1].

In this context, we consider that it is important to highlight the impact of the economic crisis on the activity of the Romanian small and medium enterprises. For this reason, in the spring of 2011 National Council of Private Small and Medium Enterprises in Romania (CNIPMMR) held a survey on a sample of 1723 entrepreneurs, representative at the national level in all size classes, regions, age categories, forms of organization and legal branches of activity [1]. In the selected sample, the trade

companies occupied the lion's share with 39%, followed by those in the industry (17.22%), transport (10.5%), services (12%), the rest being shared by the tourism and construction companies.

Because the owner of the bankrupt firms could not be contacted (because they closed or companies have expressed willingness to provide information), the study presented two categories of survey results:

- a first category of results refers to the evolution of activities within SMEs being investigated between October 2008-March 2011 : 44,44% of the companies pointed out that they have decreased their activity, 42,87% of the companies operated at the same parameters and 12,69% of companies had an ascending evolution.
- the second category of results has in view the feedback from the Romanian entrepreneurs regarding the evolution of SMEs whose activity is known very well (suppliers, clients, competitors etc.) during the October 2008-March 2011. The survey reveals that 39.22% of enterprises have reduced their business, 24, 02% of the companies were bankrupt, 27, 25% worked at the same parameters and 51% of companies had boosted their activity.

Although the information provided by the entrepreneurs on the other firms may be affected by the subjectivism, we believe that the situation presented is relevant in order to make a complete image regarding the evolution of the SME sector during the October 2008-March 2011.

In the following lines we present situation of the 1723 investigated SMEs, stating that among them there are companies who have ceased operations due to bankruptcy. Taking into consideration the establishing year of the firms, we can observe that the companies with under 5 years of age have higher percentages of companies operating at the same parameters (48.16%) and who had an ascending evolution (17,71%) and SMEs in 5-10 years registered a greater proportion of the entities that have reduced activity in the reporting period (51,39%) [2].

Examination of economic agents depending on the field they activate emphasizes mainly the following items:

- The construction enterprises registered the lowest proportions of organizations that worked in the same parameters (31,94%) and increased their activity (8,33%) and a higher percentage of firms that have decreased their activity (59,72%) due to drastically decline in the last period of this sector,
- SMEs in the field of transport register a higher proportion of companies who have kept the volume of activity (51.18%);
- Industrial units have the highest percentage of SMEs who have boosted activity (19.34%) and the tourism companies had the lower share of economic agents which decreased activity (35.29%).

It may be concluded that a considerable part of small and medium enterprises in Romania were faced with big problems, due to the economic crisis [3]. As in other countries in the world and the EU, they have made the hard face of the economic crisis; the situation is explained by the fact that SMEs are generally more vulnerable to contextual turbulently than large firms.

Analyzing the economic performance of SMEs in 2011 compared with 2010, the situation seems to have improved, because the results were the same in 35.76% of the organizations, much better in case of 28.10% of cases, the weakest in 21.52% of enterprises. Worth mentioning is the fact that, despite these difficulties, over 20% of SMEs have invested in new technologies, more than 10% in improved computer systems and over 30% were able to launch new products.

In 2011 21.221 companies have suspended their activity with 68.1% less compared to 2010, when 66.420 have been suspended. Most of the companies that have suspended their activity were from the Bucharest-2.616 companies (compared to 2010 10.910) and the counties of Constanța-1.249 companies (3.036 in 2010), Arad 877 companies (1.833 in 2010), Brașov-854 companies (2.881 in 2010) [4].

The areas where it was registered the highest number of suspensions of activity was wholesale and retail; repair of motor vehicles and motorcycles-6.974 companies, construction 2.681 companies, professional, scientific and technical-1.802 companies and manufacturing-1.539 companies.

And the number of voluntary removals dropped last year from 186.144 in 2010 at 56.245 voluntary removals (minus 69.8%). The highest number of voluntary removals was recorded in the municipality of Bucharest-13.352 companies and in the counties of Cluj-2.806 companies, Prahova 2.271 and Constanta 2.096.

In 2010, the number of companies that went bankrupt was raised to 38.175, 85 times more than in 1995.

3. Microeconomics and macroeconomics possible measures for boosting the development of SMEs

At microeconomics level, what should do a SME in this situation? What measures the managers of the companies should undertake to resist the crisis and be able to return to profit and to boost their company? These are questions which exist in the mind of many business people who hold or are involved in the management of companies, and not only them. There are several important steps that any manager should take in order to withstand the vicissitudes of economic crisis:

- reduce costs as much as possible by eliminating expenses that are not absolutely necessary for the current task (especially the Exhibitor costs of third parties);
- boosting labour productivity translated in the most efficient possible use of the workforce;
- selection of markets on purely economic criteria;
- strengthening the portfolio of customers stable and financially profitable.

At macroeconomics level, the government should formulate policies to mandate that banks to lend to the SMEs, or provide good incentives for the banks to lend to SMEs willingly, and increase the ratio of bank loans to SMEs.

Economic recovery is contingent on access of SMEs to financing. The economic crisis has affected the relative size of the funding instruments required by SMEs: demand for investment loans and leases fell dramatically, while the demand for credit for working capital and guarantees increased. Access to finance has been restricted by commercial banks due to the financial crisis,

affecting small and medium enterprises by reducing net profit and cash flow.

Commercial banks can make use of financial product innovation based on mortgage guarantees to help SMEs obtain bank loans. Proceeding from the scope of the entire industrial chain, banks can issue credit based on the comprehensive business chain and effectively inject funds into relevant enterprises according to the business's transactional relationships. This will allow banks to provide flexible financial products and services. In terms of modalities for financing the supply chain, the strength of creditability of core large enterprises can be utilized to help SMEs obtain financing from banks. This will lower bank exposure to loan risks to some extent [5].

Commercial banks should improve services for SMEs. First, the banks should, in light of SMEs' unique characteristics, have a department dedicated to the management of financing services for SMEs and set up a center for operation for SMEs credit business, with dedicated account managers for SMEs services. Second, in terms of enhancing the efficiency of loan approval, banks should simplify the approval procedure and combine the establishment of SMEs loan relationships, ratings, credit approval, and mortgage pricing into one basket service.

The government must also initiate capacity building support services for both banks and the SME sector. Banks must be capacitated such that they'll be able to lend not merely on the basis of collateral, but rather, on the basis of SME risk using several indicators. Concurrently, SMEs must receive assistance to make them more credit-ready.

A benign business environment is usually a key determinant for the development of SMEs. Evaluation of this environment includes barriers to entry and exit, property rights protection, contract enforcement, and the functioning of the public service system.

Several steps can be taken to reduce SMEs' tax burden. These are:

- Encouraging the establishment of SMEs;
- Reducing SMEs' fees and expense burden. Currently, SMEs' burden in taxes and surcharges is excessively heavy, and therefore it is necessary to abolish all unreasonable fees and charges to create an easy and relaxed environment for SME development;

- Accelerating the promulgation of tax breaks for SMEs;
- SMEs' ability for self-construction can be strengthened as well. This can be done by:
 - Strengthening technological innovation capability.
 - Strengthening financial management, improving financial systems, and enhancing credit grading.
 - Building brand awareness to enhance competitiveness. The global financial crisis is a good opportunity for corporate upgrading, and SMEs must be responsive to updating products, developing new products, and building their own brands on an active and constant basis.
 - Boosting the construction of SMEs credit systems for further market development. [5]

The government should also improve the public service system for SMEs. To do so, the government must: Accelerate the construction of bases for small enterprises business startups, lower business startup costs, enhance advisory service capabilities for business startups, and support SMEs in various industrial parks and zones. Organize and boost technical service resources to provide support and services for SMEs' industrial upgrading. Improve commercialized services for SMEs. It is necessary to boost allies and mergers of SMEs, develop supplementary industrial and product chains based on large industries and key projects, and enhance the subcontract capability of large enterprises. It is important to implement the planning for SMEs service systems well, and to strengthen credit guarantees and services. Technological innovation services, business startup training services, market development services, and management advisory services must also be implemented so as to accelerate the establishment and improvement of a commercialized service system for SMEs.

According to National Union of Employers from Romania (UNPR) for financial crisis measures should be taken such as:

- To guarantee bank deposits and the involvement of the guarantee fund to protect SMEs and start-up sites;

- Ensuring the economic stability of the State;
 - For companies listed on the stock exchange, taking into account the possibility of delisting during the crisis;
 - For SMEs, the implementation of a financial plan and prudent investment, conservation of labour force;
 - Linking economic measures taken at European level with the national level [6].
- Among other proposed solutions, it can be noted the following:
- payment by businesses of the central government debt (outstanding invoices, and received not invoiced) but no local administration; debt-payment deferral of outstanding obligations of economic operators affected by the financial and economic crisis;
 - the compensation paid VAT to the fee;
 - exemption from taxation of reinvested dividends;
 - Unlocking lending into the economy;
 - the minimum tax, return to measures to reduce fiscality in case of companies which pay anticipated taxes;
 - return to the policies of the decrease the level of social insurances;
 - changing the payment of VAT, i.e. VAT payment at collection;
 - Quick change and a major reduction of red tape to access EU funds.

4. Conclusions

Regarding the stimulating the development of the SME sector has done very little. The European Commission recognizes the fundamental role of SMEs in the economy, they representing the most numerous number of companies, with a key role in getting out of the crisis and relaunching the economy.

The negative effects of the economic crisis were felt especially in the SME sector which has been depleted by the cost of the economic crisis, especially those in sectors such as trade, construction and real estate. The number of SMEs in bankruptcy has increased due to the fact that the pace of lending to SMEs had decreased which prevents their development and the effect of their banking solvability. Many economic bodies: UNPR, CNIPMMR, UNPR, have

proposed a number of solutions for helping the SMEs, but the Romanian Government fails in adopting measures to reduce the effects of the crisis. SMEs can act promptly applying the solutions for adapting to the new market conditions and can try to identify new markets and new solutions. Like the entire society and entrepreneurs must come back and reconsider the fundamental things related to their business: quality, customer proximity and understanding, with the expense budget and business economy.

The World’s Biggest Multinational Corporations in 2010 and 2011

Toma Sorin-George
Gradinaru Catalin

Universitatea din Bucuresti, Facultatea de Administratie si Afaceri
tomagsorin62@yahoo.com, gradinarubusiness@gmail.com

Abstract

The multinational corporations represent the main actors in the process of globalization. The aim of our paper is to analyze the evolution of the first ten biggest MNCs in the world by their turnover and profit in the period 2010-2011. The research type is a literature review. Despite the financial turmoil, the world’s biggest MNCs obtained impressive revenues and profits in 2011. In a highly competitive global market, these corporations have proved their ability to be successful in a turbulent business environment.

Key words: multinational corporations, turnover, profit

J.E.L. classification: F23

1. Introduction

The big corporation has evolved into one of the main institutions of society [1]. During the time, many researchers and professors have focused their interest on the multinational corporations (MNCs). Firstly, the large managerial business enterprise emerged in the economy in the last half of the nineteenth century. Secondly, large corporations have begun to dominate the American economic landscape since the end of the Second World War [2]. Thirdly, the world’s biggest corporations produced a huge amount of goods and services.

A multinational corporation can be defined as “an enterprise that engages in foreign direct investment (FDI) and owns or controls value adding activities in more than one country” [3, p. 3]. The size of today’s MNCs is greater than ever [4]. Some authors consider that MNCs have become so powerful that they threaten the democratic order of human society [5]. In this respect,

they obtained revenues bigger than many nation-states. Other authors emphasise that they contribute to the economic and social progress of human society [6].

In spite of the economic and financial turmoil, the world’s biggest MNCs had a pretty good year in 2011. They posted record revenues of \$ 29.5 trillion, up 13.2% over 2010, and total profits of \$1.6 trillion, up 7% over 2010 [7].

The aim of our paper is to analyze the evolution of the first ten biggest MNCs in the world by their turnover and profit in the period 2010-2011. The research type is a literature review.

The second part of the paper is dealing with the evolution of these major MNCs in the global market in the period 2010-2011. Conclusions are presented in the final section of the paper.

2. The evolution of the world’s biggest MNCs in 2010 and 2011

The MNCs represent the main actors in the process of globalization. Based on the tables and graphics presented above, we can sum up the following remarks for the year 2010:

- i. Regarding the top 10 MNCs according to their turnover (Table 1):
 - three corporations were American (Exxon Mobil, Wal-Mart), three were Chinese (Sinopec Group, China National Petroleum, State Grid), two were from Japan (Toyota, Japan Post Holdings), one was from Great Britain (BP) and one was Dutch (Royal Dutch Shell);
 - six MNCs had their business portfolio in the petrochemical industry (Royal Dutch Shell, Exxon Mobil, BP, Sinopec Group, China National Petroleum, Chevron), one was a retailer (Wal-Mart), one came from the auto industry (Toyota), one from the electric energy distribution (State Grid)

and one activated in the field of postal services and financial-banking sector (Japan Post Holdings);
- the American colossus Wal-Mart occupied the first place.

Table 1. The first 10 MNCs worldwide based on their turnover in 2010.

No.	Corporation	Turnover
1.	Wal-Mart (USA)	421,849 billion USD
2.	Royal Dutch Shell (Holland)	378,152 billion USD
3.	Exxon Mobil (USA)	354,674 billion USD
4.	BP (Great Britain)	308,928 billion USD
5.	Sinopec (China)	273,421 billion USD
6.	China National Petroleum (China)	240,192 billion USD
7.	State Grid (China)	226,294 billion USD
8.	Toyota Motor (Japan)	221,760 billion USD
9.	Japan Post Holdings (Japan)	203,958 billion USD
10.	Chevron (USA)	196,337 billion USD

Source: [8]

ii. Regarding the top 10 MNCs after their profit (Table 2):

- four corporations were from the United States of America (Chevron, Exxon Mobil, Microsoft, AT&T), two from China (Industrial & Commercial Bank of China, China Construction Bank), one was from Russia (Gazprom), one was Dutch (Royal Dutch Shell), one from Brazil (Petrobras) and one Swiss (Nestle);
- five MNCs were from the petrochemical field (Gazprom, Royal Dutch Shell, Petrobras, Chevron, Exxon Mobil), two placed their activities in the banking sector (Industrial & Commercial Bank of China, China Construction Bank), one operated in the food industry (Nestle), one in software (Microsoft) and one was from the telecommunications sector (AT&T);
- the Swiss giant Nestle occupied the first place in the top.

Table 2. The first 10 MNCs worldwide based on their profit in 2010.

No.	Corporation	Profit
1.	Nestle (Switzerland)	32,843 billion USD
2.	Gazprom (Russia)	31,894 billion USD
3.	Exxon Mobil (USA)	30,460 billion USD
4.	Industrial & Commercial Bank of China (China)	24,398 billion USD
5.	Royal Dutch Shell (Shell)	20,127 billion USD
6.	China Construction Bank (China)	19,920 billion USD
7.	AT&T (USA)	19,864 billion USD
8.	Petrobras (Brazil)	19,184 Billion USD
9.	Chevron (USA)	19,024 billion USD
10.	Microsoft (USA)	18,760 billion USD

Source: [8]

In the year 2011 the top has changed as follows:

i. Regarding the top 10 MNCs according to their turnover (Table 3):

- four corporations were American (Exxon Mobil, Wal-Mart, Chevron, ConocoPhillips), three were Chinese (Sinopec Group, China National Petroleum, State Grid), one was from Japan (Toyota), one was from Great Britain (BP) and one was Dutch (Royal Dutch Shell);

- seven MNCs had their business portfolio in the petrochemical industry (Royal Dutch Shell, Exxon Mobil, BP, Sinopec Group, China National Petroleum, Chevron, ConocoPhillips), one was a retailer (Wal-Mart), one came from the auto industry (Toyota), one from the electric energy distribution (State Grid);

- the American retailer Wal-Mart has lost his global domination and Royal Dutch Shell became number one in the world.

Table 3. The first 10 MNCs worldwide based on their turnover in 2011.

No.	Corporation	Turnover
1.	Royal Dutch Shell (Holland)	484,489 billion USD
2.	Exxon Mobil (USA)	452,926 billion USD
3.	Wal-Mart (USA)	446,950 billion USD
4.	BP (Great Britain)	386,463 billion USD
5.	Sinopec (China)	375,214 billion USD
6.	China National Petroleum (China)	352,338 billion USD
7.	State Grid (China)	259,141 billion USD
8.	Chevron (USA)	245,621 billion USD
9.	Conoco Phillips (USA)	237,272 billion USD
10.	Toyota Motor (Japan)	235,364 billion USD

Source: [7]

ii. Regarding the top 10 MNCs after their profit (Table 4):

- four corporations were from the United States of America (Chevron, Exxon Mobil, Microsoft, Apple), two from China (Industrial & Commercial Bank of China, China Construction Bank), one was from Russia (Gazprom), one was Dutch (Royal Dutch Shell), one Australian (BHP Biliton) and one British (BP);

- five MNCs were from the petrochemical field (Gazprom, Royal Dutch Shell, Chevron, Exxon Mobil, BP), two placed their activities in the banking sector (Industrial & Commercial Bank of China, China Construction Bank), two in software (Microsoft, Apple) and one was from the extractive industries (BHP Biliton);

- the Russian giant Gazprom occupied the leading position in the top. In the last four years, the Russian company was twice no. 1 and twice no. 2.

Table 4. The first 10 MNCs worldwide based on their profit in 2011.

No.	Corporation	Profit
1.	Gazprom (Russia)	44,459 billion USD
2.	Exxon Mobil (USA)	41,060 billion USD
3.	Industrial & Commercial Bank of China (China)	32,214 billion USD
4.	Royal Dutch Shell (Shell)	30,918 billion USD
5.	Chevron (USA)	26,895 billion USD
6.	China Construction Bank (China)	26,180 billion USD
7.	Apple (USA)	25,922 billion USD
8.	BP (Great Britain)	25,700 billion USD
9.	BHP Biliton (Australia)	23,648 billion USD
10.	Microsoft (USA)	23,150 billion USD

Source: [7]

The MNCs acting in the energy business have always occupied best places in the Global 500 largest corporations. Led by Royal Dutch Shell, oil refining generated \$5 trillion in sales due to the rising demand for energy in emerging markets [7]. The same emerging markets have played a major role in bolstering the financial sector in 2011. In the third place, the automotive industry performed well, especially in Asia.

On the other hand, a fundamental shift occurred in the relation to the geography of the biggest MNCs. The number of Chinese companies in the Global 500 largest corporations increased rapidly from 11 companies in 2002 to 73 companies in 2011. There are diverse Chinese companies in this top, from state-controlled resource giants (e.g., China National Petroleum) to big automakers (e.g., Zhejiang Geely Holding group) and banks (e.g., Industrial & Commercial Bank of China). It is important to note “the presence of new companies like Lenovo and Geely that grew up by first selling “good enough” products to the large

mid-tier market in China and later expanded to become global players (by acquisition of the Thinkpad division and Volvo, respectively)” [9. p. 1].

3. Conclusions

In the last century, the business world at the global level has undergone fundamental changes. As key players in the world economy, MNCs are heavily engaged in cross border investment and international trade.

Despite the financial turmoil, the world’s biggest MNCs obtained impressive revenues and profits in 2011. In a highly competitive global market, these corporations have proved their ability to be successful in a turbulent business environment. A new wave of MNCs, located especially in the emerging markets, has become a strong competitor for the American corporations.

Transnational Corporations and the Globalization of Competition

Voiculesţ Alina

alinav06@yahoo.com

Dobrişan Călin

calin.dobrisan@yahoo.com

Abstract

The historical process and moment in which the world today finds itself is the transition from world economy to the integrated global economy. Globalization is a reality that must be assumed and analyzed carefully, extracting conclusions from the work of those who benefit from this process, noticing its weaknesses and anticipating possible ways of avoiding or correcting negative effects. The rapid rhythm of changes induced by globalization generates new and vast opportunities for those able to find appropriate responses to new conditions, but also exposes to new and serious risks those who can not adapt. It is increasingly clear that today's corporate survival is conditioned by their ability to completely reorient both in terms of their own internal organization and of their relations with the environment in which they operate.

Key words: transnational society, competition, globalization, competitiveness, foreign direct investments.

Clasificare J.E.L.: F23, F60.

1. Introducere

The real dimension of complexity of the economic universe in which we live today can be better perceived to the extent that we understand that, in its turn, the large modern corporation is a true agent of globalization. Transnational corporations are fundamental in competition globalization. Transnational production interposed global competition within domestic markets, so many companies are forced to produce at the international border of efficiency or go out of business.

2. Global competition

Transnational corporations have grown in recent decades because they have internationally exploited competitive advantages. These advantages result from scale economies, superior management techniques and / or global sales networks.

Initially, global competition meant U.S. corporations entering foreign markets. Beginning with the 70's Japanese and European companies reached productivity levels similar to those of the U.S. which resulted in direct competition with each other. This was reflected in foreign direct investment flows as many transnational corporations launched their activities or strengthened their activities on major markets. Because of that, after the 70's, U.S. companies have lost significant market shares in favor of their competitors.

Transnational companies are among the most innovative companies are responsible for most private expenditure on research and development. Technological innovation has helped the *selection of the value chain*[1] (value chain consists of activities that are interwoven to enhance enterprise value: supplying, manufacturing, distribution and marketing of goods and services)[2], through which the production process can be divided and distributed across the globe. Transnational expansion reflects thus their ability to innovate and their ability to exploit it internationally.

In the XXI century, competitive advantages not only consist in products and technologies, but also depend on the speed with which innovation occurs and the speed with which new products can be created and distributed. This acceleration of global competition has been greatly enhanced by the revolution in information.

Competition is much older than globalization. With globalization, however, the first gains unprecedented momentum.

Competition can be considered a real driving force of progress, its level being an important determinant of the competitiveness of products and services.[3] Some studies reveal that high rates of productivity growth are closely linked to strong competition, a long-term upward trend in productivity leading to improved competitiveness and at the same time, a real increase of the GDP per inhabitant. Also, through competition, the benefits of cost savings and innovation turns into benefits for consumers in the form of lower prices, a high quality and a wide range of products. The more powerful, more dynamic the fight (competition) on the domestic market of a country, the more competitive those companies are abroad. Competition, governed by the laws of the market, improves the economic performance of a country. In the contemporary economy, the competitive game is indeed a tough one, with winners and losers, but on long-term the losers can return to the market becoming the winners.

In an open and liberalized global economy, increase of the competitiveness of companies has become a major challenge. Becoming competitive is not only the goal for businesses, transnational corporations, but also governments that conclude regional agreements.

In a market economy, firms compete with each other to win consumers. Competition is a stimulus for companies to have the best performance, producing quality goods and services at the lowest prices. The competition encourages entrepreneurial activity and the entry of new firms on the market, rewarding efficient corporations and sanctioning inefficient ones. In ideal market conditions, firms react flexibly and quickly to changing market demands and endless entries of new firms. The ability of firms to adjust and the speed at which they do it are a measure of their effectiveness and, by extension, their competitiveness.

Competition means *survival of the best*. Faced with increased competition and seeking higher profits, current market participants may be tempted to distort or eliminate competitors to obtain and abuse of market power.

The transnational corporation, by its very nature, tends to abuse its market position and to use excessive power. It will never have, and it is natural to be so, the initiative to create a competitive environment. In contrast, when it will encounter weak reactions, the economic environment will be dominated by the corporation and shall have the characteristics of a monopoly or an oligopoly [4]. As a result, government policy interventions are required to maintain and encourage competition. In recognition of this need, governments in many countries implement competitive policies to maintain and encourage competition, including laws and policies that deal with anti-competitive practices.

Globalization and liberalization, facilitated by rapid changes in technology, have created a new dynamic of competition.

Profound changes in the world economy under the impact of globalization caused changes also in the structure of factors of competitiveness, so, in order of importance, cost factor is surpassed by the following: *quality, speed of transactions, customer features adaptation, product image, after-sale services*.

Figure No. 1. Leverage of competitive advantages

Source: Adapted from Hill C., Jones G. [5]

In Porter's conception, international competitiveness of firms depends, on long-term, on their ability to innovate continuously, their ability to generate and maintain competitive advantages. Success in business requires to irrevocably adopt a

winning mentality, the condition of leaving the platoon being innovation, and the prize is considerable reduction of restrictions imposed to the firm and of the threats that it needs to face.

Business globalization therefore depends on the ability of innovation of firms and their ability to effectively organize cross-border networks of production and distribution with the help of advances in communication technology and management techniques.

Economic crisis reflecting distrust in the financial system, a significant decrease in the volume of stock transactions, a disturbance of market mechanisms[6], emphasizes the global competition of transnational companies.

3. Transnationality attribute of dynamic companies

As local and national economic spaces and environments open to the global economy it becomes increasingly obvious that large corporations rather than national economies are units of economic coordination.

For a transnational society it has become possible and advantageous to take advantage of the differences of wages between regions, market potential, standards and employment, taxes, environmental regulations, human resources etc.

Companies get involved in international production because they have a specific competitive advantage which is best exploited in this way. The advantage may consist of a patented product or a technique, but may also include management techniques, networks of distribution or trumps as qualifications and expertise of the company or its staff.

International corporate action takes place on the basis of functional structures circumscribed to certain world strategies. Because of that, the synthetic expression of globalization is the momentum which production organization acquired on regional or global basis as well as integration based on new criteria, of functional type, of activities within it. Flows of resources (financial and real) that enable this international production are *foreign direct investments, while economic operators generators of almost all these flows - and also the organizers of*

production processes abroad - are modern big corporations.[7]

Although transnational corporations vary in their capacity to organize production and intra-firm trade, they supply markets around the world and produce from locations situated on all continents. Even if transnational corporations do not supply each national market, their activities, taken together, determined the transition to a more intense global competition due to global production systems.

Transnational companies now compete globally, but ... remain rooted in the economic and cultural center of their country ... they mostly extract their competitive advantage from the national base and apply global strategies to cope with the competition. [8]

Porter believes that the most important choice a firm needs to make refers to how to compete: globally or by finding niches that can build a defensive strategy needed to compete on one or a limited number of national markets. Alternatives, he says, are as follow [9]:

- *global competition with a broad line of products*

This strategy is directed towards global competition with the entire line of products in the industry, with global sources of competitive advantage or differentiation required to obtain a position characterized by low total costs. Implementing this strategy requires substantial resources and a long period of time.

- *global focus*

This strategy targets a certain segment of the industry, in which the company will compete globally. The segment is chosen keeping trace of the obstacles that stand in the way of global competition so that they are as small as possible and the position of the firm can be defended against incursions of global competitors who resort to a broad line of products.

- *national focus*

This strategy seeks obtaining advantage from the differences between national markets, focusing on the focalized approach of a specific national market, allowing the company to exceed corporations that compete globally.

- *protected niche*

This strategy seeks countries with government constraints that exclude global competitors, requiring that the product mostly be made locally, using high tariffs. The company builds its strategy to comply with domestic markets subject to such limitations and pays special attention to the government of the host country to ensure that they receive proper protection.

The fact is that, at present, transnational corporations are *key entities* of economic activity as well as value creative agents, who globally allocate resources much needed to support economy growth processes. In other words, transnational corporations not only assert themselves as key entities subject to the impact of challenges of the globalization process, but also as the main forces in shaping this process.

Their primacy in terms of production, trade, investment and technology transfer in the world is unique. Transnational companies have developed from national companies to global concerns that use foreign investments to exploit their own competitive advantages.

4. Conclusions

Transnational companies are recognized as major companies with verified competition skills, which can not only comply with ordinary competition so far, but also to global competition, which is actually triggered by all of them.

By their economic, financial, technological, scientific research strength, transnational companies are a challenge for all businesses in the world, a call to a tough competition where those who manage to adapt, withstand competition and the weak are eliminated. So then, should accuse these giant companies that promote a struggle for

global primacy? Do we eliminate competition? It is wrong to fight for competition? If we do not remove it, then we must accept that there are winners and losers.

Transnationality is not an attribute of firms that are weak, but of the modern, dynamic, profitable, thus economic progress carriers.

European Integration

The Labor Legislation after the 18th Century

Abstract

The legal framework governing labor during this period was not specialized, as labor relations were absorbed in the civil relations of property. Thus, the labor relations between people were “camouflaged” by human relationships regarding property, meaning that property regulation aimed at labor regulation.

Key words: Labor Code, Employment agreement, Association agreement

J.E.L. classification: K31

1. Introduction

Labor legislation has undergone significant changes as a result of the development of the productive forces and of the capitalist relations of production, which led to the numerical increase of the proletariat [1].

2. Primary legislation

The freedom of association and organization was established in Article 27 of the Constitution of 1866 [2], and the professional associations were created and activated during this period on the basis of statutes and programs which had to be approved by the central bodies of state administration, i.e. in principle by the Ministry of Interior [3].

The law for the organization of occupations, of 1902, regulated the establishment of corporations based on the principle of compulsoriness until the entry into force of the Law for the organization of occupations, loan and labor insurance, in 1912 - the first Labor Code of Romania [4].

In Transylvania, the provisions of Law no. CXLII of December 21, 1867 have regulated the freedom of workers' association and organization, establishing the rule of submission for the approval by the competent central government authorities. Subsequently, other regulations were adopted on workers' associations, which did not differ essentially from the previous period.

In terms of miners and women's work, the legal rest and working hours were gradually enacted following the development of capitalist relations and the numerical growth of the proletariat. In that period, there have been developed for some industries several regulations referring also to the working hours of full age men, with no general rules in this regard.

Similar regulations are met in Transylvania, where industrial law provisions (of 1872 and then of 1884) were referring to the workday, child labor and legal rest.

3. Social security regulation

The problem of social security was both a concern in legislative forums and an important claim of the proletariat, and it was regulated by the law on the organization of occupations, loan and labor insurance, in 1912. This law introduced the insurance of workers against accidents occurring during work; the insurance was compulsory for businesses and professions where engines of all kinds were used, for construction companies, mines, other exploitations etc. [5].

The regulation of social securities in Transylvania was conducted by the provisions of Law no. XXVIII, in 1893, and by the Law of 1907, by means of which social securities became compulsory for several categories of workers. The law

created social security funds subordinated to the State social security office.

In 1919, by Decree no. XIX, the Diligent Board expanded social securities to farm workers. The workers' fee was based on social securities.

4. The settlement of labor disputes

The settlement of labor disputes had been provided by different laws that were regulating the activity of workers in various industries; significant references were made to strikes. In 1906, the miners' right to strike was denied and the Law against unions, professional associations of civil servants, counties, municipalities and public establishments (in 1909) was also prohibiting the right to strike. There was established an emergency procedure on labor disputes and the district court was the competent court in settling such disputes [6].

In Transylvania, there were developed a series of laws that have regulated labor disputes, such as the Law no. 13 of 1876 concerning the regulation of relations between employers and domestic servants; the (industrial) Law no. 17 of 1884; the Law no. II of 1898, which was regulating the relations between employers and farm workers.

Until the First World War, there were known only the individual employment agreement and the apprenticeship agreement. The individual employment agreement was governed by the Civil Code which, in old Romania, also included the lease contract; in Transylvania, the individual employment agreement was governed by the Industrial Law no. XVII of 1884, which included provisions for journeymen and industrial workers.

The apprenticeship agreement was regulated for the first time in Romania by the law on the organization of occupations, loan and labor insurance, in 1912, and, in Transylvania, by the industrial law, in 1884.

The Law on occupations, of 1902, provided a system of corporate based social insurance, the beneficiaries being exclusively the craftsmen. The Law on occupations created the commissions of arbitrators which, in case of conflicts, were to reconcile the employer and the employee; later, there were established reconciliation commissions

which were conducting proceedings prior to the trial of labor disputes by district courts. Similarly, the (industrial) Law of 1884, applied in Transylvania, provided for the establishment, in every corporation, of a conciliation committee composed of employers and journeymen [7].

The Law on Workers' Insurance of 1912 provided for compulsory securities. According to this law, the burden of risk in case of accident was falling on the employer (article 140) and the disease risks was falling on workers (article 125) [8].

By adopting the Labor Code (1912) - the Law for the organization of occupations, loan and labor insurance, Romania became part of the group of countries with a long tradition in regulating labor relations[9].

Also, the adoption of the Law on the organization of occupations, loan and labor insurance was part of the concerns of that time for regulating labor relations. Thus, up to that time, there had adopted the following laws:

- May 2, 1887 – *the Law to encourage a national industry*;
- June 16, 1891 - *the Law of servants*;
- 1894 – *the Regulation of unsanitary industries*;
- April 21, 1895 – *the Mining Law*;
- March 6, 1897 – *the Law of Sunday rest*;
- 1901 – *the Law on vocational education*;
- March 5, 1902 – *the Law on occupations*;
- February 22, 1905 - *the Law on child and women's labor in industry and mining*;
- 23 December 1907 – *the Law on agricultural pacts*;
- 1909 – *the Law against unions, professional associations of civil servants, county, communes and public establishments*;
- February 10, 1910 – *the Law on the safety measures for boilers, mechanical and electrical installations*. [9].

The establishment of the International Labor Organization - UN specialized agency - on April 11, 1919, gave “a new breath” to the activities in the field of social securities. It is known that, for this organization, labor and social issues are not subjects of purely internal nature in the Member States [10]. Therefore, from the very beginning, there have been adopted several agreements on social securities, such as the Convention no. 3/1919 on maternity protection etc.

5. Conclusions

The objective process of the development of capitalist forces and relations of production led not only to the numerical growth of the proletariat, but also to the adoption of the legislation governing labor relations and collective labor conflicts in their various aspects.

By the early nineteenth century, labor jurisdiction was not differentiated from general jurisdiction. The individual labor conflicts were settled in civil or criminal trials, as appropriate, and the collective labor conflicts were known as the manifestation of rebellion and revolt.

Procedural Aspects Regarding the Merger Control Within the EU

Abstract

The European examination process of mergers proposes an efficient analysis, transparent and adjusted to merger economical circumstances. The European examination of merger has an administrative side and the European Commission itself has the decisional authority to impeach or not over a transaction. The European Commission's decisions in this field are submitted to the judicial examination of the European courts. Within this article, we intend to outline the main steps of the evaluation process of concentrations at the European level, as well as the manner in which it is conducted the concentrations' investigation.

Keywords: merger, economical concentration notification, merger investigation

Clasificare JEL: G34, K22

1. Introduction

The elements of the modern market cannot be separately submitted to analysis: the private property generate competition, the competition occurs within the system of interdependent markets, the state administrates the actors occurrences on the market, everything within a strongly defined legal framework, which should paralyze the

inevitable temptations to monopolize the economical power, by obtaining a dominant position on the market and thus by setting the prices.

The merger control regulation imposed itself as a natural consequence to the need to ensure a proper evolution of the market, in the absence of a perfect competition. The main purpose of the merger control was to provide a regulation for the changes occurring on the market, in order to allow its development, yet, in the same time, to protect it against anti-competitive behaviors. In such sense, the European Commission developed a set of procedures under which is conducted the merger control, since it is of high importance whether, by means of this merger, the enterprise gains a dominant position on the market, with a negative influence on the competition. Therefore, the merger between the mobile telephone operators Vodafone and Mannesmann was allowed only after it had been demonstrated, by the participant enterprises, that the new company would non have a dominant position on the market [3].

2. European procedures in merger controls

The Commission has the competence to control the non-observance of the primary and derived law and to impose the legislation in cause, aiming to its observance by the particulars, Member States and institutions. In such sense, pursuant to art. 105 para. 1

TFEU (in the domain of the competition) the Commission ensures the application of the principles related to competition established by the art. 101 and 102 TFEU, by investigating the supposed cases of infringement of the principles stated in the TFEU. In case of declared infringement, the Commission proposes appropriate measures in order to stop it, by imposing certain penalties and charges [2].

A merger can be accepted if it is established the fact that it does not lead to the limitation or the distortion of the market competition, if it is ascertained, after examination, that it is compatible with a normal competitive environment, or if the parties can prove that the operation contributes to the effective economic development, the positive consequences complete the negative one and it put in countenance the consumers [4].

The administrative procedure for the application of the communitarian law regarding the competition was included, initially, in the Council's Regulation no. 17/62/CEE, granting the Commission the exclusive authority to apply the art. 81 para. (3) of the EC Treaty. Its implementation was made by the Commission. In certain situations in which, in the Commission's opinion, they did not contradict the provisions of the art. 81 or 82 of the EC Treaty, the first could state, officially (art. 2 of the Regulation), that the respective situation of fact does not fall under the incidence of the art. 81 and 82 (*negative clearances*). Such a negative assertion may have legal consequences only for the Commission. If breach of art. 81 and 82, the Commission could force the aimed legal persons to put an end to the certified breach (art. 3). When a breach is certified, there could be applied financial penalties according to art. 15. Such a penalty, applied as consequence of the art. 16, should aim forcing the legal person to conduct a particular behavior for the future.

The Regulation 1/2003 [1] aimed, first of all, disencumbering the Commission in this matter. The normative instrument excluded the possibility to exercise an anterior control of the legality, by introducing only the possibility of a posterior control of this aspect and, last but not least, excluded also the possibility to grant individual

exemptions and negative assertions, keeping only the system of legal exemptions (block). The benefit of these block exemptions could be pled under any jurisdiction. Many of the provisions of the old regulation were kept, yet the balancing point of the new regulation being, in present, the aspects concerning the competitive regulations' breaches.

In order to improve the process, to implement properly the principle of “one-stop shop” and to insure an efficient control, the concentrations of communitarian dimension shall be notified to the Commission within the term provided in Article 4:

“Concentrations with a Community dimension defined in this Regulation shall be notified to the Commission prior to their implementation and following the conclusion of the agreement, the announcement of the public bid, or the acquisition of a controlling interest.

Notification may also be made where the undertakings concerned demonstrate to the Commission a good faith intention to conclude an agreement or, in the case of a public bid, where they have publicly announced an intention to make such a bid, provided that the intended agreement or bid would result in a concentration with a Community dimension.”

From the content of the Article 4(1) it can be ensued that the notification may be made at any instant of the period prior to the conclusion of the agreement, the announcement of the public bid or after the acquisition of the controlling interest and even though there is no agreement or public bid, but it can be proved the enterprises' plan to merge into a Community dimension concentration, it should be concretely.

Usually, the notification is made in collaboration, between the merging parties or the enterprise acquiring the control under the circumstances of a concentration by means of acquisition of the controlling interest by an enterprise over another. The form of the notification and the manner in which this should be done are described in the Regulation 802/2004 of implementation of the Regulation 139/2004 and in the CO form. Although it is called a form, the CO form is more likely a draft, containing 11 sections, each of them indicating what kind of information shall be submitted to the

Commission. The volume of the requested information is very high, and the correct and complete submission is of great importance for the observance of short terms for decision-makings by the Commission. If the notification is not complete or incorrect and misleading, the Commission's decision shall be delayed. The requested information in the CO Form refers to the description of the concentration, the parties engaged, the details of the concentration, the owners, the form and nature of the control, support documentation, affected markets, context of market, improvements, cooperative effects of common enterprises and a statement signed by the enterprise's representatives.

What actually happens is that, whenever a concentration is not notified according to the Article 14(2)(a) of the Regulation, because an entity does not, either intentionally or out of negligence, notify a concentration according to Article 4 and 22(3), prior to its implementation, the Commission has the powers to apply penalties which cannot overpass 10% of the turnover aggregated to the concerned enterprises.

The first enterprise to receive such penalty was Samsung (33000 ECU), for the reason that it did not submit a notification in time. Since then, numerous penalties were applied, and their number is continuously increasing. An example for this is the 20 millions euro fine applied to the company Electrabel, in 2003, when it undertook the control over Compagnie Nationale du Rhone, without any prior notification. The final decision C(2009) 4416 of the Commission on the 10th of June 2009, ascertained that the claimant breached the Article 7 paragraph (1) of the Regulation no. 4064/89 by accomplishing operations of concentration with Community dimension prior to the notification and before its announcement as compatible with the common market [5].

Although the system of allocation of cases between the Commission and the Member states functions correctly in most cases, there are also situations in which assigning the cases on the grounds of certain numerical level of turnovers does not always have as consequence a correct division between the Commission and the competitive national authorities. The Commission itself explained the impossibility to divide the powers

between itself and the Member states only on the grounds mentioned above.

In such context, the Regulation 139/2004 was conceived starting with the idea that on the grounds of the two indicators taking into account the turnovers there may occur a correct assignment in all cases, and, consequently, it was introduced a flexible mechanism to allow the transfer of cases from the Commission to the Member states and vice versa. In such sense, articles 9 and 22 were simplified and clarified. Additionally, the Regulation allows the parties in the concentration to be a part in the establishment of the jurisdiction by submitting a reasoned application to the Commission, before notifying the concentration at the level of the community or nationally. The reasoned application is made by completing the CM form, available in the annex 3 of the Regulation 802/2004. Complementary information about the system of submissions and especially about the mechanism of pre-notifying submission is offered by the Commission in its Note regarding cases assignment [4].

Within the Article 4 4(4) it is stipulated that whenever a concentration has a Community dimension, the parties engaged have the opportunity to submit a reasoned application to the Commission, prior to the notification, proving that the concerned concentration affects significantly the competition on a distinct market of a Member state and ask for its examination completely or partially by that Member state in particular. Whenever the parties submit a reasoned application, the Commission has the obligation to inform the Member state in question, without delay, and the Member state has a period of 15 working days within which it can approve or disapprove regarding the examination of the case submitted.

If the Member state approves, the Commission has 25 working days, since the moment the reasoned application is received, in order to decide whether it sends the case or not. If until the 25-day delay expires, the Commission does not adopt any decision, it is considered that the decision taken is to send the case. In order to send a case, the Commission must analyze if the legal conditions are fulfilled, consult the principles stipulated in the Note regarding cases assignment [4] and verifies if the authority to

which the case should be sent is the one to have the powers to analyze it. When the Commission decides to send the case, it is not necessary for the parties to send a notification to the Commission, and the case shall be analyzed according to the national law.

Article 4(5) of the Regulation stipulates that before making a notification nationally, the parties engaged in a concentration with no Community dimension and which can be examined according to the national law of the competition in at least three Member states, can submit a reasoned application, soliciting that the concentration in question should be examined by the Commission. Such as the case of submission to a national authority, the Commission must inform the Member states about this submission without delay. They must express their agreement or disagreement within 15 working days. The procedure is closed when one of the Member states disapproves. Yet, if they all agree, then the concentration will be considered as having Community dimension and it shall be notified by the Commission, any no Member stat having the right to apply the national law.

The procedure of the examination of concentration provides also a suspension period in its implementation. Such period is regulated by the Article 7(1) providing that a concentration with a European dimension, or investigated by the Commission as a consequence to the submission pursuant to Article 4(5), cannot be implemented prior the notification and not until it is declared compatible with the Common Market. This obligation under suspensive condition encumber the enterprises to make transactions or to act together by coordinating commercial activities or prices, until the Commission does not decide that such practices are incompatible with the Common Market.

Yet, the Commission may admit certain derogations from this suspensive condition, when it receives a request in such sense, while the Article 7(2) provides itself a derogation for the public bids or for a series of transactions with fixed assets, under the condition that they are notified to the Commission and that the purchaser does not exercise his right to vote or to do so only to maintain the total value of his investments.

Article 7(2) stipulates:

“Paragraph 1 shall not prevent the implementation of a public bid or of a series of transactions in securities including those convertible into other securities admitted to trading on a market such as a stock exchange, by which control within the meaning of Article 3 is acquired from various sellers, provided that:

(a) the concentration is notified to the Commission pursuant to Article 4 without delay; and

(b) the acquirer does not exercise the voting rights attached to the securities in question or does so only to maintain the full value of its investments based on a derogation granted by the Commission under paragraph 3.”

If the enterprises does not respect these provisions, Article 14(2)(b) offers the Commission the powers to apply penalties, which should not overpass 10% of the turnover allowed to enterprises that, intentionally or out of negligence, breach the suspensive condition. Ant transaction made by breaching the non-observance of the suspensive condition may become valid only if it is authorized by the Commission by means of a decision.

3. The investigation regarding the merger control

The date when the Commission receives the correct and complete notification of a concentration marks the starting day of initiation of the first phase of the investigation. An innovation introduced by the Regulation 139/2004 is that of the possibility for the enterprises to notice a concentration of Community dimension to the European Commission, prior to the conclusion of a mandatory agreement, with the condition of the existence of good faith intent to do so.

In this phase of the investigation, the Commission realizes a detailed evaluation of the market conditions soliciting information under the form of a questionnaire, which is sent to the main consumers and active competitors on the relevant market. Phase I of the investigation closes within 25 working days since the receipt of the complete notification by the Commission. This term limit can be extended to 35 days, when is

pled the Article 9 or when are submitted engagements of the parties to make the concentration in question compatible with the Common Market (with the conditions that such engagements are submitted within not more than 20 days since the notification). During the whole period of this procedure, there exist a permanent communication between the parties and the Commission, so that the Commission receives all the information necessary for the correct evaluation of the case.

At the end of the first phase, once the Commission had evaluated the market conditions and realized an analysis of the possible effect of the transaction on the relevant market, it shall adopt a decision pursuant to Article 6. This decision can establish that either a concentration does not have a Community dimension, or a concentration is compatible with the Common Market. The Commission may declare a concentration a being compatible with the Common Market, be it conditional or unconditional with the receipt of the engagements offered by the parties. In such case, according to Article 6(1)(b) the decision to declare a concentration compatible includes restrictions directly related and necessary to the implementation of the concentration.

The Commission may declare the concentration generates serious doubts regarding its compatibility with the Common Market – in such case, the Commission assertion is certified by a decision and are initiated the procedures for the initiation of the second phase of the investigation. In such case, this is how it drafted Article 6(1)(c): *“Without prejudice to article 9, such proceedings shall be closed by means of a decision as provided for in Article 8(1) to (4), unless the undertakings concerned have demonstrated to the satisfaction of the Commission that they have abandoned the concentration.”*

Where the Commission has not taken a decision in accordance with Article 10(6) within the time limits set, the concentration shall be deemed to have been declared compatible with the Common Market.

The deadlines for the second phase of investigation start since the day of the announced decision in the first phase, which shows that the concentration in question

raises serious doubts regarding its compatibility with the Common. During the second phase, the Commission conducts a more detailed analysis of the market and the parties engaged have the right to access the file and solicit a formal hearing. It is important for us to mention that the Regulation provides the systematic call of internal boards of juries of mutual examination, conceived in order to improve the quality of the verification already considerable regarding the validity of the preliminary conclusions of the investigators.

The general term for the closure of the second phase is of 90 working days. This period of time could be extended with 15 more working days when the parties offer commitments (the commitments must be offered within not more than 65 working days). At the parties' request or the solicitation of the Commission, with the parties' agreement, the period may be extended with another 20 working days. It results that the maximal period of closure for the second phase of the investigation is of 125 working days. Yet, this period can be extended over the maximal term, when the investigation is suspended because of lack of response from the parties. If at the end of the term the Commission does not adopt any decision, it is considered that the concentration in question is compatible with the Common Market. Pursuant to the Article 8, at the end of the second phase of the investigation, the Commission can declare the concentration compatible with the Common Market, to declare that the respective concentration, as a consequence of a modification, is compatible with the Common Market or to declare that the concentration is incompatible with the Common Market.

4. Conclusions

The accomplishment of the single market, by opening the borders, dissolving the tax barriers and almost completely removing the non-tax barrier, represented new challenges for companies and investors. The easiest solution, in such hypothesis, was considered the increasing dimension of companies, in order for them to adapt to the new demands and objectives launched on a market in a continuous transition. National law has

become insufficient and ineffective regarding the avalanche of acquisitions and mergers. The conditions offered to the new European climate have become more and more stimulant. The most sensitive problem turned out to be that concerning the establishment of the type of merger which could be places under Community control, in parallel with the division of powers between national and communitarian authorities.

International Protection of Human Rights

Brasoveanu Florica
Universitatea Ovidius din Constanta
Facultatea de Drept, Stiinte Administrative si Sociologie
floriordache@yahoo.com

Abstract

Man enjoys the rights inherent in human beings wherever they are, regardless of status or region where they were born, live, work, regardless of nationality, race, sex, religious and philosophical beliefs, wealth, because these have a universal character, which is the cornerstone of the equal and inalienable rights, as a corollary of freedom, justice, security and peace in the world.

Over time the human rights institution experienced a laborious but also long crystallization process so that now it appears as a very complex institution that is both nationally and internationally regulated.

Keywords: Legal protection, Human rights, The international society

J.E.L. Classification: K33

1. Introduction

International protection of fundamental rights and freedoms of individuals defines a set of rights, freedoms and obligations of men to one another, of states to protect and promote these rights, of the entire international community to ensure the rights and freedoms in each country, intervening in situations when human rights might be violated in a particular state.

2. Content

The institution of Human Rights is bivalent because it includes principles, mechanisms, procedures related to domestic law, but also to the international law while being a national law institution, integrated within constitutional norms, but also an institution of international law, configuring features of a legal principle applicable to

relations between states.

Human rights issues today enjoy a wide interest, but also an undeniable recognition of the complexity and originality of this legal institutions and of the fact that without these rights one can not enforce a democratic society - natural condition for the affirmation of the dignity of every individual - nor create the normal legal matrix indispensable to the cooperation of nations.

The issue of human rights is not only an internal matter of states, it is one of the major problems of the contemporary world, whose compliance and enforcement demonstrates the ability of understanding and cooperation of all states and peoples that favor democracy, freedom, understanding, multiforme cooperation, tolerance and friendship among all nations and states, ethnic and religious groups in order to safeguard peace and security in the world.

The contemporary human society, the human community can not develop harmoniously and upward if this dimension is ignored or despised, because its violation is meant to lead to delays, failures or even convulsions in society.

Over time, states and international governmental organizations created by their association and non-governmental organizations have established legal rules, techniques and methods suitable for the rights and ensuring their effective implementation. Thus was established the international responsibility of States for violating human rights, for ignoring international standards in this regard. The problem of not respecting human rights is not only a national problem, but an international, global one, in whose respect the entire international contemporary community and primarily the United Nations is interested.

The affirmation, respect and guarantee of human rights by the domestic law of states and by an effective international control by

the United Nations and the specialized agencies is likely to lead to the prevention of violations and the correct application of international law that enshrines the human right to life, dignity, security, peace, property, to protect itself against the social and political harm to their person, their sacred rights, against all discrimination.

Human rights were affirmed, proclaimed, established by legal, institutional and material means so that the person is protected and safe from the harmful effects of wars and other acts of barbarity or manifestations of ethnic, religious, philosophical and political intolerance.

Human rights and fundamental freedoms always represented a difficult topic unavoidable in the public debate. The explanation is that there is no man in this world, that is, consciously or unconsciously not interested by the way their rights and freedoms are protected.

The fact that the human being was born to develop and tends to their full development, which is useful to society and to them at the same time, determines the individual's personal freedom.

The loss of this freedom leads to degradation and killing any relationship that a human is subject to. The policy theme is the importance of how the need for human rights is put into question, by those who come to power. In a healthy governance where freedom is ensured, based on love for the country, all citizens must attend the governance all with liability, interest and perseverance.

Also, human rights and personal freedoms open a social issue, because in fact this was one main reason that these rights exist today. It should be emphasized that regardless of the capacity that a state has, these rights can not be neglected and one has to understand that acceptance of these rights dimension for each of us, no matter, race, color, social status is essential for the success of a perfect cohabitation.

The respect for human rights, means poverty eradication and the access of all people to a decent life, that contemporary human society with its possibilities has to provide to all its members based on the achievements of science and technology and national use of material resources and financial, so that each individual be

interested in the progress of society and his staff. This implies a harmonious relationship between man, the state and society, a mutually accepted through common interest solidarity.

Plenary Respect for Human Rights implies equality between men and women, full equality between the sexes so that society can benefit from the constructive contribution of all its members able to express their political will and consciously participate in appropriate decision making process to achieve the community interest.

Given the many issues concerning equality, language and national culture arising from the consequences of war and evolution of society, the field of collective rights was embraced and developed in peace treaties, as object of concern to the League of Nations. Thus, it was recognized as an international obligation, the equality of minorities to the dominant nations, specifying the key aspects of equality (using mother tongue, creating minority language schools and so on).

Until the Second World War, the constitutions of most states contained provisions regarding human rights, but for abolition of slavery and protection of minorities, fundamental human rights had not gained international legal dimension.

3. Conclusions

Public international law contributes to social progress through its three branches formed by the three categories of topics: international law of states, of peoples and individuals. In his classic acceptance public international law ensures the protection of individuals with diplomatic protection.

Protection of groups is achieved through preventive diplomacy and protection of individuals by ensuring human rights. The three categories of complementary interests know a focal point their legal, nationally and internationally guaranteeing.

Public international law has gradually transformed over time into a law of peace (despite regional conflicts), meaning that, today, concerns of the international community as a whole and of the individual member states focus on man and solving all its problems peacefully. However, violence is present both as a form of intolerance, as well

as an external way of resolving or influencing complex problems countries in the international community at present are facing.

Freedom of Expression Principle

Brasoveanu Florica
Universitatea Ovidius din Constanta
Facultatea de Drept, Stiinte Administrative si Sociologie
floriordache@yahoo.com

Abstract

According with the Universal Declaration of Human Rights, the ideal of free human beings can not be achieved unless conditions that allow everyone to enjoy their economic, social and cultural as well as civil and political rights are created

Freedom of expression is a fundamental human right to publicly express their thoughts, opinions, religious beliefs and spiritual creations of any kind.

Keywords: Legal protection, Human rights, Freedom of expression

J.E.L. Classification: K33

1. Introduction

Personally I think that freedom of the press is essential for the pluralistic culture and thus democracy. A free press means a diversity of information and views on which people can adhere according to their own convictions.

Article 29 (1) of the Constitution states that "freedom of thought, opinion, and religious beliefs can not be restricted in any way. No one may be compelled to adopt or adhere to a religious belief contrary to his beliefs."

Article 30 of the Constitution deals with freedom of expression. According to para. (1) "Freedom of expression of thoughts, opinions or beliefs, and freedom of any creation through speech, writing, images, or other means of communication in public are inviolable."

2. Content

Man is free to express themselves as long as it brings no harm to others or society as a whole. Thus, freedom of expression may not harm the dignity, honor, privacy of person

and the right to their own image.

The right to privacy and freedom of the press is guaranteed by numerous international and national legal instruments. But these are not absolute, can overcome limitations. These limitations are set forth by legal rules in general. When press freedom should be determined by the right to privacy, the problem of identifying the boundaries between the two values arises.

Due to evolution of the content of the right to privacy, his delineation from the freedom of the press is better made at the international or national courts level, through the analysis of several cases than through simple analysis of regulations.

From this jurisprudence further principles, applicable standards in this area, will evolve

European Court of Human Rights has clarified as much as possible the most common problems concerning the relationship between privacy and freedom of the press. This court affirms the role of the press in a democratic society, but considered necessary to sanction them when they, by virtue of fulfilling the obligation of informing the public, violates the privacy of individuals. Journalists will be granted the freedom of the press only when acting in good faith and in compliance with ethics, and most of Europe ethical codes require compliance with the right to privacy.

Court recognized the right to privacy of public figures, saying that they hold this right even if their private life sphere, however, is narrower than for ordinary people.

The press is not free to disclose any aspect of life these people if that does not serve the interest of debate. The need to meet general interest is present also in regard with the disclosure of certain aspects of the private life of ordinary people, but analysis of this interest is more severe in this case.

In its jurisprudence, the European Court has established a determined aspect in shaping the relationship between privacy

rights and press freedom namely that privacy may exist in public places. Although it seems to complicate this situation due to difficult differentiation of public and private activity, to identify public spaces from the private, the Court determines that any person has the right to respect for his privacy when they are in a place where it can be legitimately expected they are not seen by anyone or only by a handful of people.

So, through the study of the jurisprudence of the Court, as well as nationally solved situations in different countries, the relationship between press freedom and the right to privacy is no longer characterized by vagueness. Even if the standards outlined appear sufficient and generally applicable, each press interference with privacy must be analyzed taking into account all circumstances of the case.

Regarding the Romanian jurisprudence in this area, few existing decisions are consistent with the direction followed by the European Court, but as the phenomenon included Romania as well, the number of legal actions of people whose privacy was violated by media will surely increase.

In the Constitution of Romania there are other hurdles generally on the exercise of rights and freedoms. As amended, the new Constitution art. 49 (1) states that "to exercise certain rights or freedoms may be restricted only by law and only if necessary ..." Article 49 (2) provides restrictions on the first paragraph that "restriction can be ordered only if necessary in a democratic society. The measure must be proportionate to the situation that caused it to be applied without discrimination and without prejudice to the right or freedom. "

3. Conclusions

Americans enjoy more freedom of expression than any other nation. The legal basis of American free speech is the First Amendment "Congress is not allowed to make any law" says the First Amendment, "the benefit of a particular ideological settlement ', or prohibiting the free practice, or to reduce the freedom of speech or press, or the right of people to peacefully assemble and petition the government to seek to redress the problems. Absolutization of freedom leads to anarchy, and thus

destabilize the entire system of democratic principles. Limitations and restrictions of freedom of expression in the media should be expressly provided by law, although any international document on human rights provides for states to establish certain restrictions on freedom of expression.

The legal nature of the right to self-image is controversial. The dominant view is that the right derived from the right to privacy, assuming its respect and respect each individual image. According to the fundamental law, freedom of expression may not harm the dignity, honor, privacy of person and the right to their own image. Defamation of any country, nation, any instigation to a war of aggression, to national, racial, class or religious incitement to discrimination, territorial separatism or public violence and obscene conduct contrary to morality are forbidden. These acts prohibited by the Constitution are criminalized by the Penal Code and other special laws containing criminal provisions. Defamation and insult are two of the most common offenses committed by the press.

The realization of human rights process is not harmonious, does not evolve by itself. It remains an area of struggle and challenge for domestic and international law, for access to power, resources and their distribution respectively. Therefore actions in favor of human rights start from the need that the state, society, through various forms of action, ensure equal rights and the exercise of individual rights become an instrument of participation, of the redistribution in favor of all, especially those who are or become disadvantaged, to avoid exclusion, marginalization or removing them out of social life.

Romania and the European Security and Defence Policy (ESDP) / Common Security and Defence Policy (CSDP)

Buşe Mihaela

National Defense University” Carol I”, Bucharest

mihaela200730@yahoo.fr

Abstract

Romania has been involved in the field of security and defense, named until December 2009 ESDP (European Security and Defence Policy) and is now subject to the CSDP, even before joining the EU, recorded at the 1st of January 2007.

Today, Romania is an active participant in CSDP, both political dimension, dedicated to support interests identified by Member States as common security and defense, as well as the operational, contributing in a large number of EU crisis management [1].

Key words: european integration, national security, european defense policy, Community Policies, crisis management.

J.E.L. Classification: F52

1. Introduction

Romania's reporting to the construction of the European security and defense construction assumes that it represents a higher stage, necessary in the development of the European Union's capacity to manage, military and non-military means, crisis occurred in Europe and in its vicinity. At the same time, Romania considers necessary to maintain complementarity of this process with the development of NATO, so the European defense does not constitute an element of contraposition to the Euro-Atlantic defense effort.

Romania said that the early participation to the Common Foreign and Security Policy (CFSP) may be an important opportunity to prepare our country for EU accession and participation to ESDP, a natural continuation of participation to CFSP.

Romania has decided to avoid redundancy in relation NATO - EU security and defense, and against creation of separate structures within NATO. Romania believes that the

development of ESDP should be NATO-WEU-EU cooperation principles adopted by the North Atlantic Council in Berlin (1996), Washington (1999) and Brussels (2002)[2].

Romania's efforts on this dimension concerns the convergence of their foreign policy with the Common Foreign and Security Policy (CFSP). As an EU member, Romania supports an EU more capable, more active and coherent, including the European Security and Defence Policy (ESDP) in accordance with the guidelines of the European Security Strategy. Romania also supports the operationalization of security and defense component of the EU.

From the 1st of January 2007, Romania has been fully participating at the activities of political and military structures of the European Union in various formats, such as defense ministers (informal meetings and conducted in the format of the General Affairs and External Relations), political directors of ministries defense of EU Member States, EU Military Committee meetings including the chiefs of staffs of EU Member States, Political Military Group meetings, etc..

EU membership has also led to join the European Defence Agency (EDA), a structure that plays a key role in developing defense capabilities for crisis management operations under ESDP. In this context, Romania is interested in participating at European initiatives armaments cooperation and draft defense research and technology developed under the Agency [3].

Participation in the development of the European Security and Defence Policy is one of Romania's defense policy priorities. For this purpose it has been created the Department of Defense Policy and Planning, a specialized structure for managing this problem, responsible for coordinating the fulfillment of the responsibilities of the Ministry of Defence in the context of EU integration.

2. Romania's participation in ESDP/ CSDP missions

Romania has been actively involved in numerous missions and operations conducted under the European Security and Defence Policy (ESDP) since 2003, realizing the importance and extent of which they will acquire in the context of EU approaches to promote the rule of law functioning of respect for human rights and good governance, and related fields, all of which directly affect international stability and security. Strong commitment of our country is confirmed by placing among the top countries in terms of seconded experts and equipment provided, but also added value in making decisions in the field.

Romania supports the strengthening of what has become the Common Security and Defence Policy (CSDP) after the coming into force of the Lisbon Treaty, recognizing the operational usefulness and contribution to the European construction. Therefore, our country does not hesitate to contribute to CSDP missions according to its real potential and resources [4].

Romania's national contribution, along with the other Member States, covering both civil and military landing. Thus, Romania is present in many missions conducted under ESDP, conducted on three continents: EUPM (civilian mission in Bosnia and Herzegovina), EUFOR Althea (military mission in Bosnia and Herzegovina), EUJUST LEX (integrated mission in the rule of law for Iraq), EULEX Kosovo (rule of law mission in Kosovo), EUPOL Afghanistan (civilian mission in Afghanistan), EUMM Georgia (monitoring mission) and EUNAVFOR ATALANTA (naval mission to combat piracy in the Gulf of Aden) [5].

Romania response to the recent crisis in the Caucasus illustrates the ability and determination of our state to play an important role in the expression of the Union's external policy. Romania is contributing to the EU Monitoring Mission in Georgia with a team of monitors operating under the direction and coordination of Ministry of Foreign Affairs. These missions have been helping transform ESDP into an important pillar of EU foreign policy in line with the interests of Romania [6].

It is a substantial participation from the point of view of a state that joined the EU in 2007 and it fully reveals the interest and Romania's commitment in maintaining international stability and security. Although the most important part of Romanian experts headed detachments to the Balkans, the Black Sea and the Wider Middle East, Romania has not neglected the participation in missions in remote regions such as Afghanistan and the Gulf of Aden, following the fast acquisition of expertise as comprehensive in an area that will occupy a central role in the development of the European Union, something that emerges from the Treaty of Lisbon [7].

Under the Partnership for Peace (PfP) the Romanian army has proved necessary qualities in implementing the European security and defense policy: capacity of projection, sustainability, interoperability, flexibility and mobility. Participation of Romanian army in peace support operations is another element which emphasizes the viability of Romanian military organism internationally [8].

NATO membership and involvement of Romania in the development of ESDP have highlighted the need to ensure a set of capabilities (personnel and equipment) to allow our country to support their promotion of foreign policy objectives through participation in international missions and operations, including civil dimension. Romania's objective was compiling a reserve capacity and personnel available on short notice for sending civilian and / or military under NATO or the EU, and developing a training center in the field of post-conflict reconstruction in Romania [9].

National progress towards facilitating the process of generating employment and secondment of experts in civilian CSDP missions have been an EU integrated report. Romania is on honorable position, having already approved a national concept in civil capacities.

According to the study "Is the EU able to reconstruct states drift? A review of civilian capacities in Europe", conducted by the European Council on Foreign Relations and released on October 15, 2009, Romania was mentioned in Chapter Diligents (second from a group of five, after Professionals), along with Italy, France.

In January 2010 - a time of European statistical centralization - Romania ranked number three after deployment, with 205 civilian experts present in five European missions after France (225) and Italy (214). In the present, our country has expanded its presence with civilian experts seconded in six civilian missions, their number has been reaching 218.

Romania will continue to work towards exploring ways to diversify and optimize the contribution of civilian experts from EU missions. Part of these efforts is the development of the *National Strategy for strengthening civilian capabilities for crisis management* by ministerial working group coordinated by the Ministry of Foreign Affairs, according to the decision of the Supreme Defence Council, from the 21st of January 2010 [10].

3. Romania's contribution to the development of EU civil and military capabilities

For effective EU action in the field of ESDP, Member States agreed on the need for capacity building, civil and military, dedicated to this purpose. European Defence Agency (EDA) has a central role in the development of military capabilities, and also reducing fragmentation at European level in this field of strategic importance. Romania, according to the needs and interests for Equipment, involves with EU partners in a number of programs to develop cutting-edge capabilities to achieve the greatest possible added value of these efforts.

To demonstrate its involvement in the development of ESDP, Romania has contributed to the successful completion of the Civilian Headline Goal 2008 (directory document on the development of civilian capabilities for ESDP) and actively participated in the Civilian Capability Improvement Conference (November, 2008)[11].

The contribution of our country to Headline Goal 2010 (Headline 2010 / GD 2010) of the EU is a strategic priority. From this perspective, Romania was actively involved in the development of ESDP capabilities even before the actual membership, since 2000, by participating in

the planning process forces and European capabilities [12].

Effectives and resources made available by Romania are intended for peacekeeping missions, search and rescue missions and humanitarian missions. In accordance with the commitment made in the autumn of 2000, Romania offered forces that have a different composition, depending on the type of mission to be performed, as follows [13]: for peace support missions: since 2001, a company of infantry, a group of divers (COSAR), a monitor (an inland waterway vessel carrying artillery) and a military police platoon; since 2002, a battalion of genius; since 2003, an infantry battalion, a military police company, a company mountain and diving vessel intervention ("Gregory Antipas") latter could be used for search and rescue missions.

The available forces have different efficiency levels. Since submitting the request, they are ready for action in the following terms: 15 days, divers group, 30 days, ground forces and 60 days, naval forces.

Later, at the Capability Improvement Conference, held in Brussels in November 2001, the government from Bucharest has provided a new set of forces, about 3,700 troops and 75 military and police to improve EU civilian crisis management [14].

In March 2003, Romania has reiterated his desire to contribute with forces to the EU Rapid Intervention Force and the EU civilian instruments for crisis management. In May 2003, at a meeting of EU Defence Ministers from other countries, Romania detailed its national contribution to EU Rapid Reaction Force missions.

But, on the one hand, Romania's offer for European Rapid Reaction Force is basically the same as for peacekeeping operations conducted under the coordination of NATO and, on the other hand, from mid-October 2003 became operational NATO Response Force - Quick reaction Force of NATO, composed of elements integrated land, sea, air and special forces - Romania will have to differentiate the offer for the two organizations if it wants to participate, so well said by an active way to both rapid reaction forces [15].

In March 2006 was sent to the military responsible structures of EU the Romania's

available offer. This contribution included military personnel and skills from all walks of armed forces, has been harmonized package of forces available to NATO and was recorded in the EU Force Catalogue Supplement 2006.

4. Conclusions

From the 1st of January 2007, after joining the EU, the offer of forces and capabilities of Romania has been included in the EU Force Catalogue revised in 2007. In early 2007, following the request of the EU Military Staff, Romania has supplemented its contribution to cover part of the deficit in capacities achieved at EU level.

Romania's involvement in the development of EU defense capabilities also refer to operational fast response capabilities, particularly the EU battle groups. In this respect, Romania is participating in two formations of this kind: a battle group having Greece as framework nation, plus Bulgaria and Cyprus, which is available for EU in the second semester of 2007 and the first half of 2009, another group of fighters having Italy as framework nation plus Turkey, which will be operational and available to the EU in the second semester of 2010 [16].

On the 10th of November 2008, the EU announced concrete steps to increase its military capacity. Thus, progresses an European project for an air transport fleet ("Airbus") until 2014, by contributions from Germany, Belgium, Spain, Greece, France, Holland, Portugal, Czech Republic, Romania, Slovakia and Luxembourg. The project adds a modern satellite surveillance network [17].

At the meeting of the Supreme Council of National Defense of 21.01.2010 it was analyzed and approved the Plan to use the forces and means of the Romanian Army which will be available in 2010 to participate in collective defense missions, peace support, humanitarian assistance and type coalition outside the Romanian territory.

The SCND has approved an additional 600 troops to forces acting in the theater of operations in Afghanistan, the maximum number which can be reached is 1798 troops. In 2010 the Romanian Army will participate in missions outside the state with a number of 3753 troops, deployed forces, 2342 soldiers,

and forces command deployable, 1411 soldiers.

Also, during the SCND meeting, Foreign Minister Teodor Baconschi presented the concept for building national civil capacities in crisis management (Civilian crisis management), developed for participation of Romania in the European Security and Defence Policy. The document is the starting point in developing a national strategy to define the vision and principles of Romania's participation in civilian capabilities for crisis management operations [18].

On the 7th of July 2010, Kees Klompenhouwer[19], Director of the Civilian Planning and Conduct Capability [20]of the General Secretariat of the EU Council and EU Civilian Operations Commander, who was visiting Bucharest approached topical Common Security and Defence Policy (CSDP), such as the implementation of the Lisbon Treaty and the participation of national experts to the EU civilian missions for crisis management.

The Director of CPCC presented the progress of the EU civilian mission mandates, noting the important contribution of the EU in international security. He thanked for the significant participation of Romania to the EU civilian missions, reflected in our country's ranking in third place at EU level in terms of participation in such missions. He also thanked for solid and varied expertise that Romania provides to the EU in these missions (police, soldiers, diplomats, judges, experts in the field of human rights etc.)[21].

Romania will continue to participate in the development of CSDP and try to assume a position more involved in ensuring European security.

Common Security and Defence Policy towards Implementing the Provisions of the Lisbon Treaty

Bușe Mihaela
National Defense University "Carol I", Bucharest
mihaela200730@yahoo.fr

Abstract

European Security and Defence Policy (ESDP) represents the actual Security Policy of the European Union.

The Lisbon Treaty represented a new chapter in strengthening the institutional framework to address this area, noting the establishment of the post of High Representative for Foreign and Security Policy, the establishment of the European External Action Service (EEAS) and concrete steps in implementing the provisions on CSDP objectives.

Key words: European Security Strategy, High Representative for Foreign Affairs, the European Neighbourhood Policy, humanitarian missions, international agreements.

J.E.L. classification: F52

1. Introduction

European Security and Defence Policy (ESDP) represents the actual Security Policy of the European Union. Basis of this policy were made at the Franco-British conference in Saint-Malo in December 1998, where it was intended to achieve an autonomous EU military force [1].

ESDP was then discussed by the Treaty of Amsterdam (1997) and by the Treaty of Nice (2000). Debates around European security and defense policy were boosted by the success of NATO in Bosnia (1995) and Kosovo (1999), successes that demonstrated, how big was the capability gap between Europeans and Americans, difference that EU leaders wanted to reduce. Debates have centered on the Petersberg tasks. Regarding policy instruments, ESDP will include three elements: military, civilian and conflict prevention [2].

The decision to implement an independent European Security and Defence Policy was taken by the European Council in Cologne in June 1999.

Thus, the Cologne decisions were founded the European Security and Defence Policy (ESDP) institutional conceived as part of the second pillar of the EU - CFSP. Subsequently, the Helsinki European Council in December 1999, adopted the Global Objective of ESDP - called Helsinki Headline Goal, which aimed at making the Union a set of forces and capabilities necessary for the implementation of the EU's Petersberg missions. Therefore, they have established institutionalized ESDP witch became operational since 2003 [3].

2. European Security and Defence Policy (ESDP) / Common Security and Defence Policy (CSDP)

ESDP is actually the military component of the CFSP. ESDP covers the following areas: "humanitarian and rescue tasks; peacekeeping tasks; tasks forces for crisis management; missions disarmament; military advice and assistance tasks; conflict prevention missions; stabilization operations at the end of conflicts".

ESDP has several key features which can be summarized as follows: 1. Does not involve the creation of a European army, but evolve in a consistent manner and coordinated with NATO; 2. Can mean a specialization of Member States on military functions. Specialization consists of placing each EU country, who will want to do it, on the field as it has all or only part of its military technology and skill. The advantage of such a construction would be, militarily, abate and prevent dilution means. This idea needs to mature, and European countries are still at different stages of reflection. In other words, there is still no consensus, 3. Exclude any form of territorial defense. This remains

the exclusive competence of national states and NATO, 4. Works closely with NATO in crisis management missions execution and conflicts, especially in terms of infrastructure and logistics [4].

ESDP was defined as the holder of credible operational capabilities that can rely CFSP. Integral part of the CFSP, ESDP EU offers the possibility of using military or civilian resources for international conflict prevention and crisis management. ESDP completes the range of means available to the Union in CFSP and external relations in general. The used means are national assets and ESDP provides a framework to identify and develop these capabilities, coordinate them and use them independently. ESDP can also be a purely military instrument enabling the EU to conduct armed forces in peacekeeping missions, or, where appropriate, peace enforcement [5].

In December 2001, the EU decided to combat terrorism through political, institutional, military means. In the center of EU strategy were placed: conflict prevention, stabilization risk areas (Petersberg tasks)[6].

The EU has concluded or it is still involved in 20 missions in the European Security and Defence Policy, reflecting its international commitment in regions such as the Western Balkans, the Middle East and Sub-Saharan Africa. Several examples illustrate the Union's commitment to the Balkans. These missions, although the institutional framework of ESDP, are often involving a third pillar – Justice and home affairs (JHA) – police missions.

EU intervention in conflict - as for example operations EUFOR CONCORDIA - in Macedonia ARTEMIS - in DR Congo, EUFOR ALTHEA - in Bosnia-Herzegovina, missions to restore peace and maintain it, justified that the EU has become a major player in European security since 2000, while being a consumer of security, and a supplier in the making [7].

EU initiatives on areas of strategic security, called quiet and friendly neighborhood, are part of the European Neighbourhood and Partnership Instrument (PEVP). They aim, as Professor Theodore Frunzeti, specialist in international relations, geopolitics and geo-strategy, appreciates the realization of the concept of European security, and the performance, in time,

powerful and reliable Eurasian entity that actually is placed in work, but the other terms and other coordinated the ancient Eurasian geopolitical heartland of Harfold J. Mackinder. EU needs such a geopolitical reconfiguration of the Eurasian space, because, on the one hand, compelling energy requirement and, on the other hand, the need to rebuild continental power, but not necessarily to combat maritime powers, but in a very different political and strategic dimension closely linked to long-term economic development and modern management of conflictuality which is becoming increasingly difficult in the current geopolitical formula, too fluid and full of tension, unresolved problems, frozen or open wars [8].

There are four such initiatives, which are reflected in the Neighbourhood Policy and Partnership of the European Union: 1. Euro-Mediterranean Partnership; 2. Northern Dimension; 3. Black Sea Synergy; 4. Eastern Partnership. European Union creates with these areas, in fact, some impact geopolitical bases, which seeks, first, creating solid bridges of cooperation and partnership with the East and South, a circle or semicircle of strategic safety and expansion of the European Union influence and implement control mechanisms and diminution of conflictuality [9].

3. Lisbon Treaty innovations in security and defense policy

In 50 years, Europe has changed a lot - as entire world. The world has evolved, challenges and threats have diversified and Member States can no longer deal with the new realities. This requires new rules, a process of modernization, cooperation to bring solutions for functional Union to achieve its objectives.

The Lisbon Treaty was a notable step in the attempt to create a more democratic and transparent Europe [10]. Common Security and Defence Policy (CSDP) is a relatively recent EU instrument of the Intergovernmental pillar, evolving as a concept since 1998 (Franco-British summit at Saint Malo) and operationalized in 2003 - when it was adopted the European Security Strategy (ESS) and launched the first

missions - and created for the fulfilling of the objectives set by strategy [11].

The Lisbon Treaty is a new chapter in strengthening the institutional framework to address this area, noting the establishment of the post of High Representative for Foreign and Security Policy, the establishment of the European External Action Service (EEAS) and concrete steps in implementing the provisions regarding the CSDP objectives.

The Lisbon Treaty clearly defines the role of the EU in foreign policy and security policy [12]. Lisbon Treaty innovates considerably CSDP, pursuing the objective of strengthening the security dimension of the EU. A number of modifications are made, and that change the old way of running the ESDP (set to become a Common Security and Defence Policy) and therefore formalize the transformation of ESDP in CSDP, while preserving its intergovernmental character and principle of unanimity [13].

The Lisbon Treaty contains two important institutional innovations that will have a significant impact on the Union's external action: the appointment of a "permanent" President of the European Council for a period of two and half years with the possibility of renewal and the appointment of a High Representative for Foreign Affairs and Security Policy, which will be the vice-president of the Commission and he will have the task of ensuring consistency of the Union's external action. The Lisbon Treaty provides to the Union to act more effectively and consistently worldwide. Combining various components of foreign policy, namely diplomacy, security, trade, development, humanitarian aid and international negotiations, Europe will gain a firmer position in dealing with partner countries and organizations around the world [14].

At the Extraordinary European Council on the 19th of November, the First President of the European Council was elected in the person of former Belgian prime minister Herman Van Rompuy, who takes over his new mandate starting the entry into force of the Treaty.

Regarding the Union's external action, the Lisbon Treaty establishes the office of High Representative for Foreign Affairs and Security Policy. The High Representative cumulates also the position of member of the

European Commissioner with the rank of vice-president. At the European Council from the 19th of November, it has also been decided who will occupy this position for the first time respectively Mrs. Catherine Ashton [15].

The impact of EU interventions becomes stronger with the creation of a new European External Action Service. This resource is based on the EU institutions and Member States to assist the High Representative.

The Treaty confers to the Union a single legal personality who enabled it to conclude international agreements and to join international organizations. Therefore, the EU can speak and act as one entity [16].

Military capabilities will remain still in the service of Member States and can be offered as resources in the development of CSDP operations, on a voluntary basis, but the concept of permanent structured cooperation (Permanent Structured Cooperation) allows Member States that want and fulfill the criterias and have made commitments on military capabilities set out in the 10th Protocol annexed to the Treaty of Lisbon in the development of ESDP capabilities, a top military integration. Treaty will also introduce an initial fund management operations and improving capacity to support the European Defence Agency.

A very important aspect for increasing EU crisis management missions, under the Treaty of Lisbon is to extend the coverage of the mission beyond the existing humanitarian type, peacekeeping and crisis management, including peace enforcement (known as the Petersberg tasks), to include joint disarmament operations, military advice and assistance provision, combating terrorism [17].

4. Conclusions

The Lisbon Treaty is institutionalizing the custom of "implementation of a mission" by a group of Member States which are willing and have the capacity to undertake such a task on behalf of and entrusted by the Council. The foundations of so-called "coalition of the willing" formally recognizing such operations, as was the case initiated by France in Artemis mission in DR Congo [18].

Defining the role the EU should play in the world, the Lisbon Treaty takes into account the problem of Common Security and Defence Policy, recognizing that it is part of the common foreign and security policy. In this context, it is introduced a "solidarity clause" whereby the EU and Member States are asked to act jointly if a Member State becomes the target of a terrorist attack [19].

The proposed reforms of EU regarding defense dimension (treated as a separate chapter, as in the draft of the Constitutional Treaty) aims to promote in a sustainable manner the ESDP, which could lead to the emergence of a progressive common defense, but only if there is consensus on this dimension in the European Council. The most important innovations of the ESDP introduced by the new Treaty are permanent structured cooperation, mutual assistance clause in the event of armed aggression, extending the range of Petersberg tasks, the solidarity clause, the consecration of the European Defence Agency.

Permanent structured cooperation refers to initiating a type of enhanced cooperation regarding capacities (joint projects) between Member States with advanced military capabilities and maintain close working relationships. Through this mechanism, they may assume a leading role in the development of European capabilities in anticipation of the most demanding missions ahead of other nations in the Union [20].

Other provisions of the Lisbon Treaty on CFSP / CSDP are: Union acquires legal personality - which means that the EU will now be able to conclude on their own, international agreements (Article 47 of the Treaty of Lisbon) and the pillars structure is removed, the establishment of the President of the European Council and the new High Representative is tasked with the role of ensuring coherence between EU institutions and between them and the Member States [21].

The provisions of the Lisbon Treaty aimed at the development of a Common Security and Defence Policy more transparent, more coherent and more effective to increase the importance of the EU as an international actor.

cindeamoise@yahoo.com

Abstract

The aim of this paper is to analyze the role of Belgium in the process of European monetary cooperation. Since Belgium was one of the founding members of the European Economic Community (EEC) and a strong supporter of monetary cooperation, we believe that its role regarding monetary integration was extremely important and somewhat underestimated in the literature. This does not mean that large states did not have a significant role, or that the role of Belgium was more important than that of Germany or France.

Nevertheless, by supporting economic cooperation through its diplomatic efforts and creative proposals, Belgium played an active role in the process of European monetary integration. For Belgium, the idea of an integrated Europe was represented by exchange rate stability. Even in extremely difficult situations, Belgium did everything possible to keep the European Monetary Union (EMU) on the agenda.

Key words: European monetary integration, economic and monetary cooperation, monetary policy, EMU creation.

J.E.L. classification: F15, F33.

1. Introduction

It is often said that the large Member States of the European Union (EU) were the main supporters of the European Monetary Union. Moravcsik, for example, believes that the process of EMU creation cannot be understood unless we admit that the EMU has served the economic interests of the dominant three Member States, namely France, Germany and England [1].

Dyson and Featherstone [2] also analyzed the role of large Member States. Their conclusion was that four of the Member States (the above plus Italy) supported the EMU project not only in order to protect their economic interests, but for several other reasons. First of all, the fact that the elites of these countries had realized the importance of creating a monetary regime based on the principles of price stability and central bank independence; secondly, the aim of institutionalizing monetary convergence, achieved through the Exchange Rate Mechanism (ERM) of the European Monetary System (EMS).

Others believe that the Member States accepted the creation of EMU because this arrangement provided the monetary authorities of the Member States with a new vision of how to develop monetary policies. In 1980, the monetary authorities of the states included in the ERM followed de facto the German policies. So, they actually had no say in the policy-making process, while in the case of EMU they would have regained the possibility of expressing their opinion regarding the monetary policy through the Governing Council of the European Central Bank. Other analysts argue that the EMU was created only due to an agreement between France and Germany, meaning that France agreed to support the German reunification only if Germany agreed with the EMU. This hypothesis, however, was not confirmed by the German and French leaders.

We believe that it would be wrong to attribute the EMU creation exclusively to the Franco-German alliance or to convergence of the interests of the four large countries. Without ignoring, however, the role of the Franco-German negotiations at crucial moments or the importance of the four states, the EMU project was a collective,

multilateral achievement, to which all the Member States, including the small and medium states, brought their contribution.

In this context, we should note that introducing the single currency involved reviewing the Treaty of Rome. Therefore the decision was that of creating the Treaty on EU. Within the inter-governmental conferences and the summits of the European Council, the negotiating position of each country depends on the support of the other states, whether small, medium or large. In addition, the 1992 Treaty on EU could be implemented only if it was ratified by all the Member States (at that time 12 Member States). It is, therefore, important to analyze the contributions of the small and medium-sized states as well. The small and medium states of the EEC are more open and more dependent on other economies, they are convinced supporters of trade liberalization, they strongly focus on the policies that they consider to be important due to limited internal resources, they are characterized by less formal administration and bureaucracy and have a more special relationship with the Commission, due to which their proposals reach the Council much easier. Thus, it is not surprising that the small and medium states can have a significant impact on the EU policy-making process.

2. Belgium's role

Belgium has **always** had a pro-integration attitude regarding the process of European monetary integration, often playing the role of the European Commission ally. Its main concern was to keep the EMU on the agenda. During the preparations for the Hague Summit in December 1969, Belgium made significant efforts to keep the attention on the EMU project.

Belgium was devoted to the EMU project even during difficult moments. An example in this respect is the Tindemans Report, which tried to revive the EMU during the late 1970s. It invented the concept of a multi-speed Europe, because not all the states were able to be part of this monetary arrangement from the very beginning. The negotiations regarding the monetary size of the Single European Act represented another crucial episode. That is when the Treaty of Rome suffered its first significant revision.

Although it was clear that the EMU could not be represent concrete goal, it was essential to obtain the community *acquis* regarding the monetary aspects specified in the treaty. Belgium prepared its proposals carefully, making sure not to leave Commission isolated during the negotiation rounds. Afterwards, these initiatives became the basis of negotiations regarding the Werner Report and the Maastricht Treaty.

Subsequently, Belgium played a leading role in the actual development of the EMU, particularly getting involved in the preparations for the euro project, adopted within the Summit of Madrid in 1995, and in the preparations for the introduction of the euro banknotes and coins.

During the post-war period, Belgium strongly supported the European integration. The explanation for Belgium favoring the European integration and EMU refers to its characteristics of small and open economy, its geographic location and fundamental pro-integration attitude, mainly marked by the experience of the two world wars. EMU was mainly favored by the major political parties and key social actors (the unions). The academic community was also very interested in the European issues, the European integration being an important research topic [3].

In addition, the Christian-Democrats, who identified themselves with the European unification, dominated the postwar political scene. The former Belgian Prime Minister Mark Eyskens remarked: "Europe is a country that must be loved" [4]. The Belgian agreement regarding the EMU was also extended to the relations between the political and economic authorities.

For this European country, the European integration involved an important gain of influence. The European integration had instituted the European rule of law, limiting the power of large countries. The supranational actors of EEC, such as the European Commission or the European Court of Justice, were also limiting their power.

On the European scene, Belgium was an ally of the European Commission. This relation was based on their common goal, namely the creation of a more federal Europe. In addition, the fact that the Commission was positioned in Brussels facilitated the informal contacts. At the same

time, Belgium was strongly represented within the European Commission.

Belgium's vision on the structure and functioning of EMU is found in the Belgian draft of EMU in January 1970: "A project of monetary solidarity in three stages from 1971 to 1977" [5]. The main goal of EMU, as laid down in the Hague Summit in December 1969, was the creation of a European Monetary community. According to Belgium, two requirements had to be met: the unification of the economic policies and a degree of homogeneity of the economies of the Member States. Homogeneity referred not only to institutional homogeneity, but also to overcoming the disparities in the economic and social systems. Then, the project proposed several transfer mechanisms. Major institutional reforms were needed during the last stages. Creating a supranational institution was essential and involved reviewing the Treaty of Rome.

EMU was to be organized around two poles: first, a community monetary system, like the United States (US) Federal Reserve System, and a kind of economic government of some bodies which would have the necessary power to perform a single economic policy. The economic policy was defined by the budget and income policies. For the budget policy, the new EU institutions were to establish a general context within which the Member States had to manage their budgets. The community budget was supposed to gain importance gradually. Finally, the Belgian draft proposed reducing the fluctuation margins progressively during the first stage, and parity change could take place only by mutual agreement.

The idea of a European economic government, launched by the European Commission during the negotiations on the Maastricht Treaty in 1991, enjoyed Belgium's support [6]. However, the concept was not adopted by the treaty. The economic policy remained essentially a national problem, causing a somewhat asymmetrical EMU [7]. The debates contributed, however, to the improvement of the treaty.

The Belgian integration strategy had a monetarist character. Monetary cooperation and integration were seen as a catalyst for economic convergence. Therefore, there was no need to wait for full convergence, as the

pure economists thought (for example Ungerer [8]). Exchange rate stability was central in the Belgian policies of promoting European monetary cooperation. The second area in which Belgium was involved regards credit and deposit facilities. Besides stimulating mutual monetary cooperation, these mechanisms were also a more efficient way of preventing speculations in comparison to national measures.

As chairman of the committee of experts of the Werner group, the Governor of the National Bank of Belgium at that time, Hubert Ansiaux, left its mark on the proposals regarding the development of the mutual support mechanisms. Subsequently, Belgium agreed to offer the European Monetary Cooperation Fund sufficient responsibilities and resources as to facilitate a real coordination of the monetary policy from the very beginning. Even during the European Monetary System period, the representatives of Belgium struggled to consolidate the credit mechanisms of the EEC.

In November 1995, Belgium reacted positively to the proposals regarding the Stability Pact for Europe coming from Germany. However, the Belgian Finance Minister Philippe Maystadt highlighted the need for signing a pact for monetary stability, which would focus on the exchange rates between the single currency area and the other EU Member States, besides the pact for budgetary stability [9]. In fact, he resorted to a fundamental Belgian idea according to which exchange rate stability is essential in any single market. In addition, the pact would have helped the other Member States in the process of convergence. The debates led to the creation of a new exchange rate mechanism, the so-called Exchange Rate Mechanism II (ERM II) [10].

Despite its monetarist vision, Belgium agreed with the need for parallel progress in two areas: economic and monetary. At the same time, the Belgian authorities were convinced that sustained monetary cooperation could not exist in the absence of sound economic principles and economic convergence. Economic policy coordination had to occur by recommending the Member States appropriate measures and by increasing the efficiency of the mutual coordination of the national measures.

Within the EU, Belgian representatives were known to facilitate compromises and to support agreements. Coming from a relatively small country, Belgian politicians were always forced to take into consideration the views of the other players. In addition, being a multi-cultural country, in which several languages are spoken, they are used to negotiate with people coming from other cultures. The Belgian officials often used their intellectual and diplomatic skills in order to contribute to reaching compromises at European level.

Belgian diplomats tried several times to stimulate the Franco-German reconciliation, in order to support the European integration process. Ever since the period of negotiations on the Treaty of Rome, the exchange rate remained a subject of hot debate. According to Van Tichelen, one of Belgium's negotiators, one of the issues frequently discussed was whether the exchange should remain national or become a Community issue [11]. Another example is the Belgian contribution to the preparations for the EMS, when chairing both the Monetary Committee and the Committee of Central Bank Governors. Although it was never implemented, the Belgian idea of a "divergence indicator" represented the beginning of an agreement regarding the EMS in December 1978. This episode shows how, through sustained diplomatic efforts, a relatively small country can have an impact on the processes of the EU.

Another example is Belgium's proposal within the Inter-governmental Conference on the Treaty of Maastricht to name the institution of the second stage of EMU the "European Monetary Institute". It worked as a bridge between France, which had proposed the creation of the European Central Bank and Germany, which favored the Council of the Central Bank Presidents.

3. Conclusions

Belgium played a significant role in the creation of EMU. Monetary integration was extremely important for this country, which is why it made significant efforts in order to facilitate its achievement. As an open economy, Belgium was going to benefit from a fixed exchange rate regime and subsequently from the single currency.

Although it sometimes played the role of a mediator between Germany and France, its main purpose was to enhance European integration through the creation of institutions that would be able to develop economic and monetary policies.

Although its strategy regarding EMU had a strong monetarist character, Belgium agreed with the need for parallel progress in two areas: economic and monetary. Belgium always had a pro-integration attitude and was a constant ally of the European Commission. Without its contributions, the European economic and monetary integration process would have not been the same.

Role of Romanian Public Administration in Policy Development of Social Integration of Foreigners

Cocoşatu Mădălina

*National School of Political Studies and Public Administration, Bucharest,
Faculty of Public Administration
madacocosatu@yahoo.com*

Abstract

The paper aims to analyze an issue Romania is facing at present, namely the phenomenon of integrating immigrants into the community, both from the perspective of governmental policies, and from the point of view of implementing these policies into practice.

As Member State of the European Union, Romania had to align to the European standards and to perform its activity in the field of immigration in full accordance with the position of the other state.

If in the past Romania mainly had a role of transit country for the migrant flows coming from the Eastern states, in their path to the Western, highly economically developed states, at present, Romania is also becoming a destination country.

Keywords: Foreigners, social integration, public institutions

J.E.L. Classification: K 33, O38

1. Introduction

In recent years, although Romania has retained its largely state transit character, it began to become more of a destination state.

Romania is exposed to migration routes (legal and illegal) in the countries of Eastern Europe, originating in the Middle East, Southeast Asia and Africa. Although in some EU Member States were registered migration trends in countries of Central America and South America, these have not yet been reported in Romania, due to its geographical position and low

attractiveness for citizens from these countries.

Alien is a person who is in the territory of a State without its nationality, but of a different state. [1] The concept can be understood *lato sensu*, by foreign understanding any legal subject, both natural person and legal person with no citizenship or nationality of the State in whose territory exist or work, or *stricto sensu*, referring only to individuals. The common element in both senses of the term alien is the reference to a state where a non-national jurisdiction to enter into a legal relationship, regardless of its nature. When a person leaves the State of nationality has, it continues to be a national of that State, but the legal order of the country he came, the person is "foreign". If a person reached in international waters, she gets no stranger the to any state.

Government Emergency Ordinance no. 194/2002 concerning the regime of aliens in Romania, provides in art. 2, letter a) that the alien is a person who is not Romanian citizenship. French Ordinance No.45-2658 of 2 November 1945 mentions in art. 1 that all persons that have not French nationality or not have any nationality are considered foreigners.

Also, the European States members of the Schengen Agreement of 14 June 1985 were agreed in Article 1 of the Convention implementing the Schengen Agreement, signed on 19 June 1990, that the alien means any person other than the citizens of Member States of the European Union .

2. Institutional Framework

In the context in which Romania became a full member of the European Union on 1 January 2007, border control

according to European practice is established by EC Regulation 562 of 15 March 2006 on the Community Code on the rules governing the movement of people across the border and Directive no. 38 of 29 April 2004 the European Parliament and the European Council on the right to free movement and residence in Member States for Union citizens and their family members.

In this context, a better organization of our public administration was necessary.

In order to cope with the new challenges. Thus, Romania, as country on the Union's outer border, entered a new period which implies the efficient security of its external borders, migration control, as well as the preparing and adoption of the necessary measures that converge towards the elimination of internal borders control (for the purpose of subsequently acceding to the Schengen space).

All these reasons required closer collaboration between the competent authorities in the field and a system reformation in order to fulfill the requirements. In this sense, it was necessary to create a competent institution in the field of migration, asylum and aliens' integration, including with respect to their right to work.

Successful implementation of migration policies depends on involvement and responsibility of each institutional actor (Ministry of Administration and Interior, Ministry of Education, Research, Youth and Sport, Ministry of Labour, Family and Social Protection etc.) is responsible for integrating aliens into its activity field, the coordination and monitoring of the policy belonging to the Ministry of Administration and Interior, by means of the Romanian Immigration Office, which also has the duty to offer, through its regional structures, specific services in view of facilitating the integration in the Romanian society of different categories of aliens. It has the role of observing the obligations undertaken at the international level, by means of the legal instruments our country has adhered to, and of protecting the national interest, by achieving a balance between the rights and the obligations of these categories of persons.

3. Analysis of Migration Policies

According to the Romanian legislation, only the aliens who received a certain form of protection (recognized refugees and aliens benefitting from conditional humanitarian protection) benefit of special measures aimed at facilitating their integration in the Romanian society.

Since year 2004, Romania has manifested its interest to elaborate unitary policies in the field of migration, asylum and the social integration of aliens, which to ensure the harmonization of the internal legislative framework with the international law and the Community acquis.

Also, the Romanian state aimed at the development and modernization of the institutional framework necessary for implementing the policies in the field, at adopting a modern management in the field of human, material and financial resources, and at the unitary coordination of the authorities with duties in the field, for the purpose of eliminating the situations of overlapping competences and of the efficient use of these resources.

According to the Romanian legislation in effect, the aliens legally living in Romania enjoy the same rights and liberties as the Romanian citizens (with some exceptions), rights guaranteed by the Constitution, the legislation, but also by the international treaties our country is a party to.

Hence, the aliens benefit from the application of the national regime, enjoying a wide range of rights and liberties. Thus, the revised Romanian Constitution refers, especially in Title II, Chapter II „Fundamental rights and liberties” to any persons, therefore including aliens. In the specialists' opinion, the justification consists in the fact that aliens and persons without a country first have the quality of human beings and, implicitly, a series of primary, inalienable and imprescriptible rights, such as the right to life, dignity, liberty, freedom of conscience etc. However, from the legal point of view, certain rights can belong solely to Romanian citizens, who, by means of the citizenship bond are indissolubly tied to the Romanian state. In this sense, we refer to the political rights (to elect and to be

elected in the representative authorities at the national level), to the occupation of certain public, civilian or military positions or dignities; also, aliens cannot organize, establish or be part of political parties or any other similar organizations or groups, or to initiate, organize, finance or attend manifestations or meetings that breach public order or national security.

The guiding lines of the policy regarding the social integration of aliens in Romania are found in the National Strategy regarding Migration adopted by Government Decision no.498/2011, document that expresses the general principles and the guiding lines for establishing the policy of the Romanian state with respect to the admission, stay, leaving of the territory by aliens, to the work force immigration, to granting the forms of protection, as well as to combating illegal immigration.

Also, National Strategy increase the level of inter-institutional coordination for the efficient management of legal immigration, especially of the purpose of work and increase coordination of institutions with competences in the social integration of aliens, development of institutional capacity, logistics and human resources of management institutions responsible for immigration and asylum

Overall, foreigners enjoy the fundamental rights of Romanian citizens, except political rights benefiting from civil, economic, social and cultural rights under the same conditions as Romanian citizens.

During their stay in Romania, foreigners are required to comply with Romanian law. Foreigners may leave the country at any time and may enter the country, in compliance with regulations relating to entry. Foreigners establish his domicile in Romania are required to register with the police and to regularly target identity documents.

Alien who does not fulfill their obligations under the law can be returned to their country of origin or departure, or may be sent to the country of destination.

Every state establishes legal condition of foreigners according to their own interests. This law follows from the principle of state sovereignty. [2] Foreigners on the territory of a State shall

respect the laws of the State of residence, respect and loyalty, not to take action against the receiving State. [3]

According to legislation, foreigners who were granted a form of protection in Romania have provided access to the following rights: the right to employment, right to housing, the right to health care and social assistance, social security, right to education, and by carrying out specific cultural accommodation, counseling and Romanian language, contenting in integration programs.

Regarding social policies, aliens who gained a form of protection are registered as person looking for a work place with the local agency for the occupation of the work force or at the work point in whose territorial area the respective alien resides.

Also, social households are assigned to aliens who gained a form of protection in Romania, by the competent authorities of the local public administration, on the basis of the eligibility criteria applicable to Romanian citizens.

In the situation when the persons who underwent the integration program cannot receive a social household from the local authorities, they can rent a house, and the Romanian Office for Immigration can subsidize their rent by up to 50%, for a maximum period of one year.

In what concerns the right to education, to the citizens of third countries, gained a form of protection in Romania there are provided free courses for initiation in the Romanian language for minors, as well as for learning the Romanian language for the adults. They are organized by the county and City of Bucharest school inspectorates, according to the methodologies approved by the Ministry of Education, Youth and Sport.

Also with respect to access to the social assistance system, it is performed in the same conditions as those established by law for the Romanian citizens, The aliens who gained a form of protection in Romania can benefit of a reimbursable aid from the Ministry of Labour, Family and Social Protection, which can be obtained for a period of 6 months, with the possibility of extending it for another 3 months. The reimbursable aid amounts to the value of the minimum wage in the economy, for

each family member, as is granted following a social investigation. Practice has proven that refugees have access to this aid.

In order to increase the administrative capacity regarding the migration phenomenon, on the date of January 21st, 2009, 4 European funds afferent to the General Program Solidarity and to the management of migratory flows 2008-2013 were launched, which are administered by the Ministry of Administration and Interior, respectively the General Direction of European Affairs and International Relations and the Romanian Office for Immigrations (as Contracting and Payment Authority), represented as follows:

- European Refugees Fund III (ERF III), having as objective the support and encouragement of the efforts made by the Member States to allow refugees and displaced persons in the territory and to deal with the effects of this admission, considering the communitarian legislation in the field;

- European Fund for the Integration of Third-Country Nationals (FI), having as objective the aiding of the efforts made by the Member States in allowing third-country nationals with different economic, social, cultural, religious, linguistic and ethnic backgrounds to fulfill the residence conditions, and the aiding of their integration into the European societies;

- European Return Fund (RF), having as objective the support and encouragement of the efforts made by the Member States to better manage the return, under all its aspects, on the basis of the integrated management concept and by establishing common actions which to be applied by the Member States or certain national level actions that contribute to the fulfillment of the communitarian objectives related to the solidarity principle, taking into account the communitarian legislation in the field and with the full observance of the fundamental rights;

- Outer Borders Fund (accessible starting with 2010).

4. Conclusions

Increasing awareness of the population regarding immigrations will implicitly lead

to easier acceptance of foreigners by the Romanian society and thus to respect national legislation.

In conclusion, we can say that the social policy in the field of immigration – the dimension aiming at the aliens’ integration – has as goal the support of the aliens domiciling or residing on the territory of the host-country to actively participate to the social, economic and cultural life of that respective society and, by means of that, to contribute to the development of a mutual relation based in trust and responsibility between the aliens and the community.

European Institutional and Organisational Tools for Maritime Human Resources Development

Dragomir Cristina

Constanta Maritime University, Navigation and Naval Transport Faculty

economie.umd@gmail.com

Abstract

Seafarers need to continuously develop their career, at all stages of their professional life. This paper presents some tools of institutional and organisational career development. At insitutional level there are presented vocational education and training tools provided by the European Union institutions while at organisational level are exemplified some tools used by private crewing companies for maritime human resources assessment and development.

Cuvinte cheie: maritime human resources, human resources management, seafarers, navigation

Clasificare J.E.L.: J24, M12, M54

1. Introduction

Taking into account that in a competitive, free market system, efficiency is gained when individual participants act in their own self interest [1], maritime human resources should act in their own self interest and should take into consideration the need to develop their career at all stages of their professional life in order to have an efficient response to the continous changing environment of the competitive society.

The need for professional development, education and training is usually more noticeable in the case of fresh graduates and seafarers in the early years of their careers. But also, those with more years of experience at sea need to have the opportunity to progress and learn. Sometimes in their case the process of professional development using vocational education and training tools based on e-technologies prove to be challenging. This paper presents two types of examples of development tools used at the

European Union institutional level and at the organisational level of a private crewing company, both proving useful in development the careers of working seafarers at any age.

2. EU vocational education and training tools for maritime career development

According to the Report of the Task Force on Maritime Employment and Competitiveness and Policy Recommendations to the European Commission from June 2011, the European Union's institutions has developed a number of instruments on vocational education and training useful for development of maritime human resources that include the ones below [2].

1. The European qualification framework based on the learning outcomes approach. It aims to relate different countries' national qualifications systems to a common European reference framework. In each country, a national coordination point has been designated for this purpose.

The core of the framework consists of 8 qualifications levels described through learning outcomes (knowledge, skills and competence). The associated learning relate to the complexity and depth of knowledge and understanding, the degree of necessary support or instruction, the degree of integration, independence and creativity required, the range and complexity of application/practice the degree of transparency and dynamics of situations[3]. European qualification framework is promoting better understanding and transparency of qualifications across EU and is essential for developing a European employment market, promoting mobility and lifelong learning. In Romania, an incorporating computer into the evaluation of learning outcomes imposes the adaptation of

certain paradigms such as e-assessment to the standard framework of competencies formation (as adopted by Romania’s CNCIS–Romanian National Qualifications Framework for Higher Education, following the European qualification framework)[4].

2. The European credit system for vocational education and training [5]: based on the learning outcomes approach, it helps to validate, recognise and accumulate work-related skills and knowledge acquired during a stay in another country or in different situations, so that these experiences contribute to transfer credits from one qualification system to another, or from one learning „pathway” to another. According to this approach, individuals can accumulate the required learning outcomes for a given qualification over time, in different countries or in different situations. ECVET points are a numerical representation of the overall weight of learning outcomes in a qualification and of the relative weight of units in relation to the qualification.

The number of ECVET points allocated to a qualification, together with other specifications, can indicate for example, that the scope of the qualification is narrow or broad. Allocation of ECVET points to a qualification is based on using a convention according to which 60 points are allocated to the learning outcomes expected to be achieved in a year of formal full time VET [6].

3. The Europass [7] is a single portfolio of documents to support job and geographical mobility to enable individuals to present their qualifications and skills using a standard format understandable to employers throughout Europe.

One of the Europass documents, beside the well-known Europass CV, is Europass mobility which describes the skills and competences acquired during the europass mobility experience, activities/tasks carried out, job-related skills and competences acquired, language skills and computer skills, organisational skills and competences like for example in the case of a seafarer, the good capacity in organising the tasks carried out during a voyage period, identifying priorities and managing efficiently relations with other members of the crew.

Another key competence example would be the digital competence that involves the

critical use of Information Society Technology (IST) for work, leisure and communication. It is underpinned by basic skills in ICT: the use of computers to retrieve, assess, store, produce, present and exchange information, and to communicate and participate in collaborative networks via the Internet. Use of IST requires a critical and reflective attitude towards available information and a responsible use of the interactive media; an interest in engaging in communities and networks for cultural, social and/or professional purposes also supports competence. [8]

The Europass portfolio can be widely available to be seen by the interested parties (employers, head-hunter companies etc.) through upload on e-technologies platforms of mass communication.

4. The last vocational and educational tool presented in this paper but not the least, the European Quality Assurance Reference Framework for Vocational Education and Training [8] helps state institutions to develop, improve and assess the quality of their Vocational Education and Training systems through a common tool for quality management practices which includes the establishment of national reference points for quality assurance in the case of maritime transport.

All of these institutional tools would not prove useful without a proper technological e-system of mass communication.

3. Organisational tools for maritime human resources development in private crewing companies using e-applications

3.1. Research methodology

Several observations were made at a Romanian maritime personnel recruiting company from Constanta between September and October 2011.

The crewing company was established in 2008. Starting with the last half of 2011, the company’s strategy to develop maritime human resources included the use of e-technologies and e-applications for crew evaluation and development. In the example below, the crewing company has a digital database with crew seafarers that have competencies and experience in working on chemical tankers. The electronic applications

Matrix of experience and Matrix of crew change are made in Microsoft Excel and require shore personnel with ICT skills able to operate in Excel.

3.2. Research Results

Experience Matrix application is used to record and monitor seafarers experience and its performance.

The application is based on the 2011 edition of the International Convention on Standards of Training, Certification and Watchkeeping for Seafarers (STCW), and the STCW Code, including the 2010 Manila Amendments provisions, which updates standards of competence required, particularly in light of emerging technologies, introduce new training and certification requirements and methodologies, improve mechanisms for enforcement of the Convention’s provisions and detail requirements on hours of work and rest, prevention of drug and alcohol abuse, and medical fitness standards for seafarers [9].

According to this international convention, the safe operation of a vessel depends on the skills and experience of the officers responsible for the implementation of the safety management system.

Consequently, vessels must be equipped according to a system based on the complementarities between seafarers’ level of experience and familiarity with the company processes and procedures.

3.3. Matrix of experience

For the first application, it is envisaged crew combination and association according to the following table which contains data recorded in the matrix of experience.

Table 1: The principles of seafarers’ combinations depending on the level of experience

Type of experience	Senior deck officers: Master+officer 1	Junior bridge officers: Officer 2 + Officer 3
--------------------	---	--

Experience to the post	Together, the two should have an experience at sea of more than 3 years; the master must have an experience of at least six months at sea and first officer an equivalent experience of at least six months at sea.	At least 1 year at sea
Ships operating experience	More than two calendar years	More than 1 calendar year
Experience in a specific type of tank	More than 6 years at sea	N/A
Experience on all types of tanks	N/A	More than 1.5 years at sea

In the example provided below, the matrix makes such combinations for mechanical engineers. The application makes similar combinations for all the crew ranks, like master, chief mate, officer of the watch, 2nd engineer, engineer officer, helmsman, motorman/fitter, cook, cadet, electrical officer or ordinary seaman. A special attention should be given to the development of the master career, as the master of the ship is considered the strategic crew member leading the activity on board from the operational and managerial point of view [10].

Depending on the data recorded by this application and by the matrix of crew change application, it is established a schedule of crew change from ships, in parallel to the methods of financial reward, the bonus award related to experience and seniority in the company.

Seafarers experience matrix includes the following information: name of seafarers, their functions, from master to ratings, first salary level, the current salary and bonuses awarded for experience and seniority in the company, years of experience on the current function, years of experience on chemical

tankers and vessels (in the example from figure 1), indicating the periods of boarding (on-sign) and disembarking (off-sign). The Matrix also records whether the crew members have an available certificate of competency and the date of issue.

At employment, candidates complete standardized forms for applying for the job, stating details of their education, training and certification, experience gathered from previous jobs, medical records and other information necessary to evaluate the applicant’s qualifications. The employment application is verified by the personnel of the recruitment company in order to analyze the consistency with basic criteria for employment of the company, agreed with the shipowner’s company.

Experience and appropriate certifications specified in the employment application are recorded in the Matrix of experience. Depending on the time period in which the shipboard service was conducted, the Matrix of experience calculates a coefficient of the experience years and depending on this it will be given salary allowances and the possibility to develop the career through professional advancement.

In figure 1 is represented the experience matrix for chief engineers, sent by the company on various ships owned by shipowners, the customers of the crewing company.

Figure 1: Tools for maritime human resources development at organisational level –Matrix of Chief Engineers Experience

Crewmembers' Names	dd.	1st salary	rank exp	years in rank	operators continuity	rank wet experience	chemicals wet experience	tankers wet experience	Exp. Years	C1 on-sign	C1 off-sign
1											
2		next ctr.	\$12.500	0,58	0,3	0,3	0,9	0,9		09.06.10	28.08.10
3			27.10.10							15.01.10	28.08.10
4										09.06.10	28.08.10
5	chief engineer (>3000kw)	05.12.2007								15.01.10	03.04.10
6										11.05.09	25.08.09
7										11.05.09	25.08.09

3.3. Matrix of crew change

In the Matrix of crew change it is recorded the name of crew members sent on different ships, wage levels, landing on request time

period and the landing period referred in the contract and the names of the land employees that can replace those who request to return to shore. In the following figure is a screenshot of such an application.

Figure 2: Tools for maritime human resources development at organisational level – Matrix of crew change

RELIEF MATRIX	o/b	today	after cr-chg	budget	budget			
on	name on	mths	salary	salary	min.salary	max.salary		
8	Nava 1	contract = 4mth +/-1						
9	Master	20/11	5,5	1	\$12.000	\$0	\$0	\$0
10	C/O	10/02	2,8	2	\$8.500	\$0	\$0	\$0
11	2/O	10/02	2,8	3	\$4.800	\$0	\$0	\$0
12	3/O	20/11	5,5	4	\$3.700	\$0	\$0	\$0

4. Conclusions

Both at macroeconomic institutional level and at microeconomic organisational level, tools for career development prove useful for development of maritime human resources.

At first appearance the career development tools presented in this paper have nothing in common except their utility in developing the seafarers. The argument for choosing these two separate categories of tools is reported to the necessity to approach the development of maritime human resources in the E era in a holistic perspective, at both macro and micro levels.

Also should be taken into consideration another essential common feature like the fact that all of the described tools would not prove useful without a proper technological e-system of mass communication.

The European Framework for Safeguarding Financial Stability

Ionescu Cristian

Academy of Economic Studies – Faculty of Economics, Bucharest
cristian.ionescu@economie.ase.ro

Abstract

Financial stability, as a result of the recent financial crisis, has become one of the most debated issues in the economic and political environments. Therefore, this paper aims to analyze the concept of financial stability within the European Union, describing the actual supervisory structure and emphasizing the need for changes related to new supervisory arrangements and new institutional mechanisms, in order to protect and maintain financial stability over longer periods of time.

Keywords: financial instability, european regulatory framework,

JEL Codes: E61, F33, F36, O52,

1. Introduction

The development of a single financial market is one of the long-term objectives of the European Union, especially after the introduction of Euro. After the creation of the European Central Bank, one remained issue was the optimal structure of financial supervision in the single financial market. In order to support the European financial integration and to preserve financial sector resiliency, it is necessary a high degree of coordination of regulatory and supervisory actions.

Some of the initiatives regarding a more regulatory and supervisory coordination among member states are: a) on the *regulatory* side, the establishment of the Lamfalussy framework, which aims to speed up the legislative process governing the European financial system, providing more uniform and better technical regulation, and facilitating supervisory convergence in support of financial integration and stability; and b) on the *supervisory* side, the establishment of supervisory colleges in

charge of monitoring large cross-border groups.

The negative effects of the current financial crisis on European Union members' countries induced the necessity of a more urgent coordination/centralization. There are now two main issues for regulatory and supervisory reform that must be approached: a) the expansion of the cross-institutional and cross-border scope for regulation while safeguarding constructive diversity; and b) the need for effective and coordinated supervisory actions and mechanisms.

2. The Financial Stability Challenge

“For mature financial systems, the financial stability objective may be formulated as: maintaining the smooth functioning of the financial system and its ability to facilitate and support the efficient functioning and performance of the economy” (Schinasi, 2009). In order to achieve financial stability, it is necessary the implementation of specific mechanisms that should prevent financial problems from becoming systemic and/or threatening the stability of the financial and economic system, while maintaining (or not undermining) the economy's ability to sustain growth and perform its other important functions. But this doesn't mean that all financial problems must be prevented from arising. There are two important aspects that must be emphasized: a) it is impossible for a dynamic and effective financial system to avoid market volatility and turbulence; in addition, it is impossible for all financial institutions to perfectly manage the uncertainties and risks involved in providing

financial services and enhancing financial stakeholder value; b) it is undesirable the creation and imposing mechanisms that are over-protective regarding the market stability or over-constraining regarding the risk-taking of financial institutions (these constraints

could diminish the extent of risk-taking to the point where economic efficiency is inhibited; moreover, the mechanisms of protection or insurance could, if inadequately designed and implemented, create the moral hazard of even greater risk taking).

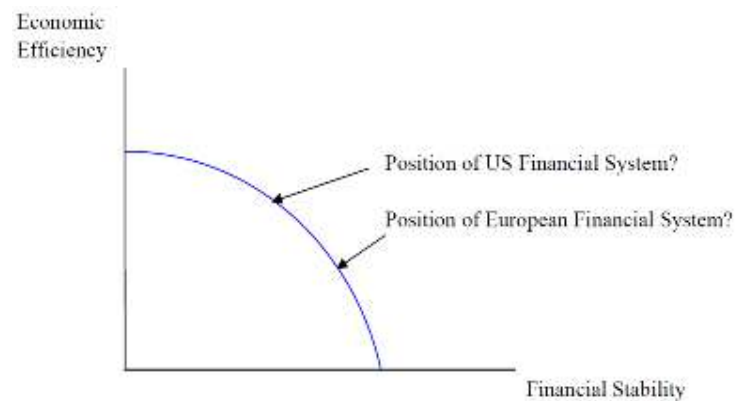

Maintaining the economy's ability to sustain growth and perform its other important functions is an important aspect of the challenge of financial stability. The achievement and maintenance of financial stability should be balanced against other and perhaps higher-priority objectives such as economic efficiency. A financial stability induced by an over-restricting financial regulatory system could decrease the probability of destabilizing asset price volatility, asset market turbulence, or individual bank failures, but this type of “stability” could also dramatically reduce the economic and financial efficiency.

3. Stability and efficiency cannot be so neatly separated

Therefore, there is an *ex ante* trade-off between achieving the economic and financial efficiency and the economic and financial stability. For example, if it taken into consideration a certain asset market, where the price is sensitive to incoming information (a feature of many asset markets), it is possible to limit the variability of the asset price by imposing restrictions in the market that would inhibit the ability of traders to price-in every small piece of information, but from a trader's and investor's perspective, such restrictions will inhibit the efficiency of the market's ability to price and allocate resources in the presence of uncertainty.

But it is possible to maintain / improve efficiency, while still allowing the financial system to innovate, evolve, and support the economic system. If the cost of this is a higher asset price volatility or capital flow volatility, the economy will choose a point along this continuum of trade-offs (figure 1a) and figure 1b)).

Figure 1a). Mature Financial System Efficiency and Stability Frontier

Figure 1b). Emerging-Market Financial System Efficiency and Stability Frontier

Source: Schinasi (2009)

4. Systemic risk in the European financial market

Taking into account the European process of integration and the resulting broader and deeper systemic inter-linkages across the European Union, there are some transmission channels that can increase the systemic risk and the probability of financial instability episodes in the European Union. The major transmission channels in the European financial market are: a) integrated money markets and other financial markets; b) integrated financial market infrastructures (payment systems; securities clearing and settlement systems and other market infrastructures: trading systems, OTC markets); c) major banks in concentrated domestic markets; d) emergence of pan-European banking groups with systemic relevance in several member states

(contagion through intra-group linkages and exposures among network of counterparties); e) centralization of business functions in banking groups; f) emergence of large and complex financial institutions with systemic relevance in several member states; g) increased foreign ownership of financial institutions and assets (Schinasi and Teixeira, 2006).

Thus, there are some sources of systemic risk and macroeconomic aspects that trigger the transmission channels that require regulatory attention: a) crises are often preceded by real estate bubbles; b) sovereign defaults pose a significant risk for the financial system; c) mispricing of assets was a major problem in the crisis and was exacerbated by mark-to-market accounting; d) mismatches in currencies can create significant problems but can be alleviated by currency swaps; e) contagion is a key concern for policy makers (Franklin, et.al., 2011).

5. Existing Framework for Safeguarding Financial Stability and the Ongoing European Debate

The European Unions’ institutional architecture for financial crisis management and resolution reflects three principles: *decentralization*, *segmentation*, and *cooperation*.

Regarding the *decentralization* principle, the crisis management that seeks financial stability is implemented at national level by the prudential supervisors, central banks, treasuries and deposit insurance schemes. The European Central Bank and the national central banks of the European System of Central Banks have responsibilities related to financial-stability, especially regarding the payment systems and national policies on financial stability and supervision. The lender-of-last-resort is also a national responsibility. In the euro area, national central banks provide emergency liquidity assistance (although they do not have any more monetary-policy (as opposed to monetary-operations) responsibilities).

Regarding the *segmentation* principle, financial stability functions are *segmented* across sectors. Prudential supervision is implemented by single (cross-sector) supervisory authorities and national central

banks and, in some cases, is shared between the central bank and the supervisor. The prudential framework followed by supervisors is largely harmonized by the European Union’s legislation, but the European Union’s directives that harmonize the European financial sector couldn’t create a strong common regulatory and supervisory framework, which had lead to a differentiation in the degree of convergence and quality of financial supervision. Supervision of banking groups and financial conglomerates is conducted separately by each of the supervisors. Thus, the coordination between supervisors requires “consolidated” and “coordinated” supervisors that have limited powers to override decisions by individual authorities. In the euro area, banking supervision and emergency liquidity assistance are provided by the national authorities. Although there are some harmonized elements of deposit guarantee schemes and banks’ reorganization and resolution, they are differently developed in each member state.

Regarding the *cooperation* principle, there are some *cooperation* structures that provide the necessary information between national responsibilities in order to safeguard the financial stability.

But achieving a balance between member sovereignty and financial stability in the European Union is very difficult in an integrated European financial system, because of the differences in integration (which was slower in the banking sector (retail banking) and higher in the market place (wholesale markets)).

So, are there any incentives to cooperate in order to safeguard the financial stability of the European Union? Table 1 illustrates the incentives to cooperate among national Treasuries in sharing the fiscal cost of a banking crisis depending on the systemic importance of banks both in the host and home country (María and Schinasi, 2008).

Table 1: Incentives to cooperate and the outcomes of sharing costs of resolution

	Host
Home	<i>Systemic</i>
<i>Systemic</i>	- Contagion important and incentives to cooperate - If contagion is an issue at the European Union level, then burden sharing might consider using the European Union’s private or public funds.

	Host
Home	<i>Non-Systemic</i>
<i>Systemic</i>	- Home authorities better placed to know financial situation of bank. Host has less of an incentive to cooperate with home authorities. - Reputational issues to be considered when settling burden sharing conflicts.

	Host
Home	<i>Non-Systemic</i>
<i>Non-Systemic</i>	- Minimum conflict

	Host
Home	<i>Systemic</i>
<i>Non-Systemic</i>	- No incentives to cooperate but home authorities better placed to know financial situation of banking group - Burden sharing conflicts. Most likely, burden on host country.

Source: María and Schinasi (2008)

6. The European Union’s supervisory structure

Regarding the European Union’s supervisory structure proposals, they involve the following elements:

- *Macro-prudential supervision*: the European Systemic Risk Board, composed by

the European Union’s central bank governors, with a mandate in assessing the systemic risks, in issuing financial-stability risk warnings and in recommending and monitoring the implementation of macro-prudential actions by the national supervisory authorities.

- *Micro-prudential supervision*: the European System of Financial Supervisors, composed by the European Banking Authority, the European Insurance Authority and the European Securities Authority, with a mandate in ensuring the consistency of national supervision and strengthening the oversight of cross-border entities through supervisory colleges and agreement on “a European single rule book applicable to all financial institutions in the single market”.

- *Market reform* of over-the-counter derivatives, which involves standardization and trading on platforms/clearing houses to make them more robust and transparent.

- *Raise international standards*, which include “regulation of alternative investment managers, amendments to capital requirements for trading book exposures and highly complex re-securitizations; enhanced disclosure of complex securitization exposures; bank remuneration policies (Schinasi, 2009).

7. Lines of defense against systemic risks and events

Taking into account the national, regional (European Union) and global levels, there are four mechanisms that aim to prevent the problems from occurring and/or becoming systemic and to manage them when they are systemic:

private risk management: a) financial-risk management at business-line levels; b) enterprise risk management at firm level; c) management controls at executive and senior-management; d) corporate governance at Board level; d) self-regulation via development/promotion of best business practices.

market discipline: a) sound accounting and valuation procedures for properly recording and valuing financial transactions/statements; b) timely reporting and disclosure to allow investors to assess risks; c) well functioning markets for price discovery and resource and

risk allocation; d) legal infrastructure for enforcement of financial contracts

public sector oversight: a) transparent and enforceable legal infrastructure; b) effective market regulation and surveillance; c) effective oversight of financial institutions (banks most heavily regulated/supervised; investment banks subject to SEC regulations; insurance/reinsurance lightly regulated; others institutional investors lightly regulated; unregulated activities).

crisis management and resolution mechanisms: a) deposit insurance protection to prevent bank runs; b) appropriate liquidity provision by central bank to keep markets smoothly functioning; c) lender of last resort operations to prevent market dysfunctioning and illiquid but viable financial institutions from failing; d) capital injections (private preferred to public) to maintain orderly transitions for institutions that are not viable (Schinasi, 2009).

8. New supervisory arrangements at European Union level

The financial crisis has confirmed that there is no such thing as an optimal or a superior financial supervisory structure. The taken supervisory reforms of the last 20 years (from a “single regulator” model to a “regulatory architecture by objective”) have emphasized that the regulatory and supervisory arrangements at national level provided inadequate cross-border dimensions of regulation and supervision. Within the European Union, the crisis has exposed high gaps in the allocation of supervisory tasks and the absence of rules for burden-sharing in case of crisis of a large European Union cross-border banking group. Therefore, cross-border banking, although provide high benefits, also implies great challenges for financial stability.

The European Union’s authorities are facing the financial “trilemma”: the trade-off between financial stability, national supervision and integrated financial markets. Only two of the three objectives may be achieved at the same time.

The current structure of European Union’s cross-border supervision implies a misalignment in incentives between home-country supervisors and host-country supervisors when managing a weak financial

institution. Thus, host countries are exposed to the impact of a crisis of local entities of foreign banks without adequate instruments of defense, in regard of both locally incorporated subsidiaries and local branches (which do not even have a separate balance sheet and income statement, being included in the parent company’s accounts). The vulnerability of host countries may be higher with regard to branches, since the host supervisor is unable to ascertain the real situation of the parent bank.

Home/host conflicts are increased by asymmetries in financial resources, the human capital of supervisors, the financial and legal infrastructure and the risk exposures. Risk exposure for the host country is higher when the foreign subsidiaries is large within the country, but relatively small or functionally unimportant for the parent bank and the home country, as is typically the case in small countries with a strong presence of foreign banks. The agency problem is increased by cross-border banking groups typically centralizing key corporate functions (liquidity, IT, large corporate lending).

In the situation of a crisis of a cross-border banking group, the incentives involve strong home-country bias by national supervisors, which determines a higher priority to national interests with little regard for repercussions in the host country.

9. Recommendations

Based on the European approach, there can be made some recommendations, organized using two dimensions: “policy dimension” (macro-prudential, macroeconomic - fiscal and monetary -, and resolution policies); and “decision level” (national, European Union and global): 1) applying macro-prudential tools to prevent bubbles (national macro-prudential policy); 2) monitoring the national application of macro-prudential tools, exposure to cross-border banks and overall exposures of European banking system (European macro-prudential policy); 3) risk-weights for sovereign debt (global macro-prudential policy); 4) mark-to-market rules to avoid mispricing of assets (global macro-prudential policy); 5) eliminating tax-deductibility of debt (national monetary-fiscal policy); 6)

bankruptcy regime for countries (European monetary-fiscal policy); 7) standing foreign exchange swap facilities (global monetary-fiscal policy); 8) compatible bank resolution regimes including contingent capital (national resolution framework policy); 9) European-level deposit insurance and bank resolution framework (European resolution framework policy); 10) resolution framework on bank group level with ex ante burden-sharing agreements (global resolution framework policy) (CEPR, 2011).

Regarding the bank crisis resolution, there is a trade-off between the failure of a bank with negative consequences and the injection of public funds. One main reason for this is the lack of a special resolution procedure for banks that could stop the confidence crisis from spreading and that could limit the externalities. Figure 1 illustrates two possible outcomes together with a third possibility (which is superior to both), that is available when adequate resolution procedures for banks are in place before the crisis.

Figure 1 Fiscal cost and systemic impact in resolution regimes

Source: Čihák and Nier (2009)

An effective system that aims to manage banking crises must be able to keep depositors safe and to reassure counterparties that the economy is continuous and not deranged from its functions of systemic relevance.

Abstract

Joining the European Union relied in a significant manner on implementing a reform at the public administration level, a reform that encompassed substantial changes in both central and local administration, and also in the public service in general.

We further present the European funding opportunities for developing the administrative capacity of Romania and Bulgaria. The first part of the study is an overview of the pre-accession period, and afterwards the study presents the current financial period 2007-2013, but also analyzes the implementation status of the Operational Programmes that finance the administrative reform in both countries.

Key words: reform administration european funds Romania Bulgaria

J.E.L Clasification.: H83

Pre-accession administrative reform

In the pre-accession period, the main issues of concern for Romania and Bulgaria was modernizing the public service and improving the functioning of the ministries in order to achieve the same performances achieved at this level in any other EU Member State.

Therefore, part of the PHARE financing was oriented towards the reform of the central public administration, i.e. consolidating the administrative capacity of ministries and governmental agencies with responsibilities in public office, police or customs. The available financing supported projects that elaborated procedures and trained public servants, as well as

investments in software and hardware acquisitions.

Nevertheless, we should admit that the support received through Phare financing did not have a significant impact on the reform of the public administration. The Phare Programme failed in making a notable difference in the process of providing the citizens with better public services.

On the other hand, there are Member States that can show sustainability proofs for the projects that benefited from Phare financing. The level of technical and management expertise has risen, mainly due to Phare projects, but generally speaking, the administrative capacity at our national, regional and local level is still frail.

Even though it was designed with good intentions, the main reason why Phare did not have the expected results was that this type intervention came rather late, in 2002.

In 2006, the European Commission stated in the country report for Romania that the reform of the public administration had made some progress, underlining the important role the General Secretariat of the Romanian Government played in elaborating the strategic planning methodology for the public institutions, along with elaborating the evaluation methodology of the public policies impact.

Continuing the administrative reform in Romania

The reform did not end in 2006. The National Strategic Reference Framework (NSRF) 2007 – 2013 – the document that reflected the national priorities in achieving the objectives set by the Lisbon Strategy – presented the great importance Romania put on developing an efficient administrative capacity. One of the 5 thematic priorities of

the NSRF is precisely the development of the administrative capacity during the 7 years of the financial programming period.

The NSRF presents the fact that the **administrative capacity of Romania is insufficient**, statement echoed by the *underperforming management structures, unsatisfying abilities of the public servants, improper institutional cooperation, facts that lead to poor public services, thus endangering the socio-economic development*. Moreover, the document reflects the necessity to a continuous consolidation of European funds management to ensure the efficient spending of such grants with the aim of achieving social and economic well-being.

Romania needed to continue improving its public management, and, as a consequence, the Administrative Capacity Development Operational Programme (ACD OP) 2007 - 2013 was designed. ACD OP is exclusively financed from the European Social Fund.

The Programme is administered by the Management Authority for the ACD OP, a structure of the Administration Ministry.

The programme's beneficiaries are the central and local administration, the higher education institutions in partnership with public authorities and the NGO's with relevant activities for the administration, in partnership, as well, with public authorities.

The projects submitted in the 6 years of existence of ACD OP contribute the *“improvement of the policy formulating processes, public management, development of a modern, flexible and reactive public office system, along with improving the quality and efficiency standards in delivering the public services”*.

ACD OP Status

For the 2007-2013 period, the financial allocation from the European Social Fund (EFS) for the ACD OP is of 208 million euros, representing 1,08% of the total structural and cohesion funds allotted to Romania.

The major interest of the authorities in the administration reform processes is visible not only because of the considerable number of projects submitted, 1317, but also by the value of these projects, of more than 32% in relation to the 2007-2013 allotted budget.

The value for the approved projects is at 116,84% of the EU allocation.

Table 1: Submitted and approved ACD OP 2007 – 2013 projects status at 31st October 2012

Projects` status	
Submitted projects	1.371
EU contribution for the submitted projects	3.080.382.947 lei
Rejected projects	764
Projects in evaluation	38
Approved projects	420
EU contribution for approved projects	1.098.168.799 lei

Source: www.fonduri-ue.ro

The 208 million euros allotted budget is contracted by 110.49%.

Table 2: Signed contracts status with ACD OP 2007-2013 financing status

Signed contracts	
Contracts and financing decisions with the beneficiaries	404
EU contribution in contracts and financing decisions with the beneficiaries	1.038.418.383 lei

Source: www.fonduri-ue.ro

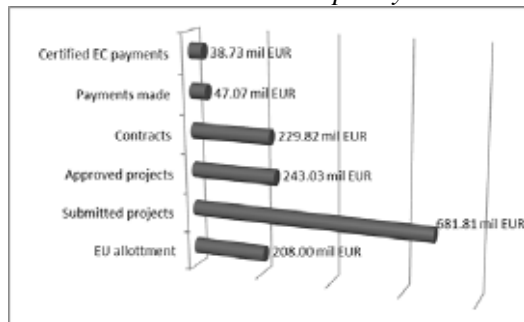

The submission of projects is at a rather good level, but the payments to the beneficiaries and the interim reimbursements from the European Commission are at an opposite one. The ACD OP absorption rate is 22,63%(as of 31st October 2012) of the financial allocation for 2007-2013 (pre-financing and reimbursements for the European Social Fund). Till the 31st October 2012, Romania claimed only 20,89% of the total sum and the EC certified only 18,62% of the sums in relation to the EU allotment(18,62% represents the real absorption rate).

Table 3: ACD OP 2007-2013 Payments status at 31st October 2012

Internal payments status	
Prefinancing	24.238.005 lei
Reimbursements from EU contribution	188.426.606 lei
Total reimbursements	224.019.584 lei
EC payments status	
Reimbursement claims	43.450.187 euro
Interim reimbursements from the EC	38.739.983 euro

Source: www.fonduri-ue.ro

Figure 1: Allotted and spent sums from the ESF by Romania for developing the administrative capacity

Source: www.fonduri-ue.ro

According to a study published by the Public Policies Institute in November 2012, the most funds were accessed for modernizing the central public administration, in comparison with the local public administration that accessed only 15% of this sum.

Figure 2: Spent sums for developing the central and local public administration

Source: The Public Policies Institute

In the next chapter, we present in brief the financing sources for reforming the public administration in another Member State:

Bulgaria finances both the administrative and the judicial systems

For 2007-2013, Bulgaria prioritizes the development of the administrative capacity and the good governance, these being the key elements for economic growth and the creation of new workplaces.

At the same time, accelerating the reforms of the state administration, by increasing transparency, will lead to the improvement of the citizen's and business environment's trust. Therefore, the Bulgarian authorities have included in the NSRF for 2007-2013 a series of activities strictly needed in order to develop an efficient state administration. For example: organizing the administrative structures, a better coordination between and within the administrative bodies, involving all stakeholders in the policies formulating process, increasing transparency in public administration, the development of human resources and ensuring efficient services for the citizens and the business environment.

The European funds destined to finance the aforementioned activities are granted from the European Social Fund through the Administrative Capacity Operational Programme 2007 - 2013. The Managing Authority for the programme is a structure of the Ministry for Finance.

The objectives of the Bulgarian programme are the equitable and open access to the services for the citizens and the enterprises and also to promote partnerships with the business environment, especially for designing policies and projects' development. Moreover, Bulgaria emphasizes on training the civil servants and the magistrates, facilitating best practices and experience exchanges, and also implementing IT&C systems within state institutions, therefore improving the services provided by state institutions through e-governance and e-justice systems.

The allotted budget from European funds to develop the administrative capacity in Bulgaria sums up to 2,30% of the structural and cohesion funds allocated to this country.

Figure 3: AC OP 2007-2013 Payments status at 30 September 2012

Information source:
<http://www.eufunds.bg/en/page/31>

As you can see in Figure 3, Bulgaria managed to sign contracts for 70,91% from the EU 2007-2013 allotment and to attract by the end of September 2012 34,39% of the EU allotment destined to improve the administrative capacity 2007-2013.

The beneficiaries of the programme are the central, regional and local authorities, judicial authorities, socio-economic partners and the NGOs.

Romania and Bulgaria are the only two Member States that designed a special OP for developing the administrative capacity.

The thematic objectives for the next financial period include the improvement of the institutional capacity and the consolidation of the public administration efficiency. The ex-ante conditions for accessing the European funds in the next 7 years is the existence of a strategy to improve the administrative efficiency of the Member States, including and reform of the administration, proving that the administrative reform will continue also in 2014-2020.

The Principle of Contradiction in Civil Trials - Communication, Persuasion, Manipulation

Marin Marilena
“Ovidius” University of Constanta,
marilenamarin@yahoo.com

Abstract

I have chosen this topic because it is an interesting one and because it has not been yet approached, as far as we know. I make reference to the fact that this topic rises, although the majority is not directly involved within the activity of the Courts of justice; this topic has a greater impact on those who are involved within the law practice- legal advisers, lawyers, judges, prosecutors.

The chosen topic is an interdisciplinary analysis of the contradiction processes at the Court of justice. Our analysis aims at aspects of civil procedural law, criminal procedural law, communication law and the right to communication, psychology and legal psychology; through this scientific event we will demonstrate the interdependence of these notions. We will make a presentation of the concepts of process, the procedure of the development of a trial; then we will relate these notions to the notions of communication, persuasion and manipulation.

Key words: trial, contradiction, communication, persuasion, manipulation

J.E.L. classification: K 41

1. Introduction

Through this paper, we will discuss and develop a topic which has never been approached until presently, from this point of view. The novelty and the importance of the proposed topic have raised the interest for practitioners.

The topic of the article has an interdisciplinary character, as it approaches apparently different notions, which, in reality, are much related to each other. We will make an interdisciplinary analysis of the contradiction processes which aims to

analyze issues of procedural, and communication law, the right to communication, and aspects of psychology and judiciary psychology.

We will also analyze the civil trial, the criminal process, the communication techniques used within the public discourse, the manifestation of information transmission skills and of persuasion skills, used in order to persuade the Court of what we call “your right” or “your justice”.

2. Romanian Law and Legal Proceedings

By approaching this topic from the viewpoint of the Romanian law, we will discuss about the procedure within the civil and the criminal trials.

The civil trial is the notice of the Court of justice by a person who states that one of his/her civil rights was violated (this person is known as the complainer) and the prosecution of this notice until the pronouncement of a Court decision.

The role of parties within civil processes is essential because they invest a court to resolve claims. Without parties and court we cannot speak about the existence of a civil trial. The position of these parties in common law procedure is contradictory.

In principle, the applicant is the person who formulates the action, chooses a procedural framework of the action, respectively, the contradictory parties, and the legal basis of the material and procedural law. The complainer chooses the court to which he/she addresses, unless the law provides otherwise, in the sense that he/she is imposed certain courts in relation to the material, territorial and personal competence of the defendant.

In support of his/her action and proof of the facts noticed to the instance, both the complainer and the defendant or any other party who intervened in the process on its

own initiative or at the initiative of the litigant parties, can invoke the exceptions and propose evidence or proof. The exceptions and, sometimes under the principle of the active role, the proof can be discussed and managed from the initiative of the Court.

In order to ensure the contradiction within the civil trial, the court has the obligation to bring all parties in discussion, under all *de facto* and *de jure* aspects on the basis of which the dispute will be resolved. Failure to observe this principle, which implicitly ensures the observance of the right to defense, is sanctioned by the nullity of the decision. As a result, both exceptions and evidence must be contradictorily discussed before the Court by the litigant parties and only afterwards the Court will take a decision regarding its administration.

Regarding the criminal trial, and here we have parties who are in contradictory judgment, in the sense that a person who feels that his/her rights are injured by a criminal act, sometimes has the discretion to formulate a criminal complaint, previous to the beginning of the criminal research - phase - or, for crimes which are strictly regulated by the law, the criminal trial can be promoted as a result of the notice "from office" of the empowered authorities.

Both in the civil and criminal trials, the statements and the requests to the Court must be proven, whether evidence or exceptions. In addition, evidence contradiction is discussed also in relation to the representative of the Public Ministry who has the obligation to supervise the criminal investigation, to directly participate to certain acts which are made during the criminal research phase and to participate in judgment meetings on criminal issues. In cases strictly determined by law, the prosecutor also participates to the trial of certain civil issues.

From our point of view, there is not too much difference between the influence of the three notions of communication, persuasion and manipulation of civil causes compared to the criminal ones. There is, however, a certain criminal "charm" that attracts the attention in particular, especially of the students during the years of study, and this charm can sometimes make a certain difference of the influence of the two types of processes.

3. European Law and Proceedings Before the ECHR

At the European level, we will analyze, in particular, the court procedure before the ECHR. The European Court of Human Rights (ECHR) has its origins in the European Convention of Human Rights in 1950, signed at Rome on 4th November, and entered into force in September 1953. The Convention represented the first collective effort in the direction of imposing and enforcing the rights stated by the Universal Convention. Initially, the Court has worked in tandem with the European Commission, but on the extent of the development of the activity between the years 1980-1990, the activity of the Court was not dependent on the Commission anymore.

The right to appeal to the European Court of Human Rights - the ECHR - is guaranteed by the Article 20 of the Romanian Constitution, according to which the constitutional provisions on the rights and freedoms of citizens will be interpreted and applied in accordance with the Universal Declaration of Human Rights, the covenants and other treaties to which Romania is a party; in the case of an inconsistency between these laws and the internal laws, the international regulations take precedence, unless the internal laws contain more favorable provisions. C.E.D.O. is not a court of control over national courts, as it cannot repeal or amend their decisions.

The individual applications may be addressed to the Court, according to the article 34 of the Convention, by any natural person, non-governmental organizations, or by any group of persons.

The procedure of a complaint addressed to C.E.D.O. has two distinct phases, namely:

The first phase when the request is examined in order to establish its admissibility or inadmissibility. If it is found inadmissible, the complaint will not be registered in order to be solved by the Court. If the complaint is found admissible, it goes to the next phase.

The second phase, in which the complaint is registered; it also includes establishing the facts, an attempt to an amiable resolution, and if this attempt fails, there will be made a report by means of which the Court will be

noticed; the latter will then pronounce a decision.

From the moment when the application was declared admissible, one of the official languages of the Court must be used, if the president does not authorize the further use of the language in which the report was done; in this case, the party who has requested the authorization has to provide for the interpretation or the translation in English or French of the spoken or written observations, and to assume the costs which result from it.

The procedure before of ECHR is contradictory and public.

The application must be completed accurately. If there are more complainers, the required information will be given for each of them, using, if necessary, a separate document. If the party designates a representative, it must be a legal adviser or lawyer, a person able to profess into one of the State parties to the Convention and to be a resident in the territory of one of these states, or to be another person agreed by the Court.

The facts constituting the grounds of the complaint must be explained clearly, concisely and in detail, aiming at the description of the events in the order in which they have occurred, mentioning the accurate data. When the facts refer to several distinct applications, each application must be presented separately. The provisions of the Convention that have been violated have to be shown as precisely as possible, or when certain encroachments in the exercise of the rights they warrant are authorized by the Convention, one should explain the reason for which it is considered that the respective encroachment was not authorized.

All resolutions and documents attached to the application must be submitted in copies; originals should not be submitted because they will not be returned. The Court cannot retain any anonymous request, or a request which is basically the same with a previous one examined by the Court, or a request which is already subject to another international court of investigation or of regulation, and if it does not contain new facts.

If the application is not filled with all necessary data, it is possible that the ECHR does not register and consider the respective request. The Court may ask the parties to

provide for any information relating to facts, documents or to other items that it considers relevant, and to invite them to provide for complementary observations in writing.

Even before deciding on admissibility, the Chamber may decide, at the request of either party, either *ex officio*, getting an audience, the parties being invited to pronounce on the main raised issues. Once it has been decided to retain an individual petition, the Court may invite the parties to provide for other items of evidence, as well as written observations. These written observations or documents can be forwarded only within the period fixed by the President of the Chamber or by the speaker-judge, and in the case when this deadline is not met, they will not be added to the file, with the exception of the case where there is a decision contrary to that of the President of the Chamber.

4. Communication, Persuasions and Manipulation

Returning to our topic, we will analyze, as I said, through the concepts of communication, persuasions and manipulation the principle of contradiction within the Court of judgment.

We can state that the development of a process represents a real art of displaying the proof in certain moments of the judgment, in relation to what it is requested in the application for the judgment call or to what it is stated during the observance formulated within the case. Even if the Romanian judicial system is not founded on the customary law, where the rhetoric and the means of verbal presentation of *de facto* situations and evidence determine the solutions that the jurymen establish, within our judicial system, the processes are judged on the basis of certain "tactics" that the parts, and in greater measure, the counselors for defense prepare them in order to convince the court about "their truth".

Here intervenes the influence of the three notions, and the part which controls them the best has the most chances for winning.

Communication means information, notice, news, report, relationship, connection; these would be the synonyms which have been offered by the explicative dictionary for the notion of communication. Although it

seems simple, the sense of communication is far more complex and full of meaning.

Communication has a lot of meanings, a lot of goals and a lot of methods of expression and manifestation. There is a concrete definition of communication, but at least it can be said that communication is the intentional transmission of data, of information.

The art to communicate is not a natural process or an ability that we are born with. We learn to communicate. This is the reason why we have to study what we learn, in order to use our knowledge more effectively. Any communication process involves creation and exchange of meanings. These meanings are represented by "signs" and "codes". It seems that people have a real need to "read" the meaning of all human actions. Observing and understanding this process can make us more aware about what happens when we communicate.

By persuasion we understand the action of convincing someone to do or to choose something, in one way or another.

The person who takes a decision often does it on the basis of other types of reasons than the logical or logical-concrete ones, being convinced of the apparent "need" or "importance" of the respective element or action.

By manipulation, we understand the action of influencing public opinion by specific means, so that the manipulated people have the impression that they act under their own ideas and interests. In reality, however, they overtake an opinion (reason, idea, evaluation etc.) that does not belong to them, but which has been induced by different means.

Manipulation is a natural human tendency (the interpersonal relationships are mostly win-loss relationships), a tendency which transfers extremely easily on the public plan, under the conditions in which the system of values that leads the social behavior has become relative.

The obsession of obtaining results at any costs also leads to questionable visions from a moral point of view (visions that nobody sanctions) at the level of the development of theories (we may exemplify by means of the

neurological-linguistic programming, which is increasingly fashionable lately, including public communication).

Practitioners can form (if they aim at it) an instinct of fairness but few are those who have the required maturity, responsibility and verticality. Sometimes values and principles are only decoratively accepted.

Manipulation also has the name of "symbolic violence", because the so-called violence occurs in an abstract way, ideally, at the psychological level, in order to determine someone to believe or to do something. Thus, knowing the de facto situation, as well as other aspects or features, we can be determined to believe what a person or a group of people proposed themselves to make us believe.

If we were asked who influenced us, we would convincingly reply: "nobody". This is the principle which manipulation is based on: our determination of not letting ourselves "tricked", of believing what we want to believe. Unfortunately, however, manipulation brings us in the situation in which we want what others have decided that it must exist, so they achieve their goals.

Thus, after we approach the topic and the established notions, and after we analyze the papers which will be presented by the participants, we will be able to achieve our purpose along with the choice of this topic.

The Intention of the Legislator and the Intention of the Parties in Contractual Matters

Marin Marilena
“Ovidius” University of Constanta,
marilenamarin@yahoo.com

Abstract

The innovative character of the proposed topic aims at the analysis of several atypical conventions, the so-called “unnamed” contracts, and the contracts “without law”, notion taken from the French law.

In the field of contracts, starting from the general theory of law and the general theory of obligations and continuing with the contractual liability in various branches of law, the legislation did not experience new normative regulations, but the evolution of juridical practice has imposed various types of atypical, unnamed contracts.

This topic has an interdisciplinary character as it approaches the notion of “contract” at the level of several branches of law, by means of mixing notions of law theory and history with notions of commercial, administrative, civil and labor law.

Key words: law, intention, contractual matter

J.E.L. classification: K 12

1. Introduction

We know about contracts and about civil contracts in particular that each of them has its specific traits, although the general theory of obligations has a series of general rules which establish the domain of contracts. We also know that the laws which regulate each contract are suppliant rules, which allow to Contracting Parties to establish together, by common agreements, the terms within the respective contracts, according to their own will. When the legislator interposes, it happens only for qualifying the type and the nature of the contract and for supplying the agreement of parties and for filling in the “gaps” within the contractual terms. This

intervention is very useful: it dispenses the parties to thoroughly decide their agreement.

The principle of contractual freedom offers the possibility and the liberty of the contractual parties to conclude whatever convention they want; they are also able to establish, by common agreements, the conclusion, the performance, the cancellation and the modification of the contract. Nevertheless the contractual freedom knows several limits established by the legislator in order to protect the parties and the third person. In this sense, the legislator has established several imperative norms which parties have to compulsorily respect.

2. Contract, law and the will of the parties

The autonomy of intention gave the possibility of the appearance of the unnamed contracts, as a special category of contracts, which are not regulated by the legislator and which are not included within the category of the usual contracts used within daily practice. The doctrine has defined the unnamed contracts as conventions concluded between the parties, which are not defined by means of special rules. At the end of this type of contract, parties can combine some specific elements of different named contracts or they can establish new elements, independent of any named contract. In these conditions, an unnamed contract will be interpreted according to the common will of the parties; when the will cannot be established, the general rules of contracts will regulate them.

A different category of contracts, that has been very little discussed within the doctrine, are the contracts outside the law, known from the French law as “*sans loi*” contracts. About these contracts, it has been thought in the sense that the parties, through their own will, have the possibility to get the contract out of the incidence of the law, and of any system of state law, and to subordinate the “legal”

relation made by them to the equity or to the universal commercial legislation.

According to another concept, that admits the subordination of the will in order to contract only to the law, the parties have the possibility to choose the suitable legal norm in order to outline the contract type and its stipulations. So, it can be stated that during the contractual activity, the autonomy of the will of contractual parts is a derived and not a primordial one, being devoted by the legal order of a determinate state.

The contract outside the law represents the result of an absolute contractual liberty. This type of contract isn't practically governed by any national legislation of positive law. In the situation of the contract without law, the will of the parties doesn't have any limits; the equivocal appears due to the lack of any original legal value; the derivate legal value is protected by the free manifestation of the will of the contractual parties.

In these conditions, the contract outside the law appears as a product of contractual autocracy that gives the possibility to the parties to create their own law, their own legal norms. At least, this type of contract may be submitted to a set of rules in which there can be included the international commercial uses known in the commercial matter as "*lex mercatoria*" which, in reality, does not exist.

3. Conclusions

As a consequence of these "considerations", some doctrinarians appreciated that, from a legal point of view, it is impossible to conceive a contract detached of any positive law; this will represent a un-law hypothesis.

Once with the appearances of the Convention of Rome, in 1980, on the law applicable to contractual obligations, that standardizes the rules of law conflicts applicable to contracts, new points of view appeared within the doctrine. Thus, it was considered that is possible to meet within the legal practice a contract detached of any positive law.

The convention also concerns the harmonization of the rules of law conflicts in the matter of obligations, family law and the conditions of matrimonial property,

successions and testaments. The main objective of these measures is to assure that a given legal situation is judged according to the material law of the same country, no matter the legal court and the EU member state where the decision is pronounced, and thus it participates at the creation of an authentic European space of justice.

Through the Regulation no. 864/2007, also called "Rome II", the Convention of Rome was changed and a normative instrument was created, an instrument on the conflict of laws for non-contractual obligations. Through this new normative act, it was given the possibility to apply several legal norms/regulations of certain de facto situations without the existence of the identity between the nationality of the norm and that of the de facto situation.

Until the emergence of the Regulation no. 864/2007, we could sustain that we met the unnamed contracts in daily legal relations, and they are governed by norms of positive law; but regarding the contracts without any law, these cannot be seen and applied in practice, as they represent only an abstract creation on which we can make a series of analysis and speculations in contractual matter. Once with the appearance of this new normative instrument, we may give other interpretations to the act of justice, in the sense of the legal regulation, in an accurate way of the potentially litigious situations.

The analysis of this category of contracts can confirm once again, if it were necessary, the importance of the legal regulations in contractual matter, in order to prevent the anarchy within the legal relations between the contractual parties and towards third persons. This means of regulation comes to complete the European legislation in order to fill in those legislative "gaps" that we talk about at the beginning of this paper.

Property Rights and Business: Institutional Constraints for Romania and EU Countries

Marinescu Cosmin
Bucharest Academy of Economic Studies
marinescu@gmail.com

Abstract

In relation to the macroeconomic paradigm of the Washington Consensus, the economics of transition disregarded, for a long period of time, both the essential significance of the institutional perspective and the preliminary need for institutional reforms. At least this is the case of several countries from Central and Eastern Europe, where the low performances of the micro and macroeconomic management are the consequences of institutional deficiencies, namely the expression of an institutional fragility. By acknowledging this fact, we are offered the possibility of interpreting the failure of economic reforms on the grounds of a vicious circle created by the institutional deficits. In this respect, the present study includes an empirical analysis dedicated to the institution of property rights and business environment, which is essentially created on the grounds of this institutional perspective.

Key words: Property Rights, Entrepreneurship, Institutions, Business Environment.

JEL Classification: D02, D23, K11, L26

1. Introduction

In the contemporary economy, the institution of property rights and entrepreneurship tend even more and more to become a subject of debate and “constructivist” interest for the modern approaches in the economic policy sphere. For instance, the desideratum for entrepreneurship encouragement that recently became almost definitory for the European economic policy agenda, especially in the actual context of economic crisis and need for economic recovery in the European Union, is well known and explicitly assumed

on every occasion. In this sense, the following can be mentioned: The Action Programme for Reducing Administrative Burdens in the European Union [1], a programme aimed at reducing the administrative burdens of businesses with approx. 25%; Smart Regulation in the European Union [2], on simplifying European legislation and reducing administrative burdens, a project meant to increase the quality of regulatory activity that would result in reducing the financial burden supported by EU firms in terms of legislative compliance; Report from the Commission to the Council and the European Parliament on minimizing the regulatory burden for SMEs and adapting EU regulation to the needs of micro-enterprises [3]; as well as various other projects, programmes and national strategies, such as The Governmental Strategy for Improving and Developing the Business Environment [4], which was based on the analysis of the Romanian business environment carried out by *Doing Business*.

Despite this “offer” (of public policies) which is generous, at least in intentions, in relation to the needs of the business environment, their sectorial implementation oftenly remained only a project, or their economic effects did not match the expected results.

2. Methodological background in the institutional analysis of the business environment

This empirical approach is conceived with the aim of analyzing the institutional quality of the business environment from the EU member states. Therefore, in order to better observe, both statically and dynamically, the disparities in the institutional quality of the business environment, I had analyzed the situation of ten countries, divided into two groups that are clearly distinguishable in

terms of institutional system and degree of economic development: the first group is comprised of five Central and Eastern European countries, while the second one contains five developed countries from the Western Europe. The Central and Eastern European group (CEE) includes Bulgaria, Estonia, Hungary, Poland and Romania, ex-socialist countries whose economies passed (or are still passing, at the level of institutional changes) through a transition process, all being relatively new EU members, while the Western European group (WE) is formed of France, Germany, Italy, Spain and United Kingdom – old EU members which are among the most developed European countries.

Moreover, in order to obtain a comprehensive image of the institutional quality of the business environment, the period of analysis includes seven years, from 2005 to 2011. On one hand, this interval was chosen taking into consideration the availability of the data and indicators included in this analysis and, on the other hand, it resulted from the need of highlighting the eventual adjustments between the pre and post-EU accession stage, at least in the case of Romania.

The institutional quality of the business environment was illustrated by calculating the Institutional Quality of the Business Environment (IQBE) indicator – an aggregate indicator that includes eight partial areas of analysis: 1) Protection of property rights; 2) Ease of doing business; 3) Contract enforcement; 4) Payment of taxes; 5) Regulatory burden; 6) Obtaining licences; 7) Corruption; 8) Institutional constraints regarding trade and investment.

But, even though the entire analysis is a much broader one, the present study aims specifically at presenting only the results that were obtained in the case of the first partial area, namely Protection of property rights. Therefore, this paper is dedicated to the institution of property rights, especially to determining the degree in which the institutional arrangement existing in each country guarantees the protection of private property.

Within the quantitative analysis, this area is going to be evaluated, for every year, by a distinctive coefficient whose value ranges between 0 and 10. All the values are based on

businessmen responses to the question “*In your country, property rights, including over financial assets are poorly defined and not protected by law (=1) or are clearly defined and well protected by law (=7)*” formulated within the *Executive Opinion Survey* conducted by *World Economic Forum*. A score of 10 points indicates a clear defining and a perfect protection of property rights, while the level 0 corresponds to the absence of any rules regarding property rights. For the period 2006-2009, the data was obtained from *Economic Freedom of the World Annual Report* [11], while the scores for 2010 and 2011 were calculated by processing the data from *The Global Competitiveness Report* [12]. As the initial values from *The Global Competitiveness Report* are measured on a different scale, they were transformed on a 0-10 scale using the following formula: $10 \times \frac{X - \min}{\max - \min}$, where X stands for the value that is going to be transformed, \min and \max being the extreme values of the initial scale (1 and 7 in this case of *The Global Competitiveness Report*).

Moreover, the average of each group is going to be calculated for every area and in every year, allowing us to draw comparisons between the two groups (CEE and WE). Calculating these averages will also offer the possibility of graphically illustrating both the evolutions recorded by each of the two groups over the entire period of time and the discrepancy that exists between Romania and these two groups.

3. Property rights as a fundamental institutional variable

The existence and the recognition of private property represent the fundamental premise of the market economy, in general. As claimed by Krkoska and Robeck [5], “the protection of property rights [...] is one of the key requirements for a proper functioning of a market economy and as such is one of the main indicators used to assess the quality of a country’s institutions”. Therefore, the institutional quality of the business environment cannot be conceived apart from the problem of property rights protection.

Even though property rights are constitutionally protected or guaranteed, their manifestation faces many “restrictions” or

difficulties in everyday life. Only when property rights are judiciously defined and efficiently protected, people will be able to really appreciate the economic values – especially the opportunity costs, according to Commander and Nikoloski [6] – being thus encouraged to invest and to take entrepreneurial risks. As stated by Sobel [7], if these solid institutions do not exist, it is more likely that the same individuals will try to manipulate the political or legislative process, in order to obtain a greater share of the already existing wealth, in an unproductive manner (for instance, by lobbying).

An institutional arrangement which insures the protection of private property will facilitate contract enforcement and commercial activities, improving firms' ability to make decisions that enhance productivity and economic performance [8].

However, in the real world the private property is not (and, in fact, it cannot be) perfectly protected and the property rights are often infringed. In this respect, the best example are the institutional constraints that arise from the political power sphere. As shown by Pyle and College [9], “state actors often undermine firms' property rights [...] directly – demanding illicit payments, or indirectly, by making capricious and nontransparent modifications to the formal economic institutions”. Such a context implies the emergence of transaction costs, those meant, for instance, to establish and maintain an exclusive control over a certain property, and who manifest whether the property is traded or not. Thus, transaction costs' evolution will be in direct correspondence with the institutional deficiencies that exist in the protection of property rights.

When the institutions are not as strong as it will be needed in order to universally guarantee the enforcement of property rights, the entrepreneurial success will rather exploit political and not economical criteria [10]. Therefore, the negative consequences will affect not only the entrepreneurial activity and the overall economic performance, but also the informal and cultural institutions, having, in the latter case, a negative impact on a much longer term.

Regarding this aspect of property rights protection, the recent (post-revolutionary)

history of Romania offers a multitude of instructive examples, which confirm the perpetuation of severe institutional deficiencies. For instance, the legislative initiatives meant to regulate the problem of the properties that were abusively confiscated during the communist regime were included quite lately among the concerns of the Romanian legislative power. Although it is obvious that the restoration of property rights cannot be possible but through the restoration of the properties confiscated since 1945, this law only solves the problem of the former owners who became state's tenants in their own houses. In the rest of cases, the state was offering compensations calculated on the basis of an arbitrarily set algorithm that could not exceed a certain amount. Due to this law, the tenants become the artificial owners of an abusively confiscated house, a fact which leads to even greater problems in accomplishing the essential objective, that of restoring property rights. Voluntarily violating an essential principle of civil law according to which the property rights are imprescriptible, the authorities created a legislation that is totally inconsistent with the legitimacy and the ethics of private property.

The decisions adopted in the mid-'90s were to generate, a decade later, serious problems in terms of property restitution. In this sense, the disputes solved only after many years and with drastic penalties by the European Court of Human Rights (ECtHR) are an eloquent example. Until the end of 2011 or, in other words, 10 years after the law on nationalized property restitution was published, only 11,5% of the requests to recover the properties abusively confiscated by communists were solved, more than a half of the requests being rejected or unsolved.

The fact that it is impossible for non-residents to own lands in Romania represents another illustrative example. According to the Law no. 54/1998, art. 3, “foreign and stateless citizens cannot obtain ownership for land” and neither the foreign legal person can obtain land in Romania through juridical acts between living persons or for cause of death, which means that foreigners need to set up companies in Romania in order to be allowed to purchase land. The Law no. 312/2005 amends this restriction, so that a non-resident which is at the same time an EU citizen can acquire ownership over land for

residences/establishments 5 years after Romania’s accession to EU (Art. 4) and can acquire ownership over agricultural land and forests 7 years after Romania’s accession to EU (Art. 5).

Therefore, in this institutional plan of property protection, EU accession imposed certain legislative adjustments, even if, *de facto*, they are not confirmed by economic or cultural evolutions in terms of property.

4. Protection of property rights: a comparative analysis for Romania and other EU countries

The values that reflect the institutional quality of the property rights area are presented, according to the time interval that was taken into consideration, in the following table:

Table 1. Protection of property rights, 2005-2011

Protection of property rights		2005	2006	2007	2008	2009	2010	2011
CEE Countries	Bulgaria	4,58	4,69	4,86	4,07	3,72	3,83	4,17
	Estonia	7,68	7,74	7,95	7,66	7,22	7,16	7,00
	Hungary	7,44	7,40	7,07	6,04	5,59	5,50	4,67
	Poland	4,58	5,01	4,93	5,42	5,98	5,83	5,67
	Romania	5,12	5,22	5,28	5,16	5,29	4,83	4,83
CEE Average		5,88	6,01	6,02	5,67	5,56	5,43	5,27
WE Countries	France	8,47	8,43	8,46	8,01	8,06	8,16	7,83
	Germany	9,61	9,45	9,18	8,78	8,54	7,83	8,00
	Italy	6,79	6,71	6,33	5,69	5,50	5,33	5,50
	Spain	7,69	7,57	7,29	6,91	6,54	6,50	6,33
	United Kingdom	9,09	8,43	7,49	7,65	7,92	8,33	8,67
WE Average		8,33	8,12	7,75	7,41	7,31	7,23	7,27

Sources: *Economic Freedom of the World Annual Report* [11]; *The Global Competitiveness Report* [12] and author’s calculations.

Over the entire period of analysis, the score obtained by Romania is lower than the CEE average, Romania’s deviation from the CEE average being, in 2011, of 0,44 points. Only Estonia is above the average over the entire period of analysis, recording, in each of all seven years, the highest score in the CEE group. The discrepancy between Romania and Estonia is, on average, approx. 2,4 points.

Compared to Bulgaria, Romania recorded higher values during the entire period, the

average difference being approx. 0,7 points. In fact, Bulgaria ranks the last in the CEE group in each of the seven years, obtaining the same score as Poland only in 2007. Moreover, since 2008, Poland also surpasses Romania, our country obtaining the second smallest score from the CEE group between 2008 and 2010.

The WE average significantly exceeds the values registered by Romania in each of the seven years, the difference being higher than 2 points in every year. Between 2005-2008 and in 2011, all the values obtained by the WE countries are higher than the CEE average, Italy being the only country whose score does not exceed the CEE average in 2009 and 2010.

Between 2005 and 2009, Germany ranks the first among the WE countries and is the country that provides the best protection of property rights of all countries taken into consideration within this study. In 2010 and 2011, its place is taken by the United Kingdom, which obtains in 2011 a score of 8,67 points. At the opposite end stands Italy, whose score is the lowest among the WE countries during the entire 7-years period.

Overall, we can infer the fact that the values observed in case of Estonia are rather closer to the WE average, its scores being considerably higher than those obtained by the rest of the CEE countries. At the same time, the discrepancy between Italy and other countries comprising the WE group is a major one, Italy’s values being rather closer to the CEE average.

In this regard, the following diagram illustrates the evolution of each group of countries as well as Romania’s position, in order to highlight the performance gaps.

Figure 1. Protection of property rights, 2005-2011

Source: author’s construction.

It can be noticed that, with the exception of the interval between 2007 and 2008 when it shows a slight decrease, the CEE average has a relatively linear evolution. At the same time, the WE average manifests a downward trend between 2005 and 2008, and a constant evolution afterward. However, there is an obvious gap between the CEE and WE groups, the average difference being of approx. 2 points.

Romania has a constant evolution between 2005 and 2008, reaching its highest value in 2009. We can also observe a slight decrease between 2009 and 2010, Romania reaching the lowest value recorded over the entire time interval – a value which remained constant until the end of the analysed period. We shall note, however, the significant difference between the averages of CEE and WE groups, as well as the discrepancy between Romania and WE average which is even a greater one.

5. Conclusions

In this analysis of the property rights institution, beyond the normative aspects imposed by the principles of the rule of law, it is easy to understand that the European statal model has gradually institutionalized the “socialization” of private property in favour of the public sector. During the last three decades, the institutional arrangement of the European welfare (redistributive) state materialized in budgetary and fiscal expansion, which continuously led to public debts and deficits. Consequently, the modest evolutions achieved in the institutional quality of the business environment need to be explained by looking at some more general patterns of the European institutional arrangement.

Abstract

One of the areas on which the global financial and economic crisis has strongly left its mark is the international trade in goods. In this context, the participation of the European Union in the international trade in the recent years has deeply declined and the prospects for the trade recovery of this group are not favorable. The maintenance of some risk factors in the world economy is the basis of the pessimistic forecasts.

This paper reflects the evolution of the export and import flows of the European Union since the years leading up to the present economic crisis as well as the factors that contributed to the decrease of the EU trade competitiveness.

Key words: European Union exports, European Union imports, sovereign debt crisis, austerity measures.

J.E.L. classification: F15, F31

1. Introduction

A consequence of the current economic crisis is the changing of the economic power relations between the states of the world. The affirmation of some emerging countries that have proven to be very skillful in fighting the crisis and the decline of others are consequences of the globalized world in which we live. The oscillations of the increases and decreases in the global demand, the intensifying of the protectionist measures adopted by some states, the estimates of the rising prices of the oil and food increase the degree of risk and uncertainty in the world economy [1].

Faced with the economic and social problems that seem to deepen from one period to another, the economy and therefore the trade of the European Union slow down, losing ground to the Asian competitors in particular. The austerity measures adopted by the majority of the Member States, which generated extensive social tensions, also reduce the purchasing power of the population and bring damage to the investment climate in the region, weakening the chances of recovery in the European trade.

Just because of maintaining these risks, the forecasts contained in the spring report of the European Commission ("European Economic Forecast"), provided to the public in April 2012, were adjusted downward to the forecasts in 2011. Thus, in the EU-27, it is projected a GDP increase of 0.0% in 2012 (compared with an increase of 0.6% mentioned in the autumn report in 2011). In the Euro zone, the GDP volume value will decrease by 0.6% in 2012, while at the level of the emerging states such as Poland, for example, the increase will be of 2.7% in 2012 (the highest increase in EU-27). Therefore, the same two-speed recovery, present in the world economy, is felt in Europe as well [2].

2. The place of the EU in the international trade in goods. The EU share reduction in the world exports

The global economic crisis perpetuated in the EU economy since 2008, the aggravated problem of the sovereign debt in the Euro zone countries, in the current period, as well as the rising unemployment led to the low participation of the EU countries in the international trade in goods. Thus, during

2004-2011, the share of this group in the world exports fell from 19.0% to about 15%. At the same time, its share in the world imports declined from 19.2% to 16%.

The most important factors leading to decreased export competitiveness of the European Union are:

- The protectionist measures applied widely by the world states and especially by the main EU trade partners: USA, China, Brazil and the Russian Federation. The tariff barriers as well as the non-tariff barriers applied to the international trade have influenced the external competitiveness of the EU exports. The monitoring reports of the International Trade Policy prepared by the World Trade Organization (WTO) show that the extra exports are hampered by the protectionist measures imposed by some countries in response to the current financial and economic crisis. These measures are inconsistent with the promises of refraining from the protectionism which the 'G20' leaders have made at the various high-level meetings. In this respect, the 11th "Global Trade Alert" report in June 2012 shows that the main trading partners of the EU have adopted about 900 types of restrictive trade barriers over the past year. These range from traditional barriers (import ban, custom duty increases, export restrictions) to sophisticated measures such as the administrative practices, less visible. The sectors most frequently affected by the protectionist measures are: food, steel products and chemicals [3];

- The competition on the foreign markets has become increasingly fierce. The companies in the EU countries are losing ground as the emerging economies of Asia are developing new competitors. However, it should be noted that the Community exporters have managed to maintain significant market share in the key sectors (incorporating average and advanced technologies), despite the high prices of the products offered, which demonstrates that the marketing, innovation and technological development policies continue allowing them to offer an attractive worldwide quality - price mix;

- The impact of the financial and economic crisis on the Community trade is significant. Reducing the industrial production and the consumption led to the

low participation of the European Union in the world trade. Also, the restriction of the trade finance has reflected negatively on the trade flows of the EU countries. Currently, the persistence of the risk factors on the developed EU economies (high unemployment, sovereign debt crisis) continues to affect the EU trade;

- The sovereign debt crisis in the Euro zone weakens the investor confidence in the business environment in the region. The social upheavals caused by the austerity measures adopted, the absence of some credible plans for the economic recovery and even the possibility of a euro zone breakup can lead to the deterioration of the investment climate.

Of the major competitors of the EU on the global market - the U.S.A., China and Japan - only China has increased significantly, in the recent years, its export market share (from 9.5% of the world exports in 2004 to 12% in 2011 however in a slight decrease from 2010, when its share in the world exports was of 13.3%) as well as the import market share (from 8.4% of the world imports in 2004 to 12% in 2011). Instead, the U.S.A., the EU and Japan have decreased their share of exports and imports in the international trade.

3. Evolution of the EU exports of goods

According to the statistics provided by Eurostat (Statistical Office of the European Union), in the period 2004-2011, the total EU exports (extra and intra) increased from 3025 billion to 4358 billion. However, the evolution of the export flows should be analyzed differently.

In the period 2004-2008 the total exports of the European Union increased from 3025 billion euros to around 4023 billion euros (increase of 1.32 times). In 2009, the total exports of the European Union amounted to 3293 billion euros, falling by 18% compared to the previous year. The pronounced decrease in the external demand recorded during 2009 led to the decrease in the volume value of the Community countries export. All the 27 EU member states recorded decreases in the export volumes in 2009 compared to 2008. For example, Germany has profoundly experienced deterioration in the global economic climate since the second quarter of 2008. The country faced a severe decline in its economic activity, considered to be the

worst economic crisis in the history of the country after the World War II. The export activity - the "engine of the German economy" - was affected in 2009 by the significant reducing of the international trade

and by the recession installing on the main export markets of Germany. Thus, the extra-export of this country fell by 17% in 2009 compared to 2008, while the intra-exports fell by 18%.

Table 1. Evolution of exports, imports and of the trade balance in the EU-27 from 2004 to 2011 (Billion euros)

	2004	2005	2006	2007	2008	2009	2010	2011
Extra-Exports	952,95	1052,72	1160,01	1240,54	1309,81	1094,41	1356,68	1553,92
Extra-Imports	1027,52	1179,56	1352,78	1433,40	1564,94	1199,19	1530,84	1713,54
Extra-EU Balance	-74,57	-126,84	-192,77	-192,86	-255,13	-104,78	-152,98	-159,62
Intra-Exports	2071,76	2214,98	2496,31	2660,15	2714,94	2194,34	2540,71	2804,13
Intra-Imports	1993,36	2140,65	2416,77	2591,68	2639,34	2126,34	2468,90	2728,09
Intra-EU Balance	78,40	74,33	79,54	68,47	75,60	68,00	71,80	76,04

Source: Eurostat 2012

In 2010, the combined exports of the EU Member States were of 3.8973 trillion euros. So, after the pronounced decrease of the exports in the European Union, in 2009, in 2010 they recorded a solid increase by about 18%, offsetting the decline in 2009. The recovery of exports in 2010 was the main engine which sustained the economic recovery in the EU [4].

In 2011, the combined exports of the EU Member States were of 4358.0 billion. The increase of only 11.8% compared to 2010 reflects the fact that the economy and hence the trade of these states continue to feel the impact of the 2008-2009 recession, of the external debt crisis and of the austerity measures adopted.

In the report published by the European Commission in May 2011 - "European Economic Forecast", there were addressed the following recommendations to the Member States:

- To do more in order to accomplish the objectives of the EU concerning the labor employment, research and development, energy efficiency, higher education and poverty reduction;
- To seek solutions for reducing the public debt, in order for the national budgets to meet the objectives set at the EU level;
- To maintain more people in employment, by increasing the retirement age and by limiting the early retirement schemes;
- To tackle the structural unemployment and facilitate the integration on the labor market of the vulnerable groups such as women and older workers;

- To reduce the early school dropout and the youth unemployment by adapting the education systems to the labor market.

According to the same experts, a major risk limiting the revival of the economic activity across the EU is to increase the deficits and the debt volume in most member countries, which will require new measures to reduce them.

In 2011 the main five exporters of the EU-27 were running 61.6% of this group. These were: Germany (24.2%), Netherlands (10.8%), France (9.8%), Italy (8.6%) and UK (8.2%).

At the level of this group of exporters, it is remarkable the evolution of the Netherlands, which since 2004 has surpassed Italy and France also, in 2008, becoming the second largest exporter in the EU-27. In 2011, this country has maintained the second position in the ranking, but its share fell compared to the previous year (11.1% in 2010). The same situation is recorded for Germany (24.6% in 2010) and France (10.1%). Italy had the same share in 2010, of 8.6% of the EU combined exports. Instead, the United Kingdom advanced in fifth position in 2011, ahead of Belgium. Thus, in 2010 the UK had a share of 7.8%, and Belgium of 8.0%, falling compared to 2011, when it registered 7.8%.

Countries, which are placed on the next four positions in 2011, belong to the Western Europe as well. These are: Belgium, Spain, Sweden and Austria. Despite the notable performances recorded by the former communist countries, members of the European Union, their combined exports

(intra and extra) represented, in 2011, only 12% of the EU-27 exports. Poland, ranked ten in the hierarchy of the Community exporters, is the group leader of the mentioned countries, its share in the total exports of the EU-27 being of 3.0% in 2011, compared to 2.4% in 2010. It is followed by the Czech Republic with 2.6% in 2011 compared to 2.1% in the previous year. In 2011, the exports of Hungary accounted for only 1.8% (1.4% in 2010) of the EU exports, those of Romania 1.4% (0.7% in 2010), while those of Slovakia 1.3% (1.2 % in 2010).

4. Evolution of the EU imports

During 2004-2011, both the intra and extra imports have increased significantly. Thus, while in 2004 their total value stood at 3.0208 trillion euros in 2011, it reached 4.4415 trillion euros. In 2009, the total imports of the EU-27 decreased by 21% compared to the previous year. If before the crisis, the EU has been a market with a high power of absorption in 2009, the low domestic demand amid the austerity measures adopted by the national governments and the rising unemployment led to the low import capacity of the Union Europe. The global trade recovery in 2010 has influenced the EU imports of goods, causing an increase of about 18%. In 2011, the combined imports of the EU-27 increased by 11.0% compared to the previous year, reaching a value of 4.4415 trillion euros. Thus, the worsening of the debt crisis in the Euro zone and the austerity measures adopted this year led to the reduced purchasing power in the EU-27.

The top five importers of the EU were running about 61% of the EU imports in 2011, reflecting a high degree of concentration of imports [5]. These were: Germany (20.2%), France (11.5%), UK (10.9%), Netherlands (9.6%), Italy (9.0%). Belgium ranks the sixth place in the hierarchy of the Community importers (representing 7.4% of the total imports) and Spain the seventh (6%). They are followed, at a great distance, by Poland (accounting for 3.3% of the total EU-27 imports in 2011) and by the Czech Republic (2.4%), being the only former communist countries with shares in the Community trade flows of above 2%. The

share of Romania, in the same year, was of 1.3%. Both the import and export flows are dominated by the countries in the Euro zone. In 2011, the share of this group of countries in the EU trade was of about 76%. The share of the post-communist states, although increasing, is quite low (24% of the EU-27 trade in 2010).

5. Conclusions

The current economic crisis has caused the strongest economic slowdown in the history of the European Union, severely affecting the economies in the Euro zone and those outside this area. It was a real challenge for this group as it revealed many structural weaknesses of the European Union. The recovery of the production and export capacity of the European countries represents, in the current economic context, one of the main measures to be taken at the European level. Bridging the gap in the competitiveness between the member countries of this group and taking action to boost the European business in order to reduce the unemployment rate should be the priorities of the governments of the Member States.

Action for Annulment and Illegality Exception Exercised before the Court of Justice of the European Union (Articles 263, 264 TFEU)

Militaru Ioana Nely

Academy of Economic Studies - Department of Law

ioanelimilitaru@yahoo.com

Abstract

Starting from the fact that, in principle, the Court of Justice of the European Union privileged applicants, namely, institutions may bring an action, we highlighted the possibility, even the exception that natural or legal persons, as appropriate, have right to initiate such action. Action for annulment exception of illegality and complementary at this level, that control the opening of the legality of acts of the European Union Court of Justice, which highlights the concern even editors EU Treaties, correct restrictions even the individuals themselves, through plea of illegality.

Keywords: action, exception, cancellation, institutional applicants, claimants individual incompetence, abuse of power.

Clasificare J.E.L.:

1. Introduction

Court 'mission is to ensure that in the interpretation and application of the Treaties "(Art. 19 par. 1 TEU) having a prominent role in the system of judicial protection established by the TEC / TFEU [1]. The concerns of the Court of Justice, Member States shall provide remedies sufficient to ensure effective legal protection in the fields covered by Union law (art. 19 par. 1 TFEU). Court is a court of original jurisdiction to complete any court constituted under any other intergovernmental organizations, while defining itself as an international jurisdiction interstate, as a constitutional jurisdiction as an administrative court as a supreme court of a federation states, even as a court of arbitration [2].

2. Action for annulment

Action for annulment is a direct action against a legislative act adopted by an institution of the Union. In this way challenging the validity of the measure and its annulment.

2. 1. Controlled acts for annulment

Acts whose legality can be controlled via the action for annulment are:

Article 263 para. 1 TFEU states "EU Court of Justice shall review the legality of legislative acts, of acts of the Council, the Commission and the ECB, other than recommendations and opinions, acts of Parliament and the European Council [3] intended to produce legal effects on third parties. Also, the ECJ to review the legality of acts of bodies, offices or agencies intended to produce legal effects against third parties.

Therefore, we believe that art. 263 para. 1 TFEU, considers all legislative and non-legislative acts having legal effects:

□ legislative acts are the acts listed in Art. 288 TFEU, ie regulations, directives, decisions, taken both by the ordinary legislative procedure (adopted by the EP and the Council together) and by special legislative procedure (adopted by the Council on the participation or participation by the Council). Are considered regulations, directives, decisions, since the legislative procedure (ordinary special) these acts may be adopted.

□ legislative acts (so named because they are not adopted by legislative procedure) provided by art. 263 TFEU are:

- Acts of the Council, the Commission and the ECB, other than recommendations and opinions, which produce legal effects against third parties;

- Acts of the European Parliament and the European Council intended to produce legal effects;

- Acts of bodies, offices or agencies intended to produce legal effects on third parties.

The TFEU, in terms of novelty, expressly provides two items that can be controlled acts under Art. 263 TFEU (action for annulment)

- Art. 271, ECJ shall have jurisdiction to review the legality of disputes by the following acts:

a) adopted by the Board of Governors of the European Investment Bank;

b) the Board of the European Investment Bank.

- According to art. 275 TFEU, the ECJ to review the legality of decisions providing for restrictive measures against natural or legal persons adopted by the Council under Chapter 2 of Title V of the TEU.

Lisbon Treaty adds to legislative acts subject to judicial review by the ECJ for annulment, and acts: the European Council, bodies, offices or agencies, which are intended to produce effects against third parties.

In principle, the economy resulting TFEU two criteria to be met by legal acts to be likely to be controlled by an action for annulment legality: come to EU institution or body (whether legislative or non-legislative acts that) [4] and to produce legal effects on third parties [5].

In the same spirit, doctrine and jurisprudence of the ECJ prior to the Lisbon Treaty with respect to TEC / TFEU and TEuratom took account both mandatory acts called - those listed in Art. 249 TEC, now 288 TFEU: regulations, decisions and directives - and unnamed binding acts [6]. Thus, during an action against a Council deliberations, the Court made a genuine principle for action for annulment "must be open to all provisions adopted by the institutions, which aims to produce legal effects [7], whatever their nature and form "therefore not only amenable to regulations, directives, decisions, but also acts that have these characteristics [8].

If the document has no legal effect, the action is inadmissible.

Also noted that the analysis of art. 263 TFEU, referring to acts whose legality can be controlled, that does not fall into this category acts Court.

2. 2. Applicants who may require control acts through its action for annulment

Plaintiffs are owners of legitimacy proceedings. There are two types of applicants: institutional (privileged) and individual (non-privileged).

institutional applicants are considered privileged since they do not have to justify any interest to act. For this interest is presumed.

According to art. 263 para. 3 TFEU privileged applicants are:

- Member States, European Parliament [9], Council and Commission may bring an action on grounds of lack of competence, infringement of an essential procedural requirement, infringement of the Treaties or of any rule of law relating to their application or misuse of power;

- Court of Auditors, the European Central Bank and the Committee of Regions for the purpose of protecting their prerogatives. Within TEuratom ECB is not entitled to bring an action for annulment;

- Each Member State, the Commission and the EIB Board. They may bring action against EIB Governing Council decisions (Article 271 lit. B TFEU)

- Member States or the Commission, only failure procedures specified in Art. 19 par. 2 and 5-7 of the Statute of the Bank (ECB).

individual applicants, considered underprivileged, are represented by any person or entity. This may appeal against:

- Acts whose recipient is or which concerns him directly and individually. For example, although the act takes the form of a regulation (without having characteristics of a regulation) [10] or a decision addressed to another person, is of direct and individual concern to the applicant;

- Regulatory act which is of direct and does not entail implementing measures.

Conditions of eligibility set out in Art. 263 TFEU are strict and were interpreted for two reasons: first, individuals are not guardians of legality (in principle they can not attack a regulation or directive) and secondly they have other means to question the validity of a Community act (except the illegality reference in examining the validity [11]).

Therefore have the capacity to act: an act to which the individual person or persons

nedestinatare, who must prove that the act of direct and individual concern them.

If the action is well founded, the Court of Justice shall declare the act concerned to be void. Annulment is retroactive pronounced by the judge, the act is considered that never existed and its legal effects made should be abolished.

However if the Court shall deem it necessary, the effects of the act to be considered as definitive (art. 264 TFEU). Institution, body, office or agency whose act has been declared void is required to take measures to comply with the judgment of the Court (art. 266 TFEU). Institution concerned has information of each cancellation, a variable discretion, but is done under the supervision of the Court [12]. The cancellation decision has *res judicata* and is enforceable against all.

Actions for annulment must be brought within two months, as appropriate, to the measure, or of its notification application or, failing that, from the date on which it came to knowledge (art. 263 para. 5 TFEU).

TFEU presents a list of resources [13] that can be claimed for the application for annulment: lack of competence [14], infringement of an essential procedural requirement [15], infringement of this Treaty or of any rule of law relating to its application [16] and abuse of power [17]

It is also worth mentioning that the analysis of art. 263 TFEU, referring to institutions that can bring actions for annulment, that does not fall into this category European Council.

It also acts setting up bodies, offices and agencies of the Union may lay down specific conditions and arrangements concerning actions brought by natural or legal persons against acts of these bodies, offices or agencies intended to produce legal effects in relation to them (art. 263 par. 6 TFEU).

□ A special case is governed by annulment Protocol. 2 on subsidiarity and proportionality, art. 8.

Thus, the ECJ has jurisdiction to rule on actions for breach of the principle of subsidiarity by a legislative act in accordance with the rules laid down in Art. 263 TFEU, the Member State and notified by them in accordance with their legal order on behalf of their national Parliament or a chamber thereof.

In accordance with the rules laid down in that Article, such action may be brought and the Committee of the Regions against legislative acts for the adoption of which TFEU provides that it be consulted.

3. Illegality exception (art. 277 TFEU, 156 TEuratom)

Individuals (natural persons and legal entities) can not challenge legal acts of the Union-normative decisions or regulations - through the action for annulment. But in making individual decisions in question respected, they can invoke the aforementioned unlawful acts indirectly through general plea of illegality of the act on which the decision was issued individual.

Thus, individuals may request not annul the basic general rule the Court only a failure to apply it on the plaintiff. Therefore, the Court can not annul the legality of which is contested act, but it inapplicable on the applicant. Illegality exception is provided for in Articles 277 TFEU and 156 TEuratom in very general terms: subject expiry deadline for action for annulment, in a dispute in which an act of general application adopted by an institution, body, office or agency Union, any party may invoke the grounds specified in Art. 263 para. 2 TFEU (lack of competence, infringement of an essential procedural requirement, infringement of this Treaty or of any rule of law relating to its application and abuse of power) to invoke before the EU Court of Justice the inapplicability of that act [18]. Text article makes no distinction Parties may rely on the exception. It can be raised by any party in proceedings in which a regulation is criminalized [19]. So may be invoked by Member States, although available for annulment of legal acts of the Union [20]. It can also be challenged regulation relates only natural for the case in which it is claimed inapplicability [21]. The Court held that the plea of illegality main function is to correct the restrictions that the action for annulment treaties imposed on individuals (to take a stand against general decisions and regulations). The Court also decided that should be taken into account "the need for a review of legality in favor of excluded persons to bring actions for annulment against acts of individual, when they are

affected by a decision application concerning them directly and individually [22] "and added that" 277 TFEU provisions are a genuine expression of a general principle, whose field of application should be widely understood. "In connection with the article in question, the Court also stated that its provisions be applied regulations themselves - acts of the institutions, which, although not as a Regulation nevertheless have effects similar and for this reason can not be attacked by other subjects of law than of institutions and Member States [23].

4. Conclusions

Exception of illegality is complementary action for annulment, given that, through this action opens the possibility and individuals, subjects under the sovereignty of Member States, to attack a general act ultimately emanating from the sovereignty [24]. The plea of illegality is merely an incidental procedure, which is imposed on another action – annulment [25], which could be raised only before the Court of Justice, given that the exception does not operate independently of pending cases [26].

- Treaty of Community law*, ed. the V, Ed C. H. Beck, Bucharest, 2006, p. 613-627.
- [14] This tool plays a fundamental role to punish acts occurred in areas covered by treaties or reserved for other than Community institutions. The Court, in a judgment said that we are in the presence of a "matter of public interest which are examined in the office" (ECJ, 10 May 1960, Germany, aff. 19/58, ECR 469). Cases of incompetence are rarely encountered in practice (ECJ, 10.05.1960, Erzeberban, aff. 3, 18, 25 et 26/58, Rec. 367). Their field of application is the same as that of the substantial forms of abuse, and applicants often base their action on the second ground (ECJ, 13. 12. 1967), Neumann, aff. 17/67, Rec. 571).
- [15] It is a "matter of public interest" (ECJ, 21.12.1954, France, aff. 1/54, Rec.9) that, contrary to experience a lack of competence development more than in French law. Fundamental rules of procedure which are not observed commonly refers to: - motivation (initially set three Community treaties: TCECO, TEC, TEuratom) and currently in: art. 296 para. 2 TFEU and Art. 162 Euratom, see Guy Isaac, Mark Blanquet, *op. cit.*, p 283; - how to vote (the procedures defined in the rules of Council - ECJ, 23.02.1988, Royaume-Uni c / Conseil, aff. 68/86 Rec. 855).
- [16] Breach of express treaty itself is concerned, infringement concerns: annexes, protocols, conventions, like other acts adopted by the Union institutions for executing treaty, for their breach also constitutes and infringement of the Treaties that define their legal force (Article 288 TFEU). The notion of "treatment" refers to primary law and secondary law and the wording "any rule of law" considers the general principles of law (recognized by Member States) or other special provisions contained in treaties.
- [17] We are an abuse of power when the administrative authority has used its powers to a purpose other than that for which these powers have been given by the Treaty (Brândușa Stefanescu, *op. cit.*, p 61). This tool is especially noted in cases of public servants Community (ECJ, 05.05.1966, Gutmann, aff. 18 et 35/65, Rec.149, 29.09.1976, Giuffrida, aff. 105/75, Rec.1395). The purpose of the act was none other than that which has been issued in a plastic forms "foreign service", see Guy Isaac, Mark Blanquet, *op. cit.*, p. 284.

Abstract

Higher education in Romania is going through a period of intensive changes based on development strategies established with the integration into the European Union. Because of the economic situation that Romania now has and the current economic crisis, the Government funds and universities own funds are virtually nonexistent. The big challenge for the higher education institutions is to align themselves to the requests of European Union through reaching the objectives that were established nationally in the development strategies based on the Bologna Process, the Lisbon Treaty and EUROPA 2020. The major problem is to finance the actions and the activities needed for reaching the objectives at the national level due to the economic crisis that affects the majority of countries.

Keywords: Romanian higher education, Lisbon Strategy, Europe 2020, National education law, public expenditure

JEL Classification Code: I210

1. Introduction

Higher education, whether we talk from public or private institutions, has always been an important priority in the public agenda because it perpetuates the creation of communities.

From a historical point of view higher education was shaped by religious, social and political pressures, the Church providing protection and privileges to teachers and students (disciples) during the rise of universities. The first universities known to

be appeared are university of Paris and University of Bologna in the 12th century, but only in the mid 1800s the purpose and function of the university was defined as "a corporation that served in disseminating knowledge" [11].

Nowdays higher education institutions are considered to be mobilizing the economic growth of a country. Tertiary education it is known to be a culture defender, an instrument that realize the collective aspirations and an engine for national economic growth. European Union talks about improving countries competitiveness by investing in innovation, research and development and educated people.

2. The Lisbon strategy

The Lisbon Strategy aim was to make the EU "the most competitive and dynamic knowledge-based economy in the world capable of sustainable economic growth with more and better jobs and greater social cohesion"[2], by 2010. It intended to deal with the low productivity and stagnation of economic growth in the EU, through the formulation of various policy initiatives to be taken by all EU member states.

The main fields were economic, social, and environmental renewal and sustainability. The Lisbon Strategy was heavily based on the economic concepts of: innovation as the motor for economic change (based on the writings of Joseph Schumpeter), the "learning economy" and social and environmental renewal.

The Lisbon strategy purpose was to create a stronger economy that would create employment in the EU, inclusive social and

environmental policies, which would drive economic growth even further.

3. Europe 2020

Europe 2020 follows the Lisbon Strategy (the period 2000-2010) and is a 10-year strategy proposed by the European Commission on 3 March 2010 that aims at "smart, sustainable, inclusive growth" with greater coordination of national and European policy.

The strategy has five main targets, which are:

- To raise the employment rate of the population aged 20–64 from the current 69% to at least 75%.
- To achieve the target of investing 3% of GDP in R&D in particular by improving the conditions for R&D investment by the private sector, and develop a new indicator to track innovation.
- To reduce greenhouse gas emissions by at least 20% compared to 1990 levels or by 30% if the conditions are right, increase the share of renewable energy in final energy consumption to 20%, and achieve a 20% increase in energy efficiency.
- To reduce the share of early school leavers to 10% from the current 15% and increase the share of the population aged 30–34 having completed tertiary from 31% to at least 40%.
- To reduce the number of Europeans living below national poverty lines by 25%, lifting 20 million people out of poverty.

This main targets are divided in seven initiatives:

- Innovation Union: to improve framework conditions and access to finance for research and innovation so as to strengthen the innovation chain and boost levels of investment throughout the Union.
- Youth on the move: to enhance the performance of education systems and to reinforce the international attractiveness of Europe's higher education.
- A digital agenda for Europe: to speed up the roll-out of high-speed internet and

reap the benefits of a digital single market for households and firms.

- Resource efficient Europe: to help decouple economic growth from the use of resources, by decarbonising the economy, increasing the use of renewable sources, modernising the transport sector and promoting energy efficiency.
- An industrial policy for the globalisation era: to improve the business environment, especially for SMEs, and to support the development of a strong and sustainable industrial base able to compete globally.
- An agenda for new skills and jobs: to modernise labour markets by facilitating labour mobility and the development of skills throughout the lifecycle with a view to increasing labour participation and better matching labour supply and demand.
- European platform against poverty: to ensure social and territorial cohesion such that the benefits of growth and jobs are widely shared and people experiencing poverty and social exclusion are enabled to live in dignity and take an active part in society.

4. National Education Law and Romanian Education System

The Romanian higher education strategy for 2007-2013 consists in directions regarding the development of higher education based on the improvement of infrastructure by attracting external funds, on growth of the importance of research and applying the research results in universities but also in the economic, social and cultural environment, internal and external evaluation of the education process, monitoring and increase the acceptance rate of students on the labour market, universities autonomy, creation of research networks, stimulation of the integration of Romanian higher education system in the European one and international cooperation through mobilizing the teachers and accessing European non-reimbursable funds that are allocated especially for these strategic directions. (Strategy for Romanian Higher Education System 2007-2013, www.edu.ro).

The law on education in Romania covers the targets regarding education established by

European Institution and by Romanian Government.

Romania’s education reform presents the next changes:

1. Synchronising education cycles with the requirements of a modern education system and the European Qualification Framework:

- reorganization of the structure of primary and secondary education: early education as ante-pre-school education (for children aged 0 - 3 years) and pre-school education (for children aged 3 to 6 years).
- the introduction of the preparatory grade in primary education.
- increasing the duration of lower-secondary education to 5 years.
- the perspective of generalization of primary and secondary education to 12 grades.

2. Modernization and decongestion of school curriculum. It desire to create a coherent curriculum framework that involves improving school programmes (curricula) by:

- reducing the amount of knowledge to be memorized by introducing the curricula based on the eight key-competences every person needs to be endowed with for personal fulfilment and development, active citizenship, social inclusion and to enter the labour market.
- reducing the number of class hours: maximum 20 class hours per week for primary education, up to 25 class hours for lower-secondary education and less than 30 class hours for upper-secondary education.
- decentralized a part of the school curriculum.
- Reorganization of students’ assessment system
- realisation of an educational portfolio, which will include all diplomas, certificates and other documents obtained following the assessment of skills acquired in formal, non-formal and informal learning frameworks.

3. Ensuring a high degree of decentralization, accountability and financing of the system through decentralization - by transferring responsibilities to the School Board of Administration and local authorities. The Law introduces the principle of “financing follows the student” by means

of which the allocation of public funds will become transparent and in line with strategic targets in education, providing the allocation of at least 6% of GDP for education chapter every year.

4. Ensuring equal opportunities to education for disadvantaged groups through equal access to education true School after school” or “Second chance” programmes.

5. Upgrading vocational education and training (VET)

- ensuring the skills acquisition, re-founding of vocational education and training schools.
- developing and supporting upper-secondary (vocational pathway) and post-secondary education.
- extending the use of credit transfer system (i.e. between upper-secondary vocational education and the post secondary education).
- providing the possibility to complete at least one vocational training programme by those low-secondary education graduates aged < 18 who have previously left school.

6. Reform of human resource policies in education:

- initial training of teachers that will include BA studies in a related qualification, a 2 years MA in teaching qualification and 1 year vocational traineeship.
- improving management quality of education institutions - only teachers who provide proof of completion of an accredited training programme in educational management will be able to occupy leadership, mentoring and control positions in education.

7. Stimulating lifelong learning through recognition and certification of skills acquired through formal, non-formal and informal education contexts.

8. Modernization of management and leadership of universities. Support, at managerial level, the course of Romanian higher education institutions towards performance and competitiveness, the law proposes a system that adds an entrepreneurial dimension to the current academic democracy.

9. Universities ranking . Higher education institutions in Romania are ranked into three

categories based on the evaluation of their curricula and institutional capacity, as follows: universities focused basically on education, universities focused on education, scientific research and artistic creation, and universities focused on advanced research and education.

10. Quality assurance in higher education. Quality education requires prioritizing higher education programmes through a process of curricula quality assessment.

11. Competitive financing and incentives for academic excellence in higher education. The universities ranking mechanism will be supported by an incentive based financing system of academic excellence.

5. Romanian Public Expenditure on Education and R&D

To meet the targets and the directions established in the development strategies for higher education, in this moment, there are three financing possibilities: allocation of funds by the Romanian Government, usage of the internal funds of the higher education institutions and, the third one would be, the structural and cohesion funds allocated by the European Union. Although the European Union allocates funds for the development of education in Romania, according to some reports on absorption of the structural and cohesion funds, provided by the management institutions, a low rate of absorption is indicated, including among the higher education institutions, leading to the necessity of establishing strategies for the absorption of funds.

6. Conclusion

Romania has made major steps towards the European Higher Education Area by reorganizing the entire higher education system. To achieve the targets set by the Europe 2020 we need to improve the quality

and increase the investments in education, vocational education and training. Also, it is necessary to increase the mobility of students and teachers to improve the quality of teaching.

In present, Romania is ranked as one of the last places in Europe in term of participation in education of young people aged 15-24 years, suggesting that youth participation in education is not being stimulated. Another problem is the overloaded curriculum, its high rigidity and does not provide graduates with practical skills and competencies.

The importance of the existence of a strategy for higher education emerges also from the Eurydice Report, Higher Education Governness in Europe – Policies, structures, funding and academic staff 2008, that promotes a strategy for higher education that must be correlated nationally with the strategy for research and development aiming to obtain autonomy for higher education institutions. To meet this objective the higher education system should attract diverse sources of funding, including partnerships with firms, partners that will finance the research and development activity in the domains they are interested in. Having financial autonomy is a fundamental aspect of the current tendencies in the higher education governness. The challenge consists in allowing institutions to develop strategic policies for achieving their own objectives but at the same time respecting the national priorities for higher education.

As can be seen from data presented in Table 1 and Table 2 the romanian average annual expenditure per pupil or students representing 21,43 % from EU average annual expenditure per pupil or students and although the public expenditure on education has an increasing trend or remains constant Romania must obtain financing sources to raise investment in education, meaning that on short-term it need to improve the absorption of European non-reimbursable funds.

Employment patterns and educational intensity of employment across EU countries: recent developments

Neagu Olimpia

“Vasile Goldiș” Western University of Arad, Romania

olimpian2005@yahoo.com

Abstract

The paper tries to identify employment patterns in the EU countries, taking into consideration the educational intensity of employment. Using EUROSTAT data, the paper presents a descriptive analysis of the distribution of skills (measured by educational attainment) and employment share by skills levels (from high to low) and by 10 groups of occupations for the EU countries. Differences in distribution of employment across occupations are analysed across EU countries and an evidence of changes in educational intensity of employment over 2000-2011 is provided. The possible patterns of employment are identified by comparing the skill distribution of jobs in each country with the basic shape of distribution in the EU as a whole. There are 4 different patterns of employment by educational level found among the European countries.

Key words: employment, skills, labour force composition

J.E.L. classification: J 21, J 24, J 82

1. Introduction

The educational intensity of employment', as introduced by Donald Williams (2010) means the distribution of employment by skill level. He conducted analysis for EU as a whole, based on data from EU-SILC and made comparisons of the EU-SILC countries with the US, a country comparable in magnitude of employment.

The concept of educational intensity of employment is related to the educational workforce composition, a favourite topic of the labour economists. There are several economists [3], [1] exploring these topics, most of them in context of jobs polarisation in the last years. Michael Peneder (2007)

used the idea and classified forty-nine manufacturing and service industries according to their educational workforce composition.

The aim of the paper is to identify the employment patterns in the EU countries, taking into consideration the educational intensity of employment over 2000-2011. The paper is organised as follows: a brief review of the current issues of employment in Europe is presented in next section. This is followed by a description of methodology and data in section 3. Estimates of distribution of employment by educational attainment in various countries of European Union are presented in section 4 and the final section is dedicated to conclusions.

2. Employment in the European Union: recent developments

Employment in most EU countries proved considerably resilient immediately after the 2008 recession, notably in light of the strong adjustment of hours worked, in some cases facilitated by the operation of government sponsored Short Term Working schemes. Labour shedding became more relevant at the end of 2009 and employment did not resume until the last quarter of 2010 [2].

The labour market deterioration following the crisis proved particularly acute in the Baltic countries, Spain, Ireland, Greece. Considerable job losses were recorded also in Bulgaria, Denmark, Portugal, Slovakia, the UK. The employment recovery is expected to follow different patterns in different countries, reflecting the current multi-speed output recovery[2].

3. Methodology of the study

The study is based on EUROSTAT data (LFS annual series) for 2000-2011. Data on employment (thousand individuals, aged 15-

64) by educational attainment (ISCED 1997 levels) and occupations (ISCO 2011) were used. As a first step, the shares of the employed population by educational attainment, for each of the 10 EUROSTAT classes of occupations (OC1-OC 10), for each EU country and at the EU level, were calculated. In the second step, taking into analysis the results in 2011, at the EU level, the data was ordered according to the level of skills (from low to high), resulting the Table 1 and Table 2.

Table 1: Shares of employed population by educational attainment and occupation (%) EU, 2011

Shares of employed population with:	OC 2	OC 1	OC 3	OC 10	OC 4	OC 5	OC 6	OC 7	OC 8	OC 9
ISCED levels 0-2	1,9	12	8,7	15	15	26	46	30	34	51
ISCED levels 3-4	16	37	53	57	63	61	48	64	62	44
ISCED levels 5-6	82	52	38	27	22	13	6,3	5,5	4,5	5,2

Table 2: Occupational classification by skill level, EU, 2011

High skilled	OC 1 Managers OC 2 Professionals
Medium skilled	OC 3 Technicians and associate professionals OC 4 Clerical support workers OC 5 Services and sales workers OC 6 Skilled agricultural, forestry and fishery workers OC 7 Craft and related trade workers OC 8 Plant and machine operators and assemblers OC 10 Armed forces
Low skilled	OC 9 Elementary occupations

Source: author's own calculations, based on EUROSTAT data

4. Main findings

Employment, skills and occupations

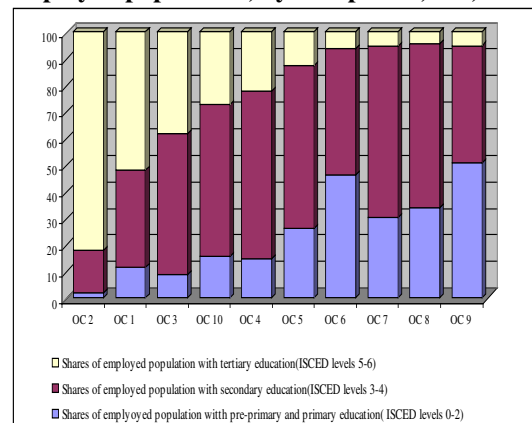

As we can see in figure 1 there are two types of occupations which concentrates the high skills (OC 2-Professionals, and OC 1 - Managers), the share of tertiary educated being 82,1 % (OC 2) and 52,9%(OC 2).

People with secondary education are prevailing in the the following classes of occupations: OC3, OC10, OC4,5,6,7,8. The share of secondary educated in the total employed people is between 47,6% and 64,4%.

People with primary education are employed predominantly in elementary occupations (OC 9) (50,8%). The ten

occupations (ISCO 2011) listed in the Table 2 were ordered according to the level of educational attainment of the workers in those occupations, resulting the following sequence, from low skilled to high skilled: OC 9, OC 8, OC 7, OC 6, OC 5, OC 4, OC 10, OC 3, OC 1, OC 2.

Figure 1: The distribution of skills in the employed population, by occupation, EU, 2011

Source: author's own calculations, based on EUROSTAT data

Figure-2: Employment shares(%) by skills level, EU, 2011

Source: author's own calculations, based on EUROSTAT data

The figure 2 reflects this ordering. Each bar represents the employment in the occupations at that skill level, as a percentage share of the total employment. The skill levels increase moving from left to right along the horizontal axis. We can observe that the employment shares are under 12% for the low skilled people. For a medium level of skills, the employment shares increase to 17%, very close to the level for the higher level of skills. For the higher skills, there are variations in the employment shares, from 6,03% to 17,77%.

Using the middle skills level as a point of reference, about 64 % of employment lies at this level in the EU countries.

The skill distribution of employment in EU as a whole can mask variations across EU countries. These are depicted in the Figure 3 where are shown by country, the mean scores of the educational level for each occupation. Calculating the mean scores for each occupation (by weighting with 1 the share of primary educated employed population, with 2 the share of secondary educated people and with 3 the share of the tertiary educated people) and ordering these scores, we obtain a sequence for each country. This sequence is compared with the above mentioned sequence at the EU level. After comparison, the EU countries are divided in four groups, reflecting a specific pattern of employment by educational attainment. First group includes countries evolving similar with the EU pattern: Belgium, France, Netherlands and United Kingdom. These countries, the secondary educated people represents around 60% of the employment. The second group consists of countries with a very small variation from the EU pattern: Czech Republic, Denmark and Spain, where In the third group are included Ireland, Greece and Italy with several variations from the EU pattern. In these countries, the share of tertiary educated people in occupations as manager, professionals is very high(80-90%). Finally, as a fourth group, Germany evolves totally different as the other EU countries, the share of tertiary educated people in occupations traditionally high skilled being lower than in other countries.

Figure 3: Employment patterns in different european countries, 2011

Source: author's own calculations, based on EUROSTAT data

Employment rates by educational attainment level

According to EUROSTAT data and generally speaking, in the European countries, the employment rate of the pre-primary and primary educated population (0-2 ISCED levels) and aged 15-64 decreased between 2000 and 2011, except Estonia, Latvia, Netherlands and Austria. Estonia and Latvia have important variations around a mean rates of 29,7% and, respectively, of 33,2%, the level in 2011 being higher than in 2000. Netherlands and Austria have a high level of employment of primary educated people (an average of 60,2%) and the variations around this level are very reduced.

The employment rate of the population with pre-primary and primary education was the lowest in Slovakia (13,3%-14,5%) and the highest in Portugal (66,8%-59,6%). The highest change in the employment rate of the primary educated people is registered in Ireland, where from 48,1% in 2000, have fallen to 35,5% in 2011, followed by Lithuania, Sweden, Romania and United Kingdom. Countries as Cyprus, Italy, France

and Slovakia are very stable in the level of the employment rate of primary educated people, with a standard deviation from the average employment rate between 0,9 and 1,2.

Starting with 2007, during the economic and financial crisis, the employment rate in Ireland fell with 13,9 percentage points, in Spain with 10,2 and in Lithuania with 10,6.

In Germany, Malta, Romania and Slovakia, the employment rate of primary educated people raised during the crisis. For example, in Germany the employment rate raised from 44,8%, in 2007 to 46,5% in 2011. In Romania the employment rate increased with 1pp annually until 2010 (from 40,3% to 43%) and fell in 2011, to 40,5%(the level of 2007)(see Appendix). In these countries, the crisis was beneficial for primary educated people.

The employment rate of secondary educated people in the European countries has values between 59%(Greece) and 79,4%(Sweden), higher than in the case of primary educated population. This is a confirmation of the fact that more educated people can easier find a job and there is an increasing demand for educated people.

In average, the European countries with the highest level of employment rate of higher educated people are: Denmark, Netherlands, Slovenia, Sweden and United Kingdom (86,3%-86,6%).

In all countries, between 2007-2011, the employment rate of the higher educated people decreased, except Germany, Luxembourg and France. Only these countries were successful in valorising their highly skilled people on the labour market. The rest of the EU countries failed in protecting their higher educated people during the crisis. For example, the employment rates fell in Greece and Estonia with 7,7-7,8 pp, in Slovakia with 6,6 pp and in United Kingdom with 4,6 pp.

Between 2000 and 2011, Ireland has an interesting evolution: until 2008 has a quasi stable employment rate around 84% and in next 3 years it fell at 70,8% (2011). Another interesting situation is Greece, where the positive dynamic is interrupted by a fall only in 2010 when other European countries (Germany or France) were out of the crisis.

5. Conclusions

The paper defines a pattern of educational intensity of employment at the EU level, in which the share of employment of low skilled can attain the level of 12% and of the medium and high skilled are very close (17,11%-17,77%)

The skill distribution of employment by occupation, in EU as a whole, shows that there are occupation educational intensive such as: professionals, managers and in the majority of occupations are employed people with secondary education.

There are different patterns in employment distribution by educational attainment and occupation across the European countries. Countries with a pattern in employment similar to the EU, as whole, are concentrating secondary educated people in occupations such as: technicians, services and sales workers, craft and related trade workers. Other countries, such as: Ireland, Spain, Greece, Denmark are interested to raise the share of tertiary educated people in professional occupations. Germany is focused to raise the share in employment of the secondary educated people.

The evolution of the employment rates by educational attainment in the last 12 years shows a general decrease for all educational levels. The financial and economic crisis brought an additional pressure on the labour markets. In all countries, between 2007-2011, the employment rate of the higher educated people decreased. Only a few European countries (Germany, Luxembourg, France) were successful in valorising their highly skilled people on the labour market.

The question for the European countries for the next years is on which position will pose the tertiary educated people? They have to solve the dilemma: more highly skilled people for top economic activities (research, TIC, innovation) or more medium skilled people dedicated to jobs (technicians in the green economy, new industries).

Considerations on the Probative Force of the Transport Document. The Implementation of the EU Legislation into the National Law

Pandele Adina Laura
Ovidius University of Constanta
The Faculty of Law, Administrative Sciences and Sociology
adinapandele@yahoo.com

Abstract

The international transport, an essential element of global economy, should be done under conditions that provide confidence to the participants in this activity, which implies the existence of an adequate legal framework. The essential legal instrument in achieving the international flow of goods is the contract of carriage, evidenced by the ascertaining certificate or by equivalent means.

Keywords: transport, contract, document, bill of lading

J.E.L Classification.: K 10

1. Introduction

The relations established between professionals are based on the idea that the person who has assumed obligations under a contract to another person will endeavor to fulfill those obligations with the utmost fairness and without prejudice to the interests of the other party. In the current regulation of the Civil Code, good faith is extended when concluding the contract, and during its execution (art.1170 Civil Code) [1].

The issue of fairness and good faith in transports regards, on the one hand, the claims and statements made by the sender to be inserted in the transport document, and, on the other hand, the carrier's correlative obligation to verify the accuracy of these statements and claims.

2. The nature of the transport document

A feature of the regulation of the contract of carriage is represented by the importance attributed to various transport documents, waybills and bills of lading.

The legislator, in the New Civil Code, taking into consideration the practice and the special legislation applicable to different modes of transport, establishes the rule that the transport document is non-negotiable.

This rule is applicable, except shipping, to all other modes of transport; road way bills, railway way bills, air way bills are non-negotiable documents. In contrast, in shipping, most often, the bills of lading are negotiable documents, "to order", transferable by the simplified procedure of the endorsement. The exception is explained by the function of security, representative of the commodity, fulfilled by the bill of lading in relation to other documents used in land and air transportation. Therefore, if any transport document is an instrument of proof, meaning that it proves the conclusion of the agreement between the parties and the freight delivered to the carrier for transportation, the bill is, in addition, a security for the transported freight.

The transmission of the bills of lading "to order" follow the rules applicable to other order papers (art.1965 Civil Code).

Regarding the content of the transport document, the new provisions of the Civil Code designate only the essential elements that are to complete the special provisions applicable to each type of transport (art.1961 paragraph 2 Civil Code).

3. The transport document is an instrument of proof

The common principle of international and national regulations is that any contract of carriage must be confirmed by a document substantiating the will of parties.

This rule is laid down in the Civil Code. The contract of carriage shall be confirmed by the transport document delivered by the shipper when rendering the goods for

transport (art.1956 of the Civil Code in conjunction with art.1961 of the Civil Code). This legal statement demonstrates that, in the transport of goods, the transport document is the instrument acknowledging the contract, its elaboration being necessary *ad probationem*.

The existence of the contract and of its provisions are not necessarily subordinate to drawing up a transport document. In this regard, the special legal provisions concerning the transport modes state that the lack, the inaccuracy or the loss of the way bill shall not affect the existence or the validity of the contract (see Art. 6.2 of CIM - Appendix B to the Convention on the International Carriage by Rail COTIF, adopted at Berne, 1980, ratified by Romania by Decree no. 100/1983, published in B. Of. no. 23/1983, as amended; Article 9, point 1 of the Convention on the Contract for the International Carriage of Goods by Road CMR, adopted at Geneva, 1956, ratified by Decree nr. 451/1997, published in the Official Gazette 145/1972 etc.).

However, the importance of a transport document is still evident.

From an administrative point of view, the existence of the transport document along with the other documents required by the legal provisions in force, allows the control of the carrier's activity. In this respect, the European regulations state that the international carriage of goods by road can be made only by those road transport operators who also have on board of their vehicle, along with the specific documents (the certified copy of the Community license, permits etc.), the transport document, respectively the CMR consignment under the CMR Convention (see the EC Regulation nr.1072/2009 on the common rules for the access to the market in the international carriage of goods by road; art. 43 of the methodological rules for the application of the provisions on the organization and carrying out of road transports, established by G.O. nr.27 / 2011).

From a civil point of view, the transport document mainly meets the role of evidence.

Regardless of the transport mode, the transport document is the evidence of the existence of a contract of carriage and of the conditions that it regulates.

The most important problem, which generates the most important legal effects, is related to the determination of the moment when the contract has been concluded. This has a great practical importance, as it marks the starting point of all the effects that the contract is to produce. This is why both the Civil Code and the provisions of special laws state that the date of the delivery of goods has to be mentioned.

The date of taking over the goods, mentioned in the transport document, plays a special role, both in the relations between the parties, and between them and third parties.

In the relationship between the parties, the date mentioned in the transport document represents the moment when the carrier's liability for the proper performance of his/her contractual obligations starts.

The date mentioned in the transport document also plays an important role for third parties, the co-contractors of the parties. Thus, in international business practices, the contract of carriage is often seen as a legal instrument required to execute a contract of sale [2].

In this situation, the issue of the transport document is of great importance both in the relations between the parties to the contract of sale, as well as between them and the carrier. Signing and issuing the transport document mark the handing over of goods, the movement of goods from the custody of the vendor or of its representatives in the custody of the carrier, the entry into force of the insurance policy of the goods that will be in transit and, in a large number of cases, the moment when the shipping fee is payable to the carrier.

From a legal perspective, the two operations are distinct, so that the carrier is not directly interested in complying with the conditions inserted in the contract of sale. But his/her interests must always regard the correctness of the information in the transport document. Generally, the liability for failure or inaccuracy of the information inserted in the transport document belongs to the sender.

Regarding its dating, and, consequently, the time of its conclusion, the liability belongs to the carrier. In this respect, it is necessary that transport documents bear the date of the actual completion of loading the goods into the transport vehicle. This rule is expressly provided for the specific legal

provisions applicable to land transport, which set the binding nature of the information referring to the date of the way bill (art. 7 point 1 CIM; art. 6 point 1, letter d, CMR Convention).

Also, in shipping, the bill of lading must bear the effective date of loading the goods and it has to be released only after the completion of loading. The United Nations Convention relating to the Carriage of Goods by Sea, adopted in Hamburg, in 1978, provides for the carrier's obligation to issue a bill of lading to the loader, on request, mentioning that the goods were loaded and specifying their loading date (known as the Hamburg Rules, the Convention was ratified by Decree no. 343/1981, published in the Official Gazette nr.95/1981).

However, this rule is not observed in all cases. The fault belongs in most cases to the loaders who fail to finish loading the goods on the ship until or at the deadline that allows them to use the bill of lading in commercial and banking transactions; therefore they insist on the issue of backdated or anticipated bills of lading. If the loader is the seller of goods, the delayed delivery may harm the buyer; therefore, in order to escape liability, he/she will be interested in getting a backdated bill of lading. This practice is listed as illegal and fraudulent; the master empowered to sign the bill of lading is liable for the false dating, and the buyer is entitled to take proceedings against him/her [3]].

The transport document is not only a proof of the agreement between the participants to the transport activity, but it also proves the taking over of the goods for transportation, their nature, quantity and apparent condition (art.1962 paragraph 3 of the Civil Code). For any inaccuracy or omission on the goods took over, entered in the transport document, the responsibility lies with the sender.

In road and air transports, the sender is responsible for all the costs and damages incurred by the carrier due to entering in the way bill incorrect, inaccurate, incomplete information or information registered elsewhere than in the place reserved for it. He/she will also respond if there has been omitted the registration of information referring to the dangerous nature of goods, or if there have not been mentioned the uniform regulations governing that transport.

Moreover, even if the carrier includes certain information in the transport document, he/she is presumed to have acted on behalf of the sender.

In maritime transport, the shipper is obliged to provide the carrier accurate data on the freight and he/she shall be liable for any loss arising from any inaccuracy of those indications; however, the carrier's right to such indemnity shall limit, in no wise, his/her liability under the shipping contract to any person other than the shipper.

4. The probative value of computerized transport documents

Traditionally, the proof of the conclusion of the contract of carriage was made in written, with the generic name of transport document.

Later, with the development of global electronic commerce, there was raised the problem of implementing the information technology in transports. In connection to this issue, the question that arises is to know the extent to which a transport document issued in electronic form should have the same probative value.

The entry into force of the New Civil Code generally resolves this problem by implicitly recognizing the possibility to conclude contracts by electronic means (art.1245, the Civil Code). In accordance with the provisions of the Civil Code, the legal status of these contracts, and of the ascertaining documents, is governed by the provisions of the special law.

The problem of ensuring an adequate and evenly legal framework, allowing to surpass the obstacles in using electronic media by professionals, was solved at European level by adopting the Directive on a Community framework for electronic signatures 1999/93/EC.

The frequent use of electronic media in various fields, the need to increase confidence in new technologies and to generally accept them, imposed the need to revise the laws in the Member States so that they do not constitute obstacles to the free movement of goods and services in the EU.

Internally, the use of electronic media, in general, and the implementation of data interchange, in particular, became possible simultaneously with the transposition into the

national law of the provisions of Directive 1999/93/EC by Law nr.455/2001 on Electronic Signatures (published in the Official Gazette nr. 429/2001). The provisions of this law now provides for the legal framework for the documents in electronic form, their conditions and probative value.

As a general rule, the law defines the document in electronic format as consisting of a series of data created electronically with a specific meaning, data to be interpreted by using appropriate software (Article 4, section 2 of Law nr.455/2001).

The need to introduce uniform provisions for the use of the information technology was also felt in the area of transports. The implementation of data exchange and the legislative solutions that ensure the principle of the free movement of goods and services involve, in time, the replacement of traditional paper documents with electronic messages. The area of transports, however, needed an adequate legislative framework that provides protection to the participants in transport activities.

The problem of finding uniform solutions in order to eliminate the legal obstacles in the development of electronic commerce has been a major concern for the United Nations Commission on International Trade Law (UNCITRAL).

In road transport, the solution proposed in order to facilitate the use of electronic data recording methods was to adopt a Protocol to the Convention on the Contract for the International Carriage of Goods by Road (CMR) concerning the electronic way bill. Under this protocol, the contracting party is able to prepare the way bill by interchanging data, provided that both parties apply a common procedure (Article 5 of the Protocol).

In rail transport, the Uniform Rules Concerning the Contract *of* International Carriage *of* Goods by Rail (CIM) provide for the possibility to draw up a way bill by electronically recording the data that can be transferred in readable signs (Article 7, Section 9).

Also, uniform air transport regulations allow the use of electronic data for recording the information on the contract of carriage (Article 4 § 2 of the Convention for the Unification of Certain Rules Relating to the

International Carriage by Air, Montreal 1999, ratified by G.O. nr.107 / 2000, published in the Official Gazette nr. 437/2000).

In accordance with the general provisions governing the matter, any electronic document has the same probative value of a written document to the extent that the recording of traditional data is associated with an electronic signature (see art. 1245 of the Civil Code in conjunction with art. 5 of Law nr. 455/2001). In this respect, there are the special provisions that assign the same justificative value to the transport document confirmed by electronic signature, regarding the contract of carriage or the delivery of goods.

In land and air transport, keeping the particularities of the documents replaced by electronic data did not raise particular problems as long as, on the one hand, those records only mean computer information, and, on the other hand, the documents are non-negotiable. The only difficulty is encountered in negotiable transport documents, used in shipping [4]. The bill of lading is a negotiable security, making it different from other transport documents used in land and air transportation, and even from the sea way bill [5].

The possibility of signing the electronic bill of lading is provided by the Hamburg Rules, if the process is not unlawful in the country where the bill of lading was issued (Article 14 point 2). Provisions relating to the electronic bill of lading are provided in documents adopted by international organizations (UNCITRAL Model Law for Electronic Commerce 1996, CMI Rules for Electronic Document Interchange, 1990). Also, the INCOTERMS Rules provide that the transport document may be replaced by an equivalent message of electronic data exchange if the parties have agreed to communicate electronically (rule A8).

The probative function of an electronic bill of lading that meets the mentioned legal requirements can not be challenged. The conclusion of a carriage contract by sea and the handing over of the freight to the carrier is similar to the way bills. In addition, compared with the transport documents used in road and air transport, the bill of lading also plays the role of security, representative of the goods; therefore, finding an equivalent in a computer system was more difficult. For

this reason, in order to ensure its negotiability, as an additional condition, there was necessary to electronically constitute a warranty of security. The legal provisions provide this solution by issuing qualified certificates by certification service providers, supported by advanced electronic signatures (see G.D. nr.1259/2001 on the technical and methodological rules for Law nr.455/2001, published in the Official Gazette nr. 847/2001, as amended). An electronic bill of lading signed with an advanced electronic signature issued on the basis of a qualified certificate may be an equivalent to the traditional bill of lading.

5. Conclusions

The contract of carriage is, in fact, an original legal instrument, as long as its existence is highlighted by the systematic use of transport documents.

Regardless of the medium used, the issue of a transport document proves (until proven otherwise) the conclusion and the conditions of the contract of carriage. In addition, it is a proof of the goods handed over to the carrier.

Abstract

In this paper, we want to present the great importance of the European Social Fund on the EU labour market, which is the main financial instrument of European Union structural actions. The European Social Fund has certain fixed objectives established rigorous enough to tackle the challenges of the Member States of the European Union. These objectives will be revealed in detail in this paper, where we try to evince their incidence on the employment growth rate also.

Key words: *European Social Fund, labour market, employment rate, social partner*

Clasificare J.E.L.: J16

1. Introduction

The European Social Fund was created by art. 123 of the Treaty of Rome “to improve employment opportunities for workers in the common market and to contribute thereby to raising the standard of living, an European Social Fund is created under the provisions that follow, whose mission is to promote within the Community the facilities of employment and geographical and professional mobility of the workers”, which through the Structural Funds reform has become a key component of promoting the economic and social cohesion. ESF is one of the EU structural funds designed to help

especially to combat unemployment, the imbalance in the labour market and to help the disadvantaged regions also, or to reduce the differences in prosperity and living standards in the Member States of the European Union. The European Social Fund is devoted to promoting employment in the European Union. It helps Member States and companies to better equip the companies and the workforce in Europe to meet the new global challenges. It is therefore a way to create more and better jobs.

The funding is spread across the regions and Member States, particularly the least economically developed, as we mentioned before. Meanwhile, the European Social Fund is a key element of the EU strategy for development and employment, with the aim of improving the lives of the EU citizens by giving them skills and better prospects for getting a job.

In the 2007-2013 period, about 75 billion euros will be allocated to regions and Member States of the European Union to achieve its goals.

The Council has indicated a number of measures that might help Member States and social partners to manage the impact of the global crisis by applying principles of flexibility.

Thus, the Council stated that it supports measures such as:

- Quick launch by the European Social Fund of further action to support employment, in particular for the most vulnerable populations, paying

particular attention to the smallest businesses by reducing non-wage labour costs;

- Mobilization for employment in the key sectors of the European economy, in particular through the European Globalisation Adjustment Fund, including through improving and accelerating its production;
- A continuous overall and significant reduction of the administrative burdens on businesses [3].

Thus, we can say that the European Union has strengthened its efforts to promote employment and social inclusion, as part of its strategy to tackle the financial and economic crisis.

The mobilization of the European Union’s funding took place through the following:

A recovery package worth 200 billion euros was announced by the European Commission in November 2008. Approximately 170 billion euros came from the budgets of the Member States and the European Union and the European Investment Bank have supplied together 30 billion euros;

- The Commission proposed to simplify the criteria for support from the European Social Fund, reprogramming costs and increasing advance payments from early 2009, so that Member States could have earlier access to up to 1.8 billion euros in to strengthen active labour market policies, reorienting support towards the most vulnerable, increased activities for skills development and, where appropriate, to choose for full funding of the Community of projects during this period;
- The Commission has suggested some changes in the European Globalisation Adjustment Fund (EGF), which was designed to support redundant workers to return to work. If accepted, the proposals will enable the EGF to interfere quickly to provide funds for training and work placement projects. The annual budget available under EGF it amounts to 500 million euros.
- The European Commission has proposed a new microfinance facility providing microcredit to small businesses and individuals who have

lost their jobs and want to start a small business.

Promoting employment was intensified also by:

- Employment Portal EURES;
- The ”New Skills for New Jobs” initiative;
- European strategy on employment;
- The Commission published a new series of monthly monitoring reports on this rapidly changing context;
- The European Commission has adopted a "shared commitment for employment".

2. European Social Fund in Romania

The European Social Fund focuses on two main areas using two operational programs "Human Resources Development", which aims to develop the human capital in Romania and "Administrative Capacity Development", which aims to improve infrastructure services and public policies.

Operational Program	Community funding (mil. EUR)	National Contribution (mil. EUR)	Total funding (mil. EUR)
Human resources development	3.476,1	613,2	4.089,4
Administrative Capacity Development	208	38	246
TOTAL	3.684,1	651,2	4.335,4

Source: European Commission

Romania receives through ESF an amount of about 3.7 million euro, meaning a total investment of about 4.3 million euro due to a national contributions of 15% of total funding, Approximately 94, 3% of these funds are for human resource development. Benchmarking with other member countries reveals that Romania ranks 10 on total allocations, being surpassed by Spain, Greece and the Czech Republic, and Poland, the clear leader in this area, with a total allocation of 3 times that of Romania. However, Romania receives more funding

for certain priorities than the EU average. Thus, to improve services and public administrations Romania receives 2 times the EU average and to support reforms to improve the quality and number of jobs receives 3 times more. For supporting the businesses and employees in order to better adapt to the changing labour market conditions, Romania receives 26%, while the European average is 18%.

A particular attention will be paid to the situation in the rural areas, given that a large percentage of the working population is living in these areas. The phenomenon of hidden unemployment and underemployment is a continuing concern and require specific actions to identify and maximize all the opportunities to integrate on long-term the unemployed persons into the labour market.

3. European Social Fund in association

European Social Fund strategy and budget are negotiated and decided by the Member States of the European Parliament and the Commission. On this basis, Member States and the European Commission schedule the operational programs for a period of seven years. Operational programs are then implemented by a number of organizations in both the private and public sectors. These organizations include national, regional and local educational and training institutions, nongovernmental organizations (NGOs) and the voluntary sector and social partners also, as trade unions and business committees, industrial and professional associations and private companies.

The cooperation with the social partners is equally important, the Commission has maintained close contact with the representatives of the employers and trade unions in order to discuss the impact of economic and financial crisis, including a high-level tripartite meeting held on 19 March 2009. However, a Report on industrial relations published by the Commission in February 2009, indicates that constructive dialogue between employers and trade unions can help the European Union to take action against the crisis.

Regarding the cooperation with the international partners, the EU has played an important role in the G20 Summit in London on 2 April 2009, which has agreed on the

international action to stimulate the economy and improve financial sector regulation. However, the Commissioner Vladimir Špidla discussed the social dimension of the crisis with his counterparts from the G8 Labour Ministers of the G8 meeting held on March 30, 2009. And the European summit in employment of 7 May 2009 strengthened efforts to promote employment and social inclusion, as a consequence of the economic crisis.

4. European Social Fund in future

The strategy for development and employment is the main EU strategy for ensuring the prosperity and well-being of the Europe and of the Europeans, now and in the future. In this context, the European employment labour strategy determines the 27 Member States to work together to increase the capacity of the Europe to create better and more jobs and to equip people with the skills to fill them, so that rigidity on labour market will be eliminated, which can affect the rating given by the credit rating agencies, being actually a two-way relationship between them, on the one hand a relatively high occupancy rate may be a factor for obtaining a good rating of the Member State and vice versa providing a low rating may increase unemployment by the fact that potential investors are reluctant to face negative economic outlook and employment will fall or at least be maintained over the short term.

In conclusion, attention should be on the most vulnerable people and on the new risks of exclusion [6].

Crisis as Opportunity for European Integration

Stanciu Miltiade

Spiru Haret University, Faculty of Marketing and International Business
miltiade_stanciu@yahoo.com

Abstract

European integration process crosses now a deep crisis caused by the complexity of the issues arising within the twenty-seven Member States which do not have yet entirely appropriate solutions, on one hand and on the other hand, by a type of inefficiency of the institutional-European management, recognized in statements by European leaders, and also by the inadequacy of the common European policy, starting, especially, from the lack of harmonization of two interests: the national interest with the community one. So, in this paper I intend to briefly summarize some of the main problems with which „ a state needs to navigate on its road to integration” and also to identify potential solutions for the crisis that the entire functional, as the European Union is called, is crossing now.

Keywords: European integration, the win-win principle, whole functional, sustainable European construction, institutional and human spiritualization.

JEL Classification, F15, A13, D73.

1. The Starting point

The integration process within the European Union involves interrelated, complex, dynamic stages taking place in a certain social, political, economic, cultural, religious, spiritual context and not only; this context involves significant chances in the candidate countries although initially the dominant philosophy of the European integration aimed especially the Single Market designing direct effects on social progress[1].

The European State which wishes to become a member of the Union, may require that, upon application to the European Council, which shall act unanimously, after

consultation the European Commission and after a favorable opinion of the European Parliament. Opinion is obtained with the absolute majority of its members. The admission requirements are subject to an Association Agreement between the EU, respectively the Member States and the applicant State. This agreement is subject to ratification by all the contracting States, in accordance with their constitutional requirements. According to the decisions taken by the European Councils in Copenhagen (1993) and Madrid (1995), a candidate state which wishes to become a Member State of the European Union must meet the following conditions:

- to demonstrate the stability of the institutions that guarantee democracy, the rule of law, human rights and which also respects and protects minorities (political criterion);

- to show the existence of a functioning market economy and the capacity to cope with competitive pressure and market forces within the Union (economic criterion);

- to convince the European bodies by their ability to assume the obligations of membership, including adherence to the aims of political, economic and monetary union (the ability to adopt the communautaire acquis);

- to be able to adapt to administrative and judicial structures, so the the EU legislation can be transposed into national legislation and to be properly implemented (administrative capacity criterion).

So, in the broader meaning of European integration process, the economic integration represents a part, mainly characterized by all measures destined to contribute to the suppression of discrimination between economic agents located in different countries[2]. Economic integration were manifested over time, in various forms, simple (areas of free trade or customs

unions) or more complex (such as monetary unions, economic union or political union).

2. From Condition to Reality

Therefore, based on those said before, I believe that the candidate countries must know before entering the Union all regulations involving their integration in good conditions (Original treaties, Treaty on European Union and all complement documents) for a detailed analysis of their situation, with respect to the conditions of accession and harmonization of national politics with the community ones so as to take into account the specifics of the candidate countries, such as: state of the economy, its ability to engage in a fierce competition with other similar economies within the Union, resources, socio-professional training, genetic heritage, education etc..

However, of particular importance for the success of the integration process is the accession process as a whole. Since at this stage the candidate state should consider, firstly, the benefits that can be obtained from integration, but also the fact that specific and economic, geographic, cultural, spiritual, political features can be recovered in better conditions. Of course that these specificities and features of the candidate state can be transformed in strenghts, from which advantageous conditions can be negotiated.

An important role in preparing the accession process has the depth analysis of: resources, production means and capabilities, qualified workforce, production of material goods taking into account the domestic and foreign markets (on negotiations). The analysis should be the basis of making new development plans for short, medium and long term, so that adapting to the requirements of the European Union will not affect anything in providing the material basis of the nation, but also the future development of that State.

The candidate countries must prepare a strategy consistent with the European Union, as far as possible and through a democratic procedure such a referendum so that public can vote for the opportunity of accession. Strategies, namely, the development plans of the countries acceding must be prepared to reduce any differences from the more developed countries of the Union. For

example, in year 2009 the indicator of serious material poverty, calculated by the European Commission vary between 32% and 1% in Luxembourg [3].

At the same time, among the main objectives, besides economic ones, must be those related to the real harmonization of income, respectively wages and pensions with the community and reducing employment.

A starting premise for analyzing the integration process is based on the fact that both effects and causes that generate them are judged differently depending on the position of the one who participates at the negotiation. The European negotiator seeks Community's interest, and the other one seeks his own interest. Harmonizing the two interests occurs throughout the pre-accession phase, which means that the negotiation should start from the win-win principle, so both parties win. Therefore, acceding states must form teams of negotiators. State negotiators must be professional, honest and patriotic, incorruptible people that know in detail the development strategies on short, medium and long term, so as to be able to support it in the future, in the period after accession.

Establishing the country's development strategy must be drawn by the best specialists in domain who know in detail the characteristics of people and by politicians, patriots. The strategy must be drawn after wide-ranging discussions on areas, counties and municipalities to take into account the views and suggestions of local communities. Negotiators must know very well the negotiating mandate in order to know what compromises need to be done when community negotiators do not agree with some parts of the developing program or when other divergent contrary to the interest of candidate states appear.

At the same time, in the post-accession in the program must be included the production of material goods and services with which the candidate state occupies one of the first places in Europe and in the world, from the point of view of quality and selling price. The post-accession program must ensure the fullest possible economic-financial-banking independence and also a political-military one and the least dependence on European Union.

Also, there should be clear provisions about the labor which must be formed by the nationals of the candidate country. At the same time, the unemployed rate must be as low as possible and it has to avoid paying the lack of work. The level of life should grow continuously and its decreasing must not be accepted no matter what the European Union claims. Once with the alignment of prices of products moving within the European Union, an alignment of salaries and pensions with the ones within the Union must be done.

Country's development has to be done in all areas using resources, means of production and local labor, as much as possible. The sector or sectors of activity set to grow in the post-accession period has/have to be in the attention of the head of the state regardless of the property. In areas where are internal and external investements and where active population has nowhere to work is better for the state to intervene in investments, directly or preferably by encouraging local investors to invest and absorb local workforce.

On the other hand, the EU developing economy as a whole must be concurrent with the economies of all member states, at least at the same time. Economic integration must become a factor of increasing competitiveness, of community capacity to use and know knowledge in the fight against limitations and uncertainties. Of its positive sides should benefit equally all countries that are members. In this sense, if countries considered undeveloped are not helped to fill the gaps between them and the stronger countries, the results will only enjoy the more developed states. The discrepancies should be reduced continuously, even at the expense of certain positions of power of developed countries. Otherwise, it will cause negative reactions, social, economic, political convulsions which gradually will move from inside to outside of those countries, undermining the economy from within the European Union, but more especially, institutional building. The crisis that included the European Union is a relevant example in this respect [4], [5], [6], [7].

This crisis has highlighted the constant need to have a policy that invests in competitiveness in Europe, in its citizens's welfare and in the quality of our environment

(...) the success of this policy if provided by a coordinated action, stated in year 2010 two senior European officials, Johannes Hahn (European Commissar for Regional Policy) and Laszlo Andor (European Commissar for Employment, Social Affairs and Inclusion) [8].

Jose Manuel Barosso admitted in year 2010 that: *in the past two years, millions of people have lost their jobs. We will have to endure many years the burden of debt caused by the crisis (...) our future will depend on the response of Europe (...) our success depends by the real implication of leaders and institutions from Europe*[9].

In other words, the president of European Commission admitted that there are disparities within the Member States, which, in fact, will affect, sooner or later, the whole called European Union.

More than that, two years later, in February 2012, European Commission published Europe's bio-economy strategy which emphasize *that Europe has to radically change its approach to production, consumption, processing, recycling and disposal of biological resources...* due to the fact *that Europe is facing an unprecedented and unsustainable exploitation of its natural resources with significant and potentially irreversible climate change... which threatens the stability of living that it depends on* [10]. And then, should we not ask ourselves about the functioning of institutional mechanism called European Union? And going forward, if European Union will not function as a whole, will appear, perhaps, on its starry blue-sky, more and more problems?

3. Crisis as an opportunity for European Institutional Change

Probably yes! In light of the above, it appears pretty clear the idea that, due to the current complexity of the European life, which carries with itself direct interdependencies but also uncertainties of meaning, the European Union is currently in a state not seen before. The special issue of the twenty-seven Member States does not correspond anymore with the one from more than fifty years ago. Differences at various levels, from social to cultural-spiritual ones between the Member States, but also the fact

that the welfare did not occur since the entry into EU structures, especially for the former communist countries and also the lack of hopeful prospects, are all concerns for European future considered as a whole [11].

And then, relatively few solutions to many European issues must relocate within the European institutional framework by making the foundation of a development for the diversity posed by the new European world. If there is a lack of diversity, the integration process cancels the meanings of life of individuals, becoming an empty shell, an utopian project that could not be put into practice. The sustainable European construction must be based on spiritual assimilation of values of integration in which people believe, think, act, live and hope [12].

If the results are not gradually materialized and are not immediately visible in each country, the integration process will depart from what the founding fathers intended to build.

At the same time, the current crisis, like George Miller said, is a crisis that man, as an intelligent and destructive human being at the same time, created: *world's most serious problems are those created by ourselves (...) they are human problems, whose solutions require changing our behavior and our social institutions* [13].

David Korten, continuing Miller's idea, said that this crisis is *essentially moral due to greed and human individualism* [14].

And then, if, in fact, the causes of current crisis must be sought elsewhere, not only in the economic world, which would be the solution for it and which will be the future of integration process? Probably a solution, with respect to the first part of the question, as other authors argue, is that through human being will spiritualize in a process of inner transformation, that can be achieved only through *effort, individual farms, concentrated effort and personal responsibility* [15].

In the words of Professor Constantin Popescu [16], the solution to the current crisis must take into account the recognition of the spiritual nature of the problem, based on behaviors like „Us Against Them”, tearing the harmony between man and others and between them and the natural environment.

Regarding the integration process I believe that it should continue, but respecting and in advantage of all involved parties. I

think that it is needed a process of European institutional spiritualization, that will lead firstly to the elimination of excessive bureaucratic process. A change in European thinking needs to be based on the whole-integrated principle, whereby each component is part of a larger whole and every action taken can positively or negatively affect all parts of the whole, in parts or in its entirety.

Otherwise, an integration process for the sake of integration is, in my opinion with other existing views, an opposite process, which can lead to bigger and bigger problems and can result in the end to an internal fracture of the whole function that I called European Union.

4. Conclusions

In conclusion, it is probably better that the crisis has come now and not later, when it may be too late to do anything to solve the deep problems of European integration.

The opportunity generated by the current crisis must not be missed, but it rather must be seized in the way of rethinking the whole process of European integration, correcting its deficiencies and, paraphrasing former Belgian Prime Minister, Guy Verhofstadt [17], it is time to lay the foundations of a new Europe. Otherwise, it is likely that after a period of time we will talk in the past about the European Union.

Clean and Secured Black Sea – a Road for European Integration

Surugiu Gheorghe
Constanta Maritime University,
gheorghe.surugiu@cmu-edu.eu

Abstract

The Black Sea area forms a vital bridge between the East and West, mostly in terms of transport and energy supplies. It is in fact a region of enormous geo-political sensitivity and latest round of enlargement of the European Union brings the EU right up to the shores of the Black Sea.

The Black Sea Region (BSR) is understood by the European institutions to reach well beyond the sea's actual shores. It includes three EU Member States, Romania, Bulgaria, Greece, and one candidate state, Turkey. It also includes Russia, Europe's major strategic partner to the East and a number of countries identified as Europe's neighbourhood: Republic of Moldova, Ukraine, Armenia, Azerbaijan and Georgia.

This paper is focused on showing regional concerns on marine environment protection and pollution prevention along with safety and security considerations in order to get a clear road of European integration with a clean and secured Black Sea.

Key words: regional concern, environment protection, pollution prevention, integration, safety and security

J.E.L. classification: R11, Q56

1. Introduction

The Black Sea is one of the most remarkable regional seas in the world. It is almost cut off from the rest of the world's seas, is over 2200 m deep and receives the drainage from a 1.9 million km² basin covering about one third of the area of continental Europe.

Its only connection to the world's oceans is through the Istanbul Strait, a 35 km natural channel, as little as 40 m deep in places. This channel has a two layer flow, carrying about 300 km³ of seawater to the Black Sea from

the Mediterranean along the bottom layer and returning a mixture of seawater and freshwater with twice this volume in the upper layer.

Every year, about 350 km³ of river water enters the Black Sea from land in over twenty countries: Albania, Austria, Belarus, Bosnia and Herzegovina, Bulgaria, Croatia, Czech Republic, Georgia, Germany, Hungary, Italy, Macedonia, Moldova, Montenegro, Poland, Romania, the Russian Federation, Serbia, Slovakia, Slovenia, Switzerland, Turkey and Ukraine. Europe's second, third, fourth and sixth largest rivers the Danube, Dniro, Don (indirectly via the Sea of Azov) and Dniester all flow to the Black Sea.

The Black Sea's catchment area is very large, with a total surface of around 2 million km², five times the surface of the Black Sea itself and a third of (non-Russian) Europe's land mass. Some of Europe's longest and largest rivers flow into the Black Sea and into the Sea of Azov, including the Danube, the Dnieper, the Southern Bug, the Dniester and the Don.

The area is inhabited by a total population of around 160 million people (BSEI, 2005). Though rather less densely populated than Western Europe, it includes some of Europe's population and industrial centres in Western and Southern Ukraine, in Russia (Rostov on Don, Krasnodar, Smolensk), in Istanbul and in central Europe (Austria and Slovakia).

The Black Sea itself covers an area of 423 000 km², not including the 37 860 km² of the Azov Sea, and its immediate coastal areas are home to about 16 million people¹ (BSEI, 2005) [7] .

The region is an economic hub, and a focus for international trade between the countries on its shores. History bears witness to the Black Sea's role in trade and therefore traffic: the ancient Greeks, the Eastern Roman (Byzantine) Empire, the Ottoman and more recently the Russian Empire have ruled

all or most of the territory surrounding the sea.

The region's natural ecosystems include forests in the West, South and East, steppes to the North, and Alpine ecosystems at higher altitudes in the Carpathians, in Anatolia and in the Caucasus.

Areas of greater natural and biological diversity within the Black Sea Region include in particular the Caucasus, Crimea, Anatolia, the Carpathian mountains, the estuary of the Danube and other wetlands. Both the Caucasus and parts of Anatolia are furthermore considered by the European Environmental Agency as “biodiversity hotspots”, because they combine a particularly rich biodiversity and an alarming rate of habitat loss [6].

2. Environment protection and the economic value of the Black Sea region's natural assets

The environmental status of the Black Sea has been the subject of major environmental concerns since the early 1990s. This has led to the signing of the Black Sea Convention in 1992.

While its vast catchment area spans much of Europe, the Black Sea is linked to the world's oceans only by the narrow passage of the Bosphorus. It is a deep sea, reaching down to more than 2000 m in places, but 87% of its volume, below 100 to 200 m in depth, is anoxic and can therefore support only a very limited range of specialized life forms.

The Danube on its own is by far the main source of nitrogen, phosphorus and suspended solids. Its nutrient load originates from agriculture and sewage running into the river and its tributaries over a vast, developed, and relatively densely populated catchment area. The nutrient discharge, which increased drastically after the 1960s, has begun to decline however.

The Black Sea's fish stock has declined drastically in recent decades. Catches dropped from a high of about 800 000 tonnes yearly for all species in 1984 to a low of 250000 t/y in 1991, causing considerable economic losses to the fishing industry in the region.

Catches have since recovered somewhat, but remain well below their earlier levels and

well below the estimated maximum sustainable yield for the Black Sea. The drop in fish stock is a result of overfishing, pollution, eutrophication and of habitat loss.

Overfishing has also altered the presence of various fishes in the Black Sea. Only five of the original 26 species of fishes which were under exploitation in the 1960s were still commercially exploited in the 1980s, as commercial fleets moved on to other species once fisheries had been exhausted.

Accidental pollution is also noted as a significant problem affecting the Black Sea, particularly oil spills, which cause considerable damage in the vicinity of ports and industrialized areas.

Waste dumping remains a problem, and discharges from both residential and industrial sites result in contamination by heavy metals, oil and derivatives, persistent organic compounds or radionuclides.

The International Maritime Organization (IMO) and the Black Sea Commission (BSC) signed an Agreement of Cooperation to increase mutual support on several environmental aspects of shipping including oil pollution preparedness, ballast water management and dumping.

The agreement was reciprocally approved by the IMO at the 26th Session of the IMO Assembly, held on 23 November - 4 December 2009, and by the Black Sea Commission during their meeting on 19-20 January 2010.

When ships unload their cargo brought from the Black Sea ports to other ports all over the world, they have to fill their ballast water tanks with sea water in order to keep their balance on their way back to the Black Sea.

It is estimated that about 3 to 10 billion tonnes of ballast water is transferred globally each year, potentially transferring from one location to another thousands of marine species that may prove ecologically harmful when released into a non-native environment. The effects of the invasive species have been devastating in many areas of the world, most notably in the Black Sea.

Being almost completely isolated from the world's oceans, the Black Sea's unique ecosystem is extremely vulnerable to the threats generated by human activities. Possibly one of the greatest of these threats is

transfer of invasive species into the Black Sea.

The Ballast Water Management Convention is comprised of measures to prevent the potentially devastating effects of harmful marine organisms carried by ships' ballast water.

It requires all ships to implement a Ballast Water and Sediments Management Plan, to carry a Ballast Water Record Book and to carry out ballast water management procedures to a given standard.

Currently there is a large project - "Environmental Monitoring of the Black Sea with Focus on Nutrient Pollution" in process of implementing [3].

The main objective of this project is to promote measures to facilitate delivery of the Black Sea Commission integrated regional monitoring and assessment products, with focus on nutrient pollution and eutrophication, including through transfer of related existing best practices from other regions, in particular the Baltic Sea.

The project consists of the following main activities [2]:

- creation of updated version of the Black Sea Information System (BSIS) in the public domain with links to European Information Systems; development of the online version of the Regional Database on Pollution; assessment of eutrophication parameters and analysis of status of data collection/reporting/use;
- elaboration of regionally agreed criteria for assessment of eutrophication; elaboration of the Black Sea reference and target concentration levels of eutrophication parameters; elaboration of a regional methodology on identification of water quality classes for eutrophication;
- Enhancing the Black Sea monitoring efforts; enhanced use of satellite observations for monitoring of eutrophication; assessment of feasibility of usage of automated systems (buoys, Ferry Boxes, automated samplers) for monitoring of eutrophication parameters in the Black Sea region, based on the experience of the Baltic region;
- development of implementation plan on setting up a modeling tool, linking background pollutants values in the Black

Sea with requirements for reducing input of pollutants.;

- transfer of best practices from HELCOM to BSC on eutrophication monitoring and assessments; organizing of a series of seminars and workshops for knowledge transfer; secretariat to secretariat exchange and mentoring

The implementation of the project will facilitate harmonization of countries' monitoring programs thus improving the regional monitoring (BSIMAP), elaboration of regional criteria for assessment of eutrophication and other pollutants.

It will be running in parallel with the Marine Strategy Framework Directive (MSFD) process providing wide possibilities for coordination and harmonization.

3. Specific aspects of maritime safety and security for the region of Black Sea

The maritime administrations of the littoral countries of the Black Sea share many common challenges associated with the adoption and implementation of international conventions related to safety and security of maritime transport and general trade.

As a strategic partner the European Commission is providing long term funding to help improve maritime safety, security and pollution prevention within the region and there are several projects under development and implementing process.

'TRACECA (Transport Corridor Europe-Caucasus-Asia)' project is one of most relevant in respect of European integration.

The project represents an opportunity for the beneficiary countries to capitalize on the international experience available from the international experts provided by the EU and, together with their national experiences develop and realize relevant maritime transport strategies and programmes, and implement "joined up" policy packages at regional and national levels in the areas of maritime safety, security management and ship pollution [1] .

The desired output of this technical assistance project is the enhancement of that knowledge and experience required by the national and regional bodies responsible for maritime safety, security and protection of the marine environment.

A further aspiration of the project is to assist the beneficiary countries in the completion of their accession to the relevant IMO conventions and to improve their implementation in a national and regional context.

The beneficiary countries have participated in a number of earlier programmes or projects related to maritime safety and security management (ISM and ISPS Codes) and pollution prevention in both the Black Sea and Caspian Sea either individually or as partners in regional programmes.

These include the following [6]:

- the “Improvement of Maritime Links between TRACECA and TENs Corridors” (Bulgaria, Georgia, Romania, Turkey, Ukraine);
- Maritime Training: Ukraine, Georgia, Azerbaijan, Kazakhstan;
- Environmental Collaboration for the Black Sea;
- Motorways of the Seas for Black Sea and Caspian Sea;
- "TACIS/2008/154-904 (EC) Motorways of the Sea (MoS) for Black Sea and Caspian Sea;
- ENPI/2008/155-683 (EC) Transport dialogue and network.

An initiative in port security management is unifying theme that affords an opportunity to deal more effectively with maritime security problems. The enhancement of existing domestic and international regimes provides an opportunity to be more effective in the fight against maritime crime [5].

As a result of ISPS Code, all ports in the Black Sea area have to comply with minimum security requirements and there is in place a large technical assistance from EU in this respect.

4. Conclusion

This article concludes that the maritime safety and security arrangements in the Black Sea region must be based – on one hand, on making use of the existing regional mechanisms and – on the other hand, on making full use of new opportunities and projects developed together with European

Commission for having ensured for the future a clean and secured Black Sea.

It also emphasizes that Black Sea marine environment protection and general maritime safety and security must rely on three principles: contribution and the will of the coastal states, effective sharing of information and common efforts on implementing and adherence to a common legislative package.

What Influences more the Entrepreneurship in European Countries: Opportunity or Necessity?

Ștefănescu Daniela
Petru Maior University of Tîrgu-Mureș
daniela.stefanescu@gmail.com

Abstract

This study aims to analyse the influence of the opportunity and of the necessity on the entrepreneurial activity in last years in European countries. In order to achieve its aim, there are used official databases related to the entrepreneurship activity measured by Global Entrepreneurship Monitor (GEM) and the main representative indicator of the economic development – growth rate of GDP per capita. In order to establish the most important factor which has the major impact to the development of the entrepreneurial activity in analysed countries, we applied Cluster Analysis, and statistical indicators and methods. According to the previous studies, there are differences between countries regarding the opportunity, respectively the necessity impact on entrepreneurial activity, thus we are focus to find if the previous conclusions are available also in the current international context, influenced by the crisis.

Key words: entrepreneurship, economic development, Cluster Analysis, opportunity, necessity

Clasificare J.E.L.: L26, O11, C38

1. Introduction

The entrepreneurship phenomenon is well represented in the literature (Cantillon, 1755[1]; Say, 1803 [2]; Marshall, 1890[3]; Knight, 1921[4]; Schumpeter, 1934 [5], 1949 [6]; von Mises, 1949 [7], Drucker, 1985 [8], Lumpkin and Dess (1996 [9]), but, in the same time, in the documents of the international institutions and organizations. This phenomenon is considered one of the most important solutions which could assure the development of the entire society. The current international economic context has

affected the national economies, in different ways, and also affected the motivations for develop the entrepreneurial activity. Under these circumstances, it is important to establish if a country in placed in the same group from the economic development level or it acts differently and also if there are different approaches to encourage the initiative to start and create new businesses.

2. Entrepreneurship and economic development

The entrepreneurship concept evolved from a period to another, based on the features of economic development. In the latest years, the concept was adapted to the new particularities of the complex economic environment, thus, Shane and Venkataraman (2000)[10] stressed that entrepreneurship includes also the study of sources of opportunities.

In the same time, international organizations have provided importance to the implication of entrepreneurship on social-economic development, and we find a significant definition of the Commission of the European Communities (2003) [11]: entrepreneurship is the mindset and process to create and develop economic activity by blending risk-taking, creativity and / or innovation with sound management, within a new or an existing organization.

One of the most recent definitions belongs to Ahmad, Nadim, and Anders N. Hoffmann (2008) [12] and Ahmad, Nadim, and Richard G. Seymour (2008) [13]. Based on their vision, entrepreneurship is the phenomenon associated with the entrepreneurial activity, i.e. the enterprising human action in pursuit of the generation of value, through the creation or expansion of economic activity, by identifying and exploiting new products, processes or markets.

We conclude this literature review with

another important definition: entrepreneurship is a multifaceted and heterogeneous activity (Audretsch and Thurik, 2001 [14]; Audretsch, 2002 [15]). Taking into consideration the wide and complex content of the entrepreneurship concept, we identified numerous correlations with other economic aspects. Thus, in this study we analyse the correlations between the entrepreneurial activity and the evolution of the considered economies, using the growth of GDP per capita. In the same time it is important to establish if the entrepreneurship activity was different influenced by opportunity or necessity in countries with similar or different economic development level. Moreover, there are influences on the economies, caused by the consequences of the current crisis.

3. Methodology

Our hypothesis is that the entrepreneurial activity was influenced different by the necessity and the opportunity, depending on the national economy development level.

In order to establish the factor that influenced most the entrepreneurial activity in the European countries considered in 2010, within the crisis period, and the main groups of countries, from the point of view of the necessity or the opportunity, we applied a method of multivariate statistical analysis, respectively the Cluster Analysis. (Jaba, E., 2007) [16]. According to this method can be formed groups in such a way that objects in the same group are similar to each other, whereas objects in different groups are as dissimilar as possible (Kaufman and Rousseeuw, 1990) [17]. Taking into consideration the fact that the investigated population's size is relatively small, only 22 countries, there are used hierarchical methods of clustering. In order to evaluate the number of clusters, one may always plot the criterion used to join clusters versus the number of clusters (Timm, 2002, 534) [18]. In this paper we registered data only for 22 European countries, which presented in the Global Entrepreneurship Monitor (GEM).

Data were collected for 2010, regards three important entrepreneurship indicators analysed by GEM (Bosma N., Harding R 2007 [19]; Bosma N., Levie J. 2009 [20]; Kelley D., Bosma N., Amorós J. E., [21],

Reynolds, P.D et. al, 2002 [22]):

- the early-stage entrepreneurial activity (tea): Combining the prevalence rate of nascent entrepreneurs (people in the process of starting a new business), and new business owners;
- the necessity driven for starting an entrepreneurial activity (nec);
- the improvement driven opportunity (opp);

Taking into account the effect of the entrepreneurial activity on the countries economy we have considered, as a representative economic indicator the growth rate of GDP per capita (gdp_cap) in 2010.

Combining the entrepreneurial indicators with the economic indicators, we also analysed the correlations between the two indicators categories, and we applied the Person coefficient.

The European countries considered are those which are included in GEM data base. Since 2008, GEM divided the analyzed countries in three categories: the factor-driven economies; the efficiency-driven economies and the innovation-driven economies.

Taking into consideration the structure used by GEM, and also focusing only on the European area, the countries presented in this study belong to the categories, as follows:

- the innovation-driven economies: Belgium (BL), Denmark (DK), Germany (GM), Iceland (IC), Ireland (IRL), Greece (GR), Spain (SP), France (FR), Italy (IT), Netherlands (NE), Portugal (PR), Slovenia (SL), Finland (FL), Sweden (SWD), United Kingdom (UK), Norway (NW), Switzerland (SWD).
- the efficiency-driven economies: Latvia (LV), Hungary (HU), Romania (RO), Croatia (CR), Turkey (TK).

The data recorded have been processed by using the EXCEL and SPSS software.

4. Results

Based on the data considered, at the beginning of the study, we calculated the Pearson's coefficient in order to establish which types of correlation are between the variables. In table 1 there are the results obtained, shown that significant correlations are between the entrepreneurial indicators.

There is an important positive correlation between the early-stage entrepreneurial activity (tea) and the necessity driven for starting an entrepreneurial activity (nec), with a level of significance of 0.05, and a medium level of Person coefficient value 0,505. Another positive correlation, but stronger then the previous is between the early-stage entrepreneurial activity (tea) and the improvement driven opportunity (opp), with a level of significance of 0.01 and the value is 0.711. The early-stage entrepreneurial activity (tea) and the growth rate of GDP per capita (gdp_cap) are negatively correlated, the result of Pearson coefficient being -0.242, but it has not statistical significance.

Table 1 Correlations between variables

		tea	gdp_cap	nec	opp
tea	Pearson Correlation	1	-0,242	,505	,711
	Sig. (2-tailed)		0,278	0,016	0
	N	22	22	22	22
gdp_cap	Pearson Correlation	0,242	1	0,307	0,03
	Sig. (2-tailed)	0,278		0,164	0,9
	N	22	22	22	22
nec	Pearson Correlation	,505	-0,307	1	0,301
	Sig. (2-tailed)	0,016	0,164		0,173
	N	22	22	22	22
opp	Pearson Correlation	,711	-0,029	0,301	1
	Sig. (2-tailed)	0	0,9	0,173	
	N	22	22	22	22

Note: *. Correlation is significant at the 0.05 level (2-tailed).
**. Correlation is significant at the 0.01 level (2-tailed).

In order to create the groups of countries, we applied the hierarchical method of clustering and we obtained the data presented in table 2, which shows how the analysed elements are clustered together at each stage of the cluster analysis. The coefficients column indicates the distance between the two clusters joined at each stage. The values here depend on the proximity measure (Squared Euclidian Distance) and linkage method (Ward’s method) used in the analysis.

Aiming to obtain the cluster solution, an

important jump can be noticed in the distance coefficient, as it can be read in the table 2. The stage before the sudden change indicates the optimal stopping point for merging clusters.

Table 2 Agglomeration Schedule

Stage	Combined		Coeff.	Cluster		Next Stage
	Clus ter 1	Clus ter 2		Clus ter 1	Clus ter 2	
1	1	2	2,005	0	0	4
2	13	21	5,230	0	0	15
3	14	15	10,375	0	0	10
4	1	8	23,277	1	0	14
5	7	12	36,702	0	0	11
6	5	6	55,242	0	0	13
7	16	19	79,407	0	0	16
8	11	18	104,732	0	0	16
9	3	9	130,637	0	0	11
10	14	20	160,945	3	0	14
11	3	7	194,435	9	5	17
12	10	17	235,260	0	0	18
13	4	5	291,333	0	6	18
14	1	14	350,820	4	10	20
15	13	22	430,662	2	0	17
16	11	16	537,672	8	7	20
17	3	13	685,345	11	15	19
18	4	10	916,403	13	12	19
19	3	4	1314,549	17	18	21
20	1	11	1853,127	14	16	21
21	1	3	4170,884	20	19	0

Thus, from this data we can conclude there are formed 2 clusters, taking into consideration the fact that the sudden jump is registered at the last stage.

The result shown by the data from table 2, can be confirmed and it has a better visualization of this criterion based on the plot of agglomeration schedule coefficients is presented in figure 1.

Fig1 The agglomeration schedule coefficients plot

As it can be seen in figure 1, the curve indicates also that will be formed to clusters for the data used. The cluster method shows as well the number of cases from each formed group, as it can be seen in table 3.

Table 3 Number of Cases in each cluster

Cluster	1	12,000
	2	10,000
Valid		22,000
Missing		,000

The data from table 3 show that in this study, Cluster 1 includes 12 countries and Cluster 2 contains 10 countries.

Taking into account that we have considered 4 variables, the way they contribute to the distribution of the countries into 2 clusters it is presented in table 4.

Table 4 Final Cluster Centers

Indicators	Cluster	
	1	2
tea	6,1	5,6
gdp_cap	,7	1,2
nec	26	12
opp	46	61

According to the data from table 4 we observe that the variable that both clusters formed are defined by the variable the improvement driven opportunity (opp), which registered the highest value. In the same time, the variable which distinguished the countries in the growth rate of GDP per capita (gdp_cap), which registered the lowest values.

Table 5 presents the cluster components, formed by the countries considered. Cluster 1 includes all the countries from the efficiency-driven economies. There are also exceptions, and in Cluster 1 we can find France, United Kingdom, Greece, Ireland, Spain, countries from the innovation-driven economies which it wasn't expected to be included in this cluster. A reason for this situation could be

based on the results obtain in 2010 by most of these countries for the growth rate of GDP per capita (gdp_cap), and also considering the economic difficulties registered during the previous years of the crisis. Cluster 2 includes only countries from innovation-driven economies, most of them from the North part of Europe, countries which were less affected by the consequences of the crisis. Thus, we can find Denmark (DK), Iceland (IC), Netherlands (NE), Norway (NW), Switzerland (SWT), Sweden (SWD), Finland (FL). Based on this structure of the clusters our initially hypothesis is partially confirmed.

Table 5 Cluster components

Countries Cluster 1	Countries Cluster 2
CR_10	BL_10
FR_10	DK_10
GM_10	FL_10
GR_10	IC_10
HU_10	IT_10
IRL_10	NE_10
LTV_10	NW_10
PR_10	SL_10
RO_10	SWD_10
SP_10	SWT_10
TK_10	
UK_10	

In order to show which variable influences more the early-stage on entrepreneurial activity (tea), we considered the variables two by two. In this way, it can be shown an expressive representation the distribution of the countries from the two clusters formed. Thus, in figure 2 it can be observed the countries distribution based on the early-stage on entrepreneurial activity (tea) and the necessity driven for starting an entrepreneurial activity (nec). According to these two variables we can notice that most of the countries from a cluster are grouped together, in the same part of the graphic. But there is an atypical situation for United Kingdom (UK) which is placed almost in the middle of the countries from cluster 2, indicating similarities with countries from the other cluster, being placed close to

Netherlands (NE) and Norway (NW). It can be noticed that in the Cluster 1 case, there are very close two countries with a different level of economic development, such as Germany, Spain and Romania. They are similar at the level of early-stage of the entrepreneurial activity (tea), but they level differ at the necessity driven for starting an entrepreneurial activity (nec). The countries from Cluster 2 are placed on the left part of the graphic, all of them being part of the innovation-driven economies; meanwhile most of the countries from Cluster are placed on the right part. This situation is explainable based on previous studies which have been shown that in the efficiency-driven economies are more influenced by the necessity to start a new business. This could explain the position of United Kingdom which belongs to the Cluster 1, but on the graphic is placed with countries from the innovation-driven economies.

Fig 2 Entrepreneurship and necessity

In the figure 3, we present the countries from the two clusters formed, taking into consideration the early-stage of the entrepreneurial activity (tea) and the improvement driven opportunity (opp). In this case, we can observe the countries from the Cluster 1 are grouped together, on the same part of the graphic, on the left side. In this part, there are countries from both analysed categories: efficiency-driven economies and innovation-driven economies. Countries from Cluster 2, all of them from

the innovation-driven economies category are placed on the right side of the graphic. This situation was expected to be registered, taking into consideration that opportunity influences in a greater extend the entrepreneurial activity.

Fig 3 Entrepreneurship and opportunity

If we compare the positions of the two clusters from figure 2 and figure 3 we can observe that we obtain an opposite situation. While we analysed necessity-driven factor, most of the countries from Cluster 2 were placed in the left part of figure 2, the same countries are placed in the right part in figure 3, where we analyse the improvement driven opportunity.

Thus our hypothesis was partially confirmed by the results obtain: that the entrepreneurial activity was influenced differently by the necessity and the opportunity, depending on the national economy development level.

5. Conclusions

Even this study refers to a period characterised by turbulences, economic difficulties, the results obtained reveal that the entrepreneurial activity was influenced differently by the necessity and opportunity. The two clusters formed were both based on the variable related to improvement driven opportunity. Thus, the opportunity played a more important role in most of the analysed countries.

As previous studies emphasize, the

entrepreneurship is more likely to be opportunity driven in innovation-driven economies countries than in the efficiency-driven economies, where entrepreneurship may, in many cases be the only option for making a living. [21]

This type of studies could be used to compare countries which belong to the same category or to other categories, in order to identify the similarities and differenced between them, and then to extend the research to identify measures, strategy which could help in a greater extend to develop entrepreneurship accordingly to the economic development level.

Posting of Workers in Crisis: Europe Looking for Solutions

Țacu Cătălin

*Doctoral School of Economy, Faculty of Economy and Business Administration,
University "Alexandru Ioan Cuza" Iași
c_tacu@yahoo.com*

Abstract

This paper presents an image of posting of workers in the framework of the provision of services in the European Union, augmented by the economic crisis. In this context, economic realities, legal system and national political interests are identified as points of reflection.

Consideration of the disparity of salary levels, resolving normative incoherence thru simplification and balance the position of political compromise, are identified as solutions for better fit adjustment of institutional mechanism of PWD, in accordance with specificities of each EU Member State.

Keywords: posting of workers, minimum wage.

Classification J.E.L.: J81, K31, M12.

1. Introduction

The current economic crisis is testing the European project and raise issues that affect even the most optimistic citizens of the European Union (EU). Fine balance between *National* and *Community* is again in the spotlight. In search of the optimal state of balance, decision-makers manifest political and institutional, in a space of alternatives, narrowed brutally by the painful effects of the crisis.

EU institutional foundation established a precise route of the road to *union*, in which the free movement of persons is ensured, to establish an internal market and promote economic, social and territorial cohesion and solidarity among Member States [1].

Along the journey to integration of the common market, the EU is based on the idea of the four freedoms (movement of goods, services, capital and persons), trade barriers

between Member States being reduced gradually. These four liberties represent the pillars that ensure a solid framework for the European project.

Nevertheless, at present, their support capability is no longer in complete synchronization. The economic crisis has contributed to increasing naturally *sloping surface* supported by the four freedoms.

Although, within the EU borders, the free movement of goods and capital is close to a complete functionality, free movement of persons and services still facing important implementation difficulties. Some of the most recent *national ingredients* pertaining to the latest phases of community integration have generated an increase of the heterogeneity level especially when the aspects of competitiveness and wages level come into question.

When are separately analysed, the two unfulfilled liberties spark numerous disputes, obstacles and dilemmas. The supreme challenge resides precisely in conciliating the national particularities and interests, in order to ensure complete stability of the fundamental liberties.

In the following I will present a picture of posting of workers in the framework of the provision of transnational services, augmented by the challenges of the moment. This situation raise a number of questions unaddressed or unsaid, designed in a constructive manner, identifying points of reflection and conclusive solutions.

2. Posting of workers in crisis

A different kind of crisis emerged within the EU in the early 2000s, has generated friendly environment to the development of the institutional concept, which would be endorsed by Directive 96/71/EC *concerning the posting of workers in the framework of the provision of services* (PWD).

The dispute has been lead between the Member States with a reduced labour cost and the states with a high labour cost. The first would lose a significant competitive advantage generated by cheap labour force. However, the Member States where the labour cost was higher, would regard the others as a "social dumping" factor which would destabilize the competitiveness and endanger the jobs of the local people. When the European Community was enlarged with Portugal and Spain in 1986, public debates about the influx of Iberian workers created a climate for legislation with regards to temporary foreign workers, in which the main argument was not equal treatment but fears that *'they will take our jobs'*. Later on, the fall of the wall in Berlin and the opening to the East created again an atmosphere where initially ignorant politicians realised that *"something had to be done"* [2].

The idea that leads to the creation of the provision regarding the posting of workers in Europe was not new. Its roots are on the *land of freedom* in the Federal Law from the United States (USA), known as the *Davis-Bacon Act* 1931.

Another possible source of inspiration is *Convention No. 94* of the International Labour Organization (ILO), Labour Clauses in Public Contracts 1949 [3].

Both these regulation acts introduce the rule of law connected to the geographical area where the service is provided concerning the workers involved in the project. The specifications remain valid only for the services provided in the name of public authorities, publically-financed infrastructure projects as well as public acquisition contracts. Both *Davis-Bacon Act* and *Convention No. 94* are considered supranational institutional approaches, but they differ in terms of power and practicability.

Based on the European Commission proposal of 1991, after a long debate and negotiations in 1996 the Council and the European Parliament adopted the PWD, to be implemented by Member States until the end of 1999. PWD applies to undertakings which, in the framework of the transnational provision of services, post workers to the territory of a Member State, provided there is an employment relationship between the

undertaking making the posting and the worker during the period of posting.

Member States shall ensure that, whatever the law applicable to the employment relationship, the undertakings posting workers to their territory, in the framework of the transnational provision of services, guarantee those workers their own terms and conditions of employment covering the main labour standards (laid down by law, regulation or administrative provision, and/or by collective agreements or arbitration awards which have been declared universally applicable) [4].

The most important reason for establishing a framework in which to perform transnational posting of workers was fighting *social dumping* to maintain a fair competition in the provision of services within the EU.

PWD entered into force gives Member States a common tool to fight the threat of foreign services providers, in special those who come from countries with low labour cost. In this context, the use of posting of workers varied from normal and decent mechanism established under a long-term partnership, to completely illegal practices associated with the term *"mailbox"*, used only to recruit cheap labour. [5].

While EU accession in 2004, 10 former communist countries was received with enthusiasm by those who saw the potential of these new markets and underdeveloped western union movement was concerned that Eastern European workers would flood the labour market leading to lower wage rates in Western Europe. Therefore, the EU-15 has imposed transitional restrictions on the right of individuals to hold a job. However, no restrictions were extended to employers from the new Member States, posting their own low pay workers, for performing the contract. Limitations not covered nor the possibility that employers in the EU-15 to relocate production facilities in the new Member States to take advantage of cheaper labour there [6].

In the case of transnational provision of services, occurred regulatory framework created by PWD, to block eastern employer's enthusiasm, which could use the competitive advantage given by the low wages they pay to their employees. Normative amalgam formed by EU rules, laws of the State of origin and core of the social standards of the

host country, applied to transnational service providers, has not reached the desired effect. In this situation Member States with high levels of remuneration think again that "*something had to be done*".

Cremers, Dølvik and Bosch [3] announced in a *union manifesto manner* that within documents of the European institutions, a reference to the *Charter of Fundamental Rights of Workers* disappeared and the centre of gravity has changed in favour of radical of the free market that seem to consider PWD as a *strange violation* of the logic of four liberties.

Umbrella of fundamental rights of workers is raised again, but this time not on behalf to purify competitive economic environment, but to protect the jobs of workers in countries with high wage level.

In the atmosphere full of *toxic emanations* of crisis, after 13 years of implementation of PWD, EU brings back into focus the concept of *social dumping*. This is the paradigm which always accompanied any discussion of the European common market, reduced labour costs of newly integrated Member States constituting a threat to national domestic markets of the founders.

European Commission responds to the call and in March 2012 launched into legislative procedure two draft laws regarding posting of workers in the framework of transnational providing of services. The first is a *Directive of the European Parliament and of the Council on the enforcement of Directive 96/71/EC concerning the posting of workers in the framework of the provision of services* and the second is materialized by a *Council Regulation on the exercise of the right to take collective action within the context of the freedom of establishment and the freedom to provide services*.

Semantically, the order of the European liberties, positioned above national interest, changes in the attitude of institutions and European officials that have to strengthen administrative control [7]. When it comes to the issue of transnational posting of workers, primacy is given to the so-called *protection of the workers' rights*. But actually, behind this shield is hiding the national interest for the creation of new jobs for native workers and stimulation of the national business environment.

Debate in European Parliament, involving social partners is a good opportunity for positive confrontation of ideas and interests.

In this paper, I propose three points of reflection, which can contribute to better fit the new institutional framework that prepares posting employees in the provision of transnational services. This will be the subject of the next section.

3. Challenges rising

Economic realities, the normative framework and political interest (national) are three components of European construction which act synergistically. For each of these elements I have identified a dilemmatic area that requires more attention.

Minimum wage is first and is the key to all problems (universal remedy).

Whether we talk about unfair competition and social dumping or safeguard employment, or whether we invoke the fundamental rights of workers, the discussion always comes at one point: the minimum wage. If the package of social standards associated to the place where the work is provided through PWD, is called "*hard core*", then surely the minimum wage is the *core nucleus*. Courageously unveiling institutional mechanism of the protective wrappings who are trying to hide the *nakedness of national interests*, we find that the wage level is the only substantial element.

A calculation applied shows that a Romanian employer pays in august 2012 a salary of 468.75 euro (average gross earnings) [8]. To relocate a worker in the Netherlands, it must *upgrade* his salary to 1456.20 euro representing an increase of 310.66% and in the Luxembourg, to 1,801.49 euro, representing an increase of 384.32% (monthly minimum wages) [9].

In comparison with the data presented above, the question arises whether it may be profitable to providing services by as a company from a Member State with low labour cost, which posts its own staff in a Member State with a high minimum wage, complying with the conditions established by PWD. Theoretically yes, under the freedom provision of services guaranteed by the EU treaties and PWD, practically no, under insurmountable differences between labour

costs. If we add the lack of competitiveness of the eastern firms to the situation described, even in the terms of low labour cost, the possibility of transnational services under PWD seems even more uncertain.

Normative amalgam, and the missing brick, can be called the second problem.

Even when adopting PWD but also in the years that followed, EU has created a comprehensive package containing social labour standards. Basically as seen in Table 1, only the minimum wage is not backed up by a European law, otherwise all components of "hard core" established by PWD are unitary covered through EU directives. On this basis, the national laws of the 27 Member States have aligned those social standards.

Table 1. Normative correlation

PWD / EU law
PWD - Maximum work periods and minimum rest periods
- Directive 2003/88/EC, concerning certain aspects of the organisation of working time (2004) repealing Directive 93/104/EC (1996)
PWD - Minimum paid annual holidays
- Directive 2003/88/EC, concerning certain aspects of the organisation of working time (2004) repealing Directive 93/104/EC (1996)
PWD - Minimum rates of pay, including overtime rates
-
PWD - Conditions of hiring-out of workers, in particular the supply of workers by temporary employment undertakings
- Directive 2008/104/EC, on temporary agency work (2011)
PWD - Health, safety and hygiene at work
- Directive 89/391/EEC, on the introduction of measures to encourage improvements in the safety and health of workers at work (1992)
PWD - Protective measures with regard to the terms and conditions of employment of pregnant women or women who have recently given birth, of children and of young people
- Directive 92/85/EEC, on the introduction of measures to encourage improvements in the safety and health at work of pregnant workers and workers who have recently

given birth or are breastfeeding (1994) - Directive 94/33/EC, on the protection of young people at work (1996)
PWD - Equality of treatment between men and women and other provisions on non-discrimination
- Directive 2006/54/EC, on the implementation of the principle of equal opportunities and equal treatment of men and women in matters of employment and occupation (2008) repealing Directive 76/207/EEC (1996) - Directive 2000/78/EC, establishing a general framework for equal treatment in employment and occupation (2003) - Directive 2000/43/EC, implementing the principle of equal treatment between persons irrespective of racial or ethnic origin (2003)

PWD = Directive 96/71/EC, concerning the posting of workers in the framework of the provision of services.

Source: European Union law (<http://eur-lex.europa.eu>).

An uninformed observer would hardly understand, why for a temporary provision is necessary to imposed local legislation (host state) instead of his own (country of origin), considering that both are based on a uniform level, created on the same principles and common interests. The question is rhetorical, and the answer is obvious, when "*minimum rates of pay, including overtime rates*" of PWD, is the only one that has no counterpart in common EU standards.

Europe, now end then, might entitle the third problem.

Historical facts point out that the Member States which participated to the normative creation process are those from the 1991-1996 periods. However, at present, the most affected services providers are those pertaining to the states that have become members after implementation of PWD.

We need to wonder ourselves if the interests from 1996, which generated the adoption of the PWD, are the same with the ones from the present of 2012.

Debate and vote on EU legislative institutions are closely linked to labour relations environment from each Member State. Key in relation to obligations under the PWD is the minimum wage. For this reason, I developed groups of Member States,

depending on the level of this parameter, based on the premise that decision-makers will be reported on the national economic interest to the vote.

To this end, Tables 2 and 3 illustrates the composition of legislative bodies of 1996 and 2012 showing number and percentage of voting power of the Member States.

Depending on the appropriate minimum wage of 2012, Member States were divided into three categories: *high* level for more than 900 euro, *medium* level between 800 and 500 euro and *low* level of less than 400 euro. Reference data are provided by Eurostat for semester 2-2012 [9] and is not restricted to minimum level established by legislation but also in collective trade or regional agreements.

Table 2. Distribution of decision-making power in EU legislative institution, in 2006

Source: Council of the European Union (www.consilium.europa.eu), European Parliament (www.europarl.europa.eu).

A natural unintentionally reality set those levels, so that distribution of states becoming just a formal operation.

Analyzing the results, the first and most

important observation is that in composition of the 1996 lacks precisely those Member States which are now responsible for providing cheap labour.

Matching mathematical weights in thirds for year 1996 and in quarters for year 2012, is the second remarkable element. The result can mean calculating and precise design or surprising manifestation of the EU's social reality.

But the most important aspect is the voting power of states with a high salary, which decreased from 68% in year 1996 to 50% in year 2012. Also, unlike 1996, when they were newly integrated, the group of countries with medium remuneration level are playing the role of mediator that can tip the balance to one side or the other.

Time will confirm or refute if this change will affect political decision forces at the level of EU legislative institutions.

4. Bright horizons

The economic crisis has awakened a crisis of empathy, tolerance and solidarity within the EU.

The necessity to protect the national interests of the member states is natural, obvious and justified, for the insufficiently-developed normative areas that still need community assimilation. At the same time, resumption of topics insufficient outlined in the past, even in inauspicious context, is an opportunity for reshaping.

This paper tries to raise the issues of construction of *European institutional framework* and calls for reflection. *Segregation* of eastern employers who post workers to transnational services with so different wage levels, by imposing economic barriers will block their integration into the common market services.

Considering the discrepancy in pay, resolving normative incoherence through simplification and balancing political compromise position, represent a solution of adaptation and better matching of institutional mechanism of PWD, to economic situation of each Member State.

EU must decide whether to continue following the road that started, sit on the weakness bench for a break, or abandon the route, or even destination. In a truly united Europe is a matter of time until "*invisible*

hand" will minimize the differences in pay between Member States.

Path of convergence on EU social standards, while naturally reducing economic disparities between Member States, seems to be the best way.

Abstract

The concepts of sustainability and information society are different topics, approached through their own different vocabularies, development policies and priorities; their lack of interaction leads to a reinforcement of their isolation and stereotypes. The information society has the advantage of exploiting increasing efficiencies from the knowledge distribution and use, the economies' dematerialization is not eo ipso eco-efficient or sustainable, but it has the tendency of generating unintended effects under the form of rebound effects. We are questioning a series of approaches regarding this issue, wanting to achieve a comprehensible goal rather than an analytical one. At the same time, we want to highlight the advantages of the Immaterialisation paradigm, “as a switch in consumption behavior from more material to less material”, as compared to the paradigm of Dematerialization; the first paradigm, that of Immaterialisation, probably has the deepest interdisciplinary roots.

Key words: sustainable development, rebound effects, eco-efficiency, i/dematerialization

JEL Classification: Q01, O44, R11

1. Introduction

Is the information society sustainable? Is the Information and Communication Technology (ICT) environmentally friendly? Does it address the development's urging

questions? The economies' trend seems to be oriented towards increasing the intangible capital stocks [22]. Anyway, the investments in ICT (Information and Communication Technology) underwent a major explosion in the 90s and the 2000s. Today we know that, for example, the catching-up increase from the 90s/2000s of the CEE economies was related to the restructuring generated by the investments made in information technology [21][2] and we are also aware of the fact that the sectors which intensively use ICT form the background for the USA's divergent growth as compared to Europe's [12]. At a global level, the prices' vertiginous downfall and the progresses of globalization have facilitated the technology transfer towards the emergent economies, and the ICT's contribution almost doubled, from almost a quarter to a third of the total capital contribution between 1995 and 2000 [9]. Anyway, economists have considered knowledge and new technologies to be the main answer to the development and sustainability issues [5][6][25][15][13]. Their main arguments are related to the ability of immaterial economies of providing increasing efficiencies; by comparison, conventional economies are more material, being based on accumulating factors (the technology is incorporated) and, obviously, dissipative. The theory of growing efficiency provided probably for the first time the possibility that economies could continue their increase without being obliged to enlarge their capital stocks. The arrival of the Information and Communication Technology (ICT) reanimated the interest in growth which is based on generating and using

knowledge and/or on the massive cumulation of intangible capital [18][10][5][6][1][2][3]. For the economists, the great hope was that of anticipating the issues of development in the most sustainable manner. Without detailing this subject, the remaining question is that related to the *dematerializing* economies' capacity of anticipating the issues of development in a sustainable manner. Their dematerialization is due to the enlargement of knowledge and/or intangible capital stocks.

We are further questioning the advantages of economy's *dematerialization/immaterialization* for sustainable development. A series of studies mostly sustain the concept of *rebound effects*: economy's *dematerialization*, costs decrease, a growth in efficiency etc. can have adverse effects on energy consumption, resources etc. [20][23] or, even clearer, “they can short-circuit many gains achieved by means of efficiency (or “the production of conventional products through innovative and cleaner production methods”) and innovation” [23].

2. Information Society and Sustainable Development: Topics, Scenarios etc.

The advantages/disadvantages of *i/dematerialization* on sustainable development are not perceived in the same manner by everyone. For example, Willard and Halder (2003) resume six major analytical approach schemes. They have in common the fact that they admit the economy's alarming effects on the environment and the problems generated by the development process, but they separate when it comes to the role that they are willing to give to the information society's technology and to *dematerialization*. Willard and Halder notice that there is a reason for considering sustainable development and information society are different topics, promoted by different scenarios and own vocabularies, development policies and priorities. Their lack of interaction reinforces the isolation and stereotypes in both cases. Anyway, there are not too many uncertainties that postponing the development of indicators and *integral* patterns (or interdisciplinary) secretly contribute to deepen the isolation and/or the obscurity of

problems which are to be generated only by initiatives and policies dictated by “pure” methodologies [23][20].

The advantages and disadvantages of *dematerialization* have been increasingly questioned over the last decades. Their re/discussion nowadays is of a great importance when it comes to durable development. We distinguish two major directions: a skeptical one, marked especially by the so-called *rebound effects* [20][16][17] and an optimistic one, but successfully incorporating the critical attitude towards the ecological adverse effects of the information society [19].

3. Economy's *i/dematerialization* or “rebound effects” reloaded

The *dematerialization* of economy is currently appreciated for its ability of substituting goods and technology that are specific to an information society with intensive-material goods and services that are specific to an industrial society (or its ability of reducing their material content), of developing better projections (*eco-design*, *eco-efficiency* etc.) etc. The correlative concepts are (consumption) *virtualization* and *immaterialisation* and the difficulties of extending the advantages of this technology are commonly generated by the interference with various production patterns, disparities and especially *lifestyles* (and/or the consumer's values). The main objections are called *rebound effects*.

The sectors that produce ICT do not lack consequences. *Eco-efficiency* is neither more nor less affected by the extraction of the precious metals that the components are made of, by using and eliminating chemical substances during the production period, by the computers' energy consumption and electronic waste disposal – it is said that the latter, for example, has increased three times as compared to the average growth of municipal garbage [23]. These are called *main effects* and are directly derived from the production of informational goods and technology. The *secondary effects* act in larger areas of the economy and society and they are directly relevant for the so-called *rebound effects*. For example, the decrease of the material content and/or energy consumption reduces the price of the product.

The growth of the requests is almost unavoidable and negates the benefits eco-efficiently obtained from these transformations/savings. In transportation and consumership, some products' informational dematerialization and traveling decrease could have adverse effects over these two domains. Studies incorporate here the role of political regimes and the consumer's values; for example, the mobility at the EU's scale has increased while the number of phone calls yearly increased in the 90s by 10%; significantly, merchandise transportation increased more than the entire region's Gross Domestic Product [23].

Tulbure (2002) especially sustains that the use of ICT does not guarantee *per se* the environment's sustainability. The argument is that *the rebound effect* is directly dependent on each IT user's behavior. In other words, the *e-worker* has the eco-efficient advantage of rarely travelling to its workplace, but this advantage can be easily defused by the large distances that are to be travelled (*e-working* facilitates especially activities made from distance). Nevertheless, the results seem to sustain this position; for example, if *e-working* decreases the net energy consumption in the first and more relevant of the scenarios then the number of kilometers is constant; the results are similar for the CO₂ emissions: if the energy total consume is constant, then the CO₂ emissions do not decrease, but stay constant; the calculations include Germany.

Other examples are provided by similar cases; for example, if satisfying the increase of consumption leads to reducing the ecological imprint from 2.3 to 1.9 hectares *per capita*, it requires in turn an increase of ICT use that overcomes the limit of eco-efficient realization [23]. Another example refers to the fact that studies like Schauer's underline the fact that investments in the information society's infrastructure can generate what he calls *Internet refusers*, a category that would be able to impose the *double infrastructure* development. More exactly, this means that the entire inefficiency derived from the high costs with the infrastructure could be converted in the refusal of moving towards a digital world and its advantages, especially if the investments are not high enough in order to facilitate the replacement of the conventional

infrastructure. This would oblige Europe to develop different infrastructures. Other examples show that Schauer (2002) find that the hypothesis of economy's *dematerialization* and/or *substitution* has not been sufficiently addressed and he believes that it functions just like Pandora's Box, not being a *win-win* solution that would also provide economic growth, workplaces and ecological benefits at the same time. In his opinion, there are *primary/secondary rebound effects* that directly address the issue of the information society's eco-efficiency in what regards both resources' consumes (components), eliminating electronic waste etc. and the modifications that lifestyle induces in the case of the consumers, regarding more the growth rather than decrease of resources and energy consume. The main arguments regard the fact that the dematerialization hypothesis (*substitution hypothesis*) is plausible only when it promises to make possible the virtualization of various material products and services; for example, it refers to substituting physical conferences with virtual ones, the paper of a document with its electronic equivalent etc. It is possible to annul the eco-efficient effects because of the fact that ICT has a positive feedback at the level of the industrial production (*addition hypothesis*), stimulating what he calls "our endless hunger for new products". Without detailing, the positive feedback at an industrial level and the consumer's eco-schizophrenia, a concept that he introduces later for underlining the *lifestyle's* role in the equation of the dematerialization's eco-efficiency, which allows Schauer to observe how the consumers can remain greatly unaffected by the ecological conclusions that they accept, seems to open a real Pandora's Box. We don't need many arguments to prove that only a combined strategy could be able to provide solutions to these problems, one in which, for example, the strategy of technological extension, the strategy of developing environmentally friendly behaviors and even the strategy of infrastructure could generate resistance because of the high costs, are all combined [17].

4. Economy's i/dematerialization or "rebound effects" exceeded

The studies above and other studies also clearly show that the debate of the information society's eco-efficiency does not lack problems. As Schauer noticed, there is no proof that ICT could directly provide a *win-win* solution. Despite this, the general conclusion is that “The revolutionary potential of new ICTs lies in their capacities to instantaneously connect vast networks of individuals and organizations across great geographic distances at very little cost. As such, ICTs have been key enablers of globalization, facilitating world-wide flows of information, capital, ideas, people and products. They have transformed business, markets and organizations, revolutionized learning and knowledge-sharing, empowered citizens and communities, and created significant economic growth in many countries. ICTs have amplified brain power in much the same way as the 19th century industrial revolution amplified muscle power” [7].

Obviously, this conclusion meets the conclusions of an entire series of studies and reports such as Essentials (2001), Batchelor et al (2003), World Bank.2012, Qiang et al (2012) and Yamamichi (2011), that underline the advantages that ICT generates over the increase of life standards, alphabetization and life expectancies especially in the developing economies. What they probably have the most in common and what is intuitively correct is that ICT determines information to circulate more, faster and on broader areas, more people can connect with each other, it provides efficiency and transparency, it transforms the way in which people live, learn and do business, it breaks the vicious circle of *poverty* by means of modifying the individual's social and economic effects and contributes to the decentralization of decisions [4][25][15]. But a manner of punctually surpassing the so-called rebound effects of the information society is provided by Simmons (2002) and/or the new paradigm of Immaterialisation (Immaterialisation Action Plan).

Instead, Simmons (2002) argues for introducing a difference between the Immaterialization paradigm and the Dematerialization perspective, even if Immaterialization was understood as a kind of dematerialization [8]. The difference is

that Dematerialization includes the virtualization of the production, while Immaterialization involves the immaterialization of the consumption behavior.

Dematerialization makes from the gains in eco-efficiency and rebound effects (Rebound Effects D) a substitution effect (price substitution effect), i.e. the amount of products and services with intangible content increases in the economy, emphasizing the increase of consumption of energy and raw materials involved in the production of specific IST products and services, while Immaterialization emphasizes rather on consumer decisions or lifestyle and appears as a “switch in consumption behaviour from more material to less material”; Rebound Effects I are in this case an income effect, not substitution effect: Immaterialization indicate that overlapping the Dematerialisation of economies with a lifestyle not enough immaterial reduce gains in eco-efficiency by increasing the consumption of goods and services with high material content. Thus, the lifestyle or the patterns of consumption are in the heart of Immaterialization understood as a "switch in behavior from more material consumption to less material." For Simmons, “consumption patterns arise from the values and preferences of individuals. IST-pull addresses the issue of preferences. There is a well-evidenced case that 'long-term value change results from generational replacement'. It seems reasonable to deduce, therefore, that long-term lifestyle change will exhibit the same characteristic dependence on generational succession”; the developments in law and environmental marketing could be stimulating on the direction of consumer values and preferences [14].

There is also a problem Simmons sees here, namely that the benefits of Immaterialization are not irreversible (post-immaterialization effects), that can be reversed by the selection mechanism, which is included in the nature of Rebound I - “the effect of that dematerialization occurring subsequently to the immaterialization switch”.

However, Simmons believes that Immaterialization challenges the neoclassical paradigm of *homo economicus* especially for the error to treat the consumer behavior “on

the basis of cost and direct functional preferences alone”, not as a matter of lifestyle. For him, “The choice to opt for immaterialisation is about lifestyle: such issues as upbringing of children; quality of life (as opposed to standard of living); and place in society weigh more heavily than cost issues. Immaterialisation may produce a cost saving: or it may not. It is *the pattern* of consumption that is changed, not necessarily or systematically its *cost*, nor (except very indirectly) its *function*”; nor at the level of investment the rational behavior is not entirely privileged, he intersecting fields including sociology, statistics and psychology [11]. Obviously, Simmons (2002) can be found here with the sociological theories of *the habitus* (Pierre Bourdieu) and of symbolic / emotional consumerism (Jean Baudrillard, Gilles Lipovetsky).

5. Conclusion

The problem of the relationship between sustainable development and an information society’s targets has been greatly taken into consideration. What we have noticed, following the ideas traced by Willard and Halder (2003), is that all these schemes and topics are especially affected by isolation. It is not a mistake to say that *rebound effects*, for example, are after all the result of multiple reciprocal unsynchronized evolutions. There is no secret that, under these circumstances, continuing in the same manner would lead to a defusing of the information society’s eco-efficient advantages by the adverse events of ICT’s use. Our task was that of considering and questioning a series of relevant approaches of this problematic. It is clear now that the simple informational *dematerialization* could be rather an error than a success in the direction of sustainable development. In this case, we should seriously take into consideration a strategy that would complete the substitution and/or virtualization efforts with *lifestyles* anticipating policies in order to increase the eco-efficient advantages of I/Dematerialization which are obviously derived from the process of substituting intangible goods with material goods and services. A durable development strategy can only be holistic. Simmons (2002) at least has

the merit of proving that questioning the issue of dematerialization without simultaneously addressing the individuals’ values and preferences has eco-inefficient effects rather than sustainable effects on development: people can discover the values of immaterialisation, but it is not sure that they are going to reduce consume (*eco-schizophreny, democratic brake*) [17]. In other words, the information society’s technology has the potential of anticipating the problems of sustainability, but it is far of being sufficient *per se*, regardless its reputation, increasing efficiency etc.

What Lessons did Arab Countries Learn From the Recent Financial Crisis?

Benchea Laura-Ramona

Bucharest University of Economic Studies, Faculty of International Business and Economics

laura.benchea@yahoo.com

Abstract

The financial crisis that began in the United States in 2008 quickly spread across Europe and eventually affected all global economic activity and financial systems. The Arab World was also hit by the global financial crisis, but the impact varied among its countries by the nature and structure of its economies and the degree of openness to global markets.

This paper captures the impact of the global financial crisis on Arab economies, its main transmission channels and what lessons did Arab governments draw from it.

In order to accomplish this purpose we first try to identify the transmission channels of the crisis and the implications on Arab economies and then we propose to find out what lessons could Arab political and economic decision makers draw from what Ben Bernanke, Chairman of the Federal reserve called "the worst financial crisis in global history, including the Great Depression"[3].

Being a descriptive study above all, the research paper is based on the analysis and critical evaluation of the available literature (literature review).

Key words: Arab countries, Global financial crisis, Economies, Globalization.

J.E.L. classification : F0, G01, A10, F60.

1. Introduction

The global financial crisis that began in 2008 was triggered by the collapse of the American sub-prime mortgage market. Many economists (Weber) consider that the crisis has its roots in a "cocktail of causes"[3]. The U.S. relaxed fiscal policy

and supervision of the financial markets together with the reduction of the interest rates (the interest rate fell from 6,5% to 1,75% in 2001, reaching a record level of 1% in 2003) led to the expansion of credit and, as a result, to high house prices and eventually to economic boom. During the same period of time, in search for substantial revenues, banks and other financial institutions came up with financial innovations, such as collateralized debt obligations (CDOs) and credit default swaps (CDSs) which exposed these institutions to high risks and finally to the transmission of the crisis.

The global financial crisis affected, directly or indirectly, all the regions and economies, including the Arab ones. Some of the effects were reflected in a fall of the international demand, lower exports, a slowdown in economic activity, a decline in foreign investments. The overall economic growth declined.

The impact of the crisis in Arab countries has shown that the region is closely connected to global economic market. The Gulf states (Saudi Arabia, United Arab Emirates, Qatar, Kuwait, Bahrain) are among the most affected. Their opening towards the global financial markets and their dependence on oil revenues in order to finance domestic economic activities came out when the crisis has expanded rapidly across the region.

On the other hand, non-oil countries (Jordan, Syria, Tunisia, Lebanon, Egypt, Morocco) registered a contraction in exports caused by the low international demand and a decline in financial inflows from tourism, remittances and foreign direct investments.

In order to reduce the negative effects of the crisis, some Arab countries took the necessary measures. For example, the Gulf countries intervened by pumping liquidities into the banking sector and increased public

spending in order to stimulate their economic activities [7].

2. Transmission channels of the crisis

The global crisis spread across Arab countries through different channels. The major transmission channels were: the financial markets, the oil market (in oil-exporting countries), exports, remittances, tourism and some authors (Jebnoun and Zarrouk) speak about the psychological factor.

The financial factor was the main channel for the crisis to hit Arab economies, mainly the GCC countries, known for their openness to global financial markets.

Before the crisis, the GCC countries witnessed a boom in financial resources due to substantial increases in oil revenues and foreign financial inflows with the purpose of financing large projects in the private sector. When the crisis worsened, the GCC financial markets had to face many shocks, such as a sharp decline in oil prices on international markets especially in the second half of 2008, a decrease in financial surpluses followed by a liquidity crisis in banking and business sectors because of the withdrawal of funds by some important financial institutions.

The impact of these financial losses, the lack of liquidity and the fall in investments, had significant consequences for the Gulf banking system. As a result, central banks in the Emirates and in other countries intervened by guaranteeing credits and deposits[5].

Another channel for the transmission of the crisis was through *the oil market*, as Arab region is endowed with almost 60% of the world’s proven oil reserves (figure 1).

Figure 1. World proven crude oil reserves by region, 2010

Source: Authors’ selection based on Arab Competitiveness Report 2011 statistical data) MENA=Middle East and North Africa

Oil prices started to fall during the summer of 2008, but until December the same year the price dropped from \$100/barrel to \$40/barrel. It started to slightly recover in 2009 and since then followed a more moderate trend [5]. According to the same statistics, in Arab countries the oil exports generates about 50% of the GDP and 80% of its profits. It is no wonder that the drop in oil prices particularly affected exporting countries, such as Bahrain, Kuwait, Oman, Qatar, Saudi Arabia, United Arab Emirates, Algeria, Iraq, Libya, Sudan and Yemen [5].

The decline of *exports* was the next factor of transmission of the global crisis to Arab countries. The collapse of the international markets led to serious decline in exports in emerging Arab economies. Actually, emerging market economies are the largest exporters to developed industrial countries in Europe, U.S. and Asia [6]. In some cases, much of the exports are to countries within the European Union (80% for Tunisia, 78% for Libya and 76% for Morocco)[5]. Therefore, the economic activity of these countries was affected by the decrease in external demand and exports fell considerably.

The decline in *remittances* and *tourism* were the next factors with repercussions in Arab economies. The latter issue (the decrease in the number of tourists) affected all Arab countries. In terms of tourism, data (World Tourism Organization) report that, in total, Middle Eastern countries received 18% less tourists in 2009. In Egypt, revenues from tourism fell by 17,3% in the first quarter of 2008[5]. The situation in the region worsened because of the recent revolts (the so-called “Arab Spring”) that have sent tourists away.

The drop in remittances was determined by the fact that Arab workers abroad, especially in Europe and Gulf states, had to leave their jobs because of the economic crisis. According to the World Bank, the Arab countries suffered the most from this situation, ahead of other countries in Latin America, Asia or Sub-Saharan Africa [5]. In the case of Morocco and Tunisia about 80% of workers’ remittances came from European countries while in Egypt, Jordan and

Lebanon more than 50% came from Gulf states. Therefore, these countries suffered indirectly from the economic standstill of oil-exporting countries.

The psychological factor was another important element that contributed to the propagation of the crisis, but often overlooked by most authors. Financial institutions are run by humans who are considered to be greedy and profit-motivated [8]. This is the reason why they assumed high risks and they failed in anticipating the side-effects of their financial innovations. Also, relying on the ability of the state to save them, the bankers behave recklessly, a phenomenon known as “moral hazard”. Nobody cares about the economic rationality since potential losses can be transferred to the state (bail-out).

The collapse of some of the world’s most appreciated financial institutions (Lehman Brothers) and the decline in the global economic activity brought insecurity to investors and to consumers. And it is well-known that economies and financial systems are driven by confidence [6].

3. The impact of the global financial crisis on Arab economies: diverse effects in different countries

The Arab World is not a monolithic structure, a homogenous reality, therefore the effects of the crisis had many faces, depending on the nature and structure of Arab economies and on their specific plans and strategies of development implemented during the period of economic growth prior to the crisis.

Being highly exposed to Western financial markets (especially in the U.S. and United Kingdom) and to speculative real estate investments, Gulf countries or Gulf Cooperation Council (GCC) countries had to produce large budgetary cutbacks. The decline in oil prices intensely affected the oil exporting countries, such as Algeria, Yemen and Saudi Arabia. Egypt, Morocco or Jordan met social and financial difficulties by the reduction of workers’remittances, exports and tourism. In other countries, such as Emirates, the economy came to a standstill, after many years of economic growth, habitually of 15% [5].

In terms of financial integration, the Arab

region falls behind the other emerging-market regions except for Africa. Under normal circumstances this low level of integration is considered a disadvantage, but it can protect a country when the global financial system sinks into a severe crisis.

The initial impact of the crisis was felt in Gulf countries, where the stock market indices lost on average 50% compared to 40% the other Arab countries [4]. This was due to the high degree of integration into global financial markets (the highest degree of integration among all Arab countries), substantial investments in U.S. assets, the sharp decline in oil price since its record in 2008 (\$147,5 /barrel) and also liquidity problems.

Kuwait was hard hit by this situation as companies had made leveraged investments in equities. The media reported losses of \$20 billion and the Kuwait Stock Exchange was closed for four days. Also, the plans for the construction of a new refinery were cancelled [4].

The same statistics [4] shows that in Dubai and Qatar house prices fell sharply with more than 50%. In 2008, Dubai sovereign debt reached \$10 billion and more than 50% of its residential and commercial projects were put on hold or cancelled.

Arab countries are generally affected by the fluctuations in oil market. Some of these countries maintain strong economic connections with the global market, linkages that go beyond oil. North African countries have strong economic relations with Europe (in terms of trade and investments) and GCC countries have huge financial investments in advanced economies [2]. All these factors have increased the economic exposure to global economic depression.

Some Arab countries (energy-importing economies), such as Jordan, Lebanon, Morocco, Tunisia and the Palestinian Territories are not directly connected to global markets. The economic activity was affected by the decrease in international demand. Therefore, export declined and remittances from workers abroad reduced considerably. Egypt and Syria are two special cases, as they import and export almost an equal quantity of energy.

Foreign Direct Investment (FDI) in Arab countries decreased with an average rate of 30% in 2009. Anyway, this decline has been

less dramatic for the Arab World than for other regions because even before the crisis these countries were not able to attract much of the FDI other than in the oil sector. In Egypt, Tunisia and Jordan FDI declined with 44%, 75% and 64% respectively during the second half of 2008 because investors from Gulf countries froze their planned investments [1].

Because of the global financial crisis Gulf countries looked for emergency lending. The most vulnerable seemed to be United Arab Emirates as the foreign debt increased from \$75 billion in 2006 to \$140 billion in 2008. Other countries, such as Algeria, Bahrain, Jordan, Libya registered a much lower foreign debt. The average foreign debt in the Arab region was less than \$8,37 billion in 2006 reaching \$10,17 billion in 2008 [6].

The effects of the crisis across the Arab World have been diverse, depending on the economy of each country.

4. What lessons did Arab countries learn?

As already mentioned in the previous sections, the effects of the global financial crisis varied among Arab economies. Also, the transmission channels affected them differently. We will develop in this section the lessons learned by Arab authorities and their reactions to the crisis.

One lesson learned by authorities in most Arab countries was that the immediate actions in terms of monetary and fiscal policies may have succeeded in reducing the effects of the crisis. Also, they intervened and tried to activate the strategic productive and service sectors.

In the GCC countries, the buildup of financial surpluses from high oil revenues before the crisis helped them to pump liquidity into their financial markets. The other countries (that did not rely mainly on oil revenues) moved quickly and tried “to implement programs to stimulate economic policies based on expansionary fiscal and monetary policies to support economic activity and maintain local growth trends and economic recovery” [7,p.102].

Some Arab countries have introduced economic reforms before the global financial crisis and they had to postpone them and to adapt to the new economic situation. For example, Egypt postponed the implementa-

tion of reforms into its VAT system.

The effects of the crisis showed in some GCC countries the high risks associated with bank lending during the previous period of economic boom based on oil revenues as well as high exposure on international financial markets. Another lesson learned by these countries was that it is dangerous to depend only on oil revenues to support economic activities. This implies some reforms in order to diversify the economy base and to expand private sector participation in order to reduce the risks associated with the dependence on oil sector.

Arab countries need structural reforms to improve their economic performance. These reforms could imply the expanding of the private sector, the diversification of the production base and the creation of new jobs. Attracting FDI along with the transfer of knowledge and technology from developed countries would add value to their economies.

The monetary authorities are aware of the necessity of reforming the banking sector, by restructuring and liberalizing the public banks, developing their capital markets, reducing the proportion of non-performing loans, increasing transparency for investors and strengthening the role of supervision authorities in order to avoid systemic risks.

Another lesson learned is the importance of continuing and deepening economic reforms and supporting national economies to face the challenges of the crisis. However, many Arab countries suffer from weak institutions and they don't have enough resources to allocate to potential “rescue package” [6]. The same authors assert that Egypt and Jordan face a difficult situation because of the budget deficit, dependence on foreign aid and a high level of unemployment.

Actually, the main emphasis of many energy-importing Arab countries was on fiscal spending programme, with the purpose of compensating the decrease in private domestic and foreign demand for their products. This programme included tax cuts, micro-credit lines and export promotion measures. For example, in Morocco and Tunisia authorities have proposed a tax “holiday”, meaning that contributors can postpone or can be excused from paying taxes for a certain period of time. Also, the

level of minimum wages increased in Lebanon, Jordan, Morocco and Tunisia and some schemes of income protection were introduced. In order to avoid laying off workers, Tunisian government recommended firm owners to employ workers on half-day shift. Finally, some forms of subsidies were added or expanded in Morocco.

5. Conclusions

This paper assessed the impact of the global financial crisis on Arab economies. The crisis impacted these countries through different transmission channels, depending on their exposure to these channels.

Oil-exporting countries (especially GCC countries) suffered from a decline in oil revenues, but they were able to support their economies due to large financial reserves. Also, financial markets were hard hit because of their integration into the global markets, but governments intervened proactively in order to protect them.

The other Arab countries were severely hit by the financial crisis through other transmission channels, through reduction in exports, remittances and tourism. Their governments also had to take important measures in order to beef up domestic demand.

It is obvious that the global financial crisis has provided a good opportunity for Arab decidents to learn lessons from it, to identify the weaknesses of their economic and financial systems and to start now to initiate development policies as well as plans for restructuring the financial systems.

Finally, it is necessary for Arab countries to implement regional policies in order to enhance the stability of their financial systems and to set up economic growth.

Regional Development Policy in Romania – Challenges for the 2014-2020 Period

Chilian Mihaela-Nona *

Institute for Economic Forecasting, Romanian Academy, Bucharest, Romania,

cnona@ipe.ro

Badea Alexandru Octavian

“Valahia” University of Targoviste, Romania

alex@atvrom.ro

Abstract

In agreement with the European Economic and Social Cohesion Policy, Romania promotes regional policy aiming generally on long term to reduce disparities in regional development and country areas. Despite efforts by public authorities to implement the ROP and despite the implementation of a Plan of Priority Measures for strengthening the capacity of absorption of structural and cohesion funds, in Romania the absorption of European funds for regional development remains unsatisfactory. In developing new strategic programming documents for the period 2014-2020, Romania will continue to face major challenges regarding the future regional development, some "taken" in the current period, others induced by the new architecture of EU cohesion policy.

Keywords: cohesion policy, Regional Operational Program, cohesion funds, strategic programming 2014-2020

JEL Classification: R11, R58

1. Introduction

The regional development policy of Romania is closely aligned with the EU cohesion policy, which is defined by its purpose, namely *to support the process of reducing the gaps between the more developed regions and Member States of the European Union and the least developed ones*. The paper presents the main tools of Romanian cohesion policy, with emphasis on the measures aiming to increase the absorption of the EU funds provided for by

the Regional Operational Program. Some new instruments of the new strategic framework of cohesion policy are also briefly presented, as well as the main challenges for the regional/local authorities for both development and implementing the regional development policy in Romania.

2. The Regional Development Policy in Romania

The *EU cohesion policy* has its primary legal basis in the text of the EU Treaty (Title XVII "Economic and Social Cohesion" and Article 148 on the European Social Fund). More specifically, Article 158 mentions cohesion as a prerequisite for the harmonious development of the EU, stating willingness "to reduce disparities between the levels of development of the various regions and the backwardness of the least favored regions or islands, including rural areas" [1].

The regional development policy of Romania is closely aligned with the EU cohesion policy at all levels and levels of development of the EU are used as benchmarks for defining local policies, following closely the Strategic Guidelines and the European regulations. In agreement with the European Economic and Social Cohesion Policy, Romania promotes *a regional policy generally aiming on long term at reducing the disparities in the development of regions and country areas*. Regional Development Act (No. 315/2004) established the main objectives of regional development policy in Romania, on reducing regional disparities, ensuring sectoral coordination at regional level and stimulating interregional cooperation. In correlation with this, the main objective of the National Development Plan (NDP), namely to reduce

the gap between Romania and the EU Member States, aimed at six priorities in development: i) increase in economic competitiveness and development of the knowledge society, ii) development and modernization of transport infrastructure, iii) preservation and improvement of the environment, iv) human resource development, promotion of employment, social inclusion and improvement of administrative capacity, v) rural economic development and productivity growth in agriculture, vi) decrease in the interregional disparities [2].

With the EU accession, the basic document guiding the country's regional development is the *Regional Operational Program*. Transfers allocated to Romania under Cohesion Policy 2007-2013 amount to 19.3 billion euros. Of the total transfers, Romania must allocate 1/3 for the Cohesion Fund, funds that will finance SOP Transport and SOP Environment and 2/3 for the European Regional Development Fund and the European Social Fund.

The **2011-2013 National Reform Program (NRP)** is currently the framework platform for defining and implementing the economic development policies of Romania, in accordance with the policies of the European Union (EU), and it is focusing on achieving smart, sustainable and inclusive growth, with high levels of labor employment, productivity and social cohesion, in line with the Europe 2020 objectives. Based on the objectives of this strategy, Romania has established through the *National Reform Program* its own goals and priorities which set the framework and directions for the sustainable economic development [3].

The, NRP 2007-2010 was **a true post-accession strategy of Romania**, by adopting the most important reforms needed to deepen the integration of Romania and to reduce disparities towards other Member States. The *NRP 2011-2013* continues the reforms undertaken in 2007-2010 and proposes reforms derived from the specific objectives of Europe 2020 and the attached documents (flagship initiatives, *Annual Growth Analysis*, *Euro Plus Pact*). In this context, the *NRP 2011-2013* includes, in addition to new actions, some of the actions already being implemented (e.g., those related to

requirements to be met by Romania in relation to the International Monetary Fund and other international financial institutions).

Stage of Structural Funds Absorption

A key element of the current development policies in Romania, especially at territorial level, is **to increase the absorption of structural and cohesion funds**. The *Priority Action Plan for strengthening the capacity of absorption of structural and cohesion funds (PAP)* is, currently, the roadmap for the short and medium term that the Romanian Government is committed to implement, in close cooperation with the European Commission. In the *medium term*, PAP implementation should lead to avoiding disengagement of substantial funds at 31 December 2013 (when the risk of disengagement is higher) and on *long term*, to create the conditions necessary to achieve the target set by the *National Strategic Reference Framework 2007-2013*, i.e., **at least 90% absorption of structural and cohesion funds allocated to Romania**.

Despite the implementation of such an ambitious plan, the absorption of European funds for regional development remains unsatisfactory. Thus, in March 2012, 8084 ROP projects submitted since January 1, 2007 were recorded, of which 3072 approved (totaling 5,397 million euros), 2684 contracted (totaling 3073 million euros - 82.47% of the ERDF allocation for Romania for the period 2007-2013) and only 580 completed (total value of 391 million euros - **only 4% of ERDF allocations for Romania for 2007-2013**) [4].

The funds from EU paid to beneficiaries in the period 1 January 2007 to 16 March 2012 amounted to 925.15 million euros, meaning 24.8% of the ERDF allocation for Romania for the period 2007-2013. Of the six priority axes, the largest share of projects completed is registered by Priority Axis 6 - (24.29% of the ERDF allocation for Romania for the period 2007-2013) and the lowest by priority axes 1 (0.12%) and 5 (2.10%). By development regions, the highest percentage of funds paid to the beneficiaries in ERDF regional allocations for 2007-2013 have been accounted for by the Centre Region (32.05%) and Northeast Region (31.91%), and the lowest by the Bucharest-Ilfov Region (only 12.64%). By priority axes and intervention

areas, there are large differences between regions in terms of absorption of funds for regional development (Table 1).

Table 1. Absorption of funds from the Operational Regional Program, by development regions, priority axes and areas of intervention in the period 1 January 2007 to 16 March 2012 (payments to beneficiaries, pre-financing and ERDF reimbursements, % of ERDF allocation)

Dev. Reg./Priority Axes/Domain of Intervention	N E	SE	S U	S V	V E	N V	C E	BI
Axis 1/DMI 1.1	17	3	6	9	7	5	15	0,3
Axis 2/DMI 2.1	66	75	71	50	60	58	63	45
Axis 3/DMI 3.1	29	55	22	25	10	38	8	0
Axis 3/DMI 3.2	58	41	4	25	27	29	25	3

Source: *Implementation status of Regional Operational Program 2007-2013*, Ministry of Regional Development and Tourism, March 16, 2012.

But what makes the absorption of European funds more difficult (including those for regional development) is that because of the irregularities noted by the European Commission audits Romania has currently suspended three extremely important operating programs. The European

Commission (EC) decided in October 2012 to pre-suspend most of three programs co-financed by EU structural funds, namely "Transport", "Regional" and "Increase in Economic Competitiveness", as Romania has at its disposal two months to remedy deficiencies. According to the Ministry of Economy, the risk of disengagement of SOP 2007-2013 is 213.8 million euros in 2012 and 1.26 billion euros in 2013 [5]. To cancel pre-suspending of funds, transparency on how they are funding projects is necessary, and also the restructuring of authorities in charge with European funds, as well as "very good preparation" for financing requests submitted to the Ministry of Finance.

3. Future Tools of Implementing the Cohesion Policy in Romania

The *Territorial Development Strategy of Romania* (SDTR) will present Romania's development vision and ensure consistency of national policy by setting targets regarding the strategic land planning (axes, poles, corridors, concentration, polarized areas and so on). The strategy is to underpin national investment programs and Romania's position on European territorial development programs. SDTR is the programmatic document which sets guidelines for Romanian territorial development and the implementation directions for a period of over 20 years, at national, regional and interregional levels, also integrating cross-border and transnational relevant aspects. SDTR will provide a strategic framework for territorial documentation, as well as for urban planning documentation, adding the territorial dimensions to competitiveness and cohesion objectives.

Another important objective of harmonious territorial development in Romania is *to improve the competitiveness of agriculture and ensure long-term sustainability of rural areas*. In this respect, one of the objectives of financial interventions supported by NRDP is to rise the quality of employment in rural areas, through measures aiming at: training of and information to adults working in agriculture, forestry and food sector, increasing the number of young farmers starting for the first time activity as heads of farms, creation and development of micro enterprises in the non-

agricultural sector, the development of rural tourism activities, improving physical infrastructure in rural areas and access to basic public services for the rural population and encouraging local development initiatives. Complementary to measures financed through NRDP *to ensure long-term sustainability of rural areas*, in 2011-2013 the financial interventions supported by ESF (SOP HRD) envisage: guidance, counseling and training for rural residents in entrepreneurship and non-agricultural domain, and labor market integration of inactive people, including those who make their living from subsistence farming. By 2013, it is estimated that a total of 135,500 people in rural areas will participate in integrated programs for human resource development and employment.

Since the economic crisis of recent years has unequally affected the regions, there are significant regional disparities in terms of poverty rates; the social infrastructure development represents an imperative of regional and territorial development policies. Region with the highest relative poverty rate in 2008 was the North East (27.2%) and the least poor were the Bucharest-Ilfov (4.7%). Also, there is a high poverty in the South - West (23.3%) and South - East (22.7%).

In 2011-2013, for achieving a balanced economic and social development of Romania's regions, *the sustainable urban development through integrated urban development plans is supported, which may include social housing projects (POR/Priority 1, Area of Intervention 1.1., Integrated urban development plans)*. The purpose of this financial intervention is to improve social infrastructure in urban areas (childcare centers, elderly centers, support centers for people with disabilities, youth centers, people in difficulty and so on) and to ensure decent housing conditions for persons belonging to disadvantaged social groups who may not have access to a home in property or cannot rent one at housing market rents [6].

In line with the Europe 2020 targets regarding *climate change and energy efficiency*, we must also mention here the support for energy efficiency in residential housing, provided through a combination of national, local and EU resources, backed by a proactive regulatory framework. The substantial support for the thermal

rehabilitation of buildings was presented by the Government as a way of reducing the energy bills of households affected by the crisis. However, the budget allocated by the Government for thermal rehabilitation of buildings was reduced from RON 32.9 million (around EUR 7.8 million) to RON 22.3 million in 2009 and from RON 40 million to RON 11.7 million (around EUR 2.8 million) in 2010 as a result of the budget constraints stemming from the crisis [7].

In order *to reduce regional disparities and improve social, health and education infrastructure*, in 2011-2013, Romania envisages investments for the rehabilitation of buildings for residential and multifunctional social centers, interventions aimed at improving the quality of social services infrastructure; investments to improve the quality of healthcare infrastructure and its balanced regional territorial division, to ensure equal access to health services; and rehabilitation/modernization/development and equipping of pre-university education, university and continuous professional training infrastructure to ensure necessary conditions for public education and increased participation in education and training.

For effective implementation of the *Europe 2020 Strategy*, an integrated approach and coordination between all stakeholders, public and private, is required. In this context, an important role could be that of ***Territorial Pact***, which may be an opportunity for a more effective contribution of local communities in achieving the Europe 2020 goals. The Committee of the Regions, the promoter of the concept of *territorial pact*, supports the involvement of municipalities and local authorities in an effort to achieve national targets for 2020.

For the period 2014-2020, the relevant authorities are already developing *strategic programming documents* based on thematic objectives of Europe 2020 and the Regulation of the European Parliament and the Council on new guidelines of EU cohesion policy [8].

A basic tool, both of elaboration, and of implementation of regional development policies and strategies, which reflects the new approach to EU cohesion policy is the ***contract of partnership***, which is developed

at national level, but by consulting and strongly involving all targeted regional partners. In developing this agreement, at national and regional level new partnership structures are created [9]:

a) Inter-institutional Committee for drafting the Partnership Agreement (CIAP) and 12 Consultative Committees organized as sections of CIAP, 10 of which are thematic committees (CCT), organized for the following areas: i) transports; ii) environment and climate change; iii) competitiveness and energy efficiency; iv) communications and information technology; v) education; vi) employment, social inclusion and social services; vii) health care services; viii) tourism, culture and cultural heritage; ix) rural development, agriculture and fishing; x) administration and good governance.

b) Advisory Committees representative for regional development and territorial dimension:

b1) Advisory Committee on Regional Development (CCDR), with responsibility for: i) urban development; ii) business development; iii) disadvantaged communities; iv) regional and local infrastructure; v) energy efficiency.

b2) Advisory Committee on Territorial Cohesion (FCTC), with responsibility for: the Spatial Development Strategy of Romania, monitoring and territorial impact; urban dimension; territorial development instruments; European Union Strategy for the Danube Region and other macro-regional strategies; European territorial cooperation.

In each region **Regional Planning Committee** (RPC) is constituted, which has an advisory role, representing a broad partnership framework for the development and coordination of the **Regional Development Plan**. RPC is coordinated by the Director General of the RDA, for each region, which also provides the secretariat. Its Membership of each RPC includes representatives, depending on the specific of each region, of: prefectures institutions, decentralized services of central public institutions, local authorities (County Councils, Local Councils) research institutes and higher education institutions, economic and social partners.

According to the vision of the new architecture of cohesion policy on focusing and theme integration, **integrated regional**

projects are the projects that contribute to achieve the priorities and measures included in the Regional Development Plan and through which to meet the needs identified at regional level, but which take into account the objectives set for Romania as according to Europe 2020 [10]. Strategic project portfolio will be an annex of the RDP 2014-2020; identification and prioritization of projects will be completed by mid-2013, and in the second half of 2013 and first half of 2014 work on preparing documentation of such projects will be done. At the regional level, the stages of the RDP 2014-2020 will correlated with the development of Operational Programs, which will allow the identification of possible funding sources. To establish a regional project portfolio, should be done the following:

- Analysis of local, county and regional development strategies for the next period and identification of investment needs,
- Analysis of national and European development directions for 2014-2020 and match of necessary investments to these directions,
- Linking information included in socio-economic analysis with the regional strategy and with the identified project portfolio,
- Establishing investment priorities and funding sources for these and discussing them in a broad partnership,
- Deciding on priorities for investment and project portfolio.

The main challenges for both development and for implementing RDP will be the good cooperation of stakeholders (public authorities, private partners, representatives of civil society, educational institutions, etc.) and of the consultative bodies existing or newly established, the coordination of measures and actions, both between regional and local actors, as well as with other national and regional policies, eliminating overlaps and areas uncovered by policy measures and action plans, the identification of those areas where policy intervention is really necessary and/or where it can have the highest efficiency, financial transparency and accountability, improvement of program management authorities, increased involvement of private partners and civil society in decision making and implementation at local and regional

level and elimination of capture of funds by certain political interest, informal or even criminal groups, increase in the absorption of funds, diminution of bureaucracy and corruption in accessing/using the funds.

4. Conclusions

In agreement with the European Economic and Social Cohesion Policy, Romania promotes a regional policy generally aiming on long term at reducing the disparities in the development of regions and country areas, using as main tools the National Reform Plan and the Regional Operational Program. However, since the absorption of structural and cohesion funds was very low in Romania, a Priority Action Plan for strengthening the capacity of absorption of these funds was set, including concrete measures to accelerate significantly the absorption of such funds.

For the future programming period (2014-2020), the Territorial Development Strategy of Romania will present Romania's development vision and ensure the consistency of national policy, while an important role will be that of Territorial Pact, which may provide more effective contribution of local communities in achieving the Europe 2020 goals. In line with the thematic objectives of Europe 2020 and the Regulation of the European Parliament and the Council on new guidelines of EU cohesion policy, the regional/local authorities are already developing strategic programming documents, based on the national contract of partnership between Romania and the EU, and new partnership structures are created at national and regional level. However, important challenges lie ahead for the stakeholders and consultative bodies in charge with developing and implementing the regional development policy in Romania, regarding better cooperation and coordination, improvement of program management and increasing transparency and accountability of funding, better involvement of private partners and civil society in decision making and implementation at local and regional level, increasing funds absorption, and eliminating corruption and red tape.

Abstract

The Union has adopted over the time many documents as regards the energetic security, documents that were fulfilled in accordance to the future evolutions, and also, why not mentioning, in accordance to the political internal and external interests of it, or by the mediation of various circles of economic interests. In any of the situations, it looks like the importance of energy has been more intensively understood after the second world war, when the governments have started the nationalization of the energetic sectors. Now we carry out an analysis of the current energy security policy and we ask to face its strengths, and weaknesses to better understand the context of the new european energy challenges.

Keywords: energy politics, energy security, energy priorities, green energy.

J.E.L. Classification: Q01, Q21, Q31, Q34, Q41

1. Introduction

The first crisis stages of the energy have occurred in the 70s, which alerted most of the European countries, and not only. In this way, as a prevision of such crisis, and after 1950, the Treaty of Establishing the European Coal and Steel Committee (abbreviated as ECSC) and the Treaty of Establishing the European Atomic Energy Community (abbreviated as Euroatom).

The aim has been always the same, consisting in the reduction of imports, but also as a balance of the nuclear powers of the Union of Soviet Socialist Republics (abbreviated as USSR) and USA. The Unique European Act (1987) and the Treaty

of Maastricht (1992) did not brought significant modifications to the common energy politics. The Treaty of Amsterdam of 1995 has firstly brought into attention the common community's decisions within the energy field: The Trans-European Energy Networks. But, before that moment, the European Energy Charter was established at Haga in 1951, signed by 51 states and consecrated in 1994 at Lisbon, by the Treaty of the European Energy Charter. These documents established the West-East cooperation in the essential field of energy. One of the parties of the Treaty refers to the environmental issues, as well.

The first major intervention of the European Committee that is taken expressively into account refers to the problems of a common energetic politics, that was established in 1995, and that took the name of Green Book entitled “European Union Energy Policy”. The White Book entitled “An Energy Policy for the European Union” was issues in the same year. Surprising was that during 1996 and 1997, the European Committee has started a series of communications under the name of “The Green Paper for a Community Strategy – Energy for the Future: Renewable Sources of Energy”, and respectively, „The White Paper: Energy for the Future – Renewable sources of Energy”. [8]

2. The contemporary situation in energy markets

The complete liberalization of the electrical energy market was established in 2004, as regards the trade and industrial consumers, as result of the meeting of Council of Barcelona in 2002. Other elements of contemporaneous energetic

strategy will be analyzed in the following lines of the paper.

One of the most recent concerns of the European Union has as first priority the ensuring, as longer term as possible, the energetic security and of energy supplying. In the last decade, many important steps were especially taken, but seems that not enough, in order to use as much “green, clean and non-pollutant”[3] energy as possible, taking into account the climate changes and the general trend (until the occurrence of the economical-financial crisis), on increasing the energy requirements on the international market.

One might try to understand the term of long lasting development on all the legislative branches, but having direct applicability over the business environment. Firstly, one might take into consideration some important issues: one might try a facilitation of the users’ access to energy, on convenient prices, of strong predictability. Secondly, the European Union has taken into account the transport problems and of reducing the energy consumption in this field, especially that this is a high consumer of energetic resources. The third point of interest that concerns the vision of the European officials consists in providing with energy, as well as the vision of such field, taking into account that Europe loses every day its own resources, depending more and more upon imports, which are many times submitted to the political conflicts. All these situations are regarded within the context of reducing the green house effects gas. The policy of the European Union is a complex and complete one, including fields of the traditional sources of energy, up to the nuclear energy and the green energy, also. The aim consists in reducing the quantity of energy consumed or in achieving the most urgent by inexhaustible sources.

When we talk about the European Union policy, in the field of energy until 2020, we might take into account some fundamental objectives, for which the legislative packages were proposed. The first consists in the long lastingness, and the concept emphasizes the concern related to the increase of green house effect gas, for an admitted level, and which might change significantly the world’s climate. In order to reach this aim, the plan entitled “Energy – Climatic Changes” was adopted in

2008. Besides this package of measurements, negotiations were performed as regards the common energetic measurements, involving simultaneously the energy providers – in other way, serious turbulences might occur towards the Community’s Space.

From here, the idea of an internal energy market will start. And beginning with 2008, the Parliament and the European Council have taken a series of decisions, thus consolidating more the concept of “internal energy market”. Although know this state of fact, one cannot say that it is completely established, where the security of energy supplying from the community’ space has in view the reduction of European Union vulnerability, as regards the energy imports, the lack as regards the supplying, as well as the predictability on supplying and of prices.

As regards the Energetic Politics of the European Union drawn up in 2007, the energy is identified as an element of special significance, being recognized as an engine of the future economic growth. Its intrinsic value will speak without saying. Its part has declaratively increased by every document drawn up since then, and up to present, but also by means of facts, as regards the economic relationships. Even if its significance is so high, one should understand that the European Union, by its components states, should take measurements in the view of struggle against the effects of using energy; among these, one effect seems to be more significant, meaning: inducing the climatic modifications.

3. The energetic EU future

In order to pass over these challenges, the European Committee agrees that the European Union should promote a common energetic politics, based on energetic security, a long lasting development, as well as on competitiveness. [9] Taking into account the security on supplying with the energetic resources, the European Union made estimations as regards the increase of natural gas, from 57% currently, and up to 84% until 2030, and as regards the petroleum, an increase from 82% up to 93%, taking into account the same time.

Taking into account the objective of a long lasting development, one should mention that in 2007, the energy sector

consisted in the entire Union, from the main producers of gas, by the green house effect. If immediate measures are not applied, in this rhythm of the pollution, the values on EU level will increase by almost 5%, and at the global level, these will increase by almost 55% until 2030 [10].

At this moment, at the level of the European Union, the nuclear and hydro energy emphasize the highest margins of non-pollution with CO₂, although these have had a high impact over the ecosystems.[6] The atomic stations seem to have a significant contribution over the implementation of the long lasting development concept, ensuring a third of the electricity production of the European Union.

If one has an assembly image over the entire world, and if one tries to see what are the current power poles, in accordance to the industrialization level, one will see that the European Union is situated amongst all these, being in strong connection to the United States, Canada, China, India or Japan and Korea.

Though, in order to be in a competition, it is urgently necessary to ensure the energy, which unavoidably will draw up the economic growth. European Union, as any other strongly industrialized state, is facing some paradigms, some ways to be followed, in order to ensure its future existence; among these, within a new age of the energetic progress one might find: the selection of the energy types, the security of supplying with energy and the price agreed, as well as the environment protection.

As regards the Green Book of the energy, finalized in 2006, a diagnosis of the energetic situation in European Union was accomplished, from where some well documented conclusions can be drawn up: the current consumption of the Union consists in 41% of petroleum, 22% natural gas, 16% coal, 15% nuclear energy and 6% of the green energy. Which is more concerning refers to the amounts of the imports, which are about 50%.

The import of natural gas is mainly carried out from Norway and Russia, and the imports of petroleum of the Middle East. Concerning is the fact that if the imports of gas are maintained, we will reach the threshold of 80% in the following three decades. The European Union cannot cover

by itself the energy demand, meaning of own resources.

The world demand of energy has increased with 1.6% per year. The consumption of combustible is increasing constantly, as well as their price, which have trained already massive increases at the electric and thermal energy. The consumers cannot support anymore the increase of prices, which will continue unavoidably because of the high dependency of imports and of the long network of supplying. Notwithstanding, there is also a positive externality: supporting the research in the field. There is an urgent need of investments, which are approximated to reach 1000 milliards of Euro.

The issues that have occurred and people will have to face with are the following: “the need of petroleum, of the high powers that are fighting for supremacy, the need of an adequate information, threatening the arms of mass destruction, the devilry of the terrorist groups, the probability that governments are not honest with people that they lead on, the responsibility and the loyalty of the government representatives”. [8]

In 2006, the European Union has established the future energetic priorities, by means of the Green Book of the energy. The strategy proposed has been developed on six fields of interest [7], meaning:

- developing the competition on the markets of electrical energy and natural gas;
- the nutritional safety;
- debates regarding the energy sources;
- the climatic changes;
- strategic plan regarding the research and innovation;
- External common politics as regards the sub-fields of the energy.

The European Union had had to impose some directives in order to oblige the member states on taking efficient decisions in the energetic field. Among these, one might recall a doubling of the green sources weight of consumption from 6% to 12% in 2012, a growth of the electrical energy produced of the non-polluting sources from 14% up to 22% in 2010. In the same time, by a series of measurements on increasing the efficiency, one might expect to a reduction of the energy consumption with 205 by year 2020.

The aim of the Green Book of energy is not an occurring one; it tries to correlate all the European initiatives as regards the energy, on proposing a series of precise actions, with a rich and clear content.[7]

Firstly, the Union, being aware of the internal market lacks, has tried to develop its own electrical energy and natural gas market, by supporting the investments and by establishing institutions able to control the European changes between nations. Secondly, it will try to replay the resources stocks problems, so as to face the crisis situations. By this occasion, an increase of the network security level will be accomplished. In the fourth step, taking into account the crisis situation, a new procedure of ensuring the solidarity between the member states will be imposed, for the member states that are in difficulty.

The measures of the Union have been diversified, and the social dialogue will become every day of priority number one; for these reasons, a public debate was proposed, meaning a debate at the level of all component states, as regards the energetic future of the Community Space, which will try to bring solutions to various issues they are faced with. In the sixth step, an action plan regarding the energy efficiency will be imposed, especially when this will add its feature of temporal updating.

This should be supported by means of a program on implementing the green methods on energy production. The plan has the part on reducing the petroleum and natural gas dependency. In the eighth step, the innovation added to all such efforts on creating a long lasting energy politics in various fields, starting by producing the energy and up to all energy's branches, will reach to the end user. Taking over the discussion has given us a new energetic energy, as regards the European Union, starting with 2007, a complex strategy that covers many fields of interest.

The tenth point takes into account the investments made within the infrastructure for supplying with energy, which unavoidably come from Russia and Middle East; for this reason, the dialogue with these parts was included in these clear measurements on following. We assume the idea of a treaty of the entire European energetic community, able to offer a

steadiness in the region. The treaty will no include only the member states, but also the neighbors, too.

All these ideas we included in the Green Book of energy, establishing as strategic objective the reducing of green house effect gas, with a significant percentage of 20% until 2020. The objective is part of a world objective on reducing such gas, as well as on promoting the energy regenerating resources, by the participation of the entire world community. In the same time, such objective strengthens the position of Europe, and will transform it into a community more and more independent as regards the energetic point of view.

To this main objective, other three adjacent points are added, as regards the increase of the regenerating resources weights, in the total of energetic consumption to 20% until 2020, the increase of energy efficiency by 20% until the same year, as well as using the bio-combustibles until 10%. To these points, a better management on trading the license on green house effect gas emissions, saving of energy, adopting the top technologies, using safely the atomic energy, as well as understanding on large scale the issues related to the energy and environment.

4. Supply and Demand European Diagnosis in energy markets

As regards the energy, although we have the same European strategies, and regarding from the resources and organization point of view, we are in a different position. We might talk about states that can ensure by themselves the resources demand for energy, then about those states that have not any resources in order to produce it [9].

The countries producing of energy are represented by Holland, Denmark and the United Kingdom of Great Britain and North Ireland. Holland has become a huge producer of gas simultaneously with discovering the deposit of Groningen in the years 50s. Though, the community's consumption of gas is covered by Russia and Norway, and then by Holland and Algeria. Denmark has covered its necessary of petroleum in a proportion of over 90% of the own resources, being a natural gas exporter. Great Britain is one of the highest producers and European exporters of energy.

The countries net importing of the European Union are Germany, France and Italy. Germany imports gas especially from Russia, in a percentage of over 85%, and petroleum on over 95%. Such significant percentages have determined Germany to think seriously on diversifying the energy sources.

Germany has adopted a state politics, by implementing the green energies [3] on a larger and larger scale. France is an imported of energy. It imports over 90% of the petroleum and gas, and over 75% coal.[1] From this reason, France has started to develop its atomic sector. Although it has enough resources to be exploited, France hasn't started to product. It imports massively from Russia, Algeria and Norway.

The idea of environment protection is still at its very beginning.[3] Italy hasn't enough energetic resources; from this reason, it imports massively from Algeria. There is not an atomic sector. Italy has adopted the strategy of green sector, being very addicted to imports. The Nordic countries, such as Sweden and Finland, have emphasized the environment protection, as well as the atomic energy.

Austria has a developed hydroelectric potential, and for this reason, it ensures three quarters of the energy from this type of resource. Belgium has adopted the variant of the atomic energy, as well as the energy imports. Belgium signifies the most enthusiastic supporting part on producing the energy in the European Union. Spain, Portugal, Greece and Ireland are importers of energy on large scale. The energetic infrastructure has become less developed in these countries. They have taken into account the massive investments in the infrastructure, though the global crisis has postponed the decisions taking.

The energetic security signifies a very important objective for each state separately, so that any of it will try to beneficiate of the global resources, thus involving themselves in a different way in various regions that own such resources.[2] In this moment, the most significant point on the world seems to be the Caspian region, which includes significant resources of ideas.

Those involved in controlling such region are represented by the states where these resources are, meaning those states that wish

the access, as well as the high petroleum companies, which own the necessary infrastructure on extracting the oil and the gas. According to Hrair Dekmejian and Hovann H. Simonian analysts [5], the states under interest in the region can be classified in accordance to the following form:

- *The front-ager states*, meaning: Russia, Kazakhstan, Azerbaijan, Turkmenistan, Iran;
- *The internal circle*, meaning: Afghanistan, Armenia, Georgia, Turkey, Uzbekistan;
- *The external circle*, such as: China, India (two high emergent forces), Ukraine, and Pakistan, Israel, Saudi Arabia (regional actors) and the group of the high forces (USA, European Union and Japan).

5. Conclusions

The interest for such a region comes from two directions. The first refers on the exploitation of such resources, and the second refers on the transport of those that can bring the interests towards some interested states, for this reason, we will analyze forwards some transport routes, as well as the shape that these might take, depending upon the interests of the high world players, meaning: European Union, Russia and USA. As regards the European Union point of view, this will try to consolidate the European market, to take away the Russia's danger and to ensure the Union's future. Russia wishes that such resources to be transported on its territory by the connection to the Drujba pipe, of over 4000km in length, and which provides supplying to the Central Europe, or by means of the Bosfor and Dardanele straits, on Bulgaria's territory, up to the Adriatic Sea. On common agreement, the European Union and USA wish to avoid such regions, thus relating to the Baku-Tbilisi-Ceyhan pipe. The other states, near the next neighborhood or which can be potential candidates on transit, are registered on virtual or real lists, depending upon interests.

In this way, building transport pipes was imposed, in order to transport the resources on high distances towards the interested regions: on one hand, from the Caspian basin

towards the Black Sea, and towards the Occident, on the other hand.

The interest of the transit countries results simultaneously with the provision with energy, the payment of transit taxes, on facilitating the own companies interests, but also on the final beneficiaries, as USA or EU. There are two ways on selecting: the first includes the definitely position of Russia, and the region will remain in a state of political dependency, thus distributing the resources in a preferential way, by means of the “Novorossijsk” Oleo-duct, the “South Stream” Gas-duct (900 km through Bulgaria and South of Italy), as well as the “Ambo” Oleo-duct (913km)[4].

The second solution has eliminated the Russian monopoly, although pipes able to avoid the Russia’s territory should be used. We might talk here about the Baku (Azerbaijan) – Supsa (Georgia and Black Sea, 833 km) Oleo-duct, the Constanta – Trieste Oleo-duct (with the most of advantages), the NABUCCO Gas-duct (as equally as significant as the oleo-duct previously mentioned).

Abstract

Agrotourism contributes sustainability in agriculture through sustainable better management of natural resources in an eco-friendly system. The farmers believe that agrotourism contributes towards the sustainability of agro-business because: proper planning generates various source of income, it helps farmers enhance their knowledge, it is beneficial for small farmers who have low soil productivity. Agrotourism is a new business with less competition, it is business activity as compared to traditional farming and it provides employment to a wide range of farmers. In addition agrotourism is better for human health and the environment and it provides local heritage and cultural experience for tourists..

Keywords: rural tourism, agrotourism, agritourism, sustainability, farm, promotion.

J.E.L. Classification: L83, Q 26, R11, M10

Introduction

In many rural regions, tourism is accepted as a natural part of the socio-economic fabric juxtaposed with agriculture. It is clear that rural tourism is based on rural amenities; however, it is not clear how this relates to agriculture. Are these interrelationships of mutual benefit, in the sense that while rural tourism provides the farmer with auxiliary funding to continue his/her agricultural activity, the latter is an important or even necessary component of rural tourism? Do active farms with rural tourism enjoy economies to scope and run their businesses more efficiently than firms with only a single

activity? [3]. The aim of this paper is on these inter-relationships agrotourism-agritourism and their importance on the rural environment and in the life of local communities.

Tourism activities have been widely regarded as key-tools for rural development. However, even when tourism and leisure may offer many chances for rural areas, policy-makers shall remember about major complexity of local development troubles and actions, these going further from economical or technological frame limits to become part of a global dynamics on changing society as a whole, wherever any activities and/or processes are closely linked to circumstances under which they come in to practice [4]. It seems very important to underscore that rural tourism is engaged by people seeking rural peace, away from areas of intensive tourism activity. Above all, rural tourism is engaged by visitors who wish to interact with rural environment.

1. Agrotourism and agritourism – sustainable vectors on rural development

Agritourism could create awareness about rural life and knowledge about agriculture science among urban school children. It provides the best alternative for school picnics, which are urban, based. It provides opportunity for hands on experience for urban college student in agriculture. It is meant for providing training to future farmers [8].

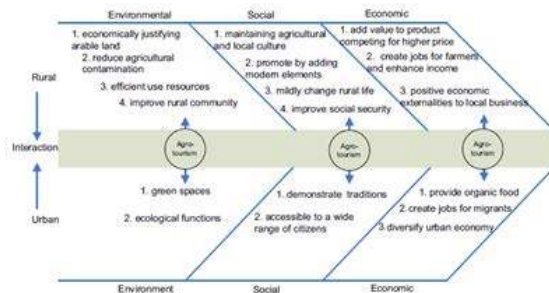

For those unfamiliar with the concept, agritourism “is a hybrid concept that merges elements of two complex industries—

agriculture and travel/tourism—to open up new, profitable markets for farm products and services and provide travel experience for a large regional market [12].

Agritourism and rural tourism are terms requiring some explanations. 'Agri-tourism' refers to all tourism and recreation activities connected with a working farm or any agricultural, horticultural, fishery or agribusiness operation (is equivalent to farm-based tourism or farm tourism). Rural tourism can be defined as a multifaceted tourism / recreation activity that takes place in an environment outside heavily urbanised areas (within rural areas, countryside), but excluding agritourism [6].

Agro-tourism is an activity that is based on the three pillars of development: economic, social and environmental, and as can be seen in the following figure is a multifunctional activity.

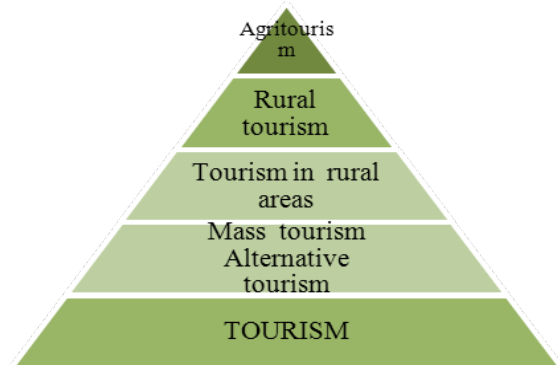

Figure no. 1 Multifunctional agro-tourism in integrated rural and urban development

Source: Zhenshan Yang, 2010, p.383

Therefore rural tourism, agrotourism and agritourism are new concepts and they have to be formed for the very beginning. Figure no.2 shows a pyramid giving a hierarchical positioning of those forms of tourism in relation to each other and in relation to mass tourism and alternative tourism.

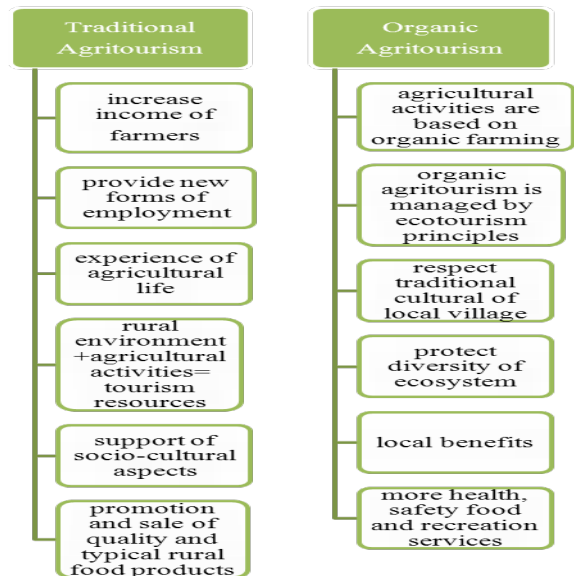

Figure no. 2 A pyramid of the range of terms related with tourism

Source: Sznajder, M., et al, 2009

Agritourism is a commercial enterprise at a working farm or agricultural business conducted for the enjoyment of visitors that generates supplemental income for the owner/operator. Agritourism includes: outdoor recreation like horseback riding, educational experiences like tours and wine tasting, entertainment like farm and garden festivals, hospitality like farm accommodation and parties and on-farm direct sales like u-pick, u-cut, or farm markets and garden centers.

Figure no. 3 Characteristics of Traditional agritourism and organic agritourism

Source: Kuo N.W., Chiu Y.T. (2006)

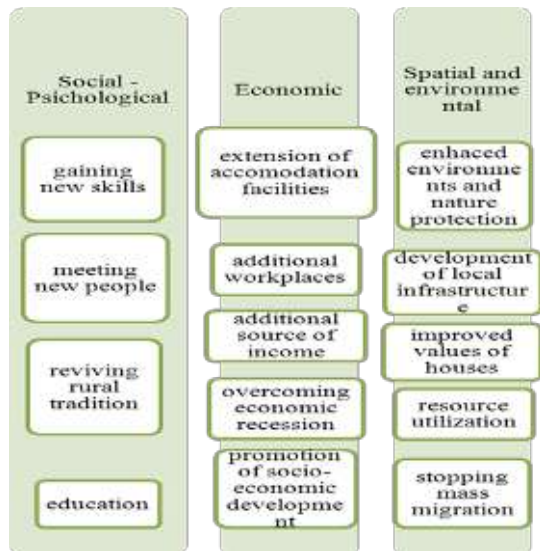

Organic farming is assigned a set of principles that range from stimulating “the natural forces” in order to restore harmony between nature and cultivated plants by a minimum of interference people and total

abandonment of the administration of such industrial chemicals [2].

The economic and social importance of this type of rural tourism it might be considered in many opinions and aspects. In figure no.4 are shown the main functions of agritourism.

Some of mentioned functions of agritourism supplement or result from one another. It difficult to say which of this functions are more and which less important.

2. Activities of agrotourism and ways of promotion in Romania

Promotional means used by the owners of rural tourist facilities are: brochures, leaflets, prospectus, specialized catalogues, catalogues of domestic tourist agencies, foreign magazines articles, informative panels beside the road, TV/Radio in the Country, printed tourist guidebooks of rural tourism.

Television is for most of us enjoyed a relaxing, leisure, as well as a support in moments of boredom. TV programmes, becoming more numerous, try as much as possible to provide a wide range of TV shows for all ages. Referring to agrotourism and especially how to practice this form of tourism, television in Romania presents a series of programs on this subject, as shown in Table no.1:

Table no.1 Shows that tackle agrotourism in Romania

SHOW	LOCATION
“Viata satului” Show	TVR1, Sunday, at 10.35 am
“Ferma” Show	TVR2, Sunday, at 12.00 pm
“AgriCULTURA” Show	Neptun TV, Sunday, at 13.00 pm
“Rodul Pamantului” Show	OTV, Sunday, at 11.00 am
“Euroferma” Show	National 24 Plus, Favorit TV, Sunday, at 13.00pm
“Minutul de agricultura” Show	TVR1, Saunday, at 11.50 am
“Zestrea romanilor” Show	TVR1, Sunday, at 7.00 am
“Buna vreme gospodari” Show	Favorit TV, Sunday, at 14.00 pm
“Romania Agricola” Show	TV Money, Saturday, at 12.00 pm
“Tezaur folcloric” Show	TVR1, Sunday, at 15.00 pm

This shows has a common aim: to promote rural development, and to make known about rural life with its potential, customs and tradition. Agrotourism, seen like a business in rural farms, has a great

opportunity in this TV shows being promoted with agrotourism, rural tourism and their forms of activity.

The category of magazines relating to agriculture, including articles on agriculture, sustainable development, rural development and other areas of great interest, listed below the main periodicals, appearing in Romania:

Figure no. 5 Journals from Rural Development

Source: Realized by authors

The Internet is today the most useful way of communication and promotion of the most visited urban population, but also by 8% of the rural population. According to a study in Romania [13], 55% of which are above the age of 50, do not know general information about what is internet and how to browse the Internet. Seen as a channel to promote agricultural information on the Internet has probably the most extensive view over the activities. The most visited sites in Romania on these theme are:

- <http://www.anunturi-agricole.ro/>
- <http://agroinfo.ro/>
- <http://revista-ferma.ro/>
- <http://www.recolta.eu/>
- <http://afaceriagricole.net/>
- <http://www.gazetadeagricultura.info/>
- <http://www.marcoser.ro/>
- <http://www.money.ro/agricultura.html>

On the role of radio to promote rural tourism information, especially on agriculture, this is a way more convenient and more used to transmit useful information. According to the same study conducted in Romania, 29.7% of respondents said they listen to the radio „Radio Romania Actualitati” (see Fig. no. 6)

Figure no. 6 National wide rating

Source: available at web

http://old.fjsc.ro/cercetare/media_rural/concluzii_rural.pdf [accessed 17 October 2012]

Reasons for rural listeners prefer "Radio Romania Actualitati" is that this post has a better coverage than other radio stations. A reason is the range of issues and programs is very diverse, as discussed topical issues of rural development and agriculture.

In addition to these radio stations to discuss issues related to the agricultural situation in our country, there is a radio station that specializes in problems of the Romanian village. „Antena Satelor” Radio station is a radio about country life, traditional values is the benchmark genuine sustainable in a world of consumers of artificial [5].

Official website where you can listen to this post is <http://www.antenatelor.ro/stiri.html>.

As a service provider activity, agro tourism presents a number of particularities which influence the way accounting is organized. Such particularities include the following aspects [14]:

a. Diversity of services, which determines the complexity of the performed activity: lodging, serving and selling alcoholic and non-alcoholic drinks, transport, treatment, entertainment, sightseeing and visits to different monastic landmarks, cleaning / ironing services etc. This aspect allows focusing on types of activities, types and kinds of agro tourism service provision of revenues and expenses, having thus the

possibility to establish the outcome and to perform an analysis of the efficiency resulted in detail.

Regarding lodging, the accommodation fee requires a 9% VAT, in compliance to the Fiscal Code in force [15], with the following particularities:

- if the accommodation fee includes one or more meals (half board or full board), then the corresponding VAT shall be calculated by applying the 9% quota. A 24% quota is applied in case the meals are separately supported by the client.

- additional services, such as cleaning/ironing services, will increase accommodation fees.

- a hotel tax requested by the local Council shall be also applied in the amount of 1% from the total accommodation fee/accommodation fee per each day of stay, a tax which is charged by the legal entities by means of which lodging takes place, together with the counting of accommodated persons, except units located in a touristic resort that owes this tax for a single night, regardless of the actual period of stay [15].

Cooking and pastry-confectionery activities are considered in accounting terms as a production activity. The first accounting recording shall apply to raw materials and supplies purchased against invoice or receipt and difference fact-finding, respectively on the basis of purchasing inventory and acquisition note for supply on the food market. Then, according to consumer bills, utility bills and payrolls, consumptions determined by food products obtaining are recorded (raw materials, supply, salaries, including benefits related to insurance and social protection and a percentage of indirect expenses distributed proportionally according to certain criteria and the utilization degree of production capacity). The final products obtaining is also recorded based on a deliver-transfer-return note. Such final products will be sold by other trade or food units or they are meant for their own restaurant, a situation requiring final products transfer into goods, goods which shall be traded en-detail.

The serving and selling of alcoholic and non-alcoholic drinks as well as meals serving takes place by means of waiter staff. The flow of such activities performed through waiters is the following: the waiter takes the order and sends it further to the administrator (bartender or cooker) from which orders are

taken by filling out the cash register note (a justifying document for outputs and sales occurring either at the bar or in the kitchen). When the client finishes, the bill is made. The cash register note and the bill shall be recorded at the end of the day in the Detailed statements of receipts and payments, detailed on administration sections (bar, kitchen), respectively payment means (cash or by credit). Input-output documents, including cash register notes, are recorded daily in the Accounting report, whose balance account shall be compared to that registered in the inventory made at the end of the day. The detailed statements of receipts and payments as well as the accounting register represent the basis of „Unit sales synopsis”, which shall be further delivered for being registered.

b. The relatively short duration of services provided shall determine emphasizing and underlying incomes and expenses for the same accounting period, being thus entitled to easily establish the financial result for every agro touristic activity developed.

c. The existence of different conditions for providing agro touristic services shall determine differences in the way of refunding services and emphasizing incomes and expenses.

d. It is quite often that they resort to collecting in advance the price charged for the provision of agro-touristic services in order to have the certainty of receiving the money owed for the rendered services and for the maximum use of the tourist lodging unit. Such activity shall determine, in accounting terms, an anticipated recording for ordered agro touristic services, while the incomes resulting from agro touristic services take place after the touristic activity is concluded. Incomes are also displayed after conclusion of such activity, as there is the possibility of cancelling the service contracted, due to various reasons.

e. To provide certain services, the agro unit may turn to the services of other service provider units. Costs incurred by these units will not be revealed in accounting as costs of tourism, but as the costs of tourist services provision activity and will be recovered by the applicant. Incomes consist in service provision

activities. Participation of several touristic for performing a touristic action makes one of them to act as the organizing unit and other units as providers, which makes showing revenues and expenses only in the accounting activity of the organizing unit and the recovery of touristic services price by the service provider units (usually tourism agencies). The providing units receive, for several service rendering activities, a bonus out of which they cover their own expenses and ensure their profits.

3. Conclusions

At first is difficult to understand, then difficult to accept, given its lack of prestige, rural tourism and agrotourism have slowly but consistently gained ground, mainly on the tourism markets in the economically developed countries, highly industrialized countries with a high urbanization level. Nowadays, the tourism in rural areas (agrotourism) is increasingly appreciated and demanded by the people living and working in increasingly stressful conditions inherent to modern civilization [1].

If rural communities have the goal of enhancing their economy through rural and agro tourism, local staff should identify which agency or institution would be best suited to be responsible for agrotourism planning and development. In some local communities, existing agencies, economic development corporations, and local chambers of commerce develop, or could develop agrotourism.

The Solutions from Romania’s Exit this Crisis

Duduială Popescu Lorena
Universitatea „Constantin Brâncuși” din Tg-Jiu
Facultatea de Științe Economice și Gestiunea Afacerilor
lorena_ucb@yahoo.com

Abstract

The some solutions to mitigate this crisis and especially its negative impact on the population have been successfully applied in several EU member states, old and new, as well as other states. There is not much to invent - the principal is not to make mistakes elementary experiences to end amateurish, to restore genuine professionalism.

What interests us, rather, is what to do afterwards. The absence of a coherent and realistic vision of the future that we want and that we are able to build it stood at the head of many of the troubles we have faced in the last year from which we all suffer further .

Key words: economic and financial crisis, global, stabilization, EU strategy, Europe 2020

JEL Clasification: F 15, F 35, F 36, F 43

Introduction

This paper is not intended to provide miraculous solutions for Romania's exit from this crisis that haunt the world for over 5 years. Overcome these difficult times will depend largely on developments in European and international economic circumstances.

Crucially, however, the resumption of healthy growth will be determined, in the case of Romania, the consistency with which it will implement measures prescribed rehabilitation and stabilization agreements with the EU, IMF and World Bank programs convergence towards adoption the euro and intelligent use of the advantages that we offer EU membership.

More far reaching strategic plans, some meritorious remained forgotten in dusty drawers of a more timid and obedient bureaucrats because of excessive

politicization. Each new form of government seems to have persisted to start from scratch, abandoning projects midway and launching initiatives whose effects are calculated in terms of media or election more than functional. We missed each time, unifying idea of systemic thinking, awareness of the fact that any apparently reasonable today may create perverse later with multiple ramifications.

That certain deficiencies are found forward thinking and elsewhere can provide only a partial consolation when we analyze our own weaknesses and vulnerabilities conceptual structural here in Romania.

Somehow, the global economic situation resembles the emphasis on climate change. In both cases, errors of judgment and refusal to consider medium and long-term effects of human action in relation to the economy and the natural environment have become global, seemingly isolated phenomena being able to trigger adverse consequences as a generalized chain. It turns thus classic example of chaos theory, which says that a tiny stream of air produced by the beating of the wings of a butterfly somewhere in the forests of Amazonia, may represent the initial impetus of a violent storm on the other side of the globe. Over natural cycles of nature and the economy once able to absorb shocks and to be self-regulating random, human foolishness interventions multiplied overlapping network of global interdependence major destabilizing element with possible catastrophic consequences. The current crisis has only to show that progressive weakening of natural systems, as well as the economic and financial, has brought us dangerously close to the point of inflection, the creation of a critical mass of negative buildup can cause collapse of existing structures become irreversible.

This is the context in which we must reweighing options are handy and offer a

clear perspective for the future. He once said that the ultimate expression of national interest is survival. Resonance of this truth has never been more relevant than now.

In a somewhat understandable, political discourse and public debate in Romania focused mainly on immediate problems in the last months of the crisis. Such concerns are legitimate and necessary. But it seems that expectations for post-crisis recovery is limited to the situation before, without any thought for the future, without questioning that may very unhealthy development model that I followed for twenty and two years has brought us where we are. Even necessary discussion about the reform of the state seems to be confined to a redistribution of power between different sections of the political elite, without showing too clearly what you want to do with this power.

In a somewhat understandable, political discourse and public debate in Romania focused mainly on immediate problems in the last months of the crisis. Such concerns are legitimate and necessary. But it seems that expectations for post-crisis recovery is limited to the situation before, without any thought for the future, without questioning that may very unhealthy development model that I followed for twenty and two years has brought us where we are. Even necessary discussion about the reform of the state seems to be confined to a redistribution of power between different sections of the political elite, without showing too clearly what you want to do with this power.

We can not say that in a time of need, we have enjoyed understanding and support European and international community. But this benevolence is neither unlimited nor unconditional. It is based on ongoing assessment of those facts and tangible achievements that inspire trust its own people and foreign partners seriousness public policy of the country, or just the essential ingredient is being questioned now and restore confidence depends highest degree, our ability to articulate a compelling perspective: this is where we want to go in a given time, is what we do to achieve goals!

The conceptual framework for this approach is future oriented. New EU strategy "Europe 2020" establishes a number of principles of action and targets to be achieved in the next decade horizon. They

are binding on all Member States will have to be transposed into national targets and trajectories to be approved and validated at the session of the European Council in June 2015. This means that each member country, and therefore Romania is responsible for the development and implementation of specific programs to implement the European strategy. Complexity effort to be made within a very tight commercial active involvement of all those who have the necessary skills to complete this process optimally.

The very title of the document produced by the European Commission states that economic recovery in the EU, will have to have three distinctive features such principles: to be smart, in the sense of relying on knowledge and innovation to be sustainable (or sustainable) for the purpose of promoting greater efficiency in use of resources to increase environmental performance and encourage competitiveness, strengthen inclusion in the sense of increasing labor employment and strengthen social and territorial cohesion European Union.

It should be noted that the new EU strategy is closer in comparison with the Lisbon Agenda which preceded it, the classical precepts of sustainable development as the dominant doctrine of European progress in the XXI century. Link human factors, socio-political and economic development process with those on considerate and responsible interaction with the environment is now organic. Has come a long way from militant-hostile attitude towards the environment (best illustrated by the famous sayings *miciuriniștă* "Do not expect a gift from nature. Need to pull them!") To acquire perennial truth that human civilization is a subsystem of the natural order of the Earth and must work in harmony with other subsystems in order to survive.

A careful examination of the five key objectives and programmatic initiatives outlined the 7 European Union for 2020 shows that they like it tailored specifically to meet Romania's fundamental priorities. Proposed measures is committed to correcting perceived weaknesses in the EU-wide global competition. Specific features of Romania in this context is that each of the priority themes, our weaknesses are higher

than those found in most member countries, and efforts will be made to overcome them will also be proportionately higher.

To be honest all the way with ourselves, we must recognize that, within a single decade, they may not be able to fulfill all transformational objectives set for the whole European Union. Total commitment to this path is, however, essential for the future of the European Romania. But let's take them one at a time to see where we stand, what we do and what results can be expected.

The indicative targets Europe 2020 are:

1. Providing an employment rate of 75% of the population aged 20-64 years

With an average of 69% of employment (63% for women and 76% for men but only 46% for those aged 55-64), the European Union is still below key performance global competitors.

The number of hours actually worked is 10% lower in the EU than in the U.S. or Japan. This is compounded by the fact that in the next 3-4 years, the natural growth of the European population will enter a negative slope, emphasizing further aging and resulting pressures on pension and social assistance.

In Romania, the situation is more serious, and the effort to recover gaps will be considerably higher. Employment rate in Romania in early 2012, 58% (11% below the EU average), down almost one percent over the figure of 2011. Negative demographic trend is among the most alarming in Europe and is aggravated by external migration of young and qualified labor.

Under these conditions, the recovery situation in Romania can not be reduced only to create new jobs and introducing it in the production of large reserves existing labor force in rural areas, but requires a range of measures designed medium and long gradual recovery demographic balance and superior capitalization of human capital. Policies increase the employment rate of labor must be combined with those relating to the development of education and training relevant to labor market needs forms, including streamlined ways of retraining and lifelong learning, improving health, promoting active social inclusion. It is necessary, therefore, strategic and integrative thinking to find expression in legislative

packages coherent and effective reporting mechanisms, monitoring and intervention.

Improving employment can not be achieved, as the recent experience of Romania, by artificially inflating staffing the administration and the public sector, often based clientele. Especially in the sphere of civil servants is necessary and urgent to establish clear performance parameters, specify expressly permanent job and monitored according to strict protocols for each type of activity.

But the main reservoir of human capital, still very poorly exploited in Romania, located in rural areas, rather than migrating to the big cities or in search working abroad will solve the problem, but the dynamic diversified through deconcentration and relocation of production activities and services in villages and small towns that are now in an economic drowsiness.

In the modern economy away many of the technological constraints once favored concentration of production in large industrial units. Stimulating the development of small businesses in rural areas, where investment in fixed assets are more modest, as suppliers or subcontractors of large-scale industry, has the advantage of reducing the economic costs associated with congestion ecological and cultural areas. Before the onset of the crisis, many banks in Romania is preparing to expand its activities in areas not yet covered by modern financial services. Beginning of economic recovery will accelerate certainly this process. A wise governance will know to bring that open opportunities, while adopting the necessary measures to create an enabling framework. Judging by the experience of other countries that have had a similar starting point with Romania, the effects on increasing employment could reasonably optimistic exceed expectations.

2. Investing a percentage of 3% of EU GDP in R & D

Accumulated expenditure for research, development and innovation is still less than 2% of EU GDP, compared with 2.6% in the U.S. and 3.4% in Japan. The measures contained in the 'Innovative Union' part of the EU 2020 strategy identifies priority areas on which to focus the efforts of European institutions and Member States, including

through more active attraction of private capital.

In this chapter Romania is not so good. Budget allocations for scientific research and technological development stands as a percentage of GDP, less than half the EU average. According to statistics recently released by the European Commission data, the actual performance of Romania is placed on the antepenultimate place among EU countries in terms of innovation. Much the same is true on objective indicators that accounts for the number of patents filed and the number of contributions published in mainstream publications of knowledge relative to population. It is, however, encouraging that, despite the scarcity of resources for research, the recovery rate of backwardness and improve innovative performance was in Romania in 2011, among the highest in Europe.

This is not just about more money from the budget (although this requirement will be fulfilled by Romania as a requirement of membership), but also by creating an ambience conducive to unleash the creative energies of the Romanian scientific community for recognition and respect for its role propelling the progress of the whole society. There is great need for politicians in Romania to learn, even at a basic level with the rigors of scientific reasoning. It is no less true that the scientific community should lean more specific understanding of the mechanisms of type modern political thought.

3. The 20-20-20 targets in terms of energy and climate change

EU Directives provide, by 2020, increasing to 20% the contribution of renewables in total energy balance, 20% reduction in emissions of greenhouse gases and improving energy efficiency by 20%. It is estimated that implementation of these goals will create at least one million new jobs in the EU, generating also other important environmental and economic benefits.

Romania is well placed to achieve these targets within. Wind energy projects in progress, plus entry into service of hydroelectric power and average and low in the short run, expanding the use of solar energy as production costs become more competitive will create prerequisites even for exceeding the target of 20% renewables.

Problem that requires resolved soon be taking over the addition of clean energy with intermittent production (wind, solar) national network safe. Reducing emissions will be scheduled by the passage of power plants from coal to natural gas and rehabilitation of heavily polluting plants. Greatest potential for compliance with European standards, but in the increase of efficiency by reducing energy intensity per unit of product, limiting losses in district heating networks and substantial improvement thermal performance of buildings. Significant efficiency reserves are in heavy industry, cement and construction materials, transport, agriculture, and domestic consumption.

4. Providing a proportion of 40% of higher education graduates in the 30-34 years age segment

The aim is increasing throughout the European Union in the number of university graduates in the age group mentioned by almost 10%, while the actual figures are 40% in the U.S. and over 50% in Japan. It takes into account the improvement of the quality of higher education, given that only two EU universities within the top 20 in the world, according to the evaluation grid from Shanghai.

Target of 40% synthesizes actually an action program extending upstream and downstream throughout the educational pathway from pre-school to doctoral and postdoctoral studies, including adult and continuing education and professional development through recycling .And in this respect, Romania starts off with the obvious disadvantages of quantitative and especially qualitative. Striving to achieve the percentage of university graduates set by the EU requires more than double the number currently produced in Romania (16%). If the EU wants to reduce early school leaving in 2020 to 10% (compared to 15% today), the current figure for Romania is about 20%. Romania also has a singular European record, recording a decline in the skills of elementary school children from primary schools, according to objective criteria of international assessments. No Romanian university not listed in the top 500 in the world.

They imagined in Romania all kinds of education and education reform discussions on this topic continues, but still leave

tangible results expected. As long as the education sector remains underfunded and poorly led, without almost no relation to the actual requirements of the labor market, as long as social and professional status of the teacher is pushed to ridiculous, Romania will be condemned to backwardness and gaps that separate the advanced countries will deepen further.

Conclusions

In the conceptual framework provided by the new European Union directives no longer have to deal with two distinct strategies: one for competitiveness and creating jobs and another for sustainable development and eco-efficiency. The two areas of concern are interrelated and approaches to fusion.

Strategy "Europe 2020" is in other respects a step towards the vision depicted in the Lisbon Agenda ending somewhat disappointing results this year, and not just because of the disturbing elements introduced by the crisis. It became clear that some agreed priority targets in 2011 will not be achieved due to insufficient allocation of funds at national and EU levers and weakness due to monitoring and assurance obligations voluntarily undertaken by Member States. Targets remain ambitious new strategy, not very easy to achieve, but if more realistic and better articulated in a logical interaction components. Implementation mechanisms are also sharper political and executive, according to the Lisbon Treaty. The main emphasis is still on development and to maximize human factor and qualitative evidence, objectively measurable, gets a share equal to the quantity in numerical or percentage. European Union no longer defines itself only in comparison, in terms competitive with other power centers or traditional or emerging growth areas, but put in competition with itself in terms of its ability to provide welfare and quality of life for their citizens.

Indicative targets established in the European Union later this year concern us directly and we in Romania. We have committed knowingly and will have to make enormous efforts to meet them, or even to get progress on this path. After five years, becoming a member with full rights and duties of the European Union. Romania can

not plead the excuse that did not get used to the EU mechanisms and requirements that they impose. For our own moral failures have no right to blame anyone else. However, it remains a fact that, due to historical disadvantages, Romania is still the main indicators of development on one of the last places in the European Union. We can count on the solidarity and support on our European partners, but the bulk of our endeavors to align the standards of performance and behavior of the EU must be made by us here in this country.

About a year and a half, I did the math, when developing the National Strategy for Sustainable Development of Romania on short, medium and long term, how and in what timeframe we can reach EU average performance on key indicators given that neither our European partners will not stand still. Conclusion experts, validated by the Scientific Council under the aegis of the Romanian Academy, was that, realistically, we can arrive at such a rate about the year 2030. Reviewing the initial estimates in light of the negative shock caused by the crisis and in view of a possible slowdown of growth in the few years of post-crisis recovery, that the point of convergence of average development trajectory of the whole EU and Romania are not changes. It will require perhaps some adjustments intermediate targets, but the strategic goal remains essentially the same. The main thing is to give us finally realize that national development model itself needs to be changed on the fly to fit into the main vein of the development of European civilization.

Necessary changes in specific mentality Romanian spoken so (too often, a defeatist and self-denigrating tone) will occur by itself, naturally, as we appropriate European norms and watch mightily in compliance. Honor honest labor is not in Europe today, an exclusive privilege Nordic or Germanic peoples, respect for law, for everybody, not only is a distinctive feature of British and prosperity through culture is not a French monopoly or Italian. They are now common goods and virtues of modern European-style civilization. Through cultivation, no less Spanish Spanish, Irish or Irish less less Finns Finns. And so non-work, theft and cheap politics are not defects of the Romanian people. We proved in history that when we

know where we are going and why we are capable of great things, worthy of all respect. Becoming more European, we receive and we Romanians additional reasons to be proud of being Romanian in Europe.

Abstract

The paper reviews the main elements of the EU cohesion policy, which is the basis of territorial economic development of the Member States. Reference elements of Cohesion Policy in the current programming period (2007-2013) are presented, and the main aspects of the reform anticipated to be implemented in the future programming period (2014-2020), including key challenges that Romania will have to face.

Keywords: cohesion policy, economic, social and territorial cohesion, strategic programming 2014-2020, strategic framework

JEL Classification: R11, R58

1. Introduction

The *EU cohesion policy* is defined by its purpose, *namely to support the process of reducing the gap between the more developed regions and Member States of the European Union and the least developed ones*. Reform of regional financial projections set out in Agenda 2000 underlined the need to focus of Community assistance in those areas where the development was lagging behind, on the one hand, and on the other hand, the need to simplify structural policies procedures. The paper briefly presents the main reforms of the EU regional cohesion policy during the current programming period, the main changes envisaged for the interval 2014-2020, as well as the main challenges for

Romania in implementing the cohesion policy.

2. Reforms of Cohesion Policy in the Current Programming Period

A new regional policy reform took place simultaneously with the conclusions of the third Report on Economic and Social Cohesion. Old objectives (supporting development in less prosperous economic and social conversion of regions in structural difficulties and human resource development) and four Community Initiatives (Interreg III, Leader +, Equal and Urban II) were reorganized (as of 2007) into only three objectives:

- **Convergence** - intended to improve the growth and factors leading to real convergence for the Member States and the least developed regions. In the EU-27, this objective concerns 84 regions located in 17 Member States, i.e. 154 million people with a GDP per capita below 75% of the Community average.
- **Regional competitiveness and employment** - designed to enhance the competitiveness and attractiveness of regions and employability of workers through a dual approach: first, the introduction of development programs to help regions to anticipate and stimulate innovation-friendly economic changes, conducive to knowledge society, entrepreneurship and environmental protection and improving accessibility, and then increasing the number and

quality of jobs by adapting the workforce and by investing in human resources. In a European Union of 27 Member States, this is valid for 68 regions, representing 314 million inhabitants. 13 of them, i.e. 19 million people, are in the stage of aid "phasing in" and are subject to special financial allocations due to their former status of "Objective 1" areas.

- **European Territorial Cooperation** - designed to strengthen cross-border cooperation through joint regional and local initiatives, to strengthen transnational cooperation through actions to promote integrated territorial development and to stimulate interregional cooperation and exchange of experience. Over 181 million people (representing 37.5% of the total EU population) are living in border areas.

In this architecture, Romania was eligible at two objectives: *Convergence* and *European Territorial Cooperation*.

The total resources available for cohesion policy in the current programming period (2007-2013) were set at 347 billion euros, representing 35.7% of the EU budget. An essential element of cohesion policy reform was the introduction of a more strategic approach to EU priorities, focusing on the Lisbon objectives (and, in 2010, on the objectives of Europe 2020), involving a new planning framework. Strategic objectives of EU cohesion policy have been identified through the *Community Strategic Guidelines*, while Member States have established national strategies and aligned their objectives through *national strategic reference frameworks*. These two documents provided the basis for the design of operational programs, also being introduced a tool for Member States to agree to focus resources on specific categories of expenses directly related to the objectives of the Lisbon Strategy and the Europe 2020 Strategy.

With the *re-launch of the Lisbon Strategy in 2005*, the cohesion policy was recognized as a *key instrument at Community level*, contributing to the implementation of the strategy for growth and jobs - not only because it represented one third of Community budget, but also because strategies designed at local and regional levels had also to part of the effort to

promote growth and jobs. The role of SME's, the need to respond to local labor qualification requirements, the importance of clusters and the need for local innovation centers is such that in many cases strategies must be built from the bottom up, from regional and local levels. Moreover, this applies not only to the economic agenda but also to the broader effort to involve citizens, who through partnership agreements and levels of government managing cohesion policy had the opportunity to become directly involved in the achievement of the European Union strategy for economic growth and job creation [1]. For the 2007-2013 programs, *specific initiatives* have been developed to promote *financial mechanisms for start-ups and micro-enterprises*, combining technical assistance and grants to non-grant instruments such as loans, equity, venture capital or guarantees.

The *Fifth report on economic, social and territorial cohesion* was adopted in the middle of one of the worst financial and economic crisis in recent history. [2] EU and Member States have responded to the crisis by taking measures to keep businesses running and people at work, to stimulate demand and increase public investment. In the midst of this crisis, the EU adopted an ambitious strategy for long-term recovery, called the *Europe 2020 Strategy*, its key objective being smart, inclusive and sustainable growth. Even more than its predecessor, the Lisbon Strategy, it emphasizes the *need for innovation, employment and social inclusion* and a *strong response to environmental challenges and climate change* to achieve its objectives. The main objectives of the Europe 2020 strategy cannot be achieved solely by policies formulated at EU or national level. Such an ambitious agenda can succeed only with a *significant participation of national and regional levels*, which is one of the main lessons learned from the Lisbon Strategy. In addition, the regional diversity in the EU, where regions have very different characteristics, opportunities and needs, requires going beyond the policy of "universal" approach to giving regions the ability and means to design and deliver policies able to address their needs, based on multiple and different types of regional development dynamics. This is what

cohesion policy gives through *localization approach*.

For the Europe 2020 strategy to be effective, it requires a *close coordination between Cohesion Policy and other EU policies*. In many areas, public policies have a greater overall impact if they are closely coordinated, rather than implemented in isolation. Relatively recent OECD studies suggest that it is important to *combine investments in transport infrastructure with support for enterprise and human capital development* to achieve sustainable economic and social development.

Fifth Cohesion Report was the first report adopted under the *Treaty of Lisbon* amending the Treaty on European Union and the Treaty establishing the European Community, adopted in Lisbon on 18 October 2007. It included *territorial cohesion as the third dimension of cohesion policy*, this following to be a *shared competence between the EU and Member States*. Five *guiding principles* were adopted to inspire political action at all accountable levels to guide the implementation of the Territorial Agenda of the EU Member States and to contribute to a culturally, socially, environmentally and economically sustainable Europe: i) solidarity between regions and territories ii) multilevel governance, iii) integration of policies, iv) cooperation on regional issues, v) subsidiary.

In accordance with the *Europe 2020 Strategy*, the EU regional policy should contribute to the achievement of its objectives on *sustainable growth* and *three priority areas* were identified (*a low-carbon economy, ecosystem services and eco-innovation*) and *two pillars of action*: i) *higher investment in sustainable growth* by encouraging a greater strategic focus on investments in sustainable growth through resource efficiency and reducing carbon emissions and ii) *better investment in sustainable growth* by improving the policy mechanisms to strengthen the application of principles of sustainable development into operational programs. It should be noted dual role of regional and local institutions to implement policies: that of *autonomous political agent* which sets local, context-specific targets (real subsidiarity) and the one of *embedded system to provide policies* that are set at a local higher level, but cannot be

implemented solely at those levels (multilevel governance and implementation) and the *task of policymakers is to understand more precisely which interventions are most appropriate to each territorial level* [3]. With regard to institutional capacity building at regional level, the EU introduced over time and supported various programs and tools for good governance practices augmentation (INTERREG and interaction, for example), the regions of the Member States applying them according to their characteristics and ideas .

3. Envisaged Changes in the EU Cohesion Policy for 2014-2020

In the context of the EU budget revision and the Europe 2020 Strategy a range of options to reform policy would be under discussion in 2013, when the current funding period ends. With the publication of the Fifth Cohesion Report in November 2010, the Commission presented its initial ideas *to better streamline the system for implementing cohesion policy and to improve assessment, course and results in a more effective target setting*. For the future cohesion policy, the *Commission proposed that funding to focus on key priorities relevant to Europe 2020 objectives, to maximize its impact*.

As indicated in the revised EU budget, but also in various reports [4], progress must be made in particular in the following *areas: concentrating resources on a few areas where Europeans want the EU to act* and on the Europe 2020 objectives and targets as well, *stronger and more focused conditionality contracts between the Commission and Member States/regions* and commitment of Member States to implement the necessary reforms for the policy to be effective, *improving policy effectiveness by focusing on results, major investments of the European Commission in human resources* and strengthened system of checks and balances within a new Council for cohesion policy. Explicit linkage of cohesion policy to the Europe 2020 Strategy offers a real opportunity to continue supporting the real convergence of the poorer regions of the EU, to facilitate coordination between EU policies and to develop cohesion policy into key a growth factor, including in terms of quality, for the entire EU, together with

addressing social challenges such as an aging population and climate change.

EU budget revision outlined a new strategic programming approach for cohesion policy in order to better integrate EU policies to achieve the *Europe 2020 Strategy* and its *Integrated Guidelines*. This approach consists of:

- A **Common Strategic Framework** (CSF) adopted by the Commission to translate the targets and objectives of Europe 2020 Strategy into investment priorities. It would cover the Cohesion Fund, the European Regional Development Fund, the European Social Fund, the European Agricultural Fund for Rural Development and the European Fisheries Fund (now, generic, **common strategic framework funds**). Each CSF fund supports the following thematic objectives, according to its mission to contribute to the Union strategy for smart, sustainable and inclusive growth:

- strengthening research, technological development and innovation;
- improving access to and improving use of and quality of information and communication technologies;
- improving the competitiveness of small and medium companies, of agricultural sector (for the EAFRD) and of fisheries and aquaculture sector (for EMFF);
- supporting the transition to a low carbon economy in all sectors;
- promoting adaptation to climate change, of risk prevention and management;
- protecting the environment and promoting resource efficiency;
- promoting sustainable transport systems and removing bottlenecks in key network infrastructures;
- promoting employment and supporting labor mobility;
- promoting social inclusion and combating poverty;
- investment in education, skills and lifelong learning;
- strengthening institutional capacity and efficient public administration.

Thematic objectives are translated into specific priorities for each CSF Fund and specific fund rules are established. Global resources available for commitment from the Funds budget for 2014-2020 are 338 993 760 032 EUR at 2011 prices [6].

- A **partnership agreement for development and investment**, which, based on a common strategic framework, would set *investment priorities*, allocation of national and EU resources between priority areas and programs, agreed benchmarks and targets to be achieved. This contract would cover the cohesion policy. In order to promote economic, social and territorial cohesion in a coherent and integrated manner, it may be useful to extend its scope to other policies and EU funding instruments. The contract will be the result of discussions between Member States and the Commission on the development strategy set out in their National Reform Programs. It should also describe the coordination between EU funds at national level.

- **Operational Programs** (OPs), which, as in the current period, would be the management main tools and should transpose the strategic documents into concrete investment priorities, along with clear and measurable targets - which should contribute to achieving the national objectives set in the Europe 2020 Strategy.

EU budget revision is a strong argument to increase the leverage of EU budget. New forms of financing for investment were developed in the programming period 2007-2013, departing from traditional financing based on grants towards *innovative ways of combining subsidies and loans*. Financial instruments help create revolving financing forms, making them more sustainable in the long term. New markets for various forms of public-private partnership are opened, also bringing into the equation the expertise of international financial institutions.

To improve financial engineering instruments in the cohesion policy, a series of *measures* could be considered:

- *greater clarity and distinction in regulation framework* between the rules governing financing based on grants and the rules governing forms of repayable assistance, especially regarding the eligibility of expenditure and audit;
- *channeling generic financial support to companies, mainly through financial engineering instruments and grants to co-finance targeted support schemes (innovation, investment environment, etc.);*
- *expanding both the scope and scale of financial engineering:* in terms of the scope

to include new activities (e.g. sustainable urban transport, research and development, energy, local development, lifelong learning or mobility actions, climate change and environment, ICT and broadband) in terms of scale, to combine capital interest subsidies with loans or other forms of refundable financing.

As mentioned above, the Lisbon Treaty added **territorial cohesion** to objectives related to economic and social cohesion. It is therefore necessary to address this objective in the new programs, with particular emphasis on the role of *cities, functional geographical areas, areas facing specific geographical or demographic problems*, and on *macro-regional strategies problems*. Integrated and territorial approach is multidimensional, adapted to the specific features and results on the ground. This may involve overcoming administrative boundaries and may require greater availability of the various levels of government to cooperate and coordinate their actions for achieving common goals. In addition, it meets the new territorial cohesion objective introduced by the Lisbon Treaty, which recognizes that the European level cannot achieve economic and social cohesion without putting a stronger emphasis on the territorial impact of EU policies. For this reason, common provisions proposed by the Commission introduce new integration tools that can be used to implement local strategies on the spot, establishing a connection between thematic objectives identified in the partnership contracts and operational programs and the territorial dimension: **community-led local development (CLLD)** (Articles 28-30 of the draft Regulation laying down common provisions) and **integrated territorial investment (ITI)** (Article 99 of the proposal for a regulation laying down common provisions).

CLLD may stimulate and involve the local organizations and communities to participate actively in achieving the Europe 2020 targets of smart, sustainable and inclusive growth, in increasing territorial cohesion and in reaching the cohesion policy goals. The European Commission proposed a single methodology regarding CLLD for the CSF funds, focused on **sub-regional territories**; placed under the responsibility of local communities through the means of **local**

action groups, formed by representatives of local socio-economic interests of public and private sectors; and achieved through **integrated and multi-sectoral strategies of local development by areas**, elaborated on the basis of local requirements and potentials, and including **features innovative in the local context**, network collaboration and cooperation. Such unique methodology will allow for connected and integrated use of funds to implement the local development strategies.

The integrated territorial investment (ITI) is a tool to implement the territorial strategies in an integrated manner, and not a secondary operation or priority of an operational program. However, ITI allow to the EU Member States to implement operational programs at inter-sectoral level and to attract funding from several priority axes of one or more operational programs in order to enforce an integrated strategy for a specific territory. Consequently, IT will provide the Member States with both flexibility in elaborating the operational programs and efficiency in implementing integrated actions through simplified funding.

4. Challenges of Implementing the New EU Cohesion Policy

Effective implementation of the Europe 2020 strategy requires a system of governance that involves actors of change in Member States *to ensure connectivity of European, national, regional and local government levels*. In order to fully mobilize all stakeholders, representation of regional and local stakeholders, of social partners and civil society should be enhanced, both in political dialogue and in the implementation of cohesion policy. Considering the above, support for dialogue between public and private entities, including socio-economic partners and NGOs should be maintained. In this context, the role of local development approaches to cohesion policy should be strengthened, for example by supporting active inclusion, fostering social innovation, developing innovation strategies and design of systems for the regeneration of deprived areas. They should be closely coordinated

with similar actions supported by rural development and maritime policies.

For Romania, a major challenge will be *to improve the quality of governance policies*, including of regional development policy, subsumed to the EU cohesion policy. European Commission studies [8] have revealed that the scores recorded by Romanian regions were very different in terms of *quality of governance indicators*, the best ranked being the North-West, South West Oltenia and Centre regions, and the worst ranked in this sense being the Bucharest-Ilfov region, the intra-national variation in quality of governance being high in Romania. Other challenge, "taken" from the current programming period, will be the *absorption of funds made available through funding mechanisms of common strategic framework*, and a new one the *strengthening of decision-making and action of local/regional partnerships* provided by the new architecture of EU cohesion policy. Also, the *creation, development and support of true intra- and inter-regional collaboration networks*, involving partners from different domains and on a scale much larger than the current one, would augment the implementation of cohesion policy objectives in Romania in the future.

5. Conclusions

The reform of the EU regional cohesion policy attempted to address the need to focus the Community assistance in those areas where the development was lagging behind, as well as the need to simplify structural policies procedures. Reorganization of policy objectives into three main areas (convergence, regional competitiveness and employment and European territorial cooperation) and specific initiatives developed to promote financial mechanisms for start-ups and micro-enterprises were among the main tools of this reform.

After the adoption of the Europe 2020 Strategy, an important goal of the future cohesion policy became to focus funding on key priorities relevant to Europe 2020 objectives, in order to maximize its impact. To achieve such a purpose, the EU budget revision outlined a new strategic programming approach for cohesion policy in order to better integrate EU policies to

achieve the Europe 2020 Strategy and its Integrated Guidelines, consisting of: a common strategic framework covering common strategic framework funds that support several thematic objectives; a partnership agreement for development and investment; and operational programs. For Romania, the major challenges in implementing the future cohesion policy will be to improve the quality of governance and the absorption of funds made available through funding mechanisms of common strategic framework, as well as to strengthen the decision-making and action of local/regional partnerships.

The Evolution of European Financial Assistance in Developing Human Resources to Improve The Performance-Competitive Advantage Relationship: The Case of Romania

Lunganu Raluca Petronela

Doctoral School of Economy, Faculty of Economy and Business Administration,
University “Alexandru Ioan Cuza”, Iași
raluca.lunganu@gmail.com

Abstract

Maintaining the competitive advantage through performance is the purpose of any company. This mission becomes difficult due to hostile economic, social and politic environment during the economic crisis. External and internal factors have a significant influence on company performance. Past studies show that internal factors as: physical, financial, human and organisational resources seem to be the most important. The research is focusing on the link between investing in human resources in order to gain competitive advantage and surviving the economic crisis. The main purpose is to show the evolution and importance of European financial assistance in Romania . The specific objectives of this paper are to highlight the relationship between human resources-performance-competitive advantage, based on the review of the theories and to describe the process of financial support through structural and cohesion funds. The results will show the evolution of the implementation of The Sectorial Operational Programme Human Resources Development.

Key words: Human Resources, Competitive Advantage, Performance, European Union

J.E.L. classification: O15, J50

1. Introduction

Social economic situation, modification of competition, unfavorable condition as a result of economic crisis has forced the owner of the business to have a serious relook at their management practices and the attitude toward performance, competitive advantage and resources. Based on existent theories the

companies can achieve sustained competitive advantage when they attract and uses resources which are valuable, rare, inimitable and have no substitute. [1] It is believed that human resources with competencies as skills, education, experience, potential and capacity are the major source of competitive advantages fulfilling all the characteristics listed above.

2. Perspectives on concept of performance and competitive advantage

There is a lack of interest in defining the “performance” concept. It is been assumed that the meaning of the word is well known and evident pointing to the end of any process, to outcome and results. French origin of the word indicates the results correlated with the success of the actions. English meaning indicate the carrying out an activity in accordance with certain objectives. The main common point is the positive outcome which can be measured. This is another issue: there are no universally criteria for measuring and evaluating of companies performance. Chronological approach on indicators used reveals five periods of time. Period between 1960-1970 performance criterion was considered firm size measured by indicators such as turnover and total asset. The second period was 1970-1980 when it was used accounting profitability, measured by net income, earnings per share and PER-price earning ration. During 1980-1990 performance criterion was considered released liquidity expressed by indicators of cash flow. The time between 1990-2001 representative performance criterion was value creation. This was measured using indicators as: return of investments through cash flow, economic added value and market value added. Currently used as performance

criterion is value creation from the perspective of sustainable development. A new concept emerged in the literature “overall performance” defined as “aggregation of economic, social and environmental performance” [2]

A superior company performance is linked with competitive advantage. This concept is described by researchers as a multidimensional and relative concept. For neoclassical economists the concept of “competitiveness” is associated with external concepts as market orientation and price manipulation. [3]. Juran adds internal concepts as efficiency and quality and suggest that any analysis of the economic competitiveness of a company must include an assessment of the competitiveness of product characteristics, evaluation of process characteristics or internal operations used for the products. [4] Porter M., probably the most often mentioned in competitiveness study, suggest that the sources of competitive advantage must be studied at enterprise and industry level. He identifies as sources of competitiveness: factor conditions, types of resources, quantitative and qualitative conditions of demand, the level of competition in related industries, the strategy of enterprise, the structure and existing competitors and the influence of national institutions. With other words, the source of a company competitive advantage is the action of two factors: external and internal. The external factors refers to the characteristics of the environment of the company, and the internal factors are the company specific resources, knowledge, capabilities.

Researchers refer to the ability to earn and maintain market share, or ability to provide goods and services at the time and place as requested by buyers, both on the domestic and international markets at prices as good or better than other potential suppliers earning at least from the opportunity costs of resources employed. Competitiveness of the enterprise may be the ability to design and produce products superior to those offered by competitors considering the price and non-price of quality [5]. Other possibility to analyze the competitiveness and the competitive advantage of a company is from value creation perspective. “An enterprise has a competitive advantage, if it is able to create more economic value than the

marginal competitor in its product market” [6]. From the perspective of positional superiority, competitive advantage can be defined as “a unique position that develops vis-a-vis its competitors” [7].

Competitive advantage comes from the ability to perform activities cheaper than competitors by using fewer resources or cheaper production process. Another source of competitive advantage is obtaining produce more effectively than rivals because greater customer benefits are produced with the same resources. The study of competitive advantage is linked to the term “distinctive competence”. This term is used to define the ability of an organization to perform a value-adding activity in ways that are superior to that of its competitors.

Competitiveness study is most often related to enterprise factors or resources. There are certain condition for a factor to become a source of competitive advantage. These condition refers to its value they must add positive value to the organization. Heterogeneity, durability and rareness are other condition of resources. They must be unique or rare among an enterprise current and potential competitors. Other condition are imperfect mobility, the inability to be imitated and the inability to be substituted with another resources by competing organizations.

They could be external factors, characteristics of an enterprise environment or internal factors, organization specific resources.

Basically, organization resources are divided in literature as follows: material resources, financial resources and human resources. Another classification in literature is by specificity: tangible and intangible. Commonly tangible resources (physical and financial) fail to met all the condition to be a factor of competitive advantage. The intangible resources as human, organizational and customer capital have a stronger positive influence on competitive advantage than tangible resources. The main reason is that they cannot be easily imitated by competitors. “This is a direct consequence of their invisibility, complexity and the complementarity with other resources and the specific environment in which they were created. Tangible resources are visible and easily to imitate or to purchase from the

market” [8].

In the process of formulating competitive strategies keeping a equitable balance between investments in tangible and intangible resources is a major challenge for the managers. Among intangible resources, human resources are more likely to produce competitive advantage because they are more often rare and can be more difficult to imitate..

3. The role of human resources in performance- competitive advantage relation.

It is widely known that people provide organization with an important source of competitive advantage through competences, intelligence, relations, values, experience and training. The way to generate advantage through superior human resources is by developing human resources through acquisition, retention, training, motivation and coordination/deployment. Because it is a process that requires considerable financial resources managers use external sources of finance.

There is a large amount of studies on the relationship between human resources and organizational performance. The correlation of business results and human resources is based on the simple premise that better deployment and use of human resources is reflected in an high performance level. Some examples are: higher profitability, less rotation, higher product quality, lower costs in manufacturing and a faster acceptance and implementation of the organizational strategy. [9] Human resources must create organizational value in order to be a source of competitive advantage. People can give value to the firm through skills, potential, experience and competences. The rareness criterion is connected with the fact that every human being is unique, it has his own level of specificity. For Romania case the rareness of human resources is translated in terms of labor mobility, due to the European integration, the effect of the brain-drain process and the aging population effect.

To become a source of competitive advantage, human resources must be inimitable. An organization can inimitable human resources in two ways: from the market or by developing internally. During economic crisis managers are forced to

limited their spending, therefore the investment in educating or training the human capital. Managers are seeking on the market workforce already qualified, the qualification responsibility being in the service of public authority. This explains the high number of projects funded by European Union for qualification and retraining of workforce.

For a resource to become a source of competitive advantage it must not have any substitutes. This is an easy criterion for human resources because it is very difficult to substitute an employee's actual work with application of technology. Even if it would be technically possible the cost of purchasing and implementing the latest technology would be too high.

There is no doubt that human resources are valuable in their capacities and abilities. Organization have to consider the employees as a source of competitive advantage through facilitating the development of competencies that are organization specific with the purpose of generate tacit organizational knowledge. Empirical research showed that investing in specific human capital can generate competitive advantage and long-term organizational performance. Companies that have interest in developing human resources recorded higher level of productivity.

In Romania, many organization recognize the growing importance of their human resources in obtaining a strategic position on the market. However there are few organization that have enough financial resources to implement a human resources development program. One of the benefits of European Union accession is contracting European funds as a source of external funding programs.

For European Union education and training developed as a policy area. To increase competitiveness it is necessary investment in human resources through lifelong learning. Emphasis was placed on the need of innovation, exchange of experience and information on good practices, mutual recognition of qualification and skills and the process of lifelong learning.

Particularly in Romania through Sectoral Operational Programme Human Resources Development 2007-2013 sets the priority

axes and the major intervention areas of Romania in the human resources field in order to implement the EU financial assistance.

The main reason of this programme is the fact that a highly qualified labour force, with a high level of education, having the capacity to respond to the new technologies and to the changing needs of markets, is essential to gain a sustainable competitive advantage.

4. The evolution of European financial assistance for developing human resources in Romania

The main instrument implemented to support economic development and structural changes is The Sectoral Operational Programme Human Resources Development. Under the coordination of Ministry of Labour, Family and Equal Opportunities seeks to increase competitiveness through developing human resources. The specific objectives of this programme are linked to improving public employment services, facilitating the access to a high quality education process and continuous education and training. There are seven priority axes: first is Education and training in support for growth and development of knowledge based society, second is Linking life long learning and labour market, third is Increasing adaptability of workers and enterprises, fourth is Modernisation of Public Employment Service, fifth is Promoting Active Employment Measures, sixth is Promoting Social Inclusion and seventh Technical Assistance. Fulfilling the specific objectives of these axes will result in increased competitiveness of organizations by encouraging innovation and the growth of the knowledge economy including new information and communication technologies.

It is known that Romania is lacking flexibility and diversity employment forms as well as forms of work organization correlated with the absence of flexibility and mobility of workforce. All these characteristics affect the competitiveness of enterprises who must face the effects of economic crisis. Through interventions in key areas there is expected an increasing of the number of specialised training, innovative actions aiming at increasing work productivity and the

harmonisation of work with family life, including through more flexible working programmes.

This analysis of data shows a relatively positive trend in the number of submitted projects.

Figure 1. The evolution of submitted projects during 2008-2011

Source: The Sectoral Operational Programme Human Resources Development 2007-2013 Annual Implementation Report 2011 (www.fonduri-structurale.ro)

At the end of year 2011 where submitted 10,204 projects. The total value is 9,92 billion euro of which 9.4 represents the contribution of the European Union. The large number of submitted projects indicates an increased interest of potential beneficiaries in developing the abilities of human resources in their attempt to build a competitive organization in order to survive the economic crisis. The increase by 23 percent compared to 2010 is due to a better coverage of these sources of funding and the development of institutions specialized in writing such projects. Unfortunately from 10,204 grant applications submitted 5,115 were rejected, 280 projects were on the reserve list and 2,993 applications were approved for funding, a total of 3.70 billion euro, of which the European Union contribution is 3.48 billion euro. (Figure. 2)

Cumulative value at 31 December 2011 of the payments made is 1.9 times higher than in 2010. This improvement was driven primarily by the large number of contracts signed during the year 2010, and secondly by increasing the speed of processing applications between 43 and 86 days.

Figure 2. The evolution of total value of the approved project during 2008-2011.

Source: The Sectoral Operational Programme Human Resources Development 2007-2013 Annual Implementation Report 2011 (www.fonduri-structurale.ro)

With a success rate of 35,68% the effects of implementing these projects may be visible at the level of target groups. The number of persons participating in financed operations increased approximately 3,77 times from 156.254 in 2010 to 589.324 in 2011.

Analyzing the distribution of participants by priority axis it is noticed that the highest number of participants are under Priority Axis number 3 Increasing adaptability of workers and enterprises. This is explained by the increased interest into improving the skills level of employees, increasing the training opportunities and the degree of access and participation in professional development. All these actions have as main purpose the high level of competitiveness and adaptability of enterprises. Second place is occupied by Axis number 5 Promoting Active Employment Measures. A number of 175.623 persons were part of active measures of modernization of work organization and human resource development to combat unemployment.

Distribution of contracted projects by type of beneficiaries show that 36% of contracts have as beneficiary public companies, 34% non-profit private companies, 24% private enterprise, the rest of 6 percent are assigned to private companies with public utility.

Though unemployment stood on a rising trend during the implementation of The Sectoral Operational Programme Human Resources Development 2007-2013 positive

effects at society level are difficult to quantify.

5. Conclusions

Nowadays it is more difficult for companies to develop strategies to gain competitive advantage. In the highly competitive market the managers must use all of organizational resources to obtain an high level of performance. A widely recognize source of competitive advantage is human capital. This resource meets four attributes simultaneously: rareness, value, inability to be imitated and inability to be substituted.

To leverage the full potential benefit of human capital investment are needed. Under the current economic crisis are required external financing sources.

The interest of European Union in education, training and employment it is expressed by financing sectoral programs. One of them is The Sectoral Operational Programme Human Resources Development 2007-2013 implemented in Romania. Due to the changes in the market workforce knows new obstacles. With a contribution of 3.48 billion euro from European Union only during year 2011 many projects contributed to development of human resources through education and training in order to improve the competitiveness of enterprises.

Rural Tourism Development Strategy for The South-West Region of Romania

Matei Florentina Daniela

Academy of Economic Studies, Bucharest

Faculty of Agro-Food and Environmental Economics

matei.florentina25@yahoo.com

Abstract

South-West Region of Romania has numerous and valuable tourism resources both natural and anthropogenic, and a long tradition in the ethnography, arguments for the inclusion of tourism among the main branches of the economy. The tourism industry developed on the background of exceptional natural resources, is a great chance of the county which has untapped opportunities, but may be the only chance of economic market conditions.

Keywords: Rural tourism, sustainable development, touristic offer, touristic infrastructure

J.E.L Classification: R11

Introduction

South West Region of Romania comprises five counties: Olt, Valcea, Mehedinti and Gorj, with an area of 29,212 square kilometers. It is bordered by Bulgaria, Serbia and South-Muntenia and the West Region.

Mehedinti county's tourism potential is dominated by landscape formed by the Danube River and its gorge, the diversity of the mountainous terrain, the existence of particular elements of flora and fauna, many of which are written in scientific reserves, plus an impressive testimony millennia past, expressed through a series of historical, architectural and art, some unique, valuable and their specificity.

Very interesting sights of this county are landscapes of Mehedinti' mountains chain, Cazanele Dunarii, Hydropower and Navigation Systems Portile de Fier I and II archaeological remains, historical monuments (churches and monasteries), nature reserves, grouped by location.

South West Region has a relatively well developed transport infrastructure, the region is crossed by three European roads: E70, E79 and E81, and two of the three pan-European corridors crossing Romania, Corridor IV - Berlin / Nuremberg-Prague-Budapest - Constanta-Istanbul-Salonic and corridor VII-Danube.

The main environmental issues affecting Mehedinti County refers to soil quality due to erosion and desertification, landslide danger exists, and air quality due to mining and chemical agents. Poor conditions of the wastewater collection network generates a high level of pollution of river courses and the insufficient number of garbage have a negative influence on the environment.

Materials and methods

In 2004, the South West region had a population of 2,317,636 inhabitants (10.69% of total population) with a density below the national average (79.3 inhabitants per km² compared to 90.9 inhabitants per km²). Rural-urban structure of the population is 52.8% vs. 47.2% (Romania - 45.1% vs. 54.9%), most rural counties are Olt (59.6%), Valcea (55%) and Gorj (53.3%).

Regarding Mehedinti according to provisional results of the census in October 2011, stable population was 254,600 people, of

which 45.7% had resided in cities and towns, while the percentage was higher in common - 54.3% of the total resident population. Under this criterion the number of resident population, Mehedinti County ranks 39th in the ranking of counties in the country.

Workforce Southwest region is the factor that contributed most to the socio-economic development, which is motivated flexibilă, innovative and highly specialized, thus contributing to the development of a dynamic entrepreneurial environment.

Regarding labor, the share of employed population is reduced 36.6% at regional level and county-level, Valcea has the highest occupancy rate (39.1%), the lowest occurring in River (34.7%). The branches of the economy, employment is concentrated as follows: agriculture and forestry have high weight-42.1%, Mehedinti County having a higher occupancy in these branches (48.4%).

Industry focuses lowest percentage of employed population (26.9%), while services have a higher share of 31%, this sector is more developed in Valcea and Dolj.

The number of unemployed has increased over time due to the liquidation of enterprises in the region, and the closing unprofitable mines, these changes have resulted in some economic and social disparities. Lack of urban jobs as people are led to rural areas, where practical, for maintenance, an inefficient agriculture, but also to other countries such as Serbia, Italy or Spain for unskilled labor.

Registered unemployment Mehedinți the end of January 2012 was 11,606 people (of which 6943 men and 4663 women) with 233 people increased from the previous month. Compared to January 2011 is a decrease of 1,794 people. After the training the 11,606 unemployed are grouped as follows:

- 525 people with higher education,
- With high school and post high 2746 people
- With primary, secondary or vocational 8,335 people.

Thus, the unemployment rate Mehedinți the end of January 2012 was 9.9% (11.3% in men and 8.4% in women), the highest unemployment rate in Romania.

Mehedinti county level, number of employees at the end of January 2012 was 40,714 people, up from 344 the previous month. Net average earnings of employees in Mehedinți in January 2012 was 1266 lei, down 201 lei / employee to that achieved in the country.

Real earning index, calculated as the ratio of the country's net nominal average earning index and consumer price index in January 2012 was 91.2% compared to December 2011 and 117.3% from October 1990, down 11.5 percentage points from a year earlier in late December 2011.

Growth followed a west-east direction, proximity to western markets by acting as a growth factor delivery. Economic growth has a significant geographical component, underdeveloped areas are concentrated in the Northeast, on the border with Moldova and the South, along the Danube. Underdevelopment appears to be largely correlated with the prevalence of rural activities, the inability to attract foreign direct investment and a low rate of entrepreneurship.

Strategic program to develop tourism in the area consisting of the counties of Timis, Caras - Severin and Mehedinti pursuing the following strategic objectives:

General objective:

Promoting economic and social development in the area of the Romania - Serbia through strategic planning in tourism development to support sustainable development of the area.

Specific objective:

Development of regional tourism potential by promoting projects, partnerships and associative structures to strengthen cooperation between the main actors in tourism as a result of the strategic program.

Table no. 1: Development Strategy of tourism infrastructure in the area consisting of the counties of Timis, Caras-Severin and Mehedinti

Results and discussions

Analyzing economic and financial indicators for the period 2007-2011 shows that after 2008, there was a depopulation in The South-West Region of Romana by the lack of jobs both in urban and in rural areas. Thus, employees chose to migrate to larger cities that have greater labor absorption, but also to other neighboring countries. Since 2010 the situation began to fix the economy at the county level began to rise, employment modificându by 3 percentage points over the previous year.

Based on the data at the county level estimates were made of the main economic and financial indicators by 2014 reflects the following situation: GDP will grow continuously since 2010 with the repopulation of the county. This is due to favorable changes in the labor market, where the number of employees will increase the The South-West Region, reducing the number of unemployed also, all these phenomena are due and employment opportunities in tourism, in all its forms manifestation. Also in upward earnings will change and with a lower but steady.

Analyzing the South-West of the country and especially Mehedinți, the poor tourism

development is due to factors such as relatively low population density in the area, infrastructure access (road and rail) to sights poor and underdeveloped, disinterest active population to develop tourist services, prices quite high existing tourism services, including ignoring the need to develop tourism by the communist regime. Also touristic offers and touristic products are competitive and the staff working in the tourism sector is under-qualified. Companies operating in the tourism sector are more interested in touristic destinations offer international and national law, thus directing customers to destinations outside the border area considered.

Conclusions

The environmental issues of the area are:

- Insufficient capacity of wastewater treatment plants (70% required) and landfill (60% of needs);
- Constant air pollution, especially in cities and around industrial centers, with frequent exceedances of the maximum specific indicators for monitoring environmental factors
- Existence of many former industrial sites, completely unidentified, and for which there is currently a methodology for identification, remediation, ecological, and no strategy for their subsequent destination (their reintroduction into the economic circuit, turning them into green spaces, etc).

SWOT analysis of the county in terms of tourism potential:

Strengths:

- High share of business travel and transit
- Local traditional market tour and transfer
- The county is crossed by European road
- Folklore and local traditions culinary, wine and wineries for wine tasting
- Bo vast cultural heritage: churches, monasteries, castles and monuments from antiquity to the present
- Lakes and watercourses can be arranged

- Parks and other protected areas with large areas
- The existence of surplus housing in rural households usable for tourism.

Weaknesses:

- Lack of unified management of protected areas to allow tourism in this area.
- Spot pollution and pollution made by tourists
- Lack of points and tourist maps
- Lack of access roads to tourist attractions
- Lack of specialized human resources in the field
- Lack of promotion of rural tourism organizations
- Lack of garbage collection and use of river basin as a landfill satulu
- Offer tourist services is poor
- Progressive degradation of cultural heritage tourism

Opportunities:

- Opportunity to access grants of EU Structural Funds
- Existence of programs administered by the Ministry of Environment and Sustainable Development which may give tourism management and operation of protected areas
- Growing interest in cultural tourism
- The existence of funding programs for rural development by non-agricultural economic activities (crafts crafts, tourism, etc.).
- Regaining traditional tourist attraction centers for tourists local and neighboring countries
- Possibility of implementing relatively simple tourist circuit of hiking trails

- Reduce damage to agricultural and forestry roads created and spontaneous manner used by repair and maintenance as a result of practicing tourism
- Existence of educational programs to train and improve tourism workforce

Threats:

- Environmental protection measures to the detriment of tourism
- Delay privatization of tourism units
- The poor quality of the environment in some areas of attraction
- The lack of competitiveness of the tourism product offerings
- Competitiveness of tourism products development in border areas
- Stagnation of rural tourism development in areas mono
- Low investment in tourism infrastructure
- Insufficient funds allocated for rehabilitation of transport infrastructure (especially road)

Regional Competitiveness: Introducing Clusters and Innovation Systems. Case Study: Sud Muntenia Region

Negrea Alina Petronela
Academy of Economic Studies, Bucharest
negrea_alina_petronela@yahoo.com

Abstract

The present research underlies on the idea that recently in both governmental long term strategies and economic theories regions are considered as centers of economic growth and as hubs in the spill-over of knowledge and that innovation is a critical component of long-term economic prosperity. The analyses focuses on discovering how regional competitiveness can be supported by innovation, emphasizing also the role that agglomeration economies and clusters have in this process. The study is based on a Romanian region, Sud Muntenia, and it presents an image of the innovation support structures, academic environment, innovation partnerships and clusters allocation in the region in comparison to the national level. The methodology used relies on quantitative and qualitative instruments, information being processed from statistical data, focus groups and questionnaires applied on the main regional actors involved in the innovation process.

Key words: competitiveness, regional development, innovation, clusters, Sud Muntenia

J.E.L. classification: O31, R11

1. Introduction

Competitiveness is one of the vexed, widely used and defined concepts by economists and scholars over the past years from different points of view. If the the concept regarding firm competitiveness is well defined and has received greater attention, when it comes to analyzing a region's competitiveness, things are not that clear and so far a common opinion hasn't been reached. The *macro-economic* level the

concept is poorly defined and strongly contested.

Despite the fact that improving a nation's or region's competitiveness is frequently presented as a central goal of economic policy and that recent developments in both public policy and economic theories place regions as centres of economic growth and of the improvement in the living standards, as key points of governance, organization and decision, arguments abound as to precisely what this means and whether it is even sensible to talk of competitiveness at a macro-economic level at all (*A Study on the Factors of Regional Competitiveness*). This is why presenting some of the definitions that are mainly used when it comes to regional competitiveness is important.

"A nation's competitiveness is the degree to which it can, under free and fair market conditions, produce goods and services that meet the test of international markets while simultaneously expanding the real incomes of its citizens. Competitiveness at the national level is based on superior productivity performance and the economy's ability to shift output to high productivity activities which in turn can generate high levels of real wages. Competitiveness is associated with rising living standards, expanding employment opportunities, and the ability of a nation to maintain its international obligations. It is not just a measure of the nation's ability to sell abroad, and to maintain a trade equilibrium."(*The Report of the President's Commission on Competitiveness, 1984* - in "A Study on the Factors of Regional Competitiveness")

"An economy is competitive if its population can enjoy high and rising standards of living and high employment on a sustainable basis. More precisely, the level of economic activity should not cause an unsustainable external balance of the economy nor should it compromise the

welfare of future generations.” (*European Competitiveness Report, 2000*)

According to Porter, the appropriate definition of competitiveness is productivity. A region’s competitiveness and standard of living (wealth) is determined by the productivity with which it uses its human, capital, and natural resources. (Porter, 2002)

Theories that regard regions as hubs of knowledge draw heavily on the notion of innovation, based on Schumpeterian and evolutionary economic insights. Innovation is seen as an interactive learning process that requires interactions between a range of actors, such as contractors and subcontractors, equipment and component suppliers, users or customers, competitors, private and public research laboratories. Systems of innovation also include universities and other institutions of higher education, providers of consultancy and technical services, state authorities and regulatory bodies (Hotz-Hart 2002, after OECD 1999).

It is beyond doubt that knowledge and innovation play a key role in economic development. This is even more visible at a regional level, as geographic disaggregation only highlights differences in development.

Michael Porter’s concept of *geographical clusters* has had considerable influence. Drawing on empirical evidence from a wide range of countries, he argues that a nation’s globally competitive industries tend invariably to exhibit geographical clustering in particular regions (Porter, 1998). This clustering is both the result of, and reinforces, the interactions between what he calls the ‘competitive diamond’. A region’s relative competitiveness depends on the existence and degree of development of, and interaction between, the four key subsystems of his diamond. (*A Study on the Factors of Regional Competitiveness*)

The European Union is among the pioneers of policy initiatives regarding the implementation of economic agglomeration concepts. The preoccupation for the reduction of disparities within the EU was probably the most powerful trigger, as this theme is given a very special attention in the regional development policy. (Cojanu, 2011)

Recent studies at the EU level deepens further the territoriality element, emphasizing the role of cities and urban areas in general, as the main sources of economic competitiveness. During the last decades EU has shifted political focus to innovation, the knowledge economy and sustainable competitiveness. Cluster based strategies have become central place in industry policy, but also in connection with regional and science policy at the EU level (Ketels&all, 2012). Clusters and networks have been identified as crucial instruments for the implementation of the Europe 2020 strategy of the EU. The EU 2020 flagship initiatives ‘Innovation Union’ and ‘An integrated industrial policy for the globalization era’ in particular mention clusters and networks as critical tools. The latter notably states that “Clusters and networks improve industrial competitiveness and innovation by bringing together resources and expertise, promoting cooperation among businesses, public authorities and universities” but also that “there is a need to develop more globally competitive clusters and networks” (Ketels, 2012)

2. Case Study: Sud Muntenia

2.1. Innovation system

The region is located in the south of Romania and it includes 7 counties (Argeş, Călăraşi, Dâmboviţa, Giurgiu, Ialomiţa, Prahova, Teleorman), 16 municipalities, 32 towns, 519 communes and 2019 villages. Industry is diverse and is the key contributor to the local economy (16.2%). Some sectors have a long tradition, e.g. chemical and petrochemical machinery and products, automotive (Dacia factories), machinery, equipment and transport devices, construction materials, textiles and food industry. Agriculture has huge exploitation potential, with 80.2% arable land. The region has a good road and rail transport infrastructure and connections to five pan-European transport corridors and the A1 and A2 highways. Naval transport is a main regional advantage due to the access to the main European navigation route of the Danube and to four harbours. The region accounts for nearly 33% of Romania’s touristic potential due to the Danube, the

southern part of the Carpathian Mountains, thermal resorts, national parks, agro-cultural and religious tourism, etc. The economy has high spatial segregation between the industrialized, richer North and the agricultural, poorer South. The region ranks 3rd in terms of national RTDI resources: it accounts for 7.7% of RDI expenditure, 6.1% of R&D units (82 research institutions, including 57 private, and 10.3% of RTDI employees (4,484 people) (INS 2005, 2009). The region has four public and private universities, with 33 faculties, located mainly in the Argeş and Dâmbovița counties. [9]

Regional innovation potential is relatively low: with a total of 457 innovative enterprises out of the 5,171 at national level, the South-East ranks 6th among the eight regions of the country (Innobarometer 2008). Innovative enterprises account for 19.9% of the total enterprise population (slightly lower than the 21.1% national mean), with large enterprises being the most innovative (48%). Innovation expenditure is very low at 1.5% of the total enterprises turnover and is mostly used for acquisition of equipment and software (82%), while intra-mural and extra-mural R&D expenditure remain very low at 12% and 4%, respectively. Process and product innovators account for 9.1% of the national total (2004-2006 data), and include a majority of SMEs (84%), concentrated in industry (75%) and services (25%). The region's SMEs (10.7% of the country) are concentrated in Prahova (30.9%) and Argeş (24.7%) and are poorly represented in Giurgiu, Ialomița and Călărași (0.9%) (*Regional Innovation Monitor*). [10]

The innovation support structure is represented by 16 industrial parks (30% of the national value), a business incubator in Câmpulung Muscel, Argeş, one center of technology transfer, innovation and business at the University of Ploiesti offering consulting services designed especially petrochemical industry and one innovation relay center. The range of services offered by them are less varied and is limited in most cases to utilities (electricity, gas, water, sewage, drainage system, parking). The available infrastructure requires large investments and their visibility among companies the private sector should be improved. The prevailing fields of the hosted companies are textile, petrochemical,

construction, electronics, medical and sanitary. Regarding the shareholder structure, they are owned mainly by county councils, there are also 2 private parks: Allianso Business Park (Ariceştii Rahtivani) and Industrial Park Kolkata - Bradu (Argecom) and 2 with joint public-private ownership: Technological and Industrial Park North and Industrial Park Mija in Dâmbovița County.

Disparities between the southern and northern part of the region are retrieved also in the geographical distribution of the support structures within the region. Thus, an overwhelming share is located in the northern counties. The representative county from this point of view is Prahova that after the inclusion of Mizil and Urlați in the industrial parks category has a number of 8 such structures, ranking second nationally after Brasov. The region's most developed industrial park is Ploiesti Industrial Park, with a public ownership with plans of expansion by opening new "work points" in Mizil, Ciorani and Urlați.

The geographical distribution of universities and research institutes in the region confirms once again the regional disparities between northern and southern part of the region. Thus, most research institutions are located in the north and their fields of study are accredited in conjunction with developed industries in the area (the petrochemical in Prahova, engineering and metallurgy in Dâmbovița County). Academic and research environment of the region is represented by: University of Valahia, Targoviste; Oil and Gas University - Ploiesti; University of Pitesti and "Constantin Brancoveanu" University – Pitesti. In the other four counties work only branches or faculties of universities from other counties or regions. Regarding the form of funding, three universities are financed from the state budget and Constantin Brancoveanu University is funded by private capital. Some universities started having a more pronounced **entrepreneurial character** and are involved in start-ups, spin-offs and spill-over processes.

Partnerships between SMEs, Research institutes and Universities in the region exist, but are specific and do not become permanent. The level of collaboration is different from one enterprise to another and according to the profile of each university.

Common projects are developed mainly with universities and research institutes from the Bucharest-Ilfov region. Few successful partnerships between the private sector and the academia and research sector were mentioned during the focus groups. Although both parties show their readiness to collaborate, things are still at an incipient and declarative stage.

2.2. Clusters

Clusters are seen as an important factor for the explanation of the empirical phenomenon of geographical concentration of economic and innovation activities. More than one definition of clusters exists, depending on its purpose and the specific context of its use.

The “Community Framework for State Aid for Research and Development and Innovation” defines innovation clusters as “groupings of independent undertakings — innovative start-ups, small, medium and large undertakings as well as research organizations — operating in a particular sector and region and designed to stimulate innovative activity by promoting intensive interactions, sharing of facilities and exchange of knowledge and expertise and by contributing effectively to technology transfer, networking and information dissemination among the undertakings in the cluster.”

One of the most used definitions of a cluster is the one of Michael Porter: “clusters can be understood as geographic concentrations of interconnected businesses, suppliers and organizations in a particular field. They bring together a variety of linked industries and stakeholders, as well as governmental and other institutions such as universities or trade associations. Importantly, a cluster is not simply composed of a group of similar businesses – for example car manufacturers – as this would be better understood as a sector. Instead, clusters represent fully formed ‘economies’ incorporating the various intertwined stakeholders involved in the production of a particular theme of end product.” (Porter, 198)

The regional cluster is defined as an industrial cluster, in which member firms are

in close proximity to each other (Enright, 2000).

There is no consensus when it comes to identifying and mapping clusters, either in terms of the key variables that should be taken into account or the procedures by which the geographical boundaries of clusters should be determined (Martin & Sunley, 2002).

Innovation is increasingly characterized as an open process, in which many different actors—companies, customers, investors, universities, and other organizations—cooperate in a complex ways. Ideas move across institutional boundaries more frequently. The traditional linear model of innovation with clearly assigned roles for basic research at the university, and applied research in a company R&D centre, is no longer relevant. Innovation can benefit from geographic proximity which facilitates the flows of tacit knowledge and the unplanned interactions that are critical parts of the innovation process. This is one of the reasons why innovation occurs locally whereas its benefits spread more widely through productivity gains. **Clusters** may embody the characteristics of the modern innovation process: they can be considered as “reduced scale innovation systems” (*Innovative Clusters. Drivers of National Innovative Systems*. OECD, 2001). Statistical evidence indicates a positive relationship between the presence of clusters and the prosperity of regional economies has brought to the fore the positive role that clusters and networks could play. Clusters and networks are increasingly seen as catalysts for accelerating industrial transformation and for developing new regional competitive advantages, speeding up the creation of firms and jobs and thereby contributing to growth and prosperity (*European Competitiveness Report, 2012*)

The general accepted *triple helix model* has to be adapted to the Romanian reality and transformed in a “Four clover” model, where the fourth actor is being represented by catalyst institutions: service providers in the field of innovation and technological transfer, centres for technological transfers, chambers of commerce etc (Guth, 2010)

The national geographical and sectorial distribution of clusters is represented in the graphs below:

Source: author calculations based on www.clustercollaboration.eu

The higher number of clusters are located in Cluj County representing 13% of the total national clusters, followed by the capital city Bucharest.

Figure 2. Geographical distribution of clusters

Source: author calculations based on www.clustercollaboration.eu

Source: author calculations based on www.clustercollaboration.eu

The results reflect a very heterogeneous situation concerning clusters. Some cluster sectors are more common than others: three in agro-food field (including wine and wood), textile and automotive, four in ICT and five in tourism and energy. The most representative sectors at the national level are tourism and energy, 10 clusters having as main activity this sectors.

In Sud Muntenia there were identified four clusters in Argeș, Dâmbovița and Prahova having as main activity tourism, electro tehnics, automotive and food. Out of this clusters, the Manufacture of motor vehicles cluster in Argeș(AUTO-AG) is clasified as a three stars cluster. (Cojanu, 2011)

Dacia-Renault has been comprising all the elements of the mature innovative industrial cluster, without being a pivot of the scientific research and world technology. Thus, Dacia-Renault is the center of ACAROM–ODETTE Romania (Association of Automobile Constructors from Romania), being the best structured and functional cluster, comprising small and big firms within the main production activity and within the support activities, consulting firms, research firms, financial organizations, universities. All the other clusters have lacked at least one main element for

innovation: the financial organizations (Dudian, 2011).

Table 1. Clusters in Sud Muntenia

NAME	FIELD	COUNTY
Agro-food Sud	Agro Food	Southern part
Electrotehnica	Electro technics	Arges& Dambovita
Carpathians Cluster	Tourism	Prahova
Dacia Renault Cluster	Automotive	Arges & Dambovita

Source: <http://clustero.eu>

Calarasi is considered as a potential cluster in Agriculture, Tourism and Electro technical Industry, **Ploiesti** with its area of influence - 3 cities (Băicoi, Boldești – Scăieni, Plopeni) and 10 communes is thought to be a **growth pole** and Dacia Renault Cluster as a potential **competitiveness pole**. The region has a great potential in developing clusters also in the glass and agricultural sectors.

3. Conclusions

The access and the availability of industry data and company business strategies are very limited.

Sud Muntenia has a set of valuable RDI factors: four university centers, a significant number of research institutes, high percentage of staff involved in research, tradition in mechanical engineering, petrochemical and agricultural good representation of business support structures, specialized human resources engaged in R&D, emerging clusters in machinery, petrochemicals industry and agriculture with great potential, the presence of large companies and multinationals in both traditional and emerging industries, a geographical proximity to Bucharest-Ilfov region, and thus by leveraging these strengths it can increase its economic competitiveness and focus on areas that have in which it has the needed human, financial and infrastructure.

Potential areas that can carry innovation research projects could be those in: machine building, petrochemical, electronics, bioginiering, agriculture or the environment, creation of industrial parks, organic farms, cultural-creative industries by making traditional handicrafts.

State Interventionism in the Capitalist Europe by Grants

Niculcea Silviu Petrișor

Abstract

Although, it is often said about the market-regulation antithesis, the market itself can not exist without regulation or without the State guarantee. Market exists because the State regulates private property, contracts, etc. The free market is not chaos but an organization whose responsible and guarantor is the State. The free market, in the strict sense of the phrase, does not exist, because the very idea of the market means the market rules that those on the market must follow. The market is not deregulation, but a certain type of regulation. The State intervention in the economy is constant and normal, because the State must ensure that the rules set - the market rules - are respected, even when it comes to the laissez-faire kind of liberal State.

Keywords: State interventionism, integration, regional policy.

J.E.L. Classification: R58

1. Introduction

Although the European Union is one of the most prosperous geographical areas of the world, the differences between the levels of development of the Member States as well as between the 268 various EU regions (including Romania and Bulgaria), measured by the Gross Domestic Product (GDP) per capita are very high.

To be united and also to remain competitive, the EU works by the regional policy for fixing the economic and social imbalances between its regions and Member States in order to reduce the disparities in the levels of development, in accordance with the Treaty of the European Union (Title XVII, art. 158 -162).

2. The Community regional policy

The socio-economic differences and the imbalances of development between the EU territories are the key factors underpinning the EU action through regional policy. The justification for action in the assisted regions requires taking into consideration the question of the value added of the community. An empirical reasoning leads to the conclusion that this justification exists when the Member State actions are not enough (the need criterion) and when the benefits generated affect (positively) the entire Union.

The community regional policy aims at reducing the disparities between the regions more developed and the ones less developed quantified, usually, in terms of the GDP/capita. This policy aims to “support those actions to help reducing the economic, social and territorial disparities within the Union” [1]. It helps to achieve this goal by concentrating the resources on those areas considered to be “left behind by others”. Most of these funds are allocated to those regions where the GDP/capita is lower than 75% of the EU average (the level of the GDP reflects quite different regional realities: in the new Member States – that meaning Romania and Bulgaria also - including the poorest 12 regions of the EU there are some regions where the GDP/capita is less than 25% of the EU average in 2002).

This policy does not address such disparities directly, but rather focuses on those interventions designed to influence the determinants of economic growth such as infrastructure, including transportation, human resources, ability to manage investments and services, in particular by means of a viable system of Small and Medium Enterprises, by an effective management of the public sector and by the information technology.

The regional policy has, in the first place, issues relating to the economic efficiency, the income levels or the employment rates. In the second place, it must be considered the optimal level of intervention: regional/national/supranational from which there can be coordinated and implemented the specific factors of the regional policy. The regional policies are disseminated by the administrative structures that have developed over time, in the same time with the spatial distribution of the economic activity. In the third place and the most important one, channeling funds to regions may generate adverse effects and for this reason it is important for the Structural Funds to not finance objectives that are in conflict or overlap, from the conceptual point of view.

The regional development policy is, by definition, recognition of the market economy weakness or a market response to the fact that the market activities do not properly react to the socio-economic needs.

The operating principle of the regional policy is based on competence shared between the EU, its Member States and its regions. The distribution method, which is the basis of this policy, focuses more than two thirds of the available resources.

When the Union intervenes in the less developed regions, by the Community funds, this intervention is based on the disparities between the regions. The Article 158 of the Treaty provides that, in order to strengthen the economic and social cohesion, the Community shall aim at reducing the disparities between the levels of development of various regions and the backwardness in developing the regions and the less favored islands, including the rural areas.

Thus, the regional policy is not only merely redistributive, transferring resources from the richest countries of the Union to the poorest regions, but it primarily has a very important role in creating new resources as well. Also, this policy has an allocation function because it allows the less advantaged countries and regions of the Union to maintain a high level of investment in the human and physical capital, in order to improve their competitiveness and growth potential and also to promote the sustainable development. It is also a policy based on the sharing of knowledge and technologies, experiences and best practices, as

well as on creating new networks of cooperation across Europe.

The regional policy concept derives from the broader concept of economic and social cohesion and defines, in the EU, a set of measures planned and promoted by the central and local government, in partnership with various stakeholders (private, public, volunteers) in order to ensure the economic growth, dynamic and sustainable, through the efficient capitalization of the regional and local potential for a better quality of life. Regional policy could include, by definition, all the activities that significantly affect the development of a region.

The regulations for the 2007-2013 programming period offers a new dimension and a new role to the regional policy: that of strengthening the growth, competitiveness and the number of jobs by integration of the Community priorities for a sustainable development as defined by the European Council in Lisbon in March 2000 and the one in Gothenburg in June 2001.

3. The European Union intervention in economy through Community Funds

The expression of economic and social cohesion was mentioned for the first time in the Treaty of Rome, but since the founding countries were relatively homogeneous from the economic point of view - at that time they did not face with some excessive disparities in the development between the regions (except for the South of Italy), it was no focus on this concept.

Although the Treaty of Rome stated, in its preamble, the need to reduce the regional disparities (the Member States must pursue the accomplishment of “a harmonious development of economy and the reducing of the disparities between the regions), various redistributive mechanisms were not foreseen at the time. Moreover, the Article 92.3 (now 87.3) of the Treaty of Rome states that the national subsidies (the State aid) could be considered compatible with the internal market only to the extent to which they promoted “the economic development of those areas where the standards of living were very low and that it was recorded a high unemployment”. The only institution that played a role in helping to reduce disparities was the European Investment Bank, which

will have given the national governments some low-interest loans for infrastructure projects. Meanwhile, it was created the “European Social Fund” to support the migrant workers.

Regarding the options of the national governments to operationalize their own objectives of regional development, between 1950 and 1960, the priorities related to the creation, development and protection of the basic industries - mining, steel, atomic energy plants, ship building - as a result of the importance which the process of industrialization had in developing the countries as well as in protecting these industries against the foreign competitors.

This approach is gradually changing, since 1970, in parallel with the Customs Union. Following the two oil shocks of the 70s and the degrees of the European competitiveness in relation to the Asian producers (especially Japanese) and Americans, European integration and a new approach to the regional policy were relaunched.

The profile of a regional policy starts to take shape during 1972-1975, while the accession of three new states: Britain, Denmark and Ireland. Thus, given the fact that England claimed damages as compensation of losses derived from the application of some common economic measures, and the last two members brought with them strong community development gaps, it occurs the problem of formulation of a mechanism for attenuating the differences in development within the group (ERDF 1975).

In the early 1980, the Commission launched a series of small integrated development programs that combined the financial support from ESF and ERDF in Naples and Belfast and in the Lozère region - projects combining ESF and EAGGF funds.

The regional policy occurs as a result of the major reforms that have occurred as a result of the EU enlargement and were initiated in the context of planning for the development of the Single Market (1985-1988). The political motivation to accelerate the promotion of the cohesion measures was driven by the fear that not all the Member States and regions will equally benefit from the Single Market. In particular, the least developed economies in the southern and western peripheries of the group (especially

Greece, Ireland and Portugal and parts of Spain, Italy, Germany and the UK) were exposed to an increased vulnerability, in terms of economy, if they did not receive a more consistent aid for their development [2].

The economic and social cohesion represents an objective only in 1986 (after the accession of Greece, Spain and Portugal, the poorest members of the group) by the Single European Act and became a central pillar of their development policy. After the adoption of the Single European Act (1986) and the launch of the Integrated Mediterranean Programs, the role of the cohesion policy increased, by including the compensation fees imposed by the Single Market, which was felt in the southern countries and in the disadvantaged regions. In the Single European Act, the goal of achieving the economic and social cohesion became clear – it was provided the legal framework for the regional policy, structured on the combined resources of the existing Structural Funds (ERDF, ESF and EAGGF - Guarantee), the Commission being tasked to formulate the rules for the management of the development programs.

Basically, the application of the Single European Act in the context of the economic and social cohesion europeanized the regional policy of the EU member states. Some of them - Belgium, Italy, France and Spain - have had to create their own sub-national institutions that have been assigned with the responsibility for implementing the development policies. Thus, in the mid-1980s, governments were no longer the exclusive judges of the regional development policies within their borders.

In February 1988, the Brussels European Council extends the solidarity fund operation, now called the structural funds - that significantly increase their allocations from the Community budget. Thus, it is officially recognized the importance of these instruments to reduce the disparities at the community level.

Reform consisted of five Council regulations and also of implementing Commission Regulations, which came into force on January 1, 1989 (being renegotiated for each programming period). This new approach brings a regional policy based on multi-annual integrated programs, which involved several levels: community, national,

regional. The logic of this approach was to set up a framework program, called the Community Support Framework which to be taken to another level in multi-fund operational programs and implemented through these ones, in the regions [3].

By this reform, there were attempted the integration and the coordination of all the Structural Funds (ERDF, ESF and EAGGF-O) at the Community level, in a single framework, for a period of five years (1989-1993). The allocation of the funds was achieved through six objectives:

-Objective 1: “Promoting the development and the structural adjustment of the regions delayed in point of the level of their development”, the delay being defined, as a general rule, as specific for the areas with a GDP per capita lower than the limit of 75% of the Community average. These regions (Northern Ireland, Greece, Portugal, most of Spain, Corsica, southern Italy, French dominions) accounted for about one fifth of the population and received about 2/3 of the loans granted by the three Structural Funds, for ERDF this part being up to 80% (loans ERDF, ESF, EAGGF);

-Objective 2: “Helping the regions with a declining industry” (ERDF and ESF credits);

-Objective 3: “Tackling the long-term unemployment” (ESF);

-Objective 4: “Facilitating the employability of young people” (ESF);

-Objective 5: “Accelerating the adjustment of the agricultural structures” (objective 5a EAGGF Guidance) and “promoting the development of the rural areas” (Objective 5b is endorsed by the three Funds);

- Objective 6 (introduced in 1995 after the joining of the Nordic countries, Sweden and Finland): “Development and structural adjustment of the regions with a very low population density, less than 8 inhabitants/square kilometer” (ERDF, ESF and EAGGF – the Guidance Section). Four principles were also introduced: compression, programming, additionality and partnership.

Compression is the basic principle of the structural reform in 1988, having the purpose to focus the regional policy instruments only where the biggest problems related to the regional disadvantages occurred. Geographic compression on some certain eligible areas is carried out by EUROSTAT by the instrument called the Nomenclature of the Territorial Units

for Statistics (NTUS), and aims the uniform distribution of the territorial units. NTUS is based on the criterion of the population number, with three levels: I - min 3,000,000, max 7,000,000, II - min 800,000, max 3,000,000, III - min 150,000, max 800,000) [4].

With the 1988 reform, the principle of compression restricts the areas of intervention of the Structural Funds and emphasizes the importance of compressing the regional policy support in areas with the GDP/capita below 75% of the Community average.

The principle of programming arises as a result of the fact that until 1988 there were funded individual projects that have had the impact of overlaps and even inefficiency. This principle relates to the preparation of the multi-annual development plans, which is based on the decisions made in partnership with the Member State and through a series of successive stages, ending up with the tasks taken by the public or private organizations. The multi-annual programming ensures a better coordination across programs.

Additionality, being one of the oldest principles of regional policy, stipulates that the Community resources complement and not replace the financial resources of the Member State receiving the grant assistance for mitigating/eliminating the disparities in development. With the reform, the European Commission succeeded in imposing this principle and in obliging the national governments to keep the national expenditure in areas benefiting from Community financial assistance [5].

The principle of partnership is closely connected with the principle of subsidiarity, which provides some independence to the junior authorities over the senior ones. Introducing the principle of partnership was an important step in the regional policy, meaning the recognition of the importance of regional and local level.

The reform involved doubling the Structural Funds allocated through the Community budget from 6.3 billion ECU in 1987 to 14.1 billion in 1993. The first programming cycle (1989-1993) was implemented differently in each country. It have been the hardest for Italy and Greece because of the difficulty of approaching the institutional changes, while Ireland, Portugal

and Spain quickly adapted to the procedures introduced by the 1988 reforms.

After the 1988 reform, the Structural Funds regulations have been revised three times, for the programming periods of 1994-1999, 2000-2006 and 2007-2013, and so have been the lists of the eligible regions. The desideratum of a balanced development of all the regions of the European community was introduced in the European Union Treaty (1992), by the Title XVII that defines the objective of the economic and social cohesion policy: “reducing the disparities between the levels of development of the various regions and the backwardness of the less developed regions or islands, including the rural areas”.

But what were missing until now were the right and the opportunity of the regions and different forms of sub-national governments to be represented at European level. This lack was offset by the Treaty of Maastricht which created the Committee of the Regions, an advisory organization of the EU, and the entry into force of the Single Market in 1993. Thus, in 1994, the nature of the institutional process in Europe changed completely. The regions could interact with the European political and administrative organizations for achieving their goals, having an advisory role for making the socio-economic policy at European level as well as increased responsibilities for the implementation of the policy at the local level.

Another change of regional policy was the creation, in 1993, of the Cohesion Fund (CF), which is for the Member States whose GDP was below 90% of the Community average. Unlike the Structural Funds, the allocations from CF were made for the projects negotiated directly with the European Commission, the intervention areas focusing on the improvement of the infrastructure and of the environmental quality.

As a result of the disparities increasing, as the number of the Member States increased, the total Structural Funds increased more than threefold, from about 43.8 billion ECU between 1988-1993, over 141 billion ECU for the period of 1994-1999 (values calculated in prices, 1992). In point of the structural policy, the community approach is on the one hand to propose and provide financial incentives and on the other hand it is to coordinate the policy of the Member States. The instruments used for this purpose are the Structural Funds (ERDF, ESF,

EAGGF, FIG) and the Cohesion Fund (for funding the environmental projects and the transport infrastructure), the community initiatives and more recently the pre-accession financial instruments. The Structural Funds supplement the usual and traditional financing. Any project financed from structural funds must demonstrate its economic impact.

The European Regional Development Fund (ERDF) was established in 1957 in order to redistribute a part of the budgetary contributions of the Member States to the less developed regions. The philosophy of the ERDF aims to strengthen the economic, social and territorial cohesion by reducing the development disparities and structurally adjusting the regional economies, including the reconversion of the declining industrial regions.

The European Social Fund (ESF) is a European Structural Fund, stipulated in the Treaty of Rome (Articles 123-125) and established in 1960. Initially, the role of this fund was designed on two levels: to cover half of the costs of the Member States for ensuring, to the workers, a productive reconversion through professional reintegration and resettlement allowances and for granting aid to the employees affected by the restructuring of the firms where they work. Managed by the European Commission and assisted by a committee headed by a European commissioner, the ESF has supported a total of 35 million people from 1970 to 1997, with an amount of about 30 billion ECU.

The European Agricultural Guidance and Guarantee Funds (EAGGF), initiated in 1962, are split in two parts about two years later. The Guidance Section contributes to the supporting of the regions whose development is lagging behind, by improving the efficiency in the production, processing and marketing of the agricultural and forestry products and the development of the local potentials in the rural areas. The Guarantees Section supports the rural development under the Common Agricultural Policy in areas with structural difficulties. Guidance section acts as a proper structural fund.

The Financial Instrument for Fisheries Guidance (FIG) helps the fishing industry in Objective 1 regions and other regions to adapt and modernize by creating a sustainable balance between the marine resources and their use, by increasing the competitiveness of the companies, by

improving the provision and development of fishery and aquaculture and by revitalizing the areas dependent on fisheries. This instrument was created in 1994 by grouping all the Community fisheries instruments.

Unlike the Structural Funds, the Cohesion Fund (CF) has not co-financed programs, but has provided direct funding to projects or stages of projects which were clearly identified at the outset. The Cohesion Fund appears as a special instrument of the solidarity policy, promotes the economic and social progress and eliminates the differences between the standards of living in the various regions and the Member States. The fields of action of the Cohesion Fund are the environmental protection and the trans-European networks associated to the transport infrastructure.

The European Union Solidarity Fund (EUSF) is the newest fund of the regional policy and was established in November 2002, as a result of the floods that affected France, Germany, Austria and the Czech Republic. The objective of this fund is to facilitate the expression of the EU solidarity for the population of a Member or acceding State which was affected by a major natural disaster. Thus, it is a fund that allows immediate reaction, efficient and flexible, depending on the nature and extent of the situation.

The pre-accession funds were designed by the European Union to prepare the candidate or acceding States to use the structural funds. As part of the EU pre-accession strategy, the financial assistance for the candidate States through pre-accession financial instruments such as PHARE, ISPA and SAPARD is implemented in compliance with the principle of avoiding the “double intervention”, by promoting complementarity and positive economic impact of implementing various community programs (Regulation (EC) no. 1266/1999).

The enlargement of the European Union from 15 to 27 Member States is an unprecedented challenge for the competitiveness and the internal cohesion of the EU. The relationship between the per

capita incomes of the richest and the poorest regions in the Union increase from 2.6 in the EU 15 to 4.4 in the EU 25, respectively to 6 in the EU 27, and the average of the GDP/capita decreases with 12.5%. In the EU27, more than a third of the population has an income per capita below 90% of the Community average (the current threshold of eligibility for the Cohesion Fund), compared to a sixth in the EU15.

4. Conclusions

Liberalism argues that the market is the only way to ensure the optimal allocation of resources, those reaching the ones that can best economically harness them and being a rewarding economic performance of these actors; the alteration of the market does not ensure such allocation any longer. Therefore, the State intervention in the economy, whether altering or not the competition, is perfectly justified and necessary, because the economy does not exist and cannot exist without the State guarantee. At the same time, the State intervention does not mean the market failure and the State must intervene in order to reconcile the objectives of this abstract entity that is the market - the purpose of the market is to produce as much wealth as possible - and the targets of the citizens, translated by the political agenda. Liberalism must be put at the service of the society and not vice versa.

Modelling the Disposable Income for the North-East Region of Romania

Pintilescu Carmen

„Alexandru Ioan Cuza” University of Iasi, Romania

carmen.pintilescu@uaic.ro

Abstract

The regional modelling has become a major topic in the specialty literature starting with the '60s, but in Romania this subject is still at an early stage. The modelling of the North-East region of Romania, which distinguishes itself from the ensemble of the other regions through certain distinct economic features, is a necessity and it aims at substantiate possible scenarios of economic evolution of the composing counties. The model presented in the paper defines the behavioural equations which describe the disposal income and its utilisation of this region.

Keywords: regional modelling, disposable income, econometric modelling.

JEL Classification: C01, J01, R23

1. Introduction

Starting with the '60s, the modelling of the regional development has been a major topic in the specialty works. The need to take into consideration the specificity of each region has led to the creation of complex regional models.

The main types of regional models are the input-output models (Leontief, 1951, 1986), the econometric models (Isard, 1960; Bolton, 1985) and the general equilibrium models (Partridge and Rickman, 2007). The models designed until now are different according to the subject of the model (intra-regional or inter-regional model), the degree of aggregation (aggregate or disaggregate models, at sector level) and the estimation method (deterministic or stochastic models, static or dynamic models) (Lemelin, 2008; Loveridge, 2004).

In Romania, the regional modelling is still at an early stage. The North-East region is different from the rest of the others through specific features: it is a region with a reduced

level of the GDP, of households' incomes and expenses, but with a very important occupational potential. This region contributed in 2008 with 17.87% to the total occupation of the country, still being a region with one of the lowest GDP levels. The modelling of such a complex region is a necessity, aiming to substantiate possible scenarios of economic evolution of the composing counties and, especially, to study the possibility of using this model in similar situations to those of the North-East region.

In the present paper, we shall present an econometric model of the disposable income and its utilisation for the North-East region of Romania which complete the model for the labour market (Pintilescu, 2012). The model is made up of a system of econometric equations which describe the economic structure of this region. In the first part of the paper we shall present the economic and social indicators included in the system of behavioural equations. In the second part, we shall present the econometric equations for modelling the disposable income and its utilisation for the North-East region. After the analysis of the stationarity of variables and the structural breaks of data series, we shall estimate the coefficients of the behavioural equations using estimation econometric techniques. The estimations of the coefficients of regression equations are showed in the last part of the paper.

The designed development model of the North-East region may be subsequently used to build plausible scenarios of economic evolution for the North-East region.

2. Data and methodology

The series of statistical data are formed of the yearly indicators registered for the period 1995-2008 at the level of the North-East region of Romania regarding the regional GDP (billions of lei/year), the total gross value added (billions of lei/year), the disposable income (billions of lei/year), the

incomes from the local budget (billions of lei/year), the governmental transfers (billions of lei/year), the net incomes and current transfers, the total consumption expenditures (billions of lei/year), the yearly total incomes of the population (billions of lei/year) and the gross investments (billions of lei/year).

The main sources for the statistical data are the National Institute for Statistics and the data provided by the National Commission for Forecasting.

The check-up of the series stationarity was performed using the statistical tests *Augmented Dickey-Fuller* (ADF) and *Philips-Perron* (PP). The estimation method used was the least square method (OLS). The structural breaks in the evolution of some indicators have been dealt by the inclusion of dummies variables (Gujarati, 1995; Maddala, 2001; Greene, 1993).

The data processing was performed using the statistical software E-VIEWS, Version 5.00.

3. Modelling the disposable income and its utilisation

The modelling of disposable income is performed, as a rule, by using the wage earnings (Artus and Bismut, 1986, van Miltenburg, 1997), the gross national product (Denton and Oksanen, 1972) or the gross domestic product (Kinoshita, 1994).

In the macroeconomic model of Romania (Dobrescu, 2000 and 2006), the disposable income (yd) is expressed by the equation:

$$YD = GDP - (BR - TR) + NOCAE \cdot ERE$$

where:

GDP – the GDP in current prices (billions of lei/year);

BR – incomes from the local budget (billions of lei/year);

TR – governmental transfers (billions of lei/year).

$NOCAE$ – net incomes and current transfers;

ERE – the exchange rate from lei to Euros.

For the modelling of the development of the North-East region, due to the lack of data as far as foreign transfers were concerned, the disposable income was approximated using the relation:

$$YD = GDP - (BR - TR).$$

Using the accounting equation of the form: $GDP = GVA + NIT$, the net indirect taxes

in current prices (NIT) were computed.

Subsequently, in order to estimate the coefficient of incomes from the local budget ($cbr = br/gdp$), of governmental transfers ($ctr = tr/gdp$) and of net indirect taxes ($cnit = nit/(ch + inv)$), we used the following econometric equations:

$$\Delta cbr = \beta_{14} + \beta_{15} \cdot cbr(-1) + \beta_{16} \cdot \frac{1}{t} + \beta_{17} \cdot D + \varepsilon$$

$$\Delta ctr = \beta_{18} + \beta_{19} \cdot ctr(-1) + \beta_{20} \cdot D + \varepsilon$$

$$\Delta cnit = \beta_{21} + \beta_{22} \cdot cnit(-1) + \beta_{23} \cdot \frac{1}{t} + \beta_{24} \cdot D + \varepsilon$$

where Δcbr , Δctr and $\Delta cnit$ are the first difference of the variables cbr , ctr and $cnit$.

In numerous studies conducted for countries with a consolidated market economy, the investments are correlated with the labour income, the stock of capital (Pindyck and Rubinfeld, 1998) or the employment (Cukierman, Pazner and Razin, 1977). Many other studies highlight the correlation among investments and GNP, GDP or disposable income (Brunia, 1994).

An important explanatory factor when explaining the investments is also represented by the interest rate.

The equation for investments estimation in the model for the North-East region is of the form:

$$mriy = \beta_{25} + \beta_{26} \cdot \frac{mriy(-1) + mriy(-2)}{2} + \beta_{27} \cdot ir(-1) + \varepsilon$$

where:

$mriy$ is the marginal rate of investments in relation to the disposable income

$$(mriy = \frac{d(inv)}{d(yd)});$$

ir is the National Bank of Romania reference interest rate.

To assess the consumption, we took into consideration the level of *Total consumption expenditures* (billions of lei/year) (ch) and we estimated the following equation:

$$richc = \beta_{28} + \beta_{29} \cdot rig + \beta_{30} \cdot ir + \varepsilon$$

where: $richc$ is the growth rate of total consumption expenditures in constant prices,

computed as follows:

$$richc = \frac{ch / ch(-1)}{cpi} - 1$$

rig is the yearly GDP growth rate in constant

$$prices: rig = \frac{gdp / gdp(-1)}{pgdp} - 1.$$

previously defined econometric models was performed by using the least square method.

The estimation of coefficients, the standard error values, the t Student statistics and the probabilities associated to these values as well as the values of the determination ratio (R-squared) and the Durbin-Watson statistics (DW) are presented in Table 1.

Source: Done by the author in the E-Views software

The results obtained highlight that the regression coefficients are statistically significant, considering a significance level of 10%, with four exceptions. For the utilization of disposable incomes, one should notice an accentuated positive influence of the GDP growth rate on the total consumption expenditures. Still, a small part of the disposable income increase goes to the increase in investments.

One should also observe a great influence of the interest rate on the investment level: at a 1% increase in the interest rate, the marginal rate of investments decreases on average with 0.82292%.

5. Conclusions

The model of disposable income of the North-East region of Romania presented in

this paper is made up of a system of econometric equations which describe the economic structure specific to this region.

The designed model for the North-East region may be, later on, used to build plausible scenarios of economic evolution for the North-East region. The simulations which will be conducted on the basis of this model will mainly focus the following aspects: the output reaction to the change of disposable income, respectively the effects of the change of disposable income on the weight of labour incomes within the gross value added; the reaction of investments to the change of disposable income and to the variation of income rate; the reaction of GDP growth rate in constant prices (the real output) to the change of the level of net indirect taxes; the simulation of inflation, that will be performed for the GDP deflator, in relation to

the change in the level of net indirect taxes; the reaction of growth rate of total consumption expenditures in constant prices to the change of disposable income and the variation of income rate.

The Impact of Economic Crisis on the Business Environment in Romania

Rusei Alexandru
Academy of Economic Studies
alexrusei@yahoo.com

Abstract

The business environment in Romania in the period 2009-2012 was strongly influenced by global crisis: economic performance declined, entrepreneurship has suffered and many companies were closed. Resisted those who have managed to adapt and to conduct business in areas that have survived best. Regional differences, size of company, financial results were the main characteristics were determined the company's ability not to leave the market.

For this work i used descriptive statistics to highlight companies that have survived the global crisis. After that, using the cluster tehniqe, i showed characteristics of these companies. This paper aims to indetify through empirical studies the relationship between economic performances and economic characteristics in Romania.

Key words: firm size, competitiveness, economic performance, business environment, survivor

JEL Classification: D22, M21

1. State of knowledge

In recent years, have written thousands of articles and many books about economic crises, but few of them treated the phenomenon as a whole. Rows flowed recently on the subject refers specifically to the current economic crisis, the main causes that provoked rather than to analyze companies that have survived the economic crisis.

In the literature, the companies survival analysis is based on Survivor Technique first applied by Stigler (1958), which is based on the assumption that the most efficient terminal

sizes is going to survive termination competition. This technique is mentioned by Shepher (2004) who used it to measure economies of scale, but the author says that "The method is worthless for evaluating firm-level economies, because it automatically includes pecuniary economies. Even some plant estimates may be tainted by pecuniary conditions" ([1], pp. 165)

Another method used was cluster technique, the technique evidenced in the book "Cluster Policies in Europe: Firms, Institutions, and Governance" (2008) written by Borrás, S., Tsagdis, D., Cheltenham, UK, Northampton, USA, 2008. The first economist to describe clusters in terms of "supply chains" was Alfred Marshall (1842 - 1924) (Marshall, 1920), which considering industrial agglomerations in England found that the geographic concentration of firms in a particular sector creates economic effects unintended positive. Cluster definition is found in legislation in Romania (GD 918:2006 - The "Impact") that cluster is a grouping of producers, users and / or beneficiaries for the implementation of EU best practices to enhance competitiveness operators. Michael Porter believes that:

"Clusters are geographic concentrations of interconnected companies and institutions from a particular area. Clusters comprise a group of related industries and other entities important from the point of view of competition. These include, for example, suppliers of specialized inputs such as components, machinery and services, and providers of specialized infrastructure. Often extend downstream clusters to various distribution channels and customers and laterally to manufacturers of complementary products and the industries related by skills, technologies or common inputs. Finally, some clusters include governmental and other

institutions - such as universities, standards agencies, think tanks, vocational training providers and employers - that provide specialized training, education, information, research and support.” (Porter M., 1998). (Porter, M.E., (1998), Competitive Strategy: Techniques for Analyzing Industries and Competitors, The Free Press, New York)

2. Research Methodology

To highlight the impact of the economic crisis on companies i used demographic data portal companies offered on the National Office of Trade Register – Recom online (<https://portal.onrc.ro/ONRCPortalWeb/ONRCPortal.portal>). According to the official presentation, the portal "is designated to online users interested in accessing legal information online about operators in Romania, registered in the Commercial Register. Information system of the trade registry is designed by the National Registry Trade in accordance with the laws in force, which has in the field. The Source of information is the business registers, computerized system maintained by trade registry offices attached to tribunals" (<https://portal.onrc.ro/ONRCPortalWeb/apmanager/myONRC/signup?p=portal.informareinitiala>). With this tool i created database of all active companies in 2009, then I checked how many of these companies are active in 2012.

In addition, i accessed the database of the Ministry of Finance, where available "information from the central database for recording MPF corporate taxpayers and public institutions, declarations of tax (VAT, excise, gambling), balance of during 1999 - 2011 the companies and operative records of outstanding obligations to the state budget " (<http://www.mfinante.ro/agentiicod.html?pagina=domenii>). So I had access to information on number of employees, turnover, financial results and regionalization NUTS2 level.

For data processing, i used empirical research by descriptive statistics (method presented Florea I. [1998] in his book "Descriptive Statistics. Theory and applications", Ed Continental, Alba Iulia, 1998.

3. The results of companies in Romania, 2009-2012

In 2009, at the start of the global crisis, at the trade registry was registered 636,964 active companies. Of these, remained active at this time 562,450 (88.3%). Most were closed by dissolution (19,774 - 3.1%), wound (13,435 to 2.11%) and radiation (12,758 to 2.00%).

Chart 1. 2012 status of companies active in 2009

Source: Own processing of the information from The National Office of Trade Register

When we look at companies that have remained in the market in 2012 in terms of regional division would look like this:

Chart 2. Split of companies by regions, 2012

Source: Own processing of the information from The National Office of Trade Register

Of the 562,450 companies remained in the market, most of them are LTDs (546,250 to 97.12%) with a total of 1-2 employees (398,238 to 70.80%) or 3-9 employees (113,263 to 20.14%)

Table 1. Split of companies by number of employees

No of employes	No of companies	Percent
1-2	398238	70.80%
3-9	113263	20.14%
10-49	41922	7.45%
50-249	7603	1.35%
>250	1424	0.25%
Grand Total	562450	

Source: own processing by the National Office of Trade Register information

Most companies that have survived are established in 2008 (60,067 companies - 10.68% of all firms) in 2007 (58,237 companies, 10.35%) and 2006 (49,734 companies - 8.84%).

Chart 3. Year when the companies still on the market in 2012 were founded

Source: own processing by the National Office of Trade Register information

In terms of turnover, best resisted those with turnover of between 100,000 and 1 million RON (23.06%) and those between 1 and 5 million RON (21.72%).

Collaborate with the number of employees, best resisted companies with turnover of between 100,000 and 1.000.000 RON with 1-2 employees (19.28%) and those with a turnover of between 1 and 5,000,000, all with 1-2 employees (11.27%)

Table 4. Split of companies by turnover and number of employees

50-249	7441	1.32%
>250	1416	0.25%
TOTAL	562450	

Source: own processing according to the Ministry of Finance

As activities, most companies that survived were those with commercial activities (193,802 companies - 34.46%), construction (58 736 companies - 10.44%), professional, scientific and technical (PFA, lawyers, doctors, etc. 57375 companies - 10.20%).

Collaborating this information with the turnover, best surviving companies with turnover between 100,000 and 1.000.000RON

with commercial activities (46,417 companies - 8.25%), those with a turnover of between 1 and 5,000,000, also with commercial activities (45,828 companies - 8.15%)

4. Conclusions

In conclusion, these changes represent a repositioning of companies depending on the industry, number of employees and turnover. The changes occurred in demographics reflect the fact that we are witnessing a process of renewal of the business environment in Romania, which can be seen as an opportunity for modernization and innovation. In fact, it is the manifestation of so-called "creative destruction process" described by Schumpeter ([2.]), the emergence of new firms able to cover niches in November market, while firms less competitive economic environment disappear.

Another chance for survival lies in the increase of employee productivity, considering that most companies have a number of employees between 1 and 2. Increased productivity can be done through specialized courses through trainings online sites or through implementation of regional programs for training of companies (especially for the SME sector).

Also, most of the companies still on the market are those with commercial activities (trades) so the companies, to survive, should focus on this sector, and the government should help them with special facilities. More than this, 28% percent are in Bucharest-Ilfov region, so they should focus their activity in this region.

An aid can come in especially for the SME sector it consists gaps in developing regions through investment programs for SMEs by simplifying administrative procedures for accessing structural instruments by supporting regional networks to support local businesses.

Acculturating or Translating Economical Terminology?

Șerban Monica

“Constantin Brâncoveanu” University of Pitești
monika_serban@yahoo.com

Abstract

The translation of economical terminology is an intricate subject matter, especially when it is placed in the context of globalization.

It presupposes sharing values, attitudes and identities. That is to say, it places two cultures into contact. This impact presupposes an acculturating process which is to make the difference in assessing the quality of translation.

This is a difficult process but, if the users of economical terminology get through a process of adjustment leaving behind the cultural traits, they may reach to foreignization (an alienation from homeland’s cultural values) which is not the aim of our research paper.

Key Words: culture, globalization, translation, identity, acculturation

J.E.L. Classification : Z 11

1. Introduction

Translators are aware that they contribute to the shaping of their own mother tongue, focusing on both the contact between translator and author and on the contact between the translator and the user – or consumer – of the translated text.

Translators have been defined themselves as the ‘guardians of language’. The word ‘guardian’ has been viewed as implying a closed attitude; that is to say, an attitude of defending one’s language and culture.

Conversely, the speaker expresses a wish to act not as a guardian but as a host(ess), welcoming new words with open arms, neologisms representing new blood for the language supposing that it is not ‘contaminated’ blood.

2. Strategies of translating economical terminology

As we have mentioned above, speakers are more inclined to inhale neologisms using different strategies which are more or less consciently put into practice. Writers or economists also have this tendency of adopting or importing new terminology, especially when economical terminology comes into play.

For this reason, the task of the translator is of utmost importance. We should mention the fact that translation is important and necessary because, on the one hand, it reveals the flexibility of a language and its various means of expressing itself and it helps at preserving both the identity and ‘personality’ of a language, on the other.

Importing foreign terminology implies that we assume the attributes of the other nation; that is to say, we absorb the language, culture and tradition of the SL (source language) which implies, at the same time, a tendency of imitating.

The word, as the minimal unit, is the tool of every translator. It is for this reason why the translator has to be aware of the way s/he manages it and the way s/he transfers it into another language and culture, respectively.

In the discussion of translation strategy, the dichotomy literal vs. free has always been at the centre of the debate. The selection of one translation strategy may be dictated by both textual and extratextual constraints. In this respect, some questions may arise: Is only the text or only the purpose of translation or other factors that generate the selection of a particular receptive mode?

Translators have categorised translation strategies as follows: direct translation (literalness, borrowing and calque) and oblique translation (transposition, modulation, equivalence, adaptation).

In the case of *direct* translation, the translator has to transfer the SL text

constituent by a constituent in the TL. In other words, the primary meaning of the word is attached great importance.

Literal translation may be classified in word for word translation and one to one translation. In the translation process, the translator should be conscious of the gaps or ‘lacunae’ in the TL that must be filled by matching elements so that a correspondence between the two messages may be created.

Vinay and Darbelnet suggest that *borrowing* (also described as adoption or importation), the most direct translation strategy, is used to fill a lacuna, that is to say, a lexical and cultural gap. [12]

Moreover, they consider that introducing an element of local colour in the TT is a matter of style and message. For instance, the terms “chamber”, “table” and “marble” are among the many borrowings introduced in English from Old French.

Dictionaries such as L. D. L. T. A. L. define the entry ‘borrowing’ as “a word or phrase which has been taken from one language and used in another language”. [14]

On the same line of thinking, Newmark mentions that borrowings are not only practical but also a means of introducing elements of local colour. [8]

Another fact to be mentioned is that the invasion of Anglicisms into the other languages makes local people feel alienated from their own LC (language-culture).

Unlike Italian and Japanese languages which import foreign words either to fill a lexical gap or to impress, the English language is liable to inventing. Adams points out that borrowing may be realized either at the lexical level or at the phonetic, phonological, syntactic and morphological level. For instance, Latin borrowed even the sounds of Greek. [1]

It is common knowledge that one of the outcomes of the linguistic and cultural contact between different linguistic systems is the process of borrowing foreign words. English, for instance, has in its inventory loan words introduced from other cultures such as Latin, French etc.

It has been mentioned the discrepancy between past and present-day lexical borrowing. In the past one language might have borrowed from another because the TL (target language) lacked either the technology or the knowledge to invent a term

of its own, as in the case of Latin borrowing terms from Greek in domains such as geography and philosophy. In the globalized world, the situation is changed. There is hardly a country in the world which lacks basic knowledge in any given subject. There are situations when there is a need to create a new term because a new product has come into the market.

Another special type of borrowing which Vinay and Darbelnet identify is *calque*. As Dollerup puts it, calque translation refers to “compounds or phrases which are rendered element-for-element [...]”. [4]

Vinay and Darbelnet differentiate between the lexical calque and the structural calque. In the former case, the translator both preserves the syntactic structure of the TL and introduces a new mode of expression.

When the result of the literal translation is unsatisfactory, Vinay and Darbelnet suggest that translators must resort to the *oblique* translation. According to the two authors, the oblique strategies that translators may choose in translation are: transposition, modulation, equivalence and adaptation.

Transposition has been defined as the substitution of one word class by another without changing the meaning of the message.

It may be both an intralingual and interlingual translation procedure. An example of intralingual translation may be the substitution of a verb by a noun as follows: “He announced that he will arrive” may be transposed as “He announced his arrival”.

Moreover, the translators admit the possibility of choosing between two types of transposition: obligatory transposition and optional transposition.

The second method, *modulation*, is a variation of the form of the message, achieved by a reshaping in the point of view. According to the two translators, two types of modulations can be distinguished: free (or optional) modulations and fixed (or obligatory) modulations.

Modulation is considered to be a type of transposition at the global level, involving categories of thought, not grammatical categories. [11]; [9]

Equivalence, one of the crucial issues in translation studies, is a relative notion since it is submitted both to the historical-cultural

framework of the ST (source text) and its translation and to the textual and extra-textual elements and situations such as the way reality is perceived or how translation traditions have been passed down.

Vinay and Darbelnet consider that the same situation can be rendered by two texts using completely different strategies. As an outcome of this situation, the SL (source language) and the TL (target language) texts are equivalent.

In discussing equivalence, various translators have debated on possible units of translation that should be conveyed in the TL such as the individual word, group, clause, sentence or the text as a whole.

Equivalence has been said to exist between texts only, not between words or meanings. We share Newmark's opinion that “one is transferring all three, it depends on how you prefer to look at the process—at least all words in the SL text have to be accounted for”. [8]

Another interpretation is offered by Bell who claims that meaning is fundamental in translation studies. He points out that “[W]ithout understanding what the text to be translated means for the L₂ users, the translator would be hopelessly lost. That is why the translation scholar has to be a semanticist over and above everything else. But by semanticist we mean a semanticist of the text, not just of words, structures and sentences. This is because the key concept for the semantics of translation is textual meaning”. [2]

Adaptation, the fourth oblique translation procedure, is used when the situation in the SLC (source language culture) is not known in the TLC (target language culture) and, therefore, the translator has to create a new equivalent situation.

Dollerup's cultural adaptation occurs when a feature in the SC (source culture) is rendered by a feature which is common to the TC (target culture) and is expected to have the same impact as it does upon the audience of the SC. In other words, “the unfamiliar is replaced by the familiar”. [6]

In any translation, gaps may appear. The translator's task is to close the gap between the two cultures involved in translation, to surpass the barriers and transcend the difficulties s/he may encounter. Therefore, s/he should be able to manage the translation strategy and be flexible in any situation. In reality, gaps arise in translation because there

are not corresponding realities in the TLC (target language culture).

3. Linguistic and cultural (un)translatability

Translation does not only presuppose lexical transfer but cultural transfer as well. The cultural element is of great importance in translation because language cannot exist without a culture and vice versa.

Regarding the concept of untranslatability, Catford [3] distinguishes between linguistic and cultural untranslatability. Linguistic untranslatability occurs when there is no lexical or syntactical equivalent in the TL for a SL item.

Catford makes a clear-cut distinction between linguistically relevant features (the situational ones) and the functionally relevant features (they are relevant to the text's communicative function in that situation).

According to Catford, both the ST and the TT must be associated with the functionally relevant features of the situation, so that translation equivalence is achieved. As he puts it, “both source language and target language texts must be relatable to the functionally relevant features of the situation” so that translation equivalence may occur. [3]

A number of objections have been formulated against his theory of translation equivalence. Some critics dismantled Catford's definition of translation equivalence. They argued that a translation is not interchangeable with its ST in a given situation since STs and their translations operate in different language communities.

Consequently, translation equivalence (TE) cannot be verified on the criterion of interchangeability in a particular situation.

As far as the translation shifts that may occur in the process of translation are concerned, Catford asserts that they are “departures from formal correspondence in the process of going from the SL (source language) to the TL (target language)”. [3]

He identifies two major types of shifts: level shifts and category shifts. In the process of translation, the level shifts occur when a SL item at one linguistic level has a TL equivalent at a different level. In Catford's view, translation between the phonological and graphological levels or between one of these levels and the levels of grammar and lexis cannot be achieved since ‘relationship

to the same substance’ is a prerequisite for translation equivalence. The most frequent shifts are those from lexis to grammar and from grammar to lexis.

Catford introduces the terms unbounded and rank-bound translation when he makes reference to the category shifts. Unbounded translation may be identified with “‘normal’ or ‘free’ translation in which SL-TL equivalences are set up at whatever rank is appropriate”. [3]

These equivalences are established between sentences, clauses, groups or words (e.g. equivalence of the type sentence-to-sentence). Nonetheless, in the translation process, equivalences may move freely up and down the rank-scale and they may generally be created at ranks lower than the sentence.

According to Catford, the syntagm ‘rank-bound translation’ applies to those special situations where equivalence is intentionally limited to ranks below the sentence.

Consequently, the translation is considered to be a bad one, or a translation in which the TL text is either not a normal TL form at all, or is not relatable to the same situational substance as the SL text.

4. Acculturation-a translation strategy

The growing interest in the notion of identity is an outcome of a continuous contact between distinct communities carried out by phenomena such as globalization.

The concept of “acculturation” is intriguing not only because it covers different meanings but also for its relevance for altering identity. The term “acculturation” is used within anthropology and folklore to refer to modifications produced by intercultural impact which alter a variety of the ‘deep structure of culture’.

On the other hand, in cultural studies, the process of learning the socialization rules is labelled as “enculturation”. As some culturalists put it, it refers to a process of transformation which begins in the domestic environment through parental appeals which act as guidance for their children.

Others conceive acculturation as a four-staged gradual process starting from euphoria, going through insecurity and recovery and, finally, reaching acceptance. Therefore, in their opinion, acculturation refers to the ability to transit to cultural spaces.

Gudykunst and Kim envisage cross-cultural adaptation as a part of an ongoing process. [5]

They consider that adaptation is a result of **enculturation, deculturation, acculturation** and **assimilation**. Moreover, they link enculturation to the process of socialization of the home culture preceding the contact with the host culture.

They also describe the terms “acculturation” and “deculturation” as a rooting out of the home culture. The term “assimilation” is finally ascribed the highest degree of acculturation. In the light of Gudykunst and Kim’s model, adaptation appears to incorporate the development of both the linguistic supply and socio-cultural traits.

In our opinion, acculturation is both a process of embracing a culture of a particular country and a product, that is to say, the outcome of a cultural alteration.

We consider acculturation to be at the centre of our debate on economical terminology because, on the one hand, it brings about issues related to authenticity and questions the problematic of translation, on the other.

5. Economical terminology in translation

We have mentioned above that the invasion of Anglicisms into the other languages makes local people feel alienated from their own LC (language-culture).

As a rule, the phenomenon of importing Anglicisms (such as “broker”) appears in order to fill a lexical or cultural gap in the TLC.

Questions may arise: Is it a matter of style as in the case of “chamber”? Is it a matter of message? Is it a matter of untranslatability?

By way of illustration, we have chosen particular economical terminology (words and expressions) in order to demonstrate their translatability.

The term “cash” has been imported by many economists without even endeavouring to translate it. Dictionaries translate it as “bani numerar” or “numerar” or “bani gheață” (used informally). We agree with the translation “plată în numerar” because it suits the economical purpose better.

Moreover, the syntagm “cash flow” has been defined as “flux de cash ale încasărilor și plăților unei întreprinderi” despite the fact

that dictionaries such as D.T.F.A. explained it as “flux de numerar”. [15]

We agree with the latest translation although “cash flow” “indică cel mai adesea, printr-o formă tabelară, totalitatea resurselor și obligațiilor de plată ale unei întreprinderi [...]”. [13]

Another example is the term “barter” which is not usually translated but acculturated as such. The D.E. dictionary defines the entry “barter” as “schimb direct de bunuri, fără mijlocirea banilor”. [13]

In addition, the D.T.F.A. defines it as “barter, troc, vânzare în contrapartidă”. [15] Since we are in favour of translating the economical terminology, we agree to the D.E.’s definition of the term “barter”.

The term “clearing” appears to be another example of acculturation. It does not fill a gap in the TL, respectively in Romanian, since we have translations of the term. For instance, the D.E. explains this entry as “ethnică de compensare a obligațiilor reciproce între doi parteneri constând în compararea creanțelor cu obligațiile dintre ei, pe baza unor reglementări prealabile”. In this situation, the translation is possible and we suggest as counterpart the syntagm “achitare or compensație”

Another example of acculturation is the term “dumping”. The fact must be mentioned that the D.E. defines this entry as “politică de vânzare a unor mărfuri pe o piață externă la un preț mai scăzut decât costul marginal”. In addition, the D.T.F.A. explains the term “dumping” as being “vânzare de bunuri pe piețe străine sub prețul de cost”. We consider that this should not be the case of acculturation and we agree with the translation offered by D.T.F.A.

6. Conclusions

Consequently, translation of economical terminology is necessary and possible. The answer to the question arisen in the title of this research paper has to be “translation” since acculturation implies not only the altering of a nation’s identity but also the impossibility of translation.

It is for this reason why the translator has to be aware of the way s/he manages the translation act and the way s/he transfers the source material into another language and culture, respectively.

In the translating process, the selection of one translation strategy may be dictated by

both textual and extratextual constraints. Hence, the translator has to be competent in choosing the right strategy and make the right decision when choosing the counterpart of a specific term or syntagm.

The strategies aforementioned are the tools of a translator but one should be aware of the fact that, in the translating process, the translator comes with his/her own cultural background which shall matter for the final product.

Perfect synonymy cannot be achieved among words and, moreover, perfect equivalence is never possible among different languages and cultures. Despite this fact, translation is and should be possible.

Subsection 1
Economy and Economic Informatics

The Econometric Modelling of the Number of the Unemployed in the SE Region of Romania According to the Number of Higher Education Graduates and the Investment Level

Aivaz Kamer Ainur

OVIDIUS University of Constanta, Romania, Faculty of Economical Sciences
kamer_aivaz@yahoo.com

Abstract

The purpose of this research was to identify several features of the unemployment phenomenon in the SE region of Romania, using several of the most significant indicators highlighting the main correlations between specific labour market indicators and an indicator by which we can assess the economic development degree of a country. The resulted regression equations, tested from the point of view of their significance, allow, on the one hand, the assessment of the existing situation and, on the other hand, the performance of the forecasting calculations required to develop different scenarios and strategies for attracting investments and EU funds in order to reduce the number of the unemployed and to absorb higher education graduates on the labour market.

Keywords: the econometric modelling; unemployment phenomenon; labour market indicators; the multivariate analysis.

JEL classification: C12, C13, C20, E24

1. Introduction

In each historical period, mankind faces a number of negative phenomena, which must be overcome. The last three decades seen through the evolution of unemployment have led states to pay particular attention to this phenomenon which is becoming increasingly thorny. 20-30 years ago, the world's average unemployment rate was 2-3% and, at present, most countries reach the rate of 10% and even over 10%. Nowadays, unemployment is rightly seen as “massive and chronic”.

Currently, workforce is highly liberalized; many millions of people leave their poor countries to work in developed countries and to secure a better life. This should be an

effective system of action but, unfortunately, it is working incorrectly. These people that come in more developed countries receive the hardest work, the most thankless; however, they receive a higher salary than the one they would receive in their home country. This is an exodus which cannot be stopped but which can be reduced by promoting efficient labour market policies. Labour market flexibility is the primary means of modelling labour supply and protection, mainly on this path of employment and not by administrative and legislative means. Labour market flexibility is not a therapy applicable with the same good results in any case of “disease”; it may also be a necessary evil. According to a report completed by the National Institute of Statistics, the unemployment rate among young people aged between 15 and 24 stood at 23,7% in 2011. Taking into account, on the one hand, this alarming statistic and the complexity of the studied phenomenon, and, on the other hand, the purpose of this research, the research methods used in this case study were: the bivariate analysis, the multivariate analysis, the correlation analysis, the analysis of variance, the analysis of regression, the statistical testing.

2. The results of the econometric modelling

The study of the unemployment phenomenon was made indirectly, based on “office” information, with statistical indicators derived from various databases; the research objectives aimed to provide all the necessary information in order to support decisions, both quantitatively and qualitatively.

Starting from the premise that the econometric model extracts what is essential at the level of the statistical data series used

in order to characterize an economic process, we considered appropriate to use the econometric modelling within this case study. Given the complexity of calculations, on the one hand, and the multiple variables, on the other hand, we used the SPSS software. All processing by which we obtained the indicators for our analysis and the tests assessing the significance of parameters were made automatically by this software specializing in econometric analysis. The trends in the evolution of unemployment are followed by an analysis of the connection and interdependence between the indicators that characterize the phenomenon, i.e. the number of the unemployed, the number of higher education graduates and the investment level in the SE region of Romania, for 1990-2012.

We are going to check for the SE region the dependence of “the number of the unemployed” on “the number of higher education graduates” and on “the investment level”. For the correlation with the processing results in SPSS, we are going to use the following names of the three variables:

y = the number of the unemployed (SOM);
x₁ = the number of higher education graduates (ABS);
x₂ = the investment level (INV).

The multiple linear regression econometric model proposed in this case will be:

$Y = \beta_0 + \beta_1 \cdot X_1 + \beta_2 X_2 + \varepsilon$ or
 $SOM = \beta_0 + \beta_1 ABS + \beta_2 \cdot INV + \varepsilon$, where ε is the random variable error (residue) and β_0 and β_1 are the parameters of the regression model.

Table 1. The calculation of simple correlation coefficients

Correlations		SOM	ABS	INV
Pearson Correlation	SOM	1.000	-.695	-.737
	ABS	-.695	1.000	.957
	INV	-.737	.957	1.000
Sig. (1-tailed)	SOM	.	.000	.000
	ABS	.000	.	.000
	INV	.000	.000	.
N	SOM	19	19	19
	ABS	19	19	19
	INV	19	19	19

The resulted Pearson correlation coefficients indicate strong and inverted connections between the number of the unemployed and the number of higher education graduates, and between the number of the unemployed and the investment level. If we also look at the relationship between the number of graduates and the investment level, we find a direct and very strong connection, the Pearson coefficient recording a value of 0,737.

For the multiple linear regression model, using the method of least squares, there were estimated the parameter values listed in Table 2:

Table 2. The calculation of regression equation parameters

Coefficients		Unstandardized Coefficients	Std. Error	Standardized Coefficients	t	Sig.
Model		B		Beta		
1	(Constant)	154113.492	13242.316		11.638	.000
	ABS	-6.790	1.705	-.695	-3.981	.001
2	(Constant)	133378.323	19089.474		6.987	.000
	ABS	1.155	5.667	.118	.204	.841
	INV	-1.105	.754	-.850	-1.466	.162

a Dependent Variable: SOM

The regression equation for the number of the unemployed is:

$$\hat{Y} = 133378,323 + 1,155 \cdot X_1 - 1,105 \cdot X_2 \text{ or}$$

$$\hat{Y} = 133378,323 + 1,155 ABS - 1,105 INV$$

The estimation $b_1 = +1,155$ shows that every change by 1 to “the number of graduates”, keeping “the investment value” constant, modifies “the number of the unemployed” in the same direction, by 1 person. The estimation $b_2 = -1,105$ shows that every change by 1 to “the investment value”, keeping “the number of graduates” constant, modifies “the number of the unemployed” in the opposite direction, by 1 person. The estimation $b_0 = 133378,323$ has no known economic significance in this case.

Table 3. The calculation of the correlation ratio

Model Summary		R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics		
Model						R Square Change	F Change	Sig. F Change
1		.695	.483	.452	31194.7228	.483	15.851	.001
2		.737	.544	.487	30191.7921	.061	2.148	.162

a Predictors: (Constant), ABS

b Predictors: (Constant), ABS, INV

c Dependent Variable: SOM

Considering that, in this case, we decided to use a multifactorial model, the assessment of the intensity of the connection between the 3 variables is done by using the multiple correlation ratios.

The result is $R = 0,737$, indicating a strong connection between the three variables. The estimated value of the determination report (R-squared), i.e. $R^2=0,544$, indicates that, within the chosen model, the variation in the independent variables explain, in the ratio of 54,4%, the variation in the dependent variable (i.e. “the number of the unemployed”), the remaining 45,6% representing the contribution of other factors not included in the model.

An important step is to test the parameters and model significance.

Table 4. Testing the validity of the econometric model

ANOVA

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	15424587535.063	1	15424587535.063	15.851	.001
	Residual	16542882415.884	17	973110730.346		
	Total	31967469950.947	18			
2	Regression	17382760945.406	2	8691380472.703	9.535	.002
	Residual	14584709005.541	16	911544312.846		
	Total	31967469950.947	18			

a Predictors: (Constant), ABS

b Predictors: (Constant), ABS, INV

c Dependent Variable: SOM

Testing the validity of the regression model:

- the null hypothesis is established: H_0 : the model is not valid;
- the alternative hypothesis is established: H_1 : the model is valid.

The F test is calculated: $F_{\text{calculated}} = 9,535$. $F_{\text{calculated}}$ is compared to $F_{\alpha; k; n-k-1} = F_{0,05; 2; 19} = 3,52$, for $k=2$ and a significance level of $\alpha = 5\%$, (table value); and since:

$F_{\text{calculated}} = 9,535 > 3,52 = F_{0,05; 2; 19}$ and prob. (F-statistic) = $0,002 < 0,05 \Rightarrow$ the H_0 null hypothesis is rejected at a significance level of 5% and the alternative is accepted; therefore, the model is valid.

The results obtained in Table 2 indicate that only the parameters β_0 and β_2 are significant, with reservations on the parameter β_1 .

The histogram of the standard notes of the residuals (of the errors or deviations of the model from reality) is as follows:

We can observe that it does not respect the normal curve, especially for the very high values, which shows that our model has problems in forecasting the high values of the number of the unemployed, but it is good on the other hand side in forecasting the lower values.

The Normal P-P Plot represents the graph of the cumulated possibilities of the standard notes of the residuals. If they would be approximately normally distributed, they should follow the line of the cumulated percentages described by the normal curve, a straight line situated on the diagonal of the graph from the lower left to the upper right.

As our points are distributed on the upper graph, we can observe that in the superior part of the graph the points exceed the diagonal, whereas in the inferior part we have an opposite tendency. This shows that for higher values of the dependable variable our regression model has the tendency to overestimate the reality, whereas for the lower values the tendency for underestimating the reality emerges.

3. Conclusions

Unemployment and employment remain some of the most sensitive issues of the economic crisis, the harmonization of the economic performance with social equity generating a multitude of problems that need to be answered.

In the economy, the lost production is the most important consequence of unemployment. Taking into account that the involuntary unemployed would like to work but they cannot find a job, a part of the potential production is thus wasted. This effect is more pronouncedly manifested during recession periods. Thus, production decreases, businesses income decreases, state revenues from taxes decrease and, thus, the population is affected again by the reduction in government transfers. The creation of new jobs depends primarily on the economic growth, which, in turn, depends on investments and on the international context.

A stable economic environment is fundamental to the creation of new jobs in the formal economy for all groups of workers, but especially for the young graduates who are longer affected by the economic downturn due to low seniority at work and lack of experience (last come, first out). The conclusions of this study indicate that, at a significance level of 5%, *the model is valid* and the variation of the independent variables, i.e. “the number of higher education graduates” and “the investment

level”, explain in the ratio of 54,4% the variance of the dependent variable, i.e. “the number of the unemployed”.

Abstract

The purpose of this paper was to realize a multivariate analysis of the monthly unemployment rate in the county of Constanta using the following variables: the average net wage (SAL), the number of the employees (EMPL), the consumption price index (IPC) for the January 2000- march 2012 period. This analysis is based on the correlation study that can be established as a consequence of applying the parametric correlation methods between the mentioned indicator and the influential factors.

Keywords: the unemployment rate; the average net wage; the number of the employees; the consumption price index; the multivariate correlation.

JEL classification: C12, C13, C20, E24

1. Introduction

For the complex analysis of the connection and interdependence of the socio-economic phenomena, the elementary statistic methods are mostly insufficient.

The ties between the mass economic phenomena are characterized by the fact that one phenomena or another vary under the influence of a complexity of factors that are of a significant importance or of a secondary importance.

The first step that needs to be taken for the analysis of the statistical connections is the identification of the correlations, establishing the influential factors and their prioritizing.

Furthermore, the analysis of the forms under which the causality relations are

manifested and measurement of the statistical connection degree is needed.

Determining the factors that have the most powerful influence on the analysed phenomena, practical measurements for assuring the optimal conditions of its development, the intensification of the positive factors, the elimination or the attenuation of the influence of the unfavourable factors can be projected and realized.

The following aims were the basis of selecting these methods: a quantification that is as accurate as possible of all the influential factors; the selection of the principal factors, the measurement of the intensity and of the direction of the existing connections between the phenomena which characterize the commercial activity.

Generally, the correlations between the phenomena are based on the fact that each phenomenon is manifested under the influence of a complexity of factors, some of them being essential and other having a reduced and less significant influence.

2. The analysis of the multivariate correlation between the characteristic indicators of the unemployment rate

The tendencies in the evolution of the unemployment rate are completed through an analysis of the connection and of the interdependence between the characteristic indicators of the unemployment rate: the average net wage (SAL), the number of the employees (EMPL), the consumption price index (IPC) for the January 2000-march 2012 period.

This analysis is based on the correlation study that can be established as a consequence of applying the parametric

correlation methods between the mentioned indicators and the influential factors.

In this case, the regression analysis undertakes the following steps:

- the development of the regression model;
- the estimation of the models' parameters;
- the verification of the accuracy of the obtained results.

In the development of the multifunctional linear regression (ANOVA), it is hypothesized that the Y variable depends on the factorial variables X_1, X_2, X_3 and it is also hypothesized the reciprocal of the latter. If the factorial variables are interdependent, the multicollinearity phenomena are produced.

According to Ragnar Frisch in his research, *Statistical Confluence Analysis by Means of Complete Regression Systems*, 1934, Oslo, this represents the linear or nonlinear relation between two factorial variables, which are considered independent, of a collinearity model. In the same time, the multicollinearity determines the distortions of the models' parameters, and its testing can be done with the help of the Farrar and Glauber. In this way, with the help of the first we test the null hypothesis which states there is no multicollinearity in the model of correlation.

The second test allows the identification of the variables that are strongly affected by multicollinearity.

The third test is used in order to establish if the value of the partial correlation coefficients differ significantly from zero. If following the application of these tests it is found that the multicollinearity exceeds limits, to lower it, the data series used in the analysis can be enlarged or we use the transformation of variables.

The multiple linear regression function has the following general form:

$$Y_{x_1, x_2, \dots, x_n} = a_0 + a_1 x_1 + a_2 x_2 + \dots + a_n x_n + \varepsilon$$

where a_0, a_1, a_2, a_i, a_n represents the models' parameters that have the following meanings: a_0 = free term, with a mean character expressing the influence of the considered unregistered factors with constant action excluding the X_1, X_2, X_i, X_n factorials included in the regression model;

a_1, a_2, a_i, a_n = regression coefficients and show with how is amended in average the variable Y when the X_1, X_2, X_i, X_n factorial variable is modified with a unit.

The estimated parameters of the model will be analysed in terms of the sign, size and significance. If we consider statistical criteria and the forecasting, these relate to: the degree of significance of parameters estimated, the share of the explained variance in the total variance of the resulting variable Y, the connections between the variables called multicollinearity factor, the size of the standard error of regression estimation parameters, autocorrelation residual values.

In conclusion, in the case of the complex connections, the calculation of the correlation cannot be limited only to variable pairs, but it must also include other independent variables with significant influence on the dependent variable that are analysed. The joint influence of these variables is measured by multiple correlation indicators.

Also, within multiple connections, the factorial variables have different influences on the variable result; some exert a significant effect on the phenomenon and must be taken into the calculations of regression and correlation, while others have a share less important and can be neglected.

The correlation methods have as an effect the simplification of the calculations and conclusions, because it is very difficult to quantify the set of all causal factors acting on a socio-economic phenomenon or process.

The quantification methods and statistical techniques, of factorial analysis, estimation and testing are represented by a set of procedures and extended range of statistical and mathematical tools.

The most significant of these procedures and tools are also applicable, in one form or another available input data in order explicitness factor and, consequently, the separation of information necessary for making decisions for action.

Multivariate analysis was performed using the 3 models in which we included a factorial variable at a time.

The table Model Summary gives us information about the predictive power of our model to "fit" to the reality that we want to predict.

The multiple correlation coefficients (R) for each model indicate strong the stochastic links for each model and the R Square indicates the proportion of the variation in our dependent variable explained by the model.

Table 1. Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.674	.454	.451	1.7239	.454	118.272	1	142	.000
2	.795	.633	.628	1.4194	.178	68.477	1	141	.000
3	.892	.796	.791	1.0620	.163	111.839	1	140	.000

- a Predictors: (Constant), SAL
- b Predictors: (Constant), SAL, EMPL
- c Predictors: (Constant), SAL, EMPL, IPC
- d Dependent Variable: UR

Model 1, with an $R^2=0,454$ shows that 45,4% of unemployment is explained by the first factor considered (average salary), the remaining 54,6% representing the influence of other factors not included in model.

Fisher's F test shows that this model contribute significantly to the predictive power of regression (Sig.F Change <0,05).

Model 2, with an $R^2=0,633$ shows that 63,3% of unemployment is explained by the two factors considered (average salary and the number of employees), the remaining 26,7% representing the influence of other factors not included in model.

Fisher's F test shows that this model contribute significantly to the predictive power of regression (Sig.F Change <0,05), i.e. each variable brings new information.

Model 3, with an $R^2=0,796$ shows that 79,6% of unemployment is explained by the three factors considered (average salary, the number of employees, consumer price index), the remaining 21,4% representing the influence of other factors not included in model. Fisher's F test shows that the third model contribute significantly to the predictive power of regression (Sig.F Change <0,05), i.e. each variable brings new information.

The ANOVA table contains the analysis of variance for each regression model, the analysis shows how efficient is our model for the prediction knowing the independent variables.

The regression models and the components of the variance are presented here: how much it is explained by the model (on the “REGRESSION” row), how residual it is (the “RESIDUAL” row), and the percentage of the variance that the dependable variable has (the “TOTAL” row).

Table 2. ANOVA

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	351.492	1	351.492	118.272	.000
	Residual	422.008	142	2.972		
	Total	773.499	143			
2	Regression	489.444	2	244.722	121.476	.000
	Residual	284.055	141	2.015		
	Total	773.499	143			
3	Regression	615.590	3	205.197	181.924	.000
	Residual	157.909	140	1.128		
	Total	773.499	143			

- a Predictors: (Constant), SAL
- b Predictors: (Constant), SAL, EMPL

The results indicate that model 3 explains best the unemployment rate variable (regression=615,590 from residual=157,909).

The verification of truthfulness of the multifactorial regression model and multiple correlation ratio based on the criterion "Fisher" leads to the following conclusion: because the probability Sig. F is less than 0,05, multifactorial regression models are valid, with a significance threshold of 0,05.

Based on the obtained results in the Coefficients table we can draw up the regression equation for the 3 models with which we can predict the unemployment rate from the factorial variables.

Table 3 The Coefficients of the models

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	95% Confidence Interval for B	
		B	Std. Error				Lower Bound	Upper Bound
1	(Constant)	9.949	.310		32.082	.000	9.336	10.562
	SAL	-3.521E-03	.000	-.674	-10.875	.000	-.004	-.003
2	(Constant)	33.778	2.891		11.684	.000	28.063	39.493
	SAL	-3.486E-03	.000	-.667	-13.075	.000	-.004	-.003
	EMPL	-5.322E-03	.001	-.422	-8.275	.000	-.007	-.004
3	(Constant)	26.033	2.284		11.400	.000	21.518	30.548
	SAL	-7.778E-04	.000	-.149	-2.396	.018	-.001	.000
	EMPL	-4.494E-03	.000	-.357	-9.218	.000	-.005	-.004
	IPC	.118	.011	.661	10.575	.000	.096	.140

- a Dependent Variable: UR
- Correlations
- c Predictors: (Constant), SAL, EMPL, IPC
- d Dependent Variable: UR

		UR	SAL	EMPL	IPC
Pearson Correlation	UR	1.000	-.674	-.433	.818
	SAL	-.674	1.000	.016	-.786
	EMPL	-.433	.016	1.000	-.112
	IPC	.818	-.786	-.112	1.000
Sig. (1-tailed)	UR		.000	.000	.000
	SAL	.000		.425	.000
	EMPL	.000	.425		.091
	IPC	.000	.000	.091	
N	UR	144	144	144	144
	SAL	144	144	144	144
	EMPL	144	144	144	144
	IPC	144	144	144	144

The regression equations for the 3 analysed models are presented as follows:

1. $UR = 9,949 - 3,521E-03 SAL$
2. $UR = 33,778 - 3,486E-03 SAL - 5,322E-03 EMPL$

3. $UR = 26,033-7,778E-04SAL-4,494E-03$
 $EMPL+ 0,118 IPC$

The “t” test applied to the non-standardized regression coefficients indicates that they are significantly different from zero for all 3 models.

After the presentation of the corresponding parameters of the models, table number 4 shows information concerning the residuals, to be more precise, the values of the dependable variable, the one that are predicted, compared with the real values.

Table 4 Residuals Statistics

	Mini mum	Maxi mum	Mean	Std. Deviation	N
Predicted Value	4.159	12.709	6.960	2.074	144
Residual	-2.179	4.363	1.45E-14	1.050	144
Std. Predicted Value	-1.350	2.771	.000	1.000	144
Std. Residual	-2.052	4.109	.000	.989	144

a Dependent Variable: UR

The *predicted value* is the gross value forecast by the model. Using this, the average of the unemployment rate when we know the average salary, the number of the employees and the consumption price index is 6,9%, with a minimum of 4,1% and a maximum of 12,7%.

Residual shows us the deviations of our model from reality. In this way we can observe that we can deviate either in minus (forecasting an unemployment rate with 2,1% lower than in reality), either in addition (forecasting a higher unemployment rate with 4,3%). Due to the fact that the average of this residual value is very low (1,45E-14), as well as the standard deviation, we can affirm that our model forecasts the unemployment rate fairly well, with a deviation of $\pm 1,050\%$.

The histogram of the standard notes of the residuals (of the errors or deviations of the model from reality) is presented as follows:

We can observe that it does not respect the normal curve, especially for the very low values, which shows that our model has problems in forecasting the small values of the unemployment rate, but it is good for forecasting the higher values.

The Normal P-P Plot presents the graph of the cumulated possibilities of the standard notes of the residuals. If they would be approximately normally distributed, they should follow the line of the cumulated percentages described by the normal curve, which is a straight line situated on the diagonal of the graph situated from the lower left to the upper right.

As our points are distributed on the above graph, we can observe that in the inferior part of the graph the point exceed the diagonal, whereas in the superior part we have the opposite tendency. This points out that for the lower values of the dependable variable; our regression model has the tendency to overestimate the reality, whereas for the higher values the tendency to underestimate the reality emerges.

The Scatter plot diagram shows that our distribution is normal (most of the values are concentrated in the centre).

3. Conclusions

The valid models presented in this paper have identified correlations on the labour market in particular that can form a basis for analysis and decision-making at both the central and local authorities, which can implement economic and political measures as well as the business and of the academics. They can guide such work according to tendencies observed can explain shortfalls in economic or social indicators can be used to predict future developments of the same indicators.

Alarming increase in unemployment levels associated with a decrease in employment will be the interest issues that require solving. In this paper we tried to systematize wide material information while conducting labour market issues in national and European level. Trying an interdisciplinary approach to the phenomenon of unemployment, the paper aims to support the theory and practice of bringing the minimum information management within the literature presented, without claiming that the subject of this thesis is exhausted.

In the analysed study case we observed that all the 3 independent variables (the average salary, the number of the employees and the IPC) can be used as predictors for the dependent variable (the unemployment rate), model 3 having the highest prediction power. Obviously, our prediction does not totally overlap the reality, deviations from it exist (of $\pm 1,050\%$) and the tendency to overestimate the lower values and to underestimate the higher values appears.

Nevertheless, our model comes with new information, its existence is more beneficial

than its nonexistence, fact that is proven by the fairly high value of the coefficient square of the multiple correlations (0,796).

The Impact of International Migration on Labour Market

Abstract

In the twentieth century international migration has become one of the essential factors of globalization alongside the capital mobility, technology and information. Migration has always been a part of global social change like colonization, industrialization and world wars. One of the most significant forms of international migration is labor migration. The stated goal of this form of territorial mobility is to increase social mobility by changing the individual migrant welfare state which has become an important object of study for sociologists.

Complex and of significant proportion phenomenon of the contemporary world, the international labor migration has attracted the attention of many specialists from national and international scientific organizations, governmental circles in various countries. Individually or collectively, voluntarily or forcibly, people have changed their residence within their own country or abroad, almost always connecting the migration act to achieving some aspirations regarding new opportunities and certainties.

The causes and possible solutions of international labor migration and its social and economic effects are mentioned in this article.

Keywords: globalization, labor migration, countries of origin, intelligence exodus, countries of destination.

J.E.L. classification: F22, F66, J11, J15, J21.

Introduction

Migration is not a modern phenomenon, nor has nowadays reached the highest levels, but it has also acquired new meanings thanks to modern communications and transportation. We are witnessing a polarization between rich and poor individuals, as the demand on the labor market structure has changed, fewer workers are needed for the production process due to modern technology now performing most of the tasks, while necessary force employment in the service sector has increased. Also differences between the incomes of those with higher education and those with secondary education are growing and the differences in terms of economic wealth between developed and developing countries are growing.

In countries of origin

For the country of origin, of departure, regardless of external migration, the export of human capital, of workforce in which there have been made significant investments, represents a loss of added value that would have been achieved in the country, source for sustainable economic growth. It could have been possible, because if we look at external migration reasons, we find that the market demand is not actually oriented to create new jobs for the labor force therefore directing it to areas outside the national space.

Analyzing the impact of migration on countries of origin, the focus is primarily on remittances. Economists are cautious in assessing the impact of remittances on development. Although used primarily for consumption, they also produce economic benefits being used to raise the level of education leads to increased productivity. On

short-term, the immigrant family benefits from remittances, on long-term - they may encourage other family members or friends to seek means to emigrate, not only because it provides an example of better income, but also by providing financial resources for departure. In addition to remittances, the effects of departure and returning need to be analyzed.

Contemporary migration compared to earlier periods tend to "collect the cream" in certain sectors of employment, from the most educated and highly skilled ones, causing a poor domestic economy. UNDP (United Nations Development Programme) report that only India, China, South Korea and the Philippines have lost 195000 workers with scientific training in favor of the United States, between 1985 and 1995. However, as in the nineteenth century, the main economic benefit of contemporary migration is the vice versa current, of transferring money from workers to their country of origin. Given that a significant portion of this revenue does not go through official channels, probably totals are much higher and thus exceed official development aid flows given to countries in development.

The impact of migration on unemployment was the subject for some countries' estimations. In theory, migration should reduce unemployment, and the experience of some countries in this field is confirmed. However, this is not the case in Philippines, Indonesia and other countries where emigration is caused by the economic crisis and migrants are a relatively small part of the population, in terms of high growth rates. However, migration can be a loss to the country of origin when migrants are educated and well trained, as the country loses the investments they made in their education and training, a loss that can be partly compensated only if the migrants return.

Old and new technologies have changed our lives, prospects and current migrant psychology. These changes reduced the distance between the migrant and his home. Transport and communication networks' impact is immense on migrants. Television has done more than to "open windows" into other worlds, it has always been the main factor in homogenization of societies. Nowadays, thanks to modern channels of communication and traveling cheaper and

faster, migrants are in constant contact with the country of origin. Psychologically, the migrant stays home and sometimes even physically coming and maintaining their identities in a foreign land. They represent a new type of migrants, which sometimes can not be detected; practicing seasonal work, they work for a while and then return home for a short period.

A special phenomenon is the exodus of intelligence, the exodus of the highly qualified "brains" and their families from less developed countries to the U.S., Canada, Western European countries.[1] It is estimated that 40% of American scientists who are Nobel laureates, come from outside America. Workforce from various underdeveloped countries of Asia, Africa and Latin America headed for Europe, while emigrants mainly from Latin America and less from Europe are heading to the U.S..

Migrating brain (so-called "brain drain") is considered a major issue facing many developing countries, including Romania. Most studies on the subject suggest that the phenomenon has two distinct negative effects. The argument that the brain drain harms the country of origin because it leads to loss of production that could be created if people would not emigrate, is not based on solid foundations. Although if preventing brain drain would increase production, this result does not justify blocking immigration policy. Ultimately, the welfare of society derives from a variety of elements, material wealth being only one of them. For some individuals, living in a society without restrictions, like preventing free movement of labor, can be enough to compensate a lower material wealth. For other people, the social environment in which they operate is more important than material wealth gap.[1] In other words, welfare is subjective, it depends on personal preference, not material conditions.

Temporary migration for business, employment, tourism, education and research is also an important feature of modern life. Effective management of temporary migration offers states the opportunity to guide migration to meet their needs and political priorities. However, the effects of immigration in the host country will depend on the state of the economy. For example, in Germany between 1960-1970, without

employing foreign workers, young and motivated, growth would not have been possible in the same way - at least not without a high rate of inflation, or without transferring production sector over abroad.

Here are some effects of international labor migration for countries of origin:

- positive effects: remittances in convertible currency in the country, reducing pressures from labor surplus resources and social tension, free professional training of their workforce, knowing it with its advanced forms of work organization, receiving grants and aid from recipient countries and international organizations specialized in social and economic development programs, aimed at creating new jobs.

- negative effects: economic losses as a result of reducing human potential and especially the working age population segment; losses from vocational education and training of migrants, demographic risk expressed by reducing reproductive potential of the population and the erosion of family institute, illegal immigration disables the individual of any social, political or economic law.

To stimulate a stable population in the country of origin is calling on three factors: the dynamic development of the economy, improving the life's social conditions and individual security, civil rights and political freedoms. It must take into consideration the interests, needs and possibilities of both countries of destination and of origin.

In countries of destination

For the country of destination, the host, the effects are usually net favorable. They manifest on the labor market by: contribution to reducing labor shortages, alleviate demographic aging and labor market tensions and on budgetary level, contributions to increase production, including exports, even in countries of origin.

For the worker and his family the effects are diverse, but are seen as positive. Regarding earnings, we find: an income that provides reproduction of worker's labor and his family, an income that it would not have been produced in the country; increasing savings and investment capacity either in durables or in launching their own business;

the emergence of a series of career earnings and work culture. The losses are economic and social: discrimination of treatment, compared with domestic labor, breach of the employment contract by the employer risk, tensions in relations with local labor, accommodation difficulties, reduced social protection.[3]

Supported by economists and blamed by the nationalists and conservatives, globalization is increasingly becoming a reality. Discussions about globalization rarely reached international migration. Movement of goods and capital are considered more impressive, comprising 29% of world GNP, while migrants constitute only 2.5% of world population. But if all these migrants would be a country, it would be the sixth in the world according the number of population, so an important feature of globalization is the movement of people.

International Organization for Migration (IOM) and the UN estimates the total number of people living temporarily or permanently outside their home state – at approximately 180 million. Continuous demand of highly skilled labor and unskilled one, and the difference between living standards will continue to structure the nature of migration flows.

In a number of countries, increased commerce replaces or reduces local industrial or agricultural production with cheap imports. Demographic trends and the aging of local workforce in many industrialized countries suggests that immigration will be the replacement solution. An additional argument raised by states which already turned to immigration practice "of replacement" is that migrants are more innovative, flexible and adaptable to technological change.

Demand for cheap and skilled labor in developed countries as well as in some developing countries in Asia, Latin America and Middle East remains evident in agriculture, manufacturing, constructions and also in low-paid sectors such as housekeeping, nursing home and "sex industry." The increasing demand gives migrants the opportunity to get hired relatively easy.

Research made by various international institutions show that migrants execute services that locals usually refuse.

Presence of globalization and its influence on the labor market, expands the number of services that nationals from the host country are not likely to do. Often the migrants are well-educated people who are willing to accept jobs that they would not accept in native entourage, but the wage difference justifies their interest. However foreign workforce in most developed countries is less qualified than national profile and is concentrated in the lowest socio-professional categories, characterized by high mobility in response to cyclical fluctuations in the labor market.

A more detailed picture of the economic consequences of migration for host-economies can be drawn from some qualitative considerations.

First, the impact clearly depends on the precise nature of immigration. Migrants can not be considered as a homogenous mass when evaluating their economic impact. And opposed, there will be different consequences for different groups in the host economy. In the labor market of host states, there is a significant polarization among immigrants. In many OECD countries (Organisation for Economic Cooperation and Development) a considerable percentage of foreign workers consists of highly qualified specialists, often coming from other Western countries. At the other end of the scale, immigrant workers, take jobs that are lacking safety, low-paid and elusive regulated.

Contemporary patterns of migration are broader geographically[2] than large global migrations of modern times, but in general are somewhat less intense. In this period there have been significant changes in technology and social infrastructure migrations. In terms of national engagement, Western European countries have acquired the multiethnic character so far, including important communities of non-European immigrants. For the first time Japan includes significant communities of foreigners while America turns to foreign population levels not seen since peak migration time of pre-war years. Autonomy of nation - states is redefined by the impact of legal migration from the past and continuing impact of illegal immigration. Advanced capitalist countries' ability to control their borders and to monitor population is no longer appropriate to the requirements. International

cooperation has not yet facilitated the implementation of these requirements. Moreover, the notion of "nationality" and "national identity" are renegotiated in response to contemporary patterns of global migration and cultural globalization. But in many cases the trajectory of these negotiations is far from clear.

Many developed countries have imposed restrictions and what is paradoxical is that these restrictions have been adopted by some countries supplying labor. Restrictions have not reduced the number of migrants but are putting pressure on people who want to emigrate. Labor trafficking would be lower if job seekers would have freedom to move and freedom of access to employment. Almost every country of transit or destination faces enduring hostility and violence against migrants, refugees, sometimes against students and tourists. While racism entails distinction based on physical difference, xenophobia describes attitudes, prejudices and behavior that deny, exclude people based on the perception that they are foreigners. Discrimination can occur systematically in the differentiated access to a decent place of living, lower access to education.

At first countries considered migration as a temporary phenomenon: workers and refugees could be repatriated and permanent immigrants were assumed to be assimilated. But migration has proved to be a difficult and complex process, and some of its consequences, accumulated over time, turned into a "a slow bomb". The presence of large numbers of foreigners significantly changed the political landscape of the U.S. and Europe. The main object of xenophobia in Europe at present is the Muslims, who formed the largest non-European minority in France, Germany, Britain and Belgium. Paradoxically, some immigrants are followers of xenophobia and racism against their peers from other nationalities.

A common question in the works of migration researchers is whether free trade and capital mobility may substitute labor migration. ILO (International Labour Organization) suggests that the short term development may encourage migration. In developing, structural changes in the economy creates labor mobility and increases the likelihood of immigration. When the migrant must choose between continuous

improvement of living conditions in the future as a result of free commerce and immediate improvement, even if temporary, often he chooses the latter, especially when the country's stability is questionable.

And yet, who wins and who loses as a result of migration? The cost of fruit and vegetables would increase by 60% if at their gathering would have not been recruited foreigners (sometimes illegal ones). Italian companies, especially in the northeast, insists that many of their factories should be closed if they will not be allowed to hire foreign workers. Farmers in Britain, Germany and other Western European countries, count heavily on seasonal migration. Germany, Canada, UK, Australia, including Italy and France, are following the American example, encouraging immigration of highly skilled workers, especially in information technologies.

In short, growth of developed economies, in a world where globalization is driven by competition, cannot be driven solely by domestic labor.

Here are some effects of international labor migration for countries of destination:

- positive effects: stimulating domestic products' competition as a result of reducing production costs by using cheaper labor, the multiplier effect (stimulation by foreign labor in production and employment in the country of adoption); savings that would have to be made in education and labor training (to import skilled labor); maintaining social stability by paying taxes.

- negative effects: increasing tensions in the local labor market, increasing as a consequence of increased demand on the labor market, the downward trend in labor costs; challenging national and ethnic conflicts between local people and migrants, social tensions manifested through discrimination and hatred towards immigrants; rising unemployment.

International migration flows directly affect the labor markets both in countries of origin and countries of destination. Migration can contribute to reducing unemployment in countries with surplus labor and in receiving countries can reduce labor market demand. Immigration completes the jobs in unsolicited sectors by local workers.

For example, in Belgium, 50% of miners, in the U.S. - 70% of farmers, in Switzerland

about 40% of constructions workers are foreigners. Immigration has an impact on regional labor markets. The migration ensures redistribution of labor in line with current requirements.

Entrepreneurs in recipient countries gain from immigrants' labor. They are ready to work in conditions of a lower remuneration than the remuneration standards in this country, so employers retain local workers wage increase. In several countries operates a labor market with double standards: on one takes place the purchasing of qualified local workforce and high paid, and on the other the foreign one ready to work on hard jobs, low paid. Immigration, so contributes to intensifying competition in the low-skilled labor, contributing to lower real wage for local workers categories, which increases social tensions and pressures made by these to politicians, to tighten acceptability of immigrants.

Organization for Economic Cooperation and Development concluded that there is no direct correlation between increasing number of foreigners in the country and the rising of unemployment. In countries with a large number of migrant workers, the unemployment rate does not grow or grows slowly. When migrants compensate goals in different segments of the labor market, they stimulate the local workforce to use their capabilities effectively and thus increase productivity. However, it can be argued that an alternative to immigration, especially in the low qualified one, is to increase the level of technology and do more intensive production process in terms of capital.

Conclusions

Migration has existed since ancient times, recording, however, different intensities from one historical stage to another and developing new forms. Transformation processes that workforce employment policies go through in the last years globally, through their amplitude, have characteristics closer to what we might call a revolutionary way to manage labor.

The process of economic transition and labor market changes affect also employers, causing changes in the position of the employer, they must establish new recruitment strategies. Today they look for

people who have the ability to perform a certain activity, and the potential to adapt to the new.

The economy, society, relationships are in constant transformation. If not mastered the means to adapt to new conditions, these changes can cause negative effects, imbalances (macroeconomic), both on the individual and in society.

The Social Effects of Current Economic Crisis on the EU Labor Market

Anițucăi Lucian Ionuț
"Al. I. Cuza " University, Iasi
Faculty of Economics and Business Administration
Doctoral School of Economics
anitucailucianionut@yahoo.com

Abstract

The labor market is the economic space in which work users are traded freely as buyers and the owners of employment resource as sellers, where labor price mechanism of free competition between economic agents adjusts the labor supply and demand. To convince how important this subject is, it is necessary to study the size of global economic inequality, since data and classifications made in the social sciences is not representing exactly the reality because they are not able to interpret situations where many families are directly or indirectly affected by the current economic crisis.

The overall impact of the financial crisis on the real economy was strongly experienced and the economy as a whole was affected by a significant slowdown in growth, which affected people, businesses and jobs.

Therefore, the current crisis has become a challenge that the social Europe can not afford to ignore if she wants to promote a 'sustainable growth'.

Keywords: economic crisis, labor market, housing bubble, recession, employment.

J.E.L. classification: F62, F66, J21, J64, J65.

Introduction

Globally, wealth concentration and inequality in income distribution is growing phenomena that have become increasingly visible in developed countries but also in the global macro-regional relations. The current economic crisis is the driving force of this process, increasing in speed and intensity, is in turn exacerbated by excessive imbalances that have severely reduced consumption.

Macroeconomic theory tends to consider unemployment the result of certain characteristics related to general economic equilibrium, turning his attention to the volume of unemployment considered an indicator of the economic situation, which helps analysts using variations on this volume and on correlations between economic variables (price/quantity) set the growth of this phenomenon, which occurs in almost all advanced capitalist countries.

Values which characterized the labor market performance in 2008, the year when the global economic crisis erupted, whose impact on the labor market is still difficult to decipher, the result of a macroeconomic framework that has changed profoundly during this year, following a route which progressively deteriorated. 2008 was therefore characterized by a significant change in the economic environment.

The objective of this paper is focused on the social effects of the current economic crisis, but also on the trends that have emerged this economic crisis and its implications on the labor market. Since the economic environment is in rapid change and most of the effects on employment are not yet known, the subject's purpose is not just presenting the global socio-economic situation based on available empirical studies, but seeks rather, according also to rapid evolution (changes) of the current context, to construct an overview of the crisis characteristics, useful for interpreting trends that will occur in future periods.

General framing of nowadays economic crisis

The current economic crisis is the result of development that took place at the international level, being important to highlight comparisons between worldwide

prevalent dynamics. Even from the early stages of the crisis, it was characterized by significant similarities in behavior in different countries, as a result of companies alike reactions to respond to a common shock. U.S. recession may end soon, thanks to the flexibility of the economy (people are used to losing their jobs and are able to adapt to another rapidly elsewhere). In Europe, however, population's flexibility is much lower and recession can be a longer and excruciating process.

The negative effects of unemployment on the social, cultural and institutional, is a priority concern of nowadays economists if we consider the variability characteristics of this phenomenon, despite the increased interdependence between different states. Thus, economists along with sociologists, psychologists and statisticians have had that to develop a greater interdisciplinary collaboration taking into consideration several social and institutional phenomena to analyze labor market.

Crisis "caused in America" has complex effects on European economies, so that European officials blame U.S. for externalities supported by their own economies, despite the excesses that took place around the world, without excesses embodied in current regulations, government distortions and poor supervision. When "real estate bubble" exploded, European leaders refused to believe that the EU is facing a problem of economic downturn. The initial ignorance that they have manifested vis-a-vis the international financial system crisis, they postponed a reaction that had to occur earlier to combat the unwanted effects that prolonged depression might have on consumers and on the countries that have integrated capital markets.

Romania, for example, suffered a crisis induced by the evolution of the international framework, but also because it was among the countries that have experienced one of the largest reductions in GDP. To a large extent, it was found that the global economic downturn coincided with the state of weakness in our country. European labor market response to the crisis was not very dramatic in the initial phase, the consequences of the recession on labor market performance is much worse in the

U.S. than in Europe, where the greatest losses occurred in Spain.

The first phase of the crisis was characterized primarily by a reduction in productivity. Regarding unemployment it can be seen a difference in results between different countries, with a significant increase in Spain in comparison with developments in euro zone economies.

The evolution of the international crisis and its social impact

The financial crisis that exploded in September 2008 marked a discontinuity in the behavior of international operators even if the world economy began a few quarters before to manifest symptoms of weakness after two years of expansion. International cycle reaches its peak actually in the second half of 2007, long before the collapse of financial markets in the last months of 2008.

The reverse explanation of the economic cycle has a double justification: on the one hand the first signs of crisis in finance, highlighted by tensions arising on the interbank credit market since the summer of 2007 and on the other hand the increased product market commodities prices, especially of the food and energy followed by accelerating international inflation that took place in early 2008.

It can be said therefore that the international economy has come to "meet" the recession that has been already weakened by a period that lasted more than a year, when they began to notice signs of minor opportunities to accede to credits while global demand felt the effects of an increase in commodity prices.

The interest price was actually focused on quantifying the losses of international financial institutions since the 2nd half of 2007. The evaluation of this loss was continuously represented during 2008, so that collected data package were able to solve the inherent problems in this asset class, which is currently addressed as the toxic Assets. In this context all the prerequisites for a prolonged phase of the difficulties concerning the conditions of accession to private sector loans were already targeted since 2007 for supporting the operation of the credit market.

After the bankruptcy of Lehman Brothers we assist to a general repositioning of the hazard ratio for unit-holders. The stock market collapse that occurs at the end of 2008 is an important aspect, not only an indicator of the severity of the crisis, at least in terms of perception on the financial market, as well as media factor, because it is a promoter element of the crisis in very fast time, of all the economic subjects.

The resentment of gravity of the crisis was distributed immediately among economic operations resonance, effect due to the events from the financial markets. It is understood that the end of 2008 the reliable clues of the companies and of the consumers from the best part of the countries have experienced repeated collapse.

The repeated response of the companies to the uncertainty transmitted by the information on the crisis quickly fell to a postponement of investment plans and decisions to minimize the quantities produced, in order to reduce stock levels held in storage and at the same time significant reductions the end of the year, the demand for automobiles. Over several months we could notice the reduced production levels given in all major countries, so that we can characterize the crisis as the worst after the Second World War.

The phase in which monetary policy fails to be fully effective it requires the proper use of the fiscal policies to counter the decline in the aggregate demand. In the months following the outbreak of the crisis in many countries they have announced measures to stimulate the economy through fiscal policies.

The global economic crisis led to a "dramatic increase" of the number of those who have lost their jobs and those with low wages, as estimated ILO Global Employment Trends 2010 report. By geographical areas, the unemployment rate in 2009, compared with 2008, according to IOM has registered the highest growth in the world just in the EU, especially in the more developed Member States.

The first social effects of the economic crisis on the labor market in the Euro zone

The disruptive effects of the crisis on the production levels influenced the evolution of

labor demand with difficult quantify results. An initial examination highlights how the European labor market in early 2008 did not report significant job losses. Maintaining the employment levels in 2008 is evident if faced with disappointing performance in terms of growth and does not constitute a specific feature for our country since a similar development took place in Italy, France and Germany, in contrast the cycle labor demand immediately reversed the upward trend in Spain, where they reported significant job losses.

In late of 2008 and early months of 2009 the decreased number of jobs was insignificant except in Spain where job losses widened further.

In Italy, in the 4th quarter of 2008 there was a slight decrease in employment (-0.5% from the previous quarter), lower if it is observed that in the same quarter GDP suffered a greater loss of 2%. In early 2009 the decline was moderate (-0.8%) compared with a reduction of 2.5% GDP.

Throughout the euro area the number of employees decreased in the 4th quarter of 2008 from -0.3% to -0.8% in early 2009. The maintaining employment was recorded in France and Spain Germany while the number of employees decreased from -1.6% in the 4th quarter of 2008 to -3.5% in the first quarter of 2009.

The decline of labor market after the recession episode was distributed heterogeneous not only between different sectors, but also between different categories of employees. The effects of the recession on various segments of the labor market (in terms of age, employment contract or skills) clearly depend on the structure of the industry sector and exposure to different sectors to negative situation created by this crisis. In the same structure the role of the indefinite time contracts contribute significantly to explain different labor market responses. Employees on fixed-term contracts do not benefit from the protection offered to "permanent" contracts for an indefinite time being affected disproportionately by adjustment employment in the euro area workforce. Before the recession, this type of contracts registered a constant increase reaching at the middle of 2007 to 17% of the total. The effects of the financial market turmoil began

to feel over the euro area economies, companies could quickly respond by reducing the number and renewing these types of contracts. Between the end of 2007 and the beginning of 2009 the number of limited-time employees has been reduced significantly especially in Spain. During the recession, there have been a number of adjustments on the labor market by using information at company level.

The fragility of economies from Central and Eastern European countries and the social effects of the global economic crisis

Following a comparative analysis between labor markets in Romania, Hungary and Poland we can find many similarities between the three segments. Latest data indicate more clearly that the labor market in Hungary and Poland is being restored, while ours continues to be dominated by uncertainty.

Human resources specialists from those three countries show the possible causes for which Romania is lagging behind. At this point, the most popular specializations from the mentioned areas are in IT/technical, financial and sales/marketing. Also, the time for identifying a good candidate for a position is approximately equal in all those three countries. Differences appear in the case of payments, Romania started from the beginning with the disability of the minimum salary ours barely reaches 153 euro/month, while in Hungary is 270 euros and in Poland - 281 euros.

Interesting are also the job offers received by executives. In Romania, the gross income of a person with such a position varies between 3,000 and 5,000 euros, at this amount adding car, mobile phone, laptop and the financial quarterly or annual bonuses. In Hungary, an employee with a similar responsibility is paid for with a gross monthly income ranging between 4,000 and 8,000 euros/month plus car, laptop, mobile, daily food allowance and bonuses. In Poland, the remuneration level for executives is only 2500-4000 gross euros/month.

While Poland has faced this crisis rather well the other countries recorded a significant reduction in GDP and Baltic countries being in recession before the bankruptcy of

Lehman Brothers suffered a much stronger reduction in GDP.

Poland was the only country which recorded a positive growth of GDP in 2009, when Romania and Bulgaria have experienced with the largest reductions in GDP. Latvia, Bulgaria and Romania had to request international financial support provided by the EU and IMF.

Cyclical differences between countries were reported before the crisis, for example in Bulgaria, Romania and the Czech Republic's GDP growth in 2008 (maintained in the last quarter) turned negative in the first quarter of 2009.

Regarding the labor market, it is more flexible in the Baltic countries, companies acting quickly to crisis effects by cutting wages and dismissal of employees especially in the construction sector where were a large number of temporary employees.

Joining EU the countries of Central and Eastern Europe was foreshadowed a optimal opportunity, and even so it was for several years, but today, triggering global economic crisis has made these countries to face a very difficult period. The economic boom with growth rates which was not being imagined by old Europe, no longer exists, and after the rapid increase followed the fall of the iron curtain, the young democracy accompanied by the current crisis slipped into a deep recession.

Unexpected events such as: the devaluation of national currencies against the euro, reducing the liquidities, public deficits and trade balances in red continue to grow strongly affected the economic and social context of these countries, which led to international institutions (IMF, Bank World EU) to intervene in helping these fragile economies.

Conclusions

There are many variations to explain the significant differences between countries which are not in the euro area and the U.S. on facing the current crisis and for answers to its economic and social policies. Accumulation of imbalances before the crisis explosion had an important role in determining the existing national differences. Countries with the most obvious signs of recovery in the economy and more

accentuated imbalances have proved more vulnerable to the crisis, feeling it in a much greater extent. The crisis had various effects on different countries, depending on the existing macroeconomic policies before and after the crisis. By doing a summary of the most important social effects caused by the global economic crisis, which is affecting and will affect the economic and social context of the EU countries, especially in Central and Eastern Europe (where our country is also located), it can be seen they are not to be ignored, on the contrary, should provoke the interest of society as a whole, in order to prevent or attenuate as much as is possible. The worst effects of the crisis seem to be: social tensions (which will continue in a much more powerful manner) triggered by poverty of increasingly large masses of the population, fears for losing their jobs following the reduction employment by force work, increasing the number of families in desperate financial situations, paralysis of consumer credit financing, the effects produced by workforce mobility (return of migrants due to the crisis and reduce the number of workers from the foreign countries/abroad). It is known that sociologists study people without jobs, and economists study the phenomenon of unemployment. The first does not wonders why there are unemployed, but how they feel and how they react in a such situation, while the economists are concerned in determining the cause of the unemployment phenomenon, why it grows or reduces. The answer to this question and the solutions to solve this problem accentuated by current crisis can be found during the study of this work.

A More Competitive Romania by Rising Performance and Economic Growth

Asalos Nicoleta

Faculty of Economic Sciences, “Ovidius” University of Constanta

nasalos20@gmail.com

Bujduveanu Aurica

Abstract

The increase of competitiveness must not be regarded as a process of exploiting the advantages on a short term but as a process of creating an economic structure based on capital investments and research-development –innovation processes. The governments in transition economies can play an important role in active facilitation of cluster development processes and supporting entrepreneurial initiatives. The challenge today for the governments is not to create more clusters but rather to create better and more sustainable ones or to create competitiveness clusters/competitiveness poles. The paper proposes to present a brief image about Romanian competitiveness and the benefits of stimulating clusters/competitiveness clusters for increasing economic growth. The stimulation of the dynamism and internationalization of the entrepreneurial basis represents a key means of developing a prosperous economy and answering the challenges and opportunities of a globalized market.

Key words: competitiveness, performance, growth

J.E.L. classification: M21, O16

1. Introduction

The most recent researches made at the European Union level go more thoroughly into the territoriality element emphasizing the role of towns and urban areas in general, as main sources of economic competitiveness. Therefore a conclusion has been drawn that the competitiveness classical theories, namely, Adam Smith’s “Absolute Advantage Theory”, David Ricardo’s “Comparative Advantage Theory” and even Heckscher-Ohlim-Samuelsan (HOS)’s “Production

Factor Endowment Theory” are no longer able to answer the new specific matters. Hence, competitiveness modern theories have appeared, among which Michael Porter’s “Competitive Advantage Theory” (1998) distinguishes itself and suggests that the obtaining of such an advantage does not lie only in factors or natural resources endowment but also in investment and capital creation efforts and the quality of these efforts stands before their quantity. Therefore, countries with poorer production factors endowment can find key branches to stimulate investments and innovations, investing in infrastructure, research-development and creation of high qualified labor supply. This task is mainly attributable to companies but the government can help with its fulfillment by creating a favorable business environment and an investment climate in order to encourage the firms to specialized and become world leaders.

The emphasized globalization phenomenon and the increase of competitiveness at national, European and international level imposed the necessity of belonging to innovative clusters for SMEs not only as a real advantage for them. Access to research findings in order to implement them in production and realization of innovative products using advanced technologies but also the adoption of common development strategies starting with the cooperation in production, acquisitions of advanced technology and equipment are just some of the benefits offered by these forms of organization which aim the development and the sustainability of some competitive advantages on national and international markets.

2. A brief image about Romanian performance

Romania is a rapidly emerging economy

with a rich history and culture. It has a geostrategic location in South-Eastern Europe, and given its access to the Black Sea and the River Danube, it is a natural hub for commerce, transportation and logistics. With a 2011 GDP of \$263.9 billion (in PPP) and a \$12,300 per capita GDP (in PPP), Romania is the 49th largest economy in the world and the 13th largest economy in European Union. However, with a GDP per capita of only 46% of the average EU GDP per capita, Romania is the second-poorest country in the EU after Bulgaria. Being the largest EU member in South-Eastern Europe, Romania has the potential to become an important player in the region.

GDP Growth. Romania has experienced a volatile economic performance since the fall of communism in 1989. There have been three periods of negative economic growth: in the early 1990s, in the late 1990s when the first major reforms began to be implemented, and in 2009, when the global financial and economic crisis hit Romania, leading to decline of 8.5% in GDP. Although the trend has been reversed in 2010, positive GDP growth has been less than 1% and remains feeble to this day.

Economic declines were caused by both domestic economic reforms and external shocks that occurred as a result of capital markets liberalization and the recent global financial and economic crisis. However, since 2001, the country has pursued fiscal austerity, price stability and structural reforms that allowed for increased macroeconomic stability. These include considerable austerity reforms implemented in 2010, which reduced public sector wages by 25% across the board, as well as public pensions by 15%, in an effort to reduce the large budget deficit.

Structure of the Economy. The Romanian economy has seen a significant change in its sectoral mix since the early 1990s, with both agriculture and industry declining significantly in terms of their contribution to GDP. Indeed, as illustrated in Figure 4a, agriculture's value added as a percentage of GDP has declined from 23% in 1990 to just over 7% by 2010, and industry's from 50% in 1990 to 26% by 2010. Conversely, the contribution of services to GDP has increased from 26% to over 66% over that period.

Moreover, the contribution of various industries in terms of value added within the manufacturing sector has also changed over the past 20 years: textiles and clothing has declined from around 18% to 11.5%; food, beverages and tobacco has been rather volatile, increasing from 19% in 1990 to 35% in 1997 and then declining to 16% by 2008; machinery and transport equipment has declined from 24% in 1990 to a low of 13% in 2000, but it has rebounded since to approximately 24% by 2008; last, but not least, chemicals has remained fairly constant throughout the period at 5%.

Current Account. As Figure 3 shows, Romania has been consistently experiencing current account deficits between 1991 and 2010, averaging -6.3% of GDP (and -7.2% of GDP between 2000 and 2010). Although Romania's exports have generally increased as a share of GDP, the demand for imports has increased even more in virtually each year between 1991 and 2010.

According to Romania's National Institute of Statistics⁵, in 2010, Romania's main exports consisted of machinery and mechanical devices, electric appliances and equipment (27% of total), transportation vehicles (14.5%), metallurgical products (12.2%), textiles, ready-made clothes and footwear (11.8%), chemical products and plastics (10.5%), agro-food products (8.4%), mineral products (5.9%) and other products such as furniture and construction materials (9.7%). Similarly, the country's main imports included machinery and mechanical devices, electric appliances and equipment (26.9%), chemical products and plastics (17.4%), mineral products (12.2%), metallurgical products (11.5%), textiles, ready-made clothes and footwear (9.0%), agro-food products (8.1%), transport vehicles (7.6%) and other products such as furniture and construction materials (7.3%). Most of Romania's international trade takes place with EU and other European countries, although countries such as China and Russia are also important trade partners, particularly in terms of imports.

Foreign Direct Investment. Romania has enjoyed considerable foreign direct investment (FDI), with net inflows of over \$61 billion between 2000 and 2010, as illustrated by Figure 6a. Naturally, the global crisis has severely impacted FDI inflows into

Romania: if 2008 saw almost \$14 billion in inward FDI, in 2009 this had declined by 65% to \$4.8 billion, and 2010 a further decline of almost 30% to \$3.5 billion. Even with this decline, Romania has remained a top destination for FDI. Indeed, Romania was ranked 10th in the world in the 2010 IBM Global Location Trends Report, based on the number of jobs FDI was expected to create. Moreover, at the end of 2010, over 171,000 companies with foreign capital were operating in Romania, according to the Romanian Registry of Commerce. The majority of the companies with international capital (63%) are manufacturing, financial services and insurance, and wholesale and retail trade sectors. The rest are in construction and real estate, energy, IT&C. In terms of source of FDI, Romania has attracted the highest amount of FDI from EU member countries (Netherlands, Austria, Germany, France, Greece), Switzerland and the United States.

3. Current Stage of Romanian Competitiveness

Romania aims to become a high added value generating economy which should bring substantial benefits to the investors and employees. The engine of this evolution is the increase of the productivity by investments in the productive capital, equipment and technologies and the human capital too. The stimulation of the dynamism and internationalization of the entrepreneurial basis represents a key means of developing a prosperous economy and answering the challenges and opportunities of a globalized market. Romania will promote the transition towards a knowledge economy and will try to get an as high as possible position on the added value scale.

Development of competitive economic advantages must be a constant process that takes into account European trends, but also by globalization in general. Therefore, the increase of competitiveness must not be regarded as a process of exploiting the advantages on a short term (such as the reduced cost of the labor force) but as a process of creating an economic structure based on capital investments and research-development –innovation processes. In other words, the outlining of a medium and long

term convergence perspective must have in view the development of an economy based on knowledge. Although great progress has been made lately, Romania has serious discrepancies regarding competitiveness in relation to the states of the West and Central Europe. The reasons of this lagging behind can be found at the level of all the elements that determine the competitive capacity. All can be translated finally in a decreased productivity which defines the competitiveness matter in Romania.

In the spatial context, the economic competitiveness is determined by: the involvement of the urban centers in the creative and innovative turning into account of the national potential that should create an hierarchical system of development areas/poles by concentrating a combination of competitive products and services or with chances to become competitive (IT, financial services, creative industries, environment services, customized services, tourism etc.) at the same time with the development of accessibility, of the education and research-innovation resources, of the business infrastructure, the quality of the environment and life;- the creation of an integrated national potential accessibility system and establishing interconnections among the elements of the polycentric system; - the use of the research- innovation potential , especially the one of the university centers which become the promoters of the innovative activity in this way and which offer multiple opportunities and chances for the professional development as factor for the stabilization of the local labor force and attraction of the highly qualified labor force; the development and promotion of the tourism by turning the natural and cultural patrimony to account as well as the perspective concentrated on the natural and cultural landscape. Also the touristic development will follow the national territory arrangement plan (the tourism section) aiming at the creative administration of the natural landscapes and the rural cultural patrimony; the creation of scale superior connections at the territorial level by stimulating the appearance and consolidation of the economic clusters.

Romania's competitive strengths:

1. Tariff barriers;
2. Firing costs;

3. Legal rights index;
4. Time required to start a business;
5. Number of procedures required to start a business.

Romania's competitive weaknesses:

1. Quality of roads;
2. Transparency of government policymaking;
3. Quality of overall infrastructure;
4. Agricultural policy costs;
5. Extent and effect of taxation / Rigidity of Employment.

Romania has been ranked 77 (fig. 1) out of 142 countries in the 2011-2012 Global Competitiveness Index Report issued by the World Economic Forum (WEF). Romania lost 10 positions from the previous report. According to WEF, competitiveness is defined as the set of institutions, policies, and factors that determine the level of productivity of a country.

Fig.1 Romanian Competitiveness 2011-2012

Source: World Economic Forum – The Global Competitiveness Index Report 2011-2012

The most problematic factors for doing business in Romania are as follows: 15.5 percent consider tax rates to be an issue. In addition, 13 percent mentioned the inefficient government bureaucracy, while 11.9 percent blamed policy instability for hampering the businesses. Access to financing is a problem for 10.8 percent of respondents, while corruption is regarded as problematic by 9.7 percent of respondents. The least problematic factors are crime and theft, and poor public health, each with 0.5 percent.

With respect to the detailed structure of the Global Competitiveness Index, Romania is an underachiever in the transparency of government policymaking (ranked 140 out of 142 countries), quality of overall infrastructure ranked 139, the extent and

effect of taxation ranked 135. Other pillars where Romania reports negative results are the cooperation in labor-employer relations ranked 137, the brain drain process ranked 131, while the availability of latest technologies was ranked 115.

On the positive side, Romania is ranked 4 in trade tariffs and 15 in redundancy costs. Other top 50 rankings are achieved for broadband internet and mobile subscriptions, the quality of math and science educations and the tertiary education enrollment rate. Romania is ranked 34 for the number of procedures to start a business and 40 for the number of days to start a business.

Romania aims to become a high added value generating economy which should bring substantial benefits to the investors and employees. The engine of this evolution is the increase of the productivity by investments in the productive capital, equipment and technologies and the human capital too. The stimulation of the dynamism and internationalization of the entrepreneurial basis represents a key means of developing a prosperous economy and answering the challenges and opportunities of a globalized market. Romania will promote the transition towards a knowledge economy and will try to get an as high as possible position on the added value scale.

As a member state of the European Union, Romania has received support to promote economic growth and social cohesion. National Development Plan represented a strategic planning document to guide and stimulate socio-economic development of Romania in accordance with EU development policies. The overall objective of the NDP, which aimed to reduce socio-economic disparities towards the EU was supported by three specific objectives:

- Increasing the long term competitiveness of the Romanian economy;
- Develop the basic infrastructure to European standards;
- Improved and more efficient use of local human capital.

In reaching the overall and specific objectives for 2007-2013, measures and actions envisaged were grouped in six national development priorities:

- ✓ increase economic competitiveness

and development of the knowledge economy;

- ✓ development and modernization of transport infrastructure;
- ✓ protect and improve the environment;
- ✓ human resources development, employment and social inclusion and strengthening administrative capacity;
- ✓ development of rural economy and increasing productivity in the agricultural sector;
- ✓ decrease disparities between regions.

The increase of the economic competitiveness is the key factor in determining the economic growth under the conditions of a full entering on a market marked by powerful competition forces. Besides, the development of the competitive economic advantages must be a constant process that should take into account the European tendencies and the globalization process as a whole. Therefore, the increase of competitiveness must not be regarded as a process of exploiting the advantages on a short term (such as the reduced cost of the labor force) but as a process of creating an economic structure based on capital investments and research-development – innovation processes. In other words, the outlining of a medium and long term convergence perspective must have in view the development of an economy based on knowledge. Although great progress has been made lately, Romania has serious discrepancies regarding competitiveness in relation to the states of the West and Central

Europe. The reasons of this lagging behind can be found at the level of all the elements that determine the competitive capacity. All can be translated finally in a decreased productivity which defines the competitiveness matter in Romania.

Management*

baltaretuandreea@yahoo.com

Abstract

Our country is characterized by high levels of biodiversity, both in terms of number of species and habitats and the ecosystems they form. In terms of natural protected areas, they are diverse from a typical point of view but also the content. Romania has the most diverse and valuable natural heritage in Europe and it is in a good conservation. Tourism in natural protected areas in our country has much more negative effects than positive ones. The permissive legislation and the inefficient administration of these areas contribute to this phenomenon.

Key words: national parks, natural parks, preservation, biodiversity, natural heritage

J.E.L. classification: L83, Q20, Q57

1. Introduction

A special place in the structure of a sustainable tourism is occupied by protected areas. Travel in these areas integrate a larger range, nature tourism, with numerous common elements of this perspective with the ecotourism, rural tourism, green tourism, adventure tourism and more.

In fact, the interdependence of these forms has made often and/ or numerous authors to address a report saying vice versa, in our opinion argued that the ecotourism, rural tourism, the green or adventure one are ways to spend holidays inside the protected areas. Of course, this vision must be accepted in connection with the areas designated a protected area. As by definition, mild environment, with nature, these forms can be applied without reservation or peripheral buffer zones of protected areas.

2. Travelling in protected areas

Great interest in visiting natural areas, mainly in protected areas is determined by the action of **specific factors**, the emergence of life changes in population, consumer behavior. Between them it must be mentioned:

- Tourists today are more numerous than those of yesterday, in the case of those who wish to participate in recreational activities, sports or evocative of adventure and want to become familiar with the history, culture and natural environment specific regions visited. Tourists today are physically and intellectually more active than the ones in past;
- There are now many forms of particular interest centers on the individual's nature and wildlife, historic sites, economic and professional activities, cultural;
- There is an increase in tourism that draws visitors' wishes to know the areas where their ancestors lived. The ecotourism, the cultural tourism and the adventurous one know also a rapid growth.
- A growing number of people are looking for destinations, tourist areas and novel products. Therefore, the opportunities to develop new areas or developing the existing one abound;
- Much stronger than in the past, tourists are concerned about the environment and society. That's why they come back with pleasure and regularity in well-organized and less polluted areas, avoiding destinations where there are ecological and social problems;
- Highlighting the tourism often encourage the environmental preservation activities, historical sites and traditions.

Therefore, the controlled ecotourism promoted to justify and serve the purposes of preservation;

- The increase of the educational level and with it the respect for nature, to the values of culture and civilization in general, a higher level of education translates into increased demand for tourism, for outdoor activities correlated with the concern of learning during the journey and to acquire new knowledge and experiences;
- Changing the population structure by age groups to increase the share of third age; the previsions of the World Health Organization show a 22.1% share of the world population of more than 60 years in 2050 and an increase in their 28.1% in 2100. Extrapolating current behaviors can appreciate an increase in the number of passengers in nature, the demand for recreational activities such as hiking, wildlife observation, fishing, nature study etc., and interest in less crowded destinations and more comfortable accommodation units and catering;
- Increasing the duration of leisure time and changes within its distribution, in particular, the fragmentation of time spent for holidays in several periods, which favors the traveling for leisure, peace and comfort. However, the increasing life expectancy allows a concentration of free time after the age of 60 years, associated with the behavioral changes caused by natural wear of the body and stimulates travel in nature;
- The increase of revenues; beyond the positive impact on tourism in general, the increase revenues encourage long-distance travel, allowing access to areas where a system of fees (parks, reservations etc.) and encourage the demand for a high level of comfort and quality service. In this context it should be mentioned the diversification options for destinations and/or forms of more unusual vacation travel for remote destinations, active rest and relaxation methods, all resulting in an increased demand for the protected areas;
- The increase of the social and environmental concerns. The worldwide population is more and more concerned about the social injustice and the

environmental issues. There is an increased concern regarding the need of low impact activities on the environment; people are increasingly involved in supporting the conservation and the development initiatives of local communities. There is also a shift of emphasis towards less resource activities with low environmental impact. All this leads to an increased interest in forms of sustainable tourism. The protected areas represent ideal places for the protection and conservation of natural and anthropogenic environment;

- The increase of labor demand determines the necessity to reconstruct the physical and intellectual capacity of the population;
- The increase of the training level of the population determines a reorientation of the hierarchy, seen in terms of a stringent need.

To these factors we can add many others, general or specific ones to an area, affecting the tourism in general or the protected areas. Given their action, we can anticipate a positive development of tourism in protected areas and an increase in the interest of such travel. Obviously, **the quantitative developments** will be accompanied by a series of qualitative changes. The most important may be nominated:

- the increased demand for tourism in protected areas, motivated by the role of these areas in the conservation of natural ecosystems in most countries of the world;
- the diversification of the offer, starting from the fact that the protected areas offer numerous opportunities to spend the holidays, responding to more and more varied needs;
- improve the services offered both in terms of content of holidays and also comfort;
- the active participation, motivated by the need for involvement in the conservation, awareness and promotion of protected areas;
- the promotion of the environmental impact forms (the ecotourism, rural tourism, green tourism, etc.) and the activities with an educational role.

In addition to these general or particular trends, there can be others, specific to each geographical area, country, region or type of habitat.

3. Natural protected areas from Romania

Romania is characterized by a **high level of biodiversity**, manifested both in terms of number of species, habitats and ecosystems that they form.

The **natural and semi-natural ecosystems** cover 47% of the country. There were identified and characterized 783 types of habitats (13 coastal habitats, 143 specific to humid areas, 196 habitats specific to pastures and hay fields, 206 forest habitats, 90 specific habitats of dunes and rocky areas and 135 farmland habitats) in 261 areas analyzed through the country.

Habitats in Romania are characterized by a specific composition of flora and fauna components and are influenced by different biocenoses or edaphic and climate factors. The influences of the arid climate from the east part and to the ocean in the west of the country and the climate differences between the plain and mountain relief imposed by altitude, have led to a large number of habitats. Another factor that determines the wide variety of habitats in Romania is represented by the chemical composition of rocks in the substrate (soil, subsoil).

Romania's territory includes in a relatively equal proportion, the three geographical units – plains, hills and mountains, with a great diversity of climatic and hydrological conditions which differentiates a number of about 52 eco-regions with a variety of terrestrial and aquatic ecosystems – specific to coastal and littoral areas of the Black Sea, grasslands, hills, mountains, lakes, streams and meadows, the dry or humid areas, including the ones specific to the Danube Delta. Our country has a unique natural heritage composed of the Carpathians (65% of cross-Carpathian region), as well as one of the most important humid areas in Europe – the Danube Delta (the second largest in Europe). It should be noted that Romania holds 30% of carnivore species in Europe and also about 300 000 ha of virgin forests.

Regarding the **natural protected areas**, among the Member States of the European

Union, Romania has the largest bio-geographical diversity (five of the 11 European bio-geographical regions, such as Alpine, Continental, Pannonia and the Black Sea steppe), this being mostly in a good conservation status. Also, due to the geographical position of Romania, flora and fauna have Asian influences from the north, the Mediterranean and southern European continental components from the north-west.

Table 1. The natural protected areas from Romania, during the period 2010-2011

Categories of natural protected areas	2010	2011	Percentage in the total level of the year 2011
	-number-		(%)
Scientific reservations	79	64	4,16
National parks	13	13	0,84
Monuments of nature	230	206	13,39
Natural reservations	661	699	45,42
Natural parks	14	15	0,97
Reservations of biosphere	3	3	0,19
Wetlands of international importance	5	8	0,52
Special areas of protected birds	108	148	9,62
Sites of international importance	273	383	24,89
TOTAL	1386	1539	100

Source: Romania in numbers 2011, National Institute of Statistics, Bucharest, 2011; The National Report of the State of the Environment for 2011, The Ministry of Environment, The National Environmental Protection Agency, Bucharest, 2012

Although in 2011 there was an increase of 153 in the number of nationally protected areas, compared to 2010, the largest increase in the recent years, the authorities in the field do not make an effort in protecting and preserving the natural potential exception only in the last year building roads crossing various protected areas and bringing serious damage to the flora and fauna in these areas. The greatest increase was the number of sites of international importance, from 273 in 2010 to 383 in 2011.

Other positive developments are seen in the natural reserves (+38 areas), wetlands of international importance (three areas), Special Protection Areas (+40 areas). Negative developments can be identified for scientific reserves (-15 areas) and natural monuments (-24 areas).

The declaration of the new natural park Cefa (lies on the border with Hungary and Romania and has 5003,80 ha), its importance and value of the existing resources within its territory, is a step in the preservation of natural areas in our country.

Table 2. The surface of natural protected areas from Romanian during the period 2010-2011

Categories of natural protected areas	2010	2011	Percentage in the total level of the year 2011
Surface –ha–			
Scientific reservations	310536	218145	1,99
National parks	316271	319495	2,95
Monuments of nature	84448	15406	0,15
Natural reservations	273056	346933	3,19
Natural parks	763894	772803	7,12
Reservations of biosphere	664446	664446	6,11
Wetlands of international importance	616571	680858	6,27
Special areas of protected birds	2988713	3694394	34,00
Sites of international importance	3284092	4152152	38,22
TOTAL	9302027	10864632	100

Source: Romania in numbers 2011, National Institute of Statistics, Bucharest, 2011; Raport național privind starea mediului pentru anul 2011, Ministerul Mediului și Pădurilor, Agenția Națională pentru Protecția Mediului, București, 2012

In terms of Occupied Areas, the Natural Protected Areas in Romania registered an increasing trend with 1562605 ha during the analyzed period, the largest being the sites of Community Importance (4152152 ha) and Bird Special Protection Areas (3694394 ha).

The Natural monuments are occupying the smallest area (15406 ha) as they are represented by species of flora and fauna mainly, such as the chamois, garofita Pietrei Craiului, Edelweiss etc..

Of the three Reservations of Biosphere from Romania, the Danube Delta occupies 580000 ha (declared in 1990) and is in direct coordination of the Ministry of Environment. Retezat occupies 38 047 ha (declared in 1979) and Pietrosul Mare (Rodnei) - 47304 ha (declared in 1979). These latter two are considered national parks in terms of surface as they fit in this category also. It should be noted that the surface of Rodna and Retezat national parks coincides with the reservation of biosphere.

Of the 13 national parks, Domogled-Cerna Valley has the highest percentage (19,35%) of the total concerning the occupied area, followed by Rodna Mountains (14,93%) and Retezat (12,05%). The lowest share belongs to the National Park Buila-Vânturarița (1,42%). Romsilva is the administrator of 12 from the 13 national parks.

National parks Domogled- Cerna Valley and Buila-Vânturarița are in opposite poles concerning the surface, respective 61190 ha and 4491 ha.

Of the 15 declared natural parks in Romania, Maramures Mountains has the highest percentage (17,47%) in terms of area occupied, followed by the Iron Gates (16,78%) and the Geopark Mehedinți Plateau (13,94%). Romsilva is the administrator of 11 from 15 natural parks of the country.

Maramureș Mountains have supremacy in terms of area occupied by natural parks in Romania, 133419 ha. Meanwhile, Cefa is the smallest natural park from Romania, with a surface of 5003 ha.

Also, Romsilva has in his custody, through Forest Reservations, over 200 natural monuments in forests.

4. The current state of tourism development in the protected areas of Romania

In general, *the landscape is in a good state of preservation*, being altered in some areas by human activities such as deforestation, motorized access in scientific reservations, and poaching, grazing and intensive construction of holiday homes. To these interventions it is added the mentality of Romanian people against the concept of protected area, the type of behavior to be taken when traveling inside a national park, the attitude towards ownership of land

located within a national park. Even if the land is owned by local people in the scientific reservations, they do not understand, being educated in this regard to work towards protecting the biodiversity, the sense of ownership is much stronger than the conservation and transmission in its current form the tourism resources in these areas. One reason may be the communist area when the ownership was dispossessed for a long time and therefore this feeling increased. However, the lack of public awareness campaigns regarding the impact of their actions on the environment causes such behavior. Analyzing the conflicts in natural protected areas of our country, we see the predominance of poaching with major effects on the number of chamois copies and motorized access and camping areas for tourists, illegal dumping of garbage in the scientific reservations. Solving these problems requires significant financial resources to control and prevent such actions, for the reconstruction of affected areas such as the dumps are stored, the presence of rangers in the key points on the trails, installing multiple boards in high traffic areas of tourists, because most of them were destructed. Finally, the application of the existing legislation on the environmental protection may reduce the number of offences in the mountains of Romania.

That part of the total national parks and natural pasture which is represented in terms of ownership, belonging to municipalities, arises major disputes in this area such as deforestation, building approvals data for various holiday homes even inside or on the edge of the park, construction of roads inside the park etc. These pastures belong to local communities, the resident population using them for grazing animals in summer. To avoid the intensive use of these natural resources, we must find alternatives for local communities to obtain revenues.

In the Management plans of protected areas, even if it states that hunting and fishing are prohibited, although there were found poaching actions, the consequence being the reduction of the number of valuable species, threatened or endangered species and even with extinction, which is requiring actions for repopulation. To this state also contributed the large number of dogs from the sheepfolds in the area. In addition, it was

reported the construction of numerous roads by illegal poachers, sometimes in areas of scientific research reserves, which prohibited any activity, much less the construction of access roads used by locals and tourists to access the sightseeing in the park or pasturing, for walks on weekends or even for different enduro competitions. All these vehicles bring serious damage to the flora and fauna in the park, pollution (gas, waste, fireplaces, intensive collection of flora etc.) resulting with irreversible effects on the biodiversity.

Also, the natural parks and natural caves are often destroyed in order to extract „mine flowers” and turning them into commercial objects. To all these it is added the household garbage dumped at the edge of glacial lakes and sheepfolds located near the rivers, gathering berries, herbs, muscles and mushrooms.

5. Conclusions

In order to mitigate the negative effects of human actions on the protected areas from Romania, there are required some actions, such as the involvement of volunteers in the management of protected areas in Europe, providing an alternative education and helping to improve the access to those who, regardless of age, acquire new skills in the field of nature protection. There is a need to improve the infrastructure in these parks by building visitor centers and information points, installation of information boards. Also, several initiatives were undertaken in schools close to national and natural parks that need to be repeated to obtain favorable results and involvement of pupils and students in preserving the biodiversity in parks. Finally, the action is to prevent the degradation of the landscapes through the co-participation of custodians, the mountain gendarmerie, police and the representatives of the forest districts.

Local communities are the first by themselves and in their interest to work and help the development of tourism in protected areas, bringing many benefits to the communities. Among these benefits there are listed:

- minimizing the negative impact on the nature and culture, impact which could destroy the protected area;

- educating the tourists about the importance of preservation;
- highlighting the importance of the responsible operators, to cooperate with the population and local authorities in order to satisfy the community needs;
- providing funds for the conservation and management of protected areas;
- the increased need for zoning the regional tourism and planning the flows of tourists for the natural areas which will become ecotouristic destinations;
- the need for social and environmental studies and also long-term monitoring programs to assess and minimize the impact;
- struggle to maximize the economic benefits of the host country, community and local businesses and especially of local people from natural protected areas;
- ensuring that the tourism development does not exceed a certain limit of social and environmental change determined by the researchers in collaboration with the residents;
- using infrastructure developed in harmony with the natural and cultural environment, minimizing the use of fossil fuels and conserving the vegetation and local fauna.

In addition to its negative effects, tourism can contribute to a raise of the living standards and the local community, being an importance source of income, the administrators of touristic areas facing an attraction of workforce involved in the conservation projects and management of the natural sites.

It can be considered that the presented confirm the existence of a valuable potential and some steps already taken in the process of setting us an integrated system of protected areas.

At the same time, the detailed analysis have confirmed, in many cases, a superficiality in managing these areas, reflected in the fact that either are not approved and therefore not operational or the lack of implementation capacity of the administration's (human, organizational, financial etc.) to create the management plans, monitoring and continuously adapting them.

Environmental Impact of Supply Chains

Brînză Georgiana
The Bucharest University of Economic Studies
georgiana.brinza@gmail.com

Abstract

In this research we create a method to transform the savings/ decrease in CO₂ into quality increase in physical distribution. And the method consists in finding the right allocation of environmental impact (in terms of CO₂ amount) from the distribution activity to every end product. We need to observe and calculate the amount of CO₂ in order to know how much CO₂ needs to be allocated to every product. The mechanism consists in offering to end-customers the possibility of selecting the distribution method they want: they can choose a high distribution level of service with increased environmental impact and, therefore, an extra cost for the customer; or they can select the distribution way with a lower environmental impact, case where they will receive a corresponding discount.

Key words: environment, sustainability, supply chain

J.E.L. Classification: C44, D22, Q01, Q56

1. Introduction

The objective of this research paper is to analyze the environmental aspects in a distribution chain in the strong relation with the economic performance of the system. In the last years the accent moved on having more small deliveries in a period of time. The work performed in all the sectors of supply chains (production/ distribution/ retail) increased the level of development of physical distribution, which can lead to environment problems. Nowadays, all the actors in a supply chain know that respecting the environmental aspects of the activities is the prerequisite of having sustainable supply chains.

This is why now firms are making

changes in their supply chains in order to reduce furthermore the environmental effects (in our case reduce the amount of CO₂). And the approaches used to undertake these actions are: reducing the fuel costs and the energy used. But there are cases when companies cannot reflect the environmental costs into the price to the end customer and they have to bear the impact by themselves. So many firms can be disadvantaged by the possible increase of the environmental costs. The answer to the problem is to determine the perfect match between environmental requests and the economical performance of the actors in the supply chain.

There are many situations in a supply chain when the environmental effects cannot be anticipated and therefore mitigated/ quantified. And the main causes for these are the market fluctuations and the uncertainty of customer demand/ needs.

In this research we create a method to transform the savings/ decrease in CO₂ into quality increase in physical distribution. And the method consists in finding the right allocation of environmental impact (in terms of CO₂ amount) from the distribution activity to every end product. We need to observe and calculate the amount of CO₂ in order to know how much CO₂ needs to be allocated to every product. The mechanism consists in offering to end-customers the possibility of selecting the distribution method they want: they can choose a high distribution level of service with increased environmental impact and, therefore, an extra cost for the customer; or they can select the distribution way with a lower environmental impact, case where they will receive a corresponding discount.

To meet our objective we develop a logistics model using vegetables and we calculate the amount of CO₂ exhaust incurred in sending the products from producers to the end customers. We create a list of data check points which need to be performed by firms

and we also give a measurement way by using specific information. The environmental costs and economic performance are strongly dependent on the customer's demand (how it splits on low costs and high costs distribution way). In other words, if the low cost distribution way is preferred then the amount of CO₂ can decrease without having bigger costs for distributors.

2. Literature review

The literature review conducted showed that there are some paradoxes of supply chain, like Rodrigue J.P. et al. [4] showed: for costs, time, reliability, network etc. For example, they analyzed door-to-door services coupled with just-in-time strategies and pointed out that the more these strategies are applied, the more the negative environmental impact is created by the traffic issues. Moreover, there is the need for every actor in a supply chain to have a tight collaboration with each other. Only this way the supply chain will move toward sustainability.

If Gyöngyi K. [2] created a list of collaboration approaches in the supply chain, on the other hand Potter et al. [3] developed a list of key performance indicators to measure how sustainable the distribution process is:

- Amount of energy used/ product
- Annual fuel consumption
- Tone km by mode
- Vehicle effectiveness
- Bullwhip
- Amount of payload used
- Tone km/ sales
- Vehicle km/ sales

Having these measures it is easier to control how the sustainable system changes and improves performance, as we have the perfect and appropriate control indicators.

The purpose of this research is to determine the amount of CO₂/ product from the distribution process. Here we have very sensitive information for the end customers. For example, if they could have visibility over the amount of CO₂ allocated to every product, their actions could be very much influenced (if they were environmental conscious customers). Example: Fujitsu Corporation Group in Japan developed a system where the ordered personal

computers are shipped directly from the plant to the customers who want fast delivery and using the modal shift transportation (with lower environmental impact) to customers who accept extended delivery lead-times (3rd day, 4th day and 5th day).

In the current model customers are free to choose the best delivery method using their priorities and thus being very efficient in reducing the impact on environment. A study conducted by Fujitsu Co.[1] showed that 30% of customers expect earlier delivery (3 days), 30% are satisfied with the usual delivery period (4 days) and approximately 40% accept an extended delivery lead-time (5 days). The possibility of choosing the transportation way is tightly related to the customer's sense and awareness about environmental issues. When we begin to offer to customers the information about the amount of CO₂ reduction they could expect a higher incentive and, moreover, new marketing techniques could be enforced to serve for this information. The following part of the paper deals with measuring the amount of CO₂/ product.

3. Measuring the environmental impact

There are actors in the supply chain who might be interested in knowing the impact of their activities over the environment. These are the environmental conscious companies for which the information regarding the amount of CO₂ per end-product generated by their activities is highly valuable. In our example we propose a mechanism to calculate the amount of CO₂ per product generated by the distribution of vegetables from the producers to the end-customers:

(1) The process is split in activities and for each activity we calculate the amount of CO₂.

(2) The amount of CO₂ is then split an allocated at product level.

Before calculating the CO₂ amount we have to measure the consumption of energy for all the identified activities. This objective is achieved by partially using the framework proposed by Simons et al. [5]. In the end we obtain the energy consumed, the amount of CO₂ eliminated and the allocation of the CO₂ amount to every product. The first tasks are to observe the processes and to identify all the transport and information steps. Then,

for each process step, the Value Adding CO₂/Time is calculated; for every transport step the Necessary but Non-Value Adding CO₂/Time is calculated. Finally, after adding all the results, the total time and total amount of CO₂ is obtained.

3.1. Analysis performed at activity level in the supply chain process

This part of analysis requires having some input data. We need to determine the amount of CO₂ eliminated in every activity. But we cannot measure this directly; we can use instead the amount of energy consumed. And to get to CO₂ amounts we will use some conversion indexes (for each type of energy), as well as how much energy is used in every activity and what type of energy.

3.2. The allocation mechanism

Basically, the allocation mechanism consists in finding those allocation percentages for every product. The formula is: *Allocation % = the amount of product unit/ the total amount* and it is usually the most efficient. „The amount of product unit” can be measured in „volume”, „number”, „time” etc.

The above formula can be changed as it is very difficult to consider that all the activities in a process are identical. So the allocation % can be calculated in many different ways in a distribution process, depending on the activity type – for example process activities and transport activities. If we consider this split, then in determining the suitable formula for the allocation% we have to take into account some specifics, like:

- Every activity has its own specifics, different machines are used in different activities, different amount of energy is used depending on the activity type - for process activities;
- The machines used in transportation have different characteristics, the loading sub-activities require different information - for the transport activities.

The following table highlights the conversion indexes values needed to determine the amount of CO₂.

Table 1. Conversion indexes of CO₂ for each energy type

	Type of energy	Conversion indexes
Process	LPG	6.3 (kg-CO ₂ / m ³)
	Water	0.58 (kg-CO ₂ / m ³)
	Electricity	0.7 (kg-CO ₂ / kwh)
Transport	LPG	3 (kg-CO ₂ / l)
	Gasoline	2.34 (kg-CO ₂ / l)

Source: www.ecomagazin.ro

3.3. Estimation of environmental impact on end product level

The mechanism of finding the right allocation of CO₂ amount to the end-product has 2 steps:

1) The activities identified in the process are analyzed and a total amount of CO₂ is calculated for the entire process. In calculating the CO₂ amount we begin with determining the amount of energy used in every activity and we continue with applying the conversion indexes already shared.

2) This is step of performing the allocation of CO₂ amount to every end product. When making the allocation we take into consideration rationality and the measurement requirements.

4. Case study

As a case study for this research paper we analyzed a distribution process from the producer to the customer in Bucharest (Ilfov County).

We choose the distribution of vegetables, this being the simplest distributive processing. In this situation we have a three-layered process formed by *procurement distribution, basic distribution, and distribution to consumer*. The ordering mechanism is based on customer filling a paper form or by using the Internet. In addition, the customer has 2 distribution methods available for selection. He can choose from having a personal or a group distribution. In “The personal distribution” the driver delivers to the customer’s door. “The group distribution” is a way in which the driver delivers to the distribution station

at the apartment complex or representative's house, and the members of the group go there, get the goods, and bring them to their own house. It is clear that from an environmental perspective the group distribution is more effective, but, in the same time, latest research studies show that customers want more personal distribution (which might require some incentives to be added).

In our example we restated all the activities from the producers to end customers with the purpose of creating an activity flow. There are 2 basic distribution centers for basic distribution and about 10 district distribution centers for distribution to the consumer in the metropolitan area. The number of orders includes about 1,000 groups (including families) per week. The district distribution centers are the case for the delivery of the jurisdiction district and those characteristics are different depending on the district area. Therefore, we investigated two different types of the district distribution center. One is situated in the center of the city in Bucharest, and another one is situated in the outskirts of the city, in a logistics center. We used for CO₂ amount estimation data collected from June to August 2012. The results for vegetables are detailed in the below two tables:

Table 2. The amount of CO₂/vegetable for distribution from city district [g- CO₂]

	Procurement distrib.	Basic distrib	Distrib. to consumer	Total
June	56.24	23.67	45.10	125.01
July	71.10	34.94	48.42	154.46
Aug	50.45	25.22	44.31	119.98
Avg	59.26	27.94	45.94	133.15

Table 3. The amount of CO₂/vegetable for distribution from the logistic center [g- CO₂]

	Procurement distrib.	Basic distrib	Distrib. to consumer	Total
June	56.24	23.67	57.46	137.37
July	71.10	34.94	59.33	165.37
Aug	50.45	25.22	53.78	129.45
Avg	59.26	27.94	56.86	144.06

The amounts of CO₂ exhaust in procurement distribution are strictly the

same, but those of two district distribution centers are different. In the logistic center, the transportation from the center to customers becomes a long distance. The result of calculation of CO₂ exhaust depends on the area of district. On the other hand, the amount of CO₂ exhaust in the basic distribution is the minimum of three processes of distribution. Oppositely, that of the procurement distribution is a high average. In the basic distribution, a huge amount of vegetables is transported and the transportation is relatively efficient.

We obtain the following result from making available the information about the amount of CO₂ to the customers: the incentive for group distribution with a lower environmental impact is enhanced.

6. Conclusion

This paper proposed the way to allocate environmental cost that translates to CO₂ amount in a distribution process for commodities and goods. The information items to measure and allocate CO₂ were arranged and the practical way was discussed. From the case study analysis, we showed that the calculation of CO₂ amount is possible. The information of CO₂ amount per product unit may be an incentive for customers to choose the better way of delivery, i.e. group delivery.

Recruitment of Personnel Management in the Context of the Current Economic Crisis

Buşan Gabriela
Ciurlău Loredana

„Constantin Brancusi” University from Targu Jiu, Gorj
gabriela_busan@yahoo.com,
loiurlau@yahoo.com

Abstract

To ensure the necessary human resources are one of the most important activities that they carry out staffing specialists within the organization. The main aim of recruitment activities is to identify sources of qualified candidates for a post and get them to run for a vacancy in an organization.

Key-words: human resources, recruitment, personnel

JEL classification: M12

1.Introduction

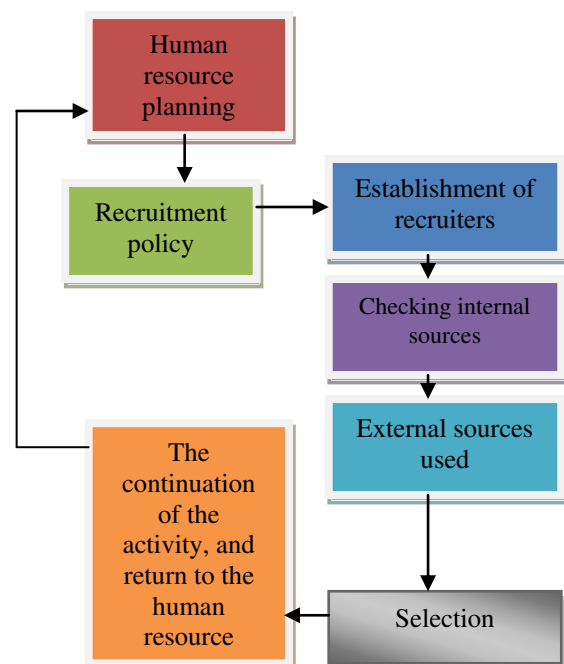

Recruitment is an essential element of the human resources policy of an organization, being the result of Confluence, the implementation of the agreement of some of the components of the performance of their duties staff of the Enterprise. Recruitment is triggered as soon as the new posts appear, or when existing ones become vacant through transfer or retirement of holders. In most organizations, the human resources Department is in charge of planning the recruitment of number of employees, representing the activity. The main task of the Department is to ensure that the number of people that it is necessary in accordance with the personnel in your organization. It is important that the person responsible for recruitment of personnel to have a large enough group of candidates, that are able to select those candidates who best match the requirements for stations that do the hiring.

2.Body text

Recruitment is a natural stage in the development of a company strategy, which seems as natural, so it becomes important when the results are not those originally predicted[1]. It is a stage of providing personnel to meet the requirements and best interests of the company, a step that requires special techniques, much documentation, professionalism and involvement; all this because the quality of recruitment causes a company's future performance.

Stages in the recruitment of human resources are clearly defined, as follows:

Figure no. 1 „Stages in the recruitment of human resources”

Recruitment policy

The establishment of policies and procedures coherent and uniform is one of the first steps to be taken when planning the recruitment of employees for your organization. Recruitment policy is the code of conduct of the organization in the field of human resources and must be in accordance with the laws, regulations and good practices in the field, in accordance with the objectives of the business of the Organization; fair and consistent; non-discriminatory in regard to sex, race, age, religion and disabilities.

Because recruitment is to be effective it is necessary to have regard to a number of principles of management practice checked. Of these, an essential role played by the following[2]:

- ✚ the choice of discerning the sources of recruitment;
- ✚ making recruitment of competent persons impartial and objective;
- ✚ making recruitment after a recruitment plan developed a differentiated for unskilled workers, skilled workers, technical staff, etc.;
- ✚ the determination of the amount of recruitment on the basis of an inventory of needs in the form of detailed descriptions of the post;
- ✚ exact information on the requirements of the post text advertising (it is not valid to provide descriptions of jobs better than in reality);
- ✚ design your ad text so that "to strike the sight and imagination";
- ✚ do not denigrate competing undertakings recruiters in the same specialty.

It is considered that a lack of professionalism providing inappropriate information or negative comments about the competition, for the purposes of recruitment of the best candidates. Those who wish to engage will consider this a sign of weakness.

Starting from these principles, you can move on to the design and implementation of detailed plans and recruitment procedures.

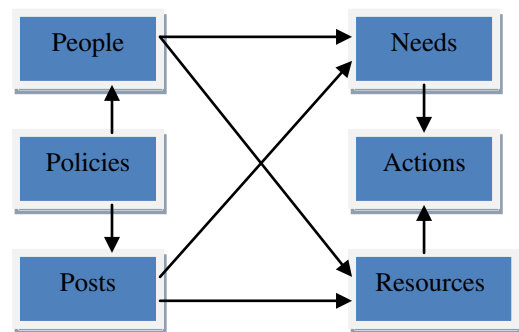

The recruitment of human resources shall be drawn up according to the following criteria[3]:

- it is consistent and fair, avoiding human resources decisions of circumstance;
- it is flexible, allowing maximum adaptability to changes in the external and internal environment of the Organization;

- corresponds to the human resources policy of the Organization;
- it is designed as a marketing plan;
- includes all the necessary elements for effective recruitment;
- calculation of direct recruitment needs is carried out by comparing the number of staff with the existing one;
- drawing up the plan of recruiting prospective nature.

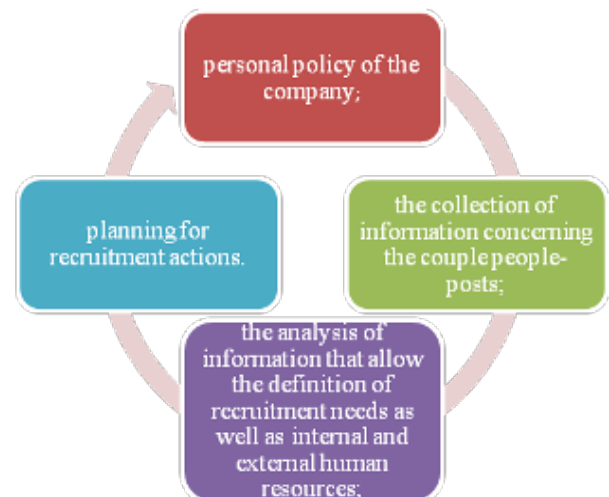

Develop recruitment plan involves a logical approach whose main components are shown in Figure 2.

Figure no 2. The recruitment plan

Recruitment plan phases are:

Figure no 3. Plan phases

Methods of recruitment of human resources

Recruitment results are influenced by the method used. Of the methods applied for staff recruitment are:

- ✚ advertising;

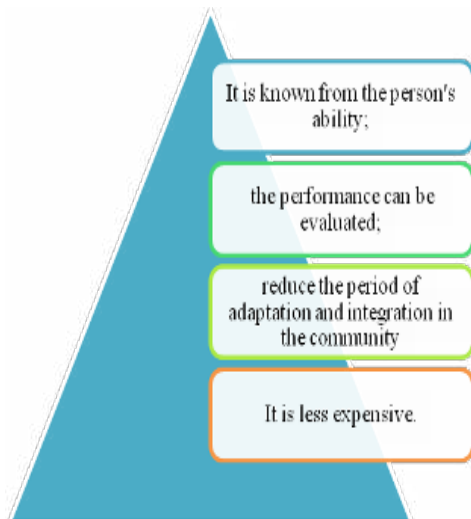

- ✿ knowledge network;
- ✿ the use of advisors for recruitment;
- ✿ searching for persons;
- ✿ the prospective employees;
- ✿ marketing activities.

Sources of human resources recruitment

Any organisation recruits staff in the internal and external environment. For stable organizations, typically, are key internal sources, this path is stimulating for personal organization, allows promotion and realization of the prospect of career plans for existing staff.

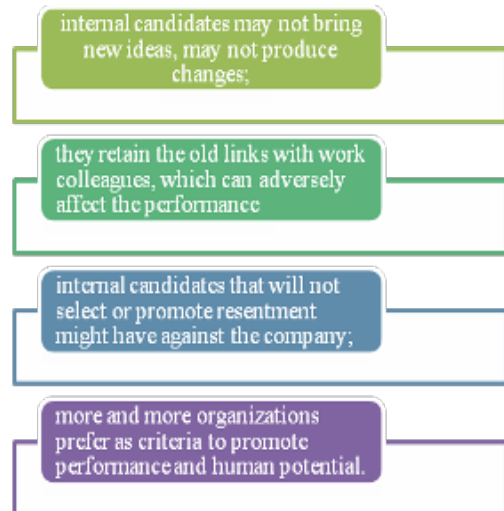

The main advantages of recruitment of staff in your organization are[4]:

Figure no 4. Advantages of recruitment

Disadvantages of recruitment of staff in your organization are:

Figure no 5. Disadvantages of recruitment

The main problems related to the recruitment of the interior can be solved through the implementation of programmes for staff development that allows the taking of the employees of some broader responsibilities, and development of adequate criteria of promoting (and/or performance of service organization)

For internal recruitment method to be effective, it is necessary prerequisites:

- both promotion and transfers to be announced;
- your ad should be displayed with a certain amount of time before you start recruiting from outside;
- the selection criteria to be clarified and communicated.

External sources of staff calls when they register a rapid development of business, when the organization is faced with the departure of some employees who cannot be inlocuti from the inside, or when it takes people with special training.

The benefits of external recruitment:

- offers several options for choosing the right candidate;
- employees come from outside can bring a new spirit in the Organization;
- the cost of new hires are often lower than those necessary training and preparation of internal employees for some new posts (especially if it comes to the technical or management).

Recruiting from outside (attracting, contacting and evaluating candidates) is a more difficult process, which has the following disadvantages:

◆ effective integration of the new employees in the company can generate other expenditures of time and money;

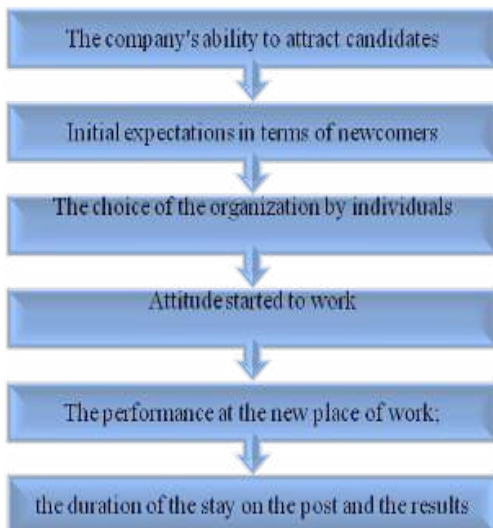

◆ recruiting from outside can adversely affect the morale of the staff (it will adopt a hostile attitude toward new-hires) given that there are inside the firm employees able to take loads of workers from outside.

Recruitment sources with the best chance to produce results with minimal costs are: applications direct, references of employees, placement agency manpower, higher-education institutions, candidates find the recruitment announcement, front candidates.

Program assessment recruiting

The need for recruiting permanent changes with the changing conditions of the environment internal or external environment of an organization. The Department of human resources or personnel issues specialist must provide a programme of recruitment, depending on specific conditions that exist in the organization. There are some models presented in the literature that serve as sources of inspiration for the drawing up of such a program. The model's perspective of recruitment Wanous offers both short term and long term. Assessment criteria of recruitment after Wanous's model are as follows[4]:

Figure no 6. Assessment criteria of recruitment after Wanous's model

Although the model can highlight strengths and weaknesses of a program of recruitment, it may not give quantitative

information concerning the costs and benefits of recruitment.

In contrast to this model, that of Hawk makes it possible to estimate the costs and benefits. It is rather a short-term rating and does not offer the prospect of measuring the effects of the recruitment of individual and collective performance, the staff in general, and its morals.

Criteria for evaluating the programme, after the recruitment model Hawk are:

- recruitment Cost per person engaged
- cost per person employed and recruitment source
- the number of employees on recruitment sources
- „production" of the source and the source efficiency
- time required recruitment sources
- the offers/acceptances
- the interviews/quotes
- employment report analysis and interviews bounce causes of employment
- comparing test results to those of the employees rejected the comparison with test results
- the performance of the new job.

3. Conclusions

In conclusion, an organization that finds and committed staff able to carry out their duties with consistency and to assume increased responsibilities is elevated in relation to the opportunities and risks of her work environment than those who struggle constantly to compile and to retain employment.

The negative effects of the crisis on departments and human resources policy are[5]:

- reducing the number of staff – firms functioned "under the employees required;
- stop employment – which occurred despite an acute needs of new employees and the increased loading of existing employees;
- reducing or blocking of training programs and training
- decrease wages and benefits-poor internal
- in most cases, measures anticriza were adopted and implemented without informing and consulting employees previous.

Direct effects on employees are:

- dropping dramatic motivation organizational performance-dropping;
- change of the attitude of the employees spirit of initiative to "fear the initiative", due to fear of losing job;
- constant Feelings of uncertainty and fear;
- diminishing confidence in the company's management;
- reducing the significant commitment to organization.

However, the economic crisis has brought a series of opportunities:

- ✓ the great work at the level of companies and the possibility of a job offer and selections in accordance with the objectives of the company's

- ✓ facilities provided by the State for the purpose of engaging people from categories considered to be disadvantaged on the labour market;

- ✓ diversification methods of hiring, which until now were considered "isolated cases: contracts for the period determined, project-based or part-time etc.;

- ✓ a large number of new graduates of higher education without job, willing to

accept an internship program that would provide work experience (and would ensure the company employing the minimum costs)

- ✓ availability – temporary – current employees to see the stability of the site demunca more important than reward pecuniara. There are, however, a risk that the attachment face of the Organization to be insincere or disappear entirely if wage reductions are not related to the growth of non-financial benefits and prospects of promotion or recognition of status and role.

Good Practices Regarding Information System For University Management - Quality in Higher Education

Carstea Claudia

“George Baritiu” University of Brasov, Romania

carstea.claudia@yahoo.com

Abstract

The paper deals with the flexibility of informatic systems in the context of multiple and unavoidable changes at the level of companies.

The concept of flexibility of informatic systems is defined and we present the factors which determine the flexibility along the whole life cycle of the informatic system. Each university is mainly interested in improving higher education and this holds true both at national and international level. At first sight the activities within a university may seem simple, but in reality they are very complex and dynamic. The application is based on the following basic requirements: on the one hand, the planning of lesson schedule of degree courses, on the other hand, the chance of having an application for constantly monitoring the occupation of classrooms or any other structure of the university. Therefore the application requires a precise and detailed mapping of all physical structures of the University.

Key words: Flexibility, Adaptability, Interoperability, System Integrating, University Management

Clasificare J.E.L.: M15

1. Introduction

Demographic changes, population migration, and reducing funding designated to national education, creates big problems concerning the university management. The main objective of the SIMUR Project is improving university management in five universities involved in this project by increasing their academic eco-systemic quality.

The major benefits of university governance systems are:

- increasing universities performances,
- ensuring academic transparency.

2. Logistics Resource Life Cycle

The management cycle of the logistics of the university's resources can be divided into three macro phases, not necessarily sequential, which can thus be considered, also simultaneously, by an operator: [1,4]

- Planning: the first drafting of the timetable, if possible diagrammatic form in the case of a recurrent event, or a simple calendar of single dates.
- Management of variations: once activities have started, the provisional calendar may certainly undergo single variation over time, which can be managed in such a way as to provide a precise and punctual communication transmitted to the person involved, and to simultaneously monitor the effective use of the resources.
- Monitoring: defined as a final opportunity to detect the actual course of events planned and the actual employment of resources. These recordings – normally registered on a sample basis – can then be the subject of statistical analyses, or used by the decision-making support system.

3. Objectives - Informatic Systems For The Management Of University Learning

The starting point of the SIMUR project is the experience of academic systems of Western Europe that successfully improve university management by introducing University Governance based on informatic technologies (university e-governance).

A computerized system of university e-governance is an integrated platform in

which all informatic flows of a university circulate synergetically, covering information referring to students, the content of the e-learning platforms and the scientific research projects. the five universities involved in the SIMUR Project (three of them universities of old tradition and two young ones) have as a partner an inter-university consortium from Western Europe which in the last decades has proved to be a provider of important solutions for university governance at the world level.[2]

Specific objectives of the SIMUR project are:

- a) Designing and implementing a standard configuration in the five universities which should be adapted to the requirements of Romanian universities to the Romanian legislation in force and to the European priorities;
- b) Redesigning and optimizing the main existing informational flows;
- c) Increasing the transparency level by providing up to date information at any moment;
- d) Increasing the efficiency of the activities of the staff involved in university management;
- e) In the context of Romania’s integration in the European Union and according to the Lisbon priorities, Romanian universities are faced with the necessity to meet the new requirements and standards.

4. The Collaborative Network

The collaborative network of the system U-GOV has been achieved on the base of academic partnership, including several universities and some companies specialized in developing and implementing software in the university domain.

The role of the universities within the partnership is that of making an inventory of the problems of the Higher Education and of proposing solutions; the specialized companies are supposed to ensure the transfer of the logistic and technical support for the implementation of the system.

In a partnership of this kind, the numerous entities involved constitute a collaborative network based on synergism. Within this context synergism means simultaneous action

or entities collaboration towards the same goal with a view to achieving a common objective with economical material, financial and human means, which otherwise would have been difficult to achieve.

The collaborative network includes universities from Italy and Romania. The Romanian universities have been selected in such a way as to allow sensing different university fields (economic, technical, and pedagogical) as well as different education forms (private and state universities).

In Figure 1 is shown in a graphically manner the collaborative network diagram.

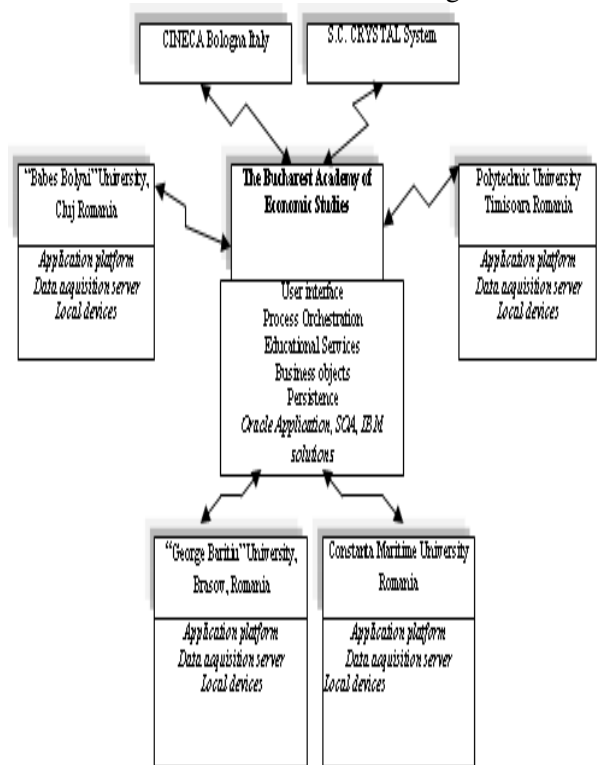

Figure 1: Collaborative network architecture

Among the advantages of collaborative networks, we can enumerate:

- Offers the possibility to reduce the duration of development and implementation of the system;
- Increase the chances to achieve a performed system because it is based on previous achievements, verified in practice and on the accumulated experience of partners along the time;
- Offers the possibility of cost reduction for the development and implementation of the system because we can use partially or

totally the software already made (software reusability);

Decreases the risk of implementing the system because it is based on the achievements already verified in practice.

5. Simur Functional Model

After performing a feasibility study in several universities in our country and abroad we have identified the following modules, shown in figure 2.[3]

- Planning and controlling;
- Accounting;
- Human resources;
- Students and Learning;
- Research.

The figure 2 suggests that there are multiple and complex connections between functional modules.

Figure 2 - The U-GOV synthetic functional areas

The Functional areas are shown in the figure 3 in an analytical form.

The name of each module and sub-module suggests the informational content.

The Informational System, in a conceptual vision, covers almost all the fields of activities within a university.

The **planning and controlling** process needs timely information, certified and above all coherent with the vision and the strategy of the university.

The **accounting module** is an integrated accounting system that does not impose a single model to the entire university

organization. Thus is guarantee full autonomy of all the inner structure of a university (departments, faculties, service centers).

U-GOV supports **Human Resources** management in increasing broader contexts, economic management, development planning, skill analysis, assessment and training.

Regarding the **Students and Learning**, UGOV offers new module that manages the course planning and scheduling.

UGOV provides uniform management of all **research** projects activates within the university, both from the operative and from the financial point of view. In addition to research products, U-GOV manages information about projects, activities, professors, researchers, groups, publications, scientific areas, laboratories and instruments.

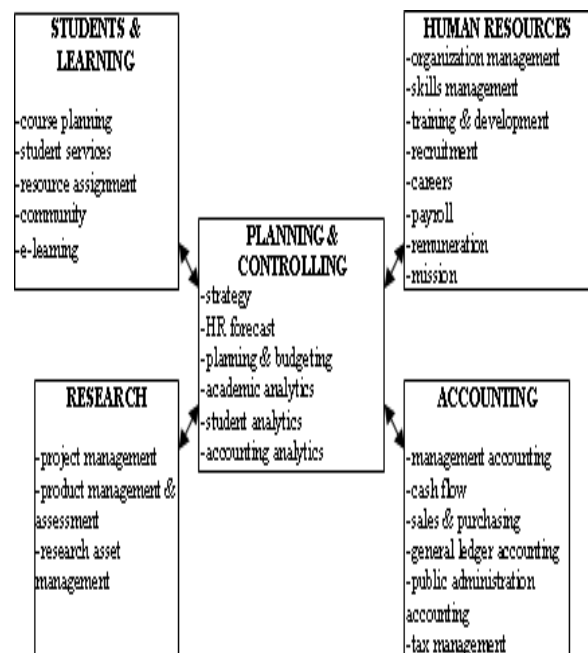

Figure 3 – The U-GOV analytical functional areas

6. Simur - A Possible Solution For An University-Gov In Romania

Based on a questionnaire we made, a study of the informatic systems in 35 Romanian universities and some universities from abroad was conducted.

The informatic solutions identified were analyzed from the point of view of:

- their level of integration,

- the modules they offer,
- the architecture and the technologies used,
- the facilities they offer.

Some conclusions were reached following this analysis:

- Generally there are five main modules (fig. 5) which include in their turn a series of applications;
- The modules of the Western countries U-Gov systems are not fully adaptable to Romanian universities and do not have all the functionalities required by Romanian Universities;
- As for the integration level of the applications of the modules and even among the modules themselves the integration is little accomplished or inexistent.

Based on the conclusions reached in fig 6 we proposed our own solution of U-GOV. Our solution is SOA oriented.

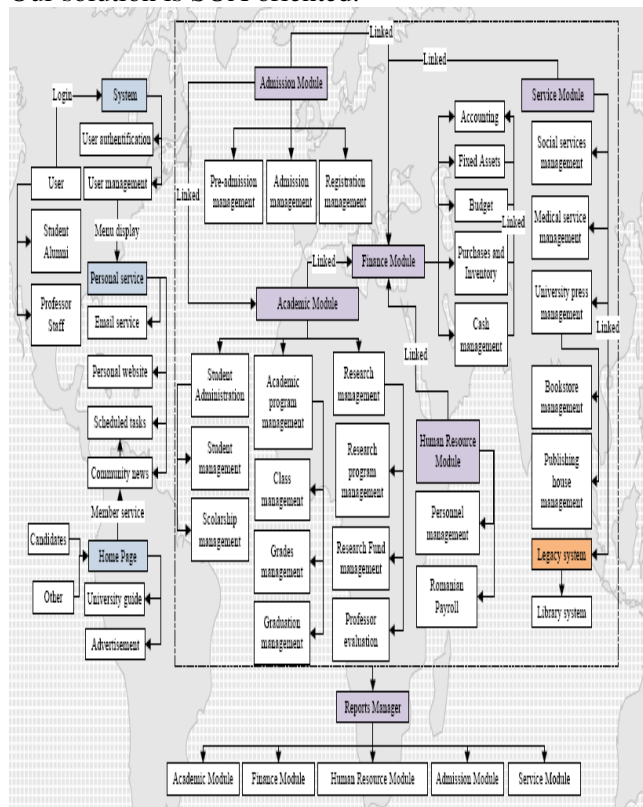

Figure 4 – A possible solution for an efficient ERP system

7. Conclusions

In the actual context, analyzing the academic environment we have drawn a

series of conclusions, among which we can mention:

- The activities in the university environment are characterized by dynamism and complexity;
- There are several factors that generates a series of changes; for this reason there is much more emphasis placed on strategic planning and management control;
- It is necessary to develop an efficient Informational System for U-GOV;
- The development of an Informational System in the SOA context is highly advantageous.

This application has been designed to allow, in general, the planning of all typical activities within a university context, with a particular reference to teaching and examinations, in terms of duration, teachers, types and other characteristics. Secondly, other activities can be planned – faculty councils, periodic meetings, seminars, conferences- for which you can manage the appointments of each person involved in terms of space and time. The application involves all the activities required to organize the calendar of events implying fixed or mobile structures of the university.

A Comparison Between Two Predictive Models of Artificial Intelligence

Ciobanu Dumitru

University of Craiova

ciobanubebedumitru@yahoo.com

Bar Mary Violeta

University of Craiova

petrescumary_odobleja@yahoo.com

Abstract

In this paper we done a comparison between a Neural Network model and a Support Vector Machine model adapted to predict the exchange rate EUR-LEU.

We emphasize the strengths and weakness of these two Artificial Intelligence paradigms and we compare the results of prediction obtained with those two models.

The Support Vector Machine model exceeds the Neural Network model regarding the prediction horizon.

Key words: Artificial Intelligence, Neural Networks, Support Vector Machines, Prediction.

J.E.L. classification: C 45, C53, C 63.

1. Introduction

Increasing accuracy of forecasting can save millions for a company and is a major motivation for using formal methods of forecasting and systematic investigation of new methods and better prognosis [27].

If a number of explanatory variables or question must be identified and predicted - time series approach has the advantage of easier collection of data and data preparation for modeling. In time series forecasting, historical data regarding prediction variables are collected and analyzed to develop a model that captures the relationship between time series observations. The model is then used to extrapolate time series forecasting in the future.

There were numerous efforts to develop and improve methods for time series prediction.

Linear approach assumes a linear process that characterizes the data generation.

There are a large number of linear forecasting models, such as moving average, exponential smoothing, time series regression and time series decomposition.

One of the most important and popular linear models is Autoregressive Integrated Moving Average - ARIMA, which was popularized by Box and Jenkins in the 1970s [3]. Often, ARIMA is also called Box-Jenkins model.

Although ARIMA models are quite flexible in modeling a wide range of time series models, their major limitation is given by the assumption of a linear form for the model. This means that a linear autocorrelation structure is assumed before the model to be according to the data. Therefore, an ARIMA model cannot capture nonlinear models that are normally encountered in the time series from economics and business. Approximation with linear models of complex real-world problems is not always satisfactory, as reflected in the well-known M-competition in the early 1980s [18].

Approach to modeling nonlinear time series is probably more adequate for most real-world problems. The world is rather nonlinear and complex than linear because there are so many possible nonlinear relationships or structures. Most nonlinear models developed during the last two decades are likely parameters. To use these models, they must be specified before. Therefore, these models cannot be used if the data characteristics do not fit the model assumptions involved. The parametric approach is quite suitable for nonlinear problems with complex structures, but there is a lack of theories to suggest a specific form of the structure.

Artificial Intelligence like Neural Networks and Support Vector Machine are

algorithms that can be used to perform nonlinear statistical modeling and provide a new alternative to logistic regression, the most commonly used method for developing predictive models.

2. Neural Networks

An Artificial Neural Network (ANN), or simple Neural Network (NN), is an information processing paradigm that is inspired by the way biological nervous systems, such as the brain, process information.

A Neural Network is a parallel computing system of several interconnected processor nodes. The input to individual network nodes is restricted to numeric values falling in the closed range [0,1]. Because of this, categorical data must be transformed prior to network training [20].

ANNs have been applied to an increasing number of real-world problems of considerable complexity. Their most important advantage is in solving problems that are too complex for conventional technologies - problems that do not have an algorithmic solution or for which an algorithmic solution is too complex to be found. In general, because of their abstraction from the biological brain, ANNs are well suited to problems that people are good at solving, but for which computers are not. These problems include pattern recognition and forecasting (which requires the recognition of trends in data).

Neural networks are used extensively in the business world as predictive models. In particular, the financial services industry widely uses neural networks to model fraud in credit cards and monetary transactions [13].

3. Strengths and weaknesses of Neural Networks

Neural networks, with their remarkable ability to derive meaning from complicated or imprecise data, can be used to extract patterns and detect trends that are too complex to be noticed by either humans or other computer techniques. A trained neural network can be thought of as an "expert" in the category of information it has been given to analyze. This expert can then be used to

provide projections given new situations of interest and answer "what if" questions.

Other advantages include:

- Adaptive learning: An ability to learn how to do tasks based on the data given for training or initial experience.
- Self-Organization: An ANN can create its own organization or representation of the information it receives during learning time.
- Real Time Operation: ANN computations may be carried out in parallel, and special hardware devices are being designed and manufactured which take advantage of this capability.
- Fault Tolerance via Redundant Information Coding: Partial destruction of a network leads to the corresponding degradation of performance. However, some network capabilities may be retained even with major network damage.

Neural networks are universal approximators, and they work best if the system you are using them to model has a high tolerance to error. However they work very well for:

- capturing associations or discovering regularities within a set of patterns;
- where the volume, number of variables or diversity of the data is very great;
- the relationships between variables are vaguely understood;
- the relationships are difficult to describe adequately with conventional approaches.

The greatest strength of neural networks is their ability to accurately predict outcomes of complex problems. In accuracy tests against other approaches, neural networks are always able to score very high [2].

There are some downfalls to neural networks.

First, they have been criticized as being useful for prediction, but not always in understanding a model. It is true that early implementations of neural networks were criticized as "black box" prediction engines; however, with the new tools on the market today, this criticism is debatable.

Secondly, neural networks are susceptible to over-training. If a network with a large capacity for learning is trained using too few data examples to support that capacity, the network first sets about learning the general

trends of the data. This is desirable, but then the network continues to learn very specific features of the training data, which is usually undesirable. Such networks are said to have memorized their training data, and lack the ability to generalize. Commercial-grade neural networks today have effectively eliminated overtraining through “bootstrapping holdout (test) samples”, and by monitoring test versus training errors [13].

Another issue with neural networks is training speed. Neural networks require many passes to build. This means that creating the most accurate models can be very time consuming [12]. However, the speed of most current machines is such that this is typically not much of an issue.

The major issues of concern today are the scalability problem, testing, verification, and integration of neural network systems into the modern environment. Neural network programs sometimes become unstable when applied to larger problems.

The mathematical theories used to guarantee the performance of an applied neural network are still under development. The solution for the time being may be to train and test these intelligent systems much as we do for humans. Also there are some more practical problems like:

- the operational problem encountered when attempting to simulate the parallelism of neural networks. Since the majority of neural networks are simulated on sequential machines, giving rise to a very rapid increase in processing time requirements as size of the problem expands. One solution to this problem is to implement neural networks directly in hardware, but these need a lot of development still.
- instability to explain any results that they obtain. Networks function as "black boxes" whose rules of operation are completely unknown.

4. Support Vector Machines

Machine learning involves designing and developing algorithms that allow computers to simulate the behavior based on empirical data.

Machine learning use learning process and examples to capture the interest features of the unknown probability distribution of

data and perform tasks that are difficult or impossible to achieve using classical algorithms.

The problem of machine learning is the need to develop techniques to enable the machine to learn from past experience and to predict the future.

Supervised learning objective is to automatically generate rules from a database of examples already treated to make predictions on new cases. Learning database is a set of input-output pairs (x_n, y_n) with $x_n \in X$ and $y_n \in Y$, which we consider to be prepared in accordance with a unknown law on $X \times Y$.

We have a regression problem when the output values are in a continuous subset of real numbers, $Y \in \mathbb{R}$ and a classification problem when the set has finite cardinal output values $Y = \{y_1, y_2, \dots, y_r\}$.

A Support Vector Machine (SVM) is a machine learning that can be used in classification problems [9] and regression problems [23].

In order to perform classification, SVMs seek an optimal hyperplane that separates data into two classes.

Support vector machine are also called classifiers with maximum edge. This means that the resulted hyperplane maximizes the distance between the closest vectors from different classes taking into account the fact that a greater margin provides increased SVM generalization capability.

The elements closest to the optimal separating hyperplane are called support vectors and only they are considered by the SVMs for the classification task. All other vectors are ignored.

SVM is one of the most promising algorithms in machine learning field and there are many examples in which SVMs are successfully used, for example, text classification, face recognition, Optical Character Recognition (OCR), Bioinformatics. On these datasets SVMs apply very well and often exceeds the performance of other traditional techniques. Of course, this is not a magic solution as set forth in “Support vector machines: hype or hallelujah?” by Bennet and Campbell [1], there are still some open issues, such as incorporation of domain knowledge, a new model selection and interpretation of results produced by SVMs.

5. Strengths and weaknesses of Support Vector Machines

Support vector machines are fairly simple concept, but very powerful, very well behaved in comparative tests with other popular classifiers [19] and have been successfully applied for problems in many fields.

Some examples of applications in that support vector machines have proven their superiority are: identifying images, medical image classification, face recognition and visually speech recognition.

Besides solving some problems that many learning methods are facing, such as small samples, overtraining, large dimensions and local minimum, support vector machines have shown a power of generalization (in the case of support vector classification - SVC) or prediction (if support vector regression - SVR) better than artificial neural networks.

Unlike neural networks, support vector machines have far fewer parameters to be set which makes it easier to determine a suitable structure for a studied problem.

An open problem is to adapt the SVM for online use (real time), the main drawback here is the long time necessary for training given that new models are rapidly and continuously presented.

Support vector regression has emerged as an adaptation of support vector classification problems to forecasting. Support vector regression has the same advantages as classification and finds increasingly more applications.

Chen, Jeong and Hardie conducted a comparative study for predicting financial gains in which the support vector regression obtained better results in estimating an ARIMA model over the MLE (Maximum Likelihood Estimation) and recurrent MLP (Multi Linear Perceptron) [10].

Although the results of support vector machines, in both classification and regression, are very good, we cannot say that exceed in any circumstances other methods.

Support vector machines (SVMs) are promising methods for classification and regression, due to solid mathematical foundation provides several important properties that other methods do not possess. However, despite the significant advantages

of SVMs are not as widely favored for data mining as a model for recognition or machine learning because the complexity of training SVMs is highly dependent on the size of the dataset. Many real data and applications to extract knowledge from databases involving millions or billions of data records and complete multiple scans are too expensive, in terms of time and computing power required to perform.

6. Models comparison

To perform a comparison between these two paradigms of Artificial Intelligence we have considered the time series of exchange rate EUR-LEU and constructed two models that predict next value for this time series.

We have trained a NAR (nonlinear autoregressive) Neural Network that uses nine past values of the exchange rate and predict the next value of the time series. The structure of the network consists in 100 hidden neurons with sigmoid activation function and an output neuron with linear activation function.

Also, we have trained a SVM that uses eight past values of the exchange rate and predict the next value of the time series.

We measured the models performances using MSE (Mean Squared Error). In both cases, for the training set and testing set considered in our example we obtained MSE between $2 \cdot 10^{-4}$ and $3 \cdot 10^{-4}$.

We used these two models to predict the next 100 values. First we used as inputs the observed values, introducing nine, respectively eight, measured values and obtaining our next prediction for the exchange rate. The results are presented in Figure 1. and 4.

Then, we used the models to predict the next 100 values but using as input the predictions obtained. For this case the the graphics observed values versus predicted values are shown in Figure 3. and 6.

Figure 2. and 5. presents the prediction errors obtained in the case of one step ahead prediction.

Regarding the prediction with one step forward, the two models showed the same performance.

The SVM model has exceeded the NN model in terms of prediction with more steps forward.

Figure 1. 100 prediction with one step ahead obtained with NN model.

Figure 2. The errors resulted in case of 100 prediction with one step ahead obtained with NN model.

Figure 3. The errors resulted in case of prediction with 100 step ahead obtained with NN model.

Figure 4. 100 prediction with one step ahead obtained with SVM model.

Figure 5. The errors resulted in case of 100 prediction with one step ahead obtained with SVM model.

Figure 6. The errors resulted in case of prediction with 100 step ahead obtained with SVM mode

7. Conclusions

Using SVM for prediction is a good alternative for both traditional methods as well as those methods arising from computational intelligence like Neural Networks (NN). To adjust the model with data we must to determine just a few parameters and this represent a major advantage of SVM over NN.

In the considered example both models have behaved well presenting the same order for prediction errors. Moreover both models have captured an external factor that have

influenced the exchange rate that is visible in Figure 2 and 4 between steps 40 and 50. The external factor was the govern resignation.

Regarding prediction horizon, the SVM model has performed better with a number of about 12 good prediction ahead (Figure 6.). For NN model the number of usable prediction ahead was about 4. From Figure 3. we can not see well the number of good prediction for NN model because the large fluctuation of prediction.

So we conclude that in this case the SVM model have performed better than NN model.

Uncertainty and Human Action. An Economic Perspective

Ciote Cristina Steliana

"Alexandru Ioan Cuza" University of Iasi

cristinaciote@yahoo.com

Abstract

Through globalization, the world economic system acquires properties and features that its component parts or subsystems had not previously; as the economic, social and political interdependencies amplify it occurs an aggregation of national markets into a single unit, which causes an increase of degree of complexity and thus of uncertainty and risks.

The heterogeneity of economic system components (individuals, organizations) is a reality and the economists have to determine variables which describe the dynamics of their action. Under uncertainty, total knowledge of future business processes is impossible to imagine. On the methodological level, beyond rational - irrational disputes, mainstream and heterodox theories converge towards action orientation to the future, which is the point of tangency with the recent theory of complexity. The proponents of both groups agree that in formulating predictions, modeling behaviors, monetary policy and income distribution, the critical factor that dominates and influences decisions is the uncertainty.

Key words: human action, uncertainty, theory of complexity, enlightened self-interest, limited rationality.

J.E.L. classification: B30, B31, B41.

1. Introduction

In economic theory, the difficulty of validation process of assumptions lies in the subjectivity of human nature; theoretical claims are confirmed by confrontation with existential reality, a reality imbued with human presence. Economic action is essentially, a human action; evaluation and

validation process cannot be neutral as long as it involves value judgments in relation to ethics and human values [1].

2. Human action - behavioral foundations (limited rationality)

Faced with the impossibility of research of facts in their diversity and complexity, exponents of rational choice theory have proceeded to a priori judgments, relying less on empirical observations of how decision makers actually behave and sharing the conviction that economic agents are rational and their behavior is also rational. The beginnings of economic rationality are dated in the classical period, the name of Adam Smith being associated with the origin of the narrow sense of rationalism, strictly circumscribed to hedonism area, eluding to the fact that the Theory of Moral Sentiments [2], the first work of the great economist, is a reference for behavioral psychology of individual. Driven by passion and motivated by the desire for freedom, having a sense of ownership and a natural (normal) inclination to work and exchange[3], man directs all its efforts and involves all available resources towards satisfying his selfish interest[4]. Thus, the individual "often promotes the interests of society more accurately than when he intended to promote it"[5].

Fully aware of the negative ordinary connotation of selfishness, Mill efforts to stress the rational sense of smithian selfishness, using the precepts of the Bible that call for love of your neighbour as of yourself. In this light it seems reasonable and natural that the individual should first think of himself and of his own interests and, once armed with this matrix, treat the interests of the others equally, not vice versa[6].

Acknowledging rationalism as the unique analysis tool, methodological purity promoted by neoclassical economists reveals

an economic agent without the human features and characteristics. Through its quantitative side, the neoclassical school of economics makes use of a homo economicus reduced to its essence, a calculating machine capable of ranking, even cardinal, pleasures and needs, extracted from its environment and doubtful imaginative, totally separated from the ethical and the religious.[7]

To compensate for the weaknesses of homo economicus deprived of the human nature, the supporters of moderate rationalism, James G. March and Herbert A. Simon proposed the concept of limited rationality considering that when individuals are in a position to choose between several options, they are not looking optimal solution but stop at the first satisfactory solution.[8]

A perfectly rational decision claims a preference to maximize quantifiable of expected utility that reveals an order of preference and a total and constant measurement of probability of all possible values. Limited abilities of individuals due to their cognitive capabilities and incomplete information cause such a request to be unrealistic to catch the behavior of the real agents studied by the economics.

According to political scientist Herbert Simon, rational behavior is *satisficient* [9], the decision maker will not have to investigate all the alternatives which could normally produce maximum benefits but must take into account only the alternatives that will produce reasonable growth of his benefits. Alternative analysis is limited to the familiar ones or to these which differ marginally from the variant that has already lived. The decisions are being adopted incrementally, in small steps and do not follow a "great" plan, a priori settled, because every choice changes the results and determines the emergence of the new problems.

Another aspect of limited rationality understood by North [10] is the difficulty of rational anticipation of environment evolution by individuals due to filtering information with preexisting mental construction. In other words, economic agents make decisions based on environmental adaptation experiences (learning) and some moral precepts (culture, moral values). Here's how North's ideas reach the complexity theory, his explanation may

be expressed more synthetically through the sensitivity of economic process to initial conditions, which is a specific property of complex systems.

From those shown above we may draw the conclusion that there are two models of decision making: rational model which concerns how decisions should be made for them to be considered rational and incremental model that shows how real decisions are made. The first model, the rational one has a normative character and the incremental model has rather descriptive one.

In incremental model [11], individuals change goals according to available alternatives but proceed inversely – by adjusting the available variants to proposed goals, perpetually reformulating the problem according to the new information. Individual agents continuously resolve existing social problems, not solve them completely at a time, sharing responsibility of choice with multiple stakeholders [12]. This continuing adaptation through mutual influence part-whole (co-evolution) of individuals (components of the system) to the economic life and society (socio-economic system) is a new reference to complexity theory.

Rejecting narrow selfishness in its meaning that denotes rapacity, considering it irrational, pragmatic realism supports so-called "enlightened self-interest", which assumes that individuals must demonstrate empathy, altruism towards other people while cooperation and reciprocity are ultimately more profitable than the generalized conflict. Following the tradition of methodological individualism, Milton Friedman belongs to this line of thinking and claims that under a liberalized trade the transactions are completed on terms generally accepted by all parties, individual gain is possible only if the prerequisites are met to harmonize the interests of all parties.

Methodological debates for irrational versus rational and deductive versus inductive approaches consume tireless efforts of the old and the new economists. A notable intervention on this type of analysis belongs to psychologists Daniel Kahneman and Amos Tversky [13] which opened a new perspective on psychological research into economic science (economic behaviorism or behavioral economics) [14]. Through

exploring prospect theory, seen as an alternative to expected-utility theory, the authors attempt to prove the invalidity of classical and neoclassical economic assumption that people behave rationally. They fundamentally differ from classical and neoclassical economists through their assertions claiming that the value (proposed as reference rather than utility in analysis) is not a linear function of the probability of action and it is not defined in relation to the final gain but in relative terms (compared with gains and losses). The methodology which behavioral economics is based on is inference that is used to identify behavioral patterns which are followed by individuals in the market decisions, based on cognitive and psychological experiments.

3. The uncertainty

One of the factors which have a decisive influence on the economic and social life is the uncertainty. This, in turns, is determined by the unpredictability and insufficient knowledge of economic processes and phenomena. A functional system aimed to achieve future results operates in a situation of uncertainty; risk and uncertainty are not yet options but they are parts of the human condition [15].

Neoclassical economists focused on removing the degree of uncertainty as much as possible. Through approximations, simplifications and calculations, they tried to determine the coordinates of a state of "equilibrium" to which all participants in economic life to tend. For to this end also efforts have been made to develop certain linear models to represent landmarks or universal rules which can be applied at any time when a change occurs.

On the other hand, heterodox economists realized the difficulty (if not impossibility) to achieve such a state, given that each individual is allowed to act freely on the market. People make decisions being ignorant of the existence of any equilibrium point which they or their competitors "must" find. The adjustment and adaptation of the economy state when a change occurs could be achieved through state intervention, which is considered by heterodox economists most appropriate solution to avoid inconsistencies; through research and statistical studies that it

undertakes, the State is in possession of most relevant information for right decisions.

Origin of the concepts of risk and uncertainty is lost somewhere in history but their use in economics is relatively recent, being utilized for the first time by Frank Knight, who works with these concepts to clarify the meaning of economic concepts such as: profit, investment decisions, financing, size and structure of firms. The founder of the Chicago School defines risk as the possibility of obtaining or not certain results based on known probabilities, the decision maker can connect possible random events with certain mathematical probabilities. The uncertainty occurs when the probabilities are unknown, so events cannot be expressed in terms of *certain* mathematical probabilities.

Throughout his work, Von Mises dedicates large spaces to the study of human action, laying the foundations of praxeology, the methodology that will have defined Austrian apriorism. Von Mises's sense of uncertainty is very clear: the fact that the economic agent acts and that the future is under uncertainty does not stand for two themes that are not independent but two different ways to state the same.[16]

Adopting the Misesian logic, we find a syllogism here [17] with a standard structure (two premises and a conclusion): major premise (future is uncertain) - contains major term and predicate of the conclusion, the minor premise (action takes place in the future) - contains the minor term and subject of the conclusion and the conclusion (action is uncertain) - contains subject and predicate.

In the absence of uncertainty, human behavior is reduced to a mechanical reaction to stimuli; but the essence of life is to search, it represents an aspiration to discover what is more convenient for us. Looking from this perspective, uncertainty seems essential for the development, creation, action, evolution.

Concerned about the relationship between uncertainty and confidence, German sociologist Niklaus Luhmann [18] considers that the dynamics of these two variables are closely correlated. As long as uncertainty is an intrinsic characteristic of life of individuals and society, his reductant - trust - allow the functioning of society [19]. On the same line of thought, showing a special predilection for formal and informal

institutions research, North believes that these restrictions are designed to reduce the uncertainty of economic agents in their daily interactions; uncertainty is the result of incomplete information on the behavior of other individuals and of existing limits in interpreting this information. [20] Therefore, there is a special relationship between institutions, uncertainty and trust: the lack of trust in institutions makes them inoperative and when there is trust the remaining uncertainty (even residual forms) remains a problem for decision makers.

In a complex and uncertain environment, the transactions between economic agents require adjustment calculations; under asymmetric information conditions, the subjects of economic action cannot certainly forecast the future, based on their experiences. The access to information materializes into transaction costs; some agents may sustain them, others not. On the line of thinking opened by Simon, Williamson uses the limited rationality by putting an economic agent in the center of the action, facing various adapting difficulties, some limits derived from their ability and capacity, complexity of information and communication barriers: the future can be only subjectively assessed and approximately predicted [21].

4. Conclusions

Complexity paradigm polarize neoclassical and heterodox approaches in a new light, which keeps mathematical tools, but it makes it more efficient, basing on computational modeling to analyze non-linear events on different time series, developing predictions on the link between and evolution of seemingly random phenomena. New theories based on complexity vision admit that individuals have a limited amount of information to underlie the decisions but through constant interactions that take place between them, knowledge spreads in the environment and reach all participants; from these processes it is projecting the structure of social institutions that will determine the emergent behavior of the system and the adaptation to the new change.

The Economy as a Complex System

Ciote Cristina Steliana

Faculty of Economics and Business Administration,

“Alexandru Ioan Cuza” University of Iasi

cristinaciote@yahoo.com

Abstract

Systemic approach of the economic phenomena and processes is already a tradition in the economic literature, this perception underpinning the emergence of what was to become the paradigm of complexity.

The philosophy that has governed the science in the modern period is going through a deep crisis that cannot be exceeded if the scientists are faithful to the mechanistic paradigm which has dominated history of thinking for centuries. Only through the returning to origins, to the simplicity of nature, by binding its links with deep philosophical and spiritual tradition, science can regain its status as a source of knowledge.

Key words: systemic philosophy, complex systems, holism.

J.E.L. classification: A12, B30, B41.

1. Introduction

In his book, *The Architecture of Complexity*, Nobel laureate for economics in 1978, Herbert Simon [1] states its intention to reform economic thinking by theorizing economic systems as complex systems. Even though at first his ideas were considered to be too vanguardist, his conception of complexity seen as an intrinsic characteristic of systems contributed to the foundation of the new paradigm of thinking that, it seems, will dominate the scientific research of the twenty-first century. The author believes that reductionist solutions to simplify the complexity generate inaccurate results; in order to make accurate predictions we have to operate complexity without simplifying it by using modelling.

2. On a theory of complex economic systems

Fritjof Capra, physicist and systems theorist, describes the current economy as a global metanetwork of complex technological and human interactions with multiple feedback loops that operate far from equilibrium and produce a variety of phenomena perpetually emerging [2]. Current global financial networks present a profound instability that produces random patterns of information turbulence causing destabilization of national and regional economies, regardless of their economic performance [3]. Circuits of global economy that must react to torrent of information tends to cause system instability, as a whole; without the design and implementation of stabilizing mechanisms the new economy will remain unstable.

The information technology revolution [4] based on the synergetic effects of three major domains, computers, microelectronics and telecommunications led to the rise of global capitalism. The new capitalism is much younger, extended, flexible, with the fundamental aspects [5]: globalization of economic activities, structuring around networks of financial flows, innovation, knowledge generation and information processing as the main source of productivity.

Distinctive feature for our times, the global economic system is characterized by close interaction and continuous change. Being aware of dynamic economic processes, the contemporary economists present economy as a continuous flow, a complex system that sets multiple equilibria; the neoclassical equilibrium proved to be a stale thinking approach. Based on the premise that the economy is complex, researchers mark the sunset of neoclassical economics, a new

era is coming: the complexity era in economics [6]

Janos Kornai accomplishes a highly original approach to economic system in „Anti-equilibrium. On Economic Systems Theory and the Tasks of Research”. The author establishes an isomorphism between economic reality and the concept of living economic system; this system is working based on the same regularities that are specific to all complex systems.

Combating the idea of formalizing and putting economic activities in abstract contours, Kornai rejects the hypothesis of homo oeconomicus overly rational, capable of precise mathematical calculations to substantiate his business decisions. Homo sociologicus proposed by the author behaves naturally, often cleverly, sometimes in a less intelligent way; most human beings are combining strict rationality with irrationality [7].

Conceived as a critique of the general equilibrium theory, the book reveals a whole new vision on the functioning of economic systems: by receiving inputs and release of outputs, economic systems undergo constant transformation of their internal state, informational and material items. Dualistic approaches to the actual economic systems require separation of real processes (production, circulation and consumption) and the control processes (observation, transmission and processing of information, training and decision-making). This separation between material and intellectual processes are performed only in theory, in practice these activities interwave and influence each other [8].

Information flow within the economic systems plays a central role, as system complexity increases, the informations multiply and execute the function of control. Bonds are formed in this system both vertically and horizontally, the organization is accomplished on several levels. The system consists of several subsystems, each with its own organization and as the more subsystems develop, the more the complexity of the whole system grows; intrasystemic relations are governed by institutions as a set of rules, norms and values that form patterns of behavior [9]. The relationship between the initial state, inputs, outputs and state transformations describe a reaction function.

The impulse consist of the inputs and the initial state and the reaction is influenced by impulse and random factors, thus revealing causal relationship only partially, the connection having a stochastic character.

Seen through the systemic approach, the national economy has the attributes of a cybernetic system with self-regulating properties, captured by the capacity to respond to the action of internal and external disturbances and to maintain self-control at different periods of time. [10]

3. Systemic philosophy - an integrative vision

Systemic thinking is a pre-eminence of holism, adopting a synarchical approach, embodied in a comprehensive theory able to identify and formulate all generally applicable natural laws, to decipher the secret of the universe, set it out as a general principle. This is also the great ambition of physicists to build the great unification theory [11] of all known forces in their diversity, theory that could not be developed until now although it had been made important progress in this direction.

Among the doctrines which promise a new qualitative leap in science we could remark the recurrence of *Hermeticism* [12] and *Gnosticism* [13]. We are witnessing a renaissance in new clothes of the values promoted by ancient civilizations that tend to restore the whole man, fully man and his rebirth, his metamorphosis through knowledge (Gnosis) [14]. The first principle of Hermes “What is up, it is down and what is great, it is even less” could be found illustrated in many contemporary scientific papers that are intended to be rewriting of the history of science from different context. The ambition of physicists to discover “God’s particle”[15] is nothing but a recognition of divine omnipresence, of the superposition "God is in the atom" and of biblical truth that man is created in God's image; fractal geometry of Benoit B. Mandelbrot reveals a microcosm seen as a reflection of the macrocosm. It seems that the law of conservation of information is rediscovered two millennia after the alchemists were focused on etheric body, which after the release of his material part what would become nothing but informational gain?

Quantum physics deals with atoms and particles as parts in a universal structure that is based on a cosmic harmony, in which the whole is not determined by the parties but the parties are determined by the whole and photons are quanta of energy that get information and act accordingly [16].

New holistic paradigm fills the gap that opened between science and religion, creates bridges between forms of knowledge, brings the respiritualization of science. New Gnosis language is the Word, the pre-Babel one, Gnosis is the knowledge through the love of light of faith, the recognition of the reality of God, invisibly visible in eternal mystery [17].

Considering the reality a flow and a continuous transformation, Chinese Taoist philosophy [18] focus on the cyclical nature of observable phenomena and argues that all developments in nature, both material and social follow a cyclic path. The Taoist cyclical model is based on polarity and complementarity and on the dynamic interaction between the two archetypal poles *yin* and *yang*, *feminine* and *masculine*; the natural order is the result of dynamic balance between the two extreme poles of a single whole. [19]

4. Conclusions

Ontologically, the world is seen through the events in a whole-system context and the phenomena are considered integrated modules, engaged in systemic interrelations and headed towards the achievement of objectives.

Epistemologically, systemic thinking brings into focus a reorientation of knowledge and a new vision upon the world, it is a syncretic thinking, much larger than the classical paradigm that admits that the object is the ontological ground of existence. This new paradigm of thinking basically admits that the first principle of universe is the relation and the mutual influences between elements are perceived as inherently dynamic. The world thus appears as a complicated texture of events, in which connections of different kinds substitute, intersect or combine, resulting in the texture of the whole [20]; the network is the fundamental model of organization of systemic philosophy to find the meanings of life.

Financial and Accounting Information System – Central Component of Economic Information System

Codreanu Diana-Elena

codreanudia@yahoo.com, c_radut@yahoo.com.

Abstract

Increasingly rapid changes in the business environment, increase the amount of data they work with an organization and greater competition in the business environment have caused systems to become an essential and vital to the success of an organization. Performance of an organization is assured while conditioned by the quality of decisions made by its manager. Making the best decisions based on large amounts of information and complex process of analysis and synthesis thereof.

Information necessary for decision making can be achieved due to the existence of an efficient, with which the data should be presented quickly, synthetic and equally relevant but give the opportunity to conduct complex analysis and some predictions..

Key words: information system, integrated information systems, financial accounting information system, decision makers, information technology

JEL classification.: C80, C88

1. Introduction

Global economy is strongly marked and influenced by technological progress in the past decades progress, which can be characterized by an unprecedented exponential growth. Hardware industry development is closely interrelated with the development of software industry.

In a few decades, computer science has grown very dynamic, unprecedented, and after his division were paved emergence of strictly specialized areas. A branch which has

attached particular importance is related to the production software, focusing on programming languages, applications and systems.

According to some studies in this field in the last 20 years we are witnessing a boom in business development, development which is based on financial globalization and especially the impact of increasingly higher you have the development of information technology. Between these two phenomena are linked quite strong: on the one hand, financial globalization is based on technological innovation and on the other hand, information technology has developed dynamically since financial capital is available.

2. What is a system?

In the current economic conditions in a computerized society, any organization can survive without having the right information in real time, both inside and outside. Collection, processing, storing and transmitting information and knowledge is the task and objectives of the information system available to the organization.

The concept of system is very common and made the subject of many papers and literature [9] abounds in a lot of definitions and concepts, such as:

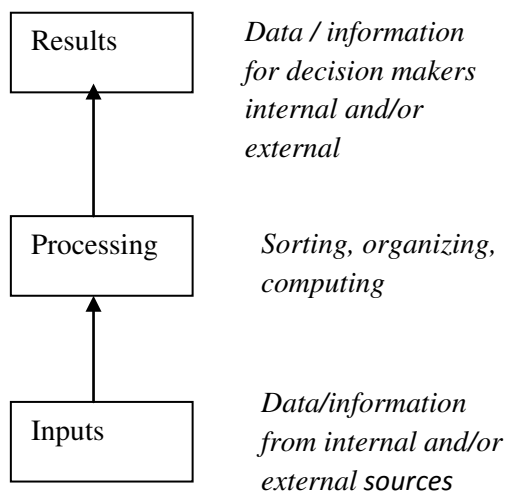

- a set of elements which interact (Ludwig von Bertalanffy);
- a lot of elements in the management of the proceedings (L. Nicolov);
- a hierarchical structure with one input and one output (RE Kalman, Falb and MA Arbib R.);
- lots of relationships (M. Mesarovic);

- a generally refers to a coordinated set of items (linked by coherent) aimed at specific targets [1].

3. Informatic systems

In any economic unit, the gathering, data processing and results is made according to organizational procedures established by law or by rules of procedure. Thus, the entries in a system consists of data or information (originating from the origin documents) that are processed obtaining information for planning, decision making and control. For a better illustration, the figure below are phases of an operation.

Figure 1: Distinct phases of system operation

Sources: Data processed by the author [6]

Information system can be defined as a technical-organizational anasambu finding procedures, record, collection, verification, transmission, storage and processing in order to meet the requirements necessary information in the substantiation and development management decisions [2].

Computer systems can take the form of a "black box" that has information entries. These are amenable to obtain information necessary for substantiating decisions through resources, rules and procedures [10].

Information systems play a crucial role in creating competitive firms to global business management and providing useful products and services to customers. Business globalization, the emergence of the digital economy and expansion of the Internet and other global communication networks have reshaped the role of information systems in

business and management. The Internet provides the necessary IT infrastructure for new business models, new processes of doing business and new ways of disseminating knowledge [5].

Today, information systems are used at all hierarchical levels and in all essentials activities of a company, the most significant developments is to assist management decisions at both operational, tactical or strategic (identifying new products, customers and suppliers, developing and evaluating strategies market and marketing campaigns) [4].

The importance of information systems lies mainly in the effective and responsible understanding by all leaders (managers) or people in an organization need to adapt to the global information society. Computer systems today are increasingly becoming a vital component of business success for an organization or an entrepreneur [7].

Information system plays a dual role: on the one hand provide all the information necessary to make decisions on all levels of responsibility, leadership and control on the other hand provides communication paths between other subsystems, as the decisions made by management subsystem are transmitted factors execution by information subsystem (downward flow).

4. Financial and accounting information system

When referring to the information system of an organization actually talking about a set of information systems. Accounting information system Oneness is one of the five subsystems of a business, yet we can say that the accounting information system is the greatest of all information subsystems of the organization, due to the high volume of financial and accounting information (over 40%), serving as a central part of the information system. Professor Dr. Dumitru Oprea show that over 80% of circulating information within an organization's information system is economical, and from this 47% is an accounting [8].

The collection, storage and processing of financial and accounting data that is used by decision makers. An accounting information system is generally a computer-based method

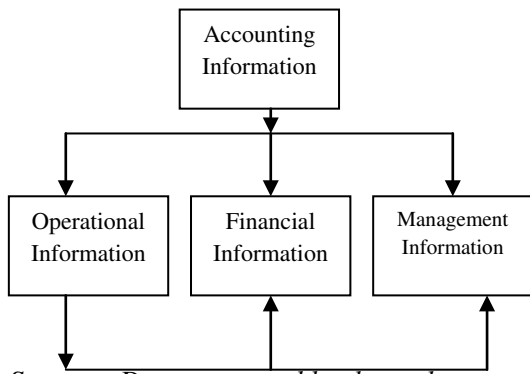

for tracking accounting activity in conjunction with information technology resources. The resulting statistical reports can be used internally by management or externally by other interested parties including investors, creditors and tax authorities [11].

In analyzing the overall efficiency of an enterprise is very important quantity and quality of financial and accounting information existing in the system at a time of economic enterprise, preferably at levels of more analytical. Quality of financial information is given and information system that uses economic organization.

Accounting information systems can provide a wealth of information and data types: financial, non-financial data, analysis results of data management, information search or anticipation, management information about shareholders, etc.

In a financial and accounting information system have three categories of information that there is a relationship between interaction as shown in the following figure.

Figure 2: Categories of accounting information

Accounting information circulating in the financial accounting information system refers to the following types of information:

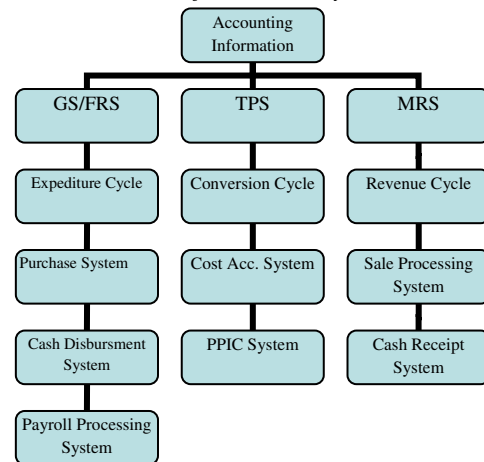

- *Operational information*: this category is represented by a large amount of data needed to manage daily activities of the organization;
- *Financial information*: they are used both managers and the organization external bodies, being derived from operational data processing or data archives;
- *Information management*: this category includes accounting information for the modspecial managers that have been derived from operational data processing as well as data from previous periods (historical data).

A traditional accounting system mainly deals with the collection, processing and obtaining financial results to be sent to external (such as investors, creditors and the Ministry of Finance) and the internal (in general management structures A modern accounting system handles both non-financial information and financial data and information.

The accounting information system is composed of three major subsystems [12]:

- *The transaction processing system (TPS)*: which supports daily business operations with numeros reports, documents and messages for users throughout the organization;
- *The general ledger/financial reporting systems (GS/FRS)*, which produces the traditional financial statement, suchas the income statement, balance sheet, statement of cash flows, tax returns and other reeports required by law;
- *The management reporting systems (MRS)*, which provides internal management with special purpose financial reports and information needed for decison making such as budgets, variance reports and responsibility reports

Figura 2: Framework for Accounting Information System

Source:

<http://www.scribd.com/doc/14528878/Accounting-Information-System>

Sign financial information systems and provide reports of business transactions and other economic activities in the course of running the company. With these systems are highlighted accounting records in chronological order, you can achieve financial forecasting, it is envisaged credit

and liquidity management can be obtained statements of financial performance of the company.

Depending on the technology used by the form and performance offered by these systems can be stand alone, isolated software applications (multi or small functions, all but with a core of basic functions without financial activity book can not take place, which is based on hardware and software running on more or less efficient in terms of possibilities, which are easier or harder to exploit, which communicates directly with other software like it or not, as the case but only by user intervention) or can be modules of complex systems that communicate directly with one another for doing business to ensure efficiency of economic organizations (ERP modular systems that can have more or fewer modules can be more or less efficient, only communicating directly or with the help of user).

In our days we talk about integrated systems. They provide users a number of advantages such as:

- Reducing long-term costs;
- Rapid recovery of investment in IT
- Increasing operational efficiency.

ERP-system developed to date have several elements which enter into their composition: classifications, receipts, payments, payroll, human resources, production planning, project management, production tracking, scheduling and tracking consumption and costs, and financial component and accounting and general accounting. [3].

The main functionality of this component are the following: automation recording financial information taken from primary documents, achieving complete accounting, analytical and summary level. Most times, this component made only financial accounting functions, ie obtaining synthetic accounting documents required by law (balance sheet, reporting VAT taxes to the budget) and those of accounting (accounting notes, register log records, accounts, cash book, sales and purchases journals, trial balance etc.). This component can be associated analysis module, type dashboard (specific MIS system or EIS), which provides summary information and intelligence on firm performance, managers need decision-making. Based on data of accounting,

different indicators are calculated, showing the financial results of the company, such as income and expenses on products / services, financial cash situation etc.

In addition to achieving data integration and reporting on activities Hardware organization as the main benefits of implementing an ERP Financial Accounting model has the major advantage automate specific operations at a rate of up to 95%, depending on the degree of customization application. Automate operations is made possible by the high degree of repeatability of financial and accounting operations and involves the application of templates already predefined existente the application or implementation. Besides increasing operating speed, automation enables people with little accounting knowledge to yet he works with this application, and also prevents human errors in some operations.

5. Conclusions

We live in an information society and any modern organization can survive without access to real-time information, accurate and consistent. Operations task processing, storage, transmission and supply of information back information system. Thus, any organization should integrate modern information technology to its business organization to be competitive in a market increasingly competitive.

Financial and accounting information system within an organization because managing the largest volume provides information for other systems, premises operating at high efficiency levels and provides the organization in charge of management support, correct and timely information for make the best decisions.

A Historical Perspective on Luxury

Cosma Sorinel

Faculty of Economics, „Ovidius” University, Constanta
sorinelcosma@yahoo.fr

Abstract

The word luxury recurs and recurs in contemporary advertising as an attempt by retailers to imply exclusiveness, associated with expensiveness and rarity. It is an inducement to consumption. Yet, the concept is frequently used in a loose or clichéd manner in both everyday language and promotional discourse.

Luxury goods have two formal features: they are refined and positively pleasing. Luxury goods fall under several categories: sustenance (food and drink), shelter, clothing (apparel and accessories like jewelry and perfume) and leisure (entertainment and sporting goods). The standard definition of basic needs will include food, dwelling, and clothing.

Needs, unlike wants, are objective or universal. Wants, unlike needs, are intentional. Unbalanced desires are insatiable.

Key words: luxury, wealth, need, desire.

J.E.L. classification: B00

1. Introduction

Why an attempt to look upon luxury from a historical perspective? Firstly, by looking into how different societies in different ages of our history dealt with luxury, we can get closer to what it really stands for and its connections to other concepts, such as wealth, power, and so on.

Secondly, an in-depth historical perspective will also provide us with valuable insights into democracy, patriotism, social harmony, human values, relationship to God, and other aspects of the human social and economic life.

Thirdly, such an enterprise will point out the fact that throughout history, almost all attempts to control people's propensity to

luxury failed to do so, which shows us clearly that such restrictions today are most likely to fail as well.

Throughout the history of mankind luxury has been a constant element in the lives of individuals and in the works of philosophers, poets, lawmakers, economists. Luxury has been closely examined in view of giving it a proper definition, finding its meanings and characteristics, its origins, causes and consequences. Yet none of the many attempts to do so can boast an exhaustive study of this matter. In its evolution in time, luxury has been both praised and condemned, there were times when its manifestations were encouraged or on the contrary discouraged.

A certain presence of luxury in the human spirit dated as back as the third millennium BC. But for so many centuries it has been associated with the concept of wealth, both being perceived as abundance of material things, as ability to satisfy numerous and various needs and desires.

Luxury exhibits intensive relativity. Since certain luxury goods can at any given time become so widely spread through trade and thus lose their status, many authors have found it difficult to define it. As a relational concept, luxury depends on what the „necessity” is in relation to historical time, subjective judgment, objective scale of measurement. The luxury-necessity relationship makes conceptualizing luxury a true challenge.

As it is subject to temporal mutability, luxury can change over time, and past luxuries can become needs or necessities. Socially-conditioned needs are bound to change. The boundary between basic needs and instrumental needs is historically determined. Plus, in time new needs have the tendency to appear and develop, just as Marx pointed it out.

The word itself comes from Latin – *luxus*, which apparently has Greek roots. It appears that the ancient word emerged in the time of

despotism to refer to excess, abundancy, even debauchery. It is related to the word *luxuria* meaning an abundance of pleasures, especially physical ones. Because of this meaning, many ancient and medieval writers condemned it as useless and immoral and repudiated it under all its forms. This attitude has continued to exist all through the Middle Ages.

The paradoxical nature of luxury consumption was pointed out more than 2,000 years ago by Greek philosophers.

For Plato, all needs are natural and universal. In his times, the Greek city-state comprised three basic needs: food, shelter, and clothing. Still, he identifies several other needs that go further than this absolute minimum.

Aristotle warns against excesses and stands for the mean course between extremes of human behavior. He extended Plato's reasoning stating that the struggle for luxury leads to the polis waging war in order to acquire the means to fulfill all the extra wants.

For Socrates, luxuries, still pertaining to the body, refer to fancy food (dainties), fancy clothes (embroidered) and fancy dwellings (with gold and ivory), all of them offering pleasure.

Roman moralists and legislators were preoccupied with luxury, which „played a central and distinctive role in both Roman thought and practice. For the Romans, and beyond, luxury was a political question because it signified the presence of the potentially disruptive power of human desire, a power which must be policed”. (Christopher J. Berry) The very destruction of the Empire was thought to have been the result of the luxurious lifestyle of the Romans.

Christianity added a moral dimension to the luxury problem, the Church treating luxury as a sin. Luxury was synonymous with lust and vice. But let us not forget that in the Middle Ages the Church became an important consumer of luxuries employing them in the service of God.

Later on, the moral arguments were abandoned and the discussion shifted to a more social and economic way analysis. But it was still looked upon as inefficient or useless for society.

The Renaissance brought about new

conditions for the concept of luxury to be comprehended. Thomas More, Jean Bodin, Montaigne, or Sully looked into the issue of luxury as a cultural phenomenon. Luxury goods are seen as status indicators.

Monarchs and aristocrats saw luxury as a sign of personal power and try to manage the issue of luxury goods, but many times this led to social discontent and even social unrest.

Bernard Mandeville is considered the first to have produced an approach of luxury from a positive side. In his Fable of The Bees: or, Private Vices, Public Benefits, he pointed to the positive effects of luxury on the society's welfare. A rich and comfortable life asks for the fabrication and trade of luxury goods.

For Mandeville, luxury is „everything that is not immediately necessary to make Man subsist”. But by this definition, very little is not luxury.

Voltaire, Condillac, Montesquieu are other names in whose writings luxury is treated as excessive behavior. Montesquieu defined luxury as living life on the expense of the work of others.

Holbach emphasized the emotional side of this concept. For him, luxury was a passionate competition driven by vanity and the desire to outdo the others. Hume gave it a psychological interpretation, luxury appealing to senses, with a fine line between vice and virtue.

It was the Physiocrats who brought luxury under economic scrutiny. Quesnay and Baudeau spoke of sterile expenditure – the available profit was spent by owners instead of being used to improve the land and the agriculture. This idea that luxury represents special expenses made only by one social class and is a form of wealth waste was embraced by Marx as well.

J. B. Say included luxury into unproductive consume and condemned it as being ostentatious.

Werner Sombart defined luxury as any expenditure that goes beyond the necessary.

He maintained that luxury is a “relational concept” that can be meaningfully defined through its relationship to necessity, even if what is necessary is not fixed.

Sombart distinguished between two senses of luxury – a quantitative sense (associated with squandering) and a

qualitative sense (meaning the use of better or more refined goods).

He suggested yet another distinction, namely that between idealistic or altruistic luxury (for public or ecclesiastical purposes) and materialistic, egoistic luxury (originating from the enjoyment of sensory pleasures).

In 1752, Hume’s essay „Of Luxury” was first published but re-titled „Of Refinement in the Arts” in 1760. This essay was meant as his response addressed to Mandeville.

The essay opens with Hume’s stating that luxury is a word of ‚uncertain signification’. He defines luxury as ‘great refinement in the gratification of the senses’.

He has generally been seen as an applauder of luxury – which is to say commodities that exceed the scope of basic needs – and the consumer society. In his view, the availability and pursuit of material and luxurious commodities benefit both the individual members of a society and the society as a whole.

Jean-Jacques Rousseau and several other contemporaries of Hume were strongly opposed to this sort of thinking, and considered excessive material consumption to be detrimental to human beings.

The ingredients to happiness are action (being occupied), indolence or repose (as a relief from labor), and pleasure. Lethargy and ignorance are banished. Hume regards reason as inert in this issue – very often one vice can be cured by encouraging another vice.

Because of its effects, luxury is seen by Hume as an ingredient in a civilized society. It becomes pernicious when it ceases to be socially beneficial. So Hume admits that luxury can be vicious as well as innocent. For him, the fault of vicious luxury lies with the government. Given that human nature cannot be changed, the task of the government is to change the situation.

In other words, Hume did not claim that luxury is absolutely profitable. He drew the difference between good luxury (refinement of the arts) and bad luxury (vicious luxury). Since no society can be completely exempt from vicious luxury (a small part of the population will always have an opportunity to take their greed to extremes), he made an option for a happy medium between the two, a rather moderate consumption of good luxury restrained and kept under control by means of good laws, administration and

social order. Thus, it would be quite possible to maintain morals and a functioning society with the aid of luxury.

We can trace a link between commerce, luxury and liberty in his writing: a trading nation is potent, its greatness is a synonym for its military power. Power and happiness are increased by the desire for luxury goods. And the growth in commerce draws an increase in liberty. This link between commerce, luxury and liberty can also be traced in Adam Smith’s writings.

For Adam Smith, the subject of needs are the need-bearers, whereas the object of needs are the needed objects. So, needed objects are instruments to serve the ends of the need-bearer.

History is the history of opulence, not of basic needs. In other words, the history of growth of opulence is the history of the expansion of needed objects. Objects that were once needed can become redundant, for instance, sharp flints are no longer used, but the need for cutting tools has not changed.

Instrumental needs are not identical. And an activity once pursued out of necessity is later in time pursued as an amusement (hunting, for example).

Smith believes that human industry was employed to procure conveniences (determined according to delicacy of taste) rather than basic necessities.

For Smith, opulence and freedom are the two greatest blessings men can possess (Lectures on Jurisprudence) and it is the modern world of commerce the only one to offer the prospect of those.

Smith assesses desire positively. Selfishness is everyone’s natural desire to better their condition.

Adam Smith is the author of the four-stage theory of the history of the mode of satisfaction of needs: the age of hunters, the age of shepherds, the age of farmers or husbandmen, and the commercial age. In the first stage, every man provides everything for himself. In the last stage, it is required the joint labor of a great multitude of workmen in order to meet the need for a warm coat, for example.

The present day economic niche of luxury products exhibits three essential characteristics: scarcity, extra value, and high quality. Many authors indicate yet another characteristic – pricing. Any object is said

to have use value, exchange value, symbolic value, and sign value. Luxury products are liable to have sign value on top of their functional or economical meaning, and are bought for the additional meaning in the consumer's society. When buying such products, the consumer in fact strives for status.

2. The Origins of Luxury

Through the history of economic thought, numerous writers who looked into the concept of luxury have tried to trace its origins and have come up with many a theory.

The Arab philosopher Ibn Khaldun found the origin of luxury in the *abandonment of the nomadic life and the adoption of the sedentary life* which led to the development of crafts, of cities and of luxury goods. He spoke of luxury inside the kitchen, the home as a whole and of the luxury of the owner's cloths.

Montesquieu, Forbonnais and later on Veblen are among the authors who link the birth of luxury to the *inequity of wealth*. Luxury is proportional to the size and wealth of the city, of the country. The great number of inhabitants generates a great amount of vanity and the desire to have the things that the upper class has.

J.J. Rousseau linked luxury to *greed*, which is a form of slavery of the human instincts. He blamed luxury for the poverty of countries.

Jean Baudrillard named four fundamental sources of luxury: *vanity, sensuality, the instinct for adornments, and fashion*. For him, needs and wants are mere instruments to entice the consumer to consume. He speaks of primary needs, minimal consumption level, and normal life.

In 1899, Thorstein Veblen, in his *Theory of the Leisure Class*, described the world of the late nineteenth century American upper class and their ways to show off their wealth. He considered luxury to be a *status symbol* belonging exclusively to this class. The industrious class is to consume only what is necessary to their subsistence. And yet, being rich and having money is not a guarantee for prestige and power. Only the showing off of one's wealth can ensure a certain position in society.

Veblen presents a seminal model of conspicuous consumption, theorizing that individuals emulate the consumption patterns of those individuals at a higher point in the social hierarchy.

3. Forms of luxury

In terms of forms, ancient authors spoke of luxury in relation to food, clothing, and home. Later on, adornments were also considered as springing from the embellishment instinct.

In terms of extent, luxury can be a complete or general nation-scale phenomenon or it can be detected only among the members of the upper classes.

In terms of intensity, luxury can be moderate or excessive, which can lead to ruin.

Another distinction was made between internal or active luxury and external or passive luxury, from the point of view of the origin of luxury goods or the resources they are made of – either locally or nationally manufactured or imported from other countries. External luxury was seen as detrimental to the local or national economy and to the morale of the citizens. Internal luxury, on the other hand, could help both agriculture and industry, would entice people to increase their income and would also help art to develop and to diversify. But active luxury could very well lead to an abundance of money which would cause prices to rise and, as a result, would make less expensive imported goods extremely attractive. And not even prohibition could stop the decline of agriculture, crafts and manufactures, because economic laws are much more powerful than the various laws issued by lawmakers. Through passive luxury a country can dispose of some of the cash it possesses, and that would have positive consequences on its economy.

Luxury was also analyzed and classified in relation to people's needs and financial means. There are forms of luxury that match the fundamental needs of the individual and his income, thus being legal and moral. But there are also forms of luxury that are to be condemned on ostentation grounds.

Other distinctions have been made between private and public luxury.

Charles Gides spoke about harmful luxury

or anti-economic luxury given as an example the use of agricultural lands for hunting. An example of harmless luxury would be art collecting.

Greed and lust generate harmful luxury, whereas intellectual and artistic needs generate scientific or artistic luxury.

From a historical perspective we can speak of savage luxury as opposed to civilized luxury, religious and symbolic luxury such as the one in Ancient Egypt, corrupt and abusive luxury such as the one in Babylon, banquet luxury in Ancient Greece, public buildings luxury of the Roman Empire, church related luxury and feudal luxury in the Middle Ages, and modern luxury dating since the 17th century.

4. Conclusion

The fact is, no matter what its origins and forms may be, we simply cannot imagine a society without luxury. Widely debated in human history, the concept is wider than any definition and is constantly changing its appearance over time.

All in all, two main approaches to luxury can be discerned. Luxury is deemed to be

negative for society since it erodes the strength of that society. Also, luxury is blamed for its moral inappropriateness. Since it creates an unhealthy and weak state, there have been repeated attempts to ban it from society or institutionalize it.

The concept of luxury has had an eventful history and continues to be surrounded by controversy and to generate debate in terms of definition, forms and origins.

Abstract

The economic growth and the research of the inflation, as objectives of the monetary policy of a country, are a major problem for all the monetary authorities of all countries and a priority for economic analyses from different times.

The fact that in the 20th century, all countries have known the inflation, most of them even the hyperinflation, proves that this type of inflationist processes, which are out of control, have recently been carried out and are still carried out in numerous countries from all continents, and the impact of this phenomenon cannot be neglected at all.

The economic history proved that no economy is insured by the unfavorable impact of the inflation.

The central bank’s main purpose is the control of the amount of money available in economy, so the economy’s normal functionality and balanced development can be insured.

Keywords: central bank, government, inflation, monetary policy, hyperinflation.

Clasificare J.E.L.: E50,E52, E58, E60.

Introduction

The events which were determined at the beginning of the transition from the centralized, totalitarian economy, to the market economy, led to a major monetary imbalance just as it happened to the other countries from Central and Eastern Europe, which started the same way. But even before

1989, great and profound imbalances have started to occur next to the economic downswing, and the inflation has taken the most dangerous form, the repressed one, manifested through penury generalized by merchandise and forced saving.

Our country has experienced with an inflationist process whose duration and amplitude was greater than the majority of the other transitional countries, as a consequence of multiple causes: the rigid price system inherited from the old regime, the administratively controlled prices, the major imbalances of economy’s real sector, the external impacts which have determined the authorities to choose the prudent and gradually liberalization. The first caution had solid reasons of political and social decree and proved to be an acceptable short term measure, but was hardly endured on medium term. The trial of solving the effects and not the causes of the phenomena, had only amplified the inflationist pressures and increased the cost of the inflationist measures.

It can be appreciated that holding the inflation in place and reducing it to levels that can be compared to the ones registered in countries with a mature market economy represents not only a prime objective but a measurement unit of the performances of the romanian authorities’ economic policy who have proposed the accomplishment of a long term economic growth, as a main objective of economic policy.

Within this context, the central bank of Romania has proceeded to change the monetary policy’s strategy and to carry the inflation targeting which allows the targeting of the inflation differential predictions in

order to insure monetary stability, as well as the reduction of the inflation at a compatible level with the Economic and Monetary Union’s membership.

The monetary policy’s strategy of the Central Bank

Since the adhesion to the European Union, and, as well as it’s admission to the European System of Central Banks, the National Bank of Romania is responsible to analyze the economic situation of the country, to evaluate the fundamental balances of the economy which can be endangered by an evolution or another of macroeconomic indicators, and to adopt the monetary policy’s strategies in order to guarantee the main objective which is the insurance of the monetary stability.

The prices’ stability contribute to the financial stability, because it takes away the dysfunctionalities and the uncertainties which can emerge at the market level as a consequence of the prices’ instability.

In order to consistently fulfill it’s main purpose, the National Bank of Romania has proceeded to the revision of the monetary policy. In 2005 it officially went to the strategy of direct targeting of the inflation, target which couldn’t be reached by the bank in the last four years, and which was predicted to 3 % in 2012.

The following chart shows that in 2011, the annual inflation rate outgrew the set target of 3 % with 0.14 %. In 2012 and 2013 an annual rate of inflation which keeps up with the fixed targets is estimated ^[1].

Chart no 1. Previsions on the inflationary trend of Romania

Source: NBR, Inflation Report, May 2012.

It can be observed from the figure number 2 that until 2012, the inflation targets haven’t reached the inferior limit, nor the superior one, but in 2013 it is estimated that the

inflation will reach the superior limit of 2.5 % (see chart no.1).

Chart no.2. The inflation targets of Romania

Source: NBR, The Inflation Report, May 2012.

The retrospective analysis on a long term period shows that, in Romania, the inflation measured through consumer prices positioned itself on a clearly descendent trend, reaching the lowest historical level, at the end of December 2011, of 3.14 %^[4].

Chart no.3. The inflationary process evolution between 2008- 2013 years

Source: NBR, Inflation Report, May 2012

The substantial decrease of the inflation rate in the second part of the year has been sustained by the relief of the food and energy commodity market (on the background of a good agricultural production on a national and international level and, as well as the petroleum’s external price’s evolution).

As it can be seen in the forth figure, if in 2010, in Romania, the highest rate of inflation was 7.96 %, being followed by Hungary and Bulgaria, with a level of 4.6 % and 4.4 %, in December 2011, the annual inflation rate was lower in countries such as Bulgaria (2 %) and Greece (2.2 %), and the highest level was registered in Poland (4.5

%) and Hungary (4.4 %). The lowest average annual rate of inflation from 2011 was registered in Czech Republic and the highest was registered in Romania (5.8 %)^[3].

Chart no.4. nflation’s rate evolution in Romania compared to the EU member states between 2009- 2011

Source: IMF, EUROSTAT.

The NBR, lately took some restrictive measures using the transmission interest rate channel, practiced some high interests intended to maintain the level of the loans given to people and companies, but those interests influenced the deceleration of the economic growth and the administration of the cash situation on the monetary market. In view of the orientation of the short term interest rates, the NBR has a set of instruments of monetary policy, such as: market operations, permanent facilities and the reserve requirements. As for the interests evolution for these operations, as it can be seen in the following table, we can affirm that their evolution is descendant, positioning itself at a 9.25 %, in case we talk about the loan facility, and at a level of 1.25 % when it comes to deposit facility. This evolution is determined by the NBR attempts to stimulate the loan and the consume.

Table no.1. The interest rates of the monetary policy and of the permanent facilities

Valid from:	Monetary policy %	Loan facility %	Deposit facility %
The 30 th of March, 2012	5,25	9,25	1,25
The 3 rd of Febraury, 2012	5,5	9,5	1,5
The 6 th of January, 2012	5,75	9,75	1,75
The 3 rd of November, 2011	6	10	2
The 5 th of May, 2010	6,25	10,25	2,25
The 30 th of March, 2010	6,5	10,5	2,5
The 4 th of February, 2010	7	11	3

The 6 th of January, 2010	7,5	11,5	3,5
The 30 th of September, 2009	8	12	4
The 5 th of August, 2009	8,5	12,5	4,5

Source: <http://www.bnr.ro/Indicatori-de-politica-monetara-1744.aspx>

According to table no.1, the interest rates on the interbank monetary market, have a descendant evolution during this period. As for the interest rate regarding to the loan facility, this is characterized by a descendant evolution on the given period of time. If in 2009, the average level of this rate was 15 %, in 2010 it was kept up at an average high level of 13 %. Nowadays, the level of this rate is 9.25 % and it is settled for the entire analyzed period of time related to the evolution of the monetary policy interest. The interest rate in case of deposit facility was about 4.5 % in 2009, and by the end of 2011 was 2 %. This rate was situated on the same level in 2011, when by the end of that year and the beginning of 2012 a decrease was registered, being nowadays situated at a level of 1.25 % (see chart no.5)

The main functions of RON-denominated reserve requirements are the monetary control and the stabilization of interbank money market rates. The major role of foreign currency-denominated reserve requirements is to contain the expansion of foreign exchange loans.

Chart no.5. The evolution of the reserve requirements in 2011&2012

Source : NBR Inflation Report, April 2012.

During the period of March 2011 and April 2012, the reserve requirements rates were preserved on the same level for both of leu-denominated reserve requirements and of

foreign currency-denominated reserve requirements.

The leu-denominated reserve requirements rate is 15 % p.a., and the foreign currency-denominated reserve requirements is 20 % p.a.

These tendencies are the result of the monetary policy desired to be set up by the National Bank of Romania in order to relaunch the loan activity which is supposed to aid the growth of the consume and the investments.

The decrease of the reserve requirement leads to a more abounding liquidity on the interbank market and this liquidity will allow a better money circulation in the system, and finally will lead to a decrease of the interests. This means that loans in Euro will be slightly cheaper and that there will be a possibility for the banks to easily finance the great infrastructure projects.

By adopting these decisions, the preservation of the sustainable resumption of the disinflation and economic recovery process are taken into consideration.

In 2009 and 2010, an attenuation of the loan activity took place in Romania, when the banks have developed a strategy which was determined by prudence. Loan institutions have adapted their strategy, territorial expansion plans, the products portfolio and passed to a detailed supervision of the operational costs.

There were several factors which led to the decrease of the reimbursement capacity of the loans: the growth of the unemployment, the decrease of the payments from the budgetary sector and the stint of some companies' activity.

The evolution of the inflation during the last decade has to be analyzed in the context of a vigorous growth of the gross domestic product until the half of 2008, which was followed by a strong downfall of the economic activity.

In figures number 6 and 7 it is revealed that, by analyzing the unemployment rate, Romania is placed on a less favorable position compared to other countries, but this circumstance is overwhelmed by the levels of the inflation rates, by the gross domestic product/citizen, and by the monthly average payment, indicators for which Romania needs stabilization policies (see chart no.6)

Chart no.6. The unemployment rate in December 2009 and December 2011

Source: IMF, EUROSTAT.

In the following figure, the statistics of the International Monetary Fund show that Romania is on top of the countries with the weakest economic performances between 2009 and 2011. This has also been seen on the life standard level: Romania's gross domestic product/citizen decreased in 2011, until it reached 7495 \$, with approximately 0.99 %, compared to 2010, and with 1 %, compared to 2009. Until 2011, Bulgaria was the European country with the lowest standard of living^[3].

Chart no. 7. GDPt/citizen of Romania during December 2009- December 2011

Source: IMF, EUROSTAT.

The adjustments on the labor market were continued in December 2011 as well, the unemployment rate decreased from 7.3 % to 7 % in 2010, and from 7.8 % in 2011; the most important personnel dismissals were registered in industry and buildings.

Figure number 7 shows the minimum levels of the monthly Euro payments in the member states, Croatia, Turkey and The United States in 2011. Amongst the member states, the national minimum gross wage in Euro was between 123 Euro (in Bulgaria) and 1758 Euro (in Luxemburg).

We can also notice that, on the classification of the member states of the European Union with national minimum wage, Romania is situated on the penultimate place, with 153 Euro per month, with only 30 Euro more than its neighbor, Bulgaria, both being the last on the top concerning the wages in the European Union (chart no.8).

Chart no. 8. The monthly minimum wage in Euro in 2011

Source: IMF, EUROSTAT.

This fact had consequences on the volume of the provisions which the banks had to come up with and on the profitability.

Conclusions

The option regarding the aiming of the inflation as a monetary policy strategy has been justified by the necessity of the accomplishment of a sustainable disinflation, which can allow Romania to adopt the Euro in 2015.

This achievement implies a balanced mix of economic policies, especially the fiscal and income policies, which can assure the decrease of the inflation in the same time with the sustainable maintenance of the economic growth. An evolution such as this one, about the inflationist target, is usually based on the foreign direct investments, which increase the economy's productive capacity and finance an external deficit, even a relatively amounted one.

That is why the National Bank of Romania is currently trying to increase the level of the investments, by a considerable participation of the internal component, based on the increase of the money saving.

The effectiveness of the monetary policy is appreciated by a good relationship between

the fiscal policy and the monetary one, on one side, and between the exchange rate policy and the monetary one, on the other side.

The National Bank of Romania, along with the Government, will have to add, beside the policies about aiming the inflation, those programs that will continue to lead to the economic growth, to insure an adequate functionality of the interbank market and to maintain a sustainable finance of the economy, and also to increase the saving grade and to totally and rationally use the internal financial resources.

Gorj County and its Stage of Economic Recovery in the Current Crisis

Enea Constanța,
Mungiu Pupazan Claudia Maria
„Constantin Brâncuși” University of Târgu-Jiu,
Faculty of Economics and Business Administration
Târgu-Jiu, Gorj, România,
eneaconstanta@yahoo.com

Abstract:

The global economy is in early stages of recovery after contraction records generated by the economic crisis, but progress is uneven. Some regions are experiencing a revival already, but others continue to struggle.

The same is true for many areas of the world economy which enjoys the financial sector recovery, although still experiencing serious problems. Euromonitor International presents the likely changes in global economic landscape in 2010. The world economy began growing again, but the recovery will be uneven.

Keywords: macroeconomic, policies mix, economic crisis, unhealthy economic growth,
JEL codes: E61, E63

1. Introduction:

Romania's economy is overheated, and growth will slow. The current account deficit will remain at alarming levels, the outlook is worsening fiscal and vulnerability to external shocks is high, especially in this time of global financial crisis.

The international financial crisis was only trigger domestic economic crisis because it has affected funding sources. New consumers in debt, and now we are borrowing more expensive or not. This situation also applies to government and business, and the population.

Vulnerabilities unbalanced economy, with many delayed structural reforms have now become evident. Lost jobs, and this is just the beginning. In 2010, the budget revenue will be lower, because we have a lower growth and will be collected more difficult due to

lack of lichidation [17]. There will be enough to stimulate the central bank lending by reducing interest and reserve requirements.

2. Free tools eliminate financial "toxic" - stop solution for crisis

We have a crisis of overconsumption. It comes from eliminating waste by investing in infrastructure based on multi-programming budget by fiscal reform is not neutral and structural reforms. Lack of local financial instruments “toxic” derivatives such loans subprime – mortgage loans with high risk – has caused many to hope that Romania will not be affected by the crisis that began in the U.S, in summer 2007 [10].

But as the credit crisis has spread to all the world's strongest financial centers, financial institutions lost confidence between banks is knowing which accounts to competitors and, fearing that if they give money to loan, could not them more able to recover.

Thus, it created a financial jam and waves propagated in the Romanian financial institutions. Most affected areas promises to be the automotive, textile manufacturing and construction sector industries, according to Tuesday

Many redundancies were announced, surrendered temporary employment contracts, references to technical unemployment, number of people affected will be between 100,000 and 400,000, according to analysts [15].

It is important that the next period, the lion to maintain as stable against the euro. Probably a variation of less magnitude around the current rate RON / euro will reduce the appetite for further imports, will retain some competitive advantage for Romanian exporters (which however must

take real measures to ensure competitiveness and medium term at least Romanian products), leading eventually to further reduce the current account deficit (especially considering that direct capital investments and remittances from Romanians abroad are no longer at levels from previous periods).

If we look at financial stabilization measures taken by some EU countries, we conclude that they have been and are targeted to players of national interest (of the banking and industrial), with majority being local or controlled by such capital. The restrictions imposed by these states, we find the obligation supported by state banks to finance the local economy a priority country, local SMEs and to reduce, while cross-border exposures. About the same direction and is heading the EU's decisions, whatever they are presented in official documents. I think that the Romanian government and other institutions authorized by adopting a realistic attitude, to focus priority attention and support to banks and Romanian-owned companies (public or private) [7].

3. Conclusions:

Reality shows however that the economy is now Gorj extremely exposed to the crisis.

This is one of the reasons why its effects were felt in the economy so fast Local. Blow to the local economic environment will come in two parts:

- The looming crisis stronger in the construction / real estate (now perhaps May joined the local economic engine), following the developments in international financial markets and restricting lending;

If we look at the local economy in terms of a hierarchy of performance companies, it's quite evident that an important driver of local economic growth is Internal consumption:

- county and local level, the percentage of SMEs relatively competitive in terms of growth in turnover and profit is approx. 5%. A majority of them are We focus on innovative sectors, heavily exposed to changes in circumstances economic (real estate, construction equipment, building materials, distribution and trade) and a strong focus on the local market.

- Approximately two thirds of the Top 10 companies (by turnover) from the sectors building materials, construction, trade,

distribution. Domestic consumption is the engine these industries and the crisis in financial markets, financing and expensiveness restricting lending is expected a significant reduction of economic performance their direct impact on employment and investments for the plan Local. In total there are approx. Gorj 10 companies in those sectors exposed, which can be affected, with a possible negative impact of population and income levels consumption;

- The share of exporting companies in the local economy is very low. Thus in ranking by turnover, Top 10 Gorj, the first export position is only 18. Less than 15% of companies present in the top export activities performed. Home exporting company with Romanian capital, is only ranked 36;

- Also, a statistical relevance of the Regional Directorate of Statistics show that the ratio of Gorj exports and imports in the county's economy is about. 1-3, in favor of imports, a relevant imbalance. Export production value came in the first nine months of the year 2009 is 33.7% of the total delivered, while the foreign trade activity Gorj county, in the first seven months of 2009, is reflected in the achievement of volume export value of EUR 425.1 million and imports totaling 1130.2 million;

- In the city of Gorj and the area of influence Periurban, announced investments in sectors estate and trade, exceeding by a factor of at least four, investing in sectors "tradeable" such as manufacturing or activities with high added value sector services.

Also the share of innovative and emerging sectors that have the potential of an outflow Faster crisis is extremely low. Despite academic potential, number entrepreneurial initiatives in innovative fields is very low, most being focused towards local market, instead of exploring global opportunities in emerging sectors. This represents medium and long term structural growth a boon for both local companies and area economy as a whole. In light of statistics, the vision of the center of Gorj innovation, there is now nothing more than a slogan:

- In highly innovative fields such as research and development, pharmacy, chemistry, equipment industrial computer, the reference number of companies, the

champions is reduced. Thus, in the software development of the approx. 700 active companies, more Less than 20 recorded an annual profit of 10,000 EUR, which is mainly subsidiaries of foreign companies which concentrate manpower and turnover locally. Unlike local entrepreneurs, they did not function or repaired interest to capitalize on local research into new products, transferring value which stems from intellectual property added to the parent company;

- A relevant comparison for the share of innovative sectors in the local economy, shows that of the 7 companies in the software industry, none appears in the Top 10 Gorj (Ranking by turnover), compared with at least 15 of the construction sector. No foreign investment prospect at the moment seems not too pink.

Small and Medium Business provides most jobs and contributes a large proportion of the welfare population and villages from Gorj county budgets. Surely, however, the local entrepreneurship childhood days are over. The local market is more more mature, competition is sharpened, and currently has a need not only the initiative and willingness to risk, but in one measure of competence. Thus, despite recent spectacular economic developments Romania, in recent years, doing business locally in Gorj County, is becoming a reality problematic, especially for SMEs.

High mortality companies (25% canceled the registrations of companies reported under Gorj ORC) is a sign of the increasingly sharp competition in the local economy. A relevant example is aggressive penetration of large commercial operators (briefly became an oligopoly) or international brands at the expense of local economic agents in the field, among whom was registered a significant increase in output from this business. Local entrepreneurs were totally unprepared for the consequences just as they are still unprepared for announced the arrival of other giants such as IKEA.

The competition takes place but also for local resources, especially human resource quality, become more expensive and more rare. In the software sector, for example, costs of salaries employers have registered a growth of over 50% in the last two years, as the advent of foreign companies in Gorj.

Both in Gorj and in South-West, small and medium enterprises, especially young entrepreneurs, face barriers to development and growth, poor access to skills and resources represent an important cause for lack of business development innovative high added value, allowing their sustainability.

Data published by the Ministry of Finance for 2007, reveals a performance relatively low local entrepreneurial initiatives, as well as serious problems of competitiveness, accentuated by Romania's EU accession.

- In Gorj County, approx. 85% of registered companies do not exceed a threshold profit € 10,000 annually, and among SMEs active only 25% exceeding this amount. Only 5% of SMEs active in county Gorj annual turnover of more than 1 million EUR.

- In Gorj, is shaping an economic fault line, between a small number companies with high turnover (about 50) a small platoon of pursuers (approx. 500) and an overwhelming majority of companies that barely survive in an environment increasingly competitive (approximately 15,000 active companies).

And in the future competitive position of small businesses will be increasingly threatened, the context crisis, increasing their vulnerability to foreign capital and large companies in trouble and attracting and retaining qualified staff or the quality and competitiveness of products and services.

If we add into the equation the fact that a majority of SMEs based their growth Gorj or live from local consumption (the activity of market services rendered to the population period January to July 2009 recorded an impressive growth of turnover, 29.5% under DRS Gorj), we get a worrisome prospect for the local economy.

Outlook Crisis is a lasting phenomenon. Most analysts estimate its consequences as at least as serious as that of 1929-1933, some arguing that the extent and impact it will be even higher. In the U.S., paradoxically represent a solution to crisis unsustainable development bases in the U.S. economy (credit risk policy and unsustainable domestic consumption), assuming a restructuring of the foundations of the economy.

Return U.S. economy in crisis, in a shorter period of 5 years is unlikely. The crisis by the U.S. administration inflationary

measures (packages of intervention government) will not only serve to mitigate the short term and to delay its effects. Although the banking sector in Romania has not encountered difficulties in the current context major economic crisis spreads quickly in the real economy, following the entry into recession of the largest Western economies.

Last but not least, at present, Romania is the only EU member country which has recently been relegated to a rating of "non-investment grade, appearance that weighs heavily in the investment policy of companies. The next few years will mean a much tougher screening, between business and built on a sustainable basis those grown in a speculative context. There are no recipes to avoid the crisis, but rather principles that will be applied more widely than in the past:

- Cost and risk management will become vital in managerial decision making. Competitive advantage based on cost will rely more and more.

- In terms of extraordinary volatility in international markets, macro-environmental analysis, understanding the macroeconomic context, especially the European and global level and tracking constant evolution of the markets will become mandatory.

- Following the government's anti-crisis interventions with inflation data, managers need to consider possible measures to protect against devaluations of currencies.

- More voices have warned that the crisis marks the beginning and end of economic development based lending. Due to the shortage of liquidity, lending and restricting growth cost financing, local entrepreneurs will have to focus, at least in the short term and environment, for alternative business models, less dependent on credit.

- Local entrepreneurs inevitably be forced to seek opportunities beyond the local market, and in recession conditions in the euro area economies, the challenge to gain access to new markets emerging will be assumed.

- Competition for local resources and local market will alleviate the short term. Term medium and long but it will intensify, and local firms will need to prepare to compete in the face of foreign competition and determine with greater experience.

Solutions will be sought and the local economy, yet still providing a Gorj important potential resource capable of sustaining strong economic development more than mediocre situation today.

Gorj will be putting his best coaches and excitement in the potential of university. Especially the local economy needs a generation of entrepreneurs who have courage to explore unique and even global market opportunities and business ambition to raise high added value.

Squandering the capital and creativity on a local market even national modest, with predictable limits, there is definitely a solution for the future of the area. Of course, this requires competence and to develop sustainable business and innovation generating high added value. From the perspective of government intervention to support the development of local SMEs, requires a holistic perspective on the promotion of entrepreneurship, which is based on provision of integrated training and assistance in the support structures entrepreneurship, supported by public funds and assets related to economic development policies Local. They should focus on building and integrating in the competitive economic clusters.

Evolution of Romanian Companies and Global Economic Recession

Enea Constanța,
Sanda Gabriel,
Grigorescu Gheorghe
„Constantin Brâncuși” University of Târgu-Jiu,
Faculty of Economics and Business Administration
eneacostante@yahoo.com

Abstract:

The economic crisis that Romania is starting to cross, especially, an internal crisis, caused by the wrong mix of macroeconomic policies taken in recent years. Economic growth is proving such an unhealthy, and that because I was in these years based on increased consumption financed by debt.

Keywords: global economics, evolution companies, economic crisis, economic growth, recession

JEL codes: E61, E63

1. Introduction:

Maintain control of macroeconomic indicators, in terms of a poorly defined budget deficit, a sustainable policy of inflation targeting and ensuring economic growth are the most difficult challenges to the authorities. It is important to follow the leu / euro pursue interest and foreign currency balance (savings and inducing still maintaining adequate liquidity in the economy), and reducing interest rates on loans (banks are willing to work with smaller margins to pass the current period?). Combining national effort (priority) with leverage provided by the international institutions, we will avoid recession in Romania [9].

Private consumption has been excessive, but do not blame people: all macroeconomic measures have been pro-cyclical, stimulating consumption, and most damaging of all, the flat is still defended by its initiators, who will not admit that they erred. Flat stimulate consumption, and today we have the first crisis of overconsumption of Romania [5].

The main cause is the excessive debt. Population can not be blamed, but the future

can be better informed and certainly more cautious on their expectations on revenue. The government may be criticized for having made a monumental strategic error: a period of economic growth, consumption growth and all this was in May and further indebted. The budget deficit increased from 1.3% of GDP in 2008 to 2.6% last year and probably more than 3% this year.

How come the government to borrow hundreds of millions of euro's with a maturity of one week, the only logical conclusion is that either there is no money for current expenses or for those already budgeted for the current year. It is absolutely inadmissible for a period of high growth and increasing budget deficit to grow, therefore, its funding costs in the short term.

2. Economic balance of the year is a disaster

Global economic recession has affected all Romanian companies from largest to stall and block the corner. Moreover, access to funds that banks boast that they make available to the business environment is blocked by the state. Basically, through the Ministry of Finance to borrow from private banks almost all the money market in order to pay public sector salaries and pensions, the government blocks, indirectly, the national economy [4].

According to sources in the financial environment, thousands of businesses around the country expected too hard VAT refunds to which they are entitled and which the IRS late to make, deadlines being exceeded for months. Instead, for every invoice issued, but not received, the state requires businesses to pay VAT decapitalization them and pushing them into bankruptcy. Establish flat tax to be paid even firms that do not record profit this year determined that 120,509 companies to suspend

operations. In this context, there are fewer voices to announce the return of Romanian economy in 2010 [12].

Solution emerging from a crisis of overconsumption is not indiscriminate stimulating consumption. In the best case, so only the tip of the crisis is delayed by several quarters. The crisis in Romania is not the same case with the crisis in U.S. and UE, it can not be treated equally. It is primarily an internal crisis, a crisis of a development model. Naturally, should supported poorest in those moments. But first impulse should not be more money from the budget and more consumers where there is no money in the budget and yet when consumed excessively. No solution to consume goods is not entirely viable Romanian - who are ultimately in Romanian goods? Dacia is a French brand, and a plan for saving the auto industry must think about Europe, because the car market has Community dimension.

Solution emerging from a crisis of overconsumption is more complex than a state aid package that may throw us back in time to high deficits and double-digit inflation. Should start with eliminating waste by reducing administrative expenditures. Cheapest money are those they already have and you can save them. So the savings made, one can think of infrastructure investment plan, because they bring jobs and training have a significant effect on the economy. But infrastructure investments must be made within a multiannual budgetary programming, the only solution to further reduce costs and eliminate erroneous allocation of public funds. Of course, fiscal policy must be directed and mistakes - not necessarily to raise revenue, which is difficult in times of crisis, but to more equitably distribute the tax burden and allow those with access to credit more difficult to safely overcome period crisis.

Also be made public a plan for euro adoption, with a targeted, such a plan will increase our external credibility (and thus will decrease the cost of external financing) and, especially, will require reforms to do so necessary budgetary and fiscal and structural reforms which they kept postponing (ie increasing competition, more flexible labor market, agricultural modernization, reducing bureaucracy).

3. Conclusions:

Four years after the onset of the economic crisis (recorded in the fourth quarter of 2008 for Romania), the Romanian foreign trade structure has changed considerably over the imports. If the first three quarters of 2008 has started with a balance of about 70% on the EU and 30% in the non-European Union during the same period in 2012, the ratio has returned to the same values in the first case, but was changed four percent on the imports to the EU.

The largest share of exports to the EU was reached in 2009, when increased significantly and reached 74.1%, easing supply about one-seventh of the Member States. Later, return to higher levels of exports was made lower rate for EU destinations and their share dropped to 70.4% starting point.

Fig.1: The evolution of Romania's trade in the first nine months of the year, from 2008 to 2012

Anul	Exporturi			Importuri		
	Intra UE 27 (mil.euro)	% tot.	Extra UE 27 (mil.euro)	Intra UE 27 (mil.euro)	% tot.	Extra UE 27 (mil.euro)
2008	18 247,8	70,4	7 686,4	29,6	30 423,8	69,3
2009	15 733,1	74,1	5 484,2	25,9	20 737,2	73,1
2010	19 514,3	72,5	7 117,9	27,5	21 513,8	72,3
2011	23 961,0	71,2	9 715,7	28,8	29 126,8	71,7
2012	23 576,7	70,4	9 927,4	29,6	29 785,3	73,3

Source: <http://cursdeguvernare.ro/cum-au-modificat-cei-4-ani-de-criza-comertul-exterior-al-romaniei-tendinte-si-cauze.html>

Although the last three years, exports to the EU increased by about 50% but those to non-EU countries by about 100%, I did nothing but go back to the 2008 structure. By contrast, imports moved by four percentage points from the non-EU related to the EU and differed in structure relative to exports. While exports in 2012 on non-euro area increased by 30%, imports from non-euro area remained about 20% lower in comparison with those of 2008, which contributed to the trade balance. If the deficit with the EU has halved, from about 12 billion to 6 billion, one non-EU relationship has fallen dramatically, almost six times (see table).

Fig.2: Modification deficit between 2008 - 2012

Anul	Deficit comercial			
	Intra UE 27		Extra UE 27	
	(mil.euro)	% tot.	(mil.euro)	% tot.
9 luni din 2008	12.176,0	67,7	5.803,7	32,3
9 luni din 2012	6.206,6	87,2	909,1	12,8

Source: <http://cursdeguvernare.ro/cum-au-modificat-cei-4-ani-de-criza-comertul-exterior-al-romaniei-tendinte-si-cauze.html>

Note that trade adjustment without foreign investment was brutal, with the deficit falling from almost 18 billion euros (9 months of 2008) to about 7 billion euros (9 months of 2009, the value that is found in 2012).

On one hand, this has contributed to macroeconomic balance and stabilize the exchange rate on a reasonable landing on the other side of the brake resulted in a strong rate of economic development and access to financial resources imposed the IMF and World Bank, and and support from the EU.

45% decrease in imports from non-euro area between 2008 and 2009 was quite exceptional and has not been recovered as the dollar rose from £ 2.52 in 2008 to an average of 3.46 USD for the first three quarters of 2012 (almost 40%, which reduced) while the euro has gained much less land, from £ 3.68 to £ 4.43.

The fact is that in the international trade, net devaluation different leu against the euro and dollar (given that the dollar has appreciated significantly against the euro in the last four years) and distinct evolution of demand from partner countries have resulted in movement of goods inputs to the supplies to the EU and non-EU, the relative change of the weights on the two streams with stabilized (values are similar for both exports and imports in 2011 and 2012).

Last but not least, by building partnerships between academics, business and local administration, future initiatives should ensure coherence of policies and initiatives to support local businesses and regional development and policy local economy.

Standard of living has improved this year compared to 2010, but still far from living standards we got used during the year preceding the crisis, as statistics show.

In 2011, the first year of Romania's economic growth since the beginning of the

crisis, we can say that Romanians have felt in his pockets a little refreshment. Low inflation and slightly higher wages created preconditions for improving living standards.

Thus, the statistics show that from October 2010 to October 2011 (the latest month for which the National Statistics Institute presented data on the evolution of earnings) net wages increased slightly above inflation. "It seems that 2012 was a relatively better year than last year, in terms of living standards," said Ionut Dumitru, President of the Council Tax. Advertisement [17]

At the end of October, average net nominal wage increased by 8.9% compared with same month last year, while the annual inflation was at the end of October, 3.55%. The National Institute of Statistics, real earnings increased over the same period last year by 5%. 2011 seems to be marked as a reversal of the first years of crisis, the standard of living has eroded continuously [14].

Progress this year appears to have been, therefore, somewhat better than previous years, but not much. In late October last year, annual inflation was 7.88%. That same month, the average net wage fell relative to the same month in 2009 to 2.5% and real earning index over the same period last year show a 10% decline in living standards. No Romanian situation late last year was no pink in the last month of 2010 real earnings decreasing by 6.2% over the same period last year. Romanians have experienced a decline in purchasing power in 2009 compared to 2008, real earnings calculated by the Institute of Statistics is lower by 5.3%[17].

Despite relatively good living standards in the first months of 2010, Romanians are far from living standards in 2008, the year preceding the crisis.

We have not yet reached 2008 levels.

Thus, in October 2011, net average earning was 1457 lei, with only 9.4% higher than the same month of 2008. Erosion due to inflation is, however, that the purchasing power of Romanians is now lower than it was three years ago. In the last three years, consumer price index increased by 16.51%. Most in the last three years non-food prices went up by about 22%, and the less food, which occurred in the three years of a price increase slightly over 8%. At the same time, services have increased by over 19% [16].

"We are still far from its 2008 level, but we must not forget that the standards of living have been achieved from a combination of illusion and reality, more data on loans by banks, shopping chain, an economic boom that was just partially sustainable," said Adrian Vasilescu, adviser to the Governor of the BNR Governor Mugur Isarescu [17].

Some areas of the economy such as IT and some industrial companies, especially those that export activity, and allowed to grant salary increases in recent years even in crisis, given that their businesses were less affected. The trend of wage growth in these segments could continue next year, although the economy may not grow as well in 2012 compared to 2011. If this year many analysts believe that we have an increase of over 2% in 2012, estimates indicate a level between 0.5 and 2% [12].

Fig.3: Evolution of wages and prices in the last four years

Source: <http://www.evz.ro/article/detalils-article/829426/>
President of the World Bank

"The public sector does not think it will be but instead of wage increases," commented, for EVZ, Ionut Dumitru, tele Presidents Council Tax. Public sector wage increase would put pressure on the state budget. Government has negotiated with foreign donors a budget deficit not exceeding 3% of GDP in ESA terms. When can we go with purchasing power at the level recorded in 2008? According to Ionut Dumitru, in two-three years, Romanians could recover what they lost in the crisis. In late October 2011, the highest wages in the economy were the sectors: IT services, where net income was 3688 lei, financial intermediation, except insurance and pension

funds, where there was a salary net average of 3,493 lei, lei air transport by 3378 net per month. The lowest net average salaries were recorded to the end of October in hotels and restaurants - 872 lei clothing - 912 lei, administrative services - 953 lei [17].

The Effects of International and Financial Crisis on Insurances Company in Romania

Florea Ianc Maria Mirabela
University “Constantin Brancusi”,
Faculty of Economics and Business Administration, Tg-Jiu
florea_mirabela@yahoo.com

Abstract

Economic and financial crisis has had many effects and created many distortions on the insurance market, although insurers were more witnesses to the crisis than participants whereas the nature of this business can not generate systemic risk they have suffered as a result of the fall in financial markets, reduce economic growth, reduce interest rates, credit quality, and as a result of direct and indirect exposure to financial institutions that had dramatic share price declines or went bankrupt.

Key words: crisis, effects, insurance company, economic development:

Jel classification: A1, A10;

Introduction

Economic developments in recent years have led to increase international cooperation between supervisory authorities. Collaboration between regulators, coordinate cross-border surveillance and the need for consolidated supervision of groups are current topics of crisis. Currently, the insurance industry faces the combined effects of deteriorating market conditions and the impact of financial crisis. Losses in insurance are lower than those in the banking sector, being mainly due to the involvement of insurers in the domain nonspecific activities. Change regulations to strengthen protection of policyholders may create prerequisites to maintain confidence that obligations issued by insurers will be honored. Financial crisis on the market could be minimized by focusing on preventing further adverse reactions and especially acting in a timely manner.

In just a few years ago, Romania's economic context was totally different from now. Economy recorded strong growth rates, as financial markets, including insurance, were booming car sales knew highs, while the real estate market is developing strongly. Today, the economic context looks different. Romania, like other countries of the world must face an unprecedented economic and financial crisis.

The volatility of the macroeconomic environment and the socio-political resulted in a rapidly changing needs and expectations of consumers of financial products and risk characteristics taken from the insurance industry. These considerable changes coupled with slow economic recovery prospects should motivate insurers to rethink internal processes and operational strategies and development, adapting them to current market conditions.

Today the insurance companies are confronted with challenges arising from increased frequency of risks taken, something that will require analytical discipline existing portfolio and risk management practiced at a good level. Another big challenge that the insurance market in Romania will have to deal with them is to find a balance between risks assumed and actual costs of the prices at which they are sold to consumers, because they have an important influence on the quality of services, and not only. Insurance market imperfections appear due to selling prices of the products do not always reflect the real economic costs of insurers. These include, in addition to the cost of risk, all other expenses related to products applied

insurers. A price is established without a strategic vision, but only on the interest of the moment, to increase market share, not reflecting the actual total costs of a product will adversely affect the profitability especially their ability to meet obligations to policyholders.

In preparation for the transition to the new solvency regime, insurers will be forced to rethink their business models and product mix, depending on anticipated capital requirements determined either on the basis of a standard formula, as is the use of internal models, full or partial.

And with that, insurance had a stabilizing effect due to long-term investment and cautious and even conservative investment policy, dictated largely solvency requirements

But noteworthy is that the international financial crisis were extended to the Romanian economy. However, in terms of direct impact, the banking system was less affected by not being exposed to toxic assets and because prudential and administrative measures adopted over time by the National Bank of Romania. Indirectly, however, the international financial crisis and especially its obvious consequence - the recession in developed countries - Romanian economy extends across multiple channels.

We are still in the midst of next year seems to be better than the one we conclude soon. So far, the crisis triggered in previous years has created many distortions on the insurance market, but not as much as those manifested in banking. Globally, insurers did not generate systemic risk is present as witnesses and not generators of crisis, they suffered directly or indirectly as a result of the fall in financial markets, reducing economic growth, reduce interest rates, credit quality and as a result of direct and indirect exposure to financial institutions that had dramatic share price declines or went bankrupt. Despite these elements, security had a stabilizing effect on the economy due

to long-term investments and prudent investment policy, even conservative.

We can noted that sales have decreased dramatically due to existing insurance crisis. Another consequence is competition for insurance replacement financial products, such as short-term bank deposits. Short-term positive effects of the crisis on the insurance business, from the need to survive and continue business were channeled in two directions: efficient communication with customers and impacting business processes to reduce costs. Product offerings continued to grow, expanding to capitalize on opportunities, offsetting reduced demand for traditional insurance products with the rapid development of flexible and lower costs for customers. Diversification of distribution channels, with more emphasis on online sales, communication and better service and quality to customers, lower costs and greater flexibility are therefore effects of the crisis and led to more flexibility in behavior insurers. Possible continuation of the crisis will reduce dividends, sales of parts of companies considered non-core business or partnership to find solutions, mergers or acquisitions. Investors' appetite for the financial sector is low due to volatile financial environment, low interest rates indefinitely and the difficulty of obtaining a high profit.

The level of profitability of insurance decreased due to the crisis prevailing in life insurance by poor performance due to falling investment indices and financial market volatility. Solvency margin of the insurance generally remained very good.

The management assets and liabilities of insurance companies faced difficulties in crisis context. The Euro area countries, Japan and the U.S., levels of interest on government bonds issued for a period of 10 years reached record low by levels. The infusion of cash made by governments of various countries in the financial system to save the banking system had an adverse effect on insurance due to reduced interest rates, especially on

life insurance in which liabilities are affected by interest rate.

It is evident that indirect effects, mainly related to lower indices, changes in interest rate and ratings of financial instruments, reduced profit margins and income from risk investment instruments "zero" was much stronger for insurance life than general ones.

Some direct effects of the crisis on companies were influenced by the financial situation of clients. Decreased income, disposable income implicitly Insurance and financial priorities change contributed to a significant reduction in sales. In life insurance, terminations and redemptions increased insurance contracts, affecting insurance available liquidity, which is accompanied by increased reputational risk. [4]

The insurance has been affected as a result of its own and customer funds investing in shares. Exposure to "counterparty risk" (the risk in return) led to an increase in reputational risk, the most resounding and sad example is that of investment in Madoff's funds - circumstances that led to a drop in consumer confidence in the financial sector. [4]

However, there were short-term positive effects of the crisis on the insurance business from the need to survive and continue business. Product offerings continued to develop products that have been launched to capitalize on expansion opportunities, offsetting reduced demand for traditional insurance products with the rapid development of flexible and lower costs for customers. [4]

The diversification of distribution channels, with more emphasis on online sales, communication and better service and quality to customers, lower costs and greater flexibility are therefore effects of the crisis and led to more flexibility in the behavior of insurers.

The possible continuation of the crisis will reduce dividends, sales of parts of the business companies considered "non-core" or

finding solutions partnership, mergers or acquisitions. It is possible that investors' appetite for the financial sector to reduce the volatility of the financial environment, low interest rates indefinitely and the difficulty of obtaining a high profit..

The Romanian insurance market also saw some effects of the crisis, not very different from those in other countries, but of course, weighted by market size: reduced sales, termination of a greater number of life insurance policies, insurers shift to alternatives for new products, new features for existing insurance, new distribution channels, another way of communicating with customers, began a period of mergers and acquisitions, which is likely to continue, leading to greater market concentration. [4]

The insurance will support and long-term effects of the crisis, by affecting consumer behavior, a temporary reduction in sales of unit-linked insurance and annuity products for sales growth with a focus on security and protection.

As you can see, has not yet emerged from the crisis and many of its details are not yet understood, therefore can not accurately determine the consequences. However, some lack of understanding does not prevent policy makers to propose new legislative changes. Therefore, we considered that the potential consequences can be seen from the crisis is important to note, even if we do not, in some cases, no empirical evidence to support our reasoning clearly. Careful monitoring measures are taken now, should be done in order to teach us to be prepared in case of future crises. A critical review of surveillance based on principles that is currently implemented in some countries, is necessary because it could lead to problems such as abuse of freedom from some market participants.

Conclusions:

No doubt, the insurance industry operates in a demanding environment, not only at the

moment of crisis, but in general. Risk insurance in a modern economy is a complex, interacting with many aspects of people's lives.

The importance of insurance industry an economy can be measured in part by the sheer size of its business, number of employees, assets under management, or contribution to national GDP. It actually plays a fundamental role in the functioning of a modern society, is a prerequisite for many activities that would not occur if there were no insurance. Ensure that this strategic industry is ready to challenge not only the task of insurance companies. Governments and public institutions have an interest in developing a framework for efficient insurance markets, sustainable and equitable. The industry has a lot to offer and experience in risk management insurance should be extended to other elements of the financial services industry, with particular emphasis on stress testing and scenario technique, thus completing integrated risk modeling.

The Economics of Hybrid Organisations

Georgescu Cristina Elena
Ovidius University of Constanta
cristina.georgescu95@gmail.com

Abstract

Although there is an abundant empirical literature describing the many different forms that the organisation of transactions can take, from strategic alliances involving several partners to network of firms tightly coordinated to franchise systems, the terminology fluctuates, making it difficult to capture exactly what is at stake. These variations in the vocabulary reflect the richness of arrangements to be considered as well as the lack of a unifying theory that could properly identify the nature of these arrangements and the logic underlying their diversity.

Keywords: hybrids organisations; transaction cost economics; agency theory.

JEL Classification: G32, D23

1. Introduction

Hybrids can be defined as arrangements in which two or more partners pool strategic decision rights as well as some property rights, while simultaneously keeping distinct ownership over key assets, so that they require specific devices to coordinate their joint activities and arbitrate the allocation of payoffs (Ménard, 1997, 2004).

Efforts for capturing the specificity of these arrangements within a coherent analytical framework remain underdeveloped. In economics, initial insights came from a Coasian perspective, with hybrids viewed as challenging the ‘boundaries of the firm’. Richardson (1972) already emphasized the importance of modes of organization which mix cooperation and competition.

Williamson also pointed out early the significance of these ‘non-standard’ agreements, although he initially considered them as unstable and transitory, before fully

integrating hybrids into his model (Williamson, 1975, 1991; Ménard, 2009). Meanwhile, a significant literature has developed in sociology and managerial sciences, mostly about networks and alliances.

2. The main characteristics of hybrids organisations

Given the above characterisation, why do parties delegate or even abandon part of their rights? From a certain point of view, this question has similarities with that of why employees transfer their decision rights to employers (Coase, 1937; Cheung, 1983). However, there is an important difference: in hybrid arrangements legally distinct entities also share some specific assets and property rights.

Three leading factors seem to be at work:

1) Parties may accept to share rights in order to face complexity. Complexity has two dimensions: it may result from the need to coordinate multiple interwoven transactions or it may be due to a changing environment. In both cases, cooperation that involves the abandonment or delegation of some rights may prevail in order to overcome the resulting uncertainties or to develop an adequate buffer.

2) Parties may view mutual dependence as a source of value, notwithstanding the fact that they often remain competitors, as strategic alliances in the airline industry illustrates. Several factors can motivate firms to endorse mutual dependence in holding pooled assets:

-the size of investments required may exceed their individual capacity, and/or economies of scale may be expected;

-complementarity may offer strategic responses to resource dependence, securing access to existing resources or facilitating access to new ones;

-learning effects might also be anticipated, each firm becoming a portfolio of skills that networking allows to transfer and recombine more efficiently;

-joint investments may help building a reputation with an expected snowball effect on revenues.

3) Payoff expected from interaction among parties may not be contractible ex ante, with specific contributions difficult to assess, so that partners look for organisational solutions that facilitate ex post negotiations to share rents with the lowest possible transaction costs. Indeed, because standard incentive contracts would perform poorly and measurement problems may be at stake, defining rules that allows a satisfactory split of the gains is not trivial. Some hybrid forms seem to have found relatively standardised solutions to the implementation of adequate sharing rules, as in franchise systems.

3. The variety of hybrids organisations

I focus on situations in which firms hand over decision rights and even property rights across boundaries, so that some rights are no longer controlled by a single party. I illustrate the variety of solutions implemented by several different institutional structures dealing with shared control. This review does not intend to be exhaustive, but rather points out properties analyzed thereafter.

Subcontracting goes side by side with standard market relationships, with parties sharing some decision rights, while keeping assets and property rights distinct. They all share at least two characteristics: key assets and decision rights remain distinct, as in the case of the millers, while one firm operates as the strategic center, which is distinct from that of the millers.

Supplier parks, “a cluster of suppliers located adjacent to, or close to, a final assembly point” (Sako, 2005), share properties with subcontractors although site interdependence usually imposes tighter coordination. Whether physically located or virtual, supplier parks mostly operate under the control of one firm. However there are cases in which shared activities are monitored through different forms of joint agreements, with partners in a more or less symmetrical position.

Strategic alliances have attracted a lot of attention in managerial sciences. They can be characterized as “relatively enduring inter-firm cooperative arrangements, involving flows and linkages that utilize resources and/or governance structures from autonomous organizations, for the joint accomplishment of individual goals linked to the corporate mission of each sponsoring firm” (Parkhe, 1993: 795). Partners maintain core assets distinct and keep control over related property rights, thus departing from mergers and acquisitions. However they jointly plan and monitor substantial activities, as in the airline industry, using contracts to coordinate and build relational trust, which particularly matters when duration imposes continuing adjustments, making spot or short term agreements of the market type inappropriate (Gulati, 1995; Jorde & Teece, 1989).

Supply chain systems also rely on contracts, but differ from strategic alliances with respect to the density and extension of shared rights. Based on complementary activities and/or competences among autonomous partners, they require tight coordination across stages, usually from production to distribution. Supply chain systems benefit from powerful market incentives while providing tight control over key transactions, without the burden of integration.

Supply chains almost always involve production, while *franchises* concern primarily distribution. However, the boundaries between these forms are blurred, with many franchisors having developed tight vertical coordination to control inputs as well as output. What differentiates franchising from most supply chains is the large number of partners giving up part of their decision rights while pooling property rights to benefit from brand names and joint actions. Franchise systems also share characteristics of subcontracting because of the central role of the franchisor, whether it is a unique entity or a group.

Joint Ventures exhibit important characteristics of hybrids in a relatively pure form. JVs “are simultaneously contractual agreements between two or more organizations and a separate legal (and usually organizational) entity with its own purpose” (Borys & Jemison, 1989). ‘Parent’

companies transfer some assets and property rights as well as some decision rights to a ‘child’ company monitored by a specific governing body, while ‘parents’ remain autonomous and often compete in other activities. This mix of global sovereignty and ‘local’ cooperation involves forms of hierarchy that complement contracts.

There are many other ways to organize interfaces among partners. *Partnership* is another non-standard mode of organization, taking various forms, from law firms to the collective organization of salmon fishermen of the Pacific Northwest (Farrell & Scotchmer, 1988). These arrangements often develop to deal with common pool resources. *Cooperatives* define another important category, almost a class of its own. The variety of their forms makes their characterization difficult, since they are spread over a wide spectrum, from quasiintegrated firms to market-like arrangements. However, numerous cooperatives share characteristics of hybrids with respect to the joint allocation of rights and their mode of governance, dominated by the “one person, one vote” principle (Ménard, 2007).

4. Theoretical explanations about reasons for going hybrid

Economic theory has paid attention to hybrids only recently, with transaction cost economics playing a pioneering role. Agency theory and relational contract theory have also taken into account some hybrid forms, while less developed approaches such as the resourcebased views have provided useful insights.

Transaction cost economics (TCE) deserves priority. The idea that there are alternative ways to organize transactions goes back to Coase (1937), followed by Williamson (1975). Both focused on the trade-off between markets and firms. However, in *Markets and Hierarchies* Williamson noted the existence of “intermediate forms of contracting” (1975), but expressed doubts about their stability and considered them as transitory. It is only in *The Economic Institutions of Capitalism* that he endorsed a more positive approach to arrangements later coined ‘hybrids’, going as far as considering them potentially

‘dominant’ (1985). In 1991, he explicitly modeled them as a governance structure that could be an efficient alternative to ‘markets’ and ‘hierarchies’, from which they differ with respect to: (a) contract law, (b) adaptability, and (c) incentives and control. Hybrids would fit transactions requiring assets of intermediate specificity and facing moderate uncertainty, providing a ‘middle-of-the-road’ solution. The resulting concept remained a bit fuzzy, with its reference to ‘semi-strong’ governance captured essentially through ‘contract law’.

The literature on **relational contracts**, which partially follows on from TCE, has shown a growing interest in hybrids. The initial inspiration comes from Macaulay (1963) and MacNeil (1974) who introduced the expression “relational” to emphasize the mix of contractible and non-contractible elements and the importance of the latter. According to Goldberg (1980), parties establish tightly meshed relations to limit the impact of: (a) imperfect and costly information, (b) opportunistic behavior, and (c) difficulties for outsiders to enforce agreements plagued with non-verifiable elements. Hence “(t)he parties will be willing to absorb a lot of apparent static inefficiency in pursuit of their relational goals” (Goldberg, 1980).

Formalizing this approach in a model initially developed to account for labor relations within firms, Baker, Gibbons & Murphy combined TCE and the ‘new property rights theory’ to explain what forces push firms towards solutions such as joint ventures or strategic alliances (Baker *et al.*, 2008). In this version, they differentiate governance structures according to how rights over assets and ‘spillover’ payoffs are allocated. If relational contracts might help dealing with non-contractibilities, they can also generate tensions and conflicts, the magnitude of the resulting transaction costs depending on whether the coordinated use of assets complement or compete with the core activities of parties involved. The problem then becomes that of choosing a “governance structure” that allows parties to maximize their payoffs while facilitating adjustments. Hybrids provide alternative solutions, possibly optimal ones, when there are significant non-contractibilities.

A major characteristic and a limit of this explanation is that rights remain ultimately in the hands of separate entities while non-contractibilities make agreements unenforceable by courts, so that the outcome depends on (relational) reputation.

There are alternative explanations to the existence of hybrids. **Agency theory** has inspired much research into franchising, with incentives and financial motivation viewed as the main issues. Maness (1996) and Holmstrom & Roberts (1998) suggest that franchising dominates fast food but not supermarkets because it provides better incentives to local managers having to monitor multiple inputs simultaneously, while costs in supermarkets mostly come from inventories and warehousing, which can be handled through specialized functions within an integrated structure. However, Lafontaine and Slade (2007) demonstrated that franchise contracts do not deliver tailored incentives, and that financial motivation has a weak explanatory power, contrary to what the theory predicts. More generally, Lafontaine & Slade (2007) show that TCE prevails over agency theory when it comes to predictability, and that the latter hardly explains the existence and variety of franchise systems.

The **resource-based view** is another influential approach, particularly in organization studies and management sciences. Boiled down to its core, it explains networks and other hybrids as ways to deal with uncertainties and change by sharing essential inputs, particularly competencies (Wernerfelt, 1984). A positive contribution of this ‘view’ is to have attracted attention to the key role of learning and capabilities. However, it hardly explains why integration is not preferred to hybrids and why there are so many ways of facing uncertainty.

To sum up, we still need a convincing theory telling us why hybrids exist and prosper and how they differ from alternative modes of organization.

5. Conclusions

Hybrids are ‘institutional structures of production’ with characteristics of their own. They resort to specific governing devices developed to deal with:

-property rights that ultimately remain distinct, although significant assets are pooled;

-decision rights that keep partners independent, although shared rights restrict their autonomy; and

-the need to design adequate incentives in a context in which frontiers among residual claimants are blurred.

Hybrids proliferate because advantages of coordination and cooperation overcome gains associated with market competition, while remaining autonomous provides more flexibility and better incentives than an integrated structure can offer.

Market Failures and Their Implications for the Consumer

Gheorghiu Gabriela

„Ovidius” University of Constanta, Faculty of Economic Sciences

gabrielag3110@yahoo.com

Gheorghiu Liviu

Inspectorate of Border Police, Constanta County

Abstract

The present paper underlines that the internal functioning logic of the free market, approached from the perspective of the interests and motivations of the participants in economic activity, places even the rational consumer in an objectively unbalanced relation in favor of the producer/trader, although the first, with his needs and necessities, should be the origin and, at the same time, the final point of the production activity.

Key words: consumer, producer, rationality, market failure

J.E.L. Classification: D11

1. Introduction

The reality of daily life gives us sufficient examples of situations in which individual decisions within free market do not automatically and warranted lead to a global economic optimum; on the contrary, not infrequently, they can determine imbalances, when the benefits or costs of a decision or a choice at the individual level differs from the benefits or costs at the level of society. Such a situation is denominated as *market failure*, both understood as “the failure of a more or less idealized system of price-market institutions to sustain “desirable” activities or to estop “undesirable” activities” – according to the definition given by Francis M. Bator half a century ago [1], but also as any performance of the market which is considered less better than the best performance possible - in Richard G. Lipsey and Alec K. Chrystal’s updated version.[2]

Specialized economic literature generally distinguishes four categories of market failures, namely: *externalities*, *public goods*,

natural monopoly and *information asymmetries*, around which our entire analysis will focus hereinafter, both from the point of view of generating causes and the effects involved on the consumers, and from the point of view of the possible solutions for rectifying them.

2. Market failures – pre-requisite of the intervention within market economy in favor of the consumer

Rational decision theory produced, in time, decisive demonstrations of individual rationality insufficiencies, the best known being *prisoner’s dilemma*, constructed by starting from a simple mental experiment, based on the idea of a game in which two prisoners under suspicion of committing a crime together participate and who are separately investigated by police authorities, without being offered the possibility of communicating with each other. Under these conditions, the two suspects will adopt the most rational decision from the individual point of view, but which finally proves not to contribute at all to getting the most rational, respectively the most advantageous result for none of the prisoners, following the aggregation of the two decisions.

This mental experiment can be very well translated into free market perimeter, within which rational economic agents may influence by their actions the activity of the other participants in the market by following their own interests for maximizing the benefits, without desiring to do that intentionally. Within this context, we deal with the so-called *externalities* or *external effects*, which designate the consequences which consumption activity or that of producing a good by an economic agent can have on other economic agents, without reflecting these interdependences in the

market price system.

Such situations in which consumers can also be enlisted may appear when a consumer's individual satisfaction depends not only on the quantities of products and services they consume, but also on other consumers' satisfaction (for example, the complaints formulated by dissatisfied consumers with regard to a specific product or service may attract the supplier's reaction of improving the offer or provided services, by which other consumers will also profit, who have not confronted such a dissatisfaction yet) or when a consumer's satisfaction may be influenced by producers' activities not only through offered products or services which he consumes effectively, but also through other modalities (for example, third persons may suffer prejudices as a result of vicious products offered by a specific supplier and effectively consumed by other consumers) – situations denominated by Tibor Scitovsky “the interdependence of consumers' satisfaction”, the first case, or “producer's indirect influence on personal satisfaction”, the second case.[3] But in both situations, the issuing agent of such an external effect will not take into consideration in his calculations the relation cost-advantage and the beneficial effects (in case of *a positive externality*) or the damaging ones (in case of *a negative externality*) his behavior can have upon the other participants in the market, so that the social value of the undertaken activity will differ from its particular.

The restorative action in the situation of putting forth the externalities consists in their internalization, by assuming by the initiator the costs or marginal benefits generated by it. The way in which the initiator of a negative externality can be made responsible, depends on the number of affected parties, as a rule. Thus, if their number is small, the most accessible solution is found within the market itself, by the agency of the negotiations that can be developed, in a particular plan, between the involved parties in order to establish a voluntary agreement of compensation or of “bribery” for the damaging external effects produced by the developed activity.[4] For example, consumers may address with complaints to the producers in order to find an amiable solution to such a disagreement, which

becomes possible through bilateral negotiations or by appealing to a third independent party, a mediator, who offers a solution to this effect.

In case of failure concerning the reaching to a reciprocally advantageous agreement, a different alternative that looms is represented by the legal system, that is constituted in an institutional mechanism of correcting externality problems, by dictating and applying some clear regulatory laws of civil and penal responsibility by law courts, if need be, for the committed crimes (negative externalities are especially considered). For example, strict norms can be adopted by which producer's responsibility in relation to the prejudices caused by defective products offered to third persons, others than the so-called consumers for whom those products were destined, should be provided.

When all these solutions fail and especially in the situation in which the number of affected parties is big, “the salvation” comes from outside the market, and public intervention is justified – either by direct regulation of the activities which cause externalities, or by tax assessment or subsidy of that activity.

Direct regulation supposes in this case the establishment of some standards that must be fulfilled by the activities inclined to generate negative or positive externalities, on purpose to prevent the production of eventual imbalances within the market, starting from the principle “it is better to prevent than to repair”. Such an example would be safety conditions in consumption that a specific product must fulfill in order to receive marketing authorization.

This approach, also known by the name of *demand and control*, however involves certain deficiencies, such as: the impossibility of taking into consideration the entire variety of situations with which economic agents directly involved may confront, and especially those who can be indirectly involved; excessively high costs generated by the political process which intervenes in the establishment of the respective regulations; low adjustment rhythm of regulation process to the rapidity of the innovation one which determines the permanent occurrence of new technologies. Consequently, it is estimated that a much better technology of encouraging the

behaviors society wants is represented by the adjustment of particular costs in order to take into account social costs, too, by levying taxes in the case of negative externalities and subsidizing in the case of positive externalities. Even this alternative is not without problems, a clear identification being difficult and especially the exact measurability of externalities in order to establish correctly the tax level, respectively the subsidy level which must not generate a new imbalance within the market by levying it.

A particular case of a positive externality which generates an imbalance within the market is represented by *public goods*.

In Paul A. Samuelson's classic approach [5] and Richard A. Musgrave's [6], *public goods* diverge from the particular ones by being *non-rival*, in the sense that they can not be distributed to each one of them, being communal, and *non-excludable*, because if they are assured to some of them, they are assured to all and no one can be excluded from using them.

However, these concepts involve a profoundly theoretical characteristic and, as James M. Buchanan also observed [7], while in daily life the characterization of some goods as purely private is obvious, the identification of some goods as purely public is difficult, if not impossible to fulfill. More exactly, in practice we find only the situation of some public goods so-called “impure” or „mixed”, these satisfying only one of the pure public goods, to which effect there can be made a distinction between *club goods* - which, although non-rival, their access can be reserved only to certain categories of consumers (the case of television or radio broadcasting available only by means of a decoder for the decryption of TV and radio signals and without which anyone can be excluded from providing those broadcasts) and *common goods* - which, although characterized by non-excludability, may be divided to a certain extent (the case of communal natural resources, the most frequent examples to this effect being sea and ocean water, fishy resources etc.).

Coming back to the idea that the problem raised by public goods can be assimilated to the one which is characteristic to externalities from the theoretical point of view, economists also applied in this situation

game theory, a different *paradox* unfolding to them, that of the “*free riders*”, which appears as a consequence of non-excludability characteristic of public goods. Thus, there will always be individuals who will prefer to profit by the respective goods freely, without contributing proportionally to social effort (tax payment, the compliance with certain limitations, the abstention from certain actions) necessary to assure them. Although morally (and sometimes even legally) condemnable, the “free rider” alternative is the most rational, from the individual point of view, because it maximizes the initiator's advantages. Paradoxically, if it is adopted by several or each one of the members of a community, this alternative leads to a non-rational solution (disadvantageous) for all.

Starting from this paradox of clandestine passenger, the bases of the theory advanced by Mancur Olson with regard to *the logic collective action* were laid, which comes to refute the presumption according to which persons with collective interests would voluntarily act together, so that to promote this type of interests. What Olson puts forth is the fact that, on the contrary, “unless the number of individuals in a group is quite small, or unless there is coercion on some other special device to make individuals act in their common interest, rational, *self-interested individuals will not act to achieve their common or group interests*” [author's underline].[8] In the argumentation of this point of view, Olson starts from the prerequisite that the person who can not be divested of the benefits supplied by a collective good, once it was produced, is divested of the motivation of willingly involving in the production of the respective good.

An eloquent example to this effect is represented by the collective action of a group of consumers, as it is the case of consumers' independent associations, as a response to certain incorrect practices a producer commits, an initiative in which certain consumers may decide not to participate in, for example by means of some annual contributions paid to the respective associations and by the agency of which these can finance such actions, but by whose results they can profit without being excluded.

Maybe the most important concern with regard to public goods is connected to who should be in charge with their production and provision, a debate on which no unanimously accepted point of view has been reached either in academic environments or in the political ones. For example, in the situation in which rational consumers, in search of maximizing their own interests, come to degrade the used commons, a situation defined by the collocation “the tragedy of the commons”[9], there are opinions which indicate public authority as the best control alternative on the majority of natural resources, in order to impede their destruction.[10] At the counter pole we find opinions which underline the necessity of ending the joint ownership system, by starting a privatization process of resource exploitation[11], although, many times, the production and provision of public goods by private sector becomes if not disarmingly ineffective, being very expensive, even impossible.

Practical experience pointed out that, worldwide, neither the state nor the market managed always to allow individuals the maintenance of a long term productive use of public goods.[12] The solutions which functioned best were different from case to case, for the most part even the institutions in charge with such categories of goods represented complex mixtures of institutions analogous to the private and public ones.

Bound up with the discussion with regard to public goods is the one concerning *natural monopoly*, respectively that situation in which a producer can realize a specific series of goods and services to the lowest cost, in comparison with any other economic agent, as a result of some scale economies. The producer who lies in this situation has the “natural”, innate power to eliminate the competition and control sale price within the market, which he will try to raise in order to scale up profit. It is easy to understand that, under these conditions, those who suffer most are the consumers, whose choices are fundamentally affected, the alternative at their disposal being an expensive one and, in most cases, even a dissatisfactory one from the qualitative point of view.

Therefore, another market failure is produced, which, in order to be rectified, the strict supervision by governmental authorities

of economic operators’ activity who lie in such a situation and the exercise of a specific control on their price policy were invoked towards protecting consumers’ interests. On the contrary, when the best modality for recovering the allotment inefficiency lost by monopoly prices is represented by the competition, governmental intervention is required by deregulating the activities which are characteristic to such natural monopolies, in the sense of guaranteeing market access for other competitors, which meet consumers’ demands with more diversified offers, and also better, both as to price, and as to quality.

A particular discussion on these lines covers the so-called public services or the services of general economic interest – respectively those services provided under market conditions and in whose provision certain required obligations must be complied with in order to guarantee the indiscriminating access of all consumers to certain essential services, by a specific quality and to accessible prices – whose representative business segments are naturally monopolized because they constitute the infrastructure of national economy, and regard activities as: gas and electricity input, post, telecommunication and transport services. These segments, initially situated exclusively in public property and having monopolist dimension, were progressively subordinated, in market economy, to an ample liberalization process, a generator of beneficial effects in terms of productivity amelioration, exploitation cost reduction and price fall on the benefit of the consumers.

3. Conclusions

The liberal apology of free market operation assigns to the rational consumer absolute sovereignty on the producer, the economic success of the latter being conditioned by the best possible satisfaction of “master’s” interests – the consumer.

This hypothesis, as attractive as it may appear theoretically, its practical validity seems to be rather menaced following the failure of the “magical power” of free market to exploit always the positive influences and to counteract the negative ones, assuring the equilibrium and economic progress. In such

situations, the regulatory or “curative” intervention of public power in economy, although not inerrable, often becomes socially unjustified and really eligible, especially when the problem of rehabilitating consumer’s sovereignty within the market by promoting some efficient measures designed to his protection, is raised.

A Characterization of the Migration Phenomenon among Young Romanian Specialists

Ghita Simona

The Bucharest University of Economic Studies

simo_ghita@csie.ase.ro

Abstract

After the political revolution in 1989, Romania was confronted with a phenomenon that has increased in magnitude throughout the following period: external migration. It became a permanent presence of the labor market in Romania. Unfortunately, this phenomenon manifests incisively among young people and among higher educated workforce.

The author has studied the external migration of Romanian young specialists in economic domain using a survey, developed during the implementation of SPIN project. The target group consisted of third-year students of the Academy of Economic Studies in Bucharest – Faculty of Cybernetics, Statistics and Economic Informatics. The study revealed the future graduates' opinion on emigration phenomenon among higher educated specialists.

Keywords: migration, labor market, survey, target-group.

J.E.L. classification: I20, J21, J61.

1. About SPIN project.

SPIN project is entitled "*Modern practice to facilitate access to the labor market for specialists in Statistics and Economic Forecasting or Economic Informatics*" (ID POSDRU/90/2.1/S/63784). It started in 2010 and it is co-funded by European Social Fund through the Sectoral Operational Programme <<Human Resources Development 2007-2013>>.

The main objective of the project is to help the future graduates in economic field to adapt to the labor market conditions. They have the chance - through participation in this project - to interact with the real business environment and to test their ability to solve

real problems of firms-activity, based on theoretical knowledge acquired during the study years.

2. Emigration phenomenon among Romanian specialists – addressed through the economic future graduates' point of view.

2.1. Survey on characteristics of Romanian labor-market

One of the tools used in the project for a quantitative assessment of the labor market is an investigation conducted in the second year of the project. The survey questionnaire was projected by several experts with responsibilities in this area.

Investigation surprised - through the questions in the questionnaire - several aspects of the labor market in our country: illegal labor, migration, labor market experience of students during the years of study, labor market inequalities.

One of the issues addressed by the questions in the survey questionnaire was the emigration phenomenon. The students in the target group presented their opinions about the existence of this phenomenon on the Romanian labor market. The sample was not representative and it consisted of 73 students who developed their practice-internship through SPIN project.

2.2. Presentation of survey results

Being asked whether they would emigrate abroad - to the proposal of an employer or an acquaintance - in order to take a job according to their training level, almost half of respondents said they would accept the offer immediately, and would temporarily emigrate (49.31%); 28, 77% of the respondents said that they would accept the offer immediately, and would permanently emigrate. Only 9.59% of the respondents said

they would not accept such an offer. It is worth mentioning that a fairly large percentage of people (12.33%) said they did not know what they would do if they are in this situation.

Table 1. If an employer or acquaintance would propose to you to emigrate to work abroad, in a job consistent with your training, what would you do?

	No. of persons	Share (%)
I immediately accepted the offer and would emigrate permanently	21	28.77
I immediately accepted the offer and I temporarily emigrate	36	49.31
I would not accept such a proposal	7	9.59
I don't know	9	12.33
TOTAL	73	100.00

Source: Survey, SPIN project.

Figure 1. If an employer or acquaintance would propose to you to emigrate to work abroad, in a job consistent with your training, what would you do?

Source: made by the author based on SPIN data

Table 2. If an employer or acquaintance would propose to you to emigrate to work abroad, in a job requiring a lower training level than yours, what would you do?

	No. of persons	Share (%)
I immediately accepted the offer and would emigrate permanently	21	28.77

I immediately accepted the offer and I temporarily emigrate	36	49.31
I would not accept such a proposal	7	9.59
I would analyze the advantages and disadvantages of such offer	9	12.33
TOTAL	73	100.00

Source: Survey, SPIN project.

Figure 2. If an employer or acquaintance would propose to you to emigrate to work abroad, in a job requiring a lower training level than yours, what would you do?

Source: made by the author based on SPIN data

Students show a greater caution if they would receive a job offer abroad, which requires a lower training level. Thus, most respondents – nearly half (47.94%) would analyze the advantages and disadvantages of such an offer; 27.4% would not accept such a proposal, and 16.44% would accept the offer, but would emigrate temporarily, for a limited period.

The following sequence of questions deals with the problem of migration phenomenon among young Romanian specialists, and the need to stimulate them to continue to work in the country and contribute to the sustainable development of Romanian society and economy.

First statement of this sequence is: "Young graduates should be encouraged to remain in Romania in order to contribute to the developing of the Romanian society". More than half of those surveyed said they fully agree (52.05%), while 28.77% of them said they agree with the statement. 15.07% of respondents are indifferent to this problem.

Table 3. Young graduates should be encouraged to remain in Romania in order to contribute to the developing of the Romanian society

	No. of respondents	%
I do not agree at all	1	1.37
I do not agree	2	2.74
Indifferent	11	15.07
I agree	21	28.77
I totally agree	38	52.5
TOTAL	73	100.00

Source: Survey, SPIN project.

Figure 3. Young graduates should be encouraged to remain in Romania in order to contribute to the developing of the Romanian society

Source: made by the author, based on SPIN data.

The responses of those interviewed are similar to the above for the statement: "Romanian specialists should be encouraged to remain in Romania to achieve a sustainable development of the Romanian economy." Almost half of the people are perfectly agree with this statement (49.31%); 34.25% - agree and 12.33% are indifferent to this problem.

Table 4. Romanian specialists should be encouraged to remain in Romania to achieve a sustainable development of the Romanian economy

	No. of respondents	%
I do not agree at all	1	1.37
I do not agree	2	2.74
Indifferent	9	12.33

I agree	25	34.25
I totally agree	36	49.31
TOTAL	73	100.00

The questionnaire responses reveal that if young Romanian specialists give up to emigrate abroad, this should be based on their stimulation and not on pure patriotism. More than half of respondents (54.8%) do not agree at all or disagree with the statement: "Romanian specialists should not migrate to other countries based on patriotism". We noticed a high proportion (a quarter of the respondents) of those who show indifference to this problem.

Table 5. Romanian specialists should not emigrate to other countries based on patriotism

	No. of respondents	%
I do not agree at all	19	26.03
I do not agree	21	28.77

The problem of having a job during college - as a feature of the concept of "modern student" is subject to the following question in the questionnaire. Half of the respondents agree or totally agree with the statement "Modern student concept implies employment during college." But there are a high percentage of people for which this issue is indifferent (34.24%). Approximately 13% of students disagree or totally disagree with this statement.

Figure 6. Modern student concept implies employment during college

Source: made by the author based on SPIN data.

Sequence of the following two questions of the questionnaire addresses the emigration-problem among Romanian graduates and Romanian specialists in general. Most of the respondents believe that the Romanian emigration among professionals is high (57.53%), while 20.55% of respondents believe that the Romanian emigration among professionals is average. Quite many, however, are those who believe that emigration among Romanian specialists is

very high (17.81%). Regarding migration of Romanian graduates, 57.53% of the target group who participated in the survey believes that the phenomenon-level is high or very high, while 35.62% think that the Romanian emigration-level among young graduates is average. On a comparative analysis of the responses to the two questions, it is found out that the percentage of those who believe that the Romanian emigration among professionals is high - is higher than that of people who say that the Romanian emigration among young graduates is high (57.53% compared of 50.68%).

3. Conclusions

Responses from the students in target group - who participated in the Romanian labor market survey - revealed the existence of the migration phenomenon on the labor market in our country. This problem affects Romanian specialists in general, but especially young graduates with high level of education.

There is a high level of migration phenomenon both among Romanian young graduates and among Romanian specialists, (specialists who are moving to other countries, where they find more jobs corresponding to their professional and wage desires). This conclusion is reinforced by the very high availability of the young future specialists, participating in the investigation, to migrate to another country, to take up a job that helps them to create a good professional and financial situation. Almost 80% of young respondents said they would emigrate abroad to work on a job suitable for their training. Also, 80% of respondents agree or totally agree that Romanian graduates should be encouraged to continue to work in Romania, thereby contributing to the development of Romanian economy and society.

Derivative Securities and Financial Crisis in Romania

Gogoncea Ramona
Academy of Economic Studies Bucharest
Ramona.Gogoncea@gmail.com

Abstract

This paper aims to investigate the impact of the global financial crisis on the young Romanian market of derivative securities. It also describes the recent developments within Romanian capital market, in general, with focus on innovation in the field of derivative products.

Key words: derivatives, investments, risk management, financial crises

J.E.L. Classification: G23

1. Introduction

Derivative securities represent relative new financial instruments and, as the Romanian capital market developed in the years of high economic growth, the usage of much more sophisticated instruments such as derivatives, gradually increased in Romania. However, even at the pick of economic growth the derivative securities were traded at low volumes in Romania. The main traders of such products in our local market are banks and the financial investments services companies. For the private investors, companies and public, those instruments are regarded with reticent and the advantages brought in area of risk management are yet to be fully employed.

The recession that began in December 2007 and continued until 2012 affected the entire world economy. Looking back to the causes, it is believed that one of the triggers was a specific type of derivatives, namely the mortgage-backed securities. The lack of regulation at that time for those products conducted to overtrade and once the bubble busted, the effect of domino conducted the crises to entire world.

In Romania, the volume of derivatives trading was not significant, therefore could not have influenced the financial crises.

However, as will be presented in the study later, the effect of the crises on the derivative market was significant.

2. Romanian Capital Market

The Capital Market in Romania is regulated by no. 297/2004 law, which regulates the setting up and the functioning of the financial instruments markets, with their specific institutions and operations, as well as of collective investment undertakings in order to provide a framework for investments in financial instruments. The first legal framework was initiated in 1994 and conducted to establishment of National Securities Commission, known as CNVM, the Romanian capital markets authority.

The investors can access the Romanian capital market through intermediaries, financial investment services companies, named SSIF, and the credit institutions – Banks – which are allowed to carry out for themselves or on behalf of their customers, financial transactions on the capital market. In Romania exist and function two regulated market operators: the Bucharest Stock Exchange (BSE) together with the RASDAQ market and the Monetary-Financial and Commodities Stock Exchange Sibiu BMFMS (SIBEX). For transactions concluded on the BSE, the clearing and settlement are performed by the Romanian Central Securities Depository, while for transactions performed on SIBEX market, by the Romanian Clearing House [1]. This type of organization is similar to the one existing in other European markets.

The Bucharest Stock Exchange was first established in 18th century; however its role in economy was visible after the privatization of central owned companies in the '90s. In the first stage after 1995, there were only 6 listed companies at BSE, the majority of Romanian companies included in

Privatization process have been quoted on RASDAQ – the OTC electronic market established after NASDAQ model – because the listing conditions were less strict.

The Sibiu Monetary-Financial and Commodities Stock Exchange Sibiu is a regulated market for derivative securities transactions, established as a commercial company since 1994. In the early stage, the Stock Exchange had commodities intermediation as the main activity. Starting with 1997 the company focused on the development and the administration of securities and financial derivatives markets.

3. Derivative securities on Romanian market

The futures contracts were registered with the State Office for Inventions and Trademarks, patents BMFMS, in December 1997, fact that constitute the evidence of Sibirian establishment in this area of financial services. Thus, SIBEX became the first stock exchange for derivative contracts in Romania through implementation of the first currency and stock index futures (futures contract was launched with the active support own index - BMS1). The introduction of futures contracts was a crucial step in transforming the stock exchange into a national center that stock market participants are able to cover their risks or to speculate on price changes using derivative securities. In November 1998 were launched futures options contracts traded on the Sibiu market, operators thus had full range of derivatives needed to hedge operations. The expansion continued by introduction for trading the first derivative with shares as underlying asset, in December 2000, and the pioneer was BMFMS again. The contracts for difference CFS's were launched in 2009, shares in 2010 and binary options in 2011. As a response to market demand, on March 2011, Sibex started to trade futures contract on oil with the underlying asset the Light Sweet Crude Oil. On April 2011, Sibex started to trade two derivatives contracts with gold as underlying asset: futures contract on gold with SIBGOLD symbol and Options on SIBGOLD futures contract with OPSIGOLD symbol. Sibex also launched for trading futures contract on Euro/Dollar, denominated in RON.

The BSE diversified its range of offered financial instruments and in September 2007 launched the derivatives market. The first derivatives available for the market participants were futures on BET and BET-FI indices. In the following year, the diversification continued, BSE introducing for trading the single stock futures and currency futures. Since 2009 BSE offers market-making services for EUR/RON futures contracts through RBS Bank Romania. However, the presence of BSE on the derivative market in Romania is still only marginal, the main market were those instruments are being traded was and continues to be the Sibex Stock Exchange. In order to increase the popularity of derivatives among the traders at BSE introduced the futures contracts with the most demanded underlying assets, such as: Fondul Proprietatea, BVB, EBS, SIFs, Banca Transilvania shares, and Commodities Futures such as Brent crude oil, milling wheat, gold and silver.

4. Capital market evolution before and after crises

The evolution of the Romanian capital market was slow, but steady, with increasing turnovers and market capitalization until 2007. The financial crises strike in 2008, and the ascending trend was stopped.

The evolution of BSE can be assessed based on the main indicators of the market, presented in the table below. It is observed a gradually increase between 1995 and 2007, with sharp increase in 2004-2006, the period of economic boom and significant drop in 2008. At the end of 2008, the capitalization of BSE was at a level similar to mid year 2005, losing almost half from the value it had at the end of 2007. Market capitalization is the key indicator of a stock market, since it represents market value of listed companies, measured as the sum of products of the number of shares of each company listed and their corresponding market price.

Table 1 – Capital Market Indicators

Year	Avg. Daily Turnover mln. RON	Capitalization mln. RON	No. of Companies with Listed Shares	No. of New Companies
1995	0	26	9	9
1996	0	23	17	8
1997	1	506	76	59
1998	1	392	126	50
1999	1	573	127	15
2000	1	1.073	114	1
2001	2	3.857	65	3
2002	3	9.158	65	1
2003	4	12.187	62	-
2004	10	34.147	60	3
2005	32	56.066	64	5
2006	40	73.342	58	2
2007	55	85.962	59	3
2008	28	45.701	68	10
2009	20	80.074	69	3
2010	22	102.443	74	5
2011	39	70.782	79	6
2012	30	90.696	81	2

Source: www.bvb.ro

In 2008, when the global financial crises stroked, the value of the listed shares drooped, the prices were going down since there were no buyers on the market willing to invest.

An important element in the analysis of capital market developments consists in number of transactions concluded on BSE. The value of transactions on the BSE increased significantly during 2002-2007. However, the stock market incurred a reduction in transaction volume growth. Thus, in 2007 the value of this indicator has increased by approximately 48% compared to the previous periods when it had three digits increasing percents 147.6% and 257.2% in 2004 and 2005 respectively.

After the downturn in 2008, the market start to recover, however the risks and uncertainty still existed, as the RON continued to depreciate, local

macroeconomic indicators had an unfavorable evolution, facts that sustained the aversion of the foreign investors towards emerging markets such as Romania.

The derivative market has a similar evolution as the spot presented above.

Table 2 – SIBEX market indicators

Year	Volume RON	Monthly average
2005	707.738	58.978
2006	4.268.710	355.725
2007	3.490.293	290.857
2008	3.618.766	301.563
2009	2.483.287	206.940
2010	1.637.794	136.482
2011	1.626.574	135.547

Source: www.sibex.ro

The official information presented by BMFMS shows that in the years of economic growth the volume of transactions with derivative securities reached its peak. The main purpose for existing of derivative securities is that they are addressing to the investors both in order to take advantage of the favorable development in the market, as well as for covering the risk in case of unfavorable evolution of the underlying asset prices. It might be that arbitrage operations may take place between the spot market and the future market.

Starting with 2006, after the introduction of derivatives having as underlying asset the new index of the BMFMS market, namely SIBEX 9 and SIBX 18, calculated based on the prices of important blue chips companies listed on the BSE, the derivatives securities market developed year after year. That year SIBEX had the historical maximum liquidity [2]. The year 2007 brought a new type of stock futures and options for shares listed on Bucharest Stock Exchange. In the following year, on SIBEX was launched the first foreign equity future contract, the underlying asset being the shares of Erste Bank.

However, after 2008 the number of transactions performed is decreasing year after year, fact that sustain the affirmation that Romanian derivative market is a young one, not liquid, and the investors are

interested in obtain speculative income and not in covering the risks on which are exposed.

Table 3 – Evolution of number of derivative contracts concluded on SIBEX

Year	Futures	Options	Total
1997	77.877	-	77.877
1998	193.203	133	193.336
1999	159.927	15.215	175.142
2000	158.536	46.752	205.288
2001	135.242	53.731	188.973
2002	225.069	67.300	292.369
2003	168.545	19.369	187.914
2004	72.901	2.273	75.174
2005	696.109	11.629	707.738
2006	4.232.059	36.651	4.268.710
2007	3.456.023	34.900	3.490.923
2008	3.578.582	40.184	3.618.766
2009	2.430.849	52.438	2.483.287
2010	1.620.078	17.716	1.637.794
2011	1.613.469	13.105	1.626.574

Source: www.sibex.ro

As showed in table above, the Romanian investors are interested mainly in futures, in contrast with behavior on mature markets. The reason probably resides in the fact that a future contract is the most straightforward out of those sophisticated instruments. On the other hand, option contracts are difficult to be applied, most of the times are used in hedging strategies which can be misleading if not thoroughly understood.

The derivative market in Bucharest is a small one, however with possibilities and prospects of increases. The diversification process commenced in 2007 conducted to yearly increases in number of contracts concluded. It must be mentioned that on BSE

are traded only futures, as the options contracts are not traded even on the market established in Sibiu for precisely this purpose.

Figure 1- Evolution of futures contracts on BSE market

Source data: www.bvb.ro

On BSE, the most traded derivatives are the Gold futures. The commodities derivative segment even if is at an incipient stage it appears that is the most attractive for investors. It appears that on both markets, Sibex and BSE the gold derivatives which are cash settled could be used by investors in order to better manage their portfolios. The assumption is that the gold price is rising on the international markets.

Apart of the gold futures, other successful products of the derivatives market in Romania are the futures on Fondul Proprietatea shares, the futures on EUR/RON exchange rate and the futures contract with the underlying asset Dow Jones Industrial Average. The later mentioned product is the star of Sibex in last two years. In 2012 more then half of the entire number of future contracts concluded had as underlying asset the Dow Jones index.

Table 4 - Futures structure for year 2012, dated 31 Oct 2012

Type	%	Volume
DEDJIA_ROM	51%	714.606
SIBGOLD	22%	309.505
EUR/USD_ROM	17%	238.980

Source: www.sibex.ro

The futures contract with the underlying asset Dow Jones Industrial Average permits to obtain profits whether the American index

grows or falls, permits to take advantage of important movements from Wall Street.

5. Conclusions

The Romanian derivative market is a relatively small market, it is young, however, appears to have the possibility to grow. The fact that was established later in comparison with other countries, after the long privatization process took place and the legal framework was set, did not allow the market to develop. Of course, the development of the derivative market is in a strong interdependency of the development of the spot market. In other words, we can expect to have a strong derivative securities market only when the spot one will be liquid and trustful.

The derivative instruments traded on the Romanian market, before and after the crises are mainly speculative ones. Due to the lack of liquidity, the specialists do not take advantage of the derivatives contracts in order to hedge their positions. Usually, for those type of activity they trade on foreign markets. The companies which are part of multinational companies are transferring the positions and risks related to their parent companies in order to be hedge against the unfavorable evolutions.

The effect of the financial crises on the Romanian capital market was extremely strong, the prices dropped significantly, consequently the turnover and the capitalization decreased. The foreign investors were less and less attracted by our local market and preferred to invest in countries with a more stable economic environment.

The measures taken by local management of BSE and Sibex were beneficial. The diversification of the products, the decrease in commissions for traders which deals derivative securities, the support and encouragement for the companies in IPO processes are example of measures that insure the development of local capital market.

In conclusion, the infrastructure for a strong capital market is already set-up, potential for development exists – taken into consideration that Romanians were only marginal involved in capital market transactions, therefore it is expected that

local market will be able to reach the level of others European markets.

Even if there are specialists who consider derivative securities as being “financial weapons”, the truth is that as long as the market is transparent and strictly regulated by authorities, controls in real time are in place then the derivatives may be a safe investment for both residents and non-residents.

Group Decision Support – How to Design a Group Decision Simulation and Presentation Environment (UAIC Iasi Case Study)

Homocianu Daniel

Baciu Livia,

„Alexandru Ioan Cuza” University of Iasi, Faculty of Economics and Business
Administration (FEAA)

dan.homocianu@gmail.com

baciu_livia@yahoo.com

Abstract

In order to practice on decision making with students in simulation rooms we did some tests and we have implemented a working scenario considering some conditions imposed by the space, software particularities and so on. The bottom line is that starting both from existing theory and pragmatic examples we have solved some problems and limitations and determined new requirements when trying to proper implement and use a decision software solution based on simulations and developed for group requirements.

Key Words: DSS, GDSS, Simulation, Specificity, Implementation, Scenario Limitations

J.E.L. Classification: D8: Information, Knowledge, and Uncertainty; D89: Other.

1. Introduction to DSS

In the 1970s the concept of Decision Support Systems (DSS) began to develop in the Information Systems (IS) community. Notable were the researches made at the Massachusetts Institute of Technology (MIT) by Gorry, Scott-Morton and Little. Additionally, by the early 1980s there were many books and papers published in the DSS field as those of Alter, Bonczek, Holsapple and Winston or Sprague. So DSS had become a recognized part of IS.

DSS are now considered Information Systems traditionally intended to improve the efficiency of the decision-making process, ensuring a better administrative control and facilitating communication.

While DSS are meant to optimize and

refine the existing information and data in order to get better results, the newest (term, methodology and technology) Business Intelligence can be seen [1] as something used to explore for new information and new hidden relationships. Many of nowadays BI solutions come with comprehensive report-building tools, but the trend in this field is:

- To create web-based reports easily accessible using enterprise portals;
- To develop tools able to drill down, slice and dice into data in various ways also offering the possibility to look at a number of variables at the same time;
- To include performance management tools as dashboards, scorecards, KPIs (key performance indicators), alert message boxes and exception indicators.

DSS have been organized into five [2] categories: Groupware (Communication driven DSS), Data driven (simple file systems accessed by queries, retrieval tools, OLAP, Data Warehouse Systems, Executive Information Systems), Docs driven, Artificial Intelligence based DSS (Knowledge driven), and Model driven (applications based on quantitative, financial, optimization or simulation models also including spreadsheet oriented and solver-oriented applications).

2. Group Decisions and GDSS

GDSS or Group DSS are traditionally interactive, computer-based systems helping teams of decision-makers to solve problems and make choices. They usually use an elaborate communications infrastructure and heuristic and quantitative models to support decision-making. Its main advantage is the collaboration, especially in flat organizations with a hierarchical structure [3] which resembles to a broader and flatter pyramid.

When speaking of Group DSS and collaboration, the decision room is a key term [4]. It actually refers to the physical arrangement for using a GDSS. For example, in a single room, workstations are made available to participants by placing them inside a continuous desk following the U shape (e.g. Execucom planning laboratory back in 1981 – see fig.1). The objective in using a decision room is to enhance and improve the group's decision-making process.

Fig.1 Execucom planning lab-1981 [5]

Below there are two additional references [6] to well-known decision rooms. Winston Churchill's War Room (set of rooms - see fig.2) is the first one and could also be considered an example of an early, completely manual DSS.

Fig.2 Winston Churchill's War Room [7]

The cabinet ministers who went to this complex of rooms when it was a working facility were doing more than hiding from bombs. Their job was to make decisions about how to fight the war. The main item in the room was simply a rectangular table with pads in front of the seated individual.

Fig.3 Engelbart's decision room-'60s [8]

The first implemented computer-based decision room (Engelbart's decision room – see fig.3) was created at Stanford Research Institute in Menlo Park, California during the 1960s. The room provided displays for a group of people who sat at computer-driven display screens being able to retrieve pictures and text from the central computer so that everyone would see them on their screen.

The main characteristics of a computer-based decision room now include: 1) participants each having a computer workstation; 2) a leader (facilitator) that coordinates the meeting; 3) a room with at least one display screen all participants can view; 4) networked computers based on client/server architecture; 5) specialized software available to participants.

3. Simulations in DSS

Many advances made in management science and all improvements now available in information technology are allowing users (decision makers) to proper use simulation techniques [9] that were previously unavailable or limited to special conditions (use of mainframes).

From a general perspective, simulation [10] is a broad term that refers to an approach for imitating the behavior of an actual or anticipated human or physical system. It is related to another one - that of model which shows the relationships and the attributes of interest in the system under study.

A quantitative or behavioral model is by design a simplified view of some of the objects in a system. A model used in a simulation can capture much detail about a specific system, but its complexity depends on the purpose of the simulation based on that model.

With a simulation study and when simulation provides the functionality for a DSS, multiple tests and experiments of the simulation are conducted, their results are recorded and then their aggregate results are analyzed to try to answer specific questions. In a simulation, the decision variables in the model are the inputs that are manipulated in the tests.

4. Special Conditions of our Simulation and Presentation Environment (SPE)

At “Alexandru Ioan Cuza” University (UAIC) from Iasi we have tested using a simulation room - rectangular shape, with twenty operating places disposed in 6 rows (first 4 rows x 3 operating paces and last 2 rows x 4 operating places), in front of an additional one meant for the instructor (supervisor). These places have desks with desktops using a wire-based network. The room is also equipped with two video projectors and two corresponding projecting surfaces on front and right-front intersecting walls in order to support video-conferences with simultaneous but separate projection of both the local presentation and the visual feed-back from distance (see fig.4).

Fig.4 UAIC simulation and videoconference room with double projection (on front and right-front walls)

The group decision scenario of our tested SPE is also conditioned by the following:

- The students (80 in every semester) play the role of employs with decision power in virtual firms (grouped in 4 banks, 5 hotels and 4 commerce firms);
- The master’s students (8) play the role of tutors (they evaluate and coordinate the groups);
- The whole scenario is based on supervised decisions simultaneously and concurrently taken by students as subjects;
- Three simulation applications provide by Tata Interactive (TOPSIM-Destination Management – for students that study

Tourism, TOPSIM-Universal Banking – Banking, TOPSIM-General Management – for students studying Commerce);

- Two different types of all three simulation applications (for instructor and for participant/student);
- Two ways of communication using the network: from supervisor to decision actors at scenario initialization moment and vice versa when collecting results;
- Two levels of security in order to protect concurrent communication channels between student teams (firms) and instructor (physical: locked room and closet for the instructor’s laptop; operating system: password protected accounts with particular user rights);
- The student teams as decision group actors can communicate only after a session of decision-making;
- Many periods of time (with specific conditioning parameters) set to transit from on to another ascending at a predetermined moment, almost as in the real world, after sending results considering a dead line during the simulation class.

5. SPE Implementation Details

The pragmatic example that we have started from is a laboratory that uses twenty desktop stations (for student groups/firms) and a laptop (instructor’s) using Windows 7. The laptop is mainly used to initialize simulations and collect and interpret results. All computers are part of a conventional wire based network connected to the Internet using a switch. All three TOPSIM simulation software products provided by Tata Interactive Systems, that we have tested comes with two versions (for instructor’s laptop and for participant’s / student group’s stations). The instructor version has two option of communication with the student applications: a network-based option and a disk-based one. The network option is very dependent by the network architecture, so we didn’t spent any time in adapting the network to that. The disk-based option uses a simple rule of association between every network shared folder on the instructor’s laptop and every student group’s / participant’s/firm’s simulation station which sees it as a Z drive after mapping. This option was initially

intended for using peripheral storage units/pen-drives and for switching them between instructor and students at the start/end of each simulation, but we have adapted it by using the network advantages - communication between nodes via shared folders converted into network drives.

We chose not to assign the stations to a domain so we have used at least two accounts on any simulation station: Admin and Student (different passwords). But the key was to design 21 shared folders on the instructor's laptop that were meant not to be moved and renamed. 20 of them were mapped as different Z drives (network virtual read-write partitions storing configuration files of the simulation application specific to a firm/student group) with Map Network Drive facility of Windows. They were intended to ensure the traffic of application configuration files in 2 different ways: from instructor to student at scenario initialization and vice versa at collecting results from simulations.

The 21th shared folder (on the instructor's laptop) was intended as a source for documentation (.doc files, presentations, video tutorials) and that's why it was defined as the R partition (read-only), considering only read rights for students. The Network Discovery option, the access to Control Panel and the Option to Disconnect the Network Drive were disabled on the Student account of all 20 stations, in order to ensure the minimum security and discretion of the decision simulation. Thus most of the communication requirements were provided using the operation system and not the software application of decision simulation.

The scenario that we have tested was implemented considering first of all an initialization of the simulation and different periods of time that conducted to different moments with different conditions of using the simulation application. For example, one big difference between two different reference periods could be the average rate of interest and that can affect essentially the parameters of decision that is taken. [11]

6. Advantages and limitations

This entire solution offers above all the plus of defining a dedicated environment for decision making with various conditions for

simulations, interactions and presentation sessions. Actually the participants of the simulation take up decision-making roles of their units to compete as teams against other units in a virtual environment (with different modules) that helps them plan, strategize, and decide, taking into account several variables that influence it [12]. It is obvious that by the decisions they make the participants influence the success of their unit.

An issue that can be interpreted as a minus is related to the need of the physical presence of the decision team (instructor/coordinator and deciders/student groups) in the simulation lab that is not always possible. Some disadvantages (mostly technical) are:

- Difficult maintenance of the lab (network cables and electric sockets) because of the format of the physical room that hosts the simulations (resistance structure based on frames and poles, right side wall of glass);
- Simulation application designed needing un-installation, remaining files remove, Windows registry deletion and reinstallation in order to prepare the lab for a new simulation with another team.

7. Conclusions

This article resumes some valuable ideas about group decision-making, simulation rooms and some relations between models and simulations in order to conclude about particular conditions of a tested environment.

The paper also presents some advantages and the disadvantages of this SPE for group decisions also defining a sort of a guided model in that direction.

The collaboration aspect, all technical conditions mentioned and the maintenance issue are key factors of success when implementing such a solution for group decisions.

Quality of Employment in the Context of Crisis: a Comparative Analysis of Romania and EU 27

Ionescu Alina Măriuca
Alexandru Ioan Cuza University of Iași
alina.ionescu@yahoo.com

Abstract

The paper aims to identify and analyze the changes in quality of employment in Romania in the context of crisis. The assessment of quality of employment is based on the analysis of dynamics of a range of indicators describing various aspects of the phenomenon. Data show that, in Romania, women are the most affected by unemployment in the context of crisis, although their unemployment rates are lower than those of their male counterparts. If compared with EU 27 average, the level of trust regarding the possibility of finding a job of similar pay if losing or quitting their current job is significantly lower for Romanian workers regardless of the category to which they belong. The main policy tools adopted by Romanian government in response to crisis effects on quality of work and employment aimed to maintain labour demand, to make the unemployed more employable, and to support disadvantaged groups.

Key words: quality of employment, crisis effects on labour market, anti-crisis policies.

J.E.L. Classification: J21, J08.

1. Introduction

Negative impact of crisis on labour market has affected individual, family and community well-being. Analysis of dynamics of the quality of work and employment is essential to identify crisis effects on labour market and the appropriate policies to counteract them, as improving job quality has positive consequences in increasing productivity and employment levels and, hence, in improving well-being of employees and in supporting social inclusion and poverty reduction.

As regards the focus on quality of work and employment among European Union member states, the issue has been officially put in the agenda of European policies since the European Council in March 2000 when the so-called Lisbon Strategy was launched. As the Social Policy Agenda states, “quality of work includes better jobs and more balanced ways of combining working life with personal life. [...] Good employment and social policies are needed to underpin productivity and to facilitate the adaptation to change.” [1]. The quality dimension was also underlined by the Stockholm European Council [2] conclusions: “re-gaining full employment not only involves focusing on more jobs, but also on better jobs ... including equal opportunities for the disabled, gender equality, good and flexible work organisation permitting better reconciliation of working and personal life, lifelong learning, health and safety at work, employee involvement and diversity in working life” [1].

In June 2001, the European Commission issued its first Communication on quality of work and employment and a set of various indicators to monitor this phenomenon have been adopted at the Laeken European Council in December, the same year. This period could be described as the “golden age” of quality of work and employment in European policy arena, determined by the succession of four supportive presidencies of the EU (Portugal, France, Sweden and Belgium), in a period of sustained economic and employment growths combined with the political context of a majority of left wing and social-democrats governments among the Member States [3].

In the following years, the emphasis on quality of work and employment has been supported by the work of various international institutions such as the Directorate General for Employment and Social Affairs of EU Commission, the

Foundation for the Improvement of Living and Working Conditions, and International Labour Organisation.

Following the broad interest manifested in European policy arena for supporting and enhancing quality of work and employment, the paper aims to identify and analyze the changes that occurred in quality of employment in Romania in the context of crisis. The choice is motivated by the fact that the security of employment can be the most important criterion of quality in a period of economic crisis while others criteria may seem more important in more clement times [4] [5]. Due to the downturn, the attention from quality of jobs has shifted to sustaining the employment levels. Thus, as a prerequisite to the quality of work, inclusion and access to the labour market are obviously essential in this respect.

The research has been organized as follows: the first section presents the indicators used to describe the quality of employment and the method of analysis; within the second section, the paper analyzes the dynamics of quality of employment in Romania, in the context of crisis; the third section provides a discussion of the policy tools adopted in Romania and in other EU member states in response to crisis effects on quality of work and employment, while last section presents the concluding remarks.

2. Material and method

The quality of employment is assessed using a range of indicators that describe various aspects of the phenomenon, such as: the structure of unemployment with respect to age and gender, involuntary part-time employment, human capital development as a way of increasing future employability, and workers' attitudes toward their chances in finding another job. The analysis is focused on Romania, but comparisons with EU27 average and with other EU member states are also made. Data sources used in the study are *EUROSTAT* and *European Working Conditions Survey* (EWCS) databases. Selected indicators of quality of employment are analyzed in dynamics, during the period 2004-2010, in order to observe the trend of indicators in the years before the crisis and the changes that occurred in their evolution after the crisis started.

3. Dynamics of quality of employment in Romania, in the context of crisis

Labour markets in the EU started to weaken in the second half of 2008 and deteriorated further in the course of 2009, when the unemployment rate had increased by 1.9 percentage points from its 7.1% low a year earlier. If at EU27 level the increasing was about 26.8%, in Romania the labour market had reacted slower, the increasing being of only 19%, from 5.8% in 2008 to 6.9% in 2009.

At EU27 level, women were less affected than men, as men's unemployment increasing was two times more pronounced than for women. That might be explained by the fact that the crisis hit first and foremost sectors where male employment is relatively high (car industry, construction). Even so, a decline in female employment was registered in 2009 for the first time since 2005. In Romania, the situation is different, as women are by far the most affected by unemployment in the context of crisis. If male unemployment rising was about 15% in 2009 and 2.6% in 2010 comparing to previous year, female unemployment registered an increasing of 23% in 2009 and 12% in 2010. One also may note that after crisis broke up, both unemployment rates on total and by gender and unemployment intensification have been maintained in Romania significantly under the EU27 average (figure 1).

Figure 1. Unemployment rate in Romania and EU27, during 2004-2010 (%)

Source: Based on data extracted from Eurostat database

Unemployment rate for the workforce aged less than 25 is about 4 times higher than for 25 to 74 years age group in Romania. In the context of crisis, unemployment rates for both age groups increased in 2008 and 2009. At EU27 level, youth unemployment has

raised in a greater extent than in Romania (figure 2). Although unemployment rates for young people in Romania are higher than the EU27 average, those corresponding to the age group 25 to 74 years are about 40% lower than the EU27 average.

Figure 2. Unemployment rate by age group in Romania and EU27, during 2004-2010, %

Source: Based on data extracted from Eurostat database

Figure 3. Involuntary part-time employment as percentage of the total part-time employment by age group, in Romania and EU27, during 2004-2009 (%)

Source: Based on data extracted from Eurostat database

Involuntary part-time employment is about two times more spread in Romania than at EU27 level and affects particularly young workers. While for employed persons aged 25 years or over the values are about 40%, for youth (15-24 years), this rate is higher than 65%. In 2008, it raised with 3.5 points comparing with the value registered in 2006, and returned in 2009 to the values specific to before crisis period (figure 3).

In many Member States the participation in lifelong learning is relatively low and is still decreasing. This is also the case of Romania, where the participation rate in formal and non-formal education and training of the active persons aged 25-64 years is about 8-9 times lower than the EU average (1-1.5% in Romania, compared to 9.8-10.9% at EU27 level). Investing in skills remains an important long-term challenge, also with a

view to a sustainable exit from the economic crisis and reducing poverty. Countries aim to promote lifelong learning in order to update and increase workers skills, thus increasing productivity and employability in the future, as well as to improve the mobility in the labour market. A positive aspect for Romanian labour market is the fact that there is a continuous increasing in the proportion of persons with tertiary education (from 13.3% in 2004 to 16.9% in 2009), which ensures, on long term, skills-upgrading and a higher competitiveness of the workforce.

If they were to lose or quit their job, less than 20% of the employed persons in Romania would find it easy to find a job of similar salary. While 27.2% of those aged under 30 would agree with the statement, only 10.5% of older workers (50+) feel the same (figure 4a). Almost 69% of the workers think it would be hard to find a job of similar salary, in case they lose or quit their current jobs. Across other EU27 member states, people are more optimistic about their chances on the labour market, as, in average, less than 50% (48.3%) of workers consider that they would be in difficulty if they have to search for a job of similar pay. The EU27 average percentages are around two times higher than for Romania for those agreeing they wouldn't have problems in finding this kind of job.

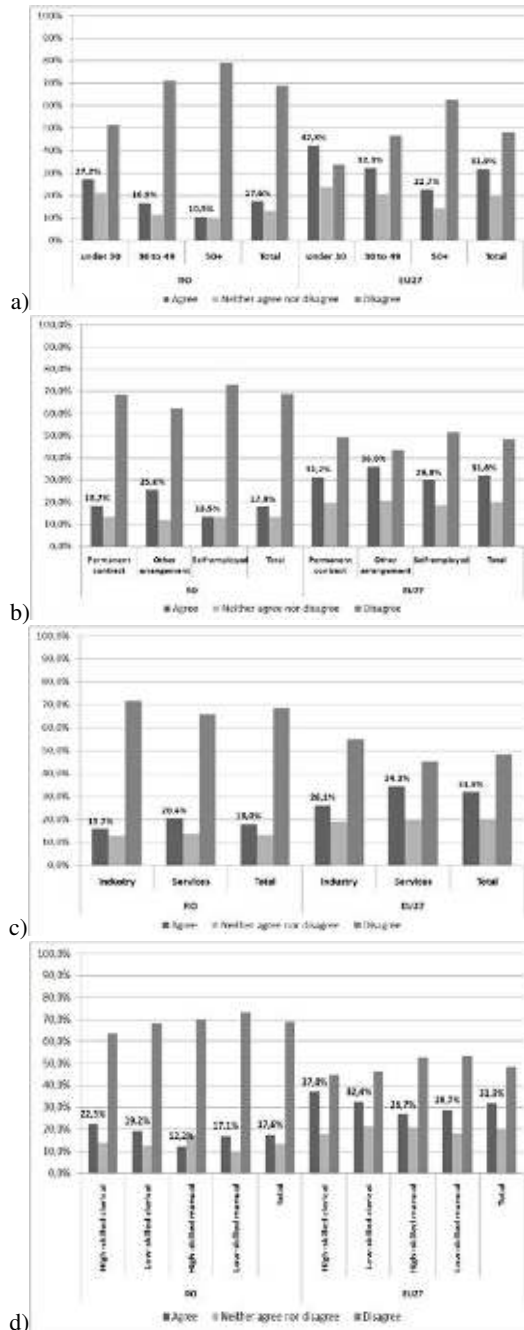

As regards the type of the employment contract, the employees with other arrangement than a permanent contract or than self-employed ones are the most optimistic (figure 4b), possibly because of the much flexible nature of these kind of jobs (25.6% of *other arrangement* group, comparing to 18.2% and 13.5%, of *permanent contract* and, respectively, of *self-employed* groups).

According to workers' perception, the hardest to find a new job is in industry sector, as 71.5% of the workers in industry in Romania and 54.9% at EU27 level disagree with the fact that it would be easier for them to find a job of similar salary if they were to lose or quit their current jobs (figure 4c).

The most skilled the workers are the easiest they seem to find a new job correspondingly paid in case of losing or quitting their current place of work (figure 4d), while the less skilled workers are the more pessimistic they feel about finding a job

of similar pay.

Figure 4. Distribution of employees by the level of trust regarding the possibility of finding a job of similar pay if losing or quitting their current job and by: a) age, b) employment status, c) sector of activity, d) type of occupation, in Romania and in EU27, in 2010

Source: Based on data extracted from EWCS database

4. Labour market policies response to the economic and financial crisis in Romania and in other EU member states

An overview [6] of the different types of

stimuli included in the policy actions to combat the crisis on labour markets in the EU shows that in financial terms the focus is on general economic support measures including tax cuts, wage subsidies e.g. in the form of reductions of social security rates, state guarantees for vulnerable companies, or financial support to SMEs.

A second focus is on infrastructure spending and sector-specific support measures for the automobile sector (DE, Y, FR, IT, AU, ES, PT), construction industries (CY, ES, LT), for transport and tourism (CY, GR, NL, PT), and steel industry (LU). In many cases, this is combined with EU Structural Funds resources. European Structural Funds (ESF) is a widely used instrument among Member States to promote quality of work and it plays a crucial role in funding the active employment policy measures. In Romania, the first signs of the crisis on labour markets occurred almost simultaneously with the opportunity to access European funding under the ESF, limiting the negative impact of the decreased public budget during the crisis. These funds were used in our country for training of the employees and enhancing the employability of disadvantaged groups and to improve working conditions by informing and training workers in the field of health and safety at work [7].

As regards adequate earnings, while LU has taken action to reinforce support for people's income by increasing the guaranteed minimum income and by providing a life allowance for people whose monthly income is below a certain threshold, during the crisis in BG and PT the public sector wages are frozen, while in LT and RO there was a major wage moderation in the public sector [7].

While most of the countries included some sort of improved unemployment benefits and flexible work contracts in their programmes, only very few concentrated their resources on such measures (RO, AU, FI, DE, IT). This includes in particular short-time work schemes and flexible working hours.

Training measures and placement activities are also applied by many countries, but none of the EU Member States put this area into the centre of the policy programme. Only one third of the Member States

emphasise this measure. This includes the creation of apprenticeship training (AU, UK), training of redundant workers (FR, CY, FI, NL, PT) or the expansion of adult training in general (DE, SE, HU). Some countries include the education and training sector into their infrastructure programmes.

Although the great majority of instruments are applied in various combinations there can be identified three sets of national approaches (table 1) that describe different logic underlying the strategies to combat the crisis [6].

a) The *state-oriented approach* counts on the strength of public and private spending which is expected to re-direct the economy to the former growth path. It depends on high multiplier effects of expenditures, being able to compensate the loss of demand in the economy. It is the case of CY, ES, FR, LU, and MT.

b) The *stability-oriented approach* assumes a short crisis. It is expected that a strong upswing will soon bring the economy back to former activity levels. Only transitional public support is required in order to stabilise employment. This approach is adopted by most of the EU countries (BG, CZ, DE, GR, IT, LV, LT, NL, PO, SE, SI). Redistributive measures play a minor role compared to general tax cuts or wage subsidies.

The *liberal approach* and least frequently (BE, DK, FI, HU, PL, SK, UK) counts on the dynamics of the economy. Restoring profit rates and supporting consumption will be sufficient to recover from the slump. In a long-term perspective, restructuring of the economy towards growth sectors will help restoring economic dynamics.

AU has strong elements of both, a state-oriented and liberal approach. EE, IR, and RO were not classified [6].

According to the study *Labour market policies in times of crisis* [8], the types of policies adopted by Romanian government, in order to tackle the labour market impact of the financial crisis are:

I. *Subsidized and unsubsidized reduction in working hours*. It has the following advantages: allows employers to reduce hours worked to avoid layoffs; helps retain skilled workers; reduce labour costs for the employers; enhances job security for workers; protects incomes of workers;

promotes skills development of workers (if combined with training); no direct financial cost for employer. Its main disadvantage is that it imposes administrative costs and changes to company's management practices. Subsidized reduction in working hours requires financial support from government and income replacement may not be perfect leading to loss of earnings for workers. Non-subsidized reduction in working hours involves income reduction for employees.

II. *Job search assistance and improved capacity of public employment services*. This type of measure improves the job search abilities of unemployed at a relatively low cost. The disadvantages refer to: ineffective in times of low labour demand; can entail deadweight costs because beneficiaries who find work through job search assistance are often more qualified and perhaps could have found jobs in the absence of assistance.

III. *Training (including on-the job training), work experience and apprenticeship programmes* build the skills of those out of employment to increase their chances of finding a job. It constitutes a costly measure and training is often not linked to the demands of employers (skills mismatch).

IV. *Entrepreneurship incentives* (training and microcredit) represent a policy not only used to improve employability but also to create SMEs. This kind of measure provides capital and skills training to potential entrepreneurs. It is costly and not always effective because training does not focus on the correct skills and because the financing is too restrictive. Another disadvantage is that poorest, women and other vulnerable groups are unable to access such programmes.

V. *Change to unemployment benefits schemes*.

In 2009 the total expenditure for labour market policy interventions raised in Romania by about 43%, to 534.52 millions of euro, up from 373.76 millions of euro in 2008. The structure of funding has changed as there has been an increase in the proportion of the expenditure with out-of-work income maintenance and support in total expenditure for LPM interventions, from 64.9% in 2008 to 84.1% in 2009.

The number of beneficiaries of LMP support increased too, to 324667 persons in 2009, up from 127579 persons in 2008, that

meant a raise of about 2.5 times, although the amount spent per person was significantly smaller: 1384.84 euro per beneficiary in 2009 comparing to 1900.86 euro in 2008.

5. Concluding remarks

The analysis of several indicators of quality of employment and the findings of a range of reports of some European institutions have demonstrated that national labour markets have responded in various ways to the economic shocks induced by the global financial crisis.

In Romania, rising unemployment has been important as it went up from 5.8% in 2008 to 6.9% in 2009 and to 7.3 % in 2010. However, both unemployment rates on total and by gender and unemployment intensification have been maintained in Romania significantly under the EU27 average. Women are by far the most affected by unemployment in the context of crisis, as female unemployment registered an increasing of 23% in 2009 and of 12% in 2010. If they were to lose or quit their job, less than 20% of the employed persons in Romania would find it easy to find a job of similar salary. Older workers (50+) and less skilled workers are less confident with their chances, being more pessimistic when it comes for finding another job.

The main policy tools adopted by Romanian government in order to prevent or to combat crisis effects on quality of employment aimed *to maintain labour demand, that is keeping people in jobs* (through subsidized and unsubsidized reduction in working hours); *to improve the match between labour demand and supply by making the unemployed more employable* (through job search assistance, training, and entrepreneurship incentives), and *to support disadvantaged groups* through change to unemployment benefits schemes.

Progress has been made in mitigating the impacts of the crisis through policy interventions, but there is still a need for much stronger linkages between investment, growth and productivity on the one hand, and employment, labour market and social policies on the other.

Competitive Strategies of Economic Enterprises

Ionescu Gr. Ion
"Dimitrie Cantemir" Christian University,
Faculty of Management in Tourism and Commerce, Constanta - Romania,
iionescu_levant@yahoo.ca

Abstract

As a result of the presented material, we concluded that the firm competition strategy of economic enterprises, it's a way of action who permits the description of a mission and the perimeter of development of global activities organization, but also the modalities of creation or increase, which compose the diverse values of activities.

Key words: firm, strategy, relations, business, competitors

JEL Classification: M31

Conceptual basis of the strategy

The most interesting definitions are:

- "the strategy groups together the determination of the objectives for a long period of a company (firm), the definition of the steps and the necessary resources in order to achieve them" [1] (Chandler, 1962);

- "the strategy is the essential way of the using and predicting the resources, as well as the way of the interaction between the firm and its environment, showing the manner in which it will achieve the established objectives" [3] (Hofer and Schendel, 1978);

- the definition of the Porter which reduces the concept to the business strategy is "the establishment of a favorable position in a field, a position at the same time which is advantageous and can be shielded by the forces which determine the competition in that field. The strategy is the way in which this competition advantage can be achieved" [6] (Porter, 1982);

- it is necessary to use the term strategy for those actions which consolidate the position of

the firm in comparison with its competitors. It is necessary to be made a difference between these actions and those which have the purpose to realize the operational improvements, such as the profitability increasing, the improvement of the organization or a superior qualification of the staff [...] this while the weaknesses or the internal inefficiency can be tolerated for a period, the deterioration of the firm position, in comparison with its competitors, can put in danger the firm" [5] (Ohmae, 1998);

- "the strategy is the art of hiring, for a long time, the firm to realize some advantages as a result of the competition game and evolution of its external medium" [2] (Gervais, 1995);

- "to elaborate a strategy suppose to choose those fields in which the firm wants to advance and to allocate the necessary resources in order to succeed in maintaining and developing the activities in those fields" [8] (Stratégor, Politique Générale de l'Entreprise, 1997).

This last definition groups together two different strategy levels:

- *Corporate strategy* which determines the fields of the firm, leading it to start or to withdraw from a specific field, with the purpose to realize a balanced portfolio of activities.

- *Business strategy* which refers to each field above-mentioned, showing the actions that the firm takes to get a favorable position in comparison with its competitors in the specific field.

The essential difference between these two strategy levels is the fact that while the corporate strategy, called too *primary strategy*, appoints the fields where the firm will start to develop, the business strategy, called too *secondary strategy*, identifies the actions and the objectives for the field appointed before.

The business environment is defined in comparison with some precisely points (customers, suppliers, competitors), and for that reason is necessary to realize an internal and external plan before planning a new strategy.

- *Operational strategy* which determines the ways in which the different elements that form the organization, such as resources or competences or personal motivations combine to implement the strategies from the other two levels above-mentioned.

In this way it is formed a strategic behavior which makes possible the operative using of the firm resources, having in view the opportunities and the menaces from the business environment, the technological changes, anticipating and preparing the possible entering and withdrawals from the competitors field. In fact at this level of secondary strategy appears the competition game.

The essence of the business strategy groups two essential concepts: objective (strategic planning-mission) and competition arm.

The strategic planning-mission includes the general objectives of the firm and represents the directions of its efforts in order to get a position in that field.

The analysis models of the activities portfolio which organize the strategic decisions depending on the competition position of the firm and the evolution of the field (quantified with the help of some indicators such as increasing rate or attraction rate of the sector) propose a series of strategic alternatives by confrontation between two criteria: build (market quotation increasing) and harvest (immediately profitability), under the following forms:

- Development conception, which aims at the obtaining of profits for a long period by accumulation of new market parts until it is obtained the leader [4] (Kotler, 1980) position. This implies some commercial and technological competences which permit to the firm to dominate its competitors and to develop.

- Stabilization conception which aims at the maintaining its competition position by means

of cost or brand strategies that will be developed in another chapter.

- Re-launching concept which aims at the stopping of an incipient decline and finding a “healthy” position for a long time. This suppose a financial improvement and than the fixation of the prices, the rationalization of the product lines and if is necessary the direction towards other fields.

- Profitability concept which aims at the maximum exploitation of an activity before to renounce to it or to exclude it from the portfolio. In this case a market quotation is preferred than immediately profits.

Volume-Cost strategies

The essential objective of the business strategies is to realize and to give to the firm a lasting competitive advantage in front of its competitors. Business strategies have an decisive role in the determination of the performance level of the respective activity, knowing that this concept is judged by the analysts, starting from a series of criteria such as: increasing, profitability, productivity etc.

The cost strategy represents the strategic decisions which direct the firm efforts to reduce its fabrication costs, including here the unitary costs of the manufacturing, as well as the conception, design, distribution and promoting costs.

These strategies underline the fact that a firm is more competitive if has the lowest costs from the field, in other words the competitive advantage of the firm is direct proportional to its capacity to reduce its costs to the minimum in comparison with its direct competitors that will permit to it to obtain a higher profit.

To reduce the costs means to realize some resources savings for the manufacturing of a product unit, this fact is encouraged by the using of concepts such as experience effect and its strategic implications.

The theory [7] (Boston Consulting Group, 1980) of the experience effect connects two coordinates of the activity: the *cumulative production (Qex)* which is a measure of the activity volume of the firm and *the unitary cost of a product (Cu)*; in this way the total unitary cost of a product decreases with a constant

percentage each time when the cumulative production of the firm for that product doubles, with the specification that this unitary cost is measured in constant monetary units, canceling the inflation effect.

The constant decreasing of the cost with the doubling of the cumulative production varies depending on the field, being in the interval of 10%-30%, that in the conditions of an increasing of the quantitative factor allow the obtaining of an decreasing curve of the unitary cost, called in the economic theory experience curve.

This curve do not belong only to one firm, it belongs to the entire field, depending on the efficiencies of that field, being here a constant indicator (but not with automatic applicability) for all the competitive firms.

The unitary costs of a firm wanders from the experience curve, making the cost derive. The experience effect is an empiric phenomenon which has three causes:

1) economies of scale and volume effect:

2) learning effect

3) the effect of the progressive implementation of some innovative elements.

4) the unitary costs of an activity level decreases when the production capacities and the sales volume increase.

Economies of scale come from the repartition of the fixed expenses to a superior volume of the goods produced and from the reduction of the investments in the capacity unit when the total capacity of the production increases. Besides the economies of scale, it is observed too the existence of a volume effect which means the improvement of the negotiation capacity of the firm in comparison with its partners (customers and suppliers) with the increasing of its volume that allows to establish an important place in the relationships with the suppliers .

So appear:

1) the learning effect (identified wrongly with the experience) is the improvement of the work productivity owing to the increasing of the proficiency and the execution speed of an operation or of the product with the realization of it in a repetitive manner.

2) Experience gaining allows to the firm to bring some modifications of the products manufactured by eliminating the unnecessary elements, or by the endowment with improved or innovative components (esthetic, functional, security of using etc), in a progressive manner when the conception and the manufacturing improve.

Conclusions

In conclusion, specialization types are different, depending on the two criteria presented above and which can be made up in the coordinates of a matrix which has: the segments which the company focuses on can refer to: customers, type of products, geographical area or distribution network. This strategic aim chosen by the company estimates that it is competent because it offers either products at a low price or differentiated products towards those existent on the market, answering in a better way to the specific needs of that aimed segment.

Research Concerning the Implementation Level of CRM Information Systems in Banking Sector in Romania

Jeflea Victor

Ovidius University Constanța, Faculty of Economic Science

jefleavf@yahoo.com

Abstract

Without claiming to be a complete study, due to the aimed objectives and research variables we focused upon, the purpose of this research is to highlight the impact of information technologies implementation used in CRM and banking strategies and to identify some directions which will serve to design, organize and develop similar researches of a wider range.

Keywords: CRM, Cloud Computing, Information System,

Jel classification: D80

1. Introduction

The research concerning the implementation level of CRM type information systems in the Romanian bank sector aimed to provide general input regarding the manner in which the analyzed banks managed to increase performances as a result of exploiting the advantages of IT solutions for customer care management.

2. Contents

The first question of the questionnaire (the filter question) aimed to validate the sample of the banks which implemented CRM information systems, resulting in 83.33% of affirmative responses, of the total number of the banks which received the questionnaires.

The second question from the questionnaire aimed to identify the main objectives of CRM information systems implementation within the banks included in

the research sample. The objectives were predefined, assuming that a CRM information system implementation cannot be performed without being adequately integrated in a relational customer orientation strategy.

We observe that the majority of the respondents consider as a foreground objective of implementing a CRM system the fidelity enhancement of existing clients throughout loyalty programs operated by CRM system (85%).

Integrating the information about clients in order to perform multidimensional analysis on their behavior facilitates the development of predictive patterns regarding the profitability of attracting customers and developing their fidelity, which ensure the support for banking institution managers to take the decisions of assigning financial resources to these two strategic axis of customer care management.

Optimizing the assigning of financial resources to profitable customers segments is fully justified from the profitability point of view, but the risk that emerges is losing some customer segments that might become profitable in time throughout customized CRM campaigns.

Information gathered after getting in contact with the customers represent the “raw material” for the CRM bank information systems. The main procedure of acquiring information about the customers is direct interactions with Front-Office personnel (45%) followed by the interactions with Call-Center operators (35%), using some amenities provided by online banking (15%) and filling out some questionnaires during marketing researches (5%).

Sales representatives of the banks registering performances frequently participate to training programs designated to create and promote a proactive attitude towards customers, create awareness regarding the link between customer care behavior and company's profitability, identify the need of each customer in order to embrace communication style and implement efficient communication instruments during interactions with the customers to obtain relevant information to be exploited in the CRM information system.

In what concerns the question regarding specific competencies, know-how and technologies used in CRM sector, the representatives of the banks which participated to this research underlined the following important aspects: the occurrence of an information system designated for CRM activities, which operates as an interface between bank and customers and offers instruments to enhance the relation (100%), the employment of multiple communication channels utilized for communicating with each customer segment (60%), training programs intended for front-office employees designated to create a proactive attitude towards customers (70%), the customization of product range and bank services in order to increase customers satisfaction (65%). The aforementioned question represents the second filter used in the questionnaire and the percentages associated with the received answers embody the result of a multiple choice carried out by the respondents.

Following the evaluation of the results, we observe that all the banks included in the research sample consider that the implementation of CRM information systems acts as a support for customer care relational strategies and brings up long-lasting competitive advantages.

Considering the frequency of the CRM campaigns, the customer care development programs, focused on seconding additional and cross selling occupy the first place (85%), followed by rewarding loyal customers through customized offers (60%), facilitated by the implementation of

multidimensional data analysis techniques within CRM information systems analytics procedures. The respondents assigned a lower running frequency to the other types of CRM campaigns listed in the questionnaire: preventing customer migration to competitors throughout actions based on satisfying individual needs (45%), offering products or services in order to create a new range of needs for the customers (40%).

CRM banking information systems ensure close monitoring of customers needs in order to make the most of the cross-selling and up-selling opportunities and to adapt to fast-changing customer needs. In our opinion customer loyalty, based on additional selling and recommendations, represents the base for a company market share increasing and fast achieving selling goals, and the profit resulting from profitable customer relationship grows with the period they remain active.

Regarding the CRM campaigns developed by Romanian banks, it is our believe that customers migration to competitors should be strongly observed, since customers have more and more alternatives in choosing the offers that maximize the advisability in banking products and services acquisitions.

The activities carried on by the competitors of the analyzed banks in the CRM sector are being counteracted, according to their representatives answers, by the increased frequency and variety of promotions and programs for developing customer fidelity (70%), launching cutting-edge financial services and products (65%), exploiting information provided by early warning systems (45%) and integrating a Competitive Intelligence module in CRM system (25%).

Although all these actions have the goal to support a defensive CRM strategy, focused on customer retention and decreasing the rate of migration to competitor banks, our opinion is that assigning an increased budget for monitoring the competition using Competitive Intelligence techniques will simplify the aforementioned counteraction activities.

Integrating Competitive Intelligence modules in CRM banking systems becomes a priority, even if they are not included in the standard packages offered by CRM suppliers, since it enables the automation of information gathering actions from different internal and external sources about competitors activity, indexing and automatic rating using a taxonomy based on complex classification rules.

In our opinion, Romanian banks should insist on using customized offers techniques, which determine a long-lasting competitive advantage, especially under the conditions imposed by e-business. For this purpose, we recommend Romanian banks managers to increase the importance of CRM campaigns on websites and contact centers based on web technologies level, in order to facilitate customized interactions with the clients.

The rapid development of information technologies facilitated the spreading of information solutions designated for customer care management, rendering possible the integration, in an integrative information system, of all the data regarding customers. The main advantages offered by the new information and communication technologies have been ranked by the participants at the research as follows: the possibility to permanently update the information about customers (95%), the rapidity of exchanging information with customers (85%), the ability to contact and manage a great number of customers (80%), the ability to customize marketing messages (75%), the optimization of selling potential during every contact with the customers (65%) and the ability to adjust customer behavior using data mining (55%).

The low rate acquired by CRM information systems components acting on a strategic level demonstrates that CRM banking systems analytical dimension, based on adjusting customer care predictability, is not exploited at its maximum potential.

A successful CRM information system offers a global view of all factors which conduce to customer profitability increasing and standardizes a process, from generating potential customers' attention, until closing a

transaction. According to analyzed banks representatives, multidimensional analysis designated to predict customer profitability is facilitated by the occurrence of the following types of information, stored in CRM information system databases: information regarding banking operations carried out by the customer, additional products and banking services offered to customers, information concerning the risk of not paying an outstanding debt, customer identification information and suggestions for services improvement.

CRM information programs used by bank institutions regard three different aspects: **operational** (marketing and sales activities automation), **co-operational** (interactions between Front Office and Call Center representatives and customers) and **analytical** (implementing specific information analyzing techniques stored in CRM databases). The evaluation of the answers received from banks representatives confirm that CRM information systems have an operational dimension orientation, by following customer care management campaigns on different customer segments (85%), CRM reports fast delivery using groupware technologies (65%), ensuring support for multiple channel communication process (60%), while analytical abilities have lower rates: the possibility to perform online analytical processing (OLAP) - 55%, exploiting information about customers using data mining - 40%, confirming therefore previous results.(fig. no. 3.10)

Our research highlights that most CRM information systems implementation takes a period of 12 to 24 months (30%), followed by implementation in shorter periods, less than 6 months (25%); worldwide studies carried out by Gartner Consulting underlined that the implementation periods of CRM systems is in direct ratio with the size of the banks. In two of the banks from our sample (10%), the CRM system implementation is still ongoing.

3. Conclusions

Successful CRM information systems implementation within Romanian banks is conditioned by implementing organizational cultures based on an excellent customer approach, promoting a co-operational and competitive working environment. CRM solutions exploiting degree within Romanian bank sector will greatly depend on reorienting the business strategies towards personalized customer care, in order to increase their satisfaction and loyalty degree.

Research for the Costs and Benefits of the Implementation of the IT Systems of CRM Type in the Romanian Banking System

Jeflea Victor

Ovidius University Constanța, Faculty of Economic Science

jefleavf@yahoo.com

Abstract

Without claiming to be a complete study, due to the aimed objectives and research variables we focused upon, the purpose of this research is to highlight the impact of information technologies implementation used in CRM and banking strategies and to identify some directions which will serve to design, organize and develop similar researches of a wider range.

Keywords: CRM, Cloud Computing, Information System,

Jel classification: D80

1. Introduction

The research for the costs and benefits of the implementation of the IT systems of CRM type in the Romanian banking system had in view getting some information with a general character about the way the analyzed banks succeeded in increasing their performances by turning to account the IT solutions destined to the customs relations management.

2. Contents

In the opinion of the representatives of the banks which took part in the research, the costs of purchasing, implementation and maintenance of the CRM systems and the personalizing possibilities of the CRM systems modules represent the most utilized selection criteria of the suppliers of CRM IT systems. The other analyzed criteria, the easy integration with other IT systems existing in the bank and the operation facility of the CRM system had more reduced answering rates.

We consider that validation of the selection criteria of the suppliers of CRM IT

systems from the financial-banking sector must include in an equilibrated manner the aspects of the functional requirements, the technical requirements, the commercial criteria and the financial criteria, the last one being a fundamental guiding mark in the cost-benefit analysis.

The implementation of a CRM system represent a new model of approaching the customers relations by a bank, having major implications on human resources, processes and technologies. In this context, we had in view, by using a question, the identification of the main successful critical factors taken into account by the managers of the banks implied in the research regarding the implementation of CRM IT system. The results showed us the following hierarchy of these factors: the capacity of customizing CRM system (90%), the adaptability at the changes occurred within the departments implied in the CRM projects (85%), the support of the external consultants by training programmes offered to the users of the system within the bank (80%) and the communication of the advantages of the CRM system implementation in all departments of the banks (70%).

We notice that all the four considered successful critical factors had very high answering rates (between 70 % and 90%), showing the importance which the managers of the analyzed banks gave them in the process of implementation of CRM system.

As purchasing a CRM IT system in a bank implies a great investment, we consider opportune the identification of the cost category which had the greatest percentage in the analyzed banks. The answers make evident the placement of the costs generated by purchasing software and hardware equipments (45%) on the first position , followed, in order, by the maintenance costs of the CRM system (30%), the costs with the training of the system users form the bank

(15%) and the costs generated by the integration of the applications and the CRM system customizing (10%).

In two situations, we noticed the outrunning of the general costs of purchasing software and hardware equipment by the maintenance costs of a CRM system and the costs generated by the integration of the applications and CRM system customizing.

The adoption of a solution of SaaS type (Software as a Service) may contribute considerably at the reduction of the costs with the purchase of a CRM system.

The sales automation modulus represents an important functionality of a CRM banking system, as it manages and consolidates the operations of the sales team from a bank. The main advantages given by the components dedicated to the sales automation as a part of CRM IT system of the banks investigated are the following: the prevision of the products sales and banking services on each clients segment (75%), monitoring the sales indices (65%), the identification of the opportunities of additional and crossed sales (65%) and the reduction of the administrative effort and the concentration on the sales processes (60%).

The performance of the sales automation modulus is conditioned by its integration in the management system for following and registering each stage of the sale process for each prospect in part, from the initial contact realized by the employees of Front – Office and Call Center, to the decision of drawing the offers of products and banking services.

CRM modulus of marketing automation takes into account the totality of the stages afferent to a marketing campaign, beginning with the conception, the performance and the measuring of the results, by the means of some software applications which facilitate the selection and the segmentation of the clients portfolio, monitoring the contacts with them and interprets the results. In the opinion of the representatives of the banks which take part in researching, the main advantages of the component dedicated to the marketing automation within the framework of CRM IT systems are: the analysis of the efficiency of the marketing campaigns by quantifiable results (85%) and the efficient management of the planning information and the performance of the marketing campaigns (75%). More reduced percentages have been allocated to the other two advantages

predefined as answering alternatives, namely: the identification of the tendencies of manifesting the clients behaviour (60%), respectively the facilitation of performing direct marketing campaigns, based on e-mail marketing and SMS marketing (55%).

By the means of the modulus of marketing automation, it is performed a personalized management of the clients of the level of operative unit and a unique administration of the clients at the bank level.

The automation of the support processes offered to the clients in CRM IT systems makes efficient the interaction mode of the banks representatives with the clients, supporting in an interactive mode the developed business processes, reducing the costs and generating the performance increase. The most important advantage of the automation component of the support processes offered to the clients, in the opinion of the respondents, is represented by quick solving of the clients' solicitations by automatic allocation towards specialized human resources (75%); the other predefined advantages obtained the following answering rates: the planning and personalization of the services offered to the clients (70%), the increase of the client's satisfaction and the creation of new sales opportunities (70%) and the possibility of rendering a self-service banking service (55%)

We suggest to the banks managers to give a great importance to the self-service banking services, which have the role of offering a knowledge basis with a multitude of answering the potential questions of the customers, to have in view the costs of the client service and the satisfaction degree of the client, to assure that the self-help type services have a positive impact on the development of the customers relations.

Cloud Computing is a globalizing form of IT services and it is situated in the worldwide economic tendencies, which aims at the reduction of the operational costs and the concentration of IT services in some global conglomerations. According to a study published in Market Watch Review in 2011, the Romanian banking system is ready to migrate towards the Cloud Computing type technology, mainly due to the high speed connection at Internet, the investments made for retechnologizing, and the competent personnel, trained to implement

and to use the services based on Cloud Computing Testing the Cloud Computing technologies has begun in the Romanian banking system since 2009. In this context, a specific objective of the research performed was represented by the identification of the reasons for which the banks managers from Romania would choose a supplier of Cloud Computing solutions for CRM IT system. The answers received made evident a precarious attitude of the majority of the respondents, who said that they wouldn't use Cloud Computing in near future, because of the risks it implies (55%); on the other hand, the benefits appreciated by the respondents who consider the migration towards Cloud a priority, are: the considerable reduction of the IT budget (25%), its extended capacity and flexibility at new business requirements (15%) and standardization of business processes oriented towards the client (5%).

We consider that the banks managers should assess the opportunities offered by software applications based on Cloud Computing model, by the means of which they can get useful information in a real time from the data volume available on the new communication channels with the customers, especially through social network.

The factors which contributed to the success of the implementation of the CRM IT systems in the banks analyzed, were put by their representatives in a hierarchical order: the existence of a business philosophy centred on client, partitioned at the level of all departments (80%), efficient training of the personnel, on competence levels, for using CRM system (75%), simplification of the IT flows in the communication with clients (55%), as well as the identification of the risk factors and finding some measures to reduce them (45%).

These results confirm the fact that any implementation of CRM system initiated in a bank needs a managerial culture centred on the adaptability at the changes of the clients' preferences, which must support the activities and their specific processes. The success key in a CRM banking approach is represented by the increase of the notoriety of a banking brand, which quantifies the results of the all employees' efforts from the departments implied in the interactions with the clients.

The last question of the questionnaire had in view the identification of the main benefits

resulted as a consequence of the implementation of CRM IT systems in the banks included in the research, which have been put in a hierarchical order, as follows: the efficiency increase of the personnel of Front Office and Call Center (80%), the increase of the conversion rates in sales (75%), the quick management of the clients' solicitations and discontents (70%) and the better knowledge of the clients' behaviour (65%).

These benefits identified at the level of the banks analyzed, support the components of a culture orientated towards the total satisfaction of the clients are: the operational excellency, the innovations in the field of products and services offered to the clients and the deep knowledge of the clients.

3. Conclusions

We consider that the best way of quantifying the benefits resulted from the implementation of the CRM IT systems in banks is represented by using some measuring systems of the performances based on the Balanced Scorecard methodology which has key indicators of performance from four different perspectives: financial, clients, internal processes and organizational learning.

Modern Trends in the Use of Information Systems in Trade Organizations

Korneenko Olga
okorneenko@gsu.by
Doroshev Dmitry
doroshev@gsu.by

Abstract

This article covers aspects of implementation and use of information technology in the activities of retail trade organizations.

Key words: information technology, information systems, implementation, necessity, trading company

J.E.L. classification: M15

At present, the small and medium-sized retail networks are under more and more intense pressure of large Belarusian enterprises. To plan the further development is possible only by providing increased business efficiency what is impossible without implementation of multifunctional and reliable information systems that enable to control the retail structure, logistics, variety of goods, prices. Modern information systems provide the ability to treat a large volume of information, to cooperate with enterprises branches, to increase speed and quality of client service.

The purpose of this article is to identify the critical factors required to implement information systems in the management of commercial activities, as well as to analyze the complexity of this process and its privileges relative to facilitation and improvement of operational control of the company.

The predominant focus at this moment is to implement widely the information and analytical systems for demand forecasting, planning of purchases, inventory management, effective merchandising, etc. [1].

The implementation of information technology (IT) in our view is connected with:

- the technological necessity – when IT using is dictated by the need to ensure complex manufacturing operations (e.g. treatment of barcode). The same technological needs force the wholesale trade organizations to implement computer programs to print shipping documentation, which volume is significant for wholesale trade and without automation is almost unrealized;
- demand for the performance analysis tools – if you have a large number of homogenous "production sites" (branches, sales managers, etc.), the results of which can and should be constantly compared. Thanks to the implementation of information systems, the assessment of enterprises state, rapid orientation in trade and financial flows, covering all stages of the movement of goods cycle become possible.

There are five main causes of difficulty of information systems implementation and use at the Belarusian enterprises of retail trade:

- surface understanding of the company management's concept;
- insufficient development of the IT-infrastructure of the enterprise;
- low qualification of consultants of the company;
- errors while selecting an automated system;
- resistance of the staff of the same trade enterprise [2].

Today the clients' self-service software tools are actively developed (self-service terminals, information kiosks, using price-checkers, etc.); IT-support of the clients' loyalty programs, collection and processing of personal data, as well as functionality expansion of POS-terminals through program

support of their functions. For example, viewing the status of inventory balances, visual identification of the product - ID Imaging, RFID- technologies support during carrying out payments, etc. They allow to offer products that meet in optimal way the needs of customers, to process quickly, to distribute orders and to monitor their execution, to schedule deliveries, to forecast the demand for optimal control of stock resources. For example, using IBS Trade House program and IBS Retail Analytic program.

The enterprises of retail trade show interest in the following areas of informatization:

- BI - data analysis systems to process more quickly large quantities of information that allow to obtain quickly the summary data on the performance of the whole enterprise (for example, SAP, Microsoft Dynamics AX, Oracle BI systems), to analyze all information available in the trade organization regardless of the kind of information system it accumulates. This decision is based on a data warehouse that accumulates information from various sources and, thanks to its special structure, allows to generate reports more quickly than ERP-systems. There is no more need to contact programmers to generate reports with the required data from different systems, to unload the data in Excel, what greatly improves the speed of the analysis and quality of taken decisions based on it[3];
- customers relationship management – CRM. In the conditions of increasing competition, a growing number of commercial enterprises are interested to know better their customers and to implement effectively policies in the field of assortment, marketing and discounts management. In addition to the various CRM- systems, these are IT-products to interact with clients via SMS and specialized programs using bonus cards;
- Stores Commerce Management (SCM) that is in demand within trading companies (for example, Visual Pos Manager (VPM) which allows from a single center to manage all the cash and discounts of retail chain, and which integrates with SAP Retail, Microsoft Dynamics AX, 1 c, Oracle Retail, etc). Among the evaluation criteria we can mention a record keeping of the needs in specific segment of the retail market, an easy scalability if the organization grows, a use of modern IT development tools, a proven technology of implementation and operation. The competitive advantages: functionality, reliability and proven technology of the implementation, assistance and training of the users;
- working places of cashiers – PosX, equipped with a cash program, because besides standard operations of money acceptance and change giving, it needs to organize the non-cash payments, the discount and bonus cards service;
- program "1 C: Retail 8" on the platform "1C: Enterprise 8" supports geographically distributed information bases (DIB). This provides clear separation of documents circulation within shops, and in the central node of the DIB the information on all shopping network is consolidated. As a result, all processes requiring information exchange are made not only with minimal effort, but also under the standing orders, and the centre gets promptly information necessary for taking management decisions on sales and movement of goods. At the same time, the "1C: Retail 8" already includes the ready plans of exchange. The "1C: Retail 8" automates the entire range of necessary operations within the retail store, new business processes, it generates accounting reports for operational management. A wide range of commercial equipment connection of various types is supported– barcode scanners, data collection terminals, fiscal recorders, magnetic cards readers, cash registers, electronic scales, etc.;
- using Pocket PCs or communicators (PDA), i.e. mobile commerce, RFID system. These devices are as a information repository on customers, products, accounts and are used to record information about sales. Data are regularly synchronized with the main accounting system of the enterprise. The possibilities: making applications for sale of goods; merchandising; the calculation

of the recommended quantity for an order; accounting of cash refunds, mutual settlements of accounts with clients; management of several firms; individual system of discounts; reminders of promotions, new products and discounts; catalogue of goods photos; planned visits to sales agents, control agents route, GPS support, control of the date and time of visit, etc. The system increases the efficiency of the sales agents and saves their time for direct communication with customers. Collection, processing and analysis of information on time close to real-time allow to adjust quickly the work of the company, as well as to take into account the change of external factors earlier than their competitors [3].

Thus, the application of information technology in retail trade largely determines the success of the development of a trade organization.

The information products are designed to simplify and to improve the monitoring system of operational activities of the company (finance and costs, stocks and warehouse, purchasing and sales, accounts receivable and pricing policy), to manage relationship with customers and suppliers, to control the sales process. If earlier the market offered solutions, affordable only by larger companies, in recent years the full-fledged mobile trade automation systems, available

even for small enterprises have appeared [4, p. 56-57].

On the modern market, competitive positions cannot be kept only by those who constantly develop and use new information technologies what results in a reduction of operation costs, obtaining additional revenue due to increased turnover and/or investment attraction of the company.

The Role of Direct Monetary Instruments in Providing Economic Liquidity

Lipară Daniel

„Alexandru Ioan Cuza” University of Iași, Doctoral School of Economics
danl_02@yahoo.com

Abstract

Money is important in the economic mechanism, defining the engine through which the Central Bank can interfere on the economy's liquidity, and also in satisfying its needs.

Monetary policy achieves its objectives through different instruments.

Along with goals and methods of transmission of monetary impulses, monetary instruments are considered the fundamentals, the basics of monetary policy. Their study is essential to highlight the interdependencies between them and their induced effects over the market economy's mechanisms.

The most important are the direct intervention tools that have an impact on the economic liquidity. In this process, the Central Bank plays the main character role.

In this article we will discover which are the main tools of direct action used by the Central Bank and how they affect economic liquidity.

What tool can be controlled more easily? When a tool is efficient? These are some questions that we will try to answer below.

Key words: money, monetary instruments, liquidity, monetary policy.

J.E.L. classification: E50, E52, E58.

1. Introduction

Considered by far one of the most important components of economical policy, the **monetary policy** can be defined as being „the interventions as a whole of Central Bank or monetary authorities over the economic liquidity, in order to contribute, by using monetary instruments and techniques, to realising economical policy” [5] or, in other words, „the action exerted by the monetary authorities (Central Bank and sometimes

treasury) over the money supply and some financial assets in order to guide the economy in short or medium term” [7].

Lots of instruments or policies that are interdependent are used in achieving the monetary policy objectives: monetary policy, commercial policy, fiscal policy, revenues policy, and last, but not least, exchange rate policy.

These instruments are helping central banks or monetary authorities to reach the general and intermediary monetary policy objectives.

„Monetary instruments consist of monetary authorities actions over money supply for obtaining macroeconomic stability” believed Coralia Angelescu and Ileana Stănescu (2004) [1]. They also stated, that monetary policy instruments are a great help in obtaining not only the durable growth objective, but the increase of production, exports and global demand, too.

So, there are **instruments through it can be achieved banking liquidity** and are called **direct intervention instruments**, and there are others, that **limitate or cap bank loans** and are named **indirect monetary policy instruments**, because it control the money supply, without having a direct action in the banking liquidity (along these, there are also exchange intervention instruments, designed to protect the national currency on the exchange market).

The most known monetary policy direct instruments are:

- open market operations;
- discount window or discount rate (refinancing fee);
- reserve requirements.

The importance of credit for the development of any economy, and the involvement in money supply process – or in the creation of currency process, make the Central Bank to be an unreplaceable actor in insuring banking liquidity.

Banking liquidity is related to the quantity of money in circulation and comes from deposits of population and companies, from Central Bank loans and from the sale of debentures that commercial banks hold.

Central Bank influences the quantity of money and especially the money supply *in diminishing it*, reducing the banking liquidity during recession periods, or *in increasing it*, rising the liquidity too, anticipating the economical revival. Central Bank's actions mainly are targeting banks borrowings through rescont or on the interbank market – indirectly – and, the intervention on financial market, as any other company through *open market operations*.

2. Open market operations

Lead to an increase in banking liquidity. Through this monetary tool, central banks sell (reducing liquidity) or purchase (rising economic liquidity) government securities on financial market.

It is the most used tool of monetary policy in USA; it is used in Romania through repo and reverse repo operations especially, although government securities are rare and short-term issued.

Open market operations used in Romania fulfill three functions: *guidance of the interest rates, control of the liquidity on the monetary market and finally, offer information about monetary policy orientation.*

The National Bank of Romania (NBR) can do the following types of open market operations [11]:

- **repo** operations – reversed transactions for increasing liquidity, through which NBR purchases assets from banks with the commitment of repurchasing them later and at a fixed price established at the moment of transaction;
- **reverse repo** operations – reversed transactions through which the liquidity is reduced (in comparison with *repos*, now NBR sells assets to banks);
- **deposits** – NBR wants through this process to reduce liquidity;
- **certificates of deposit** – NBR sells certificates of deposit to banks in order to absorb liquidity;

- **loans collateralized by eligible collateral assets** – loans given to banks by NBR for an increase of liquidity;
- **sales/purchases of eligible assets** – NBR sells/purchases eligible assets, in order to absorb or to increase liquidity; the transfer of assets ownership from seller to buyer is through the „delivery versus payment” mechanism;
- **swap currency operations** – are simultaneous operations, through which NBR *injects liquidity* (by purchasing convertible currency against lei and sell at a later date the same amount in convertible currency against lei) and also *absorbs liquidity* (by selling convertible currency against lei and purchase at a later date the same amount in convertible currency against lei).

Through these operations, the Central Bank influences – positive or negative – the companies liquidities by lending and creating bank money (scriptural money), initiating in this way the liquidity supply of the money market [5].

Open market operations are well spread in USA, where the Central Bank purchases or sells debt securities, which are easy negotiable debentures; the transactions are conducted at market price to or from all economic agents.

Government securities market interventions are effective when there is a large public debt and the Central Bank has a large number of government bonds.

By purchasing/selling of debentures, a control is exercised over bank reserves, monetary aggregates, monetary base and over the price of bonds and interest rate [9].

3. The discount rate

Is an instrument with important implications in the market economy.

The Central Bank lends directly through rescont and indirectly through interbank market.

The discount rate is the interest a bank gives to the holder of a commercial bill for selling it before maturity, for the period between the sale and the maturity of the commercial bill. The **rediscounting** is the process through which the Central Bank purchases the discounted commercial bills from the commercial banks. The fee paid to

the banks is called the rediscount fee. So, through rediscounting, the Central Bank lends the commercial banks in exchange of a refinancing fee/rediscount fee.

The Central Bank can choose which bank to lend by handling the discount or rediscount fee. *The rediscount fee will influence the discount rate and will always be smaller than this.* The discount rate is established below short term market rates.

To summarize, if the Central Bank wants to increase the quantity of money lent to banks, *it will reduce the discount rate*, allowing full access to loans. If, otherwise, it wants to limit the quantity of money, *it will rise the discount rate.* This is the **price effect** of rediscounting mechanism.

In addition there is a **quantitative effect** that shows how much money was issued by the commercial banks. If the discount rate increases, the commercial banks will borrow money more difficult, more expensive and, therefore, *monetary emission volume is lower.* Conversely, the monetary emission volume will increase [10].

The lack of liquidity will cause the Central Bank to reduce the discount rate, lending the money at a lower discount fee and increasing the commercial banks monetary emission, ensuring also liquidity in the banking system.

Bank reserves, money supply, bond yields are also influenced by handling the discount rate. Last, but not least, *the discount rate has an impact over the foreign capitals and over the equilibrium of the payments balance* [5]. Thus, an increase of the discount rate means a rise in the interest rates, that will lead to an increase in foreign capitals and to a momentary equilibrium of the payments balance. Although lending is reduced, we can say that these foreign capitals attracted, cover, in part, the lack of credit.

The Central Bank can also lend money, indirectly, on the interbank market. On this market, the Central Bank appears as a mediator between the commercial banks that have surplus of money and the ones that have deficit. This means that banks with surplus of money lend the banks with deficit. The transactions are made at an interest rate different than the discount rate.

The interbank market is open to all economic agents that have money and want to place them on short term to other economic agents. For instance, on the

interbank market in France, in addition to commercial banks have also appeared insurance companies, state enterprises that have cash and want to place it properly.

The main **limits** of using the discount rate as a direct tool of monetary policy are [7]:

- *Excessive stiffness:* the interest rate can not be changed overnight due to changes in the discount rate;
- *Limited use:* only if commercial banks need money we can take into consideration the rediscount.

4. Reserve requirements rate (RR)

Commercial banks are required to maintain at the Central Bank a percentage of the deposits from households and economic agents.

RR first appeared in USA, in 1913, extending later in all the countries. In Romania, RR policy was introduced in 1992, aiming to control the economic liquidity and to limit the capacity of commercial banks to create money through loans. The percentage of RR has suffered many changes over the years, according to NBR desire to increase or reduce liquidity. Currently, in Romania, RR is 15% to lei (since 2009) and 20% to foreign currency (since 2011).

RR are poorly remunerated, but that is because the reason of their existence is not obtaining a bonus or an interest. Their main purpose is to maintain a certain level of liquidity in the commercial banks.

RR variations can influence the growth or the reduction of economic activity. RR growth impacts in reducing lending in commercial banks, which will see reduced their sources and simultaneously the banking liquidity. At the same time, the economic activity will be affected negatively too. In order to relaunch lending, the reserves will be reduced.

RR is the only instrument, that, although strictly governed by the Central Bank rules, is directly affecting the economy, the supply and demand for money. That is why we can say that besides being an instrument of indirect intervention in the economy, is equally an instrument of direct action!

Any RR reduction or increase is **neutralizing the effect of foreign exchange inflows and outflows** [5]. A reduction of RR may be used to prevent an outflow of foreign

currency. This will lead to a decrease of credits cost while the interest rate remains higher.

RR usually are not only used for ensuring banking liquidity, but to highlight the importance that Central Bank has on the money market.

The results obtained from using this tool are not important as a number as a whole, but especially as an effect that these actions had on the market.

In conclusion, we can say that RR is a tool for monetary and credit policy which can control the volume of loans released by commercial banks. This rate does not favor or disadvantage any bank, because its level depends on the volume of deposits from households and economic agents.

The existence of RR can reduce long-term liquidity surplus and can increase the control that Central Bank has over monetary emission.

Caprio and Honohan believe that RR can be automatically controlled in order to achieve the desired level of liquidity. For example, when capital inflows are high, RR can be increased, to mitigate their force [3].

RR is rarely used on short-term because of its low flexibility compared to other instruments (for instance, open market operations). The poor remuneration of reserves by the Central Bank, the export of capital, the influence of lending are other reasons why this tool should be used rarely.

Caprio and Honohan estimated that a low liquidity banking system makes loans more expensive, so, it moves attention to interest rates. It is therefore the Central Bank's role to increase liquidity through specific actions, without this being a consequence of changes in interest rate [3].

The monetary authorities can use several instruments and, in doing so, they should take into account the market perception and unwanted speculations [3].

Liquidity can be determined by the shifting of government deposits between the Central Bank and commercial banks. Increasing government deposits in commercial banks will also increase banking liquidity. Creating a framework for the development of this process, agreed with all the banks seems to be a great limit of this shift [3].

So, what tools are best to use?

Speaking about the optimal choice of the tools of monetary policy, William Pool (1970) appreciated that the choice depends on the shocks that need to be solved. So, Pool states that when shocks are real, the best solution is to focus on the money supply. Otherwise, the authorities should concentrate on the interest rate, when the shocks are monetary.

Indeterminacy – or “multiple rational expectations equilibria” as Bruce McGough, Glenn D. Rudebusch and John C. Williams (2005) described – can appear when a short-term interest rate is used as a monetary policy instrument and especially its zero bound constraint. That why, the researchers' proposal is to use a long-term interest rate instead of the short-term interest rate, along with a forward-looking policy that can diminish indeterminacy [6].

McGough, Rudebusch and Williams consider the *forward-looking policy* – where the expected inflation over the maturity of the bond influences the bond rate – as the one that determines stable equilibrium. Although they admit that this is not the most effective solution, they see it as the first step against the zero bound, agreeing with Greenspan who said that in order to lower the long-term interest rates, the Fed must buy long-term Treasury securities [6].

Continuing Pool's classic idea of optimal choice of monetary policy instruments, Joydeep Bhattacharya and Rajesh Singh (2008) found out that there are two types of shocks that the economy confronts with: real shocks and liquidity shocks. These shocks are related to two different monetary policy strategies. So, when an economy confronts with real shocks, then welfare is increased when it is used the monetary targeting strategy. In change, inflation targeting rise welfare when the shocks are nominal. Bhattacharya and Singh also discovered that an expansionary policy is optimal under inflation targeting, and not so efficient under monetary targeting [2].

C.A.E. Goodhart, P. Sunirand and D.P. Tsomocos (2011) chose the interest rate, instead of the monetary base, as the most important instrument for financial stability, based on the natural behavior of the Central Bank that focuses on the increased demand for money during financial crisis [4].

Looking for maintaining financial stability, the operational instrument that almost all the central banks have chosen is the short-term interest rate. In this way, Goodhart, Sunirand and Tsomocos believe that during economic shocks it is better or optimal to keep the interest rate constant and to adjust the monetary base [4].

5. Conclusions

Through direct instruments, the Central Bank can ensure banking liquidity.

All the tools of direct intervention that the Central Bank can use have strengths and weaknesses. In consequence, a tool is well used at the right time and together with the best monetary policy decision.

Open market operations are used to reduce liquidity – when central banks sell government securities on financial market – or to increase it, when they purchase them. It is one of the tools for creating scriptural money.

It is most used in USA. Romania’s financial market isn’t so developed, that’s why here, we can find only repo and reverse repo operations.

The discount rate is used when a bank gives an interest to the holder of a commercial bill for selling it before maturity, for the period between the sale and the maturity of the commercial bill.

So, a reduction of the discount rate is a signal for commercial banks to increase lending, because they borrow at a small interest.

Reserve requirements rate is an instrument strictly governed by the Central Bank rules that directly affects the economy, the supply and demand for money.

Its purpose is to maintain a certain level of liquidity in the commercial banks.

Through this rate, the Central Bank can control the volume of loans released by commercial banks.

Because its level depends on the volume of deposits from households and economic agents, we can say that this rate does not favor or disadvantage any bank.

Contemporary Electricity Market

Marcean Dana-Elena
Dunarea de Jos University of Galati
dana_marcean@yahoo.com
Brăiloiu Liviu
Caraman Tania

Abstract

In economic terms, electricity is a product that can be bought, sold or traded. Therefore, this product may give rise to a market. In the context of global economy, electric energy market had specific different features for its development, these situations being also found in the European Union. Regardless of these aspect, the Union tends to uniformity; the shape of energy markets desirable needs to achieve full transparency, following the example of stock exchange markets.

Wholesale trading of electricity is carried out by an independent entity specifically and exclusively constituted for this purpose, entity referred to as "market operator". Specific to this type of market is that the operator must have extensive knowledge not only of commerce, but also technical knowledge specific to this field, in order to properly balance the potential market with the absorption capacity.

Key words: market, energy, transaction

J.E.L. Classification: F15, L22, L81

1. Introduction

By its nature, electricity is a product difficult to store, but must be available upon request. Consequently, unlike other commodities, electricity, in normal conditions of operation, cannot be easily maintained for a long time. Moreover, supply and demand for this good varies continuously and uninterruptedly. For these reasons appeared the urgent need for a control agency, so between energy units generated and the expected demand to be a close coordination.

The two traded goods on electricity market are power and energy. Power transfer is the net quantity of electricity at a time

being and it is measured in megawatts (MW). Energy refers to electricity that passes through a certain point in a certain period of time and it is measured in megawatt hours (MWh). The domain of application of electricity markets is largely influenced by the transport network, which should be available for the entire chain wholesale - retail - final customers in any geographic area; ideal for the markets is to expand beyond national borders.

This ideal has two main purposes: on the one hand to ensure electricity supply in areas where there are shortages, given that there is availability at the point of supply which, as mentioned above, is difficult to store, and on the other hand, energy is a product of export worthy of consideration, taking into account the economical advantages.

Therefore, the electricity market is an economic concept with a complex content and expressing all selling and buying transactions perfected in a specific geographical area. It has as main function the correlation, through demand and supply, of production and consumption, together with the materialization of selling and buying contracts.

2. Wholesale market

There is a wholesale market of electricity when producers offer a certain amount of the product generated to the retailers. Retailers recalculate the price of the product and offer it to the market. Since the formation of the wholesale market price is an area of competence of the great providers, increasingly more great end users are looking to purchase energy directly from the manufacturer, in order to reduce costs, knowing that it is a substantial and permanent expense. Although this advantage is generally valid and recognized, there is a

number of disadvantages. However, the bigger the final consumer, the more justified such an investment is. [1]

Figure no. 1: Disadvantages of buying electricity directly from manufacturer

* Source: Own processing of the information available at www.absenergyresearch.com/energy-market-research-reports.

In order to form a wholesale energy market, it is essentially to have a series of key elements without which its operation could have existential difficulties. Among them, there are:

- short-term spot market with an offer based on dispatch security, coordinated by the market operator;
- transactions on the spot market to be done at a price which includes collateral losses and expenses;
- short-term bilateral transactions have the same price from source to destination;
- a system based on two-phase settlement systems that use the offer, the price and the contracts of the previous day, while updating in real-time;
- network access charges to cover the costs of operating the network and other auxiliary fixed costs associated.[2]

The price is formed according to the type of market, specifically for a market for the next day by meeting demand and supply at every consumer node, determining thus the equilibrium situation, usually at intervals of one hour. The price is calculated separately for regions where the operator of the market indicates that there will be constraints on the transportation of the product to consumers.

Theoretical price for each node is generically called "shadow price" and includes one additional kilowatt hour assumed that will be needed, together with an additional hypothetical cost produced to the

system that would result from returning available units in order to optimise consumption, thus generating hypothetical cost for a kilowatt hour. These notions are particularly important in the knowledge of the formation market price of electricity and this mechanism is called „location marginal pricing” - LMP or „nodal pricing”.

3. Retail market

There is an electricity retail market when final users can choose their own supplier in a particular region. A term used in the United States for this type of consumer choice is "energy choice". A special aspect for retail electricity market is whether these consumers are faced with a real-time pricing or if the price is determined by another method, like the average annual costs for example. In most cases, consumers pay a price made in real time and therefore do not benefit of the tip to reduce demand during times when wholesale prices are high.

Although market structure varies, there are some common features that retailers must meet in order to remain on that market. Among these, the most important are:

- credit control;
- managing customers through an effective call center;
- distribution of contracts so that the system can be well used;
- agreements on balancing;
- agreements on purchases on the spot market;
- hedging contracts.[3]

Competitive retailers need access to transmission and distribution wires. This means that prices should be already established for these two services. They should provide sufficient funds to encourage owners of these wires, but also to support the idea of constructing power plants in the most efficient locations possible. Consequently, there are two types of rates, access fee - which covers the cost of the existence and cost of accessing the network and wires and regularization fee - which covers the marginal cost of transfer electricity through existing wires.

4. Electricity market in Romania

Romania has a relatively balanced capacity of power generation, based on hydro, nuclear, coal and gas, adding to them renewables (other than hydro), whose share increases exponentially from year to year.

Figure no. 2: Share of different fuels in producing electricity in 2011

* Source: Own processing of the information available at www.kpmg.com.

The most used fuels are solid fuels and hydro, natural gas occupying an unfavorable position because it is largely imported. In terms of installed capacity (translated in economic terms - quantity of product on the market), it has gradually increased from 20GW in 2010 to 22 GW in 2012p; this increase is due exclusively to the wind energy development. [4]

Figure no. 4: Romanian electricity consumption and GDP development

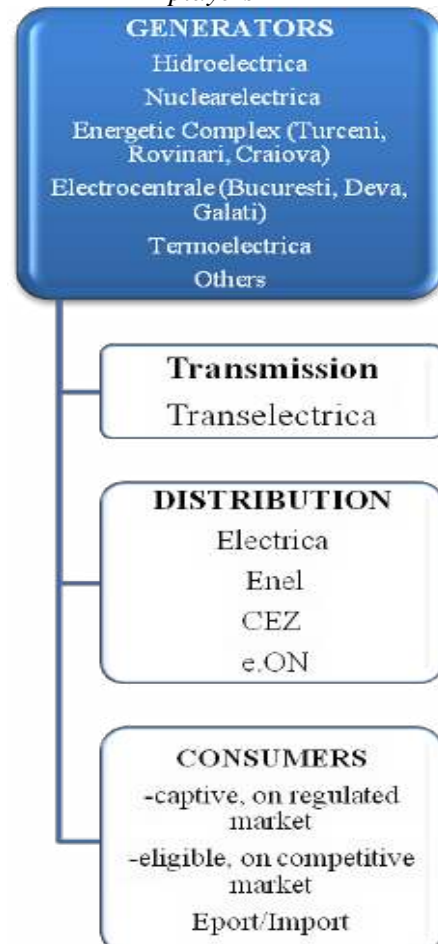

*Source: Transcription of the figure from www.kpmg.com.

In terms of consumption in this sector, the last two decades have brought significant fluctuations in Romania. Industrial decline in

the period 1989-2000 led to a collapse in electricity consumption. The first year of growth in consumption was 2000, after more than a decade of decrease, reaching a peak in 2008. In 2012, Romania registers a success in managing to balance electricity supply and demand, being even able to become exporter of electricity. [5]

Electricity generated obtains value through its circulation in the chain manufacturer - transmitter - distributor - consumer. Inside it, each actor has its well established role. For example, CEZ has both electricity distributor role by CEZ Distribution branch to the retail market, and the role of bidder to consumers through branch CEZ Sale.

Figure no. 3: The structure of Romanian electricity market and the main market players

*Source: Own processing of information available in the study "Overview of the Romanian Electricity Sector: Development and Investment Opportunities", KPMG studies, March 2012.

Regarding the electricity market in Romania, it has been liberalized since 1st of

July 2007. However, in practice, a substantial part of the electricity market continued to be regulated after liberalization. Consequently, the supply of electricity is subject of two systems: the regulated market, covering households and part of the industrial sector and competitive market, represented by large industrial consumers. At the end of 2011, the regulated market represented 44% of electricity consumption, the remaining 56% of the availabilities were disposable on the competitive market.[6]

At European level, the liberalization of energy markets was imposed on member states to complete by March 2011. Romania has not complied with the deadline imposed by the European Union, legislating this issue in July 2012. Hence, regulated tariffs were eliminated for non-household customers since September 2012 and will be removed for domestic clients since January 2013. The recently adopted law also stipulates that electricity supply in regulated conditions will be covered by the end of 2013 for industrial customers and until the end of 2017 for residential customers, the following periods aiming to accomplish liberalization.[7]

Romania's energy market liberalization and its functioning in the competitive regime is based on some solid paths, transposing the principles of creating and consolidating European electricity market:

- implementing the principle of "ownership unbundling";
- removal of regulated tariffs;
- protecting consumers;
- developing competitive environment through cumulative measures to ensure security of supply, sustainability and competitiveness of energy.[8]

Changes in the Romanian energy system are carefully monitored by both the private operators, and competent European institutes, because of the importance that this sector plays in the development of society, complex market liberalization efforts having both a particular economic impact, but also a socio-political impact.

5. Conclusions

Apparently accidentally discovered by the Italian Luigi Galvani in the late eighteenth century, electricity has quickly become a product hardly to replace for households and

without which industrial activities could not exist. Like any other particularly important product in the twenty-first century's global market, electricity benefits in 2012 from its very own market on which it is traded.

Electricity market is a relatively new concept, its necessity imposing itself increasingly stringent in the recent years or modernism. This market regulates the entire route of the economic product called "electricity". Electricity is transported from the place of production to consumers through power transmission networks (in Romania, property of Transelectrica) and electricity distribution networks property of distribution companies. Distribution companies bear full responsibility for continuity of supply and quality of the product. Electricity is purchased from producers, from another provider or imported and is sold to consumers by electricity suppliers.

Common to this relatively complex route is price formation through the snowball method, which depends on many variables, taking into account the factors of production (hydro, coal, nuclear), the difficulty of handling them and the submission of the final good to transmission and distribution processes.

Consumption and its Determinants - A Model of the Households' Individual Final Consumption in Romania

Moraru Andreea-Daniela
Ovidius University of Constanta
amoraru@univ-ovidius.ro
Moise-Titei Adina
Ovidius University of Constanta
adinatitei@yahoo.com

Abstract

The paper aims at presenting an econometric model for the household's individual final consumption in Romania with the declared intention of assessing the effect of several macroeconomic factors on consumption growth. The study is based on annual data for the dependent and independent variables from 1990 to 2011. The tested model estimates the influence of households' income, wealth, approximated by the monetary aggregate M1, monetary policy interest rate and inflation rate on households' consumption. The results show that households' consumption is significantly influenced by households' income as previously assumed and by wealth, approximated by the monetary aggregate M1. Neither the inflation rate nor the monetary policy interest rate, seem to have a considerable influence on households consumption.

Keywords: households' individual final consumption, model, influence, Romania

JEL classification: E21, B22, C13

1. Introduction

Given its essential role in economic theory the preoccupation for the study of consumption is easy to relate to. If one takes into account also its importance within national economies the endeavor appears even more justified. Indeed final consumption accounts for over 70% of GDP in most economies. Romania makes no exception – the final consumption accounts for

around 80% of the GDP, while the households' consumption accounts for over 70% of GDP. The evolution of final consumption and households' consumption respectively, in Romania is consistent with the general evolution of the economy following 1990, the year that represents the starting of the country's journey toward the market economy. Starting with the year 2000 consumption recorded a consistent and continuous growth until 2009, when the global crisis affected the economy in a visible and undeniable manner. In the next two years both the final consumption and the households' consumption maintained (in constant prices) the level recorded in 2009.

The aim of the paper is therefore to briefly review the most notable pursuits regarding the consumption function and test an econometric model having households' consumption in Romania as dependant variable.

2. The consumption function – a contemporary challenge

Consumption has been playing an important part in economic theory ever since Adam Smith proclaimed it as “the sole end and purpose of all production” [1]. But although the interest for consumption has been certainly present in subsequent economic works, the modern theory of consumption has not begun until Keynes's formulation of the psychological law on which consumption behaviour is founded in the General Theory of Employment, Interest, and Money:

“The fundamental psychological law, upon which we are entitled to depend with great

confidence both a priori from our knowledge of human nature and from the detailed facts of experience, is that men are disposed, as a rule and on the average, to increase their consumption as their income increases, but not by as much as the increase in their income” [2].

However, although Keynes’s theory, also known as the absolute income hypothesis especially well received, it was soon contested by Kuznets (1946) who used U.S. statistic data for the period between 1869 and 1938 and revealed that the average propensity to consume remained constant for the tested period [3].

This empirical puzzle led both to a revision of the Keynesian hypotheses and to the advent of several new hypotheses on consumption. The revision of the Keynesian hypotheses brought to light the relative income (Duesenberry, 1948) [4] and inertia (Brown, 1952) [5] hypotheses, while Friedman (1957) [6] and Modigliani and Brumberg (1955) [7] elaborated the permanent income and life cycle hypothesis, respectively. The Keynesian model, the permanent income hypothesis and the life cycle model are the key theories that have decisively influenced the economic policies. In their vast majority the modern studies on consumption are based on one of these three fundamental models.

With no intention of presenting a thoroughgoing enumeration of the most important subsequent contributions to the modelling of the consumption function we list here several landmarks in consumption literature – the error correction model elaborated by Davidson, Hendry, Srba and Yeo (1978) [8], the works of Campbell and Mankiw (1989) [9], Deaton (1992) [10], Muellbauer (1994) [11], Elmendorf (1996) [12], Attanasio (1998) [13], Carroll (2001) [14], and Bertaut (2002) [15].

3. The research methodology – objectives and data

Starting from the assumption that consumption is influenced by several factors beside income and considering also previous research aimed at estimating the influence of different factors on consumption, we decided to test in the current study the significance level for the parameters of the following consumption function:

$$C = f(Y, W, IR, MPIR)$$

where Y is the households’ income, W represents the wealth approximated by the monetary aggregate M1, IR is the inflation rate, and MPIR is the monetary policy interest rate.

In our study we used annual data for the period between 1990 and 2011.

The sources for the data were the statistical yearbooks and monthly bulletins issued by the National Institute of Statistics, as well as the annual and monthly reports of the National Bank of Romania.

For households’ consumption, households’ income and M1 the time series in millions of lei in year 1990 prices were stationarized by calculating the first difference.

The processing of the data was conducted using E-views Enterprise Edition 7.0.

In order to summarize the set of observations a summary statistics was conducted and the results are presented in table 1.

Table 1 Descriptive statistics

	C	Y	W	IR	MPIR
Mean	72.58994	63.44164	13.05607	58.41818	26.57364
Median	60.05564	56.57879	8.089681	27.40000	20.40500
Maximum	122.1699	102.2880	29.66779	256.1000	70.00000
Minimum	42.41815	44.18313	3.866763	4.900000	3.000000
Std. Dev.	25.61504	16.49069	9.127528	75.28839	19.80901
Skewness	0.639835	0.929238	0.556910	1.439936	0.666561

Probability	0.276291	0.196415	0.253851	0.017356	0.388400
Sum	1596.979	1395.716	287.2335	1285.200	584.6200
Sum Sq. Dev.	13778.73	5710.803	1749.547	119035.2	8240.338
Observations	22	22	22	22	22

4. The results of the study

Using the correlation matrix we can infer that many of variables of interest are correlated with one another (see Table 2 for a pairwise correlation matrix). For example, consumption is positively correlated with income (0.964), wealth (0.687) and also is negatively correlated with IR (-0.653) and MPIR (-0.760). Income is positively correlated with wealth (0.753) and is

negatively correlated with IR (-0.607) and MPIR (-0.717).

Table 2 Pairwise correlations for Variables

	C	Y	W	IR	MPIR
C	1	0.964	0.687	-0.653	-0.760
Y		1	0.753	-0.607	-0.717
W			1	-0.236	-0.663
IR				1	0.777
MPIR					1

We also constructed a correlogram using the adjusted time series (Figure 1).

Figure 1. Households' Consumption – Households' Income Correlogram

Naturally, Figure 1 shows a linear dependence between the two variables, as presumed.

In table 3 there are presented the coefficients of the consumption function and the t-statistics levels, corresponding to the theoretical consumption function model presented in the section above.

It is noticed that households' consumption is first and foremost influenced by households' income, as one may have easily previously assumed. Households' consumption is also influenced to a lesser extent however by the wealth approximated in this study by the monetary aggregate M1. As far as the inflation rate and the monetary policy interest rate are concerned, it seems they do not significantly influence households' consumption.

Table 3 Estimation of Consumption Function Coefficients; OLS Regression

	Model
Constant	1.800006** (2.615565)
dY	0.596904*** (5.001382)
dW	5.001382* (2.092240)
dIR	-0.023941 (-1.272307)
dMPIR	0.070222 (0.649623)
Observations	21 after adjustments
Adj. R-squared	0.771839

Note: t-statistics are in parentheses. Significance level: *** at 1%, ** at 5%, * at 10%

5. Conclusions

Assuming that households' consumption is influenced by a series of factors, the paper attempted at presenting the testing of an econometric model having as dependent variable the households consumption in Romania and as independent variables the households' income, the wealth, approximated by the monetary aggregate M1, the monetary policy interest rate and the inflation rate. As expected, households' consumption is first and foremost influenced by households' income. It is also influenced by wealth, while the inflation rate and the monetary policy interest rate do not bear a significant influence.

Abstract

The evolution of information and communication technology (ICT) has always had a role in the development of human society. New information technologies have produced practically a revolution in human activity in all fields, from research and design to the production of material goods and services. Human society has come to depend essentially on automated computer systems in all aspects of life. This paper deals with some of the current E-Learning systems, namely achieving an E-learning platform using the Open Source Moodle platform.

Key Words: *eLearning, software package, platform, educational system*

JEL Code: M15

1. Introduction

In this context of changes caused by new information and communication technologies, emerged and developed the eLearning phenomenon, namely: converted cultural content throughout the world into digital form, available to anyone, anywhere and anytime, amplification of information and proliferation of resources, establishment of huge digital libraries that can be accessed from personal computers to communications networks and high-speed wide area, overcome isolation and facilitate communication, develop multiple ways to represent data, to simulate interactions and express ideas, enlarging personal potentials.

Electronic learning systems represent the modern way of training and is at the same time more open and accessible than any classical teaching methods[1].

Retrieved from Anglo-Saxon literature, the term elearning, written as e-learning or eLearning, has broadened semantics, evolving from primary meaning, etymologically, from electronic learning in a broader sense, covering a wide range of educational situations, of applications and processes that involve educational content delivery via Internet, significant use of ICT and communications new media technologies to improve the quality of learning and facilitate access to resources and services as well as remote exchanges and collaboration[2].

All these changes have changed the cultural conditions in which the education and the introduction of the Internet has precipitated the emergence of a new paradigm in education and training characterized by the curricular orientation to individual needs, distribution of resources, facilitate synchronous and asynchronous communication.

Simply defined as interactive learning in which learning content is available online and provides automatic feedback to the student learning activities eLearning represent a form of education that meets the current needs of knowledge and training and improve existing structures, partially substituting them proposing a new model of education, more efficient and more adapted to the needs of society[3].

E-Learning E denotes the environment through which the training is done: the content is digitized to be stored and distributed in electronic form.

2. E-learning platform moodle open source

Modular Object-Oriented Dynamic Learning Environment (Moodle) is a software package for producing Internet-based courses, offering better security and management support and having shape a broad community of users and developers.

Source code written in PHP using MySQL and PostgreSQL databases is an asset to platform adoption due to the popularity of these technologies, and usability without modification on multiple operating systems, including Linux[4].

Evolution of the number of registered Moodle sites during January 2005 - March 2010. In early April 2010 there were an estimated 48,604 sites in 209 countries. Of the 48,604 sites, 15,347 have fewer than 10 users but there is a site that has 894,782 users, which is <http://moodle.org>. This means that Moodle can be successfully used both for sites with a large number of users, and for sites with a small number of users.

Fig.1 The evolution of Moodle sites(www.moodle.org)

The figure below illustrates the evolution of the number of registered users of the site

<http://moodle.org> in January 2005 - March 2010.

Fig.2 Evolution of the number of registered users(www.moodle.org)

This paper presents a method for achieving progress on an open source platform Moodle achieved.

The first page that opens when you start the application is entitled suggestively localhost. Is observed a page in which they are presented logo page, select the language, the menu bar, section autentificare and notices published by admin.

The menu bar contains elements that do not require authentication to be viewed (news, registration, schedule, exam dates, contacts), but also contains flexible elements which are taking their properties depending on the user logged in (chat, first year, second year, third year).

In the picture below we accessed the registration box without being logged to the platform.

Through a link the platform shows us page that contains a new element, namely, a second bar that shows the address pages and addresses taken to reach the final destination.

Fig.3 Items that do not require user authentication

Fig.4 Selecting a section for publication

Platform authentication is via username and password. All components for login are designed by the admin.

There are three types of users:

- Administrator or admin - this user has all the functions of the platform.
- Teacher or course creator - This role is usually assigned to teachers and its role in providing primary user functions to create courses, selecting participants, creation and correction of tests and examinations.
- Student or Learner - is assigned the role of visualization and use the configured users mentioned above.

Course creator role is usually assigned teachers. By entrusting this status will provide all the functions of this role that we present below.

The first step in creating a course selection process category. Course categories are created by Administrator account, their creation and configuration is done according to the varies requirements.

A category of course is where we want that course to be published. As shown in Figure we have three categories showing years of study. For this account we choose as the place of publication year 3.

Step two is to create a course is pressing adds new course button.

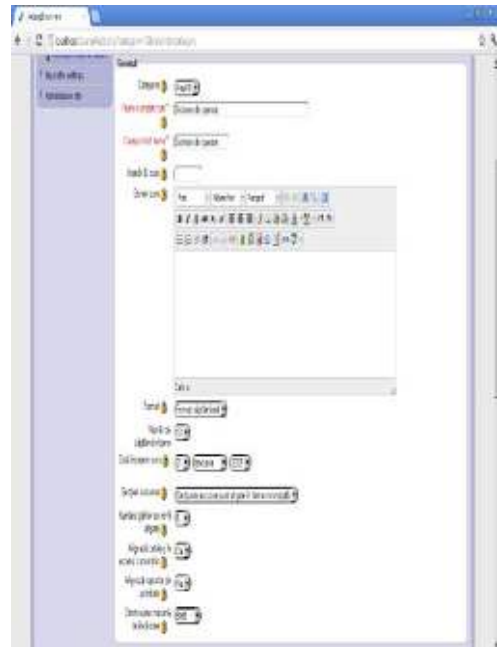

Fig.5 Setting a course

Initial setup of the course includes:

- A name given to the course (one long and one short);
- Course description and summary;
- Course format(Weekly - a weekly topic, Topic – on subjects, Social - type course focused on discussion forums, SCORM - technical format used for transferring between Moodle courses and other learning platforms).In this case will select weekley format.
- Number of sections (weeks - 3 in this example);
- The start date of the course;

- If notes are accessible to students (show gradebook to students – yes).
- If you are working in groups (Group Mode - No groups).

After completing these *changes are saved*.
After saving the settings, the teacher should detail the course content

In figure 6 is seen sharing workspace.

Fig.6 Working section

In the center section appears weekly content (plus the section dedicated discussion forum), with lists to add resources (documents, folders, etc.) or adding activities (lessons, tests, quizzes, etc.); basically, this area is used to provide to the teacher files (presentations, course support, etc.) and support materials for activities;

In the left appears menu management course. You can see the navigation menu Participants (members), Reports and management options (Course administration); In the right appears various sections support: access to forums, news, announcements of events etc..

The main operation carried out by a creative course is loading a content. It was seen that a course can be selected by weeks or topics. In each section you can define

resources (study materials) and activities, on the homepage of the course, with the condition that the "Enable edit mode" (top right) have been activated (or resources can be read but not modified).

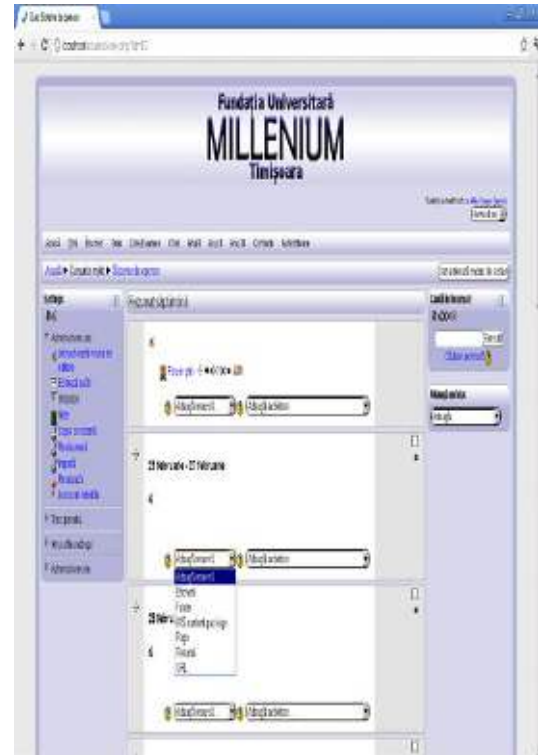

Fig.7 Activities

Resource types allow to insert almost any kind of web content current. There are many resources tipuri namely:

- Label - A badge allows text and images to be included in activities accessible via links course page.
- Folder - For better file management type.
- IMS content package - A package enables IMS content packages created according to IMS specifications of archived content is being displayed.
- Page - A page allows you to display and edit a web page in a course.
- Resource - Allows loading platform file type, eg Word, Excel, Rar, Exe etc.
- URL - for direct connection between the platform and a specific site.

To upload a visible content that do not require downloading to select the type of Page.

The following example will load a number of content items. Firstly, for the first week, loading a file with a folder. For this, the first week is selected Folder section.

Fig.8 Uploading content

After loading the desired files in the folder, return to the course page with the Save and return to course. Similarly you can recharge single file without creating a folder, the difference is that it uses the Add a resource - File.

Perhaps the simplest type of resource is web link which directs students to informational materials that are already on the Internet. A link is added to the option URL.

A second important factor is the inclusion of learners, which means that the platform provides us with choosing which can benefit from these courses. Entry is by pressing Enrolled users button found in the Settings block.

Selecting role(Assign roles: Student) through the teacher assign roles of student to those registered(you can assign the role of non-editing teacher if the teacher invites other teachers to contribute to the ongoing, but those invited will not change and manage course, will only ensure teaching and communication with students).

Enrol button next to each account will enroll students.

Fig.9 Registration of participants

Registration ends with the Finish button at the bottom, then the list of participants will be updated. The teacher can select and can send the selected or store notes about users.

3. Conclusions

If learning is a distinct educational system, e-learning is rather a means by which the remotely open learning methods can be implemented.

E-learning systems can be used as an improvement to traditional education forms than as a substitute for their.

Offering support of study by applying information and communication technologies, these systems have real advantages, allowing students to access, explore, analyze, evaluate and build on the topics of learning materials.

Tourism Infrastructure – a Factor which Influences the Quality of Tourism Services

Pascu Emilia,
Nedea Petronela Sonia
"Dimitrie Cantemir" Christian University, Bucharest, Romania
pascu.emilia@ucdc.ro,
petronela844@mail.com

Abstract

At the end of this century and millennium, the tourism and travel industry represents, at a global scale, the most dynamic activity sector and, at the same time, it is the most important workforce generator. From an economical point of view, tourism represents the main source of redressing the national economies of those countries which possess valuable tourism resources and properly exploits them. Its action manifests at a large scale, from stimulating economical development to perfecting social structure, from a superior resources' valorizing to an improvement of life conditions.

Any tourist activity requires a specific material base tourism industry, but at the same time, to ensure tourist traffic require both the tourist material specific as well as general and technical infrastructure.

Key words: free time, accommodation capacity, technical infrastructure, material basis.

Clasificare J.E.L.: L83, F63, O18

1. Introduction

Viewed in conjunction with the national economy, tourism acts as a stimulating global system. Conducting tourism involves a specific request for goods and services, demand drives the increase in their production area. Tourism demand determines supply adaptation that results in, inter alia, the technical and material development of the sector, and indirectly stimulating the production branches participating in the construction and equipping of accommodation and food, modernization of

roads, development of means transport, leisure facilities etc. Perceived in relationship to the assembly of national economy, tourism acts as an element which activates the global system.

2. Determinant factors of tourism development

In this context, the main arguments which determine the necessity of tourism development are the consequence of the following aspects [1]:

✓ because tourism resources are practically inexhaustible, tourism represents one of economy's sectors with real long term development perspectives;

✓ the complex exploitation and valorization of tourism resources, together with an efficient advertising on the external market can represent a way of growing the financial resources of the state, contributing to establishing a balance of external payments;

✓ tourism is a secure market for workforce as it redistributes the unemployed personnel coming from other economic sectors;

✓ because of its multiplying effect, tourism acts as an element of the global tourism system, generating a specific request of goods and services which determine a growth of their production, contributing to the national economy's sectors' diversification;

✓ a harmonious development of tourism contributes to the economic and social growth and to the attenuation of the disequilibrium between various areas, representing an important source of increasing the population's financial resources.

3. Regional development

The regional development policy wants to:

- ✓ diminish the existing regional disequilibrium, focusing on stimulating a balanced development and revitalizing the affected areas (with delayed development); it anticipates and solves future disequilibrium;

- ✓ accomplish the criteria of integration in the European Union's structures and having access to financial assistance tools for member states (structural and cohesion funds);

- ✓ correlate the governmental sector programs; it also wants to stimulate the interregional, internal and international cooperation, which contributes to economic development and follows the legal regulations and international agreements signed by Romania.

- ✓ tourism represents a tool for rural development by means of expanding the area of the specific offer and of creating workplaces other than the traditional ones, improving life conditions and growing the local population's incomes;

- ✓ local industry's diversification through small and medium enterprises;

- ✓ developing nonpolluting industries which would promote products such as handicraft articles, furniture, leather etc.;

- ✓ under the conditions of respecting and promoting the durable development principles, tourism is a means of protecting, conserving and valorizing the cultural, historical, folkloric and architectural potential of countries;

- ✓ by adopting a durable development strategy and imposing a series of measures for the protection of environment and human existence's fundamental principles (water, air, flora, fauna, ecosystems etc.), tourism has an ecological vocation at the same time;

- ✓ the social dimension of tourism manifests itself as a way of educating and improving the level of civilization, playing an important part in properly spending the free time.

The adaptation of tourism activities to the current level of exigencies and to the present and future mutations of the internal and

international request's level and intensity cannot be realized without the existence of a tourism material unit and that of an adequate technical and social infrastructure which would be able to valorize all tourism resources available. Valorizing the touristic potential, the natural potential (relief and geology, climate, hydrography, flora and fauna, natural parks and natural reservations) and the anthropic potential (vestiges, historical places and monuments, ethnography and folklore, as well as technical-economical and social-demographic) directly depend on the technical-material base of tourism and the quality of tourism services [6].

Over the last few decades, at an international level, the hotels' activity has gained more and more the characteristics of a true industry.

The hotels industry gathers in a coherent system all those processes developed in accommodation units generated by the tourists' receiving, hosting and departure. This is the reason why it can be established a complex and profound interdependency relationship between hotels industry and tourist activity [7].

On the one hand, tourism development is causally determined by the existence of accommodation units, their equipments, the services' variety and quality, and on the other hand, the hotels industry develops from both a quantitative and qualitative point of view as a result of tourism circuits. This way, hotels industry allows a superior valorization of the touristic patrimony by attracting in this circuit various geographical areas; it creates the conditions which would allow a larger amount of the population to spend their free time in a tourism destination [2].

The level of hotels industry's development also represents the extent to which the population's need for tourism has been satisfied. In return, profits increase, urbanization, a larger amount of free time have led to mutations in what regards consumers' behavior, in the sense that their tourism request has grown.

Insufficient or low quality hotel services in relationship with population's requests will determine changes in incomes' destination and in the way of spending free time, leading to a decrease in tourism circuits. Hotels industry and the quality of tourism services

provide a good valorization of the tourism potential, workforce, the capacity of the technical-material base and growing the efficiency of its trading. The hotels industry is influenced by tourism development and develops under the influence of various factors and economical and social phenomena in which tourism circuits play an important part [3].

The increase of tourists' number and their exigencies will lead to an increase of accommodation units and their modernization. Moreover, we will face the apparition of hotel units with complex functions, as well as a diversification of their services.

If we analyze the tradition of hospitality and the manner in which it has been managed, we reach the conclusion that hotel activity oscillates between services and industry.

4. Types of services specific to the activity tourism

Modern hostelry is characterized by a series of tendencies of integrating tourists' accommodation and alimentation. Moreover, there are some accommodation units which provide cultural and artistic services, recreation services, informing services and commercial ones [7].

Recreation and cultural-artistic services request adequate equipments (pools, saunas, gyms, sports fields, areas for holding folkloric festivals, reunions, shows, exhibits etc.) and specialized personnel able to instruct and/or supervise tourists [4].

Information services enable the possibility of acknowledging the tourism offer.

Intermediation services enable a better communication between tourists and specialized services providers: renting recreation products of personal use, booking etc.

Commercial services are represented by selling a series of necessary products during the sojourn.

Considered through the lenses of its position – that of component part of both the tourism product and the base services – public alimentation determines the quality of tourism services in its assembly, and it influences the tourism offer's content and attractiveness, having at the same time major

influences over the dimensions of the tourism fluxes' directions. In order to achieve these things, public alimentation services must complete the following requests:

- ✓ being present at every major moment of tourism consume;
- ✓ the existence of a structural diversity of this type of services;
- ✓ particularizing the public alimentation service;
- ✓ the necessity of responding to both local and foreign tourists' exigencies;

Enterprisers from the public alimentation services domain are permanently busy with providing a qualitative and quantitative development of the provided services, in order to respond to alimentation requests of local and foreign tourists. From a quantitative point of view, they focus on growing the volume of activity, and from a qualitative perspective, they permanently adapt to the requests' exigencies by means of modernizing and perfecting the production, of improving and diversifying serving methods.

In order to respond to international tourism's requests, it has been developed a network of specific, representative units, which offer ethnic food in a pleasant ambient with cultural and architectural elements, decorations, well chosen artistic programs – offering public alimentation new features and making it more interesting.

Balneary units contain both accommodation units and treatment units. Most of the treatment units are placed inside the hotels and allow a number of 95.000 procedures a day and they assure a diversified treatment base, able of satisfying treatment requests included in the World Health Organization's nomenclature: hearth diseases, renal disease etc. [8].

The therapeutically value of these natural cure factors in our country has led to the development of treatment bases which allow the treatment of various affections, the most important ones being listed below:

- ✓ renal affections;
- ✓ alimentary duct affections;
- ✓ hepatic and bilious affections;
- ✓ metabolic affections;
- ✓ inflammatory and degenerative rheumatic affections;
- ✓ respiratory affections;

✓ neurological affections etc.

These are the reasons why the development of accommodation and treatment units at the level requested by the balneary tourism market becomes a necessity. Moreover, they improve the recreation and relaxing possibilities. A scientifically funded strategy – that of diversifying tourism services in spa units – must take into account various categories of clients which favor those market segments that include this kind of services.

The characteristics of treatment and spa services derive from the definition of cures: treatment possibilities which are based on a regular use of therapeutically methods according to medical prescriptions together which a change regarding the tourist's usual environment. During the treatment, patients would benefit of medical assistance. This way, medical consults and medical assistance represent a specific form of balneary and medical services, provided in order to complete the series of spa and treatment services.

The recreation unit contains all the tools and equipments needed in order to provide a qualitative spending of free time. The recreation unit's technical and material base consists of clubs, casinos, multipurpose halls, amusement parks, sports and recreation services etc.

The recreation service was conceived as a base of the tourism service and it responds to tourists' specific needs and interests. Therefore, it focuses on the tourist's physical relaxation, his amusement and the development of his abilities. Its development aims at fulfilling the exigencies regarding the improvement of tourism units and leads to a diversification of the offer in this field. This is the reason why the recreation units' development strategy must take into account tourists' motivations, exigencies and expectations, on the one hand and the units' profile, structure and specific, on the other hand.

In order to achieve tourism services, we need a material base, a general tourism infrastructure and a special technical infrastructure.

5. Conclusions

The general tourism infrastructure which

contributes to achieving of tourism consumption is made by:

✓ road network: it occupies an important place in developing tourism travels as it is distributed in the entire country and it offers the opportunity of visiting touristic objectives even in more isolated areas;

✓ railway network;

✓ air transportation is a main factor of international tourism's development;

✓ water transportation (fluvial and maritime) are favored by the fact that

Romania is placed on the inferior course of the Danube, having 1.075 km of navigable waters. At the same time, Romania benefits from the advantages of being placed near the Black Sea, having 224 km of beaches. The fluvial channels can be developed by means of various facilities which derive from the existence of a high number of rivers and lakes.

The general infrastructure and the tourism infrastructure also include elements from the cultural networks: theatres, cinemas, clubs, museums, exhibits etc.

Theories of Migration-Conceptual Dimension

Pivodă Roxana Mihaela
Spiru Haret University
roxana_pivoda@yahoo.com

Abstract

Migration and territorial mobility of population is a complex process with a wide range of effects that are felt in the economic, political, social, cultural, religious and occurs both in the place of origin of potential migrants, and in the purpose. Thus, it creates a "hole" left by the absence of which is felt, especially family and local community, and integration and absorption of new immigrants in communities is problematic, at least in housing and employment.

Evolution of migration in Romania in the last two decades, the two moments, intense migratory flow (transition from centralizatã to market economy and accession to the European Communities) and provides for a new migration enhanced with the entry României in space Schengen. Subject of the work is a challenge to know the characteristics of migration in general and in particular for Romania in the period 1990 ÷ 2009.

Keywords: immigration, migration flows, migration brain

J.E.L. Codes: O015

1. Introduction

„Migration is the movement of a person or group of persons from one country to another intending to settle permanently or temporarily in a place other than home. Since the movement between two geographical units should not occur directly, it can still differentiate between the place of origin or destination, transit areas and welcoming place of destination or region” [1].

Overall population displacement refers to two types of migration: immigration and emigration, which represents all entry and exit of people. In this way, a migrant has a double as an immigrant receiving country and the immigrant, the country of origin.

International migration is currently underway in several forms [2]:

- ethnic migration to countries of origin;
- labor migration;
- family migration (migration migrant workers' families earlier) as the right to family reunification, guaranteed by international law;
- migration of natural disasters, political or religious persecution, wars, etc..

Also, these types of migration can be classified in turn according to the following criteria:

- legal: legal (done by following these rules) and illegal (done in violation of rules, which makes it difficult to assess);
- motivation: voluntary and involuntary;
- length of stay in the destination country: temporary, long-term, permanent.

Other international migration are:

- migration based on ethnicity;
- postcolonial migration, when colonizing countries have established strict rules for immigrants from former colonies;
- economic migration, which is one of the most common forms in recent decades. This is caused by differences between countries in terms of access to resources and jobs, and the shortage of certain specialties. Many developed countries have "recruited" immigrants and continues to encourage highly skilled labor migration from less developed countries.

2. Theories of migration

In recent decades, most theories of migration process were based on economic factors.

Classical theories are considered to be more “descriptive or classificatory schemes” [3]. In the new socio-economic conditions of rational approaches the question of migration, the question here “type econometric models cost – benefit” [4].

One way to classify these approaches reveal different aspects of migration. For example, there are approaches that focus on the factors that determine people to leave their regions or countries (wars, economic hardship, religious persecution, ecological disasters, etc.). On the other hand, there are approaches that focus on factors “pull” that determines targeting migrants to specific regions or countries (through higher wages, democracy, peace, favorable conditions of life in general).

Another way of grouping approaches is the level of analysis. For example, studies based mainly on structural aspects (comparative levels of development, living standards, demographic, socio-cultural changes, communication and transportation technologies). These explanations or approaches can be called “macro”. These were the first theories on migration and their explanatory power is demonstrated in general. However, not all who are affected by these factors macro decide to migrate. Thus, there were other approaches that have attempted to explain the decision to migrate individually. Therefore, these approaches can be called “micro”, aimed at understanding the decision to migrate individually.

However, in recent decades was introduced intermediate level or mediator between the structural and individual decisions, which may be called the light “meso”. This view is based primarily on understanding social networks and organizations that facilitate migration.

3. Macroeconomic migration approach

Demographic approach is based on the analysis of the phenomenon of migration as it provides an overview of the existence of a potential migration or application.

Regions with significant capital which generates absorption workforce shortage of staff employment and is therefore attractive for immigrants. Migration flows tend to create a state of balance, causing the premises to improve working and living conditions for migrants. The main theories of migration, macroeconomic concerns neoclassical economics, the new economics of migration, market dual dependency, world system.

Neoclassical economic theory

This theory refers to the mechanisms of the market, supply and demand that determined the distribution of prices, output and income. The basic idea of neoclassical economics, Walras attributable to a economic emerges in equilibrium, ie equality between supply and demand in all markets under perfect competition.

International migration is explained by the amount of income determined by the gap between supply and demand of labor between countries. Economic profit occurs on migration flow that occurs in the level of income from income areas/areas with low wages for income/salaries. According to this theory, labor capital migrate to rich countries but poor labor movement resulting in qualified personnel, ie international flow of human capital. These international migration flows are balancing mechanisms of internal gaps in the labor market worldwide, and while population-capital migration will lead to economic disparities and loss mitigation case that generates migration.

Some economists critical prerequisites for the development theory of migration flows only in the context of differences between countries in the level of wages. For example, if the European Union, where there are obvious differences between the levels of development of countries freedom of movement components and labor movements of population means that migration is influenced by the level of economic development of the country.

New economics of migration

Falling on the neoclassical economics, the new economics of migration brings two major changes, neoclassical conceptual framework in the sense that the individual is treated as family/household (income are reporting to the community) and the fundamental role of differential wage level is no longer a fundamental economic factor.

In this framework, the solution is related to migration of family or household decision (related to loss of income, unemployment) For new sources of income that money sent home by migrants (remittances).

Dual labor market theory

Harris and Todaro [5] revealed “migration flows” established between urban (employed or unemployed) and rural (which is entirely occupied but low wages).

Dual labor market includes a primary sector with good working conditions and stable jobs and a secondary sector with difficult or dangerous working conditions and unskilled and unstable. Avoid domestic workers in the secondary sector employment due to job instability, low wages. In this context, immigrants are that can replace labor employment in the secondary sector.

Dependency theory

This theory supports the macrostructural level that capitalist development has created a global order where there is industrialized countries (center), on which less developed countries (periphery). So poor are dependent prosperous and developed Western countries producing so underdevelopment. Arghiri Emmanuel [6] believes that the sources must be identified underdevelopment of international trade liberalization based on the division between metropolis and satellite, commercial unequal exchange between the developed countries, exporters expensive equipment and technology, and developing countries, exporting cheap raw materials. Dependency theory has “little to say about migration, especially international form” except maybe being a “fascination” for “brain drain”, the term in English “brain drain” “refers to the selective migration of talented and educated Individuals of poor nations by rich ones” [7].

World system theory

Best known exponent of current, Wallerstein (1979) defines “modern world system” [8] by attracting new order states, which încadreză in three concentric zones: central (dominant power), semi-periphery, periphery (areas which are added external as isolated parts, external world system at some point in time).

For this purpose a new category of people moving in search of a better life to urban and then to countries in central global economy. Some economic conditions, leading to the formation of these groups of people are, in general, modernization of agriculture (labor redundancy and creating a surplus in rural areas); extracting materials (domestic labor, especially peasants whom out of traditional environment), production subsidiaries of foreign companies (possibly international corporations) that offer low wages for female labor usually for short periods of time.

4. Migration approach at mezo-economic

Macro and micro perspectives were harshly criticized in the last decades of the last century because it omitted that between general and private factors there are a number of structures that enable migration, reducing its costs and channeling it in certain areas, employment niches and localities. Thus, there was migration networks have created a migration capital that increase as they develop migration. This migration capital includes the departure and material resources that facilitate inclusion in the new company to the contact and crucial information for how to be successful migration.

Effort and high costs of road opener forms capital that facilitates migration of others who usually have fewer resources or less favorable circumstances. Meanwhile, the pioneers tend to become leaders of the new group of immigrants because they can integrate into the host society. This form groups of migrants are called ethnic enclaves that have economic resources, but which often exploit the people in the group appears. For example in the U.S. there are Chinatowns or Cuban enclave in Miami. These enclaves have shown that despite intra-ethnic injustices, the term was important aid for the entire ethnic community involved. Also be included in this meso-level approach to migration, the method of migration industry, which starts from travel companies low cost, specialized in the transport of migrants by companies that give loans to facilitate migration or sending remittances.

5. Microeconomic approach to migration

Micro approaches arose from the need to explain the actual decisions of individuals who migrate, ie migrants themselves. The starting point of this view is that there is really a decision to migrate and that fact is not just a force, such as the slave trade or the mass deportations of the population. Paradoxically, most of the population subject to political persecution or economic conditions do not leave their home countries choosing to stay and endure harsh conditions.

Economic theory treats this as an investment theme migrant considering that an assessment of costs and benefits and choose

according to this calculation and attempt to maximize the benefits, whether or not shown to migrate. One of the deciding factors in the decision to migrate is profitability potential emigrant human capital in a new labor market plus costs, current income and other losses of emigration.

6. Migration factors

Migratory movements are caused by a combination of different factors, so individuals Push factors from their native places and the factors that attract, that causes them to move up in the host country.

The main factors of migratory movements may be:

a) lack of economic, employment CI country of origin, and what expectations regarding better living conditions and demand for labor in host countries encourage migration from less developed to more developed ones. Example of this type of migration in South meets (Portuguese, Spanish, Italians, Greeks, Turks) who, after World War II emigrated to northern European countries, which needed labor, such as, Germany, Netherlands, France, Switzerland, Austria, etc.. At present this type of migration occurs between poor countries in Africa, Latin America and the countries of northern Europe.

b) disaster, volcanic eruptions, earthquakes, fires, floods, can produce massive migration of people from their original location to other locations. After these disasters people usually lose all goods, arable land, houses. So that decides to start a new life elsewhere.

c) various issues, human activity is also a cause of migration. Wars (as in the former Yugoslavia) religious persecution (which caused major migratory movements in the modern era), ethnic, political structure, the existence of a repressive regime, political instability, colonization and subsequent decolonization of new land for European countries, traffic slaves.

d) socio-cultural occurs at micro (family) and macro context: modernization variables (education, urbanization, modern communication technologies, modern medical technologies), ethnicity, culture, religion, attraction of cities, how life, which makes many people in rural areas to decide

change of residence to provide more opportunities for their children. There is also the opposite case, people living in cities and decide to move to rural areas to combat stress.

7. Opinion

The problem is seen migrants in destination countries of origin and in two ways: as a source of benefits, but also as a source of problems.

Country of origin, labor migration specialist (brain drain) and labor shortages in certain sectors of the national economy leads to reduced productivity and income, and quality of life. We also produce and positive impact phenomena such as capital flows into the country, increasing GDP and raising the living standards of migrant families and communities from which they come. So, the income generated by immigrant workforce are compensated sent financial capital of the country of origin.

In that country, immigrants are welcome as cheaper labor, especially the highly skilled, bringing economic benefits (increased labor productivity and GDP) for the country.

There are some problems in the period of adaptation socio-economic conditions in the country of destination and periodic unemployment when there are negative economic effects on housing and social security system, because it creates economic problems for the country and for communities and citizens.

One problem is that resulting from correlating the aging problem in developed countries, pressure on the social security system, especially on pensions, which is rising with increasing migration flows are netted.

Mechanisms to Stimulate Employment in Romania

Ploae Victor

Șerban-Comănescu A.V.

Faculty of Economics, "Ovidius" University of Constanta

Abstract

This paper briefly summarizes the precarious situation of employment in Romania through a set of relevant indicators. Then we analyze the active employment measures under the Employment Program of the National Agency for Employment for 2011, focusing on measuring and highlighting the effectiveness of each category of measures in terms of employment.

In the context of all active applicable measures, the greatest impact on employment in 2011 was represented by the measures circumscribed to labor mediation, information and counseling (more than 83% of the persons employed on a job vacancy).

Keywords: employment / job vacancy, active employment measures, the effectiveness of applicable measures.

J.E.L. Classification: E24

1. Introduction

An active and decisive factor in the progress of any economic and social activity, labor is intrinsically linked to its provider - man with his physical and intellectual abilities. And man, as depository of these skills and experience, can only perform social and economic activities by taking a job. Vacancy, in this context, is equivalent to wasting this vital resource, with diminishing any growth potential. For this reason, in full agreement with the arguments offered by J.M. Keynes, any economic policy that would be desirable for all has to make the fullest use of labor, its central objective.

For a long time, employment or job vacancy has been associated with a balance / imbalance of the labor market where work supply and work demand occur with their

outcome- the salary. Or contemporary theories revolve around the idea that labor market is only a derivative market, employment being the result of the developments in other markets, particularly the market for goods and services, the money market, and the capital market, but which in turn affect the formerly mentioned, representing the transmitter, the receiver and a resonant of change. Therefore, although employment or job vacancy are seen as a reflection of the labor market, their roots are more diverse: they are neither only the result of labor market functioning nor are they only consequences related to dynamic growth. The conjectures of G. Abrahams-Frois¹ are eloquent in this regard:

- unemployment, as it stands for vacancy, is not entirely derived from lack of demand, as far as economy is concerned there are available jobs and unemployed people of working age at all times, as a result of a structural mismatch in demand and supply of labor;

- the creation of a number of jobs does not diminish unemployment as much, a fact which is due to demo-social causes inducing additional unemployment;

- increased production does not necessarily involve job growth as a result of prioritizing investments in productivity at the expense of capacity investments.

In this context, job creation means not only increased costs but also the measure of its effectiveness.

2. The effectiveness of Workforce Employment Program drafted by the National Agency for Employment in 2011

¹ Frois G.A., *Dynamique economique*, Dalloz, Paris, 1989.

It prefaces the analysis of the active measures to stimulate employment, the presentation of relevant indicators for the use of labor resources in our country:

- The dependency ratio of people not working as compared to that of the people who work is 1.76% downtrend;

- The replacement rate of the working age population by young population is only 76%;

- The activity rate of the working age population is 67.47%;

- The workforce employment rate fell to 51% in recent years being on a downward trend, while the tertiary sector remains the main suction valve;

- The ratio of inactivity dependence in Romania is also worrying:

- Idle / employed population = 118%;

- Inactive / employed young population = 46.3%;

- Inactive/employed adult population = 43%;

- Inactive/employed elderly population = 28.7%;

- Unemployment rate at the end of 2011 was 5.4% with an upward trend due to the flares of the economic and financial crisis.

Given all these brief aspects that characterize the unfavorable situation of employment in Romania in 2011, the National Agency for Employment (ANOFM) prepared the program of workforce employment in 2011, in full agreement with the Government Program from 2009-2012 and the European Union's strategic objectives for employment in the light of Europe 2020 .

By means of the National Workforce Employment, ANOFM estimated the employment of 324,000 people nationwide through a set of measures financed directly from the unemployment insurance budget. According to statistics in 2011 it was necessary to assist up to 1,453,721 unemployed .

By applying active measures, it was performed the employment of a number of 366,113 people, representing 113% more than it was planned.

By analyzing the human effort involved to increase service efficiency offered to the unemployed it can be seen that the largest impact on employment in 2011 had been made by the following proactive measures:

- by labor mediation, counseling and vocational guidance ,303,874 people were employed , or 83% of the total number of employed persons;

- by providing subsidies for the employment of disadvantaged people in the labor market (people over 45 or single parents providing for their families, the unemployed who have 3 years until retirement, graduates of educational institutions, disabled people, socially marginalized people), 28,227 people were employed, namely 7.71% of the total number of the employed;

- by providing an allowance for the unemployed who manage to find a job before the expiry of unemployment period, 19,221 people were employed (5.25% of total employed);

- by means of training, 14,791 people were employed (4.04% of total employment).

A major problem at the employment level is represented by the occupational training in rural areas.

Job offers materialize mainly in urban areas, the rural unemployed not having a wider range of jobs, professions and industries at their disposal.

3. Conclusions

1. To measure the level, structure and efficiency of employment in 2011, it was assumed that the labor market works in conjunction with the general requirements of the market and price theory although the evolving labor employment evolves under the combined impact of several conditions and social factors that are often different in direction and intensity.

2. The efficiency analysis of increasing work opportunities for employment must be addressed from the point of view of the relative costs involved in implementing some active measures.

3. Unemployment allowance should not be viewed only in terms of its function as passive social protection but also in terms of its function as an active support for those unemployed who, after completing their active employment measures, manage to integrate themselves into the labor market.

The Actuality of the Crafts Issue in Romania

Pop Stanca Alexandra
Universitatea Babeş-Bolyai, Cluj-Napoca
Facultatea de Ştiinţe Economice şi Gestiunea Afacerilor
stanca_pop@yahoo.com

Abstract

The issue of crafts has always been of actuality in Romania, as well as worldwide. This article sets out to present the vision of Professor Nicolae Ghiulea concerning the trades' situation in the interwar period. We expose various aspects of the vast problem and different solutions in order to solve it. Born in ancient times, crafts retain great significance even today, along with the large industry, being indispensable to any national economy, to its culture and civilization.

Keywords: craft, guilds, middle class, regulations

J.E.L. classification: A14, B30, J01, J44, N34, Z13

1. Introduction

Born in Iaşi (11 September 1884) with an original background in Mathematics, Nicolae Ghiulea was a professor of social policy at the Faculty of Law of the University of Cluj (1919 to 1942). His inclination towards Sociology came from a series of special sociological studies conducted in Paris, Göttingen and Iaşi. An economist as well as a sociologist with outstanding administrative and social leading functions, he was one of the most important representatives of cooperative doctrine in the interwar period. Ghiulea is amongst the initiators of the social market economy in Romania, also having a prestigious academic career and a rich publishing activity in the areas of statistical theory, social economy, cooperatives and sociology.

The socio-economic issues in general and the situation of his times in particular were the main concern of Professor Ghiulea. Therefore, in his studies, he also addressed the issue of trades in interwar Romania. This article sets out to present the vision of

Nicolae Ghiulea on this issue, as it was included in his paper published in 1941, *The craft problem in Romania* (original title: „Problema meseriilor în România”).

2. The craft problem in interwar Romania

As a definition, craftsmen, along with the small industrialists, traders, freelancers and small officials, form the middle class of a society, which mostly inhabits cities. It is well known that the social, economic and national importance of every social class cannot be disputed, as the absence of one of them could destroy the continuity of a nation.

The middle class, in addition to the role of support and cushion between upper and lower classes, provides a vital economic role. In countries where the industry and the commerce are not large-sized, craftsmen and retailers offer the indispensable industrial products, whereas in large industry countries, they cover specific economic needs. From a cultural standpoint, craftsmen's superior technique raised the level of culture and civilization everywhere. From national perspective, the middle class prevents the destruction or alienation of the ruling class. Ghiulea shows that the national lack of this class in our country has led to a large alienation of the ruling class, which had, in turn, Turkish, Greek, Russian, Hungarian, German and French influences, not being able to form a natural and continuous link with the art, literature, culture and national life of our people.

The middle class gives the appearance, the culture, the civilization and the nationality of the cities. Supporting and strengthening the Romanian middle class was a social, economic, cultural and political national duty. Thus, the author considers that the crafts problem, aimed exclusively and acutely at the middle class, required immediate solution.

Craftsmen were in conflict with both the ruling class and those of large industrial capitalists and working class. The capitalists considered them obsolete and a hindrance to the development of civilization due to the competition they represented. Large industries used to encourage the contempt of the ruling class towards the craftsmen, who minimized the value and importance of a middle class. Workers on the other hand, opponents of the bourgeois capitalist state, saw them as tools of capitalism, non-adherent of the international socialist conception which was gaining more and more ground in the period between the two world wars. So, craftsmen, says Ghiulea, were a strong national class, in competition and conflict with the great capitalist class and the working class, with the capitalism and the democratic socialism or the communism, with the internationalism and the social democracy.

Over time, though considered anachronistic, the craftsmen class proved its necessity and viability. However, its organizational problem was always delayed and burdened with other essential issues that made it impossible to solve. The craft problem had to be therefore strictly limited to organizational activities and socio-economic protection of this part of the middle class.

The craftsman, says Professor Ghiulea, represents the whole human industry. He is more than a worker because he has a profession, a special technical training and can be replaced with difficulty. He has a crucial economic role, because he is practically the industry's foundation, and in small industry countries, he has an important social role. Moreover, the craftsman's work is complete; it covers all aspects of work: manual work, invention work and direction work. The craftsman masters, in his activities, the work in all its aspects and the industry in all its forms, from raw material preparation and storage, to industrial processing of these raw materials into manufactured goods, to marketing its products. He therefore performs the complete cycle of the economic activity, achieving the balance between production and consumption and ensuring direct contact between producers and consumers, eliminating the intermediate.

Craftsmen are distinguished from the workers by the fact that they are not

proletarians, but small employers, with employees, little wealth, a workshop and their own tools, and they are different from the home workers because they are enterprising, independent, sell their products alone, often using their own raw materials and work for the market. They also differ from the industrialists, who are engaged only in direction work and recovery of products, not actually using their arms in their company.

Nicolae Ghiulea considers the craftsmen elements of economic equilibrium and economic peace, arguing that in the professions regime there cannot exist economic crises, only of a small and insignificant extent, there can be no unemployment, no stock of products to be destroyed in order to keep price levels. The craftsman produces as much as the market demands and does not develop its enterprise more than necessary.

In primitive times and prehistoric antiquity, craftsmen were factors of human culture and civilization. Later, historic antiquity turned work into disgrace, being dedicated exclusively to slaves. In the Roman Empire, the industrial work was done by the lower classes, which, deprived of rights and treated with contempt, were organized in colleges. Their involvement in politics and winning a place in the political organization of the state has kidnapped their freedom though. In the Middle Ages, serving took the place of slavery. The craftsmen corporations revived with the advent of Christianity and the honourable work, the work in which the craftsman began to put zeal, love, soul, art, pride, the work producing a great moral and material condition, bore the strong and admirable class of unsurpassed, esteemed and admired craftsmen. These associations, which took the form of jurandes in France, guilds in Germany and corporations in Romania, all aimed mutual assistance in economic and social struggle. The great prestige and their remarkable results have led over time the sociologists and politicians to revive the idea of these associations, but the economic and social circumstances did not correspond any longer and their attempts failed.

Guilds began to be dissolved in the second half of the 17th century, due to state leaders' intervention, because they represented closed

associations which owned trades' monopoly worldwide. Romanian guilds, shows Ghiulea, were religious associations of mutual help as in the west and had almost the same organization. Their results were weaker because Romanian craftsmen were less able to master the country's economy. They were overwhelmed by foreign craftsmen, failed to maintain a monopoly for a long time and, in time, they declined, along with all the Romanian economy. We could therefore say that the craftsmen and their guilds knew in Romania times of various glory. From clearly defined historical reasons, crafts have declined and the craftsmen's situation in the interwar period was worse than ever.

Like in the entire world, in Romania, the large industry was built on the ruins of trades. The competition from foreign and local industry and from commerce has led the craftsmen in ruins. In addition to this, the monopoly held by craftsmen in the Middle Ages dissatisfied the ruling class who came to destroy the old Romanian craftsmen and form a new class of foreign craftsmen, which became the cities' middle class.

Due to the lack of solidarity of Romanian craftsmen, the crafts problem was never taken separately into account and thus solved. All the attempts to solve it were made while solving the workers' problems in general, which shows its acute misunderstanding.

Nicolae Ghiulea lists some of the pressing economic and social problems of the craftsmen class, proposing necessary measures to fully resolve the trades issue in Romania. Lack of workshops, lack of retail shops, lack of housing; lack of improved machinery and tools; lack of motive power and economic fuel; lack of cheap credit; the difficulty of purchasing supply in favourable terms; the expensiveness of railway transport for raw materials and manufactured goods; lack of well-organized sales fairs; lack of association and organization of the craftsmen class; high duties and taxes, late paying for the supplies made by the state; insufficient use of labour and craftsmen's products in public works and supplies; lack of regulation of production and sale, in which the fight against counterfeit goods is concerned; lack of technical training; the very small number of Romanian craftsmen: here are the points forming the vast problem of trades.

In order to address this, the author recommends several measures to satisfy each of the five categories of interest: *social* (craftsmen class organization in specialized associations, general unions and chambers of handicrafts, all free and independent), *economic* (the establishment of a credit institution for the craftsmen, which, supported by the state, is meant to provide long-term interest-free investment loans, long-term operating loans with a very small interest and bearing short-term loans with low interest rates; creating supply, production and sales bureaux or the establishment of cooperatives that share the same object; organizing of national workshops for purchasing machines and tools at reasonable prices; providing goods and services of public authorities to craftsmen; establishing a simple and protective tax system; the encouragement of trades at least to the extent that the domestic industry is encouraged through various tax exemptions or reductions; removal of actions that are prejudicial to the craftsmen, of the competition from workshops and vocational schools, maintaining prices at market cost; the purchase of advantageous transportation and cheap fuel; facilitating procurement of raw materials advantageous in terms of quality and costs; favouring the payment of goods and services provided by craftsmen), *professional* (organizing vocational education, additional professional education and training, the regulation of the title of capacity, providing scholarships in the country and abroad, improving technical working conditions, prohibition of illegal actions and counterfeiting of products and ensuring jurisdictions for trades), *cultural and social* (building hygienic workshops and healthy and cheap housing for craftsmen, establishing mutualities against professional risks, for life and economy, supporting social and cultural works) and *national* (imposing a policy for increasing the number of Romanian craftsmen through: creating homes for Romanian apprentices; vocational guidance for the peasant surplus through scholarships and grants; incentives to employers through benefits and grants in order to ensure a good organization of crafts learning; supporting Romanian craftsmen in all possible ways to overcome minorities by number and quality; limiting the increase in

number of foreign craftsmen).

Of course, these were just some of the solutions that were meant to partially solve the large problem of trades in Romania, according to Professor Nicolae Ghiulea. The most important step in addressing this issue was the state recognizing the possibility to create a Romanian middle class, the possibility of Romanization of the cities by supporting a strong class of Romanian craftsmen. Leaders had to see the national dimension of the problem, recognize the danger in which the state was due to the lack of Romanian capital, lack of Romanian economic enterprises, in other words, due to the lack of a Romanian national economy and then create and diligently follow a program of administrative and law policies in this regard.

Although he was aware that the problem of trades in Romania is complex, with economic, social, political and moral dimensions, Nicolae Ghiulea believes that the moral aspect is most important. To be part of the national development, the craftsman must be morally exalted, because he is a complete worker, as his job consolidates manufacturing, transport industry, commerce, art. He is a free, independent, entrepreneurial worker. His work is superior, creating culture and civilization. He is the one from whom, says Ghiulea, we have to expect the cultural raising and increasing of our civilization. The craftsman brings welfare, creates the beautiful, collects wealth, supports culture. That was in the past and at least in our country there is no other way than this to raise our civilization, culture, ethnic wealth and power.

3. Conclusions

In the evolution of industrial labour, working in professions was an important element. Although, over time, modern industry has exceeded crafts, the social, spiritual, ethical and aesthetic superiority of the latter and their great economic importance cannot be denied. Work has evolved from the primitive state of domestic industry to specialization and exchange, initially taking the form of semicrafts and then actual crafts. The craftsman appears in the free labour era in the Greek and Roman society and rules the entire Middle Ages, and

continues to have today representatives whose work is still indispensable to the society, for work at customers' home, for repairs, for art work or for individual necessities.

Trades' merits cannot be denied and, therefore, their current situation needs to be improved. They are the economic base of the present industrial organization, they are always needed for jobs impossible to be done in factories and they ensure the continuity of national life.

Abstract

Knowledge economy is based on the existence and development of small businesses and how their development modalities should be focused on innovation, creativity, competitiveness, entrepreneurial culture, accumulation and use of knowledge, organizational intelligence, cooperation and communication.

Analysis of firm theories reveals a multitude of business development opportunities, taking into account the different cultural components and key success factors in business. As such, this paper highlights the main ways of development of small business in the current context, highlighted by the most popular theories of the firm. These, and not only these, can be considered as successful models to follow by Romanian SMEs.

1. Introduction

Known is that, permanently, changes in entities vision causes appearance and evolution of theories and specific models, in the hope of streamlining those entities, based on environmental impact assessment (located in a rapidly changing) over the entities, as well as identification, systematization, analyzing and principles combination of management of human resources at the

organizational level. This is because, in the current economic climate, entrepreneurs and managers need to rely on the flexibility and creativity of employees, on a effective interpersonal communication, on cooperation to accomplish tasks, on innovation in all areas of activity of the organization etc. But all this can be achieved at least through effective management of human resources, based on different theories of the firm, which reveals the importance of personnel in providing high performance.

Literature in this field shows that the degree of development of a business can be based on factors of influence such as real capacity to invest, ability to generate both new activity (innovation in organizational processes and specific technological each business, production processes, distribution, supply, etc..) and in terms of its results (new or improved), the ability to compete and meet global market (based on certain competitive advantages derived either from providing products obtained at lower cost than direct competitors or products with advantages against competitors or from employees competitiveness). It should be noted that, in the contemporary economy, must be considered also other influencing factors such as: degree of creativity, communicational management capacity, the degree to which members identify with the organization as a whole, the degree of integration.

During the economic crisis, small businesses did not have easy access to credit and the opportunity given by the Structural Funds has been seized for obvious reasons:

excessive bureaucracy, project evaluation periods, provided by financing etc. As such, few businesses have developed in crisis context, investing in productive capacity, technology or science (staff training, for example).

Rather, small companies have implemented strategies oriented on market needs, being flexible to provide their customers what they need, given the financial conditions of all actants. Employee creativity manifested in all activities conducted to maintain and even develop business in the current economic climate.

Of course, small businesses focused on what they hold, as an advantage (strengths) compared to direct competitors, so that they can survive in the market and, why not, to develop themselves. This is because small businesses should focus, in terms of the knowledge economy, on the maximized benefits held, and on creating new advantages.

2. Business development: concept, perspectives approach

Any business development can be viewed from several perspectives. Thus, business development can be addressed on an individual or organizational level, scientific and technological level, simple or intensive level, extensive or mixed one.

Also, the development can be defined in terms of the field of action, respectively as *operational development and organizational development*. Operational development relates exclusively to individuals, with their roles and values, and organizational development refers to all procedural development within the organization, obviously taking into account its specific environment of action.

Definitions of organizational development (Organizational Development - OD) on existing literature identify components, influencing factors and procedural elements of business development, while clarifying the difference between the concept of organizational change and organizational development. Thus, among the best known definitions of organizational development may be mentioned:

- "the process of improving the efficiency of the organization and the welfare of its members through planned interventions";
- "a planned effort, depending on the size of the organization, managed from above, to improve the health and effectiveness of the organization through planned interventions on the organization's processes, using knowledge in the field of behavior" (R. Beckhard);
- "long-term effort, sustained by the direction, regarding to improve problem-solving processes and to revitalize the organization. This objective is achieved with an effective diagnosis, established in collaboration and managing organizational culture, focusing on formal work teams, temporary teams and intergroup cultures, with the assistance of a counselor, facilitator and using behavioral science theories and technologies "(L. French and Bell CH);
- "educational strategy using by all means behavior based on experience to provide the best range of organizational options in a world in ferment." (W. G. Bennis);
- "long-term effort to improve the organization's ability to solve problems and its ability to adapt to changes in the external environment, using behavioral science consultants or change issues." [8];
- "a planned effort, coordinated by senior management covering the entire organization, which aims to increase efficiency, improve working conditions through intervention processes using behavioral science knowledge" (R. Richard);
- "a comprehensive system of data collection, diagnosis, planning, intervention and evaluation, which aims to: improve consistency of organizational structure, procedural organization, strategy, personnel and organizational culture, developing new and creative organizational solutions; development organization's capacity for renewal. This can be achieved through collaboration between members of the change agents who use behavioral science, research and technology "[2];
- "a mix of design and implementation of measures to improve the management system components (strategy, structure,

system information, system decision methodological system), aimed at increasing the performance and competitiveness of the organization"[4].

All these definitions reveals that **organizational development is a planned process** that is based on a wide range of methods, techniques and behavioral management tools in order to increase performance of the organization. Moreover, the essence of these definitions is to reveal the fundamentals of business development directions, and also of various modalities for business development. For example, definition provided by Richard R. to organizational development highlights that the planning effort coordinated by senior management aims to increase business efficiency, and improved working conditions, based on behavioral science. In other words, at a business level, improvement of working conditions increases productivity, creating a climate conducive to achieving performance through use of specific methods of science behavior (behavioral technique, social consciousness development, positive patterns of behavior development, work motivation, etc.). Thus, one can say that the natural way of business development is that of professional and behavioral development.

In essence, business development aimed its conception, design and implementation of various changes aimed to promote efficient use of resources and increase economic efficiency. As such, in the most general purpose, the purpose of organizational development is successful organizational change in order to achieve high organizational performance. In the range of the various changes can be highlighted four areas that will produce competitive advantage[6]: technological change, changes in the products and services, strategic and structural changes, cultural changes and individual.

It is known the fact that insuring the enterprise competitiveness requires the development of **new competitive advantages and strengthens existing ones**, all in relation to the opportunities and threats that characterize the environment. Therefore, a first step (method) in business development is to diagnose that business and "investigate the main aspects of the organization, economic, technical, sociological, legal and

management in order to identify strengths and faults, causes it generates and design recommendations for improvement and development"[3]. As such, any entity development is based on identifying market opportunities and establishing ways of action to capitalize on those opportunities, depending on their strengths. Clearly, business development means developing their strengths: human, technical, social, production etc.

3. Aspects of Romanian SMEs situation in global crisis

The role of small business in the context of the knowledge economy is clear: small businesses being the engine of the European economy and the most important generator of jobs and economic growth. Also, SMEs account for large firms, the world from which they came and where their competition will occur tomorrow, while for individuals, is a first job, the first step in their career and a first step towards world entrepreneurs. Also, for any economy, SMEs generate new ideas and new assembly processes that accelerate growth based on efficient use of resources.

The importance of small businesses is revealed by the fact that in the center of the European Commission policies are small business needs: improving financial environment, enriching the regulations SMEs in Europe in terms of facilitating their work, increasing EU funds for SMEs etc.

Although the current economic climate is unfavorable to small businesses, however, they find resources (human, in particular) to survive and grow. Obviously, the knowledge economy provides sufficient leverage and tools for business survival and development.

Romanian SMEs manifests themselves now in a negative context from social and economical point of view, very dynamic, with significant changes in all areas. According to experts, over 90% of Romanian SMEs have bigger or smaller problems regarding economic crisis. As crises of all kinds (social, political, economic, system) are racing in our country, we can say that Romanian entrepreneurs are accustomed to deal with all problems.

Currently, most of Romanian small businesses fail in signs of recovery from the crisis, for various reasons. Many small

businesses do not understand the harsh reality and, moreover, do not know which is that something they did well and why the business worked until one point. Also, there are some businesses that do not know their customers well, have assessed objectively neither the customer categories nor the created value or adversely affect their business. In other words, many businessmen do not really know their business.

In some profitable business, until the crisis, have been forgotten proactive encourage measures to innovative thinking among employees, and effective communication, cooperation and collaboration. As such, the crisis, there were gaps in activities, communication problems, low solidarity, low level of integration and identification with the organization and obviously low trust among employees.

Present certainty refers at the fact that effective business model in recent years does not work under current conditions. Thus it is necessary to reconsider the fundamental things about small businesses: entrepreneurship, quality, customer, business and labor organization, resource management, social behavior, motivation, cooperation and communication. Obviously, the contractor who will be concerned with customers, customer-oriented business organization, by creating an enabling environment for the development of creativity and innovation, adequate performance by motivating employees creative, inventive and performance, and develop positive patterns of behavior not only that will emerge from the crisis, but will be able to successfully develop their business.

Moreover, in the present economic crisis, it is necessary to change the basic paradigms of individuals (employees of SMEs), along with those of small business. At the organizational level, the paradigm shift usually address the strategy, structure, systems, staff, style, skills, values shared power source and leadership"[13,10,9,11]. But any change at the individual or organizational paradigm should be built, according to S. Covey"[5], on the following principles: the principle of proactive approach to reality, the mission principle, discipline principle, the principle I gain/you gain, empathic communication principle,

synergy principle, the principle of renewal (maintaining and enhancing capabilities through a balanced approach organizations dimensions: economic (physical), mental (psychological), spiritual and social/emotional.

4. How to develop SMEs revealed by various theories of the firm

In the context of the knowledge-based economy and, especially in conditions of economic crisis is required research in the development organizations in the hope of identifying new development models applicable in the contemporary economy. A review of the main theories of the firm noteworthy experts' attention on at least the following elements: entrepreneurship, with emphasis on human action (Frederick Barnard Hawley); Developing human potential in the organizational (Elton Mayo and Roethlisberger and Dickson - Management and the worker); develop social consciousness of employees (David Emile Durkheim); develop positive models of organizational behavior (Herbert Simon, Abraham H. Maslow and Mc Gregor); changing social behavior (Robert Owen - A New View of Society); moral motivation of employees (Chester Irving Barnard); organizing creative work and organization (Charles Babbage); creative and innovative employee motivation (material - share of profit) (Charles Babbage); growing importance of group work in achieving company (Mary Parker Follett); Designing and developing an enabling environment for action (Ronald H. Coase - The Nature of The Firm); creating an appropriate organizational performance (Irvin Fredrick Herzberg); cooperation and effective communication within the company (FW Taylor in his book "The Principles of Scientific Management").

All these elements are added assuming social responsibilities by small businesses. Essentially, CSR represents the obligation of the firms to use their liberty to decide and to act accordingly to their goals and mission. Freedom consists precisely in taking responsibility of facts and trademarks of the firm. Moreover, each entity develops its own kind of legitimacy, namely a specific type of social responsibility based on his resources

and developing business practices that contribute to the general well[12].

Starting from the idea that entrepreneurship is a sure way of development of small business in the current context, it worth to notify that the first person who defined the company as a human action, integrated to the market, was Frederick Barnard Hawley. Essentially every business bears the imprint and is the result of the entrepreneur, taking into account the resources held and environmental influences on the activities undertaken. To develop business, entrepreneurs should manifest proactive, in order to contribute to creating an enabling environment for action appropriate to obtain high performance.

In the context of the knowledge-based economy, developing social conscience of employees contribute to a firm attachment to the objectives to increased identification with the company to understand the purpose and mission of the company, which leads to ensure high performance and business development socio-economic perspective. The development of human potential, including the development of interpersonal relationships, increases productivity and business sustainability in the economic crisis.

R. Owen's theory, based on multilateralism development of personality, arisen from ignorance criticism, emerges as a means of business development in terms of improving working conditions and thus changes social behavior of employees. Perspective of improving the working conditions of employees with impact on business development has also been the subject of C.I. Barnard theory. In "Functions of the Executive", C.I. Barnard regulates a theory on the role of executive management, administrative management in organization development[1]. On the basis of this theory is effective communication and motivation (especially moral one).

That is why, the concerns of Charles Babbage on work specializing and its creative organization can be considered ways in business development, motivating and rewarding creative and inventive employees. The working group is the unit in which employee manifests its creativity and inventively. In "Community is a process"[7]. M.P. Follett considers the group as the core of social process, creator of personality and,

at the same time, of the individuality. The idea is also relevant in the current economic context; in which the importance of group work is major in individual and organizational development.

One of the characteristics of the knowledge economy refers to cooperation and collaboration among entities in order to enhance their performance. The idea of cooperation is not new, but is essential in the present context, of the economic crisis. Thus, the fundamental principles of scientific management theory, first stated by FW Taylor in his book "The Principles of Scientific Management" published in 1911, include "achieve and maintain a clear level of cooperation between hierarchical levels in the organization, between performers and management for the purposes of fair and efficient procedures scientific elaborated"[14]. Obviously a safe way to achieve the objectives of any organization is cooperation and therefore effective communication.

5. Conclusions

Reality shows that the time in which small businesses were managed according to an original method passed. Nowadays, managers need to behave in a professional manner; using methods, techniques and tools of modern management to apply the theories presented extensively pluses and minuses by experts in their field of activity. In this respect, it is imperative to examine the most important theories of the firm and the application of these methods to relevant, which should be considered as real modalities for effective business development.

Creative organization and work organization in small business is, for example, an effective way of business development (through professional development of employees, developing an effective organizational climate, development of creative intelligence organization, etc.) based on management and paradigm and work organization changing, basic characteristics of the knowledge-based economy.

Obviously, there are no solutions, sustainable development means, generally valid for all business, but every business can

identify the elements necessarily to build development models, theories revealed by the company.

Offshore Companies-Instrument of International Tax Planning

Radu Daniela Iuliana

University of Bucharest, Faculty of Law

danielaavocat@yahoo.com

Abstract

Offshore business are based on reputation and business, investors and consultants with experience know offshore operators worthy of trust and the scammers who kidding investors or other institutions. For this reason, the offshore operation means the assessment of the experience and letters of recommendation of potential business partners.

Currently the world economy through a period of globalization and the mobility of capital elements.

An offshore company, known as the International Business Company (IBC) is a company incorporated in the jurisdiction of a country or a territory, and which operates outside the jurisdiction in question.

Offshore companies are becoming more popular on the international market to investors from all European countries and the United States, due to the many advantages it offers, beyond the fact that they represent a real opportunity to initiate and develop international trade relations.

Keywords: offshore, business, tax planning

JEL Classification: K34 - Tax Law

1.Introduction

Representing an alternative in avoiding an excessive taxation, offshore companies have seen a remarkable rise.

Stricto sensu, the term “offshore” means the territory, located beyond the shore, offshore, away from the country of origin, in obvious contradiction with the onshore. In economic jargon, the offshore are referred to as economic activities and businesses that operate outside the State in which they are registered.

International tax planning in principle is very simple, the details are the ones that

complicates the problem. The tax authorities have often difficulties in crossing borders, in return, the companies, the rich and their money do it very easily.

Tax planning has two stages:-national tax planning as it relates to the tax legislation in the State of residence of the taxpayer;

-international tax planning which is based essentially on the following two elements:

- the use of tax havens using treaties to avoid double taxation, dangerous for international tax planning is inadequate research leadership, holding insufficient knowledge on the relationship between the various jurisdictions on national and international laws.

What's legal in one area can be considered total illegal in another jurisdiction [1], and there are a lot of traps that you can fall for lack of information.

Offshore business are based on reputation and business, investors and consultants with experience know offshore operators worthy of trust and the scammers who kidding investors or other institutions. For this reason, the offshore operation means the assessment of the experience and letters of recommendation of potential business partners.

Currently the world economy through a period of globalization and the mobility of capital elements.

An offshore company, known as the International Business Company (IBC) is a company incorporated in the jurisdiction of a country or a territory, and which operates outside the jurisdiction in question.

2.Content

Offshore companies are becoming more popular on the international market to investors from all European countries and the United States, due to the many advantages it offers, beyond the fact that they represent a

real opportunity to initiate and develop international trade relations.

Taken from the Common Law, Cyprus was among the countries that have developed legislation on companies (Cap. 113) by special law-International Trust Law (ITL), Law 89 (I) 92.

Taking into account that these companies are located in different countries, the only way through which financial moves can be verified in their entirety is through the collaboration of control bodies in the countries in question, namely the exchange of information, provided in the OECD Model Tax Convention in the framework of article 26 "Exchange of information".

In the OECD Model is approached the problem of companies that, through legal constructions, enjoy tax advantages offered by the internal legislation and modern facilities from taxation provided for by the conventions to avoid double taxation.

Such a case would be that of a person (whether or not a resident of a Contracting State) which acts through a legal entities established in a State in order to obtain the essential benefits of the Convention, which would not otherwise have been available. "All these comments, it is mentioned that:" several solutions were taken into consideration but [...] was not drawn any definitive text were not made any strict recommendations of the circumstances in which it should be applied, nor was a list exhaustive measures to counter the possible".

An increasing number of Member States have implemented the provisions of the conventions (both General and specific) to prevent abuses and to keep the law in their domestic legislation. In view of enhancing States pending legislation actions to eliminate opportunities for tax avoidance, some States trying to limit the ways of use of aggressive tax schemes and illegitimate.

The European Union is trying to facilitate the exchange of information by creating European databases (e.g. FISCALIS programme) and through the formation of committees composed of tax bodies in several countries.

Another tool available to States to counteract the multinational companies abuse is given by the methodology of transfer prices, to which reference is made in the OECD Model Tax Convention (article 9),

which was regulated by the domestic law of the State (Law No. 571/2003 regarding the fiscal code, article 11, paragraph 1. (2) the order of the President of NAFA. 222/2008), companies have to ensure not only the fact that the transfer prices can be justified by the tax authorities, but to demonstrate that they reflect market prices.

"Transfer Pricing", prices for transactions between affiliates, represents one aspect of increasingly important for multinational companies in the establishment of tax planning. This means that these companies have to apply the prices down to a level of market transactions conducted between affiliated persons, respecting what the OECD has defined as an "Arm's Length" ("arm's length" principle, in free translation, or "market price" principle in translation adapted).

On the other hand, the tax authorities have the right not to get "in a transaction which does not have an economic purpose or supervised the form of a transaction to reflect the content of the transaction", in order to determine the amount of a tax. So, if you use certain companies building businesses to choose a more favorable tax regime, the authorities have the right to determine the reality of the economic transactions between them, or to demonstrate that they have been created solely to avoid certain taxes.

Multinational companies have taken advantage of the tax treatment afforded to certain countries for certain categories of income, finding solutions to minimize tax liabilities, and choosing those forms of work organization business optimal.

Tax planning tools have become increasingly more common, giving the possibility to the taxpayer to reduce the legal size of tax liability, without offences.

International tax planning connected with treaties of avoidance of double taxation are extremely important tools for maximizing the profits obtained.[2]

According to The magazine's annual co-authored two volumes Economist, offshore companies are registered in certain countries or jurisdictions that have legislation or tax without taxes or taxes very low as long as company does not carry out activities in the territory of the country where they are registered.

In the British language designates the territory just beyond the shore. In economic jargon, the offshore economic activities are the companies that operates in the national territory of the State in which they are residents.

In other words it is about enterprises that do not carry out commercial activities in the country in which they were registered and which, from the point of view of commercial laws, are considered as foreign firms. An offshore company don't realize revenue in the country in which it was enrolled.

Theoretically, offshore companies can be set up in any country in the world, but it's not everywhere you can get and tax advantages.

There are a large number of objectives: the creation of offshore companies, the main being to reduce the parent company's profit in the areas of taxation. Parent company has a profit, and the tax on profits will decrease considerably. The company's profit-daughter offshore will be higher because the income tax into a tax haven is very small or non-existent.

Smart use of an offshore company can reduce, postpone or completely eliminate some taxes that would otherwise have been payable in respect of his business.

Many of the multinational companies are organized so that they can take advantage of the opportunity to avoid the payment of taxes in various jurisdictions in which they operate.[3]

Implementation of an offshore strategy will face almost always with some anti-avoidance laws which may be in force in the country where the beneficial owner resides or in which it operates. For this reason it is recommended that anyone who takes in consideration a plates, to consult first with a tax advisor in the country of domicile of the client and of the country in which the business operations. In the case of offshore companies, offshore jurisdiction laws will have to be taken into account along with the general laws and regulations in other countries, particularly countries where offshore company will have sales contracts and supplies.

3.Conclusions

Offshore companies can be used within the legal tax planning schemes. Also,

however, like any other tool, they can be used in illegal operations such as dirty money laundering or tax evasion. The legality of certain transactions in the case of offshore companies is defined by the law of the country in which it is registered under the laws of the other member countries of the transaction, as well as by international treaties. Many developed countries apply certain limitations concerning the operations carried out with offshore companies, but not full ban is almost never used. Our careful approach means that we can provide you with the necessary legal orientation before any important transaction to be carried out, thus avoiding any rigging or irregularities.

Many countries apply certain limitations for residents on the use of offshore companies (so-called regulation anti-offshore). The full ban is almost never used. However, there are certain restrictions discriminatory, for example, raising taxes for transactions with offshore companies for residents of the country, as well as the application of additional regulations on the exchange of foreign currency.

Many large companies in Romania are the main shareholders of offshore companies. Transfer of shares in offshore companies Romania has intensified with the growth rates of 10% to 16%. Furthermore, these companies are active on the local stock market and begin to dominate the local businesses.

Currently, there are more than a million offshore companies registered at the international level, countries who practice a more flexible system of fees and provides privacy stakeholders.

In order to support an action to have a genuine supranational impact, European Economic and Social Committee must align the position of the farms of the European Parliament, expressed in its decision of April 2011, in which, inter alia, supports the strengthening of the fight against the lack of transparency of the information relating to transnational financial transactions.[4]

Even some multinationals have come to Romania through the offshore companies, not by the parent company, the advantage being the achievement of profits. For example, the offshore company can buy the parent company supplies at a ridiculous price, and the company concluded contracts for

offshore selling these goods at a higher price. Thus, the parent company will have a smaller profit and, as a result, the tax on profits will fall. In the end, the offshore company will profit. Also, the companies set up in "tax havens" can be transferred to a third country, without prejudice to any law, the profit of the company, in the form of non-taxable dividends. The State can ask information about offshore only if it has evidence of illegal activities. The authorities of each country may make available certain information to the Romanian authorities. In the case in which the Romanian authorities provide evidence about a particular company that conducted criminal activities when the jurisdiction of the authorities concerned, as well as local banks give their consent for the liability of those involved. If the company's activities are lawful activities, do not have to do so.

A new Treaty for the avoidance of double taxation which will facilitate the exchange of information in accordance with OECD standards, was signed on June 15, 2009 by Stephen Timms, Financial Secretary to the Treasury, and W. McKeeva Bush, leader of Government Business of the Cayman Islands. The exchange of information is a vital tool for those Governments who need revenue to essential public services that we depend on all.

According to the study "The price of offshore revisited", we now have over 80 offshore areas throughout the world. Through their global investments are made with a value that ranges between 21 and 32 trillion dollars.[5]

The great challenge of offshore companies is tax avoidance, an amount estimated by experts at four trillion dollars for the period 1970-2010. From this point of view, seems rational the idea of some politicians to tax the companies in offshore areas further. [6]

Informational Systems Characteristics in the Context of Globalization

Radu Florin

Valahia University of Targoviste

florinuniv@yahoo.fr

Abstract

Today, more than ever, it is necessary that the company can exploit appropriate information at the right time, so to use it choosing an informational system tailored to its need and its way of organizing which will help it taking decisions.

Globalization, shaping and developing the knowledge company, the spread of Internet, new business models are as many reasons for which information systems in organizations must be seen from another perspective.

Key words: informational systems, TPS, MIS, DSS.

J.E.L. Classification: M41

1. Introduction

Informational systems were different defined in the literature: as realization of some features such communication, exploiting, preparing decisions [2]; as information means [3], as result of some perceptions of reality by company's members [4].

Thus, according to Laudon and Laudon [2], an information system may be defined as *a set of elements that collect, process, store and distribute information to support decisional process and control in an organization.*

Robert Reix [3] believes that *informational system consists in a set of tools and procedures for identification, collection, classification, storage, processing and dissemination of information and aims to provide timely information to all company's members, ensuring decisions making support at various levels.*

James O'Brein [4] identifies a series of informational systems' perceptions by users-managers of these systems:

- service compartment as important as departments of accounting, financial, production, human resource or marketing, which depends on operation and development company;
- an element that influences operational efficiency, productivity and motivation;
- a significant part of company's resources and operating costs;
- participate in the developing of competitive products and services which will ensure a strategically advantage on internal and international markets.

2. From organizational approach to global approach

The purpose of an informational system is to provide information required for timely decision making at any level, but also to provide a better functioning of operational systems[5]. Starting from this point of view, we can have another classification of informational systems, as following:

- informational transaction processing systems (TPS);
- management information systems (MIS);
- decision support systems (DSS);
- executive information systems (EIS).

Transaction processing systems. The role of informational systems in the early 60s was limited to automate routine activities of a company. Over time, have been developed applications in other areas of business: production tracking and staff management. The main characteristic of informational technologies at that time was processing on batches. This meant accumulate trade data in blocks at a certain period and then processing them regularly and update the database.

These operational transaction processing systems of companies are very important in data collection and validation regarding transactions, their processing to obtain reports in order to satisfy different requires, updating company database. At the same time, they are the infrastructure of future levels of informational systems.

Management information systems. A new function is add to informational systems in the late 60s, function that provides the information in making decisions to management, as periodical reports with predefined format. In this way, is realized a better use of data collected in TPS. Usually, these reports have as finality the control. The capacity of informational systems to satisfy the new requires was determining by good IT progresses, with the arrival of minicomputers, management systems of databases, application integrity or more accessible data. But, maybe the most important development was renouncing of batches processing and using on-line processing (OLTP- On Line Transaction Processing), fact that allowed combining distributed processing of TPS and activities centralization specific to MIS.

Decision support systems. Not always the reports provided by MIS are relevant enough for making decision, especially at high hierarchical levels. This is the reason for which were developed decision support systems. DSS expansion was due to the advancement of artificial intelligence, especially expert systems. Generally, in a company are more DSS because the activity of a certain area from informational resources point of view may be different from other activities.

Executive information systems. Starting with 80s, informational systems have a strategically dimension, so often is speaking about strategically information systems. At the same time, there is the necessity of management to get another type of information, others than those directly related to business: information about competition, suppliers and customers, global market. The main function of EIS is to answer the top manager strategically requires, providing fast and easy access to information about critical factors that can ensure the success of the company. Studies about EIS reveal rather an orientation to an individualized and

summarized presentation of information than to alternative decisions or developing forecasts.

From the above, we identify three important functions of informational systems:

- supporting operating activities of the company;
- supporting decision-making;
- ensure obtaining strategic advantages.

3. Globalization influence on information systems

Globalization, electronic trade and development of new technologies have made that the number of companies operating across the national boundaries to growth in a accelerate rhythm. This has resulted in a series of complications regarding planning, developing and exploiting informational systems.

Being under permanently changes to keep pace with modifications that occur all the time in any plan of economic and social activities, informational systems, in the context of globalization, are perhaps more concerned in terms of adaptability to new requirements of this process.

Products, customers, activities, available materials or human resources are the factors which companies depend on, so when we speak about global companies, all these factors are elements that can be influenced by informational systems, as follows [6]:

-products - always will be the same, whether are made inside the parent company or are made by branches from any point of the globe. Information system has the possibility to facilitate the production activity, marketing and quality control, because it is necessary to know in detail the specifics of each geographically region, both in terms of existing resources and especially in terms of customers requirements from that area. Information regarding these aspects can be easily obtained by creating an integrated informational system. Informational system integration is more important because the majority of products are made by assembling components produced in different places, geographically dispersed, this activity being influenced by the advantages from raw materials and materials prices, from workforce and fiscal facilities.

-Customer- to support the commercial activities of a company can intervene in informational system providing services in order to satisfy customers' needs, in a relatively short period of time. Thus, through new information and communication technologies, clients are even able to participate in projecting desirable products, if the producing companies have implemented a system which allows specific e-commerce activities.

-Activities- when we speak about a global company, these activities are often very complex. Many products or processes are assigned to branches that are under the influence of economic, social or politic changes. Taking in consideration this situation, it is easy to understand that in order to successfully cope with all changes that occur in the existence of such a company, one of the elements that ensure adaptation to new conditions is realizing some informational systems with high level of flexibility. By upstream integration of companies (supply contact channels and abandoning producing components of the same company), they can get obvious benefits, such as reach scales economies, specialization, flexibility in adopting production lines for manufacturing the marked required products, reduce through a better market discipline.

-Resources- although are used in common, raw materials, human resources and financial resources, this use requires also a certain distribution between different branches of the global company. Informational system through its applications may keep a strict record of these resources, regarding resources distribution and their size.

-Human component- knowledge and experience of human resources may be easily used in order to support the efforts of a company only if the informational system has the component that allows group working-teleconferences, videoconferences, Internet, Intranet, e-mail.

In order for organizations to may be competitive in the new economy, informational systems managers must take in consideration the main dimensions of these [7]:

a) economic, politic and cultural life that they must reflect on:

- cultural problems refer to language differences, cultural interests, social attitudes and politic philosophies:

- policy framework is different from a country to another, there are states where it is forbidden data transfer across national boundaries or have restrictions regarding the import of hardware and software;

- geographically, even if telecommunications have known a strong development, still feel physical distances (here we take in consideration the time differences);

- there are difficulties in finding or attracting specialists from another countries, due to differences in standard of living and labor costs.

b) building applications in order to ensure coverage of all informational requests: these applications of systems depend largely on the adopted business strategies, on the nature of activities, competitors on the market, available resources, customers and company's product, staff knowledge and experience, the degree of centralization of the system architecture. However there is a series of general applications that can be used by any type of companies, such as:

- group decision support systems;
- financial applications;
- global applications of inventory management;
- applications for regional data processing centers.

c)integration of systems strategies across strategies of global companies: the main strategies of a global company that should be set refer to virtual activities, world-wide markets, production transparency, dynamic resources management. Taking in consideration all of these, informational systems' strategies should focus on:

- integral systems and logically consolidated, but physically distributed;
- using common data in all levels of companies' components;
- developing IT applications specialized in fields.

d)development of a solid informational infrastructure: it refers to

hardware, software, telecommunications networks and other facilities in processing data. Choosing the technologic platform, it not only a technical issue, the compatibility of different architectures, but a problem with political and cultural implications.

e) improving data management:

- one of the major problems is trans-border data flows, especially economic data flows that cross international boundaries with the help of telecommunication networks. There are many countries which consider that these types as a violation of national sovereignty, arguing that thorough trans-border data flows are not respected the rules applied to import and export of goods and services or rules that have as scope to protect local and regional industries or jobs.

f) *providing grater flexibility for adaptation:* problems that should be taking in consideration in developing informational system of a global company refer to:

- conflicts that appear between local informational requires and those of global system;

- difficulties in implementing and maintenance of the system because of geographically positions;

- difficulties in establishing some common characteristics of the systems;

- difficulties in achieving a system operating under resources sharing and different operating systems, depending of computing available locally.

Regarding companies' informational systems that operate across national boundaries should be noted that they are different from other distributed systems, are considered informational systems distributed that support achieving some similar economic activities in various activities, specific to different locations of the business across boundaries.

4. Conclusion

Being subject of constant changes to keep pace with modifications occurring all the time at any level of economic and social activities, the information systems, in the

context of globalization, are perhaps the most searched because of the adapting to newest requirements imposed by this process.

The products, the clients, the activities carried out, resources available or human component are important factors for enterprises, and when we speak about global enterprises, all these factors are elements which can be influenced by information systems.

The globalization process can: obtain scale advantages, exploitation of synergistic benefits, enjoyment of geographical advantages. Aspects of globalization can be seen at the product level, sales level on market, competitive level, as well as at the level of consequences which globalization will have on environment.

International Tax Evasion

Radu Marius Eugen

“Dimitrie Cantemir” Christian University, Faculty of Law and Administrative Sciences
mariusavocat@yahoo.com

Abstract

In time, the phenomenon of the escapist took a special scale, both at the national and international level and it is seriously affecting the economic development of the States. However, the phenomenon of tax evasion is very hard to control and to quantify due to the imperfection of the tax legislation, the low level of living, low degree of civilization, culture and civic consciousness, aggressive fiscal policies that it promotes State and last but not least, corruption is present in the structures of the organs involved in combating the phenomenon of tax evasion. In the last decade, the actions aimed at elimination of the tax provisions have moved more and more from the national tax system to the outside, outside the field of action of the national tax law, this phenomenon is being encouraged and supported by the trends of globalization and economic, social and even political. In the light of this new context, an important criterion that can be classified as forms of manifestation of tax evasion is the reference, according to which one can identify tax evasion at the national level and tax evasion internationally.

Keywords: tax evasion, tax fraud, international taxation

JEL Classification: K34 - Tax Law

1.Introduction

Flaws and defects of an imperfect or incorrectly treated as legislation, as well as the faulty application of the legislation, represent the imperfections that are the basis of an

excessive taxation in which appears the phenomenon of tax evasion.

When burdens press too hard on the matter of taxation, as it tends to escapist realm to escape.[1]

One of them social and economic phenomenon is particularly important with facing the world States, is tax evasion. Given that halting it is still a challenge, trying to find solutions to limit as much as the unintended consequences of this phenomenon.

Doubting the negative effects they generate the phenomenon of tax evasion are felt directly on the level of income tax revenues, causing major distortions in the functioning of the market mechanism.

In time, the phenomenon of the escapist took a special scale, both at the national and international level and it is seriously affecting the economic development of the States. However, the phenomenon of tax evasion is very hard to control and to quantify due to the imperfection of the tax legislation, the low level of living, low degree of civilization, culture and civic consciousness, aggressive fiscal policies that it promotes State and last but not least, corruption is present in the structures of the organs involved in combating the phenomenon of tax evasion.

In the last decade, actions aimed at elimination of the tax provisions have moved more and more of the national tax system to the outside, outside the field of action of the national tax law, this phenomenon is being encouraged and supported by the trends of globalization and economic, social and even political. In the light of this new context, an important criterion that can be classified as forms of manifestation of tax evasion is the reference, according to which one can identify tax evasion at the national level and tax evasion internationally.

2.Content

International tax evasion is the result of national tax regimes and the onerous regulations of national tax autonomy which often generates a double taxation. International tax evasion is encouraged by the existence of free zones in terms of tax, also known as tax havens, true territorial enclaves that enjoy extraterritoriality and customs coming out under national laws, some of them having the legal status of real state entities. Tax havens are not, in and of itself, nothing illegal, because all the procedures, exemptions are provided for in the law.

The most common forms of manifestation of international tax evasion are abstinence and concealing.

Other methods of implementation of international tax evasion consist of:

- transfer of profits to low-tax States with using the method of handling the transfer prices;

- removal from the country of revenues of companies by paying fictitious services rendered by companies located in tax havens.

The transactions that exceed the boundaries of one State have demonstrated clearly the tendency of capital movements, actions and people around the limits of the taxation what they are hiding feature events tax (taxable events) and makes it more difficult to raise by the competent authorities of the amounts owed to the taxpayers of the State budget.[2]

A well regulated taxation, both in countries with a well-developed economy and less developed countries could provide multiple means to combat the phenomenon of the escapist. This tendency leads to a fight between Financial Authorities and continue the taxpayers, since continuing change and tightening of tax legislation to taxpayers to find legal means of reducing the tax burden by using the escapades, existing law breaches.

At the international level, there is the tendency of an extensive analysis of the imperfections, the forms that we provide tax evasion as well as combat techniques.

Fight in a normative framework against evasion and tax fraud, started at the european level in 1975 when it was debated for the first time in The Council Of Europe, default

Resolution, was adopted the Directive mutual assistance between tax authorities of several countries.

Special attention also given to the phenomenon of the escapist and non-governmental organizations, this being subject to a research conducted by the International Bar Association at the annual congresses in 1980 and 1981.

In general the concepts of tax evasion and tax fraud covers a large area of tax behavior headed to decrease tax pressure. Part of the sector shows no interest for tax authorities, no legislative powers.

One of the accepted definitions in the literature shows tax fraud as violation of direct tax revenues and the negative effect on the income of the State budget, by himself, with no importance as long as the share of either do not produce adverse effects on the functions of the State budget.

Excessive taxation, corroborated with the absence of policies to encourage investment, any State economy generates a culture of bypassing the budgetary responsibilities as a shield in front of a policy and a hostile economic environment.[3]

In recent years, experts have focused increasingly on identifying the characteristics of the fraud and the establishment of differences between national tax systems in its own approach to this issue.

Intent to defraud may refer to bad faith wanting the taxpayer to defraud IRS knowledgeably. In another situation, a deal that at first glance seems a voluntary tax fraud, if examined carefully look like tax infringement is made against the backdrop of an honest attitudes through a taxpayer's wrong guidance by incompetent people or bad faith.

An observation of tax laws in several countries (Austria, Greece, Norway, France) show that tax fraud does not require in general an intent to work on the part of the taxpayer's tax law.

In any case, the intent to circumvent the law is needed to establish the guilt of a criminal.

Where the intent is required, it is deduced from the evidence or demonstration as a fact and should manifest itself as "hiding" or "hide" (for example, in France).

If the tax debt (debt-budget) is considered as a common denominator that makes it

possible to classify the behavior of tax dodging "tax (tax avoidance) can be defined as a path, a way of removing, reducing or defer tax debt in another way than using the means and tools of tax fraud (tax evasion) and" saving "tax (tax saving), as has been described in the preceding paragraphs.

In some countries the differences between "saving" of taxes and tax evasion is not established. Anyway, it looks like it's from the scientific point of view to make the distinction between the two concepts: as shown, the "saving" of taxes is to reduce those costs by means of tax that the legislature never intended to regulate and criminalize them, while tax evasion is much exploitation of areas that the legislator intended to cover (cover) for some reason or another, failed to do it.

The previous general definition should make possible the observation of the fact how, in different countries, the legislative powers have react to those cases in which the taxpayer, without determining the current situation leads to increasing fiscal debt established by law, obtained by various means the same economic result (or similar) that the law intends to charge. So, it is possible to observe, in different countries, and how far is the tax evasion (tax avoidance) from being a legal phenomenon and distinct, with its own autonomous individuality.

It should be noted that the terminology can cause some errors, and therefore, require ratings. Large differences between fraud (a direct violation of the tax laws) and evasion (a violation of tax law indirect accepted or not) are used everywhere. However, from the point of view of legal terminology, some jurisdictions legal meaning of the term denies 'dodging' based mainly on two factors:

-there where only the direct violation of the law is punishment and violation of premium in indirect tax revenue is entirely legitimate, the term "evasion" is thus without a legal basis;

-in those countries in which the indirect tax violation of the law can be punished, the term "evasion" may be doomed to be without a legal basis, because a "illegal" tax evasion could be legally as "fraud" in the tax code includes all kinds of violation of tax laws.

The tax system of all the countries that have been studied include measures which

are not intended specifically to counter fraud or international tax evasion, but which have a strong impact on international operations. These measures are especially dodging have influence on the internal legal order, taking different forms, know the different administrative procedures or evolutions of Justice, require prior training (Basic).

Prior preparation in a country may coincide, sometimes with the evolution of a process within other jurisdictions. This is due to the fact that both of these trends are based on the same principle.

This overlap of measures based on the same principle, but taking different forms, it makes impossible the use of a classification based on the "nature" (legislative, administrative, judicial) of each individual techniques.

Of general principles relevant to General measures against evasion, interpretation and evaluation of important tax is the key point of each important element of most administrative and judicial attempts to combat decreasing tax burden (tax burden) through different means of fraud (evasion). Two different approaches can be identified, namely: legal theory and economic theory.

These two guidelines respond also to the two ways of interpretation of the relationship between private law (private law) and tax law (tax law).

Legal theory, which is the traditional, is based on the principle of dominant importance of point of law [4], and respect for the forms of law (private law), principle chosen by the taxpayer in order to drive business.

A transaction is regarded in terms of the effects it produces in private law and the fact that these forms are used to obtain a result that is different from the economic intention of the legislator.

Thus, according to this principle, if a taxpayer concludes a contract of lease (lease Marina) on five years in order to avoid capital gains taxation in the case of the average level of sales, letter of the law will be breached, but the attitude, behaviour of the taxpayer will be entirely legitimate and the effects of the transaction will be recognized by the tax authorities.

This approach is clearly a protection for the taxpayer, who conducts business on the basis of expected the judiciary and who

makes an estimate of the costs involved in the transactions that make up his affairs. On the other hand, it is also true that taking a approach classification have their own "insecurity" due to its interpretation of the Byzantine law. Certainly in this "zone" there's also a benefit for the State: when there are doubts on the estimated income, it gives stability to the national budget.

The previous theory is in violation of the economic approach which was developed by the countries that were concerned about a strong justice under economic criteria. If the taxpayer, by exploiting the formalism and leakage, obtain an economic result equivalent to one legislative power intend to tax, the law or the courts should regard them as being taxable (pay TV).

The legal approach is especially characteristic of those countries whose legal system is distinguished by a clear classification, from the point of view of the civil law (civil law), transaction and whose constitutional principles establish a "exclusive competence" severe laws on tax, accompanied by a prohibition on the concepts in this matter.

3. Conclusions

In countries with a system of private law regional (or a proper legal system of a State within the federations), preference for the effects of private law of the transaction cannot be always applied consistently.

Indeed, in some instances the application of the private law, the definitions for the classification of transactions for tax purposes proves to be useless since the different tax treatment of transactions of the same kind, if they are carried out by taxpayers that are resident in different regions (or different States of the same federations).

The Organization for Economic Cooperation and development (OECD) and the Council of Europe have reached an agreement on improving the Treaty on avoidance and tax fraud that all European countries can adopt as part of efforts to combat evasion, the OECD announced.

According to the OECD, it is a protocol that will amend the Convention on Common Administrative Assistance in respect of the fees, which follows the alignment of the international standards for the exchange of

information on tax information exchange. The Protocol could be signed at the ministerial meeting of the OECD in May 27-28.

The Lisbon Treaty could be signed by other countries who want to tax evasion, commitment to the changes envisioned "following to help developing countries to become parties to the Convention and to benefit from improved cooperation more transparency in respect of the tax environment", according to the OECD.[5]

The Protocol aims at the exchange of information, examinations of multilateral simultaneous tax and foreign assistance in respect of the collection.

Economic recession has pulled out moves billions of dollars to tax havens, which are viewed as some opaque networks of capital flows that have allowed their growing speculative investments.

OECD pressure, in many countries, including Switzerland, which has a strong tradition of banking secrecy, you needs to change the way of doing business and to offer more data partners and banks.

Abstract

The idea of wireless communication sounds good. The main reasons are increased mobility and cost reduction for infrastructure development. Although in the past, securing a wireless network proved to be a challenge to which companies did not respond yet, today there are many standard protocols that are able to offer improved security. A security policy must establish a compromise between the flexibility level of the IT services and the level of security desired. Within a wireless network environment it is paramount that organizations develop and implement security policies specific to wireless technology in order to ensure optimum security. A well-planned wireless security policy is an important step in a methodical implementation of wireless networking (security mechanisms of the 802.11 standard).

Key words: wireless, AP, security risks, IEEE 802.11 standards

JEL classification: L63, L86

1. Introduction

The increasing need for mobility and connectivity lead to wireless communication, which recorded a great explosion in the last years. The spread of mobile devices (notebooks, PDAs or smart-phones) lead to the development of wireless communication technology, but this was not the main reason. Hardware and software suppliers offer users a variety of solutions in order to share internet access between two or more devices. In order to connect the computers together, traditionally we would need cables [9]. The easiest interconnecting option of all the IT devices, is the use of wireless technology.

The physical base for wireless communication is represented by electromagnetic waves, used in the needed frequencies for data transmission. For data transfer, the main property of the waves is the frequency. The electromagnetic waves through which the wireless signal is sent are the high frequency radio waves and microwaves. The theory behind the wireless technology is that the signal can be transported by the electromagnetic waves, which are then sent towards a receptor. In order to facilitate the communication and understanding between the two devices, a protocol is needed. The connection to the internet comes from the ISP and it is then connected to an Access Point Wireless or a Router which further sends the signal. Access points play the role of a central communication point in a wireless network.

Figure 1 shows a generic wireless topology consisting of a client, an AP, a switch, a gateway, a firewall, a router, and authentication servers (**the gateway** provides an initial line of protection to the internal wired network by separating the wireless network from the wired network; the **servers** are responsible for the authentication process through the utilization of certificates; the **switch** prevents access to the internal wired network by wireless clients until the authentication is successful [5]).

Figure 1. A Generic Wireless Topology

Sursa: http://cisr.nps.edu/downloads/techpubs/nps_cs_05_004.pdf

The problem of the wireless signal is that it can not be limited to a certain radius. If a hacker is able to have signal even from 100 meters away, then he could be able to access the system but this does not mean that a wireless network should not be used. It means that security measures must be put in place.

2. Network Security

Classifying security risks means knowing how to approach three types of attacks: attacks from the Internet (low success rate), attacks initiated from the local network and attacks initiated from the same machine – the latter having a stronger impact than the first ones [9].

Level 1 attacks (physical) represent a very small number from the total number of attacks because it needs access to the transmitting environment. In this category are included the attacks which imply traffic interception inside the network. Protection methods differ according to the transmission environment used. In wireless networks the environment being shared and easily accessible the protection method used is traffic encryption [9].

Level 2 attacks (data bond) need access to the local network. The list of these attacks include MAC attack, STP attack, VLAN modification and ARP poisoning which is hard to detect and easy to use in local networks [9].

Level 3 attacks (network) are most often initiated from the internet. From the multitude of level 3 attacks, the most common are based on flooding, DoS (Denial of Service) and DDoS (Distributed DoS). There are three ways through which a DoS attack can be initiated: exterior attacks sent from the internet, attacks initiated from the local network and attacks generated from the same machine. There are three ways through which a DoS attack can be initiated: exterior attacks sent from the internet, attacks initiated from the local network and attacks generated from the same machine [9].

Level 7 attacks (application) generally exploit vulnerabilities of the web applications. Level 7 attacks can also target technologies used for web applications, a fair amount of such attacks targeting data bases. One of the most used such attack is SQL

code insertion (SQL Injection). This attack relies on the direct interrogation of the data base [9].

WEB attacks. Because of the high volumes of online transactions, most of the attacks in the last period are concentrated on the services offered on the internet. The ports associated to them were supposed to be open all the time and the protocols used at first were not made for virtual shops or electronic payments, therefore security measures were not taken into account. There have been made many improvements in order to allow web applications to accomplish actual objectives such as communication encryption in an SSL channel (HTTPS), maintaining a session between the client and the server using cookies, animating page content with the use of XHTML, CSS, JavaScript or Flash, asynchronous communication using AJAX – leading the user to a Web 2.0 experience, patched when it comes to security. Web attacks are spread into two categories: **attack against the platform:** operating system, services, communications and **attacks against the application**, which targets to compromise the system or the user.

a. Attacks against the platform are based upon exploiting vulnerabilities in the operating system, exposed services or used protocols. These attacks target access to private data or service incapacitation. These attacks verify open ports in the firewall, active services versions, then search for known vulnerabilities, that are then used in order to gain access to the systems [9].

b. Attacks against Web application are based upon the programming mode, bugs and security breaches of the programming code or programmer’s mistakes. Attacks against Web applications have two targets: compromising the system by acquiring unauthorized access on one of the application or data base servers and compromising the client by acquiring confidential information, session stealing, or code execution on the target machine. Examples: **cross-Site Scripting (XSS)** most frequent attack, directed towards client compromise; **server injections** represent a maximum impact attack which target to compromise servers inside an on-line system, malicious code execution directly in the web server by inserting SQL code (SQL Injection); **Insecure Object Reference, or the Directory**

Traversal type of attack which is specific to web applications and it is based upon referencing to a resource based upon information which can be manipulated by the attacker; **Information Leakage / Error Handling** is a vulnerability found in the case of web applications due to server configuration errors or programming errors which can divulge too much information about the infrastructure [9].

The first step in any security solution is represented by establishing clear **security policies**. Such a security policy must take into account the following: different security area separation; defining each user’s rights; defining services which need to be offered to every component of the network

We present three IEEE 802.11 standards [6] to be considered when selecting wireless broadcast devices: IEEE 802.11b, IEEE 802.1a, and IEEE 802.11g. Table 1 briefly outlines the IEEE 802.11 b/a/g maximum throughput and number of channels available from each standard to assist in the selection of the best IEEE 802.11 standard for the design [2].

Table 1. IEEE 802.11 Standard Comparisons

IEEE Standard	Frequency	Maximum Throughput
802.11b	2.4GHz	11Mbps
802.11a	5GHz	54Mbps
802.11g	2.4GHz	54Mbps

Sursa: Cooklev, T., 2004, Wireless Communication Standards, Standards Information Network IEEE Press.

Figure 2. IEEE 802.1X Technology

Sursa: http://www.cisco.com/warp/public/cc/pd/iosw/prodlit/80211_da.jpg

802.1X [3] uses the Extensible Authentication Protocol (EAP) and a RADIUS Server for network access control, see Figure 2 IEEE 802.1X Technology. EAP-TLS is selected for use as it offers a robust solution for security. In order to use 802.1X and EAP-TLS, the following components are required: Client wireless cards compatible

with 802.1X (for authentication); Client access software capable of EAP-TLS (for encryption); Wireless AP compatible with 802.1X and EAP-TLS (for authentication and encryption); RADIUS compatible with EAP-TLS (for encryption); Public key Infrastructure (PKI) (for authentication and encryption). For identification, the users must obtain a private key and a public key digital certificate that has been securely distributed to the LDAP/RADIUS server [2].

3. Methods which assure the safety of a wireless network

In the next part we will be covering the methods which are recommended to be used in order to maintain the security of a wireless network.

Modifying the wireless network’s ID for the devices equipped with an SSID (service set ID) or ESSID (external service set ID). It is easy for a hacker to find out the standard identifier for each hardware producer, so it must be modified. Use something unique, not your name or something easy to guess [8].

Deactivating the ID broadcast. Broadcasting a connection to the internet is like a written invitation for hackers to access. It must not be broadcast. The user’s manual must be read in order to find out how to deactivate the ID broadcasting.

Activate encryption. WEP (the equivalent of wired network security) and WPA (Wireless protected access) can encrypt data in a way which only the receiver is supposed to be able to access. WEP has many security breaches and is easy to compromise. 128-bit encryption does not have a great impact on the performance of the system but it raises the security level. A 40-bit or a 64-bit encryption on some devices is enough. For all security measures, there are countermeasures. There are ways to bypass the protection system, but using an encryption method is a step in the increase of the security level of the network. If possible, it is recommended to use WPA encryption. WPA encryption solves many problems that the WEP has but it still can be brought under attack [7].

Restricting device access at a MAC address level. Most of the access points (AP) and routers have a characteristic named MAC address filtering. This option is not usually

activated by the producer because little effort is required in order to configure it properly. Without a MAC filter, any wireless client can connect or authenticate, knowing the name of the network (SSID) and probably a few of the security parameters, such as the network's encryption key. Usually the more checks there are before connecting, the safer the network is and the probability that it will be accessed without consent drops.

Changing the default passwords. This is a good idea for all software and hardware devices available. Default passwords are easy to guess because many users do not bother to change them, and these combinations are the first ones to be tried by the hackers. The default password should be changed with a new one, which is harder to guess [7].

4. Threats and risks

The reduced costs of implementing a wireless network make this type of networking to be very attractive. Also, the availability of a wide range of cheap devices offer the attackers the needed instruments for an attack against the network.

“Parking lot” attacks. The access points emit radio signals in a circular patten and most of the times, the waves reach beyond the physical border of the area they are supposed to cover. The signal can be intercepted from outside the building, or even from different floors of the building from which they are transmitted. As a result, attackers can use a “parking lot” attack strategy, where they literally sit in the parking lot of the organization or in close proximity and try to access different devices which are connected to the wireless network. If a network is compromised, the attacker has reached a high level of penetration of the network. He now has the same level of access just like a trusted employee or any other user which was granted access to. An attacker can also “trick” genuine wireless clients into connecting to his network by creating an unauthorized access point with a stronger signal close to the wireless clients. The purpose is that of capturing passwords or other sensitive data when they try to connect to these fake servers.

Shared authentication key weakness. This can be easily exploited through a passive interception attack of the

transmission between the access point and it's client. Such an attack is possible because the attacker can capture both the client's “challenge” which is not encrypted and the encrypted response of the access point. The WEP encryption method uses as an encryption algorithm the flux cipher RC4. A flux cipher works by generating a sequence of random bits based on the password and an initialization vector. The sequence of bits is then applied to the transmission in order to produce the coded text. A very important trait of a flux cipher is that if both the text and the encrypted text is known, then the sequence of bits can be found out very easily and then can be used by the attacker to produce a valid authentication response for the access point. As a result, the attacker can connect to the access point.

Attack against TKIP protocol (Temporary Key Integrity Protocol). The TKIP attack makes use of a similar mechanism of the WEP attack which tries to decrypt byte by byte by sending the same packet over and over and observing the response received by the access point. Using this mechanism, the attacker can decrypt small data packets such as ARP packets in a small period of time. If the QoS service [1] is activated, the attacker can inject up to 15 additional packets for every decoded ARP packet. Although this kind of attack is not intended to recover the access key and it does not lead to it being compromised, it represents a serious attack and represents a risk for all TKIP implementations which use both the WEP and WPA2 standards [10].

5. Coclusion

Like most of the new things, wireless networks offer both opportunities and risks. Wi-fi technology can represent a big addition for an organization's networking capacity and it can increase productivity and reduce IT costs. In order to minimize risks, IT administrators can use a series of security measures and policies. This allows entrepreneurs to implement wireless networks in order to make use of the benefits of this more and more viable technology.

Modeling Regional Labour Supply in Romania

Rotaru Paul Costel

*Alexandru Ioan Cuza University of Iasi, Faculty of Economics
and Business Administration, Iasi, Romania*

ropalu00@yahoo.com

Abstract

It is well known that the labour force is a very important factor of production which influences the economic growth.

The aim of this study is to develop an econometric model for describing the labour force supply. We analyze the main indicators of labour supply in order to identify the factors that influence the employment level on the labour market, at regional level.

The data is taken from Statistical yearbooks and the databases of the National Institute of Statistics. To achieve this analysis we will use E-Views Statistical Software, version 7.1.

Key words: labour market, labour supply, econometric model

J.E.L. Classification: C2, J2

1. Introduction

In the context of the economic transition process, the labour market in Romania has undergone significant changes, especially, within the structure of the main indicators of labour. This process has been characterized by the reduction of the active population and, implicitly of the employed population.

Moreover, an important issue was the inappropriate use of the human resources, taking into account the increasing unemployment rates, especially among young people and long term unemployment.

The study of these processes on the labour market and human resources analysis is a major tool in developing programs policies and economic development strategies, employment and social protection, on both national and regional level.

In order to better understand and explain the causalities occurring in the processes and phenomena within the labour market, a series

of models have been developed to describe the relations existing between its components.

Modeling labour market is in a continuous evolution, by both the occurrence of new models and modifying and improving the existing ones. Generally, these models aim, besides highlighting the existing relations between phenomena occurring in the labour market, to outline some future developments and to anticipate the effects of certain decisions, in order to choose the most efficient economic policies.

This study carries out an analysis of the main indicators which influence the labour supply described by labour force participation rate, at regional level, in Romania between 1995 and 2011. The linkage between the labour force participation rate and the other indicators is shown through a regression model.

First of all we present a brief literature review, focusing on the main indicators which were taken into consideration regarding modeling regional labour supply. Then, after the data and methodology are described, the empirical study is made for one of the eight Romanian regions, according to NUTS II: Bucharest-Ilfov, including the capital of the country, Bucharest. The results are pointed out and interpreted, and the last section presents the conclusions of the study.

2. Literature review

In the last decades, many studies have been developed concerning modeling the labour market at a national level and especially at a regional level.

According to the American economists McConnell and Brue, the labour supply can be defined, at the same time, as: the population able to work and receiving remuneration; number of hours they want to work; the working effort.

The process of modeling labour supply involves an analysis of economic and social indicators which characterizes the labour market in terms of labour resources.

The studies carried out up to now show that the most important indicators used in the analysis and modeling labour market are: the employment rate, the unemployment rate, the labour force participation rate, the number of hours worked, the GDP per capita, the salary earnings, the labour income and the financial obligations of both employees and employers.

Most studies are focused on the estimation and the simulation of labour supply in a static framework and only a few are focused on the dynamics of labour supply (Blundel and MaCurdy, 1999).

In other studies, the analysis of labour supply is carried out taking into account the method wages are determined. Layard and Nickel (1997), Bean (1994), Scarpetta (1996) consider that the labour market is not perfectly competitive as long as wages are determined by a bargaining process between representatives of employees and employers.

Moreover, there is a connection between the labour supply and the unemployment rate, which involves an analysis on the equilibrium unemployment rate (Layard, Nickell and Jackman, 1991).

In Romania, three important variables have been selected in modeling labour market (Dobrescu, 2005b, 2006): the labour force participation rate, the unemployment rate and the labour income, per employee.

In this paper we analyze the main determinant of labour supply: labour force participation rate.

3. Data and methodology

In order to estimate a model for labour supply we will use the following indicators: labour force participation rate, average net nominal monthly salary earnings, annual expenditures to unemployed social protection, unemployment rate and GDP per capita.

The labour force participation rate (as activity rate) is defined as the ratio between the labour force and the working age population.

For all these indicators we determined growth rates indices:

$$unem = unempl_rate / unempl_rate(-1)$$

$$indemn = indemn / indemn(-1)$$

$$activ_rate = activity_r / activity_r(-1)$$

$$sal_i = s / s(-1)$$

$$salary = sal_i / cpi$$

- where s is salary earning for year t , $s(-1)$ is salary earning for year $t-1$, and cpi represents *consumer price index*. The variable sal is defined as ratio between the index of the salary growth rate (sal_i) and the consumer price index (cpi).

The statistical method used for analyzing the data and developing the econometric model is multiple linear regression.

We wish to model the dependent variable *activity rate* (ACTIV_RATE), as a function of the explanatory variables: *the logarithm of growth rate of salary* - LOG(SAL), *the logarithm of growth rate of unemployment rate* - LOG(UN), expenditures to unemployed social protection (INDEM) and the growth rate of GDP (as ratio between GDP Deflator and CPI).

The econometric equation estimated for activity rate is of the form:

$$ACTIV_RATE = C(1) + C(2)*LOG(SAL) + C(3)*LOG(UN) + C(4)*INDEM + C(5)*GDP, \text{ where}$$

-C(1) is the constant;

-C(i) with $i=1,5$, are the coefficients of the regression equation.

In order to estimate the regression coefficients we used the ordinary least squares (OLS) method. The stationarity of the series data was tested using the Augmented Dickey-Fuller (ADF) Unit Root Test and the Phillips-Perron Unit Root Test tests.

The main sources of data are *Statistical yearbooks* and the *databases of the National Institute of Statistics*. The data represents values of the indicators registered in Bucharest-Ilfov region from Romania, between 1995 and 2011.

The data was processed using the statistical software *E-Views*, version 7.1.

4. Empirical results

By applying the default procedure (OLS) for estimating the parameters of equation, we obtain the estimations of the regression coefficients, standard error, the values of the

statistics t-Student and the probabilities associated with these in the Tables 1a. and 1b.

Table 1a. Regression results

Variab.	Coeff.	Std. Error	t-Stat.	Prob.
C	0.902	0.114	7.893	0.0000
LOG(SAL)	-0.255	0.051	-4.998	0.0005
LOG(UN)	-0.223	0.040	-5.526	0.0003
INDEM	-0.115	0.032	-3.515	0.0056
GDP	0.207	0.101	2.049	0.0675

Source: Done by the author in the E-Views

We use the first or second difference to make all the series stationary.

The estimated equation is of the form:

$$\text{ACTIV_RATE} = 0.902 - 0.255 \cdot \log(\text{SAL}) - 0.233 \cdot \log(\text{UN}) - 0.115 \cdot \text{INDEM} + 0.207 \cdot \text{GDP} \quad (1)$$

We are performing the test at the 10% significance level, a p-value lower than 0.1 is taken as evidence to reject the null hypothesis of a zero coefficient.

According to the t-statistic, all parameters of the estimated equation are statistically significant, for a risk of 0.1 (all the significance levels are lower than 0.1).

Table 1b. Regression results

R-squared	0.898187
Adjusted R-squared	0.857461
S.E. of regression	0.027002
Sum squared resid	0.007291
Log likelihood	35.93460
F-statistic	22.05475
Prob(F-statistic)	0.000060
Mean dependent var	1.015082
S.D. dependent var	0.071520
Akaike info criterion	-4.124613
Schwarz criterion	-3.888597
Hannan-Quinn criter.	-4.127128
Durbin-Watson stat	2.272035

Source: Done by the author in the E-Views

For testing serial correlation we have used the classic “Durbin-Watson” statistic test. In this case Durbin-Watson (Table 1b.) is close to 2.0 (2.272035) and is consistent with no serial correlation.

In this case, R-squared = 0.898, so around 90% of the variation in the activity rate can be predicted using the model (the model has a highly comprehensive power).

The significance of the model is suggested by the F-statistic which is also high (20.05), with the Prob.(F-statistic)=0.00006.

Equation (1) represents the relation between the dependent variable ACTIV_RATE and all the other explanatory variables.

Also, as it can be observed in Table 1a. Regression results, that ACTIV_RATE is directly related to GDP (Coeff. > 0) and indirectly related to all other variable, which have negative coefficients.

For example we may conclude that, for this model, a 1% increase of the GDP is associated with an average increase of 20.7% of the dependent variable ACTIV_RATE, while holding all other predictors constant.

5. Conclusions

The results of this study show that all predictors chosen for the model estimation explain very well the activity rate as major indicator for labour supply.

As we expected, we obtain that GDP (as ratio between GDP Deflator and *consumer price index*) is directly related to the *activity rate*. Also the predictors: *salary earnings*, *expenditures to unemployed social protection* and *unemployment rate* are indirectly related to *activity rate*.

This model can be useful for a better understanding of the relationships existing in labour market between labour supply and all factors which influence it.

The results may contribute in constructing forecasts regarding future developments in labour supply and provide a crucial input for decision-makers as well as for people deciding on a future career.

Abstract

The automotive industry had to withstand the effects of the economic crisis, a fact underlined by the automobile production which had a volume decrease between 2008 and 2009. The same situation occurred on the car market in Romania, with the difference that the decline began in 2009 and it has continued up to now. Regarding the car sales, the Toyota brand was negatively affected by the crisis and the number of cars sold decreased between 2009 and 2010. The same situation is specific for S.C. Next Automobile S.A., a company that provides only Toyota and Lexus cars on the car market.

Key words: crisis, automobile, automotive industry, car market

J.E.L Code: D24, E20

1. Introduction

The crisis started in the U.S.A. has spread its effects almost worldwide, influencing a wide range of areas. In 2008 and 2009, the automotive industry produced less than in the previous years, but in 2010 and 2011 there has been a revival worldwide. The significant decrease was recorded in 2009, when production fell by 12.4%, but this decrease was compensated by an increase of 25.9% in 2010.

The figures recorded worldwide were different from what was recorded in Romania. The automotive manufacturing

companies operating in Romania have achieved positive values in the first four years of the analysis, recording a decrease of 4.5% only in 2011.

Table 1. Worldwide automobile production

	Japan	Romania	Worldwide (%)
2007	1	13,2	5,8
2008	-0,2	1,5	-3,7
2009	-31,5	20,9	-12,4
2010	21,4	18,4	25,9
2011	-12,8	-4,5	3,1

Source: www.oica.net

If 2009 was a difficult year worldwide, not the same thing happened in our country since it was the year when the automotive industry production increased by 20.9%. the automotive industry in Romania overcame the economic crisis without major problems because: it usually addresses the middle class by offering products at lower prices as compared to other competitors; it has diversified and improved the offer; the economic crisis has reduced the population's income and thus it has indirectly reduced the possibility of purchasing a more expensive car; the “Ramshackle Car Scrappage Programme” in our country and the other similar ones in the EU countries have created the chance to purchase a car, etc.

Japan had to face a series of events, more or less anticipated, some natural, some economic, so that the values recorded are negative in three years and positive only in

two years. However, 2010 is characterised by a strong recovery, reaching an increase of 21.4%.

There are differences between Romania and Japan in terms of automotive industry, both concerning the production volume and the number of employees. In Japan there are 725,000 employees working in this industry, and in our country we have 59,000 employees.

The presentation of the figures related to Japan’s automotive production is relevant to this study because the following case study refers to the sale of Japanese cars by a Romanian company.

Across Europe, Toyota Motor Europe coordinates the sales and marketing activities for Toyota and Lexus vehicles, spare parts and accessories, but also Toyota’s production in Europe. The number of direct and indirect employees that Toyota has in Europe totals approximately 94,000 people, but the investment from 1990 to date is 7 billion euros. Toyota’s activity in Europe is done through a network of 30 local marketing and sales companies in 56 states, totalling 3,000 sales centres and 9 production canterers.[7]

2. The activity of S.C. Next Automobile in the context of the economic crisis

S.C. Next Automobile S.A. is a company that operates in Pitești, Argeș County. It should be mentioned that country-wide Toyota Romania is the importer of cars with this brand. Toyota Romania opened in January 2006 in Pitești the first 3S centre (showroom, service and spare parts), spacious and modern, which allows prospective customers to know the Toyota and Lexus models.[5]

Thus, S.C. Next Automobile S.A. is a young company, only seven years old on the automotive market in Argeș County. We can determine the impact of the crisis on the company’s activity, because we can compare the values recorded in the sales, both before and after the crisis in Romania.

We have presented the dynamics of the sales during 2007 – 2012 in order to analyse the effects of the crisis on the company, mentioning that we took into consideration the first 9 months of last year. The evolution of car sales within S.C. Next Automobile Toyota S.A. is shown in Chart no. 1.

Chart 1. The evolution of car sales within Next Automobile

(per piece)

Source: www.toyotapitesti.ro

The company was in full swing when the economic crisis was felt in our country. 2007 and 2008 brought a significant increase in the number of cars sold by S.C. Next Automobile S.A. just one year after the break into the car market. In 2009 the sales decreased to almost half as compared to the previous year and the fall continued the same way in 2010. 2011 was the year when the sales began to grow and the company’s forecast for this year is that they will achieve the same number of cars sold in 2011.

Chart 2. The evolution of car sales within Next Automobile

(per piece)

Source: Auto Statistical Bulletin, www.apia.ro

We present the evolution of car sales by the importing firm Toyota Romania for the same period. Chart no. 2 shows that the importing company faced the same situation as well, thus we can say that the downward trend in sales was general and not induced only by the activities carried out within the

company which is the subject of our case study.

If in 2008 Toyota Romania recorded a decrease in the number of cars sold, not the same thing happened with S.C. Next Automobile S.A., which recorded an increase in the sales volume.

The presentation of the car sales evolution in the country, regardless of brand, is relevant for analysing the dynamics of sales for the Toyota brand versus the entire car market.

In presenting the car market we took into consideration only light vehicles because they are the object of the firm Next Automobile.

Chart 3. The evolution of light vehicles sales in Romania

(per piece)

Source: Auto Statistical Bulletin, www.apia.ro

The trend of light vehicle sales in Romania was decreasing even from the first year of our analysis. Chart no. 3 shows that 2009 was the year when the crisis was felt in our country, because the decrease in sales was significant. The downward trend is maintained on the car market in Romania and the figures of the first 9 months of this year do not encourage the hope of reaching the same value as in 2011.

Clearly, the crisis was felt within the S.C. Next Automobile S.A. strongly enough. The best example to illustrate the effect of the crisis (except the information previously provided, concerning the volume of car sales) is the number of cars used for test drives. Before the crisis in order to sell a car the company had 12 cars available for test drives, cars that automatically involved some costs. The crisis led to the decrease of the costs and one of the steps was to reduce the number of

cars used for test drives, so 6 cars were used and thus the fixed costs were reduced.

The decrease in the number of cars sold and the spending cuts have also affected the staff so it was decided to reduce the number of employees. S.C. Next Automobile S.A. is not one of the companies with a large number of employees, but the newly created situation on the market determined the company to dismiss 2 of the 4 sellers. In the mechanical and tinsmithing-painting workshops no changes occurred in the number of employees as they carry out repairs for the whole range of Toyota, Lexus and also for other car brands (in this case the repairs concern only the bodywork) and it was noticed that the income recorded in the workshops was not reduced in the same proportion as the one from the car sales.

S.C. Next Automobile S.A. managed to maintain the number of entries in the service, quite high to cover the expenses throughout the crisis. This was achieved by the continuous monitoring of the customers. Clearly, the firm's customers came back in the workshops during the warranty period offered for the cars purchased.

The company understood that reducing the sales revenue must be offset by the existing workshops within the centre. To increase the sales and to make customers loyal there are special offers, for cars and spare parts, depending on the season. These are posted both on the Company's website and on the importer's website, which gives transparency in the relationship with the clients.

The measures taken by S.C. Next Automobile S.A. to overcome the crisis are complemented by measures taken by the Japanese concerning the manufacturing company.

The analysis of the international trade, the emergence of the economic crisis, the record growth of the price per barrel of crude oil, stressing the importance of protecting the natural environment and many other aspects have led to a greater importance offered to hybrid cars.[1]

For Toyota Motor Corp. the technological strategy was focused on the hybrid models, out of the desire to become competitive on a market where the rival companies have opted for cars with low consumption. To this end, Toyota has relied on the Toyota Prius model,

which was imposed as the best hybrid in the world. Currently, the hybrid engine has also been extended to the class B and C models (Yaris, Auris), thereby ensuring easier access to the latest technology in the automotive field.

Toyota Motor Corp. is motivated by the Toyota Prius sales achieved worldwide, so that it planned to introduce 14 new hybrid cars until 2015, even though hybrid cars represent only 10% of Toyota's total sales worldwide.

In 2010, Toyota sold 808,311 Toyota and Lexus vehicles on the European market, 71,891 of which were hybrid vehicles.

The company does not obviously focus only on hybrid cars since in the future plans it aims to achieve the following objectives:

- a 2,5-liter direct – injection, Atkinson cycle engine, to be deployed first in hybrids in 2013;
- a 2-liter downsized turbocharged engine in 2014;
- a shift to CVTs in small to mid-sized vehicles;
- more six and eight speed automatic transmissions for larger cars.[8]

Toyota Motor Corp. aims to provide consumers better and cheaper products in this period of significant changes in the hope to become competitive on the automotive market.

3. Conclusions

The case study showed that the company presented was affected by the economic crisis, but to a lesser extent as compared to what happened in the automotive market in Romania. This overall good development was determined by the solutions applied by S.C. Next Automobile S.A. and by the quality of the cars offered for sale.

The proof that this situation is not unique is given by the Federal Chamber of Automotive Industries which confirmed that in Australia Toyota entered the 10th consecutive year for the best-selling brand of cars. In September Toyota managed to sell 17,300 cars in Australia, leading to a total of 159,111 sold cars for 2012 (the first 9 months), with an increase of 21.1% as compared to the first nine months of 2011.[9]

In the first quarter of 2012 Toyota also returned to the first place among the global

carmakers, having overcome the problems caused by the earthquake last year.

BrandZ Company has made “Top 100 most valuable brands in the world” and in 2011 Toyota came back on the first position after being deposed in 2010 (in this year Toyota ranked second). Toyota ranked first in the top made by BrandZ Company from 2006 to 2009. The first position was determined by the manner in which they managed the service recalls crisis of 2011 in North America and the innovative full hybrid system, used on a large number of Toyota and Lexus vehicles. The full hybrid system is a market leader recording outstanding performance in consumer and environmental protection.[3]

In 2011, Toyota's brand value increased by 11% as compared to the previous year being estimated at 17 billion euros.

Abstract

The effects of the economic crisis appeared in the services sector registering a wide spread. The services sector has been entirely affected by the crisis, but especially the field of tourism had a significant decline in 2008 and 2009. The following period offered a surprise regarding the return of tourism to the values recorded before the onset of the crisis. SC Ambassador Tours & Travels SRL managed to obtain surprising results due to the adopted decisions so that we can characterize it by the triad: availability - adaptability - dynamism.

Key-words: tourism, crisis travel agency
J.E.L. Code: D20, E00, E20

1. Introduction

Tourism, like the other sectors, has been influenced by what happened in the world economy. With the help of the relative indicators, the evolution of the world tourism is shown in Chart 1. The emergence of the economic crisis has reduced the number of tourists starting with 2008. The year 2009 represented the strongest decline in the world tourism, achieving a level of - 4.3% compared to the previous year.[2]

Although 2009 was the year in which tourism has suffered the strongest reduction, the regional tourism registered some growth namely in Africa, where it obtained a value of 5% compared with 2008. The other

regions were marked by reductions in the number of tourists compared to 2008, as follows:

- Europe (- 6%),
- Asia and Pacific (- 2%),
- America (- 5%),
- Middle East (- 6%).

Chart 1. Evolution of world tourism

Source: <http://mkt.unwto.org/en/barometer>
UNWTO World Tourism Barometer

In 2010, global tourism began to recover increasing by 6.6%. This value registered in 2010 came as a confirmation of the upward trend in international tourism in the last quarter of 2009. We should note that the positive developments in 2010 interrupted a period of 14 consecutive months of decline.

The year 2011 registered an increase of 5% compared with 2010.

The values registered at global level in the tourism sector demonstrate that this crisis was strongly influenced by only in the first two years. 2010 and 2011 represent the years when tourism has returned to the values before the crisis.

The first eight months of 2012 brought positive percentage for the world regions:

- Europe (3%)
- Asia and Pacific (7%)
- America (4%)
- Africa (6%).

In Europe the values are different according to regions: Central & Eastern Europe (+9%), Western Europe (+3%), Southern & Mediterranean Europe (+1%), Northern Europe (+0.2%).[6]

There is an increase of 5% for the tourism in the developing countries, compared with an increase of 4% in the developed countries.

The end of 2012 is expected to increase by 3% - 4% compared to the previous year, given that there was already an increase of 4% in the first 8 months of the year compared with the same period of 2011. The forecasts for next year show an increase between 2% and 4%. [6]

2. S.C. Ambassador Tours & Travels S.R.L. during the crisis

S.C. Ambassador Tours & Travels S.R.L. is a company founded in September 2007. The company operates in Pitesti, the Argeş County.

Ambassador Tours & Travels offers its customers a range of packages in various countries, cruise services, rent-a-car (limousine), school camps in the country and abroad, airline tickets and accommodation.

To analyze the evolution of the travel agency, we present the evolution of its turnover recorded by the company in the period 2007 - 2012 (9 months) in Chart 2.

The turnover went down both in 2009 and in 2011 compared to the previous years. The decrease in 2009 was in accordance with what happened in the world, this year also being the first when Romania experienced the strong effects of the crisis.

With regard to this company, it is interesting to analyze the way in which it managed to have such achievements taking

into account that the competition is fierce in this sector in Piteşti. The explanation was given by the person who runs the company by presenting the company measures to mitigate all possible negative effects of the crisis.

Chart 2. The turnover of S.C. Ambassador Tours & Travels S.R.L.
(in euro)

Source: <http://www.ambassador-travel.ro>

The evolution of the crisis across the globe has drawn the attention of all types of businesses. Consequently, analyzing the situation worldwide and in Romania, the company adopted various measures meant to lead to a better development of the company, but mostly to successfully overcome the crisis period.

The first step was the orientation of the tourism services to the people with high incomes because, obviously, they were the ones who could afford a vacation, given that a significant segment of the population had no necessary income to meet such needs. The measure is supported by statistics which show that in our country the people at risk of poverty or social exclusion is almost half of the population.

The proportion of persons at risk of poverty is determined compared to the entire population of Romania. In the last five years the proportion of this category of persons has decreased, but almost insignificantly.

Chart 3. The proportion of persons at risk of poverty or social exclusion in Romania

Source: http://epp.eurostat.ec.europa.eu/portal/page/portal/europe_2020_indicators/headline_indicators

Another adopted measure refers to offering tourism packages to the companies. This deal has been developed over time so that, this year, the revenue from travel packages from companies represents 60% of the monthly turnover. S.C. Ambassador Tours & Travels S.R.L. considers that they have managed to get their place on the market since the company was ready to provide the desired services at any time.

To become visible, the company has a permanently updated site and offers a database that provides an option to automatically register the existing deals.

The opportunity to have access to the company deals with the help of the Internet is a benefit to potential customers, especially in the current period when the new economy requires economic activities carried out at high speed. The usage of the Internet was also determined by the fact that the number of customers coming and soliciting offers directly from the working point of the travel agency was relatively low.

The decision of the company to provide new products to its customers caused its differentiation in the landscape of the travel agencies in Pitesti. This decision refers to the fact that the travel agency is a tour operator for India, South East Asia and America. At the same time, it offers tour packages in Asia (Nepal, Sri Lanka etc.) and in Scandinavia, including cruises in Europe.

The travel agency is also addressed to the elderly, and in this respect it has packages created only for that age group, and the site includes a section addressed to them. Choosing to offer packages for the elderly is supported by the fact that in Romania the population aged 60 and over represents 4.4 million people, and observing what is happening at European level. In the European Union there has been a 10% increase in the number of tourists aged 65 and over in 2011 compared with 2006. All the other age groups have decreased, especially the group aged 24-44 years, which decreased by 10%.

Chart 4. The proportion of tourists in the European Union by age groups in 2011

Source: Eurostat. Statistics in focus 43/2012

In 2011 the proportion of tourists by age groups shows that the age groups between 25-44 and 45-64 are twice the proportion of the age group of 65 and over (Chart 4). However, it is worth observing the growth in tourism registered by the age group of 65 and over compared to the previous years.

The forecasts regarding the number of population at the level of the European Union indicates that almost 30% of the population will belong to the age group of 65 and over in 2060. This group of tourists will rapidly increase and will spend more money on travel packages.[3]

The results are determined by the deals of the agency, the attentive choice of the customers to whom it is addressed, and especially the qualified personnel in the field. Over time, the agency set three staff turnovers of four people from which they selected their employees. The travel agency started with 5 employees, currently reaching a total of three employees considered to be

the most suitable. The efficient use of time and the human factor, together with the agency deals, helped them obtain very good results.[1]

3. Conclusions

Ambassador Tours & Travels Travel Agency has obtained good results in a difficult period for the economy of any country. Such results could not be registered unless the agency was characterized by availability - adaptability - dynamism.

SC Ambassador Tours & Travels SRL occupies a well deserved place within the travel agencies in Argeş due to their availability. This is one of the advantages of the agency in the surrounding economic reality and it represents the reason why customers choose it over the other.

The agency thoroughly observed the national economic trends, and adapted their deals to the consumers' real needs, especially directed to those consumers who have the potential and form the solvent demand for tourist services.

The company's dynamic nature was required to achieve the results in each of the nearly 6 years of existence on the market of tourism in Argeş.

Abstract

The firms have different behaviors on the real market. Starting from these ideas the present paper intends to identify the main explanatory elements that show the evolution of the firm.

We study the effect of time delays in evolutionary games with one population of users and two strategies. The case where the delays, corresponding to different strategies, are not the same is considered. The local stability of the stationary state for the replicator dynamics is analyzed. The stochastic evolutionary game with delay is taken into consideration.

The last part of the paper includes numerical simulations and conclusions.

Key Words: dynamics games, evolutionary games, equilibrium conditions, stability conditions, delayed differential evolutionary games

J.E.L. Classification : C730, C620, C61, D58, D00

1. Introduction

The theory of the firm put forward by R.H. Coase (1937) is based on the generalization of organizational situations in an environment dominated by the market where transaction costs are significant. [2].

Authors like O.E. Williamson (1971), S.G. Winter (1982), S. Ross (1973) H. Demsetz (1972) developed the approach initiated by. Individual firms will, in general, follow routines described by researchers, but in fact the industry is complying with the marginal principles. The industry tends towards the optimal decision, but not because of changes occurred in the

behavior of firms, where profit maximization is the result of an evolutionary process which took place in the industry. The resource-based firm theory explains performance differences between firms. Thus, the capabilities are the firm's knowledge base (they belong to the firm and not to individual agents). The need to integrate the two approaches to the theory of the firm – the contractual perspective and the one based on capabilities – is underlined by other theoreticians on this issue stating that for a better understanding of the firm, more attention should be given to the problem of distribution of knowledge/production knowledge among companies, and especially to their character.

The corporation is not only a contractual entity, it is in the same time an entity that both learns and innovates, seeking competitive advantages from economies of scale and scope based on superior capabilities. The research of Nelson and Winter, “An Evolutionary Theory of Economic Change” (1982) is the starting point for a modern literature in the field which considers the approach of the theory of the firm from an evolutionary perspective. Nelson and Winter have shown that the “orthodox” theory is objectionable primarily by the fact that the hypothesis regarding profit maximization has a normative character and is not valid in any situation [2].

Evolutionary game theory is developed by biologists for predicting population dynamics in interaction, but has found many applications in economics, social sciences, ecology and computer sciences [5], [6], [14].

Evolutionary game theory has a long history when it comes to understanding the emergence and sustainability of cooperative behavior amongst selfish and unrelated individuals at different levels of organization. The prisoner's dilemma game in particular is

frequently employed for studying the evolution of cooperative behavior among selfish individuals [16], [17].

Evolutionary game theory studies the behavior of large populations of agents who repeatedly engage in anonymous strategic interactions, that is, interactions in which each agent's outcome depends not only on his own choice, but also on the distribution of others' choices [10], [11], [12].

A feature of the evolutionary games theory describes the evolution of strategies in time. The replicator dynamics is one of the most studied evolutionary game dynamics. Evolutionary game dynamics describe how the frequencies of various strategies within a population change over time according to their payoffs (fitness) [1]. The payoffs depend on the strategies of other players and thus on the frequencies of these strategies within a population [15].

Usually, for the evolutionary games, the conditions under which equilibrium is dynamically stable are required. In the present paper we study the effect of time delay in the evolutionary game with one population of users and two strategies. We take into account both the deterministic and stochastic cases. Delayed evolutionary game dynamics are described by a system of first order nonlinear differential equations with time delays.

A discrete approach of the dynamic replicator was presented in [1].

The authors introduce the time delay in two different ways, in a social model and in a biological model.

The stability of a mixed evolutionarily stable strategy was studied.

The paper is structured as follows. In Section 2, the delayed evolutionary games are presented.

In Section 3 we study the local stability of the replicator dynamic for the evolutionary game dynamics with two strategies.

The stochastic evolutionary games are presented in Section 4. In Section 5 numerical simulations are given and in Section 6 conclusions and future research are drawn.

2. Delayed evolutionary games

A large population of players is considered. It is supposed that there are n pure strategies. A strategy of an individual is a probability distribution over the pure strategies.

We denote by $A = (ka_{ij}), i, j = 1..n$ the payoff matrix where k is a positive parameter.

Let $x \in R^n$ be the n dimensional vector whose i -th element x_i is the population share of strategy i .

Let $f_i(x)$ be the expected payoff value of strategy i when the composition of population is x . The payoff function $f = (f_i), i = 1..n$ is given by:

$$f_i(x) = k \sum_{j=1}^n a_{ij} x_j.$$

If an individual uses at time t a strategy i then it receives an expected payoff (fitness) at time $t + \tau_i$ where τ_i is the time delay of the strategy i .

Supposing that each individual of the population only uses a pure strategy $i = 1..n$, then the fitness of an individual using the strategy i at time t is $f_i(x(t - \tau_i))$, when the state of population is $x(t)$ at time t . The replicator dynamics of $x_i(t)$ is given by:

$$(1) \quad \begin{aligned} \dot{x}_i(t) &= x_i(t)(f_i(x(t - \tau_i)) - F(x(t))), \\ i &= 1..n \end{aligned}$$

where

$$F(x) = \sum_{k=1}^n x_k(t) f_k(x(t - \tau_k))$$

is the expected fitness of the population. The strategies with larger fitness are expected to propagate faster in a population.

We consider x_0 as stationary state. That means the right side of (1) is zero at x_0 . The following conditions:

$$\begin{aligned} x_{0i} &= 0 \text{ or} \\ \sum_{j=1}^n a_{ij} x_{0j} &= \sum_{k=1}^n \sum_{l=1}^n a_{kl} x_{0k} x_{0l}, \quad i = 1..n \end{aligned}$$

hold.

For the payoff matrix $A = (ka_{ij}), i, j = 1, 2$, we have [14]:

$$\begin{aligned} f_1(x(t - \tau_1)) &= k(a_{11}x_1(t - \tau_1) + a_{12}x_2(t - \tau_1)) \\ f_2(x(t - \tau_2)) &= k(a_{21}x_1(t - \tau_2) + a_{22}x_2(t - \tau_2)) \end{aligned}$$

and $F(x)$ is given by:

$$F(x(t)) = k(x_1(t)(a_{11}x_1(t-\tau_1) + a_{12}x_2(t-\tau_1)) + x_2(t)(a_{21}x_1(t-\tau_2) + a_{22}x_2(t-\tau_1)))$$

Supposing that each individual of the population only uses a pure strategy, then let $y(t)=x_1(t)$ be the proportion of individual in the population using the finite strategy at time t .

The replicator dynamic of $y(t)$ is given by:

$$(3) \quad \dot{y}(t) = -kdy(t)(1-y(t))(\alpha y(t-\tau_1) + \beta y(t-\tau_2) - y_0)$$

where

$$d = a_{21} - a_{11} + a_{12} - a_{22}, y_0 = \frac{a_{12} - a_{22}}{d},$$

$$\alpha = \frac{-a_{11} + a_{12}}{d}, \beta = \frac{a_{21} - a_{22}}{d}$$

$0 < y_0 < 1$ and y_0 is a unique interior stationary point.

For the Hawk-Dove game analyzed by Smith and Price in [13] the payoff matrix A has the components:

$$(4) \quad a_{11} = -0.5, a_{12} = 1, a_{21} = 0, a_{22} = 0.5.$$

The replicator dynamic is given by:

$$(5) \quad \dot{y}(t) = -kdy(t)(1-y(t))(1.5y(t-\tau_1) - 0.5y(t-\tau_2) - 0.5)$$

The unique interior stationary state of the equation (5) is $y_0=0.5$.

3. Local stability and Hopf bifurcation

Let $u(t)=y(t)-y_0$. Then the equation (3) is given by:

$$(6) \quad \begin{aligned} \dot{u}(t) = & -\gamma\alpha u(t-\tau_1) - \gamma\beta u(t-\tau_2) - \\ & -k(1-2y_0)\alpha u(t-\tau_1) - \\ & -k(1-2y_0)\beta u(t-\tau_2) + \\ & +k\alpha u(t)^2 u(t-\tau_1) + k\beta u(t)^2 u(t-\tau_2) \end{aligned}$$

where

$$(7) \quad \begin{aligned} \gamma & = ky_0(1-y_0), \alpha = a_{12} - a_{11}, \\ \beta & = a_{21} - a_{22} \end{aligned}$$

The linearized equation of (6) is given by:

$$(8) \quad \dot{u}(t) = -\gamma\alpha u(t-\tau_1) - \gamma\beta u(t-\tau_2)$$

It is known [8] that the steady state y_0 is asymptotically stable for (6), when $\tau_1 = \tau_2 = 0$.

The characteristic equation of (8) is:

$$(9) \quad \lambda + \gamma\alpha e^{-\lambda\tau_1} + \gamma\beta e^{-\lambda\tau_2} = 0$$

If all solutions of the characteristic equation (9) have negative real part then the stationary point $u=0$ of (8) is asymptotically stable. Then, the stationary point y_0 is asymptotically stable. If there is a solution λ of (9) with $\text{Re}(\lambda)>0$, then the trivial solution is not stable for (8).

If $\tau_1=0, \tau_2=0$, the characteristic equation (9) is given by $\lambda=-\gamma(\alpha+\beta)$. Because $\alpha+\beta=d>0$, then the root is negative. Thus, the stationary point y_0 is asymptotically stable.

Proposition 1. If $\tau_1 = \tau_2 = \tau$, the trivial solution of (8) is asymptotically stable if $\tau < \tau_0$, where:

$$(10) \quad \tau_0 = \frac{\pi}{2\gamma(\alpha + \beta)}$$

and unstable if $\tau > \tau_0$; $\tau = \tau_0$ is the Hopf bifurcation.

Proof. If $\lambda=i\omega$ is the root of equation:

$$(11) \quad \lambda + \gamma(\alpha + \beta)e^{-\lambda\tau} = 0$$

then

$$(12) \quad \omega = \gamma(\alpha + \beta)\sin(\omega\tau), \cos(\omega\tau) = 0$$

From (12) we have:

$$\omega_0 = \gamma(\alpha + \beta), \tau_0 = \frac{\pi}{2\gamma(\alpha + \beta)}.$$

Consider $\lambda = \lambda(\tau)$. By deriving the equation with respect to τ we obtain:

$$(13) \quad \frac{d\lambda(\tau)}{d\tau} = \frac{\gamma(\alpha + \beta)\lambda e^{-\lambda(\tau)\tau}}{1 - \tau\gamma(\alpha + \beta)e^{-\lambda(\tau)\tau}}$$

From (13) we have:

$$(14) \quad \left. \frac{d\lambda(\tau)}{d\tau} \right|_{\tau=\tau_0, \lambda=i\omega_0} = \frac{\omega_0^2}{1 + \tau_0^2 \omega_0^2} - \frac{i\tau_0 \omega_0}{1 + \tau_0^2 \omega_0^2}$$

and

$$\text{Re}\left(\left. \frac{d\lambda(\tau)}{d\tau} \right|_{\tau=\tau_0, \lambda=i\omega_0}\right) = \frac{\omega_0^2}{1 + \tau_0^2 \omega_0^2} > 0.$$

Thus, $\tau = \tau_0$ is the Hopf bifurcation.

Proposition 2. If $\tau_1 = 0, \tau_2 \geq 0$ the characteristic equation (9) is given by:

$$(15) \quad \lambda + \gamma\alpha + \gamma\beta e^{-\lambda\tau_2} = 0$$

- (i) When $|\beta| < |\alpha|$, the increase of τ_2 does not change the stability of the dynamical system (8). Thus, the equation (3) is stable for any $\tau_2 \geq 0$.
- (ii) When $|\beta| > |\alpha|$, the equation (3) is stable if $\tau_2 < \tau_{20}$ and unstable if $\tau_2 > \tau_{20}$, where

$$(16) \quad \tau_{20} = \frac{\arcsin\left(\frac{1}{|\beta|}\sqrt{\beta^2 - \alpha^2}\right)}{\gamma\sqrt{\beta^2 - \alpha^2}}$$

$\tau_2 = \tau_{20}$ is Hopf bifurcation.

Proof. If $\lambda = i\omega$ is a root of (15) then:
 (17)

$$\omega = \gamma\beta \sin \omega\tau_2, \quad \gamma\alpha = -\gamma\beta \cos \omega\tau_2$$

Then, $\omega^2 = \gamma(\beta^2 - \alpha^2)$. If $|\beta| < |\alpha|$ (i) holds.

If $|\beta| > \alpha$ then

$$\omega_{20} = \gamma\sqrt{\beta^2 - \alpha^2} \quad \text{and} \quad \tau_{20} = \frac{\arcsin\left(\frac{1}{|\beta|}\sqrt{\beta^2 - \alpha^2}\right)}{\gamma\sqrt{\beta^2 - \alpha^2}}$$

In a similar way as the proof of Proposition 1 we obtain:
 (18)

$$\operatorname{Re}\left(\frac{d\lambda(\tau_2)}{d\tau_2}\right)\Big|_{\tau_2=\tau_{20}, \lambda=i\omega_{20}} = \frac{\omega_{20}^2}{(1 + \tau_{20}^2\gamma\alpha)^2 + \tau_{20}^2\omega_{20}^2} > 0.$$

Hence, $\tau_2 = \tau_{20}$ is Hopf bifurcation.

Proposition 3. If $\tau_1 \geq 0, \tau_2 = 0$, the characteristic equation (9) is given by:

$$(19) \quad \lambda + \gamma\beta + \gamma\alpha e^{-\lambda\tau_1} = 0$$

When $|\beta| > |\alpha|$, the increase of τ_1 does not change the stability of the dynamical system (8). Thus, the equation (8) is stable for any $\tau_1 \geq 0$.

When $|\beta| < |\alpha|$, the equation (3) is stable if $\tau_1 < \tau_{10}$ and unstable if $\tau_2 > \tau_{10}$, where

$$\tau_{10} = \frac{\arcsin\left(\frac{1}{|\alpha|}\sqrt{\alpha^2 - \beta^2}\right)}{\gamma\sqrt{\alpha^2 - \beta^2}}$$

$\tau_1 = \tau_{10}$ is Hopf bifurcation.

The proof is similar to the proof of Proposition 2.

4. Stochastic evolutionary games

The stochastic terms arise from a variety of factors. First, there is natural variability in the payoff rate a_{ij} that results from environmental influences. Second, there is variability in the number of individuals of type i (that chooses strategy i) that actually do meet individuals of type j (that chooses strategy j) in any given time period. The relative probability that an i meets a j is of course $p_i p_j$, but the number of such interactions fluctuates.

If stochastic effects operate continually on the system, then even if they are arbitrarily small they may qualitatively change the long-run outcome. The reason is that, over the long run, it is likely that some succession of perturbations will accumulate

and kick the system out of any immediate locus of an stationary state [4].

Let (Ω, F_0, P) , $t \geq 0$ be a given probability space, and $w(t) \in \mathbf{R}$ be a scalar Wiener process defined on Ω having independent stationary Gauss increments with $w(0)=0$, $E(w(t)-w(s))=0$, and $E(w(t)w(s))=\min(t,s)$. The symbol E denotes the mathematical expectation. The sample trajectories of $w(t)$ are continuous, nowhere differentiable, and have infinite variation on any finite time interval [7]. We denote by $\xi(t)$ a stationary Gaussian white noise process with $E(\xi(t))=0$ and covariance function $E(\xi(t)\xi(s))=\delta(t-s)$, where δ is the Dirac delta function. From the theory of stochastic differential equation we understand that, formally, a white noise process $\xi(t)$ is the derivative of the Wiener process $w(t)$ [9]. The stochastic evolutionary games were introduced by Foster and Young 1990 [4].

The stochastic perturbation for the replicator dynamics (3) is given by:

$$(20) \quad \begin{aligned} \dot{y}(t) = & -kd_1 y(t)(1 - y(t))(\alpha y(t - \tau_1) + \\ & + \beta y(t - \tau_2) - y_0) + \\ & + (\sigma_1(y(t) - y_0) + \sigma_2)d_1 w(t) \end{aligned}$$

Equation (20) describes the effect of the noise perturbation on the steady state y_0 .

5. Numerical simulation

For the numerical simulations we use Maple.

We consider the replicator dynamics (5) with $k=5$.

$$\text{Then, } y_0 = 0.5, \alpha = 1.5, \beta = -0.5.$$

If $\tau_1 = \tau_2 = \tau$, we obtain $\tau_0 = 0.7853$, $\omega_0 = 2$.

For $0 \leq \tau < \tau_0$ system (5) is locally asymptotically stable.

For $\tau = \tau_0$ there is a Hopf bifurcation.

The figures 1 and 2 display the dynamics of $(t, y(t))$ and $(t, 1 - y(t))$ as well.

Fig.1 The orbit $(t, y(t))$, when $\tau_1 = \tau_2 = \tau$

Fig.2 The orbit $(t, 1-y(t))$, $\tau_1 = \tau_2 = \tau$

If $\tau_1 \geq 0, \tau_2 = 0$ we obtain $\tau_{10} = 0.43528$, $\omega_{10} = 2.8284$. The figures 3 and 4 show the dynamics of $(t, y(t))$ and $(t, 1-y(t))$ as well.

Fig.3 The orbit $(t, y(t))$, $\tau_1 \geq 0, \tau_2 = 0$

Fig.4 The orbit $(t, 1-y(t))$, $\tau_1 \geq 0, \tau_2 = 0$

If $\tau_1 = 0, \tau_2 \geq 0$, due to Proposition 2 and $|\beta| < |\alpha|$, system (5) is asymptotically stable.

When $\sigma_1 = 0.4 \sigma_2 = 0.03$ and figure 5 displays the dynamics of $(j, y(j, \omega))$.

When $\sigma_1 = 0.4 \sigma_2 = 0$ and figure 6 shows the dynamics of $(j, y(j, \omega))$ for the stochastic equation (20).

Fig.5 The orbit $(j, y(j, \omega))$,
 $\sigma_1 = 0.4 \sigma_2 = 0.03$

Fig.6 The orbit $(j, y(j, \omega))$, $\sigma_1 = 0.4 \sigma_2 = 0$

6. Conclusions

Delay is very important in the evolutionary game dynamics. In the present paper, we have considered evolutionary games with one population of users and two strategies and have studied the impact of the delay on the behavior of associated deterministic and stochastic systems.

We have studied the local stability and the existence of the Hopf bifurcation for the replicator dynamics which describe the evolution in the population of the various strategies. By analyzing the corresponding characteristic equation, we have obtained some sufficient conditions on the stability of the zero solution. Firstly, we have analyzed

the case $\tau_1 = \tau_2 = \tau$ and we have found the critical value of the delay when the Hopf bifurcation occurs. Then, with $\tau_1 = 0$ and the second delay τ_2 increased from zero, we have shown that there exists a critical value of τ_2 at which the zero solution loses its stability and the Hopf bifurcation occurs. Also, the case τ_1 increased from zero and $\tau_2 = 0$ was discussed.

The stochastic case was taken into consideration.

In our future paper we will analyze the effect on the stability for the trivial solution of the colored noise in the stochastic case and the uncertain case will be investigated.

Acknowledgments. The research was supported by the project with the title “*Real access to the real market by the simulated firm*”, POSDRU 90/2.1/S/63442.

Abstract

The present paper aims to underline the social impact of the on-line commerce and to analyse the opportunity for companies to develop their business on social networks. The concept of social commerce is defined in relation with the concept of social consumer. The main players in the social market share being the social networks the security issue must be analysed as well. Therefore, social commerce is the cornerstone of the new economy and social networks are the main medium through which it makes its presence felt. As regards advantages of social trade, they can be analyzed from three points of view: the company, the consumer and the society.

Key words: social ,network, commerce, consumer, on-line

J.E.L. Classification: M21, M31

1. Introduction

On the E-commerce market has emerged in recent years, marketing and social commerce. The implementation, organization and operation is based on a totally new technique for virtual world - conversation and social relations. Of course, the main player in the social commerce is Facebook.com social networking site with over 600 million users globally.[6]

However, we must remember that shopping through Facebook is a small piece

of what social media can offer.

Social commerce brings a new challenge for business in the commercial area, products being sold through recommendations and references from acquaintances of the consumers and the recipient's final decision to purchase the product will depend not only on its qualities, but mainly on the reference and experience concerning the product from those who recommended him[5,11]

This new marketing game is entirely attributable to social networks, especially to Facebook.

2. The concept of social commerce

Social commerce is derived from the English expression "social commerce" and is a type of commerce involving the use of social media, online media, which supports social interaction and user contributions to help purchase and sale on line of products and services.[11]

All these forms of electronic business have allowed significant changes in business environment in particular by removing geographical barriers and opening new channels of communication, collaboration and coordination between consumers, merchants and business partners. This context led the business to add a new prefix, becoming e-business, the trade to migrate to e-commerce and the Internet to become the scene of the so cold e-marketing.

What is trade through social networks? According to Wikipedia, the free encyclopedia "trade" social "is derived from

electronic commerce and involves the use of forms of social media and online content in order to support social interaction and user contributions." This approach should support the buying and selling of products / services in the social environment.[11]

Social commerce concept was developed by David Beisel and Steve Rubel, in order to include e-commerce tools to allow buyers to receive advice from trusted individuals that are useful in the buying decision. Social networks, using these tips have been found essential to increase customer confidence in a retailer against another.

An efficient message and an active communication with customers bring to the company involved in social trade, references and new customers, and replace the database with thousands of names and e-mails with a network of acquaintances, friends and customers whose conversion engine is in fact the conversation.[4]

Social commerce is a small part of electronic commerce, as shown below:

Fig. 1 Membership of social trade to traditional trade

Social commerce is already closely tied to traditional e-commerce and CRM (Customer Relationship Management).[4]

Briefly, social commerce represents the use of social networks in the context of e-commerce transactions.

3. Evolution

The long-term social trade was introduced by Yahoo in November 2005 to describe a set of online shopping tools for collaboration, such as pick lists, joint assessments for users or other contents generated for sharing information about on-line products and counseling.[6]

Monitoring social commerce is essential - Spinback research agency, part of the

marketing company Buddy Media's Facebook show that revenues in this trade will reach 30 billion dollars in 2015. Other information surprising: 90% of purchases are influenced by social and, on average, each site shared is visited by 3,2 unique visitors.

Online commerce has already a respectable age, almost 15 years, and now has a massive impact (and negative) on traditional retailers businesses that are not also online retailers. Studies predict that 20% of total retail sales will be done online in the coming years.

As social networking giant approaching IPO of \$ 5 billion, increases the pressure of Wall Street to find sources of profit growth and reduce dependence on advertising.

Of total revenues for 2011, 85% is from advertising source segment. Some investors strongly believe that the answer to this question is "f-commerce" or virtual commerce on Facebook.[10]

Amazon.com revolutionized online shopping experience by processing large volume of information that we have about customers and their purchases that turned into personalized recommendations and therefore relevant.[3]

In the last years have occurred technologies that allow users to migrate the store (via the "Apps") on the Facebook network so users do not have to exit the network to buy products. In fact, many top brands in the world, and not only, have pages on Facebook and Twitter presence, recently Google + opened its doors to companies.[4]

A number of additional current trade related social networks were identified:

- Community buyers (GDGT)
- Community group buyers (Groupon)
- Sharing information about purchases
- Purchase products
- Social Tips
- Co-shopping (eg search engine Shop Together) [6]

Social monitoring is essential-commerce statistics show that revenues in this trade will reach 30 billion dollars in 2015 and 90% of purchases are influenced by social and, on average, each site that is viewed to give share of 3.2 visitors.[9]

4. Advantages of www as a commercial means

The tremendous expansion of the Internet and especially international network (www) has led to massive consumer participation in a global market "online". Rapid adoption of the Internet as a commercial medium has led many consumers to experiment with new types of marketing methods in computerized environments. Internet development extends beyond its use as a means of communication, going to approach it as a new market.

Popularity that holds the international network (www) as a commercial medium is due to its ability to facilitate the spread of information and resources and ability to provide an effective channel for advertising, marketing and even direct distribution of certain goods and information services.

As a commercial medium, the network offers a number of advantages from the point of view both of the customer and of the seller. Advantages are the first buyer of the structural characteristics of the environment, including access to information, search mechanisms and products online that actually lead to safety buying decision.

An important advantage for the user associated with the network marketing is to access large amounts of information that helps the buyer to make important decisions to purchase a product. Another advantage is the possibility to test the products online. There is also a choice of a large number of products due to the size of the network.

Great for business is that business concluded on network transfer to client more functions through online orders. This allows the emergence of another benefit in the form of capturing customer information. Technology gives company the ability to collect and monitor consumer choice, their preferences.

Operational advantages are: small percentage of errors, save time, reduce costs through the use of electronic databases, creating new markets and retail segments, increase sales faster entry in a markets, a shorter process purchase. xxx

Social commerce brings a new challenge for local business websites, products sold passing through a number of recommendations and references from acquaintances to reach the final recipient and

its decision to purchase the product is taken only according to its qualities, but primarily references and experience in using the product of people who have recommended. And the credit for this new marketing game is entirely attributed to the social network Facebook, which, besides being managed in record time to gather a huge global audience, brought to challenge an industry expected based on rates conversion - the art of conversation and persuasion by the client message.

Despite the huge user base, Facebook is ultimately used to connect with friends, not far from the buyer first destination online. Large retailers like Gap and Nordstrom have tried and have opened shops on Facebook, closing them because of the small number of sales.

At this moment, Facebook makes money from selling advertising to manufacturers targeting potential customers hosted by social network.

Experts believe that the day when Facebook will slice a part of virtual commerce is near, because it needs other sources of profit.

An example is the relation established of Facebook with Zynga online games maker. Revenues generated by the sale of virtual goods used in games, Facebook take 30%. [2]

Players pay for virtual goods using Facebook credits, a virtual currency, and if the situation demands it, can be used for physical goods.

The reasons for which a company wants to launch social networks are: ability to expand customers; drastic reduction of costs for distribution and customer service; better promotion and faster products and services. That's why we can tell that the advantages of social commerce, they can be analyzed from three points of view: the company, the consumer and society.

5. Features of the social commerce

Social commerce is a small part of the electronic commerce, exists from a time and was propagated by Amazon and Ebay.

In order to successfully use of social media to increase sales specific methods should be used that takes into account the six pillars of social commerce:

1. **Visibility** - social networks are an ideal environment for the submission of offers, because a strong social presence can generate more traffic.
2. **Reputation**-which means creating an image of a brand to provide an identity. Otherwise, setting up an online community requires time and patience.
3. **Proximity**- meaning that social media allows to shorten the distance between brand or products and the potential customers.
4. **Contextualization**- which means that products and services could reach the right place at the right time and for the right customers. In this context, Canon may be an example of a brand that has managed to gather members of a formal group.
5. **Recommendation**- there are many social platforms that could help accomplish the next move.
6. **Customer support**- Social Media is the best place to demonstrate customer proximity, where people meet and talk about their experiences shopping. [1,2]

6. The social consumer

The social consumer is considered the person who is susceptible to:

-consuming information and learning about breaking news via sites such as Twitter and Facebook;

-to be informed about new products and social media channels;

- not applying for promotions and trusts only the relevant information;

- expect brands to be active on the same social media sites which he frequently consults.

- brands must to respond quickly to their requirements.[5]

In order to effectively sell products to consumers it is necessary a good understanding of the attitudes and behavior patterns of the target audience. A third of social network users say they would be more likely to buy a product or service used or recommended by a friend on a social networking site than to follow an advertisement.[6]

Psychologists have defined six universal

traits that have been observed at shoppers and are now seen in the case of social commerce, as follows:

- **Social Proof**- the main part of customers requesting information from friends and family members on social networking sites for advice before purchasing products.

- **Authority**: 77% of online shoppers use the opinions of other customers to make purchasing decisions

- **Deficiency**: get exclusive offers that they can redeem via social networks, like Facebook.

- **Like**: the 50% of shoppers have made a purchase based on recommendations from other people and follow them on social networks.

- **Consistency**: Purchases made by trusted brands reinforce the future shopping patterns.

- **Reciprocity**: in order to maintain social equity and to repay favors.

7. Information security

Most social networking users are skeptical about the disclosure of information on their credit cards used for payments made on a commercial site such as Twitter or Facebook.[1]

Moreover, women, that tend to outnumber men in most social networks are more likely than them and say they are uncomfortable handing over credit card information in order to complete transactions on social networking sites.

Retrieving information about the customer on site or online order processing, leads to the need to use a system of "server" secure. Among other things, this allows encoding of credit card data entered in an order form. Encoding is performed before sending data to the server the client browser.

Although it is not necessarily needed a secure server to take orders on-line, however, many users refuse to buy products through a website that does not have such a system.

Conclusions

All these forms of electronic business has made possible significant changes in the business environment in particular by removing geographical barriers and opening new lines of communication, collaboration and coordination between consumers, traders

and business partners. This context led the business to add a new prefix are becoming e-business, e-commerce trade and migrate to the Internet has become the scene to develop the electronic marketing (e-marketing).

Social commerce is the factor of re-humanizing online commerce, which is a challenge for people in marketing and calls for a new approach attitude to an area that is redesigned from scratch. The main question that marketers are looking for a response is "how to use and which method to have a highest possible ROI?"

Today, the social commerce has been extended to include the range of social media tools and content used in the context of e-commerce, especially in the fashion industry. Examples of social commerce include customer ratings and reviews, user recommendations and referrals social, commercial tools (sharing the act of shopping online), forums and communities, social applications and social advertising.

Therefore, social commerce is the cornerstone of the new economy, and social networks are the main medium through which it makes its presence felt.

Financial Innovations and the Actual Crisis

Suciu Titus

Transilvania University Brasov

Faculty of Economic Sciences and Business Administration

titus_suciu68@yahoo.com

Abstract

The paper presents the main financial innovations such as: floating-rate notes, adjustable-rate mortgages, financial derivatives, junk bonds, securitization, collateralized debt obligations (CDO). We consider that the CDO are the main responsible for the present financial crisis and this is the reason for which we devoted to them a more developed paragraph. We think that the solution regarding the banks' non-performing assets is to take a bank with problems and splitting it in two: a "good" bank, where all performing assets should go and a "bad" bank, which should contain all the others. At conclusions the paper includes a paragraph advancing solutions suggested by the author to overcome the economic crisis in Romania.

Key words: crisis, solutions, securitization, collateralized debt obligations

JEL Classification: G01

1. Introduction

The process of financial innovation has transformed the entire financial system. Like other industries, the financial industry is in business to earn profits by selling its products. To maximize their products, financial institutions develop new products to satisfy their own needs as well as those of their customers; in other words, innovation is driven by the desire to get rich. This view of the innovation process leads to the following simple analysis: A change in the financial environment will stimulate a search by financial institutions for innovations that are likely to be profitable. The rapid advance in

computer technology changed supply conditions. In addition, financial regulations became more burdensome. To survive in the new economic environment, financial institutions had to research and develop new products and services that would meet customer needs and prove profitable, a process referred to as *financial engineering*. In their case, necessity was the mother of innovation. There are three basic types of financial innovation: responses to changes in demand conditions, responses to changes in supply conditions and avoidance of regulations.

The present economic situation determines the companies to search for solutions to continue their activity in optimal conditions to avoid bankruptcy. The economic instability makes some measures necessary such as: the strict control of all the economic operations, a responsible resource management, filtering and lowering the costs within the possibilities, and the adjustment of the strategies to the new market conditions [1].

2. Financial Innovations

Floating-Rate Notes .Depository institutions, primarily banks, have been the major issuers of floating-rate notes. A floating-rate note is a debt instrument whose interest rate changes periodically according to some interest rate benchmark. A common benchmark is the London Interbank Offered Rate (LIBOR), which is an interest rate that reflects the marginal, overnight, or short-term wholesale cost of funds for the global banking system.

Adjustable-Rate Mortgages. A mortgage is a pledge of real estate to secure the payment of a loan. Prior to the 1980s, the interest rate on mortgage loans was fixed throughout the life of

the loan, typically for between 15 and 30 years. Financial institutions find that lending is more attractive if interest-rate risk is lower. They would not want to make a mortgage loan at a 10% interest rate and two months later find that they could obtain 12% in interest on the same mortgage.

To reduce interest-rate risk, in 1975 savings and loan in California began to issue adjustable-rate mortgages; that is, mortgage loans on which the interest rate changes when a market interest rate (usually the Treasury bill rate) changes. Initially, an adjustable-rate mortgage might have a 5% interest rate. In six months, this interest rate might increase or decrease by the amount of the increase or decrease in, say, the six-month Treasury bill rate and the mortgage payment would change. Because adjustable-rate mortgage allow mortgage-issuing institutions to earn higher interest rates on mortgages when rate rise, profits are kept higher during these periods.

This attractive feature of adjustable-rate mortgages has encouraged mortgage-issuing institutions to issue adjustable-rate mortgages with lower initial interest rates than on conventional fixed-rate mortgages, making them popular with many households.

Financial Derivatives. Given the greater demand for the reduction of interest-rate risk, commodity exchanges such as the Chicago Board of Trade recognized that if they could develop a product that would help investors and financial institutions to protect themselves from, or hedge, interest-rate risk, then they could make profits by selling this new instrument. Futures contracts, in which the seller agrees to provide a certain standardized commodity to the buyer on a specific future date at an agreed price, had been around for a long time.

Officials at the Chicago Board of Trade realized that if they created futures contracts in financial instruments, which are called financial derivatives because their payoffs are linked to previously issued securities, they could be used to hedge risk. The most important source of the changes in supply conditions that stimulate financial innovation has been the improvement in computer and telecommunications technology.

This technology, called information technology, has had two effects: First, it has lowered the cost of processing financial transactions, making it profitable for financial institutions to create new financial products and services for the public. Second, it has made it easier for investors to acquire information, thereby making it easier for firms to issue securities.

Junk Bonds. Before the advent of computers and advanced telecommunications, it was difficult to acquire information about the financial situation of firms that might want to sell securities. Because of the difficulty in screening out bad from good credit risks, the only firms that were able to sell bonds were very well established corporations that had high credit ratings.

Before the 1980s, then, only corporations that could issue bonds with ratings of Baa or above could raise funds by selling newly issued bonds. Some firms that had fallen on bad times, so-called *fallen angels*, had previously issued long-term corporate bonds that now had ratings that fallen below Baa, bonds that were pejoratively dubbed „junk bonds”.

Securitization. An important example of a financial innovation arising from improvements in both transaction and information technology is securitization, one of the most important financial innovations in the past two decades.

Securitization is the process of transforming otherwise illiquid financial assets (such as residential mortgages, auto loans), which have typically been the bread and butter of banking institutions, into marketable capital market securities.

Improvements in the ability to acquire information have made it easier to sell marketable capital markets securities. By dividing the portfolio of loans into standardized amounts, the financial institutions can then sell the claims to these interest and principal payments to third parties as securities. The standardized amounts of these securitized loans make them liquid securities and the fact that they are made up of a bundle of loans helps diversify risk, making them desirable. The financial institution selling the securitized loans makes a profit by servicing the loans and

charging a fee to the third party for this service.
[2]

3. Financial Innovation and CDO

Many speculative balloons start when a burst of innovation or of technological progress foreshadows the dawns of a new economy. I think financial innovation represents the most important cause of the present global financial crisis. Where did it come from? How did it determine the emergence of the present financial crisis? A possible judicial answer to this could be the Sarbanes-Oxley law, officially named „Public Company Accounting Reform and Investor Protection Act” which was adopted in 2002 in the United States in order to review the accounting practices and to rebuild the community’s confidence in the Public Companies Financial Reports. What were the events that triggered the implementation of such ruling? The answer lays in the over-displayed cases of corporate frauds as Enron, WorldCom and other famous bankruptcy scandals, all of them having the same roots into the „creative accounting” practices. This concept refers to diverse actions taken in order to bewilder, hide and embellish the economic and financial reality of the companies throughout fraud Accounting Reports. Business environment is anyway, subject to various demands to rule against sophistication of corporate frauds, thus legislation towards ethics in business was to be expected [3].

In the 1970s, the National State Association for Mortgage Loans (Ginnie Mae) issued the first securities guaranteed by mortgage loans. That is, it developed a portfolio of the loans granted, and then issued bonds based on this portfolio. Therefore, instead of waiting for thirty years to recover its money from a mortgage loan, Ginnie Mae was able to cash a significant amount of money on the spot, from the bond buyers.

In their turn, investors who were buying these new bonds got a certain share of the income flows cashed from the owners who were paying their loan instalments. This scheme was revolutionary. Thanks to this procedure, rapidly named “securitization” or “titlization”, some non-liquid assets such as

mortgage loans could now be put together and turned into liquid assets, tradable on the free market. These new instruments had a name as well: mortgage-backed securities. In time, other representative government organizations, such as Freddie Mac and Fannie Mae, entered the securitization business. They were joined by investment banks, brokerage companies and residential construction companies. But what was the investment banks’ role?

Investment banks were usually the institutions in charge of developing portfolios of mortgage bonds. In partnership with the one who had closed the mortgage loan contracts, the investment bank organized a “special purpose vehicle” (SPV). This SPV then issued bonds or securities guaranteed with mortgage receivables, which they sold to investors. In this way everybody got what they wanted. The house owner got a loan, and the mortgage broker and the assessor got their commissions. The mortgage lender made a nice profit rapidly, without having to wait for thirty years. The investment bank cashed a fat commission for the assistance granted, although it had gotten rid of the loan risk, placing it to someone else. And the investors who bought the bonds were enthusiastically waiting to cash up a constant flow of incomes, as the house owners were paying back their mortgages.

Although the securities guaranteed with mortgage loans became more popular in the 1980s, it was only in the 1990s that they started gaining momentum. The new concept was quite simple: it is much better to sell mortgages and get a nice profit in your pocket in advance, than keep them in your balance accounts and risk that one day they might become non-performing. As securitization became a very used procedure in the 1990s and the 2000s, mortgage brokers, loan assessors, commercial banks, investment banks and even public institutions such as Fannie Mae and Freddie Mac stopped thoroughly and cautiously checking up mortgage fanciers. Consequently, applicants invented inexistent incomes and brought no written proof of their salary. The most scandalous of these were named “NINJA”, by the acronym of “No Income, No Job or Assets”- (the beneficiary of the loan had neither incomes, nor job nor assets). You

may ask what rating agencies did, under the circumstances. In theory, rating agencies should have made an alarm call. But they had serious reasons to grant high ratings to the securities they were analysing. Acting in this way, they were getting a good commission precisely from the entities they were rating, plus the promise of some future contracts. Had they made a realistic rating, they could have lost the commission, plus any other future commissions. For them, it was much more profitable to grant a bank the financial equivalent of good behaviour grades and to hope that nothing wrong would happen. In the eve of the crisis, over half of the rating companies' profits were based on AAA ratings, many of which undeserved.

But how did the financial securitization evolve? Anybody who holds a normal security, guaranteed with a mortgage, naturally undertakes a certain degree of risk: the owner of the mortgaged building might not reimburse the loan. In this direction, “financial engineers” on Wall Street came up with an elegant solution: Collateralized Debt Obligations – CDO. A CDO emission was going to be divided into tranches. The simplest CDOs had only three tranches: the minimum eligible – the equity tranche, the middle tranche – the mezzanine tranche) and the first rank tranche, called senior tranche. Buyers in the minimum eligible tranche got the highest profit, but also took over the highest risk. If any debtor in the mortgage loan portfolio did not observe their obligations, the loss resulted was felt firstly by equity tranche holders. The mezzanine tranche was less risky, but the buyers also bore losses, if debtors didn't pay their loans. The senior tranche was at the top. The holders of this tranche were the first paid when the receivables were cashed, and the last that bore losses in case of payment failure.

Under this entire impressive edifice of structured financing something was rotten in the USA. It was based on a pile of substandard, dubious and risky mortgage loans, graded with BBB rating, which were put together and stuck under a mortgage security, also rated BBB. This was afterwards divided into tranches and the senior tranche – which represented about 80% of the total mortgages used – got an AAA

rating. The procedure turned some dubious assets into a gilded security, although the mortgage assets portfolio it was based on remained just as risky as before.

Securitization didn't stop here. It then continued with combining some CDOs with other CDOs, and then dividing them into tranches. These CDOs, based on other CDOs (called “CDOs square”), fade, however, compared with other products designed in Wall Street laboratories: CDOs from CDOs on CDOs, or CDO-cubed. These are joined by synthetic CDOs which put together a pile of non-payment risk insurances to imitate a basic CDO. Some of these esoteric products had more than three tranches, and sometimes reached fifty or even one hundred, each of them representing a certain level of risk tolerance.

Looking back, the danger of this kind of financial innovation is easy to understand. Endlessly dividing and “hashing” the loan risk and transferring it in all direction, the system found itself operating with financial tools that were unknown, complex, non-liquid and dangerous. [4]

Daniel Dăianu identifies the following causes for the American crisis: the failures of the rating agencies, the rise of the systematic risk, the distorted payrolls, the conflicts of interests, the casino transactions, the absence of a regulating system, the speculations, the inadequate financial system, the repelling of the Glass-Steagall Act, the securities based on mortgages, the toxicity of the packing and repacking of the financial products, the managers' irresponsible conduct, the managers' payrolls, the toxic quantitative models, the overrating of the entrepreneurial spirit, the instability of the financial markets, the Ponzi Scheme on NASDAQ; but he considers the essential cause to be greed. [5]

The experience shows that the first to react to a crisis are the local investors who tend to gather information from various sources and who also take a higher risk. They are, generally speaking, the first who sell the national assets. Still, the contamination really starts to spread when the foreign investors decide to leave the respective country, as well as other countries which are in a similar situation and which are

considered to be the virtual candidates to the next crisis. [6]

4. Solutions

Daniel Dăianu suggests three solutions: an understanding of the systemic risks at national level, of the contamination and contagion effects; the need to regulate the financial markets as a whole (including the so-called parallel banking system, of the rating agencies, of the payroll bands, and a process of securitizing the loans) and the need for common accounting standards, regulated globally.[7]

The question about what has to be done with the banks' non-performing assets has been threatening in the air ever since the beginning of the crisis. As long as there are loans not paid back, and as long as the securities derived from these loans keep losing value, banks will not be able to, or wish to grant loans. As a solution, the governments have launched a variety of proposals, all meant to extract the respective assets and dispose of them, thus giving banks the freedom to resume operations.

a) The most promising proposal asked banks to go through a radical surgical intervention which involved taking a bank with problems and splitting it into two: a “good” bank, where all performing assets should go, and a “bad” bank, which should contain all the others. The “good” bank could then start granting loans, attracting money and capital and resuming its normal activity. In exchange for getting rid of its toxic residues, the bank shareholders and creditors without firm guarantees were to take over a proportional loss to the non-performing assets disbranched from the balance and concentrated in the “bad” bank. In its turn, this was going to be managed by some private investors who hoped to make profit from a correct liquidation of its assets.

b) Another option is that the government should buy the banks' toxic assets. The price paid would be established through “reverse auction” in which the

sellers bid, by displaying the lowest price they are willing to accept in order to get rid of a certain asset. It remains to be seen whether this system manages to set an accurate price for the assets. Banks participating in the auction would have all reasons to prevent a too sharp price fall.

c) A third option for the government would be to form a sort of insurance alliance with the banks in difficulty. Let's suppose a bank has toxic assets that were initially worth about USD 50 billion. In fact, the bank agrees to pay a deductible franchise – for example, it would take over the losses of the first USD 3 billion - and the government would cover most of any other additional losses over the rest of 47 billion. In exchange for the guarantee that it will not have to pay “in advance” more than an USD 3 billion loss, the bank pays an insurance premium to the government. This method devolves upon the state to subsidise the losses registered by some private banks.

As far as the financial system is concerned, the basic idea is that the government should subsidise the private investors who accept to buy the toxic assets and thus to remove them from the banks facing difficulties. This is precisely the idea standing at the basis of the public-private system investment plan, which was launched in 2009. The shortcomings of this method consisted in the fact that these low-interest loans are without right to appeal, that is, if things don't go well, investors are allowed not to pay them, without being penalised. [8]

We think that the first solution is the best (that is, the idea of dividing and transferring non-performing assets into a “bad” bank). This approach reduces government-borne costs to the minimum, leaving the problem in private hands. Consequently, it draws the line on moral hazard and gives banks that have reborn all possible reasons to grant loans again. But it also forces investors to undertake some loss, and therefore to suffer now, not later.

For the companies that are “too big to be left sinking” there is a simple solution, and that is dividing them.

5. Conclusions

The solutions to overcome the economic crisis in Romania are:

- a better absorption of the structural funds,
- investments in infrastructure, education, research, health and agriculture,
- reduction of taxes and fees,
- reduction in the number of taxes, starting with those whose administrative costs are superior to effective collected ones,
- supporting as a priority small and medium private companies, applying new supporting schemes by the state in order to stimulate their production and innovation,
- awarding financial aid for investments and the introduction of a system of paying off debts accelerated for all the productive investments,
- a five percent cut for payment of taxes on term,
- both state companies and civil contributors should be equally treated regarding interests and penalties for not paying on term,
- attributing state orders by means of a transparent system of bidding, and public works performed in a public-private partnership,
- reducing tax dodging,
- privatization of several non-efficient companies such as Tarom, Oltchim, Hidroelectrica, CFR,
- diminishing the number of ministries and governmental agencies,
- orientation of export goods towards the largest markets such as US, China, India, Russia, Brazil, Indonesia.

Financial globalization makes it easier for crises to propagate from one economy to another, together with the import of financial products and mechanisms and with the opening of national markets for foreign investors.

Successfully overcoming the crisis means assuming some public expense which would have the role to relaunch the economic engine, giving priority to those which are performed in sectors linked to the economic increase.

Financial markets are unstable, their rebalancing cannot possibly be self-achieved and moreover, as long as financial markets exist, expansion cycles and recession will exist too.

Challenges Met by Romania in Overcoming the Economic Crisis

Suciu Titus

Transilvania University Brasov

Faculty of Economic Sciences and Business Administration

titus_suciu68@yahoo.com

Abstract

This paper advances general solutions that should be considered by governments to overcome the financial crisis. The core of this paper focuses on the measures undertaken by the Government Boc and also on the measures proposed by the foreign investors in Romania. The author suggests a number of measures to be taken in order to limit the effects of crisis, such as: a better absorption of EU Funds, investments in infrastructure, education, research, taxes reduction and increase of Romanian exports on the major emergent markets.

Key words: crisis, solutions, reduction, measures

JEL Classification: G01

1. Introduction

There are more causes for the economic crisis from Romania, such as: the much too fast opening of the capital account; the consumerist fever, based on the short-term external financing; the procyclical fiscal and budgetary policy, based on the flat income tax and on the very accentuated growth of the budgetary salaries, under the circumstances when the economy was still expanding; the delay of the structural reforms. Of all these, the fever of the excessive consumerism remains the main cause of the Romanian economic crisis.

The main reason for the crisis that started in the States and then extended to global level by a contagiousness effect is the excess of financial investments. The main responsible is the banking system from the shadow, which includes hedge funds, structured investment vehicles, non-banking mortgage dealers and all the derivatives associated to these, together with mortgage loans.

2. Solutions

The economic literature proposes the following solutions for overcoming the financial crisis: to raise the salary taxes for the richest part of the population; to levy taxes for the financial transactions; to reform the financial sector, including the segregation of the commercial banks and the investment banks, so that the commercial banks are limited to grant loans and maintain them in their portfolio; the innovative derivatives should be approved by a regulating body; all the operations produced in the banks should be recorded in the statements; to eliminate the off-balance financial vehicles; to create public rating agencies; a strict control for the shadow banking system; to create a guarantee fund, financed by the financial institutions and to modify the structure of the incentives which award the risky conduct, including the introduction of clauses which stipulate that the managers who are granted awards for performances which prove to be false are bond to return the prizes [1]

Further on, we present a set of rules proposed in the specific literature: individual initiative should not be instigated through bonus or incentives pay, not without the implication that if there are losses as a consequence of the risks taken, they should be paid for; (to clean the debts, to cut the debts from taxes and markets organized on derivatives, by imposing high percents of coverage from self financed capital, of about 90%; to eliminate the fiscal paradises; to ban, inside the European zone, the so-called “credit default swap” (CDS) products; to nationalize the stock exchange enterprises; to promote an anti-speculative monetary policy and enhance the application of the prudential regulations; to modify the accounting regulations in a way that allows the enterprises to renounce the actual value and correct the account value according to the

impact of the market decrease; to regulate publicly the assessment agencies; to elaborate a deontological code for the multinational companies, in order to implement the social function of the enterprise; to train the financial officers for their role; to rebuild the primary function of the futures market, banning the speculations; to favour the profession of risk management officer; to reform the financial institutions, IMF and World Bank, meaning to reinforce the financial stability and reestablish the credit flux to the member countries.[2]

Daniel Dăianu also proposes three solutions which could be counted as learning: understanding of the systemic risks at national level, of the contamination and contagion effects; the need to regulate the financial markets as a whole (including the so-called parallel banking system, of the rating agencies, of the payroll bands, and a process of securitizing the loans) and the need for common accounting standards, regulated globally [3]

In Great Britain, the government decides the state's intervention in the banks Northern Rock and Bradford Bingley and injects EUR 44.8 billion in saving, through nationalization, the banks Royal Bank of Scotland, Halifax Bank of Scotland and Lloyd TSB. Therefore, the generalised bankruptcy of the British banking system could be avoided. Gordon Brown develops a relaunch plan of EUR 24.2 billion, that is, % of the GDP, having as a main element cutting the VAT from 17.5% to 15%.[4]

Here area few of the austerity measures taken by some of the member states of the EU – the example of the Poland: the cut of the expenses for goods and services; the Czech Republic: dismissals from the budgetary sector; Hungary: the cut of the bonuses for the budgetary sector; the freezing of the salaries in the budgetary sector, of pensions and other social benefits; the cut of subventions for heating and lodging; the cut of the allowances for families, for children, sickness and maternity leave and the rise of the VAT.[5]

It must be noticed that the anti-crisis plans in the Eastern Europe are focused on the control of the expenditures, a typically orthodox and monetarist approach. This attempt to reduce the expenditures in the budget sector during the recession

exemplifies the paradox of saving. The more a country tries to economize, the more the investments and revenues decrease, and, thus, the resources for saving drop as well. In other words, the cut of the expenses will be further seen in the diminishing of the revenue.

3. Challenges for Romania

In order to outrun the present economic crisis, a national program of investments and fiscal stimulants is necessary, to favour the consumer and the business with a low credit level.

In what concerns the loan from the IMF, the following should be stated: Romania has concluded a loan agreement in May 2009 for 12,9 billion euros, to which are added other loans from the World Bank and the European Union. This loan was more of an emergency measure than a safety measure. Without the money from the IMF, Romania would have faced the real problem of not being able to pay the overhead expenses of the state and the exchange rate would have dropped significantly. But those problems have not been solved, only postponed.

The conditions attached to the IMF Agreement were the following: the law of the single wage grid for the budgetary sector, a new coherent law for pensions, legislation concerning fiscal responsibility, tax administration reforms and institutional reforms for the local authorities, amendments for the bank law and the deposits securitization law.

The main measure against the crisis in 2009 was the “First House” program, to which a budget of 1 million euros was allotted. But this program stimulates exactly the sectors responsible for the burst of the crisis in Romania, that is the loans for population and the construction sector. As we have already seen, the old inhabitanancies were sold and new apartments were not built. In order to be efficient, the program should be redirected towards building new apartments or the thermal rehabilitation of the buildings. This would also create new jobs.

As for the dismissals from the budgetary sector, we have to say that economic stimulation will be even more difficult in the circumstances of increased unemployment – one hundred thousands of budgeters laid off. We consider that the solution for a healthy

economic stimulation in Romania is the increase of the employment. If possibilities would be created for one in four Romanians to find employment, the impact would be huge – one million of four producing added value and paying taxes, consuming and economizing. But where is the money for these measures? It could be found by tax reformation and new favourable of crediting the small and middle-size business.

Following negotiations with IMF, the Government of Romania adopted a series of austerity measures, meant to limit the effects of the economic crisis and encouraging a possible economic relaunch.

Austerity measures adopted:

A) reduction by 25% of the expenses in the public system starting June 2009,

B) reduction by 15% of pensions starting June 1st;

There will be an exception for children's allocations and for salaries under RON 600.

Measures for economic relaunch:

1. the payment of government's debts to companies (EUR 1bn);

2. insuring governmental investment programs:

- investments in rural economy, support for SMEs in the rural area, rural roads, rural infrastructure (EUR1 billion);

- investments in environmental infrastructure (EUR 0.7 billion);

- continuation of investment programs through relevant companies in the Ministry of Economy (EUR 2bn);

- 4,000 ANL residential units;

- 1,000 houses for specialists;

- rehabilitation of 500 km of county roads;

- rehabilitation of 400km of national roads;

- finalization of works on ring roads: Sibiu, Cluj, Oradea, Lugoj, Iași, Constanța;

- continuation of works on the motorways: Transilvania, Bucharest - Ploiești, Constanța-Cernavodă, Arad-Timișoara;

- continuation of the programs “Scrap Car”, “First Silo”, “First House”;

- granting governmental guarantees to companies that got European financing but are not able to insure co-financing;

- granting further support to companies that hire unemployed people.

3. Program to fight against tax evasion;

4. Limiting public acquisitions. [6]

I have to highlight that the measure to reduce pensions by 15% was declared unconstitutional by the Constitutional Court, and therefore the Government decided to increase the VAT from 19% to 24%.

The imminence of a third year of economic contraction worries foreign investors. Therefore, The Foreign Investors Council (FIC) proposes authorities a set of measures, the following of which are considered a priority:

1) Bank for SMEs. This measure would generate a 0.4% rise of the revenues to the state budget and would create 9,000 new jobs.

2) Fast privatization of the state companies. FIC proposes a transparent privatization of a share of some state companies, by listing them on the Stock Exchange and through strategic sales, including of the minority stakes. The money thus made should be redirected to agriculture. The estimated impact of this measure would lead to a 2% rise of the GDP.

3) Private security companies at the Customs. Businesspeople ask for a simplification of the tax payment methods, simultaneous with focussing checkups on companies that present a high risk rate. In addition, FIC is willing to hire, on its personal expense, a security company to improve customs checkups. By reducing tax evasion, about EUR 460 million would be available every year for investments. FIC estimates the setting up of 46,500 new jobs.

4) First House should be made possible for the second house as well. FIC promotes the setting up of a Registry of Outstanding Debts registered by the state budget. As far as European funds are concerned, the measure suggested is outsourcing or centralising fund access process management, which would lead to a 3.6% increase of the GDP by 2015. At the same time, the bank representatives in the Council claim that the project First House has to be continued, but in a different form. They are for extending it for the clients who already own a house, simultaneously with reducing the state guarantees to only 50% of the loan value.

5) Hosting the European Football Championship in 2020, chance for infrastructure and tourism. This project, in partnership with Hungary, would have a

major financial impact on the economy as there will be new airports, highways, hotels and stadiums.

FIC reunites over 110 companies. Their cumulated investments in Romania exceed EUR 30 billion and represent almost two thirds of the total foreign direct investments made since 1990 so far.

Putting into practice the measures mentioned above would lead to a rise by 11.6% in GDP by 2015. Another more important effect of these measures would be the creation of 250,000 new jobs, all at a cost that does not exceed 0.7% of the GDP.[7] This shows that, unlike the measures taken by the government so far, which lead to a reduction of the number of jobs, there are measures that can have a positive impact on the economy and jobs.

Another aspect is not being able to access a direct factor in competitiveness improvement is to ignore the very first rule of entering in a new environment: know your competitors and learn how to act in order to create a competitive advantage. For Romania, there is a significant percentage (not aggregated data available) of funds returned to the EU due to failure to absorb. This metric follows the capability of the Romanian institutions to create projects and to allot funding according to the EU regulations. [8]

4. Conclusions

Within the context of the present economy, the present crisis demands for the reevaluation of the entire body of regulations, so that the systemic risks came out of the less benign financial innovations can be controlled. This enterprise should be undertaken with pragmatism and open-mindedly; it implies for some to get away from the imprisonment of the market fundamentalism. And one more thing should be added to these: it is not the real economy that should serve the financial one, but the other way round. When the financial economy gets to serve for itself, the consequences can be harmful for the economy as a whole... The capitalist economy needs a moral compass and it should guide the conduct of those who manage the private finances. And those who have no respect for decency in business and

do not accept the responsibility of their actions should be rightfully penalized, in one form or another. [9]

In what concerns the fiscal reform in Romania, we have two propositions: taxes for property and progressive taxes for outcome. For the fiscal reformation, a proposition is to levy a tax for property (depending of the number of rooms or real estate properties of an owner) and a progressive tax for salaries, in four steps. These taxes serve the purpose to redistribute the costs of the crisis to those who have bigger financial power.

After analyzing the real situation of the Romanian economy, Adrian Vasilescu advances the following solutions:

- investments in know-how and infrastructure,
- stimulation of internal production,
- attracting foreign direct investments,
- increase of competitiveness,
- improving the work organisation,
- increase of the number of employees paying taxes.

On short, he emphasizes the triad management-leadership-collaboration.[10]

In what concerns the “First House” program, it should be improved and extended to new buildings or towards the rural area. It should be completed with the “First Barn” program, for the young persons who are willing to invest in agriculture. For the young persons under 30s with entrepreneurial spirit, an appropriate program would be the “First Business”. It grants a starting capital of 5000 lei, under the condition of employing at least three people, and tax exemption for profit for 3 years. The government should also invest in infrastructure (building of highways, sewage and heating infrastructure, modernization of the railways). Also, an industrial policy for a period of 25 years, with clear stating of the objectives, opportunities and tasks would be needed. Among the envisaged domains should be the car industry, the agricultural building, and factories placed under state management should be built. Another important domain would be the software, produced with well-paid local people in Romanian companies. A group of companies could be placed in Iași, where young professionals from the Republic of Moldova and Ukraine could be also attracted.

In order that Romania should overcome the crisis we propose the following solutions:

- 1) Investments in infrastructure, industry, agriculture;
- 2) A better absorption of the structural funds;
- 3) Extending the “Scrap car” program for tractors and farming machines;
- 4) Reduction of the flat tax from 16% to 14%;
- 5) Non-taxation of reinvested profit;
- 6) Reduction of the number of ministries to 7 and of the governmental agencies by 60%;
- 7) Introduction of the fast amortization system for all productive investments;
- 8) Cutting budget expenses on public acquisitions;
- 9) The cost of the mobile telephony conversations should be paid by the holder, regardless of the position;
- 10) Reduction by 5% for taxes paid in due time;
- 11) VAT payment on collecting the invoice money;
- 12) Helping young people by reducing tax per salary by 10% on hiring;
- 13) Setting up a wholesale market network to take delivery of fruit and vegetables;
- 14) The unblocking of the armament industry;
- 15) Taxing 30% in units serving fast food products;
- 16) Institutional support for promoting Romanian products for export on other markets than the EU such as: China, India, Brazil, Russia;
- 17) Shift towards non-polluting energies (solar and wind power);
- 18) Stimulating privatization in fields such as education, health, research;
- 19) Decrease of bank interests in order to facilitate crediting;
- 20) Encouraging purchase of domestic products “made in Romania”;
- 21) Price cuts for food products made in the country from domestic resources;
- 22) Obliging local authorities, through law, to make investments, firstly in priority fields (water supply, treatment of used waters, sewage, transport, health, education);
- 23) Reduction of the tax per dividends to 5%.

At present, we are facing a cluster of crises: the financial, food, global heating, and trust in the political class crises. In order to outrun the crisis, the government should assume the spending of public money in order to re-launch the economic ship, but aimed at those sectors which are able to produce economic growth. The strictly monetarist anti-crisis recipe cannot take the economy out of crisis. It can put it back on the line, but only in time and with significant social price, without establishing any grounds for a proper long and medium term growth. In order to outrun the present economic crisis, a national program of investments and fiscal stimulants is necessary, to favour the consumer and the business with a low credit level.

Utilization of Logic and Symbolization in Interpretation Theory

Szathmary Miclea Camelia
Bailesteanu Gheorghe
Armean Andreea

Universitatea de Vest Timișoara, Facultatea de Economie și de Administrare a Afacerilor
camelia_miclea@yahoo.com

Abstract

The present work highlights the findings of a retrospective research in studying interpretation theory; and on that basis, it suggests a general scheme of interpretation of the hermeneutic process, focused on answering the following questions: why? what caused it? The structure of the hermeneutic process consists in: proper interpretation, the purpose of the interpretation and the improvement of the interpretation. Irrespective of the selected approaches of the hermeneutic process, there are three concepts which are always present: explanation, prediction and argumentation.

Key terms: formal economic axiomatic, explanation, prediction, argumentation, economic hermeneutics.

Clasificare J.E.L.: A12, B41.

Introduction

In economics, the discipline acknowledged for the study of interpretation theory is the economic and financial analysis. Some authors consider that an extension of study of economic and financial analysis for satisfaction of interpretation theory is not proper for scientific knowledge [1]. It is argued that the economic and financial analysis must remain the subject that offer accurate information for management, based on interpretation of account situations and financial reports. This is the only way for taking instant corrective measures without much subjective interference. As broadening

economic and financial analysis functions can be made only at the expense of precision, it would deprive the management by the easiest tool for immediate decisions and relatively sufficiently substantiated.

In my opinion, a retrospective research on the study of interpretation theory leads to the following findings:

- ✓ If in philosophy, hermeneutics represents the methodology of interpretation and understanding of texts, by similarity, in economics hermeneutics can be understood as science of interpretation of economic phenomena and process.
- ✓ The universal character of hermeneutics can not be challenged. It is a subject similar to logic or psychology and its application in economics has become a necessity.
- ✓ In modern approaches, hermeneutics is not about the interpretation itself, but the science of foresight, of object and means of interpretation, of ways to communicate, interpret and apply practically. Interpretation is intransitive of recognition, the aim being the understanding of itself, transitive, having the purpose to make itself understood, and prescriptive or dogmatic, as the legal and theological one, having the purpose the regulation of fulfilment. Hermeneutics is both synchronous, when given the predominance search for the systematic character, and diachronic, when the historic character prevails. [2,3,4,5].
- ✓ For the application of hermeneutics to be successful being successful in economy, it is required an urgent construction of a semiotics of

economics. The first step could be unic symbolization of economic concepts, notions and indicators.

- ✓ Hermeneutical process is iterative: rewrite the past (make corrections on issues that currently can be seen, but in the past were not identified), interpret future (foresight approach that implies a look from the „rewrite” past to future through “corrections”) and interprets the present through options that can modife trends (visioning approach that implies a look from future to present).

Development

Interpretation theory in economics – economic hermeneutics – must account for the progress of areas of logic and methodology (logic of problems, heuristic methodology) materialized such as: structuralist model of theories (J.D.Sneed, W. Stegmüller), local inductive logic (I. Levi), institutional logic, etc. [6]. Today is much more about “previous assessment”, “preliminary assessment”, “plausible reasoning”, “explanation”, “prediction”, to describe a stage of knowledge.

All these reasons urge us to subscribe to the idea that the economical hermeneutics is the interpretation science of economics phenomena and proceses, based on: explanation, prediction, reasoning and argumentation, in a foresight and visioning approaches [7].

Considering the general scheme of interpretation focused on the question *why*, I believe that the hermeneutical process structure includes: *the proper interpretation, the objective of the interpretation and the turning account of the interpretation*, also:

- The question requires an interpretative answer: what does the economic phenomena mean? what do we want to know? who is the user of information?
- Based on responses, hypothetical judgment is issued and one or more hypotheses in order to solve the problem;
- The hypothesis is verified by analysis and value judgments ,

than the hypothesis is converted to thesis;

- The thesis is argued through modus ponendo-ponens process or modus tollendo-ponens proceses, by abduction or retroduction;
- The thesis is capitalized with explication of perspective of interpreted phenomenon and it is generalized to other phenomena.

The question must be very clear in order not to create ambiguities. By posed questions are expected answers whicjt can describe economic phenomenon: causality, behavior and dynamics. The casual analysis is made with tools of the economic analysis seeking to identify the factors of influence, their direction and size. Also, there is accomplished their grouping based on persistence over time. Predictions are made and thesis that will be argued is issued.

Neutral of the approach of hermeneutical process, there are three mandatory concepts: the explanation, the prediction and the argumentation.

The explanation has the role of making the understanding of the phenomenon easier, process or event by revealing the generating causes. Its specificity relies on the fact that it takes place after the happening of the event and consists on the reconstruction, going in the opposite direction of time passing by, or of antecedents that lead to the event that we want to explain. It occurs usually in response to the question *why*?

In case of the explanation the „C” consequence occured, because there were initial „S” phenomena, „U” phenomena occured further and all happened under the „L” laws. So, the result is explained by assumptions and by governing laws. With regard to time, the result is based on events that took place, even itself being an accomplished fact. Its truth depends on the ability of the interpreter to understand and assert correctly the premises. The objective existence of the consequence cannot be questioned. What can be discussed is its correct perception.

The prediction anticipates the result starting from the initial phenomena, those wich are expected to unfold and from the laws governing them. So, in terms of time, the prediction is based on something that

happened, but also on something that will happen. Its truth depends on the ability of the interpreter to understand what happened, rely on the insight regarding what will happen, and to assess correctly what happened and what is inferred.

Unlike the explanation, the prediction anticipates the conclusion before the occurrence of „U”.

From what has been presented above, results that both the explanation and the prediction have a degree of relativity. If, in the case of the explanation, the degree of relativity is given by the capacity of perceiving what has happened, in case of prediction the unforeseen occurs as well. Otherwise we would accept the existence of the absolute truth.

The level and depth of an explanation depends on both the theoretical appliance used and the fineness and accuracy of „measurements” made for setting the antecedent terms of the explanation. In the case of prediction the unforeseen occurs in addition.

Hermeneutics requires a history of the explanations as basis for predictions.

The argumentation is the logical process structured on views, rules, sources, referential and reserves. Synthetical, the five parameters of argumentation are:

- *Arguments*, respectively facts, samples, data, in general, economic events;
- *The view*, meaning the advanced thesis or hypothesis. If we have arguments “A”, we have the view “O”;
- *The general rule* represents a guarantee of the relationship between arguments and view, a thing given, validated by time and generally accepted;
- *The source*, respectively the base for guarantees, meaning further data brought to sustain the general rule;
- *The qualifier* that introduces the possibility of „could”, „maybe”, „as it seems” etc.;
- *The reserve* that points at information and data which lead to conclusion or different thesis than reached before.

Based on the general scheme of interpretation (based on the question “why”, “because”, “since”) and the argumentation process scheme (based on implication “if”, “then”, “therefore”, “having impact”, “through logical deduction”) we can illustrate the interpretation and argumentation of a phenomena:

Interpretation:

- *Why*: does turnover index growing
- *Because*: market share and size is increasing
- *Due to*: competitiveness and demand increase
- *Since*: system performance or social need is increasing

Argumentation:

- *If*: system performance or social need is increasing
- *Than*: competitiveness and demand is increasing
- *Having impact*: market share and size is increasing
- *Through logical deduction*: turnover index is growing

In the modern theory a two-way approach to argumentation has been shaped [1]:

- The tendency to overlap logic and argumentation, if not entirely, then at least partly (especially in the Anglo-Saxon literature), as well as equating the two fundamental concepts: *the reasoning* and *the argumentation*.
- The tendency to oppose the argument, the formal logic. The argumentation theory is considered more as informal logic. Argumentation cannot be understood as a strict relationship between developing speakers’ evidence and taking responsibility on a thesis by the interlocutor, but as a discursive activity in the form of a multiple dialogue. „Given this point of view, the argumentation is seen as a set-up of arguments, well-ordered by criteria of argumentative efficiency, and

wich only together can provide the interlocutor's conviction (...) the emphasis falls not on the contingency strenght of each argument, but on how each argument participates in the accomplishing of the entire argumentative purpose”. [8].

From an economic perspective, I consider that the argumentation must be based on a logical reasoning because any argument is an organization of reasoning. The economic arguments pursue an objective goal, therefore conected with praxis. Also, it has a predominant social function through the effects it has on individuals and groups with whom we have contact. Therefore it has moral, psychological and communication valences. Upon the economic argument the economic hermeneutics can be built as a science for the interpretation of economic phenomena.

Investigated logical reasoning is not only concerned with practical correctness, but only with the absolute. The argumentation attend about function and correctness in concrete.

In the process of argumentation we have one or more backgrounds (evidence) to support a conclusion that is called thesis.

For example I consider the following:

- When the market share increases, the competitive position of the enterprise is improving.

The market share of the enterprise increased (basis).

Therefore, the competitive position of the enterprise has improved (thesis).

- When the enterprise's competitive position is improving, the negotiation conditions on the market relax.

The companie's competitive position has improved (basis).

Therefore, the negotiation conditions on the market (customers, suppliers, banks) relax (thesis).

- When the negotiation conditions on the market relax, the terms for product and service delivery relax as well.

The negotiation conditions on the market relax (baseis).

Therefore, the terms for product and service delivery relax (thesis).

Techniques of deduction argumentation differs in two categories, by argument type: sustaining or rejection. In consequence, there are sustaining techniques of argumentation (thesis) or rejection techniques of argumentation (thesis). There are defined sustaining techniques based on implication, disjunction, implication and disjunction (dilemmas) [8]:

- *Sustaining techniques based on implication*

This argumentation technique is known as modus ponendo-ponens.

Example: it is known that if the current liquidity of the company is less than 1, the enterprise risks insolvency.

According to argumentation techniques mentioned above, if the enterpise “Banatul” has current liquidity 0,4, then this enterprise risks insolvency.

- *Sustaining techniques based on disjunction*

This argumentation technique is known as modus tollendo-ponens.

Example: it is known that the amount of profit increases if the sales or profit margin increases. The sales did not increase. Then profit margin increased.

- *Sustaining techniques based on implication and disjunction*

Example: if labor productivity increases, then turnover increases, if product quality increases then business competitiveness increases, then, if labor productivity or products quality increases then turnover or business competitiveness increases.

Conclusion

1. Economic hermeneutics can bring benefits for theory and practice only if economic science assimilates more deeply semiotics knowledge. In this way, I consider the following rules for simbolization are adequate:
 - a. For economic phenomena, pocess, notions will be used as symbols, first letter, groups of letters or other well spread signs in literature, possible symbols derived from expressing concepts in a foreign language further symbols derived from linguistic or

- semantic form of meaning of term in Romanian (e.g. E-energy, C-cost, I-investment)
- b. There are situations when certain economic concepts are made up from different elements that must be individualized by symbols. Example: production costs can be defined in material costs, wage costs, electricity costs etc. In order to delineate these by components, one has to keep the capitalized gender symbol and for species must add another specific symbol, this represents the second rule for symbols construction. For the above example, symbols are: C_m -material costs, C_s - wages costs, C_{el} -electric energy costs.
 - c. For expressed notions with closer words will be used for symbols letters or groups of letters (with or without connection with linguistic or semantic form) so that it will be made difference between symbols; sometimes for distinction it will be added an index or exponent for letter. Example: both, quality and cost of production would imply the same letters, reason for offering „k” symbol for quality and „c” for unit cost. It is proper to use simple symbols, easy to hold in mind like one letter.
 - d. Symbols in economics will be established so as to respect the established mathematical symbols.
 - e. Sometimes, economic categories will be symbolized with numeral index attached to specific notion. Example: costs from base year C_0 and from actual year C_1 .
 - f. In economic symbolics it will be kept the signs of known mathematical operations, operations with sets and prepositional operators.
 - g. Unit size of economic indicators will be kept as symbols of absolute value but with lowercase. At the same time, for medium size indicators the symbol will be used with dash above.
2. Economic hermeneutics can not develop without formal axiomatic economics. The main directions I see are:
 - a. Postulating a number of primary economic terms: increase/decrease, intensive development, lasting development, different indexes, potential, vulnerability, bankruptcy etc.
 - b. Defining these terms with the principle of maximum consensus. When points of view about defining some terms are distinct but scientifically sustainable, then there will be specified the chosen option for defining and the coverage without violating logical principles of the definition rule.
 - c. Establishing rules from which the primary terms obtain other derivatives.
 - d. Postulating a finite number of sentences named axioms in order to embrace all economic areas: the economic status of the system, the financial status, the system evolution, the production, the consumption, distribution etc. Immediate directions that I identify are: fundamental axioms of the enterprise, leverage axioms, efficiency axioms, human resources performance axioms, production-sales correlation axioms, labor

- productivity axioms, rate of financial returns axioms, rate of economic returns axioms, synthetic efficiency axioms, growth axioms etc.
- e. Deduction from the axioms of other sentences, called theorems, that provide consistent and systematic description of complex phenomena and processes. This step is completed in what is called axiomatic system.
 - f. If the primary terms and axioms do not define, meaning that detach in the current economic language, considering them simply variables x, y, z, \dots , we obtain a formal axiomatic system. A feature of this system is that it may receive an indefinite number of interpretations.
 - g. Although I think that a formal economic axioma will bring substantial progress for economics, I consider that one must begin with making an intuitive axioma (a system of truths-axioms) and continue with an operative axioma (intermediate between formal and intuitive).
3. Interpretation theory can contain at least the following subjects: explanation, prediction, argumentation, symbolization, formal logic, interpretation with rates, interpretation with Du Pont diagram, interpretation with Pareto curve, interpretation with waveforms, with diagnosis etc.

A Brief Retrospective on Measuring Utility in Traditional Microeconomics

Șerban-Oprescu George
Academia de Studii Economice din București
george.serban@economie.ase.ro

Abstract

Economic science is always in search for a more rigorous, objective and accurate methods that could provide economics with a more elevated status among other sciences. In many cases the attempts to assume empirical methods specific to natural sciences (such as observation and experiment) were less able to lead the economic thought towards significant results. Nevertheless the use of mathematical language in economics as a formalizing method has proved to be successful. The large scale spreading of mathematics among economists overlaps with the so-called marginalist revolution. The proponents of marginalist theory made appeal mathematical language in order to explain and measure utility. In this context, the present paper attempts to analyze how the formalizing method provided by mathematics altered the traditional microeconomics. Thus, the paper provides a brief retrospective on the use of mathematics in utilitarian approach with a special focus on the debates over the measurability of utility.

Key words: methodology, quality of life, epistemology, utility

Clasificare J.E.L.:

1. Introduction

From an epistemological point of view, the strength of a scientific theory or a science in itself consists in its ability to transpose the specific abstract concepts in a common language that is known, accepted and used by a scientific community. The constant need to provide consistent evidence to sustain the scientific character of economics has led to a persistent quest for a tool that would allow economists to formalize their assumption and

arguments in a clear, objective and unified language. Furthermore, for many scientists, language is considered to be one of the most significant parts of the research method which, alongside with the object of study and the body of empirical or theoretical knowledge, guarantee the scientific framework of any research.

In this context, the present paper attempts to analyze how the formalizing method provided by mathematics put its mark on traditional microeconomics. Thus, the paper will provide a brief retrospective on the use of mathematics in utilitarian approach with a special focus on the debates over the measurability of utility. The main argument questioned is whether the traditional microeconomics propensity to ordinality instead of cardinality has favored the development of quantitative methods or it has removed economists from its real purpose i.e. effective measuring of wellbeing and quality of life.

2. Mathematics as an economic language

A brief retrospective on the evolution of economic reasoning reveals that economics was often inspired by natural sciences in its search for better methods. The elevated status of natural sciences, especially physics, among other sciences is provided by its rigorous, objective and accurate methods that can deliver consistent results acquired by experience and observation or tested in various experiments. Economics has always dreamed to this status thus economists have tried to borrow the same methods in hope for same kind of results. While most attempts to embrace empirical methods from natural sciences lead to unconvincing results, the use of mathematical language in economics as a formalizing method has proved to be more successful. Although the use of mathematics in economic can be traced back to the roots

of economic thought, one can assume that the second half of the XIXth Century is the real turning point. The large scale spreading of mathematics among economists overlaps with the so-called marginalist revolution where two out of three marginal schools (the Lausanne and the British marginalists) started to use mathematical language in order to explain the concept of marginal utility. The rapid integration of mathematical language in economics could be explained for at least two reasons. First, mathematics provides the necessary tools to operate and combine specific assumptions using logic embedded in mathematical rules and, second, more important, the quantitative methods derived from mathematics ensure the adequate framework for assessing economic phenomena. The opportunity to measure economic phenomena and use these measurements as arguments in the logical process opened a new path in economic thinking and seemed to provide a more rigorous character to economics as social science. As a result of this approach, economics ranks first among social sciences as the discipline which embraced on the largest scale mathematical language and its specific quantitative methods. Alfred Marshall is one of the economists who made clearer the role of mathematics in economics. According to Marshall, a good economic analysis should use mathematics as language and keep this language until the end of an inference. After that, one should translate the result in English, verify if it applies to real life and then forget that he ever uses mathematics during his reasoning. This approach was stated by Marshall as “burn mathematics” approach [1]. Marshall’s statement was made on a time when mathematical economics was in blossom by the works of Pareto, Cournot, Fisher and others. This direction was also followed by Edgeworth who pointed out that mathematics can be used as a much more common and understandable language to express complex ideas about economic phenomena and their dynamics.

According to Colander, once economics has moved away from labor and cost theories of value toward utility based theories, the measurability of utility became a central topic in a new more mathematical and formalized framework of economics [2]. The

new mathematical framework was set by the works of Dupuit, Cournot, Gossen strengthened by exponents of marginal revolution such as Walras, Pareto, Jevons, Edgeworth, Fisher and Marshall. Moreover, the new marginal method emphasized the analogies between economics and physics. For example, Jevons described his approach as the mechanics of utility and self-interest [3] while Pareto pointed out that there is an acute need for economics to acquire the rigorous method of physics especially rational mechanics in order to infer its results from observation and avoid any metaphysical assertion [4]. Edgeworth also noted that to apply mathematics to economics is to look at mathematical physics to see how mathematics can aid in the construction of propositions within the science [5]. In this context, mathematics became an intellectual structure in which economic reasoning could be further developed. Furthermore, Pareto argues that mathematical argument is a formal argument, based on a structure of assumptions, definitions and laws that work to move arguments to the conclusion.

3. The assessment of utility

The term utility whether coined as *ophelimity*, *wantab*, *rarite* or *desirability* [6] is based, in its very essence, on the idea that happiness is the ultimate objective of human existence, as famously argued by Jeremy Bentham [7]. In other terms, the final goal of an individual is to seek pleasure and avoid pain. Hence, utility was perceived as a continuous hedonic flow of pleasure or pain. As Kahneman and Krueger note, this definition allows Edgeworth to define “happiness of an individual during a period of time as the sum of the momentary utilities over that time period” and to formalize this definition as “the temporal integral of momentary utility” [8].

As stated before, for the recently emerged marginal analysis, the computability of utility or the possibility to rigorously measure the economic satisfaction of each individual in each particular case and transpose it to a quantitative measure unit, became one of the most important topic. The debate was started by Francis Isidro Edgeworth who, while trying to respond to some pessimistic views about the measurability of utility that had

been expressed by William Stanley Jevons, brought to light the idea of an instrument called hedonimeter that would measure utility as this is perceived by the individual [9]. The assumption that utility could be assessed using a sensory measurement sounded very tempting because such a sensory measurement would provide economics with the so much desired status of a precise science. This idea was also embraced by Irving Fisher who attempted to provide a rigorous, quantitative, definition of utility and evidence that utility could be measured [10]. Nevertheless, Fisher’s perspective was slightly different since he was trying to find a method of measuring utility that did not rely on physiological measurements such as Edgeworth’s hedonimeter. On the other hand, Edgeworth assumed that “Pleasure is measurable, and all pleasures are commensurable, by which he means not only that different sorts of pleasures felt by one person can be measured on a single scale, but also that the pleasures of different persons are commensurable” [11]. The hedonimeter idea was based on Weber–Fechner law which states that when stimulus raises geometrically, sensation augments arithmetically [12]. This hypothesis was formalized as follows:

$$p = k \cdot \ln(S/S_0)$$

where p is the individual’s perception of a change, S is the added stimulus, S_0 is the beginning stimulus, and k is the relationship parameter [13]. Edgeworth’s profound interest in quantitative measuring of utility is rather strange as, in a different context, he pointed out that “our mathematical method rightly understood ... is concerned with quantity, indeed, but not necessary with the number. It is not so much a political arithmetic as a sort of economic algebra, in which the problem is not to find x and y in terms of given quantities, but rather to discover loose quantitative relations of the form: x is greater or less than y , and increases or decreases with the increase of z ” [14]. Through this statement Edgeworth seems to eventually embrace the mainstream utility theory.

While Edgeworth was arguing that utility can be measured directly and on a cardinal scale [15], Fisher was convinced that a direct measurement of utility is virtually impossible and economics should rely on an indirect

approach. Since individuals reveal their utility through their actions we should start from individual choices in order to measure utility [16]. In this case there is no need for a psychophysical foundation for utility and economics can be freed from any psychological interference and be relied upon a “Simple psychoeconomic postulate: Each individual acts as he desires.” [17]. Nevertheless, utility can be statistically measured using appropriate methods which will “prove” the law of diminishing marginal utility. [18]. These methods rely on the indifference curve analysis that could provide estimates of statistical measurements of utility at different income levels.

Despite their debate, both Edgeworth and Fisher agreed that utility can be measured; the only divergence concerned whether that measurement should be direct or indirect. On the other hand, one of the most important exponents of marginal revolution, Vilfredo Pareto stood more firm than Fisher and disagreed with the idea that utility could be measured in any way that is useful to economics. He argued that the only way to provide purity to economics is by restricting economist approaches to observation of human action in order to build theories according to this behavior. Pareto, as Fisher, aimed to rid economics of the need for psychological analysis, and instead focus on establishing its own fundamental laws. His science of ‘logical action’ has been seen as the initiation of a longlasting separation of psychology and economics [19]. By drawing attention on the impossibility to compare utilities among individuals, or at least groups of individuals, Pareto argued that the endeavor to find a working measure of utility for economic policy was hopeless and economics should turn to mathematical formalism paving “the way for the achievements of mathematical economics from the middle years of the twentieth century” [20]. Starting with Pareto, the whole idea that utility could be measured objectively using a cardinal scale was abandoned, and replaced with the belief that this concept is not directly measurable, but that ordinal utility can be inferred from observed choices [21]. This kind of approach was further backed up by the following assumption: there is no need for cardinal utility in positive economic analysis since

any kind of preferences that can be represented by static indifference curves can be represented in the same time by an ordinal utility function.

4. Conclusion – the revival of cardinality

However, in the last decades one can see a genuine revival of cardinal utility embedded in the more complex form of behavioral economics. According to Bruni and Sugden [22] “Behavioural economists take pride in grounding their explanations on empirical hypotheses about how human beings really think and act, rather than on deductions from a priori assumptions about rational choice, and in subjecting those hypotheses to experimental test”. Moreover, as von Neumann and Morgenstern argued in 1944, cardinal utility is necessary for humans to be able to make stochastic choices. Following this argument, economists frequently choose to use cardinal models instead of ordinal models because ordinal models of behavior lack precision, detail, and tractability for describing certain classes of behavior such as dynamic choices. Even though Kahneman and Krueger argue that “life satisfaction is neither a direct, verifiable experience nor a known personal fact like one’s address or age”, they also conclude that “We suspect that many policymakers are more comfortable with the idea of minimizing a specific concept of misery than maximizing a nebulous concept of happiness[23]. This conclusion is very important as it allows economists to consider that although there is no reliable measure for utility, there could be an inverted scale of dissatisfaction which could give an appropriate measure of disutility.

Discrimination on the Labor Market in Romania – Results from a Survey Conducted by Spin Project

Țițan Emilia

The Bucharest University of Economic Studies

titan_emilia@yahoo.com

Abstract

Many European and non-European countries face different forms of discrimination on the labor market: it's about gender discrimination, religion discrimination, race, nationality, physical disability, age or political options discriminations. Equal opportunities and combating discrimination in any form is one of the basic principles of the European Strategy for Sustainable Development.

This article aims to present the point of view of future economic graduates on the main types of discrimination in the labor market in Romania, the degree of discrimination and the intensity of the phenomenon. This goal is achieved by conducting a survey among the third-year students of an economic university (The Academy of Economic Studies in Bucharest). The survey is developed within SPIN project, co-funded by European Social Fund.

Keywords: discrimination, migration, labor market, survey, target-group.

J.E.L. classification: I20, J31, J24, J71.

1. Discrimination on the labor market – one brief approach into literature.

Numerous economic studies deals with the existing inequalities between men and women in the labor market, in terms of payment, access to leadership positions, or the behavior. Female employees' lower wages compared to that of male employees' are associated with lower levels of education, training for women than for men in some developing countries [5]. Also, in these countries there is a striking presence of unpaid labor, informal or legal labor (dissociation between the paid and unpaid work, between legal and illegal work).

Women's position in society is considered inferior, characterized in greater measure by poverty, limited access to education, to well-paid jobs [2], [7]. Moreover, in the literature have emerged efforts of measuring the influence of employees' gender on economic growth of a country, at macroeconomic level [1].

2. Survey on the labor market in Romania, developed by SPIN project.

2.1. Presentation of SPIN project.

SPIN project creates a bridge between future college graduates who enter the labor market and the real business environment, preparing them to meet the conditions and restrictions imposed by future employers.

The project responds to the necessity of improving the insertion process on the labor market, for students from partner institutions, enrolled in the specializations of Statistics and Economic Forecasting, Economic Informatics and Economic Cybernetics. Innovative programs of practice-internship are organized through this project, using support-materials developed with information and communication technology. The project is in the range of initiatives to diversify inter-institutional partnerships, it is fully consistent with the revised Lisbon strategy, because it promotes the creation of conditions for the development of work-based learning schemes and supports lifelong learning. These are the exact elements needed to enhance a good integration of graduates into the labor market.

2.2. Evaluation of labor market discrimination level using a survey organized by SPIN project

In mid-2012 it was conducted - within the SPIN project - a survey among students in the target group of the project. The sample

was not representative, extending the results of the survey being made, therefore, with caution. The questions focused on several real problems of the labor market in Romania, but in this article the author focuses his attention on the problem of existence of several types of discrimination and inequalities.

Next we'll present some of the questions in the questionnaire and students' responses referring to this issue.

At the question: "Did you experience any form of discrimination during your university studies?" most surveyed persons (almost 90%) responded negatively. There were considered the following types of discrimination: gender, involvement in extracurricular activities, in selection for job offers. Only 5% of respondents said they have experienced gender discrimination, and another 5% - experienced some discrimination in selection for job offers.

The following sequence of questions aimed inequalities, discrimination in the labor market (gender discrimination, environmental, or depending on the type of companies).

Thus, relating to the existence of salary differences (discrepancies) between men and women occupying similar positions, approximately 90% of those who completed the survey believe that there shouldn't be such differences (72.6% of the respondents perfectly agree and 17.81% of them agree that there should be no such gender pay discrimination). 6.85% of persons said they were indifferent to the problem.

Table 1. There should be no wage differences between men and women for similar job positions

	No. of respondents	Share (%)
I do not agree at all	1	1.37
I do not agree	1	1.37
Indifferent	5	6.85
I agree	13	17.81
I totally agree	53	72.6
TOTAL	72	100.00

Source: Survey, SPIN project.

Figure 1. There should be no wage differences between men and women for similar job positions

Source: made by the author based on SPIN data.

A similar attitude stands out from the respondents in terms of differences in how men and women are treated at work when occupying similar positions. 71.23% of the surveyed persons totally agree that such discrimination should not exist and 23.29% - agree with this.

Table 2. There should be no differences between men and women in terms of how they are treated at work for similar job positions

	No. of respondents	Share (%)
I do not agree at all	1	1,37
I do not agree	0	0
Indifferent	3	4,11
I agree	17	23,29
I totally agree	52	71,23
TOTAL	73	100

Source: Survey, SPIN project.

Figure 2. There should be no differences between men and women in terms of how they are treated at work for similar job positions

Source: made by the author based on SPIN data

Another type of wage discrepancy is between multinational companies and the rest of the companies. Regarding this discrepancy, respondents’ opinions are more equally divided. Most say they agree with the existence of such wage differences (27.4%). 23,29% of respondents are indifferent to this problem. 23.29% of the respondents agree that there should be no such discrepancies and other 23.29% totally agree with this.

Figure 3. There should be no wage differences between multinational companies and other companies for similar job positions (respondents’ distribution)

Source: made by the author based on SPIN data.

Figure 4. There should be no wage differences between multinational companies and other companies for similar job positions (respondents’ structure)

Source: made by the author based on SPIN data

Opinions are also divided on the existence of wage inequality between urban and rural areas, for similar job positions. Weights of those who agree and those who disagree with the existence of these wage differences are equal (28.77%). 23.28% of respondents

totally agree that these differences should not exist, while for other 12.33% this is an indifferent matter.

Figure 5. There should be no wage inequalities between rural and urban areas, for similar job positions (respondent’s distribution)

Source: made by the author based on SPIN data.

Figure 6. . There should be no wage inequalities between rural and urban areas, for similar job positions (respondent’s structure)

Source: made by the author based on SPIN data.

The sequence of the following two questions of the questionnaire refers to the existence of one of the most common forms of discrimination in the labor market in Romania: gender discrimination. Most people in the target group participating in the investigation consider that the gender discrimination in Romania is average (53.42%), while nearly a quarter of them (24.66%) say that the level is lower. About 20% of respondents believe that the gender discrimination in Romania is high or very high.

Table 3. Gender discrimination in Romania

	No. of respondents	Share (%)
Very low	1	1.37
Low	18	24.66
Average	39	53.42
High	12	16.44
Very high	3	4.11
TOTAL	73	100.00

Source: Survey, SPIN project

Figure 7. Gender discrimination in Romania (respondents' distribution)

Source: made by the author based on SPIN data.

Figure 8. Gender discrimination in Romania (respondents' structure)

Source: made by the author based on SPIN data.

Regarding gender discrimination for management positions in Romania, almost half of those who completed the questionnaire survey find that the level of phenomenon is average (49.31%), while 30% assessed it as high or very high. 17.81% of respondents believe that gender discrimination in senior positions in Romania is low.

Table 4. Gender discrimination for management positions in Romania

	No. of respondents	Share (%)
Very low	1	1.37
Low	13	17.81
Average	36	49.31
High	16	21.92
Very high	7	9.59
TOTAL	73	100.00

Source: Survey, SPIN project

Figure 9. Gender discrimination for management positions in Romania (respondents' distribution)

Source: made by the author based on SPIN data.

Figure 10. Gender discrimination for management positions in Romania (respondents' structure)

Source: made by the author based on SPIN data.

3. Survey conclusions

Most respondents believe that there are inequalities in the Romanian labor market: between women and men, between urban and rural areas, between multinational companies

and other companies. Of all these types of discrimination, persons participating in the survey considered in greater proportion that it should not exist gender discrimination (regarding the salaries or the manner in which women and men are treated at work) (over 70% of respondents agree with this). Despite this position, about half of survey participants believe that gender discrimination is present in Romania, (including management positions), and it has an average level.

Corporate Social Responsibility and Competitiveness

Utureanu Simona-Luize

Economic Sciences Faculty, “Ovidius” University Constanta
simona_utureanu@yahoo.com

Abstract

Corporate social responsibility helps achieving different social, environmental and economic policy goals, but it can also contribute to competitiveness. This paper concentrates on how CSR could help competitiveness at level of individual enterprises. Moreover the connection between macro-level competitiveness and CSR is presented.

Key Words: corporate social responsibility, competitiveness, innovation, human resources, risk management

J.E.L. Classification: E23, M14

1. Introduction

Corporate Social Responsibility (CSR), as defined by the European Committee, is the concept through which companies integrate, on a voluntary basis, into their activity social and environmental concerns.

Corporate Social Responsibility refers to the actions of enterprises which exceed the objective of their activity, they are duties towards the society and the environment. Regulation measures created a more favorable framework for enterprises which voluntarily meet the social responsibility.

A strategic approach to CSR is becoming more and more important to the competitiveness of the enterprises. The access to capital, risk management, human resources management, customer relationships and innovation competence can benefit from the strategic approach to CSR.

The objectives of Europa 2020 strategy are based on CSR for a smart, sustainable and comprehensive growth, including the 75% employment target. The responsible business behavior is extremely important for the private operators from public services.

Contributing to the diminution of the social effect of the current economical crisis, including unemployment, is part of Corporate Social Responsibility. CSR offers a set of values which can form the base of the construction of a much solid society and for the transition to a more sustainable economic system.

The committee played an important role in the development of public policies to promote CSR. Starting with 2001 through the Green Paper and by establishing the European Multi-stakeholder Forum on CSR. In 2006 the Committee published a new policy. This identified 8 fields of priority actions for the EU: the increase in the degree of awareness and of best practice, support to multi-stakeholder initiatives; cooperation with Member States; consumer transparency and information; research; education; small and medium-sized enterprises; and international dimension of CSR. This policy contribute to the progress in the field of CSR.

2. Evaluation of the Impact of European Policy on CSR

The European Committee identified a series of factors which will continue to contribute to the increasing impact of its CSR policies:

- The necessity for a balanced approach which would take into account the points of view of the enterprises, of the non-business stakeholders and the ones of the Member States.
- The necessity to clarify what to expect from the enterprises, also defining CSR in EU in accordance with the new and updated international rules;
- The necessity to reward the responsible behavior in business, inclusively by means of public investments and acquisitions policies;
- The necessity to consider auto- and co-regulation systems, which are an

important medium through which the enterprises are trying to meet their social responsibility;

- The necessity to tackle the transparency of the enterprises regarding social and environmental aspects from the point of view of all the stakeholders, inclusively the enterprises themselves;
- The necessity to pay a grater attention to the human rights, which became a significant aspect of CSR;
- The necessity to recognize the important role played in the complementary regulation by the creation of a more favorable environment for the enterprises which voluntarily meet their social responsibility.

3. Competitiveness Effects of CSR

CSR can contribute to a series of environmental, social and economical policy objectives. It can also make a contribution to increasing competitiveness at the level of the individual enterprise, but also to the macro-economic level.

For the enterprise level analysis, the economical effects of CSR can be examined on the base of six factors and competitiveness indicators which take into account the following: the structure of the costs, human resources, customer perspective, innovation, the risk and reputation management, but also the financial performance. This are the factors and competitiveness indicators which are considered when the CSR is more likely to have a positive impact.

Cost Structure

The grounds which could lead to the idea that CSR can limit competitiveness need to be considered as well. These kind of arguments are: CSR is a cost without any clear advantage.

The supporters of CSR motivated that a responsible behavior in business can lead to a reduction of costs. The critics claim that CSR is expensive and that its benefits are felt only in the far away future.

In practice, the nature of the CSR measures chosen, the investments cost and the time frame considered have a big impact.

In 2003, Welford noticing that only some aspects of CSR might reduce the costs suggested that the focus of the CSR competitiveness should be on „the area of differentiation where social and environmental aspects of sustainable development will have most impact”.

Human Resources

The economical investigations proved the positive effects of the performance of human resources. It was proven that the graduates of European and American business schools (Montgomery and Ramus, 2003) focus on aspects of CSR, like the relationship between the employee and environment sustainability, ethical behavior. A big part of them would be willing to give up some financial benefits for working in enterprises with a better reputation from the point of view of social responsibility.

Even if it can be proven that CSR can have a positive impact on the competitiveness from the point of view of human resources, this cannot be applied for all enterprises. In the case of enterprises which rely on reduced costs from creating and maintaining their competitive advantage, possible benefits for improving the employees motivation will not exceed the associated costs.

Customer Perspective

CSR refers to the way an enterprise operates in relation with its suppliers, customers and competition. It includes aspects like advertisement and marketing, complains, anti-corruption measures and ethical practices.

A lot of enterprises, mostly the big ones, enforce social and environmental requirements on their suppliers.

Innovation

The fact that the relation between CSR and innovation started to be more and more recognized proves that CSR is not perceived only as reduced costs, but also as a potential source of new values and development.

Innovation is not seen as a collaboration exercise, and enterprises struggle to innovate

effectively without external help. It is now usual to talk about concepts as stakeholder-driven innovation, customer-driven innovation, society-driven innovation, open innovation. In the future, it is expected that CSR will be more important to the innovation process, as CSR, by its nature, enforces enterprises to form constructive relationships with a new range of stakeholders.

The ability of an enterprise to spot business opportunities as an side-effect of social changes will be determined by the extend to which the enterprise integrated social and environmental issues into its core business strategy.

Risk and Reputation Management

Many enterprises consider CSR to be a requirement for risk and reputation management. The enterprises face more public close examination and criticism than they used to in the past. This fact enforces the business case for CSR in terms of risk and reputation management, pressuring more the enterprises to introduce CSR deeply in their values and operations, than to use it as a simple public relation tool. From a risk management point of view, being concerned with issues like transparency, human rights, supply-chain requirements helped some enterprises to find additional positive impacts of CSR.

Financial Performance

Until now, the most of the key concepts and instruments which approach CSR were developed by the big enterprises for themselves. For small and medium enterprises, CSR is less formal and more intuitive than for the big enterprises. This is due to the fact that most often there is a strong connection between CSR and the personal and ethical views of the manager of the SME. In 2001, The European Committee defined CSR as „a concept whereby companies integrate social and environmental concerns in their business operations and in their interaction with their stakeholders on a voluntary basis.”

This definition has a number of important implications.

Firstly, the fact that CSR represents social

integration and environmental concern for the commercial operations means CSR is not only charity.

The focus is on the way the enterprises do their day by day job: the way they treat their employees, the way they produce their goods, the way they sell them, and so on.

Secondly, the interaction with the stakeholders is an essential aspect of CSR. Effective CSR requires communication and partnership with the stakeholders, like the syndicates, public authorities, non-governmental organizations and other organizations representative for their business.

Thirdly, by describing CSR as a volunteer, this definition implies the fact that CSR refers to what enterprises could do in the social and environmental fields above what they are required to do by law. This aspect of the definition works well in the framework of the European Union and in other frameworks in which the law is applied. In some countries, considering all this, CSR can, in the first place, be a way to determine enterprises to be in conformity with the law.

4. Conclusions

In the case of all six factors examined CSR has a positive impact on competitiveness at the level of the enterprise. However, the amplitude of the impact these factors have on CSR varies. Also the business case for CSR differs with the sector, size and circumstances of the enterprise.

Graduate Employability: the Core of the Development Strategy of Ovidius University

Vancea Diane Paula Corina
Ovidius University of Constanta

Abstract

The employability of graduates is a goal that every government, worldwide, imposes on the University education system. Clearly, the quality of human capital depends on both productivity growth and economic growth which ultimately translate into well-being. In these circumstances, the interest in delivering employable graduates to the labor market is immense and a policy of development based on this objective is legitimate.

Keywords: employability, Graduates, Ovidius University

J.E.L Classification: J62, E24

1. Introduction

Graduate employability is the achievement of skills, understandings and personal attributes that make graduates more likely to secure employment and be successful in their chosen occupations to the benefit of them the workforce, the community and the economy. ([1] p. 8)

Often words like "employability" and "employment" are considered interchangeable. People tend to consider them one and the same when in fact, many times, this is not true. While employability is a dynamic concept that denotes the ability to handle a job, to be employed involves a static aspect: means being paid for a particular activity. In other words, employability is the ability of a person to find a job in the area of expertise he possess in the work field he wants or where he worked, wherever and whenever it is needed.

Employability refers to the ability to get a job immediately after graduation, to keep it and obtain a new one later if the situation requires [2]. Under these circumstances, a person's employability depends on:

- Competences in terms of knowledge, skills and attitudes;
- The way in which these skills are used and displayed;
- Presentation of these competences and skills to the potential employers;
- Economic situation of the labor market, personal circumstances etc.

From the employers' point of view, employability is the propensity of the graduate to exhibit attributes that employers anticipate will be necessary for the future effective functioning of their organization [3].

Higher education must first produce employable graduates no matter what any academic subject or subjects they studied. Under these circumstances it becomes more obvious that employability depends on three essential dimensions of the process of education: curricular, co-curricular and extracurricular. If going through curricula the student obtains the necessary information to be prepared in a particular area, in addition to this he must have access to various co-curricular opportunities to enhance its ability to obtain a job, for example, to learn to work in teams, to present his work in a workshop etc. In addition, students should be provided with their various extra-curricular services to order increase their employability level. These can be provided by professional counseling centers, student associations and other specialized structures in career guidance.

Universities are required to put in the center of their development policies the need to increase the levels of graduate employability but the effort must be also sustained by students. It requires a shared commitment, university -student, regarding the acquisition of all necessary skills for a better employability.

2. What employers want in Romania

In 2010, the European Commission published the results of a survey conducted in EU Member States as well as in other countries in Europe (Norway, Iceland, Croatia and Turkey) on employers' perceptions on graduate employability. The study aimed at obtaining responses from representatives of 7,036 companies (201 in Romania) on the following aspects: abilities and competences the graduates must have, employer satisfaction level with respect to the quality of these skills and abilities, education level to fill vacancies in companies, the most important challenges facing companies, ways to boost employability of graduates degree etc.

In Romania, employers rated as very important the following skills: teamwork (80%), ability to use computer (79%), adaptation to new situations (70%), communication (70%), ability to analyze and solve problems (66%), planning and organization (61%), decision making (47%), foreign languages (42%).

In terms of employers' satisfaction a major discrepancy is noticeable.. While most employers (89%) who recruited graduates were very satisfied about their skills after employment, in Romania only 17% chose option completely agree with this statement, while 69% were relatively satisfied.

Romanian employers' satisfaction is below the average of other European countries regarding the following aspects: working with numbers, teamwork, industry-specific skills, communication skills, problem solving, the capacity to analyze, adaptation to new situations.

Top of Form

In Romania, employers expect a rate of 40% for graduates to be worked before hiring, and the studies conducted in foreign countries are not considered important aspects (33-38%) to increase chances of getting hired. When they were asked to choose an action that should be undertaken by higher education institutions in order to improve the employability of graduates, among the proposed solutions the most important were: 36% proposed to include temporary jobs in curricula and practical experience in the course, 30%, and the revision of the academic courses to match the needs of employers (18%).

It should be noted that Romanian companies are below the European average in terms of collaboration with universities to improve curricula and recruitment. 34% of Romanian employers said they prefer to recruit graduates directly from universities, 36% prefer direct discussions with teachers or directors of programs of study, 26% of career centers addresses and 30% prefer to participate in debates and seminars.

3. What students expect from universities

In general, we talk about three types of opportunities that higher education offers.

1. Chance to learn various theoretical and practical aspects and develop vocational skills. Most careers involve the acquisition of practical and theoretical knowledge necessary before the work is begun. University offers this type of knowledge and develops the necessary skills.

2. Chance to develop in general. Besides the tangible qualities, there are various less tangible skills that can be translated as: the ability to communicate, work in teams, to solve various problems. Attending university allows the development of such qualities.

3. Chance to know and understand you better. Through academic study you can know your test and your motivations, ambitions, strengths, weaknesses, etc.. You will learn what you like and what you do not like and you can benefit from the advice of other friends, teachers, specialists in career terms.

A graduate employability involves two levels of discussion:

- effective employability – the level of graduate knowledge and various skills that he has learned in university;

- perceived employability - an element of employability that comes from the hands of the student and is due to "reputation" of the University among the public (employers, other institutions, organizations, etc.). He graduated from the University of X, so he "values" about it. This is the result of opinions, judgments based on traditions, personal experiences, the perception upon the previous graduates in the labor market, etc.

Both levels are important in the hiring process and the student has expectations in both directions, both in terms of level of

knowledge, employability effective, and in terms of perceived employability.

4. What are the steps undertaken by "Ovidius" University of Constanta to increase the employability of its graduates

"Ovidius" University of Constanta focuses on the increase of the graduate employability. In this sense, the institution acts on three main directions: curricular, co-curricular and extra-curricular. Our university provides education services to approximately 18,000 students, develops 53 degree programs in 46 fields and 87 master programs, and 38 doctoral postgraduate programs and 7 doctoral schools.

The programs developed at the University include a thorough study of all fields of knowledge which are strongly connected to activities related to the practice in the real economy as well as in research and innovation. Connecting curricula and study programs on the European level is always a mandatory requirement in order to ensure comparability and compatibility with European diplomas. To meet the demands on the employability of its graduates, "Ovidius" University of Constanta has signed protocols and conventions of practice with leading employers in the local and regional market, with leading companies and local authorities and county.

The University is developing research projects with funds raised from the EU addressed to human resources that have as subject the students' skills and compatibility with future graduates labor market needs. In order to develop optimal conditions for these practical activities, specialized laboratories were built and equipped, allowing students' practical simulation of the activities taking place within firms / companies.

A mainstay in University strategy on increasing the employability of graduates is the Educational and Professional Counseling Center established in 1993 in collaboration with the Fulbright Commission in Bucharest. Objectives and purpose of educational and professional counseling services involve:

Assisting students in determining career path by choosing curricula;

Identifying training needs and organizing elective courses for students;

Compatibility with individual career profile properly;

Support coordinators to harmonize curricula graduate's skills with labor market requirements;

Training and skills development for labor market integration;

Ensure effective contact between student and university organizations;

Organization and conduct of individual and group counseling on career management issues;

Organization and conduct of individual and group counseling on personal issues and education;

Educational and Vocational Counseling Center made surveys on:

- Insertion of graduates on the labor market;

- Monitoring and analysis of students' insertion on labor market;

- Efficiency and effectiveness of education programs;

- Monitoring of student entrepreneurship;

- Causal analysis designed to prevent academic failure;

- Monitoring options on the academic route of the high school graduates;

- Analysis of learning motivation of students;

- Development of research methodology of the academic organizational culture;

- The creation, updating and managing of the databases on "Ovidius" University graduates.

Last assessment of graduate employability at "Ovidius" University of Constanta was made in 2011, a year after graduation. The evaluation was conducted through a questionnaire, graduates from all specializations being evaluated. 808 graduates were surveyed as follows:

- 89% graduate courses (day)

- 10% graduate courses IFR (time);

- 1% graduate courses ID (remote)

Study results

The time between graduation and employment

- 30.35%, of graduates are employed after graduation;

- 37.41%, of graduates are employed as students

- 32.24%, of graduates are looking for a job;

- 25.55%, of graduates say they had difficulties in finding a job;

Interpretation:

The overall rate of insertion into work one year after graduation is 30.35%;

There is a high rate of employment in jobs while still a student - 37.41%;

Percentage of graduates seeking employment one year after graduation is 32.24% and it correlates with a relatively low rate of those who had some difficulty finding a job.,

"The difficulty in finding a job" is, in fact, identifying appropriate job training and especially formulated aspirations of graduates.

Insertion rate of 18.48% of graduates in jobs appropriate training partially correlated with the rate of those who have difficulties in accessing employment;

The rest of approx. 7% may experience low social skills and / or personal marketing inability, despite counseling services that could benefit freely from the staff of the counseling centers while studying.

Efficiency of the study programmes:

- 81.52% of employed graduates practice in the areas corresponding to their academic training;

- 83.71%- of the graduates stated that the position held provides suitable conditions for career development;

- 86.01%, of the graduates stated that the level of knowledge acquired in college is appropriate to the job requirements;

Interpretation:

Insertion rate work in the field studied is also higher at the end of one year after graduation and demonstrates highly efficient curricula. The employment in the field for which the students trained is in positive relationship with the adequacy of knowledge acquired in college relative to position held, and career development prospects offered by current employment position.

The insertion level in the postgraduate programs:

- 44.77% of them graduate master programs;

84.66%, of them graduate master programs at "Ovidius" University Constanta;

- 78.25%, of graduates who do not hold a not master degrees, would like to study further the "Ovidius" University Constanta;

Interpretation:

The percentage of almost 41 of students enrolled in a master programs at "Ovidius" University Constanta shows a commitment to their own professional development and responsibility in relation to the level of competence expected.

The high rate of those holding master degrees from "Ovidius" University denotes good relations and trust in the curriculum, and good absorption of local and regional labor market for university graduates, translated into better programs adequacy of market studies labor.

5. Conclusions

The high percentage of those who would like to pursue degree programs at "Ovidius" University of Constanta demonstrates the institution's ability to maintain its beneficiaries and propose appropriate curricula to labor market requirements and specific training needs, expressed by present and potential beneficiaries.

It points out that University policy focused on increasing the graduates' employability shows its efficiency and undoubtedly must represent one of the pillars of the future strategy of the University. More graduate employees translate into a good reputation for the University, while a better reputation of the University increases the chance of graduate employability. Here's what we may call a virtuous circle!

Migration between Positive and Negative

Vancea Diane Paula Corina
Ovidius University of Constanta

Abstract

The migration phenomenon represents one of the most important issues equally for the recipient and source countries. This paper presents the effects of migration in Romania, as source country, from the point of view of market labour, education and consumption. Analysing the effects of migration we can conclude that is difficult for a country like Romania to draw a general conclusion. On the one hand, we can say that there are a lot of positive effects but on the other hand we remark negative effects also which are, unfortunately, not measurable. The paper confirms the literature which considers migration a phenomenon where the winners are in the same losers.

Keywords: migration, labour market, employment, policy

J.E.L. Classification: E24

Introduction

The economic effects of migration today are a key issue for those involved in reforming the labour market and in the educational process. Over the past 20 years and especially since 2007, for many Romanians working abroad has represented a survival solution. If at first emigration was done for political reasons, then this phenomenon was increasingly based on economic and educational reasons.

After 1989, Romania has gradually faced a surplus of labour by industry dismantling and privatization. International investments in Romania could be an alternative to attract additional labour, but, in their absence, many Romanians have chosen to direct themselves towards capital. To be an attractive area for investors to come to build from grass roots or at least use existing capacity, it was necessary for the workforce in Romania to be well qualified, cheap and the labour market

to be functional. Even in these conditions investments could remain in expectation, as they did for quite some time, due to other conditions which had to be met for them to flood the market.

The effects of migration phenomenon

In the presence of some massive economic disparities between East and West, migration was an absolutely inevitable, necessary and even beneficial economic mechanism. The beneficial potential of migration is always emphasized in public discourse, however, both in economic theory and practice, a moderate rate of migration is considered and in no way is a policy of encouraging emigration justified. Clearly, the state that will encourage emigration, for lack of programs to develop alternatives or under a so-called "reform", will face major distortions with consistent negative effects in the future. In this respect, one could illustrate the health sector in Romania which, after 4-5 years of doctors' emigration, is facing extensive problems with medical coverage positions in hospitals.

Emigration has certainly reduced tensions in the labour market and the government were facing an easier task regarding unemployment eradication and increasing employment, but this means lack of reforms, not their effectiveness.

It is estimated that in Romania there are over 3 million emigrants who produce remittances varying between 2 and 4-5 billion Euro (see data from 2008 – 2012). At first glance, strictly pecuniary, those who win are even the migrants and their families. They earn abroad, in average, four to five times in comparison with what they would have won in Romania. Unfortunately, the real winners of the migration phenomenon, with some exceptions, are the importers, many of the consumer goods purchased being imported. In this way, wealth leaves the

country, but comes back in Western countries where these goods are mostly made.

The literature clearly states that migration can be beneficial for the parties involved. At the same time, it cannot be denied the existence of the winners and losers of the process. Pritchett believes that the international labour mobility can produce global welfare. Other authors, Kahanec and Zimmermann, consider that the solution to the demographic and economic problems at the level of the EU is the free flow “brain” (brain drain). At the same time there are studies which highlight the relationships between remittances and the risk of the departure of the educated population segment.

Ratha shows that remittances inflows outweigh the losses that the country of origin has by migration, and León-Ledesma and Piracha analyse the positive effects of remittances on investment and consumption.
