On the supply side, the crisis had increased the difficulties of access to finance. In 2012, the share of new enterprises without resources amounted to 82.3%, the percentage of those with problems caused by delays in payments by customers reached 59.3%, and those with limited access to bank loans reached 53.4%. Also the difference between financial difficulties and other problems become more pronounced offer: less than 15% of the entrepreneurs faced difficulties related to the lack of technology, lack of access to skilled employees or raw materials.

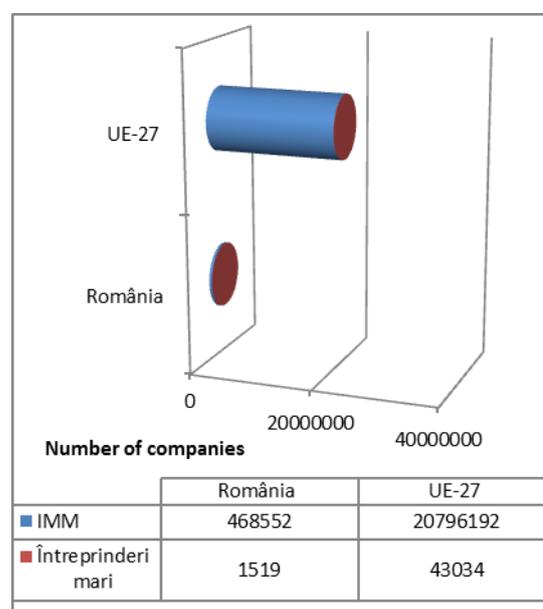

Therefore, financial constraints were the biggest challenge for new businesses.

4. The impact of entrepreneurship in national and local economy

The contribution of entrepreneurship to increase economic performance and well-being and social cohesion can be easily evidenced by the relationship between the values of the indicators for entrepreneurship and macroeconomic outcomes.

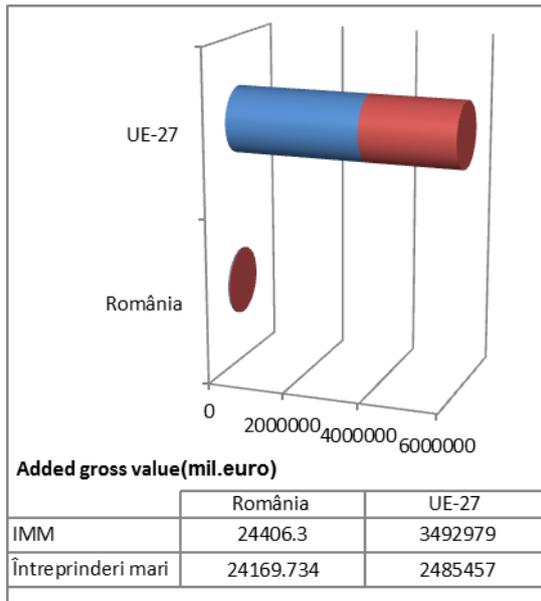

Based on the number of companies active in Romania, as the main indicator of entrepreneurship is apparent contribution to value added as comparative data with average values recorded in the European Union.

Figure no. 2. The main indicator of entrepreneurship, the number of active firms, comparable statistics Romania/UE27

Source: Processing from INS 2011 Statistics; Annual Report 2010/2011, the European Commission

Figure no. 3. Realized Added gross value, comparable statistics România/UE27

5. The laws of prosperity in sense of Robert Kiyosaki

- Robert Toru Kiyosaki, born in 1947, is an investor, businessman and motivational literature American author. Kiyosaki is best known because of motivational book series "Rich Dad, Poor Dad." He has written 18 books that have been sold in a total of 26 million copies. Although first published on his own, later, Warner Books, a division of Hachette Book Group USA, took over the publication of his books, now they appearing as publisher Rich Dad. Three of his books, "Rich Dad, Poor Dad", "Quadrant money" and "Investor's Guide" were found simultaneously in the top 10 of the best books sold, ranking compiled by the Wall Street Journal, USA Today and New York Times . "Rich kid, smart kid" was published in 2001, from the desire to help parents to familiarize children financial concepts.
- He also created the educational game "Cash Flow", published both in a classical and software version. The game knows 3 versions and is addressed both parents and children. He made numerous audio and video tapes of the series "Rich Dad".
- Probably the most important book of Robert Kiyosaki's "Quadrant money"

indicating which are the main channels for the production of income: employee, self-employed, employer and investor.

- The left side of the dial money is directly related to working time practiced. The more you work, the more money you earn. When stopped working, you no longer get money. Another feature of quadrants 1 and 2 is that taxes are high and may not be modified except by laws enacted by Parliament and this is not out of reach of common people. On the right side of the figure the time worked does not matter. What matters is the use of two levers of multiplication.
- To browse path from employee to investor, you need to strengthen financial literacy that you have in incipient form. The problem is to accumulate those financial knowledge that allow you to live decent sense Larry John. According to Robert Kiyosaki, there are five levels of financial knowledge classified into IQs:

- IQ no. 1: how to make money;
- IQ no. 2 : how to keep money;
- IQ no. 3: how to place money;
- IQ no. 4 : how to use the levier effect;
- IQ no. 5: how to informe yourself financially?

In my opinion, I think it should be 6 levels of IQ and slightly reversed order, as follows:

- IQ no. 1: from where I leave or "my financial potency";
- IQ no. 2: how to informe yourself financially?
- IQ no. 3: how to make money;
- IQ no. 4: how to keep money;
- IQ no. 5: how to place money;
- IQ no. 6: how to use the levier effect;

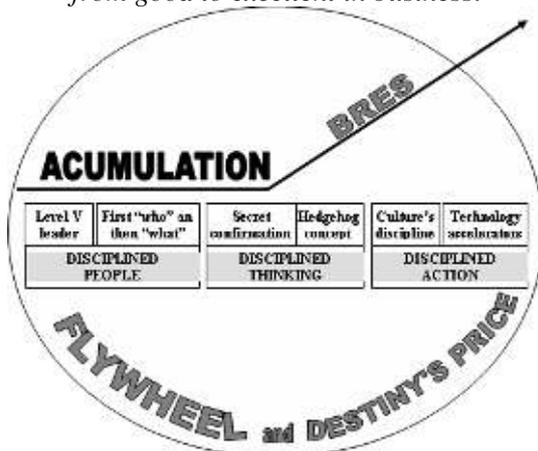

6. The laws of prosperity in sense of Jim Collins

Jim Collins is probably the most widely read writer in the world of economic literature. The book "Business Excellence" was the result of efforts by analysis of over 1,400 companies included in the Fortune 500, of which only 11 met the final criteria for business excellence. And the results of these research efforts did not fail to appear. In less than 3 years from the appearance of the

English edition of this book was already sold over 1.5 million copies. And from then until now has been translated into over 30 languages, fast becoming a worldwide bestseller.

In the book "Excellence in Business" during the 9 chapters, Jim Collins and his colleagues come to define a number of concepts and principles that enabled the leap from good to excellent in business. Essentially these principles are shown in the figure below:

Figure no. 4. Principles that have allowed some American companies to make the leap from good to excellent in business:

Source: Jim Collins, "Excellence in Business", Bucharest, 2009 [3]

The meaning of key terms in the figure above is:

1. Level V Leader: Are leaders had great results in the management of the companies they lead, are faded, quiet, even shy , are a paradoxical blend of personal humility and professional will.
2. First "who" then "why": the process of leading companies first are chosen the right people for the job and then establish "what" they did in the "what" conditions.
3. Disciplined people : There are those who manage to keep their unshakable belief that they can and will succeed in the end despite all the difficulties.
4. Facing reality: At the same time they have the necessary discipline to confront the most brutal facts in the current reality, whatever it

may be.

5. Hedgehog Concept: To go from good to excellent, it is necessary a deep understanding of three intersecting circles that lead to a simple concept, clear and concrete.

6. Thinking Discipline: Positive Education, always thinks in favor of, perceive what is good and what is bad.

7. Culture of discipline: All companies have a culture and a discipline of its own. When a company has disciplined people there is no need for hierarchy and there is no bureaucracy. Also you do not need excessive controls.

8. Technological accelerators: Never technology is not the main mean for raising the performance of a company transformation. In different companies, the role of technology is designed differently.

9. Disciplined Action: Is aware that the activity depends on the prosperity of the company, acting in favor of, perceive when something brings negative consequences for society and strives to act or to report to superior what's wrong.

10. Flywheel and Chain decline: Leap Towards Excellence never happens in a single shot. It takes perseverance to use centrifugal force to a wheel. Those that trigger dramatic change programs, revolutions and forced restructuring will fail to pass on excellence.

11. Accumulation and breach: sustainable transformations follow a predictable pattern of accumulation and vulnerability. Pushing a huge and heavy flywheel requires a great effort to impel, but by persistent movement in a consistent direction over a long period of time, the flywheel creates the start, eventually reaching the point of vulnerability.

7. Case Study Magnetic Poetry - the radiography of entrepreneurial business

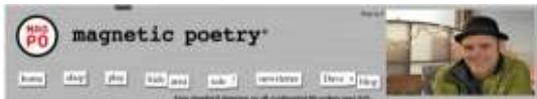

Dave Kapell, founder of Magnetic Poetry, was suffering from writer's block while trying to compose song lyrics. To overcome this problem, he wrote down interesting words on pieces of paper and rearranged them, looking for inspiration. What he hadn't figured into this experiment was his allergies. One good sneeze and any progress was sent flying across the room. Dave decided to glue the words to pieces of magnets and stick

them to a pizza tin. Then he got hungry and the now magnetized words made their way to the refrigerator door. Before too long, Dave wasn't the only one rearranging his would-be song lyrics. When friends came over, Dave noticed they started to move the magnets around, amusing themselves by writing the first magnetic poems.

After seeing his friends having fun, Dave thought he might be able to sell his word kits at a local craft fair. He made up 100 kits and set up shop at Calhoun Square, a mall in the Uptown area of Minneapolis. All 100 kits were gone after 3 hours. That night, he recruited as many friends as pizza and beer could draw and made up more kits--all of which sold as rapidly the next day.

From these beginnings, Magnetic Poetry® has now sold over three million word kits, over one billion word tiles--growing from the Original Kit to a kid's line of kits, to foreign language kits, to Voice/theme kits.

Figure no. 5. Promotion on company's website

Source: <http://magneticpoetry.com/>

In 2001, Kapell was decided to sell the 40% of the second company to U.S. Magnetix so that he can concentrate on developing new products and marketing ideas for Magnetic Poetry.

The radiography of the business of the first ten years is showing a compared evolution of total incomes as compared with total annual production costs including investment effort as follows:

Table no. 1. Evolution of total incomes compared against the total annual production costs including investment effort

Year	The total annual costs of production including investment effort (tens of thousands)	Total annual incomes (tens of thousands)
1	160	200
2	72	240
3	48	300
4	44	80

Year	The total annual costs of production including investment effort (tens of thousands)	Total annual incomes (tens of thousands)
5	22	178
6	24	194
7	26	104
8	20	62
9	12	250
10	28	270

Source: author

In the following, I propose to describe the evolution in the 12th year, the business (a total annual production costs and total annual income) by developing a dynamic forecasting model with anticipatory variables, starting from the premise of total income realized in 11th year of 250 um with 50u.m. less than the expected revenue for the same year. The forecast of total income in the 12th year will be estimated using the relationship [4]:

$$X_{p12} - X_{p11} = \lambda(X_{11} - X_{p11})$$

Where:

$$X_{11} = 250 \text{ um}$$

$$X_{p11} = 300 \text{ um}$$

Parameter λ will be estimated using the model:

$$Y_t = b_1 x_{t-1} + b_2 y_{t-1} + z_t$$

$$\text{Where: } b_1 = a\lambda_1 \text{ și } b_2 = 1 - \lambda_2$$

After solving the model we obtain the following results:

The coefficients of the variables:

$$x_{t-1} \quad 0,0925 (b_1)$$

$$y_{t-1} \quad 0,3325 (b_2)$$

Standard errors:

$$x_{t-1} \quad 0,0020$$

$$y_{t-1} \quad 0,0062$$

The result of T test:

$$x_{t-1} \quad 46,8932$$

$$y_{t-1} \quad 54,0535$$

$$\text{R-squared} \quad 0,9983$$

$$\text{Adjusted R-squared} \quad 0,9981$$

$$s_z \quad 0,8071$$

$$d \quad 2,96$$

Applying the results obtained we have:

$$\hat{y}_t = 0,0925x_{t-1} + 0,3325y_{t-1};$$

$$R = 0,9992; d = 2,96; s_z = 0,8071$$

But:

$$\hat{b}_1 = \hat{a}\hat{\lambda}_1 \Rightarrow \hat{\lambda}_1 = \frac{\hat{b}_1}{\hat{a}} = 0,4373$$

$$\hat{b}_2 = 1 - \hat{\lambda}_2 \Rightarrow \hat{\lambda}_2 = 1 - \hat{b}_2 = 0,6675$$
$$\Rightarrow \bar{\lambda} = \frac{1}{2}(\hat{\lambda}_1 + \hat{\lambda}_2) = 0,5524$$

So:

The forecast of total income in the 12th year:

$$X_{p12} = 0,5524(250-300) + 300 = 272,38 \text{ u.m.}$$

The forecast of total annual production costs in the 12th

year:

$$Y_{p12} = \hat{a} \cdot X_{p12} = 0,2184 \cdot 272,38 =$$

$$59,48 \text{ u.m.}$$

8. Conclusions

Internationally, entrepreneurship is recognized as a basic condition of economic growth and increase employment. Supporting entrepreneurship has become a priority and is considered an alternative to stopping the crisis and unemployment.

Entrepreneurial education is the main factor in entrepreneurship. It has major contributions in acquiring entrepreneurial skills, with a positive impact on young people's entrepreneurial capacity and the availability of initiatives in the field.

Romania is among the few European countries that do not yet have a national strategy for entrepreneurship education. In the past 10 years have been implemented initiatives to promote entrepreneurship education, both in the national education system and in various training programs.

By reviewing school curricula for all levels approved by Ministerial Order 5097/2009 [3], entrepreneurship education is explicitly recognized as a cross-curricular goal so being able to establish significant progress in the national system of school education.

In Romania should be developed a national strategy for entrepreneurship education. Such a strategy should provide the essentials for a coordinated and efficient development of entrepreneurship education regarding: ministerial collaboration, consultation and involvement of national and local stakeholders, ensuring key skills through national program monitoring and evaluation, with targets and indicators to measure and, not least, funding provided.

Data Mining - an Instrument Managing the Knowledge Collected for the Enterprise

Oncioiu Ionica

Dimitrie Cantemir Christian University

nelly_ocioiu@yahoo.com

Abstract

Managing the knowledge is the hottest topic of concern. This arranging or rearranging of facts is called the information and the processed information is called the knowledge. Acquiring the information can be considered an easy job but how to manage this information, how to refine this information so that it can be helpful in increasing the knowledge, are some of the questions that raise the eyebrows of many knowledge workers. What we are going to discuss in the present paper is the involvement of very innovative decision support tool data mining in managing the knowledge collected for an enterprise. Data mining is an exploratory and predictive data analysis technique. We will also consider some of the applications of data mining in this regard. The reason of using the data mining is that it gives an opportunity to have a deeper insight of various unseen patterns.

Key words: knowledge, data mining, clustering, enterprise.

Classification J.E.L.: C15, D83

1. Introduction

As we know that knowledge is a critical asset, which likes a seed, must be planted, nurtured and cultivated before we can taste its fruits. As consequences, the question is why a company's organizational objectives at times turn out to be a mess? Why sometimes results are found against the expectation? The answer is we don't know what we are measuring that is to say what is meaningful. So why can't better mix the knowledge, skill and experience of workers in any organization and make it an exceptional one? Knowledge is currently considered amongst the most valuable assets of any organization.

As organizations evolve and mature in the way they manage information, they seek ways of improving the utilization and reuse of existing knowledge as well as the creation of new knowledge that would provide an edge over their competitors. Data Mining and its associated technologies, amongst other Knowledge Management tools and methodologies, is at the forefront of this corporate battle for seeking and creating knowledge. The concept of knowledge is typically approached through the 'data-information-knowledge' sequence. Data are observations, facts or images. Formalized, filtered, contextualized and summarized data constitute information. Finally, information enriched by ideas, rules and procedures that allow actions and decisions constitute knowledge (8). From the organizational perspective knowledge is viewed as processed information embedded in routines, processes, products, rules and culture that enable actions (2). In this information age we have tremendous amount of data to explore and collect. And our memory is not so sharp that it can remember that data easily, so due to the database management system the task of collecting and managing the different related pieces of information together has become easy. But this is not the only problem. Though we are now able to collect, store and retrieve the my raid of data expanding from simple text documents to some complex information set like spatial data or a hypertext data by database management system, but this is not the only thing we needed. To have some better managerial decisions we need a tool that can summarize the data automatically or extract the interesting patterns from the odd one. We will be discussing on an innovative decision support tool data mining in context of knowledge-based economy.

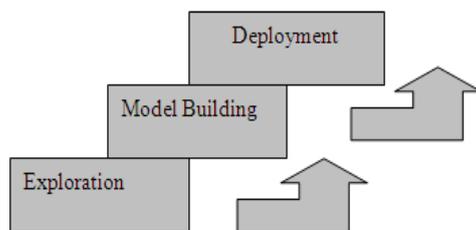

Data mining is the process of analyzing large data sets in order to find patterns that

can help to isolate key variables to build predictive models for management decision making. While data mining and knowledge discovery in databases are frequently used interchangeably but actually data mining is part of the knowledge discovery process (4). Data mining makes us prospective rather than retrospective. Data mining enables companies to segment their customer database and to tailor products and services to the needs and purchasing power of individual groups of customers so that profits earned are in right proportion of cost of serving. The data mining aim at simplifying and automating the complete statistical process, from data sources to model application. The purpose is to build intelligence into the software. From the past few years it has replaced the statisticians and constructed better models. The Statistical expertise required only to compare different techniques. The ultimate goal of data mining is prediction and has the most direct business applications (3), (6).

The process of data mining has three stages as shown in Figure 1:

- 1) Initial Exploration
- 2) Model Building with validation /verification
- 3) Application of the model to new data / Deployment

Figure 1. Data Mining Process

I) Initial Exploration: In this stage data preprocessing activities are done that may involve data cleaning, data transformations, selecting subsets of records, and from large data sets selecting the most relevant variables so that the number of variables or fields can come to a manageable range.

II) Model Building: It is an elaborative process. That involves considering various models and choosing the best one based on their predictive performance by competitive evaluation of models.

Deployment. This stage involves using the model selected as best in the previous

stage and applying it to new data in order to generate predictions or estimates of the expected outcome. For example, to quickly identify transactions which have a high probability of being fraudulent, a credit card company may want to deploy a trained model or set of models (3), (4).

2. Literature review

According with literature review data mining can be considered to be a blend of three research areas the statistics, the artificial intelligence, and data base (7), (6), which until very recently was not commonly recognized as a field of interest for statisticians. Due to its applied importance, however, the field emerges as a rapidly growing and major area where important theoretical advances are being made. Data mining is now become the most needed tool in different ways:

✓ Resource Planning – It guides in the planning and allocation of resources for research.

✓ Office Management – It helps institutional researchers to identify on which domain they have strength and for which domain they need to work with other departments. It helps them determine standard operating procedures, e.g., understanding how data are processed into data warehouses.

✓ Satellite sensing: There is a countless number of satellites around the globe. Some are geo-stationary above a region, and some are orbiting around the Earth, but all are sending a non-stop stream of data to the surface. The data thus send by them is in huge form and for analyzing it we need data mining.

✓ Personal Data: Governments, companies and organizations such as hospitals, are stockpiling very important quantities of personal data to help them manage human resources, better understand a market. So, managing that information can be done through data mining.

✓ Engineering purpose: In different engineering fields data mining is getting places because they generate a tremendous amount of data. For example in software engineering powerful tools for management and maintenance are required as large

amount of data with code, function libraries, objects, etc need to be managed.

✓ **Business Industry:** To survive in a highly competitive world, every transaction in the business industry is to be remembered for eternity but the effective use of the data in a reasonable time frame for competitive decision-making is definitely the most important problem to solve for businesses. And no other than data mining can do it efficiently.

✓ **Travel Agency:** A travel agency company with a large direct sales force can apply data mining to identify the best prospects for its services. It can use data mining to analyze its own customer experience and can find the best possible way of providing services with increase profit.

✓ **Big Bazaar:** A large consumer goods company like big bazaar applies data mining to improve its sales process. It collects the data from consumer panels, shipments, and competitor activity in order to understand the reasons for liking a brand and store. Through this analysis, the owner can select promotional strategies that best reach their target customer segments.

✓ **Data mining** uses data on past promotional mailings to identify the targets most likely to maximize return on investment in future mailings. And helps in finding trends and behavior.

Data mining tools scans through databases and identify previously hidden patterns in one step. An example of pattern discovery is the detection fraudulent credit card transactions to identify anomalous data that could represent data entry keying errors.

3. Research methods and discussion of results

Clustering is a technique of making groups or clusters from a set of objects.. Clustering is also called unsupervised classification, because the classification is not dictated by given class labels. There are many clustering approaches all based on the principle of maximizing the similarity between objects in a same class (intra-class similarity) and minimizing the similarity between objects of different works (inter-class similarity). In a cluster analysis the data is grouped with the aim of placing instances in segments in a way that maximizes the

similarity between instances of one segment and minimizes the similarity between the instances of different segments.

Predictive analysis is using business intelligence data for forecasting and modeling. It is a way to use predictive analysis data to predict future patterns. Using events of the past, managers are able to estimate the likelihood of future events.

Data mining aids predictive analysis by providing a record of the past that can be analyzed and used to predict which customers are most likely to renew, purchase, or purchase related products and services.

Clustering is particularly useful in cases where the most common categories within the data set are not known in advance. If a set of clusters is optimal, within a category, each data point will in general be more similar to the other data points in that cluster than data points in other clusters. Clusters can be created at several different possible grain-sizes: for example, enterprises could be clustered together (to investigate similarities and differences between enterprises), workers could be clustered together (to investigate similarities and differences between workers), or student actions could be clustered together (to investigate patterns of behavior).

We have conducted the survey on workers of 415 enterprises in order to find some interesting behavior of workers. We gave them a feedback from having different questions regarding their study behavior and interests. Our aim is to know how many workers are satisfied with current educational environment of enterprises. Before clustering the first thing is to know the number of clusters we follow up the formula (10):

$$k \approx (n/2)^{1/2}$$

where n is number of data points.

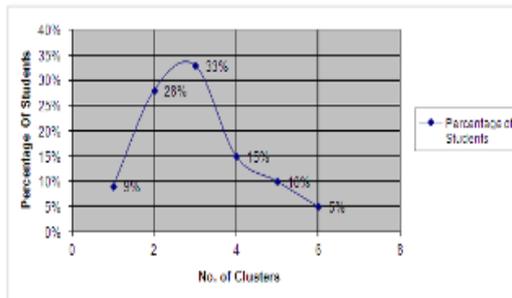

According to this we constructed six clusters, where n is 60. Cluster1: Includes those workers having most memorable hours 415 enterprises Sciences. Cluster 2: Includes workers that like attending works regularly.Cluster3: Includes those workers having percentile score above 60. Cluster4: includes those workers having sports interest. Cluster5: Includes those workers that like more courses to be offered 415 enterprises. Sciences.Cluster6: Includes those workers that likely to donate more for college when they are got jobs. We use hierarchical

clustering .In Hierarchical clustering we find successive clusters using previously established clusters. Hierarchical clustering can be agglomerative (bottom-up) or divisive (top-down). Agglomerative algorithms begin with each element as a separate cluster and merge them into successively larger clusters. Divisive algorithms begin with the whole set and proceed to divide it into successively smaller clusters. We follow the general algorithm:

1. Find the 2 closest objects and merge them into a cluster
2. Find and merge the next two closest points, where a point is either an individual object or a cluster of objects.
3. If more than one cluster remains, return to step 2

Based on the data collected the graph between no. of clusters and the percentage of workers in each is shown in the graph:

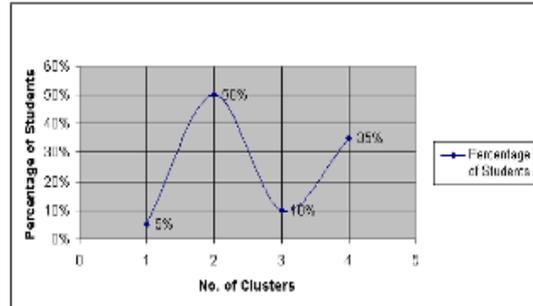

Figure 2. Clustering Stage 1

Source: own calculation

If we analyze the above data it can be clear that 33% of total workers have secured more than 60% marks and 28% of workers have attended their works regularly.15% are interested in sports activities, 10 %likes to have some more courses at the enterprises and only 5% of workers wants to donate to college when they got jobs. From this we further grouped the workers by following agglomerative algorithms. We grouped the data in four clusters having 5 % of workers that wants to donate to enterprises and they also have interest in sports.50% of workers have attended their works regularly and have percentile score more than 60.10% of the workers have interest in sports and wants to have more courses at institute. Rest of 35% is those having different opinions.

Figure 2. Clustering Stage 2

Source: own calculation

We can continue this clustering until we get the one having maximum number of workers in one large cluster. The results show that 65% of the workers are satisfied by the current educational environment of the enterprises. Based on the above analysis a predictive model can be build to know whether the workers passed out from the enterprises or studying currently will promote other undergraduates to take admission in 415 enterprises in near future.

Conclusion

The information is gathered on a daily basis and continues to be analyzed consistently. Analysis of this pertinent information can help companies to develop promotions that are more effective. When implementing data mining data quality is an important issue because a poor quality of data can make the results of data analysis for decision making wrong. On the other hand, the size of database is another issue that needs consideration. Data mining tools comes in different forms depending on the size of databases that have to be analyzed.

We think that the data mining is most useful for modeling business problems as they are affected by day to day activities but can be a boon in other areas also and it fits very well into the recent line of research characterizing and classifying analysis methods. We have conducted a survey on the behavior of workers of an enterprises to show how clustering in data mining can be helpful in managing the knowledge. Results revealed that data mining is an aid to strategic, tactical and operational decision-making in situations where numerous variables, affecting costs or benefits, has great effect on the outcome of the course of action that a company might decide to take so it requires a great deal of

inventiveness that highly educated people can provide.

At the same time, security is another concern as large amount of personal data I collected and making it secure from unauthorized access is the major concern. In this study we mainly concentrate on data mining as a tool of managing the information and in brief we have explained the information refining .There is a lot of scope for research in data mining activities.

Faculty of International Business and Economics*

ioan.popa.rei@gmail.com

Abstract

The simulation methods are implemented to develop students' professional skills and competencies in the economic field, making the link between the academic and business environments. The paper presents these methods of simulation in areas such as trade, international business, tourism and banking, applied in the European Program POSDRU/90/2.1/S/63442 project.

Key words: educational process, business simulation, teaching methods

J.E.L. classification: A23, F23.

1. Introduction

Business simulation is based on a computer program that processes the decisions of different economic actors, thus reproducing the characteristics of a competitive environment virtually.

By using assessments made after the adoption of each decision, students learn the extent to which decisions led to the strengthening of the market position of the company.

The simulation allows the experimentation of a virtual market, based on the motto "Learning business by doing business"

2. Education: Theory and Practice

A false dilemma parasite the debate about the nature of the education process: theory or practice? The issue has long been resolved. Since antiquity, school is considered to be at the same time an institution that creates personalities itself and for itself, (general knowledge, culture, behavior, etc.), and an education forum for citizenship (civic attitude, civilization, social utility). The modern University [5] should provide equally theoretical knowledge and practical skills to form intellectual personalities and professionals in certain areas. In other word, there is no theory or practice, but theory and practice. In this respect, the professor (or tutor) must create an educational framework characterized by several dimensions: discovery (or creation of knowledge through research), integration (i.e. the application and the interdisciplinary use of knowledge), application (i.e. addressing and solving social problems by using knowledge) and education (i.e. the use and the transfer of some rigorous methods for training the students).

3. The importance of simulation models

One of the human activities known since the dawn of civilization, the simulation-meaning the imitation of real processes (*in vivo*) by artificial practice (*in vitro*) - has acquired great importance in the past decades in the educational process in general, and for the creation of specialists in the economic

fields in particular. Undoubtedly, one of the drivers of the expanding use of simulation models in the teaching process is the emergence and diffusion of large electronic computer, "the most powerful simulation machine" [6], the true experimental pilot-station in social sciences. However, a broader range of motivations explain the adherence to this type of education of those who study and progress in the field of economics, and we refer, of course, especially to the youth dedicated to studying. To highlight these motivations and to reveal the requirements for ensuring a high efficiency of the simulation in the educational process, we should first answer the following question: What is simulation? The most popular definition: the simulation means the imitation of the functioning of a system with the use of a model of the relative system. Such definition is consistent with diversity of the simulation practices, starting with the magic ones belonging to the primitive man (invoking the rain), and ending with the training programs for astronauts (mimicking the conditions of weightlessness).

And this broad area of this concept is merely the expression of continuous enriching of the content or according to the extent of historical evolution: more actual content of the term, regardless of the field of application, keeps – in processed forms – the valences that it has acquired during its long existence.

Simulation is, first, a game (hence the name of "business game" for the simulation of the business activity models). This explains, to a large extent, the particular attractiveness that it enjoys. The teaching percussion of these "games" can be explained by several reasons:

- The feeling of freedom of action that they offer to "players". Indeed, with respect to a number of rules, usually reduced, it is made an infinite combination of circumstances and decisions (consider the payment required, according to the legend, by the inventor of the game of chess: two grains for the first square, four for the second, etc.). In other words, the limited space of the classroom opens to receive a virtually unlimited variety of cases: the seminary becomes the practice itself;

- The status of competition, of peer confrontation. Each of the participants are employed, by the very structure of the game (its basic rules), in achieving objectives. Hence the ability to raise the collective, a group, a sense of identification with the established goals, the activation of each participant;
- Creation of some tensioned and thrilling situations that emotionally engage participants in "the game"; the diversity of situations, the new issues that arise constantly are those that prevent routine, on the one hand, and entertain the idea of diversity, of "life", on the other hand. Games usually take place on a background marked by turning points, by nodal points, which recharge the attention and the interest when they tend to be overwhelmed by repetitive and routine elements.

The playful aspect is perhaps the first that attracts attention in the case of a simulation: it is not sufficient to ensure effective teaching (and heuristic) of this activity. We thus found that when this way of structuring the seminar is focused on its playful side, it is seen by students as a rather appropriate means to abandon the effort required for real assimilation of knowledge, with the "moral" coverage that "they work" in seminar and that they are not simply "attending". In the extreme case, the lack of consistent preparation can be stimulated, as well as the proper intervention of those that are more daring, and that now found an opportunity to be noticed. (similar to the model of the hollow drum which sounds louder). Therefore, the simulation doesn't have to be only a game (or, better, the simulation mustn't be simulated).

Second, simulation is a teaching method, a means of transmission, verification and consolidation of specialized knowledge. Indeed, the goal of the game in this case is not a mere use of time, and neither a mimicking of moods; it must be an instrument of professional training. In this respect, a few observations must be made:

- In the process of the preparation of the simulation, a central place should be given to the highlight of specialized knowledge that are required by the participation in the game. In fact, here we establish the distinction between games

of "learning" and entertainment games. The participation in the game is conditioned by the procurement of a minimum level of knowledge without which the work of the "players" is purely formal, mechanical. (There are students who have real skills for commercial activities - for example for negotiations – but who are not constrained to learn the basics of the profession and act purely intuitive. However, after a period of enthusiasm, soon they get bored of the game, because they are not motivated by a higher goal than that of the pure "bargaining").

Therefore, a preliminary selection of the players can be envisioned, on the basis of certain tests related to specific issues, tests which students were previously informed about, with a bibliography of their own. It is not so much about denying access of disinterested students, which do not study in due time, but more about managing to distribute fairly each group member to the available positions within the enterprise (or according to the role to be played, after the Latin *suum cuique tribuere* – to render every one his own). Two objectives are thus attained: the test stops being a "necessary evil" for students, because the motivation comes from the very requirements of the game; this will ensure a distribution of students to activities based on competence rather than preferences, or simply arbitrarily.

- During the course of the game it is necessary – from the part of the tutor - a continuous and explicit appeal to the specialized knowledge of students, used by them in the formulation and implementation of any decision and in the realization of all activities involved in the simulation. Moreover, periodically, a student may be questioned upon certain specific issues pertaining to the domain of the simulation, the motivation for this request being driven by the rules of the game. At the same time, it can also be proved that the correlation between the individual achievements (including, or especially, the answers given to the questions posed by the professor) and the overall performance of the team, to which the students belong to, represents a mobilizing factor in the acquisition of knowledge by each member the group.

Once again, these questionings are not to be regarded as a check-up mechanism or proof of the professor's position of authority (as students generally consider these to be the case when faced with the direct request for an answer), but as being driven by the requirements of the game, its rules, which - supposedly, were prior understood and accepted by everyone.

On the other hand, brief tests during the course of the game, where the answer is requested from the entire student mass, are useful and serve to motivate learning and thorough studying.

Of course, the features and mechanism of the simulation presented above are not intended to transform it into the so called "classic" seminary, a label attributed to the tiresome academic seminary (during which not much is being accomplished), unable to engage students, rigid. In fact, this latter tackles the other coordinate – in relation to the game – of the space where the real seminary activities take place. Utter rigidity is just as unjustified as pure simulation.

And thirdly, the simulation is also an experiment, reproducing in the classroom real life economic situations. The business game or other simulation models are a way to produce in vitro certain economic phenomena and processes without the adverse consequences that the manipulation ("sorcerer's apprentice") may have in vivo.

4. A successful application: "Practice in simulated enterprises"

Activities within the strategic project "Real access to the labor market through simulated enterprises" allowed students to become familiar with the business idioms and economic transactions similar to those in the real business environment. The project was initiated by The "Ovidius" University, Constanta, in partnership with the Bucharest University of Economic Studies, The "Alexandru Ioan Cuza" University, Iasi, The University of Timișoara and the Structural Consulting Group and had as main objective the creation of an integrated, inter-regional, simulated *enterprise* network, for the development of professional skills and the improvement of labor market insertion of

graduates coming from economic faculties, on the basis of partnerships between universities and real enterprises. [4]

From the Bucharest University of Economic Studies, 960 bachelor students and 96 master students were involved in the project. Student practice in simulated enterprises was organized in four modules that ran for 12 weeks as follows: *in the first stage (the first 4 weeks)*, the activities conducted had as main objective the development of the domain-specific simulated enterprise -trade and international business ; tourism; banking; *in the second stage (next 4 weeks)* there were conducted specific operations pertaining to the activities carried out by the simulated enterprises, with the help of the ERP component; *in the last round (last 4 weeks)*, students participated in simulations by using the TOPSIM software. [8]

The simulation software used during practice in each of the four modules (differentiated according to the study domain - trade, tourism and banking) have helped with learning and developing the skills needed to manage a business, the three programs being based on the idea of a "flight simulator for managers " (See Table 1)

Tabel 1

Trade- International Business	Tourism	Banking
Learning necessary principles for business administration Defining strategies at the enterprise level Understanding the basic principles of marketing	The successful development of a tourist attraction (mountain resort) with the help of diverse economic and social instruments	Identifying the individual factors which affect the success rate of a bank Identifying and integrating the different refinancing options Understanding business "reports" and making team decisions Managing difficult and complex decisions even in periods with high uncertainty

Source: Topsim, Tata Interactive System

5. Conclusions

The new teaching-learning methods based on the new technology are becoming more and more popular, being received with

enthusiasm by the primary beneficiaries, the students.

The simulation models used in the study programs offer students an experience that can be used in real life, allowing at the same time for the development of entrepreneurial competences.

Abstract

The aim of this research is to assess Romania's competitiveness, by analyzing the aggregated Global Competitiveness Index and correlate it with the innovation factor, and particularly with the eco-innovation factor. As it is included in the efficiency-driven stage, Romania needs to implement some regulatory measures addressing the 12th Pillar of Innovation, in order to boost its overall competitiveness and achieve sustainable development. Tackling the eco-innovation local needs by focusing on SME's can be an option, as their creativity is enhanced by the lack of extensive internal rules and regulations and their response time is lower, due to a centralized decision making process.

Key words: eco-innovation, sustainable development, competitiveness, Global Competitiveness Index, SME's

JEL Classification: Q55

1. Introduction

The intensified economic activity of human society of the last centuries has gradually affected the quality of the surrounding natural environment, and with it, the well-being of its inhabitants. In shaping this environment in order to accommodate their needs, humans have brought about some major changes with extremely negative environmental impacts.

Among the most pressing problems is that of climate change, believed to be caused by the greenhouse effect. Another important concern is that of the depletion of natural resources and the dependence on traditional fuels and energy sources, which are becoming more scarce, inefficient, expensive and unable to cope with the increasing demand in energy.

In the light of these developments, a new concept has emerged: that of sustainability. Nowadays companies wanting to pursue sustainable development must consider the 3 P's: profit, people and planet, also known as the Triple Bottom Line (TBL). The term TBL was first developed by John Elkington [3] and is aimed at measuring the financial, social and environmental performance of a company over time. At the national level, the 3 P's relate to: economic growth, social development and environmental protection. The environmental component is, thus, part of sustainable development and green solutions have been developed to address it.

Eco-innovation stands out as one of the most promising and efficient solution in delivering eco-friendly results. Its primary benefit is the fact that it generates positive spillovers in related areas. Janicke [7] argues that “*ecological modernization* - understood as systematic eco-innovation and its diffusion - has by far the largest potential to achieve environmental improvements.”

2. About eco-innovation

The sustainable development issue has enabled the market to create the necessary conditions for the emergence of eco-innovative solutions. In the field of eco-

innovation, it seems that small and medium enterprises (SME's – with less than 250 employees) have a central role, as most innovative and creative findings are usually generated by them, according to a study carried out by EIM and Oxford Research [2]

The future growth of eco-innovation is expected to be significant, that is why it is garnering greater and greater attention. Eco-innovation is a relatively recent concept. Fussler and James [6] were among the first to come up with the concept.

The European Commission in a 2011 communiqué [5], defined eco-innovation as “any form of innovation resulting in or aiming at significant and demonstrable progress towards the goal of sustainable development, through reducing impacts on the environment, enhancing resilience to environmental pressures, or achieving a more efficient and responsible use of natural resources.”

Another definition is provided by Kemp and Foxon [8]: “Eco-innovation is the production, application or exploitation of a good, service, production process, organizational structure, or management or business method that is novel to the firm or user and which results, throughout its life cycle, in a reduction of environmental risk, pollution and the negative impacts of resources use (including energy use) compared to relevant alternatives.”

Eco-innovation is also known as environmental innovation, “green” innovation or sustainable development innovation [13].

The OECD [12] considers eco-innovation to be basically the same as any other type of innovation, but it has two distinctive features:

- the innovation has to result in a reduction of the environmental impact, no matter if this effect is intended or not
- and the scope of eco-innovation may transcend the conventional organizational boundaries of the organization innovating and may involve broader social arrangements that trigger changes in existing socio-cultural norms and institutional structures.

As a study field, eco-innovation lies at the intersection of environmental economics and innovation economics. This explains why eco-innovation produces two sets of positive externalities, mainly: environmental

externalities and innovation ones, which are difficult to be assessed in monetary terms [2]. Therefore, an interdisciplinary research would be helpful in analyzing eco-innovation, and environmental policy should be coordinated with the innovation policy to yield the best results [14].

International institutions and organizations have grasped the pressing importance of sustainable development, and have integrated measures for its facilitation in the policies and regulations.

The Europe 2020 strategy is the EU's growth strategy for the coming decade and among its objectives are the increase in innovation and the solving of the energy/climate change problem. The established objectives are to be implemented by employing a series of Flagship Initiatives aimed at the primary challenges facing the European Union.

The Innovation Union Flagship Initiative is addressing the innovation challenge. Its purpose is to ensure that: innovative ideas are promoted, and ultimately implemented so that new products and services can be developed, along with the improvement of existent ones, and that competitiveness and growth are encouraged and new jobs are created.

The Innovation Union Flagship Initiative is committed to developing the Eco-innovation Action Plan (EcoAP). EcoAP focuses on “boosting innovation that results in or aims at reducing pressures on the environment and on bridging the gap between innovation and the market” [5]. The Resource Efficient Europe Flagship further supports eco-innovation and facilitates related investment.

A possible classification of eco-innovation can be the following one [9]:

- environmental technologies (pollution control technologies, cleaning technologies, cleaner process technologies, green energy technology, water supply, etc.)
- organizational innovation for the environment (pollution prevention schemes, environmental management and auditing systems, chain management, etc.)
- product and service innovation offering environmental benefits (new or environmentally improved products, environmental services – such as waste

management, environmental consulting, testing and engineering, etc.)

- green systems changes innovations (alternative systems of production and consumption that are more environmentally friendly).

3. Measuring competitiveness

Competitiveness is one of the factors which establish the economic distance between highly developed and underdeveloped countries. Therefore, it is not by chance that it is one of the pillars of the European Union for economic development and growth, in the Lisbon strategy. The necessary condition would be that the EU policies encourage companies to increase their individual competitiveness, by increasing their capacity to sell products in the home market, as well as in foreign markets. The European Commission [4] defines competitiveness as being “the ability of the economy to provide its population with high and rising standards of living and high rates of employment on a sustainable basis”.

Before that, the definition of the OECD [11] showcased a similar understanding: “the ability of companies, industries, regions, nations, and supranational regions to generate, while being and remaining exposed to international competition, relatively high factor income and factor employment levels on a sustainable basis”. Summing up the two definitions, we can say that EU’s competitiveness is enhanced by national competitiveness (at company and industry level), and it ensures sustainable development and the increase in the standard of living of its citizens.

In a project called “Measurement of competitiveness of eco-innovation” Kemp and Horbach [10] find that eco-innovation is an important factor in increasing EU’s competitiveness, and provide a set of measurement indicators. On one hand, one can measure competitiveness by assessing the overall performance of the market (exports, sales, global market shares of goods and services sold, which contain eco-innovation).

On the other hand, competitiveness can be defined by the ability of innovating firms to obtain economic benefits from competing with world economies (referring to internal

or national functions, such as production, marketing, the value chain, competition, macro-economic factors).

In a broader sense, Kemp and Horbach [10] group this indicators in four categories: (1) based on trade performance: world trade shares of exports, revealed comparative advantage; (2) based on costs and labor productivity: cost differences, productivity differences; (3) based on input measures for innovation – single indicators: data on R&D activity (although data is mainly available on total R&D expenditure rather than eco-innovation related information), business startups, patent data (relative patent average), data on innovative companies (4) based on a set of indicators – system indicators: GCI (the Global Competitiveness Index of the World Economic Forum), CS (the World Competitiveness Scoreboard proposed by the International Institute for Management Development); BCI (Michael Porter’s Business Competitive Index).

The GCI is among the most popular, consisting of a group of twelve pillars (institutions, infrastructure, macroeconomic environment, health and primary education, higher education and training, goods market efficiency, labor market efficiency, financial market development, technological readiness, market size, business sophistication, innovation). The role of this grouping is to study the level at which each country is more developed, and assign them to a certain category: factor-driven economies, efficiency-driven economies, and countries driven by innovation.

4. Assessing the competitiveness of Romania

As it has been mentioned, eco-innovation is strongly linked to country competitiveness, which is not among Romania’s strengths, as Barsoumian et al. [1] notes.

According to the 2012-2013 report of the Global Competitiveness Index [16], Romania ranks on the 78th place out of the total 144 countries analyzed in the study, with the overall score of 4.1 (out of 7 – where 7 is considered to be the most desirable outcome).

The Global Competitiveness Index is calculated on the basis of 3 subindexes: Basic requirements, Efficiency enhancers and

Innovation and sophistication factors. A percentage share is attributed to each subindex, according to its contribution to the overall GCI. The corresponding weights of the subindexes within the GCI determine the development stage of countries (just as the economic theory of the stages of development set out to do).

Figure 1. The Global Competitiveness Index of Romania

	Rank (out of 144)	Score (1-7)
GCI 2012-2013	78	4.1
GCI 2011-2012 (out of 142)	77	4.1
GCI 2010-2011 (out of 139)	67	4.2
Basic requirements (40.0%)	90	4.2
Institutions	116	3.3
Infrastructure	97	3.2
Macroeconomic environment	58	4.8
Health and primary education	83	5.5
Efficiency enhancers (50.0%)	64	4.1
Higher education and training	59	4.4
Goods market efficiency	113	3.9
Labor market efficiency	104	4.0
Financial market development	77	4.0
Technological readiness	59	4.1
Market size	43	4.4
Innovation and sophistication factors (10.0%)	106	3.2
Business sophistication	110	3.5
Innovation	102	2.9

Source: World Economic Forum - Global Competitiveness Report 2012-2013

Romania belongs to the efficiency driven stage of development (among other 32 countries such as Bulgaria, Armenia, Columbia, China, Peru and Serbia). Romania and Bulgaria are the only EU Member States which pertain to the efficiency driven stage, while 5 other Member States (Estonia, Hungary, Latvia, Lithuania and Poland) are transitioning from stage 1 (factor-driven) to stage 2 (efficiency-driven) and the remaining 20 are included in the innovation-driven stage.

The efficiency enhancers subindex contributes the most to the GCI (being more relevant for the economy at this point in time), with a share of 50%, followed by the

Figure 2. Romania's stage of development according to the Global Competitiveness Index

Source: World Economic Forum - Global Competitiveness Report 2012-2013

basic requirements subindex with a share of 40%, and lastly, by the innovation and sophistication factors subindex, which accounts for a mere share of 10%. In order for Romania to advance to the next stage of development, the innovation driven one, it must decrease the weight of the basic requirements subindex and increase the share within the GCI of the innovation and sophistication factors subindex, from the 10% it now holds to 30% or more.

Companies pertaining to countries in the final development stage compete by employing new and improved technologies or new business models and sophisticated production processes in the production of goods and services. Based solely on the subindex for the innovation and sophistication factors, Romania ranks on the 106th place, with a score of 3.2, obtaining for the Business sophistication pillar a score of 3.47 (which lands the country of the 110th place) and for the innovation pillar a score of 2.92 (the lowest of any other pillar, which secures it the 102nd place).

The GCI 2012-2013 report [16] also has a special section dedicated to assessing the sustainable competitiveness of nations, by analyzing the complex relationship between sustainability (social and environmental) and national competitiveness. An overall sustainability adjusted Global Competitiveness Index is computed, by

averaging the values of the social sustainability-adjusted GCI and the environmental sustainability-adjusted GCI. The latter two are computed by multiplying the GCI with the social sustainability coefficient, respectively, with the environmental sustainability coefficient.

The score Romania obtained for the sustainability adjusted CGI was 3.72 (a decrease of approximately 9% from the overall GCI) and for the environmental sustainability adjusted GCI the score was 3.73.

Thus, environmentally wise, Romania is lagging behind other European countries (such as Bulgaria and Hungary– with environmental sustainability-adjusted GCI’s scores of 3.97 and 4.32).

5. Improving Romania’s competitiveness by focusing on eco-innovation

As stated before, SME’s have a central role in the eco-innovative domain. Consequently, encouraging the eco-initiative at the microeconomic level can represent a good starting point for Romania in the process of increasing environmental innovation.

However, in a study conducted by Voicu-Dorobantu, Paraschiv and Marinouiu [15], the findings for Romanian SME’s were that they:

- lack long or medium term objectives in the R&D department and their approach is „work as it goes along”
- do not perceive eco-innovation as having marketing potential and thus do not have a clearly defined or implemented corporate social responsibility strategy
- implement eco-innovation because of regulation purposes and not because they recognize the potential efficiency gains
- most innovations are obtained from business networks than from own R&D departments (only 15% of the interviewed SME’s performed R&D activities)

A positive finding was the fact that SME’s have a centralized decision making process, which allows for a more straightforward implementation of eco-innovation initiatives. The benefit is that decisions can be taken in less time, enabling the organization to respond faster to market changes. And as there are fewer hierarchical levels, with fewer internal procedures and regulations to

follow, creativity can transcend easier organizational barriers and not be hampered in its initial stages.

The case for Romanian SME’s seems to be that they are lacking in the interest and initiative, but not in the implementation capabilities, which appear to be quite favorable to eco-innovation.

Because innovations are more easily diffused within business networks and clusters, SME’s are often left in the dark as they have a limited capacity of accessing such research (unlike larger organizations, such as multinationals, which benefit from extensive international support networks).

One way out of this predicament would be the establishment of SME clusters, with the intention of favoring innovation diffusion, accelerating research, strengthening cooperation and spreading research findings more easily. By being a part of such cluster structures, SME’s can have a mini replica of the extensive business networks multinationals benefit from. This will allow them to be able to compete more efficiently with the big players on the market (resulting in an overall boost in competitiveness at the industrial and business level).

Romania needs to adjust its regulatory framework to answer the needs of these small, but important economic agents, whose potential for eco-innovation would be substantial if the right conditions were in place. Special programs for research and cooperation can also be developed at national level, in order to facilitate access to funding and research and to provide a certain level of training.

6. Conclusions

Countries in the innovation-driven stage are considered to be the most competitive ones, according to the World’s Economic Forum Global Competitiveness Index. This highlights that innovation has a strategic role in the development of competitive advantages and plays a key role in economic growth.

With the attention of policy makers turned more and more towards sustainable alternatives, green innovation or eco-innovation will need to be strategically pursued and implemented in the future.

For the successful implementation of such initiatives in Romania, a reconsidered regulatory framework for innovation, and especially for eco-innovation, should be developed. In order for it to work, the framework should integrate special provisions that support the activity of local players in the eco-field, by facilitating access to and knowledge of: financing options, specialized training, consultancy services and cluster research (which is beneficial for sharing the risks and costs involved in research activities and for obtaining scale economies).

Such an innovation framework should be included in the larger competitiveness framework and the corresponding competitiveness strategy. Romania should carefully plan its transition away from the efficiency-driven stage towards the innovation-driven one, in order to have a clear view of the measures to be taken and the objectives to be attained in this direction.

Abstract

This paper presents some particularities of emerging markets that appear and develop as a result of growth and development tendency of international financial market. Excluding the option of remaining with the status of a “tired” economy, emerging markets had to react in the only way they could be rational, joining the global market.

According to the quarterly report prepared by Ernst & Young - Rapid - Growth Markets Forecast (RGMF) the global economic recovery will be achieved through investments in infrastructure programs, especially in Asia, as well as increasing demand from the domestic consumers, which will lead to the balance of the pretty sensitive external environment, and emerging market economies will grow, most likely, by 5.6% in 2013.

Keywords: emerging markets, world economy, development, growth.

J.E.L Classification.: E22, E44, F02, F63.

1. Introduction

The market is a place where companies and customers follow their own utility functions, say neoclassical economics experts. But this picture is partly incomplete, because „companies see both themselves and competitors mirrored as customers”. [1]

Between firms are complex networks of cooperation and partnership and between

managers are friendship relations. Relations between firms are a complex and a social structure with its practices, norms and subjective frameworks of understanding and relations between actors. Here can emerge two types of relationships: direct and opposition. The Direct concerns about collaboration overlay managers, property relations and hierarchical integration. The Opposition refers to the fact of being in competition. Companies, even if they do not have any direct relationship, they may be in opposition relations in the same market. These oppositions can be conceptualized as a field of forces represented by relations of power and authority based on the competitive capacity of firms. The competition is governed by regulations issued by state, grants or other types of comparative advantages. Also state is the third player in sanctioning deviations from established laws. Therefore is an important organ in shaping economic relations. [2]

The market can be considered a “social construct” divided into several levels:

- field forces with a dynamic structure which can be reached through competition and collaboration;
- an international network consisting of customers, businesses and state authorities;
- a collective project of economic management;
- a project of the state legislature. [3]

In the past, premodern markets were not structured to reduce transaction costs and to ensure a high level of capitalization profits, even if they were representing the media

where economic exchanges were accomplished.

Largely focused on maximizing strategies for asymmetric information, modern markets are competitive and flexible because they have adapted to the new economic knowledge, where information is the vital elements that allows the agent to obtain profit, at the expense of the exchange partner.

Excluding the option of remaining with a “tired” economy, emerging markets generally defined as transition economies, from agrarian or centralized forms to the industrialized free market, they found themselves in the position of not being able to afford to refuse cases, justified or not, repay loans, to up and down at will the fiscal barriers or to nationalize the foreign owned businesses. In this way, these emerging markets have to respond in the only rational way they could, to join the global market. [4]

2. Features of emerging markets

Emerging markets and develops as a result of the accentuated growth and development tendency of international financial market which “is a consequence of the needs, expressed by investors and those who wish to place their financial capital.” [5]

2.1. The evolution of emerging markets

The new international order and the globalization have led in recent decades to the restructuration a resize of the international financial market with the reorganization of the entire global economy. The external debt crisis of the 80s in Latin America led to major reforms in countries like Mexico, Brazil, Chile, Argentina, etc.

The year 1989 revealed a “new possible market” in Central and Eastern Europe and in the ex-Soviet, due to the changes in political regimes that have brought profound changes in the economy. Significant changes have taken place in Africa, the Middle following the Gulf War. The dynamic of the Asian areas is unpredictable, as countries like Indonesia, Thailand, Singapore, Malaysia, Taiwan, South Korea, Hong Kong, Vietnam and Mainland China have replaced the “traditional tigers”. In this Asian area is noticeable the dynamic Chinese economy, whose market has become one of the most

attractive for large investors. These areas including Romania, have “understood” the role and the importance of the capital market and stock exchanges in the proper functioning of the economy.

Even if initially many of these solid traditional markets such as Italy, United States, Netherlands, South Korea, Japan, etc. were shaken by large financial scandals, the things are getting better, the market becoming credible and are developing.

An influence on the emerging capital markets have the information technologies increasingly stronger and cheaper which allowed unprecedented speed of change in this area. In an interview with the “National Review” newspaper, Professor Ion Corbu said: “The change cycle has accelerated in the last twenty years and these changes the business rules. Once the change in the global business sector was measuring in extended periods – a century, 50 years, 20 years. Now these transformation periods occur every two or three years, changing the way a business leader should think the company. Also it changes our conception of the way the public institutions and companies in our country work.” [6]

The current economy is based on reducing trade barriers, privatization, democracy and emerging developing markets and is characterized by dynamism, innovation and open markets (including conservative markets like the U.S. and the UK that have been forced by the evolving events to abandon the old habits and regulations and to transform into an open market).

There is one question that is asked frequently, the problem of opening markets in countries that are out of the domination of centralist ideology. In the same interview Ion Corbu stated, “developing and transition countries must understand that economic nationalism is no longer of any use. They must abandon the vertical capital markets, where the capital was flowing inefficient through local businesses that might not be competitive on the world market.

The barriers must be removed from the expansion of network technology, the realization of the networks must be accelerated and privatizing the communication systems. These nations must also ensure that investors are able to repatriate profits. Finally, they must ensure

that their business leadership is able to accelerate the transformational effects of the network technology- and the enormous possibilities it offers- so these nations can become big winners. If developing and transition countries do not introduce these changes, they are self harming, opposing to the current trends in the global economy. “Sloths simply remain behind.”

Thus, achieving a certain level of saturation in various economic areas and the lack of attractiveness of earnings gained on certain causes, is determining the migration of capital to areas that are or may become interesting in terms of gains that are achieved by investing in these areas in conjunction with minimizing the assumed market risk.

In the other side, underdeveloped countries, the backward ones and the ones that left the socialist- communist ideals, in their desire of developing are interested in attracting foreign investment, so the intersection of these two major trends emerge and develop new capital markets known in literature as “emerging markets”.

Figure no.1 Evolution of emerging markets

Source: National Opinion newspaper (2009), “Emerging markets and “no 472, 23 March 2009, p.2, available at: <http://www.opinianaionala.ro/uploads/472.pdf>, (accessed 29 November 2012).

Vladimir Kvint, president of the International Academy of Emerging Markets, said in an interview with Forbes magazine that it is almost impossible for a business leader to not work in the world market, or at least not to explore the opportunities in the developing countries. [7]

In the last 20 years, global businesses went through critical moments and many changes, most were considered positive changes. In the 1980s, international affairs were essentially “an exclusive club for the 20 richest countries”. That changes today,

because command economies collapsed worldwide, the dictatorships have fallen, countries which once forbade on their territory foreign investments and were isolated are now an integral part of the global market.

“I remember well when, in 1988 the first 80\$ million of foreign origin were allowed to be invested in the former Soviet Union, the so-called “patriots” accused the government of selling the country. Twenty years later, in 2008 Russia received about 43\$ billion foreign direct investment and also developing countries received approximately 40% of the existing 1.5\$ trillion global foreign direct investment“, says Kvint.

Strategists, analysts, managers, politicians try to understand and evaluate the emerging countries market, but this process is difficult because it deceives statistics and studies and there are not enough information about the economic potential of these countries, not to the superior forums of the World Bank, IMF(International Monetary Fund) and the United Nations economic department.

Statistics on emerging countries on the market contradict with each other, from one report to another and sometimes within the same organization. Even in a worldwide known and respected institution as the IMF, the list of countries considered to be emerging markets is not consistent.

For example, in a situation from IMF’s Global Financial Stability Report, the emerging countries are Honk Kong, Israel, Korea, Singapore and Taiwan and in another IMF report, the category “advanced economies” was included in several countries. The ones that in the previous report were considered as emerging markets such as Hong Kong, Taiwan, Korea, Cyprus, Israel and Portugal, Greece, Spain and Ireland, were listed as emerging markets.

Later, in the same report, some countries that were previously classified as emerging markets are assessed as developing countries, including those that are clearly emerging markets such as China, India and Turkey.

In the category of emerging markets are also included the African countries despite the fact that many of them clearly belong to the category of developing countries. Some are certainly emerging markets such as South Africa, for example, but many of them are still underdeveloped, this illustrating the lack

of clear information held by the IMF in hierarch zings these countries. [8]

Studies show that an emerging country can be defined as a transition society from dictatorship to a free economic oriented market, with economical growth, that gradually integrates in the global market, an expanding middle class that improves the living standards and cooperates with multilateral institutions.

Analyzing the 192 OUN members, it can be said that 81 countries that can be classified as emerging markets, are holding 46% of the earth's surface, 68% of the world populations, and attracted 600\$ billion of foreign direct investment ,their inner market consumption being far the largest ,while their GDP (Gross Domestic Product) is only 20% of global gross.

2.2. Conceptualization of emerging markets

The definition of emerging markets is difficult to formulate because of the complexity and diversity of these markets and such an approach should make possible the distinction between the developed market concepts, frontier markets, regional markets and emerging markets.

Today, when we hear the term of emerging market we think of countries like: India, China, Mexico, Brazil, Chile, Argentina, and so on, which is only a portion of the existing emerging markets. In the same category of “emerging markets” are included newly created stock markets, the old stock markets that still exist in some developing countries etc...

In a first attempt, emerging market could be considered the economies of those countries situated between developed countries economies and developing economies.

According to the opinion of “Carmignac Gestion” Portfolio Director, Ms. WEN Zhangg Goldberg: “today we are finding ourselves in a surreal situation in which is speaking about “emerging countries”, speaking about Korea and Taiwan whose GDP per capita is very close to that of European countries such as France and Germany. Also the characteristic of emerging countries is their ability to generate higher economic growth in developed countries and

their deliberately will to integrate into the international economy. These countries are in a transitional phase: they are not underdeveloped countries.”

For example: “an emerging country is a country that is included in the list of emerging countries”, pointing out that some countries such as Korea and Greece should not be part of such a list. Greece formally complained that it is included on such a list. Another definition says that “an emerging country is a country where investors come like a turtle and go running like a rabbit”. [9]

Using a word play, it can be said about an emerging country that is “too poor to be rich and too rich to be poor”. [10]

In another approach, emerging markets are meant to be “fast- growing markets, with particular political stability”, “new stock markets in industrialized countries.” This approach is based on common features and the close performance to the savings, and on the level of access to the international capital market.

It may be noted that emerging markets do not form a compact group and is therefore difficult to give a universally accepted definition for everyone.

Researchers and other specialists have tried and are trying to explain this but the dynamic and the complexity of this domain are making particularly difficult this task.

The analysis of emerging markets must take account to the following [6]:

- size of economy;
- the level of national gross incoming per capita;
- the size of the stock market and capitalization;
- market liquidity;
- the active presence of local investors;
- the presence of foreign investors;
- legislative framework;
- communication systems;
- access to information;
- national currency, rate and stability;
- exchange policy.

If these types of multi-criteria analysis are made by specialists on close methodological basis, it can get pretty close to the same group of emerging markets. Note that the case of emerging markets is in constant change, the classifications being usually updated annually.

3. Conclusions

Therefore, an emerging market can be defined as an open market, located in a market economy from a country in the development and modernization process in which investors can make more efficient transactions but with greater risk than developed markets.

“Now is not the time for firms to have a conservative or passive attitude. Because of the analysis of the previous recessions it is shown that firms will be the most powerful and after the crisis, will be those that will clearly identify opportunities to support their development during the crisis and will make strategic decisions that will distinguish them from competitors.

Periods of crisis may provide the opportunity to introduce changes faster and with great efficacy than in times of prosperity”, said the market leader for Ernst & Young, Christian Mouillon.

According to the quarterly report prepared by Ernst & Young-Fast-Growth Markets Forecasts (RGMF), published on 25 October 2012, where is shown that the most rapidly growing economies have in plan easing the policy for boost growth and despite the negative outlook for the current year and the next one, for 25 of the emerging countries, they seem prepared to quickly recover the gap in 2013.

The recovery will be achieved through infrastructure investment programs, particularly in Asia, as well as increasing the demand from domestic consumers, which will lead to the balance of the pretty sensitive external environment.

Emerging markets economies will grow, most likely by 5.6% in 2013. Ernst & Young report indicates that the growth rates will accelerate in the next two years- as long as the Euro zone economy is stabilizing, the U.S. economic recovery recovers, and the fast growing economies countries will continue to relax monetary policies. [11]

According to this report “the expansion of the middle class in emerging countries, especially in Asia, will stimulate the demand and the trade between fast growing markets. For example, the number of Chinese households with an income between 30,000 and 50,000 dollars a year will increase from 1.6 million in 2010 to about 26 million in

2020. Consumption in most countries with rapid growth will continue to exceed the advances economies one and the growth of consumption in emerging markets will be two times faster in the U.S. and China will grow four times faster.” [11]

Co-Leader of the Center of Emerging Markets at Ernst & Young, Alexis Karklins-Marchay points out that: “long term attractiveness of the business in fast growing markets will not diminish. Although the growth slowed slightly more than expected this year, we anticipate that the recovery will be faster. While global rebalancing will continue, the business must promptly adapt to evolving or arising opportunities”. [11]

In 2036 the emerging countries will have a significant contribution to global GDP, there will be larger populations, young, well-educated, with a great capacity to spend. It is estimated that 9 of the fast growing countries will increase income per capita, at least five times in next 25 years.

Perspectives on gross domestic product for the next 25 years speculate spectacular growths in emerging markets. Nine of these countries are estimated to increase by an annual rate of at least 5% over the next 25 years, unlike countries such as Japan and Germany, which will grow at an annual rate of less than 1.5%

According to projections for next 25 years, the BRIC countries- Brazil, Russia, India and China- will be among the first six largest economies of the world. Indonesia will be in top 10 and South Africa and Nigeria will rank among the top 20 countries. Turkey, Mexico, South Korea and Saudi Arabia will rise also in the ranking of the most developed countries. [12]

“Countries should support reforms and build buffers to absorb shocks. It is worthy to put at stake a few grams of prevention today in order to avoid tons of treatment later” – Michael Deppler, Director of European Department of the International Monetary Fund.

Abstract

Any coherent systems, modern of thinking and action, companies must offer the business premises to provide an internal and external environment, enabling them integration and approval in the business environment where act and to transform benefits of owned position lasting in economic effects.

Experience has shown that speculative business carried out without compliance with legal or contractual obligations, drive either to the emergence of tense relations, litigation of disputes or situations which affect the economic interests of business partners or customers or even loss of customers and business liquidation.

This is the alternative companies that aimed at obtaining of high profits in a short time, unsustainable alternative to building a long-term market position.

Key words: business partners, expertise, trade disputes, conciliation, mediation

JEL classification: K2, M2

1. Introduction

Doing business in the trade area transparently provides access (by law) to information about products and services provided by suppliers, payments to the agreed terms and requirements relating to quality of goods / services demanded by the market and at the same time concerns the existence of relations settlement between suppliers and customers.

Proof of responsibility in relations with business partners lead to a good reputation and assumptions of economic development. All this depends on the quality of management, how they are understood and complied with ethical standards in dealing with: business partners, competition and state authorities.

2. Precursors of litigious situations

The managerial decision of collaboration with suppliers to avoid litigious situations arise, requires an assessment of the overall situation of the supplier. This is judged by a number of criteria, some qualitative estimates, others can be evaluated quantitatively. Thus, considering the following aspects after neglected can cause unwanted litigation [1]:

- ✓ structure and quality management;
- ✓ technology used and the capacity to deliver quality products;
- ✓ level of costs;
- ✓ price / quality ratio;
- ✓ possibility of research and development;
- ✓ prestige and position of the company among competitors;
- ✓ the cooperation with other companies;
- ✓ other clients who are supplying company;
- ✓ flexibility in meeting customer requirements.

Maintaining good relations between business partners with long-term perspective, must be based on the principles of business ethics. In this case, it is efficient to operate in

the following areas [2]:

- ✓ the development of activities to the highest standards of professionalism and morality in order to achieve performance and meet the interests and requirements of business partners;

- ✓ cultivating respect for all business partners, neutralizing unfair and incorrect methods in relations to them, regardless of business size business profile, or the nature of the property;

- ✓ giving up the promotion of unfair terms in contracts with clients which do not have alternative suppliers;

- ✓ seeking amicable solution through negotiation, mediation or conciliation for disputes arising over the contracts and other commercial business relationships;

- ✓ respecting irrevocable decisions given compliance processes for resolving commercial disputes by courts, the Court of Arbitration, the arbitration committee attached to the Chambers of Commerce and Industry and other national and international judicial bodies.

3. Regulations for quick resolution of commercial disputes

To conduct commercial business in a legal and institutional framework adequate, stable and encouraging development and economic progress of any dispute resolution procedure should offer a commercial judgment flexible, fast and effective solution to allow disagreements between the various partners without climate affect trade.

This desideratum responds Small Reform Law of Justice, which relating to the acceleration of settlement processes [4]. Provisions of this law have changed the provisions of the Code of Civil Procedure ,introducing a new chapter (Chapter 14) "Provisions on commercial litigation" his presence introduces the idea that the legislature has established several provisions derogating from the law, the matter commercial disputes, the conditions of a special procedure which occupies a relatively broad range of procedural rules, from a procedure of conciliation and prior to the legal status of the judgment.

Conciliation is a compulsory preliminary procedure, its failure to permit the court to not receive the request for summons. If,

however, the application is registered it will be rejected as being untimely submitted, the applicant will proceed again to make direct conciliation procedure to promote further action.

In order to resolve the dispute through conciliation directly the applicant will summon the other party ,telling them in writing of his claims and their legal grounds and all the documents that support them. When the parties (complainant and defendant) agree to resolve conflicts or disputes between them in this way alternative dispute will seek the services of a specialized professional conciliator will meet separately with each party, will develop issues in dispute and will select a list of objectives, priorities and results obtained. In conciliation strategy applies mainly to resolve the dispute through compromise and save their relationship together parties, or do short term, primarily seeing rapid resolution of the dispute.

Conciliation and mediation as may be required prior proceedings in certain cases.

In processes and applications in commercial matters, evaluated in money, before the application of a lawsuit the plaintiff will try to resolve the dispute either through mediation or through directly conciliation. If the judge recommends mediation and the parties accept it, they will present to the mediator to inform about the benefits of mediation, without giving the mediator fee. After obtaining the information the parties may decide to continue the dispute through mediation or to return to court.

At mediation, the parties directly or through representatives communicate to the mediator for the dispute, the root causes of the dispute are analyzed, the problems are being identified and then the parties needs are being outlined and proposals are launched for mutually beneficial resolution. Parties are helped to get what they need and to rebuild or to strengthen the relationship affected.

Mediation can be completed such by agreement of the parties and shall be determined by final judgment and enforceable.

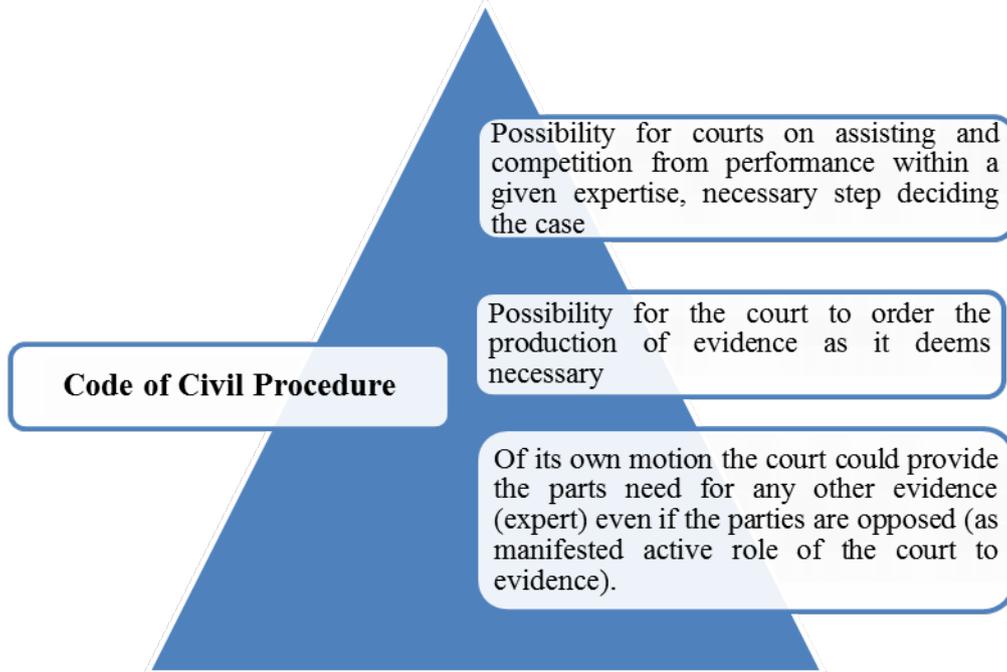

The emergence of new regulations remedies accelerated commercial disputes caused some changes and additions as evidence of expertise in commercial

litigation [6].

7206 paragraph 2 second sentence) states [3]:

Therefore the Civil Procedure Code (art.

Figure 1. Provisions of the Code of Civil Procedure

Source: information processed

Also all as a measure of speeding up the case appeared another new rule on expertise, namely: after the appointment of the expert, the court will summon a hearing in open court in which will require expert to comment on the estimated amount of work performed and the length of time necessary to carry out expertise, position of the parties will be recorded in the end. Given the position of the expert and the parties, the court will set a deadline for report submission expert and conditions of payment of expenditures necessary for the examination.

A new law is the transposition of Directive 2005/36/EC of the European Parliament and of the Council on the recognition of professional qualifications in Law 37/2009 (Law on amending and supplementing OG2/2000) governing the access of Member States of the European Union activity of judicial and extrajudicial expertise [5]. This eliminates the necessity of being Romanian citizen from conditions that must be met to acquire the quality of technical expert judiciary, adding the possibility of being a citizen of an EU Member State or the European Economic Area other conditions.

The citizen of another EU Member State or the European Economic Area which has acquired the status of judicial expert, quality certified by recognized professional bodies in those countries may be included in Table nominally containing technical experts, drawn on specialties and counties by the Central Bureau of Judicial technical expertise within the Ministry of Justice, in order to exercise in Romania, being exempted from the examination procedure.

The law also sets how they can exercise in Romania, temporary or occasional technical expert legal profession. Similar provisions regarding the recognition of qualifications and expertise activity are stipulated for extrajudicial technical experts.

Law refers to a very common situation, that of a lack of technical experts in a specialized court required: for such cases the law allows judicial technical expertise to be carried out by specialists who are not experts, they have Romanian citizenship or nationality of a Member State of the EU or the European Economic Area and meet the requirements of law to perform judicial technical expertise.

4. Conclusions

All these new legislation aimed at resolving key aspects of patrimonial and non-patrimonial disputes arising from domestic and international commercial contracts and other legal relations as trade, to make their contribution and expertise of goods as means of proof, such that any dispute triggered between business partners can be solved easily, quickly and transparently.

In this context and given that the existence of trade agreements between partners throughout the European Union or the European Economic Area, the current provisions provide a much better opening firms and covers not only trade and previous legislative niches so that trade can follow a natural course, elegant even if we are in a world where "everything is allowed".

Abstract

One obvious change in the nowadays education paradigm refers to the method of delivery the educational material. If the teacher traditionally stood in front of the room full of students and spoke to them, today ICT is increasingly used to facilitate the providing of courses, but also to ease communication between university, teachers and students. In the following article we will refer to teaching (as part of the educational process), which is becoming increasingly replaced by designing and providing appropriate courses for Computer Aided Education. This paper shows how the teachers work with “Blackboard Learn” e-learning platform so they can build a course that closely match the needs of the learning process and student requirements.

Keywords: course design, Blackboard Learn, e-learning platform.

J.E.L. classification: A23, I23

1. Introduction

In the context of changes taking place in society and thus in education, traditional education system turns out to be insufficiently flexible to adapt in timely manner to new requirements and needs on the labor market. It is therefore necessary to modify and diversify so that it can produce all the qualifications needed in the economy. On the other hand, there is also the need to change the education paradigm, the whole philosophy that underlies the entire educational system, from kindergarten to lifelong education. One obvious change in the education paradigm refers to the method of delivery the educational material. Usually

the universities in Romania have each an e-learning platform, but they use it differently: for administrative announcements, to facilitate communication between students and teachers, to deliver educational materials to students, for partial evaluation, for final assessment etc. On the other hand, e-learning platforms incorporate more and more functions so that they can be used in an increasingly wide range of activities related to training. The teaching material posted on e-learning platform is easily accessed anytime, anywhere, meeting the requirements of learners. Accessibility of learning resources definitely makes the training process more friendly and more appropriate to the nowadays demands. But how is actually made an educational material using an e-learning platform? This article shows how the teachers work with “Blackboard Learn” e-learning platform so they can build a course that closely match the needs of the learning process and student requirements.

2. Development of educational materials using Blackboard Learn

In the following it is shown how teachers work with Blackboard e-learning platform so that they can build teaching materials that closely match the needs of the computer-assisted instruction (CAI) process, including students’ requirements. Also, one can see the options available for designing courses.

There are several categories of users of Blackboard. Specialists in education assistance systems are responsible for managing and maintaining the platform, opening accounts and providing appropriate access rights for each user and supervising all activities on the platform.

After logging into Blackboard appears the courses in which the teacher is entitled to

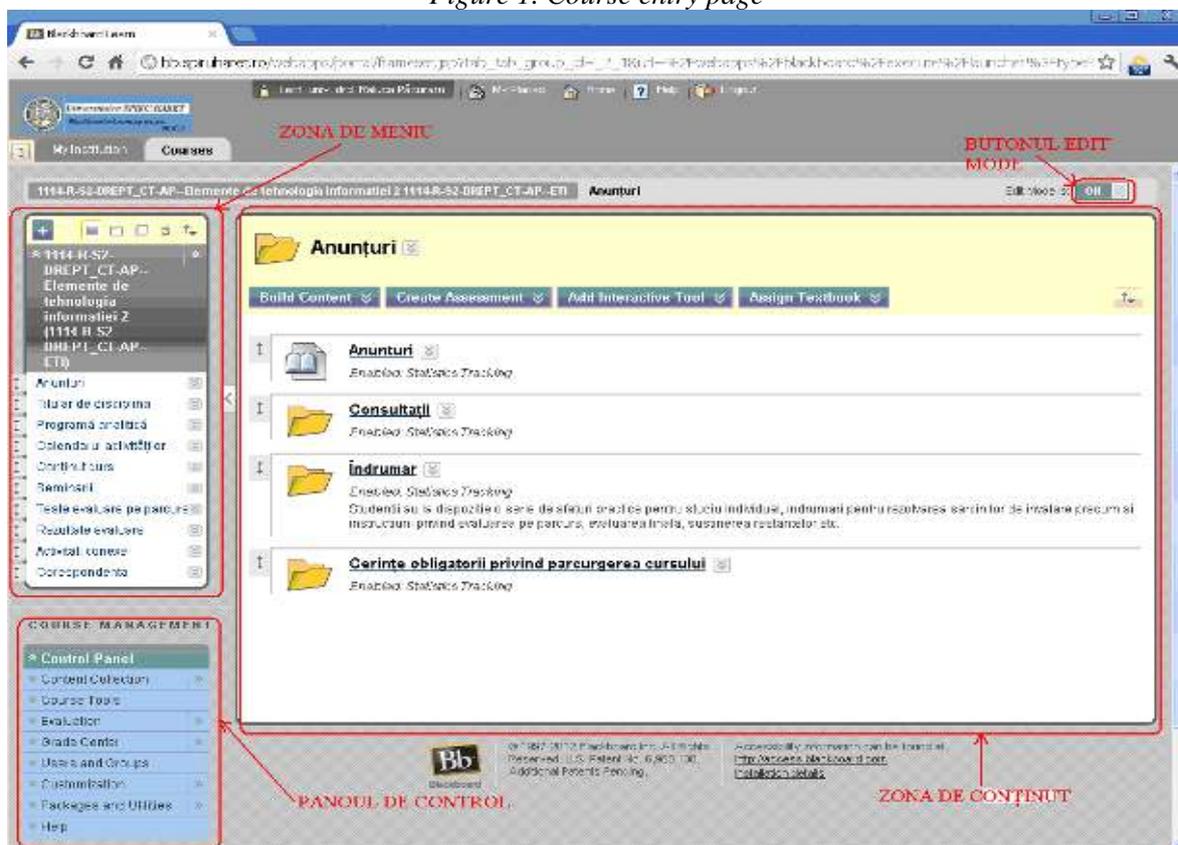

access:

- courses taught by professor (teaching materials that he builds in order to be used by students) - here the teacher has instructor rights;
- other courses in which the professor is enrolled - courses that he can only view, but not edit.

Learners can only see the courses in which they are enrolled.

Once inside the course that aims to design, the instructor has one window divided into several areas (figure 1): Menu Area, Control Panel, Content Area (details of the selected options in Menu Area).

Figure 1. Course entry page

Course Menu

Course menu is preset by specialists in education assistance systems to cover all necessary information, and includes several default options (areas). These options can be modified, deleted or renamed. Instructors can include up to ten different areas for each course. Changing course menu is done by pressing  at the top left of the area. There are the following options to change menu:

- creating Content Areas which contain information of the course, such as Course Documents or Assignments;
- creating a Blank Page;
- creating Tool Links which provides links to all tools of the Blackboard application, such as discussion forum or chat;
- creating links to other sections of the course for easy access (Course Link);
- creating External Links providing links to

URLs outside of Blackboard;

- Module Page allows you to display in a page multiple windows in which are shown various selected modules (calendar, calculator, dictionary, etc.);
- Subheader's creation - with which the menu can be divided into several sections;
- creating a Divider - creates a line that can be used to separate the menu.

If the Edit Mode is ON, then in the right of each option on the menu there is a button with double arrows. When pressing this button appear options for renaming, hiding, changing visualization permission for visitors and deleting that item. Also menu items can be moved by "drag-and-drop" them into the desired position.

Course Content

First page of the course corresponds to the announcements section, which is the first option in the menu. Then, depending on the

selected menu item, in the Content Area are displayed the appropriate information included.

A course consists of several content elements. A content element is any type of file, text, image or link that appears to users in a content area, learning module, lesson plan or folder. Instructors can add different content types in these course areas.

All these features allow the instructor to label them, to complete their description, to set options for availability (time and date). Content elements of a course are (figure 2):

- **Item** - file, image, text or link;
- **File** – can be used an HTML file. These files can be viewed as a page in the course or as a separate piece of content in a separate window;
- **Audio, Image, Video** – audio, image, video files;
- **URL** - link to a website;
- **Learning Module** - a set of content

- elements which includes a structured path;
- **Lesson Plan** – a particular content type that combines information about lessons with resources used for teaching;
- **Syllabus** - allows the instructor to build a syllabus;
- **Course Link** – provide the opportunity to create a link with another section of the course;
- **Content Folder** - contains other content elements;
- **Blank Page** - adding a blank page and customize it;
- **Module Page** – it adds a page containing dynamic content customized modules that help users track tasks, tests, new content being added;
- **Tools Area** - enables rapid addition of course specific tools (e.g. discussion forum or messages).

Figure 2. Course content elements

Another category of content elements are so-called "Mashups", allowing instructors to add content from an external website. This content can be used as an independent part of the course, as part of a test, as part of an assignment or as topic for a discussion forum. The posted content will not be copied on Blackboard, but will still be resident on the external website. You can add content from the following sources:

- **Slideshare** – is a site for viewing and sharing PowerPoint presentations, Word

- documents and Adobe PDF;
 - **YouTube** - site for viewing and sharing online videos.
- When a content element is added to the course, it is not automatically available to users. For any element, the instructor has the following options:
- **Permit users to view this Content** – select **Yes** to make content available to users. If not selected, this content is not available.
 - **Track number of views** - select **Yes** to

enable the report on users access to this item.

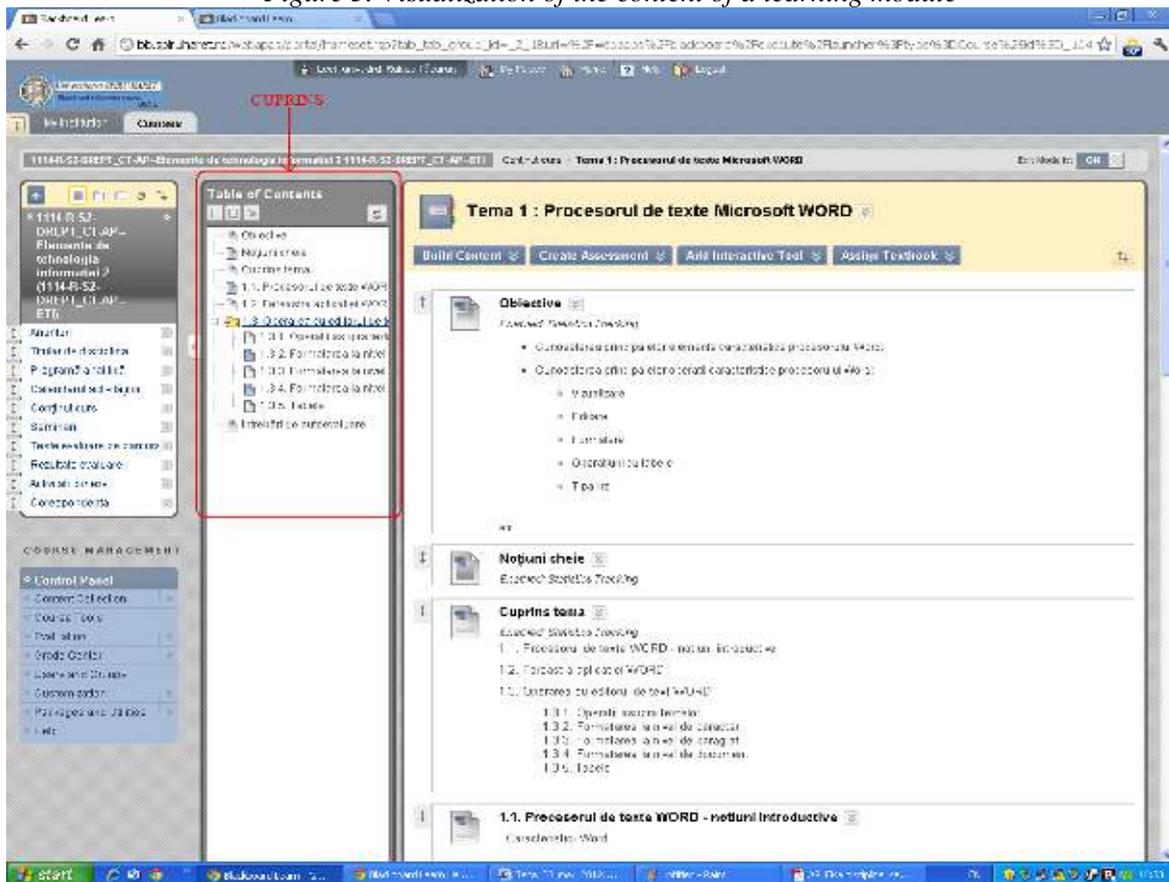

Select Date and Time Restrictions - select the time and date when the item is available. Select **Display After** so that the element appears after a certain date. If this option is selected, add the corresponding date and time. Select **Display Until** so that the element appears until a certain date. If this option is selected, add the corresponding date and time.

Learning Modules

Learning modules are used to package or present content and allow instructors to organize the corresponding course materials in Table of Contents. All types of content can be included in the learning modules, less other learning modules.

Instructors can add folders and subfolders to a learning module to impose a hierarchical structure on the content. This hierarchy is shown in outline view in Table of Contents (figure 3).

Figure 3. Visualization of the content of a learning module

Through the options available when creating / modifying a learning module, instructors can set the default way to view content, the validity for users (including defined periods of time), the order is which the module is browsed, if it is open in a new window or not, counting visitors, table of content. Learners can view the content of a learning module in two ways:

- **Sequentially:** the material is viewed in the order established by the number of each content element. Students cannot advance to the next page without having read the previous page;
- **Non-sequentially:** the material is viewed

in any order.

Control Panel

Control Panel has eight elements. To view a menu option, press the double arrow down (expand). To fold (collapse) a menu option, press the double arrow up. The eight menu options are: Content Collection, Course Tools, Evaluation, Grade Center, Users and Groups, Customization, Packages and Utilities, Help.

1. **Content Collection** (figure 4) is a "central warehouse" of files uploaded for the course on the e-learning platform. Links to these files can be used anywhere within the course. If you change an item in the Content

Collection, this change is reflected throughout the course. Using links in Control Panel, a teacher can access that content both

in the respective course as well as in all courses where she/he has instructor rights.

Figure 4. Content Collection

Course Content: 1114-R-S2-DREPT_CT-AP--ETI

The Content Collection provides central file storage for all content. Instructors can link to items anywhere in the Content Collection when creating content for this Course. When an Instructor changes an item in the Content Collection, all links to the item reflect those changes. Using the links in the Control Panel, Instructors can access the content in this Course, in all of the Instructor's Courses, in all of the Instructor's Organizations, or in all of the Courses in the Institution. Displaying 1 to 8 of 8 items Show All Edit Paging...

2. *Course Tools* contains communication options:

- Announcements - announcements for users;
- Blogs - is a tool for open communication between students;
- Collaboration - collaboration tools allow learners and instructors to engage in real time discussions, access web, open chat sessions or Q & A;
- Contacts - is a place where the instructor can add her/his own contact information or other people with various roles in the course;
- Course calendar - the instructor can define significant events relating to the respective course;
- Discussion Board - in any course area can exist discussion forums; each group of users can participate in a private discussion forum dedicated to that group;
- Glossary - each course has its own glossary of terms accessible to students;
- Journals - this tool gives students the opportunity to interactively communicate their opinion on the respective course;
- Messages - private communication

between members of the course, similar to email;

- SafeAssign - is a tool used to prevent plagiarism;
- Self and Peer Assessment - allows you to create tests for students, tests which can be corrected by fellow students; is thus obtained a constructive feedback which the student gives or receives from colleagues;
- Send Email - allows the instructor to send emails to course users;
- Gradebook Extractor - allows downloading (export) of all grades from Grade Center in text files with a specific structure;
- Tasks allows organizing activities in the course by defining priorities and their status;
- Tests, Surveys and Pools - allows creation and modification of tests, questionnaires and sets of questions; tests are automatically evaluated and grades are stored in Grade Center;

Wikis - is a collaborative tool that allows students to view, add and modify the content of a "wiki" page in the course.

3. *Evaluation* includes:

- Course Reports - reports based on access to different areas of a course, such as content area, forum area or a group;
- Early Warning System - implementation of rules and warn users by sending emails regarding poor performance based on course attendance, or after certain criteria in Grade Center;
- Performance Dashboard - activity reports, tabular forms, which observe the activity and progress in the course for all students.

4. *Grade Center* includes viewing area for all the notes (Full Grade Center), Assignments and Tests.

5. *Users and Groups* includes tools for grouping, adding, deleting, and listing users. When it is desired to display all students "Not blank" option is selected in the search area.

6. *Customization* includes tools for customizing the course:

- Enrollment options - determine how students are currently enrolled;
- Guest and Observer Access - establish visitors and observers access;
- Properties - sets functional settings for the course (name, description, availability etc.);
- Style - allows setting the style in which the course is presented / displayed to users;
- Tool Availability - determine what course tools are used and which users have access to them.

7. *Package and Utilities* includes:

- Bulk Delete – allows the instructor to select information to be deleted from the course and those to be kept for use in future. It is commonly used at the end of the course.
- Check Course Links – allows the instructor to check the links to the files that have been added to the course.
- Course Copy – can make a copy of the course thus creating a new course or can copy only certain course materials in addition to an existing course. The course in which is added can be search by certain criteria: Course ID, Instructor, Name/Description or by creation date. Adaptive Release of Content allows control of the course content use based on a set of rules established by the instructor.

Rules can use as criteria availability, date and time, the individual user status or users group status, scores recorded in the Grade Center or review status of another element of the course.

- Export/Archive Course - creates a course backup package. Export will include only course content while Archive will include, besides all content and users records and their actions in the course.
- Import Course Cartridge - downloads and imports various course materials produced by professional authors and publishers.
- Import package / View Logs - imports a course backup package (previously exported); the package content is copied in the course; the log files created during each import can be visualized.
- Move Files to Course Files – you can move existing content from a local folder of the course in Course Files.

In line with the philosophy of creation, use and reuse of learning objects, are important the options for total or partial copy, import / export of the courses and the ability to create links to different items within the same course or different courses.

8. *Help* includes contact information and links to help and support.

Conclusions

In the knowledge society lifelong learning is a necessity that all labor market actors must take into account. Advantages of using ICT in the educational process are obvious and cannot be overlooked. But to efficiently use technology, requirements must be met, and teachers will have to learn to use all the capabilities of e-learning platform and to structure teaching materials accordingly.

Changing Labor Paradigms in the Contemporary Era

Pivodă Roxana Mihaela
Spiru Haret University
roxana_pivoda@yahoo.com

Abstract

Throughout the ages there have been many civilizations, each with values, attitudes and skills, and his with them and as part of the whole man suffered the same changes and each time had to cope with these changes, the man gaining such new values, new behaviors and new attitudes.

Keywords: changes, knowledge, intellectualization, new economy,
J.E.L. Codes: B22

1. Introduction

As far as we are concerned and as I found, as well as the specific activity of human work underwent changes, gaining new meanings. Therefore I think it is still a useful overview of statistical data often reinforced within their existence, the evolution and transformation of labor spent in Romania, concept considered quite familiar in appearance, but is continually subject to continuous changes .

It's basically just about a new sense of work, the work emphasizes the importance of research and innovation by enhancing elements of creativity at work, in which the transfer of logical thinking activities on the machine, thus creating complementarity between human intelligence and software, in which most jobs require knowledge of information technology as a result of a process of intellectualization of labor, increase the quantity and quality of professional knowledge, the job holder is remunerated according to what what he knows and what he knows, the information issued, received, processed and evaluated, in which most of the job requires physical effort combined with handling information, which produce important changes labor and labor regarding moving from physical machines to the physical information and even

information only, work is often associated with an intelligent machine, being substituted in more and more cases of robotic means. „The new economy is also characterized by a rapid pace of change, requiring adaptations not just across age generations but within one’s lifetime” [1].

2. The change of paradigm

The transition to the knowledge society, the practical means the change of paradigm in all fields and especially labor. These features and concepts are reflected in the new paradigms and rules.

"Old" economy	"New" economy
Transformations labor	
routine work	work keeps changing
office (work) before all	all work before
fixed-term work program	flexible working arrangements
work (career) life	worker "just-in-time"
work "fixed"	work "phone"
worker goes to work	work comes to worker
job choice depending on the location of residence,	live in a place - you can work anywhere or telework
traditional companies, structured on the basis of centralized labor	companies with a variable structure, dynamics, dispersed geographically connected to national and international networks.

The changes that occurred due to advances inregitrate, and changes were necessary in terms of quality, the general public and especially labor, resulting in higher levels of training and knowledge of the stock due to that intellectual activities and specialized skills tend increasingly more activities to take place that involve exercise.

In order to exercise economic attributes in terms of the labor process, labor and means are necessary forms of general and specialized training. The requirement level of training is directly related to the predominant sector of the economy, the need to develop in different historical eras. Training, training by learning general and specialized direct result of labor training and retraining. In this regard, Trebici Vladimir be stated that “Recent studies on the theory and models of economic growth (S. Kuznets, Ed Denisov, J. Vaiyez, TW Schultz) revealed a very important fact: the stock of education of the working population under the impact of scientific and technical revolution, becomes an increasingly important factor of economic growth: the contribution to national income tends to increase in recent years, to overcome contribution productive fixed assets.” [2].

3. Production of knowledge

In support of the above, to highlight the beginnings of the transition to the knowledge society and the changes that took place in Romania in this respect, it is necessary to follow the development of indicators that reveal both knowledge production and transmission of knowledge outcomes, which reflects the changes occurring in the labor content and also accentuates highlights the role of scientific work, intellectual, toward which the new society, the knowledge. In terms of knowledge production, a number of indicators presented in Table no. 1, show these aspects, which occurred in Romania since 1995. There is an increase of indicators that generate knowledge production and the growth of intellectual content elements by human labor, the different knowledge is obtained as a result of work, substantially influencing in turn the labor content. Thus the number of R & D units in Romania, came to the end of 2008 to 775 units, being 26% more numerous than in 1995, the number of university courses have been treated as scientific publications albeit overall growth is seen that after 2000, it recorded a downward trend. As for following the evolution of R & D expenditure allocated was necessary national denomination, the amount for 1995 and 2000 was converted from ROL to RON, the figures presented in Table. 2.5 is expressed throughout the period in EUR. As

can be seen, this indicator shows a significant increase, the amount of R & D per capita is the end of 2008 with 135.91 RON, higher than 1995. This increase is mostly due to increase allocations for research and development, representing payment of current expenses of personnel engaged in research and development, and capital expenditures representing the purchase of equipment, tools, machinery and equipment or other expenses of this nature. The expenditure structure assignment innovation is mostly capital expenditures, purchases of equipment and software, accounting in 2006, [3] a share of capital expenditures 74.9% versus 53.4%, as held in year 2002.

Table no. 1 - Highlight value indices of scientific work, research and intellectual

Indicatory	1995	2000	2005	2008
Number of R & D activity units	615	601	806	775
Total number of researchers	35094	23179	29608	30864
Number of researchers per thousand	1,54	1,03	1,36	1,43
Undergraduate treated as scientific publications	697	1194	973	710
R & D expenses	57714800	296204600	1183659000	2980674000
R & D expenditure per capita	2,54	13,19	54,65	138,45

Source[4].: <http://www.insse.ro>, CDP101A, CDP102D, POP101A, ART116A, CDP104E and own processing

There can be seen as downward trends of some indicators that hinder the development of knowledge production, namely the number of researchers in decline by 4,230 people at the end of 2008, compared to the same period in 1995. This decrease is the result of research personnel migration trend of young professionals who are attracted by much higher salaries offered by other states. However, the data from the National Statistical Institute [5], certifies that more research effort scientific work led to a significant improvement in the number of innovations that indicate the end of 2006 a total of 28,488 products and/or services or improved susbtanțial, created in 5970 a

number of innovative enterprises from 23,404 innovations made in 2002, by 3963 innovative enterprises.

4. The innovation process

As can be seen from the table no. 2, the results of research have resulted in a decrease of 57 product innovations in 2006 compared to 2002, but also contributed to the process of innovation with 756 more in 2006 than in 2002, which representing an increase of 283.05%.

The best results of the research led the entire period to achieve product and process innovations, which hold a share of total innovation between 74.89% in 2002 and 71.62% in 2006, and most innovations in rate of 53.64% for 2002 and 58.72% for 2006, is the effect of work of scientific research, technological innovation, the emphasis on size information and design work, carried out mostly in small businesses.

Table no. 2 - the process of innovation in Romania in 2002-2006

Year	Product innovation	Innovation Process	Product and process innovation	Total innovation	Innovative enterprise size classes	
					small companies	medium enterprises
2002	582	413	2968	3963	2126	1178
					659	
					2834	1585
2004	472	1203	3461	5136	717	1817
					647	
					3506	647
2006	525	1169	4276	5970	3506	1817

New technologies are actually the result of concerns regarding improving and modifying old technologies repeated. Basically, the old technologies give rise to their rivals, while also affecting people working in old technologies, downwards its importance in the new system. New of the two exist in some cases is very high, in fact

this is the reason why we can not say that there is a uniform development of all countries.

5. Information technology

In the knowledge society, as known work includes both content knowledge production and transmission of information. Regarding the transmission of knowledge, a number of indicators presented in Table no. 3, shows the level of existing development in information and communication technology in Romania.

Table no. 3 - The evolution of ICT indicators in Romania

Indicatory	2007	2008	2009
The share of households with access to a computer at home	31,4	35	42,2
Population between 16-74 years	16739098	16696027	16664078
The number of people 16-74 years who have ever used the computer	6847343	6719591	7464651
Share of persons of 16-74 years who have ever used the computer, the population of the same age	40,9	40,24	44,79
The number of people 16-74 years who have ever accessed the Internet	4909502	5668927	6339352
Share of persons of 16-74 years who have ever accessed the Internet, the population of the same age	29,32	33,95	38,04

Source [7]: <http://www.insse.ro>, TIC101A, TIC103A, TIC104A, POP101C and own processing

Obtaining the benefits of new technologies depends on investments made for exinderea and information infrastructure, the expertise needed for new job creation and training levels of user labor, the entire population facilitating access to public information technology information and communication, dissemination of information and knowledge to all members of society. Information is basically the result of human effort for research and innovation, having a

transformational effect on both human and labor which he submitted.

Utilization of information and communication technology, seen by an increasing number of population increased as a pioneer in knowledge, reflecting a progressive development of information society in Romania.

Willingness and awareness of the need to use a computer and internet media offer is seen as a tool for acquiring new information that comes to ease and at the same time facilitate citizens' access to public information has been understood as time of the growing number of people.

As shown in the data table above, in late 2009, the share of households with access to a computer increased by 10.8% compared to 2007, while maintaining the same pace, at the end of 2010, more than half of Romanian households will have access to a computer. Regarding the share of people between 16-74 years in the total population of the same age who used computer arrived in 2009 to 44.79%, which represents an increase of 3.89% compared to 2007. While the number of Internet users in the same age group increased from 29.32% in 2007 to 38.04% in 2009. That the number of existing computers in 2008 in schools, colleges and universities[8] was 275,427, with 214,881 more than in 2001, indicating a concern for the technological development of the nation state. Most PCs are managed secondary schools at the end of 2008 with a total of 99,688 computers, 15,815 from existing computers in 2001.

6. The means of communication

Along with informational resources, a significant increase was registered among the media, who come to facilitate and reduce time consumption *acelelași* time for receipt of necessary information.

Widening access to new media, the expansion and increasing their impact has enabled their possession by a number of increasingly large population. As a result of this, the highest growth recorded in mobile *mijoacele* that a four-year period increased 2.39 times, each holding the end of 2008 Romanian, 1.13 mobile subscriptions.

Expanding Internet network, which favored increasing the number of subscribers,

has also a positive, but much smaller scale. In late 2008, Internet subscriptions reach 5,249,042, which represents an increase of 4,268,678 over 2004 subscriptions, or can estimate that one in four Romanian has an Internet subscription.

Table no. 4 - The evolution of communications in Romania

Indicatory	2004	2008
Number of fixed telephone lines	4389082	5035644
Number of fixed telephone lines per capita	0,20	0,23
Number of mobile phone lines	10215388	24467206
Number of mobile telephone lines per capita	0,47	1,13
Internet subscriptions	980364	5249042
Internet subscriptions per capita	0,04	0,24

Source [9]: <http://www.insse.ro,PTT104B,POP101A>

The slight growth in fixed telephony Please register but during the four years of the analysis was made an increase of 646,562 new subscriptions, their number per capita at the end of 2008, equal to 0.23.

As a result, as can be seen from the above analysis More and more people nowadays cannot stand without watching or hearing their TV, internet, newspapers, cell phones, radio, media players and more other devices that are their main important source of information, entertainment and more others [10].

7. Opinion

As I found work as a business man underwent specific changes of gaining new meanings over time, which is why we considered necessary an overview of statistical data sometimes reinforced within their existence, the evolution and transformations labor in Romania, concept considered quite familiar in appearance, but is continually subject to continuous changes.

In concluding this paper we conclude that work, a concept inseparable from human existence, is a specific activity by which the human own use abilities, skills and knowledge required to produce goods satisfy its necessities. Undoubtedly, the work is natural and permanent condition of human life, given that nothing is possible without

useful work and all property rights are the product of his labor. Work is a necessity, a moral commandment of humanity, it also constitutes the source of self-awareness, satisfaction, intellectual inspiration, a means of affirming each person in society.

A Parallel between Socialism and Cooperatism

Pop Stanca Alexandra
Babeş-Bolyai University, Cluj-Napoca
Faculty of Economics and Business Administration
stanca_pop@yahoo.com

Abstract

This article sets out to present a parallel between the socialist and the cooperative doctrine, made by Professor Nicolae Ghiulea and exposed in a conference in 1946. Leaving utopian conceptions, sentimentality and related ideologies aside, Ghiulea strictly refers to the scientific socialism built by Marx and Engels, and the modern cooperative, with its principles established by the equitable Rochdale pioneers. Apparently divergent notions, we shall see that the two systems are similar and connected in many ways. Nevertheless, the professor also points out the differences that singularize them.

Key words: cooperatism, socialism, capitalism, property, worker

J.E.L. classification.: B14, B30, P26, P51, Y30

1. Introduction

Both an economist and a sociologist with prominent social-administrative functions, Nicolae Ghiulea was one of the most important Romanian representatives of the cooperative doctrine during the interwar period. Born in Iași (11 September 1884), he had an original background in Mathematics, conducted sociological studies in Paris, Göttingen and Iași, and taught Social Policy at the Faculty of Law of the University of Cluj until retirement (1919-1942). Ghiulea was amongst the initiators of the social market economy in Romania, also standing out through a significant academic and publishing career in statistical theory, social economy, cooperatives and sociology.

Nicolae Ghiulea's rich scientific activity includes the conference entitled *The Marxist Socialism and the Modern Cooperative*, delivered at the „Carol I” Foundation, on

April 6, 1946, within the „Socialism and Culture” cycle, organized by the Socialist Group of Art and Culture. In the following study we shall briefly expose his conception concerning the degree of similarity between the two apparently divergent systems, as shown in the lecture mentioned.

2. Marxist socialism versus modern cooperative

The ideas of socialism and of cooperative were born with man, from his need to live, work and fight unitedly, but they took different paths over time. Looking at the beginnings of the two ideological currents, there could be observed that with the poor nations (the agricultural peoples that held land in common and worked collectively) the cooperative predominated, and socialism knew a glorious epoch in the time of Plato (≈ 400-300 BC), in Greece. The two ideas were brought back to the attention of all with the advent of Christianity and the increasing of workers' suffering. From then on, they were transformed into real social ideals of humanity.

Ghiulea found that both socialism and the cooperative have common precursors. He refers here to the utopians, the mystics, and the reformers from the sixteenth, seventeenth and eighteenth century; and later to the Saint-Simonists, the associationists, the Proudhonists, the British chartists, and the revolutionaries, who are claimed as both precursors of socialism and of cooperatism.

The parallel analysis between socialism and cooperative raises Ghiulea the question whether one can really make a comparison between the two notions. Overall, the concepts are completely different: socialism is a socio-political doctrine and cooperatism is a socio-economic doctrine; their only common element is their social nature. Even though the two concepts tend to overlap, the

co-operators don't believe in the efficacy of socialism's economic concerns, while the Marxists overlook the political leanings of cooperatives. Charles Gide, a well-known representative of the cooperative, considered Marxism as the end of the classical capitalist economy, and the socialist Karl Marx distrusted that the cooperatists could achieve a social reform without replacing the bourgeois-capitalist regime.

Nicolae Ghiulea signalled the identity of the purpose and the social ideals of the two doctrines. According to him, both aim replacing capitalism with a new social order. Socialism struggles to introduce the socialist republic, and cooperatism wants, admittedly, to establish the cooperative republic.

Professor Ghiulea starts his paper with the essential differences between socialism and cooperatism, which he lists and then analyzes separately. „Thus: socialism is revolutionary, cooperatism is evolutionary; socialism transforms the society by law, cooperatism by substitution; socialism is destructive, cooperatism, constructive” [2, p. 5].

Nicolae Ghiulea says that cooperatism is revolutionary, as much as socialism. It aims at removing the capitalist system, even if not through a legal requirement, but by the gradual conquest of all economic enterprises and the establishment of the cooperative republic on a democratic background. Cooperatives develop within the capitalist society, entering into free competition with the existing regime, following its gradual replacement. Hence we have the revolutionary character of cooperatives.

The ideal of socialism, on the other hand, is quite similar. „Socialism has the same goal: the abolition of the capitalist economic system, and has the same ideal: to create a new society” [2, pp. 5-6]. The difference remains therefore only in the means of fighting used. Socialism wants to introduce the socialist economy through the conquest of the political power and the transformation of the society by law, the expropriation of production means and their collective use.

However, both doctrines face resistance from the capitalist regime. The cooperative movement was deflected and captured by the capitalism that was developing at an accelerated pace, and socialism met strong resistance from the bourgeois-capitalist state, which did not want to lose its economic,

social and political privileges. However, it fights for permanent seizure of political power and total expropriation of production means through direct action such as creating currents of opinion, partial collectivization of business, social policies, enlightenment of the masses, etc.

Ghiulea does not agree with the statement that cooperatism is constructive and socialism is destructive, because both doctrines must first eliminate and then build other capitalist institutions, in the realization of their moral, social and economic ideal.

Socialism is based on class struggle. The socio-economic conflict in the attention of socialists is that between capital and labour, between employers and workers. On the other hand, cooperatism desires class solidarity, aiming at resolving the conflict between merchants and consumers. Nicolae Ghiulea shows that the cooperative is also based on class struggle, precisely because the worker's exploitation by the employer is what led him to join a cooperative. The insufficient salary he received pushed him to associate, thus removing intermediaries and their earnings. Moreover, the conflict cannot be between workers and traders, because they belong to the same class, the proletariat. The struggle takes place between workers and employers, working people using cooperatives as emancipation weapons in the fight against exploitation. Here's how in this field there is also no distinction between cooperation and socialism.

Socialism aims at the abolition of profit made from the surplus value which the employer fully appropriates, while the cooperative campaigns for the abolition of profit, meaning the increased price for the commodity, i.e. the intermediary's benefit. If we look closely on production cooperatives though, they were created exactly to remove the employer and the profit. It can be argued, therefore, that the cooperative members „reserve the full value of the product and, therefore, the added value, which socialism defends, in battle” [2, p. 9]. Cooperatives, in all their ways, protect work and the product of work, and are against those who exploit workers. Removing the profit and labour exploitation, cooperative approaches again the socialist ideals.

Socialism wants the abolition of the private property, which cooperatives, on the

contrary, aim to strengthen. Ghiulea brings counterarguments to this claim: socialism abolishes only the property of production, i.e. the operating property (that property which can be put into production only by exploiting wage labour), with respecting the work property (that is enhanced by the individual's own work, such as the small agricultural property, the craftsmen's workshops and the small traders' shops), and respects the ownership of household objects and of capital that workers obtain from their own savings; socialism „respects the property of their own housing, their items of personal, material or moral use, and the money earned from their own work” [2, p. 10].

The cooperative supports the peasantry and the petty bourgeoisie's property of work. In cooperatives, capital is not operating property; it is a production factor, consisting of all individual capitals and tends to become collective and replace individual capitals. In production cooperatives, since their establishment, production ownership is collective. Therefore, both cooperatism and socialism respect individual capitals, but aim at property collectivization.

Socialism does not recognize the role of cooperatives in transforming the society. Because cooperatism does not act politically, but only economically, and because it develops within capitalism, it is believed to disappear along with the capitalist system. Ghiulea combats this argument. Born to protest against the capitalist-bourgeois regime and to defend the exploited working classes, the cooperative is a movement of social transformation, because its ultimate aim is to replace the existing socio-economic organization with the cooperative republic. Indeed, the cooperative movement does not have the power to subvert the regime. It requires the political support of the Socialist Party, representative of the working classes and advocate of cooperatives. The alliance between cooperatism and socialism can successfully replace capitalism, establishing a new regime on socialist bases, where the cooperative is an aspect of its economic side, or at least a way of organizing the economy.

Considering the differences between socialism and cooperation as inconsistent, Nicolae Ghiulea pays attention to the similarities between the doctrines. First, he believes that the two doctrines must work

simultaneously and collaboratively in order to achieve the replacement of the capitalist regime. Socialism must conquer the political power, reach the head of the state and improve the situation of the proletariat. The cooperative comes to materialize the socialist revolution, by organizing the basic economic sectors, on collective, fair and equitable foundations. „Through cooperatives, socialism prepares and achieves the economic democracy” [2, p. 13], says Ghiulea.

The desire to replace the bourgeois-capitalist regime gave rise to both socialism and cooperatism. The socio-economic circumstances in England in the first half of the nineteenth century led Karl Marx to establish the scientific socialism (whose principles were set out in 1847 in „The Communist Manifesto”), and the Rochdale pioneers to found the modern cooperatism (whose principles were set out in 1844 in the „Manifesto of the Rochdale pioneers”).

Marx addressed the situation in theory and in terms of socio-politics, and the pioneers in practice, in terms of socio-economics. Both sides realized that workers will never have understanding from employers or state support in order to improve their situation, which is why they should take the path of self help, join forces and action determinately. The only solution to the social problems, considered Ghiulea, was the subversion of the capitalist regime, through the conquest of the political power and the socialization of the national economy. Marx's proposed political way, although time consuming, was going to fulfil its purpose clearly and completely. The pioneers, on the other hand, they themselves being in a position to be exploited by employers, being ruined materially and morally, chose the path of economic practice, with reduced results, but obtainable in a short period of time.

Criticizing labour exploitation, competition and the injustice distribution of goods in capitalism, socialism and cooperatism equally arose, said Ghiulea, „to remove the exploiter intermediary in all sectors of economic life, socialize the production factors and create the collective property, abolish the capitalist enterprise based on labour exploitation and seizing surplus value, socialize production and

distribution, socialize the distribution of goods, organize the economic life for the benefit of the masses, and rise economically, socially, culturally, morally the working class” [2, pp. 14-15]. One can easily observe the identity of the goals of the two systems.

Both doctrines are popular doctrines, which defend the interests of workers and are based on democracy. The socio-political doctrine of socialism is behind the socialist party, which represents the working class. In essence, this doctrine is democratic, because it seeks the possession of state power by the proletariat and thus leading the nation through the people and for the people. On its way to success, socialism also aims to achieve social democracy (through the abolition of social classes) and economic democracy (through the collectivization of enterprises). As a socio-economic doctrine, the cooperative aims at transforming the society in an economic democracy, through passing the economic power into the hands of people, in businesses established on democratic bases, called cooperatives.

Another similarity is the fact that both doctrines were designed and developed by the working class to defend their interests. Both socialism and cooperatism „are based on the same social and economic conception, they impose economic primacy over other human activities, they require the primacy of labour over capital and aim to organize the collective economy” [2, p. 16], considers Nicolae Ghiulea.

The society that socialism and the cooperative seek to establish will be organized in terms of economic democracy. „If socialism puts the entire structure of the society on a logic and fair economic basis, the cooperative is actually the construction of that basis” [2, p. 16], says the professor.

The two doctrines meet the same moral purpose as well, namely the emancipation of workers from the exploitation they are subject to, and their spiritual and moral development. Cooperatism also aims, in addition to the economic purpose of raising the welfare of all, to the formation of the socialist human, who is fair and loving. This, says Ghiulea, is the most precious source of people for the socialist movement. Therefore, through socialism, cooperatism develops, through cooperatism socialism strengthens, and by working together, capitalism can be

removed.

Although the two movements are much alike, over time there have been conflicts between them. Cooperatives were accused by socialists that they are essentially bourgeois and transmit the capitalist spirit to the working class. The importance and value of cooperatives, shows Nicolae Ghiulea, was envisaged by Karl Marx, with his brilliant intuition, since the early cooperative movement. In the first International Workers’ Congress of 1866 at Geneva, in his inaugural address, Marx expressed his appreciation for the cooperative movement as a valuable social and economic experience. He noted that, in this way, businesses are run by their workers that can emancipate through themselves, through their political and economic actions. However, Marx’s realism made him fix the cooperative’s place within the labour movement. Therefore, Ghiulea says that „for Karl Marx, the fruitful cooperative idea cannot fully succeed unless it is reported nationally, i.e. if the cooperatization of the entire national economy is made and if the political power is conquered, first by the working class” [2, p. 19]. Otherwise, the bourgeois capitalism will suppress all the cooperative movement.

Marx did not see cooperatives as the only means of struggle in the emancipation of the working class, but only one of them, which always needs to be adapted to the needs of the proletariat. In addition, he supported the development of the cooperative movement freely, without state involvement, only through the workers’ own efforts. Socialists therefore declare themselves for the cooperatives’ freedom, fighting for it within the capitalist state.

The idea of cooperative autonomy and its political neutrality was almost unanimously accepted by the various national socialist parties and recognized in the international socialist congresses, except for the countries where cooperatives were already included in the socialist movement (UK and Belgium). In the International Socialist Congress in Copenhagen in August 1910, Lenin, a leftist extremist, declared himself in favour of the cooperative movement, but with several conditions: imposing the socialist concept and a prior expropriation, entering cooperative members in the socialist party, and subsidizing the socialist political

movement by the cooperatives, through press, strikes or campaigns. By these, Lenin actually called the cooperative to join the socialist movement, but the congressional resolution was less categorical, leaving cooperatives a free hand to take decisions. The actor of the Russian revolution of 1917 kept the cooperative, which he considered the only good organism of the capitalist regime, but he followed his plan – the general expropriation and the dictatorship of the proletariat. In 1923, he defined socialism as „a regime of high culture co-operators, when the means of production have become common property and the proletariat triumphed against the bourgeoisie” [2, p 23]. Lenin admitted the cooperative as a solution to the social issue, but did not recognize its independence from the socialist movement. In 1919, the Russian cooperative movement was nationalized, and in 1923 it regained its freedom. Cooperatism in Russia was very helpful during the socialist stage of the Soviet regime, socializing most sectors of the economy (the small industry, trades, agriculture, supply and consumption).

3. Conclusions

Finally, Nicolae Ghiulea notes that, worldwide, the organization of the cooperative depended on the situation of the workers’ organization; it managed better and the linkages between it and socialism emerged clearer in the countries where the labour movement was more vivid and socialism better well-rounded. We have here the example of England and Belgium, the countries with the strongest cooperative movements, where there were close links between cooperatism and socialism. It was the same in Romania, where socialists allied with the cooperative followers in the fight for the movement’s independence, although they always encountered opposition and seizure tendency manifested by the bourgeois-capitalist state.

Professor Ghiulea states that although cooperative does not mean socialism, it can be considered as a valuable form of socialization. It turns the capitalist enterprises, in which the capital leads and the worker is exploited, into enterprises in which labour leads and the capital is the one which is employed. If in the early nineteenth

century, in the manufacturing era, the production cooperative was able and sufficient to socialize the economic enterprises, the twentieth century and the development of the large industry have reduced its efficacy, due to the inability to manage the large companies following the cooperative principles. Nevertheless, the production cooperative can always be used where special technical training is not required, where common sense, sound judgment and practical experience are sufficient (in trades, small industry, etc.). From the analysis of the production cooperative’s history, Ghiulea concludes that it „is a socialist solution in certain branches of production, to a certain degree of development of the company and keeping the strict belief in the cooperative principles” [2, p. 28].

Ghiulea believes in the cooperative’s ability to form the integral cooperative, in which the consumer cooperatives achieve the necessary production and transportation, and all the activities are based on the purest principles of cooperatives. This would create the prerequisites for the creation of the socialist enterprise and, more importantly, would achieve the social, cultural and moral uplift of the working class.

The Role and Importance of Services in National Economy

Popa Florina

Romanian Academy, Institute of National Economy

florinacarina@yahoo.com

Abstract

The tendency of entrance of services functions in all the areas of economic activity, expresses the orientation toward the economies "tertiarization", existing a correlation between the development level of economies and of services.

At the macroeconomic level, the dimensions of tertiary sector are measured by a number of indicators which express their volume and contribution to the economic and social progress. The study highlights the importance of tertiary sector in the national economy, their contribution in the economic development.

Key words: tertiary sector, service activities, economy.

J.E.L. classification: L8-L80-L81-L82-L84-L85-L86-L87-L88-L89; O1-O11

1.1.Introduction

In the actual stage, services are granted a role of prime importance, by economic theories, in accomplish the economic and social progress, these finding in the main activities creative of material and spiritual wealth. Whether until 80 years, according to classic theories, tertiary sector was characterized by a low receptivity beside the technical progress and by a diminished rhythm of productivity (compared with the other two sectors - agriculture and industry), in the last decades, this assessment can no longer be supported, as a result of the extension in many areas of services, of the technical progress, through informatics, electronics industry, modern technology of telecommunications, elements that directly have influenced the

growth of labor productivity. The reorienting opinion of specialists regarding the unproductive nature of services, has been motivated by a number of benefits resulting from this activity:

- they constitute a significant source of jobs, for limiting unemployment;
- a supply of services able to meet market requirements represent a basic element for competitiveness of enterprises in this field.

Existence of a number of categories of services such as: an efficient banking system, properly developed transport sectors, telecommunications, an efficient public administration, are essential conditions for economic growth achievement and concern in international trade, what determine services acknowledgement both as a prerequisite, and as a result of economic development.

The new systems, more and more complex, generated by technical progress, have led to an increase of the need for services involved in using of the industrial and consumption goods.

Increasing importance granted to services in the economy has resulted in the enhancement of their input to Gross Domestic Product, increase of employment level, growth in dynamics of services concern in the world trade. This evolution has led to including services within the multilateral trade negotiations, which have become Uruguay Round, finished by setting up the World Trade Organization (WTO) and signing of the General Agreement on Trade in Services (GATS).

As services sector theoreticians argue (Elena Nicoleta Untaru quotes Orio Giarini) [2], the new designation of "services economy", externalized in the most of world countries, is characterized by unlimited development of certain branches of services (financial, insurance, telecommunications,

transports), as well as by the involvement of services activities in the most of the functions carried out in the developed processes in the processing industry and in agriculture.

The activity of research and development – a consequence, but also a prerequisite of the development of production technique, contribute to the design of new products and services, meeting the market requirements, increasing their quality. In a direct relation with research and development is the education, as the use and application of new technologies also involves the upper qualification of the personnel.

Services are involved in the production processing by research and education functions, in the process of raw materials provision, in the progress of production, distribution of products on the links covering the routing from producer to consumer and, at the same time, in maintenance and repair products.

The tendency of entrance of services functions in all areas of economic activity, expresses the orientation toward the economies "tertiarization", existing a correlation between the level of development of the economies and that of services.

1.2. The importance of services in the national economy

At the macroeconomic level, the dimensions of tertiary sector are measured by a number of indicators which express both the size and the share of resources used in this sector, and the volume and contribution of the services effects to the economic and social progress.

A. A feature of the size of service sector is the input in the GDP, last decades registering a significant increase of their share, what has conferred them the role of engine of the economic growth.

In Romania, the role of services in GDP achievement has entered, on average, below the level of 50%, according to the data of ASR (Romanian Statistical Yearbook), in the period 2008-2010, the changes from one year to another showing no major meanings (**Table no. 1**).

Table no. 1 The situation regarding the contribution of services categories to national GDP

lei million current prices

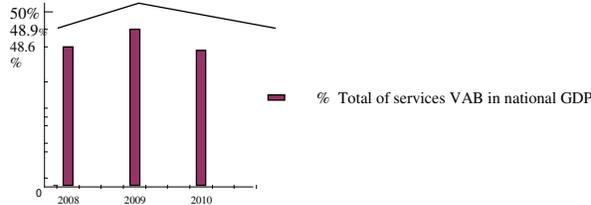

Categories of services	% in National GDP		
	2008	2009	2010
1. Wholesale and retail;...; transport and storage; hotels and restaurants	19.3	18.8	19.5
2. Information and communication	3.9	3.9	3.8
3. Financial intermediation and insurance	2.2	2.2	2.2
4. Real estate activities	6.2	6.5	6.8
5. Professional, scientific and technical activities; activities of administrative services ...	3.8	4.0	4.1
6. Public administration and defence; social insurance of public sector; education; health and social assistance	10.8	11.1	10.0
7. Shows, culture and recreation activities; ... and other services	2.3	2.3	2.0
% Total GVA services in GDP	48.6	48.9	48.6

Source: data processing from ASR 2011- CAEN 2, INS

Expressed in weights, the services have contributed to GDP achievement in the year 2008 with 48.6 %, had a slight increase of 0.3 % in the year 2009, respectively, at the level

of 48,9 %, as to return to 48.6% in the year 2010 (**Graph no.1**).

Graph no.1 The contribution of services in national GDP achievement

Source: data processing from ASR 2011- CAEN 2, INS

By analysing the Gross Domestic Product (GDP) structure by categories of resources from service activities (according to grouping in the Romanian Statistical Yearbook – ASR), for the period 2008-2010, it highlights the following questions:

- Ranking contribution on categories of resources positiones the groups of services, in all years, so:

- „Wholesale and retail; repair of motor vehicles and motorcycles; transport and storage; hotels and restaurants” are **on the first place** - their share, in the three years, is in the range of 18,8 % and 19.5 %;

- on **the second position** there are services group “Public administration and defence; social insurance of public sector; education; health and social assistance”, with weights between 10% and 11,1%;

- on **the third place** there are located “Real estate activities”, with levels between 6.2 % and 6.8 %;

- **the fourth place** is occupied by two groups, with weights significantly close (about 4%): “Information and communication” and, respectively, „Professional, scientific and technical activities; activities of administrative services and of support services”;

- on **the last place** there are found also the groups “Financial intermediation and insurance” and „Shows, culture and recreation activities; repair of household goods and other services”, the contribution exceeding scant of 2 %.

- The contribution of each category of services to GDP achievement maintained

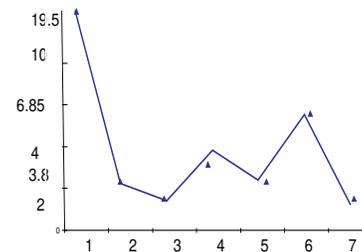

relatively **constant** over the three years, the plus or minus deviations, being, as a rule, less than 1 %.

- Two categories have **constantly** recorded **increases** (reduced, between 0.1 % and 0.3 %) from one year to another: “Real estate activities ” and, respectively, “Professional, scientific and technical activities; activities of administrative services and of support services”

- The only position with a more significant decrease of 1.1 % in 2010 beside 2009, was to “Public administration and defence; social insurance of public sector; education; health and social assistance”.

Ranking of categories of services by the contribution in Gross Domestic Product (GDP), is shown in the **Graph no. 2**.

Graph no. 2 The input of each category of services in GDP in year 2010

Source: data processing from ASR 2011- CAEN 2, INS

Notes:

1. Wholesale and retail; repair of motor vehicles and motorcycles; transport and storage; hotels and restaurants

2. Information and communication

3. Financial intermediation and insurance

4. Real estate activities

5. Professional, scientific and technical activities; activities of administrative services and of support services

6. Public administration and defence; social insurance of public sector; education; health and social assistance

7. Shows, culture and recreation activities; repair of household goods and other services

It has been counted the graph, only in the year 2010, taking into account the small

differences from one year to another, of the input of services in structure, to national GDP achievement (**Table no.1**).

B. Employment weight in the service sector emphasizes the role of human element in the share of services, being a correlation with the structure of the economy. (**Table no. 2**).

Table no. 2 Civil employment, by activity of economy

Specification	thousand persons				
	Year		% unto 2008	2010	% unto 2008
	2008	2009			
Employees on the entire economy of which:					
In the service sector	8747	8411	96,1	8371	95,7
	3667	3600	98,1	3570	97,3
The weight of employees in services in the total population of economy (%).	41,9	42,8	-	42,6	

Source: data processing from Labour force balance - end of the year, ASR 2011, INS

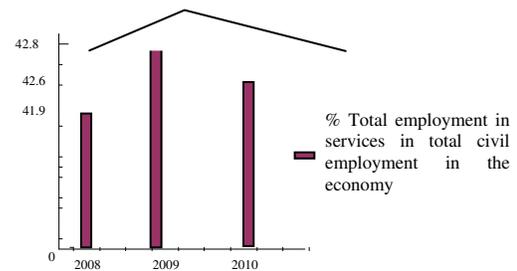

From the data referred to above, it issues that in the period 2008-2010, civil employment in the economy decreased from a number of 8747 thousand persons in 2008 to 8371 thousand in 2010, respectively, with 4.3 percent, while employees in services declined from a number of 3667 thousand persons in 2008 to 3570 thousand in 2010, respectively, with only 2.7 percent.

If consider the weight of employment in services in the total employment of national economy, it perceives an increase in the period taken into account, respectively, from 41.9% in

2008 to 42.6% in 2010. This increase, even if only with 0.7 %, reflects *the positive role of the sector in the supply of jobs and in the employment growth*, in the context of a jobs diminishing throughout the economy.

Graphic of employment in services is highlighted in the **Graph no. 3**.

Graph no.3 The weight of employment in services in proportion to the total civil employment in economy

Source: data processing from Labour force balance - end of the year, ASR 2011, INS

As regards the employment by category of services, according to data processing from Labour force balance - end of the year ASR 2011 (Romanian Statistical Yearbook 2011), at the end of the year 2010, for 6 service activities, the weight is over 5% in total services: “wholesale and retail; repair of motor vehicles and motorcycles” - 31,9 %; „transport and storage” - 11,9 %; „health and social assistance” - 11.4 %; „education” - 10,9 %; “activities of administrative services and of support services” – 5,7%; „public administration and defence, social insurance of public sector” - 5,7 %. For the other categories of services, the weight of employment is between 0.9 % (the “real estate activities”) and 4,4 % (“professional, scientific and technical activities”).

Slight increases of employees in the year 2010 unto the year 2008, have been found in "transport and storage" - 0,4 %; “financial intermediation and insurance” - 0,5 %; "other service activities" - 0,9 %.

Decreases in the same period appear in the segments: "Real estate activities" - 0,4 %, "hotels and restaurants" - 0,7 %; "education" - 0,9 %.

C. Flow of Foreign Direct Investment in services, in absolute value, have known an increase of 1.7 %, in the year 2010 unto the year 2008, decreasing beside 2009. Expressed in weights, it appears that, in the period 2008-2010, tertiary sector have come to more than a half of the volume of Foreign Direct Investment in the economy, respectively, 57,3% in 2008; 57.5 % in 2009 and 54,1 % in 2010, what confirms the *important role* of this sector of the economy *in attracting Foreign Direct Investment*. (**Table no. 3**)

Table no. 3 *Foreign Direct Investment flow in the economy and in services*

FDI flows	Period				
	2008 Thousand million euro	2009 Thousand million euro	% unto 2008	2010 Thousand million euro	% unto 2008
Total on the economy	48,8	50,0	102.4	52,6	107.7
Services	27,9	28,7	102.9	28,4	101,7
% services FDI in FDI of economy	57.3	57.5		54.1	

Source: data processing from BNR - ISD în România 2009, 2010, 2011

1.3. Conclusions

Tertiary sector represents a branch of a particular importance in the European economy, taking into account its raised contribution in the GDP achievement and in the labor force employment, of the large number of communitary agents who carries on service activities, as well as of the high-volume of Foreign Direct Investments in this sector.

Developments in the service sector highlighted their economic importance on national and international area, their contribution in the economic growth and development, being an interconnection between intensive production of services and development.

Even under the conditions of economic crisis, the sector of services maintained his overhead rhythm of evolution, with the highest weight in Gross Domestic Product (GDP), at national level, the diminishing in their input, in the year 2010 beside 2009, being insignificant (less than 1 %).

Development of an Intelligent System Prototype Intended for Accounting in Forestry Entities

Postolache (Males) Daniela

"Al. I. Cuza" University of Iasi, Doctoral School of Economics, Iasi, Romania

males_daniela@yahoo.com

Abstract

Prototyping plays a very important role for the development of an intelligent system, it allows determining the optimal structure of knowledge base and do not consume all the resources necessary to develop an entirely intelligent system. Our work shows the methodology for developing such a prototype. We made this application in order to simulate intelligent reasoning of an professional accountant from forestry. Romanian accounting knowledge, held by professionals with experience in accounting or forestry, was acquired and stored in a knowledge base, able to provide suggestions to optimize economic decisions in forestry. The results of this study are useful for researchers in the fields of decision-support systems, knowledge management, forest units management, management of information technology (IT). Also, our study is useful to intelligent solutions developers and forestry managers, given the detailed presentation of new available IT solutions.

Key words: knowledge-based systems; knowledge management; intelligent system prototype; accounting forestry knowledge; forestry expert system.

J.E.L. classification : D83, M42, O32, M10

1. Introduction

The term *artificial intelligence* was first used by John McCarthy in 1956, at a symposium attended by elite researchers, including Marvin Minsky, Herbert Simon and Allen Newell, who contributed, by their studies, to award the rank of science to this concept [12].

In the first investigations, the artificial intelligence was placed in the area of science, and of specific technologies.

Researchers proposed to transfer in the "universal computer" the ability to solve human thinking problems, extracting and using necessary information, in order to generate a symbolic representation of the "spatial" structure of the required reasoning [11].

Artificial intelligence is designed to develop technologies and information systems and is meant to emulate the functioning of the human mind when it solve problems and make decisions. Two of its most important attributes are:

- Making judgments by reference to the acquisition of knowledge;
- Increasing the performance, in terms of reasoning ability to solve tasks or assist decision, pace with the of acquisition new knowledge [2].

Tools used in knowledge management include knowledge processing technology, especially intelligent systems required to create, capture, convert, store, organize and disseminate the knowledge [6].

In forestry, the development of such a system has impact on improving accounting knowledge management. Development of an intelligent system for forest accounting units support the managers, and can be successfully used to store vital knowledge for proper conduct of business processes in forestry units.

2. Objectives

We aim to achieve an intelligent system based on accounting knowledge, decision support to operational level in a forestry district. Through this system, accounting knowledge within a forest subunit will be acquired and stored in a knowledge base. The system will acquire knowledge, will receive extra experience and expertise, and will provide suggestions to optimize economic decision processes.

The suggestions will be useful to the manager of district and, also, other officials from the functional departments of forest district, in decision making. The intelligent system can be used also for training new staff from a forest district, facilitating an interactive access to knowing processes and to specific activities.

By prototyping we wish to establish the optimal structure of the knowledge base that will be further developed in the framework of intelligent system.

In this paper we present steps to development of an intelligent system prototype, based on accounting knowledge required at operational level, in forestry.

3. Methodology

To achieve intelligent system prototype we used hybrid expert systems technology, with which we realized reasoning simulation of an accountant from forestry. Initially we developed the knowledge representation for analysis purposes, using semantic networks and decision trees. Subsequently, for the purpose of encoding, knowledge representation was achieved through rules and frames.

We used knowledge storage and management environment offered by *Guvnor* application, created within the *JBoss* Division of *Red Hat* American company.

For testing we applied modular validation technique, using *Drools* business rules management engine, also a *Jboss* application.

4. Knowledge acquisition and representation

For prototype construction we went through the following steps:

1. Initialization phase included defining of working hypothesis and establishing of the advantages of using intelligent system in forestry accounting;
2. In the analysis and design phase we realized the conceptual design and we established the development strategy;
3. In knowledge acquisition process have been several brainstorming sessions with the participation of experts from the Moldovita Forest District, Suceava County;
4. The knowledge representation used

decision tree method, developed by the group of participating experts. Knowledge codification was conducted with the help of business rules;

5. Prototype testing took into account knowledge base structural verification, functional verification and revision of prototype.

In order to develop intelligent system prototype was initiated the process of knowledge extracting, structuring and organizing. We have described the basic concepts of the solution design, we have determined the necessary features and initial prototype structure, during a brainstorming session, attended by employees of Moldovita Forest District, responsible for organizing and managing all functional departments of forestry division. It was planned the next brainstorming sessions, necessary to generate ideas on pieces of knowledge.

In the design of the intelligent system prototype we considered determining the optimal structure of the knowledge base. Intelligent solution design team was mixed, consisting of technicians, economists and engineers, specialists in different fields of activities within a forestry district.

To facilitate the participation of design team in the acquisition process, we determined the structure of knowledge on the areas: management, forest sites, accounting, security and protection, private forests, cadastral activity, hunting, regime of weapons and ammunition, horses, production, culture and regeneration, investment, repairs and forest roads, mechanization, standardization of work, human resources and payroll, secretarial and archive.

On the second level, knowledge of business processes reflected for each field, provide explanations and recommendations emulated after the inference of rules.

Intelligent solution regards storage of accounting expertise and the emulation of the accountant reasoning, so that all subunit specialists, can access the accounting knowledge necessary in daily activities.

That is why the monitoring of the ideas convergence was made by the chief accountant, an economist by 11 years experience in the accounting field, including 9 years in forestry accounting subdomain.

The contribution of each member of the design team (consisting of three forest technicians, 3 engineers, an accountant and the chief accountant of the Moldovita Forest District, Suceava County) was captured by the "black board", using heuristic knowledge, procedural rules and laws.

For setting up the "black board" *SmartDraw* visual editor was used. *SmartDraw* is specialized in graphics processing and supports clear and concise communication between participants in the planning process, providing a user-friendly visual representation [16].

The decision trees build using *SmartDraw* benefited from the advantage of flexibility in editing, viewing and updating.

Figure 1 shows a branch of the decision tree, developed for the field of activity *Guard and protection of forest vegetation*, in *Damages produced in harvesting economic process*.

We defined the following characteristics of inference nodes:

- Name;
- Code;
- Type.

Encoding knowledge contained in decision tree structure was performed using business rules. For example this module of coding rule "damagesHarvEcOp_R2":

```

1. | rule "damagesHarvEcOp_R2"
2. |   dialect "mvel"
3. |   when
4. |     r : resultList(

13. |               simplification measures apply).");
14. |       end

```

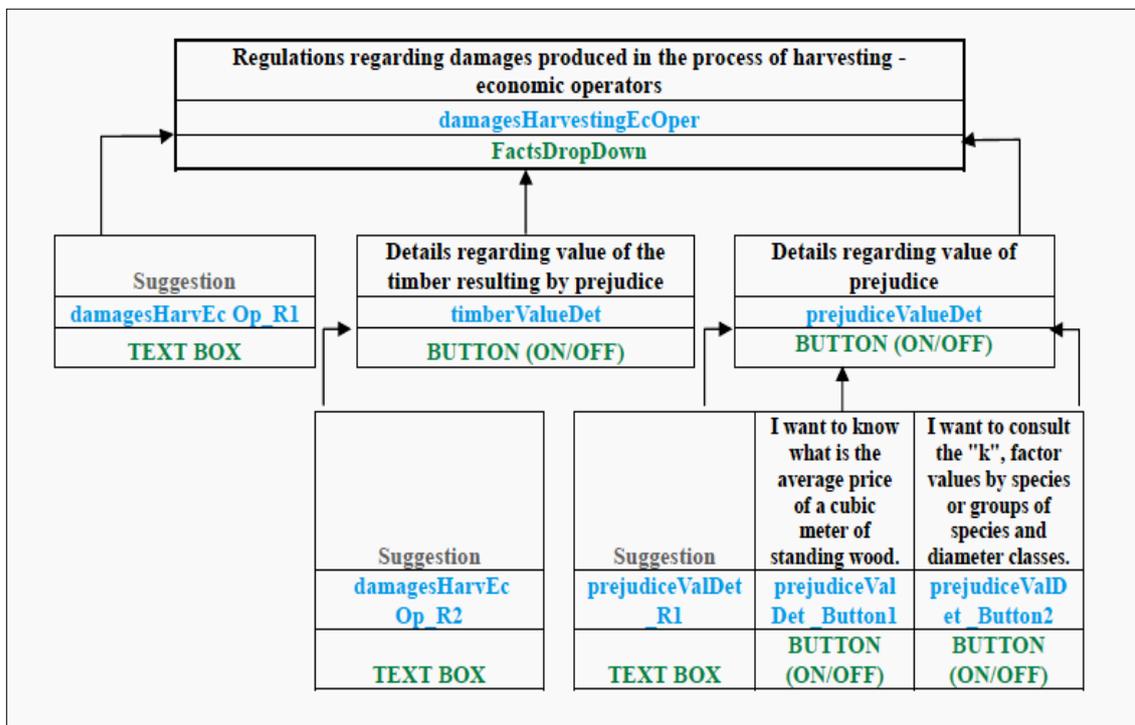

Figure 1. Organizing knowledge through frames

Decision on the correct assessment of the damage and the amount of damaged wood will be facilitated by recommendations on proper reasoning and calculation procedure.

Acquired knowledge was codified in a total of 48 rules defined through management and storage of knowledge environment, offered by *Guvnor*.

Introducing dynamic behavior of the prototype, Figure 2 covers UML state diagram, that models the intelligent system responses to external events.

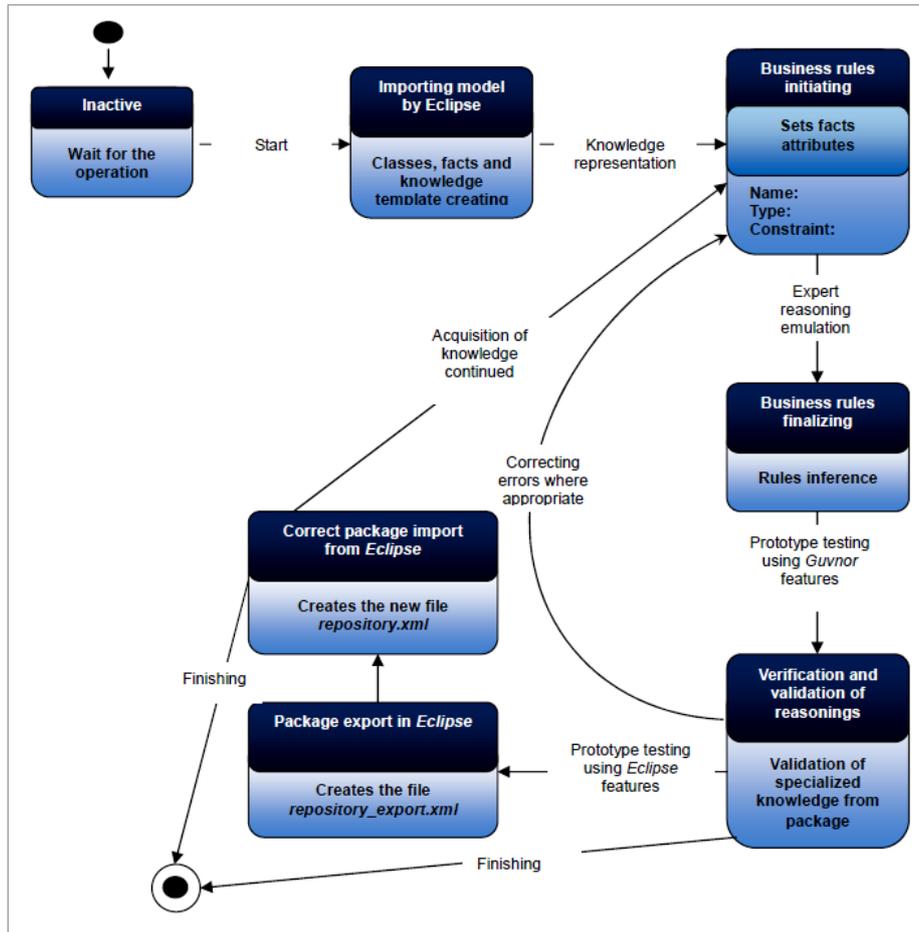

Figure 2. UML state diagram of the prototype

5. Prototype testing and presentation of results

For initial testing of the prototype, we used the facilities of the development environment *Guvnor*. It should be noted that, it was possible to check each rule, after it has been created, with a *Guvnor* functionality.

The verifications made through development environment led to the removal of circular and redundant rules. All pieces of knowledge have been checked by the knowledge engineer, in terms of logical consistency and correctness.

For functional verification and validation of the prototype, a specialist in information and communication technology, previously not involved in coding knowledge was employed in the test team. Testing was performed using a modular validation technique, with *Drools* rules management system, plug-in attached in *Eclipse* programming environment.

Pieces of knowledge have been exported to *Eclipse* through a *.xml* file generated by *Guvnor*, to verify the probability of system errors by subsequent incorporation in the final application. Raised *Drools* errors were corrected, thus revising the prototype.

Should be noted that *Drools* and *Guvnor* are open-source applications. In the last decade these type of applications have become redoubtable [4].

The Rete Tree of intelligent system prototype (Figure 3), and viewing the properties of each node facilitated error correction and validation of solution.

After validation, the design team determined that knowledge base optimization depends on the following conditions to be fulfilled by the intelligent system:

- The ability to easily locate pieces of knowledge;
- Scalability, meaning the ease way of changing when adding or removing nodes;

- The quality of being perceived as a whole, and not as a mere collection of independent and heterogeneous components;

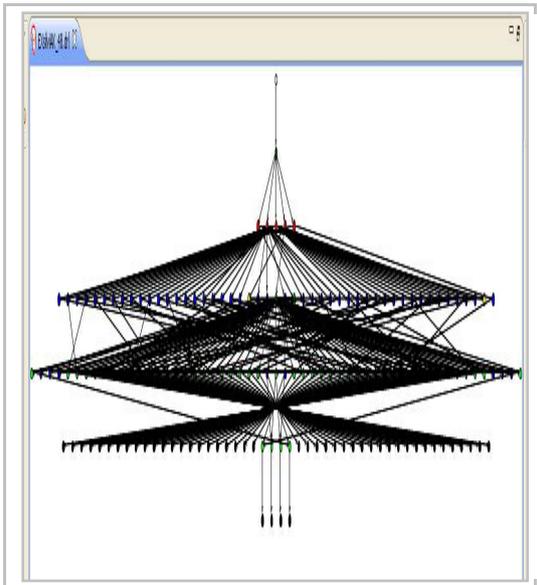

Figure 3. Rete Tree for the intelligent system prototype

- Coverage on error handling options;
- Security system regarding the confidentiality, access control, integrity of information and knowledge against alteration or corruption, and availability at any time, for authorized people.

6. Conclusions

Given the further development of an intelligent system, based on knowledge of forestry accounting, for operational level decision support, we used modeling method, producing a prototype. This paper presents the prototype development stages. Through prototyping we determined the main conditions that must be met by an intelligent system to support knowledge base optimization. In addition to these conditions, we conclude that the successful introduction of intelligent systems in accounting applications is influenced by the following factors:

- Active and iterative communication between experts and decision makers engage visible, relevant and credible knowledge;
- Translation, in order to understand each

other, when there are differences between experts and decision makers in the jargon, language, experience and assumptions related to the decisive argument;

- Perceptibility of knowledge representation, which should allow easy understanding of the modeling process, as a whole, and understanding of each rule.

Our research revealed positive implications at the organizational level by implementing intelligent applications: a better understanding of the functioning of business processes in the forestry entities and increasing expertise in the organization through effective distribution and exploitation of knowledge.

Abstract

One of the necessary conditions to align management of the SMEs in Romania to the requirements and existing standards of the EU market is the rapid integration of the latest trends in ICT.

The main requirement that must be satisfied in this context, is the transition from the informational society to the one based on knowledge, by implementing specific technologies such as ERP, SCM, CRM, document and workflow management, quality management in IT, eBusiness, eLearning and other techniques for working in Internet platforms.

ERP - Enterprise Resource Planning is a business management concept representing the efficiency activity, productivity optimization and minimizing the procedures for carrying out services of an organization in a unified system through proper planning of its resources.

Cuvinte cheie: cost reduction, e-business, planning, integration.

Clasificare J.E.L.: C82, C88

1. Introduction

Erkki Liikanen, former EU Commissioner for Enterprise Policy stated that: "SMEs form the backbone of the European economy. They are the key to entrepreneurship and innovation in the EU, and thus are essential for EU competitiveness. A proper SME definition facilitates identification of their needs and develops effective policies to

compensate the specific problems of their small size." [4]

Existing global experience demonstrates the particular importance of SMEs in national economies. After the rising of the last decades, it is expected for the next period that small and medium firms will be the main vector of economic progress, both in the developed countries and in the transitional ones. On the one hand, the attributes of the small and medium sized firms place this type of organization at the forefront of economic development. On the other hand, the coordinates that define the new configuration of the global economy are favorable to the expansion of small and medium sector.

2. What is SMEs?

For large firms, SMEs represent the world where they come from and where their competition will appear tomorrow. To individuals, SMEs are often a first job, the first step in their careers. They are also a first step in the entrepreneurs' careers. For the economy in general, SMEs are launchers of innovative ideas and a gathering of new processes that accelerate growth based on efficient uses of resources.

An important implication of external impact of the SMEs is that their contribution to development is not limited to the SME sector of the economy, but rather extends as an impact on businesses which are not covered by this sector, with an important influence. Statistics from almost all countries show that SMEs completely lead in the economy, representing over 99% of all firms, with substantial shares in obtaining GDP and providing jobs.

An essential attribute of SMEs is that they constitute an important source of jobs. Two-thirds of new created jobs are due to small and medium sector. Costs associated with creating a job in a small or medium business are small compared with those involved in creating a job in a large enterprise. They provide products and services at lower costs than larger companies, the main factors that determine this difference being the less conventional constant outgoings, a higher work productivity conditioned by the entrepreneur's constant presence at the firm.

SMEs are a factor of balance at the micro and macro economical level. Corresponding to the middle-class society, small and medium enterprises counterbalance the monopolies and oligopolies, reducing the capacity of large firms to control the market.

Determined by an economical environment which constantly changes, SMEs are flexible and have a great capacity for adaptation, due to their small sizes and the quick decision process. Being closer to the market, they easily adapt to the customer's requirements and demands.

Another important aspect is that they generate a large proportion of the applicable technical innovations in the economy. Most of the jobs will come from innovation. Experts agree that social networks, formal and informal, are vital to SME innovation process.

The role of small and medium enterprises is recognized worldwide for their unique contribution to economic development. The developed countries and the developing ones realize that the SMEs and the entrepreneurs play a vital role in industrial development of a country. Policy makers often found that SMEs can be "key" economic recovery.

Microeconomic policies for this segment focused on creating a favorable environment, improving the access to the financial support by developing investment projects and assistance in the information, training and consultancy areas. In Germany, economic and social policies focused on increasing competitiveness and productivity of these companies. The country stepped in on two levels: federal and landed ones. France has supported this sector by facilitating access to micro credits per term, by carrying out tax reforms and by promoting cooperation

between companies. Denmark thought and implemented a security program aiming the adjustment of the financial difficulties of small and medium size companies and in the Netherlands there were actions which meant to improve labor market flexibility as to maintain a high level of labor employment.

Excepting a series of barriers, small businesses also have to face with the increasing pressure of competition originating in globalization, the expansion and opening of markets, benefiting from new technologies and innovation. SMEs will have to find ways to address these challenges, because these challenges will likely continue and even increase in intensity while the EU has just expanded with new members which will increase pressure and competition.

3. ERP implementation and integration in SMEs in Romania

As part of the European Union since January 1, 2007, Romania manages to receive technical and financial assistance and support for continuing structural integration processes in the EU. Thus, the European Commission provides grants for 2007-2013, by creating specific financial instruments, having as main objectives the reduction of disparities among the regions of Europe and the increase in competitiveness and employment at the EU level in order to achieve the Lisbon objectives.

Romania's SME sector tends towards small and medium sized companies compared with the European Union as a whole, which has a comparatively higher share of micro firms. The sectoral distribution in Romania shows the concentration of SMEs is highest in wholesale and retail trade (44 %), followed by service sectors such as hotels and catering, transport, real estate and business services (29 %), construction (18 %) and manufacturing (11 %) [5].

Romania is one of the European countries that were worse hit by the recession, as its economic expansion relied more on foreign direct investments which dried up when the effects of the global crisis were felt by investors.

Romania's GDP dropped by 7.1 % in 2009 and contracted further by 1.3 % in 2010. The unemployment rate increased from

5.8 % in 2008 to 8.4 % in 2009 but further dropped to 7.7 % in 2010.

The crisis has taken a toll on Romanian enterprises, putting a temporary stop to the positive long-term developments in the number of SMEs and their contribution to employment and economic value added.

In employment terms, it is interesting to see that the SMEs were much more reluctant to shed employees during the crisis than the large firms. In fact, during 2008–2010, it is estimated that Romanian SMEs maintained their workforce at pre-crisis level, while the large enterprises shed about 6 % of their workers.

Regarding the outlook for 2011, estimates indicate a recovery, more or less in line with the EU average. The number of enterprises and their contribution to GDP (as measured by the gross value added) and employment in SMEs are all expected to exceed the pre-crisis levels by the end of 2011.

One of the necessary conditions to align management of the SMEs in Romania to the requirements and existing standards of the EU market is the rapid integration of the latest trends in ICT.

The main requirement that must be satisfied in this context, is the transition from the informational society to the one based on knowledge, by implementing specific technologies such as ERP, SCM, CRM, document and workflow management, quality management in IT , eBusiness, eLearning and other techniques for working in Internet platforms.

ERP systems have emerged as a result of organization resource planning systems development. Although in specialists approaches there are many points of divergence, ERP has several common features when implemented in SMEs:

- Are developed by objective criteria such as the function, which gives them flexibility and ability to be easy redesigned under modification of factors that are endogenous or exogenous to the organization.

- They have an open character, because they integrates a large number of entities belonging to the external environment of SMEs (customers, suppliers, financial organizations, banks, other businesses, etc.).

- Technically speaking, they work on a client-server architecture in which

information is managed on a central station and are accessed by users using usually, Technology Internet / Intranet, which provides several advantages: keeping data unity and integrity; access the same competing resource; maximum availability of services regardless of physical location of the resource or user.

- They are developed in a modular design and integrate all the processes performed in SMEs, covering, in general, these areas of activity: financial management and accounting; human resources management; inventory management; management of assets.

ERP systems architecture allows providing open model that allows data transfer both within SMEs, as well as in their external environment, starting with key suppliers and ending with the consumer network, known as SCM systems. SCM allows optimization of three categories of flows: flows of production (movement of goods from a supplier to a consumer following the latter's request), informational flows and financial flows.

In SMEs, SCM solutions use networking technology to link customers and suppliers and to generate real-time information on the evolution parameters of the production and distribution.

4. ERP - Enterprise Resource Planning

ERP - is a business management concept representing the efficiency activity, productivity optimization and minimizing the procedures for carrying out services of an organization in a unified system through proper planning of its resources, supervising and rescheduling them. According to the APIC dictionary, Enterprise Resource Planning is "a framework for organizing, defining, and standardizing business processes necessary for effective planning and control of the organization so that it can use its internal knowledge to obtain external benefits."

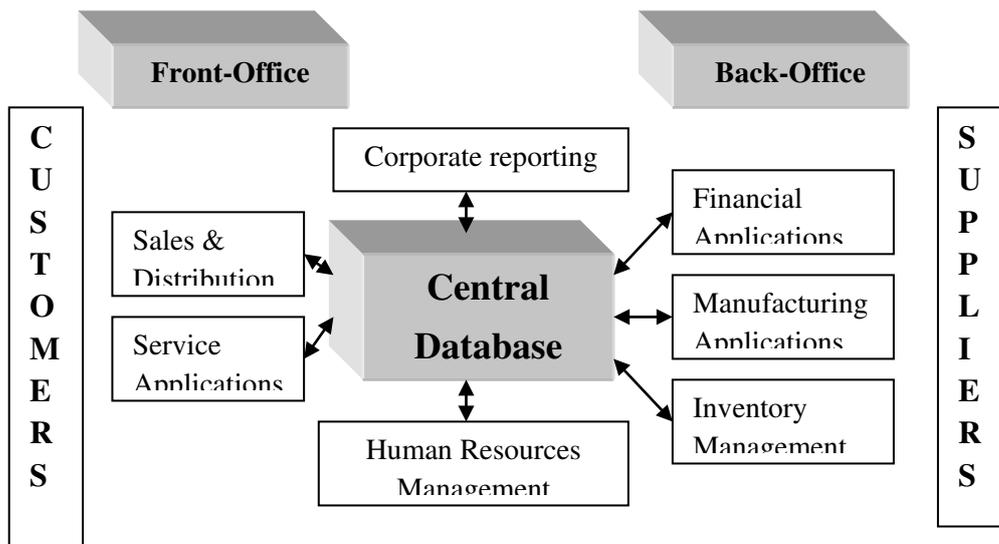

As a software solution, ERP provides support and control of the management system, and incorporates modules that support the next functional areas of business: planning, production, sales, marketing, distribution, accounting, finance, human

resources management, project management, inventory management, service and maintenance , transport and electronic business (e - business) "[1]. As a system, ERP integrates, in terms of data and flow, all the components of economic and business operations of a company. The key features of an ERP solution refer to [1], Figure 1:

- structured and modular design, which incorporates modules for all business functions

- integration of component modules in a manner that ensures the flow of information between all application modules with high transparency
- using a single database - a central database
- high complexity, etc.

Figure 1: ERP systems concept

Source: Rashid, M.A., Hossain, L., Patrick, J.D. (2002), *The Evolution of ERP Systems: An historical perspective*, Idea Group Publishing, p. 3 [1]

Advantages and disadvantages of adopting an ERP solution in a company are [1], Table 1:

Table 1: Advantages of ERP systems

What benefit	How
Reliable information access	Common DBMS, consistent and accurate data, improved report.
Avoid data and operations redundancy	Modules access same data from the central database,avoids multiple data input and update operations.
Delivery and cycle time reduction	Minimizes retrieving and reporting delays.
Cost reduction	Time savings, improved control by enterprise-wide analysis of organizational decisions.
Easy adaptability	Changes in business processes easy to adopt and restructure.
Improved scalability	Structured and modular design with „add-ons”.
Improved maintenance	Vendor-supported long-term contract as part of the system procurement.
Global outreach	Extended modules such as CRM and SCM.
E-Commerce, e-business	Internet commerce collaborative culture.

Source: Rashid, M.A., Hossain, L., Patrick, J.D. (2002), *The Evolution of ERP Systems: An historical perspective*, Idea Group Publishing, p5, [1]

Implementation of an ERP solution (eg, solutions provider ERP EBS) in SMEs in Romania quantify the benefits offered by the ERP solution, called ERP Clarvision. This brings many advantages, including:

- Sales and customer satisfaction increased by 12%

- Financial and accounting control has improved by 16%
- Stocks are reduced by 18%
- Expenditure on materials is reduced by 5%
- Expenditure on salaries is reduced by 8%

Table 2: Disadvantages of ERP systems

Disadvantage	How to overcome
Time-consuming	Minimize sensitive issues, internal politics and raise general consensus.
Expensive	Cost may vary from thousands of dollars to millions. Business process reengineering cost may be extremely high.
Conformity of the modules	The architecture and components of the selected system should conform to the business processes, culture and strategic goals of the organization.
Vendor dependence	Single vendor vs. Multi-vendor consideration, options for „best of breeds”, long-term committed support.
Features and complexity	ERP system may have too features and modules so the user needs to consider carefully and implement the needful only.
Scalability and global outreach	Look for vendor investment in R&D, long-term commitment to product and services, consider Internet – enabled systems.
Extended ERP capability	Consider middle-ware „add-on” facilities and extended modules such as CRM and SCM

Source: Rashid, M.A., Hossain, L., Patrick, J.D. (2002), *The Evolution of ERP Systems: An historical perspective*, Idea Group Publishing, p. 6, [1]

ERP systems have their disadvantages and some advantages above can become disadvantages [1]. Although an ERP system incorporates many modules, there are only a few companies that operate all functions of the ERP solution adopted. The principle of 80/20 is rather applicable in ERP systems - 80% of the organizations adopting an ERP solution using only 20% of its functions, and only 20% firms that adopt the same solution exploits 80% of functions, recommending the company to implement only those modules of the ERP solution which is really necessary. Also we notice the dependence of the solution provider, meaning that the relationship between the supplier and the customer of the ERP solution must remain very close even after implementation.

5. Conclusions

Given the fact that there is no universally accepted definitions for classifying companies into small, medium and large, though all vendors of IT solutions in view of this classification, to facilitate selection of ERP products in the database, it is useful to divide products into three groups: for small (including micro), medium and large companies considering the following aspects business size on turnover and number of employees.

ERP Romanian market remains low, with low depth, where any important project brings significant changes in the entire segment and modifies players hierarchies. There is still much dilettantism: "any provider of software solutions is address any type of company and any industry, with any solution which does not happen in a mature market."

It still expected starting the engine of any economy ERP market: SMEs. They have a small share in business applications, but everyone expects when SMEs will truly invest in IT. Thus, the stake at this moment is represented by small and medium companies, the healthy part of the private economy in Romania, which, at least theoretically, is the engine of economic recovery locally.

Implementing Cloud Computing Based Information Systems

Robu Maximilian Iosif

Doctoral School of Economics and Business Administration

“Alexandru Ioan Cuza” University of Iasi

Iasi, Romania

maximilian.robuc@feaa.uaic.ro

Abstract

Adoption of a new information system involves much more than simply buying hardware and software, it also includes changes in jobs, skills, management and organization. Most times a new information system is implemented to redesign the organization. Knowledge of application life cycle phases of information systems development is the main success factor in implementing such a system. This article will present some elements of the implementation of information systems in the context of cloud computing. Also a model of implementing cloud based information systems is offered.

Keywords: *cloud computing, information system, system, strategy*

JEL Classification: *L 86, D 80*

1. Introduction

Cloud Computing is a modern day feature that seems to quickly seize the attention of the information and communications technology. Cloud Computing is a relatively new concept in the IT field and it impacts its evolution and brings forth innovation in the way in which information technology is distributed. The term refers to the way technology will be supplied in the future, “as a service”, available exclusively over the network.

As any other state-of-the-art technology, cloud computing managed to draw the attention of companies which are now seriously pondering on investing in the Cloud. Companies that rapidly grow from basic cloud services to complex infrastructures are faced with intricate decisions regarding whether or not, components of the information system could

take full advantage of a private cloud network, which components could work with a public cloud infrastructure and which require a hybrid cloud system.

Among others, the aim of the hereby article is to clarify determinants that contribute to an efficient cloud computing strategy. Although there are a lot of concerns related to cloud computing, companies are willing to experiment cloud solutions. How do companies take the decision to implement cloud services despite these concerns? What key factors and cloud implementation models are not only compatible but, at the same time, work as efficient project models?

2. Cloud Computing and the Organizational Environment

Literature does not offer unanimously accepted solutions, the cloud is not a predefined shape and model; literature is currently unveiling cloud computing and the topic is far from being exhausted. Throughout this article, we aim to evaluate the effectiveness of the cloud projects and systems for any company or organization while trying to detach from the embellished hyperbole perspective offered by IT firms.

Determining factors in setting up strategies for adoption of cloud computing systems are grouped into three major categories: organizational, procedural, and technical factors. A summary of these factors is highlighted in tabel 1. One of the key aspects worthwile of all attention when implementing a cloud-based information system is the field the company operates in together with the acknowledgement of all issues known to have an impact on employee productivity.

Tabel 1 Main factors in setting up strategies for adoption of cloud computing

Organizational factors	<ul style="list-style-type: none"> • agility and cost benefits • impact on the competitive advantage • employee engagement • strategic organizational planning
Procedural factors	<ul style="list-style-type: none"> • employee education and training • information architecture • procedures for process implementation • responsibilities and roles - risk management
Technical factors	<ul style="list-style-type: none"> • security models • location of the cloud vendor • data backup system • data property rights • integration of non-cloud software in the cloud data system • management and monitoring

(source: adaption based on the Whitton, T. “Cloud Computing for Small Business. 8 Reasons to Outsource Your IT to the Cloud”, 201)

Once these have been acknowledged, one can move on to developing a cloud strategy. A pitch of agresiveness is dully necessary in addressing the difficult questions raised by own expectations from the cloud computing system and from the cloud supplier.

3. Information Systems Life Cycle – Cloud Computing Perspective

Literature does not offer unanimously accepted solutions, the cloud is not a predefined shape and model; literature is currently unveiling cloud computing and the topic is far from being exhausted. Throughout this article, we aim to evaluate the effectiveness of the cloud projects and systems for any company or organization while trying to detach from the embellished hyperbole perspective offered by IT firms. IT providers are currently rethinking their strategies based on cloud phenomenon and its evolution. Adoption of cloud computing is seen as the state of the art salvage solution for the IT infrastructure, primarily due to its cost reduction potential.

Cloud computing brings forth a new approach within organizations: local information systems will be replaced by standardized, centralized IT services delivered through reliable communication networks. Centralized administrative services offered for fees computed based on a ”per use” basis will eventually sunset dedicated IT systems. Cost benefits reside in the efficient use of IT resources and enhanced flexibility such as the ability to solicit and use resources only as these are deemed necessary.

Companies shift their interest towards cloud services and adjust their budgets to accomodate the cloud. A TechTarget survey questioning some 500 North American businesses of all sizes and operating in various industries reveals that 70% of these companies did include cloud initiative expenses in their allotted budgets for 2011, as compared to under 10% in 2010 [5].

For the same purpose, a survey conducted in January 2011 by Unisys shows that 44% of all questionees consider cloud computing to be top IT priority [6].

The new technology infrastructure equally introduced groundbreaking approaches in the IT system life cycle. The Cloud Computing system life cycle requires ongoing adjustment to project requirements due to changing effort levels and high speed implementation processes.

The life cycle of the cloud computing system development is similar to the traditional IT one, although implementation for information systems based on cloud computing are less time consuming and imply a smaller range of activities.

However, since Cloud computing uses a distributed infrastructure design, it is essential that data be hosted by a secured infrastructure, readily accessible, easy to store, and ensure data protection. Moreover, successful cloud solution implementation is dependent upon a thourough data safety analysis, network security, network speed, scalability, etc. to support global scale applications.

Moving your IT infrastructure to the cloud can bring forth cost reduction, increase flexibility, improve accessibility, and significantly rejuvenate the IT infrastructure of any organization. Nevertheless, in order to enjoy these benefits, any company should attentively plot its cloud implementation

strategy. Starting with the main activities highlighted in the first part of the present article, a successful cloud adoption model should consider the following phased approach to cloud service migration:

1. **Defining requirements** – The stepping stone for the organization is to define its project, to conduct a multi-layer analysis (financial, technical, organizational perspective), to match it with the cloud service offering and assess compatibility and finally, to find answers for all arising questions and obtain continuous guidance.

2. **Selecting the cloud platform and service provider** – We recommend choosing a fast, easy to use, and safe cloud platform. It is equally advisable to choose a flexible and scalable platform to ensure the company takes undivided advantage of one of the key features offered by the cloud services: ability to support and adapt to ever changing business models and future developments. Ideally, the organization would look for a cloud service provider that has a proven history of accomplishments in businesses that are similar to yours. A study conducted by the Ponemon Institute in 2010 reveals that companies are slightly easy going in choosing the cloud service provider. Only 36 % of all US respondents declared that their company remains alert in terms of deploying internal audits or thorough analysis prior to concluding a contract with the cloud vendor. An important milestone in selecting the cloud service provider is questioning their data backup and security policy. Most cloud suppliers consider data security to be their clients’ prerogative and accordingly use it as a disclaimer. Another study conducted by the same Ponemon Institute in 2011, questioning 127 cloud suppliers based in the US and Europe shows that 69% of all respondents consider the final users to be accountable for data security within the cloud. At the same time, 35% of the final users consider themselves to be responsible for data security within the cloud and, meanwhile, claim that disruptions are inevitable [4]. For this reason, it is essential to settle from the very beginning which party will be held liable for data recovery. For instance, if the provider is EC2 from Amazon, the company will be liable, whereas if the vendor is Sun Guard, accountability is a shared venture.

3. **Establishing contract terms** – Contract terms should be clearly stated and obligations for both parties, supplier and client, should cover all liabilities. For instance, according to some analysts, contract terms clarifying cloud storage capacity guarantees uptime but makes little to no reference on data availability and or protection [1].

4. **Phased migration to cloud** – An organization should consider a phased migration to the cloud which will allow the company to adjust to the new technology and minimize risks while ensuring business continuity.

5. **Planning and avoiding cloud vendor lock-in** – Data currently available in the cloud might no longer be needed tomorrow, work being handled by a department today could be accomplished globally starting tomorrow, while data published regularly in the cloud become an isolated, local necessity [8]. For this reason, it is advisable to find a cloud solution that allows quick data migration from the cloud to a local database and vice versa based on your company’s needs.

6. **Maintenance** – Moving any application from a local database to the cloud is never an easy process; for this reason, we recommend hiring a company that specializes in cloud integration technology to take care of your smooth application and data migration in the cloud. Finding a reputable cloud provider that can guarantee both application performance and uptime is critical for the success of your cloud migration. Equally, the cloud provider should be able to help with the smooth integration of the cloud applications with the existing applications [2], [3].

Taking a closer look, we can easily conclude that no “recipe for success” was yet discovered for the implementation of cloud-based information systems. SMEs seem to implement them “as they go” since the ongoing implementation entails less costs and fewer people to train, whereas corporations embrace existing implementation models usually suggested by cloud service providers.[7] The cloud technology is still in its infancy stage and, due to ever growing demand, the pursuit for implementation models for the existing methodology is very sustained; we are

currently looking for a cloud model that is sufficiently flexible and highly customizable to meet the demanding needs. In what we are concerned, we strongly believe that it will take a while before we'll see specific cloud implementation designs come to life due to the fact that this technology is not yet matured, it's still in its early days which can only mean that cloud implementation models will appear as we go and will find their roots in the traditional models.

4. Conclusions

Selecting and implementing a cloud strategy requires a combination of policy knowledge and expertise, strategy and IT. Cloud computing should not be considered a miracle solution as the cloud computing market is now maturing. Organizations have a duty to keep themselves up to the minute and assess cloud advantages and whether there are enough reasons to migrate to the cloud. In order to complete a comprehensive analysis, objectives need to be clearly stated, specifically for the total cost of the investment and the ROI (return on investment). Objectives should accordingly be realistic and attainable.

While the implementation of the cloud strategy is ongoing, the company's management team should address explicit questions both inside the company and to the potential cloud service providers. Answers to these questions will help identify the correct set of actions

The Method of Estimation of Development Potential of Trade Enterprises of the System of Consumer’s Cooperative Society of Ukraine

Mykola Rogoza
Aleksandra Kuzmenko
proinf@uccu.org.ua
oldrakk@gmail.com

Abstract

The methodical recommendations for estimation of development potential of trade enterprises are developed.

The scientific tool for determination of components of potential of trade enterprises and estimation of level of enterprise development potential is formed.

The scale of estimation of enterprises rating with the measures for effective activity of trade enterprise of the consumer cooperation system (CCS) is offered.

Key words: potential, development, trade enterprise of consumer cooperation system, estimation of enterprises development potential of the consumer cooperation system.

J.E.L. classification: F 10

Statement of the problem

The transformational changes of Ukrainian economy showed up as complex institution and structural transformations that substantiated the respective changes of external and internal environment of enterprises.

It is an ability and competence that is to use available resources (possibilities, facilities) optimally and correctly and determine the development resources [4, p. 224] is the main principle of the effective functioning of enterprise.

Therefore, the trade enterprises of the consumer cooperation system (CCS) need comprehensive estimation of environment where enterprise works, enterprise itself and its potential for the competitiveness providing, during the formation of effective

market strategy, prospects estimation and development direction of the enterprise.

Analysis of the last researches of this problem in which the decision is founded. The problems of estimation and management of potential and development potential of enterprises are the subjects of research of foreign and domestic authors: I. Ansoff, A. Tompson, A. Dg. Striklend, V. Kovaleva. B. Plishevskiy, I. Buz'ka, R. Marushkova [5], V. Shtanskiy and M. Zhemchueva [14], P. Fomin and M. Starovoytova [13], V. Mikitenko and I. Ignatieva [7].

The majority conducted researches were directed on the general problems of management of potential of enterprises the generous amount of which examined economic, strategic, production or marketing potentials [2, p. 1731].

The aim and task of researches. In spite of achievement and rather big attention of foreign and domestic scientists (O. Balackiy, A. Voronkova, I. Dzhayn, Yu. Doroshenko, O. Oleksyuk, E. Popov, E. Lapin, I. Repina, O. Fedonin, R. Feschur etc), the questions of forming of the unified method of estimation of potential of enterprise and development potential of trade enterprise of CCS are unsolved [9, s. 89].

Therefore a forming of method of integral estimation of potential and development potential of enterprises of CCS is necessary and actual.

Results of the research

The premise of effective trading enterprise management is the formation of trustworthy and impartial assessment of its potential, because further analysis is carried

out on this basis and measures for enterprise development management process improvement are taken. The assessment of the enterprise potential contains the evaluation of its components, on the basis of which general idea about the conditions of the enterprise development is formed. Thus, it is necessary to determine precisely all components of an enterprise potential, to estimate the development level and potential development of a trading enterprise.

An enterprise as a social economic system has two motive powers: a wish to survive and an aspiration for development [6, p. 6]. The necessary condition for an enterprise as a system conversion is its development. That is way we propose to the economic agents of the system of consumers' cooperatives (SCC) to use mixed enterprise development course. This course includes intensive, innovative, procedural and adaptable enterprises' development. The transition to this course of development will give an enterprise the possibility to improve the manufacturing and selling process management on condition that the products and production technology will be constantly renovated. Executives will receive the possibilities to keep and increase both internal and external enterprise potential using the methods and means of the adaptation to the requirements of inner environment. Intensive development guarantees gradual augmentation of an enterprise potential, allows to increase its level radically and to get the new quality of its own potential by means of technologic and organizational development, also to adapt to cardinal changes in outer environment. Consequently, using this approach the trading enterprise of SCC will be competitive at the world goods and services market.

Taking into consideration the basic characteristics of an enterprise potential, we can state that its model in trading is determined by [3, c. 352–353]: volume and quality of present resources; executives' and other staff members possibilities to create certain conditions to meet consumers' needs and certain conditions for high quality service; financial possibilities of assets attraction; management possibilities to use objectively present enterprise resources; information possibilities (to generate and transform information resources); innovative

possibilities of an enterprise (renovation of the technical and technological trade base); the use of up-to-date forms and methods of the economic processes and other possibilities organization and management. All these possibilities together create aggregate enterprise potential, which reflects its level of the competitiveness at the goods and services market.

The augmentation of the potential takes place at the formation stage as well as at the process of its usage [8, p. 137]. The main task of an enterprise is the use of available potential, its augmentation (due to reserves). However, the fact, that the strong points are the potential of an enterprise and the weak ones are the reserves of a potential, must be taken into consideration. Therefore one of the managerial tasks in running a trading enterprise of SCC is the use of strong points eliminating weak positions at the same time [4, p. 233].

A development potential of an enterprise is referred to as cumulative possibilities, resources, and means of functional enterprise potentials to change the index parameters of an enterprise activity providing selected development strategy. A functional potential is referred to as certain potential of the functional subsystem of the enterprise management [2, p. 1740].

Therefore, the assessment of an enterprise potential is a search for the aggregate of the characteristics, indices and properties that enable to describe an enterprise sufficiently and evaluate its perspective possibilities to meet corresponding society needs of a particular goods (or services) and the possibility to attain set goals [1, p. 7; 4, p. 224]. On the basis of achieved results of an enterprise potential assessment we can suggest perspective goals and draw rational strategy of its attainment [10, p. 89–90].

There are a lot of methods for the assessment of an enterprise potential and its development level. Each approach, method or model of an enterprise potential assessment has its advantages and drawbacks [12, p. 634–635].

We propose to evaluate an enterprise potential taking into consideration the structural functional method, which is based on the potential assessment of such functional units as trade; personnel; finance; organizational structure and management;

marketing; tools; information; innovations. Thus, the assessment of the trading enterprise of SCC potential is proposed to estimate according to the formula (1):

$$U = \alpha_{PS} \cdot PS + \alpha_K \cdot K + \alpha_F \cdot F + \alpha_{OM} \cdot OM + \alpha_M \cdot M + \alpha_T \cdot T + \alpha_{IH} \cdot IH + \alpha_{I\phi} \cdot I\phi, \quad (1)$$

where U – the trading enterprise potential;

$$\alpha_{PS}, \alpha_K, \alpha_F, \alpha_{OM}, \alpha_M, \alpha_T, \alpha_{IH}, \alpha_{I\phi} -$$

ponderability coefficients;

$PS, K, F, OM, M, T, IH, I\phi$ – normalized indices of functional units potential: trade (PS); personnel (K); finance (F); organizational structure and management (OM); marketing (M); tools (T); information ($I\phi$); innovations (IH).

Taking into consideration author's research [3], the level of an enterprise development potential is defined comparing standard values of factor features (that are accepted as 100 units) with their corresponding expected values (U''), which are defined with the help of corresponding dynamics series according to methods of moving average, extrapolation, expert evaluation or multi-factor regressive models.

Thus, let's consider step-by-step the methods of the determination of integral index of the development potential of a trading enterprise of SCC.

The estimation of the general potential of a trading enterprise according to the principles of methods of normative multidimensional mean calculation and graphic method is the result of the first stage. Herewith, the authors formed and structured the components of the potential of a trading enterprise of SCC in accordance with types, in particular:

1) trading potential (financial cycle period, commodity assortment stability coefficient, trade turnover, coefficient of service channels load, receipts from selling goods (services) per 1 m² of floor space, trade turnover expenses / receipts relationships);

2) labour potential (labour efficiency of the trading operational personnel, profitability of the payment costs, an average qualification level of trading workers, an average length of trading workers' service,

personnel employment at managerial positions, the level of the education of the staff);

3) financial potential (financial independence coefficient, self-financing coefficient, the level of income gained, selling profitability, the provision coefficient of trading stock with its own circulating assets, aggregate liquidity ratio);

4) managerial potential (the productivity of managerial staff labour, the coefficient of the managerial structure reasonableness, coefficient of the fluctuation of manpower, profitability of a capital, the coefficient of the effectiveness of the advertising actions and means of sales stimulation, purchasing completeness coefficient, regular customers' share, price rate);

5) logistical potential (the coefficient of the staff provision with floor space, the level of labour mechanization, turnover per 1 m² of floor space, floor space sufficiency coefficient, the coefficient of the effective usage of cellarage, mounting point coefficient, showroom coefficient, the coefficient of the managerial process automation);

6) information potential (the level of expenditures on the automation/informatization of the technological process, the existence of own web-site, availability of own e-mail, total amount of advertising means, total number of inner information types, effectiveness index of the information support of the managerial activity);

7) innovation potential (assortment renovation rates, technology renewal rates, managers' qualification level, corporate culture rank, return on sells from innovations).

The value of enterprise potential indices is proposed to present in the figure for computation (fig. 1), apart according to the year.

To define the value of units indices of PTE of SCC (K_r), if $\sum K_r = 1$.

To normalize the indices by maximum values.

Figure 1

Computation figure of an assessment of the potential of a trading enterprise (PTE) of SCC within 20 [created by the author]

Type of PTE	PTE indices	Enterprise					Index value in a unit	Maximum value of an index	Significant indices				
		e 1	e 2				P 1	P 2	
1	2	3	4	5	6	7	8	9	10	11	12	13	14

Next stage – the computation of the floor space potential of the trading enterprise (fig. 2) in accordance with formula (2):

$$U = \frac{\sin \frac{2\pi}{n} (\sum_{i=1}^n U_i U_{i+1} + U_1 U_n)}{2}, \quad i = \overline{1, n}, \quad (2)$$

where U – aggregate enterprise potential,
 U_i – value of i component of an enterprise potential.

Figure 2

Computation figure of the floor space of the potential and development potential of the trading enterprises (PTE) of SCC within 20 [created by the author]

PTE type	P 1	P 2	PTE type	P 1	P 2	Standard
1	2	3	4	5	6	7	8	9	10	11
...					...					100
.					.					100
.					.					100
...					...					100
Aggregate potential					Aggregate potential					340,36

Third stage – the computation of the level of an trading enterprise development potential as the difference between standard value (that are accepted as 100 units) and expectable value of the trading enterprise of SCC.

Forth stage – the formation of the development vector on the basis of which the development potential of the trading enterprise of SCC is structured graphically.

Five stage – the computation of the level of an enterprise potential (4):

$$D^U = \sqrt[n]{\prod_{i=1}^n IOP_i}, \quad (4)$$

where D^U – the level of enterprise development resources (potential);

IOP_i – integral resources assessments ($i = \overline{1, \dots, n}$).

The authors suggest the computation of the problem level of the development potential of the trading enterprise based on principles of combination the taxonomy and radar methods.

Next step is to define what type of the potential has problem development level at the enterprise.

Next stage is characterised by the analysis and the comparison with market data. The authors propose to apply the following assessment rating scale of the development potential of the trading enterprise to evaluate the level of the development potential of the trading enterprise of SCC (fig. 3):

Figure 3

Assessment rating scale of trading enterprises of SCC in Ukraine

[created by the author, [3]]

Enterprise development potential level	Enterprise activity assessment	The forming of an enterprise policy
1	2	3
Problem	Basic enterprise activity factors are negative, resources are used inefficiently	It is necessary to carry out fundamental strategy changes
Low	An enterprise is vulnerable at the competitive environment of the sector	To change the business processes activities
Average	The activity of an enterprise is sufficiently effective, an enterprise takes stably an average place at the goods market	To adjust the day-to-day management
Above the average	The activity of an enterprise is effective in whole, has competitive benefits, can become a leader	To implement marketing measures by means of маркетингові заходи шляхом conducting the exhibitions, advertising campaign in mass media, demand and supply research
Sufficient	An enterprise is a leader at the market	To monitor and to make certain actions to maintain its leading position at the market

Herewith, the formation of any enterprise development policy requires feedback support between made decisions and received results. The tool for creating this feedback support is the assessment that is the determination of the value of received results of taken managerial decision. During the implementation of an enterprise potential these results are synergy deposit made of great number of explicit and implicit effects. The above mentioned effects are of both and quantitative (production output growth, the quantity of clients and profit) and qualitative nature (the creation of positive image of an enterprise, the satisfaction of personnel needs by means of working conditions improvement). Such a variety of implementation results of the enterprise potential gives us the possibility to appraise the level of the enterprise development potential on the basis of the potential used by the enterprise.

Conclusion

The proposed methodical approach to

define integral assessment of the management of the development potential of trading enterprises of SCC with the help of analytical and graphical methods and the method of a mean is quite simple. It has sufficient system of factors to evaluate the trading enterprise potential. The methods allow making expended and complex conclusions, defining the directions for an enterprise potential improvement. The main drawback of the methods is the dependence upon expert assessment of the certain indices units' value and certain vast of calculations.

In such a way, the practical application of methodical approach of the assessment of the potential and development potential will let to provide the trading enterprises of SCC in Ukraine with new ideology, development policy, methodical tools of the development management and development potential in terms of transformation economy that will enable an enterprise to achieve the considerable development level and guarantee competitiveness and prolonged success at the market.

The Evolutionary Perspective of the Firm

Sîrghi Nicoleta

West University of Timișoara, Faculty of Economics and Business Administration
nicoleta.sirghi@yahoo.com

Abstract

The paper was based on a systematic review and critical analysis of literature on the theory of firm.

The theoretical assumption that forms the base of this paper is based on the importance of knowing the relationship between firms in different market, recognized at economic level.

Based on the need to address these questions, the objective of this paper is to critically analyze the theory of the firm in terms of evolutionary perspective.

The research goal is to identify how they contribute to explaining the evolution of firms and the performance differences between them. In this perspective the research goal is the analysis of the theory of the firms using the evolutionary theory.

Key words: theory of the firm, the evolutionary theory, the firm, the games theory.

J.E.L. classification: D21, D43, L13

1. Introduction

According to the neoclassical theory of perfect competition, the firm is to combine production factors in order to obtain a final product [1]. Thus, the company combines production factors – labour and capital in order to maximize profits.

Formed according to the values promoted by the neoclassical school (along with his contemporaries Friedrich von Hayek and Milton Friedman), in 1940 Ludwig von Mises published his work “Human action” in which he argued that the economy is a social science [2].

There were many reactions against this way of considering the economy and hence it was called into question the entire neoclassical paradigm. In this context, the

firm, the enterprise, is the form of human action, namely the creation of the entrepreneur. It is an integrative part of the market and should be integrated into the general theory of the market process and price formation.

2. The theory of the firm

The marginality debate around the mid 1930s came after the publication of several studies (Oxford Research Group - Hall and Hitch, 1939; and R.A. Lester, 1946) which argued empirically that entrepreneurs apparently do not follow the marginal principle of maximizing profit and minimizing costs within companies, so that they questioned the relevance of profit maximizing to be found in the neoclassical theory of the firm.

Ronald Coase identifies, in an article published in 1937, several sources of the cost related to the market mechanism use, that determines the emergence of the firm as an institution. The most important reason to set up a firm seems to be that of identifying the relevant prices, along the cost of negotiation and conclusion of separate agreements for each transaction [2].

The theory of the firm put forward by R.H. Coase is based on the generalization of organizational situations in an environment dominated by the market where transaction costs are significant. Without deviating from the alternative coordination of resources, R. Coase examines in turn the natural reasons for the existence of the firm, as well as the implied contract costs, the law on transactions on the market, the costs of market use, etc.

In the case of a perfectly competitive market the firms are of approximately equal sizes and cannot influence price formation, in the case of imperfect markets the competitive behavior of firms show that they are in active competition with each other and have some

power to influence the market [1]. The analysis of market structures is useful in identifying different types of markets, providing information on the performance of firms.

The paradigm on structure, conduct and performance (Chamberlin 1933, Bain 1956) dominated economic thought until the '80s. According to this paradigm, the structure of the market in which firms operate is ultimately the determining factor of performance and is measured through indicators such as profitability. The Neoclassical theory deals with the pattern of perfect competition, within which the perfect information available to economic agents provides instant allocation of production factors and access to economic goods.

According to the neoclassical theory, the firm exists to combine production factors to achieve and maximize profit (Coase 2002).

Harvard School (J.S. Bain, E. Mason, etc.) became well-known due to the conceptual research done on the structure and functioning of markets, barriers to entry, competitive strategies, economies of scale, transaction costs and antitrust cases. Contrasting the paradigm on structure, conduct and performance, the Chicago school continued to use an approach based on the neoclassical model of long-term equilibrium in competitive markets. Thus, the resources are allocated optimally and the market is the one that has the power to balance supply and demand [3].

The representatives of this school (A. Director, G. Stigler, W. Baumol, etc.) studied the theory regarding the life cycle of the firm, the firm's power on the market as a determinant of its integration. A significant contribution belongs to W. Baumol (1982) who promoted the theory of contestable markets, assuming that markets become competitive in the long term, and government interventions are not always considered necessary.

The Austrian School (C. Menger, L. von Mises, Hayek, etc.) supported the idea of minimal state intervention on the markets, bringing important conceptual developments on the theory of the firm. We observe such research on the competitive structure of markets, those relating to the dynamic nature of markets, as well as the research on the characteristics of firms, sectors and markets

3. The evolutionary perspective of the firm

The evolutionary theory defines the firm as a set of essential skills, gained from its learning ability [4]. The evolutionary approach adopts the concept of limited rationality, assuming that individuals and organizations have much to learn in a complex environment, characterized by uncertainty in the context of the knowledge economy.

Authors like O.E. Williamson (1971), S.G. Winter (1982), S. Ross (1973) H. Demsetz (1972), a.o., developed the approach initiated by R. Coase in 1937 and discovered new areas for its application. Alchian and Demsetz (1972) argued that the neoclassical theory of the firm does not actually refer to firms, but to the industry. The analysis of the literature in the field on modern theories of the firm is based on noticing a deficiency consisting in the separation of the economic theory of the firm and the one of the entrepreneur. Individual firms will, in general, follow routines described by researchers, but in fact the industry is complying with the marginal principles. The industry tends towards the optimal decision, but not because of changes occurred in the behaviour of firms, where profit maximization is the result of an evolutionary process which took place in the industry.

Langlois (2003) shows that firms with identical production functions, transform homogeneous inputs into homogeneous outputs according to well known technical “plans” [3].

Machlup (1947) and Stigler (1947) also defended the marginal principle, as a reaction to these studies. Machlup argued that firms use established routines in decision making. Alchian and Demsetz (1972) argue that the hierarchical structure of the firm's control does not minimize transaction costs, only monitoring costs[7].

The idea of the firm's behaviour put forward by Demsetz and Alchain is not much different from the market behaviour, suggested by Jensen and Meckling (1976) who introduced the idea of agency costs as a source of the firm's structure. In this regard the firm's behaviour is similar to that of the

market; it is the result of a complex balancing process.

E. Fama (1980) stated that the separation of share ownership and their control can be explained as an effective form of economic organization in the perspective of the “set of contracts”. Every factor of production within the company is to be found in inputs, which put together can create final outputs. The contractual theories of the firm are based on the importance of property rights, asymmetric information and moral hazard.

Continuing the reflection of R. Coase, O. Williamson analyzes the situations in which the exchanges reflect a large opportunist potential. Using the sources of sustainable competitive advantage has renewed the resource-based firm theory [4].

The resource-based firm theory explains performance differences between firms. Thus, the capabilities are the firm's knowledge base (they belong to the firm and not to individual agents). From this perspective, the firms are heterogeneous, the competitive advantage is translated in terms of efficiency of annuities, and the sustainability is based on the difficulty for the competitors to imitate.

The need to integrate the two approaches to the theory of the firm – the contractual perspective and the one based on capabilities – is underlined by other theoreticians on this issue stating that for a better understanding of the firm, more attention should be given to the problem of distribution of knowledge / production knowledge among companies, and especially to their character (Demsetz).

The corporation is not only a contractual entity, it is in the same time an entity that both learns and innovates, seeking competitive advantages from economies of scale and scope based on superior capabilities. Continuing the idea of coordinating knowledge, some authors (Cremer 1990, Radner 1992, 1996, Bolton and Dewatripont 1994) identify the firm with a network of communication set up to minimize both the cost of processing new information as well as its communication cost between agents [6].

The evolutionary perspective on the theories of the firm is linked to the research of authors such as Kirzner (1913), Williamson (1971), Winter (1982) and

Littlechild (1986) who introduced the term of “evolutionary economics” [7].

The approach of the theory of the firm from an evolutionary perspective had as starting point the work “*An Evolutionary Theory of Economic Change*” (1982), in which Nelson and Winter reconsidered the microeconomic analysis showing that excessive attention to market equilibrium was not needed, but rather the focus should be on the dynamic processes resulting from irreversible economic exchanges.

4. Conclusion

The theory of the firm contributes to the foundation of explanations regarding phenomena of the real economy. By their use, as a frame of reference in representing the behavior of economic agents, these opened the way for a large field of investigation. The developments registered in the field of the theory of the firm lead to the conclusion that economics opens a large research area that can certainly be extended towards advanced economic research. The problem of microeconomics is not to study the functioning of markets anymore, but to examine the ways in which firms can coordinate their decisions based on dynamic configurations in a competitive environment affected by risk and uncertainty.

Abstract

The contemporary economy is increasingly becoming an interdisciplinary science, related to sociology and anthropology, where the role of the human factor and of institutions becomes important in terms of economic behaviour. The Multi-Scale Integrated Analysis is a method analysing complex systems across multiple hierarchical levels, using both quantitative and qualitative (intensive) variables, such as personal preferences and the utility of time allocation in view to meet human needs. The method developed by Mario Giampietro and Koyo Mayumi introduces the concept of economic metabolism, live systems, allowing for the integration of monetary flows with the material flows and with energy flows, thus integrating the economic analysis, environmental, social and demographic analysis. This paper presents the general form of Multi-Scale approach with some examples for Romania.

Keywords: multi-scale integrated analysis, societal metabolism, energy intensity.

JEL classification: O13, Q1, Q4, N7

1. Introduction

Georgescu-Roegen is well-known for the application of the second law of thermodynamics (the law of entropy) to the economic process [1]. He has introduced the concept of socio-economic metabolism governed by the laws of thermodynamics and has designed the flow-fund model, which outlined the bio-economic system type, serving to the shift of the destructive modern economy into a long-term sustainable economy. The thermodynamic approach considers the economy as an integral and

viable part of the bio-system, with its own metabolism.

The circular flow diagram of the classical economic theory presents the economic process as an isolated circular flow, from companies to households and the other way round. In the thermodynamic approach, this diagram should be replaced by a diagram where the unidirectional entropy flow from environmental sources is added, through companies and households, turning then back to the environment. The circular flow could be described as a circular loop represented with a dotted line from companies to households, while the entropy flow is to be marked by continuous lines. No economy could exist without the entropy flow, while it is easy to imagine an economy without a circular flow, for example, a self-sufficient peasants' economy that do not engage itself in any commercial exchange.

The modern lifestyle is imbalanced and fights against nature by over-production and excessive consumption; moreover, this socio-economic system threatens to completely replace the traditional society that is sustainable, durable and provides a balanced and healthy lifestyle. A consequence of the thermodynamic approach to the economy is, among other things, the development of a society that encourages organic agriculture/industry, integrated with the rest of the ecosystem and which produces minimal waste, in combination with the stimulation of a lifestyle that promotes health maintenance, through the educational process.

Georgescu-Roegen had several criticisms positions related to the neoclassical theory and provided an alternative to the current standard economy of welfare. The proposed alternative is to use the dialectical representation. He has argued that the fundamental flaws in current economic theory are the concepts of Homo economicus

and the mechanistic structure of economic science: this approach clears out the human behaviour of any addiction to culture, which is equivalent to saying that man acts mechanically in the economic life. That is why this issue is usually depicted as a mechanistic conception of modern economics. The obvious conclusion is that, if the economy would be a science not only of “observable” quantities, but also of the man, it should exhaustively rely on dialectical reasoning.

Georgescu-Roegen has also insisted on the fact that the economy is part of the social sciences and the economic process cannot be understood outside the social and institutional context. He has pointed out that the economic process resides in qualitative changes, rather characterized by discontinuous jumps than by marginal changes. What is of utmost importance, in case of evolutionary structures, is the emergence of news, of qualitative changes. For these issues we have no other solution than the dialectical approach, particularly involving structural changes. This means using words instead of numbers, since real qualitative changes cannot be represented by a mathematical model.

The researches carried out in recent years led to the implementation of Georgescu Roegen bio-economic model in the development of socio-economic metabolism theory governed by the laws of thermodynamics. This achievement mostly pertains to Mario Giampietro (professor at the Universitat Autònoma de Barcelona, Spain) and to Kozo Mayumi (professor at Tokushima University, Japan) [2]. The two researchers have developed the Multi-Scale Integrated Analysis of Societal and Ecosystem Metabolism (MuSIASEM) that integrates cash flows with material flows and energy flows.

The Multi-Scale analysis of socio-economic systems allowed for the development of a behavioural bio-economic model for the modern society, based on several requirements: a total ban on arms production; standing aid for underdeveloped nations; the gradual decrease of the population to a level that could be maintained only through organic farming; avoiding energy waste activities, providing durable goods that can be recycled, avoiding

excessive work by balancing the time spent for work and leisure.

2. Methodology

The economic systems have the possibility of using energy and materials flows in view to preserve, reproduce and improve their structures and functions. All human beings, societies and ecosystems are metabolic systems. For this reason, the availability of energy and resources, together with the know-how and technology are key factors that determine the feasibility of societal metabolism models.

In the MuSIASEM approach [2], metabolic systems are characterized by the flow-fund concept whose components are the fund elements (elements whose identity remains unchanged during the economic process) and flow elements (elements that are produced or consumed during the economic process and are defining the interactions within the system).

Flow elements are cash, energy or materials flows, while fund elements are metabolic converters, since they should be able to preserve and reproduce themselves, in order to preserve the original identity. Fund elements involve consumption of some acceptable inputs for their maintenance and reproduction, as their identity implies that they can metabolize only a specific type of inputs.

It also distinguishes between exosomatic and endosomatic energy. Exosomatic energy is the energy used by a man outside his body (in the socio-economic metabolism) unlike endosomatic energy that is associated within the human body metabolism.

The bio-economic model of the society is based on multi-scale integrated analysis, which implies a hierarchical structure with several levels. In the multi-level matrix in Figure 1 one could observe the way two types of primary variables are divided into several categories, across several scales.

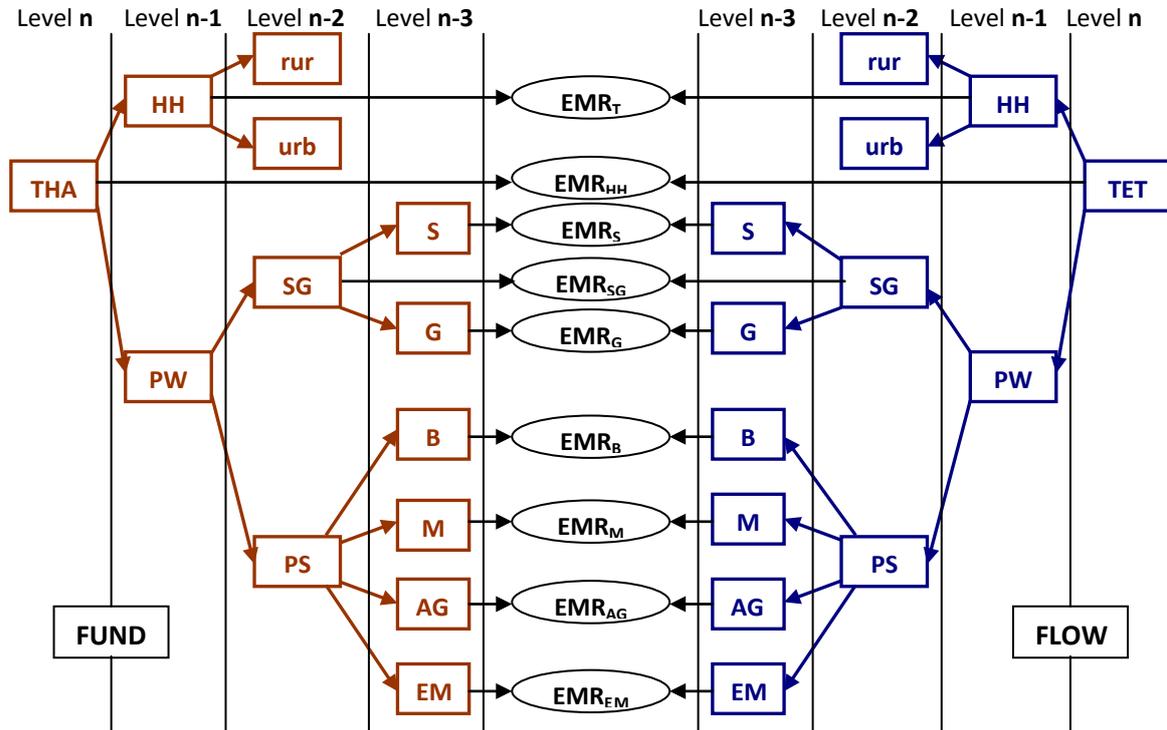

For example, the first primary variable called Total Human Activity THA can be analysed at national level (level n) and is defined as the amount of hours per year of the human activity of the society:

$$THA = 24 \text{ hours} * 365 \text{ days} * \text{population}$$

$$THA = 8760 * \text{population.}$$

This is a fund variable.

Fig. 1 Multi-level matrix with two primary variables: the fund Human Activity against the flow Energy Throughput

Source: Deliverable 3, Project SMILE, Socioeconomic Sciences and Humanities (SSH) Collaborative Project FP7-SSH-2007-1

On the next level (level $n-1$), the available national time fund THA is split between two compartments: (i) Production – human activity in paid work (HA_{PW}) and (ii) Consumption – “the rest” of human activity in the household (HA_{HH}).

$$THA = HA_{PW} + HA_{HH}$$

On the next level (level $n-2$), the amount of hours for paid work (HA_{PW}) is split between the activities in the production sector (HA_{PS}) and the service sector and government (HA_{SG}), while the consumption compartment could be seen as the sum between urban and rural households.

$$HA_{PW} = HA_{PS} + HA_{SG};$$

$$HA_{HH} = HA_{Hurb} + HA_{Hrur}.$$

The lower level $n-3$ corresponds to production sector (PS) division into four main sectors: Agriculture (AG), Energy and Mining (EM), Building (B) and Manufacturing (M), while the service sector is split between Government (G) and Services (S).

The time spent for paid activities in each sector is the result of the employees number in each sector multiplied with the amount of hours annually worked.

An even more detailed approach splits the human activity in the households (HA_{HH}) into three compartments related to the following hierarchical levels: (i) the amount of hours spent for physiological needs (HA_{PO}) - sleep, nutrition, self care, illness; (ii) the amount of hours spent for unpaid activities at the household level (HA_{UW}), generally housekeeping activities with a significant role in households stabilisation; (iii) the amount of hours spent for education and leisure, playing an important role in the society progress through knowledge and health.

The second primary variable from the multi-level matrix is a flow variable called Total Exosomatic Energy Throughput (energy metabolized by technical devices outside the human body) TET (level n), representing the final energy consumption (in Joules/year) - the biophysical approach. This is the aggregated sum of Energy Throughputs (ET_i) consumed on each of the lower hierarchical levels ($n-1, n-3$).

A similar approach is using the “value added” as a flow variable - the economic approach. On the level n the GDP is placed,

further broken down on lower hierarchical levels in the value added corresponding to the related sectors.

Intensive variables are calculated based on flow and fund primary variables, as the ratios between them, $EMR_i = ET_i / HA_i$ which are represented in ellipsoids in the middle of Fig. 1.

The Exosomatic Metabolic Rate (EMR_i) is the exosomatic energy consumption rate per human activity unit. On level n , the Exosomatic Metabolic Rate on Average for Society (EMR_{AS}) is the ratio between TET and THA.

Another intensive variable is Economic Labour Productivity (ELP_i) equal to the ratio between the added value generated in a sector and the number of hours of human activity in that sector.

The set of intensive variables is extremely important since it allows for comparisons between various organisational hierarchical levels or for the same hierarchical level, but for system of different size. They describe the qualitative characteristics of the parties, while the extensive variables describing the quantitative relationship between parts and whole.

Intensive variables can be associated with known typologies, taken over from other countries, sectors, types of households, and can provide a qualitative characterization of the metabolic elements subject to characterization, but at different hierarchical levels. Likewise, defining a multi-level matrix that characterizes the distribution of a fund variable type and a flow variable along the respective hierarchical levels, allows for the setting up of a set of correlations between intensive and extensive variable values across various scales.

Other two major variables are derived from the two primary variables described above:

The Saturation Index of Human Activity ($SIHA_i$) is the share of total human activity (THA), allocated to a certain compartment or sector (HA_i) - $SIHA_i = HA_i / THA$.

The Saturation Index of Exosomatic Energy Throughput ($SIET_i$) is the share of TET consumed within a certain compartment or sector (ET_i) - $SIET_i = ET_i / TET$.

There is a link between the development level of an economy and the metabolic model of the society. A high level of money flow

variable which raises the satisfaction of living in society entails an increase in energy and material throughput in the production sectors of the economy (HA_{PS}). That richer society will develop services sector and will work less because of allocating more time for education and leisure activities. Under such circumstances, the manufacturing sector will have to provide the society with a greater quantity of goods, energy and materials using a limited amount of worked hours.

3. Application in Romanian case

The study of the Romanian economy and its energy behaviour reveals a different metabolic profile (generally more low) as compared with other European Member States, due to multiple hidden causes [3], [4].

After December 1989, Romania has shifted from the control system to a free market system and joined the European Union on January 1st, 2007. During this transition period, Romania had to build up the civil, political and economic society from the bottom level, to exceed state bureaucracy and to develop the rule of law by ensuring an independent judiciary system. In 2000, the Romanian institutional system was not yet completely restructured, which created obstacles in supporting the transition to a market economy. All these slow structural changes in the Romanian society can be analysed based on a complex system of performance criteria, using the MuSIASEM methodology.

The Multi-Scale Integrated Analysis Methodology has been implemented for Romania under FP7 Project Synergies in Multi-scale Inter-Linkages of Ecosocial systems, socio-economic Sciences and Humanities (SSH), 2008-2012, involving several researchers from Romanian Academy (Raluca I. Iorgulescu, Lucian Liviu Albu, Cristian Stănică). Two major applications are further presented [3], [4], [5].

Multi-Scale analysis of Energy Intensity

The energy intensity calculated at the economy level is not a suitable indicator for the development of governmental policies envisaging the energy efficiency increase. The studies conducted in countries such as Bulgaria, Hungary and Romania have shown that Romania has mostly reduced the energy

intensity, which should qualify it as a competitive country in terms of energy, although the reality may contradict this. Energy intensity contains little information on changes in energy consumption behaviour that occur in the socio-economic system. Thus, the MuSIASEM approach can go beyond energy intensity in view to understand the energy complexity of interconnections between the energy flows of an economy sectors. The results of the analysis by sector reveal several aspects.

At national level (level n), the TET variable examination shows a slight downward trend in the case of Romania during periods when there were no increases in labour productivity, which means that there are various factors other than productivity and energy efficiency, that influence the behaviour of final energy consumption. The economy restructuring measures imposed by market liberalisation and privatisation of state energy companies can lead to important changes in energy consumption. Likewise, there are also some other factors of human behaviour, such as preference for computers and Internet, rather than information on paper support, or unpredictable factors related to climate changes, and so on.

The analysis of Level $n-1$ allows for a more accurate comparison of the energy behaviour of neighbouring countries, based on ET_{PW} and ET_{HH} variables. Thus, the process of economy restructuring has affected the energy consumption of the paid work sector in Romania (ET_{PW}) more than in Bulgaria and Hungary, with a drastic reduction (over 50%) in the first three years after the revolution. This shows that Hungary has experienced a powerful transition, while Romania has faced serious difficulties. Likewise, there is a sudden increase of the Exosomatic Throughput in Households (ET_{HH}) after 1996, as consequence of energy prices liberalisation in Romania.

The analysis of Level $n-2$ within the paid work sector (productive sectors, service and government sectors and agricultural sector) is even more relevant to highlight the complex mechanism of energy behaviour.

Productive sectors are characterized by the highest level of energy intensity (EMR_{EM} , EMR_{BM}). In recent years, the exosomatic metabolic rate in these sectors has slightly

increased, while the value added per hour of work grew faster than in other sectors, indicating a relative improvement in energy efficiency. As compared to neighbouring countries, Romania has a high level of the industrial energy throughput because of the still inefficient mechanism of industry inherited from the communist regime.

The service sector (including public services) presents an exosomatic metabolic rate by 50% lower than the production sector. A slight increase of its energy throughput per hour of work without being accompanied by an increase of nominal value added generated per hour is characteristic, a trend opposite to other EU economies which focused on service development.

The agricultural sector in Romania reveals a very low level of energy intensity, because the work is mostly based on people's work than on technological capital. This trend has not significantly changed in recent years, therefore continuing to attach high importance to animal and human productive capital. It is a consequence of property reform, which returned the agricultural land confiscated during the communist period to peasant households. Land fragmentation and lack of technology have kept the low value of the agriculture exosomatic metabolic rate. The value added generated by the agricultural sector is well below the European average, consequently determining lower prices for animal and crop products than those in the EU, and low income of peasants from the sale of products.

Socioeconomic Metabolism in Industry and Transportation

This analysis allows for a detailed characterisation of structural changes in the Romanian economy at sub-sectors level (lower levels $n-3$ and $n-4$) in the category called Productive Sectors (level $n-2$). Among others, the method allows for making a cross-checking of data: (i) starting from a lower level (using national statistics, starting from individual sub-sectors) (ii) starting from a higher level (using Eurostat) with aggregated statistical data. This double check is extremely important for economies with structural changes and changes in statistical methodologies, when the lack of official statistical information (effect of the informal economy) induces errors in time series compilation.

The following are on level $n-3$: (i) Energy and Mining (EM), Building and Manufacturing (BM) from the production sector (PS) (level $n-2$); and (ii) sub-sectors of service sector and government (SG) (level $n-2$) namely Transport (TR), Public Administration (PA) and other sectors (OS). Energy and Mining (moving from level $n-3$ to level $n-4$) was disaggregated into six industries, while Building and Manufacturing was disaggregated into two sub-sectors.

The first significant difference between the Manufacturing sub-sector and Building sub-sector refers to energy metabolism. Manufacturing sub-sector is 4-5 times more intensive in terms of energy than the Building sub-sector. Further disaggregating the Manufacturing sub-sector, it includes twenty-one industries that can be organized into three groups.

The adoption of this approach not only allows comparison of results with other sectors of the Romanian economy (in view to study the way structural changes affect the energy intensity of the economy), but also with similar sectors in other European Union countries.

4. Conclusion

The Multi-scale integrated approach enables the analysis of complex systems across multiple hierarchical levels (eg, households, industries, regions, whole countries) using concepts characteristic to live systems. The basic idea is that socio-economic systems present two distinct types of metabolism (endosomatic and exosomatic) and two general forms of representation: Fund categories (capital, land, people, hours spent for activities) which maintain their identity throughout the duration of the analysis, and Flow categories (energy, value added, food, material flows) - items that are produced and consumed during the economic process. The system organisation and survival depend on the capacity of each component element to continuously ensure the necessary inputs (the flow elements) that must be processed and consumed.

The method is implemented by an increasing number of researchers, both for assessing the behaviour of complex economic systems and in particular cases, such as the correlation of statistical indicators

on different scales, interpolation of time series defined in a certain scale of aggregation by using information from the level of other hierarchical scales, etc.

The method was also applied for Romania in view to analyse the energy intensity, as well as for the analysis of industries behaviour. There is still noticed the presence of old influences from the communist period, both at institutional and economic level, rigidities in the restructuring of certain energy industries and privatisation delays, low input of technology in agriculture, all these positioning the Romanian economy behind the EU states, in terms of competitiveness

Abstract

Knowing deviations and analysing them is useful to managers for planning and control. In the current circumstances, managers have a multitude of information, which sometimes lead to informational suffocation. For the analysis of deviations, BI solutions such as QlikView can be used. The article aims to present the possibilities of integrating BI in the analysis of deviations, in a bakery company.

Key words: business intelligence, deviations, analysis, bakery

J.E.L. Classification: M11, M15, M41

1. Introduction

Following the execution of the manufacturing process deviations can occur from the scheduled levels of the quantities and production costs. Control is one of the basic management functions providing the compliance of the forecast performance and set objectives with the plan. The main objectives of the analysis of deviations are to identify the causes of the deviations, to adopt the necessary corrective measures and to identify responsibilities [1].

The analysis of deviations allows for the determination and evaluation of the various factors that determine the difference between actual and standard costs.

The general method is analytical: starting from the observation of the deviation from the standard cost, the breakdown of this deviation into sub-deviations corresponding to various calculation items and on various causes is attempted, in order to get as close as

possible to the actual manufacturing conditions and to allow for the initiation of the necessary corrective measures.

2. Importance of the deviations analysis for the managerial process

The occurrence of deviations is the result of a multitude of causes, and the problem of the management is to identify the persons or centres that are responsible [2].

The analysis of deviations allows for updating the database, setting responsibilities for each deviation separately, integrating the relevant factors in the assessment of the company performance, renewing standards in order to make decisions and set the budget [3].

Following the analysis of the deviations and the identifications of those responsible, the management can take a number of corrective measures through which the set objectives can be reached.

Knowing deviations is useful to managers for planning and control. In order to use a deviation in the performance evaluation it is crucial for the manager to understand the cause of the deviation in question.

For a better monitoring and interpretation deviation rates can be calculated, based on the values in previously determined absolute amounts.

Currently managers receive a huge amount of information, especially concerning the manufacturing process [4]. In this context, we believe that BI solutions are recommended method in order to avoid informational suffocation and to make a pertinent analysis based on which correct decisions can be made.

3. BI solutions for the analysis of deviations

In order to make correct management decisions, based on accurate and up-to-date information it is necessary to have more than intuition. Taking into account that in most organizations there are huge quantities of information related to production indicators, financial statements, sales data, balance sheets, forecasts, managers lack information updated in real time based on which to be able to build a decision-making system. The implementation of a Business Intelligence (BI) solution in a company is an advantage due to the overall view of the database and to the fact that managers are allowed to make better decisions, in a faster pace [5].

Any BI solution takes information from multiple sources, either internal or external of the company and in any format integrates it into a single consistent data warehouse [6]. Thus all data are collected in one place, without duplicates. Based on the collected data, the BI system enables accurate analysis leading to the identification of the causes of the problems that occur in a company. Making interactive views may take just a few minutes. Depending on the facilities of the BI system or of the platform on which it is developed, the analysis reports can be distributed to anyone on the Internet. Those who receive the files can interact directly with the report: they can filter, sort and rearrange information.

We are presenting below a few analysis reports made with the help of the application QlikView. The data are taken from the database of a company manufacturing bakery products.

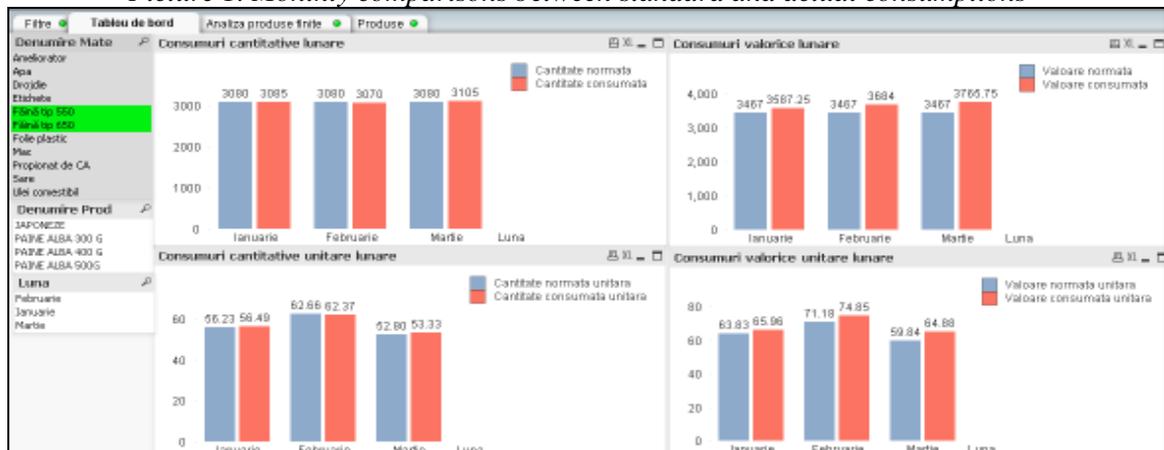

products.

We chose the application QlikView due to the fact that it constitutes a powerful BI tool. QlikView is a complete BI and data analysis software package that provides a better way to work with the data of a business [7]. The graphical interface provides users with high interactivity. With a few mouse clicks, they have immediate access to all the information. Organizations can discover, in this way, information unsuspected before, they can better understand what happens in the current activity and consequently, they can make the best decisions for their development.

We analysed the following reports:

A. The monthly comparison between the quantity of material used to manufacture bakery products and the established standardized quantity, between the standardized value and the spent one, between the unitary standardized quantity and the unitary consumed quantity, and between the unitary standardized value and the spent one. Even if the differences seem to be small, for a big quantity of bakery products they are significant. We can see in Picture 1 that the spreadsheet contains in addition to the corresponding charts, a few tables with the values related to the materials, bakery products made and the month. By the simple or multiple selections of these values from the tables, the charts change instantly, presenting the same comparisons but only for what was selected. Thus, by a click we can display the comparisons for one month, or a group of selected months, we can see the quantities and values required to manufacture one product or a group of products.

Picture 1. Monthly comparisons between standard and actual consumptions

Source: prepared by the authors

The deviations from the standard raw material and direct material consumptions are plus or minus differences resulted from the failure to observe specific forecast consumptions or other causes (the use of replacement materials, works not taken into account in the determination of the standards, price changes etc.). The deviations related to raw materials and direct materials can be deviations in terms of quantity or price.

For the company management it is important to determine the difference between the actual cost of the actual production and its standard cost. The result of this difference is interpreted as follows:

- A negative cost deviation corresponds to an actual cost that is lower than the standard cost and is called favourable deviation;
- A positive cost deviation corresponds to an actual cost that is cost higher than the standard cost and is called unfavourable deviation.

This separation of deviations highlights the significance of deviations as a consequence of the manner of organizing the

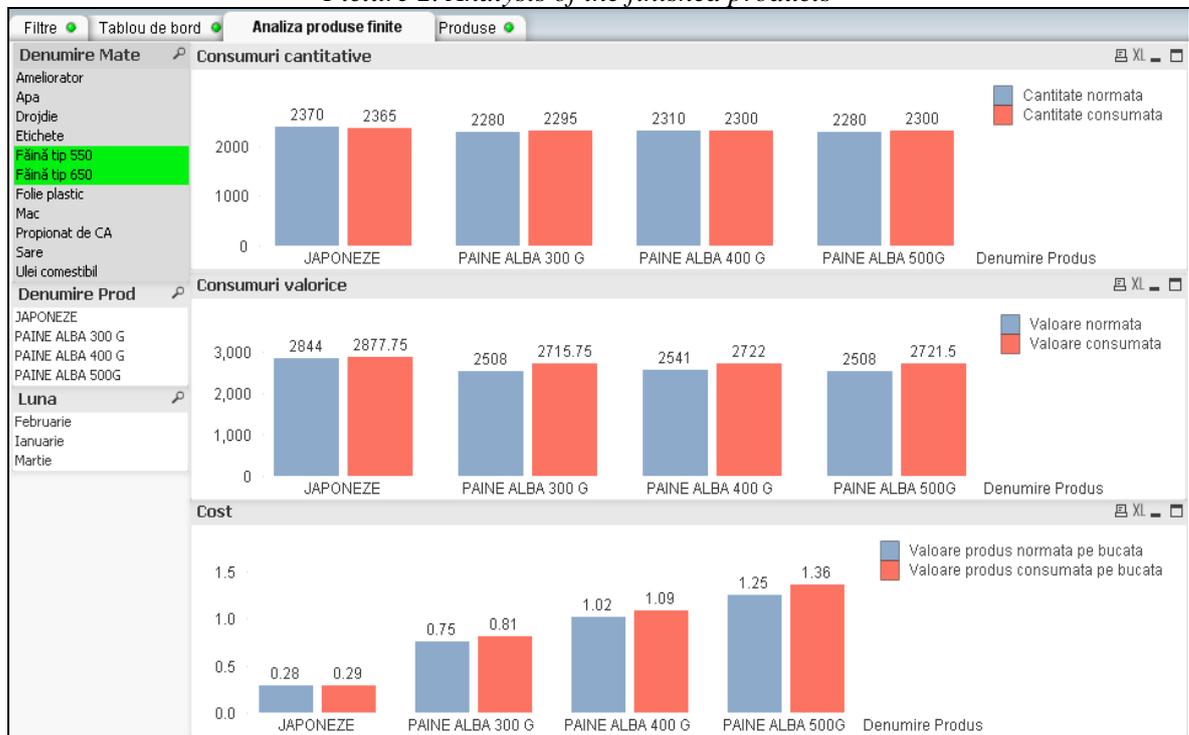

activity, which can be effective or ineffective.

Another grouping of deviations takes into account the responsibilities, such as:

- Controllable deviations imputed to responsible persons;
- Uncontrollable deviations generated by external factors, such as the increase in the price of the materials and that cannot be imputed to responsible persons.

B. Analysis of the finished products. In this chart an analysis is made for each finished product. The standardized and the actually consumed material quantities, the standardized value and the value spent for the products made and the standardized and spent value per piece are highlighted. This information can be displayed during the desired time period or for certain materials. In picture 2 we can see that information is displayed for the material “Flour” standardized or consumed for each of the finished products for a period of 3 months. This chart too can be easily changed by selecting other options.

Picture 2. Analysis of the finished products

Source: prepared by the authors

The differences occurred between the standard product quantities and the actual ones can have multiple causes: the evolution

of the demand in the market, problems in the operation of the company, lack of raw material, worker strikes etc.

An extremely important aspect of the analysis of the deviations is to determine their causes. A favourable deviation of the price of raw materials can result from the fact that poor quality materials were purchased. A favourable wages deviation can also be the result of the fact that poorly skilled workers were used, which will impact the quality of the manufactured products.

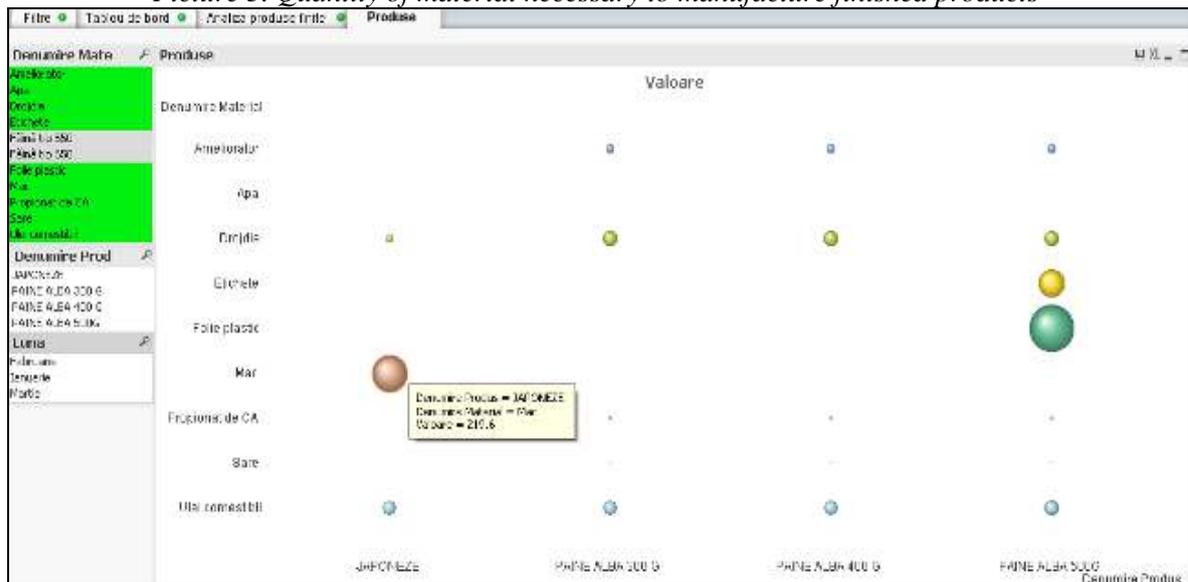

The deviations within the limits of an acceptable range are often unavoidable and

are considered controlled, and no investigations are required in relation to their causes

C. The quantity of material required to manufacture each finished product.

In picture 3 we selected all the materials except the “Flour” because the quantity of flour is much higher than the other materials required for manufacturing bakery products and this is why these materials were not even visible in the chart.

Picture 3. Quantity of material necessary to manufacture finished products

Source: prepared by the authors

Deviations from the standard raw material and direct material can have causes such as: the incorrect determination of the standard quantities (of the recipes), sub-standard consumption with serious consequences on the quality of the products, unjustified loss, and inappropriate operation of the machinery.

4. Conclusions

For the management of the bakery company it is necessary to analyse deviations in terms of nature, size and causes in order to determine the measures required so that actual costs can comply with the set standards. By using the standard-cost method actual costs are compared to standard ones and the deviations from the latter are determined, on cost centres, calculation items, and causes.

Business Intelligence answers all challenges related to obtaining information. It eliminates resource and time wastes, it

excludes errors, it crystallizes the management’s vision concerning important aspects of the business, it instantly supplies information to all those involved, irrespective of the data amount and complexity.

Deviations can be used in the performance assessment. The production manager can receive efficiency bonuses if the operational expense budget is observed. The understanding of the causes that determined the deviations can be used for learning based on experience and thus for the improvement of the company performance. The results of the analysis of deviations is a basis for the substantiation of the costs for the next period.

The management by exception consist of focusing attention on the fields that are not within the expected parameters. The fields with higher deviations receive more attention.

Deviations must be reported taking into account the following:

- The correct identification of the influence

factors;

- Setting responsibilities for each employee, in order to identify the people responsible for unfavourable deviations;
- Deviation reporting must be oriented towards unfavourable deviations, as a consequence of the management by exception;
- Deviation reporting to the company top management can also include details in the case of deviations supplied at lower level, on causes and responsible persons.

Control is exercised especially in the case of unfavourable deviations, being a consequence of the management by exception. By analysing deviations and setting responsibilities the manager can take corrective measures meant to lead to the achievement of the set performance. Following the analysis the level of performance that must be reached can also be reviewed.

BI capitalizes the advantage of the company applications (ERP, CRM, SCM) already installed, which maximizes the benefits of IT investments. All the companies that made huge investments in building data warehouses can make the next step through

the implementation of a BI system that completes investment efforts.

Policy Action to Prevent Unemployment in EU and Romania

Vancea Diane Paula Corina
Ploae Victor

“Ovidius” University of Constanta, Faculty of Economic Sciences
economics@ovidius-university.net
vploae@univ-ovidius.ro

Abstract

The present paper presents a comparative situation on the Active Labour Market. Policies in the country members of the EU with a specific accent on the Romanian labour market. We discuss about the public employment services, training schemes, employment subsidies adopted by the countries in the view to help the unemployed find work. We conclude that not all the countries have the same commitment in the efforts to cut the unemployment; even they face a very difficult economic crisis.

Key words: labour market, unemployment policies

J.E.L. classification: J21, J64

1. Introduction

Faced with an extended economic crisis which generates a rising unemployment rate that achieves dramatic dimensions in some countries like Spain 24-25%, and Greece 21-22%, the EU struggles to find solutions to employment growth, increasing consumption and, of course, economic growth. The average unemployment rate in EU is 10,5 – 11% (higher in the euro zone and the highest since the introduction of the euro), but this hides record differences between countries. Dispersion of unemployment rates in euro zone (euro area) reached an unprecedented level. This is explained, to a great extent, by the worsening employment in the countries facing high levels of sovereign debt. Almost 40% of the increase in unemployment in EU is due to massive increases in unemployment rate in Spain. It stands on this occasion the differences in the level of development of countries belonging to the EU. The answers

of the member states in this case were quite different, which further segmented the labor market at the level of EU. Interestingly, in addition to the countries which were actually faced with large imbalances, there were increases in unemployment in other areas which initially showed no major problems in terms of financial balances.

What is really threatening is that there is a worsening of the situation in terms of the duration of unemployment. Record figures are registered in Ireland, Slovakia, Spain and the Baltics. The unemployment rate has also dramatically increased among youth, especially in Greece, Spain, Portugal.

Romania is no exception since it strives to improve the employment. With a rate of unemployment in the crisis situated at around 7.5-8% and serious problems in the employment of youth and vulnerable groups, Romania folds on EU policies and recommendations on active measures of employment growth, together with fiscal consolidation [1].

In these conditions, finding the policy mix generating jobs is not an easy task. The measures applied in EU countries are different, sometimes contradictory. The same are the results. Not always are they conclusive and, unfortunately, in some cases even worsen. Although efforts are supported, as this analysis demonstrates, the general employment situation in the EU, instead of improving, sometimes worsens or remains difficult.

2. Short overview of the policy action plan

Policies that support the increase in the number of jobs encourage the demand for labor force and facilitate the transition to a job, remain the crucial point in preventing unemployment and strengthening labor market. At the same time, the emphasis is, in

both EU and Romania, on the adoption of unprecedented measures regarding labor law in order to support a favorable employment growth and reduce labor market segmentation. The reforms that took place in most European countries in the field of labor law have been consistent, relying mainly on provisions aimed at reaching a critical objective: internal flexibility of the labor force through a greater decentralization and more flexibility in wage policy. Also, the new provisions which amended law on unemployment benefits systems have supported transitions back to work. It was emphasized, especially after the onset of the crisis, the adoption of active measures for the employment of Active Labor Market Policies. There have been allocated significant financial resources for initiating and implementing programs aiming back into work, career orientation and lifelong training, all this in order to reduce unemployment and increase employment, especially among young people and the disadvantaged.

Action and job-search assistance policies remain the most used tools in the fight against unemployment. There were developed new strategies and action plans designed to support both young people and the long-term unemployed in finding jobs. There were no specific action plans for sectors that have been especially hit by the crisis (e.g. Spain). To improve the efficiency of measures, some countries have adapted institutional network in order to support their unemployed, reorganizing the Public Employment Services (e.g. Czech Republic, Hungary, Spain, Belgium, Ireland) or increasing the number staff involved in hiring. One-stop-shop Specialized Offices were set up (Czech Republic, Hungary, Ireland) and, at the same time, in many countries, they outsourced employment activities to private specialized companies (United Kingdom, Slovakia).

Naturally, the emphasis was laid on attracting vulnerable groups in the labor market. For these, various incentives such as wage subsidies and tax incentives are maintained in many EU countries (Cyprus, Spain, Belgium, France, Greece, Sweden, Latvia, Bulgaria, Luxembourg).

Job creation schemes have been initiated and measures have been taken to activate the

unemployed to start to work as self-employed (e.g. Austria, Czech Republic, UK).

Life-long learning and training has also been a strong point in the action plans designed to improve the structure of the labor force. New training schemes for the unemployed have been developed by revising training needs and priority areas. To improve the impact of training programs and life-long learning there have been allocated substantial funds in the development and implementation of activities, internship and apprenticeship schemes in private, public, community or voluntary sectors.

At the same time, were implemented various programs designed to improve employees' skills and abilities by strengthening their training rights, both during office hours and by removing them from production.

A problem that was raised in many countries and was partially resolved during the crisis was to attract women in business. Italy, Malta, Hungary, Austria initiated participation friendly schemes giving women income tax cuts and structuring various child care programs, going to refinancing child care expenses (Netherlands).

The problem of unemployment benefits represents a serious concern for the European space; its size, the granting period were different topics addressed in EU countries. Given the need to ensure fiscal consolidation in most European countries, it was raised the question of cutting the unemployment benefits or reducing the granting period, in parallel with the introduction of more stringent criteria for eligibility. However, in Italy and Portugal, steps have been taken to extend support to new groups of workers, and in Denmark the period of granting unemployment aid was extended.

In terms of labor taxation, another important component of policies in labor, an increase of the tax in most countries is noticed. These measures were imposed due to the effort to improve fiscal balances and the consolidation of public finances. Almost half of the EU member countries have changed their tax systems since 2011 [4]. Tax rates have changed for surcharging the highly paid people. (Belgium, Greece, Italy, Cyprus, Luxembourg, Portugal, Spain). There were situations when tax rates were reduced (Hungary, Latvia, Finland, Germany)

especially for the vulnerable, those with children and those with low incomes. We notice a different policy to taxation in Spain that provides substantial reductions in social security contributions for those who hire young people and people with a long-term contract.

The countries, which in the outbreak of the economic crisis had a rigid legislation in the field of employment, have had to take measures to reform the legal framework. Many of these have introduced, under the pressure of unemployment and massive segmentation of labor market, changes on individual and collective redundancies. Romania, for example, has massively adjusted the Labor Code, introducing new provisions relating to the extension of the trial period, the change in the number of daily working hours, the redundancy facilitating formalities etc. Such provisions for redundancy costs were introduced in Portugal, Spain, Greece, Slovakia, Czech Republic.

With the reform of labor legislation the so-called “staff loans” appeared between companies on fixed-term periods (France). In this way, companies could better cope with temporary difficulties.

A more efficient legislation of temporary work contracts allowed a more pronounced flexibility of the internal market, absolutely necessary in crisis.[2] Romania was among the countries that have allowed access to fixed-term employment contracts, extending their duration and the number of possible renewals. However, it has been considered, in most countries which have applied such provisions, including Romania, that the abuse of such fixed-term contracts should be discouraged, thus limiting the use of non-standard contracts that threaten job security.[3]

Collective negotiations can be another obstacle for improving the structure of the labor market. From this point of view, the crisis contributed to the end of collective nationwide negotiations, very common in Romania, being applied the negotiations at sectorial level. The contracts signed at company level have replaced the contracts signed at national or branch level. As a result, serious changes have occurred regarding working with unions, the system of consultations with the social partners, in this

regard the legal provisions being consistently reviewed.

The social background was quite tense, given the wage cuts in the public sector especially; the dialogue was difficult, being sometimes interrupted by broad and even violent social movements and even (Greece). For the implementation of new labor contracts that provided tax cuts instead of salary increases, There were often created tripartite structures that also included governments of countries in crisis.

The crisis has led to frozen minimum wages (Greece) or a very little increase, possibly with inflation. In addition, measures have been taken in order to achieve more flexible arrangements on the number of working hours, changing the legislation on short-times working schemes or part-time contracts.

There were created various employment schemes for the elderly and, in some countries, the early retirement schemes were limited or even eliminated (Denmark, UK, Austria, Finland, Spain).

In Romania, several changes are made in the Labor Law in 2011.

Among the main changes introduced by the new Labor Law in the view to increase the flexibility of the labor market are: the trial period is longer (for workers it has been extended from 30 to 50 days, while for executive positions from 90 to 120 days), for temporary agency work maximum period was set up to 24 month, but with possibility to be extended to 36 month, maximum length of fix term contract has been increased from 24 to 36 month and only 3 successive fix term contract can't be concluded, the working time can surpass 48 hours and the overtime can be compensate with 3 days and, in contrast with previous legislation, in case of collective redundancies the employers are able to give priority to performance criteria witch replace social criteria.[1]

3. Conclusion

The recent years have been years of labor market reform. Noticing the challenges determined by the crisis and not only, most EU countries have proposed radical changes in labor legislation including both present and the years to come. Most provisions of the new legislation refer to measures capable of

mobilizing labor, making a more dynamic market and improving competitiveness. Countries facing widespread unemployment and major financial imbalances have understood the need for massive salary adjustments and restructuring of the labor market. Unfortunately, not all countries have complied with the actual need to liberalize the labor market to achieve high flexibility. While some countries had ambitious plans, the others have taken rather marginal measures without results. However, most countries have taken into account the EU recommendations.

To improve the unemployment situation, which unfortunately continues to remain alarming, it is necessary for countries to pursue several priority points at the level of the EU: to maintain the pace of reforms and track results; to continue to identify those policies aimed to attract new groups in the labor market, especially young people; to prevent possible delays in the level of employment alongside with the economic recovery by maintaining an inadequate legislative framework, to ensure attention and resources necessary to training programs; to financially support the reforms in education aimed at the adequacy of qualifications obtained by graduates in relation to the new requirements of the labor market; to create appropriate social protection systems along with the introduction of effective policies to stimulate labor (flexible taxation systems and categories of incentives).

Export Credits Insurance in the International Practice

Văduva Cecilia Elena

Administration, Romania

vaduva.ceciliaelena@gmail.com

Abstract

The credits insurance has the mission to offer protection to the economic agents against the specific export risks. An export contract can have as object delivery of goods, execution of works and carrying out services, including cession of licenses, patents in favor of some buyers or beneficiaries residing abroad.

When the contracting parts convey that the requisites, works and services, which represent the object of the present export contract, are not to be paid at delivery, but after passing an interval of time, the supplier grants the external buyer a commercial credit. Consenting to such a modality of payment, the supplier assumes the credit risks in export, the treasury effects of the export operation with the term payment. In order for the credit export locks up for a period of time the supplier's financial resources incorporated in the delivered products on credit, this sees himself obliged to complete them.

Cuvinte cheie: the export, insurances, risks, economic crisis, suppliers.

Clasificare J.E.L.: F21, F65

1. Introduction

The supplier credit is granted on short periods of time. In the case of export of high values, the supplier cannot lock up the financial resources on longer periods of time, without putting in danger his own financial administration. The buyer sees himself obliged to obtain the resources that he needs in order to pay the import of the products delivered by the supplier. In this sense, he addresses to a bank on the supplier's market, asking for a loan that he needs and which carries the denomination of buyer credit. This is a form of the financial credit characterized

through that it is related to an export operation.

At the supplier credit, the contracting parts – supplier and buyer – draw up a single document, commercial contract, which contains all the elements referring to the delivered goods: structure, quantities, price, value, terms and payment modalities.

At the buyer credit, two different documents interfere: the commercial contract concluded between the supplier and the external buyer and the loan contract concluded between the buyer, as a beneficiary of the external credit, and the credit bank.

The export is realized through the mediation of the commercial credit granted by the supplier to his business partner, the external buyer, either through the mediation of the buyer credit granted by an external buyer's bank. Both forms of export credit follow the favoring of the commercial exchanges in the interest of the contracting parts and are granted by the private operators (suppliers, banks) in conditions appropriate to those practiced on the market (the interest rate, duration, modality of schedule reimbursement).

Together with this credit forms are also met others having help character, trusted by the state through their governments or through the specialized public institutions.

2. The export credits insurance

The external credits from public resources are trusted in the most advantageous conditions than those practiced by the private operators (interests under the market level, longer periods of reimbursement, grace periods). The aid- credits from the public resources are trusted on bilateral or multilateral bases and follow the favoring of the economic development of the beneficiary country[1].

The bilateral aid-credits are legal, they cannot be used in order to pay for some import of products and services from the donor country.

Usually, the credit insurers do not guarantee the aid credits, but they remain in the task of the state.

The export credits insurance covers a multitude of export risk, which are going to be grouped depending on the moment when the risk happens and its nature. Viewed through the prism of time when they happen, the risks covered through the export credits insurance refer to the precursory period to the signing of the contract, either to its posterior period.

In order to enter with his products on the foreign market, an economic agent is obliged to prospect that market to convince himself if and in what conditions he would be able to export on the respective market.

Prospecting the external market claims expenses from the potential exporter's share, without existing the certainty that the action is going to have success, is going to make possible the conclusion of export contracts. Even if in some countries exists the practice of bearing by the state of a share from the prospecting expenses for the expenses that remain in the economic agent's task, the risk of commercial failure of the prospecting action cannot be neglected. In order to protect himself against such a risk, the potential exporter can conclude a prospecting insurance at a specialized organism in such insurances.

In the case of some important objectives aiming the delivery of products, execution of works or carrying out services over the boarder of high value, the international competence receives sharp forms. Some economic agents, in order to put themselves in a more advantageous position in the competition at which they participate, present firm offers valid on a certain period of time.

The modification of the economic conditions (price, interest, currency, financing conditions) in the validity period of the firm offer towards those taken into account at the elaboration of this, can train for the exporter agent, in the case of order adjudication, a loss that cannot be recovered from the importer. The offeror is obliged to put up bail in favor of the buyer, which is going to guarantee that the offeror in case of

the transaction adjudication, will sign the external contract in the conditions foreseen in the present offer.

Insurances against risks can be concluded, which are going to be incumbent on the exporter's remission of firm offers on longer periods of validity.

After the conclusion of the export contract can appear two categories of risks[2]:

- ▶ some in the time interval between the moment of the signing of the export contract and that of the delivery at export of the ordered products accompanied by legal documents;

- ▶ others in the delivery period on credit of the products and until the cashing of their equivalent value.

In the period of the proper production of products, which are the object of the contract for export, subsists the risk of interruption of the contract for reasons that are out of his control.

To the extent to which the ordered goods, works or services have unique character and after the termination they can no longer be valorized by other beneficiaries, the interruption of the contract generates losses for the exporter.

The risk of recording losses from the exporter's side, in this phase of the unfolding of the contract is a manufacture risk. If the exporter has put up bail in favor of the buyer, which to guarantee in case of necessity the return of the paid advance, at the concluding of the contract or a quality guarantee, when the exporter loses the right over the guarantee.

In the case of the international cooperation works, (the execution by the exporter of some key objectives abroad or of some works with the help of the equipments, machines and materials and which follow to be distributed, after the realization of the contract) exists the risk that those material values belonging to the exporter may not to be able to be brought back in the country of origin from political reasons.

During the commercial contract, the manufacture period can be extended on a longer period of time. In conditions of inflation, the rapid growth of internal prices could increase the manufacture costs of the requisites so that the contract registers losses instead of benefits. The risk of increase of the

internal products can be protected through a guarantee of the economic risks.

After the delivery of the products (the loss of the executed works or the carrying out of services) by the external partner, for the supplier appears the risk of failure to pay in term of their equivalent value by the external customer[3].

In classic insurance company or the specialized insurance organism, which acts from the order and for the state account, can protect the exporter against such a risk. The guarantee of the credit risk is trusted by the insurer of the credit either to the exporter (in the case of the supplier credit), or to the bank (in the case of the buyer credit).

The bails put up by the exporter in favor of the buyer through which guarantees the good quality of the contract execution or the return of the advance received from the buyer in the case of the non-fulfillment of the contractual obligations by the supplier, can be valorized in the established conditions.

The risk of currency can also appear, in this phase of the unfolding of the export contract. If the external customer (debtor) has honored in term the arrangement assumed towards the supplier in the case of the supplier credit in the case or towards the bank, in the case of the buyer credit over the export can hang over the risk of registration of a losses resulted from the differences between the existent currency at the conclusion of the contract and that practiced at the payment of the credit. Against the risk of currency, the exporter can conclude a insurance in order to protect him in such circumstances.

The risks of the credit at export have been approached through the prism of the moment when this is manifesting.

Such an approach aims at the nature of the respective risks, which make the difference between the commercial, political, currency and economic risks.

The commercial risks, also denominate as risks of non-payment, are related to the buyer's behavior towards his supplier. When the external buyer is a private natural or legal person, this presents the risk of non-payment. He can be sued in order to oblige him to respect the commitment assumed through the contract.

Against the public buyer, who shirks from the fulfillment of the contractual obligations

that he has assumed, there is no way of attack in justice. From this cause the risk of non-payment from the private buyer's side is considered a commercial risk, while the same risk coming from the righteous public buyer is considered a political risk.

The notion of political risk has a large sphere of covering in which enters: the proper political risk as also the non-payment risk from the public buyer and the non-transfer risk of currency towards the supplier. The proper political risk is referring to war, revolution, etc. and at those public authorities (nationalization, requisition, sequestration, prohibition or restriction of the import of certain products, limitation of the currency transfer, repatriation of the actives belonging to some foreign persons), which prevent the execution of the contract.

Political character also has the measure taken by a public authority from the exporting country to forbid the export of a certain contractual product and encountered in the manufacture period.

The execution of the contract can be influenced by the measures taken by a third country.

Some insurance organisms assimilate the risk on non-payment of an export contract concluded as a righteous public partner, with the political risk.

The risk of non-transfer of the currency by the exporter, whom has trusted a supplier credit of towards the credit bank, in the case of the buyer – credit, appears when the supplier cannot enter in the possession of the currency representing the equivalent value of his export because the monetary authority does not transfer the value owed by the importer agent to his supplier and for whom he deposited the equivalent in the local currency[4].

This transfer rejection of currency gets the character of a political risk, being generated by a measure taken by a public authority, and not by his customer's incapacity of payment. Some insurance of export credits assimilates the natural catastrophes produced on the territory of other country than that of the exporter of the political risk.

In the case of some catastrophe, a regular insurer covers the disappearance or damage to the insured goods, and an export credit insurer covers the buyer's impossibility to

enter in the possession of the ordered goods or to pay them at the settling day.

There are within them: the risk of currency exchange, the risk of manufacture costs increase of the products, which make the object of the export and the fluctuation risk of the interest rate.

The risk of currency exchange appears when the money of the exporter's country and the money of the importer's country are not related between them through a fixed exchanged report.

This makes that, the course in which it is effectuated the exchange of the two currencies to evolve from a period to another provoking negative or positive effects for the exporter.

The exporter asks for the term payment in order to protect himself against the risk of currency exchange, and also the credit bank, which has trusted a loan to the importer, may use various solutions.

✿ to contact an import in his customer's money or in another money, so that the risk of currency exchange, afferent to the agreement of payment expressed in another money than the national one to complete the risk of currency exchange afferent to his debt.

This solution must operate with identical amounts of cashing from abroad and to pay towards abroad, settling days on the same date and to present the same risk of currency exchange or the most appropriate.

✿ the exporter to sell his product at a course previously established.

The exporter avoids the risk of registration of a negative influence from the fluctuation of the exchange course, but also that of the realization of a favorable influence.

Each of these solutions presents advantages and disadvantages and sometimes - presents technological difficulties of application. The exporter addresses to an export credit insurer in order to offer him the necessary protection against such a risk. The exporter is subdued to the risk of exchange course not only when he sells with the payment on term expressed in another money than his ones, but also when he himself concludes the subcontracting contracts with the payment in term in the contractor's money or in another money.

The export credit insurer covers the risks of exchange course, which appear in both circumstances.

The risk of increasing the manufacture costs of the product, which makes the object of the export, appears as a consequence of the inflationary phenomena, which manifests on the market of the exporter's country at the products with long cycle of manufacture, this risk is well marked and can make the costs increase to be rapid so that it can exceed the margins taken in the pre-calculation and the transaction results in losses[5].

If the exporter, from various reasons of caution, includes a bigger margin, can arrive at a level of the offer price, which makes him uncompetitive. If the exporter solicits the inclusion in the commercial contract of a clause of price revision, this solution could not agree to the importer.

In order to protect his interests, the exporter solicits to the export credit insurer insurance against the economic risks.

The fluctuation risk of the interest rate perceived at the supplier-credit and also at the buyer-credit. When the interest rate is being established so that the importer is going to pay to exporter on the validity period of the supplier-credit or to the credit bank on the validity period of the buyer-credit, the supplier must take into account the level of the interest at which this could obtain the necessary money for refinancing. If the interest of the market manifests a tendency of increase, it must be taken into account at the conclusion of the loan contract with fixed interest. There is the risk that the interest of the market to be superior to the fixed one foreseen in the contract, at the contract with fixed interest, disadvantaging the credit exporter or the credit bank.

Different solutions are applied for the exporters' or banks' protection from the risk of the interest rate fluctuation at the credits trusted to them.

In some countries, the public institutions administrate the mechanisms of export refinance with the fixed interest rates. The state bears a share of the interest that it has to pay to the exporter when it loans from the market in order to complete its financial resources; another solution consists in the establishment of the perceived interest by the banks to their external customers. The difference between the market interest

(higher) and the fixed interest, cashed from the external customer, is borne by the state in the whole validity duration of the credit contract.

No matter the organizational forms and their judicial statutes, the specialized organisms in export-import credits insurance conclude approximately the same types of insurances, use the same types of policies, put into practice different insurance premiums.

3. The causes of political nature

During the global economic crisis, many countries with difficulties, which have put them in the impossibility to honor in term the arrangements assumed by external creditors. Many countries due to the lack of currency resources necessary in order to pay the external debt service have been obliged to solicit the re-staggering of the external debt arrived at settling day to creditors.

This fact was determined by:

- the necessary rise in the price of gross petroleum by the OPEC members countries,
- the increase of the interest rate on the loan capitals market,
- the exacerbation of the protectionism by the developed countries,
- the mistakes of economic, monetary financial politics of some capital importer countries.

Other causes of political nature have contributed and contribute to the non-collection of the external debts:

- the breaking out of armed conflicts in certain regions of the world,
- the overthrow of some governments by coup d'état or by modification of some political regimes;
- the dismemberment of some states with federal structure,
- the setting up of the embargo against some states.

The political events have a strong impact over the economic increase in the countries in which these are produced and over the international commercial and financial relationships. The exporters are more afraid of the political risks than the commercial one.

In order to take shelter from the consequences of such dangers, the exporter countries and the credit banks solicit to the

specialized governmental organisms the credits guarantee or insurance, which they trust to some external partners, who present more significant country risks.

After 1982s, the governmental organisms of credit insurance have paid indemnifications to the insurants in amounts, which exceeded the cashed insurance premiums, for the negative balance of the annual financial operations, appealing to the reserve funds previously constituted.

The governmental organisms of credit insurances have taken measures, in order to exceed this critical financial situation[6]:

- ✓ they have ceased to receive in insurance the credits granted to the countries encountered in the incapacity of payment or about to arrive in such a situation, they have established commitments ceilings for the countries that benefited of unlimited insurance or they have reduced the previous ceilings to others,
- ✓ they have reduced the indemnification percentage of the damage, correspondingly increasing the franchise;
- ✓ they have prolonged the term at which the insurance indemnification becomes eligible in the hope that meanwhile the debtor is going to find solutions in order to pay for the outstanding credit;
- ✓ they have increased the perceived insurance premiums;
- ✓ they have narrowed the application sphere of the insurance.

4. Conclusions:

Through measures taken, the insurance governmental organisms have followed the improvement of the report between the cashed premiums and the owed indemnifications and the realization of the financial equilibrium through the transfer of the losses provoked by the political risks over the insurants.

Apart from the measures taken in their relationships with the insurants, the credit insurance governmental organisms have also acted on the intensifying line of their collaboration with the big international private insurers in order to limit the negative effects of the insured political risks. It is about the participation at the insurance of some political risks as co-insurers and the reciprocal receiving and yielding of some

important parts from the subscribed political risks.

The risk problem of currency exchange has acquired a bigger importance since the main convertible currencies freely fluctuate in the market.

The risks of currency exchange appear as a consequence of the fact that in the relations between the insurant and insurer, are used two currencies: the national currency and another currency in which it was released the export contract. The course at which the external customer's currency is exchanged in the exporter's national currency (credit bank) fluctuates from one day to another, in the exchange currency inevitably appear the financial influences, which advantages or disadvantages the insurant. The insurant can solicit to the insurer to introduce an exchange currency clause in the insurance contract on the basis of which this last one retrieves over him the currency risk.

Abstract

The present work comes in support of delimitation, identifying and solving complex problems arising from the implementation of the global economy. Unemployment is a contemporary economic phenomenon increasingly spread due to a complex and comprehensive in nature, affecting the economic, social, political, psychological and moral development. It represents a negative state of the economy that indicates not using a part of the workforce employed.

This study has a special role both in the short term and long term, through the analysis of the occurrence, development and interpretation of the evolution of the unemployment rate.

Despite deepening the economic interdependence and increasing globalization, we can help improving the quality of contemporary economic life.

Key words: Unemployment, unemployment rate, world economy, National Association for Employment, European Commission.

JEL Codes: E24, J64, F41

1. Introduction

At present, the main obstacle to increasing competition means solving environmental problems. The term performance took the direction of the overall approach including both financial and non-financial aspects, which mainly relates to the basics of social responsibility. In the past financial performance is ranked first, but now economic entities have realized that

motivation is what today's successful future in the context of sustainable development of society [3], is called aggregation performance overall performance involving economic, social and environmental. Although not new, globalization is the essential characteristic of the contemporary world. It consists in integrating several states and populations for excessive because of lower transport and communication costs, eliminating artificial barriers to the movement of goods, services, capital, knowledge and individuals between states.

Globalization will be carried out in parallel with the detailed study of the divide on the evolution of the economic development of the different state groups and with the regionalization of the world economy [5].

Unemployment is an imbalance in the labor market at its national level – an excess of supply over demand for workforce development levels and meanings of different countries, currently having a permanent character, but that does not preclude the existence of employment status permanently full. It can be defined as a state of economic inactivity, full or partially, particular to those who have no job, looking for one, but cannot find work as employees. It is the meeting place of confrontation of global supply and demand. Unemployment is the term used in the event of a lack of jobs for able-bodied and suitably qualified personnel for the provision of services. This phenomenon is characterized by the fact that part of the population is in search of a job [10].

When the number of people in search of a job becomes serious economic problems take

proportions within the region or state concerned, through increased social spending for the maintenance of the unemployed.

This phenomenon is caused by the economic situation observed during periods of recession (economic depression) which takes about 2-3 years, followed by a period of economic boom with reducing unemployment [7].

2. Unemployment extension-dominance of present forms

The causes of unemployment are determined by labor market mechanisms which are subject to the economic circumstances, demographics, technical or scientific. This appears due to a unfavorable developments in socio-economic activities, additional requests related to employment by the new generations or persons at the age of two [2]. At present, unemployment expansion takes place in the following forms:

- ✓ *Unemployment conversion;*
- ✓ *Recurrent unemployment;*
- ✓ *Unemployment exclusion.*

Unemployment conversion means affecting employees who had stable jobs in portfolio licensing, without having a length of work.

Recurrent unemployment includes people who know a succession of periods of employment and unemployment. The most affected are young people and people with low qualifications.

Unemployment exclusion includes the active population, including older persons, poorly qualified or unemployed for a long period, even if you receive unemployment allowance or not.

Thanks to the training process and the direct causes that determine it, unemployment can be classified as follows:

- Cyclical unemployment is a form of structural season unemployment which occurs during the recession of the economic cycle, or it may take birth in collapsing economic activity in certain seasons of the year.
- Unemployment of discontinuity appears and operates in accordance with the regulations concerning maternity leave and other aspects of family life.
- Frictional unemployment represents the effect of marginal use labor, justifying the

reasons for refusing a post due to the low salary offered.

- Unemployment of expenses is determined by the inability of a part of the active population called technophobes, use and adaptation of existing advanced techniques involving abstraction, interactivity, speed of execution and great flexibility. This type of unemployment can be avoided or reduced by improving the preparation and orientation of staff.
- Flashing unemployment is due to the inadequacy of mobility incurred and of divergence between the qualifications required of persons wishing to obtain a job.
- Seasonal unemployment exists due to the restriction of economic activity during certain periods of the year in which the economic conditions are less favorable. It is specific to the agriculture, construction and tourism.
- Structural unemployment is bounded by the restructuring of the economy trends on activities which are subject to economic and technical progress, the energy crisis and social and political phenomena. It was met both among the least developed countries and in the developed world or in transition to a market economy. The reduction would mean big investments, retraining, redeployment of affected persons, etc.
- Technical unemployment it shows a company's activity through disruption of the prolonged lack of orders. Affected individuals are required to receive unemployment benefits from the company. The return takes place once the resumption of activity.
- Technological unemployment it is highlighted by replacing the old techniques and new equipment technologies and centralizes some capital. Overcoming the phenomenon occurs with the retraining of labor in accordance with the new regulations.

3. Amplification of unemployment. Case study-Romania

3.1. Current situation

In our country, unemployment is amplified because of unused production capacity in the context of a deep economic

recession and a strategy of transition to a market economy competitive. We should always take into account the destructive effect of interest on investment, wage rigidity in the fall, releasing labor increased due to refurbishment and stagnant job creation [6].

Continuing research I found that unemployment in Romania is presented under the following forms: *conjunctural*, *structural* and *technological*.

Essential tool for determining the degree of unemployment is the unemployment rate.

It measures the percentage of workers unemployed in relation to the total labor force. It is considered one of the most important macroeconomic conditions indexes of a country [4].

It is monthly calculated through a survey on a random sample of 60,000 households and 375,000 companies [9]. Are taken into account only people who are actively looking for a job. The rate of unemployment is thought to be around 4-5% of the work force. During periods of low unemployment salaries grow faster being a cause of inflationary pressure [8].

Currently, in Romania, the unemployment rate is around 10% (on the economy), among the unemployed and a large proportion of workers in the branches of energy-intensive. Thus unemployment greatly affects young people and women. Due to the recession we are in, unemployment is a continuing upward trend.

3.2. Statistical study of the National Agency for Employment (NEA) for the unemployment rate registered in March 2013

According to the NEA, at the end of March of this year, the unemployment rate has seen a national level 5.58% with 0.20% lower than that recorded in February 2013 and 0.43% higher than that recorded in February of the previous year.

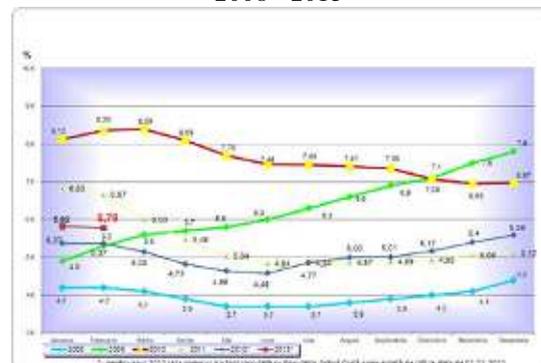

At the end of March the total number of unemployed persons was 492,427 lower than 17 982 people by the end of February. By doing this the total registered unemployed was 183.048 and 309.379 unpaid indemnity. The number of unemployed fell by 19.815 persons indemnity and the number of unpaid increased by 1.833 persons compared to those recorded in February.

Therefore, the share of unemployed persons in the total number of unemployed bud 62.83% increase the previous month by 2.58 percent.

In terms of unemployment by gender, the March compared to February of the same year, we highlight the following results: the male unemployment rate decreased from 6.47% to 6.22% and the female unemployment rate declined from 5.02 percent to 4.87 percent. On 31 March 2013 the number of unemployed women was 203,423 people.

The graph below shows the evolution in the number of registered unemployed in the period 2008- 2013.

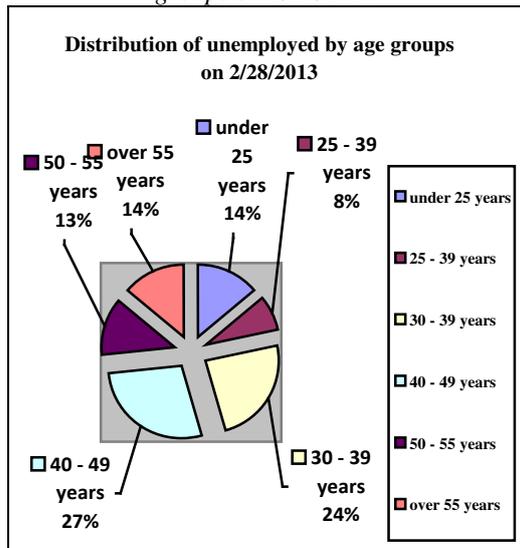

Figure 1. Evolution of unemployment rate during 2008 - 2013

Source: www.anofm.ro

Depending on the age groups the structure of unemployment in March 2013 shall be presented in the following form: 60.360 unemployed were under 25 years; 39.144 unemployed were between 25 and 29 years old; 118.944 unemployed were between 30 and 39 years; 139.002 unemployed were between 40 and 49 years of age; 63.664 unemployed were between 50 and 55 years old; 71.313 unemployed over 55 years of age. Thus we present the following diagram:

Figure 2. Distribution of unemployed by age groups on 2/28/2013

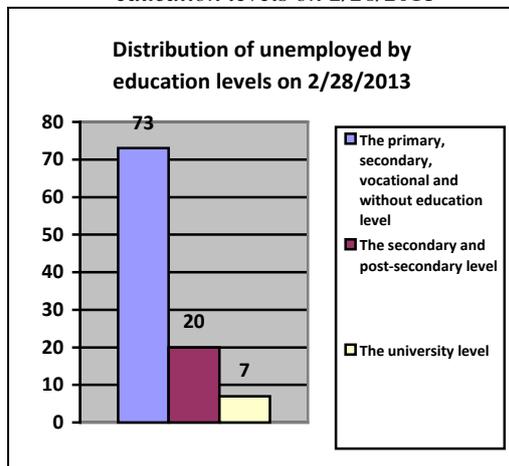

Source: www.anofm.ro

Depending on the level of training of the persons under investigation, the unemployment rate was recorded as follows:

- ✓ The primary, secondary, vocational and without education level – 73 percent;
- ✓ The secondary and post-secondary level – 20 percent;
- ✓ The university level – 7 percent.

Figure 3. Distribution of unemployed by education levels on 2/28/2013

Source: www.anofm.ro

According to statistical research provided by the NEA, the highest unemployment rate decreases were recorded in the counties of Alba (to 0.60%), Harghita (to 0.49%), Florida (0.41%), Mureș, Sălaj and Bacău (by 0.39%).

The unemployment rate has reached the highest levels (being from 8 to 11 percent) in

a few districts as Vaslui with the highest rate of 11.20%, Mehedinți with a lower one reaching 10.37%, Teleorman with a similar rate of 10.08%, Dolj with 9.96%, Alba with 9.12 %, Galați with the rate of 9.11% and Buzău with the smaller rate of 8.37%.

3.3. The forecast of the European Commission (EC) concerning unemployment in Romania in the period 2013-2014

The European Commission improved the prognosis for unemployment in Romania positively changing the unemployment rate reaching 6.9% in 2013 and 6.8% next year from an estimated 7.3% advance in September for both periods. So we hope that our unemployment rate to maintain the slight decrease.

However, let's not forget that the improvement in the labor situation is slowed by difficult economic conditions.

In the winter of economic forecasting, European Commission stated that unemployment was reduced from 7.4 percent of the work force (15-74 years) in 2011 from 7% in 2012. The same organization predicted that unemployment among young people, which currently accounted for 23%, will be reduced slightly this year, but will remain at a high level.

According to data announced by the National Institute of Statistics, the unemployment rate in seasonally adjusted form in December fell by 0.2 percentage points from the previous month at 6.5%, and compared to December 2011 is down by a point, the number of unemployed aged between 15 and 74 years, reaching 661.000 people.

4. Conclusions

According to the National Employment higher fidelity, the total number of unemployed recorded in the county agencies for employment was 675,790 persons, including 289,490 women, so that the unemployment rate among women was 6.84%.

In accordance with specific labor laws, eliminating all barriers to the labor market should lead to the elimination of all forms of involuntary unemployment, increasing

competition among employees for the best jobs (or higher salaries and working conditions), increase competitiveness between employers for the best employees, the effects of increasing productivity, reducing bureaucracy, increasing real incomes generalized and stimulated people's desire to train [1].

Romania ranks in the top ten EU countries with the lowest unemployment.

In good times, it was relatively easy for the unemployed to trust the market's ability to hire, but in tough times, contemporary situation changes radically.

Let's not forget that we face today and a rapid increase in labor migration from rural to urban. Thus, if no action will be taken for the rapid replacement of the labor market, we could be faced with problems like terrible periods of famine [11].

In conclusion it is very important that the measures include vocational guidance, training and the launch of the labor market a reality and for young unemployed persons who are not registered at present, giving them the opportunity to be trained and finally employed.

Abstract

The theory and empirical research have revealed that the consumer behavior is influenced not only by the consumer personalities and motivations [52], but also by the influences coming from the external environment of each person, regardless of its age. In the case of children's purchasing behavior, the studies have shown that the child's experience one can have in the purchasing process is part of consumer socialization [44]. This way, his evolution as a consumer is connected to the influences coming from people in contact with, over time. Of the many external influences, reference groups, especially family (the main factor), followed closely by peers and then the media act as agents of children consumer socialization.

Keywords: child, child socialization, socializing factors, influence

Classifications J.E.L.: M30 ; R20

1. Introduction

In most cases a single person acts as purchasing agent for products for the whole family, but is more than one person behind the decision-making process [52], this being a consequence of the fact that the needs and desires of others family members are also taken into account. Regarding to the family, various authors [2, 32] in their research revealed that children influence their parents purchase decisions. Starting at a very young age, children are brought by their parents in the shops and are familiarized with purchasing processes [25],

they are asked for opinions and are allowed to impose their own desires (source). In this way, the parents are the first agents taking part in the formation of the child as consumer. They appear as discussed the following concepts: socialization consumer children and socialization agents of consumer child. So, the parents, friends group, media and general context (social and cultural environment) together constitute social agents in the socialization process of the child as a consumer [24, 21].

2. Consumer socialization concept and stages

Consumer socialization process was first mentioned by Scott Ward [49] who defined it as "the processes by which young people acquire skills, knowledge, and attitudes relevant to their functioning as Consumers in the marketplace". Other authors have defined this term as being "the ways in which individuals learn skills, knowledge, values, motives and roles appropriate to their position in a group or a society" [5] or "a developmental process that proceeds through a series of stage as children mature into adult consumers" [24], „the process in which the individual constantly harmonizes himself or herself with the environment by learning or changing new attitudes, values, and current norms" [21].

The research on consumer socialization of children field has been largely influenced by Piaget's cognitive developmental theories, which is closely related to childhood [11]. McNeal [31] discuss the five stages that a child may have in his evolution as a consumer:

- I. Observing - is the first stage in the child's development as a consumer. It often happens that

- parents take their children since the very young - two months [36] with them when they made different shopping, introducing him in the stores atmosphere;
- II. Making requests – most times, once they arrive in stores, they insistently demand a product, resorting to various tactics to get what they want (crave, gestures or even start to cry[7, 49]. These requests, preferences (for colors or sounds) begin to be made after age 18 or 24 months [48, 8, 13, 17];
- III. Making selections - this stage begins at the age of 3-4 years old, when the child already go up and can go one up on the shelf where he can take himself the products that have attracted his attention by putting them in the shopping cart with parents[37];
- IV. Assisted purchases - at the age of 7-8 years they have discretion in spending their money on the products they want. Now they better understand that money can be changed by the desired products [31];
- V. Making independent purchase – in this stage, (11-16 years old), the age allows them to get their own products. The needs and preferences are not met by parents [18, 30]. The independence from parents in terms of shopping, is in this context that last step in modeling the child as consumer.

Subsequently, Deborah Roedder John [49] in a comprehensive study: Socialization of Children - A Retrospective Look at Twenty-Five Years of Research - gather the five stages of McNeal [31] in another form (table no. 1), grouping the children ages in only three stages.

Table no 1. Consumer socialization stages

Characteristics	Perceptual stage, 3–7 years	Analytical stage, 7–11 years	Reflective stage, 11–16 years
KNOWLEDGE STRUCTURES:			
Orientation	concrete	abstract	abstract

<i>Focus</i>	perceptual features	functional /underlying features	functional /underlying features
<i>Complexity</i>	unidimensional simple	two or more dimensions contingent (“if–then”)	multidimensional contingent (“if–then”)
<i>Perspective</i>	egocentric (own perspective)	dual perspectives (own + others)	dual perspectives in social context
DECISION-MAKING AND INFLUENCE STRATEGIES:			
<i>Orientation</i>	expedient	thoughtful	strategic
<i>Focus</i>	perceptual features salient features	functional /underlying features relevant features	functional /underlying features relevant features
<i>Complexity</i>	single attributes limited repertoire of strategies	two or more attributes expanded repertoire of strategies	multiple attributes complete repertoire of strategies
<i>Adaptivity</i>	emerging	moderate	fully developed
<i>Perspective</i>	egocentric	dual perspectives	dual perspectives in social context

Source [49]

Thus, the child evolution as consumer is taken into discussion, starting from the first moment the child is present in the family purchase decisions, passing through acquiring knowledge and skills during the grow up process, until the first opportunity to make their own purchased decisions, independent of its parents.

3. Socialization agents of the child

The evolution of each individual, starting from the childhood, is a result of its interaction with other members of the group and the society. Psychological approach to the problem, called Systemic psychotherapy starts from the premise that humans influence each other [22]. Such an approach, particularly related to the child socialization process, requires consideration of factors (agents) that underlying the modeling and influence of the child's behavior as a consumer. A number of researchers [49, 46, 21, 12, 23] group the agents of child socialization in family, friends (colleagues), media and culture.

The parents are considered to be the main agents of socialization because they are the ones that shape the child's behavior as a consumer [29, 38, 47] from childhood to adulthood [50]. According to Ward [49] the parents can influence the child's socialization process as a consumer due to the fact that since childhood they observe the parents behavior on purchasing decisions for products necessary in the household and many more. Also, the parents train them in discussions about the type of products purchased or consumed by the family (eg, they cultivate the idea that only a certain type of grain consumption brings necessary nutritional intake [20]). Between the two parents, the mother has a greater influence on the process of socialization [6, 41] than the father, who has a less significant role [9, 3].

Like the parents, the peers are likely to influence the purchasing behavior of the child. Socialization through friends can be achieved either by the fact that it wants to be accepted or integrated to a particular group, so he only buys or consumes products or services [28, 39,40, 2] or is taught how one can use the type of product or how certain products satisfy the needs or desires they feel, or they simply are being aware of products or brands they already use [42, 43]. The influence of the friends in the process of socialization increases with the age of the child while the parents manifested influence decreases [40, 49].

On the influence of mass media, Moschis [40] states that „no other agent of socialization has received more attention than mass-media’ because together with the parents and friends, advertising influences in a great extent the choices the children do in

relation to goods or services [1, 14, 15]. Currently, the programs and advertising targeted to the children is omnipresent at TV. Thus, the media inform them about the existence of various products and stimulates them in their purchase [14, 16]. Mass media (especially television) influence children to form (independent) perceptions about products, product use and develop brand preferences [26].

In terms of culture, can only say that it can be defined as „all material and spiritual values created by mankind and institutions necessary to communicate these values"[53] and it is raised for very few times in the researches targeted on consumer socialization. Among the countries that have conducted researches in this area one can include China [33, 34, 51], India [10], Mexico [27], Turkey [21, 19] and New Zealand [35]. All these researches were performed strictly at a national level, but it would be interesting to see the difference between a family with a child in China (where there is one child policy) and a family with a child in the United States or, why not, in Romania. As part of culture and social environment, understanding the differences between cultures help clarify the degree of influence of consumer socialization factors in each culture (family structure, type of relationship with friends, colleagues) [23].

Although the most investigations have been limited to the four factors mentioned above, along with them one have to take into account the child's gender, socioeconomic level or age, which in turn have an influence on the process of socialization [43]. These attributes define the extent to which the child is willing, is stimulated and allowed access to social components. They also exert influence on product categories, brands to which the child pay attention to.

Conclusions

The whole process of socialization, along with the component factors, take part in shaping the child as consumer. Starting with the family and the environment in which the child it is grown, from the first contact with the external environment, including here the former cultural environment in which he was grown,, the child is influenced to manifest in a certain way in the process of buying and

consuming of the products. The consumer socialization is not just the acquisition of knowledge regarding consumption, but also requires motivation manifests how buying and consumption activities. The current knowledge is limited by the limited number of information resulted from the research conducted up to date. On the other hand, the access to information related to the consumer behavior of buyers and children is subject to ethical restrictions of marketing research, which further slows the process of knowledge.

Future research

In terms of future research it would be interesting to see how the child socialization process occurs in different types of families, different cultures as well as the reverse socialization occurs (knowledge gained by parents from their children).

Ensuring the Profitability, as an Essential Objective of Public Organization in Management.

Anastase (Bădulescu)Ileana
Tomis University, Constanta
mimiana2005@yahoo.com

Summary

The article refers to aspects related to strategy as a key factor of the organization development, either public or private, if you don't know the good direction, you will never reach the desired place. The public administration needs, in my opinion, a reevaluation of objectives and strategies on medium and long term in order to optimize the public services. Without pretending to exhaust the strategic management process, I emphasized, in connection with the pattern proposed by economists Rue and Rolland, main steps to be taken by a public organization management so as to elaborate and implement a realistic strategy. [1]

This step implies the substantiation of the strategy, based on a thorough analysis of the public organization and its specific environment for action, followed by the establishment of strategic options and the selection of most feasible ones. The next step is represented by the implementation and operationalization of the strategy.

Key words: organizations; management; public; strategy; decisional.

J.E.L. Classification: H83

1. Introduction

In this article I would try to present the need of strategic management within public organizations, as well as the way the public organization could develop and maintain a viable connection between objectives, resources and opportunities so as to satisfy public needs.

Public management researches essentially refers to the public organizations leadership. Therefore, before starting any step in analyzing management dimensions in public sector, we have to understand what the

organization generally means and, in particular, the public organization.

The starting point of our analysis is the finding according to which the organization represents extremely complex and hard to define entities.

They represent crossing points for structures, technologies, human resources, groups, policies, etc.

Understanding the reasons behind the organizations functioning can cause big troubles to any rational person. In this short description we may find few of the main important themes related to the organizations management.

The need of strategic perspectives, scopes and determined objectives:

- rationality;
- the importance of organizational environment;
- labour specialization and division;
- coordination and control, organizational design.

Each one of these elements is essential to understand the organization. Evidently, the integration of different trends, key problems and action in a coherent and unitary effort represent the main attribute. In structuring the organizational management there are two major approaches: those based on verticality and horizontality. The first one presents the organization as a pyramidal structure and essentially based on formal authority elements.

A person is officially appointed as a leader of the organization and this automatically confers to him the needed competences so as to take all important decisions, not subject to any discussion but execution without any delay.

Content:

The decisional factor is clearly separated by the executional one and lower levels only apply the received orders and send to the next

hierarchical level the needed information for decision making.

The organization is based on clear objectives, rules and regulations establishing the role and position of each one, providing the action framework and ensuring a unitary functioning.

The simple employee is only asked to execute orders instead of creativity; actually, creativity could become even dangerous for him. The horizontal approach of the organization implies the exceeding of the exclusively formal level and the insertion in the equation of the communication and laterally cooperation need from the organization.

For this point of view the pyramidal organization is exceeded and unable to react to modern society needs.

Formal structures are always doubled by very strong informal ones, whose neglect could lead to a malfunction of the organization.

Therefore it is important for the organization to promote horizontal cooperation instruments, based on internal networks, the promotion of personal initiative and communication.

Chapter I: Researches in the modern organization

Researches related to the organizational development revealed that organizations tend to develop structures based on formal authority, vertical coordination in case of stable environments and to encourage flexible structures, based on horizontal coordination and creativity in case of changing environments. Evidently, each one of these two approaches has both, advantages and disadvantages and most of the times the modern organization represents a mix of elements from those two areas.

They are not excluded but rather complementary, the manager having the choice to establish the best mix of factors for an organization and a given situation. Another interesting factor regarding the structural evolution of the organization refers to the dimension-oldness relationship, small organizations being generally based on simple and informal structures.

Once they develop and grow, pressures related to ensuring organizational coherence

and discipline lead to formalization and complication of structures. This aspect was extremely exemplified by various bureaucracies tending to „increase to the maximum level of incompetence”.

Evidently, the increase of organization dimensions is not always directly proportional to the increase of results for this organization, but easily could actually be inversely proportional.

Another problem in order to understand the functioning of the organization refers to information and informational technology. Jay R. Galbraith defined the organizational uncertainty as the difference between the information hold by the organization and the one it needs at that moment.[2]

The issue of modern organization relationship with the information is of great importance. The quantity of information received is huge under conditions of modern technologies development and leads to serious problems on the information processing and data selection of a real importance for an adequate functioning.

Another issue related to the organization structuring refers to its capacity to relate with the existing resources. Understanding the importance of each resource is essential for the organization.

The necessity of judicious using of financial resources due to economic and politic pressures or labour force profile modification requires an intelligently structured answer on behalf of the manager.

Treating the present labour force, better professionally trained and of high expectations, on the basis of administrative model traditionally based on formal authority and rigidity represents a risky option.

Many times the modern employee is more trained in a specific area compared to his hierarchical leader, conferring to him more power and influence and determining him to adopt a more critical attitude towards the leader’s capacities and authority. In this context, the human resource motivation and its mobility become more delicate.

When referring to public organizations we take into account the public administration, at central or local level and economic institutions under the state control.

The role of strategic management is to integrate the strategic vision at all levels of the organization and to use all existing

resources to achieve the objectives defined according to effectiveness, resources economy and quality conditions.

Strategic management implies a timely decision on what the organization has to do in the future (planning), establishing who will do it, how will do it (resources management) and monitoring the ongoing, control and assessment activities. [3]

By way of consequence, occasionally arises the idea according to which for an organization leaders are more valuable than managers. Continuing this idea, Brian Clegg and Paul Birch stated that: „Managers fulfill tasks that would have been fulfilled anyway and leaders do things that could not be done without them”. [4]

We consider that the above presented statement is little exaggerated, both concepts presenting important aspects within an organization.

The concept of management refers to the assumption of responsibility in order to achieve an objective and effectively allocate the resources (material and human) with this purpose.

On the other hand, the leadership concept refers to the process of influencing and directing of organization members to achieve the objective.

Warren Bennis and Bart Nanus succeeded in resumming the difference between management and leadership to a single statement: „Managers are people doing things the right way and leaders are people doing the adequate things”. [5]

We consider that in a public organization (or any other type) we need both leaders and managers; or more precisely, people to occupy both positions. A strategic vision is needed and current activities to be carried on. Managers' attitude towards human relations can take different aspects, the intention to inter-relate but also the preference for a lower degree of emotional involvement in those relations.

Thus the two perspectives may look paradoxical, their cohabitation seconds the managerial activity, including the search for compromises and the establishment of a power balance. The leaders especially dealing with ideas, interact in a more intuitive and empathic way.

An interesting aspect is the way the subordinates describe their managers, namely

their leaders. In their vision, the manager is implacable, relaxed and manipulator. At contrary, leaders are described by highly emotional adjectives.

Warren Bennis, in his research *On Becoming a Leader*, enumerates 12 differences between manager and leader:

1. The manager is in charge. The leader innovates.
2. The manager is a copy. The leader is authentic.
3. The manager maintains. The leader develops.
4. The manager stresses the systems and structure. The leader stresses the human resources.
5. The manager is control-based. The leader is trust-based.
6. The manager has a short term approach. The leader has a long term approach.
7. The manager answer questions such as: Where? How? The leader answers at: what exactly? And why?
8. The manager is permanently oriented depending on immediate results. The leader is oriented on medium and long term results (impact).
9. The manager copies. The leader creates.
10. The manager accepts the status. The leader is disputing it.
11. The manager is doing things the right way. The leader is doing adequate things.

Strategic management approaches underline interactions between managers at all organizational structure levels as regards the substantiation, elaboration, implementation and assessment of the strategy.

The advantages are those pursued with priority by practicing strategic management.

Ensuring the profitability, as an essential objective of the organization, the establishment of action lines for the organization, the concentration of employees efforts with the purpose of achieving the objectives, the consistency of actions for the management and the other employees of the organization so as to apply the proposed strategy, ensuring the organizational flexibility in order to value all the opportunities of the exogenous environment but also strong internal points. [6]

A normative, evolved and dynamic decisional pattern is proposed.

It plans an effective way to structure the decisional process, by integrating elements of the iterations involved in a logical framework, reflecting the operability of the decisional mechanism. [7] One of the doubtless advantages of using this decisional pattern consists of warning the decider on possible (mutual) influences between the decisional process in its integrity and the (exogenous and endogenous) ambient environment of the organization.

Another advantage is generated by the fact that in an economic world in a permanent change, the decisional process is placed in a “vicious circle” usually generated by a stimulus situation that generates another at its turn, being at its turn a source for another decisional process.

This decisional “perpetuum mobile” corresponds to economic fragility and instability created by an ambient environment usually hostile and hard to define for many of the Romanian managers.

The complexity of the decisional pattern and the impeccable logic recommends it for use in strategic and tactical decisional processes for all companies in Romania, irrespective of their dimension or field of activity. From a theoretical perspective, it confers a coherent image of the entire decisional process with its elements and phases and emphasizes the correlations between them.

From a pragmatic perspective, the pattern can be used for training and improving the competences of the managers and specialists from the economic organizations that use scientific management as a working instrument.

Using the pattern also occurs when trying to compare results of certain companies, which - under similar economic conditions – addressed the same strategic pattern. Different results that were “accepted” are generated by the influences, mutual or unilateral of the environment and decider/deciders on each phase of the strategic decisional process.[8]

Conclusion:

Organizing the company as a managerial task consists of decomposing it in elements

that will compose the production process, their examination in order to recompose them in comparison with certain economic, technical and personnel criteria so as to achieve the objectives established under an increased effectiveness.

The greatest importance in organizing the company is represented by the aggregate of work processes developed within the company, named procedural organization.

Depending on the covered fields, the procedural organization could be approached as follows:

- organizing the entire activities of a company;
- organizing different component activities (production, sale, marketing, supply etc.)

The relationship between all these factors of influence, active in the public organization environment, emphasize the complex situation where the public organization is conditioned for its functioning by features usually being situated beyond its control or influence capacity.

Is true that the relationship between the organization and its environment is not unilateral, it has the possibility to choose and try to influence few factors, although the efforts are not that easy. Therefore, the public organization is impossible to be understood, analyzed or led in the absence of understanding the importance and influence of the environment it is placed in. [9]

Abstract

Romanian trade is placed, at the beginning of this millennium, at an intermediate stage of a complex process of development. Since 1995, Romania has experienced a steady increase of the retail market due to the entry on the Romanian market of some modern international trade chains and to the changes made in the Romanian consumer's behavior.

In this paper, we present the concept and characteristics of the hypermarket and we characterized the modern Romanian retail. Assuming that there are a variety of factors that shape the modern retail, we analyzed the impact of the macroeconomic variables on the development of hypermarkets on the Romanian retail market. The research methodology was based on the method of multifactor regression and on the method of statistical correlation. The results of the study showed that the hypermarket had a spectacular evolution in the Romanian retail, marking a milestone in the evolution of consumption.

Key words: hypermarket, modern retail, Romanian market, retail market.

J.E.L. Classification: L81, M31.

1. Introduction

Trade is the form of human activity that has achieved, throughout human history, the most powerful and lasting ties between the countries of the world and their peoples. The term of trade is defined as *an exchange of products, knowledge and, at the same time, a way to join together different nations* [1] and *it is the expression of the relations of exchange between producers and consumers,*

relations which help buying raw materials or products to resell them at the same physical state, but on convenient conditions for consumers [2].

In the vision of the EU, the modern concept of **retail** concerns trade and distribution activities and involves a large variety of forms (shops, e-commerce, open markets...), formats (from small shops to supermarket), products (food, non-food, medicine with or without a prescription...), legal structures (self-employed, franchised agents, integrated groups...), locations (urban/rural, in the center/in the suburbs...) [3].

Retail sales experienced in Western Europe, over a history of over 150 years, significant structural changes named *a succession of six revolutions* [4] which characterized the dynamism and the prosperity of the distribution activity and contrasted with the states of cyclical crisis of the economic environment of each country [5]: the emergence of large stores (at the middle of the nineteenth century), the development of branching (approximately 20 years later), the occurrence of popular stores (between the two world wars), the creation of supermarkets (in the '50s), the apparition of hypermarkets (in the early '60s), and maximizing services (in the early '80s).

In this regard, the literature developed the theory of *the retail wheel* [6], which is based on the principle of cyclical ratio of the point of sale, focusing on distribution cost, meaning that a new form of retail distribution appears on the market when it is able to operate in a cost-effective manner, charging prices lower than competitors. According to this theory, the big wheel of distribution reunites the four cycles corresponding to the most important retail formats, namely: department stores, popular stores, supermarkets and hypermarkets.

2. The hypermarket – a promoter of modern retail

The concept of hypermarket appeared in France in the '60s (the first hypermarket was opened in June 1963 in Sainte-Genevieve-des-Bois), the operating principle of the hypermarkets being: "Tout sous le même toit" - "Everything under the same roof" .

Hypermarkets have seen a major transformation from the moment of their creation when they were like large storehouses selling goods at low price, without any attempt to promote their products, and up to the moment when they started to create an image characterized by a more luxurious decoration, a more careful interior design, more costly architecture [7].

Hypermarkets have also been a model for the implementation of the French, German and English distribution companies in the countries found in transition, especially in the period after 1989, as a natural reaction of these companies to the lack of opportunities to develop their markets. European retailers have exploited the opportunities the found in the transition countries immediately after the liberalization of these economies. Poland, Czech Republic and Hungary are the most developed in this regard, especially for traders of food and for Do it Yourself stores.

In modern retail, the hypermarket has been defined as *a self-service store with a sales area greater than 2,500 square meters, reaching 22,000 square meters* [8].

The main features of a hypermarket can be summarized as follows [9]:

- A large selling area associated with a wide range of products and a generous parking space.
- It combines the retail principles with the features and facilities offered by supermarkets, stores that offer discounts and deposits.
- A reduced price policy based on partnerships with local and international suppliers.
- The self-service method supported by effective merchandising and a wide variety of promotional techniques.

With regard to the future of the hypermarket, André Tordjman underlines since 1988 that maintaining the appeal of hypermarkets is their essential issue as they reached the maturity stage of their life cycle

[10]. Recently, Perrigot and Cliquet [11] have confirmed this view in a study that argues from a scientific perspective and econometrically tests the saturation of the French retail and the hypermarket entry, as retail format, in the decline phase of its life cycle.

3. Evolution of the hypermarket in the context of development of Romanian retail

The Romanian retail market has experienced the most dynamic developments in the European Union countries, covering three important stages of its development process.

The first stage (1990-1999) was characterized by the emergence of a large variety of products on the market, through a galloping inflation and the decrease of the purchasing power of Romanian consumers. During this period the first supermarket (1995) and First Metro (1996) appeared reaching a peak level of consumption in 1998.

In the second stage (2000-2008), the Romanian retail market had a constant growth (Figure 1.), with the highest rate of growth (8.5% annually) in Central and Eastern Europe [12], as a result of: the diversification of consumption, the boom of consumer credits, the increase of the Romanian consumers' demands and their orientation towards modern and online trade.

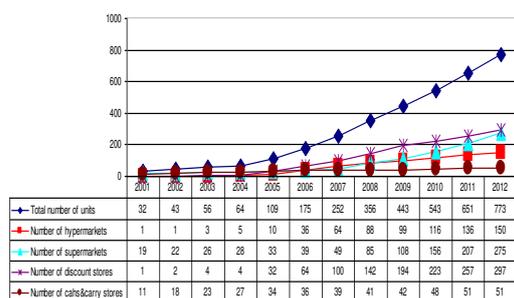

The first hypermarket opened in Romania belonged to Carrefour group, situated in the west area of the capital city, in the headquarters named Militari, with a selling area of 9000 square meters, having 2,000 parking spaces and a shopping arcade of over 6000 square meters [13].

A maximum of domestic consumption is reached in 2003, and 2005 is considered the psychological line for the development of modern forms of commerce in Romania.

Joining the European Union in 2007, Romania supported the development of retail trade by harmonizing tariffs and increasing imports.

The economic crisis interrupted the upward trend of the Romanian retail trade and generated a decline that lasted until mid-2009.

Figure 1. The evolution of modern trade formats on the Romanian market

Source: Data processed by authors from http://www.magazinulprogresiv.ro/pagina/314/Retaileri_internationali.html, Accessed on February, 11, 2013.

In the third stage (2010 – 2012), the Romanian retail market was at the beginning of its growth [14], this being illustrated by: the fragmented nature of the market, maintaining traditional patterns of trade, the emergence of the new retail formats, switching from a major proportion of traditional trade to the equal share between this and modern commerce and the early stage of the development of electronic commerce.

At the beginning of 2011, the five largest retail chains on the Romanian market (Kaufland, Carrefour, Real, Penny Market and Plus) had a cumulated market share of only 22% [15], and there was room for new entries. 2012 was the year of diversification on the Romanian retail market as every major retail chain developed a mix of different store formats tailored to the local conditions and to the specific segments of consumers. The forecasts made by the analysts of the European Commission show moderate growth trends for Romania in 2012-2013, and a gradual recovery of private consumption up to a growth rate of 3.4% in 2013 [16].

In 2013, Romania's retail system conquered new territories in the medium and small urban areas, which represented a very good expansion potential for both discounters and small sized chain stores. In addition, the Romanian rural environment, with about 10 million potential customers, was a particularly attractive market for large retailers. At the level of this year, experts predicted the opening of more than 250 new units in the retail market, investment being made by major international retail groups for continuous capitalization and to conquer the

market potential in the next periods of economic boom [17].

Currently, the development of hypermarkets is performed on the following directions:

- Diversifying the trade formats used by the same retailer.

- Opening smaller selling areas, placed in the urban zone (for example, the French retailer Auchan launched the concept Auchan City on the Romanian market in 2012, a store of 5,000 m² focusing on food, while Cora opened two new locations, also considerably lower than the existing ones).

- Better management of costs.
- Applying differentiated marketing strategies adapted to the target customers.

For 2010-2020, the analysts of Oxford Economics have predicted an average annual growth rate of 5% [18], as a result of the upward trend of the purchasing power, the aggressive development of modern trade and the change of the purchase behavior. These factors will contribute to the predicted growth of 62% of the Romanian retail market value, meaning a turnover of 26 billion euros annually.

4. Methodology of research

The purpose of this research is to analyze the evolution of hypermarket within the context of the Romanian economy development, during 2001-2012. In this regard, we identified the macroeconomic factors with major influence on the development of modern retail formats in Romania and we evaluated their impact on hypermarkets.

01. The objective of this paper is to evaluate the impact of some major macroeconomic variables on the development of hypermarkets in Romania

To observe the evolution of hypermarkets on the Romanian retail market we used the number of hypermarkets, as there are reliable data for the period under review. The turnover or total area of Romanian hypermarkets would have certainly been more useful in our analysis, but there are no reliable statistical data, which enable their quantification.

From the multitude of macroeconomic factors relevant to characterize the state of the national economy, we used the GDP, expressed in Euro, in total value, the average

monthly net salary [19], the inflation rate and the exchange rate EUR/RON [20] as we considered that these indicators reflect the development level of the Romanian economy during the period under review, from a dual perspective: the state and the individual. The values of these indicators are summarized in Table 1., indicating that after the redenomination of the national currency in 2005, it was necessary to normalize the data expressed in lei.

Table 1. Values of some economic indicators in Romania, in 2001-2012

Anul	HY	GDP (mld. E)	AMNS	ER	IR
2001	1	44,8	305,376450	2,6026	34,5
2002	1	48,4	388,134517	3,1255	22,5
2003	3	50,3	486,827042	3,7555	15,3
2004	5	58,9	596,545217	4,0532	11,9
2005	10	79,2	737,83	3,6234	9,0
2006	36	97,1	1.029,17	3,5245	6,56
2007	64	121,2	1.011,25	3,3373	4,84
2008	88	136,8	678,75	3,6827	7,85
2009	99	115,9	862,42	4,2373	5,59
2010	116	122,0	1.335,42	4,2099	6,09
2011	136	136,4	1.642,67	4,23,79	5,79
2012	150	136,4	1.715,08	4,4560	3,33

Source: Data processed by authors

The hypotheses of the study were the following:

I1. The evolution of hypermarkets is influenced by the gross domestic product.

I2. The evolution of hypermarkets is influenced by average monthly net salary.

I3. The evolution of hypermarkets is influenced by inflation.

I4. The evolution of hypermarkets exchanging apparatus is influenced by the exchange rate Euro / leu.

The methodology used was based on the multifactor linear regression model. In the analyzed econometric model, the number of hypermarkets is the dependent variable, the macroeconomic indicators representing the independent variables. For the data analysis we applied statistical methods of analysis with the help of the computer software Excel, Data Analysis module.

The model which verifies the hypotheses of research are presented as follows:

$$HY_i = b_0 + b_1 \times GDP_i + b_2 \times AMNS_i + b_3 \times ER_i + b_4 \times IR_i + \varepsilon_i \quad (1)$$

(HY = number of hypermarkets; GDP = gross domestic products; AMNS = the average monthly net salary; ER = the exchange rate; IR = annual

inflation rate; ε_i = error; i = years from 2001 to 2012).

The results of the multifactor regression model are summarized in Table 2.

Table 2. Results of the regression function

Regression Statistics					
Multiple R					0,9918

Source: Data processed by authors

The multiple correlation coefficient (r), with the value of 0,9918, which is the ratio of the correlation that indicates a strong link between the dynamics of hypermarkets and the main influence factors analyzed. The coefficient of determination - R square - has the value 0,9837 and expresses that 98,37% of the variation in the number of hypermarkets can be explained by the variables taken into consideration. The adjusted correlation report of 0,9744 shows that the total variation is due to the regression line, taking into account the number of free degrees. F test shows which is the role of the independent variables in explaining the evolution of the dependent variable. The value of the F test (106,05) and materiality ($0,0000002 < 0,05$) indicates that the regression model is valid and can be used to analyze the dependence between variables.

The free term b_0 , with the value of -312,062 is the point of intersection of the regression line with the axis OY. Because the t statistic registered the value of -7,447 and P-value = $0,0001 < 0,05$, it means that this coefficient is significantly different from 0, with the confidence interval [-411,144; -212,979].

The coefficient for the variable GDP, with the value of 1,4032, is positive and indicates a direct link between HY and GDP, so that an increase of 1 Euro of the GDP determines an increase of 1,4032 points of HY. Since P-value = $0,0000401 < 0,05$, the coefficient is

significant, situated in the range of confidence [1,038; 1,768] (Table 3).

Table 3. Coefficients for the independent variables

	Coefficients	Standard Error	t Stat	P-value
Intercept	-312,062	41,9020	-7,447	0,0001
GDP	1,4032	0,15443	9,0867	4,01E-05
AMNS	0,0324	0,0114	2,8203	0,0257
ER	44,6603	9,1110	4,9018	0,0017
IR	3,6875	0,6462	5,7062	0,0007

Source: Data processed by authors

The coefficient for the AMNS variable with the value of 0,0324 is positive and indicates a direct link between HY and AMNS, so that an increase of 1 leu of the AMNS increases the HY with 0,0324 points. Since P-value=0.0257<0.05, the coefficient is significant in the range of confidence [0,005; 0,059].

The coefficient for the ER variable with the value 44,6603 is positive and indicates a direct link between HY and ER, so that an increase of 1 leu of the ER increases the HY with 44,6603. Since P-value = 0,0017<0,05, the coefficient is significant in the range of confidence [23,116; 66,204].

The coefficient for the IR variable, with a value of 3,6875 is positive and indicates a direct link between HY and IR, so that an increase by one unit of the IR determines an increase of the HY with 3,6875 points. Since P-value=0.0007<0.05, the coefficient is significant in the range of confidence [2,159; 5,215].

The results of the created econometric model are influenced by the manifestation of the phenomenon of collinearity [21], which occurs when a group of independent variables are strongly correlated.

Table 4. The matrix of the correlation between the independent variables

	GDP	AMNS	ER	IR
PIB	1			
AMNS	0,811929	1		
ER	0,610176	0,714892	1	
IR	-0,80028	-0,7316	-0,78613	1

Source: Data processed by authors

In this case, there is an over-evaluation of the coefficient of determination, and of the dispersions of the estimated coefficients, which leads to an increase in the confidence

intervals and can distort the interpretation of the model. The demonstration of multicollinearity is carried out by analyzing the correlation matrix of the independent variables considered, matrix which is presented in Table 4.

The result analysis indicates a strong positive correlation between the variables AMNS and GDP, a positive correlation between the variables ER and GDP, and between ER and AMNS. The correlation matrix showed that between the variable IR and the variables ER and GDP there is a very strong negative correlation, and between IR and AMNS there is a strong negative correlation.

From the analysis of the coefficients it results the following regression model:

$$HY = 119,375 + 2,616 \times GDP + 0,344 \times AMNS + (-39,461) \times ER + 0,539 \times IR + \varepsilon_i \quad (2)$$

The results of the regression function show that the hypotheses of the study are valid and, therefore, the evolution of the hypermarket is influenced by: *the gross domestic product, the average net monthly salary, the exchange rate of the national currency against the euro and the inflation rate.*

5. Conclusions

At present, the Romanian retail presents a high potential of development, showing an accelerated development of its life cycle. At this stage, the features of modern trade formats are finalized, the level of competition increases, modern retail networks are reinforced and there are still attractive locations for implantation, which allows to achieve attractive rates of profit.

The conducted research shows that the dynamic hypermarkets in Romania are part of a positive trend, being influenced by the overall economic and social development of our country, analyzed through the development of the GDP, the average monthly net salary, the exchange rate and the annual rate of inflation. It is interesting to observe that the Romanian retail continued its positive evolution during the economic crisis of recent years, a fact justified by the desire of some major international investors to gain significant market share, which will generate substantial revenues during the anticipated economic recovery.

The limits of the study are derived, on the one hand, from the evaluation of the hypermarket development in Romania only through the number of units and, on the other hand, from the analysis of a limited number of influence factors. In the future, the research will be continued in order to create a methodology for the calculation of an index of retail development, which will be based on a larger number of determinants.

Abstract

The article reveals the essence of the technological architecture and shows its place in the informational and technological architecture of an integrated management system of marketing interactions specific technological solutions in marketing interaction management of commercial enterprises in various formats are revealed.

Keywords: information technologies, marketing interaction, information and technological architecture in management of processes of marketing interaction

J.E.L. classification: M15, M31

1. Introduction

Under the modern conditions the institute of eBusiness develops rapidly, that changes the nature of a market economy and generates new key success factors. One of the main objectives of the integrated management system of marketing interaction is to develop information and technological architecture that focuses on the adaptation and integration, provides an effective information interaction and coordination of marketing interaction activities.

Analysis of the problems of information and technological support of companies marketing activities was made in researches of local scientists: Alacheva T.I.[1], Balabanova L.V.[1], Voytchak A.V.[2], Pintchuk N.S.[3], Galuzynsky G.P. [3], Orlenko N.S. [3] etc.

As rightly noted by scientists, «IT development processes and systems require a transition to a new, multidimensional understanding of information processes, the

social role of the information resource» [4, c.120-121]. One of the major problems of modern control theory, according to these authors, is to develop an information model that would ensure the viability of the enterprise in a constantly changing and complex environment in which it operates [4, c. 120].

Despite the large amount of researches being conducted in this area, such issues as the development of effective technological solutions for retailers of various formats remain open.

Therefore, the aim of this article is to develop the technological architecture, focused on the adaptation and integration, that provides effective information interaction and coordination of marketing interaction activities.

2. Contents

As rightly consider O.V.Danilin and A.I.Slusarenko, «attempts to define and build a basic IT system without guidance on the concept of enterprise architecture usually leads to duplication of effort and, mostly important, accompanied by difficulties at the interfaces interaction and, consequently, prevent the integration of different systems» [5].

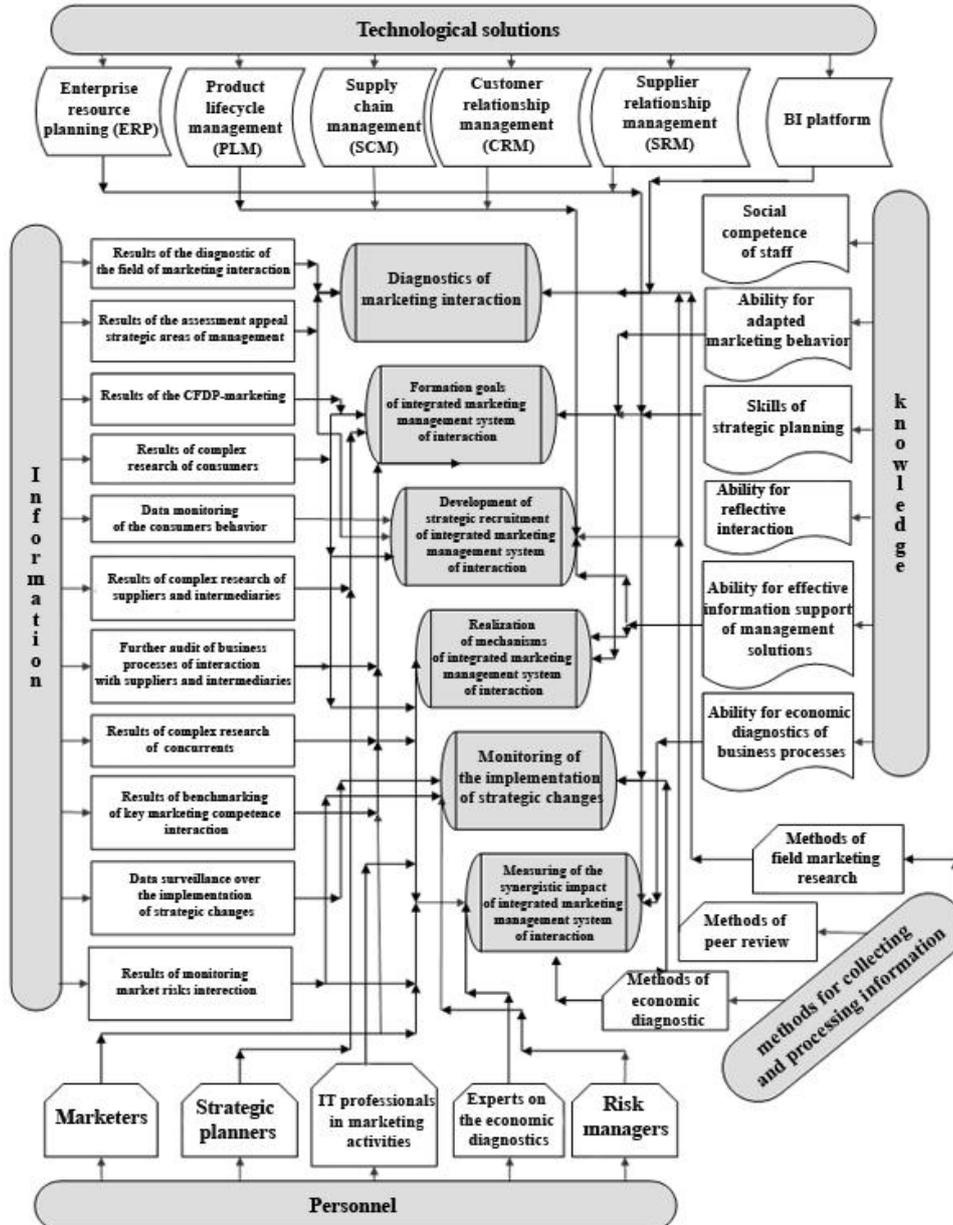

The technological architecture should be seen as a key component of the information and technology architecture of the integrated management of marketing interaction system, which is the main mechanism of the interpretation and implementation of goals in the field of management of company marketing interaction through adequate IT infrastructure. The necessity in the formation of technological architecture of marketing

interaction integrated management appears, when many enterprises face essentially significant problem of synchronization purposes and tasks of business processes and development of their information and technological capabilities.

The technological architecture in integrated marketing cooperation

management should ensure the development of complex technology solutions in following areas: Enterprise resource planning (ERP), Product lifecycle management (PLM), Supply chain management (SCM), Customer relationship management (CRM), Supplier Relationship Management (SRM) (Figure1).

Figure 1. Block diagram of structural relationships in the IT architecture in terms of key processes integrated management of marketing interactions.

Development of the technological architecture involves building of technological infrastructure that provides a «pass-through» operational business processes support at all stages of the integrated management of marketing interaction and a portfolio of a software products, that analyze the information according to specific functional requirements.

To solve marketing problems in each of these areas, commercial enterprises can use specialized software products. For complex solving of recourse management problems major trading enterprises should use these technological ERP-class solutions as: Microsoft Dynamics AX, Sage ERPX3, Oracle JD Edwards EnterpriseOne, SAP Business Suite.

For commercial SME it is advisable to use an integrated comprehensive enterprise management system: ERP ASTOR: Shop for your platform «1C: Enterprise 8», ERP

ASTOR: Trend Shop, SAP Business One. In order to manage relationships with customers and suppliers companies use CRM-, SRM- and SCM-decisions both within the integrated ERP-systems and local programs. So, retailers can implement a full-blown CRM-project using software ITOGO! RetailSuite, that has automated segmentation processes, analyzes their advantages; develops loyalty programs of the contact center, SMS-communications, sales, service, internet sales and internet service etc. As a local domestic SCM-solution noteworthy software «Quasar-Micro», offering Web-based software for the organization of e-business.

The characteristics of systems and software products, that can be used by enterprises of different formats, depending on the scope of their activities directed on formation of technological architecture, which supports solving marketing interaction problems are presented in **Table 1**.

TABLE 1. Characteristics of systems and software products, which can be used by enterprises to form technological architecture that supports solving marketing interaction problems

Systems and Packs software	Characteristics	Technological Platform	Enterprises
1	2	3	4
Information system «Best-Marketing»	Information system «Best-Marketing» offers specific recommendations to improve the situation of firms in the market using the following analytical methods of marketing: SWOT-analysis, development Ansoff matrix for product positioning in the market, development 4P strategy, using Rosenberg models.	Windows environment	SME
Program complex «Galaxy»	Program complex «Galaxy» (manufacturer corporation «Galaxy») is an integrated information system standard MRP-II with elements of ERP. Modular architecture «Galaxy» helps you to build the enterprise management technology that covers all elements of the business.	Windows environment Database management system «Atlantis»	Large enterprises
Information system «Marketing Expert»	Information system «MarketingExpert» can be used for development of strategic and tactical marketing plans interaction and control the execution of these plans. Marketing planning is based on the application of GAP-analysis, SWOT-analysis, Portfolio-analysis.	Windows environment	SME, large enterprises

<p>Integrated enterprise management system «IT- Enterprise»</p>	<p>Integrated enterprise management system «IT- Enterprise» (creator Scientific-Production Enterprise «Information Technologies» Kyiv) is an integrated fully functional MRP-II-system, that provides a full management of material, production and financial resources, supply planning, production and sales, planning capacity of utilization; describe the technologies and standards, quality control of products. The system allows you to track the mechanisms of interaction with customers.</p>	<p>Platform MSSQL</p>	<p>Large, medium enterprises</p>
<p>Automation control system «DeloPro»</p>	<p>System «DeloPro» (developer Ksykom software, Kyiv) automates key business processes and operations related with the trade agreements and the formation of a commercial workflow, analyzes the activity of business enterprises. The system has the following features: sales management, procurement, manufacturing, finance, accounting, accounting of goods, inventory control, accounting contractors, price lists, statistics, Web-extension.</p>	<p>Platform MSSQL MSOLAP Services</p>	<p>SME</p>
<p>Information system for customer relationship management «SAIL-Management and Marketing»</p>	<p>Information system for customer relationship management «SAIL-Management and Marketing» («SAIL Corporation») is an analytical CRM-system for the management of marketing interaction with consumers. The system allows you to improve customer service through a process of various divisions coordinates work and preserves information about the history of each customer. The database system stores the information about the relationship with customers at all stages of the marketing interaction life cycle with them.</p>	<p>Windows environment</p>	<p>SME, large enterprises</p>

A special place in the firms technological architecture must hold information processing technologies such as Digital Signal Processing (DSP) technology online analytical processing (OLAP - On-Line Analytical Processing); technology for automating business processes (EDMS - Enterprise Document Management System); ITDM technology of data mining (DM-Data Mining); technology that extracts data from the new non-trivial knowledge in the form of patterns, relationships and laws (KDD - knowledge discovery in databases).

The key concept of understanding the role of information and technology architecture for the interaction of enterprise marketing management is the concept of «chain of added value» that the proposed M. Porter in

his book «Competitive Advantage». In the analysis of the enterprise Porter recommends to stop thinking in terms of organizing the distribution and offers to focus on business processes and create additional value chains that cross organizational framework, the boundaries of departments and functional entities. A string of additional cost includes all business processes that must be performed on receipt of orders from customers for delivery of the final product.

Channel marketing interactions company that operates on principles of «value-added chain» M. Porter, covers all required business process cycle marketing interactions to ensure the highest level of customer satisfaction, which necessitates the formation

of a comprehensive area information interaction.

The information and technology architecture in an integrated management system of marketing interaction (IT architecture IMSMI) is a general model of information marketing interaction that determines the strategies, technologies, processes, information support of business in marketing interaction.

The development of IT architecture IMSMI should ensure the implementation of important features of the integrated management system of marketing interaction:

- Formation of relevant information capital portfolio for the companies and its effective use;
- Ensuring of active information exchange between business systems of marketing interaction based on the integration of information;
- Implementation of the appropriate information security policy;
- Synchronizing of business processes of marketing interaction and information technologies.

The information technology architecture is based on service-oriented approach. The services are stand alone functions and function blocks (such as «building applications for the purchase of goods», «request for information on the balance of goods in stock», etc.), the according to which is made via well-defined stable interfaces. To maintain specifications and descriptions of services in the IT architecture IMSMI, it is provided as so-called repository service that stores addresses access to each of the registered services, its location in the network, rules of the call, etc. Repository enables to use needed services and helps make necessary applications to solve specific problems in marketing interaction.

Creating the technological architecture on the enterprise is associated with significant costs - not only buying of these products or software development, but also an acquiring of technical equipment, the creation of information infrastructure, reengineering of business processes and staff training. That is why the majority of medium and small enterprises for information technology supports the processes of interaction marketing strategies should use IT outsourcing, based on the use of SaaS-

Technology (Software as a service). As a SaaS-products of domestic enterprises the addition Predictix «Cloud», «cloud» system management tasks and projects of Russian company «Megaplan», «Virtual office» of Ukrainian company «Astelit» can be recommended. However, it should be emphasized that domestic trade enterprises for their transfer to the «cloud» technologies should solve not only technical problems (relative with internet speed), but also business transparency problems, psychological barrier: it is necessary to be ready to keep data of remote servers.

3. Conclusions

The impact of information technology on the quality of the marketing tools of interaction can have very serious consequences: define the scope of marketing activities and marketing field boundary interactions alter the fundamental principles of marketing behavior interactions, and provide a number of new tools of competition, shift emphasis in marketing relationships with separation on mergers.

Thus, we can conclude that an important prerequisite for a comprehensive and operational performance of all functions of the integrated management of marketing interaction system is to develop information technological architecture, the main component of which is the technological architecture that improves the ability of the enterprise in the effective implementation of marketing strategies interaction through the synchronization of marketing interaction business processes and information technologies.

Prospect for further researches in this direction is the study of technological solutions for the marketing relationships management of companies on various platforms of interaction: with customers and business partners.

Abstract

The contemporary economic environment requires new strategies and solutions on how to manage the current key problems that the modern society is facing. This paper presents an inquiry of the Behavioral Market Segmentation Theory applied in the transport sector. We explain how certain groups of people can have various types of behavior regarding different means of transport. The study of the consumer behavior represents an important part for developing new ways on improving the services provided by the transport companies and highlighting the progress of the intelligent transport systems.

Key words: *consumer behavior, intelligent transport systems, social development, technological progress, Behavioral Market Segmentation Theory*

JEL Classification: A10, D03, D11, F60, I31, L91, M30, Q56

1. Introduction

The modern human existence is based on consumption of goods and services (either as individuals or as members of different social groups). The theory of consumption, as it is

known, explains the preferences of individuals and economic entities, based on the measurement of the dimensions of their needs and consumption pattern [7].

The market segmentation theory represents a different marketing strategy that involves separating a group of individuals (targeted market) from the rest of the cluster and place them into subgroups of consumers who have common requirements, and fulfill their needs or desires that are believed to be common in the targeted segment [1].

In the last decades the companies involved in understanding the consumer behavior regarding the transport environment have faced the same problem: the knowledge of the way in which consumers respond to various stimuli in order to achieve the essential key for the success of the market – profit maximization.

Studying consumer behavior has become a necessity for companies, as they can learn how buyers choose their goods and services to satisfy their needs [3].

For the contemporary society, where technological and scientific progress in many areas tends to substitute the human labor, it becomes very important and significant to study the consumer behavior, considering that the global resources are scarce and we have to find more alternative solutions, that

human society needs to be at its disposal; thus only those goods and services that meet their needs will survive in the actual economic market [4].

Therefore, knowing and understanding consumer behavior has become a necessity; ignoring the manifestation of the behavior can cause serious imbalances in the economy [2].

The choice of each individual to walk, drive their personal auto vehicle or to take the public transport is influencing the mode of how the local, regional or global economy evolves. All of these choices are influenced not only by the environment but also by the population density, employment density and the distances that are needed to be covered.

The necessity to supply the needs of the population worldwide cannot be done only by a company, so we must “break down” the total demand into segments and allocate different segments to different companies that are the most equipped to handle the situation [6].

To apply with success the Market Segmentation Theory in transport systems we have to consider four major factors:

- clear recognition of the cluster segment that we are targeting;
- effective number of individuals that are selected;
- amount of resources that is needed;
- policy and resources of the company.

2. The Black Box Model - A new way to study Consumer Behavior in transport

The specialists in the field of marketing Kotler P. and Armstrong G. suggest a basic pattern to buyer behavior; it uses the term "black box" and shows that marketing incentives influence over the decisions on buying consumer goods and services. They also study the main factors that influence the consumer behavior: cultural, social, personal and psychological. The consumer survey is problematic from the perspective of determining as accurately as possible the

output through knowledge processes that are taking place in the black box.

Figure 1: Scheme of a Black Box Model in behaviorism

Source:

<http://en.wikipedia.org/wiki/File:Blackbox.svg>

The Black Box Model (figure 1) can be applied in any domain, from psychology to sociology, physics to economy and also in the transport sector. The scheme presented in figure 1 shows the interaction of stimuli with the input that is “filtered” by the Black Box results the output and sets of answers that are needed to understand the consumer behavior in transport systems [5].

By studying the sets of stimuli and the pattern of each individual we can apply the Black Box Model Theory and determine or influence the decision of each person.

The external factors (**sets of stimuli**) like economic, social, technological and demographic influences are “supplying” the potential customer with different types of information that represents the input.

After the input is established the **Black Box** is analyzing the contents. Many psychologists resemble the Black Box Model with the process of thinking in which we always know the data that is entered, the possible results but we never know what the output will be. However a series of internal factors were identified as: attitudes, personality, perception, factors that participate in the formation of the buying decision.

The **sets of responses** (output) represent the final step of the process which determines the answer of the person if to buy or not a particular product.

To better understand the consumer behavior we have to comprehend how the environmental stimuli interact with the

decision process which determines the person to respond favorable when choosing different types of products, promotions and services.

Table 1: Black Box Model shows how stimuli, consumer characteristics and decision processes interact in eliciting consumer responses

Environmental Factors		Buyer's Black Box		Buyer's Response
Marketing Stimuli	Environmental Stimuli	Buyer Characteristics	Decision Process	
Product	Economic	Attitudes	Problem recognition	Product choice
Price	Technological	Motivation	Information search	Brand choice
Place	Political	Perceptions	Alternative evaluation	Dealer choice
Promotion	Cultural	Personality	Purchase decision	Purchase timing
	Demographic	Lifestyle	Post-purchase behavior	Purchase amount
	Natural	Knowledge		

Source: Sandhusen R. L., 2000, *Marketing, Barron's Educational Series, Third edition, P. 181*

According to [8] the *Black Box Model applied in Marketing (Table 1)* shows how the *environmental factors* interact with the *consumer characteristics* and results the *decision process*. This black box model (Table 1) is linked with the black box theory in behaviorism (figure 1) which is concentrated on the relation between the stimuli and the response of the consumer regarding its decision. As we can see from the above table the *environmental factors (marketing stimuli and environmental stimuli)* and the *buyer's black box (buyer characteristics and the decision process)* have a large impact on the *buyer's response* regarding his needs.

When applying the Black Box Model in different clusters usually the *marketing stimuli* are processed by the company and the *environmental stimuli* are given by the social factors. The *buyer characteristics* and *decision process* can be taken only by the buyer.

As we take a closer look at *The Black Box Model in behaviorism* and *Black Box Model applied in Marketing* we can see that they can easily be applied in all types of companies with different domains of activity from around the world which can help improved the economic well being of their clients.

As a general conclusion regarding the Black Box Model applied in transport we say that the importance of identifying the real needs of the public should be the most important aspect that a company should analyze.

3. The behavioral market segmentation theory applied in transport systems

The need of mobility has increase considerably in the last decades which means that the behavior of the population has changed. Clearly, transport systems have a positive economic and social effect on the wellbeing of individuals.

The behavioral market segmentation theory is about understanding why specific costumers are within a market. The preference, attitude and demographic variables are the key components of the market segmentation theory (MST).

The approach we want to make between the behavioral market segmentation theory and transport systems consists in analyzing all the essential factors that are part of the MST and applying them in different transport sectors improving this way the Intelligent Transport Systems (ITS) [Intelligent transport systems (ITS) are advanced applications which, without embodying intelligence as such, aim to provide innovative services relating to different modes of transport and traffic management and enable various users to be better informed and make safer, more coordinated, and 'smarter' use of transport networks.

Source:http://en.wikipedia.org/wiki/Intelligent_transportation_system].

The market segmentation theory can help us categorized different types of customers in

order to be able to meet their demands. The MST usually groups individuals by gender followed by the type of transport used to travel long or short distances, preferences regarding the comfort provided by the mean of transport.

Table 2: Passenger transport in the European Union during 2000 – 2010

	2000			2010		
	Passenger cars	Buses	Railways, trams and metros	Passenger cars	Buses	Railways, trams and metros
EU-27	83.0	9.9	7.1	84.1	8.8	7.1
Belgium	83.4	10.5	6.1	79.4	13.6	7.0
Bulgaria	59.8	32.4	7.7	79.3	17.0	3.7

(1) Excluding powered two-wheelers.

(2) Passenger cars: break in series.

(3) The railway in Liechtenstein is owned and operated by the Austrian ÖBB and included in their statistics.

Source: Eurostat (online data code: tsdtr210)

Source: Eurostat, accessed at 13.04.2013, http://epp.eurostat.ec.europa.eu/statistics_explained/index.php?title=File:Index_of_inland_passenger_transport_relative_to_GDP,_2000-2010_%28index_2000%3D100%29.png&filetime_stamp=20121016055843

According to the Eurostat statistics revealed in 2012 (see Table 2) the trends in passenger transport is variable from country to country depending on their specific needs.

The table presents information about the type of transport that is used (rail or road) and as we can see the most dominant mean of transport is by cars. An explication about the

consumer behavior related to the predominant use of the car can be that by using this mean of transport the consumer is more mobile and flexible in traveling.

The Eurostat statistic (see Table 2) is providing important information about the consumer behavior from country to country.

As a first indicator we can see that consumers' behavior is different from a country to another depending on their different cultural patterns. In some cases (Belgium, France, Italy, Luxembourg, Austria, Sweden, United Kingdom, Switzerland, FYR of Macedonia) we can notice that the passenger car transport has decrease in favor to buses or railways.

The market segmentation theory can be applied in transport by using the data presented in table 2; according to the theory the territorial location of the population is one of the most important steps in segmenting the group of people that we are interested in. As we can see from the table people have different types of behavior from a state to another regarding the mean of transport they use.

The economic influence is an important factor which determines different types of people to use their personal cars more than the public transport (Table no. 2).

A very important aspect in the behavior of each individual is represented by its own culture which determines different types of behavior from a region to another. As we can see in the above table the countries from the European Union have a significant increase of individuals that travel by car in comparison with Turkey which is not a member of the E.U.

The knowledge of consumer needs and buying process is the cornerstone of all successful activities in transport and not only; it represents the key to understand how buyers fulfill their needs, recognize information, evaluate brands, make purchasing decisions and behave after they buy the service or object they wanted; the marketing operators can learn about how to

act in order to meet the needs of their customers.

4. Conclusions

In this article the authors tried to implement the *Black Box Theory* and the *Behavioral Market Segmentation Theory* in the transport networks. In this way we had exposed and studied how to implement new concepts in attracting passengers to use different types of transport contributing on reducing the impact that uncontrolled transport have on the environment and wellbeing of individuals.

The aim of this paper is to offer support to companies from the transport sector in developing new marketing strategies which can help the consumer decide what type of services needs to access. This study of what type of transport people uses shows that are important differences between consumers and their behavior regarding the mode of travel.

The Deconcentration of Public Services in Romania

Bilouseac Irina

“Stefan cel Mare” University of Suceava, Faculty of Economics and Public Administration
irinab@seap.usv.ro

Abstract

The current social concerns have caused an increasingly noticeable decline of the centralised system, as the deconcentration and decentralisation processes of the past decade have led to a shift of powers towards the local government structures.

Deconcentration, the underlying principle that defines the organisation and functioning of local government structures and the focus of the present analysis, entails the redistribution of administrative, planning and financial responsibilities from central government authorities to lower-level local authorities. However, despite the fact that these structures function on a local level, they are closely linked to central authorities and still remain upwardly accountable to central governments.

We believe that the implementation of deconcentration will increase the efficiency of the strategies of central governments, as deconcentrated services are closer to the civil society and can thus make more competent decisions in agreement with the local interest and necessities.

Key words: deconcentration, public services, decentralization

JEL Classification: M12,H83

1. Introduction

The public services of any European state are paramount for the improved quality of life of all citizens, and the functioning of local government structures needs to be reorganised in terms of efficiency in order to bring them closer to the people.

The deconcentration of public services can be defined as the territorial delegation of certain administrative responsibilities to lower levels of the central government

authorities stationed in provinces and counties.

Under these circumstances and given the importance of deconcentrated services for the economy and the impact they may have on the citizens' quality of life, the findings of the present analysis show that the management of these services must remain in the responsibility of deconcentrated structures on a local level. We believe that the implementation of this principle, alongside decentralisation, is the only way to meet the needs of local communities.

2. Various trends in defining deconcentration

In an attempt to provide a brief definition of deconcentration, one may describe it as an intermediate form of centralised and decentralised governing structure, entailing a transfer of administrative, planning and financial responsibilities among various lower levels of central government structures.

Deconcentration does not oppose centralisation, but is a more diluted form of the latter or a type of imperfect centralisation, as it allows for a certain independence of public services provided by the civil servants appointed by central authorities. However, centralised administration is practically active at all times, since, on the one hand, civil servants are upwardly accountable to central government authorities and, on the other hand, the government is entirely accountable for their decisions.[3] The similarity between deconcentration and centralisation is revealed by the way local government representatives are appointed by central authorities and not through the vote of the local constituency. The similarity between deconcentration and decentralisation consists in the fact that the local authority representatives have the power to make decisions on a local level, without the approval of upper government structures, but

are, however, inspected by the latter and must comply with the decisions of their superiors. [8]

Article 120, paragraph 1 of the Constitution of Romania provides that: “The public administration in territorial-administrative units shall be based on the principles of decentralization, local autonomy, and deconcentration of public services.”

The Framework law no. 195/2006 of decentralisation defines deconcentration as follows: “the transfer of administrative and financial responsibilities from central governments and other specialised structures of the central authorities to their own lower level regional structures.” This principle is also stated in Article 2 paragraph 1 of the Law no. 215/2001 republished of the local government structures, as an essential principle of organisation and functioning of public administration: “The organisation and functioning of local authorities in the administrative and territorial units are based on the principles of decentralisation, local autonomy and deconcentration of public services (...)”

In A. Teodorescu’s opinion, administrative deconcentration meant “enhancing the power of the central government agents located in counties and municipalities”, while Paul Negulescu analysed the same principle, defining it as follows: “When a local or special authority, whose representatives have been appointed by central government structures, are granted the right to make certain decisions, one cannot speak of decentralisation, even though a certain degree of autonomy is permitted in those structures. In this case, we are dealing with a diminution of the centralised system. This diminished form of centralisation is called deconcentration.” [4]

An opinion we acquiesce with is that of Petru Filip, who stated that deconcentration consists in the delegation of authority, duties and responsibilities between the central and the local government structures, in terms of the public services provided for the entire community. [5]

3. Graphical depiction of deconcentration

There are two types of deconcentration: *horizontal* and *vertical*, as depicted in Fig. 1.

Vertical deconcentration, which has been depicted first, entails the hierarchical subordination of deconcentrated services to their respective central government structure, while the second type, horizontal deconcentration, consists in the local management of these services by the central government representatives in the region. [2]

Horizontal deconcentration is the type that has been adopted in Romania, where the prefect is the one managing the deconcentrated public services on a local level. However, there is no way of identifying those public services that may require this type of double subordination of these services to the prefect and to the central government authority, as this may lead to conflicting decisions. [2]

The graphical representation of vertical or horizontal deconcentration is outlined in the figures below:

Fig. no. 1 Graphical representation of the vertical deconcentration of public services

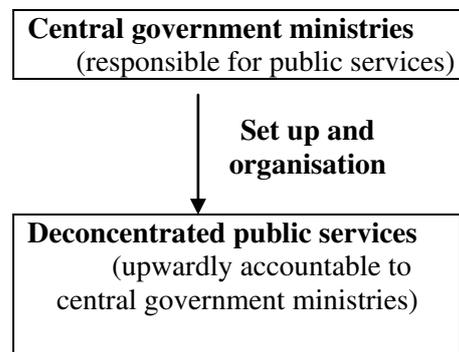

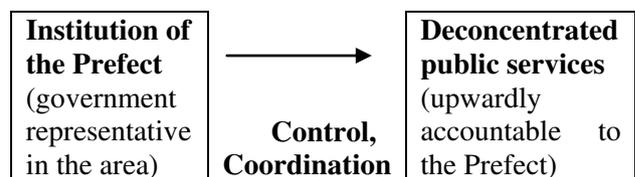

Fig. no. 2 Graphical representation of the horizontal deconcentration of public services

The two figures depict the double subordination of the deconcentrated public services, both to the prefect and to the particular central government structure in charge of each public service.

4. Prospects of deconcentration

Deconcentration is not directed at promoting local interests but is meant to support the central government structures perform their responsibilities by maintaining, however, the same hierarchical structure and thus disregarding the principle of autonomy.

In most cases we are dealing with strictly specialized services, since, clearly, the prefect cannot be involved in the management of very specific activities and, if this system is maintained, the managing responsibilities of the prefect and the activities subordinated to the central authority must be accurately outlined and differentiated.

Therefore, deconcentration is a weaker form of centralisation, entailing the redistribution of certain responsibilities to different local authority levels but maintaining upward accountability to central government structures. [2]

We can argue that the deconcentration of public services can also be defined as a territorial dispersion of administrative responsibilities, entailing the setting up of regional or county offices of the central government, followed by the delegation of administrative control from central structures to these local or regional authorities.

At present, the administrative and territorial reorganisation as well as the division of Romania into regions is necessary, in light of the recommendations formulated by the European Union. Certain deconcentrated services on a county level will be taken over by regional structures. However, it remains to be seen whether the development of a new administrative structure that would assume the responsibilities of both central government and county structures will actually bring about an improvement in the quality of services provided to local communities.

We can definitely argue that deconcentration is an improved and weaker version of centralisation and the deconcentration of the administrative system therefore consists in transferring responsibilities from central government structures to their representatives in the region that are still upwardly accountable to central government authorities, even though they are at the citizens' service.

5. Types of deconcentrated public services

Table no. 1 presents the deconcentrated public services and the central government ministry they are administered by. The deconcentrated public services of the administrative and territorial units are “all the structures in the administrative territorial units that are not decentralised in terms of administrative and financial responsibilities and are upwardly accountable to the ministries and to all the other central government structures administered by the State, as observed in the current legislative standards that regulate their organisation and functioning.” [7]

A number of other entities are established and are upwardly accountable, coordinated or governed by the ministries, and their responsibility is to carry out the provisions of each respective ministry in each of their specific sectors.

Such deconcentrated public services have various names, such as: inspectorates – in the case of the county police inspectorate of the Ministry of Defence, the education and training inspectorate of the Ministry of Education, Research, Youth and Sport, the offices for agriculture and rural development of the Ministry of Agriculture and Rural Development, or the care and social services offices of the Ministry of Labour, Family and Social Security, as well as other agencies and bureaus.

Moreover, the Ministry of Culture and Cultural Heritage manages museums, libraries, theatres, cultural centres, cultural publications, printing houses and movie sets that carry out the provisions related to the general interest for culture manifested by the population.

Similarly, the Ministry of Education, Research, Youth and Sport manages the education and training institutions in the country, as well as the public higher institutions, public academic libraries and research and development centres that carry out the provisions of the ministry in terms of the general interest of the population related to learning, education and research.

Table no. 1 Types of deconcentrated public services

Deconcentrated public services
County offices for public healthcare
County offices for culture, worship and national heritage
Regional commissioner office for consumer protection
County commissioner office for consumer protection
Territorial offices for small and medium sized enterprises and cooperative societies
County offices for labour and social security
Territorial labour inspectorates
County retirement offices
County employment agencies
Regional social inspectorates
County agencies for social services
County sports offices
County youth offices
National and municipal sports centres
City and municipal sports clubs
Student cultural centres
General offices of county public finance
Regional and county excise duties and operations offices
County Internal Revenue branches
County offices for agriculture and rural development
Territorial inspectorates for the quality of seeds and propagating material
Territorial inspectorates for forestry and hunting
County agencies of payments and agricultural intervention
County agricultural consulting agencies
County offices for animal breeding improvement
Payment agencies for rural development and fishing
County offices of soil taxonomy and survey
Environmental protection regional and county offices
Regional commissioner offices of the National Environment Agency
Hydrographical basins offices of the Romanian Waters National Administration
Food and veterinary county offices
Regional and country statistical offices (DRS, DJS)

Deconcentrated public services
Territorial units of the National Agency for Mineral Resources
State inspectorate for constructions
Territorial branches of the Agency for Energy Preservation
County Postal service offices
Regional Postal service offices
Romania Licenses and Vehicles Registration
Romanian Road Transport Authority
Regional offices of the Romania Licenses and Vehicles Registration
Regional offices of the Romanian Road Transport Authority

Source: Emergency Ordinance no. 105 of October 6, 2009, www.gov.ro

The list presented in the above table and including a number of deconcentrated public services of the ministries and of the other central governing structure offices in the administrative and territorial units is stated in the Emergency Ordinance no. 105 of October 6th, 2009 [5], with the subsequent alterations (www.gov.ro). There is a double upward accountability of these services:

- vertically, to their respective central government ministry;
- horizontally, to the prefect, as central government representative in the area (in charge of the deconcentrated public services on a local level).

6. Conclusions

The decentralisation and deconcentration processes are currently unravelling, as the number of public services is constantly rising [9]. We believe that the trends to be identified in the future should encompass a constant development of deconcentration, by recognising new types of public services and by focusing, where possible, on the conversion of deconcentrated services into decentralised public services, according to the needs of the local communities (as is currently the case with services such as healthcare, education, etc.). Our strong belief is that public services need to be constantly deconcentrated and thus eventually lead to an improved management of these services and to a higher quality in their provision.

Performance Indicators of Human Resources in Health Organization

Boldureanu Daniel

University of Medicine and Pharmacy „Grigore T. Popa”, Iasi
boldureanu@yahoo.com

Abstract

Human resources are the most important components in healthcare industry, with a significant component in the current costs of health services.

Performance indicators of human resources in hospitals are set in the Order of the Minister of Public Health number 112/22 January 2007 regarding performance criteria as follows: a) the proportion of doctors from total hospital staff, b) the proportion of medical staff from total hospital staff., c) the proportion of highly educated medical staff from all medical personnel, d) the average number of visits to a physician in outpatient.

This paper examines the quantitative indicators of human resources performance in the “St. Spiridon” County Clinic Emergency Hospital Iasi during the period 2007-2011.

Key words: human resources, health, hospital, performance.

J.E.L. classification: I12, M12.

1. Introduction

The human resource is, at present, a decisive factor in promoting the image of the organization in the market. The image refers not only to the product quality but also to the services provided before and after sale [1].

The human resource management involves continuous improvement activities of all employees in order to achieve the mission and objectives of the organization [2].

Successful application of human resource management requires the existence of a performance evaluation system, a system for stimulating and rewarding the employee's results [3]. The managerial performance is important in health because the hospital is a

major component of any health system in the world [4].

2. Methodological framework

According to the European standards, in our country was developed a series of indicators to quantify the performance management in Romanian public hospitals. The quantitative indicators consist of a group of 19 indicators, grouped into four main areas: Human resource management, the use of the service, financial performance and the quality of medical care [5].

There are four indicators for human resource, as follows [5]:

1. The proportion of doctors from total hospital staff

The proportion of doctors in total hospital staff is calculated as the percentage ratio between the numbers of doctors employed in hospitals compared to all persons employed in the hospital.

2. The proportion of medical staff from total hospital staff.

The medical staff includes: doctors, pharmacists, superior health personal: physiokinetothersapists; medical bioengineer, biologist, biochemist, chemist, physicist, psychologist, speech therapist, sociologist, physiotherapist, social worker, graduate nurses, midwives, medical equipment technician, dental technician, nurse, health official, medical registrar, medical statistician.

3. The proportion of highly educated medical staff from all medical personnel - is the ratio of medical staff with higher education from the preceding paragraph.

4. The average number of visits to a physician in outpatient is calculated as the ratio between the number of outpatient consultations and the number of physicians providing ambulatory consultations.

It is included in this category: the doctors who provides consulting in integrated

ambulatory, physicians providing outpatient consultations in specialized ambulatory (for athletes, students, dental care, etc., the doctors from specialty offices, medical oncology, diabetes, nutrition and disease metabolic, infectious diseases, family planning, tuberculosis dispensaries.

The dates for these indicators are provided by the human resources department of the hospital and are not directly related to the hospital casuistic.

3. Analysis of human resource indicators

The personnel structure of the “St. Spiridon” County Clinic Emergency Hospital Iasi at 1st January 2012 is:

Table 1. The personnel structure of the “St. Spiridon” County Clinic Emergency Hospital Iasi

No.	Staff category	Number of people
1	TOTAL HOSPITAL (no residents) of which: (2+9+14+15+23)	2,243
2	TOTAL PERSONAL PHYSICIANS – no residents (3+5+7+8)	1,549
3	Physicians (no residents) of which:	373
4	Physicians UMF	213
5	Medical assistant with high education of which:	56
6	Medical assistant (short-term studies)	10
7	Other medical staff with higher education (pharmacists, biologists, chemists, psychologists, physician)	47
8	Ancillary medical staff (nurses, registrars, statisticians)	1,073
9	Auxiliary medical staff (sick nurses +medical carers+ stretcher bearers) of which:	497
10	Sick nurses	240
11	Medical carers	192
12	Stretcher bearers	61
13	Ambulance drivers	4
14	Total TESA (including staff management)	84

15	TOTAL WORKERS of which:	111
16	Cooks	23
17	Unskilled kitchen workers	2
18	Total staff kitchen	25
19	Facilities maintenance workers	76
20	Drivers	4
21	Lifters	6
22	Personal service- fireman	2
23	Physicians residents of which:	668
24	Physicians residents	666
25	Pharmacists residents	2
26	TOTAL HOSPITAL – with residents (1+23)	2,911

Source: http://www.spitalspiridon.ro/docs/plan_management.pdf, accessed April 2013

The analysis of human resource indicators at the “St. Spiridon” County Clinic Emergency Hospital Iasi shows:

A. The proportion of doctors from total hospital staff

The proportion of doctors from total hospital staff is a specific indicator measuring the proportion of total personal physicians. A maximum value (100%) indicates a high occupancy of posts, according to the legislation applied in the Romanian health system.

In the “St. Spiridon” County Clinic Emergency Hospital Iasi, the proportion of doctors from total hospital staff is much higher than the national value.

It may be noted that in 2007 year (33.28%) has been observed a significant increase compared to the national average (10.82%), which is explained that a large number of resident doctors have chosen to work in their residential period in “St. Spiridon” County Clinic Emergency Hospital Iasi.

Table 2. The proportion of doctors from total hospital staff in “St. Spiridon” County Clinic Emergency Hospital Iasi

	Values achieved (Percent %)
2007	33.28
2011	16.64
National average	10.82

Source: Annual evaluation of management activity assessment sheet 2007-2011.

B. The proportion of medical staff from total hospital staff

The proportion of medical staff from total hospital staff signifies a high degree of professionalism of the medical act by an increasing number of health professionals.

At “St. Spiridon” County Clinic Emergency Hospital Iasi, this indicator had a value of 74.67% in 2007 year and decreased to 69.05% in 2011 year, which is above the national average (64.61%).

Table 3. The proportion of medical staff from total hospital staff in “St. Spiridon” County Clinic Emergency Hospital Iasi

	Values achieved (Percent %)
2007	74.67
2011	69.05
National average	64.61

Source: Annual evaluation of management activity assessment sheet 2007-2011.

C. The proportion of highly educated medical staff from all medical personnel

At “St. Spiridon” County Clinic Emergency Hospital Iasi the value of this indicator obtained in 2007-2011 period were above the national ones. The possible explanations could be:

- a significant number of medical staff have graduated higher educational courses organized by University of Medicine and Pharmacy „Grigore T. Popa”, Iasi (especially medical assistant);
- existence of a significant number of highly educated medical staff, by organizing competitions for new employment after the block period on the maximum norms of the organization, to improve the quality of care;
- the presence of teachers from University of Medicine and Pharmacy „Grigore T. Popa”, Iasi through their integration into the hospital.

Table 4. The proportion of highly educated medical staff from all medical personnel in “St. Spiridon” County Clinic Emergency Hospital Iasi

	Values achieved (Percent %)
--	--------------------------------

2007	48.05
2011	30.36
National average	26.48

Source: Annual evaluation of management activity assessment sheet 2007-2011.

D. The average number of visits to a physician in outpatient

In “St. Spiridon” County Clinic Emergency Hospital Iasi this indicator was achieved almost double than the national average in analyzed period.

Table 5. The average number of visits to a physician in outpatient in “St. Spiridon” County Clinic Emergency Hospital Iasi

	Values achieved (Percent %)
2007	48.05
2011	n.a.
National average	26.48

Source: Annual evaluation of management activity assessment sheet 2007-2011.

* n.a. – not available data.

It may be noted that with increasing the number of doctors employed, decreases the number of visits per physician in outpatient. This aspect has a direct influence on the quality of medical care, because it reduces the time allocated to each patient and the number of consultations of the medical personnel is not exceeded.

According to the managerial plan [6], the possible explanation might be:

- a high addressability to ambulatory clinics;
- the existence of equipments for the investigations, along with the possibility of clinic hospitalization in the immediate vicinity;
- development of the national program to perform medical tests (the hospital ambulatory had a recognized medical analysis laboratory, according to ISO quality standards).

4. Conclusions

The analysis of indicators for human resource from St. Spiridon” County Clinic Emergency Hospital Iasi revealed:

- there was a significant increase compared to the national average of “The proportion of doctors from total hospital staff” indicator, which is explained by the large number of resident doctors who have chosen to work their residential period in hospital;
- the proportion of medical staff from total hospital staff is above the national average;
- the proportion of highly educated medical staff from all medical personnel has a high value, which leads to a higher quality of care;
- the average number of visits to a physician in outpatient is much higher than those assumed by the managerial contract and than the national average, representing an increased efficiency of the medical staff.

The major problems of human resources in the future are: stopping the migration of the medical staff, the lack of salaries motivation and the job security. The concrete measures for an efficient use of human resources in hospital could be, in our opinion:

- employment at maximal personnel norms for different structures of the hospital;
- staff performance evaluation based on performance criteria defined in accordance with the objectives of the annual managerial hospital plan;
- exact criteria for personnel evaluation and stimulation;
- development of personnel recruiting plans necessary to provide quality services for insured patients.

Quality Indicators Used in the Analysis of Health Managerial Performance

Boldureanu Daniel

University of Medicine and Pharmacy „Grigore T. Popa”, Iasi

boldureanu@yahoo.com

Abstract

The managerial performance of public hospitals contains four main groups of indicators: human resource management, the use of the service, financial performance and the quality of medical care.

This article analysis of the largest hospital in the North-East region (“St. Spiridon” County Clinic Emergency Hospital Iasi) through quality indicators used in public hospital management performance.

According to the current legislation, the quality indicators used in analysis of the managerial performance analysis are: the hospital mortality rate, the nosocomial infection rate, the index of diagnosis, the number of patient complaints.

The analysis results indicate that “St. Spiridon” County Clinic Emergency Hospital Iasi achieves a high quality in their activities, but there are possibilities for further improvement.

Key words: quality indicators, managerial performance, hospital.

J.E.L. classification: I12, M12.

1. Introduction

The concept of quality in health is extremely wide and currently debated. Summarizing the expert opinions, the three fundamentally dimensions of quality in health are [1]:

- *professional quality* - if the product or service meets all the conditions set by the health professionals in the medical field (standards of practice);
- *quality in terms of customer* (patient satisfaction) - the patient expectations from a medical service;
- *total quality management* - the most

efficient and productive way of using health resources within the limits set by health authorities (managerial efficiency).

A. Donabedian described a new three dimensional model of quality - structure-process results model, with the following components [2]:

- „*structure*” - a relatively stable characteristics of the health care provider, techniques, tools and resources available, organization and infrastructure characteristics at workplace;
- „*process*” - a set of activities that take place within provider and patients framework, the health care process means quality only when was established a relationship with desired health status;
- „*result*” - a change in current and future health of the patient, which can be attributed to health care provided.

The performance (results) in management shows the way in which the desired objectives are achieved. They define the actual situation or the initial situation in the decision process [3].

In health, the concerns about a new system of quality standards have materialized into three levels: theoretical, practical and institutional [4].

According to the European standards, in our country was developed a series of indicators to quantify the performance management in Romanian public hospitals. These quantitative indicators consist of a group of 19 indicators, grouped into four main areas: human resource management, the use of the service, financial performance and the quality of medical care [5].

2. Methodological framework

There are four indicators of medical care as follows [5]:

1. Hospital mortality rate calculated as the

ratio of number of deaths in hospital, any time from internment and until death and the number of patients discharged.

2. The nosocomial infection rate determined by the ratio between the number of patients with nosocomial infections and the number of discharged patients. This indicator is calculated on the total hospital and in each section.

3. The index of diagnosis according during the period of hospitalization means the number of cases where diagnosis code at admission is the same with the diagnosis code at discharge, if both diagnoses are located in the same group of codes at the beginning of each class of disease.

The codes expressing suspicion about the disease, screening, disease contact, organ lesion, joint lesion are considered concordant.

4. The number of complaints / patient complaints.

The study is the result of a process of deduction and induction, investigation and critical interpretation and comparative studies regarding the managerial performance and the quality indicators in Romanian public hospital.

The purpose of the article is to study the quality indicators of “St. Spiridon” County Clinic Emergency Hospital Iasi, as it shown in the managerial plan and managerial report [6].

3. Presentation of the hospital

“St. Spiridon” County Clinic Emergency Hospital Iasi is a regional university hospital with legal personality, first class competence. The hospital has the function to provide medical care to the population, both curative and preventive, and it is an important regional center for professional training for students, medical residents and doctoral students.

The hospital activity

The hospital performed as reported in 2011 a total of 49,971 cases of inpatient hospitalization and 32,421 partial hospitalization, in 2010 a number of 39,466 cases of inpatient hospitalization and 30,693 partial hospitalization and in 2009 a number of 39,746 cases of inpatient hospitalization and 35,347 partial hospitalization (table 1).

Table 1. Inpatient and partial hospitalization

Year	Inpatient hospitalization	Partial hospitalization
2009	39,746	35,347
2010	39,466	30,693
2011	49,971	32,421

Source: http://www.spitalspiridon.ro/docs/pla_n_management.pdf, accessed April 2013.

4. Analysis of qualitative indicators

A. The hospital mortality rate

The first indicator of quality health care measure the hospital mortality rate (per hospital and per hospital section) and it is due to the complications occurring during hospitalization.

At “St. Spiridon” County Clinic Emergency Hospital Iasi, this indicator is above the national average, but it is explained by the complex casuistry: severe cases from the whole Nord-East Region, medical cases often outdated and dying in hospital. Also, the presence of surgical departments, oncology and hematology leads obviously to a large value of the indicator above the national average.

Table 2. The hospital mortality rate

	Value
Values assumed	1.34
Values achieved	1.34
National average	1.32

Source: http://www.spitalspiridon.ro/docs/pla_n_management.pdf, accessed April 2013.

B. The nosocomial infection rate

The nosocomial infection rate (on the total hospital and in each section) represents the hospital infections that patients contact during hospitalization (before or after surgery).

A high value of nosocomial infections indicates that in that hospital disinfection is not quality. By using a high quantities of disinfectants and with a low quality it isn't respected strictly the control and prevention measure of the nosocomial infection.

This leads to a higher cost of hospitalization due to the high consumption of drugs (especially antibiotics) for the control of nosocomial infection.

At the same time, reporting a lower rate of

nosocomial infection rate, although the antibiotics consumption is high, leads to a false reflection of reality in that hospital.

The rate of nosocomial infections in “St. Spiridon” County Clinic Emergency Hospital Iasi is 0.71%, equal to that proposed. It is a normal value for a hospital with such a large variety.

For this organization respected the rules established by the health authorities to ensure functional circuits, without unwanted epidemiological events. It was provided four areas, namely: the "clean" area, the "dirty" area, the "neutral" area and the "intermediate" area, which meets European health requirements and ensures fluency of activity.

C. The index of diagnosis according during the period of hospitalization

The index of diagnosis according during the period of hospitalization reflects the opportunity and necessity of hospitalization in a particular section of the hospital.

A degree achievement close to 100% indicates a high degree of professionalism, admission protocols and criteria well defined.

At “St. Spiridon” County Clinic Emergency Hospital Iasi, this indicator had a value of 74.67% in 2007 year and decreased to 69.05% in 2011 year, which is above the national average (64.61%).

Table 3. The index of diagnosis according during the period of hospitalization

	Percent %
Values assumed	81 %
Values achieved	81,30 %

Source: http://www.spitalspiridon.ro/docs/pla_n_management.pdf, accessed April 2013.

In “St. Spiridon” County Clinic Emergency Hospital Iasi, the index of concordance between the diagnosis at admission and at discharge is 81.30% higher than the assumed value of 81.0%.

Although this indicator was achieved, the remaining 20% (to the 100% fulfillment) is high, so there are opportunities for further improving.

D. The number of complaints / patient complaints

In “St. Spiridon” County Clinic Emergency Hospital Iasi, the number of complaints analyzed and solved is zero, as was assumed by the managerial contract. Although the hospital activity is not perfect, the employees and the managerial team are trying to work better, and the absence of claims confirm this.

4. Conclusions

The analysis of the quality indicators of “St. Spiridon” County Clinic Emergency Hospital Iasi indicates:

- the hospital mortality rate (1.34) is above the national average (1.32). The presence of surgical departments, oncology and hematology leads to a large value of the indicator above the national average;
- the hospital nosocomial infection rate (0.71%) is equal to the assumed value and it is a normal value for a hospital with such a large variety of cases. For this it was provided four areas: the “clean“ area, the “dirty“ area, the “neutral“ area and the “intermediate“ area, which meets European health requirements and ensures fluency of activity;
- the index of concordance between the diagnosis at admission and at discharge (81.30%) is higher than the assumed value (81.0%) that indicates a high degree of professionalism, admission protocols and criteria well defined;
- the number of complains analyzed and solved is zero.

It can be said that quality indicators proposed by the management contract was made entirely.

However, the quality indicators of the “St. Spiridon” County Clinic Emergency Hospital Iasi it can significantly improve by the development and implementation of a system for monitoring the quality of care, to achieve the following measures:

- development and the using of a patient satisfaction evaluation system for the hospital services provided;
- establishment of a interdisciplinary ethics committees for clinical analysis of incidents, accidents and medical

- malpractice cases;
- using of an identification system regarding the quality of medical care in each section or department of the hospital.

The Experience of Activity of National Service of Mediation and Reconciliation of Ukraine

Borovykov Oleksandr

Human Resources Management and Labor Economics Chair, Poltava University of Economics and Trade
www.borovykov.at.ua
borovykov@ukr.net

Abstract

The article reviews the main provisions activity of National Service of Mediation and Reconciliation of Ukraine, and especially activity of Poltava branch office of its institution.

Key words: mediation, reconciliation, conflict, strike, arbitration.

J.E.L. classification: M12, M14, M54, O15, J5, J7.

The general formulation of the problem

National Service of Mediation and Reconciliation of Ukraine (hereafter: National Service) is a permanent state institution. This service was established by Decree of President of Ukraine in accordance with the Law of Ukraine "On the procedure for settling collective labor disputes (conflicts)" on November 17, 1998 № 1258/98.[1.]. The purpose and objectives of this state service is to facilitate the settlement of collective labor disputes (conflicts).[2.].

In general some of the tasks this state service are the implementation of measures to prevent disputes, strikes and collective stopped working, other actions of social protest.

In detail the specific tasks of this state service are:

- promoting social interaction between participants - employment in the settlement of collective labor disputes (conflicts) arising between them;
- predicting the emergence of collective labor disputes (conflicts) and facilitation their timely decision;
- mediation and conciliation in resolving

collective labor disputes (conflicts);

- ensure the implementation of social dialogue, development of agreed proposals for the development of socio - economic and labor relations in Ukraine;

- implementation of measures to prevent the occurrence of collective labor disputes (conflicts);

- improvement of the legal culture of the participants social - labor relations.

During 14 years of service activity, there were 1801 disputes (conflicts) with the number 94.3% of disputes (conflicts) resolved.

During service existence total number of registered collective labor disputes distributed by level of management as follows: at the national level - 3, sectoral level - 12 at territorial level - 71, at the production level - 1783 units of disputes.

Branch office of National Service in Poltava region is valid from January 2001.

During the existence of Branch office helped to resolve 64 disputes and the direct participation of Branch office resolved 60 disputes (claims were brought 133 employees, 97% agreed) in 277 companies, institutions and organizations of Poltava region.

Disagreements were resolved almost in 750 companies, institutions and organizations. Dozens of strikes and other protests of economic directions were also prevented.

Only in the last two years the Branch office in Poltava has conducted over 200 conciliation procedure (matching meeting, conciliatory commission) to facilitate resolution of collective labor disputes and prevention.

The direct participants in these disputes were more than 68,000 persons, representing

86% of the total number of persons in these enterprises.

Branch office in Poltava acting together with local governments, executive authorities, employers' associations and trade unions involves collaboration of labor arbitrators and experts. Agreements on cooperation with all actors involved in the regulation of industrial relations were concluded.

Professionals or rather 18 labor arbitrators (including arbitrator - author of the article) help in the effective work, 5 persons of independent intermediaries and in each district information and consultation center (29 persons) were established and operate who are actively involved in monitoring of the state of industrial relations of collectives of enterprises, institutions and organizations of the region. Branch office in Poltava has five specialists.

Branch office through the media system conducts outreach to educate the public on legal issues, as well as highlighting experience thus seeking to increase the level of legal culture of the participants social - labor relations and individual citizens. For this purpose Branch office prepared newsletters, publications of regional, city and district newspapers and service bulletin, the sites of service, municipal and regional news agency "News of Poltava" in own WEB-page.[3.,4]. Twice a year sessions "hot" telephone line are conducted. Periodically interviews on radio and television are given.

Strike is a form of social protest

Article 44 of the Constitution of Ukraine stipulates that those who work have the right to strike in order to protect their economic and social interests.

The procedure for exercising the right to strike is established by laws of Ukraine, taking into account the need to ensure national security, health, rights and freedoms of others. Barring a strike is possible only on the basis of the law.

Even a third of the textual part of the Law .[1.] is devoted to the strike.

Strike is a temporary suspension of work by collective voluntary workers (absenteeism, failure to perform their job duties) companies for the purpose of settling a collective labor dispute (conflict). The

strike can be initiated if conciliation failed to resolve a collective labor dispute (conflict) or the owner or authorized body avoids conciliation procedures or fails to comply with the agreement reached in the course of resolving collective labor dispute (conflict).

Chapter III of the Law .[1.] provides procedures for strikes and includes a number of articles: Article 17. "Strike", Article 19. "The decision to declare a strike", Article 20. "Guidelines strike", Article 21. "Conclusion of an agreement on resolving a collective labor dispute (conflict), monitoring its implementation", Article 22. "Recognition strikes illegal", Article 23. "The decision on the recognition of the strike illegal", Article 24. "Cases in which the strike is prohibited", Article 25. "Addressing labor dispute (conflict) in the case of the prohibition of the strike", Article 26. "Ensuring the sustainability of the enterprise during the strike", Article 27. "Safeguards for workers during the strike", Article 28. "The consequences of employee participation in the strike".[1.].

The Law .[1.] provides mandatory conditions under which a strike is possible. Firstly, it can be started when it was preceded by conciliation. Second, the decision to declare a strike or disagreement with a strike is taken at a assembly or conference workforce. It is also defined body leading the strike. There are other required procedures, including written notice seven days prior to the strike of the owner, or his representative, as well as prevention providers and consumers of firms.

The strike as a social phenomenon is a form of manifestation of protest, which characterized certain criteria that distinguish it from other protest social issues.

The protest is usually massive, public event, or certain categories of citizens, which is aimed at attracting attention - subjects of the general public, employers to unresolved problems in different areas of society and is accompanied by the slogan, in some cases, the use of visual tools (posters, symbols), audio and video equipment.

Protests take place in various forms. They can be in the form of rallies, demonstrations, strikes, street procession, march, march-walking, assembly, picketing, fasting and so on.

Among the variety of forms of protest

strike occupies a special place that has its legal nature, the features.

The difference from the other strike protest (rallies, demonstrations, marches, pickets, meetings, fasting, etc.) is as follows.

First, a strike can only be applied by workers, individuals, who are employed by a legal entity or individual entrepreneur under the labor agreement. Other protests can be applied not only employees, but also by other categories of citizens (pensioners, students, the unemployed, etc.).

Second, the strike is regulated by the Law of Ukraine [1]." Holding rallies, demonstrations, meetings, street processions is regulated by the Decree of the Presidium of the Supreme Soviet of the USSR "On the procedure for organizing and holding meetings, rallies, street marches and demonstrations in the USSR" dated 28 July 1988, p. Number 9306-XI in the part that does not contradict the laws of Ukraine. Procedure for the rest of protests such as hunger strikes, picketing is not regulated by law in Ukraine. It is true that the legislature does not recognize some forms of protests, although they have a place in public life in Ukraine. Among them distinguish hunger, including collective, self-immolation and so on. Usually these activities are radical and are accompanied by a person voluntarily, knowingly harms to health for the sake of meeting their requirements.

Thirdly, the strike made exclusively during working hours, at a time when workers according to the laws, conditions of employment and collective agreements, works rules are required to perform their work duties. Other protests are usually held after hours (e.g. lunch breaks or on weekends, public holidays or non-business), but there are cases where workers protest actions - rallies, pickets, meetings are held simultaneously with the strike, and it is quite permitted by law - part of the ninth article 19 of the Law of Ukraine [1] (in the absence of constraints in the implementation of the law by the court according to the law).

At last time, the strikes are ways to pressure the employer in order satisfy the demands of workers. Spectral effects of other protests can be directed not only to the employer (employers), but also public authorities and local governments.

Of course, the strike was different from

other protests, but along with the differences strike has similar traits to them. So, strike, like all protests, appears amid unresolved disputes and is usually massive, public, attracting the attention of the public and the media.

After analyzing the characteristics of the strike, which allow to separate it from other protest social issues, it can be simply concluded that any strike is a protest, not any protest is strike.

The Law [1.] defines the list of cases in which to hold strike banned. There is a list of professions whose members are not allowed to strike. In particular in Ukraine (Article 24) public authorities (except clerical and support staff) (prosecutors, courts, and the Armed Forces of Ukraine, government, safety and security) have not the right to strike.

In case of an emergency Parliament of Ukraine and the President of Ukraine may prohibit strikes for a period not exceeding one month. Further ban must be approved by the joint act of the Parliament of Ukraine and the President of Ukraine. In the case of war situation martial law prohibiting strikes comes until canceled.

Conflict situations that may arise in enterprises, institutions and organizations must be addressed in the legal framework in accordance with Article 25 of the Law, when the service's recommendations to resolve conflict is not included by service filing the application for solving the conflict respective regional court.

Company received the decision to declare a strike by organ of trade union or other organization of employees that is authorized in accordance with Article 3 of the Law [1.] to represent the interests of employees, the general meeting by a vote of employees and is considered adopted if it receives the majority of employees. The decision to declare a strike is in a protocol.

Employees of the enterprise independently decide whether to declare a strike announcement in a company.

No one shall be compelled to participate or not to participate in the strike.

Authority, headed strike shall notify in writing the owner or authorized body not later than seven days before the strike, and the continuous current production for fifteen days.

The owner or authorized body

(representative) must as soon as possible to prevent suppliers and consumers, transport organizations and other interested companies, institutions and organizations on the decision of employees to declare a strike.

Location during the strike of workers, who take part in it, is defined by body (person) that controls the strike, with the consent of the owner or the authorized body (representative).

In the case of meetings, rallies, pickets outside the enterprise body (person), who heads the strike, must notify the scheduled event local executive authority or local authority not later than three days.

Authority (person), leading the strike, acts during a strike within the rights under this Act, informs employees about the course of settling a collective labor dispute (conflict).

Powers authority (s) as head of the strike are terminated unless members signed an agreement on the settlement of collective labor dispute (conflict), and if the decision on cancellation or termination of the strike.

Safeguards for workers during the strike are under Article 27.

Participation in a strike of employees, excluding strikes declared illegal by the court shall be regarded as a breach of labor discipline and can not be grounds for disciplinary proceedings.

By decision of the employees or the unions by the strike fund from voluntary contributions and donations may be formed.

For employees who did not participate in the strike, but due to his conduct were unable to perform their work duties, representatives are kept wages in an amount not less than the established law and the collective agreement concluded at the plant, both in time just not the fault of the employee. Accounting for these workers is the responsibility of the owner or the authorized body (representative).

Also, it is most important that the persons who are the organizers of the strike, the court acknowledged illegal, or that do not perform decision to recognize the strike illegal, as well as individuals who impede curb illegal strike, are called to disciplinary or administrative liability under the Law. [1.] Procedure and safeguards provided for in Articles 43 and 252 of the Labor Code of Ukraine is not applicable to these persons.

And Article 28 of the Law [1.] provides

for the consequences of employee participation in the strike. The organization of the strike, the court recognized illegal or participation therein is a violation of labor discipline. The strike workers who take part in it are without charge. Time employee participation in the strike, the court recognized that illegal, is not counted in the total and continuous employment.

The main direction of Branch office in Poltava considers prevents conflicts, timely and effective responses to them in the latent stage. These actions occur periodically in the trolleybus public traffic companies in Poltava and Kremenchug, at the enterprises of the sugar industry, housing - public utilities area, institutions of in the nonprofit sector. If at the beginning of the activities of Branch office in Poltava in 2001 in Poltava region there were 17 strikes in manufacturing, for example, employees of the holding company "AvtoKraz" (Kremenchug, Poltava region) 6 times suspended its work by requiring payment of arrears of salary. In recent years, social - labor relations demonstrate the absence of strikes in the Poltava region, it is also the positive result of activities of Branch office in Poltava.

Conclusions

National Service analysis showed that dominant and immediate causes of collective labor disputes in enterprises, institutions and organizations are:

- considerable arrears of wages;
- mass violations of the law in terms of pay and safety (delays and payment of wages, non-payment and indexing of income and compensation for loss of wages due to violation of the terms of payment; violation of the minimum wage; discrepancy tariff rates, salaries level established by law, sectoral agreements, unpaid bonuses, allowances for hazardous working conditions);
- numerous violations of social rights and guarantees of employees, on remuneration, a significant number of companies that suspended their activities and to which applies the procedure of liquidation, bankruptcy or reorganization;
- low level of wages in certain sectors of the economy;
- violation of social and labor rights of

employees.

Comparative analysis of the dynamics of collective labor disputes and claims of employees shows no trend to a decrease or increase in their number, but can be seen clearly in a cyclical dynamics of disputes, the time interval which is 4 years.

Condition of political relations in Ukraine leads, firstly, to improve workers protest activity in general, who understand that at this time their actions to protect their rights can be most effective, and secondly, on the basis of political events in groups often manifested leaders associated with certain political parties and thoroughly interested in the maximum draw attention to the situation in the company, institution, or organization. Third. One of the most significant constraints that impede the transformation of conflict in collective labor dispute is the absence in the workplace leaders or active enough action groups that can take on the organizational issue of the collective labor dispute.

Number of collective labor disputes remains low due to a number of constraints:

- unwillingness of employees to long-term focused work in the settlement of collective labor disputes, willingness to use "big" protests;
- lack of teams of leaders who can take on the organizational issue of the collective labor dispute;
- fear of losing their jobs with limited employment;
- lack of legal culture;
- unregulated issues primarily responsible for violations of the Law of Ukraine "On the procedure for settling collective labor disputes (conflicts)" in existing legislation, lack of enforcement of decisions of conciliation.

The cases retrying at National Service to register a collective labor dispute and assist in its decision proves the fact of application performance by employees procedures for settling collective labor disputes (conflicts). It can be concluded successfully determined once a collective labor dispute, the parties in the event of disagreement are turning to new procedures for resolving collective labor dispute again.

The practice of National Service shows that most participants preferred the conciliation commission. At present, the most urgent is the requirement of employees

to payment of unpaid wages, and the company for which registered collective labor disputes usually are in poor financial condition. Therefore gratuitousness procedures of conciliation commission works as a determining factor. It is also important that the decision of the conciliation committee in accordance with the requirements of the law, is binding. Furthermore, it is this procedure that allows the conflict to the negotiating table, to find compromises to reach agreement on the requirements of employees, negotiate joint implementation of measures that can satisfy both sides.

Long-term resolution of the dispute in alcohol production (Poltava region) is due on the one hand the presence of excess capacity in the country for the production of ethanol, delay in creating the conditions for the production of alternative products, on the other hand the resistance of local government employees and attempts to eliminate this company, which is the economic basis for the existence of the small city. Additional reasons were neglect or failure to respond to the demands of the employer's employees.

Poor knowledge of the Laws of Ukraine is in the field of conflict and labor. It should be noted that employees, unions and other bodies are authorized to represent them, do not make full use of the laws of Ukraine for collective rights in the field of labor relations. Terms ignorance participants and sometimes indifferent employees or union leaders restrain them from entering into collective labor disputes and conflicts.

An Application of the Kalman Filter for Market Studies

Buşu Mihail

The Bucharest Academy of Economic Studies, Faculty of Management

mihail.busu@man.ase.ro

Cioacă Sorin

The Bucharest Academy of Economic Studies, Faculty of Finance and Banks

cioaca_sorin@yahoo.com

Abstract

One method of isolating the useful signal from the noise is by using a soft-processor Kalman filter. There are many applications of how one could use a Kalman filter: using navigation systems, such as satellite or radio, and sonar tracking systems. The guidance systems in military applications is another use of Kalman filter. In the recent years, they form the basis of GPS, which is used for car guidance.

Key words: filter; kalman; signal; system; application

J.E.L. Classification: C02, C61, G11

1. Introduction

The mathematical theory on which Kalman filter is based could be shortly described as follows.

Let $Y_n = 1, 2, \dots$ observed data, $q \times 1$ vectors.

The sequence (Y_n) is assumed to have the structure

$$Y_n = S_n + \eta_n = C_n X_n + \eta_n,$$

where (S_n) is the information carrier signal, while (η_n) is the perturbing noise signal. More precisely, we accept a dynamic representation

$$S_n = C_n X_n, n = 1, 2, \dots$$

whose elements are given below.

Continuing, we start from a model of observed data

$$(1.1) Y_n = C_n X_n + \eta_n$$

The observing data equation (1.1) is connecting the $q \times 1$ vector of Y_n observations with the $d \times 1$ X_n vector. Here C_n is a $q \times d$ matrix, while η_n is a $q \times 1$ vector

of uncorrelated vector with $E[\eta_n]$ and $\text{Var} \eta_n = H_n$.

The states vector X_n is not directly observable, but it is assumed to follow a Markov process of order 1, i.e.

$$(1.2) X_n = A_n X_{n-1} + \varepsilon_n, n = 1, 2, \dots$$

Equation (1.2) is describing the states behaviour. Here A_n is a $d \times d$ matrix and ε_n is a $d \times 1$ error vector, uncorrelated with $E[\varepsilon_n] = 0$ and $\text{Var}[\varepsilon_n] = Q_n$.

The initial vector X_0 is assumed to have

$$(1.3) E[X_0] = a_0 \text{ and } \text{Var}[X_0] = P_0$$

and the errors are assumed to be uncorrelated two by two, i.e.

$$(1.4) E[\varepsilon_t \eta_s] = 0 \text{ for all } s, t = 1, 2, \dots$$

and

$$(1.5) E[\varepsilon_t X_0] = 0 \text{ and } E[\eta_t X_0] = 0 \text{ for all } t = 1, 2, \dots$$

The matrices A_n, H_n, Q_n, C_n are assumed to be not random. The statements (1.1) and (1.2) show that X_n could be written as a linear combination of ε_s and η_s for $s \leq n-1$ and X_0 for any n .

2. The general case of the Kalman filter

Kalman filter is a recursive estimator from the linear estimators class of least squares.

The matrices A_n, H_n, Q_n, C_n are assumed to be known for any n .

Let Ω_n be the sequence which contains all of the observations made until moment n inclusively.

Let $a_{n|n}$ be the optimal linear estimator of X_n based on observations of Ω_n . The $d \times d$ matrix of mean squared errors (EPM) of $a_{n|n}$ is

$$(1.6) P_{n|n} = E[(X_n - a_{n|n})(X_n - a_{n|n})']$$

Given $a_{n-1|n-1}$ and $P_{n-1|n-1}$, estimators $a_{n|n-1}$ and $P_{n|n-1}$ of X_n and $P_{n|n}$ based on information

of Ω_{n-1} could be computed using the prediction equations

$$(1.7) \quad a_{n|n-1} = A_n a_{n-1|n-1} + \varepsilon_n, \text{ for } n = 1, 2, \dots$$

and

$$\begin{aligned} P_{n|n-1} &= E[(X_n - a_{n|n-1})(X_n - a_{n|n-1})'] \\ &= E[(A_n X_{n-1} + \varepsilon_n - A_n a_{n-1|n-1})(A_n X_{n-1} + \varepsilon_n - A_n a_{n-1|n-1})'] \\ &= E[(A_n(X_{n-1} - a_{n-1|n-1}) + \varepsilon_n)(A_n(X_{n-1} - a_{n-1|n-1}) + \varepsilon_n)'] \\ &= A_n E[(X_{n-1} - a_{n-1|n-1})(X_{n-1} - a_{n-1|n-1})'] A_n' + E[\varepsilon_n \varepsilon_n'] \end{aligned}$$

i.e.

$$(1.8) \quad P_{n|n-1} = A_n P_{n-1|n-1} A_n' + Q_n, \text{ for } n = 1, 2, \dots,$$

The mean of crossed terms of the product are zero, by (1.4) and (1.5).

Since X_{n-1} is a linear combination of ε_s and η_s , $s \leq n-1$, and X_0 , this size is also uncorrelated with η_n .

The equations (1.1) and (1.7) are providing a prediction for Y_n , i.e.,

$$(1.9) \quad Y_{n-1} = C_n a_{n|n-1}$$

The prediction error is

$$(1.10) \quad V_{n-1} = Y_n - Y_{n|n-1} = C_n(X_n - a_{n|n-1}) + \eta_n$$

with EMP

$$\begin{aligned} F_{n|n-1} &= E[V_{n|n-1} V_{n|n-1}'] \\ &= E[(C_n(X_n - a_{n|n-1}) + \eta_n)(C_n(X_n - a_{n|n-1}) + \eta_n)'] \\ &= C_n E[(X_n - a_{n|n-1})(X_n - a_{n|n-1})'] C_n' + E[\eta_n \eta_n'] \end{aligned}$$

from which we get:

$$(1.11) \quad F_{n|n-1} = C_n P_{n|n-1} C_n' + H_n$$

The mean of cross terms of the product are zero by (1.4) and (1.5).

Updating equations tell us how to update the estimator of the X_n matrix and corresponding EMP matrix, as soon as a new observation upon Y_n become available. They are

$$(1.12) \quad a_{n|n} = a_{n|n-1} + P_{n|n-1} C_n' F_{n|n-1}^{-1} (Y_n - C_n a_{n|n-1})$$

$$= a_{n|n-1} + K_n V_{n|n-1}$$

$$(1.13) \quad P_{n|n} = E[(X_n - a_{n|n})(X_n - a_{n|n})'] =$$

$$= P_{n|n-1} - P_{n|n-1} C_n' F_{n|n-1}^{-1} C_n P_{n|n-1}$$

$$= P_{n|n-1} - K_n C_n P_{n|n-1}, \quad n=1, 2, \dots,$$

where $K_n = P_{n|n-1} C_n' (C_n P_{n|n-1} C_n' + H_n)^{-1}$ is called Kalman gain.

The equation (1.12) shows us that, the higher the predicted estimator is the more adjusted the estimated state will be.

The equations (1.7), (1.8), (1.12) and (1.13) are constituting the Kalman filter. Given X_0 and P_0 , the Kalman filter provides the optimal linear estimator of the state as new observations become available.

3. The gaussian case

Now, let's consider the linear system again

$$(1.14) \quad X_n = A_n X_{n-1} + \varepsilon_n$$

$$Y_n = C_n X_n + \eta_n, \quad n \geq 1$$

where $X_n \in \mathbb{R}^d$, $\varepsilon_n \in \mathbb{R}^p$, η_n , $Y_n \in \mathbb{R}^q$ are random variables and A_n and C_n are deterministic matrices of $d \times d$ and $q \times d$ matrices, respectively.

We will now assume that the vectors (ε_n, η_n) , $n \geq 1$, are independent and have the same multidimensional Gaussian repartition with mean 0 and covariance matrix equal to the unit matrix and X_0 has a Gaussian repartition with mean x_0 and covariance matrix P_0 . Finally, we assume that the A_n matrices, $n \geq 1$, are non-singular.

For any $n \geq 1$, let F_n σ -algebra generated by Y_1, \dots, Y_n and

$$(1.15) \quad \bar{X}_n = E[X_n | F_n]$$

$$(1.16) \quad P_n = E((X_n - \bar{X}_n)(X_n - \bar{X}_n)') | F_n$$

where ' ' means the transpose. When F_n is known, \bar{X}_n is the best (in the sense of mean square) estimator of X_n (based on observed data until moment n) and P_n is the conditional covariance matrix of the errors.

Let's denote \mathbf{P} (respectively P_0) the set of symmetric matrices non negatively defined (respectively positively defined) of $d \times d$ dimension. For any $P \in \mathbf{P}$ and $n \geq 1$ we define

$$\Phi_n(P) = (A_n P A_n' + I)(I + R_n + R_n A_n P A_n')^{-1}$$

where $R_n = C_n' C_n$ and I is the unit matrix of order d . Then $\Phi_n(P) \in \mathbf{P}$ and Φ_n takes P_0 into itself. The recursive equations of Kalman could be written as

$$(1.18) \quad P_n = \Phi_n(P_{n-1})$$

$$(1.19) \quad \bar{X}_n = (A_n -$$

$$P_n A_n R_n) \bar{X}_{n-1} + P_n C_n' Y_n$$

The fundamental result shown in the following is that the applications Φ_n , $n \geq 1$, are contractions in P_0 , if we endow P_0 with the Riemann metric δ which is invariant to

conjugacy. More over, the fact that those contractions are strict and/ or uniform , depends on the observability and controlbility properties of the system (1.14).

These results are demonstrated in their natural context, considering the symplectic group of matrices which are invariant to P_0 . In this context, they could be seen as a generalisation of the Perron-Frobenius theorem.

The present study, made by Bougerol (1993), is elementary, in some sense.

Some of the utilized ideas are existing already for the symplectic matrices (see, as an example, Shayman (1986)). The semigroup H was already induced in a different context by Wojtkowsky (1985). Note, finally, that the contractibility property of Ricatti transformation is a generalisation of the nonnegative matrices under Hibert metric (see Birkhoff (1957)).

4. The semogroup of the hamiltonian matrices

We associate to the (1.14) system, the matrix M_n of order $2d$, defined by its block form:

$$M_n = \begin{pmatrix} A_n & A_n'^{-1} \\ R_n A_n & (I + R_n) A_n'^{-1} \end{pmatrix}, n \geq 1.$$

The M_n matrices are part of the simplectic group $Sp(d,R)$ which is defined by the set of the whole matrices M of $2d$ order such that $MJM = J$, where

$$J = \begin{pmatrix} 0 & I \\ -I & 0 \end{pmatrix},$$

and I is the unit matrix of order d . Since $M^{-1} = JMJ$, we could see that $M \in Sp(d,R)$.

We write

$$M = \begin{pmatrix} A & B \\ C & D \end{pmatrix},$$

where A, B, C, D are matrices of order d , results that BA' and $A'C$ are symmetric and $AD - CB = I$.

The set H of Hamiltonian matrices could be defined as

$$H = \left\{ \begin{pmatrix} A & B \\ C & D \end{pmatrix} \in Sp(d, R) \mid A \text{ este invertible, } BA' \text{ and } A'C \in \mathcal{P} \right\}$$

Let's define three subsets H_1, H_2 and H_0 of H as follows:

$$H_1 = \left\{ \begin{pmatrix} A & B \\ C & D \end{pmatrix} \mid BA'' \in \mathcal{P}, A''''C \in \mathcal{P}_0 \right\}$$

$$H_2 = \left\{ \begin{pmatrix} A & B \\ C & D \end{pmatrix} \mid BA' \in \mathcal{P}_0, A'''C \in \mathcal{P} \right\}$$

$$H_0 = H_1 \cap H_2.$$

Observe that H_2 is the dual of H_1 (in the sense that $M \in H_1$ if and only if $M' \in H_2$).

We will use the following well-known result.

Lemma 1.1. *If $P, Q \in \mathcal{P}$, then $I+PQ$ is invertible.*

We will firstly prove,

Proposition 1.2. *H is a semigroup under the operation of product of the matrices, and H_1, H_2 and H_0 are bilateral ideals of H .*

Proof. Let $M_1, M_2 \in H$ and $M_3 = M_2 M_1$.

For $i=1,2,3$ we write

$$M_i = \begin{pmatrix} A_i & B_i \\ C_i & D_i \end{pmatrix}$$

and note $Q_1 = C_1 A_1^{-1}$, $P_2 = A_2^{-1} B_2$. Since $M_1 \in H$, matrix $C_1 A_1 \in \mathcal{P}$ and since

$Q_1 = A_1^{-1} (C_1 A_1) A_1^{-1}$ results that $Q_1 \in \mathcal{P}$. In a similar way, $P_2 \in \mathcal{P}$. Then we have $A_3 = A_2 A_1 + B_2 C_1 = A_2 (I + A_2^{-1} B_2 C_1 A_1^{-1}) A_1 = A_2 (I + P_2 Q_1) A_1$.

From Lemma 1.1 results that A_3 is invertible. In the following we will use the statement

$$A_2 D_2 = C_2 B_2 + I = C_2 A_2 P_2 + I = A_2 C_2 P_2 + I.$$

Since $C_3 = C_2 A_1 + D_2 C_1$, we have

$$\begin{aligned} (1.20) \quad A_3 C_3 &= A_1 (I + Q_1 P_2) A_2 (C_2 A_1 + D_2 C_1) = \\ &= A_1 (I + Q_1 P_2) (A_2 C_2 A_1 + A_2 C_2 P_2 C_1 + C_1) = \\ &= A_1 (I + Q_1 P_2) A_2 C_2 (A_1 + P_2 C_1) + A_1 C_1 + C_1 P_2 C_1 = \\ &= A_1 (I + Q_1 P_2) A_2 C_2 (I + P_2 Q_1) A_1 + A_1 C_1 + C_1 P_2 C_1. \end{aligned}$$

This representation of $A_3 C_3$ shows that $A_3 C_3$ is in \mathcal{P} . In a similar way (or by using the transpose), we get the fact that $A_3 B_3 \in \mathcal{P}$.

Therefore, $M_3 \in H$, so H is a semigroup. Moreover, if $A_2 C_2$ or $A_1 C_1$ is invertible, then (1.20) shows that $A_3 C_3$ is positively defined. So H_2 is a bilateral ideal of H . Similarly, H_1 is an bilateral ideal of H and so $H_0 = H_1 \cap H_2$ is.

The following result is useful in association with the fact that the system (1.14) is observable and controllable with the fact that the associated Hamiltonian matrices are in H_1 or H_2 .

Proposition 1.3. *Let*

$$M_n = \begin{pmatrix} A_n & B_n \\ C_n & D_n \end{pmatrix}, n \geq 1,$$

A matrix in H . Then $M_n M_{n-1} \dots M_1 \in H_1$ if and only if

$$\det (A_1 C_1 + A_1 A_2 C_2 A_1 + \dots + A_1 \dots A_n C_n A_{n-1} \dots A_1) \neq 0$$

and $M_n M_{n-1} \dots M_1 \in H_2$ if and only if

$$\det (B_n A_n + A_n B_{n-1} A_{n-1} A_n + \dots + A_n \dots A_2 B_1 A_1 \dots A_n) \neq 0.$$

Proof. For any

$$M = \begin{pmatrix} A & B \\ C & D \end{pmatrix} \in H$$

let $\xi(M) = A \cdot C$ and $\alpha(M) = A$. We will firstly prove that if $M_1 M_2 \in H$, then

$$(1.21) \quad \xi (M_2 M_1)x = 0, x \in \mathbb{R}^d,$$

if and only if

$$(1.22) \quad \xi(M_1)x = \xi (M_2)A_1x = 0, x \in \mathbb{R}^d.$$

We will firstly use the following properties:

- (i) if $P, Q \in P$ and $(P+Q)x = 0$, then $Px = Qx = 0$;
- (ii) if $P \in P$ and $M \cdot P M x = 0$ for any arbitrarily matrix M , then $P M x = 0$.

We know from (1.20) that if $Q_1 = C_1 A_1^{-1}$ and $P_2 = A_2^{-1} B_2$, then

$$(1.23) \quad \xi(M_2 M_1) = A_1 (I + Q_1 P_2) A_2 C_2 (I + P_2 Q_1) A_1 + A_1 C_1 + C_1 P_2 C_1.$$

The right side is a sum of non negative symmetrical matrices. Therefore, if (1.21) holds, then $A_1 C_1 x = 0$ and $A_2 C_2 (I + P_2 Q_1) A_1 x = 0$. That implies $C_1 x = 0$ (since A_1 is invertible) and $A_2 C_2 A_1 x = 0$ (since $Q_1 A_1 x = C_1 x = 0$). The reciprocal results immediately from (1.23). Now, from the equivalence between (1.21) and (1.22) we conclude the following:

$$\begin{aligned} &\xi(M_n \dots M_1)x = 0 \\ &\Leftrightarrow \xi(M_1)x = 0 \ \& \ \xi(M_n \dots M_2)\alpha(M_1)x = 0 \\ &\Leftrightarrow \dots \end{aligned}$$

$$\Leftrightarrow \xi(M_1)x = 0 \ \& \ \xi(M_2)\alpha(M_1)x = 0 \ \& \ \dots \ \& \ \xi(M_n)\alpha(M_{n-1}) \dots \alpha(M_1)x = 0.$$

Since the matrices $\xi(M_i)$, $1 \leq i \leq n$, are nonnegative and $\alpha(M_i)$, $1 \leq i \leq n$, are invertible, the before statements are equivalent to

$$[\xi(M_1) + \alpha(M_1)\xi(M_2)\alpha(M_1) + \dots + \alpha(M_1) \dots \alpha(M_{n-1}) \xi(M_n)\alpha(M_{n-1}) \dots \alpha(M_1)]x = 0.$$

This proves the first statement. The second one is obtained by duality.

5. The contraction property

For any matrix

$$M \in \begin{pmatrix} A & B \\ C & D \end{pmatrix} \in H$$

we define an application $\Phi_M: P_0 \rightarrow P_0$ by

$$(1.24) \quad \Phi_M(T) = (AT + B)(CT + D)^{-1}, T \in P_0.$$

The fact that the right side member P is an well-defined element of P_0 will result from Proposition 5, which follows.

A direct computation shows that

$$(1.25) \quad \Phi_{MN} = \Phi_M \circ \Phi_N, M, N \in H.$$

Let's note that (1.17) could be written as $\Phi_n(P) = (A_n P + A_n^{-1})(R_n A_n P + (I + R_n)A_n)^{-1}$,

which shows us the fact that $\Phi_n = \Phi_{M_n}$.

Therefore, by (1.18), we have

$$(1.26) \quad P_n = \Phi_{M_{n-1}}(P_{n-1}).$$

This equation is so called the discrete Ricatti equation. The classic Ricatti equation is similar. In the regularity and bounding hypothesis, if P_t , $t \in \mathbb{R}_+$, of the matrix differential equation

$$dP_t/dt = A_t P_t + P_t A_t - P_t R_t P_t + S_t, P_0 \in P_0,$$

where $R_t, S_t \in P$, $t \geq 0$, then there exists a family $N_t \in H$, $t \geq 0$, such that $P_t = \Phi_{N_t}(P_0)$ (see Herman (1979)).

Definition 1.4. The Riemann distance δ in P_0 is defined by

$$\delta(P, Q) = \left(\sum_{i=1}^d \log^2 \lambda_i \right)^{1/2}, P, Q \in P_0$$

where $\lambda_1, \dots, \lambda_n$ are eigenvalues of PQ^{-1} .

Mass (1971) proves that δ is the Riemann distance in P_0 when this set is considered as a metric Riemann space. Particularly, (P_0, δ) is complete and is the usual induced topology. Home ownership is the distance δ to the conjugation and reversal invariance: for any invertible matrix A and any $P, Q \in P_0$ we have

$$\delta(APA', AQA') = \delta(P, Q) = \delta(P^{-1}, Q^{-1}).$$

We will prove that Φ_M is a contraction in (P_0, δ) for any $M \in H$.

Proposition 1.5. Let

$$M = \begin{pmatrix} A & B \\ C & D \end{pmatrix} \in H.$$

Then

(i) For any $T \in P$ (respectively P_0), $CT + D$ is invertible and

$$(AT + B)(CT + D)^{-1} \in P$$

(respectively P_0);

(ii) if $M \in H_2$, then $(AT + B)(CT + D)^{-1} \in P_0$ for any $T \in P$.

Proof. Let $T \in P$. The matrices $P = A^{-1}B$, $Q = CA^{-1}$ and $S = A(T+P)A'$ belong to P . Since

$$CT + D = QAT + QAP + A^{-1} = (QS + I)A^{-1},$$

By Lemma 1.1 results that $CT + D$ is invertible.

Now, the relation

$$(AT + B)(CT + D)^{-1} = (AT+AP)A'(QS + I)^{-1} = S(QS + I)^{-1}$$

Gives us the end of the proof.

In the following we will use the euclidean norm in R^d and the operator norm induced in the set of matrices: if M is a matrix of order d , then

$$\|M\| = \sup \{ \|Mx\| : x \in R^d, \|x\|=1 \}$$

Proposition 1.6. Let $T, S \in P_0$ and $\alpha = \max \{ \|T\|, \|S\| \}$.

For any $P \in P$ we have

$$\delta(T + P, S + P) \leq \frac{\alpha}{\alpha + \beta} \delta(T, S)$$

where $\beta = \inf \{ \langle Px, x \rangle : \|x\|=1 \}$.

Proof. The mean theorem implies

$$(1.27) \quad \log \frac{a+r}{b+r} < \frac{m}{m+r} \log^+ \frac{a}{b}$$

(where $\log^+ x = \max(\log x, 0)$) for $0 < a, b \leq m$ și $r > 0$. It is known (Gantmacher (1959, Cap.10, §7)) that the eigenvalues of TS^{-1} are real, positive and have the following minimax representation. Let

$$\lambda_1(T, S) \leq \lambda_2(T, S) \leq \dots \leq \lambda_d(T, S)$$

The eigenvalues of TS^{-1} written in decreasing order; then

$$\lambda_k(T, S) = \min \{ \max \{ \frac{\langle Tx, x \rangle}{\langle Sx, x \rangle} : x \in V \} : V \in \Gamma_k \},$$

where Γ_k is the set of k -dimensional linear subspaces of R^d , $1 \leq k \leq d$. We will prove that

$$|\log \lambda_k(T + P, S + P)| \leq \frac{\alpha}{\alpha + \beta} |\log \lambda_k(T, S)|,$$

$1 \leq k \leq d$.

Let's firstly assume that $\lambda_k(T + P, S + P) > 1$. Inequality (1.27) implies that

$$\log \frac{\langle Tx, x \rangle + \langle Px, x \rangle}{\langle Sx, x \rangle + \langle Px, x \rangle} \leq \frac{\alpha}{\alpha + \beta} \log^+ \frac{\langle Tx, x \rangle}{\langle Sx, x \rangle}.$$

Then,

$$|\log \lambda_k(T + P, S + P)| = \log \lambda_k(T + P, S + P) = \log \min \{ \max \{ \frac{\langle (T+P)x, x \rangle}{\langle (S+P)x, x \rangle} : x \in V \} : V \in \Gamma_k \} = \min \{ \max \{ \log \frac{\langle Tx, x \rangle + \langle Px, x \rangle}{\langle Sx, x \rangle + \langle Px, x \rangle} : x \in V \} : V \in \Gamma_k \} \leq$$

$$\leq \frac{\alpha}{\alpha + \beta} \min \{ \max \{ \log^+ \frac{\langle Tx, x \rangle}{\langle Sx, x \rangle} : x \in V \} : V \in \Gamma_k \} \leq$$

$$\frac{\alpha}{\alpha + \beta} \log^+ \lambda_k(T, S).$$

Since the left hand-side is positive, we firstly have

$$\log^+ \lambda_k(T, S) = |\log \lambda_k(T, S)|$$

and then (1.28) holds. When $\lambda_k(T + P, S + P) = 1$, inequality (1.28) is obvious. Finally, if $\lambda_k(T + P, S + P) < 1$, then we use the relation:

$$\lambda_k(T + P, S + P) = \frac{1}{\lambda_{d-k+1}(S + P, T + P)}$$

And apply (1.28) to the eigenvalue $\lambda_{d-k+1}(S + P, T + P)$.

It is obvious that (1.28) immediately implies the stated result.

Theorem 1.7. We have the following properties:

(i) For any $M \in H$ and $T, S \in P_0$,

$$\delta(\Phi_M(T), \Phi_M(S)) \leq \delta(T, S).$$

(ii) For any $M \in H_1$ (or $M \in H_2$) and $T, S \in P_0$,

$$\delta(\Phi_M(T), \Phi_M(S)) < \delta(T, S).$$

(iii) For any $M \in H_0$ there exists $0 < \rho(M) < 1$ such that, for any $T, S \in P_0$,

$$\delta(\Phi_M(T), \Phi_M(S)) \leq \rho(M) \delta(T, S).$$

Proof. Let $M \in H$. Then we have $P, Q \in P$, where $P = A^{-1}B, Q = CA^{-1}$ and

$$\begin{pmatrix} I & 0 \\ Q & I \end{pmatrix} \begin{pmatrix} A & 0 \\ 0 & A^{-1} \end{pmatrix} \begin{pmatrix} I & P \\ 0 & I \end{pmatrix} =$$

Let's consider

$$\tau_P(T) = T + P, \tau_Q(T) = T + Q,$$

$$\gamma_A(T) = ATA', \sigma(T) = T^{-1}$$

defined on P_0 . From (1.25) we get

$$(1.28) \quad \Phi_M(T) = (\sigma \circ \tau_Q$$

$$\circ \sigma \circ \gamma_A \circ \tau_P)(T).$$

We already noted that γ_A and σ are isometric in (P_0, δ) . From Proposition 1.6 results that τ_P and τ_Q are contractions.

This fact, together with (1.29) proves (i).

If $M \in H_1$, then Q is invertible, from which results that τ_Q is a strict contraction (by Proposition 6). Similarly, if $M \in H_2$, then P is invertible and τ_P is a strict contraction. In both cases, (ii) results from (1.29) as well.

Now, let's prove (iii). Let $M \in H_0$. Then P and Q also are invertible. Moreover, $\tau_P(T) \geq P$ for any $T \in P_0$, in the sense that $\tau_P(T) - P \in P$, from where

$$(\gamma_A \circ \tau_P)(T) \geq APA'$$
 and so

$$(\sigma \circ \gamma_A \circ \tau_P)(T) \leq (APA')^{-1}.$$

Let $a = \|(APA')^{-1}\|$ and $\varepsilon = \inf \{ \langle Qx, x \rangle : \|x\| = 1 \}$.

From Proposition 1.6 results that for any $T_1, T_2 \in P_0$ we have

$$\delta(\tau_Q[(\sigma \circ \gamma_A \circ \tau_P)(T_1)], \tau_Q[(\sigma \circ \gamma_A \circ \tau_P)(T_2)]) \leq$$

$$\leq \frac{a}{a+\varepsilon} \delta((\sigma \circ \gamma_A \circ \tau_P)(T_1),$$

$$(\sigma \circ \gamma_A \circ \tau_P)(T_2)) \leq \frac{a}{a+\varepsilon} \delta(T_1, T_2).$$

Since σ is an isometry, this inequality together with (1.28) implies (iii) with $\rho(M) = \frac{a}{a+\varepsilon}$.

6. Conclusion

As an application to the contraction property, we will give an immediate proof of a classic result of R.E. Kalman. Let's assume that the system with constant coefficients

$$X_n = AX_{n-1} + \varepsilon_n, Y_n = CX_n + \eta_n, n \geq 1,$$

is controllable and observable. The controllability for the general system (1.1), (1.2) comes to

$\det(I + A_n A_n' + \dots + A_n \dots A_2 A_2' \dots A_1) \neq 0, n \geq 1$, and the observability to $\det(A_1' R_1 A_1 + A_1' A_2' R_2 A_2 A_1 + \dots + A_1' \dots A_n' R_n A_n \dots A_1) \neq 0, n \geq 1$, where $R_n = C_n' C_n, n \geq 1$.

Let M be the Hamiltonian matrix:

$$M = \begin{pmatrix} A & A^{-1} \\ RA & (I + R)A^{-1} \end{pmatrix}$$

From the proposition 3 results that there exists an integer $p > 0$ such that $M^p \in H_0$.

Thus, Theorem 1.7 gives us the fact that there exists a power of Φ_M which is a uniform contraction. From the fixed point theorem, there exists a matrix $P \in P_0$ to which all the solutions P_n of the equation (1.18) converges when $P_0 \in P_0$.

The Risk- an Element that Influences the Success of an Entrepreneur

Călin-Costin Georgiana-Delia
Valahia University of Targoviste
delia.costin@yahoo.co.uk

Abstract

The main objectives of this paper are: to highlight the important role of the entrepreneurial risk and, also, to determine the particularities of the business creators and of the risks that the entrepreneurial activity it involves.

The base of this research was the specialized literature that offers a wide and varied range of theoretical issues related to the innovative and pragmatic field of entrepreneurship.

In the business world, the route from the identification of an opportunity to the optimal exploitation of it isn't without risks whereon the entrepreneur assumes in order to succeed.

The result of this research is represented by the idea that although the entrepreneurship presents some risks, the consideration of a certain degree of controlled risk may produce positive effects, and also were identified the main issues regarding the entrepreneurs and their risks.

Key words: entrepreneurship, entrepreneur, business, risk, progress.

J.E.L. classification.: M13, L26

1. Introduction

The study of risk and of its implications on entrepreneurship represents a topic of great interest not only for entrepreneurs (persons that are permanently under the influence of a certain degree of risk), but also for the specialists who performed various researches in order to find out as much information as possible regarding this phenomenon and its effects for the business creators.

The entrepreneur is often exposed, in a lesser or greater extent, at certain types of risks that arise from the exercise of his

profession and from his actions and, that may cause, equally, moral and material effects on different intervals of time.

Every entrepreneur assumes a certain degree of risk when he/ she starts a new firm, but the mode of reaction of each of them at the identification and the management of the entrepreneurial risk is influenced by the particularities of personality of each creator of firm.

The identification of the main issues regarding the creators of business and their risks contributes to the creation of a clearer image of the risky situations that the entrepreneurs have to face.

2. The Risk - an Element that Influences the Success of an Entrepreneur

2.1. The entrepreneur- a person with impact on the progress

The entrepreneurs have captured the attention of the specialists through their considerable potential and through the way in which they manage to exploit their qualities in order to fulfill a great professional ideal, namely the dream of being the creator of a business and to contribute to its development, and, thus they have an important word to say on their personal evolution, but also, on the progress of the society and of the humanity.

The creators of enterprises are persons ambitious and capable of great achievements, people who can influence not only their personal and professional development, but also they may have an important impact on the economic development of the region in which they operate, and through the innovations that they achieve, the entrepreneurs can influence the progress of the mankind.

Also, about the entrepreneurs it can be mentioned that are people who believing in

their ideal and in their own forces, they mobilize all their skills (traits such as: creativity, courage, high intellectual capacity and, not least, high degree of seriousness) and they work hard to succeed.

The entrepreneurs may also present a negative trait, so in order to accomplish their strong desire for success and profit, they may neglect what is truly important in life: the attention for the family members, for friends and even for the own person.

Regarding the essentials characteristics of the creators of businesses, Marius Ghenea [1] believes that “an essential quality of an entrepreneur is the right attitude”, and certain specialists [2] consider that “another defining trait for the entrepreneur is the finalization of the efforts and his involvement in starting a business.” It can be said that another characteristic of the creators of enterprises is represented by the fact that “an entrepreneur confronts with new changes, with innovations, so the assumption of the risk becomes a necessity.” [3]

The strong degree of motivation that underlies any profile of a successful entrepreneur makes this character to take some risks, and among the reasons that determine the creator of business to risk there are: the desire of affirmation, the desire for gain, the desire for high income, the desideratum to demonstrate his capacity and that he can achieve success, the desire to bring certain benefits not only for himself or for his family, but also for society, the desire to create his own job, the desire to create jobs for others, the desire for achieve prestige, and others. Regarding the motive for choosing the entrepreneurial career, some authors [4] claim that “the motivation for actions of the entrepreneurs lies in their dissatisfactions.” Also, about the motivations of the entrepreneurs, Delia Popescu [5] mentions that “it can distinguish several determinants of the entrepreneurial behaviour: the sociocultural environment, the family background, the experience or the professional environment and the system of education.”

The multitude of risks that an entrepreneur may face make that the choice of the entrepreneurial profession to be a possible option only for the persons with a high degree of motivation. The idea that the risk can impede the start of a business is also

supported by some specialists [6] who affirm that “for many people, the dream of become boss and of earn enough money is sufficient to stimulate them in becoming entrepreneurs. But the lack of capital, the characteristic risk of any business can inhibit many people.”

Irrespective of the qualities that they possess, of the motivations and of the assumed risks, it can be said that “the entrepreneurs contribute, through their actions, to the modification of rate, form and location of the economic development. So, the abundance and the quality of the available entrepreneurs are important causes of the growth and of the development.” [7]

2.2. The risk- an important determinant of the modern economies

The risk manifests itself in a variety of types, in all fields of activity, but especially in the field of entrepreneurship where is given a real interior and exterior fight for achieving success, where both the satisfactions or the success and the failure are more strongly visible.

Regarding the consequences that the risk or the materialization of an uncertain event can produce, it can be mentioned that those effects can concretize either in satisfactions, in favorable results or, on the contrary, in results below expectations.

The moral and material implications of the risks that the entrepreneurs endure in order to obtain various personally and professionally achievements are issues that can produce effects either for a small or larger period of time and some of them can generate results for all the lifetime of the creator of business.

The identification of the entrepreneur’s risks and of its effects and possibilities of reduction and even of elimination of their occurrence are important objectives for scientists who realized in their studies different analyses of risk and of its implications for the business creators and for the progress of the society.

The large number of risks that the different actual activities involve, was also noted by authors as D. Popescu [8] who claims the fact that “the manifestation, in the current period, of the trends of risks’ increase led to the shaping of the so-called “risk management” that aims to reduce the degree

of risk afferent of the various activities. It is based on the thorough evaluation of the phenomena and processes, and on the strategic management of all resources of the enterprise.”

From the moment that decides to start a business, the creator of an enterprise can be confronted with several forms of risks that can have a significant influence not only on aspects such as: his financial resources, his welfare, his social image, but also on his health and on his relation with family and friends. Regarding the types of risks of the entrepreneurs, authors such as D. Popescu [9] mentions that ”any entrepreneur, regardless of the degree of motivation, has to face the following risks:

- a) the risk of the business- a significant proportion of all enterprises fail within the first five years, primarily due to the poor managerial training;
- b) the financial risk- the entrepreneur invests all or almost all of his financial resources in business;
- c) the career’s risk- leaving a secure job, for an uncertain future;
- d) the family and social risk- a business supposes little free time for family and friends;
- e) the psychological risk- the risk of personal failure if the business fails.”

Also, about risk, authors as Tanțău [10] claims that ”in businesses, the risk presents consequences that influence the course of an action. These consequences depend on the probability of apparition of a certain event that may cause certain losses.”

An entrepreneur may achieve success when assumes some risks taking account of his personal moral and material capacities.

Usually, the risks are seen as determinants of unwanted events, but they also can generate favorable effects and it can be said that they are necessary in entrepreneurship because the fact that the calculated risks can produce a positive impact on the results of the business and on the expectations of the creator of business. The idea that the risks can be beneficial it also appears in the work of Tanțău [11] who claims that ”in certain business, a great part of the revenues arises precisely due to the assumption of certain risks. Therefore, the most risks should not be seen by their negative impact. So, the risks should be limited, and the entrepreneurs

should configure a clear system of risk management, but who also enable, at the same time, the obtain of incomes. For achieve these two objectives, the risk must be measurable and estimated.”

Although ”in general, the entrepreneur is willing to assume certain medium risks, and the management of the risk in the small/ medium enterprises mostly has an intuitive character” [12], in order to prevent, to reduce and even to eliminate the eventual occurrence of the unfavorable and uncertain events it is important for an entrepreneur to know and to apply in his enterprise the management of risk. Regarding the risk management, specialists such as D. Popescu [13] mentions that it ”is a cyclical process, with several distinct phases, which takes into account both the permanent evaluation of the risk, but also a conduct of control of it. The phases of the cycle are: the identification of the risk, the analysis of the risk and the reaction at risk”, and in the opinion of author Tanțău [14] ”the management of risk is at the same time a set of tools and techniques, but also a necessary process to implement the strategies of development of an enterprise. The management of risk also includes all those processes of management and of conception of the organizational structures necessary for the efficient implementation of the techniques and of the methods of measurement and of risk control.”

3. Conclusions

As a conclusion it can be said that the entrepreneurs are persons who have significant intellectual qualities that support them in the process of transformation of their dreams and objectives in real facts.

Also, it can be concluded the fact that every entrepreneur has a certain motivation for the choice of his career and that he has his own manner to understand and to react at the occurrence of certain unfavorable events, but he can obtain a lot of achievements when he assumes calculated risks considering his moral and material capacities.

Last, but not least it can be said that every entrepreneur has his unique way to perceive the risk and react to it in function of his personality, of his degree of training and of his experience in life and in the field of entrepreneurship.

A Critical Review of Service Quality

Ciceo Andreea

Faculty of Marketing, Academy of Economic Studies Bucharest

andreea.s.ionescu@gmail.com

Abstract

The aim of this paper is to draw attention upon the importance of service quality and the evolution of the concept accross the years. In order to attain this goal, the authors will make a review of the "service quality" concept – for what does it stand and how it can be measured?, as well as the most notable managerial implications associated with service quality.

Keywords: services marketing, service quality, SERVQUAL, SERVPERF

J.E.L. Clasification: M31

ability of being intangible, perishable, heterogenous and inseparable [8][9]. A service cannot be experienced until it is purchased (intangibility), it is produced and consumed at the same time (inseparability), it cannot be stored as products can be (perishable) and it cannot be performed in the same way each time (heterogeneity).

Further in the paper, the authors will deal with the definition of the "service quality" concept and the methods used in the process of measuring it. Finally, in the end of the paper, the authors will present several managerial implications implied by the service quality.

2. Defining service quality

One of the first attempts in trying to explain what service quality stands for was made by Grönroos, in 1982 [10]. According to his theory based on previous conducted researches on the subject, service quality is defined by three major dimensions: technical quality, functional quality and image. By technical quality, Grönroos refers to what the customer actually gets – the service itself, as a result of his/her encounter with the provider of the service. Functional quality, on the other hand, relates to how the technical quality (the core service) is offered to the customer. The image is how the provider of the service appears to be in the eyes of the customer. Moreover, Grönroos sustained that the functional quality was what can make the difference between the same services offered by different providers, assuring a certain competition advantage.

Two years later, Grönroos refined his findings and managed to bring more light on the service quality matter, proposing one new concept – perceived service quality, and a model of total perceived service quality (Figure 1).

1. Introduction

In 1970s, the services marketing area started to become a subject of interest. It was the time when marketers still believed that the marketing concepts applied for products, would also work for services [1]. However, that failed to happen, leading to a vivacious and continuous search for those elements that could individualize and offer a clear view of the services' essence.

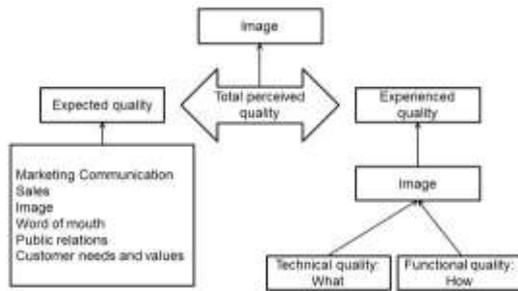

Throughout the years that came, marketers tried to find the right definition for the service concept. But their views were divergent, hardly homogenous.

However, accross the time, most of them subscribed to a definition according to which services are more likely to be "acts or performances rather than objects", intangible and not owned [2][3][4]. The definition was also completed by the very aim of services, namely that of satisfying the customer [5][6].

Still, Edvardsson considered that such a definition relied too much on the services characteristics, failing to underline the very essence of services [7].

These characteristics refer to the services'

Figure 1. Total perceived service quality

Source: Grönroos, C., *Service Management and Marketing. Customer Management in Service Competition*, 3rd edition, John Wiley & Sons Ltd., West Sussex, 2007.

In Grönroos' view, perceived service quality is the outcome of the customers' evaluation between what they expect to get and what they perceive they have been delivered. In other words, the gap between expected service and the experienced one, thus the gap between the expected quality and the experienced quality [11].

What is of vital importance in this equation is how customers' expectations are borned and by what are they influenced. Creating expectations is, to some extent, the result of the provider's marketing activities and campaigns. If the provider of a service overpromises, then their customers will set very high expectations for that service and thus, the probability that they will become dissatisfied about the way the service is delivered may increase dramatically. Therefore, it is better to promise less and deliver more, managing at the same time to surprise the customer in a pleasant manner [12].

Over the years, other models explaining the essence of the service quality concept also appeared and were developed. Contemporary with Grönroos, Lehtinen and Lehtinen proposed a similar model for understanding the meaning of service quality, a model that consists of three dimensions: physical quality (physical characteristics of the service), interactive quality (the interaction between the provider's personnel and the customers) and corporate image (provider's image) [13].

Further, Gummesson proposed a customer perceived quality model, having four dimensions: design quality, production and delivery quality, relationship quality and technical quality. Apart from these,

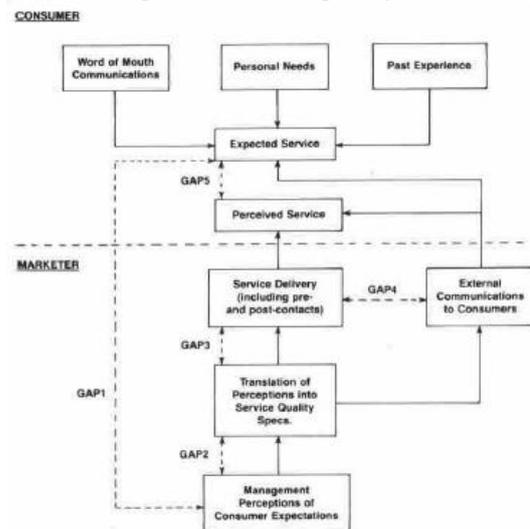

Gummesson also included the gap between experience and expectations and the influence of the provider's brand, image [14].

Moreover, in 1985, Berry, Parasuraman and Zeithaml also tried to explain what service quality was. In order to do this, they conducted several focus groups with customers and in-depth interviews with representatives from the providers' side. The areas of services taken into consideration were: retail banking, credit cards, securities brokerage and product repair and maintenance. As a result of that research, they succeeded in establishing 10 determinants of service quality, namely: reliability, responsiveness, competence, access, courtesy, communication, credibility, security, understanding and tangibles [15].

Furthermore, they even settled a service quality model (Figure 2) based on five different kinds of gaps that appear at different levels [16]:

- The gap between consumers' expectations and management perceptions over these expectations,
- The gap between the management perceptions of consumer expectations and the firms' service quality specifications,
- The gap between service quality specifications and the actual service delivery,
- The gap between the actual service delivery and the external communication about the service,
- The gap between the expected and the perceived service.

Figure2. Service quality model

Source: Berry, L., Zeithaml, V.A.,

Parasuraman, A., “Quality Counts in Services, Too”, *Business Horizons*, May-June 1985, pp. 44-52.

However, the initial reason staying at the base of this initiative has been that of developing models in order to understand the meaning behind the concept of service quality. Grönroos has never had any kind of thoughts on going beyond these explanations, into the measuring problem, as for him a study about the customers’ perception on service quality on a particular service would normally be followed by a classic customer satisfaction research. [17].

Still, the models that have appeared for the measurement of service quality are mainly based on Grönroos’ theory.

3. Measuring service quality

Measuring service quality is subject to both qualitative and quantitative methods.

Although, qualitative methods in the area of services are less common than the quantitative ones, they seem to be quite appreciated for helping the researcher to accommodate better and easily with the area of interest and better consider the dimensions involved in the process of measuring service quality. Moreover, what makes qualitative methods suitable for this area – services, is the possibility of gathering data on dynamic, experiential processes and the interactive nature of services phenomena [18].

One such qualitative method is the critical incident method. According to it, respondents are asked to recall and recount experiences with a certain service, those who deviate from normal, in particular, either in a favourable or unfavourable way. Respondents are asked to describe as detailed as possible these experiences in terms of what happened during that experiences and what made them label these experiences as being critical. Such an approach is useful in identifying the problem areas and the strengths, making the management more aware about what should they do better and what should they keep doing [19].

However, the quantitative methods seem to be more popular with researchers and thus, more used in the studies they are conducting. One of the most well-known such quantitative methods is SERVQUAL.

In 1988, after defining the 10 dimensions

of service quality and elaborating a service quality model, Parasuraman, Zeithaml and Berry took the next step. It was the first attempt of measuring service quality with the help of a dedicated instrument that they called “SERVQUAL”. The base of this instrument was residing in the qualitative research that led to the 10 dimensions of service quality. Thus, the authors generated various facets to each of the ten dimensions. Eventually, there were a total of 97 items to be evaluated, each item being put into two statements: one measuring expectations, and one measuring perceptions. Further, each statement was accompanied by a seven-point scale ranging from “Strongly Agree” to “Strongly Disagree”. Afterwards, the collections of the data was done on a sample of 200 adult respondents, spread across five different service categories. Then, after constantly refining the results, SERVQUAL was an instrument consisting of five dimensions characterized by 22 precised items. Briefly, the five dimensions were: tangibles (physical facilities, equipment, appearance of personnel), reliability (ability to perform the promised service dependably and accurately), responsiveness (willingness to help customers and provide prompt service), assurance (knowledge and courtesy of employees and their ability to inspire trust and confidence) and empathy (caring and individualized attention the firm provides to its customers) [20].

Over the years, SERVQUAL was applied in both the business-to-business and business-to-consumer segments [21], as well as for a large range of services such as public services [22], tourism [23], health care [24], education [25], Internet services [26], mobile communication [27], banking [28] and the list may continue.

However, despite its wide usage, SERVQUAL is subject to several criticisms; among these, the instrument’s strict orientation on how the service is provided [29], the lack of validity of its dimensions for certain services area [30][31], as well as the measurement of both expectations and experiences [32].

As regarding the last criticism, researchers tried to find the right way to assure an accurate measurement. According to the Liljander’s research, the results prove the fact that measuring only the experiences,

while taking into consideration appropriate attributes for measuring, reflect a quite accurate reflection of how service quality is perceived [33].

This assumption proved to be the base for an improved SERVQUAL, namely SERVPERF, an instrument developed by Cronin and Taylor. SERVPERF is an acronym for “service performance only” and, as the name suggests, this instrument only measures the experiences [34], as opposed to SERVQUAL which measures both experiences and expectations.

4. Conclusions

Service quality has a great influence over the well going of a service firm. Therefore, the manager of such a firm should pay great attention to it and the consequences it may have on his business.

Understanding what the functional and technical quality (as according to Grönroos service quality model) refer to and how these dimensions may be developed is vital, because these are the means to the customer’s satisfaction. Thus, the managers have to take care so that the expected service is equal to the perceived one. In order to assure this, it is of primary importance to understand how the service quality is perceived by customers and, at the same time, to stay truthful in the relationship with the customer, making him only promises that can be kept.

Measuring service quality is an additional assurance and an indicator of how well the provider acts in this area, as well as a tool for enhancing his performance and motivating him with the progress of his work.

To summarize, a service provider should constantly improve his interactions with the customers. Otherwise, customer will leave, opting for a provider that knows how to deal with them, enhancing his reputation and image and the repurchase of his customers that eventually will become loyal to that particular provider.

Strategic Capacity Assessment Action at S.C. Hervis S.A. During the Crisis

Ciobănică Mihaela - Lavinia

„Spiru Haret” University, Faculty of Accounting and Financial Management, Constanța
mihaelavinia@yahoo.com

Abstract

Crisis management is an organizational function. The failure can cause serious problems for stakeholders, loss for the Organization itself or may even lead to its disappearance. Public relations practitioners are part of crisis management teams. Therefore, a set of practices and lessons from our experience the practice would definitely represent a useful clock resource for professionals in the field.

Cuvinte cheie: resources, strategy, crisis

1. Introducere

The process of transition from the planned economy, strictly centralized, bureaucratic administration, at the market, decentralized, involves transformations in all sides of the political, economic, organizational, legal, social and psychological. Such a transition is the change of conception and on the leadership of the economic units, abandoning old methods, techniques and tools of management and implementation of all management companies. The decentralization of management and investment companies with a genuine autonomy requires thorough knowledge of the theoretical principles, methods, techniques and management tools that allow managers of companies, as a scientific and effective basis to assume competences, attributions and responsibilities delegated to them in the current stage of transition to a market economy [1].

This work approaches a topical issue in the context of the requirements imposed on the firm's management, the challenges of the current period of transition to the market economy, the diagnostic analysis of the

starting point in designing, establishing and implementing strategic solutions for improving economic and financial viability and management of commercial companies.

2. General presentation of S.C. HERVIS S.A.

Hervis Sports company, founded in the early 70 's in Austria, has a tradition of more than 30 years in the field of selling sporting goods of the highest quality, at the best prices and with the most attractive deals. Hervis Sports stores are multi-brand concept, with 60% of the products belonging to the dedicated sports brands-Adidas, Nike, Puma, Colombia, Mammut, Wilson, Kettler, Scott Fischer, Atomic, etc., and 40% of own Kilimanjaro, X-Fact, Denali, Bengel, Seems, etc. Hervis Sports belongs to the Spar Austria Group 100%.

3. Determining strengths and weaknesses at S.C. HERVIS S. A

3.1 Financial field

The complexity of the decisions involved in the management of investment projects, leading to the idea that to get some different entities with different objectives, responsibilities and corresponding methodological nature different activities [3]. In table 1 are shown the main strengths and weaknesses in financial literacy to S.C. HERVIS S.A.

Table 1. The main strengths and weaknesses in financial literacy to S.C. HERVIS S.A.

Strengths	Causes	Effects
Good liquidity of production	Increasing the volume of production sold	The company's ability to honor some of the short-term debts
Increased economic return	Getting profit during the analyzed	The development of an efficient activity
Indebtedness of the society is less than 50%.	Decrease in debt as a result of the reduction of medium and long term	Reducing costs with interest
The degree of restraint of assets according	The average level of investment of capital in the company	Flexibility and possibilities of adaptation to the environment
Positive amounts of net Treasury	Streamlining the availability payment	The financial autonomy of the society
The rate cut stocks	The correlation of the supply processes of production	Reducing storage costs
Weaknesses	Causes	Effects
The great crentelor recovery and repayment of debts.	The negative impact of the Romanian economy situation of the companies.	Disruption of trade flows and to honour the contracts with suppliers.
Return on total assets decreased.	Underutilization of production capacity.	The limited possibilities of the society to accomplish major investments from its own resources.

3.2 Commercial

Within the S.C. HERVIS S.A. commercial domain is represented by two compartments: purchasing and selling, both subordinate to the Director. Because within the organizational structure of the company there is a specialized Department of marketing, the company's management owns few and incomplete information about clients, competitors and its suppliers. Hence the company's inability to seize and to adapt

to the changes occurring in the time or action. Also, low interest on the part of senior management for organizing this compartment as well as the lack of a separate Department of public relations, make the company's products to be little known, in particular on the internal market. Table 2 presents the evolution of the volume of total production, and the evolution of stocks.

Table 2. The evolution of the volume of production and the evolution of stocks

Indicator	2009	2010	2011
The level of production delivered	126. 244. 705	108. 246. 136	107. 431. 815
The level of stocks	29. 893. 124	20. 546. 727	15. 082. 171

For the disposal of domestic production has been expanding the company's distribution network in the country-reusindu sale of manufactured production and

valorization of 10000 pairs with stock sales slow in the society. In table 3 are presented the main strengths and weaknesses of the domain.

Table 3. The main strengths and weaknesses in commercial domain at S.C. HERVIS S.A.

Strengths	Causes	Effects
1. Harnessing the unused space by renting.	The existence of some unused space within the society.	The growth of turnover, profit.
2. Low level of prices.	Using a small factor for profit.	Advantage over competitors.
3. Export activity (over 95%).	Due to the demand reduction internally.	The growth of turnover, profit.
4. High competitiveness in the market.	Efficient use of production technologies, specialized personnel.	The company's products compete successfully in foreign markets.
5. Low levels of stocks of finished products.	Expanding distribution network internally.	Reduce storage costs, increase turnover.
Weaknesses	Causes	Effects
1. The lack of allocation of funds for the promotion of products both internally and externally.	Low interest on the part of senior management to the Organization's marketing department.	The company's products are little known, in particular on the internal market.
2. Participating in fairs and exhibitions.	Non-existent marketing department and lack of staff specilizat to deal with organizing these promotional events.	Trade fairs and exhibitions provide a complex and complete advertising; represents a specialization of the company give up.
3. The lack of an effective marketing activities.	Non-existent in the society of a specialized marketing department.	Reduced capacity of instituting the changes in the organisation and action response to trends in demand and the action of the competition.
4. Reduced attention to the internal market.	Pretty little application	The loss of business opportunities.

3.3 Resources

Hervis Sports Romania, part of the Spar Austria Group, has chosen TotalSoft for the provision of services of payroll and personnel administration. Hervis Sports trades through its 10 stores in Romania, goods belonging to the strongest sports brands in the world-Adidas, Nike, Puma, Colombia, Mammut, Kettler, Scott Wilson, etc., but also its own brands, such as Kilimanjaro, X-Fact, Denali, Benger, Seems, etc. Hervis Sports currently has a team of over 150 people and plans to increase this figure before the end of the year, by opening new stores. The partnership with TotalSoft, the leading provider of payroll outsourcing services in Romania, was achieved against the background of enlargement strategy of the business and the need to have with a vendor promptly, no matter how much it would increase the number of employees. I was looking for a partner to take over the full responsibility of

the human resources and payroll and to give us the freedom to focus on us plans to expand nationwide. The selection of TotalSoft have mattered much very good references that the company has in the field of payroll outsourcing, but also the fact that utilizes a highly rated software platform in the market, said Managing Director Hervis Sports Romania. In addition to salary calculation, which will pass in TotalSoft functions since early august, the contract provides for the supply of services of administration of staff, including mandatory filing to the State authorities. Services offered by TotalSoft are based on the Charisma HCM, preferred solution to 500 national and multinational organizations, in fields such as banking, financial services, distribution, retail, medical-pharmaceutical, manufacturing, construction, engineering, utilities, public institutions. With this system are managed salaries of more than 10% of the active work

force of Romania and are based on more than 25% of the approximately 130. 000 salaries managed by way of outsourcing. Human resources domain comprises all activities

within the Organization for the achievement of the objectives of assuring and developing human potential and the need for evaluation of internal factors are found in table 4.

Table 4. The evaluation of internal factors in the field of human resources

3. Structural and managerial rigidity.	2	0, 12	0, 24
4. Neoperative information system.	2	0, 10	0, 20
5. Major interest for economic recovery and rehabilitation management.	3	0, 16	0, 48
6. The use of a large number of management methods and techniques.	3	0, 15	0, 45
7. Failure to comply with the requirements of rationality of the decisions.	2	0, 13	0, 26
Internal global power in the field of MANAGEMENT	-	1, 00	2, 67

Sursa: S.C. HERVIS S.A

As a result of internal factors weighted rating points that influence the management activity, a medium to large internal power of his managerial to S.C. HERVIS S.A. .

4. Conclusions

The main issues considered as strong points of the company which is the subject of a case study from the analysis of its financial scope are:

- General good liquidity as a result of the increase in volume of production sold, which lead to a revival of the company's ability to honor some of the short-term debts;
- Profitability increased due to economic profit for the reporting period and the evolution of inflation, which in turn leads to the development of an efficient activity.

In the S.C. HERVIS S.A. is a inability to seize and to adapt to the changes occurring in the environment, or because the action within the organizational structure of the company there is a specialized marketing department which makes the commercial manager of the company to dispose of the few and incomplete information about clients, competitors and its suppliers.

At the end of the SWOT analysis can come off a few conclusions: company Hervis has in large part by human resources, material and financial for the development of competitive products for both the domestic market and foreign market but also for carrying out a business profitable; Special attention will be given to retechnologizarii, the realization that quality-price ratio to be optimally, market study, meeting the needs of our clients and of their loyalty, as well as staffing for the optimal Exposition activities.

Management of Personnel Fluctuations at the CN Romanian Post

Ciobănică Mihaela - Lavinia

„Spiru Haret” University, Faculty of Accounting and Financial Management, Constanța
mihaelavinia@yahoo.com

Abstract

The importance of the human being in the direction of a successful business is one that makes human resource management, a set of competences, skills and attitudes essential for all managers.

The mechanisms of a market economy requires effective management practice and performance at all levels, and this cannot be achieved without competent human resources, strong reasons for performance.

For any successful organization, human resources is the core around which gravitate around all other resources (financial, informational materials), and issues relating to recruitment, selection, training, professional development, evaluation, and reward and motivation are the main directions of human resources management within any company.

Keywords: human resource, succesful organization, competitive management

J.E.L Classification: M12

1. Introduction

Personnel/human resource management is the set of general and specific activities concerning safety, maintenance and effective use of personnel within the economic agents (companies, multinational companies, banks, insurance companies, etc.).

Competitive management of human resources is essential for the success of any organization. Human resources management responsibility lies with both the general manager and head of the Division of human resources, it has the responsibility to become familiar with the issue and on the procedures applied in this area by the performing companies, both in the country and abroad [2]. Within this work present a pattern of recruitment, selection and hiring of human

aresurselor in the company of the Romanian Post using a model interview, analyzing the satisfaction level of employees in the company.

2. Analysis of level of satisfaction at CN Romanian Post

Human resource development involved a process of training of people to perform the tasks needed by the organization. The problem is the recognition of the type of training that employees need. All decisions must take into account the training of submissive employee motivation training. There are a number of training techniques and elements necessary to ensure that a training program to be effective [3].

Assuring the necessary human resources represents one of the most important issues with which any organization is confronting, the manner in which such activity is being performed influencing the future results in a great extent.

An important condition for complete and efficient use of human resources is assuring them greater stability. The mobility of manpower appears both under the form of inputs and outputs, no matter the generating cause, and modify the scriptic number of personnel in a certain period. When analyzing the movement of human resources, a distinction may be performed between their circulation, resulted from objective causes – employment, retirement, decease, invalidity, disease, and fluctuation of human resources from causes unknown by the Company in a certain period of time – better working conditions, greater salaries, facilities awarded to employees [1].

As a result of the restructuring processes taking place at the level of the company, the HR Department has achieved in collaboration with companies specialising in training and evaluation a study to measure a number of parameters required in setting staffing policy.

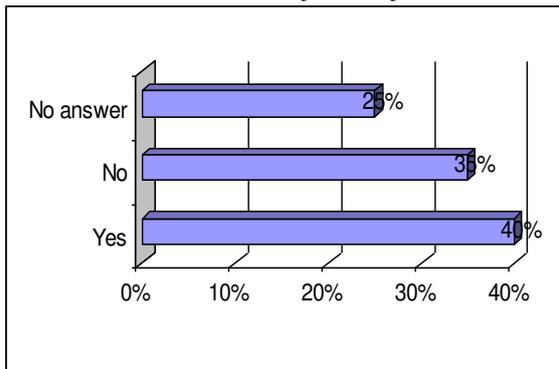

This was achieved by conducting extensive research that has taken place at the level of each Office, the Agency, through the distribution of the postal workers has a questionnaire which looked at the degree of training of the personnel, the motivation to work and working conditions.

Of data that has been collected as a result of this extensive research we selected a few that will specify how are preceptute of employees motivation, personal and professional development in the company, according to several parameters that influences performance, as follows:

1. *To what extent do you think that the Romanian Post fails to motivate you to achieve your objectives, purposes and objectives of the Organization?*

The answer to this question is summarised in Figure 1.

Figure 1 Percentage of employees satisfied with the attainment of the objectives

Source: CN Romanian Post

A small number of participants (10%) is motivated by the Romanian Post to achieve personal goals related to profession and organization. This percentage is given to that person in the organization who can dictate and guide the activities according to its own interests. The highest proportion is given by those whose satisfaction is at a medium level (66%). This is not a thing at all because Îmbucurator has the effect of a general dissatisfaction which can only be negative. In this section you can find people new staff employed with an average age of low expectations from the Organization are much higher. Is a segment that should be taken into account in carrying out the activity as a prerequisite in obtaining superior results. The

final category of participants is the one whose interests and expectations coincide to a very small extent with those of the Organization (25%). The percentage of dissatisfied, makes us believe that there are errors in the selection and recruitment process, or as a result of inaccurate descriptions of the future job.

2. *What factors do you think would improve your level of engagement within the CN Posta Romana? (in order of importance to insert page numbers from 1 to 5)*

Table 1. Factors of motivation of personnel

Factor	Place
Salary	I
Rules of organisation	II
Recognition of professional achievements	III
The level of communication	IV
Professional achievement	V

Source: CN Romanian Post

Of the listed factors was removed very clear salary. As expected the physiological needs of everyday is related in a very large measure of getting a satisfactory salary, salary, which at the time was not to disappoint. Motivation level is closely correlated with the rules of organization existing in the company, which denotes the tendency of employees to have greater freedom of action in carrying out their tasks. An important factor in weight motivational a recognition on the part of owns the company management professional achievements of our employees. According to the communication on the horizontal and vertical is poor at the company level, requiring improvements to increase motivation of employees, a special importance with perform professionally to each employee.

3. *The absence of factors which lead to the loss of your level of engagement within the CN Posta Romana? (in order of importance to insert page numbers from 1 to 3).*

Table 2. Factors that cause the lowering of employment of employees

Factor	Place
The level of communication	I
Salary	II
Rules of organisation	III

Source: CN Romanian Post

The factors chosen are the same as the previous question but the order is different. Notice that a decrease in the level of communication within the Organization would be more organization than a reduction in salary.

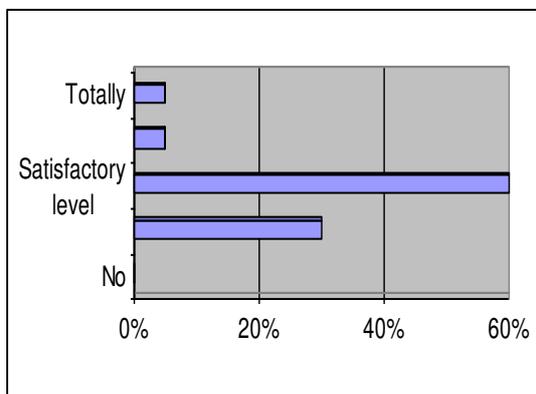

An impairment of the rules of the Organization would attract to itself a frustration on the part of employees, which would have the effect of an impairment of the results at the general level.

4. Do you think that your motivation occupy an important place in the objectives of the Organization CN Posta Romana?

The result of this questions is not at all encouraging for the organization. The percentage of those who believe that the organization is not involved in their reasoning (50%) requiring action on the part of the management organs. The involvement of the Organization in motivating staff shows that its interest is oriented to other objectives and to a much smaller extent, the staff [4].

5. Do you consider that the salary reflects the work done?

Figure 2 The percentage level of contentment in the remuneration of staff

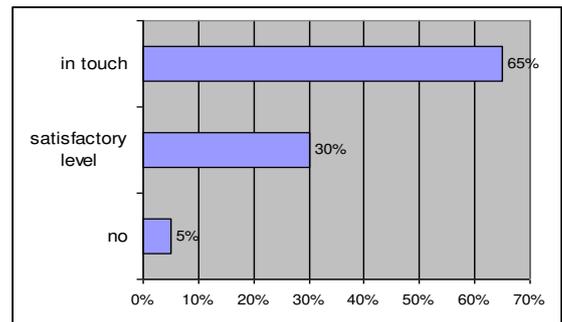

Source: CN Romanian Post

The proportion of those satisfied with the salary (10%) is given by the leading professionals in the organization. Unhappy in this case can be considered quite high (30%).

6. In the current conditions and in relation to the work performed, the salary will help to satisfy your daily needs?

Figure 3 The percentage of satisfaction of needs

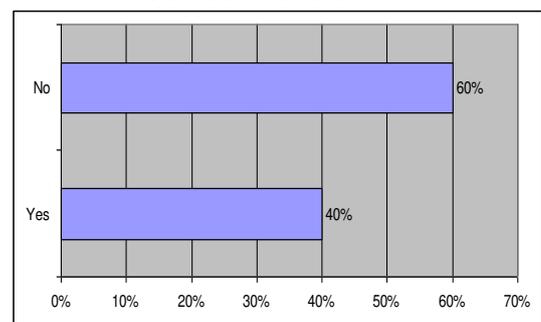

Source: CN Romanian Post

The answers to this question should coincide to a large extent with those of the previous question. But note that the 10% employees satisfied with their salary does not find it anymore. This is explained by the continuous growth of needs, at a pace that surpasses that of wage growth. The degree of discontent is explained by the large number of young people involved in the Organization, the youth who was at the time of solving specific problems: the Foundation of age a family, buying a House, etc.

7. You want to take advantage of bonuses and/or other cash benefits?

Figure 4 The percentage of employees who want bonuses

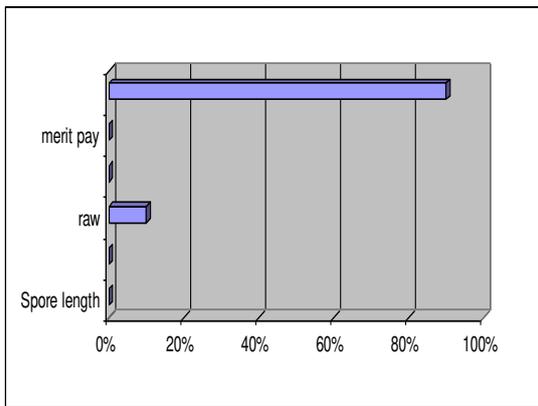

Source: CN Romanian Post

Increases are awarded according to seniority within the company and depending on the results obtained by the people working in the commercial Department. We believe that the granting of bonuses is not justified in the case of many people within the staff of TESA.

7.1 In the last 12 months that are salary increases that have benefited?

Figure 5 The level of increases awarded last year

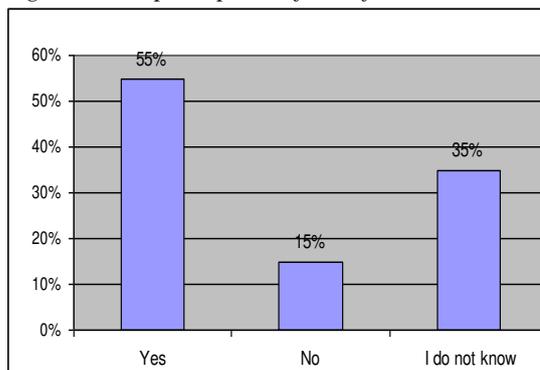

Source: CN Romanian Post

Under the prevailing wage increases amounts hote. However, the granting of which is made only to persons with a minimum of 1 year experience in the Organization and who were not prosecuted for disciplinary reasons during the year. This is a cause of frustration for people with an age less than 2 years and with very good results.

8. Do you consider that increases are generally granted in justifiable?

Figure 6 The perception of benefit increases

Source: CN Romanian Post

Note that 30% of staff did not know if the extra allowances are granted justifiably.

This result is due to a defective manner of presentation of the rules then provide extra allowances to its employees. In the commercial Department, a staff member considers that increases resulting from sales of products, are low in relation to the effort. This category formed by 15 percent. Most employees approve the distribution of increases.

8.1 Mention three reasons which justify the granting of increases?

Of the factors which justify the granting of increases we mention the following:

- direct involvement in solving all problems faced by the employee even if they exceed the strict sphere of the industry;
- supported work not only for themselves but also for the justification for strengthening the company's position and prestige of employee motivation for in its activity and the attainment of objectives;
- loyalty important contribution to increased sales in terms of the expected profit.

8.2 What are the reasons that you think does not justify the granting of increases?

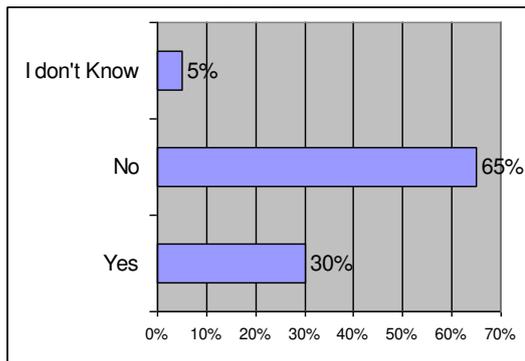

- criteria, assessment of subjective appreciation of the contribution to the development of non-company;
- scope of work of employees

In the current moment, it encourages the involvement of employees in certain moments of the work.

To maintain them in a constant voltage is required for the development of a system much more clearly to grant increases.

9. From the moment of recruitment organization have been promoted?

Figure 7 Passing percentage in the company

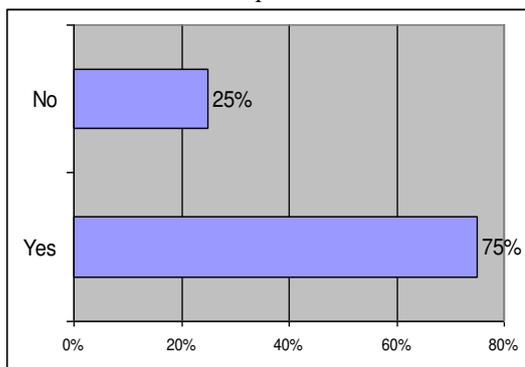

Source: CN Romanian Post

Some of the staff that fits in the percentage of 30% cannot speak of an effective advancement, a new post, but an increase in duties and responsibilities as a result of the development of the organization.

A percentage of 65% represents the personnel at the beginning of the work staff shall inform it on the same post, without exceed the duties and responsibilities set out in the job description at the time of hiring, and 5% of staff received in some tasks not part of those set out in the job description. These temporary delegari, without being accompanied by precise explanations have created confusion among the staff.

10. If you have not attended any training course, you want to follow one?

Figure 8. The percentage of employees who want to improve their

Source: CN Romanian Post

Staff development is one aspect that has been treated with great attention by senior management. However, you don't have to

look like staff development is a permanent activity. Youth Development Department staff must record all specialists and managers within the company, which will include programs attended, and, especially, by what ended it. Managers create a plan for attracting and retaining people with the skills needed by the organization. Implementation of the plan shall involve the recruitment, selection, integration, training, rewarding, choosing the most appropriate benefits and evaluation of performance in order to assess if the objectives are reached. These activities represent the components of human resources management.

3. Conclusions

The importance of human resources for the work of a company is increasingly recognized and in the case of Romanian companies. Domestic enterprises have greatly recovered from this chapter.

Improvement of human resources management in their case should not be cut down just to promote new activities, to îmbunatatii those already charged.

CN Posta Romana has to begin to attract the workforce quality and qualification. It is true that faced the problem inherent to observe that this workforce has either not exactly necessary qualification, is not willing to accept the conditions offered by the company. The proposed measures are particularly counting on the human resources management, but their application will not only lead to a radical change in the situation. They need to be supported by other measures in the field of management, commercial. It is necessary for the Organization to obtain financial resources to be able to implement the proposed measures. Training process will have to begin with a re-evaluation of the concept of managers and subordinates over this area. Although it may seem simple at first glance, the old conceptions are hardly removed.

*"Constantin Brancoveanu" University from Pitesti,
Faculty of Management Marketing in Economic Affairs Braila*
ciorasteanugianina@yahoo.com
mihailescumariana@yahoo.com

Abstract

Organic farming aims at producing authentic respecting nature. Organic agriculture in the European Union is one of the most dynamic sectors. In recent years, organic farming sector in Romania has experienced strong growth by increasing the number of certified organic operators. Due to biodiversity, large agricultural areas, fallow land, fertile land, clean water reserves, Romania can be considered awaking giant of organic farming. The boom in organic production must be combined with the development part of the marketing process. Today increasingly more people are informing online. Strategic thinking farmers are aware that they must engage in online business promotion. Involvement provides small farmers a chance to address: to a larger audience, to particular groups, to communicate fast, to communicate on a personal basis with clients or potential customers.

Keywords: organic farming, social media, online marketing.

J.E.L Classification: Q 13, M31,

1. Introduction

Strategic thinking involves thinking in real time and in perspective, discovering and exploiting opportunities. Small farmers with strategic thinking understand that the market for organic products present opportunities that intelligently exploited, will contribute to the farmer development. Organic agriculture develops. In the past three years has increased acreage organic producers due to

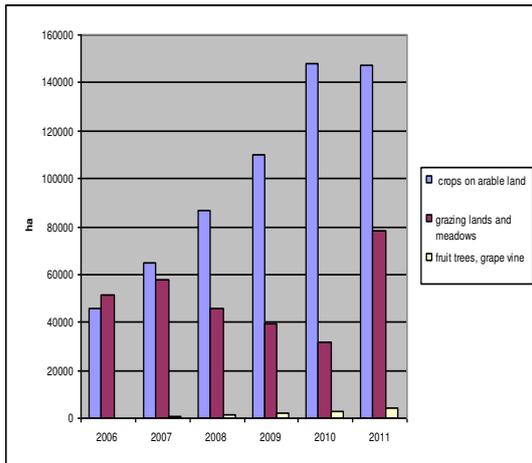

support provided through grants. The Common Agricultural Policy subsidies will continue for organic farming. Many of those who grow organic are small farmers. In the market they compete with imported products from the European Union, provided in specialized stores, department stores or online. Supermarkets and hypermarkets have created districts dedicated to organic products, or have developed their own brand of organic products. Consumer interest in organic products is growing. Using online marketing is a smart way for small farmers to exploit current market conditions because in this way quickly reach consumers, offering fresh produce at reasonable prices by eliminating intermediaries additions.

2. Brief characterization of organic farming in Romania

In Romania organic farming experience a boom, increasing organic acreage and the number of manufacturers.

In the period 2007-2012, the area cultivated organically grown 3.5 times. In Romania, organic farming increases every year at a weighted average rate of 23%. In 2007, the total area cultivated by organic production was 131 448 hectares of which 46.865 surface area conversion and 84.585 certified organic. In the year 2012, the area under organic farming was 450000 hectares, while cultures from spontaneous flora (plants growing without cultivation) of certified organic area is collected from an area of about 520000 hectares. The areas in the ecological system increased by 45% in 2012 since 2011. [1]

Figure no. 1 Area planted according to the organic production method

Source: www.madr.ro

Although according to the rules of organic farming acreage has grown tremendously in the last two years the share of the area under organic farming holds the total agricultural area is only 1.6%. This places our country share among European countries with the lowest surface area organically grown. Romania surpasses just Bulgaria 0.5% and Malta 0.2%. The share of total utilised agricultural area (UAA) occupied by organic farming (existing organically-farmed areas and areas in process of conversion) in EU is about 5%.

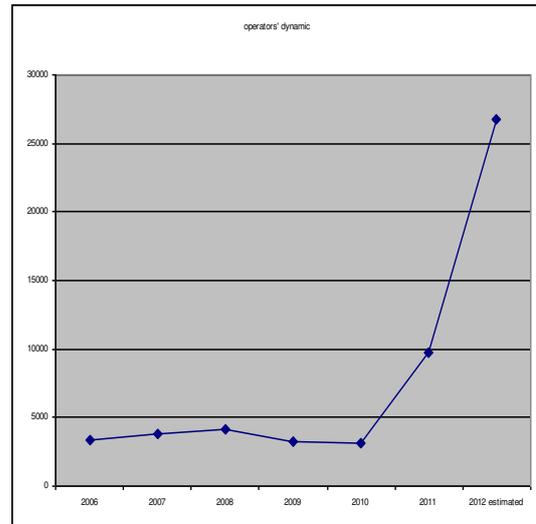

Table no. 2 Area under organic farming

Year	EU (27 countries) %	Romania %
2005	3.6	0.7
2006	3.7	0.8
2007	4.0	1.0
2008	4.4	1.0
2009	4.7	1.2
2010	5.0	1.3
2011	-	1.6

Source: <http://epp.eurostat.ec.europa.eu>

Since 2010 the number of certified operators in farming increased significantly compared to previous years. This was due, in particular, to existing support measures for the conversion period provided under art. 68 of the Council Regulation (EC) no. 73/2009 establishing common rules for direct support schemes for farmers under the common agricultural policy and establishing certain support schemes for farmers. Subventions granted in 2011 were about 3 million in 2011, and in 2012 of 4.5 million euro. [2]

Figure no. 3 Operator's dynamic

Source: www.madr.ro

In 2012, of the total of operators in organic agriculture, 103 are in the processing segment, 211 in the marketing segment and 26390 are agricultural producers. As regards the processed products sector in 2012 there was a significant increase in the number of processors (from 48 units in 2007 to 103 in 2012) and the assortment of organic products was much more diversified including: products processed from cow and sheep milk (feta, butter, cream, etc.), products processed from soy (milk, tofu, croquettes), sunflower oil, various assortments of bakery products (bread, pasta, cookies), products processed from rice, muesli, herbal teas, forest fruit juices, products processed from hemp seed, bee by-products (wax, pollen), products processed from pork (sausages, ham) and organic wine. [3]

In 2012 the registered processors in organic agriculture represents only 0.39% of total operators in organic agriculture. Much of products from organic production are exported. According to Ministry of Agriculture and Rural Development (MARD) 70-80% of organic products in Romania are exported annually. [3] Part of this came back to the country in the form of processed products imported from countries that have developed processing industry. So the weak point of organic agriculture is processed. A timely business during the current economic situation is the application of modern technologies in processing natural food products. [4]

The surface of a holding in organic agriculture in vegetable production ranges

from about 100 square meters, for vegetable cultivation in solariums, up to ca. 2000 hectares for field crops. The average surface of a holding in 2011 was about 20-22 hectares. [3] This shows that most of those working in organic farming are small producers, small farmers. Obviously their financial resources are limited, so money are use to promote participation in fairs.

3. Tools of online marketing

Because we live in the internet age many people, when they want to purchase a product use the online environment to gain information on price, quality, origin, etc. According to a study conducted in 2010 the Internet has a key role to document organic products, 75% of respondents said they will inquire online about organic products. [5] Due to these conditions, even the small farmer can not neglect online marketing. Any farmer who wants to be successful in selling organic products is bound to create an on – line presence. An effective way would be to create a website. But to create a professional website requires financial resources, resources that small farmers do not have, and when they have it, not always willing to direct them towards the virtual world. In the tech of today there are many ways that small farmers can promote their products and activity, to potential buyers, for free or at low-cost. Among these options are: sending emails, creating a Facebook page, blogs, uploading multimedia files, registration of business at the location-base.

▪ **Sending e-mails.** E-mail is the main mode of communication in professional environments. When a person buys a product the farmer may require the email address of the person, to be able to provide information about his work. In this way, it is left to the discretion of the client whether to accept or not to receipt of information from the farmer.

The farmer must create an email address that incorporates his business name. If the business is bearing his name the farmer would have to enter into a word to refer to organic products. Customer should not be intoxicated with emails or too much information in each e-mail. A message sent once to two weeks will not overload the receiver. Also, messages sent must contain useful information for the recipient. A

customer does not need to be informed about the time of sowing, but will be interested in harvesting. Product prices, promotions, places where you can buy are useful information for customers.

▪ **Using Facebook** - Facebook is a social networking site that let users to: store pictures, videos and information and to share with others. It also allows posting comments, questions and answers. Facebook is free to use. Demographic information published in April 2013 offered the following snapshot of Facebook users in Romania: total of users 5944080, penetration of online population 69.28%. The largest age group is currently 25-34 years with total of 1 792 180 users, followed by the users in the age of 18-24. Male/Female User Ratio on Facebook in Romania is 1/1: 50% male users and 50% female users. [6] The large number of users makes Facebook a formidable marketing tool. Any farmer can register as a Facebook user. It is not difficult. Facebook provides its own step-by-step guide to creating a business page. A Facebook page can be created for a business, place, company, organization, brand or product, in order to connect with customers or potential clients. [7] Facebook can be accessed from any computer (a desktop or a laptop) or from an mobile device. On Facebook page a farmer can publish business name, address and contact details. It can also make a brief description of his activity and the organic products he offers. Because pictures and videos are a major element of Facebook’s attractiveness the farmer can post photos of the products and production methods. In this way potential clients can learn how products are grown without the need to come on the fields or orchards. Facebook page makes it a useful tool for promoting if farmer regularly post new materials (prices, announcements, events photos, videos). Since Facebook page allows posting comments and asking questions is very important to respond quickly to any questions and comments, positive or negative. It is possible that negative comments and questions left unanswered to turn into negative publicity. [8] For positive comments farmer should address thanks. For negative comments and questions responses are necessary to be prompt. In this way the farmer show that has nothing to hide, and so builds a positive reputation. Facebook page is

an efficient way to promote products or business because it provides real-time information. It can also be used as a research tool. The farmer can run a Facebook contest or conduct a survey.

▪ **Creating a blog** – a blog is site that includes a series of 'posts' about farmer's interests. A blog allow farmer to promote his business, get in touch with clients and potential customers, to get feedback regarding his activity. Those who read the blog have the opportunity to make comments, positive or negative. Comments can be read by farmers but also by other visitors to the blog. How comments are handled contributes to potentate or reduction of confidence in farmer's products. Favorable comments builds trust to potential customers in the farmer's products, and negative comments gives the chance to the farmer to improve and develop products offered or business. So, readers and customer comments, provide fast feedback of business and products. With the blog information can be updated quickly. A blog allows exchanging links with other blogs, hence, a greater dissemination of information. Farmers are good at sowing and raising product, are not trained in IT. However, blog is easy to use. Farmer writes his ideas and post it to blog. He needs to push a few buttons. Currently there are blog platforms which allow bloggers to quickly customize the look of their blog without having to know about website programming. Blog platforms use templates which can allow bloggers to get started quickly and concentrate on content, rather than manage technical aspects of website development. They are ideal for small businesses. Blogging platforms that allow farmers to create blogs are: WordPress Blogger or Tumblr. [9] For a blog to be followed the information must be refreshed and updated frequently, at least weekly. Business blogs are more effective when used in cooperation with other social media: Twitter, Facebook, You Tube. Placing on the blog buttons like: retweet and Facebook Share, including a Facebook like box to blog contribute to disseminate information provided and therefore increase the number of potential customers.

▪ **Uploading videos to YouTube** – is a simple way to attract potential clients. All over the world 800 million people visit

YouTube every month. [10] YouTube lets farmer to show his organic products and techniques in action. Uploading videos to You Tube is completely free. Farmer can create a You Tube channel personalized with farmer's name, logo, background or other elements. On the channel farmer can keep track of channel views, video views, subscribers, and more. [10] Using information available farmer can improve products, his videos and channel. A video show to potential clients that the farmer is a person who knows what he's talking about, he knows to cultivate organic products, he knows his business. Customers are satisfied that the person selling is the same person that cultivate and grow products. To attract potential customers (views), farmer must use some keyword tags when uploading video. Words like: organic, eco, bio, healthy, natural, cultivated in Romania, made in Romania attract people interested in organic food, people that can turn into farmer's customers. Every video uploaded should have a goal related to farmer's business.

▪ **Using location-based marketing** – by registration of business in Google Places or Yahoo!Local. 97% of consumers search for local businesses online. Google Places for Business gives access to free tools that help business get online, be found on Google Search and Maps and get closer to customers. [11] Adding listing to Google Places for Business is free. With a Google. It is possible to add images and videos, can display a running program, types of products. [12] Registration of business in Google Places system will make the farmer to be found more easily by potential customers. In addition, when used search engine Google for a search, the farmer will be better positioned in the list of offered.

4. Conclusions

Increase organic acreage and number of operators in organic farming is only the first step in transforming Romania into an organic market player. Investments in processing and promotion are necessary to move from the stage of the source of raw materials for industry to a pillar of bio industry. Organic products market is in constant growth. In contemporary economy customers are becoming more knowledgeable and have

available electronic information. One way farmers can reach potential customers quickly and convincingly is through online marketing. Like any activity, growing products or animal breeding, involvement in the online requires planning, setting objectives, monitoring. If there is not logic involved in online marketing activity will lead at wasting a lot of time and seeing very little return. Although most of the online promotional methods does not require financial resources because they are free, it require a different type of resource, time. Social media has built around frequent updates, so is not sufficient to create a Facebook page or a blog. To acquire clients information presented must be fair and updated frequently, otherwise customers may think that the farmer no longer dealing with organic products.

Abstract

Quality is a strategic tool for global management of the organizations that determine, in the highest level, the competitiveness of products / services / firms / companies, domestically and internationally. Customer and staff satisfaction, responsible approach of the society requirements can be ensured through a proper leadership in all organization processes according to defined policies and strategies, with the integration of basic principles of TQM. The top management of S.C. Cupido S.A. has decided to implement a strategy based on EFQM model, oriented towards customer's satisfaction, staff satisfaction and a greater community integration of organization. It can be appreciated that the degree of implementation of the approach adopted by the organization, in terms of determinant factors, is 81% of its potential (if considered all relevant areas and activities). The degree of extending of the obtained results, it covers many areas and relevant activities undertaken by S.C. Cupido S.A. (68.5%).

Key words: EFQM Excellence Model, Romanian Model of Business Excellence, Total Quality Management, determinant factors, results.

J.E.L. Classification: M 14.

1. Introduction

Customer satisfaction is a key issue in terms of service quality evaluation. Customer satisfaction depends on the balance between the expectations that customers have and what they actually experience in terms of products and services of that company. Consumers will be satisfied when will receive a service / product that exceed their expectations. Quality offered by companies differs from quality perceived by the consumers. Reducing the gap between the two grades allow customer satisfaction achievement [1].

Excellence Model of the European Foundation for Quality Management (EFQM) was introduced in the early 1990s to serve as a framework for assessing organizations for the European Quality Award. It is now most commonly organizational model used in Europe and underlies the vast majority of national and regional Quality Awards, including the Romanian Quality Award JM Juran [2].

EFQM Excellence Award is not a standard, but rather a benchmark assessment and a management framework [3]. In practice, this model can be used:

- To recognize and promote the most effective customer experience.
- To develop organizational vision and future goals in a tangible and measurable way.
- To achieve efficiency in all processes of the organization: resource allocation,

generating business plans and management priorities.

- To identify and understand the systematic nature of the business, key links, cause-effect relationships.

The Fundamental Concepts underlying the Excellence Model are:

- Results orientation. Excellence means getting results that delight all the organization's stakeholders.
- Customer orientation. Excellence means creating sustainable value for clients.
- Leadership and Perseverance. Excellent means visionary, charismatic and tenacious leadership.
- Management based on processes and data. Excellence means managing the organization with a set of systems, processes and interdependent and related data.
- Staff involvement and development. Excellence means maximizing the contribution of employees through their involvement and development.
- Learning, innovation and continuous improvement. Excellence means discussing the current situation and put into practice the change through learning, innovation and recovering the improvement opportunities.
- Development Partnerships. Excellence means developing and maintaining partnerships that bring value.
- Social Responsibility. Excellence means going beyond the minimum legal requirements to operate the company and the effort to understand and respond to stakeholder expectations of society [2].

2. The Romanian Model of Business Excellence

The Romanian Model of Business Excellence - Romanian Quality Award in particular - is conceptually and functionally similar to European Model of Excellence in Business used by EFQM to assess candidates for European Quality Award.

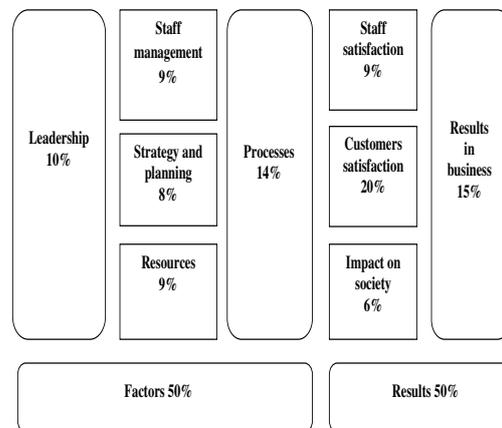

The Romanian Model of Business Excellence is a non-prescriptive framework based on 9 criteria (figure 1). Five of these criteria refer to „Determinants factors” and four to „Results”. Criteria regarding the „Determinants factors” evaluate the activities

undertaken to achieve the „Results”. „Results” are caused by „Determinants factors” which are continually improved based on feedback from „Results”. The model allows various approaches to obtain excellent results in all aspects and is based on the following premise: Company Leadership lay the foundation for Policy and Strategy, and these are implemented through People, Partnerships, Resources and Processes, in order to obtain Excellent Results, both in key performance areas, as well as on the Clients, Staff and Impact on Society [2].

The main objectives of the Romanian Quality Award are:

- Orientation and focusing the managers and employees attention from Romanian organizations - in the most relevant and effective way – on the activities involved in the implementation of Total Quality Management (TQM), and on beneficial role of TQM.

Figure 1. The Romanian Model of Business Excellence based on EFQM Excellence Model

- Foster companies and individuals towards the development of their concerns for continuous improvement of the quality.
- Demonstration of beneficial results that can be obtained - in all aspects of organization activities - by implementing the principles of TQM [4].

The fundamental logic of this model - applied since 2000 to assess candidates on Romanian Quality Award - is: exceptional business results, characterized by customer and employee satisfaction through an expected impact on society and a positive impact effect on the organization, will be

achieved only through a management able to inspire, support and encourage a specific organization culture of Total Quality Management, properly directing employees and ensuring, through appropriate strategy and planning, an appropriate management of resources and processes [4].

3. S.C. Cupidon S.A. concerns regarding the continuous improvement of their products or services

Quality of products and services offered by a tourism enterprise is crucial in increasing its market competitiveness by attracting new customers. Realizing this aspect the top management of S.C. Cupid S.A. is concerned about the continuous improvement of its products and services aimed to obtain the Romanian Quality Award – Model of Business Excellence.

Following the diagnosis made at the S.C. Cupid S.A. in 2011 and respectively 2012 has been highlighted effects of total quality management in the analyzed period and a number of issues that should be improved in the future (tables 1-9).

Table 1. Subcriteria and performance indicators regarding the S.C Cupidon S.A. leadership

SUB-CRITERIA AND PERFORMANCE INDICATORS	Number of answers	TQM effect		
		+	-	0
LEADERSHIP INDICATORS				
<i>a. Managers obviously are involved in promoting within the institution of the Total Quality Management (TQM) principles, especially on the following areas:</i>	48	43	4	1
- The quality of the organizational structure of the institution; concordance between the structures adopted and institution operation;	12	12	0	0
- Qualifications, skills and experience of the management members of the unit and of its departments;	12	12	0	0
- Their ability to correctly interpret laws affecting the organization, to make decisions, to plan their acts and others;	12	10	2	0
- The quality of communication between the various governing bodies, staff and operational;	12	9	2	1
<i>b. Managers support and get involved, providing resources and assistance.</i>	20	15	4	1
- How to fulfill managerial roles, behaviors roles and management styles, their relevance to achieving mission objectives and ensure unit performance;	9	7	2	0
- Ways of working, competence and efficiency of administrative and technical services;	11	8	2	1
<i>c. Managers personally involved in relationships with customers, suppliers and other organizations;</i>	12	11	1	0
<i>d. Managers recognize and appreciate the efforts and merits of staff.</i>	30	26	4	0
- Professional ethics of governing body, the relationship between first-line managers, mid-level (intermediate) and higher level managers, between authority, autonomy and centralization in unit operation;	12	12	0	0
- Strengths and weaknesses in the organization, operation and management of the institution;	9	5	4	0
- Projects and programs to improve the organization and the management.	9	9	0	0
Total	110	95	13	2

Evaluation of each criterion regarding the determinant factors analyzed was performed as recommended by EFQM, depending on

the approach taken by the organization and its degree of implementation.

Table 2. Subcriteria and performance indicators regarding the S.C Cupidon S.A. staff management

SUB-CRITERIA AND PERFORMANCE INDICATORS	Number of answers	TQM effect		
		+	-	0
STAFF MANAGEMENT INDICATORS				
<i>a. Planning and improving of human resources:</i>	33	25	7	1
- Implementation of personnel policy adopted in relation to the mission and objectives of the organization;	11	9	2	0
- Concerns to improve personnel policy;	11	8	3	0
- Application of criteria for recruitment, appointment, promotion and so on, of staff;	11	8	2	1
<i>b. Supporting and developing staff competencies:</i>	22	18	4	0
- Effectiveness of professional development of staff and promotion procedures, including the system of selection for leaders at all levels;	11	8	3	0
- Degree of knowledge and acceptance by personal of the criteria used in assessing performance;	11	10	1	0
<i>c. If the staff of institution agrees about the previously established objectives and regularly assess their own performance.</i>	11	9	2	0
<i>d. If the staff of institution is involved, support and ensure delegation of responsibilities and is awarded being recognized their contribution to:</i>	22	15	6	1
- Fair and reasonable determination of tasks, duties and responsibilities of staff;	11	8	3	0
- The efficiency of pay and benefits systems;	11	7	3	1
<i>e. If the institution establishes and maintains dialogue with its staff; if the institution is concerned about its staff:</i>	22	16	4	2
- Achievements and failures in personnel policy;	11	8	2	1
- Perspectives, personnel policy directions in order to protect employees and maintain institutional quality of the organization.	11	8	2	1
Total	110	83	23	4

Table 3. Subcriteria and performance indicators regarding the strategy and planning of S.C Cupidon S.A.

SUB-CRITERIA AND PERFORMANCE INDICATORS	Number of answers	TQM effect		
		+	-	0
STRATEGY AND PLANNING INDICATORS				
<i>a. Policy and strategy are based on adequate and detailed information:</i>	60	48	10	2
- Measure of adequacy and enrollment of the mission and goals of organization in general demands of the field;	12	9	2	1
- The extent to which planning process takes into account the state plan (if is any) and is compatible with it;	12	9	3	0
- How is correlated the plan with the annual and multi-annual budgets?	12	10	2	0
- Does the organization have a sufficient database to perform properly the planning activity?	12	11	1	0
- Does the organization have a planning mechanism for using the resources and preparing the future changes or developments of the institution?	12	9	2	1
<i>b. Policy and strategy are developed:</i>	60	47	12	1
- How clearly are expressed and if there is ambiguity in the mission and objectives statement;	12	10	2	0
- How should the priorities be arranged depending on the mission and objectives?	12	9	3	0
- To what extent are registered pressures and how resist the organization to such pressures of random or inappropriate development of its mission;	12	9	3	0
- The correlation between the actions regarding products and services with the mission and objectives of the organization.	12	9	2	1
- The plan of activities of the institution derives organically from its mission?	12	10	2	0
<i>c. Policy and strategy are communicated and implemented:</i>	24	21	3	0
- Mission and objectives are well understood within the organization? Are they properly found in the documents of the organization and its practical activity?	12	11	1	0
- Are registered concerns for self-assessment of the modality to achievement the missions and institutional objectives and to what extent this is done?	12	10	2	0
<i>d. Policy and strategy are periodically actualized and ameliorated:</i>	48	39	9	0
- There are components of the mission and system of goals that are not well accomplished?	12	9	3	0
- The extent and manner of employment of planning officers in implementing the plan;	12	9	3	0
- What strengths and weaknesses were identified?	12	11	1	0
- How does the organization propose to remedy the weaknesses identified?	12	10	2	0
Total	192	155	34	3

Table 4. Subcriteria and performance indicators regarding the S.C Cupidon S.A. resources

SUB-CRITERIA AND PERFORMANCE INDICATORS	Number of answers	TQM effect		
		+	-	0
RESOURCES INDICATORS				
<i>a. Foreign partnerships are managed</i>				
- Providing the necessary staff, competent and stable for managing external partnerships;	11	9	2	0
- Providing and managing the adequate resources to carry out the organization's external partnerships;	11	8	2	1
- Ensuring customers satisfaction;	11	8	3	0
- Stabilizing the relationships with organization suppliers.	11	10	1	0
<i>b. The financial resources are managed:</i>				
- Consistency of the correlation between financial resources, mission and objectives of the organization;	12	10	2	0
- Mechanisms for allocating financial resources; the "productive" distribution of the financial efforts;	12	9	2	1
- Financial planning and satisfaction of the present and anticipated needs of programs and services;	12	9	2	1
- Strengths and weaknesses in financial resources field, measures to remedy weaknesses; major orientations and future projects.	12	9	3	0
<i>c. Buildings, equipments and materials are managed</i>				
- The correlation degree between the dimensions, characteristics and specific of the infrastructure with organization mission and objectives;	12	10	2	0
- The extent to which the material resources, equipments and facilities are adequate to the contemporary exigencies of the activities;	12	9	3	0
- Necessary comfort and functionality level of technical facilities, equipments and other components of the organization's infrastructure;	12	9	2	1
<i>d. The technologies are managed</i>				
- The extent to which the technology used is appropriate to the contemporary requirements and to the general objectives of the organization;	12	9	3	0
<i>e. The informations and the knowledges are managed</i>				
- The sizes, structure and capacity of the services and of the information and documentation tools;	11	9	1	1
- Providing the communication and of the electronic tools;	11	10	1	0
- Implementing the concept of computerization;	11	9	2	0
Total	173	137	31	5

Table 5. Subcriteria and performance indicators regarding the S.C Cupidon S.A. processes

SUB-CRITERIA AND PERFORMANCE INDICATORS	Number of answers	TQM effect		
		+	-	0
PROCESSES INDICATORS				
<i>a. Processes are systematically designed and managed:</i>				
- Process capability;	12	12	0	0
- Promptness in products delivery;	9	8	1	0
- Response time to commands;	6	7	0	0
- Deviations;	8	6	0	1
- Innovation times;	7	7	0	1
- Adaptability;	9	6	1	2
- Costs related to quality;	5	5	1	0
- Saving;	9	9	0	0
<i>b. The products and services are designed and developed based on customer needs and expectations.</i>				
- Determination of the requirements related to the product / service (customer requirements, legal requirements, etc.);	12	9	2	1
- Reviewing the requirements related to the product to determine if the organization is able to meet these requirements;	12	11	1	0
- Establishing an appropriate system of communication with the customer for an operative solution to the issues that may arise in the interpretation of its requirements.	12	9	3	0
- Planning the design and development of product / service so as to fully satisfy customer requirements;	12	10	2	0
- Achieving the product / service monitoring process parameters and product characteristics, to meet customer requirements;	12	11	1	0
- Monitoring the information regarding the degree of assurance of customer's satisfaction.	12	9	3	0
<i>c. Providing after-sales assistance to the product and services:</i>				
- A proper conducting of the delivery and post-delivery services activities;	12	10	2	0
- Establishing an appropriate system of communication with the customer for an operative solution to the issues that may arise after products / services sale.	12	9	3	0
<i>d. The customer relationships are managed and enhanced</i>				
- Identification of the customer requirements related to the product / service;	12	9	2	1
- Customer satisfaction;	12	9	3	0
- Adequate system of communication with the customer.	12	9	2	1
Total	185	155	24	6

SUB-CRITERIA AND PERFORMANCE INDICATORS	Number of answers	TQM effect		
		+	-	0
INDICATORS REGARDING THE IMPACT ON SOCIETY				
<i>a. Measurements of the perception:</i>				
- Perception of the community regarding the institution.	10	7	2	1
<i>b. Performance indicators:</i>				
- Results of the impacts assessment of the organization on community life;	10	6	3	1
- Complementary measures undertaken by the institution in order to improve its impact on community life.	10	5	3	2
Total	30	18	8	4

Table 9. Subcriteria and performance indicators regarding the results in business of S.C Cupidon S.A.

SUB-CRITERIA AND PERFORMANCE INDICATORS	Number of answers	TQM effect		
		+	-	0
INDICATORS REGARDING THE RESULTS IN BUSINESS				
<i>a. Results regarding essential performances:</i>				
- High quality level of products /services offered by the organization;	10	8	2	0
- Correct ratio of quality / price of products / services offered by the organization;	10	9	1	0
- Continuous improvement of quality of products / services offered by the organization.	10	7	3	0
<i>b. Indicators regarding essential performances:</i>				
- Market share;	11	9	2	0
- Turnover / employee;	12	12	0	0
- Capital rentability;	9	7	2	0
- Sales rentability.	8	6	2	0
Total	70	58	12	0

Approaching refers to the methods adopted by the institution to meet each point of the criteria, and the evaluation was carried out taking into account:

- Suitability of the methods, tools and techniques used in relation to the approach taken;
- The extent to which the approach is systematic and based on prevention;

- The extent to which the approach taken was integrated by the working methods adopted by the organization;
- The existence of analyses / periodical systematic evaluations;
- Implementing improvements based to the results of this analysis / evaluation.

The implementation degree is the extent to which has been implemented the adopted approach (compared to its full potential), and the evaluation was performed according to a proper and effective implementation of the approach:

- Vertically, at all hierarchical levels of the institution;
- Horizontal, in all areas and activity sectors;
- In all processes involved;
- In all services involved.

Evaluators assessed separately the approach and respectively its implementation degree, in percents (Table 10) and expressed the overall result, as the shares indicated by the EFQM model.

Table 10. S.C. Cupidon S.A. determinant factors evaluation

Determinants factors	Approach	Implementation degree. [%]	
		Global	According EFQM
Leadership (10%)	- The organization has strong evidences regarding systematic and solid approach, and respectively, prevention systems.	86.4	8.64
Staff management (9%)		75.5	6.80
Strategy and planning (8%)	- There are clear evidences of development and improved efficiency as a result of regular evaluations.	80.7	6.45
Resources (9%)		79.2	7.13
Processes (14%)	- There is a good integration of the adopted approach in normal operation and planning activity.	83.4	11.68

Evaluation of each criterion referring to the results was performed according to the excellence degree and respectively, to the extending degree of obtained results.

Evaluation of excellence degree of obtained results was based on:

- The existence of positive trends and / or good performance (a certain time interval);
- Reporting to the organization objectives.
- Comparison with other competing tourism enterprises, comparable in terms of performance with S.C. Cupidon S.A.;
- The existence of evidences demonstrating that the mentioned results were effective obtained based on proper approach.

Evaluation of the extending degree of the results was performed according to:

- The extent to which the results "covering" all relevant activity fields of the institution;
- The extent to which there are full series of results for each sub-criterion considered;
- The extent to which it was understood and presented the relative importance of each sub-criterion.

The evaluators assessed separately the excellence degree and respectively, the extending degree of the obtained results, in percents (Table 11) and then calculated the overall result.

Table 11. S.C. Cupidon S.A. results evaluation

Results	Degree of excellence	Extending degree, [%]	
		Global	According EFQM
Staff satisfaction (9%)	- Many results show positive trends and / or continuous good performance on a period of at least 3 years;	75.0	6.75
Customer's satisfaction (20%)		68.8	13.76
Impact on society (6%)	- In many areas you can make favorable comparisons with predetermined objectives; - Many results represent the effect of the approach.	47.4	2.84
Results in business (15%)		82.9	12.44

According to the analysis can be appreciated that the degree of implementation of the approach adopted by the organization, in terms of determinant factors, is 81% of its potential (if considered all relevant areas and activities). Regarding the extending degree of obtained results, it covers many areas and relevant activities undertaken by S.C. Cupid S.A. (68.5%). It is recommended to continue the organization approach primary oriented on results, which will take the form of ensuring continuous improvement of products / services quality to meet customer requirements, but also on improving the organization's impact on society.

The main direction of action established based on the diagnostic analysis, which will be implemented in summer 2013 are the following:

- Maintaining the position on the market;
- Increase length of stay;
- Improving the general environment by expanding green spaces and walking paths, creating an optimal space for sociability (open meetings);
- Improving the comfort degree of actual receiving structures at a level corresponding to 4 and 5 stars categories;

- Reviewing the diets by reducing their severity and also their diversification;
- Strong development of recreational and entertainment activities;
- Development of prophylactic area;
- Diversification of the tourism products with products such as „form restoration and health”;
- Protecting and enhancing the environment;
- Relocation of charges based on the quality level;
- Pursuing a higher quality of products and tourism infrastructure;
- Reviewing the personnel programs through technical training taking into account all the new technologies and equipment and management training using the modern systems in the tourist activity;
- Launching a promotion program to improve the company image;

4. Conclusions

The EFQM model is based on the principle that customer's and staff satisfaction and also integration of the organization in the life community are obtained through leadership, policy and strategy, personnel management, resources and processes. Ultimately, all this leads to excellent operational results.

The advantages of this approach are huge. In particular, it is a rigorous and structured approach to improve the institution state, an objective evaluation based on a number of criteria widely accepted in Europe, an assessment based on facts and not on individual perception, a way to reach a coherent orientation and consensus on actions to be taken by each employee, from the same excellence vision.

The analysis conducted in S.C. Cupidon S.A. revealed that the degree of implementation of the approach adopted by the organization, in terms of determinant factors, is 81% of its potential, taking into consideration all relevant areas and activities. Regarding the extending degree of obtained results, it covers many areas and relevant activities undertaken by S.C. Cupid S.A. and also some activities need to be improved. This is the reason why the top management of S.C.

Cupidon S.A. identified and established the main directions which will be implemented in summer of 2013.

It is recommended to continue the organization approach primary oriented on results, which will take the form of ensuring continuous improvement of products / services quality to meet customer requirements, but also on improving the organization's impact on society.

The Trends in Banking Management of Romania

Dinculescu Elena –Silvia

Vîlcu Anca

Constantin Brancoveanu University of Pitesti

nataliadinculescu@yahoo.com

Abstract

In a banking environment such as Romania's, constantly changing and subject to the pressure of a fierce competition, all the attention of the banks management teams is oriented towards the costs and their possible reduction in regard to maximizing the profit.

In our opinion the main challenge for the Romanian banking system is to compete to reduce bank costs - as far was a frantic competition between banks mainly aiming at filling the market share. Also consider that 2013 could be a more difficult for the banking sector in Romania.

The profitability of banks is likely to fall under pressure to reduce interest margins and competition, increase investment costs for expanding networks, but also the global liquidity crisis.

Key words: banking market, competition, credit, deposit

Clasificare J.E.L.: E59, F33, G21, G24

1. Introduction

In Romania, the competition continues to grow, new banks founded and therefore, the customers have the opportunity to choose of the banks that they will meet their specific needs in terms of financial-banking services.

In the financial-banking sector, services and products are all similar in their effect, therefore a bank must maintain competitive advantage.

Quality of services is an area in which an organization is able to act and is and key to future developments. One of the secrets to insure a good service to the customer is understanding the needs and desires wishes it.

The main objective of the banking market is to offer additional benefits to the banks

customer, advantages will result from two important consideration [1]:

- Tariff's most financial services should fall as a result of higher domestic market. Competition will be the main factor of a sale, although can be envisaged reducing profit margin of the bank;
- The customer will benefit from increasing freedom of choice by targeting the institutions that offer lower prices or by obtaining the services that were not previously available.

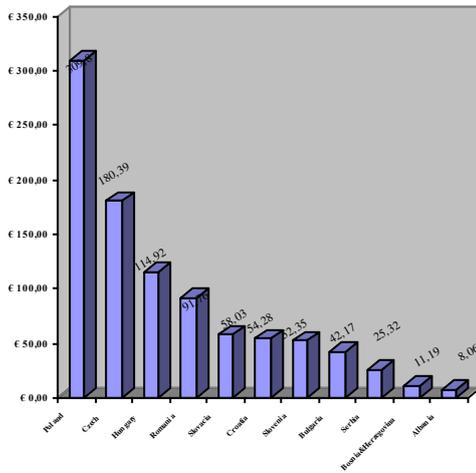

2. Romanian banking market overview

Total bank assets from Central and Eastern Europe (CEE) had the last year, similar to 2010 and 2011, a generally positive inclination although the European economy has been affected by the recession. [2]

Romania remains the fourth largest banking market from CEE the total value of bank assets is 91,76 billion EURO slightly above the average for Central and Eastern Europe for the first time in the last years.

Our country has been surpassed by countries like Poland, Czech and Hungary. (Figure1)

Figure 1. Total banking assets CEE
-bn EUR-

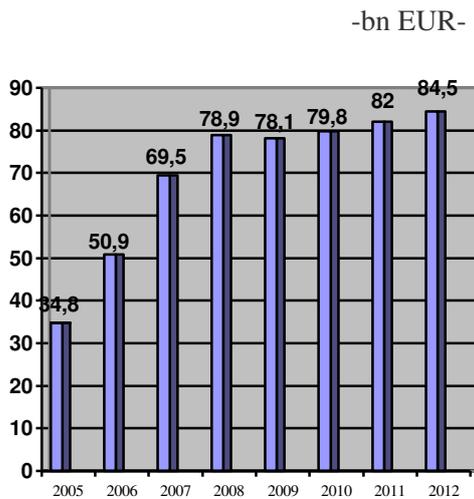

Source:www.ecb.int

Increasing inclination was determined in principal, for the second consecutive year, by Poland, who stays a leader with a total bank assets of 309,80 billion EURO being a powerful engine of growth, if we consider the market size of the area. In the same time, countries like Croatia, Slovenia and Bulgaria, recorded insignificant increases on the value of bank assets for the year 2012.

The activity of credit institutions from our country continues to be moderate in 2012 as shown by the evolution of total net assets increased by only 2,8 billion EURO. (Figure 2)

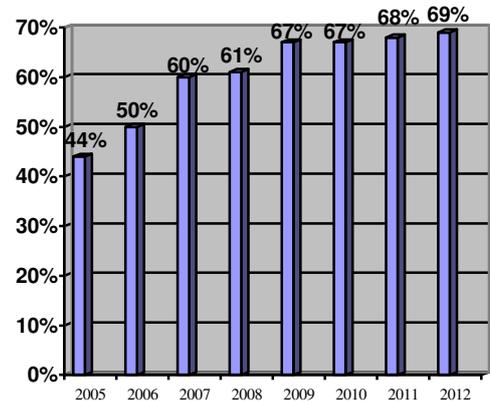

Figure 2. The evolution of the aggregated bank assets
-bn EUR-

Source:www.bnro.ro

Given the international economic and financial context, years 2011 and 2012 can be characterized by a moderation of activity in the banking system from Romania, it was confirmed by total net bank assets development as well as they share in GDP. (Figure3)

Figure 3. The evolution of the share net bank assets/GDP

Source:www.bnro.ro

Regarding the bank loans in the Central and Eastern Europe it increased by approximately 13% in nominal terms compared with the values recorded in the previous year.

Their distribution according to the destination is not equable valid for all countries in this area, there are significant differences.

So if countries like Slovenia, lending activity focuses on the corporate sector, at the other end are countries such as Romania where the attention is focused on the retail and consumer loans register a higher level.

Credit institutions in our country had to face pressures caused by fierce competition recorded in the banking sector and because the parent bank reduced the volume of funding.[3]

Difficult situation recorded in the groups levels and their decision to focus on banks markets where is operating the banking institution mother determined foreign owned banks operating in our country to reduce the exposure to the Romanian banking sector, which can put pressure on local subsidiaries in Romania. [4]

Total bank loans continued on a decending inclination in 2010, the volume of granted funding was 61,2 billion EURO with

about 3.3% smaller than the previous year. The main causes who stand on this development were determined in part by:

- fear of risk
- non-performing loan
- low profitability
- decrease the available income of population
- increased inclination for savings

All these factors have influenced the lending process and helped to get a negative evolution.

Regarding the structure of the loans, lending Corporate segment continued to grow in 2012 reaching a level of 26.7 billion euros, while household loans remained at a relatively stable nominal values.

High growth rate of non-governmental credit (granted to households and non-financial companies) until 2008 was replaced by a contraction in the last two years. So if the growth rate of loans in lei reached negative levels in real terms since 2009, this inclination being maintained and last year, foreign currency loans had a different dynamic pace of growth in real terms and reached negative values in January 2010, resuming positive growth, but quite insignificant for the second half of 2012.

Unfortunately, Romania recorded the highest level of non-performing loans from CEE countries.

Evolution of these non-performing loans continued to increase in 2012, although the growth rate was lower than the previous year, leading to a worsening of credit quality in many banks, which significantly affected the profitability of the entire banking system, the recording at the end of a year was a lost of about 100 million EURO.

All of these factors: reduced lending activity, increasing the number of non-performing loans and higher costs determined by the changes in regulations imposed by the National Bank of Romania regarding the lending process, leading to an increase higher and higher of pressure on costs to credit institutions activity, prompting them to exert a strict control on medium and long term on them.

In the year 2012, deposits recorded a positive inclination in many CEE countries. Therefore, unlike the pre-crisis years (2005-2008), many countries in the CEE growth

deposit exceeded or was at the same level as that of loans.

Despite the tendency of savings of the people in our country, the deposit value in Romania remains below the average of CEE countries.

The nominal value of total deposits continued to grow in 2012, reaching 40.5 billion EURO. So, the tendency to save was visible last year. This is because of the appetite of people to save and showing a higher precautionous in the management of revenues.^[5]

However, the average loan /deposit ratio recorded in CEE countries has stopped his strong performance launched in the years before the economic crisis. While in some cases it decreased for most of the countries is still one above par.

In terms of penetration of the cards on the national market, Romania has great potential for development, more so in the last two years the number of valid credit cards and debit cards had a slight decrease inclination compared to the 2007 -2008.

The number of valid card and the value of transactions increased in 2012, compared to 2011. So, there were about 13 million valid cards in circulation and the total value of payment was 1,335 billion EURO from 1,071 billion EURO in 2011.

However, Romania and Bulgaria recorded, per capita, the lowest levels of value of card transactions in CEE countries belonging to the EU. The report credit /capita (0.13) registered in Romania is two times lower than the one in Poland (0.25).

It can be said that in 2012, the banking system was profitable, although only 25 of the 41 banks operating in Romania were actually profitable.

The top ten players in the banking market, the changes were relatively small, considering the total net assets: BCR and BRD remain the biggest players according to market share with a small decrease for both banks in 2011 (Table1).

Besides the two banks recorded the worst financial losses due to costs associated with obtaining non-performing loans.

Table.1 The evolution of banks' market share

Bank	2010	2011	2012
BCR	19.8	20.1	19.27
BRD	13.9	13.6	13.1

CEC Bank	6.4	7.0	7.35
Transilvania Bank	6.2	7.3	8.08
Raiffeisen Bank	6.5	6.7	6.45
UniCredit Tiriatic Bank	6.0	6.3	6.85
Volksbank	5.8	5.0	4.51
Alpha Bank	6.2	4.7	4.50
ING Bank	3.6	4.0	4.51
Bancpost	3.9	3.5	3.31

Source: author's data

The banks situation for 2012 is:

- BCR remains in first place with a 19,27% market share, smaller than 2011, the total value of assets is 70,6 billion lei.
- BRD achieve a market share of 13,1% compared to 13,6% in 2011 and 14% in 2010.
- Transilvania Bank managed the biggest increase reaching 8,08%, up by over 0,7% from 2011.
- CEC Bank, obtain a growing market share of 7,35% compared to 2011. Bank is the most important financial institution owned by the state, and one with a strong network of agents in rural areas.
- Unicredit Tiriatic Bank recorded a growth of 0,5% compared to 2011, reaching a market share of 6,85%, despite the problems faced by the parent bank at home.
- Raiffeisen Bank has returned to the share that was in 2010 and 6,45%, after having an increase in 2011 to 6,7%.
- Volksbank Romania has a share of 4,51%, due restructuring efforts after a powerful exploded in the mortgage for the population.
- ING Bank reached 16,5 billion lei and a market share increase by one percent.
- Alpha Bank continued to lose ground because of the crisis in Greece, reaching at 4,5%.
- BancPost, like all Greek banks is losing ground, recording only 3,31%.

3. Conclusion

In the Central and Eastern Europe, Romania has the least banked population together with Bulgaria and Poland. So our country has a level of bankarization of 56%

of the population over 15 years, well below the average of 80% of Central and Eastern Europe.

Banking market in the region suffered a severe decline after the 2008 banking crisis, but started to recover since 2010.

According to Study Financial Market Data Services (FMDS) of GfK, the population level of bankarization has increased lately and is expected to grow further, given the undeveloped potential of countries such as Romania and Bulgaria.

The most used bank products are current accounts and bank cards. So, in the first half of this year in Romania, one third of Romanians have at least one current account, and over 40% of the citizens of countries have a credit card. Almost 39% has a debit card and 4,5% of the people a credit card. Compared to 47% of the population in Central and Eastern Europe has a current account, while about 50% have a credit card.

Consequently the main, short and medium term, inclinations of the banking system in Romania can be mentioned:

- increased funding pressures
- reduced lending activity
- increased orientation to attracting projects co-financed from EU funds, considering the low rate of absorption and the fact that there is potential for co-financing of such projects, some banks already positioning itself in this segment
- controlling costs and optimizing the branch network
- changes in the competitive environment, there are already inclinations of consolidation at he levels in the banking groups.

All these factors leading to optimize the banking branch network and then to develop and improve alternative distribution channels to replace traditional network size. [6]

Banks in our country allied European inclinations of development in alternative channels such as mobile and internet banking.

Under these conditions, the main short and medium term inclinations of the Romanian banking system include: small banks repositioning by targeting niche segments, a potential consolidation of the

banking system, increased competition to attract and retain "good" customers, increasing the level of penetration the cards.

As a result credit institutions in Romania have changed the orientation of the rapid expansion mainly based on quantitative targets, to a more qualitative guidance regarding strategy, branch network, product portfolio and cost control.

Models of Voter Behavior

Dinu Gabriel

*Faculty of Economic Sciences / Department of Economic Sciences, “Eftimie Murgu”
University, Resita, Romania,
g.dinu@uem.ro*

Abstract

When there is only the voter in the voting booth in front of the ballot, what is he thinking? His interests? Or his fears? Gestures or words to any of the candidates? How orient the voter in the maze of offers and candidates? Is the choice you make entirely rational? Or does it include trace elements, feelings, likes and dislikes, fears, hopes? No doubt that in many cases, the answer is multivalent.

Key words: voter, attitude, model, behavior.

J.E.L. classification: M31

1. Introduction

The development of decision-making process of voters preoccupied the specialists from the `50s. Of these, the American school of research, which includes Lazarsfeld, Berelson and Katz, developed various theories and explanatory models that we tested on the occasion of various electoral confrontations in the era. In these theories, the focus was either on socio-demographic elements, or the voter`s rationality. In these years that followed, the explanatory models of electoral behavior have been developed and diversified, with progress in shaping consumer behavior of products and services.

2. Theoretical considerations

In 1986, Denis Lindon, from the inventory of existing explanatory models and from a thorough analysis of the factors that can interfere with the electoral decision, he proposed a general structure of an “ideal” explanatory electoral model: the vote of an individual is the result of an interaction between the individual’s political attitudes, on the one hand and on the other hand, the

actual election offer (the number and the characteristics of candidates). The political attitudes, although, can be “explained by the socio-demographic characteristics of the individual, by his past and his personality through his current living conditions, by some influences from their family, their friends and political organizations, and by the recent developments. [1]

Although the advanced model by Denis Lindon is theoretically correct, however, due to the large number of issues that should be taken into consideration, it has possibilities of practical application rather limited. However, there are operational models that take into account a smaller number of factors. They can be grouped into three categories, according to Denis Lindon. [2]

a) socio-demographic models: correlation based on the electoral socio-demographic decision of the individual

b) psychoanalytic models origins: they consider the establishment of relationships between the deep and past electoral decision and the personality of the individual

c) attitudinal models: this time the electoral decisions are correlated with the individual’s political attitudes.

Zaharia build an explanatory model from the category of attitudinal patterns “with a strong application “that” highlight how voters think and how they decide the election” items that “should be taken into account in the drafting of the electoral of the candidate. [3]

Trying to unify the value system of the individual and the society in which he lives, given that many individuals value system differs from the system of socially accepted values. In this situation, when the rationality understands the relationship between value systems and decision voter, the voter thinks it is an image of themselves as reasonably as possible, though, for others, it seems unreasonable. [4]

The result in what can and should be a party or a candidate seeking to compete successfully in an electoral competition is:

1. To identify the main segments of voters (to be determined on the basis of socio-demographic, but also attitudes and behavior)
2. To determine the main factors influencing the choices of each segment of voters
3. To agree endogenous components-political program, language, dress etc. with the expectations of voters who intend to be addressed.

3. Models of electoral behavior

Currently, the literature distinguishes three categories of explanatory models [4]

A. Socio-demographic patterns. Socio-demographic models aim to highlight the probabilistic nature relationships between social and demographic characteristics of voters (sex, age, level of education, profession, occupation, income, place of residence, religion, etc.) and their vote. There are many disputes about how socio-demographic characteristics of an individual or a corporate can be held liable for the political choice. However, as will be seen in one of the subsections, such inferences can be made. It should be emphasized, however, that they should be interpreted more as trends, as inclinations, as probabilities rather than a strictly defined statistical and causal relationships (for example, whom only vote with the party X or the candidate Y will be voted only by townspeople etc)

B. Models of psychoanalytic inspiration. These models explain the voting behavior of an individual as being primarily inspired not by rational considerations, but it profoundly affect attitudes and even unconscious on the candidates. These attitudes include: the need for authority and rebellion against authority, fear and desire security, degree of identification-as perception, not unconscious desire-of the voter with his candidate, on the contrary, the hatred and aggression towards it. These models have a high degree of arbitrariness or, at least, the analysis made in the light of them may be more difficult to quantify. The result of an election campaign is a feeling in the minds of voters, with all its train of features: irrational collective imaginary, ineffable, hope, imagination, self-

suggestion, etc. The psychoanalytic theories have had a deep impact on marketing in the 50s, especially in terms of research on motivation: commercials for products whose packaging is addressing to the consumer subconscious, stimulating fantasy and imagination, the use of sexual symbols in promoting products etc. So, an electoral campaign can successfully use techniques for creating the image of the candidate corresponding to one or another of the dominant models of voter decision that he wants to persuade. However, a candidate who wants to be seen as a bringer of peace in a world governed by chaos risks, if the techniques are not properly mastered, to be assimilated with the messenger of that chaos (see the video of PDL in the presidential election in 2009 between the two rounds regarding the restoration of communism if PSD returns to power).

C. The attitudinal models are most commonly used and present the vote of an electoral election as a resultant vector with cognitive components and affective dimensions of his personality.

In extremis, the decision to vote for a candidate can be assimilated by the decision to buy a product. Analyzing how making a purchase decision if the buyer is forced to choose between several brands representing the same type of product, it is found that there are many attitudinal explanatory models of its decision, on which we will mainly stop in this book.

C1.The disjunctive models: the buyer believes that it must be chosen the brand with the best score for an attribute, no matter the importance of the attribute to the consumer (for example choosing a perfume that has a special package, even if it is more expensive or does not smell so good as another scent that the consumer would have chosen).

C2.The connective model: the buyer sets a minimum threshold for each attribute that you consider important. The brands that have not scores “to pass” to all attributes that are considered important will not be bought.

C3.The lexicographic model: the buyer operates in a sequential manner. He ranks attributes of a product according to the importance you attach to the overall assessment of the product. Then compare the marks on the most important attribute and retain the one that has the highest score. If

there is a tie between several brands, the buyer goes to the second attribute importance, and so on. This pattern is the opposite situation of an impulsive, unconscious choice, the buyer can not justify why he purchased that product.

C4. The compensatory model: unlike the three previous models, this model developed by Rosenberg and Fishbein, believes that it is recognized by a buyer offset the lower scores on some attributes and higher scores on the other hand, for the same product. In essence, it is a linear-additive model, the consumer choosing the brand with the best overall score, obtained by summing the products between the importance of the attribute and the scores of each brand on that attribute.

Another classification proposed dividing the attitudinal models into two classes: compensatory models and non-compensatory models. The compensatory models show that the high score obtained for a product compensates the low score obtained by the same product for another attribute. The compensatory model highlights the importance of the overall evaluation of the product. The non-compensatory models assume that high scores for a product attribute does not compensate for low scores obtained for another attributes. [4]

The same classification considered the non-compensatory models as hierarchical; the buyer chooses an attribute of a product and compares it to the same attribute of another product. The process continues for all the attributes and then is ranked according to their scores. The non-compensatory models have as submodels, the conjunctive disjunctive and lexicographical model (discussed above) and, in addition, the elimination of their appearance. In the decision model, each product is viewed as a collection of aspects (attributes). The choice is done hierarchically, the alternatives are compared on the most important attributes, and alternatives as “crossing threshold” are removed. This second classification concludes that persons placed in a position to choose between several products used in 90% of cases, the lexicographic model, followed by the compensatory model. In terms of the provided information and the description of the models, the two classifications do not differ significantly. They show concern for refining researches and theorists working

tools in the analysis of consumer decision-making process (and in this case, the voter).

How do these models predict the decision of the electoral strategy of the party or the candidate? The answer to this question might be formulated by analyzing the consequences of using each of the four models:

The disjunctive model is the least rational and therefore the possibilities that have the candidates to influence voters who adopt this model are very limited. It must be identified and emphasized those attributes likely to cause spontaneous decisions from voters. In practice, both the identification and the improvement of the attribute are very difficult.

The connective model is synonymous with the choice by exclusion. The voter will eliminate the candidates who have a weak point, considered as unacceptable. The interest of the candidate is to improve its image on the dotted improperly attributes, the weaknesses, as SWOT analysis which will be further developed. For this it is necessary to change the behavior in the manner required by the electorate and to emphasize the change on all the occasions in public. But we must take into account that an enhanced image process is too long and another sudden change in the behavior leads to counterproductive and low credibility.

If the decision model applied is lexicographical, the candidate will determine the hierarchy of attributes that the voters make, will use a simple call strategy on the most important attribute in order to emphasize the differences in relation to other candidates. The communication effort in this direction should be maximum, provided that the actual candidate possess the qualities that he highlights (or create the impression that the created image fits to him) in its communication policy.

If the voters decide in a compensatory manner, the candidate has the interest to determine the hierarchy of attributes and try to improve their obtained scores in all the attributes, but especially determinant attributes. The communicational strategy must rely on a called multiple strategies or the ideal content should be different depending on the target segment which it is addressed and the communication effort should be distributed in a balanced manner between the various determinant attributes.

4. Conclusions

These models can be applied equally to a consumer product or service, and also to a person who votes on a party or a candidate. The identification of the type of conduct adopted by the voter is essential because the party or the candidate will have to formulate different strategies to adapt better to the way of how the voters choose the decisions.

A serious analysis of the political market is impossible without studying voter behavior (or user) offers political, macro-environment is an essential component of marketing that can be influenced by marketing actions of the political structure. The study of human behavior is essential for understanding how people will react - most often very different - methods of marketing of that structure.

Voter behavior is required, we consider a special field of study of marketing as methods of market analysis - with complex issues and continually adapt - requires knowledge of the mechanism of transformation of social needs in bidding policy.

Romanian society, like all contemporary societies, is in, let's say, a natural and continuous change, amplified by the news

and untimeliness of the transitional period. The pace of change is becoming greater, which makes us believe that it could become downright insurmountable, having already seen the consequences of human behaviors and attitudes that are showing their inability to cope.

A Study Regarding the Tourism of the Area Iron Gates

Dinu Loredana

*Faculty of Economic Sciences / Department of Economic Sciences, “Eftimie Murgu”
University, Resita, Romania,*

L.dinu@uem.ro

Abstract

The paper wants to highlight the importance of promoting the tourism area “Iron Gates”. Analyzing the current situation of the tourism in the area we can say that the tourist area Iron Gates is a tourist area with a quite valuable potential.

Key words: tourism; tourists; focus group.

J.E.L. Classification: L83; L80.

1. Introduction

The tourist area „Iron Gates: is located in the south western Romania along the Danube valley, belonging to most of the Western Carpathians (Banat Mountains) and the western extremity of the Southern Carpathians (Cerna, Mehedinti and Tarcu Mountains). However this is a complex cross-border, where the Danube is the generator of the impact on the landscape.

If from the past until present, the gravity center of the tourist traffic was either Herculane or Drobeta-Turnu-Severin, it seems that the future includes new forms of tourism such as those caused by the increased interest for the areas with agro-tourism attractions and portions of parks and nature reserves, which will raise the attractiveness of Danube, placing in the area a new pole of attraction. The less conventional accommodation structures that exist in the area between Orsova and Svinita, demonstrates, fully, the interest for a new form of tourism in the area.

The tourist area „Iron Gates” is a less mature area, because the main tourist activities and tourist flows are centralized in a few poles like: Baile Herculane, Orsova and Drobeta Turnu Severin, each of these being representative for a particular type of holiday. For example, Baile Herculane is a

traditional center for health tourism, staying for at least 7 days, Orsova is a recently established center for the weekend tourism and Drobeta Turnu Severin, a traffic tourism or a transit with a short stay. Extending this tourist area by including in the circuit and other areas of interest will lead to the increased tourism phenomenon.

In our country, the situation of the resorts went into a period of decline after the revolution of 1989, which decreased the quality of tourism into an alarming proportion. However, some states, earned over time an undeniable reputation. Among these states, one of the most known, Herculane, enjoys a place of honour, because of the history of places, springs, establishments spa and other advantages in the area.

Herculane Resort is located on both sides of the river Cerna, one of the most beautiful gates of the road between Bucharest-Timisoara, at a distance of 364 km railway from Bucharest and 169 km from Timisoara.

Herculane Resort, is a city which is dominated by a permanent tourist resort of international interest, the resort itself comprises two districts: Zavoi and Pecinisca.

Herculane Resort is accessible by all means of transport. It is on the main thoroughfare-rail and road-Bucharest-Timisoara, which binds to the major capitals of Europe.

One of the favourite targets of tourists is “Pestera Haiducilor” and “Grotta cu aburi”, but you can also visit “Piscul Ciorici”, “Varful Elisabeta”, “Poiana cu peri” etc. On the mountainous ridge are some tips such as: “Piatra Camenei”, “Inaltatul”, “Medved”, “Varful lui Stan”.

Among the various trips, the ascent at White Cross is the most enticing and often sought.

“The Cat’s Path”, how it is named the trail that goes to the left, from 50-60 m of the

White Cross, leads to Jelarau source and from here to Suscu (1200 m).

Leaving to the left “The cat’s path”, you can arrive at “Serban’s Cave” and “Serban’s peak”, where we can also find “The Domogled peak” (1106m).

There are many other interesting places to be visited, marked or unmarked trails that lure the tourists coming from every area.

You can organize trips at Semenici and Valea Cernei, Cheile Cernei, in Drobeta Turnu Severin (Podul lui Traian, Tabula Traiana), in Targu Jiu (the museum complex Constantin Brancusi), you can also the monastery from Tismana, tours at Ponoare Karst.

The development strategy of promoting the tourism resort must start by understanding the strategic thinking of all the activities and its implementation. Marketing plays an important role in the elaboration of this strategy by providing the required information to develop the strategic plan. However, in Romania, the place that is occupied by marketing in the structure of a business differs from one case to another, so, in some cases, marketing is lacking or is only “with the name”.

2. Results

The research of tourism phenomenon integrates a wide thematic range, from the conceptual clarification and defining its place in the strategy of development, to highlight the determinants, the development trends and the forms of expression of the coordinates and market mechanisms and also to assess its impact on economic, social cultural, environmental and political plan. All this are based on using a variety of data resources, of a research tool where are not missing the mathematical models and comparative analysis, on the achievement of some investigations from a marketing perspective or modern management. [6]

The existence of each individual, but also of the society as a whole, it would not be possible without consumption, each of us having the role of a consumer. Everyone feels the need to leave the environment in which he lives every day in order to recover physically and mentally after a day, a month or a year of working or simply he wants to visit new places and meet new people. That

person becomes a consumer of tourist services when deciding and going on a trip for a few days, or only to spend a vacation.

Romania, by the variety of the natural elements, by the multiple evidences of a millenary history and culture, also by buildings acquired over the years, has a reach tourism potential exploited to some extent. In what follows I have tried to present a study about a wonderful tourist area which came into obscurity.[5]

This theme follows a very important issue, namely the consumer awareness towards the tourist area Iron Gates.

Just hoping that I will find the answer to this question, I have conducted a group discussion (like “focus group”) at which took part a number of 10 people. To form a homogeneous group of people (this is required in such studies) were chosen people whose main feature (common) is the passion for tourism in general and especially the lovers of mountain and hiking outdoors.

To study the awareness of the tourist area Iron Gates were used information derived directly from the consumers.

The structure of the group who took part at the discussion, according to the criteria of gender and age was as follows:

- under 20 years: 2 males and one female, total: 3 people;
- 20-40 years: 3 males and 2 females, so a total of 5 people;
- 40 years: a male person and a female, so a total of 2 people

It can be seen that the group of the 10 subjects had a total of 6 males and 4 females.

Regarding the origin of the participants, they come entirely from urban municipalities respectively Drobeta Turnu Severin and Resita. The close relatively of those who participated at the discussion represented by the investigated tourism product can be build in a hint of bias towards the studied area, taking into account that we are talking about an area from their home counties.

The discussions were held, of course, due to the tourist area Iron Gates, taking into account the study of awareness of the potential tourism of this area.

Due to the absence of technical means that are necessary for such methods (audio and video devices), the assessment and quantification of the answers was difficult. That is why this discussion group has

proposed a more general objective, that of revealing the awareness of the studied tourism product among some potential consumers.

The receptivity of the people who participated in this discussion was high, recording important contributions of the participants in treatment the proposed topic. This made the task easier for the animator (moderator), especially since there was a very clear common direction about the opinions of the participants.

The discussions in the interview group had as main objective, as stated, assessing the awareness of potential tourists on the tourist area “Iron Gates”.

Being limited by the lack of special technical means for such studies, the discussions on this subject can be summarized by presenting some conclusions drawn as a common direction regarding this topic.

As a general conclusion of the interview group, it may be said that the awareness of tourist towards the tourist area “Iron Gates” is very low, the area being least promoted in order to attract a large number of tourists.

The knowledge of the participants at the interview was limited, largely, to the following aspects:

- the most participants at the interview felt that the area “Iron Gates” is limited, as tourism potential, only at the area Gura Vail;
- also, most of the subjects have never visited the area “Iron Gates”, their „outputs”, as tourists, are limited at visiting Herculane resort;
- regarding the tourism potential of the area, most of the participants knew only the existence of several caves in the area (especially the Grotto Outlaws);
- regarding the floristic richness of the area, the knowledge of the participants was limited, largely, only at the existence of the black pine of Banat in the area, and speaking about the fauna, all knew about the existence of a large number of vipers in the area;
- the few participants who had visited the area as tourists, were unanimously agreed that the lack of infrastructure facilities (mainly access roads) and the travel arrangement (no tourist signs and ancient markings) consists the biggest problem which with the area” Iron Gates” is facing;
- everyone who visited the area (actually

only 2 out of 10 people) had done with their own („outputs” of few days with accommodation in tent) and declared themselves very satisfied with the scenery and generally by the encountered natural beauties;

- all the participants in the discussion agreed that the area is far less promoted and the interest of tourism enterprises, especially of the authorities towards promoting the area, is very low;

- about the anthropogenic potential of the area, most of the subjects knew the features and the elements of the existing tourist attraction in the area, especially those from Herculane resort, that are in fact, well known.

3. Conclusions

After the discussions and the interactions of viewers between the participants, concluded the need for a higher promotion of the resources for a superior recovery of the existing tourism potential.

The presented conclusions illustrates, therefore, a low degree of knowledge speaking about the area, which combined with the lack of planning for tourism, leads to remain in anonymous the beautiful area Iron Gate with all its riches and beauty.

The tourism plays an important role that can't be challenged in the national and international economy, in the social behavior of those who practice it in the existence of those who ensure the operation just because of the scale that it took.

The romanian tourism decline has various causes such as economic crisis, low consumption, exchange rate, low quality of services, poor management, marketing almost nonexistent, the lack of strategy and development concept clearly enough field, myopia government policies, dilapidated state of infrastructure, significant investments, competition in the area etc.

Effective exploitation of tourism potential can not be achieved with current national infrastructure.

Tourism is a great chance of rapid economic development of Romania. It has to respond adequately to the Romanian option of integration into European structures and international. Recovery tourism is beneficial throughout the country and its international promotion can become an element of

recovery of Romania. Basis of existing material can be effectively used only by professionals who have mastered the techniques operations and international tourism.

Without tax incentives, without aggressive promotion, without quality services, without modern infrastructure, Romanian tourism will remain only a perpetual chance. It is clear that, for Romania, tourism is a big chance that it must be capitalized at the beginning of the third millennium.

The romanian tourism success depends on the design and implementation of an aggressive marketing- positive, by creating strategies to promote the regions and to build strong brands that will be imposed on a market characterized by fierce competition.

Exploiting the Potential of Agritourism in the North East Region During the Current Crisis

Dionisie Cristina

Economic Faculty – Petre Andrei University

cris_dion@yahoo.com

Abstract

This approach has amply analyzed the influence of the current crisis in the development of the agritourism sector from the North East Region.

The study examines the evolution of some important indicators of agritourism activity and identifies the main causes which contributed to the outlined trends.

The research reveals that the principal condition of sustainable development of rural tourism depends on how bridging strategies, specific policies are correlated with those of the area, which will result in: the orientation of investment towards activities in rural areas, shaping and determining the most appropriate forms of organization of rural tourism; development of support industries in downstream and upstream support rural tourism, counseling and support for business development for farmers and agritourism.

Expanding business in rural tourism depends on creating favourable conditions: food supply, promoting traditions, crafts and the specificity of the countryside, the promotion of housing, the improvement of infrastructure, equipment and services.

Key words: agritourism, rural tourism strategy, tourism management, sustainable recovery

J.E.L.: M16 International Business Administration P5 Comparative Economic Systems

1. Introduction

Endowed with a great potential in agritourism, the North East region, arousing the interest of tourists is independent of the economic situation. Special conditions in running businesses in rural areas require the creation of preconditions for the

harmonization of the economic components of the natural environment: offering various packages of agro-products, the existence of a variety of offers for accommodation; rhythm and supplies in a timely manner with traditional gastronomic products, traditional folk art, craft; promotion of folklore and traditional habits through the packages offered; the existence of an offer for highly paid jobs in rural areas; the creation of the necessary infrastructure in public and private services sector; arrangement of natural surroundings and the observance of ecological requirements.

2. Considerations on the potential productivity of agritourism in the North East Region during the crisis

Researching sources of data from statistical directories, online publications and statistical data according to an enquiry conducted by young entrepreneurs in tourism show the following conclusions on the potential productivity of agritourism in the North-eastern Region during the crisis [1]:

a) The North East Region has a potential interest in agritourism, which capture tourists' interests and tourism entrepreneurs despite the crisis. During the crisis it has maintained the trend of increase in pensions, the number of seats to the category "pensions, villas and chalets" reaching in 2010 and the number 7933 units reaching 401 graded overall Northeast regions in 2011.

b) The preference of tourists for the same sort of tour packages is the same. Thus, the most sought-after rural tourism product packages remain in the areas of Bukovina and Neamț area. The second – area, guesthouses segment is Ceahlău Mountain, particularly in the areas of Ceahlău, Durău, Bicaz.

c) Brand notoriety had a decisive impact in maintaining particular preferences for foreign tourists. Specific offerings of rural tourism and agritourism in Bucovina are most often accessed, due to the notoriety of the brand.

d) Investments, how to manage EU funds for investment and advertising were the key factors for stimulating the rural tourism and agritourism in some areas. The two main resorts of the North East region, Vatra Dornei and Durău benefited from different sources: European funds and particular investments for the development of winter sports in Durău.

e) Better use of the potential in agritourism versus previous periods of crisis in the areas which have diversified leisure travel services. Significant investments have been made in the Arini areas, with ski slopes, ski lift, ice rink, sports fields, swimming pool, which has led to an increase in the number of tourists and make better use of rural tourism potential of the area. Investments in the Piatra Neamț – skiing, gondola, chairlift and tubing have attracted tourists who visited touristic packages.

f) Most areas in North Eastern Region have not adopted and implemented strategies and crisis action plans (local or regional), crisis measures at local and regional level in order to protect and encourage rural tourism and agritourism;

g) In most areas of the Northeast Region, the development of tourism, including the agritourism and rural tourism are not correlated with environmental projects. Tourism Practice in Romania shows that ecotourism strategy remained in reality only in the draft stage.

Evaluation of how to exploit the potential of agritourism must be made in a realistic way, based on the findings and observations on the spot and at the same time, depending on the evolution of the main indicators and tour consumer behaviour during the crisis, compared to previous periods.

Offering accommodation to the North-East Region has increased both in terms of existing units and 18.8% of the seats offered with 3.8% in the period 2009-2011. Moreover, the ability of the guesthouses accommodation has seen a steady growth since the establishment of their initiative, the North East Region has increased four times

its capacities. Most of the new pensions were put into service in Vaslui county (pensions by increasing the offer of 31.1 per cent) followed by Romania (16.9%). However the highest levels of capacity in graded accommodation shall be maintained in the counties of Suceava and Neamț (49% and 47%). Overall, the number of pensions recorded an increase of 6% over the period of the crisis, these accounting for 12.9 percent of those throughout the country.

Table 1. The evolution of guesthouses, villas and chalets (places)

Province	%2010/2009	%2011/2009
Bacău	0,9	3,7
Botoșani	16,9	0,1
Iași	1,3	21,6
Neamț	2,6	-0,3
Suceava	9,0	13,8
Vaslui	31,1	5,0

Source: calculated after Anuarul statistic al României, online, www.insse.ro/cms

Most belong to the middle category of accommodation comfort environments. Suceava is the only county in the Northeast Region with a 5 *. Botoșani County, which has the lowest number of hostels in the region and which records the highest number of seats (23 places for all degrees of comfort). The services offered are: accommodation and meals. Additional services include low cost activities: buggy rides, sleigh rides in winter, hiking, and picnics at Stânele. Most guesthouses have rooms equipped with TV, hot water, breakfast included and access to an equipped kitchen. Rarely is given full Board/half board, laundry service as under. Young entrepreneurs in the tourism investigation revealed three main groups of additional services for the Northeast Region:

1) Services, which should be developed as a priority: carriage rides, tobogganing, cycling, hiking, picnics in the henhouse, transport from the train/coach, ping pong tables, billiards, participation in traditional activities (milking cows, sheep curd preparation, cooking traditional foods, traditional dances, painting eggs, pottery, carving, etc.)

2) Services that should be provided on request of some groups of tourists: ATV

rentals, horseback riding, skydiving, paintball, hunting, fishing, gathering mushrooms, forest fruits, pool, spa, sauna, jacuzzi, hairdresser, training pets etc.

3) Potentials Services: archery, car rides, swimming pool, setting up craft workshops, establishment of recreational areas.

Good access to the rural tourism packages in the Northeast region is reflected by the increase in the number of tourists arrivals in hostels in 2011 with about 40 000 people compared to 2009 and the number of overnight stays with 3.1% overall Northeast Region. Most arrivals were registered in the counties of Neamț and Suceava, registering the highest number of overnight stays (with about 30 percent higher than in the Neamț). High season periods remain December and July-August. The lowest level of tourist activity was recorded in the second half of January, February, March, October and November.

Reduction in the income in the period of crisis has marked some changes in tourism consumption:

- 1) Spend a smaller number of nights in the same bed;
- 2) Reduction to a single night of the weekend tourism;
- 3) Raising claims against the quality of services and the requirement for the greater number of value added services provided in hostels;
- 4) Increased interest and dining preference within the own resources;
- 5) Predominance of appointments on telephone through agencies or specialized units.

The crisis marked the period and some changes in terms of application segments that have appeared in the House of the North-East Region: grandparents with grandchildren, lovers of extreme sports (rafting, endure and climbing); aficionados of organic products, and closets;

Considering the main developments in rural tourism trends, achieving a maximum of touristic services utility is closely related to the overrun of the main constraints related to infrastructure, tourism, environmental factors, the existence of administrative services, supportive resources, the opportunities for achieving financial equilibrium of the fauna, the political and

social conditionality, the existence of information and tourist information centres.[2]

3. Necessity of rethinking the correlation between tourism strategies and development plan

Rethinking the correlation between tourism strategy and strategic plan for development of related tourist areas should be balanced with [2]:

1) Retrieval of business (including projects and business plans) in the content of the rural development policies. In this sense, a positive influence could be the professional identity valorized in rural areas, through its correlation with crafts and traditions of the area; own production of handicraft goods and art handicraft is strongly encouraged; gourmet products from the farm are better sold;

2) Applying modern strategies of tourism from the European model. In this sense one can mention the experiences of European countries: Austria has created "village tourism" and "Recreation Resort rest" in the countryside with a decisive contribution to the development of those areas; Belgium through association of agritourism investors and has created new niches, with a decisive contribution to the development of those areas; Finland by practicing rural tourism and recreational activities in the form of riding and skiing, or in small wooden "castles" has brought a considerable contribution to the development of rural areas; the French model of agro-tourism, which has become a real problem-solving solution of some agricultural problems;

3) Stimulation of farmers and investors for the conclusion of contracts for time sharing their information could constitute a solution and also boost long-term cooperation with a view to the creation of new tourist and agro tourist pensions;

4) Promoting rural tourism and levers available to decision makers on the grounds that the rural countryside and rural life is a common property of all inhabitants of an area, and the great potential of rural space is equally of concern to all.

5) Use of European instruments for availability of funds and the implementation of policies linked to the rural tourism

strategy: the European Agricultural Guidance and guarantee fund (EAGGF); The European Regional Development Fund (ERDF); The European Social Fund (ESF).

6) Rethinking of strategies to launch the Romanian tourist village on the world market through the decision makers at mezo-economic level. The complex process of launching on the market of the village, as a tourism product, should be permanently monitored through the use of consumer/ and tourist vision. The existence of the necessary logistics for knowing consumer preferences and the need to boost the tourist promotion of the Romanian village in the European market.

7) Linking policy of tourism product tourism strategy for the area. Product policy should be foreshadowed by natural factors, infrastructure (general and specific), quality of service, achieving the internationally-agreed standards of comfort. In this context there can be suitable tourism products, in accordance with the requirements of the Organization accepted by the owners.

8) Strategic management and the factors that underlie the development of rural tourism in the North-East Region should be focused on solving the problems of infrastructure and logistics divisions, those related to the tourist offer and the knowledge of quantitative and qualitative level of the human factor.

9) The main objectives of the strategy planning may include: harnessing the potential of agro tourism; decreasing seasonal, referring to the extension of the tourist season and exploitable for a period exceeding the limits considered specific season; attracting a greater number of Romanian and foreign tourists; Economic and social efficiency of rural tourism activities, through enhanced cooperation and development of partnerships; diversification of rural tourism, by adopting any form of possible alternative activities and facilities in the area concerned; preservation and conservation of the environment and tourist attractions.

Adoption of a framework policy for the prevention of threats to the natural environment because of the natural factors and abusive behaviour from some owners: measures to combat soil degradation and protection of the areas exposed to the risk of

flooding. For this purpose it is necessary to achieve the afforestation in order to correct the abuses made by some owners, through irrational deforestation of certain tourist areas have produced damage in a natural ecosystem. Improving the impact produced by some phenomena requires urgent implementation of public infrastructure, support for less-favoured areas, and improve the quality of the landscape.

The concerns for tourist guesthouses approval should be accompanied by measures which improve the level of development of the area.

Conclusions

Correlation of tourism strategies and policies with those in other fields requires a relationship between tourism and agriculture, tourism and industry between the impact of modernization and the prelaunch of the Romanian village. Pushing forward agricultural programs and support through innovative tourist holdings requires the deployment of new agricultural, handicraft activities in the presence of tourists: carpet weaving, sewing and singing folk music, painting eggs, sheep shearing, etc.

Main measures on the part of local decision-making factors such as financial aid, investment in the development of tourism and craft activities, actions to promote rural tourism, planning for development of sports should be directed towards those areas where farmers are willing to carry out these activities and stand at tourists.

In conclusion, it is possible to boost rural tourism by improving the strategic capacity of the rural space, which requires a collective effort on the part of from all the factors involved in the development of tourism and the economic development of tourist areas in the North-East Region.

Employee Motivation Theories and their Applications in Modern Organizations

Drogomyretska Mariana

Faculty of Economics and Management

*Poltava University of Economics and Trade, Higher Educational Establishment of the
Ukrainian Central Union of Consumer Societies*

mariana.puet@mail.ru

Abstract

The essay is dedicated to the determination of the essence of employee motivation in today's business environment. The main need-based and process-based theories of motivation and the possibility of their application in modern organizations are considered. The existence of the relationship between employee motivation and organizational effectiveness is proved by author.

Key words: motivation, content theories of employee motivation, process-based theories of motivation,

JEL classification: M54.

1. Introduction

Employee motivation is the most burning problem faced by employers in today's fast-moving business environment. The thing is that unmotivated employees prefer to spend little or no effort in their jobs, produce low quality work and leave their job in an organization for better proposals. On the other hand, employees who feel motivated to work are likely to be creative, enthusiastic and productive, turning out high quality work that they willingly undertake.

That is why the given essay is dedicated to the development of better understanding of various employee motivation theories and the determination of possibility of their using in modern organizations.

2. Defining Employee Motivation

The Webster's online dictionary defines motivation as the psychological feature that

arouses an organism to action toward a desired goal; the reason for action; that which gives purpose and direction to behavior [1]. It goes without saying that motivation is the willingness to work at a certain level of effort. Every employee has different ways to become motivated. For this reason employers need to get to know their employees very well and use different tactics to motivate each of them based on their personal wants and needs, values and goals, intentions and expectations.

According to Edwin A. Locke and Gary P. Latham [2], the concept of motivation refers to internal factors that impel action and to external factors that can act as inducements to action. We can safely assume that the internal motivational factors are created from within the human itself and can be affected by the wish to perform or self-development. Instead, the external motivation factors are created from the outside and are outside control of an individual. These could include organizational policies and practices, working conditions, salary, interpersonal relationships etc. Obviously, motivation can influence not only the acquirement of person's skills and abilities, but also the way and the degree in which these skills and abilities are exploited.

We identified that in the whole world there are numerous definitions of motivation, which is logical, because there are many different personalities, interested in doing research in this broad subject area, as well as various motivation theories and programs exist in organizations at all times.

We completely agree with Dwight D. Eisenhower [3], famous as the thirty-fourth President of the USA, that “motivation is the art of getting people to do what you want to do because they want to do it”. Moreover, we

have every reason to believe that motivation is an effective and dynamic instrument in the hands of every manager for inspiring the workforce and creating confidence in them. Through the employee motivation, management creates “will to work” which is necessary for the achievement of organizational goals.

3. Historical Overview of the Field of Employee Motivation

It’s important to keep in mind that historical views on motivation, although not always accurate, are of interest for several reasons. For one thing, these approaches provide a foundation for contemporary thinking about motivation. For another, because they generally were based on common sense and intuition, an appreciation of their strengths and weaknesses can help managers gain useful insights into employee motivation in the workplace.

One of the first writers to address work motivation over a century ago was Frederick Winslow Taylor (1856 – 1915), an American mechanical engineer who believed that workers are mainly motivated by the paycheck and they don’t like working at all [4]. Taylor suggested that workers would need very close supervision and that production should be broken down into small but measurable tasks in order to ensure the highest possible output from workers [5]. Over time workers got bored with the routine nature of their repetitive tasks, they wanted something more than just pay. From these and similar observations we may generalize and say that Frederick Taylor was right at the point he started but wrong on where he believed the need for motivation stopped.

3.1. Content Theory Approach to Employee Motivation and the Possibility of its Application Nowadays

By the 1950s, several new models of work motivation emerged, which collectively have been referred to as content theories. Often criticized as being descriptive, these theories focus on what motivates employees to choose certain behaviors.

The most recognized of all the content theories of motivation is Maslow’s Need Hierarchy Theory, which suggests that as

individuals develop, they work their way up a hierarchy based on the fulfillment of a series of prioritized needs (see Figure 1).

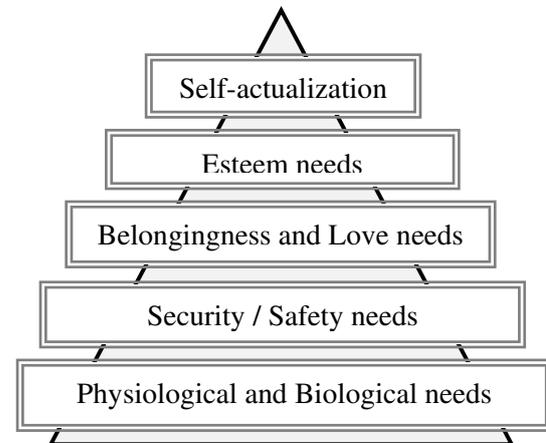

Figure 1. Maslow’s Hierarchy of Needs, an original five-stage model [6]

On the basis of the given model we can assume that physiological needs are the basic needs for sustaining human life. These needs include food, shelter, clothing, rest, air, water, sleep etc. They lie at the lowest level in the hierarchy of needs as they have priority over all other individual needs. Unless and until these basic physiological needs are satisfied to the required extent, other needs do not motivate an employee in organization.

Speaking about security or safety needs, it should be mentioned that these are the needs connected with the psychological fear of loss of job, property, natural calamities or hazards. An employee wants protection from such types of fear. He prefers adequate safety or security in this regard i.e. protection from physical danger, security of job, pension for old age, insurance cover for life and so on. The safety needs come after meeting the physiological needs.

Social needs, which include such things as love and belongingness, occupy the third position in the hierarchy of needs. Being the most prominent psychologist of the 20th century, Abraham Maslow (1908 – 1970) suggested that an employee is a human being, which desires to belong to one or another group, regardless if these groups are large or small. By the way, Abraham Maslow argued that esteem needs include the need to be respected by others, need to be appreciated by others, need to have power and finally prestigious position. Once the previous needs

are satisfied, a person feels to be held in esteem both by himself and also by others.

And, finally, self-actualization needs. This is the highest among the needs of the hierarchy of needs advocated by A. Maslow. Self-actualization is the desire to become what one is capable of becoming. It is a “growth” need. Here, a person feels that he should accomplish something in his life. He or she wants to utilize his/her potentials to the maximum extent and desires to become what one is capable of becoming. Though everyone is capable of self-actualization, many do not reach this stage.

Practically, physiological needs of employees in modern organizations can be met by offering a fair competitive wage and lunch/coffee breaks so that the employee feels comfortable that his/her basic needs are satisfied. Next, an organization can ensure that the work facility is safe, so that employees feel physically safe. Modern organization can also have a fair progressive discipline policy ensuring job security. Besides, managers can encourage employees to participate on work teams and/or sponsor informal gatherings so employees may socialize to help meet their social needs. A reward and recognition program for good performance or perfect attendance could help managers to satisfy the employee’s esteem needs. Finally, to help satisfy employees’ self-actualization needs, organizations can offer in-house development, or offer reimbursement for tuition or relevant training seminars.

On the whole, however, Maslow’s theory of motivation is widely accepted but there is little empirical evidence to support it in modern organizations. The pattern of hierarchy of needs may not be applicable uniformly to all categories of employees, because each person has plenty of needs to be satisfied, which may not necessarily follow Maslow’s need hierarchy.

To bring Maslow’s need hierarchy theory of motivation in synchronization with empirical research, American psychologist Clayton Alderfer (born in 1940) redefined it in his own terms [7]. His rework is called as “ERG theory of motivation”. Instead of the five needs that are hierarchically organized, Alderfer proposed that basic human needs may be grouped into three categories, namely “existence” (E), “relatedness” (R) and

“growth” (G). Actually, existence corresponds to Maslow’s physiological and safety needs, relatedness corresponds to social needs, and growth refers to Maslow’s esteem needs and self-actualization [8]. Alderfer believed that needs are met in no specific order, while Maslow’s theory states that needs are met one by one and in a specific order.

Another content theory of the same period is Herzberg’s Two Factor Theory, also known as the Motivation-Hygiene Theory, which postulates that there are certain factors in the workplace that cause job satisfaction, while a separate set of factors cause dissatisfaction [9]. Famous American psychologist Frederick Herzberg (1923 – 2000) classified these job factors into two categories: hygiene and motivational factors.

Hygiene factors are those job factors which are essential for existence of motivation at workplace. These do not lead to positive satisfaction for long-term. But if these factors are non-existent at workplace, they lead to dissatisfaction. On the contrary, motivational factors motivate employees for a superior performance. The motivators symbolized the psychological needs that were perceived as an additional benefit [10]. Generally, Herzberg’s Two Factor Theory can be a valuable aid to managers of modern organizations because it points out that improving the environment in which the job is performed goes only so far in motivating employees [11].

Furthermore, McClelland’s acquired-needs theory is the one content theory of employee motivation that received the greatest amount of support in modern organizations. According to this scientific approach, individuals acquire three types of needs as a result of their life experiences [12]: the need for achievement, the need for affiliation and the need for power. All individuals possess a combination of these needs, and the dominant needs are thought to drive employee behavior.

Actually, David McClelland (1917 – 1998), an American psychological theorist, stated that most people do not possess a strong achievement-based motivation. Those people, who do, display a consistent behavior in setting goals. That is why organizations meet achievement needs by providing employees with challenging assignments,

competitions and rewards for excellent work. Power needs may be met by offering opportunities for advancement and increased responsibility. And employers can meet affiliation needs by creating a team environment that is safe and respectful for all employees.

Acquired needs theory indicates the following characteristics and attitudes of achievement-motivated people in modern organizations:

achievement of objectives matters more than material or financial reward;

greater personal satisfaction is felt by achieving the goal than from receiving praise or recognition;

money is regarded as a measure of success, but not the end in itself;

neither status nor security are prime motivations;

achievement-motivated people constantly looking for ways of doing things better;

achievement-motivated people will gravitate towards jobs and responsibilities that challenge them and satisfy their needs - for example sales and business leadership and management;

achievement-motivated people have the capacity to set high personal goals that they believe to be attainable [13].

It's self-evident that all four of these content theories are helpful in understanding employee motivation on the basis of needs. However, other theories of motivation also have been posited and require consideration.

3.2. Process-Based Theories of Employee Motivation, Widely Used in Modern Organizations

Process-based theories of employee motivation are concerned with how motivation takes place. They focus on why people choose certain behavioral options to fulfill their needs and how they evaluate their satisfaction after they have attained their goals. Two of the most recently popular process theories with a cognitive perspective are the Expectancy and the Equity Theories of Motivation.

Thus, Expectancy Theory is based on how we want something and how likely we think we are to get it. The formal framework of expectancy theory was developed by Victor Vroom, a business school professor at the

Yale School of Management, who was born in 1932 in Montreal, Canada.

This motivation theory states that if an individual believes he or she can do something then he or she is more likely to accomplish it. Thoughts and efforts are vital to this theory because if someone does not think they are able to do a task, he or she is not likely to put forth much effort. Therefore, motivation is decreased. Failure does not motivate a person to try harder. Successes, even if they are small, motivate people to improve [13].

In deciding how much effort to put into a work behavior, individuals are likely to consider:

their expectancy, meaning the degree to which they believe that putting forth effort will lead to a given level of performance;

their instrumentality, or the degree to which they believe that a given level of performance will result in certain outcomes or rewards;

their valence, which is the extent to which the expected outcomes are attractive or unattractive.

On the contrary, Equity Theory attempts relational satisfaction in terms of perceptions of fair/unfair distributions of resources within interpersonal relationships. It was first developed in 1963 by John Stacy Adams, a workplace and behavioral psychologist, who asserted that employees seek to maintain equity between the inputs that they bring a job and the outcomes that they receive from against the perceived inputs and outcomes of others [14]. It is worthwhile to mention that inputs are logically what we give or put into our work. Outputs are everything we take out in return. These terms help emphasize that what people put into their work includes many factors besides working hours, and that what people receive from their work includes many things aside from money [15].

In short, we each seek a fair balance between what we put into our job and what we got out of it. But how do we decide what balance can be considered as a fair. The answer lies in Equity Theory. What matters here is that the three primary assumptions applied to most applications of Equity Theory in modern organizations can be summarized as follows [14]:

employees expect a fair return for what they contribute to their jobs, a concept

referred to as the “equity norm”;

employees determine what their equitable return should be after comparing their inputs and outcomes with those of their coworkers. This concept is referred to as “social comparison”;

employees who perceive themselves as being in an inequitable situation will seek to reduce the inequity either by distorting inputs and/or outcomes in their own minds (“cognitive distortion”), by directly altering inputs and/or outputs, or by leaving the organization.

4. Conclusions

Coming to the conclusion, it is important to note that most organizations which operate in different fields are spending so much money trying to inspire employees that they have spawned an industry, often called as ‘the motivation industry’. It’s a multibillion-dollar business in which top gurus command fees of up to \$65,000 for a speech. Billions of dollars of rewards are sold to companies – from T-shirts to exotic vacations – to be dangled in front of workers to boost performance. Trouble is, there has been exhaustive academic research trying to find out what motivates workers, and it has turned up almost no evidence that motivational spending makes any difference.

In general, motivation offers several benefits to organizations and their employees: higher efficiency, reduce of absenteeism, reduce of employee turnover, improvement of a corporate image and good relations and encouraging of initiative and innovation. Thus, we can’t disagree with Rick Pitino [16], highly successful and noted American basketball coach, who said: “The only way to get people to like working hard is to motivate them. Today, people must understand why they’re working hard. Every individual in an organization is motivated by something different”.

Emotion Management in Health Care Services

Grigore Claudia

Abstract

An exploratory investigation of the relationship between employees' emotions and their outcome at work was developed in this study based upon three main dimensions resumed by the scientific literature in this field: a) affectivity as a determinant of attitude at work; b) the emotional state of mind as a determinant of employee behavior; c) working activities that involve employees emotions.

This paper focuses on the analysis of the last dimension, referring to health care services, area where the emotional involvement of healthcare professionals is extremely high. Starting from the idea that the emotional health of employees is directly reflected in the quality of health services, we believe it is essential to draw attention to some activities that involve more than performing the tasks and responsibilities mentioned in the job description.

Key Words: emotional management, medical services, emotion in health care services, medical staff, patients-medical staff relation.

J.E.L Classification: I 12, J 24, L 84

1. Introduction

Emotions management in the workplace is a relatively new subject in the literature. But, in the last three decades there has been a growing concern of researchers from different fields such as psychology, economics or management, regarding this concept. Challenges emerged from the economic and social environment, increased pressure from both inside and outside the organization, gradually more active

requirements expressed by the clients, business risks or the growth of stress factors are just some aspects that contributed to the emergence of the study regarding the employees' behavior in workplace. With the time pass, an increased influence of those factors led to some changes in the management style and in some organizations' vision.

2. The increasing importance of feelings

A new tendency arose in rivalry arena of the economic activities: a shift from "rational organization" to the "emotional organization" [3]. This represents actually a trend that generated a new approach to economic entities. In this context, the emphasis is on analysis of the elements of emotional and social impact on health human resources, in terms of cause-effect relationships.

The effects are particularly noticeable in the services field where direct contact with consumers may generate high emotional involvement. If we focus on the healthcare sector, we see that affection, communication, emotional involvement and sensitivity are key elements in building relationships between healthcare professionals and patients. Obviously, the most important position is held by doctors.

Latest studies on human resources in the health sector have a significant contribution in redefining the role of human capital in the sanitary units. The researchers point out that the medical profession whose purpose is the "defense of the most precious value of human - health" is clearly superior to other professions which only satisfy the specific needs [1].

Practicing a medical profession emphasizes, among other things, its acting a psychological role. The nature of activity

involves the expression of some specific emotions, very deep. Beyond the effective responsibility, physicians represent a real moral and psychological support for patients. According to the Code of Medical Deontology, the physician should be an ethical-professional model that prioritizes the interests of the patient in detriment of any other type of interests [13].

Physicians' behaviors play a key role to improve the health of the patient. Therefore they must provide trust and safety that health problems will be solved.

The literature underlines the importance of adjusting feelings and emotional expressions of the physicians to the patients, especially when they communicate the diagnosis. Physician behavior in such situations generate a series of questions, such as: How much emotional involvement is there in this interaction? What professional attitude must they have to the patient? How to manage the patient's feelings and emotions in a critical situation? [9].

3. Managing Emotions at Work

Feelings have nowadays become one of the most valuable aptitudes an employee can have. Regardless of all the technical knowledge one may have, the way we display our image in front of our bosses, our clients and even our partners set the difference from work performance to mediocrity. Emotions are therefore managed in order to create a sense of courtesy, warmth, happiness or even sadness.

And all this aspects have a greater resonance when talking about medical services. Patients should not only be cured from their medical problems, but they ought to get comforted for the emotional pain that an illness may entail [4], [6], [5].

Arlie Russell Hochschild [5] first presented in a theoretical manner how employees actually manage their emotions at work. Skills are no longer defined in this perspective in terms of technical competencies, but of the means the employees use to handle their own emotions when interacting with clients. This process where feelings get actually managed in order to display a publicly desired image was called by the author as “emotional labor”.

Such efforts of displaying other feelings

than the ones a person may actually have were thought to be best applied in the service industry where the interaction between customers and employees is the key ingredient for companies to survive in a competitive environment. In order to better understand this standpoint Wharton [11] has argued that services are best differentiated from goods by the fact the first represent “intangible activities, that are created and consumed simultaneously as they are delivered to the end customer through the social interaction between their supplier and the client” (1993, pp. 206).

Even though we may speak of private companies or public institutions, services are the ones that finally dictate how employees should really perform a specific role when interacting with clients or citizens. And this activity gets even tougher when a person should hide feelings of sympathy or sadness towards a grieving patient in order to show an image of professionalism and to offer comfort for any physical or mental pain.

4. Emotional effort in health care services

Depending on the job a company requires an employee to perform, there can be identified different types of efforts like the physical or intellectual ones. However, the current scientific literature on organizational behavior and human resource performance speaks of a third type of effort: the emotional one [10].

Furthermore this gets more difficult in case of physicians who have to interact with patients and their families. How would the medical staff feel in a situation when they would need to tell a family that one of his members is about to die and there is nothing else to be done? Surely that physician would try to display an image of comfort and understanding for the family's potential loss or grievance. This is actually where the emotional effort really interferes as the medical staff ought to perform not only the therapeutic act, but also the emotional support for both patients and their families.

Some authors [8] even argued that such situations can actually estrange someone from his or hers real way of being. Though a worker may succeed to perform a certain display of comfort or courtesy, some of the experiences from his personal life may set a

mark on his emotional background.

For example, a physician who is in the middle of a separation process from his wife will surely find it difficult to smile in front of his patience. However, in this domain, not doing your job properly will certainly affect the services you provide (in this case medical treatment), but it will also influence the patients' well being.

In order to avoid alienation from the authentic self, Conrad [2] suggested three components for emotional labor that companies or institutions should consider when evaluating the performance of their employees and their effort. The first one is the emotional harmony component where a person actually feels the emotions he displays. The second one is the emotional deviance where the worker perform a different role than the one required by the company. Such situation can be subject to disciplinary measures as employees may show feelings of angriness, annoyance or disrespect that may alter the relationship with customers and their perceptions over the service quality. The third component in this perspective is emotional dissonance. Such situations may come up when a worker shows the emotions a company requires him, but may not actually internalize them as his true believes. This is the part where one could notice the highest emotional effort, but it may also be the situation that determines the uppermost turnover rates.

Patients tend to ask for understanding and comfort when being treated by an illness. This could actually be an instinctive way of performing their role of grievance. However, some medical staff may only consider they are doing their job when performing the physical treatment without taking into consideration the emotional impact an inappropriate behavior can have over the patients' general well of being. It comes almost naturally to think of the difference between public and private medical providers. While the later know that carrying for patients does not only mean to apply medicines, but to comfort the ones who suffer, the public institutions may have a propensity to not take into consideration this perspective.

For instance, an abortion clinic may certainly not only perform the act of helping women to solve an unwanted pregnancy. It

will also have the responsibility to not point the blame on the person who decides to pursue this step in her life. Nurses or physicians who may love children can find difficult to perform this act and moreover to support women in their decision to make an abortion.

A study of this kind was made by Wolkomir M. and Powers J. [12] with the help of participant observations and in-dept interviews in an abortion clinic. The authors think that "workers labeled patients as distinct types and developed specific interactional strategies for each type that enabled them to meet patient needs while simultaneously maximizing the rewards of emotional labor and minimizing costs" (Idem, pp. 155). In this perspective, costs were actually represented by the moral discrepancy between taking a life and the one of the medical act of saving the mother. Patients that were easy to deal with in such cases (e.g. women who made the decision and were comfortable with it) made work much easier for the staff as they only needed to perform the medical act.

Things however became complicated when the patient did not have a clear picture of the consequence the abortion may have or when their decision was not entirely made. Feelings like anger or sadness from women who wanted to take an abortion were increasingly hard to deal with and were perceived by the nurses and physicians as situations that consumed all of their energy.

5. Conclusions

In our opinion, emotion management is one of the most significant criteria for evaluating service performance in the medical domain and the effort entailed by such acts should certainly not be overlooked.

Companies should know how their employees perform their role in the interaction with clients in order to develop the best cultural practices when providing a service.

It is of a greater significance for hospital managers to influence the image physician and nurses exhibit to patience. Such encounters may affect the perceived quality of medical services, but can also alter patients' physical and emotional health.

As we have already argued emotion

management has a special role when coming to evaluate health care service performance. One should not forget however that a physician's activity entails a large number of pressures, especially in situations where so-called ethical dilemmas arise. It is important to note that medical activities involve a sequence of emotional states that may have a direct influence on the quality of services.

The patient is the primary evaluator of quality regarding the health act. Doctor-patient relationship is a key factor in determining the quality level of services received. In most cases, particularly serious cases, this relationship is special, affective type, in which attachment is mutual, both from the patient and the doctors. It should be noted, however, that regardless of the emotion felt, the physician is responsible for the proper treatment of the patient.

In this context, we believe it is essential to make a careful monitoring of the factors that directly affect the emotional health of medical staff, especially doctors, so that high pressure situations may not influence, in a negatively way, the quality of the therapeutic act.

Abstract

The modern times that we all are living, asks us to relate and communicate more and better. The technological boom that helps us communicate faster and easier but the ability to communicate is held only by few. In the business world, communication has become one of the most powerful progress instruments through which charismatic managers raise their business trajectory and through which they send constructive ideas towards the coworkers. The modern manager has to improve constantly their communicative proficiency in order to maintain and improve his company position. The markets evolution, globalization and the prolonged crisis make the managers' adaptation process to more be accelerated and those who can't keep up to risk losing the competition and bankruptcy. All these can be easily avoided if the manager has good communicative competence and preoccupations towards perfecting the communication process in the firm he manages.

Key words: communicational proficiency, managerial communication, organizational communication, communication.

Jel classification: D22

1. Introduction

Communication is for every manager an activity that leads to efficiency [1], an instrument that solves the problems that appear and helps fulfilling the tasks. Because of this, communication tends to be one of the most difficult aspects in managers' work

especially that without a proper communication, managerial or organizational activities can't take place. Communicative competences are a “must have” in transmitting messages both inside and outside the company. The proper reception of the message can be obtained by using efficient communicative strategies that also ensure getting the feedback. To accomplish his role, a manager can rely on the functions of communication, being interested all the time in research, documentation to ensure the best possible relations with all the coworkers. The lack of communication and especially the lack of communication practice can raise exposure obstacles. On the other hand, communicative competence can be developed at any age through study and practice.

2. Literature review

In order to achieve the aim and objectives of communication, the style of communication has to be adequate to the interlocutor [2]. During the time, the interests towards communication and its effects in the organizational life led to the appearance of a lot of theories and patterns and the number of scientific researches increased constantly each year. So, they have come to the conclusion that it is very important to have an open communication between managers and employees [3] in order to maximize the efficiency of the organization through transparency and communication [4]. Researchers' preoccupations in communication targeted towards other aspects like: communication as an occupational discipline [5],

managerial efficiency [6], leadership [7], organizational communicative improvement programs [8] and so on. In order to realize a detailed analysis of the organizational and managerial communication it is necessary to broaden the approach of the researchers by integrating theory and practice [9].

Communicative competences and their features related to managerial efficiency are actually instruments of evaluation of the managerial talent, are the ones that make the difference between a good manager and a so called one. If a manager knows how to communicate, he will win the trust of his coworkers [10] and will have a positive influence on the environment where he works. Perfection in communication can be obtained by organizing from time to time a training program for all the managers or the ones that are related to communication in the firm.

No matter of the communication form or technique, the most important aspect is efficiency [11]. An important feature of the managerial communication is the nonverbal communication [12] through which they can send relevant information to the receivers. Very important is also the way the manager talks to the employees [13] especially if the firm has recently passed through a major change, the aim of the messages being the one of reducing the incertitude towards the new strategy [14].

3. The research methodology

The quantitative empirical research results presented in this paper is a part of a larger research applied in a poll.

The data was gathered through interviews using the face to face investigation technique.

The instrument used to gather the data was the questionnaire which besides the identification data also contained a number of 10 questions related to communication features and the importance of abilities in communication of the managers of the firms that took part of the poll and was applied to the people with leadership and decision function on all three managerial levels.

This part of the questionnaire was adapted according to the features of the efficient negotiator [15] and the meaning difference was used, the four level choice.

The research unit is set as being the

person with the leadership and decisive function in the firms that took part in the research: team leaders, supervisors, managers, department leaders, consultants, general managers and compartment managers.

The observation unit is represented by companies from Dambovită County, mainly based in Targoviste.

The period used to gather data by interviews was January – August 2012. The data were process in a data base as Microsoft Excel sheets.

We appreciated that a better image of the information extracted by the poll is give through medium average of the subjects' estimations. That is why it was calculated the medium score for each type of answer to the 10 questions related to communication process using the formula:

$$\bar{X} = \frac{\sum x_i * n_i}{\sum z_i}$$

Where:

x_i = relative frequency,

n_i = the grade given by the subject

z_i = the total answers.

The study had the aim the analysis of the managers' attitude toward the importance of communication abilities.

Presumptive hypothesis of the research were:

I – Dambovită's managers show a moderate interest towards communicative competences

II – managers underestimate the importance of abilities in communication.

4. The dimension and structure of the sample

The study was realized on a representative sample of 360 firms from each CAEN domain using a random simple scheme.

The sample structure according to the Dambovită Register of Commerce [16] data is representative for the real distribution at the county level (diagram 1).

It was applied 400 questionnaires to more than one manager in few bigger companies and 394 were validated.

To establish the size of the representative sample in order to gather significant statistical data the formula Taro Jamane,

method that starts from the whole number of people without taking into account the characteristics of the population and is recommended for small groups:

$$M_E = \frac{N}{(1 + N * e^2)}$$

Where:

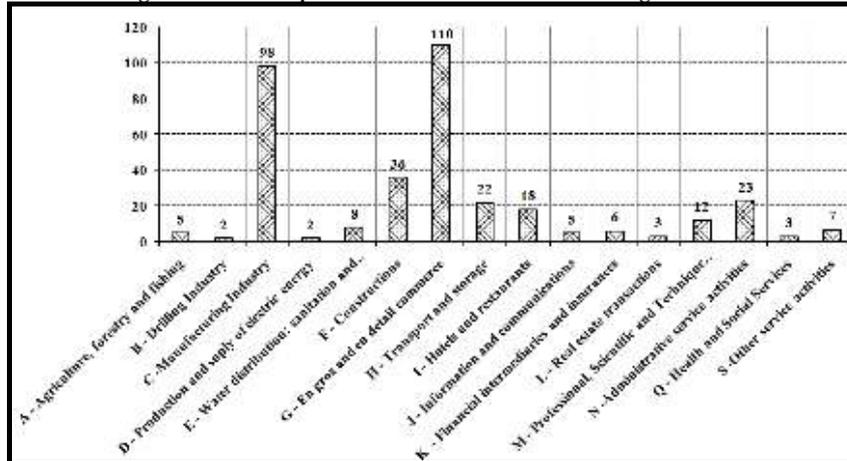

- e = is the maximum admitted error,
- N = is the measure of the studied

group.

The maximum admitted error degree considered is 3%.

The targeted group is represented by all the companies having a number of employees between 10 and 49 from Dambovit County, that means 602 firms.

Diagram 1. The pattern structure according to CAEN

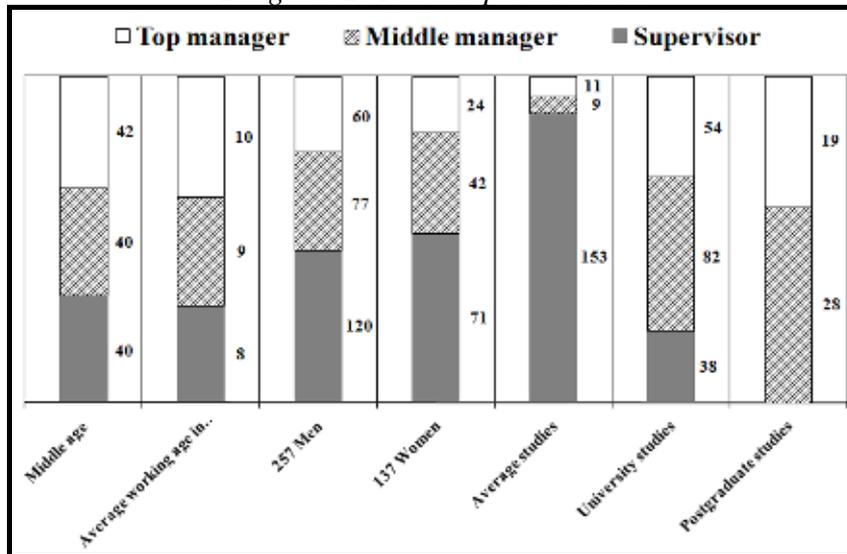

Source: Register of Commerce data base for County Dambovit, 2012

The 394 managers questioned in the study form a similar sample that reflects

the reality of the Dambovit County (diagram 2).

Diagram 2. The sample structure

Source: Collected subjects answers

With the average age between 40 and 42 and the 257 men and 137 women managers, they have an average age in the firm somewhere between 8 and 10 years.

From the educational point of view, from the first line managers or supervisors (191) that took part in the research, 80.10 %

graduated average studies.

Managers of middle level (119) in 68.9 % graduated university studies or postgraduate (23.52%).

From the 84 top managers 64.28 have university studies and 22.61 % have post graduate studies.

The education level of the sample we used is: 44.16 % with bachelor degrees; 11.93 % master degrees or similar and 43.91 % with average studies.

5. The results of the research

For a better clarification of our respondents’ opinions, we sought to clarify the importance of communication needed and

effective skills in uncertainty and complex circumstances.

We asked the questioned managers to tick according to their importance characteristics of the communication abilities evaluated on a scale of 4 points from 1- unimportant to 4- very important. In the table below we have noted with R- the total response, with n- the absolute frequency and with % - the average.

Table 1. The importance of abilities in communication

	R	4		3		2		1	
	n	%	n	%	n	%	n	%	
1. The ability of asking questions	394	72	18,27	24	62,44	58	14,7	18	4,57
2. The ability of expressing thoughts orally	394	15	38,58	18	46,70	41	10,4	17	4,31
3. The ability of listening	394	21	5,33	36	9,14	28	71,8	54	13,71
4. Nonverbal communication	394	42	10,66	58	14,72	19	48,4	10	26,14
5. Paraverbal	394	67	17,01	10	25,89	17	43,9	52	13,20
6. Written communication	394	12	30,71	14	37,82	87	22,0	37	9,39
7. Opening (tolerance towards other points of view)	394	16	41,12	114	28,93	76	19,2	42	10,66
8. Empathy	394	18	4,57	55	13,96	61	15,4	26	65,99
9. Patience	394	16	41,37	10	25,63	96	24,3	34	8,63
10. Respect towards the	394	23	58,63	12	31,73	36	9,14	2	0,51

Source: Poll out survey data

Because all the answers received were extremely varied in evaluating a single communicating ability, we chose that our analysis is better to show the average score.

Managers’ attitude towards communication skills can be easier seen in the diagram below:

Diagram 1: Interest shown towards communication abilities

Source: Poll out survey processed data

The answers show that two of the ten characteristics: (1) respect towards the interlocutor and (2) the ability of expressing

thoughts orally; were considered **very important** for communication getting average scores between 3.48 and 3.15.

Most of the managers (90.36%) think that respect is the main ability that facilitates good communication; among the answers a very low percentage (0.51%) considers it unimportant. So the ability of verbal expression of thoughts is appreciated by 85.28% of the managers as being the second best ability and very important for communication; only 4.31 of the respondents consider it unimportant.

Five of the features enumerated in the questionnaire were evaluated as being **important** for communication and got the following average scores: patience (2.91) opening and ability of asking questions (2.9), written communication (2.8) and para-verbal communication (2.34).

Patience is appreciated in a percentage of 67% very important and important, only 8.63% of the respondents think it is unimportant.

Opening in communication (tolerance towards other points of view) is appreciated in a percentage of 70.05% very important and important, 10.66 % of the managers think it's not important.

The ability of asking questions, the third characteristic important for communication was appreciated by 80.71% of the respondents as very important and important and 4.57% think it's not important.

Written communication in 68.53% was appreciated as very important and important and 9.39% appreciated it as unimportant.

The last of the five communicative abilities of the group appreciated as important is para-verbal communication appreciated in 57.11% as being a little important or not important. Here, the appreciation towards the value of this feature for importance is lower, (42.89%) but very close 50 % made the average score to maintain between 2 and 3 points.

Active listening (1.92) and nonverbal communication (1.84) were evaluated **less important** abilities for communication.

Listening capacity is less important or unimportant for 85.54% of the responders, only 5.33% step it as very important.

Nonverbal communication is a little important and not important for 74.62% of the respondents, only 10.66% appreciated it as very important.

Considered as **not important** as communicative ability, the empathy got an

average score of 0.91, the respondents appreciated in an average of 81.47 % that it is unimportant and a less important, only 4,57 % thought it is very important.

6. Conclusions

Out of the ten communicative abilities presented to the managers that took part in the survey, seven were appreciated as being important or very important the other three were not taken into account.

From the point of view of the specialists in communication each of the features is important but the level of importance is varies according to the context of communication.

The resulted difference can only show that managers underestimate the importance of abilities in communication and so it confirms the second hypothesis of our study. This conclusion is supported also by the other results of the survey that shows managers interests for the practical abilities of the employees.

We can also conclude that that these answers show incomplete knowledge of what communication and communicative abilities are so, a not very big interest for this subject.

Not being major priorities of the questioned managers like the financial aspects of the company, the state of the national and international economy, the administrative and law chaos and so on, we can say that Dambovită's managers show a moderate interest towards communicative competences and so it confirms the first hypothesis of our study.

For the managers that are aware that it is necessary to keep up with the time we live in, we recommend:

- Permanent development of communicative competences for study and practice;
- Use of all the communication channels exploiting technology of the communication.
- Preoccupation for periodical organization of training and improving communication skills programs in their company.

It is the easy way to put in the shadow a topic and than to throw all the blame on a on it as “bad communication”.

Mergers & Acquisition Trends on the Romanian Investment Market in 2013

Humă Elena

Institute of PHD Studies Academy of Economic Studies, Bucharest

humaelena@yahoo.com

Abstract

The value of the mergers and acquisition market doubled last year, reaching 788 million dollars, although the number of the transactions diminished as a comparison with 2011, according to Ernst & Young [1]. The same audit company is estimating an increase of the mergers and acquisition market, especially coming from privatizations, financial sector and energy.

Key words: merger, acquisition, investment market,

J.E.L. Classification: M21

1.Introduction

Net or new investments are represented by the expenditure for assembly works, construction, installations, equipment and transport means, other expenditure for creating new fixed assets for developing, modernizing, rebuilding the existing ones as well as the value of services related to the ownership transfer of the existing fixed assets and lands paid from other units (like, for example the notary duties, commissions, transport, loading and unloading the expenditure).

The research method used for this article is the method of observation, as a main method presented according to the methodology of the research. The happenings on the investment market were firstly observed, then gathered, summarized and written. In the time period of economic crisis faced, there are only few major investments left to be concluded, some of them coming out as a result of past major investment projects performed

Although the number of the investment transactions diminished slightly in 2012 compared to 2011 (114 transactions during

2012, in comparison to 120 transactions during 2011[2]). This increase was assured by doubling the average of the transactions for which the values were made public.

Despite all the instability and confusions, despite the macroeconomic situation, the year of 2012 was a good year for the mergers and acquisitions market [3]. The most important transactions took place in business sectors like agriculture, electronic commerce, renewable energy and real estate. The investments came from the following countries:

- USA – 8 transactions
- France – 5 transactions
- Cyprus and Great Britain – 4 transactions each
- Germany and Canada – 3 transactions each.

Germany, as main investor, was replaced by the USA.

On the other hand, there was no Romanian investment outside the Romanian borders, called outbound investment. This is a clue to the fact that the local players are no longer interested in outbound, but they keep their focus on consolidating the business inside our country. The most appealing sectors, depending on the announced values of the transactions, were the real estate sector, retail sector, production, fast moving consumer goods, energy and mining.

The year 2012 meant also an increase of the number of transactions with strong companies, but also continued the tendency from 2011 and 2012, when the companies being in insolvency or being in other difficult situations were dominating the local transactions.

If we take into account also that in 2012 the biggest transaction from the last 2 years was accomplished – the producer of chemical fertilizer AZOMURES was bought by the AMEROPA HOLDING. With this big

transaction, the trust of the investors in the Romanian economy was reinforced.

2. Trends on the Romanian market

If during 2011, the Romanian mergers and acquisition market were equally split between the foreign investors and the local ones; in 2012 the foreign investors had 54% market share. The percentage for the foreign investors is higher and this indicates that the Romanian investment market presents a high interest for the investors coming from abroad. They are seeking for attractive opportunities to invest in.

Even since the financial year 2009, an important role for the investment market of Romania was played by the World Bank. Its role was a major one, because the involvement had great impact on defrosting the way Romania was perceived abroad. World Bank has assisted the Romanian Government in designing and implementing the crisis response, strengthen capacity for improved governance, and provide detailed advice on key reforms.

World Bank will involve also to strengthening the procedures inside the General Secretariat of the Government and Ministry of Public Finance in order to assure that new policies are approved only when financing is available over the medium level.

A sector that will be developed during the future, a project already approved by the World Bank is the transport sector. The World Bank officially approved the national transport sector strategy, and this translates into the approved investment program for the coming years 2014 - 2020 and the 2013 and 2014 proposed budgets.

The percentage of the investments private equity type has decreased, almost at half, from 35% in 2011 to only 18% in 2012. This decrease underlines the difficulty of foreign investors to identify interesting objectives in Romania to the extent of their portfolios and also focusing on selling the portfolio companies owned for a very long time.

3. Previsions for 2013

In 2012 the mergers and acquisition market registered a dynamic tendency, tendency that continues in the beginning of

2013 also. This trend will be supported by the wanted political stability and by the privatisation process that will be restarted, as well as the waited transactions from the financial sector and of the renewal energy sector. From this point of view, for sure 2013 will be better than 2012.

The first quarter of the year was very promising for Romania, because several major foreign investments, in amount of over 2 billion Euros, were announced. These investments will be made in industries like agriculture, wooden industry, and alternative sources of energy.

Investors should stick with stocks. Patient investors can pick up bargains during periods of weakness -- of which there could be plenty in early 2013, when things will likely be messy in Washington and on Wall Street. But with economic disaster averted overseas, and as the clouds of fiscal uncertainty at home begin to part later in the year, the corporate profits can continue to grow modestly on the back of good-enough economic growth. Cash-rich companies that can manufacture growth in a tepid economy will deliver the goods to shareholders.

In the following, several examples of investment are given, for the year of 2013.

4. Investments on fuel market

OMV Petrom will invest until 2015 approximate 200 million Euro in redeveloping of the mining located in Suplacu de Barcau [4], in order to unlock some supplementary reserves of coal, according to the declarations of the company's representatives.

OMV Petrom is operating with highly mature veins and lately, OMV Petrom succeeded in reducing the rate of the decline of the production to approximate 1% per year. In the present, in the present moment, the company supplies approximate 40% from the needed crude and gas in Romania. The projects for the development and the investments in innovation are and will always be essential in order to maintain the production on a stable level.

5. Austrian Group opens a fifth branch in Romania [5]

The Austrian group Holzindustrie Schweighofer made it public: they are going to invest around 150 million Euro, in a lumber plant that is going to be build in Reci region, near Covasna County.

The plant is going to be functional starting next year and will assure work places for approximate 650 people. This is going to be the fifth production unit owned by the Austrian investor in Romania.

6. Chinese competitors on wireless and routers market and on energy market

TP-LINK, worldwide and local leader on wireless routers is opening its representative office together with a logistics centre in Bucharest city. The centre will act as a regional hub that is going to assure the distribution and the technical support for TP-LINK products for the users from South-Eastern Europe. The branch located in Bucharest will be organised and will function as a limited liability company, having a social capital in amount of 1, 6 million Romanian Lei and, for starters, will have 10 employees. Up to the end of the year, a call-centre will follow, for which additional hiring will be done.

Company China Huadian Engineering will invest over one billion Euros to construct a new group in addition to Rovinari thermo plant located in the Energetic Complex from Oltenia region. The project developed by the Chinese in Romania will add a capacity of 600 de MW to the existent power.

7. The biggest photo-voltaic park in Romania

Promocion Inversolar 65 from Spain will perform an overall investment of 100 million Euros in what it is going to be the biggest photo-voltaic park in Romania and one of the biggest in Europe (having around 200 hectares). Also, the park has 317.000 solar panels and it is almost ready to function near Sebes, in Arad County.

The park has a total power of 65 MW and this power could satisfy the needs for 100.000 inhabitants. This project created 700 work places.

8. Investing in a technologic centre built in Cluj

It is not easy to start constructing a town, due to the economic contextual reasons, but, if the available funds can be invested, every dream becomes true.

A little town similar to Silicon Valley will be built in Cluj County, as a result of an investment of 300 million Euros [6]. The town is going to be spread over 300 hectares. Many IT companies and apartments for IT specialists are going to be build here. The technologic centre will be ready within the end of this year. The project includes also a business accelerator, for entrepreneurs and for business ideas. The works to the Romanian reproduction of the American town started from March and are estimated, in the first stage, to 10 million Euros.

This means soon enough, Cluj will have its own Silicon Valley, no need to travel to America to enjoy a walk; this will become possible after the construction phase will be finalised.

9. Michelin plans to expand his business in Romania

Michelin is operating in over 170 countries, has 113,443 employees, Net Sales of 21.5 billion Euros.

The famous tyre producer Michelin, with a turnover of 500 million Euros and 2 billion (of which two-thirds were growth investments) invested only during 2012, released the information that intends to invest [7] in a marketing centre located in Bucharest that is going to be opened till the end of 2014. This branch is going to coordinate the entire marketing activity in Bucharest. Furthermore, the French producer takes into account opening a new plant in Zalau.

Michelin is present on the Romanian market since 2001, and, in the present moment, owns three plants, all producing tyres.

10. Conclusions

Although the mergers and acquisition market finds itself still in crisis, the investors are still interested in high returns on investments. Many transactions took place and many more are waiting to happen. The investments made with the help of the mergers and acquisition continues, even if it

is done with less impact as in the past. This situation is temporary, due to the economic restraints, according to the specialists, that expect the market of mergers and acquisitions to expand to the extent of glorious years of the past.

The tendencies on the investment market are hard to be predicted. The investors tend to select very carefully the companies and projects worth invested in. Due to the economic crisis, the investment options remain limited.

One can never predict with great accuracy what the future has in store, but, analyzing the figures, it is clear that things are still happening, even if not to a big scale, as it was the case in the past.

Prospects for foreign direct investment continue to be full of risks and uncertainties. The flows of the global foreign direct investment exceeded pre-financial crisis in 2012, but the recovery is expected to level off in 2013. Despite record cash holdings, transnational corporations have to convert available cash into new and sustained foreign investment, but are very unlikely to do so while the instability remains on the international financial markets. Even so, half of the global total will flow to developing and transition economies, underlining the important development role that the foreign direct investments can play, including here even the least developed countries. A broader development policy agenda is emerging and

has inclusive and sustainable development goals at its core. In what concerns the investment policy, this new paradigm poses specific challenges.

At the national level, it includes integrating the investment policy into the development strategy, incorporating sustainable development objectives and ensuring relevance and effectiveness.

At the international level it is necessary to strengthen the development dimension of international investment agreements, manage their complexity and balance the rights and obligations of States and investors.

In the end of 2013 the image of the mergers and acquisition market will become clearer, the amounts transferred will be public released and the comparison could be made. One thing is for sure: the investors have the sums; they are just waiting for interesting opportunities to be issued.

Abstract

"Personal brand" is a popular present-day marketing term, and what makes it of interest are mainly its two components: on one hand, the individual, and on the other hand, marketing itself. In the circumstance in which every brand has its own strategy, that every one of us builds more or less consciously, it becomes necessary to somehow translate the strategies employed for developing, strengthening, and maintaining brands, from the organizational level to the individual level.

This paper suggests a case study regarding employing the means available through social networks such as LinkedIn, Twitter and Facebook within the Romanian cultural space, intended for developing one's own personal brand.

Keywords: Personal brand, virtual environment, social networks, career, personal development.

J.E.L Clasification.: M31

1. Introduction

Simultaneous with the development of IT, the Internet has become the most utilized communication vector in developing an efficient personal brand related to the individuals' personal development. Specialized literature reveals the fact that the

history of the "personal brand" concept is comparatively brief, since its beginning is quite recent by comparison to the onset of the first signs of general marketing.

The originality of the present paperwork derives from the novelty and the character of neologism of the "personal brand" concept.

2. Literature review

The need for developing a personal brand through social networks, as a component of a larger strategy of developing the personal brand consists in the following reasons: through the Internet the individual identity can be made public, projecting it in for directions: who you are, what you do, how you do it, where are you aiming at [1]; moreover, the personal brand is something that no one can deprive you of, and cannot be detached from you [2]; from the financial and economic viewpoint, regarding developing businesses, the employees' personal brand may attract stakeholders [3]; the personal brand is one of the chief instruments that can confer a stable competitive advantage on the human resources market[4]. Brand and brandings are omnipresent and universal [1].

Moreover, a study presented in [5] reveals the fact that people make use of the appropriate social network profiles in order to get online information on companies, products, or brands.

According to [6], social media represents a series of activities, practices and behaviors

carried out between communities that convene on-line in order to share information, knowledge and opinion by means of mass media. Social media marketing is different from traditional marketing, therefore it requires special attention and a strategy in order to attain the trademark image and loyalty.

4. Objectives and method

The present study aims to highlighting the way in which social networks are employed by young people between the ages of 18 and 35, residing in Romania, of high school or university level training, for the purpose of building personal brands.

The study was built based on 1.900 questionnaires, 1.856 out of which were declared valid. The questionnaires were implemented in one of the largest university centers in Romania- Iasi, although, beside Romanian respondents, it was also proposed to Erasmus students from partner universities within the program, from Spain, the Czech Republic, Turkey, Greece, France.

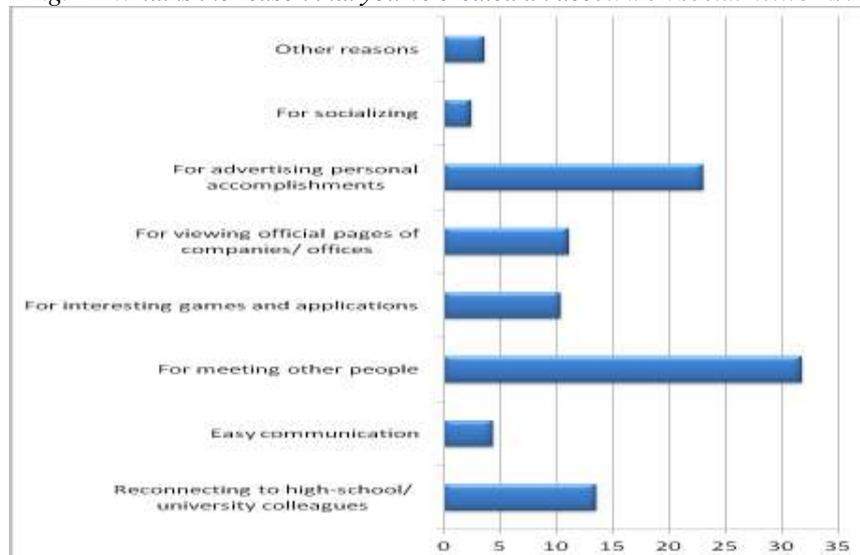

5. Results

In conceiving the questionnaire, we began from the assumption that the Internet offers the following advantages:

- constantly provides information to and from clients;
- financial resources necessary for communicating over the Internet are comparatively low;
- it is working 24/7 - a maximum of availability

Fig. 1, related to the motivation behind the creating an account one or more social networks, reveals the following: the main reason for creating such accounts is that of meeting other people, the reason why a social network is there in the first place. The second reason pointed by the respondents on this question, of an approx. 18% is accessing games and applications on the respective social networks. 20% of the respondents are making use of their account on social networks for viewing official pages of companies or professional offices, fact that may be classified as strengthening companies' brand.

Fig. 1 – What is the reason that you've created an account on social networks?

Once we know how much time those in question spend on social networks, a most important feature of our scientific approach is identifying where the users log in to social networks, situation shown in fig. 2. Thus, nearly half of the respondents log in from their home computer/ laptop. That signifies the fact that, in most cases they may upload

personal information to their accounts, such as pictures and movies, in a relaxed state of mind, and having time available. A quarter of the respondents access social networks from their mobile devices, which implicitly leads to lack of constraint from several viewpoints: they may connect from anywhere, at any time and they make take advantage of Smartphone

technology gadgets and they may upload authentic pictures and movies instantaneously. A mere 16% connect from work, mostly for reviewing news/ novelties.

Fig. 2- Where do you usually access your social networks accounts?

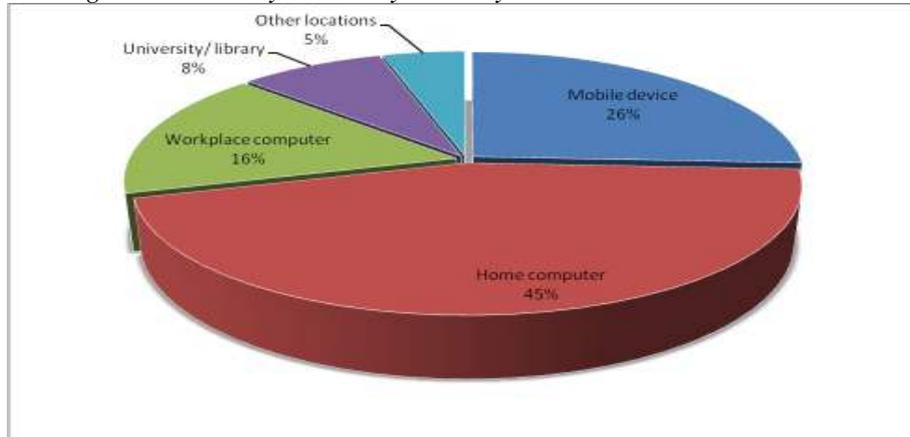

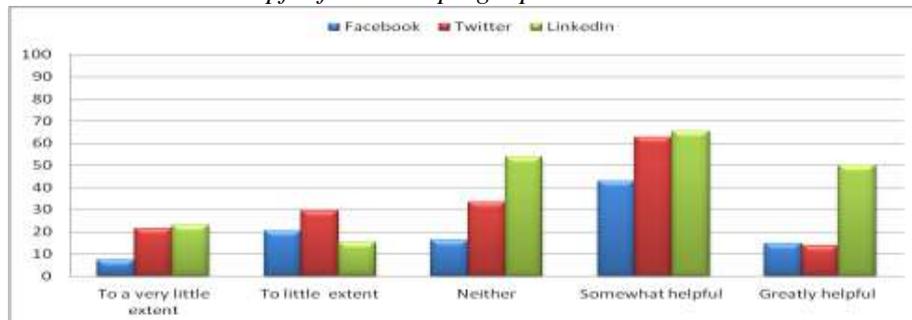

Fig. 3 illustrates what respondents believe regarding the extent to which posting certain information on social networks may ease their developing a personal brand. Thus, most of those questioned believe that most helpful may be the information of Facebook, ranking

second yet at little percentage difference is the LinkedIn account. Least helpful proves the Facebook account, just little over 10% considering that information posted there may help develop a powerful personal brand.

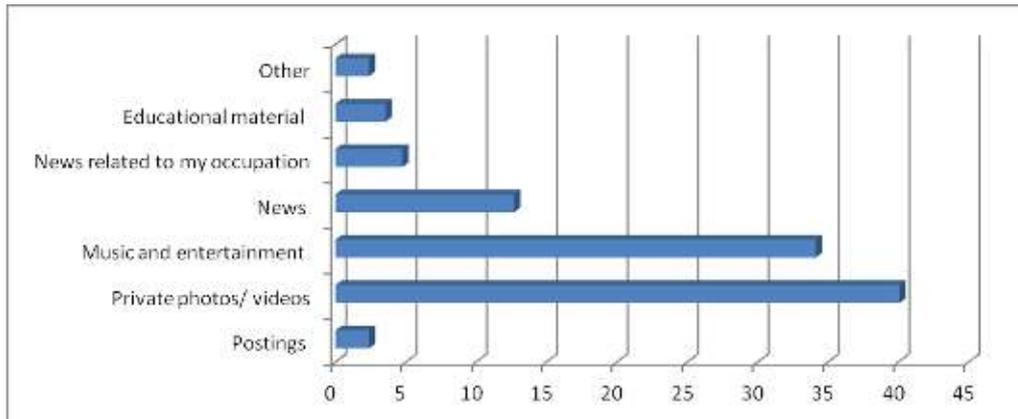

Fig. 3 - To what extent do you believe your account on either of the following social networks may be helpful for developing a personal brand?

From the viewpoint of creating, consolidating and strengthening personal brand through social networks, we've also questioned the participants in regard to their interests when accessing other people's accounts as visitors, results being shown in fig. 4. Thus, some 40% are interested in picture and video postings, of those whom

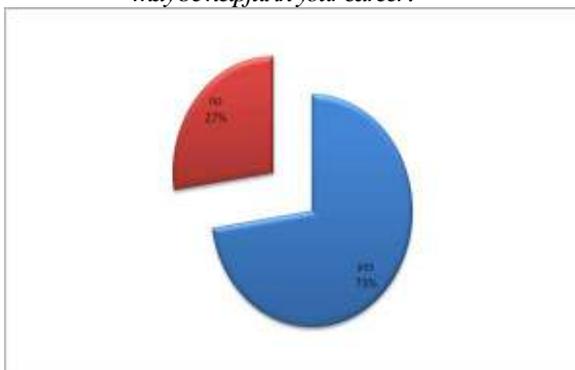

they visit, which implicitly leads to developing personal brand, based on private information posted on social networks. A little over a third of the respondents are directly interested by music or entertainment postings on friends' pages. Some 12% are interested in news previously accessed by friends, whereas a mere 4% follow news related to their field of activity.

Fig. 4- What are the aspects you are interested in when visiting other people’s accounts on social networks?

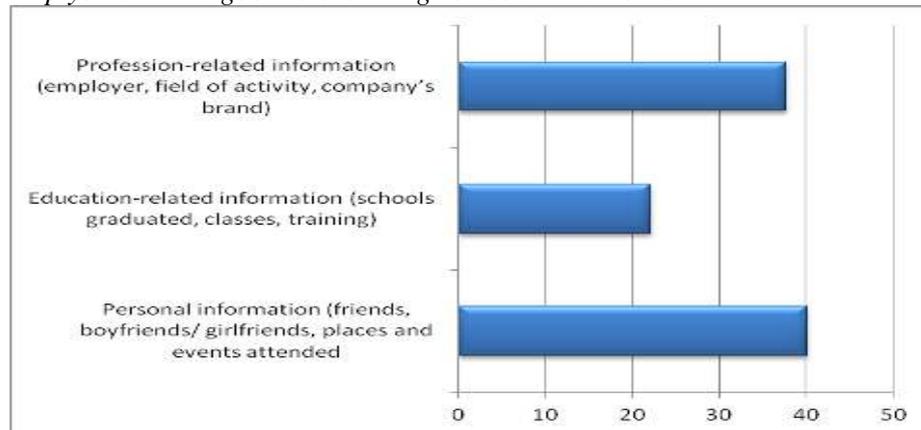

Since personal brand does not necessarily mean a career, the last question posed within the study refers specifically to this aspect, in a way that the respondents are urged to express their opinion regarding the fact that a personal brand may or may not prove helpful in building a successful career. The results, as illustrated in fig. 5, highlight the fact that a mere 27% of them (taking into account the 3% of the respondents who do not own an account on either social network) do not see any connection whatsoever between a powerful personal brand and a successful career. Most respondents (over 70%) are aware of the fact that a powerful personal brand may represent the foundation stone for a career.

Fig. 5- Do you believe that developing a personal brand may be helpful in your career?

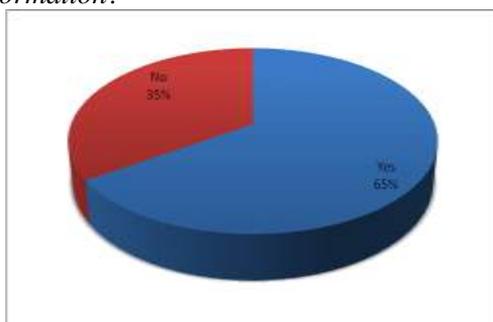

Within the context that 92% of the respondents believe that a well conceived personal brand may help them with their career, one of the points in the questionnaire referred to the nature of the information that, once posted on socializing sites may implicitly be conducive to creating a good to best image. The results are shown in fig. 6. Thus, some 40% of the participants consider that private, family-related information is that that is most helpful to draw the attention to them among friends. One third of the respondents hold on to the opinion that the profession-related information (such as job, employer, possible promotion, position, etc) may have positive impact on friends, whereas a mere 20% believe that education-related information regarding courses pursued, schools graduated, trainings they took part in, might play a role in creating a favorable image for them.

Fig. 6- Please choose a single type of information from among those listed below that you believe may help you create a good to best image on social networks

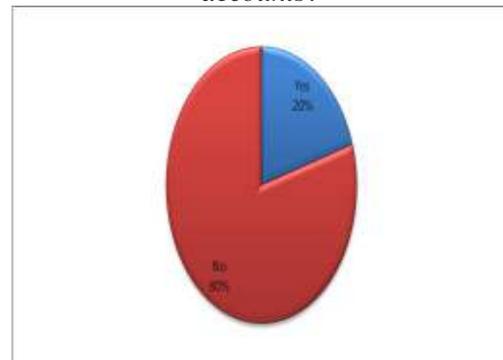

Considering also the scenario according to which there is a chance that a solely Internet-based personal brand may have a mostly virtual component, detached from the near reality, we questioned participants to the studio also in regard to posting fake information or omitting some truths on social sites. The results are shown in fig. 7 and they confirm the hypothesis of a fake personal brand on social networks, since about two thirds of participants in the study, owning accounts on at least one social network, have at least once posted fake information on themselves.

Fig. 7- Throughout your activity on social networks, have you ever lied or posted fake information?

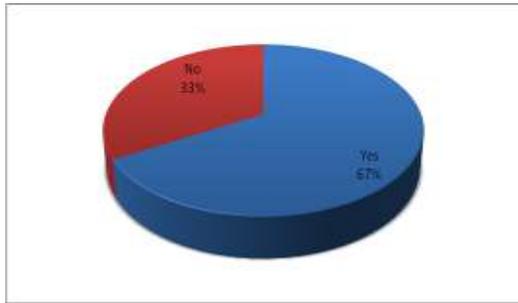

Correlated to the previous question, fig. 8 shows the responses related to declining real identity within the virtual environment. One may notice that at least 20% of the respondents have at least once declined their real identity over the Internet, on their accounts on social networks.

Fig. 8 - Have you ever pretended to be someone else on any of your social networks accounts?

Given that within the online environment there is also a possibility of transferring brand capital from the employer to the employee and vice-versa, one of the questions within the study referred to the fact that, provided the existence of social groups made of employees of certain companies, what is the percentage of respondents who belong to such groups. The results, as shown in fig. 9, indicate that 67% of social networks users participating in the study do belong to such groups (we note the fact that some 79% of the respondents to the questionnaire work full-time).

Fig. 9- On either social network, do you belong to any group made of co-workers?

6. Conclusions

The implicit conclusions of this study may be extrapolated and formulated thus: the majority of people targeted by the study own at least one account on at least one social network such as Facebook, Twitter or LinkedIn. This aspect emphasizes once more the idea that one may create, consolidate, and communicate a personal brand by means of social networks.

We conclude to the present study that most respondents are aware of the impact and the general importance of personal brand, all the more of that of personal brand, which in most cases they associate to “a good or a very good image” in the eyes of friends. By ranking the type of information that in the general opinion would implicitly lead to a powerful personal brand, we are deriving the following classification: personal information, profession-related information, and lastly, education-related information.

We notice a general awareness regarding the veracity of an exclusively online personal brand, built on social networks (at least 20% have declined their true identity on social networks and at least 65% have posted fake information).

Regardless of the fact that most respondents perceive the developing of a personal brand as an opportunity for developing their career, most of them relate to it in a domestic, non-professional fashion; they connect to social networks for relaxation, mostly from their home computer, posting private information, and besides, they are following on acquaintances’ social websites the same type of information—mostly personal, family-related.

Based on the information acquired, we may refer to a mutual transfer of image

between companies’ that the respondents work for brand and personal brand, provided that over a third of those employed belong to employees’ groups.

The initiators of this study aim that in the near future extrapolate the study at European level, for the purpose of achieving a comparative study regarding the Romanians’ and the Europeans’ perception concerning the creation and development of personal brand by means of social networks, considering a series of particularities that would be defined at the moment of implementing the project. It is also perforce that later on, a similar study should be applied to a sample group representing top employers, to be able to make a connection between what is being offered to, and what is expected to be gotten by employees.

Abstract

Consumers are confronted daily with dozens of decisions on buying a product and more than ever they refer to Social Media as the main and most important source of information and impressions from consumers worldwide. This article tackles the issue that companies nowadays still struggle with: understanding, properly using and incorporating Social Media marketing efforts into the overall marketing communications strategy. Moreover, it presents the particularities of communicating through Social Media instruments, as well as the advantages and disadvantages of using such online communication environments, thus offering companies a comprehensive guidebook on this matter.

Key words: Social Media, marketing communications, strategy, Web 2.0, word-of-mouth.

J.E.L. Classification: M31

1. Introduction

Communication through Social Media differs from traditional communication by the fact that the results are not achieved immediately. To lead a successful Social Media campaign, the company should allocate resources specifically to deal with these online environments and strive continuously.

After launching the company's presence via this online channel and entering into a social network, the challenging part starts, actually supporting interactivity. In order to build a long-term, sustainable relationship

with the consumer, based on credibility, the company must prove continuous involvement. Only this way will it be able to capitalize on the positive effects of using Social Media marketing.

The development of Web 2.0, the Social Web, means that the Internet is not just about search anymore, but about social context, hence the growing importance of the word-of-mouth. Taking into account the fact that search is free online, consumers' efforts are reduced to a minimum and the information available is practically endless, favoring a quick and easy access. Internet search can be a step in the buying process or it can be a continuous activity, done by the consumer out of the pleasure of gathering information about a certain product or type of activity, service [1].

The online information sources can be classified in two major groups:

- Personal sources: user generated content, potential consumers;
- Impersonal sources: generated by the company.

The less knowledge a person has of a certain area, the more he will search and trust personal sources. Increased use of the Internet and Social Media has led to the evolution of a new communication channel for companies. This is practically a new opportunity for companies to reach more people through their messages, right where and when they actually start searching. Therefore, companies can have a proactive approach towards consumers and be closer to them.

In a Social Media Examiner research [2] on 3300 U.S. marketers, the author points out that companies have finally realized the importance of Social Media: 90% of the

interviewed marketers said that Social Media was important for their overall marketing communications strategy. However, almost half of them have an experience of less than a year with this kind of online communications channel.

Companies use Social Media with two main goals in mind: some wish to promote or sell online, without having as final objective online word-of-mouth generation, and others clearly define this objective.

A great example where the online marketing strategy objective was to generate word-of-mouth was the famous online prints campaign from BMW, Audi and Subaru that turned into a viral success, propagating it rapidly worldwide.

They created such a big buzz that afterwards a Bentley print appeared in response to the three. But no one knows if it is really true, as the print is considered to be too obscene to actually belong to the company. What should be highlighted in this campaign is that through these series of prints, such intense online word-of-mouth was generated that even after a few years the campaign was remembered by consumers.

Social networks, generating online word-of-mouth, are a very useful instrument in the overall marketing communications strategy. Moreover, the companies should at least monitor and react to negative online word-of-mouth more often than offline word-of-mouth, because dissatisfaction with a product spreads more quickly and generally, dissatisfied consumers will vocalize these feelings as opposed to satisfied consumers, who publicly express their delight with a product less frequently.

2. Rules for generating positive online word-of-mouth

In order to generate positive online word-of-mouth companies have to follow three general rules [3]:

- To communicate a clear and interesting enough message as to be spread, that means to create “buzz”;
- To choose and contact a relevant group of influencers, out of the three previously identified types [4]: “Social Broadcaster” type, “Mass influencers” type and “Potential influencers” type.
- To choose the appropriate channels for

broadcasting the message. According to Daedalus Millward Brown [5], each social network has its own specific image, with which the company will automatically be associated, once it has an active account on that network. For example, Twitter is associated with self-development, achievements, innovation, leadership and Facebook is associated with stability, sense of belonging and feelings.

The second rule can be put into practice correctly by companies only after having an in-depth knowledge about the groups of influencers. The “Social Broadcaster” type (1% of Social Media users) is made up of influencers with a very broad audience. For example, bloggers with a very high number of followers (people that read every new post). According to ZeList [6], the most influential blogs in Romania are: umbrelaverde.ro, bookblog.ro, tudorchirila.blogspot.com. The “Mass influencers” group (16% of the Social Media users), generate approximately 80% of the impressions and opinions about products.

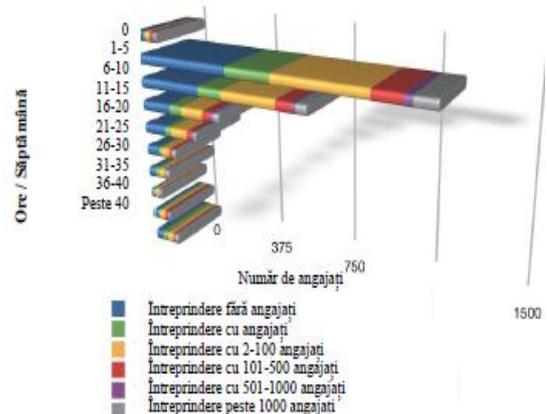

The “Potential influencers” group (83% of the Social Media users) consists of regular consumers who can have an impact on their family, relatives or friends.

Nowadays, the Social Media instruments with most users and which are also used by companies in their marketing communications strategy are: Facebook, Twitter, LinkedIn and blogs [7]. One can easily see that the first three are from the social networks category.

3. Particularities of marketing communications using Social Media instruments

A particularity of the communication using Social Media instruments refers to the relationship between company size and the time invested in social media marketing [8].

Figure 1. The relationship between company size and the time spent on Social Media

Source: Stelzner Michael A., 2011 Social Media Marketing Industry Report, Social Media Examiner, April 2011, pg. 14

Therefore, there is an inverse relationship between the size of the company and the time invested in Social Media. This could be explained by the fact that a smaller company has a lower marketing budget, hence a lower communications budget. Therefore, it will try to seize every opportunity that has a low cost.

Taking into account that using Social Media is practically free, a small company will focus heavily on using it, especially since Social Media instruments can possibly reach many potential customers (of course, depending on the specific company and segment of customers addressed). Nowadays, however, large companies tend to use more traditional communication channels. The main reason for this would be that they are used to these channels, can predict the results that can be obtained from the campaign, and the budget is not necessarily a problem for them, as opposed to small businesses that have much lower budgets.

For an online word-of-mouth campaign, the company must target key influencers and provide them with the product so that they can try it and see its benefits. The influencers will spread word-of-mouth further in their networks of friends. It was found that an influencer affects the views of 14 people [9].

A survey [10] conducted in 2006 in the United States showed that word-of-mouth influences to a greater extent the purchase intention when it comes to fast-food's, flu drugs and breakfast cereals. Conversely, online word-of-mouth influences to a greater extent the purchase intent for technological products and computers. Some of the reasons identified for these specific product categories, for which the influence on the purchase intent is performed online are specialized sites and product ratings.

Daedalus Millward Brown urges the use of Social Media and explains, "You have to go where the consumer is" [11]. As arguments, they claim that on social networks people are much more open and transparent, so they are much more likely to express their true opinion about a brand.

In essence, the marketing communication activities conducted on Social Media for generating word-of-mouth have unique characteristics that other communication

methods do not possess. Consumers have the greatest confidence in word-of-mouth, word-of-mouth spreads ideas more quickly, and the information generated from word-of-mouth are in the context of a story, therefore allow the proper interpretation of each consumer's way of thinking. Last but not least, a satisfied customer shares that feeling with 3-5 friends, yielding an exponential spreading of the message [12].

4. Advantages and disadvantages of using Social Media instruments

Michael Stelzner identified the following advantages of using Social Media instruments in the overall marketing strategy of a company [13]:

- Creates business exposure;
- Increases website traffic;
- Better ranking positions in the search engines;
- Develops new partnerships;
- Reduces marketing costs;
- Generates increased turnover.

The advantages identified by Michael Stelzner don't include a series of strengths of Social Media, among which the main is to generate word-of-mouth and to monitor it. Other advantages of using Social Media instruments are: to increase awareness and improve brand or company image or to create a bond with customers and to receive feedback from them.

If not used properly, Social Media can also create disadvantages for the company:

- Loss of consumer credibility. Once the company has launched Social Media marketing, it should support a high level of interactivity with customers or else risk losing credibility with consumers;
- Generating negative word-of-mouth from customers. The company has no control over the results, thus the generated word-of-mouth can sometimes be negative. Therefore, the company can be exposed to "attacks" from various dissatisfied consumers. The propagation of negative word-of-mouth on the Internet is more intense and lasts longer, as people's comments are being archived for a long time. However, if a company has dissatisfied customers, it is better to know in advance and try to solve the problems,

before they have a huge impact on sales.

5. Conclusions

Consumers have always relied on the recommendations of family, relatives or friends when they made the decision to buy a product or service, but word-of-mouth began to have a more important role in recent years due to the emergence and intense development of Social Media.

Wishing to cut costs, companies have turned to alternative methods of promotion, cheaper but effective. Thus they have turned their attention to Social Media and Internet. Moreover, on emerging markets, Social Media and word-of-mouth are the main influencers in consumer purchasing decision. Therefore, we can state that Social Media's power should not be neglected in the marketing communications strategy of the company.

As a general trend, due to the fact that virtual communities are rapidly expanding, benefiting from increasingly more social environments where they can interact, there is more generated online word-of-mouth.

The trend of increasing connectivity and the desire to communicate virtually stimulates even more the need for expression of individuals, enabling them to share their thoughts and impressions about brands, products or companies [14].

Vulnerabilities in Romanian Tourism Development

Ioniță Roxana - Mihaela

Christian University "Dimitrie Cantemir" Bucharest

Faculty of Tourism and Commercial Management Constanta

ionita_roxana2000@yahoo.com

Abstract

Once the communism was removed and our country has joined with european democracies, the change in political, economical and social regime determined the touristic sector to fall into a deep crisis.

Although Romania, in terms of tourism is considered one of the European countries with the most rich and diverse natural and human tourism resources, tourism development in our country has experienced various structural problems, which were the low competitiveness of tourism, delaying privatization, poor quality of infrastructure and tourism services.

Keywords: tourism, service, quality, privatization, fiscal policy

J.E.L. Classification: L83

1. Introduction

In terms of tourism, Romania has good potential, being considered as a future tourist destination. In this regard, the development of tourism in our country should act as a major goal and a means of overall economic and social development in the current national policy development and integration into European structures. This will be done only if it will yield significant improvements on the quality of Romanian tourism products and services.

2. Tourism development in Romania

At the beginning of this century and millennium travel and tourism industry is, worldwide, the most dynamic sector and at the same time, the most important generator of jobs. From economy point of view, tourism constitutes the main source of recovery of national economies of those

countries with important tourism resources and exploit them properly.

In this context, the main arguments that determine the necessity to develop tourism, resulting in the following [3]:

- tourism resources are practically inexhaustible, tourism is one of the economic sectors with real prospects for long-term development;
- advanced management and utilization of tourism resources accompanied by effective promotion on foreign markets can be a source of increasing foreign exchange earnings, contributing to the balance of payments;
- tourism is a safe labor market and the redistribution of the unemployed from other sectors heavily restructured;
- tourism through its multiplier effect, acts as an activator element of the global economic system, creating a specific demand for goods and services that result in an increase in their production area, thus contributing to the diversification of national economy structure;
- harmonious development of tourism throughout the area of economic growth and social and mitigation of imbalances between different regions, constituting a major source of increase in household incomes;
- tourism as a means of developing rural areas by extending specific offer and create jobs in rural areas other than traditional ones, improving living conditions and increasing incomes of the local population;
- while respecting and promoting the principles of sustainable development, tourism is a means of protection, conservation and recovery of the potential cultural, historical and architectural heritage of country folk;
- the adoption of a strategy for sustainable tourism development and

enforcement of environmental protection measures, the fundamental values of human existence (water, air, flora, fauna, ecosystems, etc.), Tourism has also an ecological vocation;

- the social tourism manifests itself as an active means raising education and training and human civilization with a special role in the use of public leisure.

Romanian tourism offer is very diverse and includes the following main forms of tourism products and programs that: Romanian seaside holidays, holidays in the mountains in summer and winter treatments, spas, tours with visits to some areas of cultural and historical interest, organization of congresses, symposia, seminars, hunting and fishing activities, etc. agritourism.

Today in our country are about 160 resorts and spa towns holding cleaning mineral resources, of which 24 are of national importance spas with recognition and internationally.

Tourism development in our country has experienced various structural problems, which were the low competitiveness of tourism, delaying the privatization process, poor quality of infrastructure and tourism services.

The transition period was able to reflect all the problems facing tourism industry in Romania. If the communist regime of Romania tissue around a mystical aura of the chosen people and official speeches praised Romania's natural qualities and the quality of people who inhabit the years after the fall of communism collapsed archetypes ruthless communist discourse.

Suddenly Romania remained exactly as it was actually unusable infrastructure heiress, who places it in a slacker, and with a nationalized economy has blocked chances rapid development of important sectors such as tourism. Moreover, people and places lost their skills and chances to develop tourism in Romania were real fast at the beginning of transition but things have been convergent evolution. On the contrary, fell advantages that Romania was in the tourism sector: natural resources landscape, coastline and mountains, cultural and religious legacy of churches. Unfortunately, these are not enough attractions and tourists seeking a welcoming environment, quality accommodation, restaurants and other

entertainment worth the money. None of this has not resulted in a clear travel [2].

In Romania, delaying privatization tourist facilities and the lack of fairness of the process itself, which unfortunately hide economic interests that have brought great disservice for Romanian tourism. But currently most at risk for Romanian tourism is losing start competing with neighboring states. Thus, our classic rivals, Bulgarians, known since 2002 visible progress on import of tourism, while in the case of Romania, the situation does not look good. Tourism policies in Romania have known and still know so structural weaknesses and functional. Privatization later realized, was the main cause of this stagnation. In 2003, 40% of tourist assets were privatized and, more importantly, they totaled 44% of the housing units.

Poor quality of services, all derived from delays in privatization was, is order functional weaknesses which, in a highly competitive international market, its effects are felt. Can be considered constant Romanian tourism in recent years is the poor quality of services. The number of employees increased tourism, unfortunately not training them. As a result of long storage of tourism assets in state hands, managers of tourist locations were not motivated to change staff or invest in training sessions, but rather these interim managers have delayed a fact that brought major disadvantages Romanian tourism and even their business [2].

Tourist market competition is strong, Romania's main competitors are strong countries can boast a pretty substantial advance. Thus, in countries such as Greece, Turkey, Hungary and Bulgaria in recent years, tourism has experienced an unprecedented development. Perhaps more comparable socioeconomic, Bulgaria is the country that has managed in recent years to attract foreign investment to rebuild the tourist. A clever political marketing and cultivating business relationships with Germany brought a great advantage Bulgaria. Presence in major tourist catalogs Neckermann and TUI increased the Bulgarian tourism, especially seasonal tourism on the Black Sea. In Europe generally great battle was won for those countries with access to clear water and a

varied landscape in the coast: Slovenia, Greece and Turkey.

More interesting is how Hungary, a landlocked country, managed through effective management quality and attract more customers than the Romanian seaside. Lake Balaton twice attract more foreign tourists than Romanian seaside.

Turkey, Greece and Bulgaria, are great competitors of Romania's tourism market. Tourism development in these countries has evolved linear, without much major political and economic obstacles. These countries have developed highly effective program of tourism development, which consisted in providing tax incentives and promoting the coherent state and the business involved in this sector, the realization that only by providing quality services loyal customers can be led to real development. In Central and Eastern Europe, tourism industry seems to be a profitable investment in tourism is concentrated increasingly more from western countries have realized the potential new entrants into the European Union [2].

One drawback in the development of tourism in our country is the state of infrastructure. Thus, air infrastructure does not allow a significant tourist traffic and many airports in country operază foreign markets. Road infrastructure (streets, roads, highways) and railway infrastructure puts us in a not very honorable in Europe. Few investments have been made in this area were always accompanied by a long series of delays and postponements that have brought only disadvantages of tourism development [2].

Another problem is the situation in which the spas, which are disastrous consequence management. State buildings, which tourism experts say should be replaced rather than refurbished, lack of basic road infrastructure to support tourism development and to encourage travel, tourism stagnation are causes of Romania.

In terms of quality tourism services, tourism privatization latter had negative consequences of this view. Thus, the same employees can be found everywhere careless, poorly stimulated by wages offered and a chronic lack of respect for the tourist. With privatization, the owners have realized that this is probably the most important tourism marketing, with important consequences on

customer loyalty. Tourism experts say that retaining a customer / tourist costs 10 times less than attract a new customer.

Another role in the development of Romanian tourism plays local governments. Extremely important in the context of fiscal decentralization are local, as they began to play a decisive role in the progress / regress Romanian tourism. Attribute local tax collection led to the creation of a relationship between tour operators and local officials. In many resorts, public-private partnership is virtually nonexistent and this has led to the perpetuation impossible for tourism infrastructure quality standards: sewage over 100 years old, demolished road infrastructure, poor public services [2].

Regarding fiscal policy, in financial terms, the state has not done much to stimulate growth and attract quality investors. The proposed alternative would be a more relaxed fiscal policy necessary investment in tourism, knowing that tourism profits are small and only sustainable long term. In comparison, Greece and Turkey have created a very friendly environment for investors who want to develop business tourism.

In Romania, the main weaknesses identified in the tax system are [1]:

- although seasonal season lasts only three months, building or resort fees are paid for a full fiscal year;
- public services are paid twice because local government provides questionable and payers are required to manage their own infrastructure;
- excessive taxation requires tourism operators pay 14 plants and 3 local taxes (taxes are 35% of the prices of hotels and restaurants);
- tourism profit rate is 2-6% annually, one of the lowest in the economy. Hence tax fraud, a phenomenon realized at the level of authority. In Turkey and Greece, taxes are 4-5 times lower than in Romania because the authorities have realized that besides tourism sector can develop and related areas.

Reducing corporate tax Romanian economy could positively influence the Romanian tourism. Starting a consistent set of financial measures to support the economy in general and tourism in particular, would be

as sustainable singurs that the executive can take to remedy the situation.

Another aspect concerns investments and promotion policies just because money for to promote tourism are very few and European funds are difficult to access.

As recommendations, we can mention: tax reduction because the reduction would bring great benefits and investors in tourism, encouraging and developing business tourism, meetings and motivational efficiently promote Romanian tourism, Turkey is a good example where Free State promotes tourism - private or public (free for charter trips, even complete elimination of income tax, free advertising guidelines consular services and lobby state), tourism development areas (the Hungarian model) and transformation the Bucharest in central urban attraction [2]. For this recommendation to materialize, it needs restoration and rehabilitation of the old part of Bucharest entire infrastructure of the city, the development of regional development programs with EU funds for development of SMEs - SMEs in tourism. This recommendation makes sense since the absorption capacity of EU funds will improve considerably.

3. Conclusion

To become competitive in the European market and especially the Eastern European is a growing according to international statistics. Romania must take urgent steps out of the inertia that entered the Romanian tourism over 20 years. Already Bulgaria, Greece and Turkey are far ahead of Romania as tourism development level. Disability must be recovered in a relatively short period of time, but we can see how the lesson taught by our neighbors.

Abstract

The study aims to identify the methods used to motivate employees in the company Next Automobile. The company tries to use a wide range of motivations to keep staff form for sales activity. Salaries are based on specific job responsibilities and sales consultants have wages calculated according to the number of vehicles sold. There are theories that analyze organizational factors and theories that combine the two categories of factors in explaining human behavior at work. Research was performed using a questionnaire designed to obtain information about the methods and motivational systems that are used and that could be used in the future with efficiency. We identified positive points, and aspects requiring improvement, after which we made a proposal for improving the motivation process in this company. We have highlighted the motivational theories that society uses to motivate employees and conclusions are based on answers of employees.

Key words: motivation, organizational factors, employees, analyze, improvement.

J.E.L. Classification: M12

1. Introduction

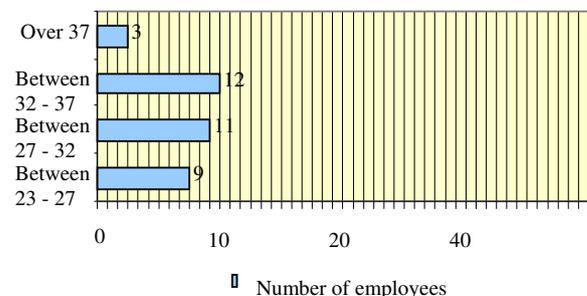

Motivation is a major component of management and a subject of the most commonly treated in the literature, so it captures a wide variety of approaches, often contradictory.

In terms of the concept underlying the management, we distinguish two major meanings of motivation: motivation narrowly and motivation in broad sense [1]. In terms of

work psychology, motivation is defined as the sum of internal and external energies which initiate and support an effort oriented to a goal of this organization, which will satisfy individual needs [2]. For an individual to be motivated to work, he must be satisfied that doing a certain activity, it will satisfy their own necessities [3].

The study is based on a survey conducted through a questionnaire to gain a complete picture of how to use motivational methods and identify the commonalities between what the company offers as motivation and what really motivates employees. We also identified points that do not match or better said human needs that are found in all 35 employees of the company Next Automobile and are not found in the methods used by the company today. Among those needs met that wish to mention the need for development needs of belonging, and the need for safety regarding work. Also we noticed the use of the theory of "X" and "Y" which is manifested in two directions - positive and negative.

Fig.no.1. Aged of employees at S.C. Next Automobile

Source: the conducted study

Fig.no.2. Seniority of employees at S.C. Next Automobile

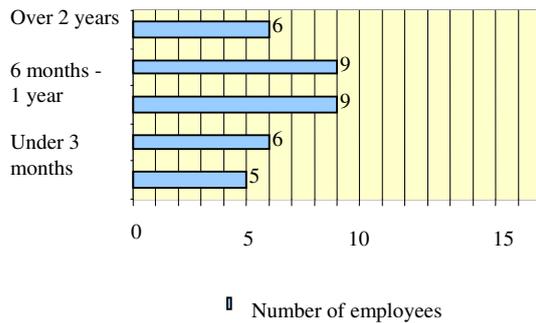

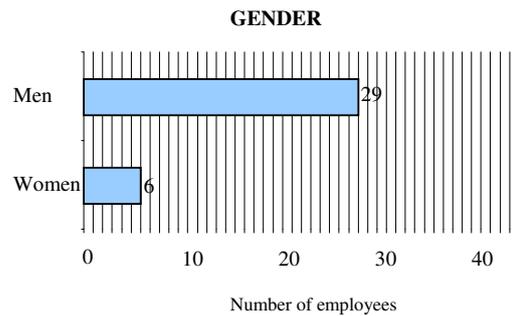

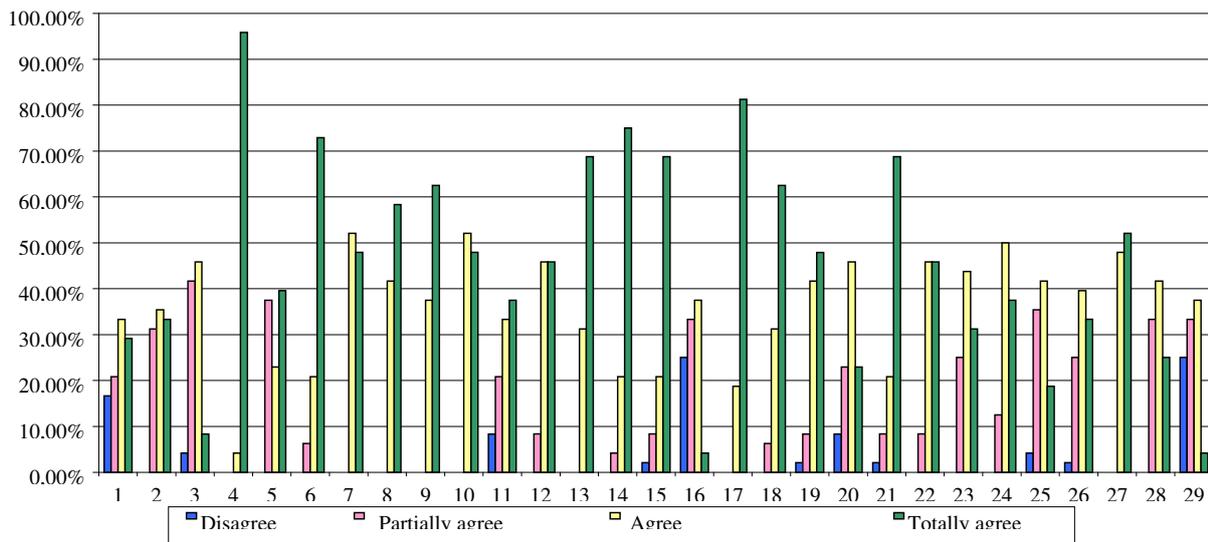

Fig.no.3. Gender of employees

2. Analysis in the present

Includes questions that reflect the situation at the moment in terms of motivation in this company.

Fig.no.4. Score given by employees currently

Question 1: "I am happy (a) my current salary package". Percentages are divided half for those who are not or partially satisfied, half for those who agree and totally agree, which means that the package is not sufficiently motivating salary but not a critical factor, demotivator.

Question 2: "I think a percentage of sales benefiting motivates me to sell more". Opinions are divided in similar proportions to „partially agree, I agree and I totally agree”, which means that from this point of view the company motivates its employees to sell more by providing percentages, but this system is preferred only half of employees. atmosphere in the company and increase

This shows a very pronounced orientation towards a stable income employees and less than directly proportional to revenue results. So we can say that employees focus on business rather than the acceptable limit to make a greater effort to generate higher revenues.

Question 3: "I believe recognized my merits". Percentages obtained "partially agree" and "agree" are the majority demonstrating that employees feel that they are recognized merits only a small extent and measures should be taken by management in this regard, adopting various methods to remedy this situation would lead to a better employee motivation.

Question 4: *"I think my major contribution to our company"*. Most of the 35 employees agree with this statement understanding their role and considering the value brought by each of them as important. Company management should focus on motivating policy that encourages employees to submit increasingly more effort and work more efficiently and thus bring better results.

Question 5: *"Preparing for that I received so far helped me better fulfill my responsibilities"*. They have given major score for "partially agree" and „I totally agree". The general impression is that the training they have received to date is insufficient to carry out the specific responsibilities with maximum efficiency. \

Question 6 and 7: *"I think i work enough"* and *"I think my results so far are good enough"*. Ratings majority are "partially agree" and "totally agree". This shows that employees believe they can work harder and better but not sufficiently stimulated.

Question 8 and 9: *"That part of an international network makes me more motivated to reach my goals"* and *"Being part of an international network makes me want to be increasingly better "*. Most employees are perfectly willing, which means that their needs according to Maslow's hierarchy of needs in terms of membership are largely covered.

Question 10: *"I helped with ideas / solutions solved new problems / have streamlined the work of company / department"*. Employees responded with "agree" and "strongly agree" in almost equal proportions, proving that their views on the contribution to the company is good or very good. This combined with the opinion expressed by employees on non-recognition of their merits is a major motivation.

Question 11: *"I think the reward received for ideas / new solutions is satisfactory"*. Opinions are divided between the 4 variants, proving that sometimes their opinion about their impact on the Company can not see in the results and rewards.

Questions 12 and 13: *" I work in a united team "* and *"Team in which I work is distinguished by solving team"*. Most employees agree and totally agree, but there are reserves and possibilities for improvement.

Question 14: *"Internal communication firm providing me all the information I need to perform their duties"*. The answers to this question are quite positive, mostly entirely agree. Note that the organization provides employees the information they need.

Question 15: *"I think they are well integrated into the work team"*. Employees are considered well integrated in the team they work.. There are also less positive opinions. \

Question 16: *"I believe that the responsibility they have at this time correspond my training"*. Opinions are divided, the majority percentages are divided between variants "disagree", "partially agree" and "agree" instead very few employees are in full agreement 4.17%.

Question 17: *"In the future I want to take on new responsibilities in the company"*. Employees generally believe that assuming new responsibilities in the company is one of the opportunities that could benefit in the future.

Question 18: *"Atmosphere is pleasant work"*. Responses to this question show that employees do not have a very good opinion about the atmosphere at work.

Question 19: *"I feel safe at this job"*. Most employees feel safe workplace current, majority proportion in this category are divided between "totally agree" and "agree".

Question 20: *"The equipment that i use make me feel safe at work"*. Opinions are quite divided, the percentages are relatively close, but with a positive tinge. There must be seen the equipment with problems and be solved because can occur cases of injury to employees, which would prevent the use of that employee a period of time.

Question 21: *"I know I can count on colleagues when there is a problem"*. Based on feedback we see that teamwork is one of the strengths of this company.

Question 22: *"My coordinator directly encourages me and stimulates me to become better"*. Most of their department coordinators stimulates employees to become better.

Question 23: *"I am perfectly satisfied with the work area (eg, sales, engineering, and so on)"*. Most employees are relatively satisfied or satisfied with the area in which they work. Others are less happy or unhappy.

Question 24: *"There are people in the company where I can go to for advice when a*

problem is beyond me". Employees in the company believes there are people who can help them solve overshadow problems. Creating an internal communication system where experienced people to be encouraged to share the information we have, so we can eliminate the stress of lack of information.

Question 25: *"I think i have chances of advancement"*. There are many opinions for employees "partially agree" and those who "i am agree", which leads to the idea that the chances to promote exist, but all depends by employees.

Question 26: *"My opinion is taken into account"*. Employees generally believe that their opinions are taken into account. Paying more attention to this aspect can actually improve the working atmosphere and hence employee motivation.

Question 27: *"I think i work more than they are paid"*. The general opinion is that employees work more than are paid (about 52.08% "totally agree").

Question 28: *"I think my company is interested in long-term development"*. Most employees do not believe their company is interested in developing long term. This result corresponds with the views about job security.

Question 29: *"I believe that my offer experience in versatile fields"*. Approximately 60% of employees responded with "partially agree" and "agree", the rest being only partially agree with the statement. Usually this is the case in a small company, where positions are highly specialized, an employer must cover several administrative or operational needs of the company.

3. Analysis in the future

Includes questions aimed at obtaining information about the desires, methods and

motivational systems that could be used in the future of this company and that could be fully effective.

Question 1: *"My results/results of others stimulate my competitive spirit"*. 90% of employees believe that networking stimulates the results of other employees.

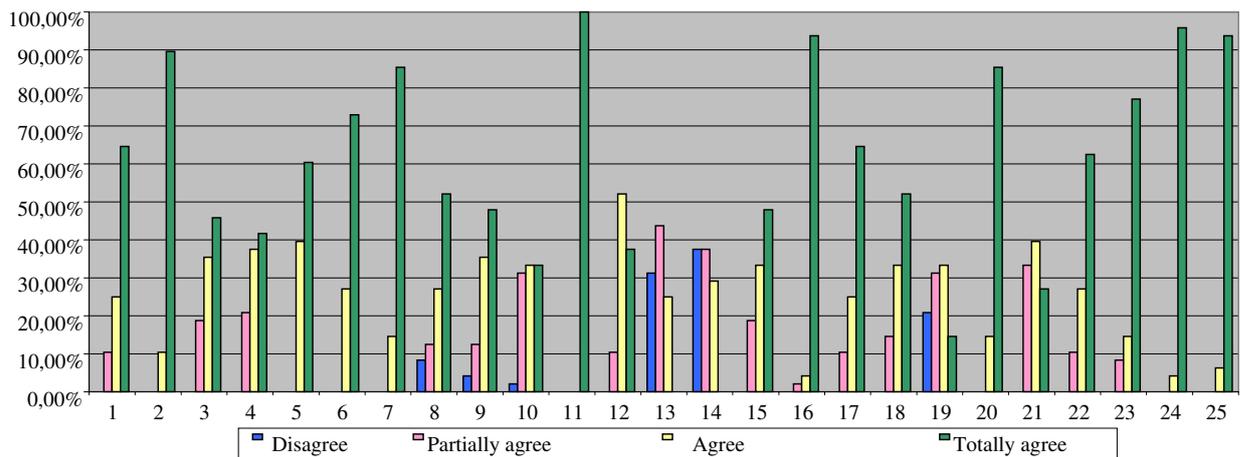

Question 2, 3 and 4: *"I want to be the best in my area firm", " I have to prepare better to be better "and "The experience that i'll gain will help me in the future be the better "*. Most responses is a "totally agree". Both employees and companies tend to invest in their long term development.

Question 5, 10 and 11: *"I think I am sufficiently prepared in the field that i work "* and *"I believe that employees still need training"*. Most employees are considered sufficiently well trained in the field working. The vast majority of employees see training provided by the company as a benefit, the employee understanding the impact of this long term.

Question 6: *"I think I deserve a higher salary"*. Most employees believe that deserves a higher salary.

Question 7 and 8: *"I think my expectations from my coordinator should be expressed more clearly"* and *"I think my expectations of the coordinator should be expressed more clearly"*. 85% of employees believe that the expectations of coordinator of them should be expressed more clearly, and only 50% believe that their expectations of the coordinator should be expressed more clearly. Deduce a complaint from employees to the coordinator directly in terms of communicating expectations, but the second percentage has a quite pronounced dose of subjectivity. A good manager is primarily a good communicator.

Fig.no.5. Score given by employees for future

Question 9: "I think the atmosphere could be improved". 90% of employees believe that the atmosphere can be improved to somewhat or radical.

Question 12: "I think I need additional safety equipment to feel secure". 50% of employees believe that they would need additional safety equipment. Personal security is one of the most urgent needs of an individual and must be addressed. Issues regarding safety at work can seriously affect the group atmosphere.

Question 13, 14, 15, 16, 17 and 18: „My coordinator acts with me as if I were indifferent to the needs of the business", "My coordinator considered that i should be directed to do my duties", "My coordinator believes that if i have satisfactory working conditions i found satisfaction in job", "My coordinator believes that i learning to accept responsibility ", "My coordinator believes that i have the best performance when i receive the responsibility and freedom to carry out a project" and "My coordinator think that i can contribute much more than normally seen and I underused talent". The first three show a style of type X, the other referring to a style of type Y. Notice a slight difference in favor of style Y, therefore we encourage this type of behavior coordinators team / department.

Question 19: "I think that not enough emphasis is placed on organizational

culture". 65% of staff agrees that there is sufficient emphasis on organizational culture. Question 20: "I think preparation and/or my experience recommend me to other responsibilities in related fields". Sensing that can do more things/can handle different types of jobs, an employee will feel a little safer because it is becoming more indispensable (it will be very difficult to recruit another person who can do everything do it).

Question 21: "I would like to take more account of my opinion about the field in which I work". They desire to express yourself more account of their opinion. In this way they will bring impact to the company.

Question 22 and 25: "I think I would be a good coordinator" and "I trying to have an overview". These questions are designed to check if wish to advancement expressed in previous questions is based on trust.. Nearly 50% think it would be great coordinators, nearly 40% believing they still have something to learn.

Question 23 and 24: "I try to understand the needs of those around me" and "I try to help those around me to solve their problems". These questions are designed to verify the individual in terms of personal involvement in relationships with peers and to compare them with expectations that they have from others.

4. Conclusion

Based on the survey results we observed using motivational theories in a lesser or greater:

- Theories of hierarchy of needs (Maslow's theory, ERG theory - Existence, relatedness, Growth) of all 5 categories of physiological needs are satisfied and this is not in totality. exist in the light of these theories an obvious need manifested by satisfaction of other needs;
- Theories „X” and „Y”, manifesting both the positive and negative direction. The majority of employees have no motivation to act according to theory X, remaining at the level of the Y or oscillating depending on the situation from theory to another, thus not having business continuity and no results.
- Dual factor theory - we propose that they should focus on the development of employees, increasing recognition of their work in various ways, and encouraging initiative and responsibility.
- Theory acquisition success - although employees want to maintain a high level of performance that is encouraged sporadic but not enough by firm.
- Theories of human capital - our suggestion would be that they always benefit from training through a program of continuous training and well established on the basis of employees' personal and professional needs, to have a career development plan for each employee in order to allow both personal development and change ritual activity.
- Theory expectancy - is manifested through the desire of employees to get new responsibilities and to try tasks increasingly complex. On the other part we can see that employees are already highly motivated to evolve, expectations or better probability of success is high if they will find inner strength to fight for their fulfillment. Here a role it has direct coordinator that can grant or deny this occasion of employees (depending on the direction the company). It can direct, guide each employee receiving new responsibilities or changing old ones.

Employee motivation theories presented above are not fully implemented and some not in a manner consistent reason which leads to a low motivation of employees of this company is reflected in the results obtained in daily activities in employee performance.

Following the research we carried out and the conclusion we reached, our proposals are:

- Organizational culture - employees expressed their desire to be involved in defining and developing solutions to improve business activities. These lead to a higher employee satisfaction and full realization in the work environment and the development of environmentally firm, market consolidation and not the least performance.
- Training employees - our suggestion is that manager with the company to define human resource manager in the company training plan and career development for employees. The plan must be permanent (long-term) and relevant for both business and employees.
- Atmosphere and communication - our suggestion would be that they provide a clear definition of the above and stimulating employees in these respects.
- Recognize - this was clearly expressed by employees as a suggestion for improvement. Following the survey we found that employees want a permanent recognition. At this point merits recognition is achieved through share sales. Our suggestion is that the general manager and responsible human resources show transparency in granting this percentage, but to use and other methods of financial and non-financial motivation (like giving rewards , congratulations employee in meetings or meetings of the company).

Abstract

The aim of the article is to present the impact of the global crisis on the marketing activity. In this period of crisis, in order to diminish the negative influences of the crisis, the marketing budgets must be made more efficient. Consumers, especially in a time of crisis, become more careful, get more informed, look for alternatives. Panic is the first negative effect which the economic crisis brings in the consumers' consciousness. Not all consumers are affected at the same level by the financial crisis. The winners of the crisis are not necessarily the big companies, but those which applied strategic principles and competition strategies. A mistake which a company can make in a period of crisis is that of searching only temporary solutions and abandoning any strategic measures on a medium or long term.

Key words: marketing strategy, economic crisis, online marketing, customer direct marketing.

Classification J.E.L.: M31, M37

1. Introduction

At the moment, economy is confronting itself not only with an economic-financial crisis but also with a dangerous crisis of credibility and trust. Because of the repeated mistakes and of the decisions without any real background, the consumer becomes more and more sceptical and mistrustful of companies and their offers, a situation in which the companies must treat critical problems by elaborating some offensive marketing strategies and to define the

policies through which they can regain their lost credibility.

In the last few years, the business world recorded deep changes, so that the managers and the enterprisers were obliged to make special efforts for a permanent adaptation to the market in order to face the sudden changes which interfered in the consumers' behaviour, in the competitors' actions, in the customers' and providers' attitudes, the speed of reaction being able of making, in this period of crisis, the difference between winners and losers.

In this period of crisis, when they want to reduce costs, the companies reduce their marketing budgets, in most cases giving up to the values that they sustained, without trying to find cheaper channels and ways of communication.

Any marketing strategies in a period of crisis must first plan this moment from the minute when it is known that it started and only after that to offer solutions in order to pass over this period in an efficient manner. The marketing strategy represents the most difficult thing to make in a situation of economic crisis, the uncertainty factors are mainly on the market and they affect the relations between the organisation and its environment. The present economic crisis creates through its amplitude, a domino effect, bringing to the fore not the problem of the possibility of hitting an organisation but the problem of the moment when it is inevitably done.

During of crisis, in order to diminish the negative influences of the crisis, the marketing budgets must be made more efficient by making customers faithful and attracting them by building a strong, distinct brand image.

Marketing strategies in a time of crisis must be analyzed both in relation with the

evolution progress of the company's market and in relation with the potential that it has and the structure of the components of the marketing mix. The periods of economic crisis affect two major components from the process of purchase with major influences on the entire market and especially on the marketing strategies: the purchasing power and people's behaviour[1].

The purchasing power affects the volume and the structure of the consumption, being in advantage the products with a high degree of utility, with reduced prices and payment facilities. People's behaviour modify the criteria of evaluating material goods and services, these appreciating more the quality and the reliability than the image benefits and being less available to invest in new products, which were previously unknown. Also, for the products of long use or those which are not of strict necessity, the decision of purchasing is postponed [2].

Consumers, especially in a period of crisis, become more careful, get more informed, look for alternatives. There passed the time of those who offer and think they have a large market outlet. The market becomes more fragmented, competition loses its location, value becomes a very relative concept, trust does not represent a guarantee anymore and the only element which offers trustfulness is the creation of a direct relation with customers.

In a period of crisis, one of the first measures adopted by the companies' management was the reduction, sometimes substantial, of the marketing budgets. Promoting the business is essential for any enterpriser, and neglecting the communication actions may lead to significant losses on a long-term. In a time of crisis, the companies must adopt concrete strategies so that their message can get at the market domain to which it addresses.

Now it is fashionable the so called “crisis” marketing. In crisis situations, not investing in marketing or reducing severely the budgets is as if you got ready to make your way out of the market.

2. Marketing Strategies

The influences of the economic-financial crisis on the marketing activity of companies are obvious in all the components of

marketing mix, taking into account the fact that a large part of these, especially small companies reduce their marketing budget without getting ready, by elaborating a strategy of managing crises, through which they may be able to reevaluate opportunities when they appear. This makes that, in a period of crisis, the companies which are better organized, from the point of view of marketing, to dominate the competitors less responsive to change.

The crisis is synonymous with the drop of consumption, the compression of economy and the lowering of the volume of sales. In this case, any organisation will re-evaluate the reference criteria, and one of the best measures would be the market share. Even if the volume of sales drops, even if their value drops, even if the profit drops, only one measure remains unaffected by the crisis and that is the market share. And when the crisis ends, the fact that our organisation has maintained its market share will be translated in a considerable bigger volume. But this market share cannot be maintained through lack of activity and perspective, it is directly linked to the marketing activity too.

Lately, more and more companies decided, when recalculating their budgets, to reduce the expenses for advertising and marketing. But specialists in communication say that advertising is the one which bring the biggest volumes of sales in difficult periods and the companies must take advantage of the opportunities from the next periods. Advertising in a period of drop in economic activity should not be seen as an obstacle for profit, but as a collaborator to profit. It is thought that the raise of the market share brought by advertising can be made with a more efficient cost policy during recession. A solution to pass over periods of crisis is involving consumers in the marketing activities of the company.

In a period of crisis, the company must focus more on the customers' needs, that is why the present customers are more important than the potential customers, the higher importance being given by the fact that it is less expensive to invest in programmes of making these loyal than attracting new customers.

The use of marketing research in a period of crisis, a period in which consumers desperately look for a better offer, cheaper

products, is a necessity [3]. More companies use reductions, coupons and discounts as a strategy of attracting customers in this period and the majority of clients admit that these methods have a certain effect, motivating them to buy. Of course that in order to attract customers, the advertising messages must be congruent with the recession.

Because this period of crisis causes a battle of perceptions and not of the reality, what matters is to make the difference and to place products in a good manner, in order to combine perception with reality. Marketing places not only the product or the service but the entire business. A difference through innovation imposes the prices desired by the company even in a period of crisis. The permanent highlighting of the competitive advantage, especially if the company manages to maintain a balance in the price policy, to maintain the consumers' interest, has a good image and it preserves its profitability.

If a company did not early infer the rearrangement of the market in which it develops its activity and it did not elaborate a plan B for a period of crisis, then most probable it is not ready to operate with the appropriate strategy or tactics. The sudden changes that interfere in the consumption, in the competitors strategy, in the providers' attitude and in the customers' payment possibilities make the rethinking of future orientation to be the number one priority of all companies.

The selection criteria to choose marketing strategies in a period of crisis are the following:

- efficiency criteria (the level of strategic costs; the duration of recovering strategic investments, the level of revaluation of existing resources; financial needs attracted by the capitalization of the strategy);
- risk criteria (the degree of strategic risk; the degree of competitive risk; the stability of the strategy in aleatory conditions of the market);
- opportunity criteria (strategic opportunity; the level of anticipating results).

Most companies reacted on the international economic crisis by reducing expenses, postponing investments and a severe diminishment of advertising budgets. These measures did not always prove to be

efficient. The winners of the crisis are not necessarily the big companies, but those which applied strategic and competitive principles.

The main measures recommended to be taken in sales in a period of recession or economic unsafety, are related to:

- a precise application of rule 80:20 in what regards customers, an identification of the most profitable on the short-term and an assignment of resources for them; ignoring unprofitable customers on a short-term; a partnership with powerful companies;
- redefining the objectives and the task of the sales force, establishing a way of remuneration in accordance with the accomplishment of tasks;
- rethinking the role of the sales force: encouraging the salesmen who produce new customers and reducing costs with those who just manage a customers' portfolio;
- reducing the number of specialists or technical experts and using them just to serve customers who bring significant incomes to the company;
- reducing the costs of serving customers with at least 30% by identifying distribution channels with reduced costs as the Internet, by reducing the number of employees in this domain or by using temporary employees;
- eliminating services which are not clearly required by customers and offering services which are paid;
- personnel deductions in all the departments, from those employees with low performances[4].

In the distribution policy, reducing the budget may be considered a mistake. In the context of the economic-financial crisis, a better analysis of the market is necessary in order to identify the consumers' needs and desires, their reactions, so that the companies can revise their portfolio, so that they can adapt their marketing strategy for an efficient use of the budget [5]. The companies which apply efficient marketing measures, in the distribution policy, in moments of crisis, can raise their sales, while those who choose to reduce the budgets do not outrun a quite small growth.

An important role belongs to the sales force which can successfully contribute to the adaptation of the company's activity to the turbulent environment from a period of crisis to diminish the consequences of the crisis on the marketing policy.

In the product policy, in a period of crisis it is not a favourable moment to launch new products or packages. Looking for new niches for new products or promoting them are elements of the strategies for a growing economy.

The central point of the product strategy in a period of crisis must be the customer. In periods of crisis, the losers will be those organisations which think they know better what and how they must sell, and not the consumer and there will survive only those which will learn to listen to their customers.

In the future, business will be of two types – on the Internet or none. The presence on the Internet ensures to business a global spread. The online shops represent a cheaper source of goods; these appeared before the crisis and their main trump is represented by the low costs of maintenance, this having a direct effect on the costs of products. At the same time as the beginning of the economic collapse from the start of the year 2009, the online shops were affected too so a lot of them were closed and those which remained had to adapt themselves.

The online marketing is an advantage in a time of crisis for those who use it in an intelligent way. Consumers get more informed before buying online a product or a service. Most people make important decisions on the purchase (budget, brand, product, shop) after having been informed online.

The price in an online shop is smaller than in a classical shop. This thing is still not enough in a period of recession because even before the crisis the price was smaller. In order to attract the customer it is necessary to resort to certain marketing methods.

The present economic conditions forced consumers to become much more selective when they choose where and how to spend their money, that is why the marketing campaigns must be applied in a creative manner. Making a partnership directly with a marketing company proves to be less expensive and more successful than the alternatives from inside the company.

The direct marketing specialists are useful especially for attracting customers and maintaining them. In an unstable economy, companies cannot rely on the recognition of the brand and on the mass marketing to survive. Indeed, direct marketing, both in its traditional form and in his integrated one, is essential for targeting consumers' specific needs, offering impulses and formulating the most efficient solutions for small and medium companies.

The direct marketing tools correctly used may sustain the business of a company in a time of crisis. In the present economic context, more than ever, a promotion campaign must aim at obtaining a direct answer, a clear action from the person to whom the message is presented. The direct marketing tools come to meet the need of palpable, measurable results. The direct marketing is, by definition, a mechanism of promotion which allows you to send clear messages to an identified audience [6].

3. Conclusions

In crisis situations, not doing marketing is as if we were getting ready to close the business. Lastly, not the budget is our problem, but rather how efficient we use it, how we pursue the media channels and the approaches which will allow us to communicate more efficiently with our consumer, which will ensure us that we know our consumer and that we respond to his expectations, that we have managed to start a dialogue so that the sale of our products and services can actually respond to a well-identified need.

Panic is the first negative effect which the economic crisis brings in the consumers' consciousness. Advertising agencies must be flexible and capable of adapting to the new changes from consumers' attitudes or behaviour.

Now when the markets are becoming stable, we need a professional and sophisticated marketing. The companies which will cut the marketing budgets will create the premises of failure.

In a period like the present one, what matters is to promote yourself as much as possible in order to send your message and

your offer to the customer. A reorientation of the resources assigned to a channel to another channel is normal, but the complete giving up to promotion is a major mistake.

Not all consumers are affected at the same level by the financial crisis. The good marketing is that which understands the problem which the consumer has to solve. There is a need more than ever to know how the customer redefines his value and how he reacts in case of a crisis.

Business may remain profitable during economic crises too when: these focus on a gradual development; we focus on regaining lost customers; we manage to obtain new customers deriving this benefit from the customers who already exist; we get involved into cheaper promoting strategies.

A successful marketing is led by a marketer who understands very well from the point of view of the business the problem which the consumer has to solve [7]. In a period of crisis, you must know how the consumer redefines his value and how he reacts in a case of crisis. The consumer is looking for durable products, which offer safety and whose proportion price/quality is perceived as being very good. Market researches are essential in a period of crisis: we must devote enough time to get in touch with consumers, to find out their points of view, their suggestions and to study directly the way in which they interact with the product or the service of the company.

A mistake that a company can make in a period of crisis is that of searching only temporary solutions and abandoning any strategic measures on a long or medium term. We do not have to forget that an economic crisis usually has a quite long duration and even if the market is much more unstable as usual, we do not have to neglect the objectives on a long or medium term. The company must have a vision and the horizon of this vision must get over the estimated period of crisis.

The Current Stage of Shale Gas Exploration and Exploitation in European Countries Compared to the U.S. Situation

Abstract

World countries are more and more concerned about finding new sources of energy, given the fact that the consumption is growing and the deposits of natural / conventional gas, known and currently exploited, can only provide the demand for a short period of time. Unconventional gas identified and exploited currently in the world, include shale gas, tight gas, sandstone/carbonate rocks, CBM-Coal bed methane and Methane Hydrates. Of all these, shale gas presents the highest interest. The explanation may be based on one hand on the american model of success regarding shale gas exploitation, and on the other hand on the geological predictions, which indicate potential shale gas resources in various european countries. The interesting fact is how each country will choose to convert resources in shale gas reserves and to exploit them for the benefit of the economy, the society and the environment.

Keywords: shale gas, technology, fracturing, development

J.E.L. classification: O13

Introduction

Shale gas currently represents a concern of several european countries governments, a reason of worry for the population and for various environmental organizations, a reasearch topic for many institutions from the

healthcare, environment and technology fields, attempts to harmonize the EU legislation. If we accept that each country has its specific elements, in terms of resources and reserves of shale gas, of legislative framework, the overall level of economic and social development, the dependence on imports and the orientation of the energy policy, it is natural to find different models of approach regarding exploration / exploitation of shale gas. This paper presents the current stages in terms of shale gas exploration in the U.S. and also in some european countries.

1. U.S. situation

In the U.S., even if shale gas was considered "the boom of the moment", there were necessary, although, two decades of research and testing, until the new unconventional resources begin to reconfigure the new energy market. U.S. reserves of shale gas (mostly located in Texas, Apalache, Illinois and Michigan states) are estimated at about 24,400 billion cubic meters, which would be enough to ensure consumption for a period of 100 years and a production that represents 35% of the total production of natural gas. [6]

The pioneering phase of this fuel was conducted in Texas state during the period 2000-2010. It is known that, with allmost 10-15 years ago, the technology of hydraulic fracturing has been used very little, because the costs were huge, two to three times higher than in the case of conventional deposits of gas. As technology has been upgraded and improved,

shale gas exploitation has become cheaper and a growing percentage of these resources has become recoverable from rocks. Currently, in 16 U.S. states, companies continue to extract shale gas using hydraulic fracturing. In the same time, in other ten states there are local moratoria required for temporary not using this method, applied until the completion of some detailed studies regarding the impact of hydraulic fracturing on the environment. We should also mention that, at present, certain states like New York, Maryland and New Jersey have banned hydraulic fracturing temporarily (even though this method has been greatly improved through intensified research in this direction) and Vermont could follow their example. [8]

In these states, shale gas exploitation was banned after, in November 2011, the Environmental Protection Agency of U.S. (EPA) published a 190-page report showing that hydraulic fracturing is responsible for several incidents of massive pollution and earthquakes and will conduct a thorough study in this regard which will be ready by the end of 2014. [1]

On the other hand, at the end of 2012, South Dakota and Alaska joined the group of U.S. states that have updated their regulations on oil and gas exploitation, answering in this way, to the issues raised at a large-scale by hydraulic fracturing.

Therefore, on 18 December 2012, the Council of Environment and Mineral Resources of South Dakota (a subdivision of the Ministry of Environment and Natural Resources of the State) has proposed some changes to its regulations on gas and oil, by which the Council wishes to have more information regarding the fluid chemicals used in the technology of hydraulic fracturing and also wishes to solve the problem regarding the restoring of unused production wells. [10]

On December 20, 2012, the Commission for the Conservation of Oil and Gas in Alaska has proposed the add of an amendment to its regulations on hydraulic fracturing. The amendment contains several requirements, such as a mandatory analysis, before and after the drilling, of the water used for fracturing and a compulsory isolation of the fluids that

are used for fracturing. It is also mentioned that these new regulations will be approved, very likely, after several months of public consultation.[10]

The size reached, currently, in the U.S., regarding shale gas exploitation can be put both on the account of substantial deposits that it holds, and also on some particular aspects: the areas where shale gas reserves exist, are easily accessible and far away from human communities, population density is lower compared with the European states populations, so there is a smaller impact; the gas deposits are located at lower depths than those in Europe; there are fewer environmental regulations, and the owner of a land has all the rights for the subsoil mineral reserves, compared to Europe, where the reserves, in most of the countries, belong to the state. [9]

Referring to the importance of shale gas, the American professor, John Deutch, quoted by CNN Money, said: "In the 50 years I have worked in the energy sector, shale gas revolution is, by far, the largest event that I witnessed. [2]

2. Europe's situation

For *Europe*, it is estimated that shale gas deposits could be valued between 18,000 and 35,000 billion cubic meters (located in Norway, Sweden, Netherlands, Austria, Poland, France, Ukraine, England, Romania, Czech Republic etc.). But the production of conventional gas in Europe will drop in the future, and demand will continue to grow, which will mean the need of increasing imports at a level of 450 billion cubic meters by 2035. [11]

In these conditions, shale gas exploitation could help reducing imports (mainly originated from Russia), improving EU supply security, even much smaller prices, thus ensuring, theoretically, better conditions for economic growth and social welfare.

Poland is the first European country which launched a real industrial exploitation project on the long term, being determined to substantially reduce its dependence on the Russian gas.

It is assumed that Poland would hold large reserves of shale gas that wants to use to reduce its dependency on imported natural gas from Russia and build gas power plants to replace the coal as the primary source for electricity. The National Institute of Geology of Poland considers that the potential of shale gas reserves is valued at 1,920 billion cubic meters, which means that Poland would be the third European country after Norway and the Netherlands, reason for which, so far, were issued 109 licenses for shale gas exploration, for some large state-supported companies (PGNiG, PGE, Tauron, Enea, KGHM Polska Miedz), and some giants like Chevron, ExxonMobil, Eni, Marathon, 3Legs Resources and BNK for perimeters of Baltic Sea area. But, so far, it hasn't been reached yet, the stage of shale gas extraction.

Officially, ExxonMobil announced its withdrawal, because the results of the first prospects were not satisfactory. "Commercially speaking, we couldn't identify a constant and justifiable flow of hydrocarbons in the two blocks that we have drilled near Krasnystaw, Lublin Basin (South-East) and around Siennica, Podlasie (East) Basin", said Adam Kopysc, spokesman for ExxonMobil Exploration and Production company. [4]

On the other hand, the French company, Total, decided to take the full license owned by ExxonMobil which ensures 40% of the mining rights on Chelm and Werbkowice perimeters, and aims to continue the research and begin a commercial exploitation, if the results will be convincing [10]. To remember is that the geology of the country is different from the American one and it may require more advanced technologies to extract the gas.[5]

Poland is the first European country currently working on the elaboration of a specific tax framework for companies which extract shale gas. A special charge of shale gas will be introduced in 2015 as a "mechanism that will ensure that poles obtain fair income without discouraging the investors and the production," said Jan Vincent-Rostowski, Minister of Finance of Poland. [3]

In *Ukraine*, where it is estimated to exist the fourth largest deposit of shale gas in Europe, valued at about 1,200 billion cubic meters,

licenses were issued to mining companies Chevron and Shell, but neither here were made significant steps, so far. [8]

At the 43rd World Economic Forum in Davos, on January 24, 2013, a contract which valued about \$ 10 billion was signed between Ukraine and Shell company, regarding a project for the development of the exploitation of shale gas. Holding the 4th place in Europe on shale gas reserves, Ukraine hopes to develop this resource, overcoming the controversy regarding hydraulic fracturing technology and to reduce its dependence on energy from Russia. The signed contract should allow Ukraine to partially use its own gas resources. The production expected by the authorities to be achieved is of about 10 to 20 billion cubic meters of gas per year in the next 15 years. Ukraine imports large quantities of gas from Russia, and in the recent years, the gas supply was effectively stopped by Gazprom, with the intention to determine Ukraine to agree to pay higher prices for the imported gas, with economic consequences which have reverberated across the entire Europe[10]. The relatively low population density may be a factor able to promote the development of shale gas deposits in Ukraine.

France was the first European country to ban hydraulic fracturing. The moratorium was imposed in 2011 and still remains in force, but the discussions in this regard are likely to be resumed. France is among the richest European countries in this kind of reserves, the shale gas potential being estimated by the U.S. Department of Energy (DOE) to 5,300 billion cubic meters. This estimated volume is more than 21 times higher than the reserves from Lacq area, Pyrenees-Atlantiques region, where gas were extracted for half of century. But, in the absence of exploratory drilling by hydraulic fracturing, method banned in France by a Law introduced on July 13, 2011, this evaluation cannot be validated [10]. It has to be specified, that in France, three-fourths of the consumed electricity is generated by nuclear plants. On February 26, 2013, The Academy of Sciences held a debate attended by several representatives of scientific research, and among the topics that were discussed was also included the one on shale

gas, more accurate, it has been questioned the problem of the ignorance of these resources that exist in the subsoil of France. This conference was held following the publication of a report called "Scientific research face to face with the challenges of energy", conducted by the Academy of Sciences on January 14, 2013. This report is criticizing the government's policy in the field of unconventional hydrocarbons, and stresses that "decisions were made in haste, without opening the file". By this phrase, the institution targets directly the decision to maintain the moratorium on hydraulic fracturing even in what is concerning the scientific research. The conclusion, after the debate held in February 2013, is that France is not aware of the resources stored in its subsoil. "For a developed country like ours, we have very poor knowledge of our subsoil," said Mr. Nicolas Arnaud, hydrogeologist at the University of Montpellier. It is believed that the political and economic decisions are not taken wittingly and may not therefore be justified as scientific arguments.

Regarding the shale gas, there are opinions that the estimated data on the reserves, made by the Department of Energy of the United States, do not match, without any doubts, with the reality. These can be either higher or lower than the estimates, but for scientists, the problem is a different one: to know if, one day, they will be able to give, finally, a true evaluation, scientifically founded, about shale gas reserves in France. This answer can not be given as long as hydraulic fracturing technique is forbidden, even for scientific research. [10]

But the debate on unconventional hydrocarbons in France is far to come to an end. Within the National Assembly, the Minister of Productive Recovery unveiled on February 19, 2013, that he is for the technological experimentation on the French territory. The Minister would like to entrust to a public company the research on shale gas extraction techniques. However, he stressed that the experiments should be conducted under the control of the government and parliament. Even former Prime Minister, Michel Rocard believes that the wealth of France, of over 5 billion cubic meters of shale

gas, according to an evaluation, should be exploited. But, Madam Delphine Batho, the Minister of Ecology, Sustainable Development and Energy, declares herself, on the contrary, reluctant regarding the public funding of studies that would subject alternative hydraulic fracturing techniques. "I think oil companies have the means to finance their own research on drilling techniques", she declared. [10]

The point of view of the Minister makes clear that there is no question about raising the moratorium on hydraulic fracturing technique for shale gas in France. However, the question arises whether it can be found a way to raise the moratorium for scientific purposes and, in particular, for a research that would solve the environmental problems which appear from hydraulic fracturing technique, the only technique used so far. [10]

Great Britain, even if it was among the first countries which gave licenses for shale gas exploitation, in 2011, it banned their extraction through hydraulic fracturing, after two earthquakes occurred in a region where were conducted this kind of activities. But, in 2012, Edward Davey, the Minister for Energy and Climate Change of the UK, has revoked the decision and announced that hydraulic fracturing presents no risk. "Shale gas is a resource with significant potential for the UK. It could contribute significantly to our energy security, reducing the country's dependence on gas imports", said Davey. "My decision is based on evidence. It comes after studying in detail the latest scientific research and advice of professionals in this area", said the British official. [3]

In *Ireland*, Enegi Oil company announced on February 21, 2013, that they have taken steps at the Oil Business Department of the Irish Government, to obtain a license to explore shale gas. This initiative comes after the successful completion of its own program of research, "Clare Basin Licensing Option". Thanks to this program, the company would have received an award in February 2011 and since then, the work to gather and evaluate the technical data has intensified, analyzing, simultaneously, new geological data for the formulation of a provisional estimate of the potential of the area. The results of the

program revealed that the whole area has a strong potential in terms of shale gas. Furthermore, the conducted studies have allowed the discovery of a region located in a seismic zone with significant shale gas resources. In November 2012, Enegi Oil group declared that an independent report estimated that the resources explored in "Clare Basin Licensing Option" program were evaluated at 101 billion cubic meters of shale gas, of which 33 billion in areas with high potential. The General Director of the company, Alan Minty, made the following statement: "We believe that the surface covered within "Clare Basin Coverage Option" program has a great potential. Based on this idea, it is necessary the beginning of broader explorations. For this reason, we applied for an exploration license that would allow us to perform our work and prove the potential that this region owns. [10]

In *Switzerland* it was created a favorable current regarding shale gas. The Vice president of the Anonymous Society for Swiss Oil (SEAG), Patrick Lahusen, recognized the energy revolution that currently the first world economic power (the U.S.) experiences, and he is convinced that Switzerland holds too, its substantial reserves of shale gas. "We face a true revolution. All theories according to which, on our planet, there are reserves of gas for only 20-30 years, may be forgotten. We have supplies for at least 200-300 years", he said. In Switzerland, Patrick Lahusen created several companies and he stays at the origins of 8 of the 18 exploration wells on Swiss territory, in the last 50 years. Convinced that Switzerland has in its subsoil huge resources of natural gas, he believes that he could start exploring using the recently discovered techniques, once the Swiss government will give endorsement: "There have been incidents and pollution. But recently, new regulations were introduced to reduce the environmental impact. Currently, a new method of fracturing the rock is available, without using water and other chemicals. It uses propane in liquid form, which, after fracturing, goes up to the surface in gaseous form, where it is stored and can be reused. "It is intended that SEAG and the American company eCorp International

associate to perform about 30 drillings in Switzerland. [10]

Recently, *Germany* declared that its state is favorable regarding shale gas exploitation and that authorizes its extraction through hydraulic fracturing, but must be considered, however, certain conditions. Therefore, the German government banned the practice in certain protected areas, while the Ministry of Economy and the Environment prohibits fracturing in areas of sheltered waters and mineral springs. At the beginning of February 2013, the Upper Chamber of the German Parliament (Bundesrat), representing the 16 federal states of Germany, declared its agreement with the adoption of a resolution by which to require the environmental impact that shale gas exploitation could have on the environment. This step aims to ensure people and remove the idea that all natural gas extraction techniques are harmful to the environment. [10]

Also, the Environment Minister, Peter Altmaier, is for the banning of hydraulic fracturing in hydrologic protected areas to avoid any popular movement.

Aware of the energetic potential of shale gas and the wealth of its subsoil, Germany gave a larger spread to the debate on shale gas and is preparing to adopt a law which targets regulations about shale gas extraction, without banning it. The German government is currently in the process of adopting a law to regulate activities related to shale gas.

According to the estimates of the Federal body of Geophysical Sciences, Germany would have shale gas reserves of 1.3 billion cubic meters. [10]

These resources, once exploited, could allow Germany to become self-sufficient in this regard and would contribute substantially to the security of supply and energy price stability. Moreover, Germany is considering a gradual ending in the production of nuclear electricity till 2022. The use of shale gas shows great importance for Germany, given that its consumption is estimated at 86 billion cubic meters per year. [10]

In *Bulgaria*, the withdrawal of the license to explore and exploit gas (awarded in June 2011) for a perimeter of 4.398 km² located in the

north-east of the country, occurred after some protests of environmental organizations and people, regarding the risks involved by the working method. The decision of the Bulgarian government is motivated by the lack of data to ensure environmental protection in the area of exploitation, as a result of using the method of hydraulic fracturing. [5]

Regarding Romania, although the American company Chevron obtained the concession in 3 blocks in Constanta county and another one in Vaslui county, and the government has not extended, at the end of 2012, the moratorium established in the same year regarding the exploration and exploitation of shale gas, the prospecting works are delayed because of some protests of the local population. In one town and two villages from Constanta county, on December 9, 2012, were held referendums on this topic, which were not, however, validated, due to the poor turnout of residents.

Conclusions

If in the U.S., the successful exploitation of shale gas led to a transition from the status of importing country to the status of exporting gas country, as well as to a real process of re-industrialization of the country, by relocating from Europe, to the North-American continent, of various energy-intensive industries, not the same can be said about the situation in Europe.

In Europe, so far, there is no country where shale gas exploitation has already started. But there are countries whose governments and parliaments are for the use of hydraulic fracturing, as extraction technology of shale gas (Poland, Ukraine, Turkey), as are others that have totally banned the use of this technique, not only for exploitation, but also for prospection and even for the scientific research of shale gas reserves (France), or preferred to establish temporary moratoria, to analyze better the environmental impact.

In Western-European countries, the progress is slow in this regard, with the exception of Great Britain, which recently raised the moratorium on shale gas mining. Not only France, but also the Netherlands and Luxembourg have suspended the prospective works, while in Austria the costs of

compliance with the environmental regulations make shale gas exploitation uneconomical, even if those resources would be in the subsoil of the country. [8]

It is expected that, after the first successful shale gas exploitation will be seen in some European countries, the reluctance of other countries regarding the use of hydraulic fracturing may diminish, but the situation will continue to be very different from one country to another. Therefore, the European Parliament, after adopting two resolutions, one on the industrial effects of shale gas exploitation and the other one analyzing the impact that hydraulic fracturing has on the environment, recommended to its member countries to be cautious and to consult the population in this thorny problem.

Abstract

Shale gas have become an attraction for almost all countries in the world, in search of new resources. In USA (which represents a real model of success), shale gas provides reliable, affordable, organic energy, responsibly produced. But/ However, these results have been reached after some intense technological and ecological activity research, performed in more than 20 years. Shale gas exploration generated extensive controversy in many European countries, the main reason being related to the possible dangers which their extraction technology implies. The SWOT can be a useful tool/method to underline the right decision regarding the exploration and the exploitation of shale gas in Romania. The real value of the estimated geological shale gas reserves, along with impact studies on health and environment can contribute to local, regional and national, economic and social development.

Key words: shale gas, resources, exploitation, impact

J.E.L. classification: O13

Introduction

It is known that the economic development and the welfare of the population depend on the resources of the country, on their quality and quantity, but also on the capacity to exploit and use them efficiently, thus ensuring a sustainable development.

A very important non-renewable resource is represented by the natural gas. Natural gas can be „conventional” or „unconventional”. The Petroleum Law 238/2004 (Art.1(3)) states „Natural gas include free gas from methane gas deposits, gas dissolved in oil,

those from the head of gas associated with the oil deposits and gas resulted from the extractions of condensated gas mixtures”. [7]

Shale gas belongs to the category of unconventional gas and is natural gas trapped in fine grained sedimentary rock, less porous and less permeable, called shale. Shale gas was discovered for the first time in U.S., with more than 25 years ago, and it have been exploit for about 15 years. The technology used for the shale gas extraction is called hydraulic fracturing (HF), a proven technology used since the 40s in more than one million wells producing oil and natural gas.

Statistical data shows that the current natural gas production in Romania is about 11 billion cubic meter/year (more than three times lower compared with the maximum production of 35 billion cubic meters, recorded in 1986), and the domestic consumption (represented by people and companies) is evaluated at 15-16 billion cubic meters/year. It can be observed a difference of 4-5 billion cubic meters of gas, represented by imported gas, mainly originated from Russia. [7]

Even if the known deposits at this moment in our country are valued at almost 100 billion cubic meters (which is considered to be sufficient for 10 years), the increase of the domestic consumption determines the orientation towards projects on source of gas diversification. In this context, it can be observed that, for more than 2 years, the interest for shale gas resource knowledge has increased and the concerns for their exploration/ exploitation have intensified. This approach, became, also, the subject for debate for specialists in the political, economic and social field, and a reason of concern for a large part of Romania’s population.

In this context, this paper aims to develop the SWOT analysis elements, for an accurate understanding on what would imply the shale gas exploitation / exploration in Romania.

1. Identifying opportunities in shale gas exploitation

Even if the issue of shale gas shakes the entire world, they are, for now, an economic reality only in North America, where, after more than 15 years, there have been clear successes.

Therefore, currently, it is considered that the Americans provide over 30% of the gas consumption from unconventional resources, compared to only 3%, as it was 10 years ago. One effect of the development of shale gas extraction was the strong cheapening of gas on the American market, which came to cost, currently, five times less than in Europe. In April 2012, prices have fallen to \$ 70 per thousand cubic meters, due to higher production, this rate being the lowest from the last 10 years. Meanwhile, the Europeans were buying Russian gas with more than 400 \$ per thousand cubic meters.

Shale gas exploitation led to the increase, with 50%, of U.S. natural gas production, generated more than 600,000 new jobs and contributed with more than 20 billion dollars to the local budgets of some U.S. states, showed Derk Magness- project leader for the development of natural gas from gas-bearing clays of Chevron company, in Central and Eastern Europe- at the World Energy Council, Central and Eastern European Forum for Energy (FOREN- June 17, 2012). Also, the natural gas from gas-bearing clays provides heating for 56 million of American households, generates a fifth of the U.S. electricity needs, creates raw material for fertilizers, plastics, etc. Given the recorded results so far, the U.S. has proposed to invest, during the period 2013-2018, 400 billion \$ in shale gas production, leading to a number of 5 million jobs created in this field. [4]

The opportunities of ecological exploitation of shale gas in Romania would be: a higher gas production, which would satisfy the increasing domestic demand; the reduction of imports from Russia; independence and safety on the energy market; the cost reduction of gas, which will be reflected in the decrease of population

and economic agents bills, and further, they can reduce the production costs and the selling prices of their products; new jobs and growing incomes. All this facts could be premises for the regional and national development of Romania.

2. Strengths of the shale gas exploitation

There are opinions that state that Romania would have important deposits of shale gas, following the argument that gas trapped in rocks is found where it exists or it existed and were extracted oil deposits. Knowing that Romania, was in the early twentieth century, the third world producer of oil, it can be assumed that the shale gas resources are considerable. [2]

Hydrocarbon production in our country dates back to 1857 for crude-oil and to 1909 regarding natural gas. It can be stated that Romania has tradition and experience in this activity.

3. Which would be the possible threats / risks that may arise from the exploration / exploitation of shale gas?

The aspect that creates the greatest debates and the highest rejection of population from different countries, targets environmental risks that can arise from the working technology (hydraulic fracturing) used for the exploration and exploitation of shale gas, and also because of possible errors and human mistakes.

As a brief description, the working method, in the case of shale gas, comprises four steps: (1) a vertical well is drilled until the shale layer is reached (less porous and less permeable rocks), (2) the drill then runs horizontally through shale formation, (3) the fractures created are kept open through the high pressure injection of water (90%), with sand (9.5%) and other chemicals (acids, chlorides, salts, etc.0.5%) enabling circulation gas flow, (4) after the gas is extracted, the pressure is released and the water returns to the surface. [8]

This process could generate several potential dangers, such as: it could affect groundwater; the methane could escape into the atmosphere and potency, so, the effect of global warming; it could generate earthquakes; it would occupy large areas of

land, disturbing transportation and community life; it could affect population health.

The risk of water pollution

(a) The extraction of shale gas requires *the use of large quantities of water* (between 2300 and 4000 cubic meters) in rock formations, in order to recover trapped gas at a distance of one or two kilometers (or more) below the surface. Regarding the required quantity of water, API (American Petroleum Institute) says that it is lower than in the case of other trade or recreational activities. For example, in 2009, in Pennsylvania, all hydraulic fracturing activities used only 5% of the volume water used for recreational activities such as golf and skiing. Paris water consumption, is on average, 550.000 cubic meters of drinking water per day compared with a consumption of 10,000-15.000 cubic meters required for drilling. [1]

(b) If drilling is not done properly, there could be *the risk of groundwater contamination and the risk of discharge of wastewater or chemicals*. [8]

Water can be contaminated with chemicals used in hydraulic fracturing, as well as with waste water from fractured or crossed formations, which contain heavy metals (As, Hg) or radioactive particles. [7]

On the other hand, The American Petroleum Institute says that the studies conducted by the Environmental Protection Agency (EPA) and The U.S. Water Protection Council have confirmed that there is no direct link between the hydraulic fracturing operation and the impact on groundwater. As an explanation, it is reminded that wells are drilled at a distance from those for the drinking water, the fracturing is performed very deep, far below the level at which there are aquifers, and when a well is drilled, it is coated with layers of cement and steel which play the role of a barrier between the well and the drinking water. Official concerns regarding the impact on environment and health induced by HF (hydraulic fracturing) appeared in 2010, when the EPA (Environmental Protection Agency), at the request of the American government, decided to study the impact on drinking water and public health. It is mentioned, this time, that in U.S. were found

several major gas leak into the environment and groundwater were contaminated with gas and fractionation fluids.

Being aware of the existence of views and fears that HF can contaminate groundwater, Derek Magness, project leader for the development of natural gas from gas-bearing clays of Chevron company, said on June 17, 2012 (FOREN) that using two established technologies-horizontal drilling and hydraulic fracturing, natural gas from gas-bearing clays can be developed in a safe procedure regarding environmental protection. Hydraulic fracturing method, used to open the pores of reservoir-rock, is performed at a depth of 3-4 km., below the aquifers level. Besides this natural protection, Chevron company practices stipulate that the well used at drilling should be composed of several layers of steel and cement, to prevent any possible contamination. [3]

The risk of air pollution

Air pollutant emissions may occur due to the transport of heavy trucks and pressure aggregates, as well as from the manipulation of fluids that contain dangerous substances and which can evaporate into the air.

So far, studies show that shale gas wells pollute some more than conventional gas, because there are being used more wells, and hydraulic fracturing consumes a lot of energy from diesel engines. Thus, the HF process obviously generates *CO₂* and other *air pollutants*. It could be said that shale gas is as harmful for the climate as it is the exploitation of coal. [3]

According to the U.S. Environmental Protection Agency, hydraulic fracturing process used for shale gas exploitation is considered to be the second source of greenhouse gas emissions in the U.S. after the coal-fired power plants. [5]

The biggest fear is related to possible *gas leak* outside the probe by accidental leakages in pipes, if there are cracks, or in valves and other equipments. Methane is considered a very dangerous gas and emissions are difficult to measure. United States Environmental Protection Agency (EPA) has developed and published a study which showed that shale gas emissions are 2.2%, which means slightly above the level of gas

emissions from conventional sources. It also states that the level of emissions will decline as a result of environmental practices that prevent gas leakage or burning, and that are currently applied in most of the new wells. EPA is working on the most comprehensive study so far, in terms of all aspects of shale gas and which aims to reduce public fears. [5]

The risk of potential earthquakes

Because of hydraulic fracturing, which means *injecting large volumes of wastewater, it is believed that the seismic movement may intensify*. A study of The U.S. Geological Survey shows that there has been recorded an increase of frequency and magnitude of surface earthquakes felt in the U.S. and associates this change due to the drilling activity for oil and gas. [7]

Regarding the risk that the HF produce seismic movements, Mr. Derek Magness said that Chevron is conducting complete seismic studies to place the operations at a safe distance from tectonic faults; the seismic activity of the area is closely supervised throughout the operations using acoustic sensors and other established technologies, which allows to precisely identify the extent of cracking in the reservoir rock. [3]

The risk of noise pollution, occupying land areas, affecting transport and community life

Another risk of shale gas is the *occupation of large areas of land* required for digging wells, parking and handling heavy equipment, space for surface equipment, gas processing facilities and their transport, accessible roads. This could lead to the *removal of some areas from agricultural circuit, land desertification, degradation of wild flora and fauna, landscape destruction, transport congestion, destruction of roads and driveway network, bridges, noise pollution*.

Specialists state that hydraulic fracturing is a noisy process, but that lasts only five days, after which the gas will start to flow. Then, the trucks, the portable offices and the containers are taken to another site of operation. [5]

Regarding the danger generated by the transportation, an observation of the European Parliament comprises the following comparison: if for a platform with eight wells there are required 4000-6000 transports within six months to ensure the functioning of wells, to ensure the functioning of wells for a typical commercial center there are needed about 15000-25000 transports within a year of operation.

In terms of landscape destruction, Bruce Niemeyer, one of the regional directors of Chevron, considered as a remarkable aspect related to shale gas mining “the absence of anything remarkable going on” above the ground. Marcellus area from Pennsylvania (U.S.) did not look at all like a field of gas wells, like anyone would expected to look. [6]

It can be said that currently, the impact on local communities in Europe may be lower than it was in America at the beginning of the activity of this industry, and, in the future, may still diminish.

Risks on health and quality of life

Hydraulic fracturing method realizes the deep pumping of large quantities of water (90%), sand (9.5%) and *additives (0.5%)* to break the layer of the rock and release the gas. Another big concern is related to *these additives, which contain 600 chemicals* (instead of 4, the number of chemicals used to exploit conventional gas), some of them considered carcinogenic. The dissatisfaction of the population is also connected to the aspect that it is not communicated clearly what chemicals are being used, invoking issues related to the protection of a particular “trade secret.” [7]

Exploiting companies only resume to mention that these chemicals, in their majority, are found in common products that we already use (such as cosmetics and home cleaning products). But, according to a list provided by The New York State, we find that among the *750 chemicals identified by the researchers, there are: 58 substances with problematic properties, 6 substances that require special attention because of their potential effects they may have on humans and on the environment (acrylamide, benzene, ethyl benzene, naphthalene, ethylene, tetrasidin, isopropilbenzen /*

Cumene), 17 substances are considered toxic to aquatic organisms; 38 substances are classified as toxic to human health, 8 substances are considered carcinogens, 7 substances are classified as mutagens, 5 are classified with negative effects on the reproductive function.

U.S. Department of Health, found, after analyzing a study on hydraulic fracturing, that this procedure can be done in a safe manner in New York State area. The study details the potential impact of hydraulic fracturing method for a variety of environmental factors, starting with the impact on water resources, to the impact on air quality. It was also analyzed the potential impact on the socio-economic field and on the quality of life. It states that, in order to avoid potential hazards, it is necessary to comply with the regulations adopted during the last years.

4. Weaknesses in shale gas exploitation

It is estimated that shale gas reserves in Romania would be located at depths greater than those in the U.S., which would mean higher costs. Also, the perimeters of Romania, which have already received the operating license, are located in populated areas and this aspect concerns the inhabitants in terms of health and safety. Moreover, in Dobrogea region, these blocks are close to the seaside resorts and some important sights, which questions the development of touristic activity in this area.

Conclusions

Shale gas exploitation has proven to be a real success for the U.S. economy. More and more countries, consider, at present, that the exploitation of these resources can bring economic and social benefits, which is why they decided their exploration.

At european level, it is found that the attention and the attraction for shale gas differ from the U.S., but differ from one country to another and from one period of time to another. Because of the controversy regarding the technology of work- hydraulic fracturing, in some european countries like Bugaria, Ireland, France, Czech Republic shale gas exploitation has been banned, in the German state of North Rhine-Westphalia

was introduced a moratorium, and in England and other countries were conducted extensive public protests against this method of working. (HotNews.ro). For some time, in some of these countries (England, Ireland, Germany), the situation has changed, in that many fears were removed as a result of scientific studies conducted and it was decided to exploit shale gas.

In Romania, even if the temptation of politicians and Romanian specialists in exploration / exploitation of shale gas is high, there is a strong opposition from the population and various environmental organizations, generated by the concerns regarding environmental protection and safety of life. The lack of complete information and the lack of dialogue with the population on the benefits and threats related to the prospect of exploration / exploitation of shale gas appears to maintain this situation.

For the population, in particular, we believe that extensive actions are needed for a properly and complete information, from competent and responsible bodies/ individuals regarding all the issues related to shale gas.

Education Development as a Prerequisite for the Formation of a Competitive Wage System in Consumer Cooperative of Ukraine

Kostyshyna Tetyana

Human Resources Management and Labour Economics Chair, Poltava University of Economics and Trade,

tkost2007@yandex.ru

Abstract

The article reviews intellectual and innovative factors of education development. These factors influence on wage system and increase it competitive.

Key words: education, wage system, competitive, consumer cooperative.

J.E.L. classification: A23, J30, F 12

Introduction.

The importance of higher education in the economics of Ukraine as a major factor in the formation not only of a competitive economics, but also a new quality of society as a whole is growing.

Therefore the problem of supporting the development of education and science is deeply social and refers to the priorities of social development and also directly linked with the national interest, improvement of quality of life and national security.

However higher education should not be a mirror of social and economic problems, but rather a tool to overcome them, a window into the future. So in most countries of the world where knowledge has become the driving force science and education are given priority. In the Materials of final board "Higher Education in Ukraine – European dimension: progress, problems and prospects" it indicates that we have to create conditions for the proper positioning of the dignity of the teacher, scholar, intellectual, rather than passively observe the marginalization of Education [1, p. 1].

The article aims is to identify the main factors of education development and find out their impact on competitiveness of wage system.

Results

The education reforms conducted abroad are focused on current and future needs of society, the efficient of resources using including directly educational systems. Ukraine can not and must not remain aloof from these global trends. A comprehensive and deep modernization of the education system - is imperative educational policy of Ukraine, its main strategic direction. Strengthening the role of globalization in terms of innovative components of economic development of countries, inextricably linked with the development of information technology, determines the need for highly skilled labor force characterized by the prevalence in the composition of its functions elements of a higher, creative order.

First of all, it concerns the security of the labor force, able not only to perceive accumulated by previous generations the volume of empirical and theoretical knowledge, assimilate it, but also to systematically raise the level of competitiveness, trying to apply a creative approach to the use of the knowledge gained.

It should be noted that in the creation of a competitive environment activation of the innovation processes of social development led to increasing the role of education and training in the development of human resources.

The increase in the quality requirements of the labor force with the development of modern technology requires constant improvement of knowledge and skills of the individual during working life to ensure its productive employment, occupational mobility and competitiveness.

First of all, the implementation of the tasks will require the inclusion of the individual in the system of continuous education.

Improving the quality of educational

services aimed at providing the conditions for the formation of a system of continuous education so-called "life-long education" to improve vocational structure of the labor force, acts as one of the most effective ways of increasing the competitiveness of the national workforce. With the increasing importance of innovation factors of competitiveness of national economies is the development of education, quality of education is a necessary precondition for sustainable and innovative dynamic changes in the economy, the transition to innovative information model of social development.

Standards of education in Ukraine are traditionally high, which manifests itself primarily in the higher level of coverage of education, literacy of the adult population, maintaining a high proportion of people with higher education.

A comparison of the index and the index of education rankings with an index rating and regional human development index in 2011 is presented in the table 1.

Table 1. Indexes and ratings indices of education and regional human development in 2011 [2, p. 23]

	Level of education		Level of regional human development	
	Index	Rank	Index	Rank
ARC	0,374	17	0,495	9

Kyiv city	0,825	1	0,695	1
Sevastopol city	0,618	2	0,579	2

Given that the index of regional development is determined on the basis of determination of 9 indexes: the demographic development, labor market development, material well-being, the living conditions of the population, education, health and health care, social protection, ecological situation, the financing of human development, it can be concluded that level of education is one of the most influential factors in the formation of the regional human development.

Thus, the rating of the index level of education of Kiev - 1 corresponds to the first ranking of the regional human development index, Sevastopol is a 2 rating as the index level of education, and on the regional index of human development.

Modern civilizational trends have an impact on the system-reform education in Ukraine. The first trend is the increasing globalization of the economy, the relationship and interdependence of the world.

Deep processes of this trend are stipulated due to the development of science, technology, production, leading to the formation of the world's total economic space and planetary information field, the results of an intensive exchange of material and spiritual production.

The second trend is caused by the formation of a positive environment for individual human development, its fulfilment in this world. It is these trends contributed significantly to the reform of the education system of independent Ukraine [3, p. 179].

However, despite the positive indicators of the standard of education in Ukraine, in the development of the education system in the 1990s there has been a build-up of negative trends: inadequate funding of education, regional uneven distribution of educational facilities in the country, the ineffectiveness of the reorientation of education systems to the needs of the labor market, inadequate curricula of the education system that does not provide graduate and professional life skills necessary for their

employment in the new integrated economics.

It should be taken into account that the high standard of education serves an important factor since the country's competitive advantages. First of all, it is the need of information and intelligent technologies in the educational process in order to manage the modern methods of the educational process, significantly improving the quality of training of highly skilled specialists.

At the same time providing access to the world achievements of science and education, the development of the education market increases competition between universities in both domestic and foreign markets, as those who do not provide a sufficient quality of education can not compete.

Experience shows that competition - is an effective factor in the development of the education system, which makes it necessary to implement a set of measures to overcome the disadvantages and consequences of self-isolation, improve the system of education at the level of modern requirements, the implementation of its information, the introduction of innovative technologies in practice, the development of new methods and criteria assessment of knowledge, overcoming the contradictions between domestic and world level education, joining the national system of education in the global educational space.

In the transition phase of the accession of Ukraine to the World Trade Organization, which involves growing openness of the national economics, there may be significant transformational change. This primarily refers to the need to ensure access to national education market foreign institutions that have developed material and technical base and financial resources to support the introduction of new methods of educational process [4, p. 33]. Consequently, this leads to increased competitive pressure on the education market by foreign institutions, while among the internal factors of increased competition in this market should be allocated, first, the deterioration of the demographic situation in the country, increasing the number of educational institutions offering educational services.

The transition to a postindustrial society

makes it necessary to review not only the technology of education, but also directly to its content, clarify the optimal structure of knowledge for all age groups. It is considered essential to ensure a regular updating of knowledge with the acceleration of technological change processes in order to prevent the rapid aging of the least mobile of the content of education. Developed countries pay considerable attention to the growth of the educational component of human capital, since employers are interested in preparing skilled and educated professionals to high-tech manufacturing. That is why they help finance educational institutions, scholarships paid the most talented students, provide training in the workplace. Attach the so-called "investment" in young professionals, which provides employer means that it is potentially interested in fixing this specialist industry.

For its part, the government is also interested in constructive cooperation with employers, as corporate payment for education allows to redistribute public funds more task-oriented and reduce the financial burden on the state budget. In a number of countries implementing programs under which employers who provide temporary jobs first graduates are now provided wage subsidies.

It is considered appropriate to the application of incentives for the employers to provide permanent jobs for young professionals. In particular, some countries have a support to employers who offer permanent jobs for young professionals, especially in the case when, during the practical training, the trainees successfully show their talents and realize their knowledge.

In our opinion, it is necessary to take into account the dominant influence of educational factors on the validity of the formation of a competitive environment in the labor market competitive pay system and human development. This degree of adaptability of education and training to dynamic changes in supply and demand conditions in the labor market, and to provide labor, professional qualification options that meet the needs of social and economic development of society, are the determining factors of growth competitiveness - capacity of human resources. Functional characteristics of education in the formation of innovative

society is not only "... ability to provide those learners accumulated in previous years the knowledge and skills but also the ability to perceive and use in practice, new scientific ideas, technological tools and production methods to form in the innovative abilities, initiative and enterprise" [5, p. 34].

Inadequate response system of vocational education directly related to the maintenance of the production sector, the changes in the employment structure in transformational change led to the preservation of old patterns Training Workers. Vector selection experts shifted from prioritizing work related to the implementation of their inherent creative features, jobs that do not require high-level qualifications. Thus, according to a sample survey of the population of economic activity conducted by the State Statistics Committee of Ukraine, much of specialists with higher education are not forced to work in the specialty (70% of those in the physical, mathematical and engineering, 46% - biological, agronomic and Health Sciences 76% of technical experts in applied sciences and engineering) [6, p. 7]. Ultimately, this leads to gradual depreciation of their accumulated knowledge and skills of professional skills, and thus weakening the competitiveness of the workforce.

The instability of the current situation on the labor market relates primarily to the specifics of the present stage of transformation of economy of Ukraine, which appears due to the lack of a clear correlation between the level of education of employees and amount of income received by them. Current income is the result of differentiation of restrictive state fiscal policy, since the state, acting as employer-monopoly in some segments of the labor market, established a monopoly low prices for high-skilled labor.

However, please note that, even if the manufacturing and technological innovations dictate the feasibility of employment of additional workers, employers may refrain from it if the marginal cost of hiring such excess. This may make the problems of the education system, because on the one hand, it signals that there is market demand in certain trades and trying to adapt the size and structure of its production in accordance with them. On the other hand - graduates can not find a permanent job in the specialty, because of their employers' costs of hiring too large,

although the salary of the workers may be low.

Wages in the present socio-economic situation is the most important factor in shaping the attitude toward labor, ultimately determines the state of motivation to work.

In most cases, young uncompetitive in the labor market because of experience, specializing almost absent, and a limited number of vacancies in the business can not get it. To enable a first job graduates of educational institutions directed the Verkhovna Rada of Ukraine of the draft law on quotas of jobs for graduates. However, the effectiveness of this law is to be determined by the extent to which employers received training requirements caused by the quality of educational services and the level of interest of employers in hiring members of this category of employment.

Educational services in the system of consumer cooperatives in Ukraine are provided by 23 educational institutions of first level of accreditation and 2 educational institutions of fourth level of accreditation. The need to ensure competitiveness of the national labor force in the face of increasing integration in the global economy stimulates the formation of a competitive wage system. The quality of the latter undoubtedly related to the educational level of workers, in particular the system of consumer cooperatives.

Given that, in our research, uncompetitive remuneration system both in terms of level and mechanism of formation is the disincentives influx of skilled labor in the system of consumer cooperatives, it is necessary to qualitatively improve the training of students in economics.

The increase in training of specialists in this sector is stipulated by higher prestige of obtaining these specialties and a guarantee (at the current time) to obtain a sufficiently high and stable income.

The task of increasing competitiveness and consumer cooperatives in particular, necessitates improving training engineering professionals to meet the needs of modern information technology. With the intensification of innovation processes need to ensure the growth of the country's competitiveness, particularly of consumer cooperation in technical and technological fields, increasing the relevance of training of

scientific and technical profile.

It should be noted that the employment of young people who are first entering the labor market, rather problematic, since this contingent is least prepared for by the existence of a highly competitive labor market. Lack of experience, lack of professionalism and poor feasibility obtained in higher and secondary vocational schools of knowledge in practice, preference in employment are more experienced and skilled workers reduces the chances of youth employment after graduation in higher education. It is therefore necessary to pay due attention to improving the competitiveness of the national youth labor market, including consumer cooperatives, which could lead to maintaining high educational level of the human resources of the country in the long term and ensure the realization of competitive advantage.

The Cabinet of Ministers of Ukraine "Ukrainian breakthrough: for people, not politicians" in particular includes:

- government ordering according to the needs of society and of its funding from the state budget;
- expanding the autonomy of higher education institutions and the democratization of domestic life;
- adaptation of Ukrainian higher education to European standards and requirements of the Bologna process, keeping the best achievements of national education, providing compatibility curricula of higher education institutions within Ukraine and other European countries;
- increased state control over the quality of the educational process, denial of licenses universities, where the process does not meet the established standards;
- ensuring the implementation of the priority right to higher education from the state budget gifted children from low-income families;

- formation mechanisms of identification and selection of gifted young people and giving it the socio-pedagogical support and more.

Conclusions.

In the current circumstances it is necessary to take into account that educational services should promote the absorption of graduates of the body of knowledge and skills on a particular specialty, to ensure obtaining of a new social status in the society, and development of technological and psychological self-organization. This is possible only by improving the quality and competitiveness of university services, achieving the educational institution a competitive advantage over other universities that offer services similar in content, scope and purpose, in a particular segment of the labor market.

A Managerial Early Warning System for the Sustainable Knowledge Based Organization

Leon Ramona – Diana

*The Faculty of Economics and Business Administration, Alexandru Ioan Cuza University
of Iasi*

ramona.leon@feaa.uaic.ro

Abstract

The article aims to highlight the main characteristics of a managerial early warning system which is designed especially for the sustainable knowledge based organization.

In order to achieve our goal we used an ethical approach and focus on case study as the research strategy. Based on the results of a documentary study and in-depth interviews, we have selected three sustainable knowledge based organizations from the business environment from Iasi and Madrid. For each of them, we have conceived, tested and validated a managerial early warning system, based on an artificial neural network.

The results have showed that the artificial neural network, on which the system is based on, must include at least 28 factors. As a consequence, it has theoretical and managerial implications. On the one hand, it proposes a new strategic instrument. On the other hand, it highlights the most important elements that are influencing firm's profitability.

Keywords: strategy, artificial neural network, sustainable knowledge based organization, early warning system.

J.E.L. Classification: L21, M1, M14

1. Introduction

As the economic environment became more dynamic, complex and uncertain [1], [2], [3], the need for new types of firms and strategic instruments had increased. As a result, the sustainable knowledge based organization has been developed [4] and the early warning system, which was especially developed for anticipating natural disasters

[5], was introduced at the organizational level [6].

Based on these we ask ourselves, what is the structure of a managerial early warning system, conceived for the sustainable knowledge based organizations? Which will be the elements that should be included its structure if we would like to use it in order to anticipate the future threats and opportunities?

We will answer to these questions in the following sections of this article. Next, we will summarize the particularities of the sustainable knowledge based organization and the ones of the early warning systems and we will present the methodological approach that we used. In the fourth part, we will highlight the main results and in the end we will indicate some directions for further research.

2. Characteristics of the sustainable knowledge based organization and managerial early warning systems

Developed against the backdrop of globalization, the sustainable knowledge based organization is an economic entity that aims to increase its short, medium and long term market value by dealing with knowledge, economic, social and environmental issues. It is usually described as a complex and adaptive system that combines the economic, social and environmental objectives with the ones regarding knowledge in order to adapt to the challenges that occur in the micro- and macro-environment [4].

As we may notice from Figure 1, its main characteristics combine the interests in knowledge creation, dissemination and use with the ones in developing a partnership with the members of the community in which it operates.

Figure 1. Main characteristics of the sustainable knowledge based organization

Source: [7]

So, it differentiates from the post-bureaucratic firms, that had been consecrated in the specialized literature, by its way of perceiving the employees (who become knowledge workers which are concerned with developing themselves and ensuring that the future generations will have access to the same quantity of natural resources), the multiple categories of objectives (focus on economic, social, environmental and knowledge issues) and the implementation of programs that bring benefits to all the stakeholders [8].

Starting from these, when a strategy is developed several aspects must be taken into account. The managerial early warning system is the one that may satisfy this need since it combines the internal with the external perspective, the subjective approach with the abstracted one.

The managerial early warning system is a strategic instrument that allows protecting company's competitive advantages by scanning, analyzing and interpreting the factors from the micro- and macro-environment [9], [10]. It may be based on a managerial debate [9] or it may use an artificial neural network [10]. The first one will be subjective and time-consuming while the second one will be abstract and will necessitate additional efforts in order to increase managers' implication in strategy's implementation. As a consequence, we assume that a managerial early warning system should combine these approaches in

using both managerial debate and artificial neural networks. The managerial debate should be use in order to identify strategic factors, to build scenarios, to develop strategic answers and to formulate the future strategy. The artificial neural network should be use for determining the future evolution of the elements that may influence firm's performance.

3. Methodology

The research goal was to identify the main elements of a managerial early warning system which is based on an artificial neural network and designed especially for the sustainable knowledge based organizations.

In order to achieve our goal, we aimed to:

- identify at least one sustainable knowledge based organization in the business environment from Iasi and Madrid;
- determine the most important factors that may influence firm's strategy;
- conceive a managerial early warning system based on an artificial neural network;
- use the developed system for anticipating the threats and opportunities that may appear during 2013 – 2015, base on the events that succeeded in 2007 – 2011.

We used an ethical approach and we combined the advantages of using the documentary study and in-depths interviews

with the abstract character of the artificial neural network.

The documentary study and the in-depths interviews focused on identifying sustainable knowledge based organizations in the business environment from Iasi and Madrid. According to data published on the Chamber of Commerce website, there are 72 potential sustainable knowledge based organizations in Madrid and 49 in Iasi. Then we analyzed the annual informs of each of these companies. The units of analysis were represented by the characteristics of the sustainable knowledge based organization, namely: multiple categories of objectives (economic, social, environmental etc.); planning on short, medium and long term; open organizational culture; investing in human resources; collaborating with other firms and reduced number of first line and middle managers. In the end, we noticed that only 23 firms could have been described as “sustainable knowledge based organization” (16 were from Madrid and 7 from Iasi).

During 15th of July 2012 – 1st of February 2013, we have contacted the managers of these companies in order to establish a meeting. This had two goals. First of all, we wanted to check if the firm has an internal knowledge base and the activity is organized around interdependent teams. Secondly, we wanted to present them the possibility of participating to the development of a managerial early warning system. Only 9 managers have accepted the meeting. In the end, 5 firms met the last two conditions and only 3 (1 from Madrid and 2 from Iasi) accepted to participate to the development of the early warning system.

Further, we conducted an in-depth interview with the managerial team from each company and we identified the main factors that may influence their strategy. These were presented in a “cause-effect” map and reunited elements from the micro- and macro-environment.

We collected data regarding the evolution of each of these factors, during 2007 – 2011, from internal (annual reports) and external documents (Eurostat, World Bank databases). In order to estimate the future value of these, we developed an artificial neural network using *Allyuda NeuroIntelligence*. The main characteristics of the artificial neural network were a learning rate of 0.7, a momentum of

0.8 and a target error of 0.01.

Based on the results offered by the artificial neural network we determined the main threats and opportunities that may appear during 2012 – 2015 for each of the selected firms. The results for 2012 were used for an external validation. In other words, in March 2013, we presented our assumptions for 2012 to the managerial team. Each of them confirmed it and their answers served as a validation procedure for the managerial early warning system’s structure.

The results that we had obtained for 2013 – 2015 were used in the Spanish company in order to develop scenarios and establish the future strategy.

4. A viable strategic instrument for the sustainable knowledge based organizations

For each of the selected companies, we had developed a managerial early warning system that aimed to identify the opportunities and threats that may influence company’s profitability during 2013 – 2015. According to this, we followed three phases: predicting (scanning the environment), diagnosing (identifying the future threats and opportunities) and reacting (developing scenarios and building the strategy).

First, we had analyzed the evolution of factors that were describing the *socio-demographic environment* (population’s distribution by education, wage and age etc.), *economic environment* (inflation, interest rate, foreign investments, economic growth rate, employment rate, taxes etc.), *technological environment* (investments in research & development, product and process innovation, technology absorption etc.), *legal environment* (efficiency of the legal system, market deregulation, protection of the intellectual property etc.), *political environment* (corruption, transparency of the decisional process, government efficiency etc.), *profitability* (incomes, costs, profit etc.), *competition* (number and characteristics of the most important competitors, the degree of industry’s atomization etc.), *customers* (satisfaction, company’s dependence, lost customers etc.), *human resources* (satisfaction, education, retention etc.) and *services / goods* (quality, price, time and costs generated etc.). Each of these was discussed during the managerial debate. In

the end, we obtained a list of 30 to 35 factors, depending on company’s activity. For the firms that were operating on a stable market the number of factors was less than for the one that was activating on an instable market.

The evolutions that these factors had during 2007 – 2011 were introduced in an artificial neural network (Table 1). Based on

a back-propagation algorithm, these estimate the values that these indicators will achieve from 2012 until 2015. The level of confidence for these estimations varies from 90.5% to 95% depending on environment’s complexity and volatility and on market’s maturity.

Table 1. Characteristics of the artificial neural networks developed for the selected sustainable knowledge based organizations

Characteristics	Firm A	Firm B	Firm C
City	Madrid	Iasi	Iasi
Size	Medium	Small	Big
Industry	Services	Services	Production
Firm’s experience on the market	7 years	8 years	103 years
Economic volatility	Low	High	High
Market maturity	Low	Low	High
Number of factors included in the artificial neural network	30	35	31
Number of learning cycles in the artificial neural network	486	1174	3176
Average training error in the artificial neural network	0.004178	0.00736	0.004291
Level of confidence	95%	90.5%	95%

Besides, we have noticed, that no matter the size of the firm or the domain of activity, this is vulnerable to economic phenomenon. This generated most of the identified opportunities and threats (Table 2). We also noticed that the changes that will occur on

the competitors and clients level will generate a couple of opportunities while the transformations that will succeed at the political level will stimulate the appearance of some threats.

Table 2. The opportunities and threats that will appear during 2013 – 2015 for the selected companies

	Opportunities	Threats
Firm A	<ul style="list-style-type: none"> • slow economic growth; • reducing the taxes; • reducing the bureaucracy; • increasing investments in education. 	<ul style="list-style-type: none"> • reducing the foreign direct investments; • slow growth of corruption; • increasing market’s deregulation; • reducing the entry barriers; • reducing market’s size.
Firm B	<ul style="list-style-type: none"> • slow economic growth; • reducing industry’s atomization; • increasing market’s regulation; • increasing market’s size; • increasing the exchange rate for euro. 	<ul style="list-style-type: none"> • increasing the price of combustible; • increasing the inefficiency of bureaucracy.
Firm C	<ul style="list-style-type: none"> • slow economic growth; • reducing the inflation; • reducing the number of employees from the domain; • reducing the number of competitors; • increasing the demand on the international markets. 	<ul style="list-style-type: none"> • increasing the inefficiency of bureaucracy; • increasing the level of corruption; • increasing the imports; • reducing the demand on the national market.

As we may remark from Figure 2, the

foreign direct investments are influencing the

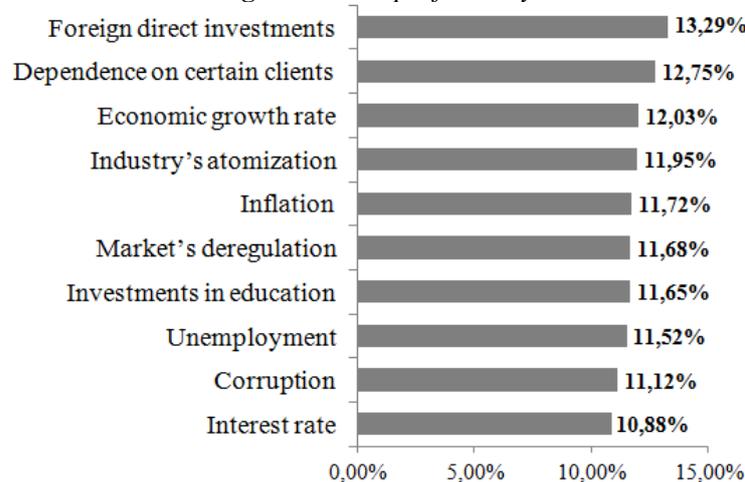

small, medium and big companies from Iasi and Madrid, from production and services area. In other words, what happens with the national economy is affecting the firms and, on the same time, is affected by their behaviour. Therefore, the foreign direct investments are occupying the first position while industry’s atomization is placed on the fourth place.

Another important aspect is represented by the level in which the firm is depending on a reduced number of clients. If this dependence increases then the organization becomes more vulnerable. It has to deal with the elements that are affecting it directly and also with the ones that are affecting its clients. Any event that will cause reducing the profitability of its clients will be perceived as an indirect threat since it will also diminish its own financial performance. This result may have been generated by the fact that all the analyzed firms were operating in the business to business area. Therefore, the financial problems of their clients have a powerful impact on firm’s performance. In the business to customer

area, firms are usually distributing the indirect risks (except for the ones that are offering exclusive goods or services or the ones that are satisfying a special need).

If we strictly refer to the 10 most important elements that influence the profitability of the sustainable knowledge based organization, we observe that the highest influence is exercised by the economic environment, customers and future human resources. The investments in education guarantees company’s access to certain value and quality of knowledge. This will be used in order to satisfy clients’ demands (it will stimulate innovations regarding firms’ products and / or processes) and it will generate added-value in the economic environment. Therefore, this ranking is highlighting the double perspective from which knowledge is analyzed in a sustainable knowledge based organization. It’s a purpose in terms of creating and disseminating and also an instrument when it comes to increase company’s profitability and to ensure its short, medium and long term market value.

Figure 2. The most important elements that may influence sustainable knowledge based organization’s profitability

Last but not least, we identify that 28 factors were common to all the analyzed companies. More than 50% of them were referring to intangible aspects of the business environment (like, efficiency, bureaucracy etc.) which reflects the importance that knowledge creation, dissemination and use have it for the sustainable knowledge based organization. In other words, when a strategy is developed for the sustainable knowledge based organization, managers should take

into account not only the internal factors that encourage knowledge creation, dissemination and use (namely, organizational culture, human resources’ satisfaction etc.) but also the external factors (like, investments in education, bureaucracy, efficiency of the legal system etc.).

5. Conclusions and further research

Through this methodological approach,

we demonstrated that a managerial early warning system, based on an artificial neural network, is a useful strategic instrument for the sustainable knowledge based organizations since it is capable of anticipating the future opportunities and threats. These have theoretical and managerial implications since it extends the literature and it offers a new strategic instrument.

Despite these results, the research is limited by the fact that we only concentrated on 3 firms from the business environment from Iasi and Madrid and we only use the artificial neural network for estimating the future value of the strategic factors. The results may have been different if we had used an artificial neural network based on the feed-forward propagation algorithm or if we had combined the artificial neural network with the rough set theory.

Starting from these, we aim to extend the research so that we could generalize the structure of the managerial early warning system and to develop a comparative analysis between the results that are offered by an artificial neural network based on a back-propagation algorithm, one that is based on the feed-forward propagation algorithm and one that is combined with the rough set theory.

Abstract

The Brand represents the most valuable assets of a company, so brand management is an important new activity in companies. Although normally concentrate their branding efforts towards developing new product and corporate trademarks, branding can be also used in Human Resources, more precisely in Resource Management.

Having a value-centered culture of the "employer of choice" kind means having under control a few key features: internal and external good reputation, identity, image, corporate social responsibility, leadership, empowerment, personnel policies and strategies. Each and every of these features is critical and must be integrated within the brand's global vision.

Investigating of the position of employer of choice are directly proportionate to respecting ethical principles in influencing employees, regardless of the adopted style.

Keywords: Employer's Brand, Brand Strategy, Employer's Branding, Brand Equity.

J.E.L Clasification.: M31

1. Introduction

The Employer's Brand is the virtuous circle thereby increasing employees' motivation leading to an increase in employees' performances, that is also conducive to improvements in client's relationship, and increases the brand's net value ("brand equity"), having an effect on employees' motivation and attracting suitable people to work within the organization. They somewhat justify the usefulness of the Employer's Branding through the benefits that the relationship employee -client - a perspective that emphasizes on the internal marketing and on the relational marketing. [1]

2. Literature review

Employer's Branding is essentially a three phases process. Firstly, when a firm develops a concept of particular value it is potentially and practically offered by employees. That proposition adds value that represents the core message conveyed by the Employee Brand. It is essential that this valuable proposition come from a comprehensive audit of the characteristics that make the company an ideal place to work. Once the proposition of value was established, the second step in the Employer's Branding is represented by selling it on external markets. The third phase of Employer's Branding

implies achieving the brand promise, made in order to attract recruits to the company, incorporating part of the organizational culture, and in order to keep the existing ones. In other words, that latter step means selling the Employer’s Brand on the internal market [2].

Categorizing companies on these criteria is not neglected in Romania neither. Every year, the Capital magazine makes a top 100 employers based on the criteria: workplace conditions, communication within the workplace, salary and benefits package, professional formation quality [3].

A study undertaken by James O’Rourke IV, on 3,000 subjects, shows that 60% of those had knowledge of behavioral abuses by bosses. The reasons they don’t make them known are: the company’s lack of interest in such issues, lack of protection (anonymity, protection against reprisals, etc.) [4] Therefore the leaders’ ethic must be a relevant ingredient for the connection between the reality of the brand and its promises.

There are five steps to be taken for developing a powerful Employer’s Brand [8]:

- understanding your organization
- create a convincing brand promise for the employees who reflect the brand promise to the clients
- develop standards for quantifying the achieving of the brand promise.
- rallying all the practical people to support and strengthen the brand promise and,
- execute and measure.

A powerful Employer’s Brand *lowers the recruiting costs of the company* as, due to their loyalty, the organization does not need to replace existing employees with new ones, the retention costs being lower than recruiting and induction costs. What is more relevant, a high level of involvement makes employees work better (*enhances efficiency*) and be more careful with company assets. Successive studies showed that employees’ strong involvement makes the company grow. *Young companies* that are riding the waves but do not have a consecrated name, may use Employer’s Branding to attract the people fit to make the company grow. A particularity of the Employer’s Branding in such companies is that it is developed *organically* and often it is “*a direct extension of the founder’s personality.*”

In the context of employer’s marketing, the Employer’s Brand can be regarded as a set of distinctive images about a potential employer, as they appear in the mind of target groups – potential employees[6].

3. Objectives and method

This paper has importance for all because the Employer’s Brand is little talked of in Romania, although intensely used in branding and human resource management in the international environment. Indispensable as a survival and development instrument of economic and non-economic Romanian companies, Employer’s Brand has a huge potential from the perspective of sustainable development, competitiveness and the diminishing of labor migration from Romania companies to other European companies. Moreover, the case study is a novelty, being the first notable to have recorded results.

This paper analyses how personal brand is perceived by applying a series of cross questionnaires, in the sense that in 119 companies were applied two types of questionnaires to be able to identify employer’s and employees’ opinions. From each of the 119 companies, 5 questionnaires were applied for employees .

The 119 companies in which the study was conducted are located in the North-East Region, private-capital companies with more than 50 employees. The questionnaire addressed to the employer was filled in by the HR department manager and the questionnaires addressed to employees were filled in by persons hired at least as middle management from various departments. The questionnaire was applied from April 2012 to October 2012.

4. Results

The first questions of the questionnaire addressed to the employees respondent to the study refer to the identification of the company size and of the activity field, and the answers are illustrated in figure 1 and figure 2. Thus, the majority of the companies participating to the study have from 100 to 200 employees (approximately 80% of them), and 10% have even more than 200 employees, which gives relevance to this

study. The main fields where more than half of the targeted companies operate are, in order of importance: commerce, service providing and the industrial, financial-economic field.

Fig. 1 – How many employees have you got?

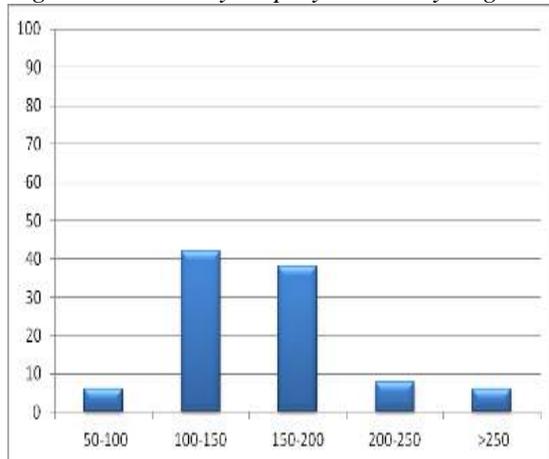

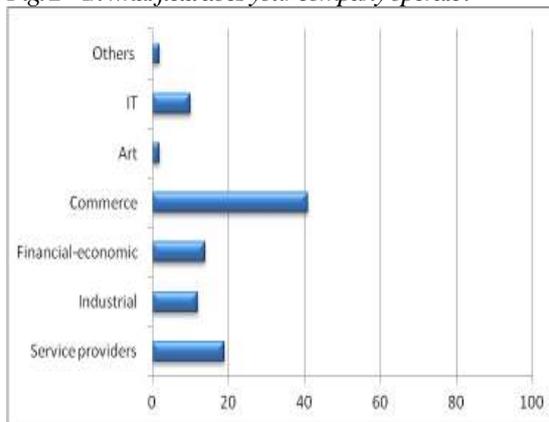

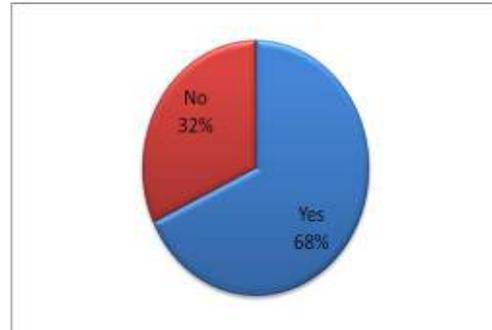

Fig. 2 – In what field does your company operate?

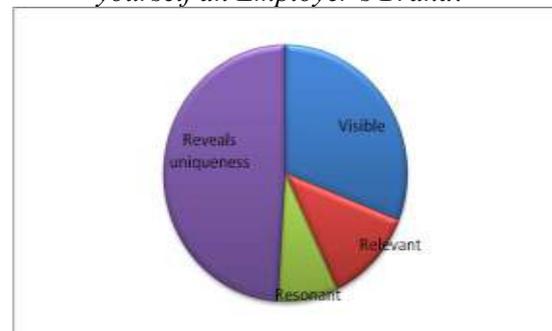

Questioned about their perception upon the company, meaning that if they reckon the company having Employer’s Brand, the majority of the respondents – employer’s representatives have answered they reckon the company as having Employer’s Brand, as it results from figure 3.

Fig. 3 – Do you reckon your company as having Employer’s Brand?

Those who considered that the company they represent has got Employer’s Brand were asked to check one characteristic according to which they answered affirmatively to the previous question. The results are shown in figure 4 and indicate that the representatives believe the company’s uniqueness as being a defining characteristic of their brand (almost half have given this answer), a quarter of them believe that the fact they are visible on the economic market offers them the Employer’s Brand statute. Less than 10% have considered their company relevant for the economy, at least regionally, this being a motivation for the Employer’s Brand.

Fig. 4 – Check what characteristics of the following you fulfill in order to consider yourself an Employer’s Brand?

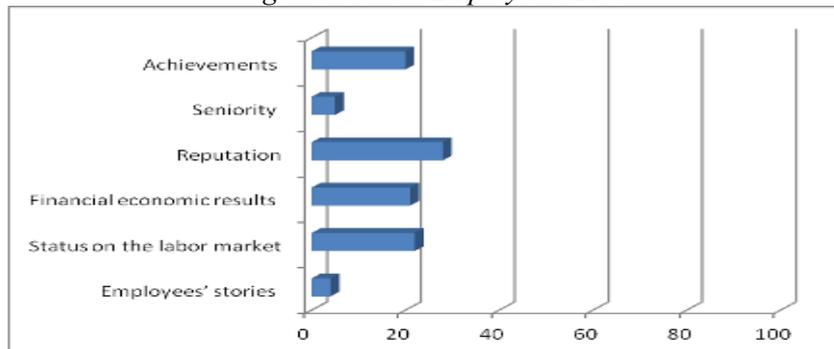

[7] confirms in a way the result to this question because the idea that an Employer’s Brand cannot exist in a static market environment can be found here, needing dynamics. Therefore companies need, in order to build an Employer’s Brand with its own characteristics, to establish an evaluation system for employers and a way to obtain a feedback from partners. A category of company’s partners can be considered candidates to hire in that company or even their employees when they were candidates. From this perspective, the employees were

questioned about the criteria they take into consideration to state about a company that it has got Employer’s Brand. The results, as they are shown in figure 5, indicate that the company’s reputation is the first aspect they think at, followed closely by 3 characteristics

that obtained roughly equal values in the survey: the economic-financial results, the statute the company has got on the labor market as well as the accomplishments (product innovation, available marketing).

Fig. 5 – As a candidate for employment, on what criteria do you decide that a company has got or not the Employer’s Brand?

As it has been demonstrated, the employees’ performance and implicitly the company’s performance are a result of the reward in a way or another, figure 6 shows the results at the question *Which is the employees’ reward form – in order for the satisfaction of the employees’ work to be assured?* At this question, for 43% of the companies, the motivation is being done by salary only (with the notice that in these cases the salary is much above the average), 18% of the companies offer performance bonuses, and 13% of them special results bonuses. For 26% of the companies, the advantageous way agreed by both the parties to motivate is the incentives (holidays, family special events, anniversaries).

can work following courses, specializations, trainings, even if it is just updating the information in the work field.

Because we consider this to be very important, training the Employer’s Brand companies’ employees, we interviewed the companies’ representatives about who establishes the training needs for each employee. The answers to this question are shown in figure 7 and indicate the fact that most of the times the direct manager or the head of the department is the one who establishes the training needs. So, in each of these two cases, we underline the fact that it is a person who is permanently in touch with the employee and can objectively evaluate these training needs. In 20% of the cases, each employee decides what he needs from the training and necessary competencies point of view, HR assigning about 10% of the training needs.

Fig. 6 – What is the employee’s reward form – in order to assure the employees’ work satisfaction?

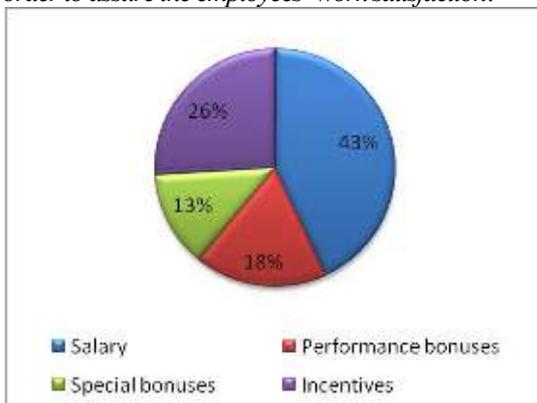

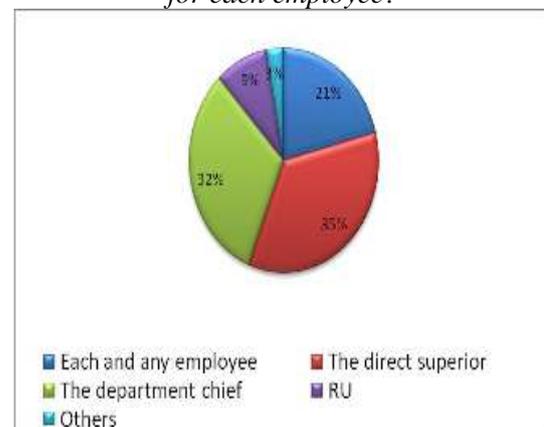

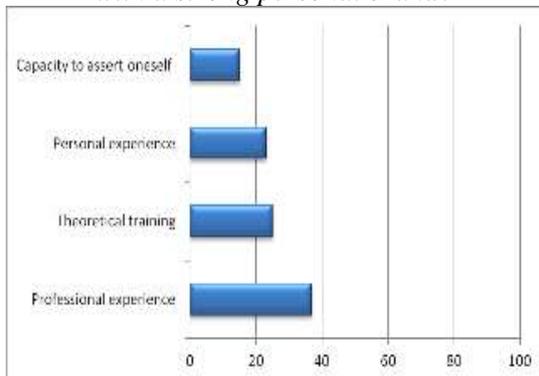

Fig. 7 – Who decides the training necessities for each employee?

The company’s performance mirrors the employees’ performance who, at their turn,

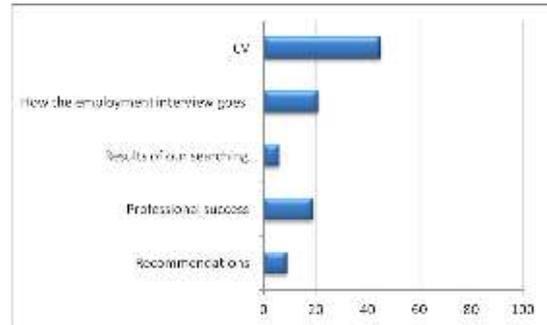

Starting from the hypothesis that Employer’s Brand positively blends with the personal one, we were interested in finding out the company’s interest point when they decide to hire a candidate with a strong personal brand. As figure 8 shows, work experience is substantially ahead, with approximately 40%, followed by theoretical training, a bit more than 20%. Work experience is another point of interest, (approximately 20%) and the candidate’s imposing capacity, in front of colleagues and managers, through ideas, speech, education, communication, etc.

Fig. 8 – What is the company’s point of interest when they decide to hire a candidate with a strong personal brand?

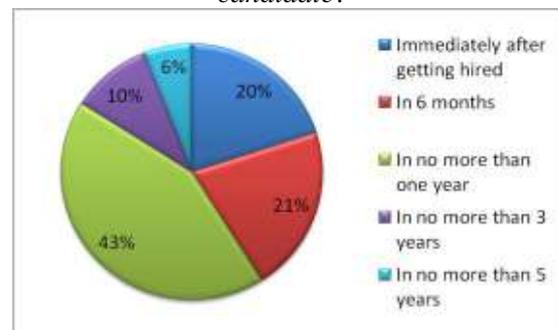

Asked about the criteria upon which somebody has got personal brand or not, the companies’ representatives gave answers shown on figure 9. Thus, almost half of them make this assessment on the basis of the CV, on the assumption that it contains all the relevant information about that person. Approximately 20% of the companies have taken into consideration the way the interview went in order to assess the candidates’ professional achievements. Less than 10% of the companies make this assessment based on the research results obtained by each human resources department.

Fig. 9 – Upon what criteria you assess that a candidate has got personal brand or not?

On the other side, according to [4] a successful Employer’s Brand shall not resume to just attract and keep talented people. He shall also try to encourage, motivate the employees in order to continuously improve the productivity and the quality of products and services. Employer’s Brand is a kind of commitment made by the employer to the employees. Taking into consideration that it should be one on long term, another question put to the employees was the one about the time period in which a company (branch) realizes that it hired a candidate with a strong personal brand. The answers (figure 10) showed a large period of time, meaning that almost half approximated one year, 20% think immediately after hiring, and in 6 months it can be clear that you have chosen a person with a strong personal brand. A lower percentage, of only 10% chose 3 years as the necessary period of time for observing the employee’s personal brand.

Fig. 10 – How soon can a company (branch) realize if it hired a strong personal brand candidate?

5. Conclusions

The reputation of the company and its brands, the admiration or respect they generate have a direct effect on recruiting, relations with partners, the financial world and larger communities where the

organization operates. A valuable proposition should first of all be relevant to people, and then it must be different from the competition's.

Companies participating in the study consider that one of the most important characteristics that gives them the status of companies with an employer's brand is their uniqueness, while employees think that employer's brand should be reflected in the reputation the company has, in its financial results and last but not least, in the status the company has on the labor market (how attractive it is for graduates, for instance, or for people with a vast confirmed experience in a field).

External company reputation is a source of pride for the people working for it. They boast with their workplace, they feel they belong to an elite group. They know that the name of the company in their resumes will count if they want to leave at a certain time.

The management of the organization, plays an important part in transmitting the spirit of Employer's Brand by supportive actions. The leader is the one at which people are looking to see if the new direction is taken for granted, if changes are made or if it is just rhetoric. The mission of the Employer's Branding manager is to remind the management that what they say and do influences a lot employees' perception about the organization.

At question about reward form, for more the 40% of the companies, the motivation is being done by salary, 18% of the companies offer performance bonuses and 13% of them special results bonuses. For a quarter of the companies, the advantageous way agreed by both the parties to motivate is the incentives

Work experience is substantially ahead, with approximately 40%, followed by theoretical training, a bit more than 20% when we talk about the company's interest point when they decide to hire a candidate with a strong personal brand. Work experience is another point of interest and the candidate's imposing capacity, in front of colleagues and managers, through ideas, speech, education, communication, etc.

Internal measurement systems show what is important for the company. As such, actions connected to Employer's Branding should be measured and assessments made public to employees, proving hence the solid efforts of the company in keeping their promises.

From this stand, the results of the questionnaire confirmed that in the companies considered to have an employer's brand, employees' training is more intense than in other companies having no employer's brand and many times the costs are supported by the company at certain financial or time restrictions for employees. In the most of the times the direct manager or the head of the department is the one who establishes the training needs. So, we underline the fact that it is a person who is permanently in touch with the employee and can objectively evaluate these training needs.

It is relevant for the authors of the study to continue investigating this topic, making a comparative analysis between companies with an Employer's Brand or a potential one, classified according to development areas of Romania. A comparative analysis of the achieved results at various periods of time would also be relevant, awarding time for strategy implementing and having employees' and employers' opinions on Employer's Branding inquired again at a later time.

Study on E-commerce Market Segmentation

Mihai Daniela

University of Pitești, Faculty of Economics

dana_mihai2005@yahoo.com

Abstract

E-commerce has experienced an explosive growth during the latest years. In 2012, the transactions made in Romania exceeded 218 million euros and over one million buyers. The average value of a transaction was 60 euros for payments in foreign currency, and 45 euros for payments in RON. The buyers' average age is between 25 and 34 years, being 83.5% urban population.

Since these criteria of market segmentation are widely recognized, this paper intends to present the results of a study aimed at testing the level of significance of other potential variables of market segmentation for on-line commerce: the subjects' level of education, income and gender.

The conclusion is that, despite the relative low average value of a transaction, the income is the most important criterion in market segmentation.

Key words: e-commerce, customer, on-line buyer, on-line payment, transaction.

J.E.L. classification: L81, L86, M31.

1. Introduction

E-commerce represents an electronic information exchange between a business entity and its customers. In other words, e-commerce is the sale and commerce with goods and services through Internet technologies. [5]

Many people consider e-commerce as any electronically driven commercial transaction for the purchase of products like books, CDs, tickets and other products of this kind. But e-commerce, in its true sense, has a greater impact on business development and includes actually not only new purchases, but all activities that support the marketing objectives of a company, including

advertising, sales and market research, payments, after sale activities, customer service and others. [2]

The selling is an interpersonal activity that completes the exchange of marketing in terms of transfer of the property over the goods or services. The selling is the representative of all the other marketing actions; without a client, there exist no organization, and without selling there is no client. To sell does not mean only to conclude a deal (I offer economic goods and for exchange I receive an amount), but to obtain satisfied clients, to make them constant etc. This means passing from a transactional attitude to a relational one. [1]

Therefore a wider range of services have developed, providing support and advice for this relatively new field of business. These services include, for example, Internet service providers, firewall security products, digital signatures, on-line transactions or complete systems to buy, and general services such as consulting, web design, website production and other advisory industries existing in the virtual industries. [2]

According to the Economic Cooperation Organization and Development (OECD), the electronic commerce (e-commerce) means to conduct business through Internet, to sell goods and services offline or online. [3]

The electronic commerce is a dynamic set of technologies, applications and business processes that unite organizations, customers, and suppliers through electronic transactions, electronic exchange of information, goods and services. [6]

According to numerous authors, there are positive signs about improving on-line consumer behavior. This behavior, together with confidence for on-line shopping, getting better every year, is directly proportional to the decrease in crime on the Internet and increasing security of payment options. [4]

2. E-commerce in Romania

E-commerce history started in 1994, but Romania's first on-line store was opened in 1997. Some authors consider that the Romanian e-commerce started in 2000, with a few large projects: eMania, Rate.ro, MagazinulTău, Okazii and eMag. [3]

Lately it has experienced an explosive growth, as it can be seen in the statistics presented in table 1.

Table 1. The evolution of e-commerce on-line payment by credit card, in Romania

	(million euros)				
	2008	2009	2010	2011	2012
Value of trades	53	92.8	127.8	157	218

(Source: www.insse.ro [9])

More than one million customers, representing over 11% of the total of about 9 million Internet users existing in Romania, contributed to these transactions in 2012 [11].

The average value of a transaction was 60 euros for payments in foreign currency, and 45 euros for payments in RON [7].

Regarding the categories of products purchased, the application is closely related to the existing shops in the market. The potential products to be purchased were the following: computers, software accessories, hardware, clothing, shoes, books, magazines, DVDs, electronics, telecommunications services, cosmetics, pharmaceuticals, baby items, tickets, vacations, travel services, hotel services [10].

Although the value of transactions made in Romania in 2012 was over 218 million euros, it is well below the level of other countries - table 2 - but there are for further growth.

Table 2. E-Commerce on-line payment by credit card

	(billion euros)							
	Germany	Turkey	Russia	Poland	Czech Rep.	Hungary	Romania	Bulgaria
Value of trades	28	73	6	4.5	1.8	0.95	0.218	0.12

(Source: <http://www.gpec.ro/blog/e-commerce-romania-2012> [8])

The number of Internet users, including Internet shoppers, has increased exponentially from year to year. [4] Another positive trend in the e-commerce industry is the diversification of shopping cart, a fact certified by the increase of certain categories of products [6].

According to the studies performed regularly, there are positive signs of improving on-line consumer behavior. This behavior, together with confidence for on-line shopping, getting better every year, is directly proportional to the decrease in crime on the Internet and increasing security of payment options. [4]. There were 11.3 billion active cards enrolled in 3D Secure, in 2012 in Romania, out of which 410,000 were actually used in on-line trading, in the 3D Secure system [7].

3. Research objectives and methodology

The central objective of this study was to identify the extent to which the different criteria of market segmentation influence the quality of e-commerce user.

The statistical data on on-line transactions made in Romania in 2012 show that the average age of buyers is between 25 and 34 years [10]. Therefore it is obvious that this factor (age) is an important criterion of e-commerce market segmentation. Also, 83.5% of shoppers are from urban areas; and this is another important criterion for segmentation.

In classical trade, other important criteria are income, education and gender. This paper aims at evaluating the influence of these factors on the buying decision for e-commerce. Specifically, we aim to rank these criteria in terms of their influence. The analysis will focus solely on the quality user/non-user, without taking into account the volume of transactions made by certain categories.

The method used to obtain information was the survey, the sampling method is the random selection and the main instrument used was the questionnaire.

The questionnaire processing was done using Excel's features and analyzing the frequency distribution using χ^2 nonparametric test.

The **calculated value** (χ_c^2) is determined based on the data from the selective market research, as follows:

$$\chi_c^2 = \sum_{i=1}^m \sum_{j=1}^n \frac{(O_{ij} - A_{ij})^2}{A_{ij}} \quad (1)$$

where:

- O_{ij} = the result of observing the investigated phenomenon, corresponding to row i and column j ;

- A_{ij} = the assimilated result corresponding to the null hypothesis applied on the evolution of the investigated phenomenon, located at the intersection of the row i and the column j .

The **theoretical value** (χ_t^2) was determined from the statistical tables based on the following elements:

- the **number of freedom degrees** – calculated as: $(n - 1)(m - 1)$, where n, m is the number of specific categories of the investigated phenomenon;

- the **level of significance** – determined by the probability which guarantees the result of observation.

The investigated factor has a **significant contribution (influence)** on the evolution of the phenomenon only if the determined theoretical value is less than the calculated one:

$$\chi_t^2 < \chi_c^2 \quad (2)$$

4. Study on e-commerce market segmentation in Arges county

According to the statistics on transactions in Romania in 2012, the buyers’ distribution by gender was 54.8% men and 45.2% women, and their average salary was between 1,400 and 1,800 RON. [8] In addition, the average value of a transaction in 2012 was 60 euros for foreign payments, or 45 euros for payments in RON [7].

These facts support the opportunity and necessity of this scientific research. In this first phase of the approach, the research was limited to a narrow market territory – the Arges county.

The survey period was 1 to 10 March 2012, and the working locations were Pitesti mall and shopping galleries of the most important three hypermarkets in the city. These locations were chosen in order to include in the sample people obviously interested in shopping at the time. This feature of the target group has the advantage of increasing the representativeness of the sample, despite its small size; therefore the conclusions can be extended at least regionally.

400 subjects participated in the experiment of determining the influence of the three variables (gender, education and income) on the frequency of e-commerce use. They were randomly selected among those who frequented the above mentioned commercial areas. The following distribution resulted by centralizing responses:

Table 3. The distribution of responses according to the segmentation variables

	Total	Women		Men	
		Undergraduate education (including students)	Higher education (university and post-university)	Undergraduate education (including students)	Higher education (university and post-university)
Total subjects	400	123	134	48	95
Income < 1,000 RON	102	57	8	22	15
Income 1,000÷ 1,500 RON	85	38	27	13	7
Income 1,500÷ 2,000 RON	114	27	44	10	33
Income 2,000÷ 2,500 RON	61	1	32	2	26
Income > 2,500 RON	38	0	23	1	14
Users of electronic commerce	59	10	22	13	14
Income < 1,000 RON	5	2	1	2	0

Income 1,000÷ 1,500 RON	12	5	2	3	2
Income 1,500÷ 2,000 RON	31	2	13	7	9
Income 2,000÷ 2,500 RON	8	1	4	1	2
Income > 2,500 RON	3	0	2	0	1
Non-users of electronic commerce	341	113	112	35	81
Income < 1,000 RON	97	55	7	20	15
Income 1,000÷ 1,500 RON	73	33	25	10	5
Income 1,500÷ 2,000 RON	83	25	31	3	24
Income 2,000÷ 2,500 RON	53	0	28	1	24
Income > 2,500 RON	35	0	21	1	13

(Source: made by author)

The influence of the criterion "level of education" on the quality of e-commerce user/ non-user involves extracting the observed distribution:

Table 4. Observed distribution by level of education

O _{ij}	Users	Non-users	Total
Undergraduate education (including students)	23	148	171
Higher education (university and post-university)	36	193	229
Total	59	341	400

(Source: made by author)

This is the distribution according to the null hypothesis (according to which the subject's level of education does not influence his/her quality of e-commerce user/non-user):

Table 5. Distribution by level of education according to the "null hypothesis"

A _{ij}	Users	Non-users	Total	
			absolute value	%
Undergraduate education (including students)	25	146	171	42.75
Higher education (university and post-university)	34	195	229	57.25
Total	59	341	400	100

(Source: made by author)

$$\chi^2_{calc} = \frac{(23 - 25)^2}{25} + \frac{(148 - 146)^2}{146} + \frac{(36 - 34)^2}{34} + \frac{(193 - 195)^2}{195} = 0,3255 \quad (3)$$

It seems that the influence of education on the quality of the e-commerce user/ non-user is very low.

In order to analyze the influence of the criterion "level of income" on the quality of e-commerce user/ non-user, the observed distribution must be extracted:

Table 6. Observed distribution by level of income

O _{ij}	Users	Non-users	Total
Income < 1,000 RON	5	97	102
Income 1,000÷ 1,500 RON	12	73	85
Income 1,500 ÷ 2,000 RON	31	83	114
Income 2,000 ÷ 2,500 RON	8	53	61
Income > 2,500 RON	3	35	38
Total	59	341	400

(Source: made by author)

The distribution according to the null hypothesis (the income does not influence the subject's quality of e-commerce user/ non-user) is shown in table 7.

Table 7. Distribution by level of income according to the "null hypothesis"

A _{ij}	Users	Non-users	Total	
			absolute value	%
Income < 1,000 RON	15	87	102	25.5
Income 1,000 ÷ 1,500 RON	12	73	85	21.25
Income 1,500 ÷ 2,000 RON	17	97	114	28.5
Income 2,000 ÷ 2,500 RON	9	52	61	15.25
Income > 2,500 RON	6	32	38	9.5
Total	59	341	400	100

(Source: made by author)

$$\chi^2_{calc} = \frac{(5-15)^2}{15} + \frac{(97-87)^2}{87} + \frac{(12-12)^2}{12} + \frac{(73-73)^2}{73} + \frac{(31-17)^2}{17} + \frac{(83-97)^2}{97} + \frac{(8-9)^2}{9} + \frac{(53-52)^2}{52} + \frac{(3-6)^2}{6} + \frac{(35-32)^2}{32} = 23,2776 \quad (4)$$

It seems that the influence of *income level* on the quality of e-commerce the user/ non-user is stronger than that exerted by *education* segmentation criterion.

The observed distribution according to segmentation variable "subject's gender" is presented in table 8.

Table 8. Observed distribution by subjects' genders

O _{ij}	Users	Non-users	Total
Women	32	225	257
Men	27	116	143
Total	59	341	400

(Source: made by author)

This is the distribution according to the null hypothesis (the subject's gender does not influence his/ her quality of e-commerce user/ non-user) - table 9

Table 9. Distribution by subjects' genders according to the "null hypothesis"

A _{ij}	Users	Non-users	Total	
			absolute value	%
Women	38	219	257	64.25
Men	21	122	143	35.75
Total	59	341	400	100

(Source: made by author)

$$\chi^2_{calc} = \frac{(32-38)^2}{38} + \frac{(225-219)^2}{219} + \frac{(27-21)^2}{21} + \frac{(116-122)^2}{122} = 3.12 \quad (5)$$

It seems that the influence of *income level* on the quality of e-commerce user/ non-user is the strongest, followed by the segmentation criterion "subject's gender." The insignificant influence of the variable "education level" could be explained by the inclusion of students in the category of subjects with secondary education.

The "level of income" is the variable that best segments the analyzed market, and therefore we intend to check if its influence is so significant that it may lead to the rejection of the *null hypothesis*.

Since the results of observation may be guaranteed with 90% probability, the number of freedom degrees corresponding to the frequency distribution is:

$$(5-1) \times (2-1) = 4, \quad (6)$$

and the theoretical value of χ^2 is:

$$\chi^2_{t\ 4;0,1} = 7,779. \quad (7)$$

Note that $\chi^2_i < \chi^2_c$ and the null hypothesis is rejected in this case, and "the income" has significant influence on e-commerce, too.

5. Conclusions

Along with the generally accepted criteria (age and area of origin) which divide the e-commerce market, **income** is also important, at least in the Arges county. The influence is obvious in case of on-line transaction volume, but the conclusion was not very predictable in the context of this investigation (the quality of e-commerce user/ non-user). This is because the average income and the

unit value of a transaction record quite low levels.

The other two investigated variables (subjects' education and gender) have almost insignificant influences on on-line trading, unlike the traditional trade.

This research could be extended to more representative samples, such as a national one, or other segmentation variables could be tested.

Abstract

The problem encountered in present by the organisations from Romania, no matter the activity sector is that of the formal character of implementing the quality management system. The quality management system is implemented in order to obtain immediate goals (participating to auctions, fame, adopting community and international acquis), without analysing the long term effects of these implementations, without punctually answering questions like: was the implementation of a quality management system beneficial or not? Did the processes and the products of the organisation improve to such an extent that they satisfy the clients' demands and expectations?

This study tries to approach the efficiency of the quality management system, both from a theoretical and practical point of view, efficiency, which, once proved won't doubt the utility of this system successfully implemented worldwide.

Keywords: continuous improvement, the evaluation of the effects, costs analysis.

J.E.L. Classification: M21

Introduction

The process of continuous improvement of the products'/services' quality within an organisation must have as main purpose the better satisfaction of the clients' needs and expectations [9]. In this complex process,

two questions must be answered: *Are the clients' demands and expectations satisfied? Are the clients' demands and expectations increasing or decreasing?*

To these questions we can answer only by implementing an evaluation system of the effects caused by introducing in the organisation a quality management system, system which should actually initiate the way to the activity's continuous improvement and performance.

No critical analysis of eventual lacks in developing and implementing the system is realised, everything was perfect, the quality system doesn't have any deficiency, its implementation has no problem, no useless costs haven't been carried out, nobody doubts the necessity of implementing this system and its effects, of financial results on long term, if we are about to improve the activity or if we are getting worse. The evaluation sticks to tracking down typical non-compliances that take place once with auditing the enterprises by certification bodies, to certification or surveillance audits, to identifying the non-compliances that refer to the manner of respecting the standard's demands, and not to the evaluation of the implementation's effects [6]. Even these audits refer to the lack of measurable, tangible objectives. The intangibility of the quality management system is one the characteristics that has to be taken into account at its implementation. Finding measurable, relevant objectives and their identification and evaluation means can represent solutions for solving this problem.

Furthermore, we can notice that, after realising the transition to the family of ISO 9001 standards from 2008, an acute lack of professional materials that bring improvements, updates, a new power to this practical and theoretical demarche, the quality management is felt. ISO 9001:2008 takes account of an approach based on the management of the organisation's processes, and from here, a more logical structure, the orientation towards the client and the evaluation of his satisfaction, as well as the top management commitment for a continuous improvement. The main purpose of an evaluation system of the quality management system is that of knowing the real situation of the organisation, of non-compliant products and services and of carrying on concrete measures for continuous improvement .

Theoretical Fundaments and Hypotheses

Thus, we can appeal to utilising some methods and techniques of the economic-financial analysis in evaluating the efficacy and efficiency of implementing the quality management system within the organisations from Romania.

As methods, we propose:

✚ The method of decomposing or splitting the results;

✚ The method of comparing the results. We can thus realise an analysis of the wages and costs evolution on the basis of data taken from annual financial situations elaborated for a certain period of time, the elements, the factors, the causes of the phenomenon studied being highlighted; the analysis can be of structural type, being able to determine the correlation between each factor and the phenomenon analysed, as well as the correlation between different factors that operate upon the analysed phenomenon [3, 5]. Knowing the factors, their nature and the links through which they help at forming and modifying the results of the organisation's activity, as well as establishing the possibilities of improving the functioning of the enterprise as a system, represents basically a defining element of the object of the economic-financial analysis realised within an organisation. Being a qualitative analysis that utilises for the purpose of the nature's research of the economic

phenomena the method of comparing the results, it is assumed that each result of the company's activity is studied, not only as a measure in itself, but also in accordance with a certain criterion, used like a comparison base, fact that will allow the knowledge of deviances interfered in time and space [2].

In order to see if the implementation of the quality management has favourable effects on the evolution of the main indicators that characterise the company's activity, we will comparatively analyse the evolution of total wages, of total costs and of profit during the analysed period, as well as of the turnover during the same period.

We can also appeal to *analyses of quantitative type* of the economic phenomena

We can thus determine, with the help of quantitative methods of economic-financial analysis: **the modification of the turnover's indicators, the rhythm of the modification of the turnover's indicators, the evolution of the turnover and the average indicators regarding the turnover.**

In order to evaluate the effects of the implementation of the quality management system, it is recommended to use the *post-factum analysis* type (*the diagnostics analysis*).

The realisation of a diagnostics of the enterprise can be motivated not only by the situation in which it encounters difficulties, but then when, as Jean Pierre Thibault says, “the enterprise has a good health state”, but its improvement is wanted.

The implementation of a quality management system within an organisation brings real benefits to this one, but the improvement of the system must go on. The quality management system doesn't develop separately from the other functions and systems of the organisations, they mix themselves and they complete one another continuously, and the diagnostics analysis allows the effects' evaluation (positives or negatives) of the movement of the entire gear, in general, and of the effects of the implementation of the quality system, particularly.

In order to sustain this argument, we possess the answers that the diagnostics analysis gives to some problems like: Which are the results of the enterprise?; Are they satisfying or not and why?; How have them been obtained?; Which are the wanted

performances and objectives?; Which is the level of the performances?; What is to be done in order to achieve this level? Concrete measures that have to be carried on on short and long term.

The results, the performances and their level and the future of the enterprise can't be realised without quality.

In the light of those presented, we specify the fact that, in terms of goal, the diagnostics can be restrained to certain problems or extended as a global diagnostics.

The diagnostics realised for the evaluation of the effects of the implementation of the quality management system can be treated under double aspect: Internal diagnostics; External diagnostics.

The necessity of tracking down the quality through specific indicators has determined the usage of mathematical and statistical methods, which have grouped in a new science, named calimetrie [7]. These indicators synthesize either a group of characteristics (measurable or attributive, technical and functional etc.), or the entire system of characteristics of a product or system.

We can thus track down the effects of the implementation of the quality management system on the activity of an organisation by utilising the indicators of the qualitative performances and the indicators of the lack of quality, indicators that can synthesize the quality of the products obtained as a result of the implementation of the quality system, or we can evaluate the quality of the system itself by generating some numeric or attributive data about the implemented system, data that can constitute possibilities of comparison with the preordained referential.

We remind the partial indicators of the quality, that refer to specific characteristic of different products, the values being specified in normative documents (for example, the breaking resistance of a yarn) [4], the cumulative indicators that are used at complex products, the average quality indicators that are used in synthetic expression of the quality of the products realised on qualitative classes.

The costs concerning the quality represent the costs that are implied by the assurance of a proper quality and those necessary to give

confidence, such as the losses caused by not realising the proper quality [7].

The implementation and the maintenance of an efficient quality management system in an enterprise can contribute to the improvement of its processes, assuring the losses' reduction caused by errors.

The evaluation of the efficiency of the quality management system through the costs concerning the quality has in view the costs that result from internal operations and those from external activities. The costs' elements are analysed according to the PEF cost model (prevention, evaluation, failure). The prevention and evaluation costs are considered investments' costs, and the failure costs represent (material) losses.

The evaluation of the efficiency of the quality management system through processes' cost has in view the compliance and non-compliance costs for all the processes of the enterprise.

The evaluation of the efficiency of the quality management system through the losses concerning the quality has in view the internal and external costs, caused by the non-compliant quality. Both losses categories can be material or immaterial. The cost of internal and external failures is considered material losses. Although the quantification of immaterial losses is in many cases difficult, in order to correctly evaluate the efficiency of the quality management system, we must take into consideration such losses, such as:

- ✚ The losses caused by the negative impact of commercialising some qualitatively inadequate products over the enterprise's image;

- ✚ The loss of future sale;

- ✚ The loss of sales because of the fact that, as result of commercialising some qualitatively inadequate products, other producers aim to realise similar products or substitutes of them;

- ✚ The costs for regaining the client's trust, trust lost as a result of purchasing some products non-compliant with the demands;

- ✚ The losses caused by a labour inadequate efficacy within an enterprise, for example, in the case of an inadequate ergonomics.

For evaluating the efficiency of the quality management system, we propose the usage of “financial report of activities

concerning the quality”. This report has to be periodically analysed by the management of the organisation, assuring the correlation with other commercial data, like the turnover, the capitalization, the solvency, for the following main purposes [7]:

- ✦ The evaluation of the compliance of the quality management system with established referential and of its efficiency in realising the objectives;

- ✦ Establishing the objectives of the quality and of the costs concerning the quality, for the following period;

- ✦ Identifying other fields, which receive attention by the enterprise’s management.

For identifying the costs concerning the quality, per total and per categories, our country uses “The quality’s costs balance”, presented in table no. 1 from above, which is used for:

- ✦ The comparative analysis for categories of costs for quality, for their weight in total costs concerning the quality (horizontal analysis);

- ✦ The evolution analysis of costs concerning the quality, per total and per categories (vertical analysis).

The costs analysis concerning the quality has as main objective the coordination and the maintenance under control of economic aspects of activities for assuring the quality. The analyse of the costs concerning the quality can contribute to realising the objectives specific to these stages, commencing with identifying the critical points and finishing with assuring the implementation of corrective or efficient measures of improvement. This analysis takes into account the highlighting of the costs’ elements and structure concerning the quality, the level of the enterprise or of some compartments, on products or on groups of products, of the incidence of these costs on the financial indicators of the enterprise. The standard ISO/DIS 10014:2005, Guidelines for managing the economics of quality, emphasises the approach of quality’s economic aspects in direct relationship with the satisfaction of the clients’ demands, as Kelada appreciated. Among the costs’ elements concerning the quality, the failures’ analysis (internal and external) is the most important, allowing the highlighting of the corrective measures that are imposed, helping at the same time at the substantiation of the

investments necessary for preventing the appearance of failures in the following processes.

Empirical model, dates and methodology

We propose utilising the Access *Cal_manag* application in order to facilitate the effects’ evaluation of the implementation of the quality management system, both from the perspective of the beneficiaries, respectively of the clients, and from the perspective of the organisation that implemented the system. The program started with the hypothesis of finding a correlation between the clients’ appreciations concerning the products’ quality of the organisation and the qualitative control of the results of the same products, correlation that manifests during two periods of time: before and after the implementation of the quality management system, respectively which was the effect of system implementation in the light of the two coordinates. By using this application, the people responsible with attributions in the quality management process benefit of a useful instrument with the following facilities [6]:

- Creating questionnaires concerning the clients’ satisfaction degree;

- Obtaining synthesis situations concerning the questions from the questionnaire before and after the implementation of the quality management system;

- Introducing situations concerning the types of imperfections ascertained before and after the implementation of the quality management system;

- Obtaining summarizing situations concerning the weight of tracked down imperfections, both at costumers, and within the organisation, in the stages reminded and obtaining the correlation wanted in the program;

- The possibility of interpreting and illustrating the clients’ answers, the control’s results and the correlation by utilising some statistical methods and techniques.

The *Cal_manag* application is made of the modules: *Questionnaire_structure_creation*, *Questionnaire_client*, *Lot_control*, *Results*, *Synthesis_results*.

Questionnaire_structure_creation is a module that creates the structure of the

questionnaire. The questionnaire has 12 questions and it is addressed to 14 clients. The questionnaire will be applied before the implementation and after the implementation of the quality management system.

The form *Questionnaire_structure_creation* contains the following VBA code attached to the Combo-box question_type box and to the after_update event. After creating the questionnaire’s structure, we click the Questionnaire_creation button that will fill in the Questionnaire_structure table.

Questionnaire_client module is represented by a form that takes over the data from the clients and memorizes them in the Questionnaire table.

Lot_control module is represented by a form that takes over the data concerning the controls made before and after the implementation of the quality control system.

In order to operate the informatics program, data have been generated that have determined the possibility of collecting and modifying them in view of obtaining the desired result: the data obtained from the clients have be processed (14) and the results from realising the qualitative reception of five products lots, data concerning the non-compliances analysed, before and after the implementation of the quality management system (figure no. 1).

Figure no. 1 – Number of non-compliances on lots

Lot_control			
	Lot name	Low tensile strength	Irregular sizes
	Lot 1	14	13
	Lot 2	15	16
	Lot 3	8	7
	Lot 4	6	5
	Lot 5	4	5
		0	0

Lots 1 and 2 are appropriate to the precursory stage of the implementation of the quality control system. Lots 3 and 4 are appropriate to the posterior stage of the implementation of the quality control system.

Results module is represented by a form that provides synthesis results concerning the questions from the questionnaire.

Figure no. 2 – Questionnaire results for yes/no questions

Results: Form			
QUESTIONNAIRE RESULTS			
Test_number		↓ 1	
Question number		↓ 1	

Do you entirely know the products that are manufactured and commercialized by X company?			
Results			
YES	57,14	%	
NO	42,86	%	

In the form from figure no. 2 is presented a rate situation for question 1.

In figure no. 3 is presented the final result of the clients’ answers on a question related to the number of imperfections on non-compliances types.

Figure no. 3 – Results for questions of “more answers with values and comments” type

Results: Form			
QUESTIONNAIRE RESULTS			
Test_number		↓ 1	
Question number		↓ 12	
Which are the main non-compliances detected by you on product A and what was their weight in the total of non-compliances?			
Results			
Low tensile strength		2568	
Irregular sizes		1956	
Low resistance to stitches		2112	
Low resistance to the action of micro-organisms		2598	
Uneven thinning (fabrics)		1306	
TOTAL		10240	

Imperfections types that appeared to each of the lots, to products that have been submitted to qualitative and quantitative reception are: low tensile strength, irregular sizes for STAS 6023-86, reduced resistance to stitching, reduced resistance to microorganisms’ activity and uneven thinning (fabrics).

Synthesis results module is intended for providing final results concerning the situations from before and after the implementation of the quality management system.

Thus, as a result of the undertaken research it was found that there is a direct correlation between the clients’ demands and those of the quality, respectively there is a significant influence of the implementation of the quality management system within the organisation.

In figure no.4 is presented a synthesis of the data from the questionnaire before and after the implementation of the quality management system.

Figure no. 4 – The results’ synthesis for data from the questionnaire

SYNTHESIS RESULTS QUESTIONNAIRE BEFORE THE IMPLEMENTATION OF THE QUALITY MANAGEMENT SYSTEM				
quantity	Sold quantity	258800		
	Rejected	10540		
amount		959	0,371	%
	Resolved			
	Trashes			
AFTER THE IMPLEMENTATION OF THE QUALITY MANAGEMENT SYSTEM				
	Sold quantity	25880		
	Rejected quantity	3236		
	Resolved amount	2800		
	Trashes	436	0,168	%

Figure no. 5 – Synthesis results
obtained after control

CONTROL			
BEFORE THE IMPLEMENTATION OF THE			
Total defects of low tensile strength	29		
Total defects of irregular sizes	29		
Total defects of low resistance to stitches	16		
	9		
Total defects of low resistance to the action of micro-organisms	20		
Total defects of uneven thinning	102	5,1	%
TOTAL			
AFTER THE IMPLEMENTATION OF THE QUALITY MANAGEMENT SYSTEM			
Total defects of low tensile strength	18		
Total defects of irregular sizes	17		
Total defects of low resistance to stitches	7		
	7		
Total defects of low resistance to the action of micro-organisms	7		
Total defects of uneven thinning	56	1,9	%
TOTAL			

In figure no. 5 is presented the results' synthesis of the qualitative reception (of internal control) of the products, before and after the implementation of the quality management system. We observe a correlation between the data from the questionnaire and the data obtained from the control, with the meaning of obtaining better results, both from the point of view of perceiving the quality by the client, and from the point of view of products' qualitative control: both the number of the quantity of the products rejected by the client (from 959 to 436) and the failures' number (from 102 to 56) have decreased.

The program's objective has been touched, meaning that the hypothesis of the existence of a correlation between the clients' appreciations concerning the products' quality of the organisation and the results of qualitative control of the same products was

proven, correlation that manifests during two different periods of time: before and after the implementation of the quality management system.

The data generated by the program have shown that the effects of the implementation of the quality management system within the organisation have been felt positively.

Conclusions

Analysing the economic-social context and the peculiarities of the organisations from Romania, we consider that the evaluation of the effects implementing the quality management system should focus, besides the methods of trust generation on the products and on the services of the Romanian organisations (the audit, the certification, the trust), and on utilising new methods and techniques of the economic-financial analysis in evaluating the efficacy and the efficiency of the implementation of the quality management system, of the diagnostics analysis, the application of statistical methods and techniques, of the science of a fair quality measurement, of quality management, of computer software and last, but not least, on the redefinition of theoretical coordinates.

Career Analysis in the Public Administration System

Morariu Alunica

„Ștefan cel Mare” University of Suceava, ROMANIA

Faculty of Economics and Public Administration,

alunica.morariu@gmail.com

Abstract

Considered to be the professional history of an individual, the career is one of the most important issues the contemporary organizations are facing, be it from the public or private environment. The Romanian public administration reform in the recent years also aimed the human resources of the central or local public institutions and authorities. It has made its presence felt, either through legislative changes or by creating new tools for human resource management in public administration. In our concern, through this paper, we want to dwell on a few elements of analysis of the career in the public administration system, with reference to the institutional framework in Romania.

Keywords: professional development, institutions/public bodies, human resources, career planning, performance, mobility.

Clasificare J.E.L.: H83; M12; O15.

Introduction

By analyzing the legislation with direct or indirect impact on the career, we find that career management in the civil service is provided by the National Agency of Civil Servants together with the public authorities and institutions, by establishing the legal framework on the one hand, and the policies and tools for planning and management of human resources on the other hand, along with applying the principles of equal opportunity, motivation and transparency [1]. In Romania, local public administration career management evolves amid a regime of administrative decentralization, a context that can better serve local interests, and so, the local public services can be controlled by the

elected local authorities as they are not required to subject themselves to the orders and instructions from the center [2]. We appreciate that the local development is based on the local potential, allowing local skills and resources to manage their own destiny [3]. A major role in career management is held by both the civil servants as well as by the contractual staff contributing through continuous training and professional performance improvement to the development and achievement of efficiency of the local administration.

As concerning the contractual staff of public institutions and authorities, their careers are managed, in particular, according to the Government Ordinance no. 286/2011, by institutions and authorities through the main budget administrators who may issue internal rules on the management of their careers. The occupant of the contractual position is free to decide over the involvement or non-involvement, whether to commit or not to the career by any action or non-action.

In this context, we believe that facilitating career development in public institutions can lead to the improvement of the efficiency of local administration:

a) By attracting valuable candidates (prospective employees) interested in their professional growth and able to cultivate within the organization the spirit of competition and orientation towards performance;

b) By motivating the current employees of the institution in response to their aspirations, whether it is conducted by training them, by mobility, by promotion, by advancing them on consequent salary scales or by any other specific means;

c) Ensuring the continuous need for human resources capable to meet the requirements of the organization and contribute to the achievement of its objectives.

Of course, in order to be realistic, the presented motivation methods must be completed by other methods to resist on the labor market and to attract the most competitive candidates.

1. Career debut. Career planning

Career debut is one of the most important moments in the professional life and in most cases, how we get started in your career leaves its mark on our future. The career debut is part of the result of our career planning work developed during the study period, specific to the career exploration stage in the age range 15-22, according to the correlation between career stages and age after Steers, R., as it is shown in Table 1.

Through career planning prior to the moment of the professional debut, we pass through the process of identification of aspirations, the formulation of objectives and ways to follow, as well as the development of a personal occupational concept according to the luggage of knowledge, skills, acquired abilities or/and abilities in the process of acquisition as a result of professional development programs planned based on the results of self-evaluation / assessment of

individual performance and opportunities[4], [5], [6], [7].

The career plan can be predicted before the individual is integrated into an organizational structure (whether we consider an local or central institution/public authority). Designing and implementing a plan makes the difference between achieving what we want and hoping to obtain what we want. The chosen study specialty and faculty already assume the existence of such a plan. But, in reality, many people end up working in areas other than those for which they have specialized and obtained a degree. However, a timely projection of the career and setting personal development goals on short (1-2 years), medium (3-5 years) and long term (e.g. 10 years), as well as the possibility to take the necessary actions to achieve the objectives, could avoid the apparition of dissatisfaction and several lost years. [8]

The beneficiaries of career planning and development of the planning activities are both the employees, by identifying personal career objectives which can help to identify possible future employment opportunities and improve the job requirements, as well as the organization by ensuring that qualified employees are available when needed. [9]

Table 1. The correlation between career stages and age stages

Career stage	Age (years)	Career aspects
The exploration	15-22	Identifying interests and choosing the career; Obtaining the education necessary to exercise the chosen career;
Early career (the attempt)	22-30	Obtaining the first job and adjusting to its requirements and those of the supervisors;
Early career (the stabilization)	30-38	Transfers and promotions; Choosing the level of involvement; Deepening the perspective on occupation and organization;
Medium career (the development)	38-45	Establishing the professional identity; Choosing between different career paths - technical <i>versus</i> managerial etc.
Medium career (the maintenance)	45-55	Providing independent contributions to the organization; Assuming more responsibilities;
Late career (the plateau)	55-62	Developing subordinates; Active contributions to the development of the organization; Dealing with the threat of the position represented by younger, more aggressive employees;
Late career (the decline)	62-70	Withdrawal plan (retirement); Dealing with reduced responsibilities and reduced power; Development of a successor.

(adapted after Steers, 1988) – [10]

We believe it is essential to create such a career plan as early as possible to avoid the blocking in the wrong career. The development and implementation of a career

plan, preferably under the guidance of a mentor, help us get what we want. The studies one opted for only assume the existence of such a plan. [8]

2. Marks of the specific course

The socio-economic conditions of the recent decades, in many cases, determine graduates from a field of study to practice in a different field.

The situation evolved in a similar way within the sphere of the public administration where in the 90s, with the privatization and/or closure of certain state economic units, a relatively large number of technical professionals have migrated to the public sector, as the public administration was fully developing under the administrative reforms specific to that period. Thus, the local public administration structures developed human resources that have gone through a comprehensive process of conversion, along with the development of the post-revolutionary Romanian public administration school.

Undergraduate and postgraduate education in management and administrative sciences developed and created disciplines or new study programs within dedicated educational structures or new ones, mainly aimed at training specialists in the fields of law and institutional management and public administration. [11]

Thus, after completing the necessary studies, any interested person who meets the general and specific conditions may participate in the contest to fill a public debutant position. The candidate admitted to the recruitment contest is appointed, according to the law, in the public service which he ran for.

Typically, obtaining this initial position and adjusting to its requirements is part of the early career. At that moment begins the onset of the civil service or probation period and according to government Ordinance 611/2008, it lasts for:

- 12 months for Class I civil servants including public services whose employment requires undergraduate studies attested by a license or equivalent diploma, or superior education studies, graduated with Bachelor degree or equivalent;
- 8 months for Class II civil servants, comprising public functions which require short-term superior education, graduated with diploma;

- 6 months for Class III civil servants, which includes public functions which require high school or post high school education, completed with a baccalaureate degree.

During the internship, specific civil proceedings are intended to be applied, such as [1]:

- the stage is performed according to a program approved by the head of the authority or public institution and suggested by both the head of the department where the newcomer will be operating and by the human resource department;
- the internship is conducted under the guidance of a civil servant with permanent status, acting as supervisor with attributions of coordination, support, supervision, providing suggestions on training programs that need to be followed by the debutant and evaluation.

The recruitment and integration of civil servants or contractual staff is the starting point of the professional itinerary of the individuals. It is the moment when the human resource management department should explore the new employees, know them better from one day to another, from one stage to another, and, beyond their knowledge, skills, abilities, to explore their aspirations and expectations, what motivates them and what makes them gain performance, what they wish for in future.

In other words, beyond the fact that the employees go through the process of discovering and learning the culture of the organization, the latter shall advise and integrate them in order to determine them to provide enhanced performance. *The debutants* must be *convinced* to aim in the future towards a professional career and not just a job. We believe that the period of training of the human resources in local public administration and the first two years of training, in particular, are crucial for the future occupant of any public office or contractual function. To confirm the importance of the early years of professional activity, we highlight the results of several recent studies conducted in the U.S., according to which "one of the reasons why a considerable percentage of 55% of the new employees fail or voluntarily leave the

organization during the first two years of employment is generated by their wrongful admission misuse and failure in assimilation into the new working environment " [13].

Arthur R. Pell, a dedicated practitioner and collaborator of several prestigious U.S. universities, associated career debut with boarding and believes that a successful *boarding* is conditioned by the design and implementation of a comprehensive plan to initiate the new employee during the first few months. In fact, according to the same author, the best plans include at least the following elements:

- Accurate explanations on the employee's individual purpose and on the collective purpose of the organization;
- During the integration process, the situations that will occur must be presented in an honest and objective manner to the new employee; otherwise our subject faces a risk of failure due to incorrect presentation of the existing situation;
- The critical key objectives of the new employee in its first months of activity, compared with the multitude of tasks;
- The major set goals and the deadlines at which they must be met;
- Another important premise for the successful integration of the new employee in the public entity is choosing a tutor/mentor.

At the end of the stage, these factors as well as many others from the evaluation stage, contribute to the achievement of the qualifier "appropriate", which opens for the debutant the way to a permanent position. Once this qualification was obtained, the debutant civil servant will be appointed as permanent civil servant, by transforming the position into a civil service of execution of the appropriate class corresponding to the graduated studies.

The occupant of a contractual debutant position will cover the training period established by law, which may not be longer than one year, and subsequently, the debutant will be promoted to the superior professional position, class or level as a result of a contest or examination.

3. Career development

The career development of the employees is a critical investment of the organization with a high level of risk, with the possibility of losing the funds invested in the employee training if they do not return more value to the organization. We find that employee development does not benefit the public entity in a very facile way. Thus, the organizations must carefully choose the ways to spend their training and development resources. An increasingly popular approach aligns the training fields and development strategies with the mission and key objectives of the organization. [14]

At the base of the career development stands the personal development plan - the career plan that every individual is free to develop.

The public authority or institution develops internal policies and tools for planning and management of the human resources, the main tools that contribute to career development planning are:

- *the individual performance evaluation report*; the individual performance evaluation process is focused on determining how employees honor their duties and responsibilities devolving on the public office or position held, in conjunction with the objectives and purpose of the organization; the results are communicated to the employees and based on these performance indicators a performance improvement plan is established;
- *the position appointment and/or predicting career paths plan*; human resource planning is necessary to achieve a more efficient and effective use of the human resources, to have more satisfied and better professionally prepared contractual staff and civil servants and to identify a more effective use of the development opportunities; [8]
- *Individual development plans, and, implicitly, professional training plans*; within the planning process of the individual development of the human resources in their professional debut period in the public entities, a major role is held by the career advisor; [15]
- *Establishing the responsibilities* for each public office / contractual position in

relation to the duties of each compartment.

Career development in public administration is seen as the progress of all legal situations and effects by promotion and mobility on a superior public position that are recorded from the beginning of the civil service work relations and last until the termination of the work relations.

The main means of career development within the local public administration are [1]:

- Promotion to the next professional class as a result of a contest or examination;
- Promotion to a superior professional class following the graduation of studies which allow advancement by participating in a contest and obtaining the qualifier required by law;
- Promotion to a higher salary level based on the professional performance and acquired seniority;
- Promotion on a leadership civil service position as a result of the participation and passing of the examination or contest organized for this purpose.

To all this is added the career mobility which is often designed in order to develop the knowledge, skills and competences by conducting internships within other public authorities or institutions, in the terms of the law, or by temporary transfers to another department of the public authority or institution.

Concluzii

The organization must identify the needs and opportunities, to plan its development directions, to forecast the human resources and to ensure for both the civil servants and the contractual staff the necessary information and the appropriate career development training [7]. The career development of the local public administration staff should be designed only in close connection with the analysis of the individual performance achieved by each civil servant or contractual employee, their aspirations, the need for training in relation to the objectives of the local public administration and implicitly, of our public entity.

In conclusion, to achieve the desired impact on individual and organizational

development, the career planning process must take into account [16]:

- both civil servants and contractual staff should be seen as individuals with unique needs, expectations, skills and abilities;
- both civil servants and contractual staff feel more motivated by an authority or institution that responds to their aspirations and needs;
- the local public administration staff, taken individually can develop, change and grow in new directions if they are offered the necessary training opportunities, mentoring and guidance.

Finally, in terms of career development aspirations, we identify within the professional sphere of local public administration, at least two profiles of the modern civil servants or contractual staff. There can be found within the sector of the public activity, to the extremes, on the one hand, the *career focused employees*, committed to their professional development and career ascent, and on the other hand, there is a category of employees whom we call *passive employees*, perceived as being caught in the continuous routine of their work without being very concerned with their performance and/or promotion within the organization.

Abstract

Focusing on the evolution of the Internet, organizations and their brands approach the relationship with the young audience thoroughly, relying on quality and differentiation. This happens because young people get bored quickly, some are shallow, but they are connected and available waiting for immediate answers and results. They are addicted to the latest technological innovations, primarily using information from the online environment and they often pay less attention to the people around them. Therefore, brands must be those that provide the necessary means for the young people to change something and to encourage them to do it quickly, keeping the original character of the proposals even if media is controlled by consumers and the practiced marketing is viral and based on collaboration.

Cuvinte cheie: brand communication, youth, strategy, technology, online

Clasificare J.E.L.: M31

1. Introduction

Today's young audience primarily manifests itself in the virtual environment based on the technological innovations, but young people are involved in real life as well, in the context of social and environmental campaigns which they initiate and develop or in which they are involved. In the studies about youth, considered as a target of the communication undertaken by many organizations, young people represent a heterogeneous public who does not have much

patience, but it is eager to learn many things, being connected to reality. At least in these respects, young people can be loyal on the long term, even if they are difficult to deal with and, especially, to convince [3]. Besides, with respect to the lack of homogeneity of youth, there are differences between those with higher education and those who are still in high school, each segment having its own features and perceiving its members as different from others.

The promotional communication domain oriented towards the young audience is increasingly approached by the specialists in marketing and advertising (marketingportal.manager.ro, iaa.ro, zf.ro, smark.ro, apprentice.ro, theindustry.ro), mass-media (tvr.ro), associations of traders (ccib.ro) etc., all of them being meant to find the efficient ways of conveying business or educational messages, especially with modern electronic media.

In this paper we will refer to issues related to youth characteristics at present directing the brand communication strategies to such an audience, bringing forward the experiences of some organizations too.

2. Methodological Issues

The main objective of this study is to support the idea that the brand communication strategies must also consider and address the young public through traditional and online marketing in order to influence the purchase and consumption decisions and behaviors both internationally and in our country. Thus, using the qualitative research method we have consulted various sources of secondary information, such as: synthesis of some profile events, analysis, case studies etc. The research

started from the analysis of “Romanian Youth Focus” held at the end of last year in our country, an event enjoying international attendance, adding analysis and interpretations of articles focused on the strategies used by brands for their young customers and the presentations of practical initiatives in international companies (some of which operating on our market as well) regarding the use of marketing and communication tools to address the young audience.

The assumptions from where we have started refer to: the existence of certain features of the young audience which have to be known and used by organizations to attract young people in the members community and the existence of a significant degree of influence upon the consumers purchasing decisions with respect to the organizational promotional communication supported by traditional and electronic instruments, under the influence of a number of variables related to the conditions of application of the brand strategies for young people, the social characteristics, their standard of living, their awareness and ability to use the information technologies etc.

3. The Youth Characteristics

The report called “Tânărul în România. Profil urban de marketing” (http://research.smark.ro/tanarul_in_romania.html) shows that the most common category of young people in Romania is that of the “retired” [4]. On the other hand, according to the study “Litteris et virtutes” (http://research.smark.ro/litteris_et_virtuti_.html), 81% of the respondents said they have met at least one person who has profoundly marked their life, most of them mentioning between 3 and 5 people. Likewise, for young people and for Romanians in general, the family is the central value, young people agreeing with the classical model of the family, getting married quite early, having children and their own home [10].

In its turn, Discovery has conducted a research regarding the male youth in Europe (http://www.iqads.ro/relevant/valori_de_brand.html) in which it is stated that 26% of them are people for whom it is important to support their family, when the family values are in competition with the desire to have a career and to form groups of friends [4].

After 1980 sociologists and marketing specialists delineate two generations that

greatly influence the specialized research [8]:

- those born between 1978-1999 (generation Y) are narcissistic, individualistic, pragmatic and oriented towards material values, believing that they deserve to receive everything; they live in an environment dominated by the present time, the rapidity with which everything must happen, they can do more things at once and are oriented towards friends rather than towards the family; for them the advertising is a source of information and entertainment;

- the young people of generation Z, born after 2000, are analyzed in the study “Generation Z - Digital in Their DNA”, developed by JWT Intelligence; the study states that 90% of them cannot live without the Internet; young people are angry because they cannot get in touch with the world and their friends when they are not online, having a strong emotional reaction; although the attention paid to the broadcasted content is lower, television remains on the first place in the media consumption of “generation Z” [10].

The young people in contemporary society are different from those of the previous generations by the fact that they belong to the digital world, whose technologies have influenced the brain, a thing explained by Nicholas Carr in his book “Superficialii” [1]: the users from this age group access the search engines for documentation, so for them only the most popular items are relevant, reducing the total number of used sources; when it comes to documentation of existing materials in the virtual medium the youth must choose content from various hyperlinks, the same thing happening due to the developing of social networks that provide updated information.

In its turn, in Romania, the “360 Insights” Agency undertook a number of studies about the narcissism and egocentrism of the youth in our country, given that there are two generations: the first – of the adolescents (16-18 years): individualistic, self-centered, confident, courageous, assertive and with a strong desire to be noticed; the second – of the young generation (19-24 years): adventurous, explorer, friendly, opened and concerned by their professional status. It is obvious that the young audience should be integrated into the community to meet new people, but also to be remarked, given that it is managed by someone and is engaged in teams to achieve success. Another interesting

aspect is that the youth believes that the state is the most responsible (85% of the respondents) for solving community problems, followed by them (35%), as well as brands and companies (26%) [9].

In an interview given to theindustry.ro, Gottfried Langenstein (Vice-president of ARTS) supports the idea that, in the case of the media, there is a shift in the consumption habits related to generations: older people still prefer classic television, young people are attracted by computers, a reason for them to start searching television stations and broadcasting in the online environment [2]. The orientation towards such a type of content is not exclusively reserved for the day it was sent; young people find out about it and they want to watch it long after the live version. The vice-president of the French-German cultural channel talks about the ARTE bilingual website which has currently become one of the most creative and advanced television sites with facilities such as the timeshift (ARTE+7), Video on Demand, interactivity (the documentaries grouped under the name “Webdocs”) and the user generated content (ARTE Creative). For example, the ARTE+7 service allows the free visualization of a program a week after its first broadcast, free, its popularity increasing enormously and reaching five million viewers per month. The official of the television station emphasizes the idea that the average age of the television public of a documentary is about 50 years old, and on the Internet, of only 25-30 years. The television channel is present, in the social media, on platforms like Facebook, Twitter, YouTube, offering more interactivity especially to the young audience who becomes interested in the content. This occurs on the creative ARTE platform too since people can post content and pictures.

The companies can also intervene in the educational sector helping young people to take quicker and easier decisions about their future, based on studies such as those carried out on students of Xth and XIth grades by the nongovernmental organization “Școala de valori”, in partnership with Unlock Research [16]. For example, one of the research results is that there are young people who manage their own businesses, but who are still undecided with respect to their professional route and are concerned about the lack of time.

4. The Study of the Brand Strategies Characteristics for Young People

Young people simultaneously use multiple devices (TV, computer, smartphone, tablet) and have permanent availability by immediate access to a communication channel, targeting immediate answers and quick results. In order to have marketing success, especially in the online environment, the organizations must create messages for communication campaigns by considering several aspects [9]:

- to be based on simplicity, the messages more easily to understand being more easily accepted;
- to draw the attention from the very beginning, because young people tend to keep their focus on a topic only for a short amount of time;
- to provide interesting content for distribution in the social networks, using the same language.

The communication campaigns must adapt to the specific of the market, the young audience being the one that sets trends. Mihaela Nicola, shareholder and CEO of the “The Group” company says that: “The younger audience prefers visual information to the detriment of the written one, small amounts of relevant information, viral campaigns, non-PR commercials which have a humoristic component and enhance customs of everyday life.” [12].

It is important that the communication with the public, especially with the young one - permanently connected to the Internet, should be constant, avoiding temporary communication for a limited period, after which contact is interrupted, while waiting to return with a message during other campaigns. Simultaneously, the message the companies send by communicating with the young audience has to be achieved through BTL, which offers greater interaction and involvement and transposes the brand values into real life.

Another characteristic of the present period which can be exploited by companies is that the online presence reduces and even cancels the distance between individuals and groups through applications like Skype or Messenger, allowing initiation and maintaining the dialogue through live sound and image with people from the entire world, intermediates videos watching from a global perspective.

Nevertheless, it is not recommended that the online environment should be exclusively used

for communication towards other channels, the brands being encountered in other environments too if a coherent strategy is ensured. It is necessary to initiate and sustain a dialogue so that brands may find themselves in the position of friends, without authoritatively imposing a certain decision regarding the purchase.

From another point of view one can intervene on the strategy of public segmentation to consider interaction with the young audience in perspective even if for the moment it is not a part of the main target. In the future young people may choose a brand that they know and appreciated as active when they were teenagers or students and that offers them a competitive context in which to be appreciated [8].

To address the current young audience the brands have to approach the participative marketing, reaching a consistent target group of consumers through advertising and the social and involving actions. As the young people are very active, curious and open to new items that are wanted by many brands, especially during the age interval from 18 to 24 years old, their loyalty is hard to gain [11]. Such an orientation is called “experimentalism” in the report “Ghid de conversație de la român la român” undertaken by the Unlock Market Research, many brands being interested to follow it, with the intention of attracting the community members too [17].

5. Experiences regarding Youth Communication Campaigns

The companies and their belonging brands are more and more concerned to build and to expose not only ideas about the present time but, more likely, complete scenarios. Nevertheless, for the initiators of communication projects it is quite difficult to get in touch with the young consumers only on the Internet because they need the real environment interaction via mobile phones, traditional mass-media, to which one can add tools of unconventional approach, on the street, such as: entertainment, games, competitions, music or dance etc. It is clear that the brands that always assume such creativity are those that remain in the mind of this atypical consumer category. In this respect, we shall present a series of experiences of some prestigious companies and brands which sell their products and services on the market in our country.

* The “Parental Control” promotional campaign conducted by Sprite in 2012 focused on the problem of the young people’s reaction against authority to which the question of parental involvement in the social media was added. Sprite has sent messages of support to young people and launched initiatives to reduce parental control that has spread increasingly online. Through such a campaign, young people could win their favorite prizes while parents were led into believing that prizes were strictly educational. In the digital campaign, the site had two sections - one for the parents and one closer to the young people. Visitors were filtered through a set of questions to which only young people knew the correct answer. The campaign included a free telephone line by which parents were taught different things about the stages in the development of adolescents. During the three months of the campaign the website was visited by over 130,000 people, with an average of approximately 2,500 hits per day. More than 30% of the users returned several times to the site. The campaign brought a 26% increase in sales in comparison with the previous year [6].

* In the early ‘90s Puma changed its position from a company that produced only sporting goods to one of sport and lifestyle, a thing materialized in the current period by means of two communication projects dedicated to young people: “PUMA Social” and “PUMA Creative Factory”. The “PUMA Social” platform supported the “Street Heroes” event through which the brand offered the young participants entertainment possibilities and made them interact by practicing team sports. Afterwards, teenagers could watch a concert of famous artists or take pictures using a dedicated application, actions included in an after-party. In the lifestyle segment, through the “PUMA Creative Factory”, the brand has provided the interested persons the option to customize the texture and colors of Puma sport shoes which they could later purchase from a store of the company [6].

* Coming from a controversial field of activity, at least in terms of the relationship between natural resources exploitation and its some of its unintended effects, **Petrom** wanted to get involved in social responsibility campaigns, educating young people being one of the followed directions view the most beautiful places to visit in România: a website

with the campaign name where they collected all the stories of the places they visited, the namesake mobile application, the portable version of the map on the site which helps users locate the touristic objectives around them. In 2011, the “Construim pentru viitor” project developed by Petrom has helped it renovate and equip 18 schools and two non-governmental organizations from 20 communities where the company operates. In the same year, the third time in a row, the company has supported the non-formal educational project aimed at young people between 14 and 18 years old and called “Leadership authentic”, conducted by the “Leaders” Foundation. For students, Petrom has collaborated with “Aspire Academy” for a program dedicated to leadership, entrepreneurship and innovation. More recently, through the “Țara lui Andrei” project, Petrom has been involved in environmental protection, community development and education too [7].

* Having a brand in continuous development, Samsung cannot overlook the younger generation, thus having launched the “Trends of Tomorrow” campaign addressed to those aged between 16 and 18 to provide information and advice for the choice of a career. Both by means of RIUF and of a caravan reaching the major universities in the country, people from the management team, from advertising, research or human resources have spoken to students about the career opportunities and challenges in these areas. A national projects competition of personal development has been conducted as well [7].

* Following the recruitment of students in technical programs to integrate them into the company, Siemens Romania has implemented several projects which aimed at undergraduates and masters students and declared its interest to collaborate with higher education. Siemens offers various development programs for both students and graduates, all of them presented on the company’s website [7].

* Interesting to approach in this study is the case of Grolsch company that has gained both in Europe and overseas, the title of “Berea oficială a artelor contemporane” [15]. The targeted audience is represented by the nonconformist young people who live in major cities, are educated, independent and active and they are constantly seeking change. Based on the slogan “Proud Sponsor of the Experimentalists”,

Grolsch has chosen innovative projects from the early stage of its launching in Romania: the design of a beer bottle using a mosaic and the exhibition of paintings belonging to some contemporary artists in Bucharest.

* Being mainly addressed to the young audience, Orange has used the 3D HD projection technique and touch screens permanently connected to the Internet placed in the bus stations in Bucharest to be closer to the experimentalist trend, under the new slogan “Today changes with Orange”. The company has launched innovative applications for smartphones with which users can view works of contemporary art, among other things.

* Continuous innovation made by Red Bull targets young people who are active, enterprising, who make intense intellectual and physical effort, enjoying every new experience and taking decisions spontaneously. The Austrian company supports global Red Bull Music Academy (music workshop), Red Bull Flugtag (contest for amateurs of short and low lift flights), Red Bull X-Fighters Exhibition (acrobatics show on motorcycles), Red Bull Illume (contest of action and adventure photos all over the world) etc.

6. Results

Generally speaking, companies are concerned with identifying the public behavior especially that of the young people in the situation in which such a category becomes the preoccupation of those involved in their own marketing. We can talk about an exchange of value among members of the young people’s community and brands which should always provide reasons for conversation to be rewarded by the dynamic consumers, through different messages addressed to them.

We can thus prove the first hypothesis of the study which claimed that there is a set of characteristics of the young audience to be known and used by organizations to attract them into community members and offer them reasons to stay, to provide ideas and support their implementation.

Successful experiences of some known companies with different business objects, still present on the market in our country, reflect the fact that they are expanding their concerns to attract young audiences through projects based on extensive marketing strategies which start with online interaction

and continue with the use of smart phones, mass-media and even with “atypical” events. It is such initiatives based on creativity that support the extension of the brand influence upon young consumers.

Taking into account the social characteristics of young people and their standard of living or even to what extent they access revolutionary technologies through more and more sophisticated equipments, brands apply promotional communications strategies that influence the buying decisions of such a social category whose members refuse any advise regarding what they should do and rely on the power of the personal example, revealing their personality as long as organizations offer them certain values to adopt. Thus, it becomes evident that the communication rules change when the recipients of the message are young people, a thing which demonstrates the second hypothesis of the study too.

7. Conclusions

The most important results of this paper refer to the context in which brands can initiate communication with young audiences characterized by curiosity, self-centeredness and openness to dialogue.

As a consequence, it becomes evident that the brands they appreciate are those that facilitate their access to products and services and offer them the opportunity to spend more time with their parents and friends. To be able to support two-way communication, brands should use simple and direct messages to address young consumers, to accept that they cannot control everything they say and let them express themselves, to prove that they care about them, to monitor the evolution of their preferences and to present the results and finally to continuously adapt their plans according to the young people’s needs.

Abstract

The extension of businesses presence in the online environment permanently determines the identification of new ways to make them more dynamic, to increase their efficiency by attracting public and potential acquisitions. One of these methods is the affiliate marketing which is a practice in which the merchant (business owner) rewards one or more affiliates (partners) for each visitor or customer brought by his or their marketing efforts. Basically, through affiliate marketing there are promoted a company's products and, instead, is earned a commission if the sale is made. It works similar to real-world business based on commission, in terms of a win-win transaction.

Cuvinte cheie: online, affiliate marketing, customer, merchant.

Clasificare J.E.L.: M31

1. Particularities of the Online Marketing

On the Internet, the difference between different types of marketing (advertising, public relations, sales promotion, direct selling) becomes unclear, the website of an organization usually being a combination of them. The presence on the Internet brings to organizations a particularly important competitive advantage as an alternative not only for products promotion, but also a supplementary distribution channel.

To be successful on the Internet, marketers should know the fundamentals of the marketing process, including: the assessment of people's needs and desires; the

market research; product, price, distribution and promotion policies (marketing mix) etc. Although, the online marketing has its roots in the traditional marketing concepts, it is different due to a new process – the interactivity. Now, the sellers can have anytime interactive relationships with consumers in their own offices or homes. Contrary, buyers can interact with sellers in a new way, the communication being carried out in two ways. Thus, online marketing targets individuals through the Internet, being effective for trips, shares, computers and software sale etc. It has the advantage that the organization can establish closed relationships with its potential clients, through direct communication, using personalized e-mails, pursuing their benefits, previous orders etc.

Therefore, modern marketing techniques focus on the interactive side of trading, highlighting the importance of communication techniques (relational marketing, individual consumers oriented marketing and so on). In fact, any transaction involves an intensive information exchange, on stages: information dissemination, informational contact, information exchange, decision, consensus, products and/or services traded exchange.

From this point of view, the Internet marketing expression domains are almost as extensive as in the real economy, the most common being [1]:

- web sites;
- internet advertising;
- direct marketing by e-mail;
- permission marketing;
- affiliate marketing;
- online marketing research;

- online data exchange;
- online public relations;
- Internet integrated marketing.

There is interesting that the organizations' size is an irrelevant detail on the Internet, yet. In a shopping center people can see the size of the market competitors immediately; on the Internet that is not possible. The small companies can compete with the bigger ones, but this may be changed as more and more companies entering the web, bringing the power of their famous brand names. Now, it is still the moment when new or smaller companies can establish a brand identity on the Internet. Moreover, in the online business world, companies can be quickly surrounded by competitors who state they can offer the same products in similar circumstances and they can do that immediately [2].

2. The Affiliate Marketing Concept

The affiliate marketing can be found in the online working techniques category, based on the concept of “Cost Per Action” - CPA. Specifically, the merchant or advertiser rewards one or more partners – the affiliates (publishers) for each sale, registration in a newsletter etc. that they are making on their websites. Thus, affiliate marketing can be described as performance-based marketing, as it isn't based on other traffic counting techniques, such as “cost per click” or “cost per 1,000 impressions”. This technique may be associated with other specific to online marketing, such as: search engine optimization, e-mail marketing, banner-based advertising etc. [8].

In this type of marketing, a website is used to drive traffic to another, playing a significant role in the online sales strategies. The person who promotes a site earns if he persuades the visitor to access the destination site with main goal to action, particularly through making the purchasing decision.

For affiliates, such marketing represents a quick and low cost way, but not the easiest, to earn money online, if the products belong to some merchants. Basically, affiliates bring together buyers and sellers and earn a commission from that facilitated transaction.

The affiliate marketing system is based on cookies, meant coded texts sent by a server to an internet user to retain information about its behavior when he access a website. The

affiliate site visitor click on one of the merchants' promoting instruments supported by the affiliate and in that moment being generates the cookie that holds information about the visitor directed from the affiliate site. If, during commissioning, the user places a product order on the promoted merchant site, the affiliate will receive a certain price percentage of that order [9].

Specifically, merchants initiate campaign urging visitors to take action (to buy), determines the percentage or amount given to the affiliates and load into the affiliate system different promotional tools as marketing actions elements with measurable results (horizontal or vertical banners, graphical banner with “special offers”, generated links, newsletters enrollment, questionnaires etc.). With these, buyers need to be persuaded to buy a product from a clearly identified online store. Further, affiliates enroll their sites and apply to the merchants campaigns; after they have been accepted they have access to all available promotional tools and can use them in any ways to generate as many real decisions from the potential buyers (as visitors of the affiliates sites), called “conversions”. These partnerships are developed by serious and experienced merchants who can offer quality services to the clients directed by the affiliates [7].

There are specialized networks in support of affiliates that create intermediate systems between them and retailers through affiliate programs. Such networks can help including affiliates in the specialized programs of certain merchants using a simple method. These provide applications that generate reports and payment systems for all the network affiliate programs through a single membership: the report includes commissions on product categories, tools performance report etc.

On the other side, in the affiliate networks merchants can benefit of traffic monitoring services, reports, payment processing and they can access a large affiliates database.

For affiliates, the networks access and maintenance costs are non-existent. However, there is necessary a payment from the merchants (different from one network to another) as a poundage from percentage from which they pay to affiliates as a fee for their services. Moreover, merchants give their affiliates an income (sales) percentage or a

cost per action as means of rewarding [8]. In Romania, the poundage for the affiliates is different from case to case, between 3% and 6% [6].

Internationally, the affiliate marketing has been applied by professionals since 1996 when Amazon launched its own program that offers to experienced affiliates the opportunity to earn substantial amounts [7]. Another example is the dealer CaptainGO - online hotel reservation system which provides 5% of the booking price to the affiliates that are promoting it, including TourismGuide.ro - a travel portal. If a TourismGuide visitor clicks on a CaptainGO banner and continues to make a reservation at a hotel, then TourismGuide will receive 5% of the sale.

3. Reasons for Affiliation

The affiliate marketing represents one of the online activity fields with the highest growth rates and one of the most efficient methods to earn money for the following reasons:

- it is cost effective: the internet marketing is inexpensive and there are not production costs; it isn't necessary a business location or employees;
- it targets a global market: online marketing gives the opportunity to contact people from different areas, in a quick and easy way;
- it isn't necessary a membership fee;
- there are no storage or transportation problems (the merchant due);
- it isn't necessary the customer support or an answer to their complaints;
- it is ensured a passive income: it is possible to earn money even if the affiliate is not online;
- it is possible to work from home.

To be successful with such a marketing tool, affiliates should know the market demands, learn how to promote products, what works and what doesn't on the market.

First of all, they should choose to promote successful products. It can be a mistake the involvement in too many affiliate programs that take time and bring into focus different areas. Therefore, it is better if the market demand is known and there are identified that products adapted to the promoted site topics. If that site generates significant traffic, it can

be used an online research in order to get information about the reasons of purchasing decisions.

Besides banners, on the site can be used some different traffic sources to promote products. The chances to earn money increase when there is a frequent traffic sent to the commerce sites. An example is Google Adwords: it can be simply made an ad in the adwords account, then it can be used the affiliate link in the target page URL of the ad. Make sure to place the banner ads on different areas of your site's pages. Some positions will make the ads more noticeable than others.

Obviously, the affiliate has to constantly estimate the conversions and to determine if the campaign cost is less than the profit, to keep it active. Thus, it is necessary to determine the performance of each campaign and to make decisions for future action. Many affiliate programs provide statistics that can offer information in this regard, but the affiliate can use its own conversion tracking software.

As the affiliate marketing is very competitive, those involved must also be aware of new techniques and market trends to exploit most of the arisen opportunities.

When a product is promoted there is also supported the person or the company behind it, so it is appropriate that they being chosen carefully: the affiliates sites visitors are guided in the purchasing process by their advices, becoming very important to be happy with their purchases and return on those sites. Normally, companies that provide an efficient technical and commercial support to the customers will register their satisfaction. Such businesses are aimed to be included in the affiliation programs, based on a well prepared plan.

4. Romania's Experience Regarding the Affiliate Marketing

Along with the expansion of the Internet goods transactions in our country (which will reach one billion euros in 2013, in the opinion of key players), there have been created collaboration systems between: merchants (online stores), affiliates and customers. As mentioned before, the affiliate has the intermediary role. He is the website owner, being able to direct the traffic,

through links, to the online stores listed in an affiliate marketing platform or which has its own affiliate marketing system.

The best known local affiliation examples are “2Parale” and “Profitshare” - which belongs to eMag.ro. In addition, we can mention F64.ro, the biggest cameras and accessories store from Romania, and Altex - one of the leading retailers of IT&C and electronics from the local market.

4.1. The Systems’ Beginning by Establishing “2Parale.ro”

The first and largest affiliate marketing network in Romania – “2Parale” (part of the Leo Burnett Romania, with over four years of experience in Romania) is a “3rd party network” type in which the merchants pay only for the results: network acts as an intermediary, providing a quick and effective solution to promote and earn money. In 2011, the company paid commissions to the affiliates worth 300,000 euros and, in 2012, almost 600,000 euros, according to the company’s manager. In the last year, the network had over 230 active campaigns through which online stores have presented to the affiliates their offer and specific promotional tools. These campaigns have generated 145,000 sales exceeding 41 million lei (VAT not included) and counted nearly 60 million clicks [3]. Most campaigns were presented under the categories: “Entertainment”, “Collective discounts”, “Cosmetics”, “Electronics” and “Tourism”. “2Parale” platform has over 15,000 registered affiliates (large retailers, niche sites, websites optimization experts, bloggers, social networks and various communities) [6].

In 2011, the company extended its activity in Bulgaria, through “2Leva” system. In order to define its position on an increasingly competitive market, last year “2Parale” took the strategic decision to merge with the affiliate platform “2Performant” (holding the locally exclusive using rights), which allows it to expand in several countries from Central and Southeast Europe, as well as Turkey, as the management statements [3]. The company is also active today on the markets from Serbia, Iraq and Cyprus.

Particularly, taking full control over the affiliation platform, “2Parale” intends to invest in its development with new features

capable to increase the merchants and affiliates performance from the network. In its turn, “2Performant” – an affiliate platform developed in 2010 – provides the technical system for sales recording and monitoring, as well as for all actions generated through “2Parale” network.

4.2. The Answer of the Main Challenger

eMag is the most important online store from Romania (owned by Naspers group, one of the online biggest global players), with 70% market share in Romania and, also, the largest store in South East Europe according to its turnover, with 1.3 million orders in 2011.

Since 2009, the company owns “Profitshare” – an affiliate marketing network through which affiliates has access and supports only the network owner’s campaign. This system is designed on the amazon.com model, the largest online retailer in the world, who created this business in 1996.

This year, the system supported by eMag experienced a noticeable change towards the 2.0 version (multi-advertiser affiliation platform), provided by Conversion Marketing - company which is, also, hold by eMag.ro.

Until now the eMag system has paid commissions worth a million euros to its affiliate members. From now on it intends to directly compete “2Parale” through a new system version, on the Romanian online advertising market (estimated at 40 million euros this year), in which eMag (with revenues of 180 million euros estimated for 2012), has proposed to earn five million euros [4].

The advanced system “Profitshare 2.0” will attract those affiliates which have a good market position and offer quality services, which have experience in the field and a large base of customers. The earnings awarded to affiliates will be set by merchants – while Conversion Marketing and eMag will receive a percentage of the commission paid by the merchant to its affiliate.

In the “original” version – in the “Profitshare” system are involved about 25,000 affiliate sites; in addition, there are other affiliates who achieved special campaigns with Google AdWords and Facebook (the last has generated just 5% of the eMag sales). Thus, the affiliate buys online advertising from Google to attract customers to eMag products and services.

*

According to the manager of “2Parale”, budgets spent for affiliation on the Romanian market by the national advertisers will be about 3.5 million this year, with an increase of approx. 60-70% compared to 2012 [5]. There is estimated that “2Parale” will have 40% market share, while the companies are facing problems such as: lack of the Romanian people practice in the online commerce, developing services (payments, courier, internet covering, specific marketing etc.), aggressive communication and development of the offline retailing, low purchasing capability and so on – general issues of the e-commerce industry.

Conclusions:

Now, the merchants require performance-based measuring mechanisms for the sent messages, while the supremacy of the brand-based advertising is not so obvious. The marketers talk about omni-channel marketing and analytics to understand where customers come from and the important companies become interested in this field, too. In turn, market analysts are able to observe and analyze the characteristics and development of the affiliate marketing as more information about the implementation of the system will occur. They value the affiliate marketing and consider it as an important support in achieving of their goals in the online environment. On the other side, the fast growth of the affiliate marketing encouraged the specialists to find solutions to remove any difficulties of the system functioning, providing retailers and affiliates ways to maximize their profits and to improve business efficiency.

Abstract

In the marketing approach, the organization's image has a complicate substance. From many managers' point of view, the image is an important capital for their organizations, and a basic patrimonial element. From the marketers' point of view, the image is an important factor for the process of creating and increasing the demand for products and services, or for the market share increasing process. In a strong correlation with consumers' image, the products or services' image are symbols of publics' status and role, and a way to facilitate and hierarchize individual choices. The consumers' decision process is based in a significant measure on image.

In this paper, we attempt at presenting some general aspects concerning image and identity in the academic field and to mention some of the most important means to create and deliver the image to the organizations' publics.

Key words: marketing, academic, image, identity, image delivery.

J.E.L. classification: M31

1. Introduction

From marketing point of view, the image is a collective mental representation of a product, a service or an organization and is formed over a large time period, in a strong correlation with the value system of the involved public.

Brand's image is a synthesis of the organization's image, is a patrimonial

element, and in many cases is considered as brand image of the organization's products or services.

The identity of an organization is strongly correlated with the organization's image and requires a strategic planning approach. The American professor Philip Kotler considers that the personality of a successful brand is the result of the application of an identity program creation. In his opinion, the identity refers to the means by which the organization wants to be identified by its clients, and the image represents the modality the organization's public perceives it by [1].

2. Marketing, Image and Identity: Conceptual Elements.

Basic component of the general strategy of the organization, the market strategy means to establish a few important elements: a good marketing segmentation, target selection, an appropriate marketing 'mixture', going from the Four "P" policies and so on, to achieve marketing goals [2].

From the marketing point of view, image has a strong relation with the concept of product. This concept is an assembly which involves the following elements: tangible elements (the material support of product), intangible elements (such as brand, price etc.), communications about the product and the image of the product [3].

For the academic field, the concept of product is more complex, because, in an approach of services marketing, it involves a global product and partial products. The global product is created going from basic, auxiliary, supplementary and potential products, and the partial products involve

tangible elements (physical ambience, equipment, personnel and clients). At the same time, communication and image are included in the global product [4].

Through the achievement of marketing goals are achieved the major global policy goals of organizations. On the other hand, marketing goals can be achieved by realizing an efficient communication system, which can allow achieving the communicational goals of any organization.

Marketers consider that, in the case of commercial communication, the most important goals aim to create and consolidate the products notoriety and image and to stimulate the consumers' behavior. When the communication is corporate, the corporate value of the organization can be increased through a great notoriety and a favorable image of the organization, and by stimulating the organization's public behavior [5].

In the same opinion, building and strengthening a favorable image for the target market is one of the most important goals of a communicational policy for organizations, and the image cannot exist without communication. Because it is necessary to satisfy the consumers' needs, image is more and more important.

The identity of the organization is created with the purpose of modeling the image of the public-consumers about themselves, image determined for each person by various factors [6].

The image and the identity can be defined only in a strong connection, and, in a global vision, those two concepts are the same reality perceived by two social, distinct entities: the organization and its public [7].

Experts consider that corporate identity is the management of all ways and means by which the organization is presented to its publics, through experience and perceptions and the image is what the public perceives from the identity that was created and projected [8].

3. The Components of the Image

In a marketing approach, there are various opinions regarding the image: product's image, brand's image, organization's image etc.

The product's image is defined as a synthesis of cognitive, affective, social and

personal mentally representation of products for the consumers [9], or the way that an existent or potential product is perceived by the consumers [10].

Brand has an important position in the communicational strategy of enterprises. The brand's image can be defined as the assembly of consumers' opinions about a brand [11], or the mental representations associated with the evocation of a brand, result of a decoded operation realized by the consumer [12]. In the same last opinion, the brand's image has a subjective, stable and selective character. Subjective, because it can be differentiated from a person to other, stable because is founded on consumers' information and attitudes over a significant time period, and selective because is corresponding to a consumer's mental synthesis about the brands, in such a way as to simplify the brands perception.

The organization's image is a more complex notion, because it is the result of various combinations between partial images, corresponding to various targets and realities.

Specialists consider that the components of organization's image are the following [13], [14]:

- Social image, created going from the organization's employment supply;
- Financial image, determined by the financial value of the organization, the credibility and trust that its generated in financial environment etc.;
- Technological image, depended upon the technological performances of the organization;
- Commercial image, that refers to the way the organization's products and brands are perceived by the consumers;
- Public image depended upon the organization's preoccupation to be integrated in the community, to resolve various problems of the community.

For the academic field, the social image can be founded on the measure that the teachers' community and the other employees of the university adhere to the university's goals and objectives, the financial image can be related to its capacity to get financial resources (to invest and to pay the employees), technological image can be founded starting from the professional perspectives of the organization (new fields, new curricula, new methods etc.), the

commercial image can be built upon the trust of the university's clients (high-school, bachelor, and master degree graduates, economic organizations etc.), the university's performance and public image can be founded on the university's capacity to be integrated in the community.

Marketing communication is very important for the creation of the global image of the organization, but there are various factors that can influence the image. Specialists work to create the desired image, which corresponds to the global goals of the organization, is founded by the assembly of the organization's declared values, and is the object of the communicational strategy [15].

Through formal and significant messages, this image is delivered, and when the strategy is good and coherent these two images are dovetailed.

But, there are various internal (from the organization) or external (from its environment) factors which can create situations when the delivered image is far from the desired image. In this case it is about the real, formed image, which indicates the way that the organization's image is perceived by the public.

In the academic environment, it is difficult to create, identify and determine the image of universities, faculties, departments etc., because it can be influenced by various factors, bounded on the way through are perceived the global and partial products, concerning not only educational and research services (profiles, specialties, curricula, didactic and research activities, students support activities, physical ambience, equipment, teachers' prestige, students results etc.), but other services such as accommodation, student canteen, sport basis or entertainment, medical care etc. Also, for the university's image of a significant importance are the alumni, the stakeholders, the implication in the community life etc.

Specialists consider that, in the academic environment, the image has the following components:

- Notoriety, referring to the percentage of the public that heard about the university;
- Content, a qualitative component reflecting the connotations that exist in the persons' mind;
- Intensity, a quantitative component, that expresses the image through the

concentration of its' attributes;

- Clarity, that means how distinctive is in relation to the competition;
- Historic, which means that the past of an image is a very important component of the actual image (being known that the image of prestigious universities of the world is built on tradition) [16].

The image is strongly related to the marketing mix elements: with product policy (being one of the product's components), with price policy (the level of taxes can create a piece of image), with distribution policy (the relationships of university with the business environment concerning the practical training and the distribution of students on labor market) and with communicational policy (the communication tools are the principal means to deliver the messages which express the university's image).

4. Delivering the Image

The organization's identity reflects the permanent and fundamental character of the organization, expressed by various features, such as: status, shareholders, nationality, activity etc.[17].

Creating the organization's image is a complex process and involves efforts and creativity.

The organization must transmit a message which can suggest the principal characteristic and the market position.

This message must be expressed through symbols, mass communication, atmosphere and events [18].

Brand meaning can be expressed through: verbal elements (naming, wording, description), visual elements (picturing, symbols, animation) [19].

Starting from those opinions, in the same general manner, in the academic field the image can be delivered through the following means:

- Symbols: people, animals, objects, or simple words combinations, all these symbols are very important elements that can create means for people and facilitate an easy recognition of the university or faculty. Colors, sounds and music can increase the recognition of images;
- Using mass media to communicate symbols and messages. Press, television,

radio can be used to deliver the desired information about universities or faculties. Through advertising universities can transmit various information, especially those which concern the university's offer, the admission terms and modalities;

- Printed materials are a very important tool used for delivering the image. Flyers, brochures, catalogues etc., can be successfully used to inform the public about the university's offer, about the basic and supplementary educational services, about the history etc.. These tools can be used in connection with other communication tools, such as direct marketing or marketing events;
- Design and atmosphere can contribute to create and deliver a favorable image. Buildings, amphitheatres, laboratories, lecture rooms, furniture, colors etc., can create a distinctive image for any university;
- Public relations and marketing events are one the most indicated means to create and deliver the university's image. Press conferences, press releases or interviews allow informing the press and the public about the activity, the major performances of students or teachers or the important events of universities. Events can transmit to the public important information about the university's offer, the way it is involved in communities. The Open Gates Day, the Olympic contests, the Workshops or seminars etc., all of these instruments can create and deliver the image in an efficient way.

In time, by developing technology probably the ways to deliver messages as to express the image will diversify and will allow universities to be closer to all categories of their interested publics.

Conclusions

The identity and the image are two important concepts for the global policy of universities.

Through identity the universities are trying to show who they are and what they are doing.

The desired image is the way that the universities are perceived by their publics and corresponds to global goals and objectives of the universities.

Through marketing communication tools, universities deliver messages that express the image.

When the desired image and the real image are corresponding, it means that the communicational strategy was efficient.

Special Features of the Human Resources in the Field of Commercial Companies

Munteanu Valentina

Andrei Saguna University, Constanta, Faculty of Economic Sciences

valentinamunteanu@yahoo.co.uk

Abstract

As a factor of production, commercial staff is defined by the number and its structure, work capacity and the work that it carries each worker in the exercise of his profession.

The number and structure of trade personnel define the people who are employed in the field of commercial companies, grouped by gender, age, education, work experience in the profession, as well as share in the total staff of employees in a firm.

In the commercial field has certain particularity, arising from the nature of the activity, i.e. the economic relationship. Among men whereby they shall transmit to each other (commodity money). The specific content of the work is given to employees in the field of commercial activity, which are a category of people specializing in relationships of Exchange and purchase of goods for resale, and performs operations that require attainment of goods on the market (bringing the sale, presentation)

Keywords: personal, commercial, special features, economical.

J.E.L. Classification.: M12

1. Introduction

Development of economy and technology, the rapid transformation of the social environment of organizations, social responsibility and increase of mobility of human resources, represent significant issues that highlight the importance of human resources for an organization.

The operators used for commercial activity a significant potential labor force called the human resources of the trade.

The concept should not be watched but

simplistic, reducing work only at the stage of production – the identity factor. In reality, it is inseparable from the person who provided it, man, through intelligence, strength and will, the creator himself of material and spiritual goods. In the process of work it is, in the legal sense, the person having rights and obligations and operates within a social framework that enables it to manifest personality. Therefore, to refer to his place in the economy is better suited to the concept of commercial staff, without omitting the significance of his own work and as a factor of production.

In the field of trade, although the size of the units is different, work takes place in relatively small groups, a situation imposed by employment in the specialty units and managing the direct responsibility of the team of workers.

2. The characteristics of the process of work in the field of commercial companies

As a factor of production, commercial staff is defined by the number and its structure, work capacity and the work that it carries each worker in the exercise of his profession. In turn, they have a qualitative and quantitative assessment, expressed by the economic indicators at the level of each unit or trade as a whole.

The number and structure of trade personnel define the people who are employed in the field of commercial companies, grouped by gender, age, education, work experience in the profession, as well as share in the total staff of employees in a firm.

Regarded as carried out activity for a specific purpose and in a social setting, the work generally has a richer content than mere labor spending, a more broadly and specifically: physiological, psychological, economic and sociological. [1]

Physiological Meaning of labor is given to energy consumption and muscle breakdown of the worker in the exercise of his profession. Nature of the products and heterogeneous nature of the work requires different skills and efforts of the staff of the commercial sector. For example, while the sale of the goods shall be carried out with power exercise greater due to the quantities of goods traded; selling electronic goods is subject to the technical training of the worker, the ability of dialogue and the power of persuasion in the relationship with the customer on the characteristics of the products. The physiologically, commercial work is of medium intensity, with defective orthostatic and neuropsychological effort required by permanent contact with company with finished products. The intensity of labor is, however, due to the uneven flow variability of demand within a given period, which takes into account the size and organization of staff bands.

The economic meaning of labor is given a physical or spiritual creation resulting from physical and intellectual effort and its specific character of human labor. The results are different professions in society and form the basis of social division of labor.

The worker's work in the commercial field has its identity economically, being creative services through which the goods reach the consumer products (historically, the appearance was the merchants of third social division of labor). Towards production, where the work is a relationship between the labor force and labor, with the object of organizing relations and cooperation which he assumed, in the commercial field, this report is complete with a social relationship between seller and buyer. The buyer is a partner of the vendor in the exchange relationship. The working process of the seller is concluded to the extent that the buyer accepts the goods, the seller and received through recognition of such acceptance of its work; and it occurs to the extent that commercial worker proves his prowess to showcase their wares and to transform the purchase intention of customer in a firm decision to purchase.

Division of labor in the commercial field is narrower than in the production of material goods, the merchant with products supplied by a large number of producers, which

obviously requires exacting knowledge for sellers of goods and suppliers, as well as the allocation of preferences. Inside the commercial units, professional Division of labor, however, is narrower than in other areas, the worker conducting commercial activities of heterogeneous, switching from one activity to influencing labor productivity.

Psychological Meaning of labor stems from human nature. Although the effort inherent rendering they result in fatigue, brings work or must bring satisfaction, it is also the result of spiritual manifestations (Endeavour, will, judgment, memory, innovation, etc.) that go with it and give the person the feeling of success. For that work to be accompanied by the pleasure of being performed, it must comply with certain motivations and to bring the joy of creation and the worker a certain position in society. Psychological skills for work in commercial field consist of desire and the pleasure of the worker to provide commercial services with honesty for contracting firms (of course, for an adequate income as a motivation to work) to see the ever-prosperous firm in which they work and a clientele attached thereto.

Sociological sense of labor is determined by the context in which it takes place. Although divided on the profession, the work falls within a system of cooperation is organized into teams, groups, collectives, taking birth, including ratios of interpersonal relationships, with special meanings over the labor efficiency. In the field of trade, although the size of the units is different, work takes place in relatively small groups, a situation imposed by employment in the specialty units and managing the direct responsibility of the team of workers.

3. Number and composition of staff in the commercial field

Busy commercial staff holds an important and growing proportion of the total working population in the countries with developed economies, due to the increase in mass of the goods brought onto the market, ways of serving our clients, continuous growth demands in the supply or use of the products and carrying out an intense marketing activities both in upstream and downstream markets.

The commercial activities of the company are on the rise due to the increase and diversify the range of products, the role of services in the economy and attracting towards this sector of the workforce in the branches of production of goods made available as promoting technical progress.

In terms of the complexity of the commercial activity, imposed by the nature of the goods and the service trade, it deepens the technical division of labor, leading to the presence of various commercial establishments in the professions. The largest of these refers to the actual trade activity (purchasing, storage and sale of goods) and is executed by specific trade staff. Another part relates to the specific activities of other economic sectors (transport, production, maintenance, etc.), with a low weight, but in trade, being carried out by non-trade staff.

Part of the commercial is staff met in the sphere of production, the distribution-related activities, if the producers themselves to participate in this process. He formed the firm's sales force and is composed of one or more persons occupied in contacts with customers and suppliers and prospective or actual studying the markets. Their responsibilities are defined by functions such as HR, marketing agent, promoter, marketing technical engineer, purchaser, workman, analyst, Planner, economist, market research analyzer, etc. They submit reviews of products, make the products demonstrations, negotiate transactions, provide service and, at the same time, collect information on suppliers, trading conditions in the market, the competition situation and the way of their own business needs.

Due to the importance of sales in the business, the sale is today more and more a job for the team, in the sales force of the enterprise leadership itself playing (for customer transactions director leading), engineers and technicians for information and professional assistance provided to clients, service pledges during the after-sales and others. The number of commercial production tends to increase as manufacturers direct relationships with merchants organized retailers or consumers.

Commercial staff is grouped according to the nature of the work done in two categories: technical and administrative task force. [1]

The operative staff is busy in activities of technical shops and warehouses: heads of units, storekeepers, sellers, cashiers, cooks, waiters, etc. These features have the greatest share in the total commercial staff. He restructures as modernization of trade, together with the increase in the number of large department stores, diversification of the forms of commercial distribution of products and changing forms of sale. Workers work enriches the contents of their operatives, thus enhancing its relations with the public, the technical advice given to customers, sales promotion and provision of commercial services.

Operative staff is organized into working groups whose size (number) depends on the system of division of labor within the department or district and the norm of the sale that each worker must meet.

Administrative and technical staff shall carry out the operations of the management, administration and maintenance company (services, offices, laboratories, etc.). It is made up of economists, engineers, lawyers, clerks, cooks, serving staff, whose number, powers and hierarchical dependencies are determined by each company's organizational structure. Constitute the organizational chart of a company including their management, functional structures (offices) and posts their components, all rendered in a design showing the hierarchical system of preparing, making and carrying out decisions. Under this latter aspect is highlighted two types of hierarchical relationships: linear type, in which the governing body (steering committee, bureau, director) keeps ties to each service or office and coordinating functional type, in which senior management (deputy director, commercial director, chief economist, chief accountant) take over the coordination of the bins. Modern pyramid structure leaving the organization charts of hierarchical leadership in organizing in favor of "Daisy" in which specialists are face to face around the body managing the decision-making process.

Summarizing the requirements of commercial staff, it should be borne in mind that-before-stressed that the work in this area has, along with its techno-economic component, and a social component, the exchange is, by its nature, and a relationship between persons who offer goods or services

in the counterpart, even if they take monetary form. That's why it is necessary for commercial workers both mastery of a profession, but also psychological and moral and cultural levels to enable them to adapt to the needs and temperament, behavior of the various categories of customers. These qualities relate equally to the operative staff and leadership.

Operational staff (including in this category and force the sale of undertakings) must, first and foremost, to be a good connoisseur of cargo, utility, storage conditions and the way of presenting them and have found them skill in dialogue with potential buyers. These qualities are the skill in technical execution, obtained through experience in the workplace. Secondly, the vendor is required to be a good market; the prospector must have the ability to generalize the demand made by the consumer universe those features (preferences, motivations and buying habits) which will enable stock management and the formulation of the corresponding supplier's orders with the application. Furthermore, he must master the art of influence, to shape the tastes of buyers and promote market new products offered by manufacturers. Finally, he has, through his mental and moral qualities to win customers. These requirements necessitate that the recruitment of personnel in the field of trade task force to be made on the basis of tests showing physical and intellectual skills of a person to work with the public or with firms.

So start to make wage differentiation in practice place the same category of employment depending on the capacity of workers and the interests of the company's problems. The differentiation is done according to a system of assessment and scoring through annual tests and dialogue with workers, held by specialized personnel of companies in such areas. [2] To this are added and new forms of motivation in enhancing the profits of enterprises, including their own priority employees to purchase shares.

For technical and administrative staff and, in particular, for commercial professionals firms (economists, analysts, technicians, cooks) problems of market research, negotiating deals with partners, promote products, scientific stock management, financial management, and, on a broader

level of management, are areas in which talent and vocation for this industry is associated with mastering scientific methods of analysis and forecasting the preparation and decision-making, economic calculation and mathematical modeling, psychology and sociology. [3].

4. The characteristics of human resources in the field of commercial companies

In the context of the transition to a competitive economy, the ability of enterprises to initiate internal changes inherent to the external face is determined mainly by the characteristics of human resources available to him. American society for Training and development has identified nine key areas of human resources management [4]. Training and development; organization and development; the Organization/job projection; human resource planning; selection and provision of personnel; staff and research information systems; Rewards/advantages; advice on personal problems of employees; union/labor relations.

The importance and complexity of human resources management are analyzed and Michael Armstrong [5]. In one of his works.

The concept of Jean Marie Peretti, [6] in his work "Resources humanize", personnel function, at the level of any existing organizations, involves the following activities: management of human resources; personnel management; the formation; social development; management of personnel costs; information and communication; environment and working conditions; social relations; hierarchical management and counseling staff; external relations.

All these activities should be reflected at the level of companies which have as their object the production, processing and marketing of products. They may become "enterprise" modern, efficient, able to introduce new technologies, but if you manage to promote the particularities of human resources at their disposal, these peculiarities, by imposing a Romanian authentic management.

The current requirements as a commercial employee to be qualified, the tense situation of the labor market, the Labor Code provisions will cause it to be aware of his

value and to develop a more critical stance toward the organization. The new type of worker in the commercial field will require modern management methods in the field of personnel aimed at both the material incentives, as well as the intangible: the situation of employment in terms of detailer, the formation of high-performance work teams, etc.

Development programs designed by human resources officers, they will be able to present the actions and modalities that will be the basis for maintaining and promoting workers' interests in the field of trade in terms of participation in the achievement of the strategic objectives. However, the successful application of a strategy in the field of personnel cannot be completed without the existence of an information system that would provide the possibility of checking the information, allow obtaining special information with confidentiality and accuracy of recorded data (employees need to see from time to time your personal data, to ensure that the information posted is accurate and up to date).

It is also useful to the acquisition and implementation of a human resources information system, corresponding to the needs of the Organization, in addition to aiming computerization of manual activities and concern for the strategic use of information related to human resources. The enterprise needs a quick and easy access to this information, access being totally bin management staff and managers. The system will have to be linked to the production system and to be updated. Estimated costs are related to both the technical side and the human: are needed investments in equipment (networked computers), software (developed by software experts employed) and specialized personnel.

5. Conclusions

In the field of human resources companies have specific features. The quality of human resources in the commercial field has an important contribution to achieving the objectives of the enterprise, primarily by increasing profits and reducing risk. Human resources management assists each management level, guiding and developing business plans, which will allow for the

efficient use of human resources. Design and implementation of strategies and policies for the development of realistic enterprise require deep understanding of current constraints, as well as a new strategic vision of the use of resources, to overcome the current crisis.

Managerial Style and Organizational Climate

Munteanu Valentina

Andrei Saguna University, Constanta, Faculty of Economic Sciences
valentinamunteanu@yahoo.co.uk

Abstract

The organizational climate, through its effects it produces in terms of individual or group, has an important role in obtaining the performance of an organization.

Today intercede through a complex connections, the life and work of the group. Optimizing any key of the climate will have a positive effect at the level of the group. Climate positive is based on the Manager's organizational ability to listen, to avoid and eliminate conflict situations, on the establishment of responsible, participatory climate, discussing and sharing of responsibilities.

The aim of this work is the presentation of the relevant dimensions of organizational activity, dimensions in connection with driving style and performance in job satisfaction, with impact on profits and organizational performance.

Keywords: management, organizational, climate, performance, satisfaction.

J.E.L. Classification.: M12

1. Introduction

Organizations cannot be imagined as operating somewhere in a vacuum, but in an environment whose features are both members of the Organization, as well as the structures, processes and practices.[1]

Organizations are creating organizational climate and only to the extent that changes in social, economic, and political causes that organizations trail review, the fundamental purpose of the possible integration of organizational networks. Organizational climate may be beneficial for staff development only to the extent that organizations are able to anticipate changes in the environment, to adapt and to cancel optimized.

E. Paun [2] defines the organizational climate "intellectual and moral atmosphere which reigns in the grouping, the collective perceptions and emotional conditions existing within the organization. The climate express conditions generated by the confrontation between the expectations of employees and conditions of work and life of the organization, is a collective psychology, a phenomenon, a collective state of contagion that reflect in what we might call the human internal environment of the organization. "We infer from this that in shaping a climate optimum organizational references are not just our depictions of what should be an organization's climate, but also the conditions that it puts at our disposal. In reality, the human factor is directly responsible for creating and optimizing the organizational climate and the organization itself.

It is useful and necessary for organizational managers to know the opinion of the staff employed on the orientation of the management of the institutions. Climate positive is caused and maintained by a management style, by motivating positive actions, combining individual with collective interests, the existence of feedback between the manager and the staff of the institution.

The team leader must take into account the individual needs of each Member. Knowing people contribute to improving relations through frank and open communication. Given a definition of leadership is therefore to understand how specific personnel to think and act in the process of leadership.[3]

There are several basic styles: autocratic democratic (McGregor, 1960), object-oriented style employed-oriented task style (Fiedler, 1967), participative, autocratic, consultative paternalist (Harbinson/Myers), transformational vs. transactional (Bass, 1989) [4]. but what is important is to adopt that style that fits the Organization's leader.

This study seeks to demonstrate that the

type of driving done (transactional/transformational style) induces significant changes in the organizational climate.

2. Objectives

Starting from the premise that the management style influences the climate in institutions, this work aims to achieve three objectives to support this idea.

The overall objective is and the foundation of this work is that it is next, driving style influences the climate of the Manager of the institution he leads.

Specific objectives:

- highlight managerial style-climate interactions in institutions.
- highlight managerial styles typology in the organizational context.
- highlight the psychological characteristics of the organizational climate.

3. Specific working assumptions

Based on the objectives set out above, to find out whether the managerial style of the climate influence is due to chance or not, or other variables, we tried the following assumptions.

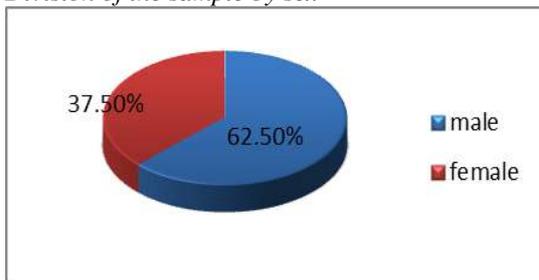

H1: managerial style is presumed to influence the positive climate of the institution.

H2: guessing that transformational leadership style to induce significant changes in the organizational climate.

4. The characteristics of human resources in the field of commercial companies

Participants in the study come from an organization with a majority state-owned, with the profile of activity – provision of services.

Figure No. 1. Diagram of the structure of the Division of the sample by sex

The research has been investigated a number of 80 participants, of which 50 men, representing percentage 62.5% of the sample and 30 women representing the remaining 37.5%.

From the structure diagram representing the scattering sample on "sex", it follows that the proportion of 62.5% of subjects are male and 37.5% are female

Participants interviewed were between ages 25 to 59 years. The most predominant age of research participants is 45 years old, representing a percentage of 10% of the total number of those asked.

Figure no. 2. – The distribution of subjects by age

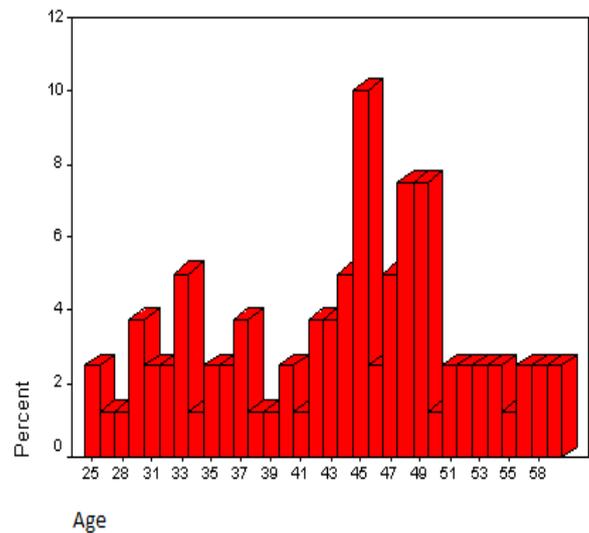

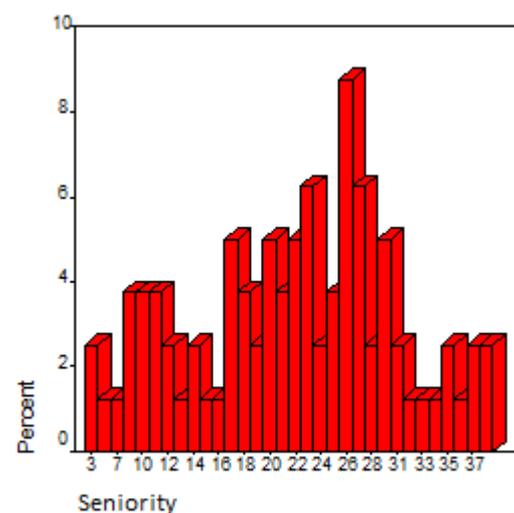

Figure No. 3. – The distribution of subjects depending on seniority

Seniority of the participants varies between 3-38 years old. The most predominant age of participants in research is 26 years old, representing a rate of 8.8% of the total number of those asked.

5. Working tools

OC IV questionnaire, used to measure the intensity of the organizational climate depending on the goals of your organization.

Questionnaire for psychosocial climate was used for measuring the intensity of the organizational climate depending on material and conditions of life.

The questionnaire for the identification of leadership for identification of the type of leadership (transactional/transformational style).

6. Analysis and interpretation of data

By applying questionnaires, we wanted to realize driving style adopted by the manager, as well as the traits of a climate in which employees operate.

In view of the results obtained as a result of processing the data in SPSS program one can say:

- how to define the tasks and objectives, both at the level of the entire organization and each employee is well established (clear goals).
- the structure as a way of organizing effective both at the level of the entire organization and each employee is well (organizing efficient).
- the quality of relationships between employees with reference to communication and collaboration on the professional line is very good, both at the level of the entire organization, and each employee in part, positive relationships.
- motivational climate in the organization is assured by: salary, promotion, development, jurisdiction, etc, is very good, with motivations encourage each employee in part.
- the organization provides resources and working conditions in order to achieve a task performance, and support for each individual employee.
- the organization has adopted a management style effectively, supporting individual and collective performance

while ensuring the conditions for efficiency.

- the organization has a general positive attitude and constant over some changes, as reflected in the style he adopted: flexibility, adaptability, initiative, creativity, etc.

- there is a level of organization, from its leadership a major concern for the improvement of working conditions, the provision of material and technical equipment, material resources needed, as well as the general atmosphere, for the proper conduct of the work.

- there is a level of organization, management of a major concern to ensure the flow of information concerning the rules of procedure that are applied to all employees; They shall be communicated to employees information about certain decisions taken by senior management; information and decisions taken concerning the conduct of their work, as well as the major concern on the part of the management for the introduction of new working methods in order to improve the quality of the organization.

- organization-wide, there is on the part of its leadership a major concern for increased performance, giving them a motivating employees through material and moral incentives (praise, appreciation, promotion) and the human factor that is focused, the work done is proper training of employees in the organization.

- organization-wide, there are some concerns on the part of management for the employee's participation in the management of the organization concerned by the responsiveness of the suggestions and proposals from employees, and differences of opinion are settled through collective discussion.

- organization-wide, there are employees, to some extent, easily identifiable leaders of existing in the organization.

Hardworking staff appreciates the active and direct involvement of the transactional leader in the Organization's activities and feedback from it. Transactional leader is perceived by employees and for rewarding performance, anticipation of intervention

actions, errors, and setting standards of performance of employees.

The staff welcomes the identification of transformational leader worker with company goals and the role of the leader model. Transformational leader is perceived by the employees and for the promotion of a spirit of sportsmanship, the clarification of expectation, energizing, the proposal of new solutions to old problems and needs centering on the individuality of employees.

7. Conclusions

Following the collection and processing of data, it is confirmed that managerial style positively affects organizational climate of institutions (between the two fixing the correlation relationship) and that transformational leadership style to induce significant changes in the organizational climate in an institution. It is confirmed that indeed, a positive climate in an organization is established and maintained by a management style, which aims at motivating positive actions, combining individual with collective interests, the existence of feedback between the manager and the staff of the institution.

Therefore, we can say that the active intervention of the leader, rewarding performance, forecasting errors by the leader, corrective action through setting standards of performance, motivation of the leader and the foster team spirit, are just some of the psychological dimensions of managerial style that influences organizational climate in a positive way in the institutions, referring also to the technical and material conditions and lifestyles of employees, to ensure the flow of information and the quality of that motivating employees and centering on "human factors" and participation in the process by accepting the leadership of ideas and solutions proposed by employees.

As a result of the analyses carried out, we can affirm that the transformational leadership style induces significant changes at the level of the organizational climate and the role of the leader model, by powerful motivation provided by identifying himself with the objectives of the organization in question.

A transformational leader in your organization, promotes team spirit,

stimulates creativity, make proposals for new solutions to old problems.

Abstract

The organizational culture of a university influences not only the relationships that exist between the members of the academic community but also the quality of the teaching process and students' development. Based on these, we developed a research in which we focused on analyzing the values system from the oldest Romanian universities. We aimed to find out if the professional status influences the evaluation of the most dominated organizational values.

In order to achieve our goal we used an ethical approach and applied our own methodology called “Organizational Values Inventory”. Therefore, through a survey based on questionnaire we evaluated students' and academics' perception on 37 organizational values. The research sample was represented by 1165 persons.

The results have showed that both, academics and students, believe that the most important values that are promoted in the university culture are: quality, competence, tradition, responsible attitude, focus on results and competition.

Keywords: organizational values, university, quality, competence.

J.E.L. Classification: M12, M59.

1. Introduction

Unlike the business agents, universities have distinctive characteristics that are strongly correlated with its institutional culture [1]. Because of the nature of its activity, it is difficult not only to establish and to measure long time objectives but also to define a coherent and sustainable vision [1]. It is an organization that perceives a different type of market success (the profitability is not defined on a monetary scale), has to compete on a special market (the one of the educational programs), has to satisfy different types of needs (like, the one of personal development) and the effects of its actions cannot be seen in a short time (the effects of a good education can be observed after a couple of years).

In this case, identifying the organizational values is critical because each and every one of them influences the relationships between the members of the academic community, the quality of the teaching process and also its results.

Taking all these into account we decided to analyze the most important values that are promoted inside the oldest Romanian universities, from both academics' and students' perspective.

The methodology that we follow in order to achieve our goal is presented in the next section of this article while in the third part we made a resume of the most important results that we obtained. In the end, we

presented a couple of conclusions and also further research directions.

2. Research methodology

We aimed to determine if the professional status influences the evaluation of the most dominated organizational values from the oldest Romanian universities. In other words, we wanted:

- to identify the most important values of the university's culture from students' perspective;
- to identify the most important values of the university's culture from academics' perspective;
- to determine the differences between the currents and desired values from both students' and academics' perspective.

The research strategy that we used in order to achieve our objectives was represented by a case study. We focused on the oldest Romanian higher education institutions, namely:

- Alexandru Ioan Cuza University of Iasi,
- the Bucharest University of Economic Studies,
- the University of Bucharest,
- the Babeş – Bolyai University of Cluj – Napoca,
- the West University of Timișoara

From a methodological point of view, we used our own methodology, called “Organizational Values Inventory” [2], [3]. This focused on evaluating the intensity of 37 possible values which had been selected after analyzing the results of previous studies. The analyzed researches had been conducted in other universities and also in public and private institutions [2], [3], [4].

The first version of the “Organizational Values Inventory” had been developed in 2004 [5] and focused on ensuring its compatibility with one of the studies developed by the American Management

Association (AMA 2002 Corporate Values Survey, AMA Research, April / May 2002, American Management Association, N.Y.). Based on the obtained results, a new version of the questionnaire had been developed. This had been validated after processing 1330 questionnaire that had been completed during January – February 2007 [3].

In the process of data analysis, there had been used medium coefficients that represent the intensity of promoting the values (presented as a percentage). In determining the coefficients, it had been applied a five points scale according to which the value situated on the first position received 5 points; the one from the second position, 4 points; the one from the third position, 3 points; the one for the fourth position, 2 points and the one from the fifth position, 1 point. The sum of the coefficients determined for all the 37 values was 100. These medium coefficients had been used for determining the intensity of promoting the values at the level of each category of respondents.

So, we used an ethical approach and applied a survey based on questionnaire. The survey was developed, from January until March 2012, on a sample of 1165 persons. According to Figure 1, 85.32% of the respondents were non-managers, 6.27% were first line managers (head of department, head of laboratory) and 8.41% were middle and top managers (rector, vice – chancellors, deans and vice-deans). On the other hand, the distribution regarding the professional status shows that 42.73% were academics, 36.20% of the respondents were first grade students, 9.89% administrative personnel, 5.67% master students, 4.90% were doctoral students and 1.29% researchers.

For processing the collected data, we used both SPSS Program and Microsoft Excel. We also applied techniques like systematization, tabling and graphs.

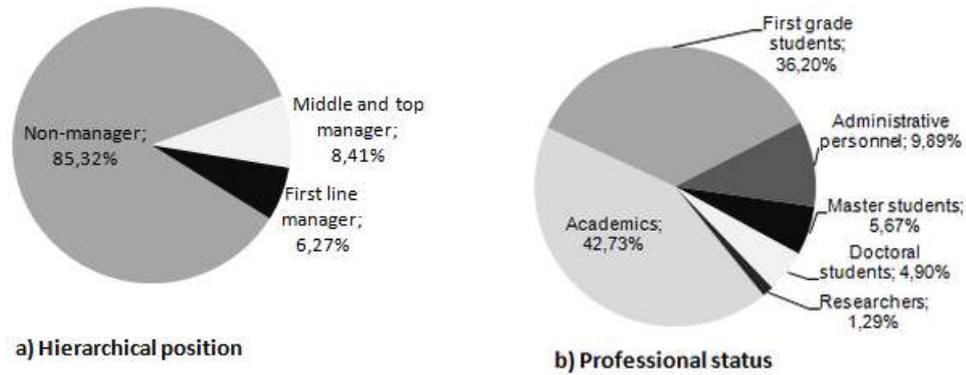

Figure 1. Respondents' distribution by hierarchical position (a) and the professional status (b)

3. The most important organizational values in the Romanian universities

Analyzing the most important ten values that students and academics had identified as being promoted at the university level (Figure 2), we observed that:

- quality is considered to be the most promoted value by both categories of respondents.
- both the students and the academics sustained that the organizational culture is dominated by: quality, competence, responsible attitude, competition, fellowship, focus on results and fairness, honesty, dignity, ethics and integrity.
- academics considered that the organizational culture is based on quality, competence and responsible attitude while students pointed out that the fundamental values of the university are quality, competence and competition.
- the intensity of competition is perceived more by the students than by academics. The students have placing it on the second position while the academics have included it on the eighth position. This result may be caused by the fact that the students have to compete with one another in order to obtain better results, a scholarship or a state – funded study place.

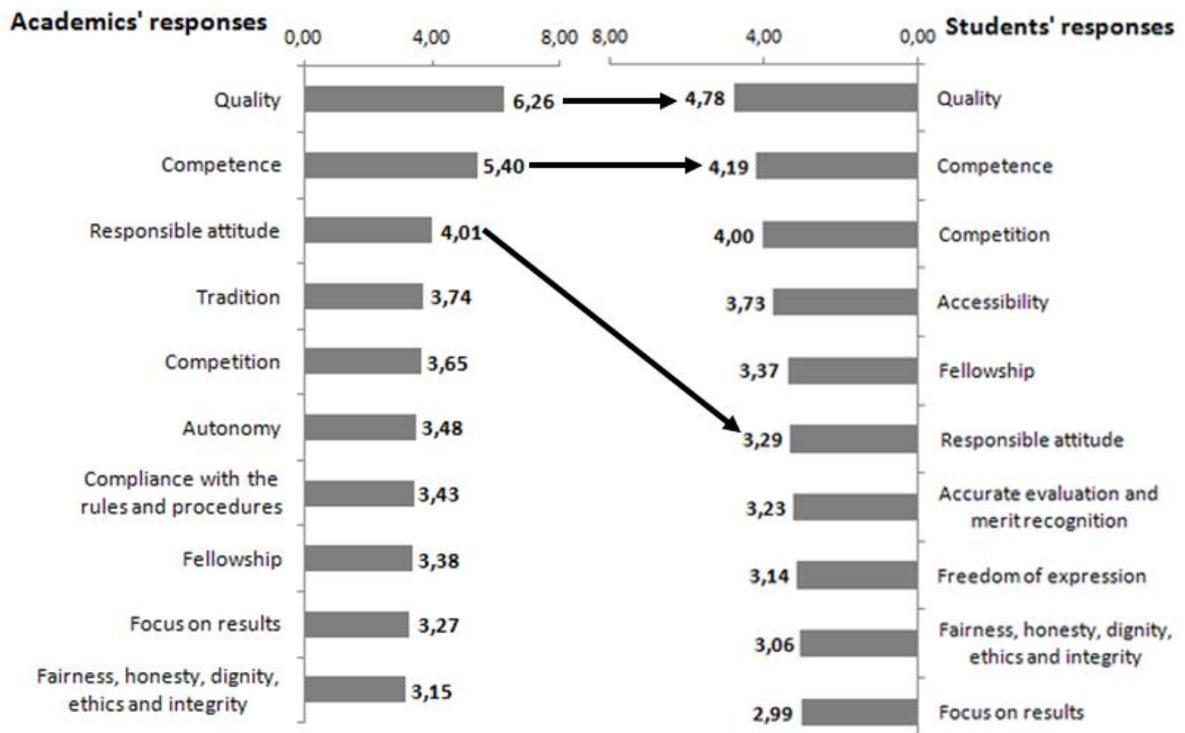

Figure 2. Comparative analysis between the ten most important organizational values that characterize Romanian universities, according to the academics' and students' points of view

On the other hand, if we take into account the ideal situation or the values that the students and academics will prefer to be promoted inside the university environment (Figure 3), we realize that both categories of respondents focus on a professional working environment that encourages communication, collaboration and cooperation. As a result, both the academics and students described the ideal cultural organization as being based on: quality; competence; fairness, honesty, dignity, ethics and integrity; accurate evaluation of individual’s performance and merit recognition; fellowship; creativity, innovation and inventiveness; open communication between the members of the academic community; cooperation, collaboration and partnership.

We must remark that some values are occupying the same positions in the hierarchies of both categories of respondents.

These are represented by quality (which had been situated on the first place), fairness, honesty, dignity, ethics and integrity (on the fourth place) and open communication between the members of the academic community (eighth place). This reflects that academics and students are offering the same importance to these values although they are not necessary evaluated them using the same criteria.

Besides, when it comes to describe the ideal organizational culture of Romanian universities, students and academics focus on quality, competence and fairness, honesty, dignity, ethics and integrity.

Another aspect that we should take into account is the importance that the accurate evaluation of individual’s performance and merit recognition has it for academics. They placed this value on the fourth position while students situated it on sixth position.

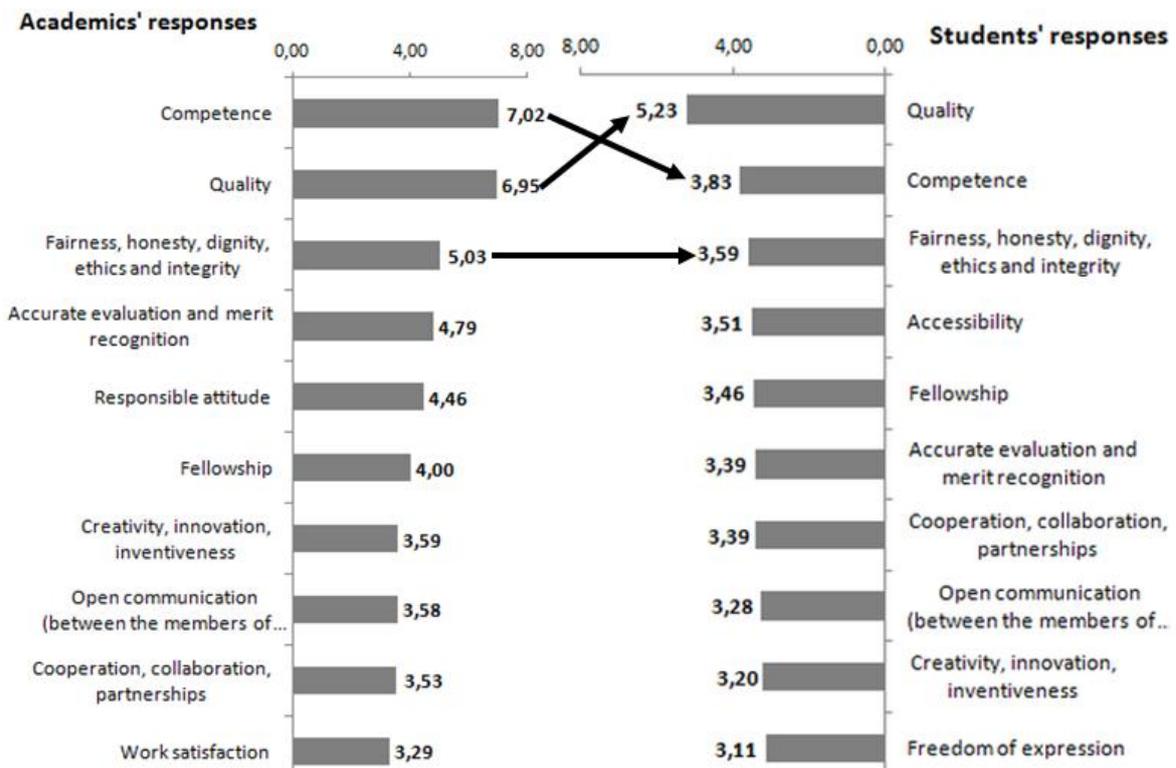

Figure 3. Comparative analysis between the ten most important organizational values that should characterize Romanian universities, according to the academics’ and students’ points of view

If we realize a comparative analysis between the existent and the desired ten most important values promoted in the Romanian universities, from students’ perspective, we observe that:

- 7 values are situated in the top ten most promoted values in both real and desired

situation. These are represented by quality, competence, accessibility, fellowship, accurate evaluation of individual’s performance and merit recognition, freedom of expression and fairness, honesty, dignity, ethics and integrity.

- quality and competence remain the core values in both cases.
- the values that are characterizing a rigid environment – in the current situation – namely, focus on results, are substituted – in the desired situation – with others that are oriented towards flexibility like, open communication (between the members of the academic community) and creativity, innovation and inventiveness.
- fairness, honesty, dignity, ethics and integrity rises from the ninth position – in the current situation – to the third position – in the ideal situation.

The situation is almost similar if we realize a comparative analysis between the existent and the desired ten most important values, from academics' perspective. In this case, we must highlight that:

- 5 values are situated in the top ten most promoted values in both real and desired situation. These are represented by quality, competence, responsible attitude, fellowship and fairness, honesty, dignity, ethics and integrity.
- quality and competence remain the core values in both cases.
- the values that are characterizing a rigid environment – in the current situation – namely, tradition, compliance with the rules and procedures, focus on results, and competition are substituted – in the desired situation – with others that are oriented towards flexibility like, fellowship, cooperation, collaboration, partnership and open communication (between the members of the academic community).
- fairness, honesty, dignity, ethics and integrity rises from the tenth position – in the current situation – to the third position – in the ideal situation.

Taking all these into consideration, we sustain that the most important values that are promoted and should be promoted in Romanian universities are quality and competence. In other words, both, academics and students, believe that the organizational culture that is developed in the university is based – just like it should be – on proving and using high competences.

Therefore, the employees are highly qualified and know how to develop and to use the competences of their colleges /

students. On the other hand, the quality of services that the academics are offering is valued by both providers (academics) and clients (students).

Besides, it seems that the professional status does not affect the way in which organizational values are evaluated. Both categories of respondents have described the organizational culture as being hierarchical, rigid and based on quality, competence, tradition, responsible attitude, focus on results and competition. The first two values are perceived positively and are included in the portrait of how the organizational culture should be. The other ones are substituted with fairness, honesty, dignity, ethics and integrity, fellowship, accurate evaluation of individual's performance and merit recognition, cooperation, collaboration and partnership and open communication between the members of the academic community. All these are reflecting the respondents' necessity of developing themselves in a flexible environment in which they have the possibility to use efficiently what they know, they may have an exchange of opinions with the other members / colleagues and they have the satisfaction of being appreciated for their performance.

4. Conclusions and further research

The organizational values influence directly people's behaviour and indirectly the relationships between the members of the academic community, the quality of the teaching process and also its results. Starting from this point, we wanted to determine if the professional status affects the evaluation of the organizational values. We aimed to know if the students and the academics will identify the same values as being the most promoted, respectively the most important, inside the oldest Romanian universities.

The results have showed that there are little differences between the organizational values perceived by the academics as being the most important and the ones identified by the students. In the first place, both of them described the organizational culture as being based on quality, competence, responsible attitude, focus on results and competition. The competition is perceived more powerful by the students than by academics. Students have placed it on the third position while the

academics have included it on the fifth position. This may be caused by the fact that students have to compete with one another in order to obtain better results, a scholarship or a state – funded study place.

In the second place, both academics and students would prefer an organizational culture in which quality, competence, fairness, honesty, dignity, ethics and integrity, fellowship, accurate evaluation of individual's performance and merit recognition, cooperation, collaboration and partnership and open communication between the members of the academic community would be better valued.

Besides, we remarked that both categories of respondents have the necessity of developing themselves in a flexible environment in which they have the possibility to use efficiently what they know, they may have an exchange of opinions with the other members / colleagues and they have the satisfaction of being appreciated for their performance.

All these results will be used in a future research that will aim to identify how the organizational values could contribute to the development of a quality culture in universities.

Abstract

We live in times of rapid change and innovation. Things that seemed unimaginable just a few decades ago, are today an undeniable truth. Advances in science, in technology, in consumer behavior have changed the ways people live, work, communicate. The pace of development of new technologies and consumer behavior is increasing.

Key words: Internet business model, management, innovation, communication.

J.E.L. classification:

M21 – Business Economics.

1. Introduction

With the advent and explosion of the Internet, have emerged and business environment that have the internet existence. The process was imperceptible at first, but grows exponentially as it moves.

Communication is a growing necessity in contemporary society. In a society such as information, communication and transfer of information is done mostly through technical means. Primordial, information society consists of an interconnection of a large number of computers, thus enabling the creation of a network with virtually unlimited resources to send a huge amount of information

With virtually unlimited access to information posted on the Internet, consumers looking for products or services, find, compare, make decisions more easily

than in traditional commerce. In this sense, one can say that in the new information society of the nature of time and space limitations have been greatly reduced, the information may be processed, stored and transmitted efficiently, and costs associated with the transfer of information is continuously decreasing.

2. General trends of Internet business

These trends, combined with how managers see and thus promoting business growth through the Internet, can be systematized with the determination from the perspective of customers, competition, complexity and virtualizing their business.

In Romania, the volume of Internet commerce sales reached annual total of approximately EUR 250 million, but estimates show rapid future growth, given that consumer behavior indicates orientation to trade increasingly on the Internet. For 2012 was estimated an average increase of 15-20% market profile.

Taking as benchmark U.S. online business, you can analyze a survey by Citibank among small firms, which reveals that very few make use of the advantages offered by the Internet business promotion. According to a study in the U.S., even if social networks are the new trend of online presence (stating that "if a company is not present on one of the social networks, then that company does not exist"), 81% of respondents said they never attempted to promote on these networks. Thus, 47% do not think that Facebook, LinkedIn or Twitter could provide added value to their business,

21% believe that they are for personal use only, and 18% do not know how to use these networks. On promoting online, 40% of companies surveyed do not have a website, 62% do not send promotional emails (so-called spam) and 84% have tried e-commerce solutions. However, 74% of those who own a website claim that it is useful for business.

As a study of IAB Romania and eResearch Corp, ran from June to July 2010, the impact of advertisements on the Internet to users in the form of further information on the product or service - 37% of cases, relaying messages about this - 30% of cases, this purchase - 15% of the cases. Acquisition rate after further information is 29%, close to the rate of purchase by making a click on the banner - 30%.

The same study shows that a significant, almost three quarters of users - 72% additional tracking information they have in traditional media, and more than a third - 37%, pursue acquisition performance following information in their possession of traditional media. Regarding the source of information in the online environment and the impact on the purchase decision, the study shows that 45% of users seeking information on blogs and 44% in the forums, and that, on social networks.

VIU study suggests that the impact of online advertising occurs both in the determination of the purchasing decision, on the one hand, and the purpose of amplifying the intention to purchase, on the other hand, whether exercised or not users click on banner. It should be noted, however, that Internet advertising can have a negative impact, the opposite of what was intended when the form intrusive, annoying to users.

In Romania, there is a need for future social media presence on the Internet, although currently only about 9% of businesses have presence on these social media (Facebook, Twitter, Youtube, etc..), But about 82% have a own web site.

Corroborating market potential with exponential growth trend of online business and the Romanian entrepreneurs desire to be present as much in the online environment that Romania can expect a steady increase in online business. Amid the financial crisis and preferences Romanian buyers to purchase low priced Romanian business will move at least partly their own businesses on the

Internet. However, there are certain trends or reasons that make Romanian entrepreneurs have reservations about access their business online. Basically, they need to understand (without making condoning these social media) that the amount of appearances in the media like Facebook, Twitter, LinkedIn, make a positive impact on the image of their companies and not necessarily the direct quantification of the proceeds from this presence.

3. Development of business models on the Internet

An Internet business must start with choosing a model of many existing models, as previously analyzed. Whatever, type of business model that will be used for the development of electronic business depends largely on the nature and specificity of these, and foremost, if you are a new business or if you are considering building an online presence for an existing business.

In this sense, planning electronic business has some differences in the approach, imposing the formulation of responses to different sets of questions, as shown below summarizes represented.

Electronic Business Planning:

- a. Starting a new business on the Internet:
 - You can build a business on the Internet offer in satisfying consumer needs ?
 - Who are the potential customers of new business on the Internet ?
 - What will be the impact of promotional strategies, pricing and distribution of new business?
 - The potential market will generate sales and profits sufficient to justify the risks of undertaking a new business on the Internet?
- b. Building an online presence for an existing business:
 - Building a web presence is a logical way to increase sales and profits for existing business?
 - Potential customers online are different from traditional clients of the firm?
 - The new electronic activities which will complement traditional activities of the firm?
 - The business has the financial resources, information and time required to build an online presence?

Building an e-business (an integrated value chain) with the capability to use the

Internet, is the creation of a complex undertaking. The complex integration of business solutions, all highly performing at a high level of availability and scalability, requires an architectural model of e-business.

Integrated value chain consists of the traditional functions of management, plus special features such as integration management products and services, customer relationship management or performance management requirements that exceed the performance requirements of a traditional business. In an e-business success, all these areas are closely integrated to give the organization the ability to sell quickly and efficiently to produce optimally and deliver products or services.

Moreover, in an e-business success, this value chain is based on a basic foundation that balances the organization meets the requirements of reliability and operational flexibility, that of being 24/24 × 7/7 × 365 days / year, in a highly volatile electronic marketplace.

In the new competitive in the digital environment is easier for an organization to be comprehensive, but it is also more difficult to maintain consistent service level across the country, across the region and around the world. E-business companies must be ready at any time to adapt very quickly to changing e-business environment, depending on the speed with which competitors appear unpredictable market pressures. E-business is today, as business climate requires continuous optimization of business and IT strategies. This is because e-business model has a significant impact on any traditional business process, both types of businesses developing in parallel. The best example of this was Dell, the U.S., and in Romania, keeping the proportions, a great example would be Computer warehouse. From the beginning, Dell's strategy was closely linked to IT strategy (from order processing, passing to production to invoicing and collection of bills) for both customers and suppliers. Dell topped the IT industry just based on a business model that integrated both the traditional business and e-business, translating famous strategy of just-in-time delivery (just in time) into a component basic business success itself. Unlike traditional providers, e-business model Dell was founded on the premise and

"zero inventory" zero inventory, ie trying to avoid as much as possible blockages stock.

4. Comparison of traditional business profitability and business on the Internet

Internet business profitability can be achieved either by increasing revenue or reducing expenses, which can be achieved through a variety of specific electronic business:

→ Increase sales revenue: sales can be made by electronic - on the Internet that has some undeniable advantages given the characteristics of the online environment as a platform for business models. Continuous availability offers the possibility of unlimited transactions is one of the most significant reasons for initiating electronic sales. Meanwhile, sales revenue transfer from the traditional to shape Internet business does not create real income, the main purpose of Internet business should be to identify new customers and generate new sales, so as to achieve total revenue growth. Other examples of ways to increase sales revenue through the use of specific e-business applications can be used for intelligent information systems - which stores information about each customer's purchases, and can assist in making future purchases or hosting forms of advertising online on their websites - that can bring additional income as a secondary source, which is the core business.

→ Reduce costs: can be done in a variety of ways, resulting in the online features, and one of the most illustrative examples of cost savings related to the interaction with the client, allowing customers information and actual acquisition with minimal involvement of the company.

Developing an Internet business requires a careful analysis of its profitability, which can be based on clear specification of the main sources of income and situation projected revenue, costs, respectively profits.

A specific business on the Internet is the possibility of obtaining income from multiple sources, which are not related to the principal activity of the company in question - which may be, for example, Internet sales of products or services.

Among these, it can mention:

- Advertising revenue - is widely practiced selling advertising space on their websites;

- Income from sponsorship - by requesting sponsorship for the content of their sites, as perceived and sponsorship fees to cover costs;

- Income from alliances - by attracting business partners to share development costs of a business model on the Internet, instead offering free advertising space on their websites;

- Income from registration fees or a membership and subscriptions - by charging subscription fees to use their own websites;

- Revenue from specialized data recovery - by trading their user profile data - which must be done with their consent - to other interested companies;

- Revenue from sale of goods and services - that is, the mark-up charged on goods and services in an e-commerce model;

- Income from commissions and trading fees – i.e, the commissions charged on transactions made through third parties such company;

- Revenue from information and market research - by charging fees for access to studies and information from its own sources;

- Income from fees forwarding - ie, fees charged to guide their clients to other firms.

These examples are not exhaustive, but illustrates many possibilities to achieve profitability in business on the Internet.

5. Conclusions

It is necessary to deal with the strategic vision of e-business as a continuous cycle involving both current business models and creating future e-business models, business modeling selective experiments. The purpose of these "projections" are as follows: refining the current rules of business, while creating new business rules for e-business. Challenge of managing e-commerce organization can be daunting, because e-commerce organizations (differs substantially from traditional business operations. In essence, management involves two fundamental decisions: operational decisions and financial decisions. Management of e-commerce is best seen as a compromise between these two decisions:

how organizations differentiate and integrate the operational and financial aspects.

Connected with the management problem, the issue of resources, ie, how to assemble and use resources organizations in order to succeed in e-business. Four different approaches, but interrelated, are required to assemble and mobilize resources: placing "bets" strategy, i.e. The betting on a strategy to increase the power company, to learn how to manage alliances with business partners to outsource operations (accounting, personnel, etc..) and maintain optimal operational parity between inputs and outputs.

Abstract

Ensuring profitability in Internet businesses during the economic crisis, involving a complex approach, both at the institutional and policy makers who directly and indirectly affect the environment more or less conducive to business development and field action for these companies and the companies who are called to deal with increased demands, even though online was less affected by difficult economic conditions.

Key words: Internet, economic crisis, online business, profitability.

J.E.L. clasification:

M21 – Business Economics.

1. Introduction

The development of information and communication technology (IT&C), especially the Internet, is vital support for online businesses. Both current state as well as at international level over the business in Romania, decisively determine the evolution of internet business. Profitability, in particular, is directly influenced by many factors, of which developments should be carefully analyzed from increasing access to the Internet and awareness of the population about the possibilities offered by Internet trading, the measures taken to regulate transactions and online payments or to combat cybercrime.

2. Governmental measures to overcome the economic crisis by online business environment

A comprehensive scan of the problems caused or exacerbated by the economic crisis, targeting information and communication technology, either directly or indirectly, internet business is carried out in the Digital Agenda for Europe, a programmatic document in the Europe 2020 strategy to overcome the current crisis and prepare the EU economy for the challenges of the next decade. Emphasizes both at European level and in Romania, the following:

- Fragmented digital markets: in Europe it can speak about some inhomogeneous mixture of national online markets, and Romania just made the first steps in developing their own online marketplaces.

- Lack of interoperability: identify gaps in standardization or public procurement and the lack of coordination between public authorities at European level being considered as a major problem in Romania, in the sense that the regulatory framework in this area is still development.

- Development of cyber crime and reduce the level of trust in networks: With the emergence of new forms of so-called crime "cyber" - who know a variety of increasingly large, such as: data traffic, embezzlement, theft ID, etc.. - The European Union is required to establish mechanisms to prevent and combat such threats as effectively. Regarding diminishing confidence, Romania is in a critical situation, both in Europe and

internationally, although attempts by various legislative initiatives and projects to solve this problem in this respect is noted MCSI initiative introducing CERT-RO (National Center for cyber security incident response in Romania), and supporting initiatives specialized organizations such as BSA (Business Software Alliance).

- Low investment in network development: much greater efforts are needed to ensure the widespread incorporation of broadband communications systems, encourage private investment, which will be complemented by public investment for the development of electronic communications.

- The need for increased efforts on research and innovation: it can be appreciated that in the field of information and communication technology in Europe investments are made at a fairly high level, and current efforts are insufficient, particularly given the intellectual advantage of research fails to transform into innovations based on market requirements. In Romania, efforts are made punctual, private initiatives of research institutes under the aegis ANCS (National Authority for Scientific Research), national research institutes or certain universities.

- The low level of "digital literacy" and the deficit of qualified human resources: in Europe it can speak about a severe lack of human resources who possess the professional skills in the field of information and communication technology, and especially at a sufficiently digital literacy. In the field of information technology and communications, although the current trend of valuable human resources in this area is to migrate to international companies, Romania ranks the top internationally but ranks much lower than the rest of the European countries in the number of users with an acceptable level of digital literacy.

- Encountering some difficulties to solve various challenges arising from modern society: namely, more easily solve some of the current challenges in areas such as education, culture, health, environment, etc.

Providing a favorable environment for business on the Internet maintaining profitability in Europe and in Romania involves taking effective action to address these issues from the bodies with powers in

these directions. If the Digital Agenda for Europe sets out well-established lines of action to each of the issues identified, assumed by Romania it can be said that the implementation is done, at least so far, quite hesitant at both European and Romanian . Although the proposed measures aimed particularly the crisis, in fact all crisis is a major factor that slows down implementation. 2011 and the first half of 2012 were marked in particular by extending the economic crisis, the problems in the eurozone and European leaders' attempts to overcome them, and Romania faced specifically, as in 2010, with consequences of the crisis reduce the effects of measures taken by the Government - the effectiveness of which can be regarded as questionable. This led to passage of the background of initiatives that have some direct and immediate effect on the main current problems of the European economy, including those regarding information technology and communications.

Moreover, a study of the opinion of the Romanians and Europeans at the end of 2012 shows the importance given to actions aimed at facilitating small business on the Internet, and, moreover, significant differences between the level of importance given from Romania to the European Union concerning measures and expanding access to the Internet or to increase consumer confidence in online commerce. Moreover, in the Internet, the degree of prioritization of actions for this area is for Romania, the lowest among all the seven action areas of Europe 2020.

The situation is worrying, especially in the case of Romania, whose economy has been significantly affected by the economic crisis, and in particular would need concrete measures to provide some viable framework for maintaining profitability of firms. The situation in Romania shows not only the need for greater involvement of bodies, but also the need to recognize the great potential offered by Internet businesses for economic recovery and crisis.

4. Measures taken by companies to overcome economic crisis

Beyond the context in which firms operate, the profitability of a business

requires not only the existence of a superior offer, many clients and a turnover of above average; profitability also involves:

- A design of e-business and technology architecture;
- Internet Marketing Strategies;
- Online brand management (management of own brand online);
- Strategies for positioning products or Internet market price;
- Online advertising, internet promotion tactics to increase web traffic;
- Solutions for customer relationship management and technical support;
- Market research and analysis efficiency of own website;
- Analysis of customer satisfaction and solutions for online communication;
- Services and strategies for choosing e-business partners;
- Online payment solutions and eCommerce strategies.

It should be emphasized in particular that, compared to traditional businesses in the Internet business, adapting to rapid change that is required from firms can be considered as superior, and often crucial in achieving profitability.

Profitability, the ultimate goal of a business involves a logical, integrated and structured approach, that if Internet businesses to focus or refocus the firm's activities, or to integrate within them. In this sense, it is necessary from strategic managers, thoroughly grounded in accordance with established principles and steps of strategic management.

An Internet solution to increase profitability is to develop and implement an e-commerce strategy, which involves the following steps:

1. Establish activities and offer products and services that will be subject to online transactions.
2. Define the list of products that will be subject to electronic commerce.
3. Definition of parts involved in e-commerce transactions: setting target consumers is important because underlying the transaction to identify the necessary components: establishing distribution channels, sales force training, allocation of financial resources.
4. Strategic analysis of competitors.

5. Including electronic distribution environment in the marketing of the company.

6. Business skills in the work allocation of e-commerce: e-commerce transactions require new knowledge and experience regarding business strategy, technology and creativity. For virtual companies strategic plan is designed for a period of one year due to rapid changes in this field.

Internet marketing involves the development of a set of activities, including establishing specific web marketing strategy, partnerships, creating affiliate programs, access to information and electronic journals letters, subscribing to search engines, etc. Choosing the optimum combination according to the specific company and the supply of goods or services, is a greater challenge in conditions of economic crisis, it is vital to maintain business profitability.

Based on Michael Porter's delineation of competitive advantage, invisible component of the strategy, can achieve an analysis of key options and possible combinations that you can approach companies doing business on the Internet, in order to maintain profitability in difficult economic conditions. Depending on the type of competitive advantage is chosen - at low cost (reflected in a reduced price) or the differentiation of the offer (the qualities of similar products offered by competitors) - reflected in a higher price can highlight two strategies appropriate Internet business, the economic crisis:

⇒ Low price strategy: it can be a way of maintaining the profitability of Internet business during the crisis, which finds a solid foundation in reducing purchasing power as a negative effect of the crisis, the impact on consumer behavior. Because low-cost access to information facilitated by online media, consumers are oriented generally easier to goods or services sought offered at the lowest price - including through websites that perform price comparisons, and enhances the economic crisis some such behavior. There are numerous studies that made comparisons between the prices on the Internet and that, in the traditional, and most of them show that Internet prices are lower - although there have been some studies that have shown the opposite. The same empirical studies show that price fluctuations are much smaller in

the online environment.

Although these prices for some given product or service varies depending on the vendor, despite the pressure imposed by the competition, which is largely due to differentiation strategies used by firms.

⇒ Differentiation strategy: can be a winning option for internet business through differentiation bidders can establish a preferential price in order to maintain or increase profitability. Empirical evidence shows that, in general, companies operating on the Internet apply differentiation strategies offer. For example, a study of the online retailers in Italy shows that only 5% of them did not have a well-founded strategy of differentiation, and the most important differentiating factor is for 41% of the companies credibility brand. Brand value can be built either through advertising - online or through any other media through sites that display your guest reviews or through social networking sites.

Other distinguishing features include the development of online product range (35% of Italian businesses) techniques customer loyalty (29%) and pricing strategies (27%).

Quality customer service is another significant element of differentiation of online business that can be reflected by the speed of response to customer requests, delivery speed, quality applications available to client - the possibility of contacting the company, offering suggestions for purchase etc.

It should be noted that the differentiation strategy can give better results in terms of efficiency, effectiveness and profitability to low price strategy, given that, as shown in studies of literature of consumer price sensitivity is lower in the online compared to the traditional, and more customer loyalty to a particular brand is higher in rural compared to the traditional online.

Given the importance of promotion in the Internet, as shown above, it can be argued that the objective of profitability imperative to choose a suitable advertising strategies, rigorously developed and implemented.

The optimal combination of online and traditional advertising is a topic debated in the literature, generally concluding that a combination of the two types of advertising is preferable to a strategy based entirely on online advertising. Since in the case of online

advertising, the cost is usually directly correlated with the level of interaction with the customer (e.g., number of clicks or number of purchases), providing data such as advertising works and how - data not can be obtained with traditional advertising, the effectiveness of online advertising strategies commensurate is much easier than if traditional advertising. Furthermore, it is recognized that online advertising can speed build consumer confidence to a particular business. The high number of media websites, offer a very large advertising space, leading to a low price for online advertising.

Online advertising knows various forms, such as banners, text, images and multimedia advertisements in websites. This type of advertising is becoming increasingly sophisticated, for example, ads can be sent directly to the user, depending on its profile by web content analysis in the form of targeted advertising.

The highest costs are recorded for online advertising in the search engines, where the firm pays websites to send ads to users searching for specific terms. It can be said that, despite the abundance of information available on the Internet, the very nature of online search shows lack of full transparency of price advertising. Thus, when performing an Internet search, the links appear in descending order on the screen, depending on the number of hits, and there is a greater possibility that users see links that appear first, so that attempts a position to influence either through advertising or through sponsored links.

5. Conclusions

Internet business in Romania follows the global trend of evolution of the Internet but also has a lot of features. Overall, the course of their development is one ascendant both in terms of number of users and the turnover of entities that invest and make profits in this environment. Throughout the world Internet is an important lever for business, so it is the least hit by the economic crisis and among the first recovery.

Thus, despite the economic crisis, it can talk about enhancing internet business considering that more and more companies have built or widened to an extent increasingly larger Internet business models,

both at international level and in Romania. For Romania, this was possible on the basis of favorable evolution of Romanian online environment that can be played the most illustrative of the evolution of the number of users online - as compared to 2007 when there were about 3-4 million users, in 2011 their number increased to over 6 million. This is due to the increasing popularity of the Internet in mass population and expansion of providers who offer their services not only in cities but also in rural areas.

Business, both the traditional and the online needs combined measures taken at government level and in companies to overcome the negative effects of the financial crisis. By weighing the benefits that economic activity is online, it appears that every positive measure taken by the government positively affects online business in Romania. However, measures taken at government level must necessarily combined with measures taken at each company operating on the Internet.

Knowledge Management - a Prerequisite for the Development and Management of Intellectual Capital

Nicolae (Gîju) Elena Daniela
University Valahia of Targoviste
nicolaeelenadaniela@yahoo.com

Abstract

In the literature of corporate management, the concepts of knowledge management and intellectual capital have become an important area of concern. Knowledge management contributes to significant growth of intellectual capital through the management ability to solve problems in an efficient manner with the ultimate objective to generate competitive advantages. This article aims to show what intellectual capital is and how knowledge management is contributing to its development.

Keywords: knowledge management, knowledge, intellectual capital, development, factor of production

J.E.L. Classification: M 10

1. Introduction

When we talk about knowledge, a traditional point of view is to view it in a hierarchical structure: data, information and knowledge. Data represents the first form of information and have no significance. It may exist in any form and may be useful or not. Data could be converted into information using five main processes [1]:

- Condensation – items of data are summarized into a more concise form and unnecessary depth is eliminated;
- Contextualization – the purpose or reason for collecting the data in the first place is known or understood;
- Calculation – data is processed and aggregated in order to provide useful information;
- Categorization – a process for assigning a type or category to data;
- Correction – a process for removal of

errors.

The information represents grouped data, sorted and classified which were given a meaning through relational connections. This significance may be useful or not. In organizations, it often becomes embedded not only in documents or repositories but also in organizational routines, processes, practices, and norms. Information becomes individual knowledge when it is accepted and detained as a closed compression to the truth and a valid interpretation of reality [2].

2. From knowledge management to intellectual capital

Based on the differences between data, information and knowledge and also the importance of the latter category, a new concept has emerged and evolved, subsequently becoming the practice for large companies, namely knowledge management. Knowledge management involves processes of *identification, creation, storage, transmission and use* of knowledge. This requires a system for generating, perpetuating stock of knowledge and facilitating knowledge sharing. Organizations that succeed in knowledge management consider knowledge as a resource and develop organizational norms and values that support knowledge generation and knowledge sharing.

Analyses conducted by many experts reveal that in the current economy knowledge satisfy four essential economic roles or functions [3].

As raw material, knowledge is greatly participating in obtaining modern products. It is obvious to everyone that the manufacture of a computer or a TV incorporates not only metal, plastic and other materials, but many acquaintances. Moreover, in the value of these products, knowledge has the largest share. For example, in the cost of a

sophisticated computer of thousands of dollars, the actual costs of metal and plastics etc. incorporated and of energy used for to obtain it are tens of dollars, representing only few percents of its total cost.

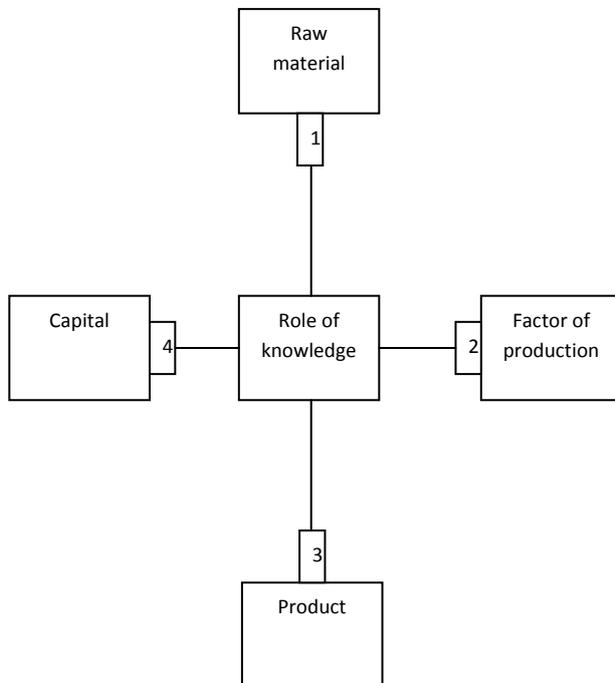

Figure 1: Roles of knowledge in economy
Source: Roşca, 2008, p. 61

Defining the concept of knowledge management also differ, as of approaches regarding knowledge by author, without a crystallized definition, it can be inventoried the following approaches on knowledge management, according to which knowledge management is a process of transformation of intellectual and informational capital into permanent value [4].

In the new economic context, knowledge management is a new discipline representing the key resource to become competitive. There is no clear consensus on how this discipline can be defined, but generally, it can be understood as responsible for designing and implementing a system that aims to identify, capture and share knowledge systematically within a company so as to be converted in value for it. In general, knowledge becomes a value for the company when it contributes positively to the objectives pursued by the company itself [5].

Although most methods for evaluating the application of knowledge management focused on its contribution to the

development of intellectual capital, there is no consensus on the application and validity of a single method. Researchers find that it is difficult to prove a direct link between knowledge management and organizational performance applying this concept, efforts to assess this link materializes in the use of both quantitative tools, as well as the quality ones.

Intellectual capital [6] is defined as the result of continuous approach of the problem of knowledge management in an organization. Considering knowledge as part of human capital, knowledge management is a part of structural capital. Intellectual capital can be approached as reflecting knowledge in accounting.

The literature offers many definitions of intellectual capital as follows:

- Intellectual capital is the possession of the knowledge, applied experience, organizational technology, customer relationships and professional skills that provide a competitive edge in the market [7].
- Intellectual capital is quite simply the collection of intangible resources and their flows [8].
- Intellectual capital of the company is the sum of knowledge of its members and practical use of this knowledge [9].
- Intellectual capital is knowledge that can be converted into profit [10].
- Intellectual capital may properly be viewed as the holistic or meta-level capability of an enterprise to co-ordinate, orchestrate, and deploy its knowledge resources towards creating value in pursuit of its future vision [11].
- Intellectual capital is the group of knowledge assets that are attributed to an organization and most significantly contribute to an improved competitive position of this organisation by adding value to defined key stakeholders' Marr and Schiuma [12].
- Intellectual capital is a claim to future benefits that does not have a physical or financial (stock or bond) embodiment [13].
- Intellectual capital is the set of knowledge and information owned by a person or institution and actively put to the service of accomplishing economical objectives Xavier [14]

Intellectual capital consists of [15]:

- *Human capital*: Human capital refers to the body of knowledge, skills and training, skills and ingenuity, skill and attitude, learning ability and motivation of individuals who compose the organization. Company values, culture and philosophy are also included in the human capital.
- *Structural capital*. Capital structure may be described as the infrastructure that incorporate, support and qualify human capital and made possible the labor development in the company (programs, databases, organizational structure, patents, trademarks). It also makes reference to customers, the company-customer relationships, organizational processes, management, production and marketing

The engine that drives knowledge management is the premise that as the organization that produces goods will use and manage tangible assets an organization that produces information and knowledge should use and manage intellectual assets. Knowledge and management of its elements (processes, components, categories) become the basis for the management of intellectual capital of an organization. Subsequently, intellectual capital is transformed due to its value for the organization in intellectual property. Therefore, researchers seek to address *knowledge management as a methodology that leads to the development of intellectual capital and property*, the process itself becoming part of this methodology [16].

Knowledge management is more about tactical and operational issues. It is also more detailed and focuses on facilitating and managing those activities related to knowledge, such as its creation, capture, processing and utilization. Its function is planning, implementing, operating and monitoring all activities and all programs with the knowledge that requires effective management of intellectual capital.

3. Conclusion

It is concluded that knowledge management is the management of processes governing the identification, creation, storage, dissemination and use of knowledge

by using technology, organizational structures and human resources to determine in the most effective way problem solving, decision-making and fulfilling organizational objectives. Assessing the effectiveness of the implementation is done just on the principle that effective implementation of knowledge management processes lead to the development of intellectual capital, which is why measuring value added by knowledge management actually means measuring its contribution to the development of intellectual capital.

Abstract

Entry of commercial enterprises play an important role by maintaining active competition for existing businesses and development of innovation and long-term growth. Rules and regulations often restrict the entry have only a negative effect on competition. Moreover there are numerous papers providing evidence that the ability of firms to enter the market and develop normally depends on the ability to attract external funding for new projects to be undertaken

Keywords: competition, potential, competitive market, limit-pricing

JEL Classification: D20, D22, D23

1. Introduction

The potential competition can be defined as being the competitive pressure on a market by one or more companies, which are not actively present on that market. The potential competition can determine an incumbent firm on one certain market to exploit its power on that market, having as a result the reduction of prices or improving the quality of products and services. The positive effects of the potential competition can come about in two different ways, the first one being the discipline of the incumbent firm as the entry threats, resulting in a reduction of prices and improving the quality. As far as the second is concerned, the existence of the potential competition increases the probability that new companies enter the market, resulting in

positive effects for the consumer. Michael Porter, one of the greatest business writers, defined the potential competition as being one of the 5 fundamental competitive forces which can determine the profitability of a company.

For example, an incumbent firm will try to create barrier strategies known as entry deterrence to stop the entry on the market for some possible companies, which might enter the market. These actions may be as price reductions, new investments in technology for increasing the production, introduction of new brands or maybe some new products. All these activities are for the benefit of consumers, but also in the same time might stop some great positive effects that would benefit from entry. If the incumbent firm sets the prices above the average costs, a company entering the market would have to set the prices below the competition, but in the same time make the firm profitable, and to gain some control over the market. Probably, the incumbent firm will take the decision to reduce the prices, and again take the control on the market, but in the same time the second firm can leave the market without any costs. If the prices change rapidly, the incumbent firm would have to adopt a reduction in prices, as a response to the competition. In contrast, the price changes would characterize the movement as not being profitable, having as a consequence a high profit for the incumbent firm.

2. Theories which bring arguments against potential competition problem

There are theories which bring arguments against potential competition problem, while others bring arguments demonstrating it's an efficient theory. Consider a perfectly competitive market, a situation where the companies and consumers are small and numerous (sellers and buyers do not determine the change of prices). For simplicity, assume the fact that everyone are using the same technology and there are no fixed costs. The buyers have all the information about the price and quality, choosing to buy from those companies which sell at the lowest price. In consequence, the company which sets the price above their competitors will not be able to sell anything, while an enterprise which sets the price below the competitors will be able to capture all the market. [1] This means that the companies will have to set the prices equal to the marginal cost. In the case in which two or more companies produce identical products, they compete in terms of price. For simplicity, assume the fact that the firms have identical functional costs and there are no fixed costs. In this case, the buyers will choose to buy the products from the company which is able to sell at the lowest price. If there are no constraints in what capacity of production is concerned, the competition will force the companies to set the price equal to the marginal costs.

3. Another theory of the potential competition

Another theory of the potential competition is the theory of „limit-pricing”. This theory sustains the fact that an incumbent firm may prevent the entry of other companies on the market or to slow down this process. According to the classical theory of „limit-pricing”, the incumbent firm sets a quantity limit, so that the actual demand to be insufficient so that the potential company to avoid the entry on the market. In other words, the potential competitor notices the quantity of products and services that the incumbent firms offers, and in the moment in which decides to enter the market, it can be assumed that the incumbent firms will continue to offer the same quantity of products and services. This means that the potential competitor will be able to sell to the „remaining customers”. If the quantity that the

incumbent firm chooses is too big so that the potential competitor choice to remain unprofitable (if what remains from the market after the firms sells all its quantity, it's too little), the potential competitor will restrain from entering the market. The logical weakness of this classical theory is that once the potential competitor has entered the market, it may be profitable for the incumbent firm to raise the price.

The theory of limit-pricing is an example of anticompetitive strategy. An enterprise will always take actions to prevent potential competitor from entering the market. Apparently, like in all models of anticompetitive strategies, the firm will always take aggressive measures of protection, only if they have an effect on the potential competition. The firms should focus on maximizing the profit in the short term, as long as it is the only enterprise from a specific market.

For many centuries, it has been proved that there may be excessive penetrations of markets in the industries with fixed costs. The reason is that the profit of the potential competition will increase the rivalry, will reduce the prices and will increase demand. Secondly, there is the so called „business-stealing” which means that a big part from their profit, will return to their potential competitors. The potential competitor will enter the market if the sum of these two components is bigger than the cost of entry. Then, the estimation of probability of entering the market of a potential competitor and identification of the actual entry on the market are simple tasks than the identification of the unfulfilled effect of the potential competition, because it is much easier to identify the actual competition rather than potential competition.

4. Competitive advantage

Understanding the competitive advantage is another challenge for those who take the decision in a firm. The ability to develop a competitive advantage in our days is an extremely laborious thing, because an competitive advantage which has been achieved, may be lost rapidly. The companies sustain a competitive advantage as long as the services which they offer, and the way

they distribute, correspond to some specification from the customers. The competitive advantage is the result of the difference between the products or services of an organization and those from the competitors from the buyers minds.

Generally, the firms must anticipate as fast as possible how the environment, structure, culture change so that there are just advantages. The competitive advantage has become a subject of movement and the ability to change location and position. The potential strengths and weaknesses must be seen as strategic resources, because together with the objectives of the company will help to develop the competition spirit.

In what prices are concerned, comes the next question: Does the potential competition limit the price of a product? Or maybe the price of products remain high until the actual potential competitor appears? The potential competition can discipline the price. Under certain conditions the incumbent firm will have taken the decisions before the potential competitor will take the decision of entering the market, affecting the environment by reducing prices. For example the incumbent firm, fearing of the entrance of new firms on the market will take the technological innovation decision so that it could enlarge production. A potential competitor will know that the incumbent will have lower variable cost in the future, this low cost meaning that the incumbent will set lower prices if the potential competitor will enter the market, than if the incumbent hadn't invested in new technology. As a consequence of lower prices, and the extra capacity of production, the potential competitor will have to set some lower prices. In this way, the price of entry on the market will be lower than the cost, being insufficient to cover all costs, finally deciding not to enter the market.

Moreover, having an extra capacity of production, the incumbent will set the prices at a low level, even if there is not threat from another firm entering the market. The potential competition has disciplined the price. If there wasn't for the potential competition, the incumbent would have taken the decision to grow production by investing in new technology, having a higher price. The possibility of entering the market for firms, limits the price that the incumbent

would have practised, the so call „limit-pricing” strategy.

The potential competition limits the price under certain conditions. Firstly, the incumbent will have to determine the potential competitor that the entry is totally unprofitable. In the last example, the company has decided to invest in new technology, reducing in this way the price, but in the same time reducing the probability for a new entry on the market. Secondly, the limit-pricing strategy has to be viable, the benefit must overpass the costs. The incumbent firm profit will be lower because of the applied policy, caused by applying some lower prices, and not a price which could assure a maximum profit.

The term of potential competition appears in other context, apart from the analysis of competition. Some authors make a distinction between the actual potential competition and the perceived potential competition. Potential competitor may have the capacity to enter on a market with certain conditions, for example in case of a merger between two companies, threatening to raise the price.

Is there a link between potential competition and firm's initiatives to innovate? The incumbent will have access to a new technology which will confer a monopolistic position on the market. Innovations can be achieved after intense and costly studies of research and development. There are two paradigms to describe competition in innovation. According to the first theory, the company that spends the most money on research and development will certainly be the first to invest. This means that R & D competition is like a kind of auction, where the company that spends the most on innovation will win. According to the second paradigm, research and development expenses will increase the chances for a company to be innovative.

Fundamental to leading the company's ability to stop other companies entering the market, is the ability to take action before competitors. Some of these actions are aimed to benefit consumers. These barriers to entry can be classified into three categories: natural, alternative and administrative. Alternatively, natural and administrative barriers are classified as exogenous input. Natural barriers are due to supply and demand fundamentals. The trade barriers are,

for example administrative, legal monopoly or restriction of entry.

In general there should be a relationship between levels of entry barriers and leading the company's ability to set prices above competitive levels [5]. If barriers to entry are low, prices should be close to competitive levels, and if entry barriers are high, prices should be close to the monopoly, while intermediate entry barriers should be associated with prices located between the competitive and monopoly levels. For example, in the absence of entry barriers, prices will be located at competitive prices, unless there is only one company active in the market.

If the limiting pricing is used to stop the entry, then when entry barriers are high, although prices will be kept relatively low. Another indirect method to analyze the effect of potential competition is the analysis of profit levels. If high profits are in the concentrated markets, the competitive potential is low. Also, the difference between the profits of industry and firm level is a very important element for leading companies in measuring profit. Furthermore, it is well documented that most of the profit is then sent to other employees and suppliers.

Potential competition is in itself a threat to any firm in a market. However, for consumers, potential competition is important because in some cases can stop taking place between different understandings of market leaders that have concluded agreements on the practice of a single price. Potential competition may develop in principle, in order to adjust market prices, to increase the quality of products and services sold by market leaders, these things are achievable by adopting pro-competition policies, something that would benefit all consumers. Also by adopting these government policies, will enable market expansion, the range of products offered to consumers by eliminating barriers to entry, along with amending the legislation to stop the bureaucracy to protect certain companies from the market, and successful potential competition removal that would enter the market [3].

Also, any potential competitors who want to impose on the market, to conquer a better position, bring new production capacity and provide resources, should not be neglected.

Following entry, can cause decreases in current prices, rises in competitors costs that are already on the market. Size is directly proportional to the importance of barriers to entry, with competitors already on the market reaction. Mass production may be a negative factor for potential company, because they are required to enter the market at a much larger scale, the investment effort is extremely high. Clumsy effort to retain is another feature of potential companies that will have to make considerable effort to retain current customers and potential for their products. The volume of capital required for market entry can be an obstacle, because to the initial costs, it can add other things related to customers, advertising, or even the initial losses.

Mainly, the potential competitive is the pressure on leading companies to the possibility of market entry of some other companies, generic called potential competitors [4]. They may be attracted by the profits achieved above average in some markets by leading companies, possibly due to low competition. When market entry barriers are high, decrease the threat of possible companies that wish to enter the market. In general, both theoretical and empirical analysis confirm that the current competition is more competitive than the potential applied only in certain limited areas. Theories also suggest that barriers to entry are potential determinants of competitive power.

Moreover, potential competition can be excessive or detrimental. In industries with fixed costs, there may be several companies who wish to enter the market. The threat of entry can be costly, unprofitable in terms of company leadership with effects as premature and excessive investments in production capacity. Some empirical studies suggested that the entry barriers are critic for the efficiency of competitive potential. Some studies also showed that the efficiency of competitive potential is different from one market to another. The competitive potential can be effective on those markets where long term contracts are concluded and where massive investments are not necessary.

The entry of commercial enterprises on market plays an important role by keeping an active competition for existing firms, by developing innovation but also by long term

economic growth. Rules and regulations which mostly restrict the market entry have a negative effect upon competition. Moreover, there are numerous papers that prove that the capacity of a firm to penetrate a market and to normally develop depends on the ability to attract external finances for new projects that are bound to happen.

Experience is a decisive factor for the potential competitor. Fail rates (leaving the market) are frequent, more than 60% of the new-entries not succeeding in business, leaving the industry in no more than 5 years. Intern strategy diagnose is realized by analysing the potential of enterprise [2]. The analysis of the potential of enterprise must identify the strengths and weaknesses of the activities of enterprise. As referred before, the analysis must be made through comparison to other competitors from the same sector of activity, the real focus being on identifying the relative position of the enterprise in the sector. This analyse offers an answer to the following question: “What can the enterprise do better than its competitors?” and it evidences the competitive advantages and disadvantages of an enterprise as well as its distinctive competence. According to the authors of this model of strategic diagnosis, the analysis of the potential of an enterprise principally refers to three basic domains.

1.The positioning of an enterprise on its markets that includes the following essential aspects : the part of the market hold by each commercialised product, the penetration of products on different geographical areas, the sales volume, the number of clients, the fidelity level of clients, the profit margins, the reputation of enterprise on its markets, the level of technique and quality of products, the nature and volume of post-sale offered services and of commercial facilities, the contribution of each product in turnover and in profit, the sale prices and their fluctuation in time and zone, the promotion and publicity policies, the diversity of products, the characteristics of distribution network etc.

2.The positioning of an enterprise in relation to its factors of production that refers to the analysis of production equipment, human resources, energetic resources and raw materials resources which can be assured by the enterprise. Concerning the production

equipment, the study aims: the volume, the structure, the technique level, the quantum of mechanization and automation, the specialised or universal character, the size of production capacity and the indicators of usage, the possibilities of static flexibility etc. The analysis of human resources is made in relation to the number and structure of existent personnel, to professional characteristics and qualification, to aptitudes, level of experience and specialization, social climate, relations with unions, to salary, to ways of motivation, level of work productivity, level of fluctuation etc. Raw and energetic materials resources are studied in the same context but from the point of view of existent suppliers, supply and storing policy, of the prior factor in supplier-enterprise relation, of level and fluctuation of procurement prices, of negotiations aptitudes.

3.The positioning of an enterprise in relation to its competitive factors of which the most important are: financial force, management system efficiency, research-development and innovation potential, flexibility level, the speed of reaction to the changes of competitive environment, the capacity of satisfying the individual requirements of clients, the existence of experience phenomena etc.

5. Conclusion

The conclusions dragged from the internal strategy diagnosis allow the enterprise to adopt measures for eliminating the weaknesses susceptible of compromising its evolution in the future and it enables the enterprise to establish the strategy based on valuing its strengths and competitive advantages. Intern strategy diagnose is realized by analysing the potential of enterprise. The potential analysis of an enterprise must identify the opportunities and threats found in the environment, the specific successful key factors found in the domain of activity in which the enterprise operates.

Dynamics of Tourist Accommodation Possibilities in Romania Under the Impact of Economic Crisis

Olteanu Laura

Babeş-Bolyai University, Cluj-Napoca, Faculty of Economics and Business Administration
olsa02892@yahoo.com

Abstract

For the capitalization of the tourist potential of a country its detailed knowledge is required. This is possible through the analysis of its components. The material and technical basis is presented in the form of highly diversified structure through which customers' needs can be met.

Keywords: *material-technical basis, tourist accommodation structure, analysis, trends, destinations*

J.E.L. Classification: *M31*

1. Introduction

Tourism has experienced a continuous development due to people's desires to travel, but also because of ongoing curiosity to discover places and cultures. Over time motivations diversified generating the development of different forms of tourism such as spa tourism, mountain tourism, seaside tourism, cultural tourism, science tourism, etc.

This diversification of the motivations needs a diversification of resources and a variety of technical-material basis which is required to meet the tourist needs of customers.

Ensuring tourism products requires both material goods and basic tourist services such as accommodation, food, transport and leisure. Material goods are reflected in at least three categories of elements, namely the heritage of natural, cultural, artistic, historical, architectural, technological, structures of tourist accommodation, covering a wide range of accommodation preferences of domestic and foreign tourists.

medical etc. resources, forming the physical setting and manifesting attractions for tourists, certain elements of infrastructure or equipment even though they do not generate motivation or demand but contribute to their satisfaction (hotels, restaurants, golf, gyms, theaters, conference, etc.) as well as some access facilities related to transportation chosen by tourists. [1] The specific material-technical basis includes [2] accommodation, catering facilities, transportation, installation possibilities of lifts which provide access to high altitudes, leisure facilities which provide fun and recreation and also provides enjoyable outdoor time, treatment facilities for particular forms of tourism ie the health spa, rural tourism in an uncrowded setting and holiday villages.

Secondary (desk) research on the analysis of the development of tourist reception reflecting functions of tourist accommodation and tourist accommodation capacity in Romania between 2005-2011.

2. Dynamics of tourist accommodation

Dynamics of tourism heritage in Romania under the impact of the economic crisis takes into account the analysis of the development of structures of reception for tourist accommodation, tourist accommodation, the development of tourist accommodation capacity, the development of tourist accommodation capacity on tourist destinations and the development of tourism accommodation capacities by type of ownership between 2005-2011. Currently in Romania there are plenty of reception

Source - Romanian Statistical Yearbook 2011 pp. 611, Romanian Statistical Yearbook 2012 pp. 585

Analysis of tourist reception with functions of tourists' accommodation shows that the total analyzed period registered an increase by 23.56% of reception units in 2010 compared to 2005, respectively 18,38% in 2011 compared to 2005. It should be noted that after 2008 the total number of tourist accommodation establishments recorded a steady growth, although the growth rate was reduced. Thus growth was by 5.26% in 2009 compared to 2008 and 2.49% in 2010 compared to 2009.

We can state that increases were registered through the whole analyzed period, hotels and motels with an increase of 243 units in 2010 compared to 2005 representing an increase of 21.05%, respectively 7,58 % in 2011 compared to 2010, chalets with an increase of 21 units representing 18.58% in 2010 compared to 2005, of which 18 units were built after 2008 representing an increase of 15.51% in 2010 compared to 2008, urban touristic boarding houses as well as rural touristic boarding houses. Decreases were

registered in tourist inns throughout the period under review, registering a decrease of 7 units representing a decrease of 63.63% in 2010 compared to 2005, in 2008 5 units of 11 existed, the number of camping and houselet-type units went down by 19.35% in 2010 compared to 2005, respectively 42,74% in 2011 compared to 2005. In 2010 compared to 2008 the number of camping and houselet-type units decreased by 9 units representing a decrease of 8.25%. Decreases were recorded throughout the period under review for school and pre-school camps as well.

The largest proportion from the total number of tourist receptions with functions of tourists' accommodation is made up by hotels and motels with more than 60% for the whole analyzed period, followed by camping and houselet-style units with 10.89% of the total in 2005, with a decrease that does not fall below 9% at the end of period and school and pre-school camps with a proportion of 10.23% of the total at the beginning of period, halved in the years 2010, 2011. The

lowest proportion consists of holiday villages, tourist inns and youth hostels, less than 1% of the total, throughout the period under review. Hostels, which present an insignificant proportion, still registered an increase from 0.87% in 2005 to 1.67% in 2010 and respectively 2,89.% in 2011 of the total. Increases in total accommodation structures during the analyzed period were recorded at the urban touristic boarding

houses from 3, 86% in 2005 to 5.91% in 2010 and respectively 20,98 % in 2011, as well as at the rural touristic boarding houses by 3.94% in 2005 to 6.51% in 2010 and respectively 24,18 % in 2011.

Tourist halting places although proportionally decreased until 2008, they increased in the second half of the analyzed period. After 2008 there were decreases in total tourist inns and ship accommodations.

Source - Romanian Statistical Yearbook 2011 pp. 611, Romanian Statistical Yearbook 2012 pp. 585

The analysis of tourist accommodation capacity shows that throughout the period under review the number of units continuously increased, the growth was 10.27% in 2010 compared to 2005. The growth was successive in the second half of the review period, ie after 2008.

At hotels and motels, tourist accommodation capacity increased throughout the period, the largest increase during this period being of 4.03% in 2008 compared to 2007. Since 2008 increases were constant by 3.41% in 2010 compared to 2009. Hostels registered an increase during this period the highest values recorded in

2006 compared to 2005, by 42.36% in 2009 compared to 2008 by 21.70%. Inns registered a decrease of - 66.78% in 2010 compared to 2005. The largest decreases were registered in 2007 compared to 2006 by -33.09% and - 28.67% in 2010 compared to 2009. At chalets a steady decrease was present until 2008, followed by a significant increase of 13.05% in 2009 compared to 2008. Tourist villas and bungalows also presented a decrease in the number of available accommodation units until 2008, followed by increases of 1.90% in 2009 compared to 2008, 5.22% in 2010 compared to 2009 and decrease 29,53 % in 2011 compared to 2010.

Although school and preschool camps showed continuous decrease during the analyzed period the existing accommodations in urban and rural tourist boarding houses significantly rose. After 2008 the largest increases were recorded in 2009 compared to 2008 achieving an increase by 14.54% in urban boarding houses and by 17.01% in rural boarding houses. Tourist halting places showed an increase in existing accommodations during the second part of the

analyzed period, while accommodation on ships steadily decreased since 2008. After 2008 the highest increases were registered in 2009 compared to 2008 achieving an increase of 14.54% in urban tourist boarding houses and 17.01% in rural tourist boarding houses. Tourist halting places stood out for the increase of the existing units in the second part of the period, while ship accommodation spaces experienced a continuous decline since 2008.

The tourist accommodation capacity increased throughout the period, without any decrease after 2008. Thus seaside as a tourist destination increased tourism capacity by 13.80% in 2010 compared to 2005 and decrease by – 29,85 % in 2011 compared to 2005. Spa tourism benefited of capacity increase in tourist accommodation by 2.05% in 2010 compared to 2005, respectively 11,92% in 2011 compared to 2005, while in mountain tourism tourist accommodation capacity increased by 26.36% in 2010 compared to 2005, respectively 39,37% in

2011 compared to 2005. In mountain tourism the growth of tourist accommodation capacity was higher in 2010 compared to 2008 being an increase of 2.77%, than in spa tourism where growth was by 1.04%. Danube Delta stood out with an increase in tourist accommodation of 4.09% during the period under review, however, it can be pointed out that in 2008 the number of tourist accommodation units in the area showed a decrease by 19 units representing a decrease of 15.57% in 2008 compared to 2005, but from 2008 they registered a continuous

growth. It can be stated that the highest proportion characterizing the accommodation units is noticed in other cities approximately 31% during the analyzed period, the lowest being in the Danube Delta between 2% and 3% during this period. The proportion of seaside accommodation decreased of 21.08%

in 2005 to 19.41% in 2010, respectively 12,49 % in 2011. In 2009 this proportion decreased to 18.56% of the total while in 2008 it registered a 19.28%. The mountain area remained stable with small changes of 19.59% in 2005 of the total, 19.87% in 2010, with an increase of 20.64% in 2009, in total

Table 4. Touristic accommodation capacity and activity, by touristic destination %

Regarding the ownership private property represent a significant proportion by more than 80% of total accommodation capacity during the analyzed period. If in 2005 there were 3516 private tourist accommodation

units registered representing 83.2%, in 2008 their number increased to 4222 units representing 87.23% of the total. After 2008 this percentage exceeded 90% of the total.

Table 5. Touristic accommodation capacity and activity, by type of ownership-number

Years	Total	State majority	% in total	Private majority	% in total
2005	4226	710	16,8	3516	83,20
2006	4710	638	13,54	4072	86,45

3. Conclusions

Based on the analysis performed it can be concluded that after 2008 there were no dramatic decreases regarding the examined indicators. The analysis of tourist reception structures with tourist accommodation functions shows that the number of reception units increased throughout the analyzed period, the total number of tourist accommodation units presented a steady increase, even though the pace of growth was reduced. Increases can be observed at hotels and motels, chalets and urban and rural tourist boarding houses, and decreases were registered in tourist inns throughout the period under review, the camping and houselet-type units, school and pre-school camps.

In the total number of tourist reception units with tourists' accommodation functions the largest proportion is represented by hotels and motels with over 60%. The lowest proportion is presented by holiday villages, tourist inns and youth hostels, less than 1% of the total for the entire period. Tourist accommodation capacity by destination grew throughout the period without any decrease after 2008.

By ownership, private ownership represents a significant weight, which increased after 2008.

For a better exploitation of tourism potential there must be an adequate promotion of tourism, but also a provision of quality services. Moreover, a better capitalization of the resources of the Danube Delta would be welcome, an area full of potentials but not properly used.

Consumer Preferences for Products and Tourism Services in Romania Between 2008-2011

Olteanu Laura

Babeş-Bolyai University, Cluj-Napoca, Faculty of Economics and Business Administration
olsa02892@yahoo.com

Abstract

In a strong competitive market where consumers are becoming more demanding knowing consumer behavior in tourism services is essential for decision-makers. It is necessary to know their preferences to form a variety of offers able to meet their increasing diverse needs.

Keywords: *tourist preferences, average period, number of travelers, number of arrivals, number of nights*

Classification J.E.L.: *M31*

1. Introduction

Consumer preferences for products and travel services are influenced by a number of factors that determine their purchasing process. Purchasing products and services is a major goal for firms because it directly influences the financial results of companies. As Theodore Lewit stated if something is not sold, there something terrible happens, therefore nothing. To avoid this it is necessary for companies to know the market, especially the customers. Customers are influenced by a number of factors in purchasing goods and services. Currently there are several approaches to analyze these influencing factors. Jolibert Alain and Pierre - Louise Dubois, in the work *Le Marketing. Fondements et pratique* are addressing these factors as individual and environmental factors. As individual factors personality, cognitive style, lifestyle and perceived risk are presented, while as environmental factors the socio-demographic and economic factors are described. [1]

Lazar Dumitru in his work *Bazele Marketingului*, believes that the explanatory variables of consumer behavior are personal

psychological variables, individual variables and social variables.[2] Among personal psychological variables the following are taken into consideration: perception, learning, motivation, personality and attitude, as individual variables: gender, age, life cycle, occupation and income are included and for the social variables: culture, reference groups, role and influence of the family, social class and lifestyle.

Other authors such as Philip Kotler, in his work *Marketing Management* states that influencing factors are cultural factors, social factors, such as reference groups, family, role and social status, personal factors such as age and life cycle stages, occupation, wealth, lifestyle, personality and self-opinion and psychological factors - motivation, perception, attitudes and beliefs. [3]

Culture is deeply rooted and cannot be changed. Therefore, companies need to adapt to customer demands. It would be inappropriate to market swimwear in Arab countries for the local inhabitants.

As social factors family and the main reference group will mainly influence consumers' decision regarding tourism products and services. A partner with higher income has also a greater impact on influence. Side groups have significant influence because friends whose experiences about the visited areas can be extremely attractive. They will also influence decisions on services, accommodation, etc. Influence will be deeper if the communication with the group is stronger.

Among personal factors age, life cycle stages, wealth, lifestyle will directly influence the purchasing decision regarding tourism products and services. Old-fashioned tourist will hardly jump onto a ship to admire coral reefs of the Red Sea, they will be less open to extreme sports. Individualists will test the waters more easily, they will explore everything they meet.

Motivations will largely determine the choice of tourist destinations. A childhood dream to see Egypt will lead a strong desire to visit that destination. A honeymoon in Paris will create nostalgia, desiring for a return. The created attitude is determinative as a negative attitude requires high costs to attract customers. Perception can be everything when a client chooses a destination. Perception depends mostly on the received information, on education or previous experiences. Immateriality says the word. Therefore, credibility and information have a crucial role in the return of a client.

2. Consumer preferences in tourism

Choice of tourism products and services are not always based on rational factors, motivation is extremely diverse. Analysing consumer preferences for products and tourism services in Romania between 2008-2011 provides a view of tourists’ preferences from the perspective of secondary research, of statistical data provided by the National Institute of Statistics of Romania.

Thus it presents tourists’ preferences regarding tourist reception structures with tourist accommodation functions at tourist destinations, particularly regarding foreign travel as well as preferred means of transport.

The analysis of tourists’ preferences regarding tourist reception structures with tourist accommodation functions based on the number of arrivals shows that hotels and motels come first with a mean of 5165 tourists, followed by hostels with a mean of 444.25 tourists and agroturistic pensions with a mean of 333.75 tourists. The lowest average number of arriving tourists to tourist reception structures with tourists accommodation functions between 2008-2011 was recorded in tourist chalets with a

mean of 10.500 tourists, followed by school and pre-school camps with a mean of 78.750 tourists.

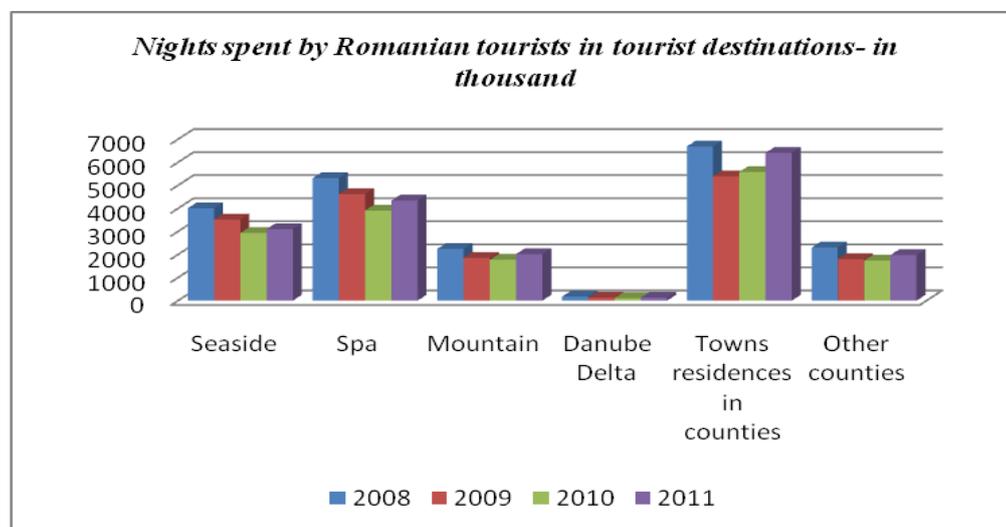

Table 2. Romanian tourists arrivals in tourist destinations - thousand

	Seaside	Spa	Mountain	Danube Delta	Towns residences in county	Other counties	Total
2008	833	728	998	96	3363	1107	7125
2009	788	640	831	70	2884	928	6141
2010	703	568	815	68	3012	907	6073
2011	736	689	963	82	3541	1021	7032

Source- Romanian Statistical Yearbook 2009 pp. 959, Romanian Statistical Yearbook 2011 pp. 616-617, Romanian Statistical Yearbook 2012 pp. 591

Analysis of tourists’ preferences regarding tourist destinations revealed that tourism in towns, residences in counties have the most significant proportion during the entire analyzed period, followed by tourism in other counties, mountain tourism and seaside tourism. It can be stated that although the country is full of mineral water, nature and actual treatment possibilities, spa tourism occupies the penultimate place before tourism in the Danube Delta, another extremely attractive area for tourists. Thus the number of tourist arrivals in towns, residences in counties

represented a proportion of 47.2% in 2008 for total tourist arrivals in tourist destinations, reaching 50.35% in 2011 of the total. Furthermore, at other tourist destinations insignificant decreases were recorded, arrivals in mountain tourism recorded a slight decrease from 14% in 2008 to 13.69% in 2011. Likewise, arrivals to the seaside recorded a proportion of 11.69% in 2008 of total, while in 2011 this number reached 10.46%. The Danube Delta presented the lowest proportion, 1.35% in 2008 of total arrivals, while in 2011 this proportion was 1.20%.

Graphic 1.

The number of nights spent by the Romanian tourists at tourist destinations decreased between 2008 - 2010 considering all forms of tourist destinations, however this indicator showing an increase in 2011. The analysis of the total number of overnight stays at tourist destinations

declined by -43.58% between 2008-2010, while it increased by 12.01% in 2011 compared to 2010. Although proportionally the Danube Delta recorded the lowest value in 2011 compared to 2010, it recorded the highest increase in the number of overnight stays namely by 19.26% and for the period

between 2008-2010 presented the largest decrease -37.35%. Between 2008-2010 this indicator presented significant decreases in seaside tourism by -26.77% and by -21.05% in mountain tourism, in other counties by -24.33%, while in 2011 compared to 2010 there were the following increases: 5.79% in seaside tourism,

11.04% in mountain tourism and 13.33% in other counties. We can state that regarding preferences for overnight stays in tourist destinations the most popular were county residences, followed by spa tourism and seaside-tourism.

Table 3. Nights spent by Romanian tourist in tourist destinations – in %

	Seaside	Spa	Mountain	Danube Delta	Towns residences in counties	Other counties	Total
2008	19.33	25.62	10.83	0.83	32.25	11.10	100
2009	20.30	26.69	10.72	0.71	31.12	10.43	100
2010	18.27	24.35	11.04	0.72	34.78	10.84	100
2011	17.26	24.15	11.23	0.74	35.64	10.98	100

Given the average length of stay it can be stated that on the top of preferences is spa tourism which decreased from 7.3 days in 2008 to 6.3 days in 2011, followed by seaside tourism where a decline from 4.8 days in 2008 to 4.2 days in 2011 can be observed and mountain tourism with an average of 2.2 days in 2008 and 2.1 days in 2011.

It can be seen that although towns, residences in counties were the most popular among tourists regarding the number of arrivals and overnight stays, according to the average length of stay this tourist destination holds fifth place after spa tourism, seaside tourism, mountain tourism and other counties, the Danube Delta being the last on the list of preferences.

Table 4. Average length of stay – in days

	Seaside	Spa	Mountain	Danube Delta	Towns residences in counties	Other counties	Total
2008	4.8	7.3	2.2	1.8	2.0	2.1	2.9
2009	4.5	7.2	2.2	1.8	1.9	1.9	2.8
2010	4.2	6.9	2.2	1.6	1.9	1.9	2.6
2011	4.2	6.3	2.1	1.6	1.8	1.9	2.6

Source- Romanian Statistical Yearbook 2009 pp. 959, Romanian Statistical Yearbook 2011 pp. 616-617, Romanian Statistical Yearbook 2012, pp.591

The analysis of travels abroad shows that travels to America and Africa are declining. Between 2008-2010 the trips to Europe decreased by -18.78% while there was an increase of 22.96% in 2011 compared to 2010.

Considering the preferences of tourists for travel in Europe can be stated that there were increases in Belgium, namely by 175.7% in 2009 compared to 2008, by 26.85% in 2010 compared to 2009 and by 4.44% in 2011 compared to 2010, in case of Bulgaria there was an increase of 26.41% in 2009

compared to 2008, 54.54% in 2010 compared to 2009 and 66.52% in 2011 compared to 2010. 2009 compared to 2008, by -25.14% in 2010 compared to 2009 and a significant increase of 39.32% in 2011 compared to 2010, and for Sweden by -33.33% in 2009 compared to 2008, by -43.90% in 2010 compared to 2009 and respectively by -47.59% in 2011 compared to 2010. Greece there was a decrease by -9.95% in 2009 compared to 2008, by -33.17% in 2010 compared to 2009 and with a significant increase of 96.40% in 2011 compared to 2010.

Source [4]-Romanian Statistical Yearbook 2009 pp. 962, Romanian Statistical Yearbook 2011 pp. 622, Romanian Statistical Yearbook 2012 pp. 596

The analysis of the number of departures of Romanian visitors regarding type of transport shows that road travel is preferred by more than 70% of total departures, followed by a steady increase of air travel

from 28% in 2008 to 25% in 2011 of the total. Ship travel ranks last among the tourists' preferences presenting a low proportion of less than 1% of the total during the analyzed period.

3. Conclusions

The data analysis revealed that although between 2008 - 2010 there was a decrease according to the analysis indicators, in the last year of the period, in 2011, there were significant increases. Romanian consumers of tourism services show clear preferences for hotels and motels, hostels and pensions for agrotourism. Less preferred are tourist halting placing and chalets. Most overnights were recorded in towns, residences in counties, at the seaside and in the mountains. Based on the average length of stay of tourists' preferences were outlined for the spa, seaside and mountain area.

Regarding traveling abroad Europe is mostly preferred in a significant proportion. Within Europe the following countries: Italy, Hungary, Greece, Germany, Bulgaria, Austria obtained the highest proportion. The most preferred means of transport is road travel, followed by air travel.

This analysis provides an overview on consumer preferences regarding products and tourism services in Romania with more profound results. Being aware of the actual customer preferences it makes possible to approach clients even more, and to create offers to meet the needs of the customers. There is no efficient promotion in tourism without knowing the real and actual needs and desires of customers. For Romania the

improvement of material and technical basis and the improvement of service quality is essential. Although there are different types of accommodation we can notice that preferences have a clear direction. It requires more pronounced segmentation of tourism and implementation of policies and strategies appropriate for each market segment. Romania is a country very rich in landscapes, natural potentials which allow the development of different forms of tourism. Tourism can provide substantial revenue, can create jobs throughout the year by permanently balancing supply and demand

An Empirical Study of Consumer Behavior in the Cuban Mobile Phone Market

Oncioiu Ionica

Dimitrie Cantemir Christian University

nelly_oncioiu@yahoo.com

Abstract

The adoption of mobile phones in most countries has been exceptionally rapid over the last three decades. In response to this new wave in technology, Cuban government under Raul Castro has made it clear that he will be reducing the size of Cuban state expenditure in favor of private participation in the economy, the genuine liberalization of Cuba's telecom sector is expected to be hampered quickly over the coming years. This exploratory study therefore attempts to examine consumer behavior in new mobile phone markets. The study surveyed 315 Cuban consumers to identify their motives for purchasing new mobile phones on one hand, and factors affecting operator choice on the other. The results indicate that price and properties were the most influential factors affecting the purchase of a new mobile phone whereas price, availability and friends' operator were regarded as the most important in the choice of the mobile phone operator.

Key words: consumer behavior, mobile phone, market.

Classification J.E.L.: G14, L17, M31

1. Introduction

The deregulation of the telecommunication industry in 2008 was a revolution in Cuba that created the need for new mobile services. This is because the monopoly hitherto enjoyed by the Cuban Telecommunication (ETECSA) did not pay off as consumers could not enjoy quality services. Current cell phone use in Cuba may be more promising but you should be very cautious about renting cell phones in Cuba.

Also, recently the Cuban government bought out the ETECSA cellular service provider but it is a mystery as to why since the Cuban government can't even run sugar mills so we are not sure why they think they can run the mobile phone system in Cuba. Further challenging this situation is the global need for new mobile services (Bradner, 2002; Wag Staff, 2002).

Besides, the current state of affairs in the mobile phone industry indicates a shift from second-generation mobile phones to third generation. This means that a mobile phone is not only a device used for speaking but also a handset that allows consumers a variety of new services such as Internet access. This services in Cuba is controlled by the government, which decides who can plug in. Only about 450,000 Cubans, or 4% of the population, go online, according to official statistics. The cost also is prohibitive for most Cubans - \$6 for 30 minutes of Internet access in a country where the average person makes about \$20 a month. However, the number of cell phone users passed more than a million last year and is growing fast. Like Internet access, the cost of sending mobile messages remains high - about \$1 for text messages sent internationally and \$2.30 for short videos or pictures. Several foreign companies have partnered with Cubacel, Cuba's state-owned mobile phone monopoly, to allow minutes to be added from abroad to Cuban cell phone accounts.

The Cuban perspective is that handsets are merely used as connectors to the internet, and the actual surfing is done via laptop or other PC, thereby allowing users to use sharper screens. In other words, the best

feature of the new mobile phones is the ability to connect to the net free from time and place constraints; thereby permitting consumers to have easy and relatively cheap access to the net via computers. The question then is can't this situation be avoided or controlled? The answer is fairly simple but economically important. Consumption is a fundamental part of every economic and social system and changes in consumer behavior have varying implications for the whole society. Also, consumption is in part culturally determined and thus can be held up as a mirror of society. It is therefore imperative that consumers be analyzed to be able to serve them better.

In trying to understand consumer behavior, motive which is one of the basic determinants of consumer behavior, becomes imperative. The motives that affect consumer behavior and give direction to the purchase and use of mobile phone services, including the perceived value-added services are grossly under researched especially in Cuba where the need to collect general information about the users of mobile phone services has become particularly urgent in order to guide industry operations and policy makers.

In the light of the above, this study attempts to first describe the trends in the information and telecommunication (ICT) sector to illuminate the issues underlying consumer behavior. This, of course, is predicated on theoretical framework that articulates recent studies concerning factors that seem to affect the choice of a mobile phone and operator by consumers, as well as intention to adopt new mobile phone features and services like Multimedia Message Service (MMS) and sending e-mails. Finally, the paper reports the survey finding along with their managerial and theoretical implications.

2. Literature review

Many theories, models and concepts have been borrowed from other fields as well as developed by marketing researchers in attempt to understand consumer behavior. In many cases, these ideas overlap and even

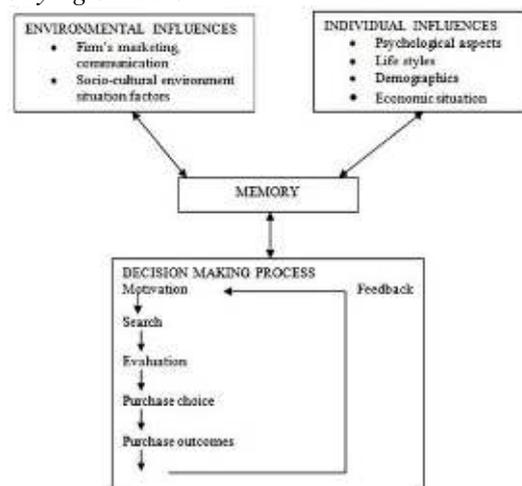

compete with each other as useful description of consumers. To date, no one approach is fully accepted, nor is it likely that a single grand theory of consumer behavior can be devised, that all researchers would agree on.

However, Chisnall (1995 cited by Lancaster and Massingham 2001) states that buyer behavior models have two basic functions:

- Firstly, they describe in simplified form, the parameters or characteristics affecting the purchase of certain types of goods and services.
- Secondly, they allow predictions to be made of the likely outcomes of specific marketing strategies.

Consumer behavior is complex. In order to investigate it in detail it is advantageous to break down the purchase process into a model. The Figure 1 below shows a simplified model of consumer buying behavior.

Figure 1. Simplified model of consumer buying behaviour

Source: Lancaster. G. and Massingham L. (2001) Marketing Management

The model above is explained as follows: Marketing communications from companies are always around us. Some of these are retained in memory and we have an image of companies and the goods and services they provide. This may lead to a motivation to purchase the service or to be aware of it for future use.

Culture: Culture is the broadest environmental factors and is defined by Assael (1996) as “Norms, beliefs and customs that are learned from society and lead to common patterns of behavior”.

Social class: This is the grouping together of individuals or families who have certain common social or economic characteristics. Members of the same social class are often felt to exhibit similar patterns of behavior and hence similar views and interest.

Situational factors: These also determine a purchase and may be a major aspect in purchase behavior. The consumption situation will directly influence consumer brand perceptions and purchase behavior i.e. where precisely service is going to be consumed.

A further aspect of consumer decision making is the process involved in purchase and this is divided into five stages.

The first stage is when an individual feels a need that a service will satisfy and is motivated to evaluate the services on offer. People have many varying needs, if a need is intense, then they become motivated to purchase the service that will satisfy it.

This search for alternatives constitutes the second stage of the decision making process and it may be external or internal. External search involves physically looking for alternatives while internal search involves searching the memory for what a person knows about a product/service and suppliers or providers. When consumers have enough information they will evaluate the alternatives in the market place. This is the third stage of the decision making process. The criteria on which products/ services are evaluated vary depending on how many brands are available.

When products or brands have been evaluated, one product/service is then selected for purchase. This is the fourth stage of the decision making process. However, purchase intention can be affected by unforeseen factors like price, influences of other people etc. these may lead to no purchase at all.

Finally, purchase outcomes will either be satisfaction or dissatisfaction with the purchase choice.

In another recent study by Liu (2002) on the factor affecting the brand decision in the mobile phone industry in Asia; it was revealed that the choice of a cellular phone is characterized by two distinct attitudes to brands: attitude towards the mobile phone brand on one hand and attitude toward the network on the other. While price and

regularity of service were found to dominate choices between network providers, choices between mobile phone brands were affected by new technology features such as memory capacity and SMS-options, more than size. The trend will actually be not towards small phones but towards phone with better capability and larger screens.

In a recently research and markets study (2011) reveals that Cuba still has the lowest mobile phone penetration in Latin America, one of the lowest levels of Internet penetration, and is among the five lowest in terms of fixed-line teledensity. Cuba's fixed-line services remain a monopoly in the hands of government-controlled Empresa de Telecomunicaciones de Cuba SA (ETECSA), while mobile services are provided exclusively by Cubacel, a subsidiary of Etecsa.

There remains substantial state control over the right to own and use certain communications services, including the right to access the Internet. In the same time, in case of Cuba, most analysts of marketing would agree that the consumer decision-making process is an extremely complex phenomenon. Even for the purchase of a single commodity, a multitude of differently weighted factors affect each decision. This complexity is increased as individual purchase decisions are aggregated because the factors and their relative weights vary among persons faced with the same purchase decision. Given this abundance of relevant variables, it would be useful if a method could be developed that would identify in advance which variable or group of variables would be most useful in a given situation.

One way of grouping these important factors into relevant categories is to conceive of the decision process as affected by four kinds of factors or variables: (1) personal system variables (e.g. conscious and unconscious needs), (2) social system variables (e.g. membership and reference groups), (3) exogenous variables (e.g. relative price and purchase convenience), and (4) risk reducing variables (e.g. trusted stores and brands). Categorizing the multiplicity of possible variables into four groups makes them more manageable in analyzing their role in a given situation.

Studying the consumer-decision process in further simplified if the relative influence

of each variable system is regarded as a function of the person's perception of the choice situation. Three perceptions particularly may act as filters to determine the group of variables with the greatest weight: (a) the perceived performance risk of the decision-to what extent does the person think different brands perform differently in ways that are important, (b) specific self-confidence – how certain is the person that the chosen brand will perform as he expects, the person think that other people judge him by his brand decision.

Limiting the perceptual filters to three is, of course, an oversimplification. For example, reaction to high perceived risk probably depends on the risk perceived.

With the development of modern telecommunication system, three distinct views of business communications have emerged.

A second view emphasizes the use of telecommunications to enhance normal business processes. Connecting with customers and suppliers and coordinating activities at remote sites were forerunners of today's full range of today's telecommunications to argument normal business processes.

Finally, telecommunication is fully integrated into society and may be seen as an essential service or utility. Telecommunications systems are vital national resources subject to regulations intended to protect the public interest. The nature and effect of regulation are subjects of ongoing debates, an open question include the nature of the public interests protected, the need for regulation, the desirability of different forms of regulations, and the effect of regulations on the development of new services.

3. Research methods

The data for the study were collected by means of questionnaire within selected group included the persons in the North-West region of Cuba. Their age varied between 20 and 30 years. The data consisted of 315 copies of questionnaire, of which 128 were from Female and 187 from Male. Almost all (about 99.3%) of the respondents had at least one mobile phone in use at the time of the survey, which reflects the actual situation

among the population in the North-West region of Cuba.

Questions inquiring the acquisition of a mobile phone and choice of operator were implemented with statements, which respondents had to rate in their order of importance on five-point Likert Scale. The development of the scales was based on two sources: First was the existing statement found in the literature. The second base was our knowledge obtained as the outcome of two focus group interviews conducted among 21 youths. In the first focus group the theme was mobile phone acquisition, and in the second group the theme was operator choice. Youth consumer purchasing motives concerning the choice of a mobile phone as well as operator are not well known in theory, i.e. no commonly accepted knowledge of the factor influencing youth consumers' decision making exists. Thus, the results obtained have some limited applications since they are considered interim.

4. Discussion of results

The trend that mobile phones are purchased earlier was verified with the data. A confirmatory factor analysis (table 1) of the statements suggests that three factors (see e.g. Sharma, 1996; Hair et al, 1995, for more detailed presentation of factor analysis method) were chosen in terms of Eigen value of larger than 1.0. The Bartlett's test of sphericity was highly significant indicating high correlation between the variables. The second factor analysis presented in this paper satisfied the above mentioned tests also. The identified factors represent 54 percent of the variance of the variables. The first factor can be called manufacturer as the highest loadings relate to three variables pertaining to properties, image, and new services. The second factor exhibits largely loading for four variables relating to market conditions. Price and availability had the highest loadings for the second factor. The third factor is defined by two items relating to other people's influence. Thus, it can be called influential persons. Influence of the manufacturer explained most of the total variance (23%).

Table 1. Confirmatory factor analysis on mobile phone choice

Motive	Manufacturer	Telemarket conditions	Influential persons
Image	●83		
Services	●81		
Properties	●80		
Price		●74	
Audibility		●67	
Type		●69	
Free calls		●57	
Salesman			●76
Family			●65
Employer			●59
Friends			●49

Source: own calculation

Regarding of the factor affecting the choice of an operator, the choice of the operator was affected primarily by price and audibility: around 85 percent felt that the price the operator charges had affected their choice at least relatively much. In addition, audibility was the second most important motive: 86 percent felt that audibility had affected their decision at least relatively much. Other motives of significance were properties, friends' choice of the operator, contract type and free calls. Salesman and employer were the least important affecting the choice of one's operator.

A confirmatory factor analysis (table 2) of the eleven statements was carried out. Four factors explaining 64 percent of the variance of the variable were identified. The factors can be labelled as:

1. Features and brand
2. Quality of the operator
3. Component in pricing
4. Influential persons

The first factor has the highest loadings for four variables pertaining to operator's features and brand. The second factor (quality) has the highest loading for three variables relating to price, audibility and type (supply of different contract types). The factor three can be called components in pricing, because two of the highest loadings for this factor refer to free calls and family's operator type. The final factor refers to employers or salesman's influence and can thus be labelled as influential persons. The influence of the first factor (feature and brand) is the highest explaining 25 percent of the variability.

Table 1. Confirmatory factor analysis on operator choice factors

Motive	Features & brand	Quality	Component in pricing	Influential persons
Image	●82			
Services	●78			
Properties	●73			
Friends	●54			
Price		●85		
Audibility		●83		
Type		●54		
Family			●83	
Free calls			●62	
Employer				●84
Salesman				●72

Source: own calculation

Respondents were asked to mention the services they are presently using and to indicate if they intended to use the services in the future. Most popular services used nowadays are logos and ringing tones. Over 72 percent of the respondents had order logos and tones for their mobile devices. These two were followed by phone bill inquiry (63% had ordered) and call forwarding (56% had used). Only five percent of all respondents had never used any of these fours. According to the data, the use of mobile phone services seems to remain at the same level during the next 12 months.

Additionally, approximately two thirds of each group considered that poor usability had had only a little effect on their use of the services. Other factors affecting the adoption of mobile services such as small screen size, slow data transfer and poor functionality had relatively low impact on the possible adoption.

Conclusions

This study was conducted to analyze consumer decision-making process in particular, and to increase our current understanding of the mobile phone market in general. In addition, the study was an attempt to cast more light on the much-unexamined area of mobile phone purchase, operator choice, and use of mobile phone services. The main result of the study indicates the following:

First of all, the age of purchasing a mobile phone among young Cubans has lowered in just a few years 18-19 to 14-15.

Secondly, the factors underlying the purchase of a mobile phone were found to be manufacturer, market conditions and influential persons. For the choice of operator, the factors were found to be

features and brand components of pricing, quality, and influential persons.

Thirdly, only about 17 percent of the respondents felt that their use of mobile services would increase in the next 12 months. Two critical challenges are urgent here:

First, service marketers can (and must) distinguish conceptually between the production and distribution of services. The problem of making services more efficiently and widely available must not be ignored in favour of other elements of the marketing mix that are easier to deal with. The problem of overdependence on one or two elements of the marketing mix is one that service marketers cannot afford. The sum total of the marketing mix elements represents the total impact of the firm's marketing strategy.

Fourthly, this discussion points out the critical role of product development in the distribution of services. It indicates that making services available is often a product development as well as a distribution problem. However, the findings contribute to the existing albeit scarce literature on consumer behaviour in mobile phone markets.

At present, the operator market in Cuba is one of the most aggressively competed markets, and the competition is driven by price discounts. Although price was found as an important variable affecting youth consumer choice, audibility was practically calling for equal attention.

We hope that, while technology in the 21st century is playing a key role in modernizing economies everywhere, Cuba's short-term gains no remain woefully insignificant.

Abstract

The issue concerning the collaboration between the academic environment and the business environment presents a larger interest at European level. The approach of the superior education institutions to representatives of labour market, becomes a solution for the superior education institutions, as they function in the society and knowledge economy – opened to a great number of students waiting to be offered the opportunity of a harmonious integration on the labour market after graduation – to accomplish goals related to students' professional training, to the accommodation and knowledge implementation in real economy, to the accomplishment of an economic-financial performance that could provide them their survival in the competitive economy. This work, starting from the interests of both parties regarding partnerships, identifies and materializes a series of management activity courses in this field, fact that allows the scientific approach of the collaboration university – labour market representatives.

Keywords: higher education, business environment, partnership.

J.E.L. Classification: I 23

1. Introduction

„Universities represent the source of energy of the generation based on knowledge..... They have to adapt to the

requirements of the global economy, based on knowledge, as well as in other areas of the society and economy” said Janez Potočnik – European official. Thus, in the context in which it is well known the fact that the dimension and the quality of human resources constitute the main motives for both acknowledgement and their dissemination, long-term success of the new society depends crushingly on the university education system. However, to play this role in the current economic-social context, the superior education institutions must adapt to various challenges, among which we enumerate the ones of interest regarding the current study:

➤ The necessity of educational services to adapt to the dynamics and fluctuations on the labour market determining variations, sometimes surprising, in the structure of competences searched by employers, in which concerns types of qualifications, in the nature of necessary knowledge;

➤ The capacity to answer to changing needs on the labour market through the training of people who return or come to the university to update and upgrade their knowledge or to learn new notions that allow them to keep their jobs or to find a new job;

➤ Acceptance as a fundamental objective belonging to the activity of superior education institutions the training of graduates easily employable and useful on the labour market.

➤ Superior education institutions are mainly responsible for offering viable research products and in accordance with the

competitiveness level reached by the labour market;

➤ Organizational and judicial restructure so that this permits universities to sign and deploy multiple partnership types with entities from outside the academic environment;

➤ Increase need of cooperation between universities but also among them and external representatives of the academic environment (employers, different types of NGO, representatives of the local, regional, national community, etc.)

Therefore, society and academic environment, as they exist at present time, need a better collaboration and a mutual flux of ideas to provide the context in which the individual companies to perform and nationally competitiveness could be talked about. [1]; [2]. Now it cannot be accepted that universities, withdrawn in an ivory tower and acting outside some forms of collaboration with the business environment, analyze from distance different social contexts towards which they have direct responsibilities. But, trying to make such a partnership work, is not easy, prove to be the various controversy and attempts, sometimes failed, that appear internationally. At the same time, there are also examples of good, successful practices along partnerships, from which, in this study, we will present a part, in order to formulate the most relevant propositions for the Romanian academic space.

2. Examples of good practices regarding operational partnerships between academic environment and business environment

Synthesizing the data offered by specialty literature, we present a series of examples of successful partnerships between academic environment and business environment.

Partnership: Siemens – University of Lincoln

Collaboration forms: Partnership in C&D area

Business environment advantages: The growth of the turnover by six times of the Siemens Company toward the one mentioned in the initial business plan.

University – Advantages: Involvement in organizing the internships, in the performance of consultancy projects, in employing graduates, of the Siemens Company; The requirements regarding the technological abilities necessary to a future employer at Siemens are integrated in the study programs in the engineering area; Establishment of a master in partnership.

Partnership: BAE Systems –University of Bristol

Collaboration forms: Partnership for educational and research activities

Business environment advantages: Carrying on fundamental research and application activities by all university researchers for the purpose of BAE Systems; Attraction of employees that know and are adapted to expectations of BAE Systems Company.

University – Advantages: Experience exchange between the staffs of the two organizations; Organization of internships; Employment of university graduates.

KPMG – ICAEW/ICAS - University of Birmingham, Exter și Durham

Collaboration forms: Partnership in the improvement of labour force abilities

Business environment advantages: Identification and drawing the top future specialists.

University – Advantages: Graduates obtain an university qualification diploma ICAEW/ICAS in the accountancy area and relevant work experience at KPMG

Study fees and accommodation are supported by KPMG and also graduates are hired with a 20,000 £annually.

Concerning Romania, discussions held with representatives of the academic environment and with representatives of the business environment, as well as data made public, allow us to appreciate that the partnership university – labor market is not relevantly represented. More, if from companies there is a certain opening, sound propositions, strategic fundaments from universities do not establish. Also, within Romanian superior education institutions, there are no departments with precise tasks in promoting and consolidation of partnerships, tasks in this direction being unclearly assigned, not being paid in addition or

strategically integrated. A cause that determines this situation is the unprofessional approach from the management perspective, of the issue related to the collaboration between academic environment – business environment, approach that would allow the identification of steps and substantive actions to intensify collaboration.

Within present work, part of a complex study regarding collaboration between university and labor market, we present an analysis matrix of interests of universities/ business environment as well correspondences between them, matrix that can be used to establish directions of action for successful partnerships.

3.Management approach of academic environment – business environment partnerships

To elaborate a behavioral pattern and a management strategy of partnership process, on the one hand, obstacles must be known and on the other hand, factors that provide the success of a partnership. Specialty literature identifies factors that can support academic environment – business environment partnerships progression.

- **Equality**
- **Trust between partners**
- **Mutual interests.**

We appreciate that the first step in initiating a successful partnership is *identification of common interest or of congruous interests* and, on this basis the result, according to the specificity and resources of the university. An analysis of interests of the two categories of organizations that expresses the object of this study would be appropriate.

Interests motivating superior education institutions in creating the partnership (UI)

UI1. Graduates on the verge of employment

Present society creates a labour force market constantly expanding and changing and universities are requested to deliver competent specialists. A study carried on in 2007 on 377 students from state and private universities from Constanta and Bucharest [3] reveals the next results referring to the

problem of integration on the labour market, after graduation: Students choose to pursue a faculty, according to their possible chances as future graduates, on the labour market; The majority of future graduates wish to work in the private environment, either owning their business (30%), or having a job in a private institution (29%). This attracts once again the attention on the importance that universities should pay, not only to professional training but also to students' mentality making so that these easily integrate according to conditions imposed by competitive economy; There isn't too much students' confidence regarding their chances to find a job according to their university training in the first year after faculty graduation;

UI2. Activity of relevant research

The research activity is the way to a good image on the market, to attract, on this basis, students, and, at the same time, the only way to attract financial resources from the private environment, that superior education institutions have.

UI3. Diversification of financing sources

In conditions of manifested competitiveness on the tertiary educational services market and, with reduction of budgetary financing of universities or even the lack of it, **the problem of identifying new funds sources for universities**, other than those coming from basic activity (study taxes, research activities etc.) is vital.

Interests that motivates the business environment in partnership founding

BI1. Human resources that participate in the increase of organization performance

It is widely accepted the fact that human resources well trained are essential in explaining companies performance, people being those having the capacity to strengthen to a certain extent the effect of using the other resources. There are numerous studies in the field that support the significance of human resources as a strategic element in modern management and the fact that, more and more, the competitiveness does not focus

any more on products but on human resources. These convictions are sustained by the founder president of Microsoft Company, Bill Gate's declaration in 1992: *“If 20 of the best people I work with leave me, in couple of months you will not hear any more about Microsoft”*.

BI2. Enhancing efficiency through innovative activities

Studies conducted until today confirms the fact that the innovation is an important source of competitive advantage, technological change and economic growth and the private environment feels directly this aspect, in the competitive fight. This is supported also by the fact that in Romania, although investment in the research activity is at a very low level (according to Eurostat statistics in 2010 -2.33% from the investment total sum at the European Union level), the greatest share, namely 38% is represented by the investment made in the business environment.

BI3. Diversification of financial resources

The management of each organization working in the market economy is interested in finding new fund sources and the collaboration with the academic environment may be a solution. Thus, establishing the involvement of the business environment in the collaboration with the academic environment can also be made through financial motivation of companies.

Viewing, both academic environment interests and also business environment interests, more types of correspondences can be represented at the level of these interests, which are the bases of the foundation of academic environment – business environment partnerships.

4. Compatibility between the Interests of the Academic Environment and the Interests of the Business Environment

University environment Interests (UI):

UI1. Graduates to be employed

➤ **Business environment Interests (BI1):** Human resources to participate in organization performance

Activities in partnership: Organization of jointly internships, of any type of activity that suppose combining theoretical and practical activities; Employers' involvement in graduates recruitment; Employers' involvement in counseling and professional orientation activities; Employers' involvement in the process of conceiving and carrying on study programs.

(BI2). Activity efficiency through innovative activities

Activities in partnership: Students involvement in research activities whose products are destined to companies' activity efficiency;

(BI3). Diversification of finance sources

Activities in partnership: Employers' involvement in all activities that suppose the raise of employment degree, including in counseling and application organs of the university and their payment.

UI2.Relevant research activity

➤ **Business environment Interests**

(BI1): Human resources to participate in organization performance

Activities in partnership: Involvement of human resources within the company in the research project addressed to companies, fact that contributes both to their awareness and to the intensification of the access to the newest knowledge in the field.

(BI2). Activity efficiency through innovative activities

Activities in partnership: Carrying on research and counseling activities for the benefit of partner companies by the representatives of the academic environment, aiming companies' activity efficiency.

(BI3). Diversification of finance sources

Activities in partnership: Involvement of business environment representatives, in collaboration with the academic environment in the progress of some research activities with results addressed to third parties or in activities of fundamental research and payment of this involvement.

UI3. Diversification of financing sources

➤ **Business environment Interests**

(BI1): Human resources to participate in organization performance

Activities in partnership: Organization of improvement/specialty classes for the human resources within partner companies and/or for existent human resources on the labour market; Organization of counseling and professional orientation activities addressed to human resources within partner companies and/or to existent human resources on the labour market.

BI2). Activity efficiency through innovative activities

Activities in partnership: Offer counseling services for the business environment; Elaboration of a portfolio of research products that the university can provide to the business environment against payment;

(BI3). Diversification of finance sources

Activities in partnership: Carrying on shared research, counseling and professional orientation activities, classes organization addressed to a third party willing to support them financially; Sponsoring activities from business environment for the university environment, for which the benefits of the business environment can be measured in monetary units (promotion, tax and fees exemptions). [4]

As it is emphasized, collaboration forms between academic environment and business environment are numerous, some of them could be defined as passive (those where the business environment “buys” products/services offered by the university), others going beyond a commercial relationship, based on a mutual collaboration and involvement of each of the partners for the optimal satisfaction of everyone’s interest. This last type of collaboration represents, in fact, the real business environment – academic environment partnership, the one that is interesting for ensuring a sustainable social-economic development. Starting from the collaboration forms mentioned above, we

appreciate that these can be grouped in the following categories:

Forms of academic environment – business environment collaboration:

1. Collaboration for integrating the students/the graduates into real work activities;

2. Collaboration for mutual development of study programs;

3. Collaboration for developing counseling and professional orientation activities

4. Collaboration for developing research programs;

5. Involvement of business environment representatives into managerial, consultative bodies at the level of higher education institutions;

7. Collaboration for offering improvement/specialization classes for the employees;

8. Collaboration between university and professional associations.

Conclusions

The labour market in Romania is characterized by the lack of human resources competitiveness, by the existence of graduation diplomas of higher education which, beyond the formal certification do not offer the confidence that their possessors own a set of knowledge and specific skills, by the students’ lack of confidence that the study system is capable of preparing them for what is asked on the labour market, by the lack of some systems of promoting the human and professional values.

In order to overcome these inconveniences, the universities have to “reinvent” themselves, to define their role in the new society and, at institutional level, to conceive and to function within some organizational models that allows them to rise on the tertiary education services market, to clearly formulate their mission and their strategic objectives and to act accordingly in order to achieve them.

It is obvious that a perfect model of university for the society of knowledge does not exist, but the necessity of flexible organizational approaches that encourages the interdisciplinary, the partnerships, the

collaborations and rationality specific to market economy, for the universities' functioning is outlined. It is highlighted, in this context, an obvious challenge to which the universities have to answer, namely *the improvement of university management system* for the purpose of improving teaching and research performance.

In the present paper, this problem was approached from the perspective of assuring the favorable framework that sustains the collaboration and the academic environment – business environment partnership for a suitability of educational services to students' current requirements and to work market expectations.

As resulted from specialty literature study, but also from the implementation of project activities, the business environment requires a series of difficulties in assuring a convenient functioning of the collaboration with the university, and at their turn the representatives of academic environment encounter a series of problems in trying to initiate collaborations with the business environment.

In front of these records, we considered useful to identify the motivator factors, both for the business environment, and for the academic environment, fact that could determine the action for the purpose of overcoming the described difficulties. In other words, we raised the issue of interests that each of the concerned parts would have in order to get involved in a partnership relationship. As a result, at the level of academic environment the following have been identified: the growth of graduates' employability level; relevant research activity development; financing sources diversification. In what concerns the business environment, the identified interests are: human resources hiring that participate to the growth of the organisation's performance; activity's efficiency through innovative activities; financing sources diversification.

Abstract

In the context of a changing business environment, an organization must adopte appropriate and timely decisions based on the information available in order to obtain or enhance competitive advantage. The necessity of optimal decision making by overcoming limitations of data collection, analysis and interpretation of information led to widespread proliferation of decision support systems (DSS) in the practice of organization management. This paper aims to highlight the need and role of support systems used for the “intelligent” decisions making (decision support systems, expert systems or fuzzy rule-based systems) as a solution to an efficient decision-making process.

Key words: decision support system, expert system, fuzzy rule-based systems, intelligent decision making

J.E.L. classification: C60, D70, D80, M15

1. Introduction

The necessity of optimal decision-making by overcoming limitations of data collection, analysis and interpretation of information led to widespread proliferation of decision support systems (DSS) in the practice of organization management.

Widespread introduction of computing systems in the industrial, commercial, banking or other type units, the development of information and communication technologies, the increasing complexity of technical processes and economic uncertainty that dominates these processes, required new approaches in decision making. Management information systems and traditional methods

of scientific management, whether in decision theory, operations research, statistics, simulation, cybernetics, systems theory are ineffective in decision making especially in those systems characterized by unstructured or semi-structured problems. The limitations imposed by the disadvantages of using classical methods and by the fact that, at the level of the organizational environment, decision-making should have increased flexibility, have led to the necessity of the use of information technologies in order to eliminate errors due to human factor and to automate decision-making for programmable decisions or to assist decision makers for the both. The development of such software applications involves the collection and processing in real time of a large volume of data and information, the use of economic-mathematical models for complex analysis and interpretation, as well as establishing correlations between the variables analysed in decisional situation in order to sustain decision-maker for pertinent analysis.

This paper aims to highlight the need and role of support systems used for the “intelligent” decision making (decision support systems, expert systems or fuzzy rule-based systems) as a solution to an efficient decision-making process.

2. Theoretical framework

Although in the literature there are many approaches to the decision support system (DSS) concept, most of them reveal the main role of using DSS: increasing understanding degree and preparation of the decision by the involvement of decision- maker factors in all phases of the decision problems, from formulation to solve and interpretation of them.

According [1] DSS is „a model based on a set of procedures for processing data and for assisting the manager in decision making process. A DSS should be simple, robust, easy to maintain and monitor, adaptable to certain situations, complete, with a friendly interface”.

DSS is defined as “an extensible system capable of supporting immediate analysis and decision modeling, oriented towards future planning and used at unplanned and irregular intervals”[2] or as a system that has the following properties: active interaction with the user, acts on a present and future time horizon, ensures greater efficiency in decision making, provide flexibility in defining objectives, addresses decision factors from different hierarchical levels of the system [3]. DSS is “a system of three interacting components: User Interface (Dialog Management), data management , management component models [4]. DSS is “an interactive system that helps the decision maker to use data and models to solve unstructured problems” [5] and presents five specific characteristics [6]: contains a knowledge base that describes the environmental aspects of the decision maker (eg how to do various activities of decision-making), has the ability to acquire and manage descriptive knowledge and other type of knowledge (procedures, rules), to produce immediate knowledge as periodic reports, to select a subset of knowledge to be viewed or to derive to other knowledge needed to the decision making process and also can interact directly with decision makers enabling the flexibility to choose solutions.

Other authors [7] define DSS as “a cybernetic system, adaptive and interactive able to assist decision makers from different levels of the system in solving complex problems, improve the quality of decision making process by modeling data to respond in time to the requirements addressed by decision makers. DSS uses the latest techniques of data management, diversified models of their processing, relying on modern computing and communication tools”.

In some cases, management issues are too complex for a rigorous mathematical modeling or would be too costly solving them using only the optimization and

simulation techniques. To overcome these difficulties there are used alternative solutions based on artificial intelligence which are reflected in the elaboration and use of knowledge-based systems that imitate the reasoning process of the human intellect.

Expert system is “an intelligent computer program that uses knowledge and inference procedures to solve problems sufficiently difficult as to require human expertise to be solved”[8].

“Although expert systems have proved success in solving problems that can not be resolved with conventional numerical methods, their role remains limited to support functions and the believe that verification by human factor of the solutions generated by artificial intelligence would become unnecessary is a very dangerous mistake”[9]. Despite the differences between these concepts, explained in terms of different visions, the border between the two concepts still remains vague.

3. Categories of support systems for intelligent decision making

3.1. Structure and functionality of decision support systems (DSS)

Based on specialized literature approaches, it can be considered that an DSS is composed of the following subsystems:

1. Data Subsystem includes databases containing information specific to the situation and are managed by database management system .
2. Models Subsystem is a software package that includes financial, statistical and other quantitative models. A key feature of this system is that it contains language that allows the construction of new models being called MBMS (Model Base Management System).
3. Knowledge base subsystem can support any of the other subsystems or can operate independently.
4. User Interface Subsystem in which the user communicates with DSS.
5. Communication Subsystem with other computer systems including Internet, Intranet.

User is considered as a part of the system and DSS enables a strong interaction between it and the computer. Data Subsystem of a DSS includes the database management system

and the query system. DSS database is a collection of interrelated data organized to perform the organization's requirements to access and multiple uses and timely.

Data Subsystem includes external data about market surveys, government regulations, tax systems, data on the national economy. These data may come from the government, trade associations, market research firms, but also from the economic system's own efforts to collect data. Internal and external data can be stored in the DSS database or can be introduced when they are needed. External data are often obtained through the Internet. Confidential data may include directives used by the decision making factors. External data are organized in standard, relational, objectual, multidimensional database, depending on the complexity of its applications. Databases can be general or specific application oriented.

Database management system creates and maintains database and allows access to data, linking tables and generates reports. The database integration with the models is the essence of DSS.

Models subsystem consists of: the models database, database model management system, modeling language, director of models, tools for execution, integration and processing of order models.

The models database contains statistical, financial, management and forecasting tools as well as various quantitative models used for analysis. Models from the database can be divided into four categories:

a) strategic models are used to support top management decisions. It can be used to develop objectives that must be achieved by the organization, planning major acquisitions, the choice of the location of the enterprise, environmental impact analysis, development of special budgets.
b) tactical models are mainly used for intermediate levels of management to streamline the organization's resources (recruitment patterns, sales promotion, current development budgets) and extend over a time horizon of 1-2 years.
c) operational models are used to support the daily activities of the organization

(production scheduling, inventory, quality control, maintenance of equipment) and stretch a very short time period (days, months) and mainly use internal data.
d) analytical models are used to analyze data (statistical models, scientific models, management models). Because DSS work with semi-structured and unstructured problems is often necessary to adapt the models. This can be achieved by high level programming languages or by specific modeling languages. Database management system model generates subroutines functions and reports, creates new models, up-gradation and modification of existing models, data handling models, allow interaction between the models through a database. Director of models is a catalog of models characteristics and other programs included in the models database. It contains the definition of the models and its main function is to provide answers to questions about capacity models. Knowledge base subsystem is used in solving of unstructured and semi-structured problems requiring expert systems or other intelligent systems. Advanced DSS contain a component of the knowledge database that provides the information needed to solve certain aspects of the problem and can improve the operation of other components. Knowledge database is composed of one or more intelligent systems. A DSS which also includes a knowledge base is called intelligent DSS, expert system or knowledge-based DSS.

3.2. The role of expert systems to support decisions based on artificial intelligence

Knowledge-based systems offer solutions to complex decision problems, creates advanced organizational learning situations for decision makers, contribute to increasing professionalization of management.

Within these categories of knowledge-based systems, a central place is occupied by expert systems (fig. 1).

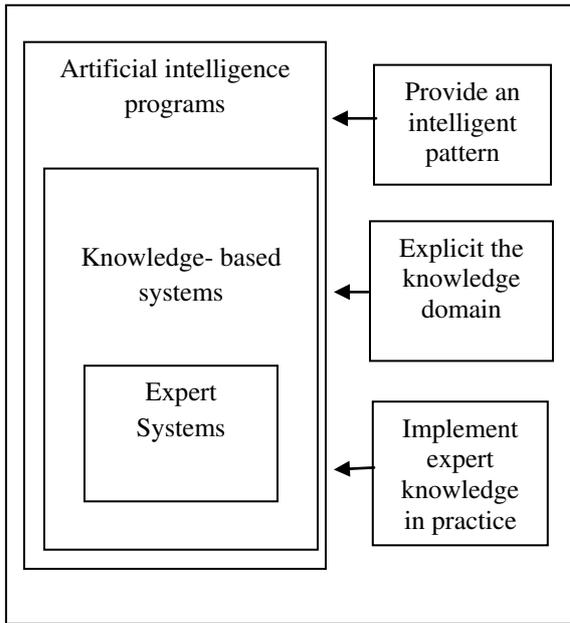

Fig. 1 The place and role of expert systems within knowledge based systems
 Source: [10]

Expert systems (Fig. 2) allow decision makers guidance in choosing the appropriate model of the system situation which is imprecisely defined, offer solutions and build new models based on existing ones adapted to the situation described.

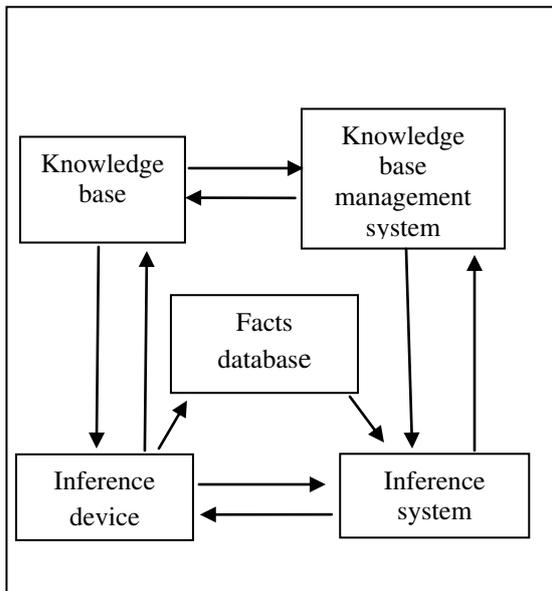

Fig. 2 Structure of an expert system
 Source: [7]

Knowledge base of expert system contains rules and data that use information as a basis for decision-making process.

Inference device includes an interpreter to decide how to apply the rules and a plan setting out the order in which these rules are applied. How the system uses knowledge is particularly important because the expert system must have a lot of knowledge about the the respective domain. To solve an intelligent program it is necessary to provide it specific high-quality information in conjunction with the field. The use of artificial expertise increases the possibilities offered by human reasoning through its permanent character. Human expertise can quickly depreciate, whether it is a physical or mental activity. Human expert must constantly practice and refine continuously to maintain top positions in any field and any significant period of non-use of knowledge can seriously affect expert's knowledge. In case of artificial expertise, once the information is acquired is always available to the user, excluding accidental damage of information. As a result of the influence of factors such as emotional one, a human expert can adopt different decisions in identical situations, while an expert system is objective. Expert systems compared to human experts are expensive, especially during the use stage. Their relatively high cost of the development stage is offset by reduced operating phase cost.

Another advantage of artificial expertise is related to the ease of transferring or reproducing it. If transfer of knowledge from one person to another is laborious, requiring extra time and long experience, artificial expertise transfer is a simple process of copying. Documentation for artificial expertise is much easier, allows to obtain consistent and reliable results, while in the case of human expertise it is extremely difficult, time consuming and it should be verified.

It is estimated that expert systems approach is suitable for solving those problems that meet one or more attributes: cover a limited area of activity, are poorly structured, are too complex to be addressed by other method and information it describes may be incomplete, imprecise or uncertain. Expert systems are found among several categories of software: applied expert systems or knowledge-based systems that contain specific knowledge of the application

domain, framework expert systems which are prefabricated systems, suitable for one or more types of problems, basic systems such as specialized programming languages or object-oriented programming languages. Similarities between expert systems and decision support systems:

1. DSS classification (specific systems, generators and basic systems) is similar to the expert systems classification (applied systems, framework system and basic systems);
2. both types of systems can be used to solve many types of problems such as prediction, simulation, planning and control;
3. some specialists believe that expert systems are tools for incorporation into decision support systems;
4. promoters of artificial intelligence consider that decision support systems are a syntagma that designates expert systems applications.

Differences between expert systems and decision support systems:

1. expert systems are focused strictly on a specific problem while DSS applications have a variable, unpredictable and vaguely defined domain of application;
2. in terms of processing technologies, expert systems use symbolic computation while DSS use numerical models and databases;
3. in case of expert systems, user attitudes towards the system is limited to acceptance or rejection of general solutions, while for DSS the user attitude is free and creative.

3.3. Fuzzy rule-based systems'role for intelligent decision aking

Because in most cases, decision makers facing of decision-making problems under fuzziness conditions based on incomplete information, researches in the field have revealed the necessity of integration DSS with algorithms derived from fuzzy sets theory proposed by [11, 12].

According to Bloom's revised taxonomy [13], knowledge can have four dimensions: factual, conceptual, procedural, and metacognitive. Factual knowledge are isolated fragments of information, such as the words' definitions and knowledge about specific details. Conceptual knowledge appear in the form of information systems, such as classifications and categories.

Procedural knowledge includes algorithms, heuristic or discovery learning techniques and methods, and knowledge about the situations in which these methods and processes are used. Metacognitive knowledge is knowledge about the thought processes and information related to thinking and how these processes can be used effectively. Based on cognitive dimensions mentioned above fuzzy systems supposes factual knowledge stored as data in computer memory in the form of databases, and also procedural knowledge stored in the form of rules (called procedural language programs)[14].

Fuzzy rules-based systems require a modeling decision making through the use of descriptive language based on fuzzy logic and attributes [15]. These systems allow automatic generation of fuzzy models that incorporate the knowledge of human experts and integrates the symbolic and numerical processing in a common scheme. A substantial part of these systems is the genetic fuzzy systems in which genetic algorithms are used to study components of fuzzy systems based on rules. Genetic fuzzy systems represents fuzzy systems improved with learning processes based on a genetic algorithm. Genetic fuzzy systems was widely extended due to their inherent flexibility and capabilities of the different criteria to reunite the optimization and realization of “the trade-offs between interpretability (human understanding) and accuracy”. Another special category of fuzzy rules-based systems widely explored in the literature is the fuzzy rules-based systems Mamdani for control, modeling and classification. This type of system have two major components: (1) fuzzy system inference, through which the inputs in the system are subjected to a process of fuzzy reasoning in order to obtain the outputs system and (2) fuzzy knowledge base, which includes the set of knowledge about the problem needed to be solved.

Because the fuzzy inference process rules use rules in the form of IF-THEN, fuzzy rules-based system is capable to perform the qualitative aspects of human knowledge modeling and reasoning without a precise quantitative analysis. However, the system requires a rigorous design and model execution and also a proper selection of parameters.

The main advantages of the use of fuzzy rules are reflected in the elimination of unnecessary rules and in the selection of effective input elements that can contribute to performance improving, to reduce the cost of computing and to obtain a precise analysis rules. A major disadvantage of fuzzy systems is the difficulty of building a rules database, which is generally times consuming. Once carried out the rules database, it requires continuous adaptation by adding new rules consistent.

4. Conclusions

Intelligent decisions requires a superior scientific decision making process based on information technologies support in order to eliminate errors of human factor and to automate decision-making for programmable decisions or to assist decision makers for the both.

In order to achieve this aim, DSS have an important role. In the current business environment, characterized by global competition, the decision makers must have access to a complex set of decision support tools in order to adopt quick decisions with a high degree of accuracy.

In such context we conclude that the decisions support systems used for intelligent decision making is necessary on the basis of several considerations.

Firstly, these support systems contribute to mitigating the limits and restrictions (cognitive, communication, time) effects of facing human decision makers during their activities in order to deal with those issues which are characterized by their importance and complexity.

Secondly, the implementation of these systems aims to provide feasible information in real time needed to support managerial decisions making process in order to shape an organization more profitable, more agile and more flexible, able to faster respond to external challenges.

Abstract

Our paper focus to approach an analytical analysis between the quality assurance process and the organizational quality culture. The main but was to demonstrate that, the both process are providing together to Romanian universities performance.

Keywords: quality assurance, quality culture, higher education services, university performance.

Classification J.E.L.: I29; R38; M14.

1. Introduction

Quality evolution in higher education has added different hues to the definitions of the concept and status of quality [1].

Quality - Definition

Exceptional - A traditional concept linked to the idea of "excellence", usually, operationalised as exceptionally high standards of academic achievement. Quality is achieved if the standards are surpassed.

Perfection or consistency - Focuses on process and sets specifications that it aims to meet. Quality in this sense is summed up by the interrelated ideas of zero defects and getting things right first time.

"Fitness for purpose" - Judges quality by the extent to which a product or service meets its stated purpose. The purpose may be customer-defined to meet requirements or (in education) institution-defined to reflect institutional mission (or course objectives).

"Fitness of purpose" - Fitness of purpose evaluates whether the quality-related intentions of an organization are adequate. It provides a check on fitness for purpose. As such, it is not a definition of quality *per se*.

Value for money - Return on investment or expenditure is used to assess quality. At the heart of the value-for-money approach in education is the notion of accountability. Public services, including education, are expected to be accountable to the funders. Increasingly, students are also considering their own investment in higher education in value-for-money terms.

Transformation - Sees quality as a process of change, which in higher education adds value to students through their learning experience. Education is not a service for a customer but an ongoing process of transformation of the participant. This leads to two notions of transformative quality in education: enhancing and empowering the student or researcher.

Standards - Definition

Academic standards - The demonstrated ability to meet a specified level of academic attainment. For pedagogy, the ability of students to be able to do those things designated as appropriate at a given level of education. Usually, the measured competence of an individual in attaining specified (or implied) course aims and objectives, operationalised via performance on assessed pieces of work. For research, the ability to undertake effective scholarship or produce new knowledge, which is assessed via peer recognition.

Competence Standards - Demonstration that

a specified level of ability on a range of competencies has been achieved.

Competencies may include general transferable skills required by employers; academic ('higher level') skills implicit or explicit in the attainment of degree status or in a post-graduation academic apprenticeship; particular abilities congruent with induction into a profession.

Service standards - These are measures devised to assess identified elements of the service provided against specified benchmarks. Elements assessed include activities of service providers and facilities within which the service takes place. Benchmarks specified in 'contracts' such as student charters tend to be quantified and restricted to measurable items. Post hoc measurements of customer opinions (satisfaction) are used as indicators of service provision. Thus, service standards in higher education parallel consumer standards.

Organisational standards - Attainment of formal recognition of systems to ensure effective management of organizational processes and clear dissemination of organizational practices.

2. Quality assurance in higher education academic services – a continual evaluation process

Harvey highlights several definitions for the quality concept, according to which it is synonymous of [2]:

- exceptional, when it circumscribes exclusiveness, excellence and attaining norms;
- perfection or coherence, when it is defined through the absence of any flaw and the capacity to succeed from the first try;
- aptitude for function, when it evaluates the capacity to accomplish a mission or a predetermined mission or if this mission or this function is adequate (in the second case, one talks about the aptitude of *functioning*);
- profitability, when it evaluates the effectiveness of the expenses engaged are (similar to measuring efficiency);

➤ transformation, when it evaluates the added value of the educational experience in point of students' improvement and increased autonomy.

Martin & Stella emphasize two main orientations in quality assurance:

- respect for norms, when certain higher education aspects can be defined and measured and the same norms can be applied to all the courses and all the institutions. These norms can be minimal (leading, for instance, to the closure of certain institutions or programs unable to attain their level) or related to excellence (setting an ideal that institutions or programs need to tend to);
- adaptation to the goal pursued, because the institutions' missions and objectives are different and evaluation does not rely on common and quantifiable criteria, but depends on the analysis of the specific context. Quality is attaining the goals pursued (it becomes self obvious that the acceptability of these goals has been firstly demonstrated) [3].

In the study realized for the Organization to Economic Cooperation and Development (OECD), Tremblay and Kis, without proposing a strict definition of quality assurance, prefer to highlight the complexity of this process [4].

Tremblay and Kis state that quality assurance is a “process assuring the participants' trust in the service creation and delivery process (inputs, process and results), corresponding to expectations and to minimal demands threshold” from the consumer's / client's perspective. At the same time, the quoted authors admit that quality assurance can be defined as a “systemic, structured and continual attention to quality in terms of maintaining and improving quality”.

Fave-Bonnet (table1), based on certain official texts concerning the Bologna process and the European Higher Education Area (EHEA), observed that “quality assurance” can be translated by: quality assessment; quality assurance or guarantee; quality management [5].

Table 1: Three directions associated with quality assurance

Term	Central question	Objective	Action
Quality assessment	How to measure quality?	Measure the quality	Implement an evaluation
Quality Assurance	How to ensure quality?	Show that the quality is there	Check the quality
Quality management	How to get quality?	Manage Quality	Implement procedures and a culture of quality

Source: adapted Fave - Bonnet 2007

The ambiguity that can surround the concept of quality assurance is that each of these three meanings refers to a process of quality improvement. Fave-Bonnet notes that, because it gives rise to several interpretations, this concept allows for a “soft consensus” particularly useful in the context of construction of the EHEA.

In a global approach, the perspective of quality assurance in the academic educational services orients the goals of this process to:

- “proving that public funds are efficiently spent”, “defending social interest”;
- “promoting future performance rather than judging past realizations”, „means of improving efficiency in the provision of academic education” [4].

In a debate on the compatibility of the two main goals, some authors state that they are incompatible, “as the essential openness to improvement will be missing if the goal is responsibility (bearing the consequences)”, while others state that they are inseparable “as responsibility can always be reformulated to be centred on improvement” (6). For Tremblay and Kis, it is essential for the quality assurance systems to tend to find a balance between different interests related to improvement and imputability. “From the perspective of responsibility (imputability), it is important for the quality assurance systems to provide information to the different participants, yet quality assurance must also be / become a mechanism able to improve quality rather than oblige to respect bureaucratic demands” [4].

3. Quality assurance practices in Higher Education Services

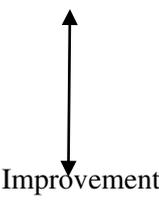

The practices associated to quality assurance are varied, although in the specialized literature the accent falls on the external assessment practices for the quality management systems in academic institutions: accreditation, certification and homologation.

One of the authors uses the term “accreditation” [3;4], others, the term of “certification” [2] to designate the process leading to a judgement, to a certification or an official recognition concerning the compliance of a program or a institution with the specific and predefined quality norms, be they minimal or excellence norms. When accreditation or consent relate to an authorization to exercise a function, then one talks about homologation [3].

An assessment refers to the very process of “external assessment [...] of the quality of higher education institutions and programs” [7]. Harvey mentions that assessment can refer to inputs (such as allotted resources), processes (i.e. way of functioning) or results (for instance, design and granting of diplomas and academics’ number of publications) [2].

Generally, these three mechanisms differ through the objects they evaluate and the nature of their consequences (*Table 2*).

Table 2: Typology of quality assurance mechanisms

Finality	Mechanism	Question	Accent	Results
Accountability  Improvement	Accreditation	Is it good enough to be approved?	Adaptation (mission, resources, processes)	Favorable or unfavorable decision
	Evaluation	How far the results are good?	Results	Level (including favorable decision or unfavorable)
	Audit	Objectives are met? Process is effective?	Process	Qualitative description

Source: adapted by Tremblay and Kis, 2008, p. 266.

4. Quality culture

The concept of quality culture completes the structural dimension of quality assurance (quality assurance guidebooks, definitions of the process, instruments) with the dimension of an organization’s values, regarding the members’ engagement, the values it relies on, skills and attitudes [8]. An important step in the evolution of the key principles of this concept was taken in the context of the European University Association (EUA) to assist the universities in their effort to develop and implement an internal quality culture and to encourage the dissemination of the current best practices in the quality assurance domain. From this perspective, EUA has identified a set of principles, promoting a quality culture:

- building an academic community and identifying the personnel with the institution;
- developing the students’ participation to the academic community;
- internalizing the quality culture through internal communication, discussions and responsibility developed by understanding the resistance to change and the development of strategies needed to go over it;
- agreeing on a general framework for quality processes and analysis standards;
- defining the main institutional data – historical, comparative, national and international – gathering and analyzing them systematically;
- including the adequate internal and external parties concerned;
- highlighting the self-assessment stage as a collective exercise for the entity under analysis, to assure the implementation of the

adequate stage (it includes academic personnel, administrative personnel and students);

- assuring a subsequent check up for the internal analyses: for example, implementing the adequate recommendations and the feedback circuits in the strategic management [9].

The concept of higher education quality culture largely takes the form of a normative ideal. Starting with the EUA recommendations (2006, 2005), taking over the concept of orientation towards practice, the idea that became prevalent was that there are “good” quality cultures, for which it is worth fighting and “bad” quality cultures, which should be avoided.

“An organizational culture supporting the development of an approach for an efficient and effective quality management allows the educational institution to meet its objectives and to consolidate the quality of the education and of the services provided” [10]. From this perspective, quality culture refers to development and respect of the internal quality assurance processes [11]. However, such a functionalist understanding has a few main flaws, first of all the question what can be considered a “good” culture, a question to which it is just as difficult to answer as it is to answer to the questions on the nature of quality as such.

Quality culture can be understood as a social phenomenon, with a historical development, differentiated, most probably, into several subcultures [12]. The concept of quality culture does not provide a common goal for all the institutions, but a common departure point. If we perceive quality

culture rather as a matter of context than as a set of procedures, then the concept can be used as an analytical instrument – as a way of analyzing the current strategies, practices and principles, thus creating the basis for a future consolidation [13]. In this sense, a quality culture analysis could very well start with “[...] the question about the way in which a higher education organization meets the challenge of consolidating quality in a certain domain, for instance the domain of teaching and learning or the research domain” [8].

The first two stages of the project “Examining Quality Culture in Higher Education” (EQC) have demonstrated that, although most higher education institutions have a strategic document, either on an institutional or on a faculty level, not all the strategies have the same success: the most efficient strategies are those assuring clear objectives and responsibilities [14].

Legitimacy can be found by joining strategy and institutional identity and it is important to accept that each institution does not have to establish the same quality-related objectives, although in many national contexts there is a tendency to align external and internal quality assurance processes. However, the issue of priorities remains unsolved and it is even necessary to realize partial synergies between different types of reasoning, for instance using the external feedback as a lever for the internal reforms. Adhering to the external standards (for example, in the context of accreditations or of the national frameworks) requires different strategies and means compared to the approach of the internal challenges and the principle of functional differentiation (for instance keeping different entities for different goals) can provide solutions on an operational level, yet it will not solve the potential strategic conflicts.

All the three stages of the EQC project have proved the importance of the temporal dimension. In the context of institutional quality assurance, “unplanned” change is usually described as a problem. Paradoxically, the processes targeting a continual improvement have a particular tendency rather towards stability than to dynamism, which usually results in the kind of bureaucracy that has affected the quality assurance perception.

Most of the studies carried out in this sense support the idea that efficient strategies must not just be aware of the complexity of the institutional and environmental changes; they also need to embrace them, considering that efficient strategies need to be *significant* helping one understand what is going on, through the integration of the meanings and values already constituting a specific and client-oriented culture and a marketing environment for the institution.

The consolidation of a strategic dimension of the institutional quality culture is supported by values such as:

- institutional identity and values are defined in strategic documents, or in the strategic document, delineating to a certain extent an institutional ideal;
- Strategic goals admit the difference between the improvement of the internal structures, processes and results and the indicators’ improvement;
- Institutional strategies in the quality domain, implementing change on an organizational level, to meet the external quality assurance demands.

5. Conclusions

“A quality culture development requires time, effort and is closely related to values, beliefs and a cultural determinant that cannot be changed rapidly”[15]. This cultural element has a strong political dimension, quality assurance referring to power and ideology, reason for which it is important to focus not just on strategies of educational services quality and adequate quality assurance instruments [14].

After a number of years of functioning of the homologation and accreditation system, it is legitimate to ask whether the results obtained by the higher education institutions mark a relative process in point of institutional quality, namely a more complete satisfaction for its beneficiaries-clients (students, parents, society) and for the institution’s personnel, a more pertinent integration in the collective life and operational results at levels comparable to the international references. For this reason, it would be necessary for universities to accept that the educational process, once designed and set into operation after homologation or accreditation, must be permanently submitted to continual self-evaluation and improvement.

The 2010 version of the European excellence model EFQM, highlights in particular the need for the organization to assume its responsibility for a sustainable future, which involves the integration in the organizational culture of a set of ethical principles, clear values and the highest organizational behaviour standards concerning the quality management system.

The new version of the EFQM model keeps the basic structure, changing the weight corresponding to each criterion, according to the RADAR (Results, Approach, Deployment, Assessment, Refinement) method. This method represents an extended approach of the Deming cycle: PEVA (Plan - Do - Check - Act -PDCA) [16].

The implementation and certification of a quality management system in agreement with the standard ISO 9001 determines a positive impact on the social performance of the academic organizations, and implicitly on their capacity to meet the requests of the EFQM excellence model. Consequently, we can confirm the hypothesis that the quality management system assurance and certification in higher education institutions orient the organization's actions in the sense of shaping a quality culture, and both processes support the performance of the excellence-oriented universities.

Abstract

Currently, human problems occupy leading positions in business analysis, although personnel function has been almost absent from the economic literature. Quality workforce is essential to the success of any organization, in peak areas and in areas less technologically advanced. Not only are organizations interested in human resources but also society as a whole. Effectiveness of human resources affect national wealth, the success of a country in international competition, special programs are supported by communities. Essential motivation for choosing this theme stems from my conviction of the need to recognize the leading role of human resource in the processes of social change and economic performance in the context of obtaining new type of development. My main goal is to remove a little of the mystery of economic and social life in which we live.

Key words: human resource, motivation, performance, promotion

J.E.L. classification: J21, J24, J81

1. Introduction

The "Human Resources" field has received much attention in recent years. At the macro level, endogenous growth theory suggests that human capital accumulation is the main driver of macroeconomic growth. At the micro level, "resource-based theory" nominates human capital as a major source to support the firm's competitive advantage. The growing importance of human capital, is largely determined by the development of

information and communication technologies, especially the shift to "knowledge economy"[2].

Human resource is the only resource that may be able to increase their value over time, unlike all the other resources that are worn if not physically, then moral[10]. Human resource is often called the "most valuable asset", although does not appear in the accounts. But the success of an organization depends on how its members implement its objectives, this is why the capacity and quality of human resources are crucial for the performance of the organization[1].

2. General presentation of Apulum

Apulum company was founded in 1970 in the city of Alba Iulia and is the largest producer of porcelain in Romania, with a diversified production: household china, hotel restaurant catering, decorative objects, figurines.

Hallmark "Apulum" is solid guarantee of quality porcelain, backed by over 35 years of existence, a brand whose credibility is resulting from the company's key strengths: quality materials, modern technology, equipment, personnel structure, value for money as perfectly adapted to customer requirements, modern management, dynamic, responsive to changes in internal and external business environment[11].

The factory was organized into two sections: porcelain and vitrus. Vitrus products lead to loss and therefore the management decided to drop the production of vitrus and all work was transferred to the department of porcelain. By grouping all activities in one production hall, the maintenance costs and the costs of utilities

department were reduced, without affecting the quality of production or working conditions of employees. Currently (2012), the factory produces 7200-7500 tons porcelain / year.

Regarding the evolution of the number of employees, the study shows that their number decreased from 2010 until 2012 with 402 employees (38.32%) reaching 647. Staff has been reduced by restricting activities and due to retrofitting with high productivity and good quality machines. Regarding personnel structure by gender, in 2010, the total number of employees (647) consists of 233 men and 414 women.

Related to economic and financial analysis, in 2010 the solvency ratio value is 2.01 – an optimal level that provides warranty coverage current liabilities from current assets. For the next few years, although there is a decrease in current liquidity indicator due to the increase of current liabilities, the indicator remains at a satisfactory level.

The level of immediate liquidity indicator is included, in the analyzed period, between 0.60 and 0.63 - a satisfactory level - which means that the company can cover its current liabilities from disposable available.

Net profit margin knows modest values between 6,73% and 11,17%. An improvement in net profitability margin is expected from higher turnover associated with internal and external controls.

3. Specific human resource management practices within Apulum Company

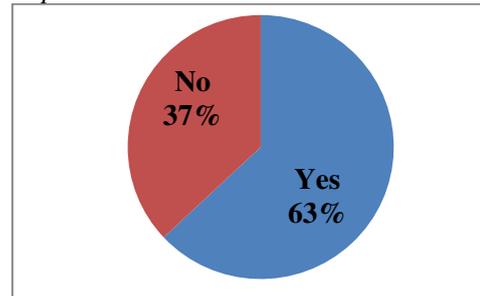

Best way of research is the investigation based on the questionnaire, which appears to be one of the most commonly used techniques in social and human sciences. Survey conducted within Apulum company tries to emphasize these aspects, being complemented by a number of 100 persons, of which 41 are men and 59 are women. Following data interpretation, were able to see different opinions and views of the participants, on how are conducted activities within the company where they work. Purpose of the activities is examined to ensure safety of employees, focusing on how it recruits and selects staff, ensuring its training, evaluation and reward each employee so that there is always motivation

to work with maximum efficiency[3].

When asked "In your company there is a human resources department?" all the 100 employees who participated at the study answered "Yes", representing a good thing for business.

When asked "In your company, job descriptions are basic for conducting business?" , of the 100 employees who were subject to research, only 37% responded negatively, while 63% of them said yes.

Graph 1. - Results regarding job descriptions

Source : own processing

The question "Do you consider that, at present, in Romania, the major share in the decision to employ a candidate has" emphasizes the importance of experience and studies in human modeling and helps build experience.

Analyzing the responses of 100 employees surveyed by gender, we get the following results, which are presented in the table below:

Table 1 – The responses regarding decision criterion of employment by gender

Response options		No. Of replies	%
Studies	Men	11	26,83%
	Women	24	40,68%
Experience	Men	30	73,17%
	Women	35	59,32%

Source: own processing

Employment decision is based, on a complex process, especially since the climb on hierarchical levels in a company, should therefore sought and selected those who possess appropriate knowledge, skills and personal characteristics corresponding to business requirements. According to this table, it appears that women attach greater importance to the education and experience than men.

When asked "Give a mark from 1-5 (1 - most important, 5 - least important) for each of the following criteria according to which you think recruitment and selection is based on" we made a table where are presented, along with scores obtained , each of these criteria in the form of means and variances.

The table below sets out the criteria for recruitment and selection of employees, in descending order by importance:

Table 2. - The results concerning the selection criteria

Selection criteria	Average	Variance
Experience in the field	2,23	1,68
Studies	2,27	1,60
Professional knowledge	2,29	1,71
Qualities, skills	2,45	1,31
Recommendations	3,12	2,13
Age	3,16	2,05
Relationship or acquaintances	3,43	2,33
Appearance	3,73	1,60
Sex	4,4	1,12
Nationality	4,74	0,43
Zodiac	4,94	0,08

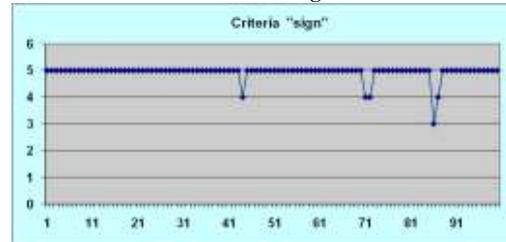

Source: own processing

It can be seen that the respondents opted for education, experience, professional knowledge and skills, qualities, individual skills as the most important criteria, averaging about 2. It is natural that skills, knowledge, or habits to be crucial elements in terms of recruitment, because in fact, these elements contribute to decisively fulfill effectiveness objectives at all levels of the company. Employees considered as unimportant criteria nationality, gender and zodiac, their average being about 5.

Regarding dispersion, if it has a low value, that mean employees are focused on the same answer, however, if the dispersion has a high value, each employee has a different value criterion[4].

The chart below illustrates that almost all employees have opted for the same answer (sign), in this case the majority view that this criterion is least important.

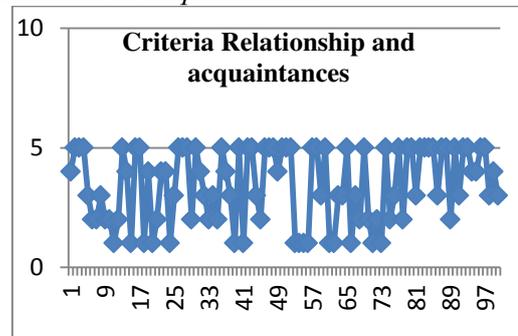

Graph 2. - Responses concerning criterion "sign"

Source: own processing

To emphasize the difference between a dispersion with a low value and one with high value I made the chart below:

Graph 2. - Answers concerning criterion "relations or acquaintances"

Source: own processing

To highlight the differences between men and women in the table below are the selection criteria, along with the average and variance for each criterion:

Table 3. - Answers regarding selection criteria

Selection criteria	Sex	A	V
Studies	M	2,24	1,11
	F	2,19	1,78
Nationality	M	4,80	0,30
	F	4,69	0,52
Appearance	M	4,00	1,32
	F	3,54	1,71
Experience in the field	M	1,95	1,07
	F	2,42	2,01
Professional knowledge	M	2,27	1,46
	F	2,31	1,87
Qualities, skills	M	2,44	1,32
	F	2,46	1,30
Age	M	3,20	1,47
	F	3,17	2,51
Relationship or	M	3,22	2,17

acquaintances	F	3,59	2,34
Recommendations	M	2,85	1,78
	F	3,31	2,28
Sex	M	4,46	1,08
	F	4,36	1,14
Zodiac	M	5,00	0,00
	F	4,83	0,38

Source: own processing

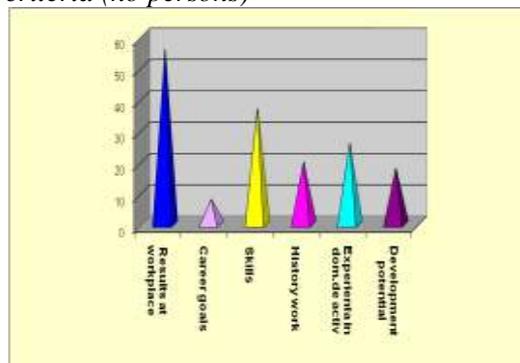

According to averages calculated from data in the table, the difference between men and women is based on the following criteria:
 1.appearance - women put more emphasis on physical appearance, compared to men who do not consider appearance as a relevant selection criterion (average = 4);
 2.experience in the field - is more important for men (average = 1.95) than women (average = 2.42);
 3.the recommendations - this criterion is relevant for men but not for women who believe that the choice should not be made based on recommendations.

Regarding the dispersions calculated, this shows that the most obvious differences are recorded in the criteria field experience, age and recommendations[5].

When asked "Which of the following forms of training is mainly used in your company?" most of the employees, 79% responded that the company uses the training at the job, 16% consider the it is used the training outside the workplace, provided by the company, 14% voted for other types of training, 13% voted for trainings offered by specialized companies at work and 7% believe that the company is using trainings offered by specialized companies outside the workplace.

When asked "criteria according to which employees are promoted", respondents were asked to choose from the 6 choice, that tendency which manifests within the organization. The most important criteria are the results obtained at the workplace and skills, study highlighting that no preference is given to experience (26%) and work history (20%), development potential (18%) and career goals (8%).

Graph 3. - Results regarding promoting criteria (no persons)

Source: own processing

Women considers the results, skills and experience in the business are the criteria that should guide the promotion, while men consider relevant criteria career goals, seniority in the company and potential development posed by the individual.

When asked "Indicate on a scale of 1-5 (1 most important, 5-least important) that you think are the main factors of motivation" I made a table presents the motivation factors, together with average and variance for each.

Table 4. - The main motivating factors

Motivating factors	A	V
salary	1,85	1,76
job security	1,91	1,98
working conditions	2,46	1,42
job attribution	2,99	1,48
team	3	1,58
promotion possibilities	3,13	2,09
economic and financial facilities	3,14	2,02
organization culture	3,83	1,24

Source: own processing

It is noted that the main motivating factor for employees is the salary. Wage is seen as a measure of importance for an employee in an organization, especially for the employees at lower hierarchical levels (workers) the main source of motivation is the prospect of higher wages[6].

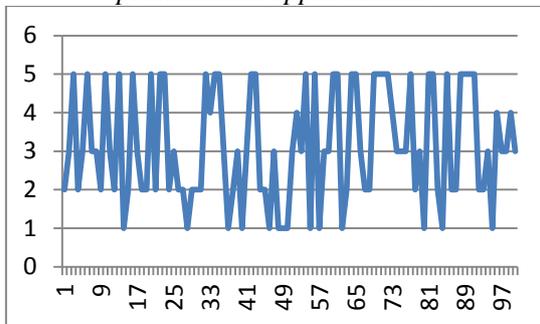

The main concern for the company is job security, which is highlighted by this study, as this criterion is 1.91 average.

In terms of motivating factors, we see that the dispersions are between 1.24 -2.09, indicating that for employees, criteria have approximately equal importance.

Organizational culture is the motivating factor, which recorded the lowest dispersion, which means that employees give the same lack of attention to this criterion.

In contrast, lies promotion criteria with the highest value of the dispersion of all the factors listed, which indicates that employees appreciate differently the importance of this criterion, giving different grades, as shown by the chart below:

Graph 4. - Answers regarding criteria "promotional opportunities"

Source: own processing

For women, motivating factors are job security, working conditions, the team they belong and job attribution, and men are motivated by salary and organizational culture of the company.

Motivation is one of the most important responsibilities of managers, forcing them to find the best ways to make their subordinates to achieve performance at work[7].

When asked "What do you like at the current job?", 58% responded that they like the work they do, 22% think that it is not tiring, 20% of employees are excited about the performance, 18% felt that their colleagues are the best, 14% think that the workplace is clean and 10% responded that they had good leaders.

Analyzing the responses of 100 employees who participated in the study, by gender, the results are as follows

Table 5. - Answers on current job

Selection criteria	S	A	V
Is clean	M	7	17,07%

	F	7	11,86%
Not tiring	M	4	9,75%
	F	18	30,50%
The work	M	28	68,29%
	F	30	50,84%
Good colleagues	M	10	24,39%
	F	8	13,55%
Good leaders	M	8	19,51%
	F	2	3,38%
Good performance	M	7	17,07%
	F	13	22,03%

Source: own processing

As shown in the table, for women count the performance at work, performance and that the actual work is not tiring, while for the men count colleagues and the good leaders. Both women and men, is important that workplace is clean, so that they can work in decent conditions.

There is an intrinsic motivation of employees to work they perform and also a lack of appreciation for the firm's managers, with negative effects on work climate[8].

4. Conclusions

Implementing effective human resource management requires consistency from more specific activities of this domain. Using the full potential of human resources can only be achieved through good management based on strategic principles that stimulate their continuous development.

The analysis of essential human resource management practices within company Apulum resulted a series of positive and negative aspects[9].

One positive aspect is that the company has a human resources department and develop human resources strategy. Women put more emphasis on discipline at work, and men on health and safety, these activities having the function of maintenance. Another positive thing is that the company, to maintain and motivate employees, use different procedures.

As general conclusions on the concepts and practices of human resource management within company Apulum we can emphasize:

➤ human resource management is characterized by a high degree of formalization of HR strategies but, however, the objectives are not made known to

employees;

➤ is given a relatively low job descriptions as a tool for development business employees;

➤ main tool for planning human resources is the spontaneous human resource needs;

➤ main criteria used in recruitment and selection are: experience, education, professional knowledge, skills, individual skills;

➤ workplace training is exclusive form of training in relation to outside company;

➤ individual and organizational career planning are deficient in business activities

➤ lack of participatory management.

Methods and Techniques to Motivate Human Resources in NFA ROMSILVA

Preda Costel
Valahia University of Targoviste
florinuniv@yahoo.fr

Abstract

In the context of continuous development of society, of a trend of globalization of markets and economy, it is increasingly felt the need to integrate in the work of Romanian institutions the Department of Human Resource Management.

Romanian institutions must be brought up to the international bodies' standards, environmental requirements, given the strong competition and emphasized dynamism.

The importance of human resources management in the work of institutions is increasing, the success of the latter depending on the effectiveness of programs conducted by management professionals the organization disposes of.

Keywords: motivation, human resources, organization, globalization.

J.E.L. Classification: M12

1. Introduction

The concept of motivation of human resources is essential in the management of organizations as a result of awareness by management that what determines human resources to be performing is their retention in fulfilling the targets assumed at the organizational level.

Naturally, all organizations are concerned with the identification of solutions to achieve sustained performance levels of employees. This means increased attention on the part of the organization's management, human resources management and departmental management on how employees can better be motivated through various ways such as incentives, premiums, leadership, other kinds of benefits, but also the context in which the work is carried out. From this perspective,

the aim is to develop a process of motivation and a work environment that allows employees to give the results proposed by the management.

In the current social context, motivation is the most important responsibility of managers of any kind to get the expected performances. Successful management, however, depends also on the usage and compliance with the basic requirements: the priority of the quality, motivation and participation of the stakeholders involved and the rational use of resources.

2. Motivation factors

The manager has to identify the motivation factors specific for every organization and use them in managing human resources. From this point of view, the literature [1],[2],[3] identifies a number of motivating factors (appreciation, personal material interest, involvement in work, emulation, the pride of belonging to an institution, ideology, career) that must be considered by the level of management:

Appreciation. As a factor of motivation, appreciation can be considered as a state of mind and a behaviour. It requires an attention directed towards the collaborator, to his person, his work:

- politeness - to say “hello”, “goodbye”, to be concerned about the health of the person concerned, to establish a relationship before you dive into folders;
- listening - to create opportunities to listen to collaborators, either individually or collectively;
- small gestures - to give thanks when a person strives to help you, to make gifts (anniversary, celebration, marriage), to be willing without going into people's private life;

- attention given to work - to give feedback on work, to say what was done, why and to what end, to avoid to ask always finishing a job in a very short time, thus cancelling other works, as the effort would not matter;

- congratulations and criticism - it is needed to highlight the person and tell what is wrong as problems arise;

- information - new events, team results, changes in procedure or people.

Personal material interest. Each person is sensitive to his personal interest, particularly financially. People in management say too easy that even this factor is determinant, it always gets overlooked.

Involvement in work. The responsibility of every manager is to create involving work conditions by empowering collaborators and by the motivating content of labor.

Emulation. A well-founded emulation is an important motivation factor, people being very careful about their image. It is difficult to find a good balance between emulation and cooperation.

The pride of belonging to an institution. The pride of belonging to an institution or service is powerful motivation leverage. This may result in a factor or combination of factors such as:

- the prestige of employer with whom he works, his reputation, his competence, his qualities as manager;

- the team, the service or direction of belonging, its image, its recent successes.

Ideology. It can be understood in this context as “ideology” the external reasons beyond the service or institution motivating employees’ increased efforts. Herzberg showed that beyond motivation factors, there are factors whose absence causes demotivation, which means it is not enough to meet the needs of individuals to bear motivation at work.

Career. Implementing a career model was linked to tradition, to the existence of a certain political system, way of thinking.

Other authors [4] identify several factors that combine both internal motivational elements of employee and social, economic context of the organization:

Mobilization and empowerment. Empowerment reflects the idea that a person, group, organization acquires the power of control over one activity. An employee

whose feeling of empowerment is high perceives as significant his activity in the workplace, perceives himself as competent and will be able to make choices that will impact his activity. The conditions that favor the feeling of empowerment are reflected in the critical understanding of its environment and the person’s ability to act on this environment. To increase the autonomy and decision-making, the person must acquire technical and social skills.

Involvement and collective effort model. Organizations need to recognize the importance of understanding the dynamics of individual motivation in working groups. Jeanson, Duvillier, Genard and Piraux identify the collective effort model as a framework that can help us easily understand the phenomenon. The concept of “social disgust” (reduction of individual effort in order to achieve collective efforts) shows that the workgroup can be a motivator.

The collective effort model shows the influence of three psychological states on the motivational force: the expectation, the instrumentality/means and valence.

- expectation is the degree of effort expected to be effective;

- instrumentality is the level of performance perceived as a tool/means to achieve a result;

- valence is the degree to which the result is seen as desirable or undesirable.

Motivation by values, insurance/stability and incentives. Values play a key role in order to make sense of work and thus to build the identity and professional relationships. They often insist on the terminal values such as fairness, respect. It would be better though to consider the instrumental values such as conduct, skills, socialization, which are more compatible with various incentives.

Organizational behaviour (organizational citizenship). The altruism and dedication in the workplace contribute to organizational efficiency through the promotion of informal aid or cooperative behaviour. To develop these values are needed factors such as satisfaction, psychological empowerment, charismatic leader.

In modern leaders business predicting their collaborators behaviour is essential and even though it is extremely difficult to predict the specific behaviour of each one and all together, experts must identify not

only who/what is responsible for a particular behaviour, but also how it can be influenced. Identifying the causes is a sterile action, without echo in the leading process if one cannot act based on them. Robert Heller [5] believes that taking orders is much less motivating than to take part in planning and decision making.

3. Commitment to work

Commitment to work is topic of interest for literature. Wright and Pandey [6] suggest that even the most distinct and well-defined concepts on commitment are not necessarily mutually exclusive and are based on many antecedents and consequences are. These theoretical approaches could be differentiated on groups starting from the object and purpose of the commitment.

Unlike the commitment to work, the commitment based on values has a greater degree of stability, considered as an attribute of the individual which does not change with the change in working conditions. Individuals with high levels of motivation are expected to perform better and to be more satisfied in organizations because of the convergence between their aims and values and those of the organization of which they are part, allowing them to serve the organization and to fulfill their own needs at the same time.

4. Organizational specificity and motivation

Analyzing the organizational dynamics, there have been identified several essential aspects in motivating employees [4]:

The morale and well-being of employees. In the last twenty years, the British public sector has undergone a radical change, which led to new work practices, such as flexibility and performance. This has led to an increase in anxiety and stress among employees. The example of police service and prison, generating voltage sectors, demonstrated the importance of considering the well-being of employees, in particular regarding the management of emotional and mental health. Ignoring these issues can have destructive consequences for the motivation to work in the public service.

Motivation and management by objectives. The Spanish national police

implemented a system of management by objectives. This type of management aims to increase the efficiency and quality of service, its result translating into reduced rates of crime. This also included financial incentives (paid) and non-financial incentives, with the objective of managing growing means of motivation. Indeed, the decentralization of the decision-making process, leadership, institutional coordination, cooperation between factors that influence motivation.

Effects of fairness feelings and low wages on the intrinsic motivation. The link between motivation and reward is not clear and linear. It is necessary to develop a clear and fair procedure, on the basis of legitimacy and fairness in terms of allocation of these rewards. The cost of unjust allocation perceived by employees in the context of low levels of pay is significant.

Information and communication technology (ICT): a tool for motivating staff. Motivation to work depends on various factors, both personal and organizational. Information and communication technology is an important component of the current work organization, and thus can be a motivating factor in the work of the officials. This determined the Administration to accept re-discuss the procedures and methods of operation.

Human resource policy and working life feeling. The introduction of the notion of professional life allowed a better understanding of the various factors of motivation and commitment to work of employees. This feeling is also apparent from the desire of self accomplishment.

5. Conclusion

People are the main resource of National Forest Administration ROMSILVA. They know what, when, where and how to act in order to achieve strategic goals. The institution exists and is growing because people have the physical and mental ability to organize, implement and develop.

Human resources of National Forest Administration ROMSILVA are the safest investment that guarantees the survival and development of the institution.

In human resources, management decisions are the most difficult because it involves people with specific needs,

personality, with their own goals and personal problems. In an institution, the adoption of managerial decisions can affect employees' health, career, professional future or even their lives. Management decisions in human resources must be adapted to the personality and professional training of employees.

Human resource management decisions must consider that the National Forest Administration ROMSILVA staff is a heterogeneous group; it must be considered as a set of distinct personalities with goals, hopes and individual goals that could be concerted. Human potential is not the same for each individual; the genetic inheritance, biological factors, social, cultural, educational, conjunctural, familial influences etc. are different.

Strategies to Improve Human Resources Management in the NFA ROMSILVA

Preda Costel
Valahia University of Targoviste
florinuniv@yahoo.fr

Abstract

In the modern economy, both managers and employees must continually face complex and challenging pressures generating opportunities.

They need to ensure that all available resources and those that can be attracted by companies can create ways to guarantee the prosperity and long-term efficiency of firms in which they work. Efficiency refers to the ability to identify what is necessary to be achieved in the future in order to be achieved an optimum adaptation to continuous changes in the socio-economic, political, environmental context. Particularities of human resources and their complexity pose particular problems to managers at all organizational levels; so that their management is an important aspect of business management.

Keywords: resources management, human resources, strategies

J.E.L. Classification: M12

1. Introduction

The behaviour of the NFA ROMSILVA employees can be influenced by human resources manager by two main types of strategies: direct influence which refers to strategies that are the direct interaction between manager and those wishing to influence them and situational adjustments, those strategies designed to change the nature of the situation in which an employee works, starting from the idea that changed circumstances will affect internal motivations.

The best understood and practiced is the method which involves improving employee performance which will lead to grant rewards

such as wage, bonuses, promotions increase etc. And if this will not take place, will be applied punishments such as redundancies, transfers and refusal of salary increases or promotions.

This method is actually an exchange: improving employee behaviour in exchange for rewards offered by NFA ROMSILVA. To engage in such an exchange, it is essential that the employee to have better performances and the manager to be able to offer rewards or to apply punishments announced.

While almost all influencing strategies are associated with a particular type of rewards, the difference between providing a set of rewards or external punishments, and appealing to foreign relations between NFA ROMSILVA employees is significant. The respect for a person with authority within the NFA ROMSILVA or a due to that person may be motivations strong enough to cause someone to act on request.

It is possible to combine interpersonal influence with rewards or punishments. If the relationship with the manager is important enough, the employee will react to the threat of losing his friendship or respect, acting as requested. Sometimes employees are influenced to change their performances due to the fact that the request is consistent with their values and interests, which leads to behaviour change [1].

2. Strategies to improve human resources management

To be able to use this strategy, NFA ROMSILVA manager must hold data and information on which he can explain the need for behavioural change. To change their behaviour, employees must understand the reasons for this change. It can be hard for a head with authority, which required people to change because he said so, to adapt to a

strategy to ensure that they understand and accept the request.

During the employee activity development, a kind of value progression can occur in the sense that, when they are young, insecure and try to triumph, employees may value things that represent the needs of the first level in Maslow's hierarchy, but once they get to control these needs, they are becoming more concerned about meeting the needs of upper-levels and this is the reason why managers of change, not risking to address the needs already satisfied and that no longer concerns employees, must be aware of these needs.

NFA ROMSILVA managers can influence employee behaviour not just by using direct interaction, but also by changing the nature of the working environment, based on the assumption that the factors of the situation changed will get in touch with the motivational forces of employees, determining the performance increase.

One way to improve the work environment is increasing participation in planning, setting goals and making decisions processes. Such system is the management by objectives.

Another way to improve a monotone working environment, devoid of challenges and unmotivating is the job enlargement program that has divided the factors of work in satisfaction factors and motivators [2]. People can be satisfied or unsatisfied by factors such as salary, benefits or working conditions, but these cannot motivate the employees of NFA ROMSILVA. Motivation appeals to deeper feelings of growth and development.

Giving greater attention to factors of satisfaction in a situation (pay, working conditions, human relations) can determine people to be more satisfied (or less satisfied), but will not increase performances only if there is job enrichment. The job, by its structure, should provide more challenges, the opportunity for personal and professional development, greater recognition and a stronger sense of contribution.

If job enrichment option is chosen, the manager of NFA ROMSILVA must decide to allow employees to review their work and see if they can create their own working environment. Employees are allowed to work in teams, usually led by a team leader who

was made special training before. The team gathers to discuss about the institution, department, job or specific issues in order to investigate the factors that cause low results and to make recommendations to management.

A strategy commonly used in NFA ROMSILVA involves placing employees on positions of competition. It starts from the idea that people will be motivated to increase their performance where they will have the opportunity to win.

Another way to change the current situation is the transition from one situation of deprivation of information to a situation of information enrichment. The provision of information can form the basis of a kind of informal competition between NFA ROMSILVA, or may form the basis of rewards for those involved who can feel the satisfaction of noticing an increase in the level of performance.

Most programs to modify the behaviour of employees are using the provision of information as an important element in getting higher performance. As they reach the goals for improved performances, the manager of the NFA ROMSILVA seeks changing in terms of results, presents the results to the employee and shall encourage, praise and support him. By this combination of praise and recognition with the provision of information in the NFA ROMSILVA it is obtained a style change for many managers, who spend more time interacting with their subordinates. This is a sufficient explanation for the success of the behavioural modification programs in the NFA ROMSILVA.

Another way to improve the human resources management within the NFA ROMSILVA relates to improving communication. Communication is one of the most challenging issues of the work of a manager. The source of most problems of communication within the NFA ROMSILVA is represented by the difference between the content of the message or the impact that the manager intends to convey and how other members of the organization receive the message.

One of the best ways a manager can become more efficient is to find out what impact his actions and words have on those around him [3]. The key to getting to know

the impact of the message over the others lies in the challenge of a reaction from their side, the feedback, which implies a risk. In personal relationships, people are becoming more open to others as they gain more confidence in each other. In the organizational context, things change due to, on the one hand, the fact that the manager holds the power, and on the other hand, the fact that information is distorted from their passage through informal channels of communication.

There are methods of development of an effective communication strategy that facilitates managers the insurance of fair perception of their messages, as well as methods of obtaining the feedback needed.

Also, we consider that there should be feedback not only between manager and subordinates, but also between the manager and the other managers. When discussing with their hierarchical superiors, managers of NFA ROMSILVA are facing many of the problems faced by their subordinates when given the opportunity for feedback, when discussing with their subordinates, managers must be aware of the standards that subordinates must achieve, the degree to which an employee must improve its performance and the consequences of a possible failure. Communication having as subject the manager's expectations regarding performances should start before engaging the subordinate.

In the current institutional life, employees have learned to disguise and hide their feelings, especially to those occupying high positions in the hierarchy. Therefore, it is often difficult to know what the real impact of the message on others was. The result can only be a polite smile, a verbal agreement or an apparent consensus, the transmitter assuming, wrongly, that these signs of external feedback from the receiver represent the truth. A person who has good interpersonal communication skills can determine and check the real impact that his words have had, and may determine whether the eventual problem derives from a inability of communication or from the filtration system of others.

In the process of improving performances related to communication, probably no skill is more important than to receive fair and accurate feedback regarding the impact of the

own message on others. This requires sensitivity, due to the fact that most people are afraid facing a direct confrontation with anyone asking about their performances. It is not easy for a person on a inferior hierarchical position in an institution to deal with a person with a higher status, to give an unsolicited and perhaps unwanted feedback. The risks involved, from the perspective of the person on the lower level, are so great that, if the situation remains intolerable, the safest strategy is to rebuke and to hope that the passage of time will improve existing conditions [4].

Another way to improve the human resources management within the NFA ROMSILVA is the training and improvement of employees aiming to identify, assess and by planned instruction to facilitate skills development that allow individuals to reach performance targets relating to present or future posts.

After an employee has been assigned to a post, he should use several types of training to be allowed to update his skills. For some, the focus should fall on technical training (the person is helped to improve his skills in using the equipment or technical programs). For others, the training should involve interpersonal skills (the ability to work with others) or cognitive (the ability to think clearly, to plan or to solve problems). Other programs are sometimes called training programs, although they are in fact educational programs, whose purpose is to extend a person's vision or understanding of the issues and problems that are often essential for human development in the field of management or in certain positions within the company [5].

3. Training and improving goals of employees

Within the NFA ROMSILVA, the training and improving goals of employees should be:

- helping them to achieve a peak performance in achieving their work;
- preparing them for the future development of job.

Training and improvement of employees can be carried out both in the workplace and outside the company, using a variety of methods and techniques such as:

- Solving problems.
- Case studies.
- Presentations.
- Demonstration.
- Movies and video equipment.
- Discussion in the group.
- Exercise working with documents.
- Interpretation of roles.
- Games.
- Critical incidents.
- Simulations.
- Outdoor experiential learning.

For training programs of NFA ROMSILVA to be effective is useful to be integrated into the general policy of the institution and be preceded by an evaluation of posts and persons occupying them in terms of compatibility of knowledge, skills and attitudes required and held.

One form of training is job rotation, in which a person spending time in a series of posts to gain specific experience first-hand, usually under the guidance of a qualified person. Recently, more and more training programs began to dress modelling format. The usual practice is that of the video recording of the actual performance or staging of role play to demonstrate undesirable behaviours. Those trained are practicing by roles the observed behaviour [6].

Career management aims to ensure long-term correspondence between career development needs of employees and positions and career paths available within the institution. The assumption underlying this approach is that people want to advance within the institution.

Institutional development aims to provide intra and inter-group healthy relationships and helping the groups to anticipate, initiate and lead change. Institutional development involves the existence of a regulatory, re-educational strategy, which is likely to affect the systems of values, attitudes, involving the formal reorganization of the institution, in order to cope with the accelerated pace of change.

4. Conclusion

Human resource management decisions must consider that the National Forest Administration ROMSILVA staff is a heterogeneous group; it must be considered

as a set of distinct personalities with goals, hopes and individual goals that could be concerted. Human potential is not the same for each individual; the genetic inheritance, biological factors, social, cultural, educational, conjectural, familial influences etc. are different.

In the spirit of conservation, people have a very high resistance to the changing trend; on the other hand, people show an unexpected adaptability to actual change. People need help to cope with change and encouraged in their efforts to participate creatively in the process.

Economic and social values are perceived differently by different individuals. National Forest Administration ROMSILVA must have the ability to drive positive individuals, to focus their eigenvalues.

Strategic Approaches In The Formation Of Human Potential In Terms Of The Competitiveness Of Enterprises Of Consumer Cooperatives In Ukraine

Rudych Lesia

Poltava University of Economics and Trade

rudich_82@mail.ru

Abstract

My own approach to strategic trends of human potential development in the context of enterprise competitiveness of Consumer Cooperatives in Ukraine has been posted.

Key words: Human potential, members of consumer cooperatives (shareholders), the system of consumer cooperatives, strategic approaches, competitiveness.

J.E.L. classification: J11, J10

1. Introduction

Competition as an integral part of the market economy certainly appears in the structure of organizations of consumer cooperatives. Taking into account the degree of differentiation of organizations of consumer cooperatives and their integration with the subjects of agricultural production the competitive environment can not be put aside. Besides we must keep in mind that during the transformation of the economic system processes of development of subject of consumer cooperatives are activated which are able to act rationally and engage in competitive relationships. Possibility of competitiveness of organizations of consumer cooperatives is manifested in the competition with other similar entities. The presence of related objectives and resource limitations of mobile processes lead to the intensification of competitive processes, during which the possibility of competitiveness organizations of consumer cooperatives is realized.

The steady conceptual apparatus has not been formed in the theory of competitive organizations of consumer cooperatives yet. Competitiveness is determined by complex

factors of the external and internal environment of life. There must be distinguished three moments in the concept of “factors of competitiveness organizations of consumer cooperatives”. Firstly competition in the system of consumer cooperatives is a form of competition in general. Competitive activity in the system of consumer cooperatives can be defined as a contest in which competing parties are interested in achieving the same goals. Competition is performed for achieving benefits and advantages.

2. Contents

Further to the researches, the active study of the problem of formation and development of human potential in the domestic scientific literature is highlighted in the works of such Ukrainian scientists as D. Bogynia, N. Dudina, N. Ilchenko, T. Kostyshyna, G. Kulikov, L. Lisogor, V. Nyzhnik, M. Semykina, E. Libanova, V. Shamota, G. Dmytrenko, M. Dolishniy, A. Chuhno, O. Grishnova, A. Kolot, A. Korovskyi, V. Petiuh etc.

Peculiarities of human development in the system of consumer cooperation were researched by O. Velychko, L. Voynash, Y. Gavrylenko, L. Drobysch, S. Semiv, L. Stepanov, L. Shymanovska-Dianyich etc.

On the social-economic development organizations of consumer cooperatives currently affect three main factors: market, increased competition in life quality and innovation and production factor. These factors require additional investments, increase of employment and solving of other strategic objectives.

Studies show that the result of the formation of human potential in the context of the competitiveness of enterprises of

consumer cooperation will depend on the fact of implementing strategic approaches. Solving of this problem requires the consolidation of efforts of government institutions, the system of consumer cooperatives, civil society and the business community for supporting the rural population and the activation of involvement to the institute's membership of consumer associations and unions.

From our point of view the policy of governmental institutions should include:

- measures for accelerating economic and political reforms aimed at comprehensive improvement of socio-economic situation in rural areas, providing public access to basic social services, economic resources, etc.;

- providing equal access to qualitative health services regardless of place of residence, property status and other characteristics which require implement the reorganization of the health system and the restructuring of inefficient rural district hospitals in centers provide primary health care;

- modernization of social support and address principle of its providing.

As analysis of key financial and economic indicators of the economic system of consumer cooperatives shows the system is gradually emerging from the crisis (change activities in some areas) and improving the efficiency of its operation. The argument of this fact is the increase in activity, increase of the size of existing assets, and increase of the size of working capital, net profit growth of others. Therefore for stabilization of the cooperative system in the future the management of all types of resources must be improved and the scope of activities by finding new shareholders must be expanded.

Today as for the long-term development of consumer cooperatives in Ukraine the motto "System is for members" is actual which according to the Strategy primarily involves "the subordination of economic and social business ideas and objectives of consumer cooperatives; non-profit nature of consumer societies and organizations ... increasing of the role of consumer cooperatives in social transformation in the country "[1, p. 8].

Besides the main directions of improvement of the shareholders of consumer societies in Ukraine for increasing

their role in cooperative activities are identified in the "Strategy of Consumer Cooperatives in Ukraine for 2004-2015 years" approved by XIX Congress of Consumer Cooperatives in Ukraine in 2004:

- strengthening the promotion of cooperative ideas for the revitalization of cooperatives;

- implementation of the program of the Institute of members of consumer associations and unions, their active participation in the management structure of cooperative control system;

- providing of organic combination of personal, collective and public interests by acquiring member of Consumer Societies of corporate rights, the establishment of cooperative enterprises, a large share of economic activity, financial resources, a cooperative benefits;

- provision on preferential basis to members of consumer associations and unions multilevel cooperative education, professional development opportunities and training cooperative assets, access to new information technologies;

- creation of centers of spiritual life in the cooperatives, amateur competitions, sports events for developing harmoniously developed and spiritually wealthy individuals on the basis of recovery of national culture, spirituality, respect for ethical, legal, family norms, values, personal life;

- development of strategies and approaches of cooperatives, participation in elected bodies, management and control [1, p.18].

This approach specifies that the role of the Institute's membership should be occurred in three main areas: economic participation, management and control of social services (figure 1).

In accordance with the social features of consumer cooperation should be coordinated with the economic system by the use of the new feature and formed market mechanisms that contribute to the successful implementation of economic-financial, industrial and technological, managerial, commercial activities and the achievement of financial stability at the level of individual entities. For the realization of its social purposes of cooperatives the financial stability must be achieved, the interconnection and cohesion of social

mission and commercial activities of their organizations and enterprises must be provided; the social welfare of members of the cooperative movement must be formed

through specific mechanisms that provide the implementation of the economic-financial and managerial activities.

Figure 1. Increasing of the role of members of consume associations and unions [1]

According to the results of our survey, we have identified the main problems that hinder the inhabitants of rural areas, regions and cities to enter into the consumer societies.

Based on selected issues the specific measures to improve the incentives of potential shareholders were offered (table 1).

Table 1
Measures for enhancing incentives for shareholders of organizations and enterprises of the system of consumer cooperation in Ukraine
[compiled by the author]

<i>The problem of engagement with shareholders</i>	<i>The approaches of engagement with shareholders</i>
Loss of credibility of consumer cooperation	Saving of the shareholders' trust and interest to participate in the work of the societies
The problem of accounting of cooperative payments	Compliance with the provisions of the cooperative paid members, associate members, consumer companies and their unions, enhancing the responsibility of individuals for issuing funds to shareholders
The imperfection of the program completion and distribution of property	The implementation of the third stage of the programme, assigning to shareholders 75% of the property system
Age of employees	Engagement the youth with the work of societies by giving it the soft loans through the Bank "Ukoopspilka", admission to experience a period of training in higher educational institutions, cooperative, if a person stays to work in the system

Weak attention to work in a low branch of consumer cooperation	Decentralization of management functions from the CST, the intensification of the work of district committees
The lack of economic interest of shareholders	Provision of workers' societies that are shareholders' systems, the systems of privileges with purchasing goods in retail, discount tuition for their children in universities of cooperative institutes
The low level of labour conditions	Increase of labour protection requirements, measures to engage capital to the modernization of existing enterprises
The high level of taxation	Reducing overtime expenses, stocks of goods in warehouses, rationalization of amortization policy
Problems of organization of work of the commissions of the cooperative control, and local x of the general meeting of shareholders	Review of functional tasks of management and control

Generalized approaches of work with shareholders that concretize methods and mechanisms of solving shareholders' problems filed in figure 2.

Engagement with potential shareholders
Advocacy of cooperative ideas among residents of rural area
Engagement with youth to participate in the system of cooperative management
Completion of the program of division and securing property
Enhancing the economic interest of shareholders by focusing on a family membership in cooperatives
The increase in the number of orders for the target children's learning of shareholders in cooperative universities
Raising the level of wages, bonuses and cooperative payments (dividends) for members of the consumer societies, the use of discount cards
Providing of broad participation of shareholders in the work of administrating authorities, auditing commissions, boards of cooperative control system of organizations and enterprises, participation in the activities of joint ventures
Optimization of engagement of the system employees
Increase the size of the additional contribution of the unit by the supreme bodies of management of societies

Figure 2. The main directions of work with shareholders which can be taken at the level of organizations and enterprises of the system of consumer cooperation in Ukraine [compiled by the author]

Effective implementation of these areas should be based on the concept of social responsibility (a model) that will allow enterprises and organizations of consumer

cooperation to get a competitive advantage relative to private entrepreneurs who operate in rural areas. Thus trust attitude to the entire system can be formed as a whole, i.e. it will

influence the formation of potential member of consumer cooperation.

3. Conclusions

As the main measures of increasing social responsibility of consumer cooperation system, you need to set pay rates below a living wage; the formation of new working positions; implementation of services by shops; delivery of goods for invalids, pensioners, disadvantaged population; providing of school food; the implementation of free services; granting privileges; the organization of complex field teams; charity; production of quality products, due payment of taxes. Further to the core activities of cultural and educational area, there must be the organization of leisure of rural population; the organization and arranging of rural holidays; increasing of qualification of employees; participation of employees in the management; arranging contests between the organizations and enterprises of consumer cooperation; giving lectures on issues that are

interesting to rural population.

The social responsibility before employees is shown in improving working conditions at the workplace; participation of the staff in making decisions, care for development of the staff in the professional and psychological direction, care for its family members.

Increase of the number of shareholders of societies is the main source to rebuild its working capital and the renewal of consumer cooperation in Ukraine, in particular in the context of its competitiveness.

Perceived Leadership Style Influence on Job Satisfaction for Staff to Aviation Companies

Rus Mihaela

*Faculty of Law, Administrative Science and Sociology
Ovidius University, Constanta, Romania
psiholog_m@yahoo.com*

Abstract

This paper deals with the influence of perceived leadership style on job satisfaction of employees. One caveat is necessary at the outset to say that there is no pure driving style, but it is just depending on how it is perceived by employees, the impact it has on their behavior and on organizational performance. Of particular interest in this research is that certain leaders of behavior dimensions have repercussions on job satisfaction more precisely, on which aspects of it. Thus, some of the dimensions studied behavioral targeting: consideration, structuring, tolerating uncertainty, etc. One of the assumptions of this paper is that job satisfaction depends on the manner of self to subordinates, when employees are satisfied with certain aspects of their work tend to manifest those behaviors that maintain or enhance satisfaction on those dimensions.

Key words: satisfaction, leadership, employees, work, behaviour

J.E.L. Clasification: A1, A14, D2

1. Introduction

Failure research on specific personality characteristics style leader moved out of the state leader [1]. New approach to management theory known as situational or contingency theory, put forward the idea that there is a leadership style according to each situation but rather it depends on a number of factors: driver characteristics, nature of the task, the characteristics of subordinates, organizational level, external environment, etc.

But the most obvious finding is that personalization management provided to the confluence of individual characteristics, behavioral dimensions and the specific situation facing the leader.

Collection attitudes that employees have to work is determined primarily by the behavior of the leader determined situational factors. But also depends on job satisfaction, and the ability of the leader to identify the needs of employees, and meet them. Maslow's pyramid of needs proposes that comprises five aspects: physiological needs, safety, social, esteem, self-actualization. The first three categories can be grouped under hygienic factors nomenclature as it relates to physical working conditions, company policy, control, and so on, and the last two are motivating factors and consider issues such as updating, recognition for the work itself, responsibility, promotion, etc.

Also, job satisfaction can be influenced by the manner of self-employees, expressed in response to work situations. Called impression management, the self is defined as the process by which individuals control the impressions others are forming on them having a special role in interpersonal and organizational behavior. Two components are considered to be the basis of this process: impression motivation (the degree to which people are motivated to control the opinions of others about them), and impression construction (referring to the fact that once motivated to create a certain impression, individuals can diversify their behavior so as to influence the impressions of others towards them).

2. Research on leadership behavior

Mihuleac(1994) defines leadership behavior as "action, movement,

organization, integration, or coordinated movements adapted to the environment".

Among the best known theories of leadership styles include those developed by several groups of researchers from Ohio State University, and the University of Michigan. The purpose of this research was to determine effective leadership dimensions by observing or recording driver behavior effectively [2].

Studies at Ohio [1] started immediately after the Second World War and were based on the design and implementation of so-called "behavior description questionnaire driving." Two researchers [3] have designed a descriptive list of 150 items and then asking members of several groups to assess their own leadership. Analyzing the results, the researchers concluded that there are two factors that explain the behavior of effective leaders: consideration and initiating structure.

Consideration is the type of central management feature people concerned about establishing harmonious working relations based on trust, respect and also to stimulate the participation of subordinates in the organization and perform their work.

Initiating structure behavior management is focused on the task, the organization and efficient structuring of business. Research has suggested that these two dimensions are independent and that the leaders characterized by high values on account size produced the highest job satisfaction[4].

Studies from Michigan originated in a research conducted [5] on the behavior of leaders working groups differentiated by the level of productivity achieved. The research results led to the conclusion that leaders with high productivity tended to be centered people that pay more attention to human relations within the group. In contrast, leaders of groups with low productivity tend to be centered on the requirements of work tasks, the less interested people needs. The conclusion was that the two research approaches to leadership are actually two alternative orientations along a single continuum. Thus, a leader is being focused on people or on task. It was also found that job satisfaction was higher among group members led people-centered leadership.

In further research Floyd Mann [6], proposed a new approach to behavior management, adding dimensions on human relationships and the achievement of administrative tasks. In Mann's conception of leadership behavior involves the development of three functions which in turn requires the presence of three skills: the human relations, technical skills, administrative skills.

Somehow the review and analysis of results of several research [7] concluded that there is a common framework for all. On this basis they developed the theory of the four factors, which in their opinion summarizes the basic structure of what can be called leadership. The four factors are: support to facilitate interaction, emphasizing purpose, facilitation work. The authors of this model have concluded that effective leadership behavior is determined not only by focusing on human and psychological support given to them but also from the combination of all four factors.

Another approach is the approach to leadership traits [1]. Starting from the idea that traits are characteristics of the individual including physical features, intellectual ability and personality, research has shown that many features are associated with the fact that people become leaders, or with effectiveness as a leader. But all research shows that there are some traits associated with leadership: intelligence, empathy, self-confidence, domineering spirit, motivation to lead, emotional stability, honesty and integrity, need for achievement. Thus, leaders or the most able of them tend to be above average in terms of these dimensions, although not very strong connection.

The limits of this approach are given that, even if some features seem to be related to leadership, there are several reasons why this approach is not the best way of understanding and improving leadership.

3. Job satisfaction

Job satisfaction refers to a collection of their employees attitudes towards their work[8]. Can distinguish at least two aspects of satisfaction. The first of these

can be called facet satisfaction and is defined as an employee's tendency to be more or less satisfied with various aspects of his work. In this respect, the most relevant attitudes towards work are contained in a relatively small group of facets: work itself, pay, promotion, recognition, benefits, working conditions, supervision, coworkers, and organizational policy.

The second is the general satisfaction, and is actually a general indicator, amounted to a person's satisfaction with her work that crosses different facets [5]. Overall satisfaction is in some sense an average or overall attitudes that have individuals from different aspects of their work, so that two people can express the same level of overall job satisfaction, for different reasons. More specifically, they might be compensated attitudes towards different facets of their work.

Organizations measure job satisfaction primarily because it is assumed that this would be directly related to the immediate goals (short term) of the organization for the purpose of reducing costs and increasing performance, reducing absenteeism and errors. Long-term orientation, aiming to bring employees to the organizational environment and improving scientific understanding of the organization[8]. But when managers discovered that there is no correlation between job satisfaction and performance level, their interest in this direction decreases. Also, measuring job satisfaction in different working groups gives managers the ability to detect groups express dissatisfaction and by the development of plans to remedy the situation.

Job satisfaction is a positive emotional response, determined by labor requirements, may be the result of a feeling of satisfaction that the individual derives from work performed what he expects from work, achievement expectations about the job. Also this dimension can be seen as an overall approach can be applied to different facets of employee work. Considering this aspect managers may omit other hidden dimensions because they assess overall employee satisfaction.

Warr (1987), makes a distinction between extrinsic and intrinsic job

satisfaction. The first issue relates to aspects of work itself: the freedom to choose how to fulfill their duties, level of responsibility required by workstation, applications and variety of tasks. Extrinsic satisfaction refers to those aspects of work which are background task itself: salary, working conditions, working hours, procedures, industrial relations, occupational safety [9].

Job satisfaction is legally psycho "outcome gap between what individual get that reward work and what he expected I should get, when rewards are equal between the two results in a state of complete satisfaction." [10] State further states that when that employee is below the expected gain is deploying a state of dissatisfaction which is all the greater as the difference between aspirations and what they get is higher.

4. Methodology of study

4.1 Research Objectives

The objectives of this research are to determine to what extent perceived leadership style affects job satisfaction. More specifically, what is important is which of job satisfaction dimensions are influenced by how employees perceive the leader's behavior. A second objective is finding how the self influences job satisfaction and are impacting on its size.

4.2. Research hypotheses

HS1. Perceived leader behavior influences job satisfaction;

HS2. Autoprezentarea (employees tend to appear in a favorable light) influence job satisfaction.

4.3. Research instruments

For this study we used three assessment tools: LBDQ (Leader Behavior Description Questionnaire, Stogdill, 1963), Scale Management impression, managers and employees (Singh & Vinicombe, 2001) and JSS Global (Job Satisfaction Survey-Global, Lamond & Spector, 1999).

4.4. Participants of study

For this study we used 94 subjects from an airline, which were applied three assessment tools with a mean age of 42.4 years, 76.7% women and 23.3% men.

5. Analysis and interpretation of results

As you can see the scales scores self-promotion and networking success are below average which means that employees do not have the desire to actively interact with his direct supervisor to communicate what they have achieved and not involved in other activities than those initiated by the company to be noticed by influential people who could support career.

Table 1. Correlations between scores obtained at JSS-World and Scale MI

scale	Perf	Apra	Preg	Inte

Munc	..240*	-.049	.021	.117
Org	.101	-.086	-.009	.100

According to the table above it can be said that employees have a reduced tendency to fight to achieve goals which they have set on their careers, contributing innovative ideas and exceeding expectations superiors even if they are satisfied with collateral benefits offered company (holidays, paid sick leave, flexitime, etc.) relationships with colleagues, the nature of work (type of tasks performed), the resources that the organization makes available (tools, equipment, financial resources) training programs that are offered, work safety, rules and procedures that must comply in order to fulfill their tasks, the physical environment in which they carry out their

work, and they are satisfied with the work that render.

It also shows that employees are less interested in their possible promotion seeking challenging tasks that can be distinguished and agrees to give them to solve complex tasks (even in situations where they believe they can accomplish only half of the work requested) when resources are satisfied that the company provides, the nature of the physical environment in which they work and training programs.

Since employees are satisfied with the training programs and the physical conditions of work are not interested in collaboration with senior people holding them and not participating in corporate uninitiated to search for key people who could support career.

According calculated correlations can say that employees who perceive their leader as concerned about the overall condition and their position are satisfied in terms of salary, of how they work is appreciated, promotional conditions and the amount of work performed.

On the other hand, when the leader is perceived as clearly defining its goals, and bringing to the attention of subordinates what is expected of them, employees will appreciate the salary of the prizes it offers, the control showed leadership received recognition, workload, training requirements, job security, working conditions and the rules you must follow to fulfill its duties.

Also, when the leader is perceived as acting as a representative of the group, employees will be satisfied in terms of wages, the rules which govern their work, general work and organization in general.

Employees will be satisfied in terms of salary and in situations where they perceive the leader to be able to support uncertainty and postponement without becoming anxious or nervous, as effectively using persuasion and discussion expressing strong convictions as giving subordinates the opportunity to take initiatives , make decisions and act and not least it is perceived as demonstrating foresight, the ability to provide accurate results.

Subordinates are satisfied with other benefits such as awards, when they perceive

as having persuasive leader when it pressures to ensure production and maintain the unity of the group when he runs resolving conflicts arising between members. However, when employees perceive their leader as proving foresight, the ability to provide accurate results are satisfied in terms of supervision, recognition, workload, in terms of training, the possibility of further training, promotion, are satisfied physical conditions of work rules, work in general.

When the leader is perceived as exerting pressure on the group to ensure production employees are satisfied with collateral benefits, and rules.

When subordinates perceive their leader as maintaining group unity as he runs and maintaining good relations with superiors with their influence, they will appreciate the other benefits provided (eg awards.) Co-benefits, recognition, workload respectively of rules that must be complied with.

6. Conclusion

Hypothesis postulates consisting in that: perceived leader behavior influences job satisfaction, and the manner of self depends on job satisfaction of employees were confirmed. The results show that, firstly, employees tend to display certain behaviors within the organization when satisfied or certain aspects of their work. For example it was found that there is a tendency to make more effort to achieve goals related to career, contributing innovative ideas and exceeding the expectations of superiors, they are satisfied with the benefits provided by the firm side, relations with colleagues, the nature labor resources that the company provides for them to fulfill their tasks.

Correlational study conducted between LBDQ and JSS scales revealed that there is a close link between perceived leader behavior and job satisfaction, employees are satisfied with certain dimensions of their work when they perceive their leader as exhibiting certain behaviors (for e.g. employees are satisfied in terms salary when the leader is perceived as consideration structural, representative group when tolerate uncertainty, is persuasive and tolerate freedom.

7. Utility of study

Utility of the study is that leaders, knowing the behaviors they adopt when employees are satisfied with certain aspects of their work, may, by identifying their necessities to help amplify those behaviors considered would benefit the organization (and the subordinate) at a time and manifest themselves according to these sets situational behavior of professional employees will appreciate. This is very important as it reduces staff turnover scale, thereby reducing costs involved in such a phenomenon.

8. Limits of study

A limitation of the study could be considered that the study was applied in a single organization, the results can not be generalized. It may be that the records reflect only a feature of the organization and to extrapolate the results need to be studied more specific organizations as varied.

9. Research directions

As new research directions, you can study within the same organizations that participated in the present research, where to aim, how much dimensions considered above (perceived leader behavior, job satisfaction, and self-presentation) are relevant to the performance of employees and how they have an effect on occupational stress.

Marketing Policies, Promotion and Communication on Pharmaceutical Market in Romania and European Union

Sălăgean Liana – Ramona

Faculty of Economic Studies „George Barițiu” University Brașov, Romania

lianaugb@yahoo.com

Abstract

The research – based pharmaceutical industry can play a critical role in restoring Europe to growth. In 2011 it invested an estimated 27,500 million in R&D in Europe. It directly employs 660,000 people and generates three to four times more employment indirectly – upstream and downstream – than it does directly. However, the sector faces real challenges. Besides the additional regulatory hurdles and escalating R&D costs, the sector has been severely hit by the impact of the tax austerity measures introduced by governments across much of Europe in 2010 and in 2011.

Key words: marketing, pharmaceutical industry, public healthcare system, profitability, generic products.

J.E.L. classification: M31

1. Introduction

Though the pharmaceutical area is special in economy by the regulations, restrictions and message, marketing activities retain their importance and sequence although often there are differences of substance. Channelling the interests of the pharmaceutical market, it can be said that the principles of marketing a pharmaceutical product provides recipe for success in the market, despite the fact that it is sold in a highly regulated market, whether we are referring to the Romanian market, the European single market or any other economic market.

More than that, in the context of global drug sales reached a value of 600 billion dollars and it is expected that the next decade will reach 1.300 billion worth, growth largely due to modern drug penetration in third

world countries. Romania, as an emerging economy, respects these predictions. Otherwise, whether pharmaceutical sales in 2004 amounted to USD 900 million (data provided by Cegedim.com), and in 2006 had reached approximately \$ 1.4 billion, is expected in the near future will reach over \$ 3 billion, following an annual growth of 20 percent. In the area of market research is important to identify therapeutic needs of the population, dates from the statistics at regional, national or even global. It seems unethical, but economic reality calls any pharmaceutical company to produce just what will be required, so those products that would ensure satisfactory sales. The largest corporate expenses occur through research conducted to develop new molecules, research that can sometimes take years and there is also the risk of not lead to the expected result. Once obtained the final formula, useful therapeutic, clinical studies will last for years and it means exorbitant cost for pharmaceutical companies. The current law require pharmaceutical companies to those expenses that are purpose to protect patients from possible unexpected effects of the drug.

2. Application of the principles of marketing in the pharmaceutical area

Knowing how to sell is an art, but to know exactly where you positioned as a brand or as a company, now and in the medium and long term, to know whom to sell and to know what the patient's expects from you, all this combined means marketing. The companies that have a good marketing strategy are enjoying its power, materialized in increasing sales, profits, reputation and market success. Currently, the business world is focused on the marketing strategy, and the reason is easy to understand because 51 of the largest economies in the world are not

countries but corporations and brands and companies are born and die with a high rate. Neither the pharmaceutical industry has not remained immune to this global trend, especially since the pharmaceutical companies are collaborates with energy companies and banks.

Competition is fierce between companies, technologies are the same so, quality standards are respected everywhere, rarely happens even an original medicine does not have a competitor with similar therapeutic effect. In this context, focus has shifted to the company's ability to differentiate by competition, to create a favorable image in the eyes of specialized medical staff and the general public, of which potential patients that may occur. Often the patients reported better results after taking a drug of a company what has a good image on the market, in spite of bioequivalent drug competing with it. [1]

A proper marketing strategy is based both on information and data relating to competition and own brand as well as strategic marketing ability to correctly interpret these data and reaches the conclusion. Usually right marketing strategy is based on a very simple idea and very easy to understand and competitors precisely for these reasons it rejects the idea. Further, proper marketing strategy is to answer the question: what would be preferred my product and not the product of competition?

The continuing evolution of marketing combined with existing development environments and new ones, resulted with the birth of practice marketing methods, completely unknown a decade ago. Pharmaceutical companies also take part in these trends, and when the law does not allow them to promote their products, choose the option to promote their own image. [3]

Digital marketing is by definition well targeted. Ability to communicate "one to one", personalized and receive a response from the target audience allows measurement of the effectiveness of the product and its promotional campaign, and, why not, adjusts the campaign.

This kind of marketing is at the beginning; although many large companies have interactive websites which except of public information it also have an interactive aspect witch approaching the public by the

company. The importance of this channel comes from the fact that 20% of their free time, people spends on the Internet and the promotion budgets for this channel is 5%. Often, is stated that a website is like a business card for a company and also a type of promotion that requires lower costs. All pharmaceutical companies have their own website where they often are publishing information about medicines, including those whose promotional media is prohibited. There are also sites created for a single pharmaceutical product, such as the Novartis www.exelon.com. [5].

It is noted that while promoting the drug is banned in the country, and because the site is external, does not violate the Romanian law. Is useful for patients, doctors and company, thus indirectly promote their product.

Blog marketing. The blog is a tool of the Internet, a tool that allows a dialogue, a debate between a transmitter and several receivers. Its advantages are speed communication and response that is directed not to a single point but to all, thus the information can be used by all interlocutors. The blog is a communication tool, a marketing technique, a listening device and a way to interact directly with customers. Experts are saying that the company management can learn a lot by reading blogs. So, the company can learn what are saying the patients, the specialized staff and even the general public about the company's product or about the company.

Shopper marketing. It is a marketing technique applies only for the OTC drugs. The concept is defined as the new methodology which helps to understand the customer behaviour on the market and help to develop communication strategies at point of sale, or in pharmacies. The mechanism of this type of marketing plans to see the pharmacy and the drug from patient's perspective, the customer who is buying a product from the pharmacy. Thus identifying what patient's real needs, what are the barriers between him and targeted drug, how it feels, what enjoys and triggers the whole process and what its influence purchasing decisions, why he is buying a product or not, how he perceives a similar product to the competition. Another shopper marketing

technique is the technique that uses visual devices that record customer focus.

Through this mechanism we can find out exactly where the customer first looked at the shelf, at what focuses its eyes on a product, what he wanted to read or what element of the product box was attracted more. Through these surveys we can identify factors that may cause the patient to choose to purchase an OTC medication to the detriment of competition. That is why medicine shelf visibility is an advantage for manufacturing companies are willing to pay.

Viral marketing. It is a modern technique by which a company makes its customers to talk about it, about its products to recommend those products. The company must show a certain understanding of potential customers and try to get into the social psychology of the environment in which they live, in order to provide value through information that they provide to them. If more and more people send further marketing message, increasing the number of receptors is exponential. Strategy is extensively used by pharmaceutical companies because the lawmaking in the area of pharmaceutical advertising, they find as a way to promote their image and brands. It is certain that large companies are having reputation and positive image that is transmitted from person to person, so no costs.

Incentive marketing. It is a strategy by which a company manages to strengthen the relationship with partners and customers through gifts. It can be efficiently in terms of cost because there is offering a unique experience and create a lasting impression when it is performed in a surprising way. This method is used by pharmaceutical companies in their relationships with doctors and pharmacists and contributes to building benefit collaboration. The collaboration will be materialized by choosing drugs produced by the company o the detriment of competition.

Fusion marketing. It is a strategy in which two companies choose to support each other, thus giving more visibility to both companies at low costs. Many times, the pharmaceutical companies choose to produce a medicine in collaboration and its promotion is done also in partnership. In this way, both companies are reducing their costs, as a way

of saving intensely used in the business world.

3. Communication policy in the pharmaceutical marketing

The whole effort of a company and especially its results should be made known to those targeted as customers, especially factors of influence in the domain (doctors, pharmacists). Communication is a process that includes at least four elements: source (the issuer), the message, the communication channel, the recipient (receiver) of the market.

The issuer in this case is the pharmaceutical company who transmit its message through specific media (advertising, PR, sales promotion). Receiver can be the target audience or if the law not allows, specialized staff that can prescribe or supply the product. The message can be a text message written or read, an image, a gesture, a radio broadcast, television or the internet. Channels (media) are the ways in which the message it is sent to the receiver.

The media and the advertising

The television is characterized by a wide audience, high visibility, and credibility, combination of image, colour and text. It also has great importance the specific of television, the audience that is addressed to, existing televisions that have general audiences and niche televisions addressed only a segment of the population. The disadvantages of television are first of all related to the price paid for the advertising spot because the cost depends on the audience and on the audience.

Newspapers readers have a basic constant between tens of thousands and hundreds of thousands at the most popular in Romania, frequent appearance and the emergence of a national coverage and the cost is much lower than of television commercials. The disadvantages of this channel are short – lived, limited reproductive capacity and quality, the need to incorporate the messages several times and the passive nature of newspapers.

Opposed to newspapers, magazines aimed specific socioeconomic groups, provides a high quality reproduction have longer life span (a few weeks). The shortcomings of this channel are: higher price for advertising,

reduced flexibility, longer response time from the readers, and reduced frequency of appearance.

On the radio, benefits are similar to those of the television, but the audience is often lower and can be provided only audio messages that have a weaker impact on the audience. As a consequence, the price of radio advertising is lower than the price of TV advertising.

Outdoor advertising. is made by panels, neon signs, advertising on public transportation, it is characterized by a good ratio cost / results, allows repetition of exposure, attracts attention by showing the product in crowded places, on large areas, with visibility, brings big support to promote through other media. The disadvantages: the small selectivity, the message should be short. This channel is often used by pharmaceutical companies to promote their own name.

The Internet is the newest and most modern way of communicating an advertising message. The advantages of the internet are multiple: the communication is easy, provides a large amount of information, it is interactive, information can be updated constantly, can generate direct response, offers the possibility of direct communication with the receiver.

The interpersonal communication through medical representatives has the advantage that it provides a direct contact, offer the possibility of immediate transmission of the message, has the ability to improve information during the discussion, the understanding of the message is easier, cost of this channel is low and can have as effect the purchase decision.

The ability to select the most appropriate channels for transmitting the message to a given set of objectives is one of the most delicate tasks of marketing.

Most of the times in an advertising campaign the promotion is made in several ways, so the messages are more easily reach the subjects. When promoting drugs, for the specialist staff the chosen variants are magazines, advertising and mailing address and addressing doctors and pharmacists through medical representatives. For medicinal products that can be promoted for the population approached ways are many, because the law allows under certain

restrictions radio or TV commercials, promoting through newspapers, internet or advertising panels.

4. Communication objectives of the advertising message

The first objective is to win favorable attitude toward customers demand. The favorable attitude creates if the messages allow customers to easily identify the products of the company and to differentiate from other products on the market. For this purpose, the messages must include information about the product, its qualities so that a doctor or pharmacist to be convinced of the high quality of the product and favorable price and in this way contribute to selling the drug by prescription and recommendation. Once satisfied the first objective its aims to convince the qualified persons to contribute disinterested, based on confidence in the product, for selling the medicine. Another objective is to increase sales and market share and then as the last objective of improving the company's image and its products among current and potential customers in the market. [2]

5. Conclusions

Pharmaceutical companies have invested in 2012, with about 130 million euro to promote their products in the average portfolio. The net value is around EUR 20 million, according to estimates of Media Hub. This amount does not include special promoting where they spent other significant sums and that would make the total pass 200 million euro. But, most likely these amounts will not be anything in the coming years it is expected that the amount invested in advertising will increase by over 15 percent annually, according to pharmaceutical market growth through market development and advertising.

Organizing Strategies in Ecotourism Management

Simoni Smaranda

University of Pitești, Faculty of Economics
tsmaranda@yahoo.com

Mihai Daniela

University of Pitești, Faculty of Economics
dana_mihai2005@yahoo.com

Abstract

Ecotourism is coordinated nationally by a central body, whose duties imply mainly to manage the ecotourism activity on national level, to develop the ecotourism strategy, and to promote ecotourism domestically and internationally. Its activity is supported by regional organizations that conduct and coordinate the strategy for ecological tourism locally, collaborate and form national networks. Located at pyramid basis, the sectorial organizations in the ecotourism destinations (parks, reserves, ecosystems) are the basic cells of the ecotourism system.

Key words: sustainable tourism, ecotourism, ecotourism management, organizational strategies.

J.E.L. classification: L83, M31.

1. Introduction

Ecotourism is not a fashion, but a necessity of the third millennium, with benefits for ecotourists, local community, or organizations involved in sustainable use of natural protected areas. Ecotourism has become a tourist market segment with growing potential for its environmental responsible, sustainable, righteous qualities. The ecotourism market is the economic and geographic space where demand and offer for ecotourism services interfere with the society and influences directly their state and evolution over time.

The International Ecotourism Society considers that the ecotourism market is a market niche of nature tourism, defined as those trips in undisturbed areas, offering relaxation in nature based on tourists'

moderate activities in the environment and the welfare of local communities [3].

Ecotourism is also defined by its objectives of nature conservation and support for local people. Therefore is more difficult to quantify how many tourists in natural areas are motivated by the principles of ecotourism.

Estimates show that ecotourism holds between 20% and 40% of the global flow of tourists and recorded 10% of total international tourism. Some studies on tourist motivation revealed an increase in those who practice nature tourism and especially those who want to know the wild environment, although the ecotourism groups should be designed from 6 to maximum 30 visitors.

Ecotourism involves practicing tourism activities and related economic activities, in a natural, unpolluted environment, with beautiful and refreshing sceneries. Lately, ecotourism has been associated with national parks and nature reserves, having the function to protect and conserve, invest in and support the traditional rural economy, and maintain social, cultural and historical traditions of local communities [4].

2. Ecotourism, a component of sustainable tourism – a short literature review

The concept of ecotourism has emerged in the 1980s, as an alternative to mass tourism of intensive development. Although it was not established as such, ecotourism has direct links to declaring the first national park in the world (Yellowstone, USA), in 1872. The ecotourism activities developed within wild nature, in remote and fragile areas of the world. Ecotourism is also an alternative to traditional tourism of industrial type, from tourist resorts or overcrowded urban centers [2].

The concept of "ecotourism" was defined in 1991, at an international seminar on ecotourism of the Expert Council for Environment Canada (CEAC). In 1991, the International Ecotourism Society (TIES) defined ecotourism as "the responsible travels to natural areas that preserve environment and support the welfare of local people" [6].

The World Union for Nature Conservation (IUCN) stated that ecotourism "is an eco-responsible travel in undisturbed natural areas, in order to relax and appreciate nature and past or present cultural features, promoting conservation, having low negative impact, and providing benefits for the communities involved" [3].

Ecotourism is a component of sustainable development and is often named "green" or "soft" tourism. The definition accepted by UNWTO is relevant in this regard: "Ecotourism is a form of tourism in which the main motivation is the observation and appreciation of nature and local traditions" [4].

To summarize, ecotourism is a form of tourism in wild natural areas and traditional cultural areas slightly modified by man, that should be sanctuaries for the protection of nature and ancestral forms of civilization, and support the economic development of local communities [5].

In the narrower sense, ecotourism is based on the observation of nature, offering distinct tourism products, specific to cultural, scientific, and research tourism, practiced in countries with remarkable biodiversity, with nature reserves, national parks and local communities with unaltered customs and traditions.

Ecotourism helps protect vulnerable natural habitats and historical and cultural values threatened by degradation and destruction by intensive tourism, mass tourism or hunting. Ecotourism is thus a way to sustainable use of the environment and a tourism product with therapeutic (mentally or physically) properties [3].

3. Ecotourism management

Ecotourism management is the management, anticipation, organization, coordination, and control of all ecotourism resources to achieve maximum efficiency,

providing tourists' relaxing without prejudicing the environment.

In practice, the managerial process should consider permanently that ecotourism activities (research, study, recreation, education) must be made very carefully so as not to distort the environment, landscape, authentic and especially wildlife or local people. The recreational activities that may be practiced within the protected areas (some characteristic to mountain, adventure, or sport tourism) are the following:

- studying and admiring the landscape, flora and fauna (including the creation of panoramic view points);
- photographing, filming and painting landscapes;
- hiking in nature;
- ballooning;
- educational visits (courses, workshops, projects, activities and ecological restoration of habitats)
- educational visits (courses, workshops, projects, activities and ecological restoration of habitats);
- climbing, skiing, caving;
- gliding and paragliding;
- water travelers (kayak, canoe or rafting);
- visits to cultural, historical, and ethnographic tourist spots;
- knowledge and learning the local traditions (craft, dance, cuisine).

To conduct an effective ecotourism management, the following requirements must be considered [5]:

- the main motivation in practicing ecotourism is the observation and appreciation of nature, cultural traditions in natural areas;
- ecotourism should include educational features (afforestation, agriculture, rehabilitation of endangered species);
- inventory of resources including the protected natural and cultural areas;
- tours are conducted on small groups (up to 25 persons), usually by local tour agencies;
- ecotourism supports the protection of natural areas by generating revenue to host communities, providing business opportunities, jobs and increasing environmental concerns and the need for conservation of natural and cultural areas (UN);

- the ecologically sustainable development determines the level of ecotourism activities;

- setting the support threshold, in compliance with the consumption per tourist and standards to classify ecotourism facilities;

- providing professional training in ecotourism (staff accommodation facilities, guides, local communities involved), increase service quality (as important as the ecotourism attractiveness of the area);

- supporting material recycling, alternative energy resources, low-impact substances (biodegradable detergents, unleaded fuels).

UNEP suggests the existence of an integrated management and a development plan that takes into account national and local development strategies, based on impact studies and clear measures (monitoring tourists, tour operators, application of environmental standards) and in compliance with the legislation in effect (laws regarding environment, tourism, labor).

A condition for success is the involvement of local communities in ecotourism projects through partnerships, in order to increase their responsibility and ensure that some benefits are theirs. These partnerships are based on transparent networking collaboration, made current with system information necessary to certify as intra- and intergenerational equity. Ecotourism principles and best management practices allow institutional capacity building at local, regional and international levels.

4. Organizing strategies of ecological tourism

The tour operators on the tourism market noticed an increased interest in ecotourism and started promoting "eco" products, as [5]:

- ecotour or ecotravel;
- ecotravel or ecologic trip;
- ecovacation or eco-holiday;
- ecoadventure or ecologic adventure;
- ecosafari;
- ecocruise;
- ecoexpedition.

The need to respond in every respect to consumer demand for ecotourism has led to the diversification of organizational and

functional systems, involving operators with different qualities, namely:

- **sectorial organizations**, specialized in supply chain links of ecotourism products, some used in traditional tourism (camping, retreat, cottage, guest house, camp motel, hotel, cruise ship), some specific (ecolodge, ecomotel) built on ecological principles, recyclable materials that use alternative energy and have indigenous design;

- **organizations by destinations**, as parks, reserves, ecosystems, etc. They encourage cooperation and coordination between different sectorial organizations and coordinate activities in a particular area, jointing actions to promote ecotourism;

- **ecotourism organizations**, viewed as a whole, nationally or globally, with responsibilities in studying and predicting ecotourism phenomena, or in developing strategies and policies for sustainable development.

There are cooperative and subordination relations between them, while their activities overlap often. In such circumstances, we may state that there is a system of organizing ecotourism activities, structured on three levels similar to that in Figure 1:

- central (coordinator) body;
- regional (local) bodies;
- sectorial organizations.

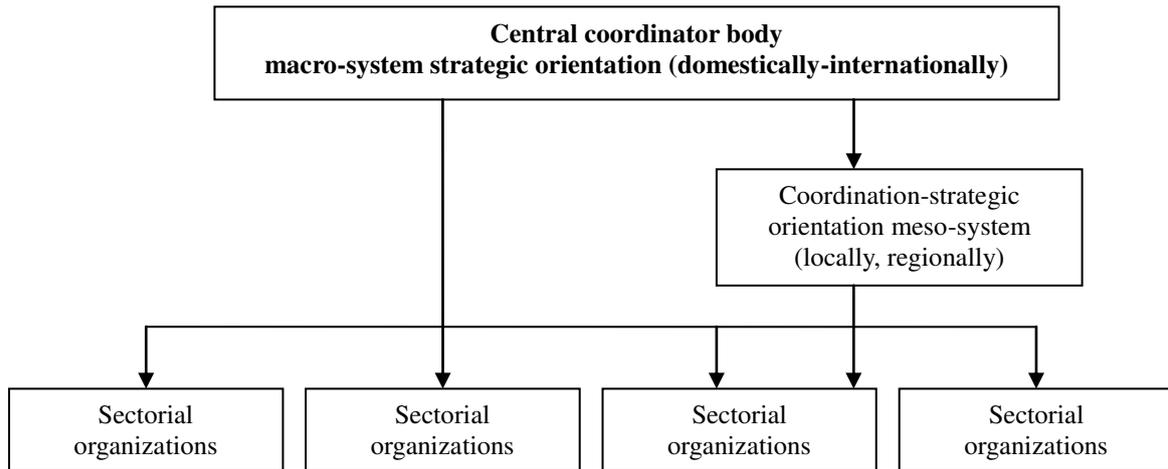

a) In most countries, ecotourism activity is coordinated nationally by a **central body** whose functions depend on the development and importance of ecotourism in that economy. The central body may be synonymous with national administration and often correlates with international bodies and their structure. Its primary functions are to coordinate ecotourism activities nationally, to develop the ecotourism strategy, to promote ecotourism domestically and internationally, to initiate and promote specific laws and regulations, to be representative within international bodies.

b) The **regional organizations** develop and coordinate the ecotourism strategy locally in collaboration with municipalities, conduct ecotourism marketing activities, providing and receiving information and a variety of promotional activities. These are known as "organizations by ecotourism destinations" [2], representing the main categories of eligible natural ecotourism resources [3], namely:

- national and natural parks;
- valuable terrestrial ecosystems (game reserves or birdwatching, ichthyofauna, deciduous or coniferous forests);
- ecosystems marine (formațiuni coraligene) sau ecosisteme umede (mangrove, estuare, delte, lacuri, mlaștini);

- marine ecosystems (corals) or wetland ecosystems (mangroves, estuaries, deltas, lakes, swamps);
- nature monuments and preserves;
- botanical, faunal, caving research centers;
- exceptional phenomena (polar auroras, meteors, eclipses, Fata Morgana).

Figure 1. General scheme of the organization system in ecotourism, for strategies and interests of major involvement on vertical and horizontal

(Source: made by authors [1])

The regional organizations generally have functional autonomy and their own budgets, such as NGOs, associations and foundations. They may collaborate and form networks nationwide.

The tourism planning of protected areas vary from country to country, as tourism facilities differ in each park; these are largely determined by their natural specific objectives, tourists' motivations, valuation possibilities. The existing equipment fits quantitatively and qualitatively the limits imposed by these ecosystems, but disrupt their balance when exceeded.

Tourism valuation of protected areas involves the regional organizations as follows [2]:

- setting of entry and exit points, as well as itineraries;
- organizing a tourist information centre;
- building the general infrastructure (road network, pedestrian network, parking space, water and electricity facilities, etc.);
- managing tourist flow: their sizes, tie hourly visiting groups, their frequency, duration of visit, etc.;

- arranging accommodation, food, sports and entertainment facilities according to specific conditions, resources, principles of tourism planning and development standards (technical regulations);

- arranging sightseeings;
- restoring degraded landscapes and sightseeings, signaling sightseeings, equipment and utilities.

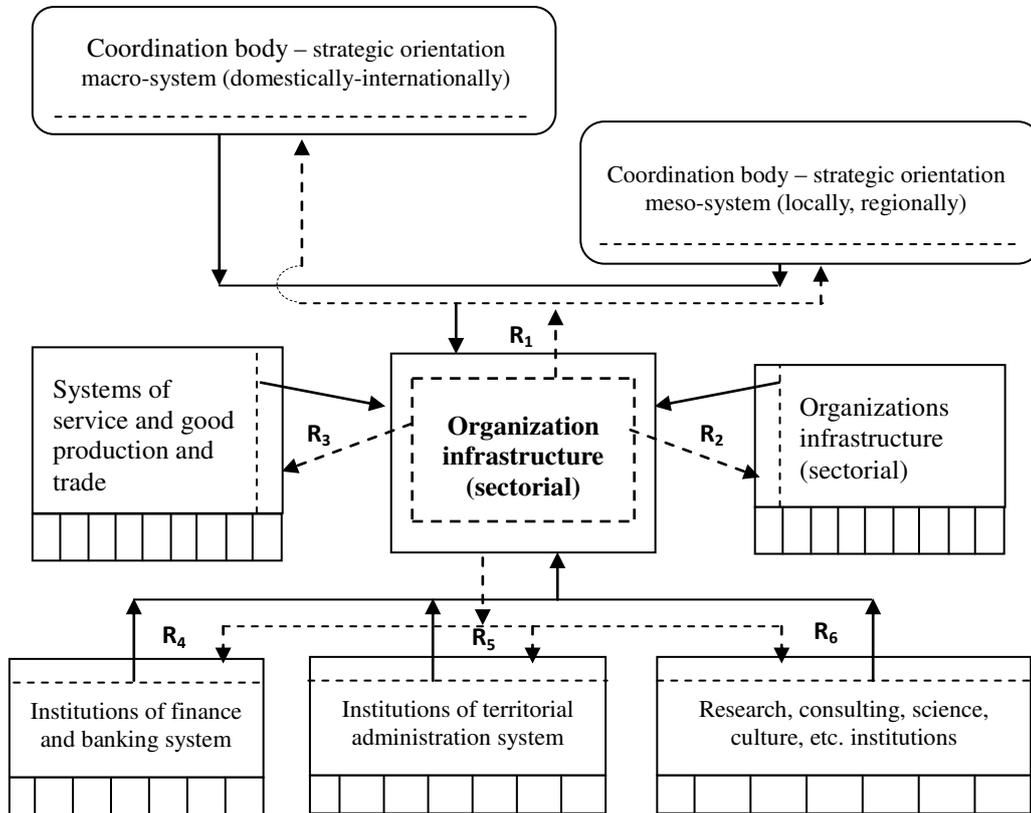

c) The **sectorial organizations** are the basic cells of the ecotourism system, being specialized in supply chain links in ecotourism product, such as:

- very diverse *accommodation structures*, some used in traditional tourism (from camping, retreat, cottage, guest house, camp motel, hotel, cruise ship), some specific (ecolodge, ecomotel) built on ecological principles, of recyclable materials, using alternative energy and indigenous design;
- *meal structures* with specific local food, organic food, often developed by local people that have the opportunity to build small businesses;
- *complementary structures* - transport services, guides, sports equipment rental,

leisure and sport (various sports facilities, natural ski slopes, swimming pools, horse riding etc.), handicraft products specific to each place, depending on the existing tourist

resources. These structures also provide residents the opportunity to enter the ecotourism business.

Figure 2. The system of infrastructure (sectorial) organizational relations, integrated into ecotourism interests

(Source: made by authors)

The scheme presented in Figure 1 allows to be adapted to the specific conditions of each country. It refers to the presence of one or more systems, to structure activities on two or three levels of organizational and strategic coordination, and the duties and powers belonging to each link. This model also allows for recognition as such, based on accurate documentation of the relations and obligations between them. Figure 2 provides an example.

Depending on the interests that require the need for collaboration between policy system – Figure 2, the actual content of relations R1 R6 ÷ detailing the convenience in an official document, usually in bilateral profile, taking into account their particular relationship with each of the components of the relational system.

5. Assessing performance of ecotourism management

The most important criterion for evaluating the performance of ecotourism management is respecting the carrying capacity of the environment, which translates into hospitality tourist reception capacity consisting in: capacity building or physical (degree of amenities tourism structures), social ability - perceptual (relationship of tolerance and communication among residents and visitors), ecological capacity (the use of resources and degradation), economic capacity (degree of participation of other sectors to support tourism), psychological capacity (tolerable level of congestion in tourist season). These types of capacity control tries to determine the level of development of tourism services, because

above a certain threshold it may lead to degradation, making a major tourist region or locality in time and space lose the function of active tourist destination.

The requirements formulated by the "Programme of Action 21" Code of Ethics in Tourism (UN, 2001), the "Johannesburg Declaration 2002" was done by developing a practical guide for the use of indicators for sustainable tourism features. Table 1 presents these indicators for assessing the sustainability of tourism [4]:

Table 1. Performance indicators in ecotourism management, as part of sustainable tourism

Indicator	Quantification means
Site protection	Delineation of sites according to IUCN categories - International Union for Nature Conservation, based on knowledge of protection criteria.
Tourist pressure	Quantifying the number of tourists per year and month, with the maximum and minimum flow setting.
Intensity of use	Assessing usability maximum ratio between the number of persons per hectare with tourist facilities.
Social impact	Calculating the ratio between the number of registered tourists per year / month and total resident population.
Developing conditions	Applying balance studies and environmental impact of all tourism activities, specifying the use of resources.
Waste management	Establishing wastewater treatment capacity, collection, processing waste to determine capacities of development of tourism.
Making plans	A general development plan with sectorial components (tourism, transport, urban facilities, etc.) and well defined objectives of socio-economic importance.
Quantifying and presenting fragile ecosystems	Analysis and strict records of species of flora and fauna endangered, estimated the number of individuals per species.
Customers' satisfaction	Regular assessing the consumer satisfaction by applying specific questionnaires (at least every 2 years).
Satisfaction of the local population	Establishing periodic set residents' satisfaction by applying specific questionnaires (at least every 2 years).

(Source: made by authors [4])

After a careful analysis of the sustainable tourism indicators we observed that the first category of indicators is easier to apply, while the last three are made up of variables consistent with their quantitative and qualitative features of the site. Therefore, identifying and assessing indicators of sustainable tourism in protected areas should be the contribution of tourism experts with

sufficient knowledge on the quality of environmental components.

6. Conclusions

Ecotourism management is the management, anticipation, organization, coordination, and control of all ecotourism resources to achieve maximum efficiency, providing tourists' relaxing without prejudicing the environment.

The ecotourism management should meet the following directions of action:

- detailed knowledge of customer preferences and motivations;
- quality management is based on the quality of ecotourism resources, raw materials, ecotourism and training facilities;
- quality refers to all services provided by a firm;
- the human factor with cultural and information on environmental issues carries quality in ecotourism;
- to promote the performance achieved by some travel companies that have been known to influence service quality management application accordingly;
- eco-business leads to eco-efficient results, namely the market of environmental goods and services.

To achieve these objectives, the ecotourism activity is structured in organizational terms on three hierarchical levels - the central (coordinator) body, the regional (local) organizations, the sectorial organizations - each with their own strategic objectives and having a functional system designed so to facilitate their achievement.

Integrating Internal Branding in Marketing Strategy

Slavova Milanka

*Department of International Economics and Politics, University of National and World
Economy Sofia, Bulgaria*
m Slavova@unwe.acad.bg

Abstract

Brand is a major asset of the company. Building brand equity requires a lot of efforts in brand positioning and development. In the recent years more attention is given not only to the outward branding activities but to the role of employees in the branding process. Internal branding is an essential part of the marketing strategy and branding decisions as part of the company marketing mix. It ties outward brand promise with creating employees' brand loyalty. External and internal brand correspondence strengthens the brand and increases customer satisfaction because employees are the most important brand ambassadors. The paper discusses the process of internal branding and its congruence with the brand equity development.

Key words: *internal branding, behavioral branding, brand understanding, brand loyalty*

JEL Classification: M310

What is internal or behavioral branding?

Internal or behavioral branding is an integral part of the company marketing strategy. It contributes to the strong consumer-brand connection by building consistent employee-brand relationship. “Live the brand” becomes a necessity for successful business strategy. According to Patrick Harris internal brand management “...should be the creed by which the whole organisation elects to live and breathe” (Harris, 2007). Internal branding creates competitive advantage for the organization by involving employees in the branding process. It allows the employees to understand their role in delivering the brand promise outward and motivates them by

being proud to work for the company and to convey brand values. Both customers and employees have to see and feel that their values are reflected in the brand. They have to feel it as their own brand.

The attention of researchers and companies management to internal branding is determined by different reasons. A major one is the dissemination and the domination today of the culture of sharing. Customers become co-creators of the brand. They are better informed on the companies' products and services, and the inconsistencies that can exist between the externally disseminated values and the internal reality are easily identified. Customers have more pre-purchase information and share their consumer experience in social media with numerous potential buyers. Customers can build and ruin a brand very fast. However, involving customers in the consumer-created brand marketing cannot be done by isolating company own employees. They have also to be integrated into the process.

The growing share of services is another reason for the growing importance of internal branding. People are a major element in the services marketing mix decisions since they have a direct contact with customers. The brand promise has to be delivered in all the contact points with customers because their satisfaction depends on the brand experience and service.

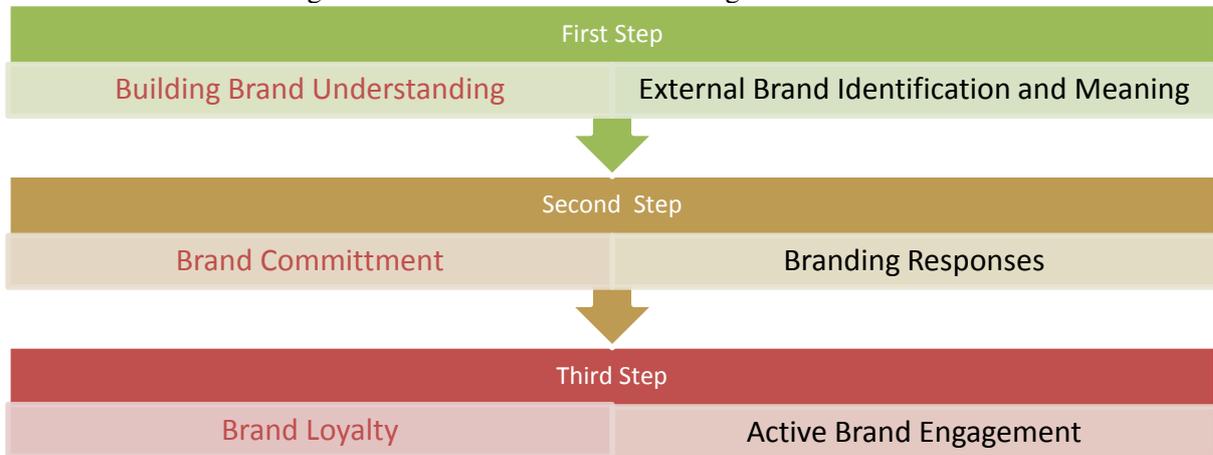

Integrating internal branding

The internal branding should match the external branding efforts. The employees should be considered as part of the company target market. Since external branding is currently the more developed process, the internal branding can follow its logic. One of the most popular brand building models is Keller's Customer-based Brand Equity Model (Keller, 2001) which comprises of

brand identity, brand meaning, brand responses and brand relationships. Based on this model the corresponding internal branding stages could be brand understanding

by the employees, commitment to the brand and evolving loyalty. The alignment process is shown on fig.1

Fig.1 Internal and External Brand Alignment Process

Based on Customer-based Brand Equity Model (Keller, 2001)

Building Brand Understanding is the first step in the internal branding process. It builds employees’ brand awareness. The first stage includes a variety of activities that help the employees to develop better understanding of the brand values and how their performance is interrelated with them. The marketing research tools as surveys, focus groups, and in-depth interviews can be used to identify to what extent the brand promise is understood by the employees. For example, if the company claims that it puts more efforts in delivering the brand promise than the competitors the company management has to clarify and explain to employees what this means for the concrete interactions with buyers.

The external managerial task at the first stage is to make brand “stand out in ways that are relevant to consumers’ needs... familiarity must lead to a strong, positive consumer-brand connection.”(Kotler, Armstrong, 2012)

A good example of the first stage is Lufthansa brand academy Seeheim. Its goal is to create a basic understanding of the importance and impact of brands in general and provide vision and future strategies for Lufthansa brand. The participants experience the Lufthansa brand with all their senses and become brand ambassadors. The main target groups for the Brand Academy are managers and service staff on board and ground. The academy has also new training devices and

learning levels for employees and managers from all the regions in which the company operates.

In the case of rebranding employees’ involvement is also necessary. They have to understand the business reasons for the rebranding in order to accept the new image and support the marketing department in consistently conveying the company’s rebranded message. The brand ambassadors in this case could be influential employees from different departments, geographic regions and job levels. Their main task is to communicate the new business strategy and signpost it to their peers.

Brand commitments is the second stage in the internal branding process. The major task at this stage is employees’ motivation. It is achieved by the development of individual and collective motivational initiatives. In order to keep the employees and attract new talented people the companies must have a clear internal message what they stand for and how it is translated into everyday obligations and responsibilities of the employees. Brand commitment is achieved when the employees identify themselves with the brand and are ready to apply additional effort to achieve brand goals.

Employee participation in the brand strategy development increases their brand understanding and develops brand commitment. For example Wrigley

developed the "platform of change" that focused on promoting the transfer of knowledge between employees, developing a lasting culture of positive accomplishment and motivation, and rewarding the staff for their efforts.

Many companies are trying to involve employees in the new product launches in order to improve their understanding of the product benefits, increase commitment and encourage them to become brand ambassadors. For example Nestle South Africa were launching a unique range baby cereals Nestum & Cerelac, nutritious meals in single serve sachets and designed an internal competition to make a 1 minute advert promoting product convenience. More than 500 employees took part in the competition. (Nestle, 2010).

Another tool for motivating employees is story-telling. The overall goal of story-telling is to develop the business, its profits and reputation by building trust and inspiration. Stories prove that the brand is authentic – realistic and tangible because the brand promise is delivered by real people. For example the corporate brand platform of Chevron “Human Energy” motivates the company personnel by showing the challenges that the company faced through the years. “The Chevron way” is the company vision on the key values that company holds in working with people inside and outside the company. Story-telling in FedEx inspires personnel by connecting personal life changes of the employees with the socio-economic and technological changes taking place in different regions of the world. Story-telling workshops at Philips internalize business goals and improve the communication among technical and other company departments. (Forman, 2013)

Brand commitment corresponds to the external step of branding responses. Its goal is to form customers’ positive attitude towards the brand and gradually to develop brand internalization that will lead to more sales and profit.

Brand loyalty is the third step in the internal branding. It can be achieved by human resource policy changes, new employees’ evaluation systems, compensation schemes, etc. The most successful companies have developed internal branding programmes with the joint

efforts of Marketing and Human Resource departments. Their cooperation is a major factor for employee-brand-consumers relationship. Brand loyalty cannot be achieved without the personal example and involvement of the company management and leadership.

Better work environment is another factor for employees’ brand loyalty. The employees in Shell Bulgaria appreciate highly the working conditions in the company. Many researchers consider the opportunity for work-life balance as an important reason for pursuing a career in a company and building brand loyalty. (Pujaisri, Wilson and Evannschitzky, 2008). Flexible hours, telecommuting options, compressed workweeks and family friendly work environments are part of the tools with which the companies can recognize outside company life of the employees and the congruence between external promoted brand values and attitudes towards employees.

Where should company start the internal branding process?

Building a brand-based culture in the company will keep employees motivated and with clear idea about his or her role in delivering the brand promise. The first step in creating such culture can be an internal brand audit that will identify the employees brand understanding, commitment and loyalty. The audit should target the employees and the management of the company. It will provide guidelines for the development and the implementation of integrated internal and external brand strategy. Some of the issues that can be included in the brand audit are the following (Brand Insight Assessment, 2012):

- ✚ What is the employees understanding of the brand?
- ✚ Is the employees’ brand understand relevant to the external brand promise?
- ✚ Is the organization consistent in communicating brand identity inside the company?
- ✚ What are the major channels for informing the employees?
- ✚ What are the main motivational tools for delivering the brand promise by the employees?

- + What is the level of employee satisfaction with motivation?
- + What are the major contact points between customers and employees throughout the brand value delivery?
- + What support and training employees need in the contact points?
- + Do new and existing employees receive training?
- + Are the employees interested in developing a career in the company?
- + Does the management understand the need of internal branding?
- + Does the senior management develop internal and external branding strategies?
- + How is the Human Resource Department integrated in the marketing strategy development and implementation?
- + How are the results of the internal branding programmes measured?

The audit can be based on employees' confidential surveys and focus groups to identify specific issues in employee-customer contact points. The combined efforts of internal management and outside consultants will contribute to the objectivity of the internal brand audit.

Conclusion

Internal or behavioral branding is a needed component in the marketing strategy of the company. It requires joint efforts of the company management, marketing and human resource departments. Strong internal branding enhances company brand equity and results in higher customer satisfaction and profits.

Teamwork – a Solution for Romanian Organizations

Stan Ștefania Anca
„Vasile Alecsandri” University of Bacau
anca_stan68@yahoo.com

Abstract

Creating an environment that is built on teamwork and establishing an effective team is a real challenge for any company and it is the responsibility of the organization, the manager or the team leader and of each team member. Thus, Romanian managers are required to have in-depth knowledge of their team hence they can make use of their full potential. The purpose of this paper is to analyze teamwork in the Romanian companies. Based on the analysis of 90 completed questionnaires, we are presenting the conclusion: being innovative and capitalizing creativity and quality more than quantity both for the individual and organization level, Romanian’s managers know that an inspired solution for crisis is based on the concept of high performance team.

Key words: work group, team, teamwork, team leader

J.E.L. classification: M 59

1. Introduction

To succeed the organizations must rely on the knowledge, skills, experience and perspectives of a wide range of people to solve complex problems, to take good decisions and to provide effective solutions. The fundamental unit of labor in the modern organizations is the team and not the individual. According to these forecasts, when management seeks faster and better ways to best match resources with the customer expectations, the opportunities and the competitive challenges then the organizational structure is critical at the team level and not at the individual level. This does not necessarily mean that individual performance and accountability are not important. The challenge for the team

management is rather to balance the roles of the individuals and the role of the teams and to transfer or promote one or another.

2. What is a team?

One definition we have used to help reflect on this question was Bailey and Cohen (1997) definition of team. “A team is a collection of individuals who are interdependent in their tasks, who share responsibility for outcomes, who see themselves and are seen by other as an intact social entity, embedded in one or more larger social systems and who manage their relationships across organizational boundaries.”[1]

Jon R. Katzenbach and Douglas K. Smith in their 1993 book, *The Wisdom of Teams*, provide practical distinctions among the kinds of groups currently operating in organizations.

- Working group - the members of this group interact primarily to share information, best practices, or perspectives, and to make decisions to help each individual perform within his or her area of responsibility. There is really is no reason for either a team approach or common/mutual accountability. To members of this group, team building activities are pointless and take time that could better be spent “doing real work.”
- Pseudo-team - this is a group trying to be a team. There often is no common, shared goal, or the goal is not seen as a valuable contribution for the organization. Pseudo-teams are the weakest of all groups in terms of performance impact. They almost always contribute less than working groups because their interactions detract from each member’s individual performance without delivering any joint benefits. For a pseudo-team to become a potential

team, the group must define goals so it has something concrete to do as a team that is a valuable contribution to the company.

- Potential team - may share a common, significant performance goal and may be trying to address teaming obstacles. They require more clarity about purpose, goals, or work products, and more discipline in hammering out a common working approach. It often has not yet established collective accountability. Or perhaps team members have not been relieved of other responsibilities, forcing them to prioritize their time and effort.
- Real team - a small number of people with complementary skills who are equally committed to a common purpose, goals, and working approach for which they hold themselves mutually accountable. The possible performance impact for the real team is significantly higher than the working group in that the contribution of the whole is greater than the possible sum contribution of individuals on the team.
- High-performance team - a group that meets all the conditions of real teams and has members who are also deeply committed to one another's personal growth and success. The high performance team significantly outperforms all other like teams, and outperforms all reasonable expectations given its membership. Members of high performance team pool their diverse talents, experiences, and perspectives to produce solutions that are greater than what they would have produced as individuals merely coordinating their individual activities.

In conclusion, we can say that teams are complex, unique entities that have been characterized as: two or more individuals who interact socially, adaptively, have a shared or common goals, hold meaningful task interdependencies, are hierarchically structured, have a limited life span, whose expertise and roles are distributed and are embedded within an organizational and environmental context that influences their process and outcomes.

2. The role of teams in achieving the high performing organization

Teams and performance are an unbeatable combination. Several phenomena explain why teams work well.

Firstly they bring together complementary skills and experiences that by definition exceed those of a single person on the team. This broad mix of skills and experience allows teams to respond to complex challenges such as innovation, quality and customer service.

Secondly, the joint development of clear objectives and establishment of team relationships that help resolve problems in real time. Teams are flexible and responsive to changing events and demands. As a result teams can adjust their approach to new information and new challenges with greater speed and higher accuracy than those working in large organizations.

Thirdly the team offers a unique social dimension that enhances the economic and administrative aspects of work. Real teams do not develop until the people do hard work to overcome barriers that stand in their way to achieving collective performance. Overcoming such obstacles together helps people who make up the teams to build confidence in each other. They also increase their mutual purpose to perform for their team regardless of individual needs.

Teams do function better in an organizational culture that encourages high performance by promoting the following five principles:

1. Teamwork is characterized by a set of flexible and adaptive behaviors, cognitions and attitudes. Teamwork is defined as a mechanism by which members are able to adapt and adjust in a timely manner and to action in order to meet the demands of the team members thereby resulting in coordinated, synchronized collective action.
2. Team members must have the willingness, capability and preparedness to assume the duties of their fellow teammates. Teams that successfully engage in backup behavior will achieve a level of performance greater than the sum of its individual members.
3. Teamwork requires the coordination of the collective interdependent team

member behavior. Team coordination can be defined as the process by which team resources, activities and responses are organized to ensure that tasks are integrated, synchronized and completed within established timeline constraints. The coordination makes possible the team performance and its effectiveness.

4. Teamwork requires team members to actively manage conflict with the aim of creating and maintaining harmonious interpersonal and inter-team relationships. Every team member must make a concerted effort to contribute to the collective social system within which the team members operate. Team members must consciously manage interpersonal relationships because good relations can prompt the voicing of concerns, the giving of feedback and the implementation of change.
5. Teamwork requires leadership skills that enable directing, planning and coordinating the activities. The leader is not only responsible for the outcome of a project but also for building a strong and effective team. Each team members needs effective support so as to fulfill his or her role in a project.

Despite its many advantages working in teams is increasingly hard work in today's rapidly evolving business world. Today's teams are facing with complex, high-stakes issues that require clever innovation, resourcefulness and disciplined action[3].

Success or failure of the teams depends on organizational commitment to training. All employees depend on new technical skills, new interpersonal skills and new administrative/supervisory skills. Team members should not only learn one another's jobs but they will also acquire new skills in areas such as problem solving, goal setting, team dynamics, business operations and interpersonal relations.

3. Teamwork in Romanian organizations

This paper is analyzing teamwork in Romanian organizations. The premise of this research is that full the team's potential is not exploited and it's being blocked by the leader's inability to understand that a group will work only if the entire organization appreciates and relies on teamwork.

Research on work teams in Romanian organizations was based on using the following attributes to define team performance:

- Clear goals – goals should be specific enough to give the team direction. Associated with providing clear goals is the development of meaningful and acceptable performance measures so that the team members can feel confident in their own achievements.
- Resources – for teams to operate effectively they must have access to resources. These resources include money, equipment, technology, people and information.
- Organizational support – teams cannot operate without the support and commitment of middle and upper management.
- Decision making authority – teams require decision making authority and therefore a certain level of empowerment in order to carry out their work efficiently.
- Effective leadership – team leaders do not direct or control work but instead work as coaches and mentors.

Our research is based on the assumption that creating an environment based on teamwork in Romanian organizations involves building an organizational culture that is based on the concept of teamwork.

We have used an explorative research and have administered questionnaires and field research including interviewing employees and managers. We have selected a number of 90 organizations from Eastern region. The companies questioned were sampled from different fields of activity such as:

- services 70%
- production 17%
- construction 9%
- others 4%.

The questionnaire has two sections. The first section contains information about firm, field of activity, number of employees, respondent's age. The second part of the questionnaire includes a set of 110 items. This set of items was divided into five sections corresponding to the five essential attributes of a team performance: direction, structure, work processes, relationships within the team, relationships with other teams. Each item was structured on a Likert scale in 10 steps and respondents had to

encircle the note that best indicated their attitude towards these claims.

Research of theoretical, methodological and practical advantages of teamwork in organizations has enabled us to synthesize the following results:

- ✓ For Romania the developments taking place internationally are opportunities in the integration process of transition from an industrial society to a knowledge society. The main resources of the knowledge society are not financial or material resources but knowledge, illustrated by social and human capital. Power is not given by money, providing control and distribution of resources but it is given by knowledge. Teams bring together complementary skills and experiences that exceed those of a single person on the team. This broad mix of skills and experience enable teams to respond to complex challenges such as innovation, quality and customer service.
- ✓ Perhaps the most important characteristic of an effective work team are the assigned objectives. It is important that the team is allocated realistic tasks and access to appropriate resources to implement. In Romanian organization the teams don't have a written statement about their mission.
- ✓ Group decision – a mature team that works well take a number of decisions after a debate in which all views were analyzed. In Romanian companies, employees often find different solution to problem but they are afraid to make suggestions and avoid assuming responsibility for their decisions. Consequently most decisions are passed from one to another until a decision is inevitable. Groups are generally slower to arrive at decisions than individuals, so sometimes it is difficult to utilize them in situation where decisions must be made very quickly. Also, if a powerful leader dominates the group, other group members may quickly conform to the dominant view.
- ✓ Reward systems – it is necessary to be designed to encourage cooperation, critical thinking and problem solving. In the Romanian organizations the pay system must be focused on performance within the team, it must provide

incentives to perform better and learn more skills and to stabilize team members' performance. Companies that use teams must try to strike a balance between rewarding the group and rewarding the individual.

4. Conclusions

Employees, team leaders and managers of Romanian companies should be educated and motivated to build and sustain teamwork and team effectiveness. One problem is to transform the traditional work collective in high performance teams traditional team of employers represent a group of individual who believe and act as individuals, each with its work program.

Romanian organizations must recognize the competitive advantages from playing as a team. The benefits for the organizations are: improved quality of work life, lower absenteeism and turnover, increased innovation, better organizational adaptation and flexibility. Teams represent one of the best ways to support the broad – based changes necessary for the high - performing organization. And executive who really believe that behaviorally based characteristics like quality, innovation, cost effectiveness and customer service will help build sustainable competitive advantage will give up top priority to the development of team performance.

The premise is that team potential is not being exploited and it is actually blocked by the inability of the Romanian leaders to understand that a group will perform only if the entire organization appreciates and relies on teamwork.

Abstract

Although commercial services always accompanied the trade activities, the impact and power of these business were really felt about 3 decades ago. This paper aims to present the concept of commercial services from different points of view and to analyze various commercial business operations that implied the need to group trade services in several categories for easier administration, but also for solving economic and social problems such as vertical or horizontal competition. Due to the complexity and characteristics of commercial services, organization of commercial activities should provide flexibility depending on the time of the request, the moment of performance and the consumer behavior. Therefore, the knowledge of the characteristics of business services and their consequences for consumers and traders can influence the efforts to achieve results and to assume commercial risks. A briefly presentation of the commercial services development and their effects in the activity of a successful furniture trader is provided in order to demonstrate the importance of this type of services.

Key words: commerce, services, development.

J.E.L Classification.: L81, L84, M10, M31

1. Introduction

Modern trade grow from one period to another, becoming more and more an

integrated system in terms of relations with producers, as well its relations with consumers.

The new forms of distribution, acting in terms of increased competition, tend to favor prices and perform a transfer of tasks between partners, especially the move to producers or consumers. Such a trend is also felt in the area of commercial services development.[1]

The wide variety of commercial services, the continuous multiplication of possibilities to achieve them, and mutations that interfere with requests and demands purchases generate an increased complexity of those service integration systems offered by every type of commercial unit.[2]

Thus, modern trade represent, from one period to another an increasingly integrated system both in terms of relationships with producers, and in terms of its relationship with consumers. Such a situation has implications for achieving location field services and duties of the partners, and the difficulties of perception or establish trade margins relative to the operations performed by each partner.[2]

2. General considerations on commercial services

Retailers of our days, the last door to the consumers, organize the so called logistic-supports, known like commercial services, in order to:

- facilitate the selection and choice of merchandise (i.e. -information, consulting);

- improving confort and easier purchase(i.e.-extended time-table);
- ensure best conditions to the use of products purchased(i.e.-post sale services).

Establishing of commercial services, and as well the sizing of supply capacity policy are components generated on the one hand by the stiffness and perishable supply, and on the other hand, on the demand variability.[3,4]

Regarding the definition of commercial services system, there are many challenges, including some belonging to prestigious schools or professional associations. Thus, "American Marketing Association" defines commercial service as "an activity offered at the act of sale, which provides benefits and customer satisfaction without exercise physical exchange as a good".[5]

Considering that the above definitions play an incomplete role in the case of specific commercial services, the specialist A. Tordjman, in "Strategies of competition in commerce – the services for customer", use the ideas contained and complete and adapt them to the new developments in business, offering a more complete and a strong pragmatic point of view. By A. Tordjman, commercial services can be defined as "the sum of satisfactions or utilities a shop offers to its customers shop."[2]

In terms of commercial services, their approach must be done from the global evolution of service activities worldwide point of view ; instead, it is necessary to take into consideration that any predictive approach of these issues can not ignore the requirements outlined by the world economy, the more since the general trading and retailing one in particular,tends to a sharp internationalization. In addition, experts estimated that, worldwide, economic developments began to take place under the influence of several factors acting intensity becoming stronger in the direction of expansion and amplification role in the economic life services.[6]

The enterprises`offensive in various markets is focused on a package of „services”that integrates –more than ever before-the observance of terms and vivid contacts between enterprises and customers;we could say that services rendered to customers represents a window between the market and the enterprise`s value

creation.[7]

Summarizing these points of view we can say that commercial services represent in the meantime:

- a complex system of utilities, benefits, advantages and even consumers rewarding and not as simply selling of products;
- an integrated sector, which groups all activities related to the sale of goods (eg cleaners, security services);
- an element of the marketing policy of any company which offers buyers additional benefits.

3.Characteristics and typology

Due to the complexity and characteristics of commercial services, organization of commercial activities should provide flexibility depending on the time of the request, the moment of performance and the consumer behavior.

Thus it is clear that knowledge of the characteristics of commercial services is essential for the organization of the business units and for grounding corresponding sale strategies.The well understanding of the specific features of commercial services is needed to deal with the distribution`s requirements,accordingly with the package of services rendered to the client.

Considering the consequences for businesses and consumers can be distinguished three types of features:[8]

- Preparation and consumption are simultaneous;
- User participation in the delivery of services;
- The price of services is a demand price.

Commercial services have some specific features that are important for understanding the constraints associated to the policies by the joint effort of the distribution channel`s members.[7]

In this respect,Ph.Détrie,A.Maurial and A.Tordjman consider the following specific features of the services that could be provided by the distribution sector:[7,9]

- ✓ **Intangibility**-the service is partly intangible and difficult to be measured,seldom specified and often included in a complex product;
- ✓ **Simultaneity-production/consumption**-the service cannot be stored,is based on a

personal relationship and may be placed in a relational and/or emotional context;

✓ **Heterogeneity**-the service cannot be renewed until being identical, is evaluated by both outcome and mode of provision and requires sometimes the customer's involvement.

The area of services associated to the product trading is complex and consequently not easy to be defined and identified.

The category of commercial services involve a wide range of operations, and prospects for different content, so it is necessary to use groupings and classifications to consider the range of available services and how to integrate them in the economic activity.

The most popular commercial services systematization identified five main groups:[8]

1. **As the nature of services**, depending on which could be scalable the competitive ability of different types of trade companies, there are: rental services (cars, clothing); repair services (household appliances ,cars service); services related to the sale (parking,home delivery);

2. **After the sale service site criterion**, useful classification for the outlets trade policy by targeting specialized forms of marketing to their customers,we can evidence the following services: services single-sold (insurance, travel agencies, banking); services sold with the product (home delivery, credit, schedule).

3. **Following the origin of services**: classification important in ensuring the balance between producers and traders in the distribution of specific costs and risks it can be identified: services related to production (integrated into product,like the instant food products) and services generated by new sales methods (conditioning, presentation, labeling information).

4. **After the service functions criterion**, classification offering the choice and an operative integration on each type of service organization and the continuous completion of the product range, there are the following types: psychological (parking,proximity); technical (transport,service);financial (consumer credit,card payment);extra commercial (restaurants area).

5. **Concerning the services integration system**: classification which provides the

necessary implementation of various business strategies and solves the problem of describing the organization of sales.

Another typology of commercial services grounded by A Maurial, highlights services by 4 chronologically stages of buying products:

➤ Services of access to the product,like proximity,parking or advertising;

➤ Services of information concerning the products:quality labelling,consulting or possibility to test the product at home;

➤ Services concerning the purchase of products:delivery,transport,return of old goods;

➤ Services of the use of products:post sale service,guarantees,assembly instructions.

The more a trading system available to a company is developed, including a large variety of services, the more increases their potential and can cover a larger range of consumers.

4.The commercial services-mix

Commercial services can be considered as an element of the marketing business - manufacturing and commercial - concerned to provide additional utilities product to shoppers or points of sale.[8]

Development of commercial services concomitantly with new information technologies and product-service interference led to a series of transformations and institutional changes. [9]

In this approach, services are a source of diversification and strong individuality of the offer of each commercial enterprises. This phenomenon is more striking as some companies that add to their core business several additional services, which, at first glance, are furthest from the profile of products sold. For example, some shopping malls or large areas stores have been selling tourist trips or organized classic restaurants or fast forms ,organized cleaners or repair the clothes activities, rental cars, DIY material, video cassettes, etc.. We have also bear in mind that such services can be provided either directly undertakings specialized staff who organized units or branches in the store, or acting on behalf of and for commercial firms concerned. In both cases, these services contribute to exercise a powerful attractions to shops on potential clients by harnessing

marginal utility it offers to consumers.[2]

Based on the concept of marketing-mix, which examines the implication of the various resources of organizations to achieve certain results and economic effects has been developed the strategic model of service-mix, ensuring the proper functioning of any combination of services to achieve a certain level of growth, and reasonable costs in relation to these combination effects.

In the structure of the commercial service model proposed mix D.Patriche can found the following components:[9]

- ✓ Conditions and supporting activities:
 - technological developments;
 - promoted policies about facilities created;
 - development and promotion;
 - ways of managing labor force;
 - psychosocial climate of the company;
 - typology of activities performed.
- ✓ Primary activities
 - good-service integration;
 - preparing product for use;
 - consumer information and
 - maintain bought products in perfect order.

Elements such as merchandise, commercial network, commercial technologies and consumer services have led a number of common trends and influences on business services,as follows: [2,9]

- changing in management processes and strategic shift to commercial services and new management systems;
- growth and diversification of commercial services through individualization of each business unit type or form of sale;
- modernization of commercial services, continuous dialogue with the customer, the service provision and business activities improvement;
- contradictory tendencies in the development of services in a general sense, but also influencing the commercial services (i.e. natural consumption of services, , considered the preserve of specialized business units).

5. A successful experience

IKEA can be given as an example of a company that has revolutionized the furniture retail through distinct strategic positioning, which beside marketing represents the specific set of activities of the company.

IKEA company was founded in 1943 by

Ingvar Kamrad. At first, this young Swedish sold postal stationery. Then he had the idea to sell furniture in 1947, and opened its first branch.IKEA then rapidly diversified products sold quickly launched a range of accessories and decorations, then fresh light districts of northern origin. His creative genius was that he imagined objects made of parts, kits that can be assembled at home by anyone, while ensuring reliability and sturdiness. These features were those who conquered audiences worldwide. [10]

The strategy that the company use to develop its commercial services is to increase and diversify, the variety of services offered to consumers being a basic feature of the IKEA concept.

It can be said that IKEA commercial services offer covers all their typology. Thus, concerning *services by their nature*, the company offers customers the possibility to return products if they are not fully satisfied, have furniture rental services for professional photo shoots and filming commercials and cinematography, repair services are available for textile products. Speaking about *the location of services in the sale*, IKEA has sold with product services such as home delivery. Considering their origin, the services offered by IKEA are both linked to production and sales generated by new methods (presentation, informative labeling of products), the company paying attention to both. Regarding *service functions*, the company covers the whole range, focusing mainly on technical functions like the possibility to obtain quality products and on psychological ones, like the attention paid to all categories of quality customer, service in shops, or reward for their loyalty through financial services and gift cards. Upon the *system integration criterion* IKEA services are both exogenous (financial, that consumers have various payment methods) and endogenous (delivery, installation and finishing touches).[11]

The range of services offered by Swedish giant is very diverse and differs depending on the region or country where they are provided, company adapting its offer to the specific needs. For example, in the UK, the company offers customers the possibility to get a considerable discount to purchase products if they give back old furniture in the premises and In the U.S., offers free advice

regarding redecorating homes or offices. IKEA covers also all the elements that make up the concept of service - commercial mix as it was previously described, as follows:

Concerning *conditions and supporting activities*

- for technological developments, the IT Department provides the software solutions Microsoft Dynamics NAV and Landsteiner Retail, which provides support for all processes within the company (retail, logistics, financial accounting, and so on).

- regarding the policies promoted by the firm on the availability achieved and development and promotion policy, now all IKEA stores are franchises, this being the main strategy of internationalization of the company. The main part of franchises belong to IKEA group, just few franchisees being entrusted to outside group.

- Referring on how to manage the human resources, in each IKEA store there is one team of each of the departments. Trained workforce is specialized and trained to explain the benefits and to inspire people to discover IKEA products, the main task being the brand building and motivating people to visit stores.

- Taking into consideration the psychosocial climate of the company, employees appreciate it like innovative.

- That type of activity is a manufacturer and distributor of furniture known worldwide for its unique and modern pieces.

Concerning *Primary activities*

- IKEA provides both good-service integration and preparing product for use, the low-cost business strategy being based on selling furniture as individual pieces assembled together with a special kit assembly, they will be transported and assembled at the residence of the purchaser.

- the consumer information is ensured by a series of catalogs and websites through which to choose the desired product before visiting the store. Before buying the product, the merchant provides the information required about the desired product.

- the maintenance of bought products in perfect order is also ensured through a wide range of after sale services.

The variety of services offered to consumers is a basic feature of IKEA, the company adapting its models sold in trends of each season. It also tries to cover a very

broad range of potential consumer preferences, taking into account their economic and social status.

The Swedish company has placed great emphasis on customizing its business units in order to create their own identity by which to differentiate itself from other furniture manufacturers in the market. Thus outlets IKEA products are distinguished by products placement in a way quite handy for customers, signaling districts and friendliness of the staff. Thus, the company is trying to make most attractive stores with a warm, welcoming climate, in order to increase the shopper satisfaction.[11]

IKEA concept is based on partnering with customers and maximize the use of raw materials to meet the needs and preferences of people by providing them quality products at affordable prices.

6. Conclusions

The more a trading system available to society is developed, including a large variety of services, the more it increases their potential and can cover a range of more consumers.

The wide variety of commercial services, the continuous multiplication of possibilities to achieve them, and mutations that occur in buyers demands generate an increasing complexity of such services integration systems in the offer of every type of business unit, as well as difficulties in terms of cost support and delimitation. Therefore, solving these problems is based on the reasoning to take into account both the location of each partner in the flow of products from producer to consumer and, in particular, the role of trade in consumer satisfaction system as well as the possibility of tracking these costs, the concept of a commercial character and, lately, of some emerging trends in product-service system utilities.

As we can see from the example of IKEA, commercial services provided by a company contribute rather than significantly to its development, playing an important role in its success.

Defining Performance Management in the Public Sector

Stăniț Alexandra,
„Lucian Blaga” University of Sibiu, Romania
alexandra.stanit@ulbsibiu.ro

Popa Liliana Mihaela,
„Lucian Blaga” University of Sibiu, Romania
lili.popa@ulbsibiu.ro

Abstract

Improving the performance of public sector is an important goal for the policy agenda in almost all industrialized countries. Public sector organisations are facing with the most demanding performance challenges in living memory. The recent comprehensive spending review reflected the poor state of the public finances and therefore imposed an era of financial cuts and constraints onto public sector organisations. Against a backdrop of everincreasing service demands this means that public sector leaders have to find ways of delivering more with less.

Key words: performance, performance management, public sector.

J.E.L. Classification: H4, J3

1. Introduction

Improving public sector performances is major for the political agenda of all industrialized countries. The performance of the public sector is generally closely linked to overall economic performance of different countries.

The quality of the products and services in the public sector became in time one of the fundamental goals within all the public and administrative authorities of the developed countries. The reformes in the public sector have focused on increasing the quality of public services, reducing budget allocations for public services, getting closer to the citizens, increase efficiency and effectiveness of the sector. Quality as a competitive strategy has been applied in an original way to the industrial processes and, more recently, on services.

The private sector performance measurement tools and techniques are increasingly being used in public organisations. It has been argued that the use of these techniques could help public organisations minimise waste, eliminate fraud and abuse of public resources and subsequently be more efficient and effective in providing services to citizens. Although some researches have reported the success of the private sector performance measurement models, in transferring these private sector concepts and tools to the public sector have appeared some problems that need to be examined. As such, in this paper, a conceptual analysis of the contemporary performance measurement frameworks is undertaken to determine their appropriate adaptability and implementation in the public sector.

2. What is Performance Management?

The concept of performance meets in literature with different meanings, like with the word successful, the result of an activity, or of an action. In the economical domain, the concept of performance covers different understandings, such as growth, profitability, productivity, efficiency. The concept of performance has been accepted recently in the public sector.

Performance management is what organisations do to become more successful and stay ahead of their competitors. In fact, managing performance is the most critical task of any manager. If organisations succeed to implement the right concepts, their performance management processes allow them to define and communicate their strategies, measure, report and monitor

progress in order to manage and improve business performance. [3]

Performance management can basically be defined as a set of management processes, often supported by information technology, that help to improve the strategic decisions people make every day. In the end it is the quality of those decisions that will separate successful companies from the rest. Performance management is therefore a modern umbrella term for a set of management approaches that enable organisations to define and execute their

strategy, and to measure and monitor performance in order to inform strategic decision making and learning. [3]

The basic performance management model integrates processes for defining strategic objectives, measuring performance, analysing performance and reporting and reviewing performance and aligning people and culture. All of these are focused on performance improvement which is the central premise of performance management (see Figure below).

Figure 1: Enterprise performance Management

Source: What is Performance Management, Advanced Performance Institute, www.ap-institute.com, accesa la data de 22.04.2013

Strategic Performance management is about defining, assessing, implementing and continuously refining an organisation's overall 'business' strategy.

This goes far beyond the narrow definition of performance management, which is often used simply to describe the act of performance measurement and reporting. Strategic Performance management is about identifying what matters, measuring this and then managing to improve the effectiveness, efficiency and overall performance of an organisation.

Measuring performance is relevant to what organisation is trying to achieve on a

broader scale, and it also refers to the feedback into every employee's daily working life, enabling transformational change to produce real results.

Modern performance management approaches bring together these key aspects of management to form an integrated approach. In the past, performance management was sometimes narrowly associated with either people or performance.

Using the basic strategic performance management model, organisations start with defining their strategy, then move on to measuring performance, and use these indicators to analyse performance in order to

extract insights and make better informed decisions which lead to actions and performance improvements.

Strategic Planning – This step involves creating a business model and strategy (either corporately or for a business unit). We can include here Balanced Scorecard Strategy Maps and value-driver mapping. Informed by strategic analyses, organisations identify what are the strategic objectives they plan to accomplish. [2]

Performance Measurement and Monitoring – Organisations design key performance indicators (KPIs) to measure and monitor how well they are delivering on their strategic objectives. Most important is to ensure the metrics are relevant and meaningful. Many fall into the trap of measuring what is easy to measure instead of what will provide the best insights.

Business Intelligence (BI), Analytics and Modelling – In this step organisations use their performance data and metrics to analyse performance. This step is all about creating a solid evidence-base to inform decision making. *Business Intelligence* and modelling approaches include marketing and sales analytics, customer analysis or click stream analysis.

Reporting & Reviewing Performance – In this step organisations translate the insights gained from their performance information into management reports and dashboard and put the review processes in place to act on the data. It is all about evidence-based decision making facilitated by the performance review processes. [2]

Aligning People and Culture – In this final step organisations ensure the people, culture and leadership approaches are focused on performance improvement. It is about creating the soft elements of a high performance organisation to ensure the performance management processes.

More advanced performance management approaches integrate with other key management processes. Here we briefly look at some of those processes in turn and explore the need for alignment.

Financial Planning, Consolidation & Budgeting – By integrating budgeting and financial planning with corporate objectives and priorities organizations ensure that the financial resources are spent on the things that actually matter the most. Some of the

leading organisations are now able to update their budgets and forecasts on the fly, based on a continuous inflow of both financial and non-financial data.

Project and Programme Management – The delivery of projects and programmes needs to be aligned with the corporate objectives and priorities in order to ensure that efforts are focused on what matters the most. The activities (projects and programmes) need to be prioritised based on strategic needs and therefore have to be aligned with the strategic performance framework of an organisation.

People Performance, Rewards and Recognition – For most organisations their people are their most valuable and most expensive assets. In the end it is people who deliver the projects and implement the strategic plans. By aligning budgets and projects with the strategic performance framework organizations have made major steps towards alignment. However, by further aligning reward and recognition systems as well as personal performance management processes to the performance framework organizations can create a tight integration between what matters the most and what people perceive as important. [2]

Risk Management – The management of risk is too often narrowly focused on just financial risks. While these are important, they are not enough. The performance framework has identified the key drivers of future performance and it is therefore important to assess and monitor any risks in relation to all your performance drivers in order to achieve alignment between your risk management and what matters the most for future performance.

Performance Reporting, Dashboards and Scorecards – Relevant performance information is not only crucial for better decision making and performance improvement, it is also a requirement for most organisations to demonstrate to external stakeholders and regulators that they have delivered desired levels of performance and that they have complied with rules and regulations. Integrated strategic performance management solutions allow organisations to use any of their data to produce and deliver reports, dashboards and scorecards for their stakeholders – internally or externally.

Business Intelligence and full analytical integration – By aligning and integrating the above processes with the performance framework organisations create an invaluable set of data which they can use, in an integrated way, to inform decision making. For example, the information on value driver

analysis, customer relationship management, financial forecasting, and risk logs can be used to challenge, test and revise corporate strategies.

Figure 2: Enterprise Performance Management Model

3. Performance Management – an imperative for public sector organizations

In connection with the public sector is often arises the question about organization's structure and its role in the economy and in society, if they actually serve the public and if they are effective.

In a traditional model, the public sector so as Lane[1] specify serves the public through a set of sensitive hierarchical structures.

On the other hand , ew can also refer to organizations that pursue the public interest because they depend of public choice and administrative services (bureaucracy) and are the ones who must ensure effectively the goals to be achieved.

In the Marxist model, the public sector is made entirely in the service of the dominant and represents an unproductive sector.

This conception, in fact, rejects the democratic structure and processes type.

According to the liberal model, public sector is put in relationship with the private competition. Borders between the two sectors, and are not well defined, are constantly moving, but these are decided by society and, as a result of victory in the election of different political currents. Is self-understood that increasing public sector involves increasing the amount of public spending and thereby a increasing state involvement in economic and social life.

Definition of the public sector must preceded by selecting a criterion for distinction between the public and private sectors.

Performance management has never been more critical in the public sector than it is today. Governments around the world now take this extremely seriously and many have introduced legislations and frameworks for this specific purpose in the organisations that report to them.

Many public sector organisations approach Performance management very mechanistically, with an emphasis on collecting and reporting data, often simply to keep regulators happy. Many appear to have lost sight of the value of the exercise and the benefits that they, as budget-managing, public-serving enterprises, could glean from the results.

The process of measuring performance in public sector is one particularly difficult for several reasons: [4]

1. The multitude and diversity of stake-holder of a public organization: current and potential customers, the voting citizens, elected representatives, nonprofit organizations, professional groups, unions, public managers.

2. Differences in values and perceptions about performance of some various stakeholders;

3. The absence of a competitive environment in which some services are offered precisely because the monopoly position for certain services that have some public or administrative authorities;

4. The nature of public services;

5. The complexity of political environment that generates a number of risks, with direct influence on achieving performance;

6. The influence of political values.

4. Conclusions

Public sector performances are generally closely linked to overall economic performance of different countries. Improving public sector performance is a goal that has important role in the political agenda of all industrialized countries.

Approached properly, Strategic Performance management can have a big impact on improving organisational performance. This finding are important in a climate where governments around the world take Performance management very seriously.

Yet, while the practice exists it is the way performance management is handled and directed that makes the biggest difference between top-performing and failing organisations.

Many organisations have difficulty in designing and implementing a

comprehensive performance management regime that supports and drives improvement. Without it, organisations are depriving themselves of vital information they need to manage their business and to demonstrate improvement to their stakeholders. The key is a strong culture of improvement where performance is recognised and built on, and where poor performance is put to challenge.

Main Directions of Labor Potential Development of Trade in Ukraine

Stepanova Larysa

*Human Resources Management and Labour Economics Chear, Poltava University of
Economics and Trade,
lara-step@yandex.ru*

Abstract

The article reviews the main provisions of national programs for maintenance and development of labor potential of Ukraine and gives some additional proposals for the development of the labor potential of the trade industry.

Key words: labor potential, labor recourses, socio-economic development.

J.E.L. codes: J3, J5, O15, O24

In terms of socialization of the Ukrainian economy issues of labor potential become more urgent. Against this background, a solution of problems of efficiency of its use is very important as it creates the foundation for the effective functioning of businesses and industry in general.

The deterioration of the country's workforce, the annual increase of intensity of the external migration of working-age population in the country and abroad, the low rate of reproduction, the growth of population aging, increasing the total number of pensioners, the annual deterioration in health as junior, middle and senior age groups, low life expectancy, especially women, in all regions of the country - typical phenomenon of the labor potential of Ukraine.

The problems of labor potential development studied by Ukrainian and foreign scientists: D. Bogynja, E. Bozhko, K. Brewster, M. Volgin, B. Genkin, O. Grishnova, M. Doronina, E. Kachan, A. Kolot, L. Kostin, T. Kostyshyna, I. Kravchenko, O. Krushelnitska, G. Kulikov, S. Lebedeva, E. Libanova, L. Lisogor, V. Novikov, Y. Odegov, I. Petrova, V. Savchenko, M. Semikina, L. Shaulska, R. Yakovlev and others.

Despite the relevance of the above-mentioned research scientists, the problem of the labor potential development of commercial enterprises remains unresolved, which is determined by the specifics of the industry.

The purpose of this article is to determine the main directions of the national program of development of labor potential and to supplement them by taking into account the specifics of the trade industry.

The results.

The purpose of national targeted social program "Maintenance and development of the labor potential of Ukraine for 2008-2017" is to create the legal, economic, social and institutional framework for the maintenance, reproduction and development of the workforce.

National social program "Preservation and development of labor potential of Ukraine for 2008-2017 years" [1] is aimed at:

- sustainable socio-economic development, increase wages, improve welfare of the population, especially the working one;
- creating appropriate conditions and safety in all areas of production and services for proper reproduction of labor potential intellectual and professional development;
- opportunities for productive use of labor potential through appropriate economic grounds;
- balanced regional development, improvement of the quality and competitiveness;
- development and implementation of a modern system of motivation;
- practical implementation of social protection either employed or unemployed;
- implementation of measures preventing diseases, especially professional ones;

- strengthening health, significant development of medical science;
- widespread adoption of healthy lifestyle programs, measures to promote a safe and friendly working environment, reducing the risk of loss of life and health of workers at work.

Maintenance and development of labor potential in the national program are solved with the implementation of the following tasks:

- improving of the quality of life by increasing real incomes;
- increasing the real state assistance in health, education, pension and insurance system;
- increasing the role of the family in the country and on this basis to increase the number of marriages and reduce the divorce rate;
- conducting a nationwide effective migration policy that would most consistent national interests of Ukraine, its socio-economic, political, cultural and ethnic development, facilitate resolution of geo-strategic and geo-economic problems;
- introducing modern resource-saving and environmentally friendly technologies;
- increasing at least 3-4 times the level of innovation in manufacturing;
- creating conditions for the public, timely and quality health care for all populations, establish a system of compulsory state social health insurance;
- enhancing the ability of public recreation and improvement of the population; improving conditions for women, freeing them from the production of heavy and hazardous conditions, to provide opportunities to work on a flexible labor regime;
- ensuring the development of the housing market, functioning families at all stages of its life by creating a developed social infrastructure, public and private social welfare services;
- providing affordable, high-quality and free secondary education, integration of vocational, higher and postgraduate education in Ukraine in international education system;
- creating the necessary conditions for the implementation of lifelong learning;

- creating quality jobs on the basis of extensive development of small and medium-sized businesses, self-employment on the basis of investment and innovation mechanism;
- promoting employment for certain socio-demographic groups (youth, women, the disabled, soldiers discharged from military service, etc.);
- reducing the level and duration of unemployment by implementing measures of active labor market policies;
- protecting the rights and guarantees of citizens through the development of social dialogue between the government, unions and employers at all levels;
- strengthening supervision and control over the observance of labor legislation;
- improving the legal regulation of social and labor relations in alternative sectors;
- ensuring further harmonization of legislation on industrial relations with international and European standards;
- creating conditions for the promotion of productive labor, entrepreneurial and business activity;
- ensuring the further development of market mechanisms to regulate wages and increase the role of collective agreements at all levels of social partnership;
- providing prevention and reduce occupational injuries and illnesses, reduce harmful factors of working on the body and reduce the number of jobs in hazardous and arduous;
- decommissioning buildings and structures that are in poor condition, reduce the number of jobs with dangerous, hazardous and adverse conditions;
- stimulating investment in clean technologies and create safe working conditions;
- increasing the effectiveness of safety management at all levels to create a system of education on occupational safety for employees of enterprises, institutions and organizations of all forms of ownership.

The expected effect of the program of preservation and development of the labor potential of Ukraine is:

1. Providing social dialogue based on decent work, higher wages and incomes of the economically active population to a level

that will ensure the processes of reproduction, well-being and quality of life.

2. Quality increase of the labor potential of Ukraine.

3. Achievement of the decent level of social security.

4. Ensuring the appropriate level and quality of life of workers under the EU social standards.

5. Eradicating poverty among the employed population.

6. Providing public access to quality continuing education, training of personnel and lifelong learning.

7. Mobility of labor potential through access to the housing market.

8. Providing healthcare reform workers according to The World Health Organization (WHO) standards, disseminating standards of a healthy lifestyle by providing essential health services, recreation and leisure for families.

9. Promotion gender equality and elimination of the worst forms of child labor and any discrimination in the workplace.

10. Prevention loss of highly skilled labor potential of external labor migration, brain drain termination and intellectual property products from Ukraine.

11. A significant increase in the middle class as the main segment of the population that will provide stabilization in society.

12. Providing conditions to belong to the middle class doctors, teachers, scientists, engineers and technicians, and others.

Conceptual foundations of efficient utilization of labor potential is defined as a complex system of measures and actions at the macro, mezo and microlevel (Figure 1).

Among the offered directions that will promote professional competence, qualifications and employment potential of commercial establishments are:

- inventory of existing professions and skills, comparison their compliance with the qualification requirements of jobs in each business unit;
- special courses and seminars on evaluation of personnel commercial establishments consumer cooperatives for determining the suitability of the employee to the specific area. We have developed the appropriate estimation procedure professional and personal

qualities trade workers in accordance with the activities in this field;

expanding the qualified professionals use and teachers in the learning process in-service training for employees. We offer themed seminars for workers, professionals and managers of commercial establishments, including "The effective sale", "Evaluation staff - not just certification", "Staff development companies: Stages and Results";

Figure 1. Implementation of the conceptual effectiveness foundations of using employment potential at the macro, mezo and micro levels

- facilitate internships workers on advanced trading enterprises, training of personnel in the field of education, Ukraine;
- sectoral workshops with leading companies in the region, countries to exchange experience on a commercial basis;

- development of personnel policies for commercial establishments aimed at developing professional skills of workers and the effectiveness of economic activity;
- application of modern motivational and incentive mechanisms for effective work, including determining wages through an assessment of the contribution of personal and professional qualities of the employee;
- individualization of wages in the organization, increasing its dependence on the level of labor efficiency, professionalism, skill, complexity, working conditions and employee accountability for the results of work that will improve labor activity, increase the incentives for efficient work.

Conclusions.

Conceptual approaches to efficient use and development of labor potential trading enterprise are real guidelines for the implementation of the company, because, firstly, they are based on the needs of the modern retail industry in the development of labor potential identified in the sociological surveys, analysis of statistical information; Secondly, they included advanced foreign and domestic property to ensure the efficient use of labor potential.

Issues of Marketing Strategies in the Banking Industry

Sudacevschi Mihaela
“Nicolae Titulescu” University, Bucharest
msudacevschi@univnt.ro

Abstract

This paper intends to analyze and to characterize activities specific to financial – banking marketing. Banking marketing is the most important marketing tool, that allows the development of bank activity, improve the performance and achieve its strategic objectives. Increasing the importance of marketing in banking activity is determined by the development of banking industry, increasing the complex environment in which acts banks and increasing competition on the banking market.

Banking promotion is the method which banks use to spread the world about their products and services to customers. Many banks use a mix of advertising, to promote their banking product and services. Banks have a unique challenge when it comes to marketing, because they do not offer tangible products for consumers. Promoting a bank requires to convincing consumers to trust a bank with their money and make customers feel like they are getting the most value for their money.

Key-words: financial – banking marketing, banking products and services, financial – banking marketing mix, marketing strategies.
J.E.L. Codes: G21, M31

Introduction

The concept of marketing, from its birth until today, touches several key areas, including services, especially banking. The banking marketing is expected to develop a distinctive brand that is considered best reputation of the financial institution and it will integrate also, the new information technologies in the marketing strategy of the bank.

The bank is a financial institution. Its primary activities include borrowing and

lending money. Many other financial activities they were allowed over time. Marketing as it is known today is a way of managing a business so, that each strategy is applied with foreknowledge of the impact of such a decision on the customer. Banks have broadly three dimensions, i.e. deposits, borrowings and other related services.

The Relevance of Banking Industry

The relevance of banks in any economy is measured by their contributions in economic development and growth. [1] Banks are profit seeking as well as profit making institution. As a result of the bank’s ability to retain deposits from the customers and give loans to users, they are involved in capital creation which yields profit to banks, and revenue to the nation in the long run. Banks have two major portfolios: loan and investment portfolios. [2] While investment involve business buying lands building factories and offices, machines, raw materials and finance purchase of goods, loans from negotiation between the bank and its customers and results in a written agreement design to meet the specific credit needs of the customers and the requirements of the banks for adequate security and income. [3] In other, to generate the funds the banks must receive deposits from customers who keep their money with them. Thus, to encourage deposits, they engage in sales promotional activities that will stimulate and increase customers to deposit their funds with them.

The concept of mix marketing encompasses:

- Identifying the most profitable markets now and in the future;
- Assessing the present and future needs of customers;
- Setting business development goals and making plans to meet them;
- Managing the various services and promoting them to achieve the plans.

Banking products and services are the result of the activity of commercial banks. In banking institution, product and service concepts have become interdependent and interchangeable, being used to describe what is the offer for the consumer. Choosing a supplier of financial – banking products and services is the result of bank’s success in explaining the actions, attitudes, values and decisions of well-defined categories of consumers, whether individuals or legal persons.

In market economy, a banking product or service is offered to customers at the same time by several credit institutions, which are in direct competition with each other. Although, generally, the banking product or service is basically the same, in practice appear some differences from one bank to another.

Services are elements that accompany the products generated by banking services for the clients’ accounts. Although in the specialized literature exists a clear distinction between financial - banking products and services, on the Romanian banking market banking products and banking services are rigorously separated, because it is supposed that any banking service is accompanied by at least one banking product and vice versa, any banking product implies the existence of one or more banking services. Banking services are the effect of the banking operations that are made on the account of its customers.

Characteristics of Services

The features generally recognized for all types of services are the basis of distinctions between the different consumer goods and services categories. These are:

1. Intangibility – means that services are intangible and cannot have a real, physical presence as does a product
2. Inseparability – means that services are inseparable from the point where they are consumed and from the provider of the services.
3. Variability - means that banking services quality and consistency are subject to variability, because they are delivered by people, and human behavior is difficult to control. Personal performance and quality can vary by time of the day (people get tired),

time of month or year, workload, experience, attitude, knowledge and other factors. Maintaining client trust during lapses (which will happen) is critical. Researches show that employee satisfaction is the most important factor in providing high quality service.[4]

4. Perishable – means that services cannot be stored for future use.

Banking Marketing Strategy

When setting its marketing strategy, a bank must analyze in detail the overall activity, the goal which is targeted and the market share target. The bank overall strategy should be defined by several elements:

- Setting–profit activities and those that generate loss for the bank and identify activities which will be kept, developed, restricted or eliminated in bank future offer.
- The expected profit of the bank, according to the rate of market expansion and the bank market share.
- Setting the long-term objective of the bank.

Setting the long-term strategy of the bank must collect a large volume of information from all areas of bank activity. Marketing plays an important role in processing and analyzing the information and bank’s marketing department provide a large amount of information – necessary to define the overall strategy. Marketing strategy also involves the share market analysis and bank activities, both now and in the future. Since planning is a continuous process, banks’ managers must take into account the changing of banking general operations.

To the basis of implementation of the overall marketing strategy is the marketing plan, which will take into account all available information.

Marketing plan is a written document that describes the programs developed for an organization (a bank), a banking product or service or a brand. Marketing plans can take several forms but generally include five basics elements:

1. A detailed situation analysis that consists of an internal marketing audit and review and an external analysis of the market competition and environmental factors.

2. Specific marketing objectives that provide direction, a time frame for marketing activities, and a mechanism for measuring performance.
3. A marketing strategy and program that include selection of target markets and decisions and plans for the seven elements of the marketing mix.
4. A program for implementing the marketing strategy, including determining specific tasks to be performed and responsibilities.
5. A process for monitoring and evaluating performance and providing feedback so that proper control can be maintained and any necessary changes can be made in the overall marketing strategy or tactics.

Banking market strategy takes into account the elements of the marketing mix (Product, Price, Place, Promotion, People, Physical evidence, Profit), of the marketing expenses and amount of financial resources required for the marketing plan can be implemented.

Fig. 1 Banking marketing mix elements

Marketing strategy will focus on bank's activities related to the markets served and will be established according to the new markets targeted. Thus, the marketing strategy will try to help the bank to launch the offers that meet customer's specific needs, better than the competitor's offers. The importance of customer satisfaction is

reflected in the bank's achieved performance and therefore, permanent adjustment of supply to the market demand should be the main goal for the overall strategy of the bank. The bank will continuously monitor the changes in the level of banking products and services demand so as changes in customers' behavior will not affect banks activity and performance.

Banks have a high level of competition and effective marketing can have a large impact on consumers who are choosing new services. When consumers are set out to choose a bank or a banking service it is easy to become overwhelmed by the amount of choices that are available. To make a bank more approachable, the marketing efforts must be focused on the easy of comparison between products. The bank might use marketing materials that talk about the different types of accounts, makes recommendations based on where customers are in their lives, or target special – needs customers like frequent international travelers or new parents. In doing so, bank can let his customers know that it can help them to choose an account that is right for their needs. [5]

New product development in the retail banking industry has changed traditional banking practices. Banks now act as retail operations, with branch staff responsible for meeting sales targets as well as providing customer service. Banks have opened new channels to market, delivering a range of services by telephone or by Internet.

In parallel with developing new products, banks opened new channels to deliver new products while increasing customer convenience. Services such as online banking or online applications for loans or mortgages also reduced the banks' costs of doing business with customers. Some established banks set up alternative online banks that offered a full range of banking and related services, but without branch facilities. [6]

Romanian commercial banks have speculated the interest of their customers for social networking and try to attract new customers by virtual agencies. BRD – GSG was one of the first credit institutions which launched a virtual agency, followed by Unicredit Tiriac Bank. Virtual agencies are used only to provide customers' information on bank services, but in situations in which

confidential information is required for making banking transactions, the discussions between customers and bank employees are repeated on the telephone.

Other banking communities from the Romanian banking market, promoted by Facebook are Raiffeisen Communities, ING Bank Romania and Transilvania Bank. Banks' interest in Facebook is not new. In Western Europe and the U.S., banks have turned to Facebook since the early years of the launch of the networking platform. Thus, in 2010, an Italian consulting company drew up a top ten banking communities on Facebook. At that time was registered a range of tens of thousand fans - ING Bank has registered 14,000 fans for U.S. Facebook page, Citigroup managed to collect 10,000 fans on the Facebook page in Argentina, while BNP Paribas raised at that time over 120,000 fans. (according to www.conso.ro)

Another aspect that marketing department should analyze it to define banking marketing strategy is the behavior of competitors. A bank must collect information about competitors' marketing strategies, their objectives, their strengths and weaknesses and their possible reactions to its policies. The competitors' objectives are determined by the characteristics of the banks and their activities, namely: bank size, its history, business management and economic data.

Competitors' strengths and weaknesses shall be identified through analysis of data relating to competitors' transactions on the banking market, their market activities, the number of customers and their accounts, market expansion plans.

Understanding how a competitor reaction can influence the bank's marketing strategy and plan and can lead it to launch new banking services, to expand its activity on the banking market and develop promotional activity using offensive and defensive marketing activities.

Competitive marketing strategies

Marketing strategy is determined by the size of the bank, its objectives, its place in the market – when it was launched the strategy and target market place, as an effect of applying marketing plan. There is no strategy to be effective for all banks, but depends on each bank.

Marketing strategies may differ depending on the unique situation of the individual business. However there are a number of ways of categorizing some generic strategies. Strategies based on market dominance classify banks based on their market share. Typically, there are five types of market dominance strategies:

- leader
- challenger
- follower
- specialized bank
- nicher

Market leader objectives include expanding the overall market, protecting the current market and increasing market share. Protecting the current market share involves launching new products and services to attract new customers and increasing service quality and, consequently, the market competitiveness. As the competition in the banking market has greatly increased, banks may adopt a market-leading range of defensive strategies for maintaining market share.

To expand market share, the leader must search new customers, identify their needs and launch new offers. Consequently, the strategies which will be adopted focus expansion on new markets and geographic expansion. Applying these strategies and achieving bank's marketing plans depend largely on promotional activities and bank's ability to make itself known on the market.

Banks need effective strategies to retain their existing customers and attract new customers.

Sales promotion is a promotional marketing technique designed to create sales for a product or service over a defined period of time. Sales promotion activities are measurable in terms of products or services move, number of contest entries, or other quantifiable count. Sales promotion help financial institutions achieve their overall mission to keep customers put and bank vaults full. In some cases, offering new or better services, free merchandise and attractive interest rates might even work to drive a customer from a bank on one side of the street to a competing bank right across the street. Some banks even use sales promotion tactics that include paying customers to open a checking or saving account. In 2010, Citibank ran a promotion

offering customers up to 100 USD if they opened a checking account with at least a 100 USD deposit and then kept account open for a minimum of six months.

But promotion activities include also, personal activities, public relations, direct marketing, trade fairs and exhibitions, advertising and sponsorship. Promotion needs to be precisely coordinated and integrated into the business global communications message, and this is called Integrated Marketing Communications. The promotion mix (the marketing communications mix) is the specific blend of promotion tools that the company uses to persuasively communicate customer value and build customer relationships. (Kotler, 2010)

The issues of promotions are becoming more and more complicated as internationalization of financial services continues to increase. The most important promotion tools for financial services are personal selling and advertising, in order to create awareness of the brand and establish personal relationships. The external factors influencing the choice of promotion strategy are technology orientation of the industry, cultural aspects, competitiveness of the market and economic factors. Adaptation of the promoting strategy is performed to a great extent, due to customer's different performances and expectations, as well as local conditions of the host country. However, banks attempt to standardize their promotion as much as possible in order to reduce costs and reach economies of scale. [7]

Conclusions

Marketing activity is an integral part of our social and economic systems. In our complex society, companies ranging from large multinational corporations to small retailers increasingly rely on advertising and promotion to help them market products and services. In developing a promotional strategy, a bank could combine the promotional mix elements, balancing the strengths and weaknesses of each, to produce an effective promotional campaign. Banks consider many factors in developing their marketing strategy, including the type of services, the target market, the buyer's

decision process and the channels of distribution.

The marketing strategy of a bank is generally developed with a specific purpose in mind and is the end the banking product or service of a detailed marketing and promotional planning process.

The Budgets’ Role in the Audit of Economic Entities

Tănase Gabriela Lidia
Academy of Economic Studies, Bucharest
gabrielatanase26@yahoo.com

Abstract

The audit of economic entities is a necessity, giving assurances regarding the integrity and efficiency of management, efficiency and effectiveness of control measures, and fairness of financial statements. Budgets are useful tools in business management and decision making, which allow management to achieve superior results through effective resource management and proper planning of activities. The purpose of this research is to highlight the budgets’ importance and role in the audit of economic entities, through the information that they can provide.

Keywords: budgets, audit, internal control

J.E.L Classification: M41, M42

Introduction

The audit represents the insurance that the financial statements give a true and fair view of reality, are free of errors, in accordance with accounting principles and regulations in force and that the control measures adopted by the entity are effective. In performing the audit activity, we should analyze not only economic transactions and other financial aspects, but also elements of detail relating to business continuity, competence and integrity of the management, mode of operation, goal setting, activity planning, etc. Budgets as managerial tools have a key role in activity performance and decision adoption. Although we are aware that economic entities budgets are tools for internal use, we believe that budgets should be analyzed and taken into account in the audits of economic entities. They can provide useful information on the general knowledge of the entity, setting the framework for the activities and providing information to assist auditors in reviewing the business, those involved in

running the business, and so on. The purpose of this research is to highlight the link between budgets and audit, and how budgets can provide useful information for the audit activity.

1. The audit and budgets of economic entities

To highlight and discuss the need and role of budgets in performing the audit process, we must understand the significance of audit. In the financial accounting and economic field it means to control, to check and aims to assess the quality of internal control, the true and fair view of the accounts and to protect against fraud [10]. Financial audit is an examination conducted by an independent professional that offers an opinion on the validity, accuracy and effectiveness of internal control, an opinion regarding the true and fair view of financial statements, which increases the level of confidence of the internal and external users in the information provided by the entity [10].

The internal control of an economic entity is subject to both internal and external audit review. Internal control is verified by the internal audit and the analysis of external audit starts from the internal audit report on the effectiveness of internal control [11]. Following this relationship, shown in figure no. 1, we consider it necessary to understand both the mission of internal audit and the internal control role.

Figure no. 1 The link between external audit, internal audit and internal control

Source: own source

Internal audit is an insurance process [12] whose role is to assess internal control and management system [11], checking whether the economic entity complies with its own rules, identifying waste and mismanagement, while assessing the economy, efficiency and effectiveness for all categories of resources used [7].

Internal control aims to ensure the efficiency and effectiveness of operations, reliability of financial and reporting statements and compliance with laws and regulations [9]. The internal control system is a set of policies and procedures adopted by an entity in order to achieve management objectives, to ensure the implementation of management and forecasting policy, to ensure activity efficiency, accuracy and completeness of records, allowing detection of fraud and error and the drafting of financial statements as required by law [17].

The role of audit is to provide assurance related to the activity of the economic entity, to the control measures implemented and its financial statements. Therefore, in conducting the audit we think it is important to consider not only economic and legal substance of the transaction, but also other elements to guide the auditor in performing his work. For starters, the auditor should fix some coordinates regarding their general knowledge of the entity, of the field of activity, of the management, the people, and of the way in which they operate, etc.

Budgeting is an internal process. Information regarding budgets is for internal use and is accessible only to internal users. The information contained in these decision-making tools are, in our view, sensitive data because they translate into values future action plans of management and include information such as: future prices, costs of production, the expected sales, expected results, advertising costs, and so on. And these plans can ensure the success of the entity.

Considering these factors, we can say that generally, budgets are not elements for audit. And yet we wanted to take this research to the next level and see how budget analysis could provide auditors essential information, strictly related to their objectives. We believe that any activity performed by the entity has an impact, more or less evident on the business. Or the analysis of the state of health

of the business is the very mission of audit. Thus, budgets can provide useful information for the audit.

2. The link between economic entities budgets and audit

Before starting an audit, the auditor should know the general characteristics of the entity, which allows him to better assess specific risks associated, plan audit engagement, identifying elements that will have a significant impact on information. The knowledge of the audited entity allows the auditor to identify practices that could significantly affect the financial situation [17]. General knowledge can come from both external and internal sources such as: previous audit reports, reports of the Board of Directors, budgets [10] or strategic plans [8]. This involves gathering information and records relating to plans and work programs, budgets and budgetary exercised of prior years [12]. Information about budgets and results are considered useful in obtaining basic knowledge about the activity of the audited entity [6].

For internal audit, all areas of the company are object of the audit activity [11] and the financial audit covers all information systems. Thus, forecasted or internal information can be audited as well [10]. Based on these considerations, we can state that the audit can be extended to the budgets if they provide essential information to the auditor in performing his activity.

Internal audit identifies waste and mismanagement, assess economy, efficiency and effectiveness of all resources use [7]. Or entity budgets aimed precisely efficient management of resources, activities, ensuring efficiency, effectiveness and economy of the business. What better way to analyze all these elements than studying budgets? Internal audit can also verify the control process of budget execution [11].

As to internal control, it allows the accomplishment of management objectives, management policy and forecasting activities [17]. The internal control system involves determining general attitudes, perceptions and actions taken by the management concerning the entity's internal control system, its emphasis, philosophy and operating style of management [12].

integrity, ethical values of management [3] etc. Thus, the analysis of internal control may involve a budget check. Budgets set management objectives and help achieve them by forecasting the activity. Also, budgets correctness and execution provide information on the involvement of management in the effective planning of the activity, on the importance attached to the efficient management of the business, about general management philosophy, how managers conduct the business, their values, their capacity and performance, and so on. The control procedures also include comparing and analyzing financial results with predicted values [12]. In other words, verify budget execution is useful in evaluating the internal control system, one of the internal controls procedures being, the comparison of the results with the approved budget [8].

Financial audit is also designed to test the entity's internal control (including risk assessment), efficiency, effectiveness and economy of activity [10]. Or internal control verification as an essential part of achieving the audit engagement involves, as we have shown previously, checking budgets.

We tried to emphasize the link between audit and budgets by using the transitivity mathematical model. According to this principle, if A determine X and X determine B, then A determine B (Figure 2).

Figure 2 Transitivity model

Source: own source

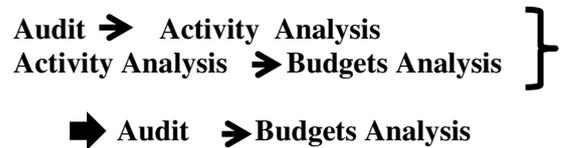

In our view, X from the transitivity principle is the element that links audit and budgets, representing our unknown. “A” represents Audit and “B” Budgets. Thus, based on this formula, we consider that the link between budgets and audits can be done through analyzing the quality of activity performed and its characteristics.

We know that the audit aims to ensure stakeholder that the financial statements are true and fair, in accordance with the laws and regulations in force, without significant errors, analyzing the effectiveness of internal control. In other words, it verifies the activity

of the entity. In performing the audit, we also use information obtained from analyzing budgets and budget execution. Budgeting provides additional security that the business is managed in an efficient manner, that the use of limited resources is controlled, that effective corrective action is taken in time, and so on. Budget preparation starts from the desire of the management entity to manage the business effectively and to plan the work so that they can achieve the goals set, being able to control the activity and take timely corrective action. Thus, budgets help activity development in optimal conditions.

In other words, budgets are useful for the activity of the economic entity and the activity is reviewed by the audit (figure 3).

Figure 3 The link between budgets and audit

Source: own source

The audit analyzes the activity and the activity involves implementation and monitoring activities planned through budgets. So, we consider that budgets are important in performing the audit activity. The auditor's mission should take into account budget study as an important part in determining stability, efficiency and characteristics of the business.

3. Information provided by budgets and their role in the audit

The audit has the role to certify the accuracy of the information provided to the external users. We agreed that budgets are management tools for internal use, are confidential and are not subject to audit such as financial statements are. However, as noted earlier, for a high quality audit, we must take into account the information provided by the economic entities' budgets. As Arens et al. (2003) [2] said, sometimes perhaps the most important audit elements are not found in the accounts. Budgets can provide essential information in planning the audit. They can help the auditor in determining the items to be audited, to analyze the quality of management,

leadership characteristics, business continuity, etc. Essential information that budgets can provide to auditors with the aim

of helping to achieve their mission, are shown schematically in Table 1.

Table no. 1 Information provided by budgets for the audit mission

Information provided by budgets to auditors
Budgets are evidence that prove the continuity of activity.
Allow analysis of management involvement.
Allow verification of employee involvement and satisfaction experienced by these.
Provide information regarding the concern for efficiency, effectiveness and economy.
Allow verification of effective resource management.
Allow analysis of level of accountability of the employees.
Allow verification of business organization and assignment of responsibilities.
Provide information on existing communication and coordination within the entity.
Enable the analysis of the level of stress associated with the preparation and execution of budgets.
Determine the possible existence of handling or management games.
Allow analyzing the causes of budget deviations.
The audit can focus on elements that have significant deviations from the budgeted values.
Offer the possibility of analyzing the process of adopting corrective measures.
Allow obtaining information about management features.
Provide information regarding management capacity and qualifications.
Budget execution is an internal control procedure and that is why is subject to audit.
Demonstrate the concern of the leadership for achieving management objectives.
Budgets and budget execution gives auditors information about the effectiveness of internal control.
Provide data on general knowledge of the entity and activity.
Help determine acceptance or denial of the audit engagement.
Help establish audit objectives and audit risk.

Source: own source

One of the objectives of the audit process is to analyze if the principle of business continuity is respected. This step is particularly important because it affects the values of the elements presented in the financial statements. Thus, auditors need evidence to assert business continuity, something more concrete than just a simple insurance from the management. Planning activities to be undertaken in the next period through budgets show auditors the concern of management for the future activity of the entity, indicating its intention to continue the work.

The preparation of budgets also provides auditors with information regarding the degree of management involvement in the activity. The concern of management for ensuring effective activity may offer auditors valuable information on the commitment and dedication of management. Also, it is more unlikely to find irregularities or errors when there is close supervision by management.

Employee involvement and satisfaction experienced by them is another useful information provided by budgets in order to achieve a quality audit. If employees are committed to achieving the objectives set through budgets, their performance and the entity performance will increase, and their concern for carrying out their task reduces the risk of significant errors.

The mere existence of budgets means a major concern for achieving a good work, organized and controlled; concern which can reduce the risk of errors. Also, budgets provide clues to the auditor on management's concern for efficiency, effectiveness, efficient resource management and for the achievement of objectives set. This careful activity planning through budgets and budgeting features, which allows them to provide better organization of activity and to make people involved accountable for their work, ensure the quality of the business. Individuals receiving such responsibility are more attentive, more involved, more

dedicated, more responsible in their activities. An efficient organization and a thorough communication between departments ensure an adequate and efficient activity, so no chaos or errors arising from lack of coordination and communication. Also segregation of duties and responsibilities is important for auditor regarding internal control system analysis.

The auditor should not lose sight of one very important aspect of budgets. We mentioned that budgets involve management and employees in achieving the entity objectives through accountability. Their desire to achieve the budgeted values and avoid significant deviations along with the stress associated with achieving these objectives can lead to handling budgets or actual values. Also, if managers are conditioned to the achieving of budgeted values they can resort to different game or schemes for amending the results. Or this is of particular interest for auditors in conducting the audit, indicating the possibility of irregularities.

We believe that the auditor should also be interested in analyzing the causes of deviations from budgeted values. This can occur either when handling values, recording of human error, or due to failure of management to adopt and implement decisions to meet the objectives. Thus, the auditor should focus on analyzing those elements representing significant deviations, either positive or negative. Significant negative deviations may suggest lack of effective internal control, problems of organization and employee motivation, and so on. Also, for the auditor is important to analyze the existence of a process for adopting corrective measures and for their implementation. These elements determine the competence and involvement of the management and can reduce the risks of error if deficiencies and problems are identified and corrected. This verifies the entity's internal control efficiency.

Budgets also help the auditor in analyzing leadership characteristics based on the goals and objectives set and estimated values (too optimistic, pessimistic, realistic, involved, responsible, negligent, careless, manipulative, etc.). Budget execution and the decisions implemented by the management

allow the assessment of the ability and quality of management.

Budgets and budget execution gives auditors information about the effectiveness of internal control because they are useful tools in setting goals, helps achieving them, allowing efficiency and effectiveness business development, with careful management of available resources, providing information about the involvement and commitment of management in business planning, and about the philosophy and values of the leadership.

The auditor aims, before the audit engagement, to obtain general knowledge of the entity and the work performed by it to better assess risks. This can be achieved by analyzing budgets and information provided by them. General knowledge of the entity determines the acceptance or refusal of the engagement. All the information provided by the budget can assist the auditor in determining its mission objectives, audit risk and areas of interest.

Conclusions

We believe that the utility of budgets should not stop just at the roles that studies already assigned them. Budgets informational potential is much larger. Although they are tools for internal use, budgets can provide useful information to auditors in carrying out their mission. This information helps the auditor to analyze and understand the situation in the entity, to determine areas where problems may exist and must submit to a detailed analysis, to determine audit risk, to fix mission objectives, also allowing the auditor to analyze the quality of internal control.

Modern Approaches in Romanian Management in the Context of Knowledge Economy

Tocan Madalina Cristina

oana.vasioiu@gmail.com

Abstract

The increasing globalization of business, leaner organizations, products and service convergence and vast development of technology implied that the issues of more efficient and effective operation of an organization's knowledge assets have become more important than ever before. Years ago Peter Drucker warned us that those who will wait until this challenge becomes a “hot” issue are likely to fall behind and perhaps never to recover. As Drucker has predicted, knowledge has become the key economic resource and the dominant source of competitive advantage today [1].

The main objective of this paper is to present the status of the knowledge management implementation in Romania, after the introductory part of the paper in which the concept of knowledge management is presented. Conclusions are presented at the end of the paper.

Key words: knowledge, knowledge management, knowledge economy

Clasificare J.E.L.: D8

1. Introduction

Society has recognized the value of knowledge for centuries. For hundreds of years, family members have passed off their commercial wisdom to their children, master craftsmen have painstakingly taught their trades to apprentices and workers have exchanged ideas and know-how on the job. However, the terminology of knowledge management was not widely used until the middle of the nineties.

2. Defining knowledge management

Based on the review of the literature presented by many academics and practitioners, it can be concluded that there is not yet a common consensus on the definition and concept of knowledge management despite a great deal of interest on the subject. Defining knowledge management is especially difficult, as different perspectives or schools of knowledge management can yield different dimensions and meanings. For example, management information systems researchers and practitioners tend to define knowledge management as an object that can be recognized and controlled in computer-based information systems. Management researchers, on the other hand, address knowledge as processed based on individual and organizational competencies such as skills and know-how [2]. Thus, different perspectives on the concepts of knowledge can lead to different definitions of knowledge management.

However, in the simplest term, knowledge management means exactly that: management of knowledge. It can be extended to management of organizational knowledge for creating business value and generating a competitive advantage. It consists of the processes required to effectively manage knowledge. It is a systematic, explicit and deliberate building, renewal and application of knowledge to maximize a firm's knowledge-related effectiveness and returns from its knowledge assets [3]. Knowledge management is essential for enterprises to determine where they are going and for organizational survival in the long run. It is a key requirement to future successful enterprises and is rapidly

being recognized by firms to be of major strategic importance.

Salleh and Goh's [4] definition of knowledge management where it is a process of leveraging knowledge as means of achieving innovation in process and products/services, effective decision-making, and organizational adaptation to the market for creating business value and generating a competitive advantage to organizations.

Uit Beijerse [5] considers that “the knowledge management can be defined as a strategic orientated way of motivation and facilitation of the company's members engagement in the development and utilization of their cognitive capacities through the valorization of its information sources, experience and capabilities of its members”.

However, in the simplest term, knowledge management means exactly that: management of knowledge. It can be extended to management of organizational knowledge for creating business value and generating a competitive advantage. It consists of the processes required to effectively manage knowledge. It is a systematic, explicit and deliberate building, renewal and application of knowledge to maximize a firm's knowledge-related effectiveness and returns from its knowledge assets [3]. Knowledge management is essential for enterprises to determine where they are going and for organizational survival in the long run. It is a key requirement to future successful enterprises and is rapidly being recognized by firms to be of major strategic importance.

The essence of knowledge management is built on intellectual capital, which includes Human Capital, Social Capital and Corporate Capital. All three are essential components of Enterprise Knowledge. Human Capital it is made up of an individual's past, present and future. Each of us brings a unique set of characteristics and values from the past. These include expertise education and experience. Built on these characteristics and values from the past, they represent a set of capabilities and ways of seeing and living in the world (such as creativity and adaptability). Just as important as things from the past and skills of the present, we each have a future capacity and a particular potential for learning. Social Capital includes

human and virtual networks, relationships and the interactions across these networks built on those relationships. Corporate Capital includes intellectual property, both formal and informal (e.g., patents, ideas, etc.), and corporate functional and organizational processes. It also includes all the data and information captured in corporate databases, all that has been made explicit.

Knowledge management can be viewed as a process for optimizing the effective application of intellectual capital to achieve organizational objectives. The knowledge management challenge is to discover and capture our tacit intellectual capital, share this capital through the Social Capital and leverage Corporate Capital (that which is visible or explicit). From another point of view, knowledge management can be defined as a collection of disciplines, technologies and practices embedded in an information infrastructure that supports creation, sharing and leverage of intellectual assets – tangible and intangible – in an organization to achieve business goals. Or, knowledge management can be defined as simply the encouragement of people to share knowledge and ideas to create value-adding products and services.

3. Research methodology

Utilization and superior capitalization of the company's workers knowledge it is seen as an important factor in achieving competitive advantage by organizations. Organizations which have analyzed the way in which they use knowledge discovered that they to possess more knowledge than they realize.

Are already well known the great advantages resulting from an organization's ability to identify capture and use knowledge in order to gain maximum added value. This leads to new challenges for management. Knowledge management is considered by academics and practitioners a useful tool to better manage intellectual capital of an organization.

However, till present there were not so many studies regarding the application of knowledge management in Romania, and those that exist focus mainly on large companies and do not provide a basis for comparative analysis to correlate data across

borders and no other studies national or international.

In 2002 the OECD launched a comparative research in the member countries in order to find out more about the existence, dynamics and efficiency of knowledge management practices in the private sector and for measuring the degree to which these practices are used [6]. To do this, a group was formed from the representatives of the respective ministries and research organizations, which aimed to formulate a basic questionnaire that was used in each of the participating countries.

In order to identify the extent to which knowledge management practices are used in Romania in the fall of 2011 we conducted a survey based on a questionnaire developed by OECD experts.

In this paper I will present and analyze the research results, research which is intended to be a basis for further research. In the following pages is a presentation of the operational details of the research, followed by a presentation of results of basic questions, presentation by mainly descriptive statistics. Since the number of respondents is rather small, we conclude that there are further opportunities to develop statistical analyzes. However, some conclusions are possible based on the analyzes presented.

The research covered various sectors of the national economy, but the important ones were:

- Commerce;
- Agriculture;
- Financial services;
- Accounting and advisory services;
- Education;
- Other.

For each sector 300 companies were randomly selected, and in early November questionnaires were sent to companies to be completed. A reminder was sent by mail in mid November. In total, 89 companies responded in a way that enables analysis, 10 have indicated that the questionnaire was not relevant to them because they are too small. Some respondents indicated lack of time to respond. The sample of companies that responded to the questionnaire was distributed unevenly between sectors, but their distribution that allowed clear differentiation in terms of company size. The overall response rate was 33.7%, which is not

entirely satisfactory, but compared to other surveys (eg, Community Innovation Survey), the response rate is much better. Complementary data analysis process questionnaire, telephone interviews were conducted six (ex-post) of companies responding to the questionnaire

The questionnaire comprised 11 questions, and its starting point-Question 1 - consisted of a list of management practices that can be used in knowledge management programs. These practices have been grouped under the headings:

- Policies and strategies;
- Leadership;
- Incentives;
- Capture and knowledge acquisition;
- Training and mentoring;
- Communication.

Respondents who indicated that use one or more of these practices were asked to continue with the questionnaire, while those who indicated that they do not use any of these practices were asked to move to Question 10, which refers to reasons that may encourage respondents to implement such practices (this is referred to as skip-model).

Questions 2-9 are about the reasons and results of the implementation of knowledge management practices. Also in this section respondents were asked who is responsible for the implementation of these practices, if exist budgets to implement these practices and if their impact and effectiveness is measured. Finally, they were asked to specify if their organization was met any resistance to the introduction of these initiatives.

Question 10 refers to the reasons that would determine the organization to adopt and implement knowledge management practices. Finally, question 11 is purely administrative and is related to the number of employees in the organization

The questionnaire was accompanied by a cover letter, whose main purpose was to motivate respondents to complete the questionnaire. As structure the cover letter contained a introduction of the study, the reasons for which organizations should participate in research, the benefits of the participation and contact details.

In addition to the survey conducted by e-mail, there was an attempt to gain some qualitative assessments by phone. After the questionnaires were returned, some of the

companies were asked if they are willing to discuss the questionnaire by telephone. 9 companies agreed and finally in early January were conducted six interviews.

Distribution of respondent companies according to size (employees) are characterized by a higher response rate for large companies (21%), an average response rate of 12% for very small and a lower response rate to enterprises (as 10%).

4. Results- Utilization of knowledge management practices in Romania

Question 1 - Using knowledge management practices. Regarding the use of knowledge management practices it was observed that more concrete, operational practices (capture and acquisition, training and mentoring, communications) are more used than formalized strategic practices. Although knowledge management practices are widely used at the operational level, the incentives to promote the use of knowledge management practices are still very common. 2% of companies have a written policy strategy and knowledge management, about a quarter of respondents have a value system to promote knowledge culture, approximately 40% have policies or programs to improve employee retention and almost half have completed or strategic partnerships or alliances used to acquire knowledge. 20% of respondents will formulate written strategies and policies for the knowledge acquisition and sharing of in the next 24 months and about 15% of respondents will use in future policies and programs directed at retaining employees and create a culture that promotes knowledge sharing. A very high proportion of respondents 69.5% said they did not know if they use written policy or strategy for knowledge management.

Leadership. Most respondents indicated that knowledge management practices are the responsibility of managers (67%), but also a high percentage it is occupied by employees not involved in management activities (13%). Perhaps most surprising is that almost 15% of respondents gave the answer "do not know / not applicable" to the question whether the activities of knowledge management practices are the responsibility of managers. 2% said that their organization has a knowledge officer (Officer of knowledge),

while 72% said "not applicable" in this regard. 5% of knowledge management practices are used as explicit criteria for assessing the performance of workers. More than half (67%) responded "do not know / not applicable" to this question, while 21% intend to use in the next 24 months.

Incentives. A small number of organizations- 10% reward the positive effects of sharing knowledge with monetary incentives, while 18% of organizations reward the positive effects of sharing knowledge with non-monetary incentives.

A very large number of organizations do not intend to use these incentives in the next 24 months, and 3% for monetary incentives and 8% for non-monetary.

A large number of respondents -82% believe that monetary incentives and 64% of the non-cash as a form of reward, not used.

Knowledge capture and acquisition. Most widely used form of capture and knowledge acquisition is the capture and use of knowledge obtained from other sources (82%). This is followed by the allocation of time to obtain and disclose information capture and the use of knowledge obtained from research institutions (respectively 51 and 62%) and encouraging employees to participate in project teams with external experts (49%).

28% believe that it is justifiable to devote time to obtain and communicate knowledge and meanwhile, 13% of respondents plan to devote time to obtain and communicate knowledge and use knowledge obtained from public research institutions.

21% do not encourage employees to participate in project teams with external experts and uses knowledge obtained from public research institutions.

Training and mentoring. Generally organizations give more support for informal than the formal training. Practices most widely used are: encouraging employees to transfer knowledge from more experienced workers to new or less experienced (79%), encouraging employees to continue training (85%) and providing training outside the organization in order to maintain current skills (82%).

Formal and informal education and training in terms of knowledge management practices are considered not applicable in 84% and 77% of organizations. However,

13% and 10% of respondents plan to introduce forms of formal and informal training in the following 24 months.

Communication. Most common practice in communication is the preparing of written documentation such as lessons learned, training manuals, work practices, articles, etc.. (59%), followed by updating databases with the best and new working practices (46%) and by facilitating collaborative work between physically separated teams (28%).

Many respondents indicated that generally the practices listed in this section do not apply in their organizations. Thus, 44% indicated that in their organization does not apply the use of virtual teams to facilitate collaborative work between physically separate teams, 21% gave this response to the updating databases with best practices and 13% the practice relating to the use of written documentation to record lessons learned.

Question 2 - Knowledge management practices not included in the questionnaire. Only 8 companies have indicated that use practices / knowledge management tools which were not included in the questionnaire: international Project Teams; innovation Management; standardization; the quality management system certificate; internal training on specific products; forum intranet.

Question 3 - Reasons for introducing knowledge management practices. This question respondents were asked to state the reasons which led to the implementation of knowledge management practices.

Only one reason stood out, namely improving competitiveness, which is the purpose of all practices and management activities. This was followed by: to increase efficiency by using knowledge to improve the production process, to facilitate the integration of knowledge within the firm or organization and to protect company / organization knowledge losses due to departure of employees .

It is interesting to note that at the end of the list of reasons, is why "To jointly promote knowledge transfer", which has a low value, although the reason is the highest level of use to question 1, policies and strategies. Also improve collaboration with external experts has the lowest value of all the reasons, although it is a widely used practice (question 1).

Question 4 - Effects of Knowledge Management. One variable, improve employee skills is the most important, followed by increasing adaptability of products or services to customers. The lowest values are assigned to: prevent obtaining duplicate in research and development to increase capacity to acquire knowledge from external sources and increase market position.

Question 5 - Responsibility for implementing Knowledge Management. In little more than half of the company's top management is responsible for the implementation of knowledge management, followed by the HR department. However, the more a company is smaller, the likelihood that top management is responsible is higher.

Question 6 - Efficiency measuring. Only 15% of companies measure the effectiveness of knowledge management. Instruments used for measurement are: the analysis of economic indicators, quality control and intermediate indicators, audit, measurement of specific achievements (eg, time to deliver technical documentation), control of the database, number of inputs and access intranet.

As an observation related to efficiency measurement it can be noted that in most of the organizations knowledge management complement traditional management activities. Therefore to distinguish knowledge management and to measure its success is almost impossible for many companies.

Question 7 - Factors that contributed to the introduction of knowledge management. By far the most important source for introducing knowledge management is the management organization (83%). A second important source is customers (47%), which means that knowledge management in many cases is a reaction to the need to optimize customer relationships.

It is interesting that 20% of companies indicated that supplier relationships are a source for introducing knowledge management. Also, about a third of all companies mentioned as a source the competitors, indicating that knowledge management is considered as an important tool for the competitiveness of the

organization. Consultants or academics do not play a significant role.

Question 8 - The budget for knowledge management. 15% of all companies have indicated that they have a budget for knowledge management, the remaining 85% stating that they do not have such a budget.

From the group of companies indicated that they have a budget, 38% indicated that within 24 months of the budget relating to knowledge management practices will increase and the remaining 62% will be reduced.

From the companies which indicated having no budget, only 16.5% plan to introduce a budget, the remainder indicating that no or do not know (64.5%).

Question 9 – Resistance. Resistance to the introduction of knowledge management practices is generally very low. Only 9% of companies indicated that they encountered resistance to the introduction of knowledge management practices. In most cases resistance came from non-management employees.

Motivation to continue or implement knowledge management is consistent with what is expected theoretically. Knowledge management is introduced where tacit knowledge workforce out of control and can not be adequately used by society. Second and related to the first motivation, knowledge management is increasingly seen more as a reaction against the loss of skills resulting in employees leaving.

5. Conclusions

In Romania at present, we cannot discuss about the existence of strategic activities in terms of knowledge management. Within the Romanian companies knowledge management practices are related more with functioning of the organization and there are not part of a set of strategic activities, resulting in the development of strategies, plans, programs, incentives to achieve goals etc. In general, large companies have a wide range of activities based on knowledge management and knowledge management strategies more explicit.

Although written knowledge management strategies are not frequently in Romanian companies, 20% of respondents plan to formulate written policies or strategies for

knowledge management. Even if the Romanian companies do not have written policies or management strategies based on knowledge, some of them have policies and programs directed at acquiring knowledge retention and key employees for their organization of partnerships or strategic alliances with other organizations concluded.

Resistance to the introduction of knowledge management is generally low, employees being mentioned most often.

Regarding the possibility of expanding or introducing knowledge management in Romanian companies, the main motivation behind it would be the need to control and maintain the tacit knowledge of employees in the company. Second, and related to the first motivation, knowledge management is seen as a reaction against the loss of Knowledges determined by the leaving of employees.

As a conclusion to the above, we can say that although in many organizations in Romania knowledge management it is its infancy in application, the beginning was made by applying it to a number of companies.

The Relationship between Motivation and Efficiency of Human Resources

Tudorache Ana-Maria
Valahia University, Targoviste
anatud85@yahoo.com

Abstract

Most experts in human resource management give motivation a fundamental role in achieving efficiency in work. Performance is the result of individual characteristics of a person, of the efforts in his work and the support it receives from the organization. The concept of motivation is a key element in studying work performance. In this article we intend to see the relationship between motivation of human resources and work efficiency obtained by them. To this end we present two theories concerning this relationship.

Keywords: motivation, efficiency, human resources.

J.E.L. Code: J01, M12

1. Introduction

The concern for measuring and improving the efficiency of human resources has been and remains an important subject in work psychology. Work efficiency can be defined, as an operational form, as a variable dependent on two factors, individual abilities and motivation, in addition to the work environment. Practice has shown us that some people have characteristics that enable them to achieve high efficiency but are not making efforts in this direction; in other words, are not motivated. Others, however, are highly motivated, hard working, with aplomb, but the results are not matching their efforts.

2. Human resource efficiency

The true competitive difference between the organizations is based – now more than ever – on the efficiency of human resources

involved in such organizations. And this efficiency can be triggered by a single element: motivation. [1]

Thus, the motivation of human resources is a key element of individual and organizational success because motivation is the internal driving force that creates employees' will to work. [2]

In these circumstances, motivated employees want success, will give maximum performance regardless of task they have to perform. [3]

Going by this reasoning, we can say that where motivation is, there is also productivity and performance, and the binomial “motivation–performance” is and will be the main factor for individual and organizational success. [1]

According to Schermerhorn et. al. [4], obtaining a high efficiency is conditioned by the presence of the following three factors:

Efficiency = individual characteristics + work efforts + organizational support

Maximizing each factor allows any employee of a unit of work to achieve desired efficiency levels. Individual efficiency equation shows that this situation occurs in the gap between individual characteristics and task requirements or the case of an insufficient organizational support or because of both reasons. It follows, therefore, that managers must find means of motivating their subordinates as they are the ones who decide to intensify efforts. Hence the conclusion is that managers should motivate each of these subordinates.

Table 1. Relations between the variables of work efficiency equation, key factors and implications on management

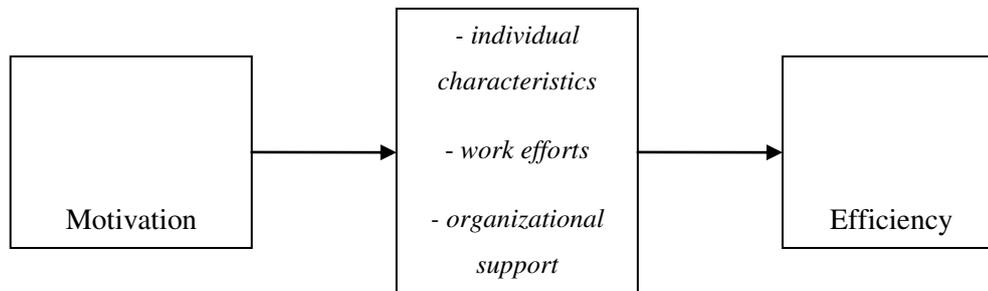

Variables	Key factors	Implications on management
Individual characteristics	Demographical, psychological, behavioral characteristics	Improving the ability to achieve a high efficiency due to the efficiency of recruitment, selection, hiring and training process of employees
Work efforts	Work motivation	Improving the will to achieve high efficiency by creating a stimulating environment and implementing an effective system of using the rewards
Organizational support	Resources machinery, equipment, organizational structure and size of the company, techniques, culture, work tasks design, interpersonal and group processes	Improving the ability to achieve a high efficiency due to effective planning, organization, motivation and control processes.

Source: Vagu, P.; Stegaroiu, I., *Work motivation: from theory to practice*, Bibliotheca Publishing House, Targoviste, 2007, p. 102

Employee being the sole master of the effort, the manager tends to influence this

effort using the concept of motivation. This sends us to the following relation:

Figure 1. The role of motivation in human resource efficiency

Source: adaptation after Vagu, Paraschiv; Stegaroiu, Ion, *Work motivation: from theory to practice*, Bibliotheca Publishing House, Targoviste, 2007, p. 102

3. Optimal motivation law

Optimal motivation law [5] is the most classical approach, which establishes the relationships between psychological variables and performance. This law maintains that the level of performance increases directly proportional with the increase of motivation level, but this is true only up to a point. When the person becomes

overstimulated or is excessively motivated, after achieving a certain level, its ability to achieve performance decreases. This process can be graphically illustrated by a Gaussian curve which increases and then decreases as the motivation intensifies.

According to the optimal motivation theory, the relationship between the intensity of motivation and the level of performance is dependent on the business complexity (task)

that the person has to fulfill. Thus, we can deal with the following situations [6]:

- In case of simple tasks (repetitive, routine, automated components with few options to resolve) as the intensity of motivation increases, increase performance level. “The relation of strength of stimulus to rapidity of habit-formation.”
- In case of complex tasks (creative, rich in content and solution options), the increasing motivation intensity is associated to some extent with increased performance, after which the latter decreases.

Due to the importance of the task difficulty in the relation between motivation and performance was formulated the hypothesis according to which Yerkes-Dodson Law can be divided in two factors [7]:

- The ascendant part of the curve can be considered as the energizing, beneficial factor of motivation.
- The descendant part of the curve can be interpreted as being the negative factor, the clutter effects of excessive motivation. A very high motivation can have negative consequences on performance because the pressure of solving the task is too high, stress installs and appear difficulties in focusing attention in the memory process and problem solving ability.

How the person perceives the task is also important in determining the optimal level of motivation. Thus there will be three situations [7]:

- When the subject properly appreciate the difficulty of the task. In this situation the optimal motivation considers the relationship of correspondence between the degree of motivation and performance level.
- When the subject appreciate improperly the difficulty of the task, underappreciating it. Appreciating the task as being easier than it actually is will lead to under-motivation and, hence, to the insufficient mobilization of energies and resources, the result can be a failure. In this case, the law says that it is beneficial a slightly over-motivation of the person. Thus, if the task is medium

but perceived as easy is better that the subject to have a high level of motivation so as to be able to complete it.

- When the subject appreciate incorrectly the difficulty of the task, overappreciating it. Appreciating the task as being more difficult than it actually is will lead to over motivation which will have clutter effects and will lead to failure. Also in this case is recommendable a gap between motivation intensity and difficulty of the task. If the medium task is perceived as more difficult than it really is, it is recommended that the subject to be easily under-motivated to accomplish the task to the expected standard of performance.

According to this theory we can say the following:

- It is important to motivate people who are in a very low state of motivation;
- Motivating people with low level of motivation will help improving work efficiency;
- There is an optimal point of motivation that should not be exceeded;
- The optimal point of motivation is not represented by the most powerful motivation condition;
- Motivation beyond the optimum point can reduce work performance, rather to improve it.

4. Conclusion

Motivation is represented by all those biological, psychological, social and cultural factors likely to cause, maintain and direct human behavior towards a well defined goal. At the same time, it is a key tool used by leaders insistently to achieve higher performance. According to optimum motivational theory, the relationship between the intensity of motivation and level of performance is dependent on the complexity of activity (task) that a person has to fulfill. According to Schermerhorn’s approach work performance is the result of individual characteristics of a person, work efforts and support that it receives from the organization. Work motivation contributes fundamentally to improve the will to achieve high performance by creating a stimulating

environment and by implementing an effective system of using the rewards.

Correlations existing both in the theory of optimal motivation of Yerkes and Dodson, but also in Schermerhorn’s approach strengthens the hypothesis that there is a direct connection between motivation and work performance, but the cause of these correlations could not yet be determined.

Conflict and Authority in the Educational System

Vasilescu Liviu

“Valahia” University, Targoviste, Romania - Faculty of Economics /Department of
Management

liviuvasilescu@hotmail.com

Abstract

The paper is a brief analysis focused on the challenges that confront the manager of the educational organisation in the process of conflict management from the perspective of social influence generated by the status of power in this field and by the gaps in the specific regulation that lead to pressure from the local authorities.

Key-words: authority, education, conflict, manager, power

J.E.L. Classification: J 52, J 53

1. Introduction

In the 21st century, the process of “social influence”[1] seems to be more and more overwhelming, the fields of education and educational management being particularly sensitive in this respect. Therefore, conflict management in the environment concerning the education-providing organisations by excellence reveals the presence of the “psychosocial phenomenon of prosocial compliance”[2], of the concern of the beneficial change agents for the modification of attitudes and behaviours of the educated, as well as of the educators responsible for the communities involved in the education process.

In the educational conflict management, the formation and development of a proactive attitude against conflict on the direction of peaceful coexistence, as well as the prevention, amelioration or elimination of deviance from different sources: normative, social, psychological, ethical, require special techniques of social influence based on communication as: “increasing power status, stimulation of self esteem, persuasion, manipulation, logical argumentation”.[3]

2. Social influence and conflict management in educational organisations

2.1. The conflicts in the educational environment can be generated by the difference between the power positions, in which one party possesses some form of formal or informal authority, either hierarchical or spontaneous, which may lead to the manifestation of other “effects of social influence phenomenon as: obedience, conformity, compliance and manipulation”[4].

Obedience is a behavioural pattern imposed by the social roles, the individual being subject against their will, to orders or suggestions from people with social, intellectual or age authority. A real situation of jealousy recently seen in the TV news is exemplary, in which two high-school female students are in a sort of master-slave relation, with the use of insults, threats and blows in the schoolyard by one of the parties.

As media are an extremely powerful engine of social influence, the video filmed by one of their classmates after the school classes, abruptly led not only to a wide range of commentaries related to violence and institutional authority, but also to the involvement of the highest formal authority in education.

Firstly, information as a main resource and a source of power must be questioned, as the managerial team had not been aware of this interpersonal conflict ignition, development and escalation. This fact highlights the importance of other types of power as association – the establishment of solid relationships between the educational partners, students, their parents and their class teacher, as well as the aggressor’s personal power marked by fascinating elements, according to her young colleagues’

perception: force, courage, determination, physical appearance.

Secondly, one should focus on the public's expectations whose pressure, although not thoroughly debated upon in the educational management literature, appears as another manifestation of authority that influence the decision makers in the field. They are naturally directed mainly towards “the coercion method” [5] with police intervention and the bully's removal from the educational group into another class in order to stop verbal and physical violence. The normative method of using power and parental authority are necessary in this conflict resolution, the parties being both under age and at a stage of compulsory education that excludes expelling from school.

Last, but not least, the “expert's power” [6] is to be taken into consideration and references are made to psychological and pedagogical counseling when applying the utilitarian method to the conflict parties, the aggressor, the victim and the neutral participants. The idea is that power should not be regarded as a fixed, pre-determined, limited quantity in a relationship that should be detrimentally wasted if not used against the other party. Moreover, the appropriate conduct and attitude towards reaching the relational target should not be based on the force – submission approach, but on the increase of the level of communication and self esteem.

2.2. Conformity reveals the modification of behaviour and attitude towards mechanical and uncritical acceptance and formal, docile, unprincipled submission to customs, ideas, decisions; a student unwillingly leaves the classroom under the pressure of the group of colleagues firmly inclined to unauthorised absence (truancy).

The group dynamics manifests on the direction of diminishing the formal authority of the school institution, of crossing the attitudinal and behavioural borders established by the normative framework. The pressure towards uniformity acts in a negative way as a form of majority's power onto one of the member of the school organisation, who cannot be ignored as he could become a potential factor of weakening the group's decision and action.

In the other party's perspective, authority is generated by the perception of the group's power, by the fear of conflict due to the low degree of assertiveness, as well as by the “power of reference” [7] shaped in the feeling of belonging to the group, in the identification with the group's offer of behavioural pattern.

As a representative of formal authority, the educational manager, in the position of class tutor or school principal must appeal to the parental authority of each member of the group of truant students. Such a manager must apply the “procedural power” [8], also called the “normative power” [9], by strictly observing the steps of the school internal regulation and the specific laws in the field of education that leads to sanctions against the behavioural deviance and to the long-term monitoring of the organisational group's disciplinary status.

For the student involved in this apparently masked conflict between the model imposed on by the group and his own will of accepting the organisational norm, there are needed certain techniques for stimulating the level of assertiveness, many of them based on organisational and interpersonal communication. Self-assertion, dilution and elimination of external commandments which are contradictory to his personal options and also motivation for optimism and confidence in his personal abilities are worth mentioning, as well as the “Pygmalion effect” [10] that consists of the belief that personal expectations and actions can determine the succession of favourable events.

2.3. Compliance is focused on the adoption of the majority's opinion in order to be accepted and approved or to avoid rejection, by agreement with the group through adaptation to a collective situation, by observance of law and orders. A lower secondary school student, who initially rejected the idea of wearing the coat that has the embroidered school logo (according to School Internal Rules), eventually puts it on in order to spare her classmates from constant observations of the tutor – teacher.

Social influence is performed here by the educational manager due to the investment of formal authority – a form of the structural power. Nevertheless, the basic element is the

moral power directed towards modeling and moderating the educated group's activities for strengthening team spirit, internal cohesion and forms of communication meant to positively stimulate motivation of the micro-organisational attitudes and conduct through empathy, logical argumentation and examples of good practice.

Raising the status of power in this particular situation is also revealed by the use of the irritating, nagging technique of the “power of the flea on the dog” type [11], conducive to the generation of the educational partner's embarrassment.

Under these circumstances of limited or inefficient parental authority, the phenomenon of cohesion inside the educational group becomes in itself a source of power, of authority through the internal unity of the interactions oriented towards the preservation of all the members by “the spirit of group enclosure” [12].

The divergent position of one of the group members in contrast to the majority's attitude is subject to the pressure towards uniformity in a gradual process. It initially includes the deviation encouragement by the manifestation of interest in the argumentation base and continues with the neutral phase in which the conflict topic appears as commonplace, part of the daily life. Next, the non-standard motivation becomes unacceptable in the stage of rejection of the deviant attitudinal model and finally, confronted to the threat of exclusion, the estranged group member is brought back into the educational group system.

2.4. Manipulation involves means of influencing by persuasive methods, a person, a group, a community in their actions, either spontaneous or by direct solicitation, whose purpose belongs to a will unrelated to their interests; submission of the will of the others can be made by creating the illusion of freedom, autonomy and free consent. Dissatisfaction for poor marks determines a student's parent to become a conflict party and to turn the school principal against the teacher by distorting real facts.

The manager is to use a remarkable source of power, the “definitional power” [13], i.e. the ability of giving the problem clear contour and content and of analysing the potential impact of the conflict on both

the individuals and the school organisation. Once the conflict framework is well defined, the necessary steps to the conflict solution can be made by using the power of resources (either tangible or not) characteristic to the educational environment as information, staff, students, competences, reputation and stress resistance. Besides, the correct managerial perspective comes from the formal authority in correlation to the personal power involving intelligence, logical connections, critical thinking and communicative competences, particularly in a manipulative attempt.

The general strategies of conflict management in the educational organisation focused on prevention, avoidance, minimisation, solving this process of systemic non-identification – as we have defined the notion of conflict - as well on the reduction and elimination of the negative consequences of the conflict, are structured around two basic concepts: *collaboration*, from which the actions for conflict prevention and resolution logically result, and *risk*, in the situations in which there exists the perception of the imminent occurrence or escalation of tensions within the organisational subassemblies.

In the conflict arena, power mainly concerns the effectiveness of the actions that can achieve the targets by “influence, opportunity and coercion in order to obtain the desirable results” [14], in linear relationship to the educational performer's capacity, derived from their sphere of power, both structural or personal, the latter being marked by determination, knowledge, intelligence, decision-making ability and communication skills. The structural power envisages the resources and the objective options involved in the conflict, the legal and political realities of the conflict environment and the level of authority held by the conflict parties and the conflict manager.

3. Didactic persuasion in conflict management

The complexity of the concept of persuasion as social influence is given by the multitude of relational structures built through exposure to and understanding of messages, followed by acceptance of ideas and sequencing of attitudinal, behavioural

and action modifications. The fundamental mechanisms that ensure its functionality in the educational environment refer to the nature of evidence, to the arguments to and the expressiveness of didactic communication, as well as to the nature, extent and impact of the ideas communicated.

The nature of evidence points to the arguments on which the interlocutor accepts and assumes an idea in the dialogic communication; according to Aristotelian rhetoric, influence is generated on three levels: the status of the speaker (ethos), logical reasoning (logos) and appeal to emotion (pathos) manifested with great visibility in educational conflict management.

Authority is a viable argument, easily recognisable in everyday life as social recognition of the hierarchical position of the transmitter easily entails the interlocutor's assuming of the ideas beyond their level of consistency and rigour.

"My teacher says so!" is an assertion similar to the Latin "Magister dixit", often heard by parents who supervise their children's homework, proving the argument of didactic prestige and credibility. Sometimes, parents who are highly trained in a particular field can provide counter-arguments on a particular element of the homework at home, at the class parents' meeting or at another educational activity, thus generating conflicts with their children.

On the other hand, a teacher considered the competent authority by the student can perform a behavioural change of the latter exclusively by social investment, yet the purpose of didactic communication does not consist of the automatic generation of behavioural patterns, but of the development of essential cognitive structures for filter, analysis and interpretation of the appropriate systemic information.

In didactic practice, persuasion can also exert by the argument of force; unfortunately, the use of physical force that should be an obsolete instrument is still a phenomenon present in Romanian pedagogy sometimes and often within the classroom limits with the teams of students, producing strong educational conflicts followed by monitoring activity, reprimands, warnings and sanctions.

An exaggerated level of authority may appear in more subtle forms that induce feelings of fear as the threat of punishment ("I'll ask the council for a lower grade for your discipline") or blackmail ("You know you will get a low grade if you do not participate in the contest." or "Keep on being insolent and you will flank this school subject").

The expressiveness of didactic communication in conflict management, considered an important requirement of productive communication, determines an impressed receiver, through the message content but mainly through the form of the discursive construction, that includes elements as emphasis, pauses, rhythm, figures of style. There is a proportional link between the sizes of both the content and the form of a message, so that a common minor incident will not be treated with increased linguistic expressiveness for avoiding a certain degree of irony, ridicule, or even awkwardness and, in reverse, a major conflict issue needs a certain rhetoric amplitude to achieve desirable efficiency.

Voice inflections, convincing intonation, word emphasis, posture, gestures, mimics forcefully intervene in transmitting and receiving messages to generate emotions and feelings of the conflicting parties and to increase motivation for the attitudinal change desired by the manager of the educational conflict. To obtain this effect, which is a favourable condition for the process of solution identification in an educational conflict, the conflict manager must build an elegant communication style, suitable to the demands of the educational environment. By gradual, *in crescendo* distribution of expressive discourse elements, the speaker can determine not only a certain type of authority, but also the targeted behavioural transformation.

Similarly important in educational conflict management for achieving discursive efficiency are the elements related to the nature, extent and impact of the ideas communicated, namely logical reasoning, expressiveness extension through par verbal and non-verbal elements, as well as the argument novelty, the originality of the idea in an expected type of speech or in the whole experiential practice of the conflict party.

The relevance of the conceptual content, the techniques of adding artifice, surprises and linguistic challenges of linguistic, the emotional and spiritual capacities can restore a flat pattern of communication into a discourse effectively targeted to a positive finality in managing conflict in education.

4. The educational system and formal authority

The formal authority is conferred on the teaching staff by the Ministry of National Education, the Districtual School Inspectorate, the Teaching Staff's Council and the Administration Board functioning at the level of educational institutions for the organisational positions of school inspectors, directors of educational institutions, school principals, chairmen of methodical committee, class tutors.

A conflict focused on formal communication and on the level of authority is generated by the fact that there have not been organised vacancy contests for the appointment of school inspectors since April 2008 and of school principals and deputy principals since December 2008, such managerial positions in the school organisation school being occupied by the formula of “appointment by detachment for educational interest.”

The legal powers in this context are established by the disputed National Education Law (1/2011) that also includes The Teaching Staff Status, Regulation for Organising and Functioning of Pre-academic School Education (ROFUIP, 2005), School Internal Rules, employment law, methodologies for the competitions for managerial positions on different levels of specific responsibilities as methodist, mentor, etc. and for the contests for obtaining membership in the Body of Experts on Education, the title of Teacher Emeritus and the gradation of merit in education.

A noteworthy point in this respect is represented by a legal vacuum on some important aspects of the management of the school organization. An example of such a conflict generator is the lack of the specific methodology for organising and running the competition for the positions of principal and deputy of schools, that should have entered into force (but has not) by the Minister's

Order on a date close to the time of National Education Law official publication (2011).

Consequently, the mayors of various cities, towns and villages, with the desire to offer support to their favourite teachers in taking over these managerial responsibilities, claim in their petitions art. 258, paragraph 7 of National Education Law which stipulates that “under the conditions of the vacant position of the school principal, till the organisation of a new contest, the interim management is taken, according to the School Administration Board's decision, by the deputy head teacher or by a member of the Board who automatically becomes credit coordinator”.

Nevertheless, it must be noted that Article 258 is to produce its effects after the organisation of the first session of contests for the position of school principal and deputy and, as this action has not been implemented yet, the necessary step is the appointment procedure “by detachment for educational interest”. This hub in the specific legislative field becomes a generous source of petitions and complaints and thus, it is a potential source of conflict at different levels of the educational system.

5. Conclusions

The 21st century manager of the educational organisation is confronted to a wider range of conflicts, not only within the strict school environment, but also outside it and the required equipment in order to face them is not as easy to get as one can possibly imagine. Besides the personal profile appropriate to the commitment to education and the professional and managerial expertise having as fundamental lines the acquisition of information necessary in the educational field, by both education stakeholders and the educated, the school manager should have complete legal support and be fully aware of the connections between the educational key-actors: teachers, students and their parents and local community, which are interdependent.

Moreover, the relational structure developed by the school organisations with other education related partners such as NGOs, charities, financial institutions and economic agents is far from being insignificant; on the other hand, one should

add to these positive aspects those elements targeting influence, coercion and political pressure. In this respect, references may be made to the behaviour and attitude of some of the local authority members - mayors, vice-mayors, local councilors – who, seeking to impose on the educational decision makers their own selection of personnel for the managerial team or even for the teaching staff in some educational institutions, can create a situation of tension, sometimes with huge conflictual potential.

Social influence works both ways and this principle marks not only the conflict management in the educational process, but also the perspective of global development of humanity in these tormented decades of the 21st century.

Eco-innovation in SMEs – a Draft Tool for Improvement

Voicu-Dorobanțu Roxana
Bucharest Academy of Economic Studies, Romania
rovodo@gmail.com

Abstract

The paper covers elements from a work in progress regarding a eco-innovation assessment tool, that can be implemented within a company, in particular in companies that are small or medium, but it can also be used in large firms, with a defined supply chain and a life cycle assessment tool implemented. The tool increases the topics covered by the Sustainability Assessment tool that can be found in literature, with elements related to innovation and eco-innovation (it increases the number of questions per category) in order to ensure a comparability throughout industries and in relation to the sustainability assessment. This work was supported by CNCISIS-UEFISCSU, project number PN II-RU TE_328/2010.

Key words: Eco-innovation, sustainability assessment models, SMEs

J.E.L.: D22

1. A brief glance at fundamental concepts

From an organizational point of view, innovation can be defined as the adoption of new ideas to foster organization [14]. Modern literature on the study but innovation starts with [1], developing further by contributing authors of such [3], [5] and [9], [16], [8] and [12]. Innovation is defined as a combination of invention and marketing company that forms the foundation of competitiveness [7], [13], namely "the adoption of ideas that are new to the organization that they adopt" [14]. You can find several types of innovations: technical, administrative, product or process innovations [6], [18]. It is extremely important to not only identify themselves as innovative technological transformation products, but also new ways to provide services, by the incorporation of information,

processes and procedures in the conduct of usual activities.

It is important however to distinguish between SMEs and large companies in terms of innovation capacity [15].

Several authors argue that traditional indicators of innovation such as R & D expenditure, employment, number of patents are not applicable to SMEs ([2],[11],[15]). Most of these studies on the ability of innovation for SMEs concluded that small firms can keep up with larger firms in innovation and shows no difference in the quality and importance of product innovations [19]. In the following tables, we capture the differences between SMEs and large companies in terms of innovation capacity.

Thus, SMEs exhibit behaviours such as the ones listed in Table 1 ([4]), in comparison to large companies:

<i>Dominant role of the entrepreneur / founder / owner</i>	<i>Delegated management between shareholders and board of directors</i>
<i>Reduced number of resources (capital, time employees knowledge)</i>	<i>Economies of scale, resource abundance</i>
<i>Flexible organizational capacity</i>	<i>Rigid bureaucracy</i>
<i>Emphasis on short-term</i>	<i>Focus on medium and long term</i>
<i>Local and regional focus, focus on customer needs</i>	<i>International Accent, less tight links with customers</i>
<i>Low degree of formalization</i>	<i>High degree of formalization</i>

Table 1: Comparison of SMEs and large companies

Source: [4]

2. The eco-innovation assessment tool

To develop a model for assessing the overall performance of SMEs, start the analysis of sustainability maturity assessment

models and innovation within the organization [17].

Thus, we propose a model-type diamond / radar, bringing together five dimensions of comprehensive performance assessment, namely:

1. Strategy - which aims if the company has a strategic planning process, if open to innovation and whether it has implemented its strategy and policies through appropriate mechanisms for implementing a system of eco-innovation.

2. Processes - is taken into account eco-innovation ability of the company included in the development of new products, reduce environmental impact and integration of processes taking place within the organization to greater efficiency and sustainability.

3. Organization - namely, its capacity to support innovation, namely eco-innovation through internal communication from top to bottom, bottom to top and side.

4. Connections - company's ability to integrate upstream and downstream relationships, namely the value chain with suppliers and distributors, and competitors to facilitate diffusion of eco-innovation

5. Learning ability - the ability to keep company employees always connected to the latest information in the field, to facilitate access to know-how regarding best practices for eco-innovation nationally and internationally. It is also important to take into account the company's capacity in this area to learn from the failures and successes in terms of eco-innovation and diffusion in the organization and its environment best practices learned.

The proposed model is based on the fundamental idea of a simple tool used by the organization to be able to check the position of a radar chart, which would be able to observe the evolution of indicators for each area assessed. . The tool increases the topics covered by the Sustainability Assessment tool that can be found in literature, with elements related to innovation and eco-innovation (it increases the number of questions per category) in order to ensure a comparability throughout industries and in relation to the sustainability assessment.

This will assess a total of 14 categories

for the five dimensions above, aimed categories and indicators to assess the sustainability for future international comparability in the last phase of the project, namely:

1. Sustainable development and innovation policy of the organization (Corporate Sustainability Policy)

2. Sustainable development strategy and global innovation (Overall Sustainability Strategy)

3. Government regulations (Gov't Policy and Regulation)

4. Trends impact on strategy (Impact of Trends on Strategy)

5. Supply chain (Supply Chain)

6. Green Label (Green Labeling)

7. Integrating Sustainability and Innovation (Integrating Sustainability)

8. Specifications / customer reactions (Specifications / Customer Insight)

9r. The evaluation process of the product life cycle (Life Cycle Assessment Process)

10. Eco-innovation: resource selection (Design for Environment - Material and Part Selection)

11. Eco-innovation: supply chain (Design for Environment - Supply Chain)

12. Eco-innovation: production (Design for Environment - Manufacture)

13. Eco-innovation: the use of the product (Design for Environment - Use Phase)

14. Eco-innovation: the end of the product life cycle (Design for Environment - End of Life)

Within each category, there will be questions to answer YES / NO reflecting eco-innovation capacity and improve overall performance, as described below in the next section. Each question is related to a certain score, the category total is a maximum of 4, minimum 0.

Based on totals for each category separately, we are generating a radar chart for the company in question, as illustrated in the following figure where it reaches the maximum extreme.

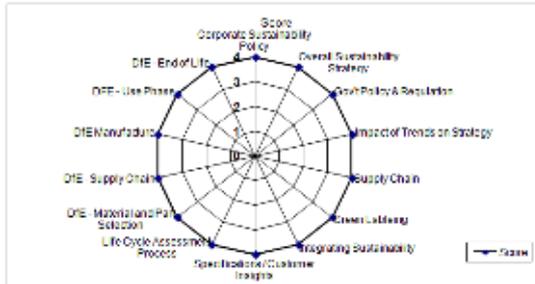

Figure 1: A spider chart of the eco-innovation assessment tool (an adaptation of the sustainability assessment tool)

Source: adapted from [10]

Thus a company that has all the indicators in all categories will be considered maximum capacity has increased eco-innovation without vulnerable areas and therefore no need for improvement. For a company that has an index less than 4, but positive, it is considered that the category is a sensitive area in which to apply specific policies to improve.

3. Model experimentation

To test his model was applied to a number of small and medium 2, the same areas mentioned where qualitative study conducted in the previous chapter, of which a company is driven entrepreneurship in Romania and developed exclusively for this environment, and the second company is part of a European network, the subsidiary of a multinational company in Romania.

The results obtained for as described in the following to each company.

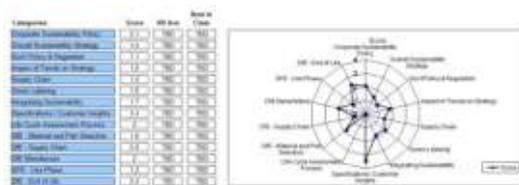

Figure 2: Applied eco-innovation assessment tool for company A

Source: author's calculations, 2013

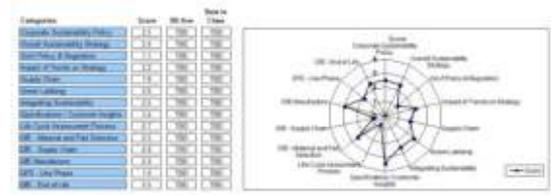

Figure 3: Applied eco-innovation assessment tool for company B

Source: author's calculations, 2013

Although interesting, the results cannot be interpreted in a macro- way, as they are not consistent. The two companies, although from the same industry, with the same capacities, exhibit completely different behaviours. Therefore, in order to ensure the proper implementation of the tool, the reserach must be conducted on a larger number of companies, from various industries and in various sizes.

4. Conclusions

This is a work in progress regarding a eco-innovation assessment tool, that can be implemented within a company, in particular in companies that are small or medium, but it can also be used in large firms, with a defined supply chain and a life cycle assessment tool implemented. The tool increases the topics covered by the Sustainability Assessment tool that can be found in literature, with elements related to innovation and eco-innovation (it increases the number of questions per category) in order to ensure a comparability throughout industries and in relation to the sustainability assessment. This work was supported by CNCISIS-UEFISCSU, project number PN II-RU TE_328/2010.

Application of the Workshop Method as a Solution for a Regional Program of the Retail Entrepreneurship Development

Yurko Igor

University of Ukoopspilka "Poltava University of Economics and Trade" Poltava, Ukraine
ivyurko@mail.ru

Abstract

Last three years in Ukraine were not favorable for the retail entrepreneurship development. Increasing the tax burden on small businesses and the development of international and national retailers has led to a decrease in the number of small retail enterprises. The improvement of the situation at the regional level can only be supported by local authorities through the creation of an enterprise development programs.

Usage of the Workshop method in the development of a regional program allows take into account the problems of entrepreneurs, to plan specific activities and to maintain a balance between the interests of small businesses and government.

Key words: Retail, entrepreneurship, development program, the Workshop method

J.E.L. classification: L81

Introduction

The basis of the market economy of any country is entrepreneurial relationships. Business development is a necessary condition for achieving prosperity in Ukraine as a whole and its individual regions.

International experience and practice of the entrepreneurship prove that the success of a country depends on the cooperation and synergy of large, medium and small businesses. Thus, in accordance with Ukrainian law small businesses are individual entrepreneurs without legal entity employing up to 20 people with an annual income of up to 2 millions euros and small businesses - legal entities - with up to 50 employees and annual revenues of 10 millions euros.

If large and medium enterprises form the economic potential of the country, the task of small business is a development of regional economy. Small entrepreneurship is the main source of regional local budgets generation from local taxes payments. It increases employment at the regional level and is a powerful social buffer that mitigates adverse crisis occurrences in the region.

Contents

Retail trade is the main activity of Ukrainian small business: in 2011 the share of the retail entrepreneurship was accounted for 57.7% of total sales of small businesses and 45.8% of the total number of persons employed in small businesses [1]. The main reasons of retail trade business spreading are a relatively small initial investment, fast money return and a high level of profitability. Also, start of that business does not require special knowledge and only a minimum of management skills. It makes retail trade business attractive as well. However, with the growth of a trade enterprise special knowledge and expertise become more and more necessary.

Retail business makes it possible for an entrepreneur to earn for a life, to have independence in decision-making, to own their own destiny, has a certain status in society. Trading business is a favorite work closely connected with communication with people. It serves to the consumers to make contracts under the most comfortable conditions, controls the quality of products, creates a positive impression on people (shopping).

Thanks to the development of the retail entrepreneurship, Ukraine managed to avoid a social explosion in the nineties of the last century and the effects of crises in 2004 and 2009, when millions of people were left without work. Besides, trade reduces gender

inequality in the country, providing jobs to women.

Under the conditions of balanced national policy, small business is able to create thousands of new jobs and support the formation of Ukraine as an economically developed country.

However, according to official statistics [1], in 2011 in Ukraine only 70 people out of 10 thousand of population had small businesses. Compared to 2008 this number decreased by 9 units, indicating a negative trend, while in the EU this figure is at least 300 people.

The analysis of dynamics of the small businesses and individual entrepreneurs number shows that by 2009 their number increased. Even during the crisis in 2009 the average number of small businesses increased. However, the 2010 - 2011 years were unfavorable for small enterprises, many businesses shut down. Especially noticeable become the reduction in the number of individuals - entrepreneurs (2 times).

Closure of small businesses led to a significant decrease in the volume of sales of small enterprises for the sake of big ones. In 2011 the sale volume of big business exceeded half of the gross output produced in the country. This fact indicates a worsening of the business climate in Ukraine.

In our opinion, the main reasons of small business development slowdown in Ukraine are:

- Enactment in 2010 of a new tax code. It greatly increased the taxes for small businesses and led to a massive closure of entrepreneurs-individuals;
- Significant expansion of national and international retail chains in Ukraine. Small businesses can not compete with hypermarket networks;
- Limited or no financial resources. Extremely high interest rates of commercial banks do not allow finance small business normally. And money from the state and local budget funds to support small businesses hardly come;
- The lack of an effective mechanism for implementing government policy to support small businesses.

The issue of state support of entrepreneurship did not take its rightful place in the activities of local authorities. The

complex of progressive laws on small business support exists, but its implementation at the regional level is a mere formality.

According to Ukrainian law since 2001 every two years complex programs of small business support are have to be developed at the regional level. These programs are one of the most important mechanisms to support entrepreneurship and to solve a wide range of problems.

In 2012 in Poltava the seventh entrepreneurship development program was created and firmly approved. Like the previous programs, at the local level it identifies main ways of implementation of the state policy for small business development. The program is closely connected to active regional policy, employment policy and investment and innovation directions of the city advancement. It aims at strengthening the role of local government in the support of small business, increasing its importance in the socio-economic development of the city and is an effective tool for solving actual problems of entrepreneurship.

In previous years, programs were developed by the traditional method. Permanent parliamentary commission Poltava City Council, branch management executive committee, the board of entrepreneurs, professionals of higher education institutions and community associations provided specific suggestions that were brought together into a single document by municipality specialists. Disadvantages of this approach are the program dependence on the activity of every part of the board, formalism and subjectivity in events creations and incoordination of individual items together; also, not all regional problems of entrepreneurship development are taking into consideration.

From the initiative of the author of the article, a new kind of method - Workshop method was used for the working out on "Entrepreneurship Development Program in Poltava for 2013-2014". Workshop is a format of a team-work. It aims to actively solving of a specific issue by its participants. Traditionally, during the Workshop leader organizes the discussion process (putting the "right" questions, clarifies all the aspects and so on) without imposing his expert opinion.

For the Poltava program discussion from several types of Workshop method it was chosen so-called "Problem" type. The goal of this type of method is to find the causes of problems and possible ways of problems solutions. This method was used for diagnosis and complex assessment of business environment, raising issues and finding solutions. Technology of the Workshop included 7 stages:

Stage I. Identification of problems that cramp entrepreneurship development in Poltava.

Stage II. Grouping problems on certain areas.

Stage III. Individual huddle of problems.

Stage IV. Discussion of ways to solve problems.

Stage V. Generation of points of the business development program.

Stage VI. Approval of the program on the Poltava City Council session.

Stage VII. Revision of the program implementation.

Working group of 35 people was pre-selected and approved. The working group included representatives of the departments of the executive committees and Poltava City Council, of the State Tax Service of Ukraine, of Poltava Chamber of Commerce, of NGOs of entrepreneurs, of Poltava Entrepreneurs Business Council and of Poltava University of Economics and Trade.

At the first meeting of the working group using brainstorming there were identified issues that prevented small businesses development in Poltava. Each of the participants proposed a problem that was fixed on paper and put up on the board. At the first stage proposed problems were not criticized and discussed. As a result, 44 problems were made during the 30 minutes work.

The results of the first phase showed that the Workshop participants most concerned about the problems associated with:

- Occurrence of administrative barriers (11 issues);
- Imperfect institutional infrastructure to support small businesses (8 issues);
- Insufficient professional knowledge and experience of entrepreneurs in doing business in today's environment (5 issues);
- The lack of effective mechanisms for

financial and credit support of entrepreneurship (4 issues);

- Illegal actions of competitors (3 issues);
- Limited access to business information (3 issues);
- Lack of social equality in doing business (3 issues);
- Lack of effective incentives for innovations in small business (2 problems).

The number of problems identified in the first phase included 5 such that directly interfere with the development of retail entrepreneurship:

- Unregulated illegal street trading and the reluctance of regulatory authorities to deal with it;
- No strict definitions of requirements for facilities to conduct retail entrepreneurship;
- Lack of control over the ratio of the concentration of retail establishments to the density of population in the city;
- Imbalance in the set out of locations of retail establishments;
- Imbalance of interests of entrepreneurs engaged in retail activities on the markets and administrative authorities of these markets.

The second phase took place in the frames of the first meeting of the working group. While working in groups all the issues were separated between common problems of the economy of Ukraine (corruption, raiding) and issues that do not directly relate to the regional business development (excess of carriers, inadequate professional training of government officials, the complete lack of legal knowledge in the deputies of local council). Participants of Workshop grouped all of remaining problems into 4 areas under the proposed methodical guidelines, including:

Section I. Entrepreneurship regulations streamlining.

Section II. Financial and credit and investment policies.

Section III. Resource and information support of entrepreneurship.

Section IV. Entrepreneurship infrastructure formation.

For the third stage (individual huddle of problems) the results of previous stages were

filled into table consisting of two columns: in the left column identified problems were recorded, in the right - possible solutions. Each of the working group members get the table and within a week had to complete this table with own proposals on possible solutions of problems.

With ready own problems solutions participants took part in the second and third meetings of the working group. There were discussed solutions of problems that impede regional entrepreneurship (IV stage). In the discussion more than 80 possible solutions were proposed. These solutions included enhancing the role of NGOs in decision-making process of local authorities, the creation of centers of administrative services, rapid informing and explanation of new legal regulations to entrepreneurs, economic competition support and ensure fair business conditions for all entities. For financial credit and investment business support there was offered to provide financial support to entrepreneurs through partial compensations of interest rates for the use of bank loans, organizing of presentations and advocacy work on the granting of preferential loans, financing of business start-ups with promising business ideas, the involvement of the small business entities in the implementation of city investment projects.

All solutions were grouped into 4 sections.

Section I. Entrepreneurship regulations streamlining. During the discussion in frames of that section, following actions were proposed:

- To consider proposals to improve regulations on meetings of entrepreneurs and send desirable changes to the competent authorities;
- For law-enforcement agencies to provide inspections of persons that do unregulated illegal trade;
- To carry out public control inspections of entrepreneurial activities by control authorities;
- To create a public committee for regulatory policy analysis and proposals for deputies of the Verkhovna Rada of Ukraine;
- To make proposals for patenting of innovative ideas mechanism simplification;

- To come forward with a legislative initiative of enterprise closure procedure simplification, etc.

Section II. Financial and credit and investment policies. At the section there were proposed:

- To organize regular competitions for identifying and financing of entrepreneurial projects of social directions and the most effective innovative projects in the priority areas of the city development;
- To create and post online database of potential investors;
- To arrange regular competitions and fairs of investment projects;
- To involve association of credit unions in the business financing;
- To train entrepreneurs to develop business plans;
- To create the database of consultants and advisors for investment questions, etc.

Section III. Resource and information support of entrepreneurship. The main proposals are:

- To create a map of sale points' localization in the city and make decisions about opening of new stores taking into account that map;
- To afford free access for the entrepreneurs of information about communal property that is subject for privatization and is rented;
- To make collective decisions of entrepreneurs that would not lead to corruption and improper protection of other businesses;
- To establish and strengthen the role of public organizations on the markets;
- To organize agricultural weekend fairs, to allocate additional sale places for entrepreneurs on the markets;
- To develop marketing programs that provide advertisement and promotions to support local businesses;
- To provide feedback between the government and entrepreneurs with a help of public opinion surveys.

Section IV. Entrepreneurship infrastructure formation. The section includes next suggestions:

- To organize seminars and trainings for entrepreneurs, to post learning

- materials online;
- To use innovative methods for selection of talented students to start their own business;
 - To introduce into the high-school subject "Economics" topics relating to business development, to create training manual for pupils "How to start own business";
 - To arrange competitions and championships among secondary school pupils on the basics of entrepreneurship to enhance motivation and identify potential entrepreneurs;
 - To create and organize of distance learning website for entrepreneurs.

Based on the suggestions made by the participants, experts of municipal Executive board formed concrete events that have been placed in the basis of regional business development program. This document was approved at the Poltava City Council.

Conclusions

So, as a result of the Workshop method usage and creative work of the working group, regional entrepreneurship development program was established. The program provides improvement of organizational and resource coverage of small business, reduction of administrative

barriers and the possibility of program adjustments (changes or additions) depending on changes in domestic and external conditions for its implementation.

The purpose of the Workshop is the exchange of experience and knowledge to create a joint specific product. The advantages of Workshop are that this method is practically oriented to offer ideas based on practical experience of participants and actively engages all stakeholders to cooperate. By using this method the basic principles of the business development program are kept: objectivity, transparency and equality (taking into consideration the interests of the local community and entrepreneurs).

The entrepreneurship development program implementation will significantly intensify retail business in the city and will help eliminate the problems hindering the retail development at the regional level. Implementation of specific program events will improve services, create new jobs and increase the local budget replenishment.

Public Policy End-of-Life Vehicles Reflected at Opel/Vauxhall

Zima Liliana Adela

*The Economic and Physics Department, Faculty of Sciences, North University Center of
din Baia Mare, Technical University of Cluj Napoca, Romania*

lili_zima@yahoo.com

Abstract:

Disposal of cars and light commercial vehicles at the end of their operational lives(-ELVs) is estimated to generate over ten million tones of material requiring treatment and disposal in 2005 within the European Union. This volume is projected to increase to fourteen million tones by 2015 as the number and average weight of vehicles increases. The company Adam Opel AG operates as a subsidiary of General Motors Europe AG, which is a major part of General Motors Corporation. Adam Opel AG is working on environmental protection for a long time (before 1990) since they realized they must act responsibly with the resources and they must invested decades of work into environmental innovation to reduce pollution and raise their sustainability. In terms of product development Opel's recycling strategy is based on two cornerstones: recycling –oriented design and development and implementation of material cycles for vehicle production.

Key words : product, life cycle, recycling, recovery

JEL: M30, N74

1.Introduction

Every year, end of live vehicles generate between eight and nine million tones of waste in the Community which should be managed correctly. In 1997, The European Commission adopted a proposal for a directive which aims at making vehicle dismantling and recycling more environmentally friendly, sets clear quantified targets for reuse, recycling and recovery of vehicles and their components and pushes producers to manufacture new vehicles also with a view to their

recyclability. The legislation was officially adopted by Europea Parliament and Council in September 2000 and was published in Official Journal on 21st October as Directive 200/53/EC as the „ ELV Directive”.

This Directive applies to vehicles and end-of-life vehicles, including their components and materials. It specifically covers motor vehicles with at least four wheels for transporting passengers and with a maximum of nine seats; motor vehicles with at least four wheels for transporting goods which weigh no more than 3,5 tones and three wheel motor vehicles. Practically the scope is to decrease the quantity of waste arising from vehicles and the legislation encourages vehicle manufactures and importers of vehicles into European Union to limit the use of hazardous substances in their new vehicles, to design and produce vehicles which facilitate re-use and recycling and to develop the integration of recycled materials. Since 1 July 2003, the use of mercury, hexavalent chromium, cadmium and lead in the components of vehicles placed on the market has been prohibited. Priority must be given to the re-use and recovery of vehicle components. The aim of this Directive is to increase the rate of re-use and recovery which (in average weight per vehicle and year) should reach 85% no later than 1January 2006 and 95% no later 1January 2015 and the rate of re-use and recycling (in average weight per vehicle per year) 80% no later than 1January 2006 and 85% no later than 1January 2015. For vehicles produced before 1980, the targets are lower [1].

Reviews suggest that ELV developments in Europe and Japan are having direct and indirect impacts on US manufacturers. US manufacturers are required to comply regulations in their European/Japanese manufacturing and sales operations. There is some reported evidence that US

manufacturers are using their experience in Europe and Japan to increase domestic car recycling in the US, and are trying to limit the need for specific regulations in the US by demonstrating voluntary progress in ELV recycling. There is also likely to be competitive market pressures from European/Japanese manufacturers operating in the US, who will be stressing the importance of recycling in their own marketing.

US manufacturers are researching, and taking steps towards, increasing ELV recycling rates on a voluntary basis. General Motors, Ford and Chrysler have formed the US Council for Automotive Research, a key objective of which is to promote and conduct research required for the technology to receive, reuse and dispose of materials from ELVs. All car's manufacturers from United States of America have developed lists of restrictions on materials that are not used as specifications for their suppliers to restrict or exclude specific substances. Ford has introduced worldwide recycling guidelines and is seeking to increase the use of recycled materials and the recyclability of materials used in manufacturing process. General Motors with Ford has also been running a similar program, initially looking at recycling bumpers into housing for headlights, and using recycling from bumpers in new bumpers [2].

2 The research regarding policy of Opel/Vauxhall end of life vehicles

As a company and industry pioneer, Adam Opel's heritage is the oldest of all German car manufactures. The roots of the Opel brandname go back to 1862 when Adam Opel embarked on volume production of sewing machines. In 1889, Opel starts its automobile production in Russelsheim at a rate of eleven vehicles a year. Today, is one of the most technologically advanced automobile manufacturers in Europe and together with Vauxhall (in the United Kingdom) sells vehicles in over 40 markets in Europe. The company operates plants and development centers in seven European countries, and employ around 40.000 people. Many additional jobs are provided by over 6500 dealer/ service sites.

In 2011 Opel sold over 1.2 million

passenger cars and light commercial vehicles in Europe, achieving a market share of 6,1%. With the market introduction of the electric Opel Ampera in 2011, the company has founded a new segment in the European automotive market and underlines its role as a trendsetter for progressive mobility solutions[3]. Besides production and the central corporate divisions, Russelsheim is also home to Opel's think tank, the International Technical Development Center (ITDC) where around 8500 highly qualified engineers, technicians and specialists meet the challenge of developing sophisticated, innovative automotive solutions that deliver exceptional value for customers including the recycling activities and finding new ways to protect environment[4].

Opel/Vauxhall welcomes the Community's initiative to adopt EU-wide rules for the environmentally-sound disposal of vehicles at the end of their life cycle. The company implemented their own Design for Environment guidelines and continue to work with other economic operators and government to develop markets and methods to improve recycling economies. The cornerstones for Opel's recycling policy are the recycling oriented design and the recovery concept for end of live vehicles(ELVs). In this vision Opel focuses on increasing efficiency in their recycling process by designing products from the start to be recyclable.

2.1. Recovery strategy

Opel/Vauxhall's recovery strategy comprises three key elements: recovery-oriented design; establishing closed material loops and recovery at all stages of the product life cycle.

Recovery-oriented design at Opel/Vauxhall follows Design for Environment guidelines which were first developed in 1993. These guidelines support design engineers to ensure as much as possible of the vehicle is recovered at the end of its life. This includes: proposals for easy pre-treatment of ELVs; material selection including increasing use of recycled materials and fast and efficient dismantling[5].

Closed material loops – in 1989 Opel/Vauxhall first introduced the use of recycling plastic in the Calibra model.

Through to today continued to release recycled materials for example over 10% of plastics in the new Astra recycled content. Since 1990, Opel/Vauxhall has worked closely with several dismantlers to study the optimal recovery/recycling process and develop design for recovery/recycling manuals for new cars and dismantling manuals for end-of-life vehicles. Opel/Vauxhall is also part of the International Dismantling Information System (IDIS) which provides computerised information on dismantling. Saab and General Motors imported models are included. In the present more than 130 plastic recycle types have been specified and approved for use in production. In comparison to new resources, recycle must fulfil all the same technical specifications and be produced at a lower costs. Where these two criteria are met, recycled materials are preferable, but quality is never compromised. The recycle team takes every effort to maintain high quality look and feel, mechanical and thermal durability, along with performance standards.

In fact because the recycled materials are of such a high standard and quality, they can be used for visible parts as well as hidden parts of Opel cars (for example Opel Insignia). Enabling dismantlers to identify materials is key to fast and efficient recovery. Opel/Vauxhall only uses recyclable plastics in car production and was the first car manufacturer to mark all plastic parts over 100 grams in 1979 according to ISO standards. To facilitate the economic recycling of cars at the end of their life, Opel/Vauxhall engineers aim to reduce the number of different material types used (numerous types of plastic are used in car production) and give preference to materials are compatible in a common recycling process(for instance, elastomers and polyethylene cannot be recycled together). Regarding the pre-treatment and dismantling is not enough for Opel/Vauxhall to integrate recycled plastics and materials which are easily recovered into production but must also make it easier for those treating scrap cars to depolluted (remove fluids which can contaminate soil, water courses and sub-surface water) and dismantle their products. To design for pre-treatment means thinking ahead to allow for the fast and efficient

removal of batteries in addition to draining fluids from components such as fuel tanks, engines and gear boxes.

Likewise, recyclable parts are arranged in such a way as to make them easily accessible and dismantable in order to reduce the time needed for- and thus the cost of- dismantling. Bodywork specialists have decreased the number of fasteners types used and try to avoid fastening techniques such as spot welding and insert foaming. Component fasteners can be loosened without the use of special tools and new attachment methods enable parts to be removed in just a few minutes- and yet remain secure while in use.

Design engineers, for example, decided to change the construction of the bumper of Corsa to speed up dismantling time. They dispensed with the usual two-part assembly of plastic bumper components and steel carrier(which is necessary to absorb energy). Now the steel support is part of the bodywork so that no additional dismantling is needed. The exterior components of the bumper is clipped on to the bodywork and held in place with two screws at each end. Removal of the front and rear bumpers now only takes two minutes.

Recovery throughout the product life cycle is the third step of the recovery strategy which is very important too. Opel has the largest network of certified vehicle dismantlers in Germany- about 240. Opel regularly audits its dismantling partners to ensure they may the requirements for environmentally-sound ELV recovery. In the United Kingdom, Vauxhall is one of the founding members of Automotive Consortium on Recycling and Disposal , which comprises representatives from motor, dismantlers, metals, and rubber industries[5]. The consortium is committed to improving the recovery of materials from ELVs to 95% in 2015. Opel has signed several voluntary agreements with similar objectives in countries like Portugal, Spain, France, Austria, Italy and Belgium.

More than 50% of Opel dealers in Germany are certified take-back points for ELVs. In addition, in 1995 Opel developed a waste disposal program. For all dealerships and service outlet taking back exchanged spare parts, fluids and packaging waste. At no cost to the last customer, Opel collects and integrates this waste into the recovery

loop. Opel is the only auto manufacturer which provide a nationwide system for treatment and disposal of almost 14.000 metric tones of automotive waste every year. The program has been introduced also in Austria and will be extended in other countries too. Manufacturing waste from Opel/Vauxhall plants is collected, sorted and re-introduced into production. At Vauxhall's Luton plant 63 tones of computer paper and 25 tones of other waste paper are recycled every year. Opel Exchange Parts is a re-manufacturing program which provides Opel dealers and service outlet a bonus for sending back worn parts (generators cylinder heads, transmissions) which- following a check- up and reconditioning are re-used for customer repairs at a lower cost then the original parts but with the same warranty.

Every year approximately 8 million cars are scrapped in Europe. About 75% of the car's material weight is recovered, with the remainder- rubber, textiles, glass and plastics-going to landfill. Although there are several factors which currently hinder efforts to recover a greater percentage of the car. Ope/Vauxhall aims to reduce automotive waste going to landfill to 5% over the next 15 years. As part of Opel/Vauxhall's overall recycling strategy, cars are designed especially to enable greater recovery of non-metal parts.

Normally in every country the final owner brings his or her car to an authorised dismantler or in some cases to a dealer who either receives a fee from the car owner or makes a payment for it. Crash damaged and relatively new cars have a high value. The cars are depolluted-batteries and airbags are removed and all fluids such as oil, fuel, brake fluid and anti-freeze are drained and safely disposed of. Tires and catalytic convertors are also removed and where possible re-used. Marketable spare parts such doors, engines and gearboxes are dismantled for reconditioning and resale. The scrap remainder- mainly metal, rubber, textiles, glass and plastic – is pressed and transported to a shredder. After shredding, the metals are separated and sent for recycling in the steel or re- smelting industries. This means approximately 25% of the car's total weight goes to landfill. On average, most countries aim to decrease the amount of automotive shredder residue ending up in landfill by a

further 80% in 2015.

Although dismantling information for most Opel/Vauxhall models is available across Europe, there is no common system in place to handle cars at the end of their life. However, with one or two exceptions, all countries in Europe have voluntary agreements (between manufacturers and related industries/associations and sometimes governments) or legislation in place to ensure that vehicle waste is properly treated and that achievement of over- all recovery targets continuously improves.

Car manufacturer's role in voluntary agreements is usually to improve the design of vehicles for recovery/recycling , provide dismantling manuals for all models, mark with common coding all plastic parts over 100 grams, work on global criteria for measuring recyclability, increase the use of remanufactured parts and participate/support projects aimed at increasing plastic recovery by- for example- better separation processes, researching new applications/markets for non-metallic materials and developing energy recovery processes for automotive shredder residues.

2.2. Limits to recycling

Opel/Vauxhall has made significant advancements over the years in an effort to increase the recyclability and recoverability of their cars. The Design for Environment guidelines enabled their engineers to ensure recovery/recycling capability from the early stages of a model's development by careful material selection, easier methods of dismantling and identification of parts and the use of recycled plastics in new vehicles .For example in 2000 30.000 metric tons of recycled plastic were used in the production of new vehicles at Opel/Vauxhall.

Thanks to this new way of thinking how to built cars so that they have a smaller impact on the environment at the end of their useful life, it is possible to recover up to 95% of most models total weight. Why then is only 75% of the average car recycled? And how will it be possible to achieve the overall recovery targets of 95% in 2015 as required in the proposed Directive 200/53/EC regarding end of live vehicles.

The three- quarters of the car which are currently recovered are fluids, catalytic convertors and batteries which are removed

in the pre-treatment phase and spare parts or metal which have a market value when re-used or recycled. What about the seat, foam, glass, bumpers and other plastics? Are these elements recyclable/recoverable? Clearly they are- however there are important limitations.

The first aspect is economic. At present the profitability of end of life vehicles recovery is based on sales revenue from market components and scrap metal. The time and labour required to dismantle additional materials is one of the main reason for the less favourable economic result of a higher recycling factor. In many countries, there is no market for recycled materials and substantial subsidies would be needed to create one.

Material composition can be another factor which acts a barrier to recycling. On average, 10% of a car's weight is plastics. There are numerous different types of plastic which are used in car production. Although Opel/Vauxhall has selected materials which are easy to distinguish and supplies information to facilitate identification and sorting for more recent models, it is still difficult to separate out the different grades- a prerequisite for plastics which cannot be recycled together. Technology is not available to separate the different grades post-shredding so it must occur at the dismantling stage – a labour intensive and expensive procedure all to obtain a material for which there is currently no market (imagine that this means for cars built before Design for Environment guidelines were introduced).

Glass, 3% of the total vehicle's weight, is also problematic. For safety reasons, front and rear window screens are bonded the car body and require special tools to be dismantled. Glass is also laminated, tinted and coated with a primer along the edges making it unsuitable for direct recycling. The amount of non-automotive, more easily-recyclable glass being recycled today currently saturates the market. Tires, which comprise the largest part of a car's rubber content, can also be recycled but- depending on the market- there are limited applications for the material. In Germany, the metal rim is removed and recycled while the rubber is used in cement kilns. Burning rubber for energy recovery is perhaps the best waste

management option but this method also faces obstacles[5].

Another factor regards health effects. A little mentioned problem with dismantling for recovery/recycling is that someone has to do it is a labour intensive and cannot be handled by automation. Removing seat foam for example can be a health hazard as the material was often been contaminated by bacteria. A study carry out by the Consortium for automotive Recycling, found that even after being treated to produce insulation panels for carpeting, seat foam was still found to contain unacceptably high levels of bacteria.

Another factor is energy recovery. Recovery of the energy contained in the different materials of an end of life vehicle, which are currently landfilled, is an important option to help manufacturers achieve increased recovery levels until viable and economic material recycling methods are developed. Heat treatment to recover energy does not require material sorting of the different plastics. Mixed shredded waste has a high calorific content, and can be used as a substitute for non-renewable fossil fuels such as coal or oil. Modern energy recovery plants are clean and emissions are strictly regulated under two European Directives and several national regulations. In many cases, emissions are lower than those from coal-fired power plants. Energy recovery is, however, not only limit by the proposed EU Directive to 10% but faces unfounded opposition from the public at large in most European countries with the exception of Switzerland and those in the nordic region.

Setting high material recycling targets and limiting energy recovery is misguided for another very important reason. As the proportion of plastics versus metal content increase in new cars to save weight and decrease fuel consumption, higher quantities of plastics will have to be dismantled and recycled to fulfil the requirements of the Directive. For example, a car which- as a result of using lightweight metal such as aluminium or magnesium- weighs 250kg less than a standard model of the same size could emit more than 50g CO₂ per km less than the heavier model. But because both cars contain virtually the same amount of non-metals, a larger portion of the non-metal components in the lightweight model must be recycled-

the share of non-metals to be recycled in the lightweight model would be about 44% compared to 33% for the heavier model-there by penalising the more environmentally-friendly version. Given the economic, technological and other obstacles to reaching high recycling targets, manufacturers are faced with a dilemma: improve fuel efficiency or increase recyclability of cars? These objectives do not necessarily have to be at odds as long as there is flexibility to choose the best waste management option taking economic, social and environmental factors into consideration.

3. Conclusions

There are about 18 million cars on Europe's roads today which are Opel/Vauxhall, Saab or other General Motors brands. Since the early nineties, company designed their cars to ensure easy and efficient recoverability at the end of their lifecycle in an effort to limit their impact on the environment and ensure sustainable mobility for future generations. But what happens to a car when it comes to the end of its useful life? Are systems in place to recover or recycle valuable materials ?

It is important to note that scrapped vehicles represent only 0,2% of total landfill volume. The reason for this is simple: currently about 75% of the car is recycled. The policy of Adam Opel AG regarding protection of environment is responsible not forget to give customers maximum driving pleasure with minimum emissions. The company are not only continuously improving conventional engines, but are also working on a full range of new, cleaner and more fuel-efficient technologies- including pure electric propulsion and various hybrid concepts. The specialists strive to improve CO2 emissions and fuel consumption without restricting driving performance. This is the principle behind the ecoflex models. Ecoflex technology consists of a lot of small, clever, changes that add up to a big increase in overall efficiency. It means improving fuel systems and eliminating hidden drags on consumption. Car buyers welcome the opportunity to drive both economically and ecologically: nowadays, up to 40% of all Opel models sold carry the ecoflex badge.

The Opel Ampera is Europe's first

electric vehicle that is powered by electricity at all times and can be used without any compromise. For the first 40-80 km, power is supplied by the electricity stored in the 16-kWh, lithium-ion battery. If a longer trip is required, the gasoline-fueled generator powers the electric motor and keeps the battery at a satisfactory level. This technology is called extended-range electric vehicle.[6].

While in theory the economic value of these environmental benefits can be measured through a combination of market prices, damage costs and non-market valuation techniques, in practice arriving at such valuations is problematic but can also be expected to give rise to a variety of further financial and economic benefits, through: promotion of resource efficiency, promoting cost savings to public authorities, by reducing the costs of dealing with abandoned vehicles, enhancing the efficiency and sustainability of treatment sector, by raising professional and environmental standards and promoting modernizations of operations Progress in this area, combined with a willingness by government to take a more flexible approach to recovery options, will be a significant step towards ensuring the cleaner disposal of End of life vehicles and thus sustainable mobility for future generations.

The Challenges of Human Resources Management Practice in a Knowledge Based Organization

Antohti Ionut

Faculty of Economics, Ovidius University of Constanta

antohi_ionut@yahoo.co.uk

Abstract

Human resources represent an important asset for modern organizations especially in the context of knowledge based economy. The main competitive advantage is represented by knowledge possessed by the employee of an organization. Human resources management practice needs a different approach meant to attract develop and fully use such knowledge. This paper aims to analyse the growing impact of knowledge over human resources management practice. Mainly we discuss the manner in which the human resources management can respond to the challenges brought by the new context. Assuming new roles human resources management will support the transfer and development of knowledge within organizations. This new approach generates a real transformation of specific practice.

Key words: knowledge based organization, human resources management, new roles, challenges.

J.E.L. Clasification: M12

1. Introduction

In a knowledge-based economy the use of ideas prevails over the physical abilities and on the application of new technology rather over the exploitation of labour in a classical manner.

Such an economy implies that the knowledge is created, acquired, transmitted, and used more effectively by individuals, companies, and communities in order to induce economic and social development.

A key concept of the knowledge economy is that knowledge and education has become a business product, a productive asset.

Knowledge based organizations have increased their demand for high-skilled

workers. Meanwhile, the demand for lower-skilled workers has declined. One of the most important challenges that such organizations are facing refers to achievement, development and retention of more high skilled people.

In such a context, the human resources management has become an important part of business model that will provide the skilful people that a company needs. New challenges arise for this particular field and should be considered in order to develop and maintain an appropriate level of knowledge for the organization.

2. The knowledge based economy - theoretical background

The knowledge economy refers to all jobs and companies in which the knowledge and capabilities of people determines competitive advantage, rather than the capabilities of machines or technologies.

The knowledge based economy has developed as a result of wide spreading usage of information and communication technologies.

In this information-intensive economy, competitive advantage is based primarily on the application of knowledge, and not all of the data, intelligence, and wisdom with which a global company needs to compete can be found in one place. Increasingly, knowledge is dispersed around the world.

In order to better understand the concept of knowledge based economy some general definition are presented.

According to the OECD report (2003) in knowledge based economy the role of knowledge as compared with natural resources, physical capital and low skill labor has taken on greater importance [5].

Another point of view at consider the knowledge based economy as the one in which the generation and exploitation of

knowledge has come to play the predominant part in the creation of wealth. It implies the most effective use and exploitation of all types of knowledge in all economic activity.

The development of this new concept was generated by several factors. First we should mention the information technology revolution. It has provided new opportunities for easy access to information from anywhere. New opportunities have been created for generating and transferring information worldwide.

Secondly, the globalisation process provided opportunities to any company, especially for smaller one, to take advantage quickly if they can adapt faster to changes that occurs e in the new knowledge-based economy. This represents a clear advantage of smaller companies over the bigger ones, because in such a new context the speed reaction is essential [4].

The companies can adapt faster to the changes that occur within the economic environment and exceed the competition by concentrating their efforts on research and development for the long time perspective and also by investing in education and training. The changes in the knowledge based economy are so rapid therefore the companies should consider the workers lifelong learning process as the primary source of maintain their knowledge potential.

Educated and skilled workers able to create, share and use the knowledge in order to ensure company’s competitive advantage are essential for a knowledge based organization. A new model of training is needed in such organizations in order to keep up with the changing technologies. In the same time these workers should be capable to access the information infrastructure that provides effective communication, dissemination and processing of information. In other words, they should be able to access and share knowledge [4].

The knowledge based economy generated a new type of organization – the knowledge based one. Such an organization is characterized by a high degree of complexity. Its main ability is to collect knowledge from around the world and use it in specific local opportunities. This way, these companies are able to stay one step ahead their competitors [3].

This new type of organization requires a

different approach centered on knowledge management at all levels, human resources making no exception. This new approach implies a different way to handle human resources management activities.

It can be argued that human resources management is facing real challenges that are bringing into discussion new roles that this domain should empower in order to achieve a greater importance and impact over the company performances.

3. New roles and challenges for human resources management

In the knowledge based economy the human resources management activities will be not resumed by the conventional functions of staffing, training and development, performance management etc. Human resource management work in the knowledge based economy will include activities that overlap with other traditional business functions (for example finance, marketing) and some new activities (for example knowledge management).

Therefore, human resources management will be no longer focused on the matter of managing people in a traditional manner. The new responsibilities are related to the management of capabilities that the employees are creating and the relationships that people must develop [1].

Human resources personnel are still accomplishing traditional tasks, although some of that activities has been outsourced (for example, staffing, benefits, etc.) or performed using specialized technologies (for example, electronic HR).

It could be noticed that an important part of conventional human resources management activities is now accomplished by line managers and professionals from other fields, such as information technology.

In the knowledge based economy, the human resources management activities have been extended. Therefore, specific responsibilities are reorganized by sharing among specialized managers, employees and external services suppliers.

The new technologies applied in human resources field allow increasing its value-added contribution to organizational performance using fewer personnel. In the same time, specialized solution for hr

generated more information available for employees and managers. It is called disintermediation of HR activities.

Fast and cheap access to accurate real time HR information will be provided by the new technologies. Access and the ability to analyze, assess, interpret, manipulate, leverage, and share information effectively will be the key to giving the organization a strategic edge.

In order to increase employee effectiveness and efficiency an improved access to information is required. This means working from anywhere and at anytime. Instant access to all needed knowledge and to essential data will be a keystone for a successful company.

The human resources management in a knowledge based organization has to develop new roles that should enable to supply company's abilities needed to adapt to the challenges of the actual context. These new roles should exceed the classic boundaries of human resources management activities. The development of new practices should increase the contribution of this domain to the organization effectiveness.

Four roles are identified that make it possible to create those needed capabilities [2]:

- human resources steward,
- knowledge facilitator,
- relationship builder,
- rapid deployment specialist.

Every organization represents a sum of knowledge, skills, abilities of its employees, that makes it different from other organizations. In the same time, these assets represent the basis to ensure a unique competitive advantage.

This new role (**human resources steward**) consists in accumulating, concentrating, conserving, complementing and recovering the collective knowledge, skills and abilities within an organization.

Human resources management specialists have to develop new capabilities among employees and stimulate commitment among them. A new kind of relationship must be developed within organization based on the principle of leading without excessive controlling. Such a relationship implies a significant, self-responsible contribution to organizational performance.

Human resources management faces few

challenges on the road of assuming such a role.

Human resources management has to provide valuable human resources to the company and also to determine the growth of value for these resources.

The key knowledge workers should be identified, attracted and retained within the organization.

The recruitment and selection process should be reshaped in order to impose higher requirements for the new entry positions. Meanwhile, career management should replace job administrative activities.

Another important role that human resources management has to assume is **knowledge facilitator**. For knowledge based organizations acquiring the most talented people and putting them to work is not the only major task. It also has to provide knowledge creation and to ensure its dissemination throughout its employees and often among business partners.

This new role of facilitating organizational learning and knowledge sharing among employees, departments and business partners involves several challenges. First, the accent is put on continuous learning process. The employees are encouraged to learn and develop their capabilities continuously. Human resources management has to find the most appropriate ways to attain these objectives.

Another challenge refers to the fact that the human resources management should provide the necessary knowledge and its dissemination among employees when this knowledge is needed. Related with this another issue that should be considered is the one regarding how to reward knowledge acquisition and sharing. Finally, this new approach should lead to the development of new organizational behavior patterns. Employees should be provided with a model of behavior that will enable them to maintain a constant effort toward the development of new knowledge.

Related with the previous role the human resources management should consider another one- **relationship builder**. The human resources management has to develop new practices that will enable employees to encourage, facilitate and sustain relationships within organization and also among business partners. This will lead to a better perception

of knowledge creation and also enables its sharing.

Related with the previous role the human resources management should consider another one- relationship builder. The human resources management has to develop new practice that will enable employees to encourage, facilitate and sustain relationship within organization and also among business partners. This will lead to a better perception of knowledge creation and also enables its sharing.

The rapid changes that are characteristic to the knowledge based economy, lead to another important role of human resources management – **rapid deployment specialist**. Human resources management has to ensure in a short time period the most appropriate human resources structure that a company need to valorize the short term opportunities that the market place bring to surface. In this manner a company could rapidly deploy its competitive advantage and overcome its rivals.

In this context, human resources management should concentrate its efforts on creating a flexible human resources structure that could easily adapt to these changes. The focus will be on results responsibility rather than the task assignment.

4. Conclusions

The knowledge based economy and the emerging knowledge based organization put at the core of business process the creation and dissemination of knowledge as a continuous endeavor.

In such a context human resources management is facing the challenge of major transformation. Two situations can be considered.

First, this domain fails to embrace these new opportunities and become less important in relation with other field of action within an organization.

Secondly, human resources management could assume the new roles above mentioned and become the most important field within an organization, having the greater impact over the effectiveness and its overall level of performance.

As further research issues we should consider the possibility of measuring the contribution of human resources management

practice to the process of knowledge creation and sharing.

Abstract

The Euro zone's deficiencies became obvious when the crisis turned permanent. The Euro zone was caught without a supervisory procedure on macroeconomic imbalances, crisis management instruments, adequate banking supervision and sufficient instruments of resolution. The primary reason for these failures is the lack of a fiscal union with an adequate authority over fiscal, structural and banking policies. Attempts to straighten these mistakes were done ad hoc and have so far been insufficient because they have implied a high moral hazard. Financial markets are increasingly aware of these shortcomings, and have begun to rely on the possibility of abolishing the Euro zone.

Cuvinte cheie: public debt, budget aggregates, budget deficit, automatic stabilizers.

Clasificare J.E.L.: G30, H61.

1. Introduction

Regarding fiscal rules, Stability and Growth Pact has had a negative impact. The Pact rules were not met before the crisis and the pact created unnecessary tensions among Member States by not allowing the defining of a strategy during the crisis and a coherent exit strategy. Original principles of the revised Pact, in 2005, remained unchanged and refers to [1]:

- the budget deficit to be within 3% of GDP;

- public debt to fall within 60% of GDP;
- Member States are required to provide stability programs that present projections for public finances four years, bringing the medium term budgetary positions in balance (deficit of 1% of GDP, is allowed to Member States, with high growth and low public debt).

- fiscal effort should be at least 0.5% of GDP per year (measured in terms of primary structural balance, estimated by the Commission).

If the debt exceeds 60% of GDP, bringing the debt to this value must be done in a satisfactory pace. Once equilibrium is achieved structural balance, it must be maintained. Only automatic stabilizers are allowed to work, the structural balance calculation method being performed by the Commission. European Commission initiated the excessive deficit procedure (EDP), when a country exceeds the 3% budget deficit (unless this excess is temporary) and set a deadline for the country to bring its deficit below 3 % of GDP. Penalties may be applicable if countries can not meet their commitments after triggering the excessive deficit procedure, but they were never implemented.

Pact shortcomings were analyzed many times (see, for example, Mathieu and Sterdyniak, 2003), formulating the following critical:

1. 3% limit does not make sense in times marked by recession. A country affected by a

recession might need a budget deficit above 3% of GDP to offset declining demand in the private sector. Thus, this increase had no negative effect on their partners because this avoids the overflow of domestic demand in neighboring countries. In this respect, Germany in 2002 there was a deficit of 3.5% of GDP and inflation rate stood at 1.4%, and the current account surplus to 1.9% of GDP: can not see As German budget deficit could have a negative impact on partners.

2. Pact is considered to be inefficient for two reasons. • It can operate only in the economic cycle and restrictive measures should be taken only when the economy is located on top of the cycle. • Covenant not consider issues balance of payments, competitiveness, private debt and housing bubbles and financial.

3. Pact should provide sanctions for countries with excessive public deficits, which induce inflationary pressures or excessive deficits accumulate, causing the European Central Bank to raise interest rates. In fact, countries in excessive deficit procedure (EDP) are often countries with low economic growth and low inflation with public deficits that need to support their growth.

4. The rationale behind the concept of a balanced budget in the medium term has no clear economic justification. A country where private saving is too low (high) will require a budget surplus (deficit). It is also reasonable to finance public investment by government borrowing and therefore some government deficits are justified. In a situation of relatively low private demand, managing the government's balanced budget requires a low level of interest so that the objective of a

balanced budget would not be feasible. A deficit kept permanently at 0% of GDP,

public debt rating could be stable and to be within shrinking share of GDP. Debt would reach a point at 0% of GDP.

5. In periods marked by economic growth, the Stability and Growth Pact (SGP) aims to reduce structural debt, but you can not put pressure on governments to do so. Episode 1999-2002 showed that the concept of good economic situation is problematic: Member States have refused to accept a ceiling on the unemployment rate, calculated by the Commission. In a recession, the rule becomes completely unworkable. Furthermore, the distinction between structural and cyclical balance is questionable: where and how should be introduced incentives?

6. Because there is a single interest rate that does not fit the specific situation of each country, each Member State should be allowed to use fiscal policy to achieve a satisfactory level of GDP (corresponding to the natural rate of unemployment).

7. Implementation of the SGP is mainly based on estimating the growth potential of the economy, which is problematic during the crisis.

2. Evolution of the gross domestic product and budget aggregates

For the period 2012-2015, according to the *Convergence Programme 2009-2012* and the *Report on the Draft of Budget Law for the year 2012 and the horizon from 2013 to 2015*, the projected evolution of Romanian GDP and budgetary aggregates has the value levels shown in Table 1.

Table 1: Projected evolution of Romanian GDP and budget aggregates for the period 2012-2015

- Mil. lei and % -

No.	Name		2012	2013	2014	2015
1	General Domestic Product		579.600	617.142	659.302	707.051
2	Budget Revenues	abs. val.	195.351	212.914	231.425	248.175
		% of GDP	33,7	34,5	35,1	35,1
3	Budget Expenditures	abs. val.	206.561	225.294	241.355	254.793
		% of GDP	35,6	36,5	36,6	36,1
4	Actual Budget Deficit	abs. val.	11.210	12.380	9.940	6.618
		% of GDP	1,9	2,0	1,5	0,9

Source: „ Report on the Draft of Budget Law for the year 2012 and the horizon from 2013 to 2015” and own calculations

As shown, the project is "optimistic", expressing the hope that **the GDP, budget revenues and expenditures will continuously grow**, while the size of the actual budget deficit (except for 2013, for which is projected a slight increase) shall decrease both in terms of absolute value and as a share of GDP, reaching only 0, 9% at the end of 2015. [1]

If these projected levels will become those effectively recorded in the Romanian statistics for the 4 years period under study, it means that the fiscal policy promoted was appropriate *and there was slightly better in Romania and foundations were laid for "the so much better" that we all want.*

Thus, a significant increase in GDP is expected, which at the end of 2015 will be with 127.451 million lei over the projected level for 2012, which means an increase of about 22%.

Budget revenues in 2015 will be with 52824 million lei over those of 2012, which means an increase of about 27%, while budget expenditures will increase by only 48.232 million lei, i.e. 23.35%, registering a regressive growth in relation to the projected increase of budget revenues.

Under these conditions, the actual budget deficit will decrease from 11210 million lei in 2012 to 6618 million lei in 2015, reaching

a share of only 0, 9% of GDP.

These trends are shown graphically in Figure no. 1.

As a signatory part to the new *Treaty on Stability, Coordination and Governance in EMU*, Romania is in a better position, given the lower dimension of the public debt - which is well below 60% of GDP. Therefore, **the new structural budget deficit limit of Romania will be 0, 7% of GDP** - which is above the 0, 5% of GDP stipulated in the treaty as a medium-term objective for EMU Member States.[2]

Control of public finances should become very strict, with a number of clear advantages, but also an important disadvantage in order to achieve this limit (which we consider to be very "ambitious").

Obviously, given the negative experience of Romania in recent years in the field of taxation, the most important advantage is **the inability to promote pro-cyclical fiscal policy**, which will be backed by **a strong fiscal discipline!**

The downside is the narrowing of "shunting" fiscal space [3] necessary to stimulate the economy during periods of recession (by lowering the overall tax burden and increase of some categories of budgetary expenditures).

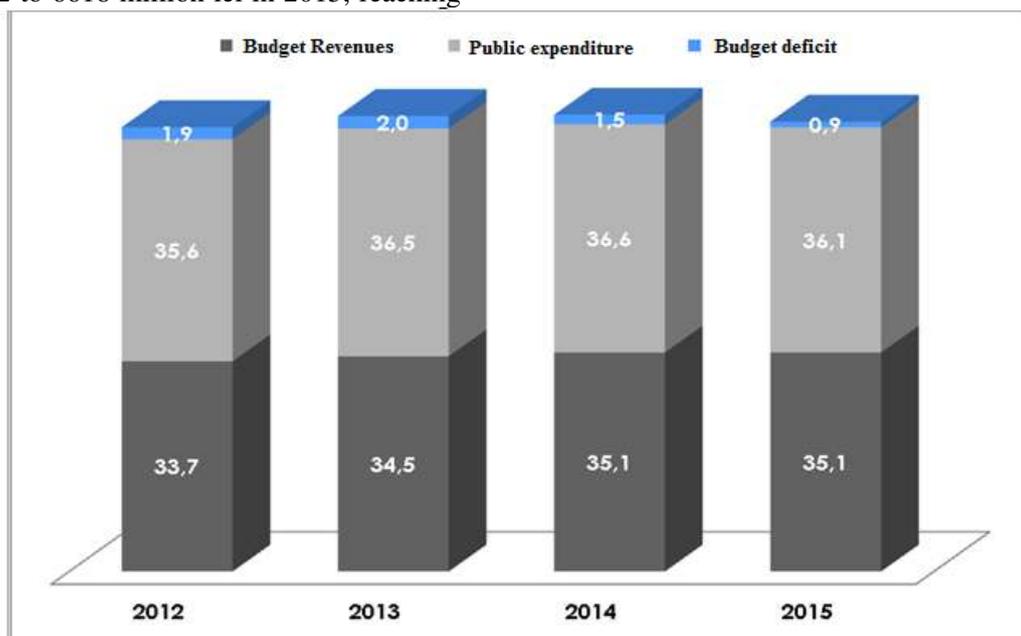

Figure 1: Projection of the share of budgetary aggregates in GDP, for the period 2012-2015

Structural deficit's limit of 0, 7% of GDP for Romania will be almost certainly achieved long before the actual budget deficit reaches at 3% of GDP - corresponding to the convergence criteria of the Maastricht Treaty (which becomes obsolete, under the new European Fiscal Compact). In fact, giving credence to projections presented in Table. 2, *evolution of the actual deficit will get us away from this part of the past in the coming years!*

However, if we take into account this level of 3% of GDP of the effective budget deficit and a coefficient of actual revenues and expenditures' sensitivity equal to 0, 3 (as has already been calculated for Romania), the output-gap should be equal to 7, 66% for compliance of the structural deficit with the limit of 0, 7% of GDP - and such economic contraction was recorded in Romania only in 1997 and 2009.

But, as stated in some papers [1], [4] it was shown that during a full economic cycle (i.e. on medium and long term), **the average actual budget deficit equals the actual average structural deficit** – so the average cyclical deficit is equal to 0 (zero). Under these conditions, by assuming a structural deficit limit of 0, 7% of GDP, *Romania has the obligation that the average of actual budget deficit over a full economic cycle to be equal to at most 0, 7% of GDP*, which compared to the historical average of structural deficit for the period 1999-2011 of 3, 8% of GDP will actually mean recording a much lower budget deficit and “shunting” fiscal space compared to the recent past.

3. Conclusions

Because of the relatively low influence of automatic stabilizers in the Romanian economy - than that of the average Euro zone member states, EU-27 and the 23 Member States of the European Union - in times of economic recession, **discretionary fiscal stimuli should be much stronger here** - which means accepting a *higher structural budget deficit* (we consider the limit of 1% of GDP) so to restore the economy to its potential.

Since the limit of structural budget deficit can not be exceeded, the solution remains **intensifying the action of automatic stabilizers**.

It was demonstrated theoretically and empirically that the intensity of automatic stabilizers' action is dependent on the share of tax revenues and social contributions to GDP, significantly higher sensitivity of profit tax in relation to the cyclical position of the economy and the progressive degree of income taxation.

In Romania, for electoral reasons, tax progressivism was "banned" and taxation proportional to a “unique quota” of both profit and incomes of the general population was promoted. In this context, to achieve an increase in size of budgetary revenues and their share in GDP based on the upward evolution of GDP and the relative reduction of the compulsory levies' pressure, *the growth of taxation base and increase of the degree of collection of taxes and social contributions established by the state, including at local and regional level is compulsory*.

Abstract

Public institutions have as their main mission the redistribution of public wealth through the community services.

In the Romanian budgeting system, education is considered a priority of national interest.

Higher education is a clear contributor to the development of the society as a whole by providing knowledge to youngsters as to develop and improve their training in various fields of study.

Currently, academic education faces a strong underfunding, which is an impediment to the progress expected. In addition, higher education is still deeply marked by the legislative changes from 2011 which came as an approach of convergence with the European requirements.

This paper appears as a practical study in which we intend to highlight the current financing system of the University of Craiova, its structure and its most "consistent" sources of financing in the context of an unfavorable underfunding.

Keywords: budget financing, subsidies, own revenues, underfunding, university management.

J.E.L. Classification: G10, G14, I22.

1. Introduction

Public institutions have features which define and distinguish them from the commercial entities, but also particularities that are imposed by the nature of the activity object.

Specialists define public institutions as entities that carry out activities, usually of a social matter, in the community interest, activities that do not produce incomes or that generate insufficient incomes for covering their costs, being necessary the allocation of budget resources to cover these costs [1].

The role of public institutions is to provide public services of high quality to meet social needs of individuals and businesses, in terms of economic efficiency [2].

The education can be found among the services offered by the public institutions in Romania and implicitly the higher education. In our country, the academic education is carried out through universities (institutions of higher education) [3].

Although the educational function is provided mostly through public institutions of higher education, private educational institutions also coexist. This situation has generated debates and disagreements regarding:

- the coexistence of public and private education;
- the training categories that the public education system must ensure (initial training, continuous training; primary training, secondary and higher training) [4].

In what follows, we will get farther from the private sector, because the subject of our study represents a public institution of higher education: the University of Craiova, that represents by far the most prestigious university in the Oltenia area.

2. Content

The University of Craiova is an institution of large dimensions, that carries on a sizable

and complex activity related to insuring at high quality standards and efficiently the educational process.

The National Education Law stipulates that all financial resources of state universities are considered own revenues [3]. For this reason, we analyze the case of an university fully funded from own revenues, its annual budget being consisted from: budgetary financing and own incomes.

Generally, state universities revenues consist of: amounts allocated from the budget of the Ministry of National Education under contracts, own incomes derived mainly from tuition fees collected under the law from individuals and businesses, foreign or Romanian, interest, donations, sponsorships and amounts obtained from other sources [5].

Budgetary financing consists of amounts allocated from the Ministry of National Education and includes: institutional funding that is received under the institutional contract [6], and complementary funding that is received under the complementary contract.

In our country, in 2011, the classification of the universities was compulsory under the new National Education Law, which refers to three groups of universities namely:

- universities of advanced research and education;
- universities of scientific research and education;
- universities focused on education.

Following this process, the University of Craiova was classified as university in B category, focused on research and education, which resulted in drastic reduction of the budgetary funding allocated to it in 2012 compared with 2011, as can be seen from the analysis presented in Table 1.

If in 2011 the budgetary funding allocated for the university amounted 82.413.177 lei, in 2012 there were granted from the state budget only 73.053.998 lei, which indicates a decrease of 9.359.179 lei, that means a decrease percentage of 11,36%. This decrease was due to the faster decrease in institutional funding in comparison with the increase in complementary funding. In addition, in the period under study we can easily notice that the overwhelming percentage of budgetary funding was represented by the institutional funding, with

a slight decreasing trend in 2012 in favor of complementary funding.

Table 1 – The Analysis of budgetary financing of the University of Craiova in 2012 compared with 2011

Type of financing	Value in 2011 (lei)	Value in 2012 (lei)
Institutional financing	68.431.334	57.293.418
Complementary financing	13.981.843	15.760.580
Budgetary financing	82.413.177	73.053.998

Source: The Annual Report of the Rector of the University of Craiova on the Situation of the Institution for 2012

The significant decrease of budgetary financing generated a strong pressure on the University, emphasizing the efforts of the people responsible with the management of the institution in the sense of judicious and effective allocation of resources that were already considerably reduced. Furthermore, in this sense, in the annual activity report published in 2013, for 2012 [7], the rector of the University of Craiova states that "the decrease of the resources from public funds generated a reallocation of funds depending on each situation and a tendency to deviate from the overall priorities of the institution". Finally, the crisis situation imposed forced measures unfavorable for the didactic staff, but especially for the non-teaching staff.

Turning our attention to the institutional funding it is necessary to mention the fact that in 2012 it was composed of:

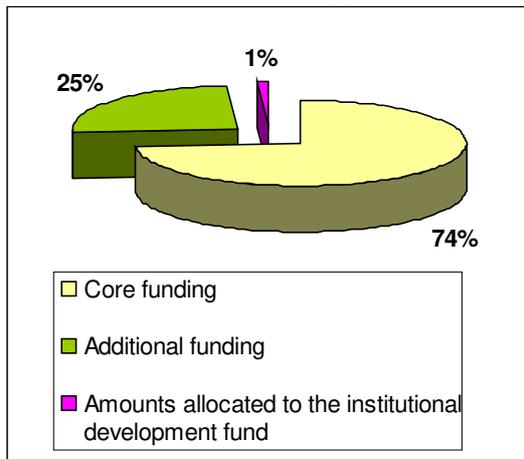

- **Core funding** that was received by each of the three university cycles (bachelor, master and PhD) related to the number of unitary equivalent students and to the number of doctoral grants, representing the total amount of 42.203.411 lei;
- **Additional funding** consisting of: funding allocated to the three university cycles (bachelor, master and PhD) related to the number of unitary equivalent students and to the number of doctoral grants and funding allocated to support the programs of local

communities development, meaning a total amount of 14.425.640 lei;

- **Amounts allocated to the institutional development fund**, namely 664.367 lei.

The structural analysis of institutional funding can be seen in Figure 1, standing out the significant share of core funding (74%), followed by the additional funding share (25%) and finally the percentage of 1% for the institutional development fund.

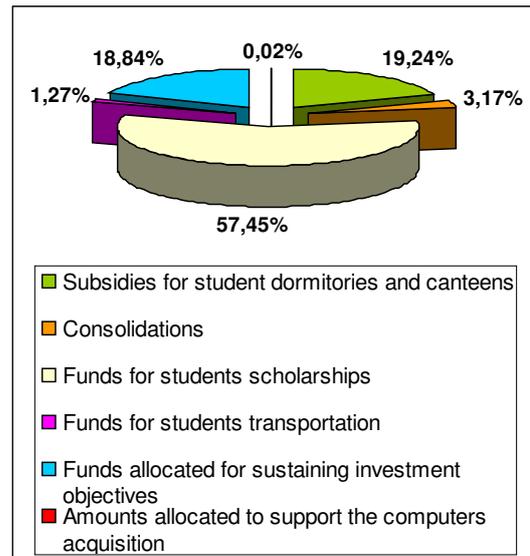

Figure 1 – The Structural Analysis of Institutional Funding for 2012

Source: The Annual Report of the Rector of the University of Craiova on the Situation of the Institution for 2012

However, the structural analysis of the complementary funding, graphically represented in Figure 2, reveals in a justified way the overwhelming share of the amounts allocated for the students scholarships funding (57,45%), followed by the share of subsidies allocated to support the activity of student hostels and canteens, more precise subsidies for accommodation and meals (19,24%), then the share of funds allocated for sustaining investment objectives (18,84%), and finally the extremely low percentage of budget allocations for consolidations (3,17%), for students transportation (1,27%) and the almost negligible percentage for the amounts received to support the computers acquisition (0,02%).

Figure 2 – The Structural Analysis Of Complementary Funding for 2012

Source: Own Processing after the Rector's Annual Report on the Situation of the University of Craiova for 2012

In the somber context of underfunding, we consider appropriate to turn our attention on the own revenues of the University of Craiova, analyzing for the start their structure and their dynamic development in 2012 compared with 2011.

As with all higher education institutions, the main source of income for the University of Craiova is the tuition fees procured from the students, master students and PhD students who are not financed from the budget. The fees quantum is set by the University Senate, at the proposal of the faculties. In addition to the tuition fees, the University can also obtain funds from: admissions, registrations, re-registrations, exceeding the legal tuition period, failed exams and reexaminations.

It is imperative to take into consideration that the process of tuition fees collection has been seriously affected by the global economic crisis. For this reason, the university management was forced to focus on stimulating other own sources of funding, such as:

- incomes from rental of premises;
- revenues from sponsorships;
- revenues from the provision of services;
- interest income;
- other incomes.

Another important source of own incomes are the amounts obtained from irredeemable external funds. University of Craiova ran in 2011 - 2012 about 50 projects of which: 38 projects were funded by the European Social Fund and 12 projects were financed by the European Regional Development Fund, aiming for: the diversification of partnerships, enhancing the added value of the implemented projects, the diversification of major intervention areas and especially the optimal allocation of the financial, logistical and human efforts necessary for implementation.

In 2012 the revenues from operational programs were estimated at the value of 21.138.785 lei, while in 2011 they amounted to 26.824.452 lei, revealing a decrease in absolute value of 5.685.667 lei which means a relative decrease in percentage of 21,20%. This is due to the fact that the University has faced more prominent, in recent years, with the non-reimbursement of payments made for the implementation and the development of EU funded projects, which attracts by itself the emphasis of the budgetary pressure.

We also believe that it is useful to focus our attention to scientific research as well, as an important element of contribution to the development of higher education and as an integral part of the mission undertaken by the University of Craiova. Scientific research is carried out under research contracts without VAT (projects won in national competitions) and under research contracts with VAT (projects funded by others). In 2012 own revenues obtained from the research activity of the University of Craiova (including subunits) were in the total amount of 9.855.751 lei, representing 12% of total incomes obtained in 2012. Analyzing exclusively the incomes of the University of Craiova (without subunits) from research activities, we note a decreasing trend. In 2012 they were at the level of 7.926.545 lei and in 2011 at the level of 11.683.113 lei. Thus we observe a decrease in absolute amount of 3.756.568 lei which means a relative decrease of 32,15%.

Moreover, we also consider opportune to analyze the issue of micro production incomes. Thus, in the period under review (2011-2012) University of Craiova performed activities of micro production through the Station for Agricultural Research

and Development of Caracal and through the Experimental Teaching Station of Banu Mărăciine. In the first case, in that period the revenues increased by 2.670.335 lei, respectively by 46,02%, reaching in 2012 the level of 8.472.622 lei. In the second case, there was a decrease in revenues from year to year at the rate of 13,50%, reaching in 2012 a level of incomes of 537.134 lei. Overall, in 2012, revenues from micro production represent 11% of total own revenues obtained by the University of Craiova.

Another component of own incomes earned by the University of Craiova are revenues of student hostels and canteens, but they have a lower share in the total own resources of the institution (7% in 2012). University of Craiova has 12 student dormitories (including the dormitory from Drobeta Turnu - Severin), with a total capacity of approximately 3.300 beds. The institution also has two student canteens: one located inside the Agronomic Complex and one located on the premises of the Campus of the Faculty of Mechanical, the latter featuring modern facilities. Revenues from student dormitories and canteen shall consist of:

- revenues from taxes of accommodation in dormitories;
- incomes from rental of premises;
- revenues from the sale of food prepared in the two canteens.

In 2012 compared with 2011 revenues of hostels and canteens increased with 692.293 lei (respectively by 14,69%). Instead, subsidies received from the state budget to support the activity of student hostels and canteens (which, as we stated earlier, are part of the complementary funding) decreased in 2012 compared to 2011 with 651.804 lei in absolute size, respectively with 17,69% in relative size.

In addition, a structural analysis of the total revenues from hostels and canteens activity highlights a decrease in the share of grants allocated from the state budget (from 44% in 2011 to 36% in 2012) in favor of their income (from 56% in 2011 to 64% in 2012).

Analyzing the overall revenues of the University, presented in Table 2, it is obvious that they have decreased in 2012 compared with 2011 to 8.746.726 lei,

respectively by 10%. This decrease was caused by:

- the decrease of the revenues from tuition fees;
- the decrease of the revenues from external funds (more precise a decrease in refunds);
- the decrease of the revenues from research activities.

However, as we mentioned before, the incomes from micro production increased by 2.058.877 lei, respectively by 30% and own revenues from the activity of dormitories and canteens increased by 692.293 lei respectively by 15%.

Table 2 – The Analysis of Own Revenues of the University of Craiova in 2012 in comparison with 2011

Type of financing	Value in 2011 (lei)	Value in 2012 (lei)
Own revenues	38.496.366	35.273.618
Research	12.445.232	9.855.751
Micro production	6.950.879	9.009.756
Own revenues of hostels and canteens	4.713.220	5.405.513
Operational programs	26.824.452	21.138.785
TOTAL	89.430.149	80.683.423

Source: The Annual Report of the Rector of the University of Craiova on the Situation of the Institution for 2012

3. Conclusions

The reduction of budgetary funding due to the classification of the university as an institution of higher education of class B and the decrease of its own revenues as a consequence of the global economic recession, generated considerable pressure on the institution and especially on the university management, which was compelled to alter its resource allocation strategy.

From the information presented above, we conclude that in 2012, the University of Craiova achieved total revenues amounting to 153.737.421 lei of which: budgetary financing in amount of 73.053.998 lei and own revenues in amount of 80.683.423 lei. These were used to partially cover the expenses (personnel, goods and services and capital expenditures) amounting to 174.785.539 lei. To cover the gap, it was necessary to use a part of the resources available at 31.12.2011, more precise the sum of 21.048.118 lei.

Following the process of "rationalization" of resources allocated from the state budget, own revenues remained clearly the "substantial" funding sources, exceeding the budgetary funding in 2012 with 7.629.425 lei, respectively by 10,44%.

Under the impact of budgetary pressures caused by both the reduced funding from the state and the reduction of their own incomes, the management of the University of Craiova main objective was to stabilize and strengthen the financial situation, being forced to adopt a very cautious fiscal policy. In this way they tried as much as possible to stimulate resources from own sources such as rental of premises, the work of agricultural resorts, sponsorships and more. Also, costs were reduced to the maximum extent possible for the purposes of continuing the activities under the conditions of a balanced budget.

In this extremely unfavorable context, our recommendations for improving the financial situation relates mainly on identifying additional sources of funding to supplement existing resources and to support the good running of the university.

Thus, we believe it would be appropriate and beneficial to approach the idea that supports the establishment of associations or foundations that contribute to enhance the performance of the university.

It should also be taken into account the variant of establishing partnerships with the private sector in order to disseminate the results of academic research in various fields. Resources obtained in this way could be used to finance the aims of the institutional strategic plan.

However, in terms of improving the current system, we consider that all efforts should be made as to unblock the sums that

are expected to be reimbursed for the projects financed from European funds. In this endeavor it is absolutely necessary to involve the project managers, which should stimulate and implicate themselves as much as possible in an active way in the recovery of the amounts paid by the University for the ongoing and implementation in good conditions of these projects.

Finally, we should not overlook the importance of engaging in the research situation, considering that the university management should identify a way of stimulating and motivating the faculties to scientific research, which is considered beneficial for both sides: both for the university teaching staff and for the institution as a whole, because research contracts represent a consistent source of private funding.

Approaching the Concept of Intangible Assets in the Context of the Knowledge Society

Balan Ioana

„Alexandru Ioan Cuza” University, Iasi, School of Economics PhD
ioana_balan85@yahoo.com

Abstract

Third's millennium society is a world of uncertainty, limited resources, speculation and sudden overthrow. These situation's characteristics seriously put their imprint on organizations in all aspects involved in these processes. In this world of change we are almost always required to identify one or more saving solutions of inexhaustible nature. The explosion of information and communication technologies have profoundly transformed the society and as result the production activities have been pushed towards the creative side. In this new age of knowledge intangible's role tends to be a predominantly knowledge base in the development of the current society.

Key words: intangible assets, organization, knowledge society.

J.E.L. classification: M41

1. Introduction

The history of the economic life is built from a succession of periods of continuity and discontinuity [1].

The term that defines the current state of society to which we belong is "change". Be it new discoveries, new alliances or arrangements, all these actions have only one purpose, namely the development of society as a whole of individuals (micro level: family, peers, community) or as a set of communities (at macro level: cities, counties, regions, states, etc.). If these “changes” with the phenomenon of internationalization ties, we can capture the concept of globalization trends.

The globalization process has started, we consider from a necessity. As national boundaries of social and economic development began to become somewhat

"tight" restrictions on exports or imports of goods as well as those relating to capital movements have been amended to encourage interstate relations and globalization has become pervasive. Given these conditions we witness significant changes in the world economy that result in moving the center of gravity of the world transition from a “world” bipolar to multipolar one as a direct result of the “new economy”.

In all areas of development there are driving forces from matter and energy moving towards information, knowledge and immaterial.

These processes of dematerialization of the economic activity are a concrete result of the economic globalization and the open markets. These aspects include many essential processes affecting all the domains of the social and economic life[2].

Dematerialization of activities, therefore is not limited to the economy of natural resources and energy. It is manifested above all elements of the current society by increasing the share of information and knowledge in the production process.

Thus, we can speak of a new knowledge-based economy that is integrating the knowledge society and sustainable development objectives, based on social justice and equal opportunity, ecological protection, freedom, cultural diversity, development, innovation and restructuring business. These processes are a new stage of human civilization which allows broad access to information, a new way of working and knowledge, enhancing the possibility of economic globalization and increasing social cohesion [3].

In this new type of economy and in the knowledge society, intangible assets such as knowledge and information management and knowledge become the new core competencies[4]. Human resource and its knowledge capital becomes the main point of

interest of the participants involved in the economic life. Moreover the sphere of interest of managers moved from one side to another, towards the physical production of knowledge production that can be exploited at levels well above the others.

Given these conditions the role of any science is almost exclusively based on knowledge and intangible elements of nature. This raises the question of how well can a science such as accounting is capable to capture these contents and how well it can to quantify their influence on the organizational value.

2. Current society challenges and accounting profession in the context of dematerialisation of activity

In the context of globalization, concepts like economics of modern e-commerce requires appealing to a core competence where knowledge is the main driving force. The new economy brings an increased interest to so-called knowledge society, employee/ employee brainpower. Throughout history, the victory was in the hands of those who used the knowledge, being aware of their potential unmatched. Knowledge is more important than before, because we are in the midst of an economic revolution that gives rise to the information age. Modern economies are now interconnected, forming a complex adaptive system. In such systems, natural resources are scarce and cognitive constraints of individuals. The shift from physical capital accumulation with decreasing returns to human capital investment, research and development, innovation- engines of the economy with increasing returns are considered to be part of the modernity. Investment in human capital, education, research and development gives positive externalities. Given these new conditions, the current society activities take place in an environment of economic, social, financial and global business full of challenges, characterized by changing shareholders and regulatory bodies in each country [5]. Under these conditions only adaptive and intelligent organization can have chances of survival and potential market dominance. As follows, the concept of the company recorded a reversible by switching to the ability to organize optimally, physical

assets over time and space, to the ability to save, operate and connect knowledge and skills[1]. At the organizational intelligence, knowledge is located in a permanent evolution, according to predetermined goals of giving a creative and an intelligent response to the environment acting agency. Moreover, knowledge is reconfigured, to diversify and expand as practicing what we want and set to influence and shape the economic environment on different actors. Therefore knowledge sources are more organic than mechanical causes due. Knowledge is based on a variety of factors able to mold and shape new adaptable firms to existing conditions. New Guidelines and very important and in the same time are to respect when we consider and organization in terms of knowledge. The concept, becomes, under these conditions, the most important asset of an organization and its key to survival in the information society [5]. Given these circumstances the role of the accounting science- as an economic image of an organization becomes one uncertain. Forced to undergo concurrent logic of legal, economic and financial, accounting presents picture of the economic life of the enterprise. As a result evaluation methods are increasingly challenged [1]. Moving towards, the economic stakes of immaterial side are increasing and in the same time are making difficult the appreciation of the true image of the company. Investment valuation methods are more and more challenged. Following the same idea, intangible economic stakes make increasingly difficult to assess return on investment. Traditional economic calculation based on static data reasoning belonging to an organization, must take into account now, the change in the organizational environment induced by the production process. Ignoring these changes, leads often to create an image inconsistent related to the economic truth. Such accounting system finds itself in difficulty to reflect the contribution of intangible investments and the way they bring value to the firm. Under these circumstances, one may wonder to what extent accounting science dominated by conflicting demands manages to highlight the economic potential of enterprise decision making and to enable it to different categories of users [1]. Current accounting systems, whose instruments and financial

reporting pacts are strongly imbued with Taylorism, have difficulties in identifying and measuring intangible investments [6]. Major problem comes from the lack of "cause and effect" relationship in recognition of costs as intangible investments and thereby "activating" their balance sheet. Thus, we can say that if the early nineteenth century legislative focus of accounting reports was related to the balance sheet, changes in recent years have led to the transfer of information interests of participants in the profit and loss account. According to the same study [6], the stock market is primarily interested in short-term profit, as shown in the income statement. Thus, users of accounting information requirements are fulfilled tasks for accounting professionals. The emphasis is on current year's results and on the influence of financial reporting for investment decision making. Therefore during the analysis of economic indicators is reduced and the interest of investors are turning to short-term performance. The character of this process is not beneficial to the long-term analysis of organizational indicators.

From this perspective and, implicit, the recognition and the valuation of intangible nature are subject to failure. As a natural consequence of this process, to achieve short-term objectives and to maximize the creation of value for shareholders is done with the sacrifice the long-term performance. Quitting strategic responsibilities cover for issues on a long term, in favor of short-term, not only it brings short-term results but in the same time it is threatening the stability or survival of the organization's competitive environment. Thus, although the role of accounting science remains the same, the way this is done varies.

The issue of evaluation and recognition of new intangible nature elements continue to incite even more controversy. The more we live in a society marked by competition and development the investments tend to depend more on the side of the immaterial heritage components of the organization than the material nature ones.

3. Performance management and corporate governance- in terms of dematerialisation of business organization

There is no doubt that the modern

economy that is becoming more "immaterial"[5]. In this new kind of economy, the competitive advantage belongs to those who are knowledgeable enough and wise enough to know and recognize that the real resources of century XXI 'st century are knowledge, information, innovation, creativity and intellectual capital [7].

As a result, the interest in intangible values became increasingly larger in recent decades. Competitive advantage based on intangible assets and the way you can combine resources (tangible and intangible) in a distinctive manner by companies lead or not to success. Production and dissemination of financial information by a company is as important as the result of human will and consciousness in organizations' success [8].

The interests of users of accounting information are different, which can lead others, such as managers, to intervene in the application of accounting policies so that the company's image to create them competitive advantages over the competition. A truly competitive company[7] must be based on knowledge and also needs to integrate the intangible assets, and to focus with predilection on the company's projects and the quality of knowledge that will create and develop. Also, factors associated to the side of the management's company need to turn their attention to the company's image, the impact that it has over the external environment and the ability to gather long-term assets and human resources.

Managing key intangible resources depends on factors related to capital management knowledge, to what extent the knowledge capital management can generate profit and under what conditions trade can take place within knowledge products. Also it became a cognitive process for knowledge-based organizations, the basic ingredient of all that is produced, bought and sold. Such intangible resources management should emphasize three components, namely resources and competence, functions and processes. Once they highlighted competitive advantage in the financial statements is guaranteed.

However measuring organizational performance in the new developing conditions is a very difficult process. This difficulty comes from the novelty of factors involved and the lack of recognition and

measurement of common policies in order to create an uniform business environment. The determination of these features is almost impossible in the absence of clear procedures or indicators to measure the influence of intangible assets on the market value of the organization. New accounting approaches at European level (IASs), International (U.S. GAAPs) and also trying to set up a national common issues regarding intangible assets. These processes can only assure us that this character intangible elements is significant in evaluating the performance of the organization and that they may be liable for failure or success of an enterprise. Due intangible forms in which they are found, the evaluation factors help to discover hidden resources management, which should be exploited and used [9]. However, pressure of the external environment influence the manner of reporting intangible elements - the desire to achieve concrete and present results (tangible) at the expense of significant net future earnings (investment in intangible data elements) makes some of the present organization to report or not the presence or absence of elements. This can be benefic or it may harm the organization. All these elements are related to the manner in which the organization manages to organize the flow of information to market competition. Success of this action is subject to the relations between organization and its information systems, on the one hand, and local governments, regional and national, on the other. Much of this information should be reported and therefore the need for policies and strategies at local, regional and national range to standardize the way they are reported is imperative.

4. Conclusions

We are witnessing today a mass phenomenon identified under the globalization and internationalization of the economy with direct influence on human society. Business operate in the virtual environment, knowledge circulates electronically and economic accounting specialists recognize new values without material form, but with strong economic influences [10]. Modern society, be it her at micro or macro level is dominated by the phenomenon of change. The latter may be

assigned, on the one hand and the processes of evolution and involution of society. All these are viewed from the perspective of quality of work human factor, which takes into account the initial and its further development. So the key to competitiveness was discovered, again I would say, so know the new values society development, human factor accounting for duty again or why not right to continuously develop and create knowledge. In the same time, the knowledge society's intangible resources are a prerequisite for achieving competitive advantage and long- term development of environmentally. Also the management of intangible resources is essential to achieve competitiveness and convergence. New economic conditions and consequently the new economy requirements, new ways to measure, recognize and report components of economic assets of the company. These newly methods are already considered a great help of accountants and managers in order to achieve profit. Given their character the recourse to this type of resources to create value represents a challenge for specialists in general. Researches in the field believe that the future will be able to make these measurements on operational parameter for each region and especially to help the development of methodological studies and the dissemination of knowledge and experience in economic society.

Income tax - European and Domestic Theoretical Approach

Abstract

Taxation of profits made by companies in general was constantly a topic discussed and interpreted, the relationship between accounting and taxation representing an area of conflict because tax principles and methods are not under the control of the company. Measurement and accounting of the accounting and tax results were conducted with different goals in mind: accounting profit reflects the application of accounting principles for fair measuring of the activity, while tax profit represents the interests of the tax authority. A possible solution to the convergence between accounting and fiscality is taxation deferred as a result of the existence of differences between accounting and tax rules.

Keywords: income tax, fiscality, depreciation, international accounting standards

J.E.L. Classification: M48

1. Introduction

Income tax, as well as other taxes, has emerged as a war tax being introduced by Napoleon in 1799. It was canceled in 1802 when the war ended, but was reintroduced in 1803 as a result of resuming hostilities. Further positioning it on a time scale, 1818 brings with it the elimination of this type of tax only to be reintroduced 27 years later, since when it remained a permanent tax [1].

When the word “tax” is pronounced, regardless of its nature, the first perception takes into account the fiscality and the obligation to pay a sum of money to the state.

Over time, due to the development of business relationships, the appearance of groups of economic entities, as a result of cross-border relations, has arisen the more acute need on the accounting treatment of taxes, and especially of income tax, given the multiple implications attached [3].

Income tax is the tax on profit gained by an economic entity as a result of doing business. Profit represents “wealth” made by the economic entity, the part of shareholders after paying tax, which makes it having a major influence on the mode of determination and on the accounting treatment that it supports it. The influence of this research topic in international research in the fields of accounting, taxation, auditing is growing and has the potential to expand as future research area.

King [5] stated that taxation makes the state, through tax administration, to be a business partner of economic entities, taxes reducing their value. Thus, management has a fiduciary duty to shareholders, considering the tax effects of business decisions. In this respect, fiscal management has in terms of payment obligations to the state budget, the task of achieving the 3 L: least, latest, legal so discussed in the literature.

The National Agency for Tax Administration, on the other hand, seeks to obtain bigger sums from the state budget, so from the perspective of the state, only one L (legal) would be equivalent to those sought by the accounting, the other two items transformed into: as much and as quickly as possible. It can thus be easily held a debate.

As can be seen, the interests of both parties (shareholders vs. State) are opposite in this respect and the results of the two will be different (accounting result vs. tax result),

each of the two sciences (accounting and taxation) using their own rules.

On the other hand, the primary goal of accounting is to ensure true and fair financial statements through its principles, accounting having though an overwhelming influence on the result (for example, the principle of independence of the year).

In order to achieve its two goals (most accurate presentation vs. ownership - state relationship), accounting developed through international bodies IASB and FASB, two accounting referentials (IAS 12 and SFAS 109) with the same main goal: income tax accounting.

2. European and national tax legislation on income tax line

Income tax treatment in terms of tax regulations is drawn in two main directions, namely:

- Tax harmonization → the achievement of a common consolidated tax base (CCCTB)
- National legislation of income tax

The tax harmonization process at the European Community level began in 1957 through the Treaty of Rome, in the art. 2 being noted that the main objective of the European Community is “the achievement of a common market and the progressive approximation of the economic policies of the Member States in order to promote within the Community a harmonious development of economic activities, a continuous and balanced expansion, an increase in stability, an accelerated increase of the standard of living and closer relations between the States belonging to it”.

A first important step towards tax harmonization at EU level was the Neumark Report in 1962. By 2001 was made some progress which led to the shaping and proactive involvement towards materialized efforts for fiscal harmonization. Through longitudinal analyses with causal and critical accents here and there, in the following paragraphs were outlined the main facets of the debates which accompanied this complex endeavor. I proceeded to an approach channeled on the debate related items, efforts, commitment and desire outlining the obstacles as a purely chronological description of the events cannot outline an overview as any essential points captured

during this process whose magnitude can be judged only a posteriori.

Thus, after many years of debate on tax harmonization and tax asymmetry at EU level, in 2001 began the debate on the implementation of the CCCTB, the starting point depicting exactly this diversity that exists between national tax systems.

In 2004, following preliminary analysis started back in 2001 they set up debates on the implementation of a Common Consolidated Tax Base.

The main objective of this endeavor was to align the tax treatment of the group, to ensure the smoothest transmission of information among its members, the focus point being cross-border groups [5] but also the uniformization of the relationship between accounting and taxation.

The main starting point, set within the CCCTB base document (European Commission Communication, entitled Towards an internal market without tax obstacles – A strategy for providing to economic entities a common consolidated tax base for activities in the EU) sees the taxation of the domestic market, creating shortages and preventing economic operators to fully utilize their own resources. This implies a decrease in welfare, respectively, an undermining of the competitiveness between economic entities in the EU and at the same time prevents the achievement of the main objective set by the Lisbon European Council.

In 2003, the Commission launched a debate on the use of referential IAS/IFRS as the starting point for determining the consolidated tax base, the aim not being the absolute takeover of provisions of the accounting referential [7]. Responses got from respondents showed a dispersion of opinions on the question under discussion, respondents generally agreed with the use of common tax base, but the manner of application of IAS/IFRS being different in the answers provided by them.

The Committee resumed in 2006 the idea of using IAS/IFRS as a starting point in developing a common consolidated tax base. The argument brought in favor of the IAS/IFRS referential is represented by the fact that in order to achieve the objective, the working groups that were responsible for carrying out the analysis on the tax treatment

of a set of items identified as causing divergences in the EU, would be relieved that work, in case where all groups of entities within the EU would apply the IAS/IFRS. Later in favor of IFRS implementation were brought arguments based on increasing the comparability and relevance of financial information [5].

In the same document it is stated that “IAS/IFRS will still be used as a base design tool, because it provides a language and some common definitions. In particular, elements of these standards that are not aligned with the CCCTB treatment will not be imported, and thus they will not have a direct formal connection with the constant changes in standards (IAS/IFRS)”.

The basic idea concerning the proposal to use the IAS/IFRS as a starting point towards the CCCTB is the relationship between accounting and taxation, manifested through the different results obtained in the two sciences (accounting result vs. tax result)[6].

Thus, most of this chapter is devoted to presenting the items subject to debate, in order to align the tax treatment at the EU level, selecting the items outlined based on the relationship between accounting and taxation.

Presenting the issues that define the CCCTB is implemented in a comparative manner being outlined comparative aspects of differentiation between the accounting treatment and tax treatment proposed for the CCCTB.

2. Tax rates

The tax rate applicable to the taxable profit is 16% with the exceptions of the article 38 of Law no. 571/2003 regarding the Fiscal code, as amended and supplemented.

3. Declaration and payment of income tax in accordance with the relevant national legislation

1) Declaration and payment of income tax, with the exceptions provided for in this article shall be performed on a quarterly basis not later than the 25th of the month following the end of quarters I-III. Completion and payment of corporation tax for that fiscal year shall be made by the deadline for the submission of income tax declaration.

(2) As of January 1, 2013, taxpayers, other than those referred to in paragraph (4) and (5), may opt for declaration and payment of income tax annually, with prepayments made quarterly. The time by which tax should be paid on an annual basis is the term for the submission of income tax declaration.

(3) The option for annual system of declaration and payment of income tax is made at the beginning of the fiscal year for which is required the application of the provisions of paragraph (2). The option made is mandatory for at least 2 consecutive fiscal years. The annual output of declaration and payment of income tax shall be made at the beginning of the fiscal year for which is required the application of the provisions of paragraph (1).

(4) Banking taxpayers – Romanian legal entities and branches in Romania – foreign legal entities are required to declare and pay income tax annually, with prepayments made quarterly. The time by which the payment of the annual tax must be paid is the deadline for income tax declaration.

(5) The following taxpayers are required to declare and pay income tax as follows:

a) nonprofit organizations are required to declare and pay income tax annually until the 25th February of the year following the year for which the tax is computed;

b) taxpayers obtaining majoritary income from cereals and technical plants, horticulture and viticulture are required to declare and pay income tax annually by 25th February of the year following the year for which the tax is calculated;

c) taxpayers referred to in article 13 letters c) - e) are required to declare and pay income tax quarterly, according to paragraph (1).

(6) Taxpayers other than those referred to in paragraphs (4) and (5), which, in the previous year were in one of the following situations:

a) newly established;

b) recorded fiscal loss at the end of the previous fiscal year;

c) have been temporarily inactive or stated on oath that there are no activities at the headquarter/secondary registered offices, situations submitted, according to legal regulations, in the registry of commerce or in the register kept by the competent courts, as appropriate;

d) they were liable to pay taxes on the income of microenterprises in the year for which income tax is applied to the system of declaration and payment referred to in paragraph (1). For the purposes of this paragraph shall not be considered to be newly established contributors recorded as a result of the restructuring operations carried out in accordance with the law.

4. Treatment of income tax by IAS 12

In all countries there are differences between the rules for determining the accounting result and the rules for determining tax result with influence on income tax. Income tax is one of the most important State budget revenues of the Planet. The importance of this tax determined the IASC-IASB in 1979 to publish IAS 12 relating to the recognition of income tax in the financial statements, regulation which came into force on January 1, 1998, revised in 1996 and 2000.

Income tax is in Romania one of the constant concerns of the professional accountant. If profit is the manager's interest, the income tax is borne by the accounting officer.

IAS 12 is known in the accountants' environment as a heavy rule in terms of the difficulties involved in the understanding and practical application of its provisions in the context of regulations in Romania. The main problem appeared in the income tax accounting is the method of recognition of current and future tax consequences of [3],[8]:

- future recovery of the accounting value of assets and liquidation of liabilities occurring in the balance sheet of an entity; and
- transactions and other events of the current period that are recognised in the financial statements of an entity.

5. Conclusion

OMPF 3055/2009 [10] makes no specific mention related to income tax implying that it is accepted the full application of IAS 12. Otherwise, subsequent regulations come to confirm this. An interesting thing is that to these rules have been approved solutions relating to the application of the legal

provisions relating to the income tax, in conjunction with the Accounting regulations harmonized with the European directives and with the International Accounting Standards, issue that to sign in the traditional line of sources of law, must be regulated.

This was necessary to clarify issues related to the application of IAS 12, but also for “giving letter of law” of some “solutions”.

Abstract

The beginning of the world economic crisis and the decrease in the financial intermediaries profits (both banks and insurance companies), made intermediaries rethink their offer in such a way as to obtain favourable results. In this context, bancassurance activity got a boost, being stimulated by the superior revenues of the bancassurance products and services in respect to the classical ones.

The present paper is an empirical study that shows the recent evolutions in bancassurance at world level and underlines the factors that stimulate the development of bancassurance products and services such as the GDP per capita, the need to save, the degree of development of the banking and assurance.

Key Words: bancassurance; banking; life insurances, non life insurances

J.E.L. Code: G 21, G 22, G 29, L 25

1. Introduction

As the world of finance has developed a great deal in the last few decades and the competition in this world became bigger and bigger each day, financial integration and bancassurance have kept the first page for investors as well as for consumers, for insurance regulators and bankers as well. The household savings and the connected management of assets become more and more interesting both for bankers and insurers.

The starting point of a new era for financial integration was the financial deregulation in Europe in the 80's. Bank assurance activities

in the Asia-Pacific region approached European levels (Retail Banker International, 2007) but tapered off in USA and incremental shares from banks.

Bancassurance is not just a simple method of distributing insurance products but a world movement that breaks down the traditional barriers between the large variety of businesses that supply financial products and services. The bancassurance phenomenon involves a full integration of financial services which allows the selling of typical insurance products, through the bank's channels, towards the bank's clients. Developed in the 90s on the mature European markets, in the context of financial deregulation, bancassurance was revitalized by the economic crisis as it offers products and services with much better revenue than the banking or classic insurance products.

As bancassurance can occur in two ways, literature is focused on two directions:

- Bancassurance formed through portfolio investment or in other words through merger and acquisitions activities. This way of forming bancassurance was analysed by Carow, 2001a, 2001b; Fields, Fraser, and Kolari, 2007a, 2007b; Boubakri, Dionne, and Triki, 2008.
- Bancassurance formed through in-house generated bancassurance products, when subsidiaries of the banks get involved into assurance activities [23].

A bank can find different ways of getting a share of the insurance market. It can decide to start up a new insurance company, buy an existing one or just get into a joint venture with an insurance company. Sometimes, banks can generate the same sort of advantages by simply developing a

distribution contractual relationship with the insurer (OECD, 1992).

Kalotychoy and Staikouras [18] consider that the way bancassurance is delivered through different affiliation models influences the outcome. Most studies before were just analysing the bancassurance activities of USA and of the European banks [8, 9, 14, 15].

One of the subjects that was very present in the bank consolidation literature was that of the risk reduction (different authors considering that bank consolidation reduces risks) and value enhancement effects of bank consolidation [13, 24, 8, 9, 20]. In order to reduce risks, banks need to span short and long-term liability/asset structures. Diamond [12] argues that this can be done through bank-insurance consolidation and more than this, bancassurance consolidation also attracts and keeps individual customers and corporate clients.

Carow [8] analysed the connection between the bank's stock prices and its decision to get into the insurance industry and did not find any significant relation. On the other hand, Bergendahl [6] considers that the profitability of bancassurance depends on the number of branches, the number of insurance specialists per branch, the number of customers, the cross-selling ratio, and the degree of learning. Fields, Fraser, and Kolari [14] consider that bancassurance combination results in positive gains for the shareholders of bidding firms and identify a positive relationship between bidder returns in bancassurance mergers and potential economies of scope.

The cost advantages of bancassurance activity were highlighted by a number of authors such as Norman L. (2007); Lih Ru Chen, Jin Lung Peng, Jennifer L. Wang (2008); Franco Fiordelisi & Ornella Ricci (2011). Most of these authors take into account the reduction of distribution costs as well as of those of management and the impact of such a reduction on the revenue. In order to sell bank products or insurance products, banks and insurers put at each other's disposal their networks, personnel and consultancy services. One major advantage is using the databases of both the banks and insurance companies and therefore being able to better understand and fulfil the needs of the clients.

In 1985, Felgren was saying that banks have greater cost advantages than the incumbent insurance companies when they decide to sell insurance products as they have the advantage of being able to use the existing structure and logistics of the bank (branches, offices, trained labour force etc). Bergendahl [6] also considers that the economic reason for selling multiple products is the efficient use of fixed capacity resources. He looks also at the customer's demand for products from a single channel and the fact that banks need different product combination strategies in order to improve the rate of return that the bank provides to its shareholders.

On the other hand, insurance companies that are also affected by the bank assurance activities tend to get no gain from bancassurance consolidation [3, 4]. This contestable market theory considers that in order for an industry to earn economic profits for an extended period, it is a must that there are set barriers that prevent potential sellers from entering the industry. According to this theory, increased competition from banks' expansion into the insurance industry will force existing insurance companies to reduce their earning spreads.

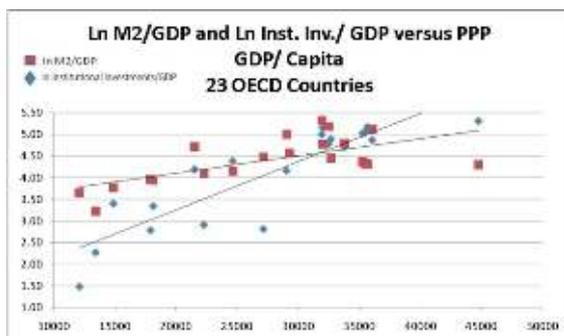

Other researchers such as Berger, Humphrey, and Pulley, 1996; Milbourn, Boot, and Thakor, 1999; Barth, Brumbaugh, and Wilcox 2000; Akhigbe and Whyte, 2001 focus on features such as organizational form, product mix and distribution networks and set a relationship between the realization of scope economies and bank-specific characteristics.

Still, even if the literature analyzing the scope economies is quite varied, little academic research considers the relationship between the realization of scope economies and joint production activities and even fewer studies can set an empirical connection between the economies of scope and the banks' involvement in the bancassurance.

Some authors, like Webb, Grace, and Skipper 2002 argue that the relationship between the banking and insurance sectors is one of causality in both directions.

Tests were performed regarding the factors that determine the key effect of private credit development, trying to show whether this development is due to the role of

banks as intermediates or to the broader role of institutional investors.

Sources: IMF, OECD, World Bank analysis.

The graph shows the direct link with GDP per capita. The income levels are increased by bank intermediation (proxied by M2 [money and quasi money] as a ratio of GDP, (the red dots) and by the role of institutional investors (assets under management as a ratio of GDP, shown by the blue dots). In the highest-income countries, institutional investors become the most important link between savings and investments.

2. Empirical evidence on the Bancassurance Market

Bancassurance didn't have the same success in all the countries where it was found. In some countries the market share of insurance placed through Bancassurance has increased at a very quick pace getting over 40% for Life insurances and over 10% for other types of insurances, while in other countries the market share stayed way beyond these levels.

In the following table, we have a list of countries from the category which have an important market share of insurance placed through Bancassurance, list provided by insurance regulators, insurance associations, Axco, Limra, and Swiss Reestimates for 2007.

Table 1
Countries Where the Bancassurance Market Share Has Shown Important Growth and Exceeds 40 Percent (Life) or 10 Percent (Non-Life) percent

Country	Bancassurers' Life Share	Bancassurers' Non-Life Share
Australia	43	Very small
Belgium	48	6
Brazil	55	13
Chile	13	19
France	64	9
Italy	59	2
Malaysia	45	10
Portugal	88	10
Spain	72	7

Sources: Gonulal, S., Goulder, N., Lester, R.(2012) "Bancassurance—A Valuable Tool for Developing Insurance in Emerging Markets" Policy Working Paper 6196, The World Bank .

The increasing role of bancassurance is underlined by the fact that in some developed countries, over 50% of the prime income generated by the insurers specialised in life insurances are from the bancassurance sector[17].

In the majority of cases, the penetration of bancassurance in Life insurance was more significant than that in Non-Life insurance. Still, Chile contradicts this hypothesis registering a 19% non-life share while the life share is of only 13%. The importance of the bancassurance can be also influenced by the different way different markets reacted to this new approach to offering insurances. For example, the data computed for Australia could be biased due to the fact that many banking groups used acquisition procedure, buying Life insurers, in order to gain better shares of the Life insurance market. This created an apparent link which cannot be considered a real proof for the fact that the market share originated in the bancassurance sales process. Still, if we look at the Brazilian market, the Italian one or the Spanish market, these were literally transformed by the bank assurance. In Germany or Japan, the clear segregation of distribution channels stops the development of bancassurance. In Italy, due to the tradition of selling insurance products through independent insurance advisors, bancassurers are unlikely to gain important market shares.

A smaller share of the market is held by bancassurance in USA, Canada or Japan as the laws are less permissive [11]. On the other hand, the share of bancassurance in emerging countries such as China, Taiwan and East and Central European countries has increased.

In Latin American and Maghreb countries, a high influence was generated by the historical links with some of the most powerful Bancassurance markets (France, Portugal, and Spain). The EU Accession countries were influenced by the presence of the Western European insurers.

In the case of Asia, bancassurance has very specific evolutions even though the global insurers had some major influence.

In the very high income markets, bancassurers align their marketing mixes with income level, by adopting complicated segmentation of their customers, a major challenge being to move from high-volume low-margin single-premium Life products to regular premium savings contracts.

According to the publicly available data regarding the structure and types of insurance products and services sold through the bancassurance activity [25], one can notice that the offer has evolved both in the general insurance zone (insurance for business, credits, financial risks) and in the Life insurance zone. The trend followed by banks and insurance companies is to offer their clients long-term life insurance products that have a strong saving side as well as private pension funds plans that have better revenues.

Table 2
Leading Emerging Bancassurance Markets

Region/ country	GDP per Capita (\$)	M2/GDP (%)	Bank Branch as per 100000 Adults	Life Premium as % GDP	Non-Life Premium as % GDP ^a	Life (Estimated % Banc assurance)	Non-Life (Estimated % Banc assurance)

Poland	11296	53	33	1.9	1.9	43	4

Sources: World Bank Development Indicators, IMF database, Axco Reports, 2008– 2009 data.

Note: n.a. = not available.

a. Including Health and Accident.

b. Bancassurance accounts for 19 percent of non-LIC Life sales in India.

The different rates of development of bancassurance around the world are also partly due to the difference in legislative and regulatory standards from one country to another and also to the differences in the tax systems and pension systems structure. For example, in France, life insurance products qualify for tax incentives and are very similar to banking products (which makes them easy to sell by banking networks).

Bancassurance has highly developed in countries where banks play a significant role in the financial system (Belgium, France, Netherlands) while in countries that turn around the stock market (UK, USA), bancassurers have a smaller market share. In countries with an underdeveloped insurance market, foreign insurers try to join forces with a local banking network, this explaining the development of bancassurance in Latin America and Spain.

3. Conclusions

1. After 2007 when the economic-financial crises started, there can be noticed a new approach used both by banks and insurance companies. They both try to use the logistic chains, employees and knowledge of each other.

2. If we compare classic products and services with the bancassurance ones, the bancassurance products give some advantages regarding the distribution and management costs. Bancassurance allows suppliers to better identify the customers' needs and offers the warranty of an increased quality of the services, making it possible to get to the win-win-win state.

3. Even though the bancassurance activities are on an ascending trend, the market shares owned in each country differs. The financial integration degree is different from one country to the other and depends on factors such as the GDP per capita, the need of saving, the favourable legislation,

4. One can notice that the offer has evolved both in the general insurance zone (insurance for business, credits, financial risks) and in the Life insurance zone. The trend followed by banks and insurance companies is to offer their clients long-term life insurance products that have a strong saving side as well as private pension funds plans that have better revenues.

Abstract

Globalization of financial markets and growing competition amid investment banks were the main stimuli for financial innovation. This paper aims to present the main implications of financial innovation. As most papers on this subject mainly cover the US market, the current paper distinguishes itself through its goal of analyzing the European securities market and assesses the impact of innovative financial instruments on the economic environment. The analysis performed in this paper shows the extent to which financial innovation is good for the economy and highlights the changes in consumer behaviour towards certain types of items used for funding.

Key Words: financial innovation, securities, crisis

J.E.L. Code: G01, F62

1. Introduction

Since the beginning of the current financial crisis, financial innovation has regained the attention of researchers throughout the globe. The impact of financial innovation has become a topic of controversy among economists, as there are believes that innovation usually is used to find a solution to complex financial issues. Merton (1992) [16] and Miller (1986) [18] characterize financial innovations as “an engine for economic growth”. Similarly, Bresnahan and Trajtenberg (1995) [2], and Helpman (1998) [9] consider that these innovations can not only generate returns to the innovators but

also may provoke changes on the entire economic system. In 2010, Michalopoulos, Laeven, and Levine [17] argue that growth is driven not only by entrepreneurs aiming to maximize their profits through the commercialisation of new technologies, but also by financial entrepreneurs who develop new ways to screen and fund the technologists. On the other hand several economists perceive financial innovation, especially new financial products, as having negative implication on the economy and blaming it for the eruption of the global financial crisis. As Tobias and Hyun [23] show in their analysis of the connections between the banking and capital market developments, the financial crisis started in 2007 highlighted the changing role of financial institutions and the growing importance of the “shadow banking system”. He shows that the excessive innovations due to the contractions of funding tended to precede the onset of financial crises. Levitin (2009) [14] characterized recent changes in retail financial solutions as “negative innovations”, such as “opaque pricing, including billing tricks and traps that encourage unsafe lending practices”. Similarly, Krugman (2007) [11] states that innovations such as CDO, SIV, RMBS and ABCP we’re sold under false pretences, resulting in higher risk exposure for investors than what was initially planned. Lastly, Johnson and Kwok (2009) [23], Litan (2010) [15], Mishra (2010) [19] show that financial innovations can not be considered fully good or bad, but contain a mixture of elements.

Lerner and Tufano (2010) [13] define financial innovation as “the act of creating and then popularizing new financial

instruments, as well as new financial technologies, institutions and markets”. In practice, the differentiation of financial innovation into process innovation and product innovation is not clear, as process and product innovations are often linked. Innovation includes the acts of invention and diffusion, although in point of fact these two are related as most financial innovations are evolutionary adaptations of prior products.

Through financial innovation financial systems perform functions like: managing risk, obtaining information that is necessary in decision making as well as pooling funds and moving them in time or space. Finnerty (1992, 1988) [4, 5] showcases a set of function’s, two of which correspond to the functions identified by Merton (1992) [16], and a third which is a mix of the latter’s movement of funds and pooling functions.

Although the subject of financial innovation has captured more attention since the beginning of the recent financial crisis, it appears to be an omnipresent process. Tufano (1995, 2003) [24, 25] illustrates how financial innovation has been part of the economic landscape for centuries. Moreover, Goetzmann and Rouwenhorst (2005) [7] showcase 19 major financial innovations spanning over the last 4000 years, ranging from the invention of interest to the creation of Eurobonds.

The study conducted by Ben-Horim and Silber (1977) [1] tests the hypothesis that regulatory constraints induce innovation. Their findings suggest that the rising prices of these items, as they approached regulatory constraints, were associated with some of the important innovations of the 1960s, such as negotiable CD. Another important study was conducted by Molyneux and Shamroukh[20] in 1996, examined the diffusion of the underwriting of junk bonds and of note issuance facilities (NIFs) during the 1978-1988 and 1983-1986 periods. They conclude that demand changes or changes in regulations have an important role in the diffusion of junk bond underwriting. In 2000, Grinblatt and Longstaff [8] demonstrated that investors use Treasury STRIPS in order to take advantage of the accounting and tax asymmetries.

2. The implications of financial innovation

Due to the distinct characteristics of financial innovation, the assessment and quantification of the benefits it generates is widely recognized as being impossible. However, several empirical studies demonstrate the positive outcomes as a result of financial innovation. Studies carried out by Tufano (1989) [26] and Carrow (1999) [3] showcased that innovators earn higher market shares than followers, even though imitation is rapid. Another benefit of financial innovation is the achievement of significant tax benefits. For instance, to the passage of the Tax Equity and Fiscal Responsibility Act of 1982 (TEFRA), an issuer of zero coupon bonds could have amortized the original issue discount-the difference between the face amount of the bonds and their issue price-on a straight-line basis for tax purposes. Being able to deduct the interest expense faster than the interest implicitly compounded on the bonds produced significant tax benefits, which were greater the higher the bond's offering yield. Also, innovations such as the shelf registration process and electronic funds transfer have led to reduced transaction costs.

From Miller [18], Silber [21, 22], and Van Horne [27] papers we derive the following benefits as a result of financial innovation: tax savings, reduced transaction costs, reduced agency costs, opportunities to reduce some form of risk or to reallocate risk from one market participant to another who is either less risk averse or else willing to bear the risk at a lower cost and accounting benefits.

The World Economic Forum [29] identifies three major negative implications as a result of financial innovation: consumer disservice, loss of market integrity, insolvency of institutions and rising systemic risk.

In the case of consumer disservice, suitability plays a key issue regarding the process of financial innovation. It is often that a financial product is designed to offer an adequate solution to a certain consumer segment but it is an unsuitable solution for another consumer segment. For instance, low documentation mortgages were initially developed for affluent self-employed consumers and small business owners for whom traditional documentation standards were onerous. For a higher fee or interest

rate, the borrowers could reduce the complexity of a loan application and speed the overall process. Later this product was offered to low-income borrowers with poor credit for whom it was less adequate. Also, some financial products are likely to generate issues if their suitability is a function of a rare event. This can lead some borrowers to choose adjustable-rate mortgages (ARM) or so-called option-ARMs or other introductory-rate products in settings where they may be inappropriate, perhaps because the applicants systematically under-estimate the chance of rate increases, or the likelihood that they will continue to hold the product over a long enough time for upward rate changes to materialize.

In the case of institution insolvency, the recent financial crisis demonstrated that the misapplication or wrong design of a financial product can play a central role in the downfall of an institution.

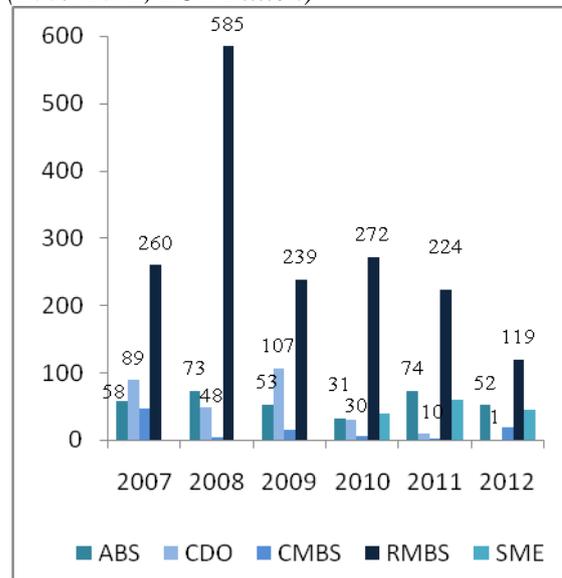

Systemic risk is not usually related to financial innovation. However, the 2007 financial crisis showed that financial innovation may lead to a build-up of risk across the financial system to such an extent that that a solvency or liquidity crisis occurs and governments and regulators eventually have to step in to prevent collapse. In order to prevent this from happening, innovators should identify the products that are likely to lead to exacerbate system risk so that the danger should be recognized and diminished before a crisis materializes. Lastly, loss of market integrity may lead to a sharp fall in both trading volume and market prices as participants seek to limit the damage to their portfolios and preserve liquidity, which in turn may have spill-over effects in other markets and, potentially, the system as a whole.

3. Empirical evidence on the Financial Innovations Market. The Case of Europe

From the beginning of the current financial crisis there have been numerous critics regarding the negative impact of financial innovation on capital markets. Such negative views, coupled with the uncertain economic conditions surrounding Europe have led to a decrease in bond issuance. Judging by their collateral, European securities can be classified as: Asset Backed

Securities (ABS), Collateralized Debt Obligations (CDO), Commercial Mortgage-Backed Securities (CMBS), and Residential Mortgage-Backed Securities (RMBS).

Figure 1 – Securities Market in Europe (2007-2012, EUR Billion)

Source: *The Association for Financial Markets, Securitisation data report, 2007-2012 (AFME)*

Securitisation grew significantly in Europe and in the Eurozone before the crisis. In 2006 and 2007, pre-crisis issuance of European securitisation placed with third party investors reached €450 billion per year [16]. In 2009, as a result of numerous downgrades made by rating agencies, coupled with low demand for corporate loans (due to reduced fixed income investment, scarce M&A activity and competition with alternative financing sources) and reduced investor base, issuance of ABS declined 28% over the previous year, reaching €53 billion, followed by a 59.16% decline in RMBS issuance (to €239 billion). However, the volume of CDO's and CMBS' issued during the same time frame doubled, due to a shift in SME loan preference for these two types of assets.

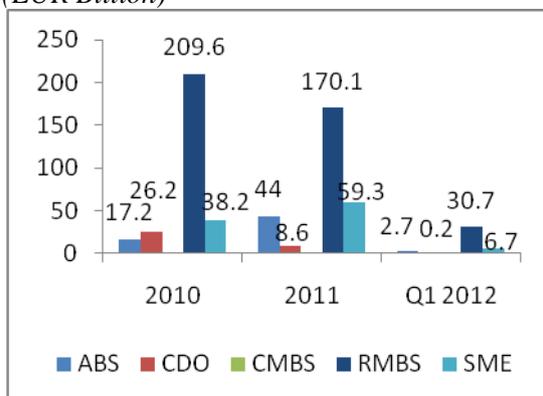

In 2010, the issuance levels for three of these main asset categories declined, (ABS – 40%, CDO – 72%, CMBS – 60%), as a result of weak market conditions and sovereign downgrades for countries in the Euro zone (e.g. Greece in December 2009). The decline in CDO was mainly determined by the separation of the SME securities from this

asset category, which from 2010 form a separate segment altogether. This particular segment demonstrated growth potential as a result of rising loan demand for mergers and acquisitions and growing demand for short term loans. Additionally, a new segment appeared, WBS (whole business securitization) where senior creditors of an insolvent business effectively gain the right to control the company. Between 2010 and 2011 placement with third party investors was still only €80-90 billion per year, due to macro volatility, regulatory uncertainty and government/central bank liquidity programmes.

In 2011, ABS issuance doubled (reaching €74 billion), as a result of strong demand for mainstream asset classes (e.g. Dutch prime residential mortgages, German auto, etc). According to the OECD [30], out of the approximately €87.9 billion placed (both public, private, and pre-placed); the majority were UK securitisations (50.7%), followed by the Netherlands (27.0%) and then Germany (11.3%). Further growth for this category was fuelled by a good retention rate (40%) in the previous year. Growth in SME issuance was fuelled by the ECB initiative to reduce collateral requirements for SME deals.

In 2012, as a result of negative economic environment still present in Europe all item classes saw declines in issuance levels. Furthermore, approximately 43% of the total outstanding was placed with third party investors, while approximately 57% was retained on bank balance sheets, to be used for repo, or used for other secured funding.

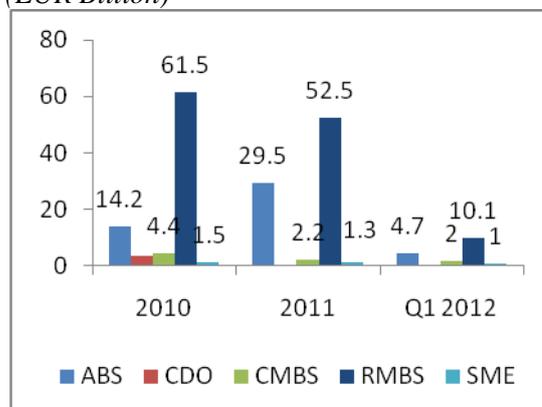

Figure 2 – Retention by Type of Collateral (EUR Billion)

Quality Securitisation to the EU Economy, November 2012

Figure 3 – Placement by Type of Collateral (EUR Billion)

Source: The Association for Financial Markets, The Economic Benefits of High Quality Securitisation to the EU Economy, November 2012

As a result, approximately €900 billion of currently outstanding securitisations has been placed with investors, down by one third from approximately €1.4 trillion before the crisis. Despite an increase in placed levels over the last two years, the share of retained issuance is still significant. This is a reminder of both the funding difficulties faced by European banks and the important role the ECB is playing as liquidity provider to the European Banking system [16].

Securitisation is an important funding tool in Europe despite its downsides and has contributed to funding real economy assets. It is a channel for borrowers to enter on the capital markets. In times of difficult access to financing, securitisation can improve credit availability by allowing banks to free up their balance sheets for further lending.

While a regulatory framework which creates a well-functioning, transparent securitisation market is necessary, its unintended consequences need to be considered. Under Basel III/CRD IV, banks, traditionally the key investors in the securitisation sector, will now be forced to increase capital deleverage and change the mix of assets they have available to meet regulatory standards; as a consequence, a reduction in their exposure to securitized products is likely. With Solvency 2, very harsh capital requirements are likely to eliminate altogether demand for securitised

products from insurance companies. Europe is facing negative growth and weak investment. One of the most pressing issues is the negative effects that Basel III, CRD4 and Solvency II will have on corporate lending. Across the businesses in Europe, this can generate lower availability for long term credit and a higher cost for the financing sources. On top of that, there is a lower equity investor base. The effects will particularly harsh on SMEs, the smaller and less creditworthy companies, at a time when they are already facing significant difficulties in their access to finance [16].

Based on estimates from Eurostat, in August 2012, Euro zone GDP contracted by 0.2% compared with the previous quarter. A resilient economic performance from the Euro zones' biggest economy, Germany (which grew by 0.3% quarter on quarter) was offset by sharp contractions in the economies of Italy (0.7%), Spain (0.4 %) and Finland (1%). Meanwhile, the Greek economy shrank a year on year rate of – 6.2% [16].

A number of bank regulatory reforms and the current economic downturn adversely impacted bank lending significantly, consequently affecting SMEs, whom rely on debt finance as their prime funding source. According to a recent ECB survey, the gap between SMEs' demand for funds and their supply is widening. In the six months to March 2012, the percentage of SMEs requiring bank loans (8%) and bank overdrafts (14%) was higher than the previous six months (up from 5% and 10% respectively). A possible source of liquidity for banks providing finance for smaller companies is the loan securitisation market. Additionally, statistics from Standard & Poor's show that between 2007 and 2011, the amount of funding provided through SME loan securitisation has been significant and performed very well: €103 billion of SME loan securitisation was issued and rated by S&P, with a very small cumulative default rate across all tranches of 0.20% of total issuance. Therefore, securitised products could play an important role in reducing the funding gap by helping to free up banks to clear their balance sheets for further SME lending.

Conclusions

The European financial market shows a dynamic landscape, shaped under growing competition among investment banks and increasingly stringent environmental regulation. Financial innovation plays a key role in these markets, reducing risk exposure and providing means of funding. As statistical evidence suggests, the placement ratio for securities is improving, demonstrating a shift towards funding obtained through securities. A key user group that is likely to capture a larger segment of the securitisation market in Europe in future will be small and mid-sized companies, as a result of loan standards practiced by banks, which have remained high. However, increasingly stringent regulatory constraints announced by governing bodies are likely to hamper issuance volume in the near future. Additionally, these could have a negative impact on the economic agents that could not meet credit standards, and were relying on this solution for acquiring the necessary funding.

Despite its advantages, financial innovation can have an adverse impact on the economic environment if it is not used properly. Proof of this is the current financial crisis, where lax government regulations, coupled with lack of knowledge on behalf of investors led to disastrous financial effects.

Considerations Regarding The European System of National and Regional Accounts – ESA 1995

Băltărețu Camelia

Romanian Academy, Center for Financial and Monetary Research “Victor Slăvescu”

cbaltaretu@yahoo.com

Abstract

The European System of National and Regional Accounts, 1995 ESA or simply ESA was adopted as a regulation of the European Council on 25 June 1996 and is an internationally applicable accounting framework that allows analytical and detailed description, analysis and evaluation structure, which is called the total economy, its components or specific aspects, its evolution over time and its relations with other economies total. It replaces the European System of Integrated Economic Accounts published in 1970, SEC 70. Data obtained from the ESA 1995 are essential tools for defining and pursuing social and economic policies of the Member States of the European Union. This article presents some considerations regarding the european system of national and regional accounts, 1995 ESA: concepts, functions, differences between the systems 1995 ESA and 1993 SNA and between 1995 ESA and 1970 ESA.

Cuvinte cheie: 1995 ESA, European system accounts, accounting, 1993 SNA

Clasificare J.E.L.: E01, M41, P24, E20

1. Introduction – Short history of national accounts

The overall objective of the System of National Accounts is to provide a comprehensive conceptual framework, a system for macroeconomic evidence and analyzing, to characterize the economic structure of a country based on international methodological standards unitary character. Used in international statistics of most countries, the system of national accounts is an accounting tool absolutely necessary for the preparation and reporting of

macroeconomic statistics, for analyzing and evaluating the performance of an economy.

The origin of the national accounts is considered to be in the interwar period, in 1928 the League of Nations held the International Conference of Statistics and in 1939 published estimates of national income. Origins System of National Accounts are based on the UN Subcommittee report published in 1947, which had like support a project of Richard Stone. At its first session in 1947, the Statistical Commission of the United Nations emphasized the need for international statistical standards for the development and maintenance of comparable statistics.

European Economic Organization published in 1950 a set of accounts, thus grounding the standardized system of National Accounts, published in 1952, whose objective was to provide a standard table with basic information to describe and analyze the economic activity and define and classify the inputs in a table of accounts. Thus, in the same year, a group of experts has formulated standards system called "national system of accounts and tables".

Compared to the Report from the 1947, which presented a set of six standard accounts (three on production, capital, foreign transactions and three accounts for core sectors: enterprises, households and non-profit institutions, government), the 1953 report also presented a set of 12 tables showing the detailed classification standard and alternative flows in the economy. These accounts were published of two revisions: first review in 1960 and second in 1964.

In 1968, a group of experts from the United Nations and the Organization for Economic Cooperation and Development - OECD has founded a new system of national accounts. They considered accounts at constant prices and distribution system was

based on "inputs" and "outputs". System of National Accounts 1993 SNA represents a major breakthrough in the national accounts and embodies the result of improving the features of the old system in 1968, its harmonization with other international statistical standard; the 1993 SNA includes separate accounts for revaluation of assets as a result of the impact of inflation, contains both classifications appropriate timing and simplification and harmonization of macroeconomic indicators, being more complete than previous versions.

2. ESA 95 – theoretical aspects

The European System of National and Regional Accounts, 1995 ESA or simply ESA was adopted as a regulation of the European Council on 25 June 1996 [2] and is an internationally applicable accounting framework that allows analytical and detailed description, analysis and evaluation structure, which is called the total economy, its components or specific aspects, its evolution over time and its relations with other economies total. It replaces the European System of Integrated Economic Accounts published in 1970, ESA 70.

Statistics obtained under the ESA 1995 are essential for definition and monitoring economic and social policies in the European Union, because they allow a consistent quantitative, reliable and comparable description of the European Union economies. Specificity of the ESA 1995 consists in its focus on the conditions and requirements of the European Union so it can be used as a central reference support for social and economic statistics of the European Union and its Member States. Romania National Accounts have been developed since 1990, based on the European System of Integrated Economic Accounts 1979 (ESA 1979). ESA methodology 1995 became operational in 2001, according to this methodology first estimates were made for 1998, 1998 being the year of the connection between the two versions of the European System of Accounts.

3. ESA 1995 – Functions

Data from the European System of Accounts ESA 1995 are essential tools for

defining and pursuing social and economic policies of the Member States of the European Union. This new system allows the European Community institutions, governments and economic and social agents to make decisions on the basis of harmonized and reliable statistics. Specific functions ESA 1995 are of major importance and concern [3]:

- monitoring and guiding European monetary policy (EMU convergence criterion was defined in terms of national accounting: public deficit, public debt and GDP);
- European Union subsidies regions through the Structural Funds (whose charges were based in part on accounts regionalized national accounts data);
- determining the European Union's own resources, which depend on national accounts data as follows: total European Union resources is determined as a percentage of gross domestic products of the Member States, contribution of each Member State to third own resource of the European Union (VAT) is strongly influenced by national accounts is determined based on average rates and the relative contribution of each Member State to fourth own resource of the European Union is based on its gross national product.

In addition to these functions, the ESA 1995 accounting can be used to analyze and evaluate:

- the structure of the total economy (value added and employment by industry and by region; income distributed by sector; imports and exports by product group; final consumption expenditure by product group; fixed capital formation and fixed capital stock by industry; structure of flows and stocks of financial assets by type of asset and by sector;
- total economic relations with other total economies by: analysis of the interdependencies between the economies of the European Union, analyze the composition and destination of exports of the European Union, comparing the role that the government of the Member States of the European Union has, comparing the rate of growth of GDP or disposable income per capita in the European Union with the U. S. and Japan;
- develop a total savings over time by: analyze the growth rate of GDP, analysis of

inflation, industrial structure comparing the total economy over a period of time, analysis of seasonal patterns in household expenditure on quarterly accounts;

- aspects or specific parts of a total economy: banking and finance in the national economy, role of government, economic structure of a given region relative to the national one.

4. Features ESA 1995 concepts

Concordance between the needs and possibilities of data collection is ensured by the eight essential characteristics of the concepts in the ESA 1995 [3]:

- *international compatibility*: since 1995 ESA system is fully consistent with the revised System of National Accounts 1993 SNA, which serves as the global benchmark for establishing national accounts, for all Member States of the European Union, ESA 1995 is the norm application in transmitting accounting data to international organizations;

- *consistency*: in all respects ESA 1995 concepts are consistent with those established worldwide by 1993 SNA; this coherence of concepts, used in the accounting identities allows the combining data from different parts of the system, leading to calculation of rates such as value added per hour worked, national disposable income per capita fixed capital formation as a percentage of fixed capital stock, deficit and debt as a percentage of GDP, or estimates by balance;

- *harmonization* with the concepts of other social and economic statistics: concepts used in ESA 1995 are like those of the SNA 1993 totally consistent with the main directives of various international economic statistics, however, concepts and classifications used by the ESA in 1995 are also used by European Union Member States in drawing up social and economic statistics;

- *operationality*: concepts used by the system have been designed specifically for their measurement, this operational nature consists of the following: to estimate certain concepts are accompanied by clear indications; has been adopted some simplifying conventions; certain jobs or activities are described only if they are of significant importance; concepts are harmonized with economic and social statistics concepts that are the base of the national accounts;

- *flexibility and multifunctionality*, the concepts are multifunctional that are suited to many applications; the flexibility ESA 1995 means the possibility of introducing additional criteria which do not conflict with the logic of the system;

- *recognition and securing a long period*, the concepts have been adopted as the international standard for decades on the one hand, and on the other hand, on the various international guidelines on national accounts, most of the basic concepts have remained unchanged;

- *focus* on describing the economic process in monetary terms, readily observable; most stocks and flows that are not readily observable in monetary terms or which have no monetary counterpart are not taken into account;

- *difference* from the majority of the concepts used in administrative data sources; this can be explained by the existence of administrative concepts that differ from one country to another, preventing any international comparison, fluctuates over time does not allow a comparison of the period, they are not consistent from one data source to another.

5. Differences between the two systems of accounts: ESA 1995 and SNA 1993

The basic principle of the ESA 1995 was and is that the new European guidelines are fully consistent with the revised System of National Accounts (1993 SNA, or SNA), which provides guidance on national accounts around the world ([2], [3]). According to this principle, the new European system of accounts can more precise interpret and present the SNA 1993 system guidelines, but can not change the basic principles of accounting. Essentially, ESA 1995 is consistent with the 1993 SNA definitions, classifications and accounting rules. However, there are some differences between the two methodologies, namely:

a) *in terms of presentation*[3]:

- in ESA 1995 there are separate chapters regarding on transactions in products, distribution and financial operations. In the 1993 SNA these transactions are explained in seven chapters dealing with different accounts (e.g. production account, the primary distribution of income account, the

capital account and the rest of the world);

- 1995 ESA describes a concept by providing a definition and then a list containing items that include but those that exclude them. The 1993 SNA describes concepts usually in more general terms, also explaining the reasons behind the adopted conventions;
- ESA 1995 also contains special chapters devoted to regional accounts and quarterly accounts;
- 1993 SNA also contains a chapter on satellite accounts.

b) in terms of concepts [3], ESA 1995 is more specific and more accurate than the 1993SNA:

- 1993 SNA does not contain very precise definitions for the terms "market", "own final consumption" and "other non-market" to class institutional units, units of local economic activities and their outputs. This implies that, in this respect, evaluation and classification of production sectors are not defined precisely enough. ESA 1995 introduced therefore more clarification and also added in some specific cases, the criterion that the sales of a market producer should cover at least 50% of its cost of production;
- SNA 1993 provides concrete recording thresholds for recording small tools in intermediate consumption;
- ESA 1995 requires that several types of household production of goods such as cloth weaving and furniture making are not significant in European Union Member States and therefore need not be registered;
- ESA 1995 explicitly refers to the institutional arrangements specific to the European Union, such as the Intrastat system for recording intra-community flows of goods and Member States' contributions to the European Union;
- ESA 1995 contains specific European Union classifications (e.g. CPA for products and NACE rev. for specific industries, but in the same time, harmonized with the relevant United Nations classifications);
- ESA 1995 contains an additional classification for all external operations by which they are divided into those that occur between residents of the European Union and those with non-European Union residents.

6. Differences between the two systems of accounts: ESA 1995 and ESA 1970

The two systems ESA 1995 and, its previous version, ESA 1970 differs both in terms of coverage area and regarding on the concepts used. Most of these differences correspond to those observed between the 1968 SNA and the 1993 SNA. The main differences found are([2], [3]):

a) in terms of concepts:

- registration of literary and artistic works (writings, musical compositions) as production, payments for this work is, from that point, payments for services and not property income;
- assessing the production of insurance services, various changes in the field;
- more detailed treatment of trade and transport;
- the use of chain indices for constant price calculations;
- the concept of lease (leasing), ESA 1970 not take into account than simple lease;
- registration spending on software development and prospecting of deposits in capital formation and not in intermediate consumption;
- recording a capital consumption infrastructural works of government (roads, dams, etc.)
- identification of new financial instruments, such as repurchase agreements (sponsorship) and financial derivatives.

b) regarding the coverage area on:

- inclusion of balance sheets;
- introduction of new concepts: final consumption, actual final consumption adjusted income, real disposable national income;
- decomposition of households in subsectors;
- inclusion of other changes in assets (introducing concepts other changes in volume, nominal holding gains and real holding gains);
- applying the concept of purchasing power parity.

c) other differences that are not a consequence of changes to the 1993 SNA:

- introduction of input supply and use tables;
- application for some registration thresholds and some references to specific institutional arrangements of the European Union;
- introducing of the concepts of active production and unemployment;

- the valuation of output at basic prices.

7. Some conclusions

The European System of Accounts -ESA 95 constitutes a coherent, consistent and integrated system of national accounts, an internationally applicable accounting framework that allows analytical and detailed description, analysis and evaluation structure of the “total economy”, its components or specific aspects, its evolution over time and its relations with other economies total.

The ESA 95 was designed to show economic processes in accordance with macroeconomic theory, providing not only a classification system and accounts structure, but also various rules such as valuation, time or recording, etc. ESA 95 is not restricted to annual national accounting, but applies also to quarterly accounts and regional accounts.

Tax Policy Measures and their Influence on the Romanian SMEs

Beca Marușă

Bucharest University of Economic Studies
marushabk@yahoo.com

Nișulescu-Ashrafzadeh Ileana
Bucharest University of Economic Studies
nisulescu_ileana@yahoo.com

Abstract

This article aims to study the tax measures taken by the Romanian authorities during the global economic crisis and their impact on the SME sector. The SMEs are essential to the economic recovery; the economic crisis had serious consequences on their number and performance. Global and SMEs' specific tax measures were taken by the Romanian government in the 2009-2011 period with the goal to countervail the negative effects of the economic crisis and to increase the budget receivables. The research method used is the quantitative analysis of documents and synthesis. The used variables refer to the SME sector dynamics, the evolution of labor productivity, indicators of corruption, tax evasion and underground economy.

Key words: tax policy, SME sector, corruption, tax evasion, labor productivity.

J.E.L. classification: E26, G01, H25, H26, H30

Introduction

The global economic crisis led to increasing budget deficits in the majority of the EU member states so that these countries had to take effective measures to correct the deficit below 3% of GDP, which was based on increasing revenue and reducing costs. The EU member states have taken a number of fiscal measures to ensure the sustainability of public finances on the medium and long term.

The tax reforms of the Member States should aim primarily to create new jobs, improving the pension systems and relaunching economic growth. In the EU

countries there has been a clear trend of increasing indirect tax rates, namely VAT and excises in the last years. After the 2009 tax changes, in the 2010-2011 period we witness an additional increase of these rates. In terms of direct taxes, the increases were lower but the coming years will demonstrate the effectiveness of tax measures in this area. Thus, tax revenues have increased mainly due to consumption taxes, while tax cuts took place mostly in the labor taxation [1].

Considering that SMEs have an important role in the welfare of the communities, they are essential to the economic recovery in the context of the current global crisis. SMEs also play a key role within the Europe Strategy 2020 context by contributing to the economic health of European economies. This strategy provides the following actions needed to support the SME sector: reducing tax burden, facilitating access to finance, supporting SMEs to enter new markets, ensuring fair competition, promoting education and entrepreneurial skills, intellectual property rights protection, encouraging research and development, SME support in the competition context [2].

A mismatch between the economic environment and the tax system can have a negative impact on the concerned country's future. The legislative stability, the elimination of corruption and red tape, reducing the liabilities like taxes, fees and contributions, the gaps in the legal system, improving the process of tax obligations collection, the efficient spending of collected resources are just some aspects that should be considered when adopting measures affecting the tax system [3].

Economists and researchers in economics claim that increasing corporate income taxes, personal income taxes and social contributions are the most harmful decisions

that can be taken during financial and economic decline. This is explained by the fact that cutting the personal income tax stimulates investments, while reducing the corporate income tax and social contributions increases labor supply and demand with a direct effect on reducing unemployment [4].

1. Research methodology

The paper combines the qualitative and quantitative research by using the specific methods, the document analysis and content analysis. In order to accomplish the established objectives we resorted to a series of references composed of specialized books, accounting, fiscal and juridical norms, studies and articles published at national and international level by several bodies in the field. We gathered data from the European Commission - SBA Fact Sheet Romania and Taxation Trends in the EU, Global Integrity and World Competitiveness in order to perform an analysis of the Romanian tax policy and the SME sector evolution in the period 2008-2011. The used variables refer to the SME sector dynamics, the evolution of labor productivity, indicators of corruption, tax evasion and underground economy.

2. General and specific tax measures with an impact on the SME sector taken by the Romanian government in the period 2009-2011

The most important tax measures taken by the Romanian government in the period 2009-2011 with an impact on the SME sector are the following [5] [6] [7] [8]:

- The decrease of the VAT rate (from 19% to 5%) for the building of social dwellings
- The firms that registered loss or zero profit were forced to pay a lump-sum tax from May 2009 till October 2010
- The loss carryforward period increased from 5 years to 7 years enforced from 2009. There are no loss carry-backs provisions
- Higher levels of social contributions for employees and employers; the decrease of employer's contributions for work accidents and occupational diseases by 0,5%
- The hike of the VAT standard rate with 5 percentage points till 24%
- Increasing the income tax base and social contributions by charging launch vouchers

and capital gains (including interest on bank deposits)

- Only in august 2010 were published rules for granting deduction of 20% tax calculation for eligible R&D costs and the possibility of using accelerated depreciation method for devices and equipment used in R&D
- Income tax of 3% obtained by micro-firms (with 1-9 employees and a turnover of less than € 100,000) is reintroduced as an alternative to the general corporate tax (16%)
- The application of the reverse charge for the supply of cereals and industrial plants starting with the 31st of May 2011
- Increases in certain local taxes (for example: the car tax, taxes on the release of certificates, authorizations for advertisements).

3. Indicators regarding tax evasion, underground economy and corruption in Romania in the period 2008-2010

As a result of tax incentive measures taken by the Romanian government and decrease in the perception of corruption in 2012, we analyzed how the business environment reacted to these changes through the number of SMEs and, more important, the evolution of labor productivity in the same period.

Romania's overall performance has changed little since Global Integrity's previous assessment in 2008. Because of its compliance with EU accession mandates, Romania earns a sparkling rating for its overall legal framework in combating corruption. However, the implementation and enforcement of that legal framework leave much to be desired. Whistle-blowing measures in the public sector do exist, but they continue to be ineffective largely because of inadequate staffing and funding. The ombudsman office has very weak investigatory and prosecutorial powers, while law enforcement is often politicized. As with many other countries, Romania suffers from poor accountability and transparency in political financing. The agency charged with monitoring party and individual candidate expenditures relies on voluntary self-reports rather than actively pursuing investigations and imposing penalties. Civil service oversight remains weak, including the

ongoing challenge of political and nepotistic criteria factoring into hiring and firing decisions [9].

According to the World Economic Forum report, among the most problematic factors for doing business include: the corruption in

the first place (17,4% of responses) ranks four places up in 2012 compared to 2011, the taxation rates in second place (13,9% of respondents' answers) and fiscal rules in fifth place with 7,6% of responses [10].

Table 1 Global Integrity Index – Romania

Scores	2008	2010	Evaluation
Overall Score	80	79	Moderate
Legal Framework Score	97	95	Very strong
Actual Implementation Score	64	64	Weak
Implementation Gap	34	31	Very large

Source: <http://www.globalintegrity.org/report/Romania/2010>

From table 1 we observe that the gap implementation of the legal framework on corruption is very high in 2008 and 2010. Regarding integrity, Romania hasn't made progress during the crisis. Overall score dropped by one point, being evaluated from strong to moderate.

Analyzing corruption as a whole, through the Corruption Perception Index (CPI), Romania is perceived as one of the most corrupt countries in the EU, along with

Greece and Bulgaria. According to the World Competitiveness, the Tax Evasion Perception Index in Romania is determined on a scale from 0-10, where 10 is the state with tax evasion seen as practically non-existent and 0 defines a perception of a state with the highest tax evasion [11].

Table 2 Indicators regarding the tax evasion, the underground economy and corruption in Romania in the period 2008-2010

Indicators	2008	2009	2010
Tax Evasion Perception Index	3,21	1,68	2,09
Underground economy share in the GDP	29,4	29,4	30,2
The total tax evasion share in the official GDP	17,45	17,57	17,44
Corruption Perception Index	3,8	3,8	3,7

Source: http://www.evaziune_coruptie.ase.ro/media/Date_Evaziune_Coruptie.pdf

In the period 2008-2010, the share of the underground economy in GDP increased by 0,8%, the Corruption Perception Index fell by 0,1, showing increased phenomenon of corruption, the Tax Evasion Perception Index decreased by 1,12, suggesting an increasingly worse perception of tax evasion and the Total tax evasion share in the official GDP remained constant.

Considering these aspects, we conclude that the fiscal measures taken by the Romanian government in 2009, 2010 and

2011 to counteract the negative effects of the economic crisis did not have a favorable impact on the indicators mentioned above. The intensification of corruption and tax evasion results in attracting increasingly less foreign investors, a reduction of their investments in Romania with negative effects on the business environment, on the SME sector and the economy in general. Only in 2012 the Corruption Perception Index increased to 4,4 from 3,8 in 2008, suggesting a decrease in the phenomenon of corruption

in Romania.

4. The SMEs' dynamics in Romania in the period 2008-2011

In 2010, compared to 2008, there was a fairly significant increase in the number of SMEs (18,96%) in Romania. This is due in particular to the increase in the number of

micro-enterprises (19,33%) and secondly in the number of small firms (18,49%). In 2011, compared to 2010, the growth was lower, of 1%; a positive trend recorded only the micro-enterprises (2,34%), the rest recorded decreases in the number of firms, especially medium-sized companies (-13,66%).

Table 3 The number of SMEs in Romania (2008-2011)

Type of SME	Number of SMEs		
	Number		Variation
	2008	2011	%
Micro	389.389	475.536	22,12%
Small	41.500	45.131	8,75%
Medium	9.174	8.348	-9,00%
Total SMEs	440.063	529.015	20,21 %

Source: SBA Fact Sheet Romania 2009, 2010-2011, 2012, European Commission [12] [13] [14]

Labor productivity is an important indicator of economic efficiency of a company showing the fruitfulness of labor used in production. Labor productivity growth is the most important factor to increase production, reduce production costs and increase the profitability and

competitiveness of domestic and foreign products. Apparent labor productivity represents the value added at factor cost divided by number of employees, rate that is expressed in thousands of dollars per employee [2].

Table 4 Labor productivity in Romania (2008-2011)

Type of SME	Labor productivity					
	Thousand €/person			Thousand €/enterprise		
	2008	2011	Variation %	2008	2011	Variation %
Micro	12,55	6,65	-47,05%	28,25	13,88	-50,87%
Small	14,62	9,75	-33,27%	289,16	181,69	-37,16%
Medium	14,96	11,15	-25,47%	1.526,05	1.126,02	-26,21%
Total SMEs	14,05	9,04	-35,66%	84,08	45,75	-45,59%

Source: processed data after SBA Fact Sheet Romania

From the above table we observe that the economic crisis was felt most strongly by micro-enterprises since labor productivity expressed in thousands of euros per employee decreased by 47% in the period 2008-2011 and the one expressed as thousands of euros per company decreased by about 51% over the same period, double

compared to the reduction recorded by the medium firms. Overall we find that labor productivity measured as thousands of dollars per company (-45,59%) fell more strongly than the one expressed in thousands of dollars per employee (-35,66%).

Conclusions

The recent economic and financial crisis has had serious consequences on the performance of SMEs in Romania. The European Commission statistics show a decrease in the SME sector productivity by 36% during the period 2008-2011, the most affected being the micro-enterprises because labor productivity measured as thousands of euros per company decreased by about 51% over the same period, double in comparison with the cut recorded by medium firms. There is a direct relationship between labor productivity and the class size in which the firm is included. Fiscal measures taken by the Romanian authorities during the analyzed period failed to stop the sharp decline in labor productivity of SMEs.

The austerity measures taken by the Romanian government in 2010, like cutting the wages by 25% to 40% (including bonuses), applying the contribution to health insurance (5,5%) to retirees with pensions higher than 740 RON and increasing the standard VAT rate of 5% caused a decrease in the purchasing power of the entire population and sales, companies being forced to adapt their offer and reduce costs, mainly those related to staff.

The main microeconomic effects of increasing standard VAT rate by 5% in 2010 were: increase of costs for the Romanian firms and reduction of the recorded profit; decrease of purchasing power of consumers has led to a decline in demand, sales and profits as well as a deepen phenomenon of tax evasion.

The flat tax on micro-enterprises which was mandatory in the period May 2009 - October 2010 has been repealed. As a consequence, the micro-enterprises proportion has improved in 2011 compared to 2010 by 1,1%. Moreover, the number of Romanian SMEs in absolute terms increased by 20% during the 2008-2011 period. The main consequences of introducing the flat tax in Romania in May 2009 for SMEs were: increase of the natural authorized individuals' number, growth of suspensions and dissolutions' number, reduction of employees' number in SMEs, diminishing declared turnover, a negative perception of business environment and the increase of tax evasion.

Fiscal measures taken by the Romanian government during the period 2009-2011 in order to countervail the negative effects of the economic crisis have not had a positive impact on indicators of corruption and tax evasion. The enhanced corruption and tax evasion result in attracting increasingly less foreign investors, a reduction of their investments in Romania with negative effects on the business environment, on the SME sector and on the economy in general. Romania is perceived as one of the most corrupt countries in the EU, along with Greece and Bulgaria, and only in 2012 the Corruption Perception Index increased to 4,4 from 3,8 in 2008, suggesting a decline in the phenomenon of corruption in Romania.

Effects of the Economic and Financial Crisis on the Revenues and Expenditures of Romanian Local Governments

Bilan Irina

„Al. I. Cuza” University of Iasi, Faculty of Economics and Business Administration

irina.bilan@uaic.ro

Abstract

In times of economic crisis, not only central governments but also local ones may experience deterioration in their financial situation. Also, the latter not only may but also should contribute through specific budgetary measures to the stabilization and recovery of the economy. Based on such considerations, this paper aims to provide, by analyzing relevant data from Eurostat and the Romanian National Institute of Statistics, an assessment of the effects of the crisis on the revenues and expenditures of Romanian local authorities, highlighting their peculiarities in relation to the effects recorded in other Central and Eastern European countries or stipulated in the literature. Also, the paper aims, by analyzing the changes in the structure of Romanian local budget revenues and expenditures, to assess the rationality of the measures adopted by local governments in crisis as well as their compatibility with the objectives of stabilizing national economy and promoting long-term economic growth.

Key words: local governments, local revenues, local expenditures, anti-crisis strategy

JEL Codes: E62, H71, H72

1. Introduction

The global economic and financial crisis emerging in September 2008 made a strong impact on the national economies of affected countries, firstly resulting in the deterioration of their economic situation (GDP contraction, increase in unemployment, exports shortfall, etc.) and secondly, of the state of their public finances. To the cyclical evolution of budgetary revenues and expenditures were added the negative budget balance effects

resulting from the discretionary fiscal policy measures adopted by national governments to counter the effects of the crisis and help the economy stabilize and recover.

Although the negative effects of economic recession on public finances were felt at all levels of government and a rational economic recovery strategy should rely on the coordinated contribution of all public authorities, the literature, including the Romanian one, most often aims at primarily assessing the impact and contribution of central governments, and only rarely and inconsistently that of subnational ones.

From this point of view, this paper aims to complement this deficiency by offering, based on the analysis of relevant data provided by Eurostat and the Romanian National Institute of Statistics, a more thorough evaluation of the effects of the crisis on Romanian sub-national communities, primarily on their budgetary revenues and expenses. For comparison reasons we will also consider, at some points, the situation of other countries from Central and Eastern Europe.

2. Local public finance in times of crisis – some theoretical considerations

In times of economic and financial crisis, not only central governments but also state or local ones may experience deterioration in their financial position, the literature highlighting ([6], [8], [9] and [10]), based on recent or past experiences of various countries, several possible channels through which such effects may arise:

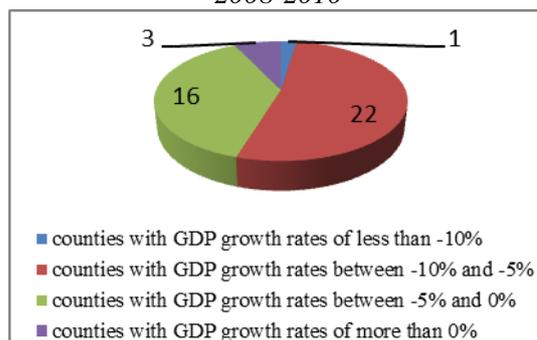

- reduced fiscal revenues, especially there where local taxes are based on less stable tax basis;
- reduced transferred resources from the level of other public administrations, mainly central governments, on the background of the financial difficulties

- that they at their turn may record, calling for fiscal consolidation measures;
- reduced access to bank credits and financial markets and higher financing costs, due to both the lack of liquidity on the market, banks’ reluctance to lending and increasing investors’ risk aversion; this could lead not only to a smaller amount of borrowed resources available for new or old projects but also, in some cases, even to the insolvency of local governments;
 - reduced income or even losses from the financial assets held by local governments, there where local authorities are permitted to invest funds in the market;
 - increased demand for social benefits due to reduced economic activity and corresponding increase in unemployment, with negative impact on the size of local government expenditures;
 - cancellation or postponement of projects developed in partnership with private agents, due to the financial difficulties that they, at their turn may register.

Also, in times of economic and financial crisis, public authorities are directly responsible for the development and implementation of strategies aimed at helping the economy in trouble recover. Although the task of economic stabilization is most often attributed to central governments, it is generally admitted that a coherent anti-crisis strategy should also take into account the complementary contribution of subnational governments. Accordingly to the recommendations of the Council of European Municipalities and Towns, "a comprehensive economic recovery cannot be initiated without the involvement of Europe's towns and regions" [1].

Two arguments can be put forward in this respect. First, some important engines of economic growth may be found locally and local public authorities are responsible for performing a wide range of activities with direct impact on the overall growth and development of the economy, such as local infrastructures. Secondly, the effects of the crisis were often felt differently at territorial level, which calls for locally differentiated compensating actions, both as magnitude and content.

Figure 1. Distribution of Romanian counties by the average annual GDP growth rate, 2008-2010

Source: the authors, data from Eurostat

A simple look at the effects of the economic crisis on the dynamics of territorial GDP in Romania confirms this situation, as can be seen in figure 1. The average annual GDP growth rate between 2008 and 2010 varied substantially between different Romanian counties, from -10.56% in Prahova to 14.84% in Giurgiu.

3. The impact of the economic crisis on Romanian local budget revenues

On the background of the global economic crisis, the effects of which were recorded in Romania too since 2009, local authorities were confronted, like other European countries, with a reduction in their budgetary revenues.

Table 1. Local budget revenue in Romania and other Central and Eastern European countries (% of GDP)

Country	2008	2009	2010	2011
Bulgaria	6.9	7.7	7.0	6.7
Czech Republic	10.8	11.5	11.3	11.0
Estonia	10.3	11.0	10.3	9.8
Hungary	11.6	11.9	11.9	12.1
Latvia	11.3	11.1	11.4	10.2
Lithuania	9.1	10.4	11.4	9.7
Poland	14.0	13.7	13.9	13.4
Romania	8.8	9.3	9.5	9.1
Slovenia	8.4	9.5	9.7	9.6
Slovakia	6.0	6.5	6.4	6.6
EU average	11.4	12.1	11.9	11.7

Source: the authors, data from Eurostat

However, as results from the data presented in table 1, not only this effect occurred later than in other Central and

Eastern European countries, only in 2011 (when there was registered a reduction of 0.4% of GDP in the local budget revenues compared to 2010), but also its dimensions were, on average, less consistent. Local budget revenues decreased within 1 or 2 consecutive years with over 1% of GDP in Lithuania, Bulgaria, Estonia and Latvia. On the contrary, the effects of the crisis were almost insignificant in Slovenia and Slovakia (where local revenues fell by only 0.1% of GDP and in only one year) and revenues even increased in Hungary.

However, this apparently favorable situation for Romania hides contradictory realities. At first glance, the data in table 2 confirm a less significant negative impact of the crisis on the overall budgetary revenues of Romanian local communities, expressed in absolute figures. Compared with 2008, these even were higher in 2011, with over 1 billion lei. However, when analyzing the structure of local revenues, we can see that the impact of the crisis on tax revenues was rather severe, as they decreased continuously from 2008 to 2011, with over 4 billion lei (almost 12% of the initial level), which confirms the general trend found in other European countries.

Table 2. The composition of local budget revenue in Romania (billion lei)

Revenues	2008	2009	2010	2011
Fiscal revenues, out of which:	37.35	36.73	34.54	33.02
Taxes on income	14.38	15.04	14.47	14.49
Taxes on goods and services	19.67	18.25	16.14	14.42
Property taxes	3.16	3.32	3.79	3.98
Non-fiscal revenues	1.30	1.34	1.55	2.20
Subsidies	4.35	4.38	5.29	5.62
Amounts received from EU	N/A	0.71	2.25	3.60
Other revenues	0.64	0.36	0.29	0.39
Total	43.63	43.53	43.92	44.80

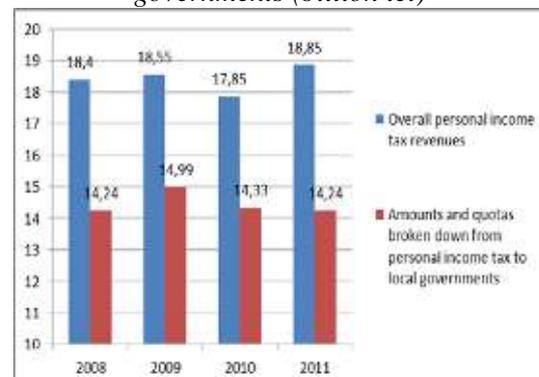

Source: the authors, data from the Romanian National Institute of Statistics

A possible explanation for this situation could be that the taxes on property (buildings, land, vehicles, etc.), based on safer and less sensitive to economic situation tax basis, represent only a small share of the total budgetary revenues of Romanian local governments, less than 10%. Thus, given the

enforced system of establishing these local taxes in Romania, which takes into account to a lesser extent the fluctuating market value of movable and immovable property and relies to a greater extent on other, more stable indicators such as the surface of buildings or the engine capacity of vehicles, revenues from property taxes have steadily risen, even on the background of the crisis (from 3.32 billion lei in 2009 to 3.98 billion lei in 2011, with almost 20%). However, the effect was insufficient to fully compensate for the reduction in other fiscal revenues.

Against the background of rising unemployment and reducing personal income and corporations' profits, the decrease in local budgetary revenues from income tax (from 15.04 billion lei in 2009 to 14.49 billion lei in 2011) appears to be a natural result of the economic downturn. The adverse impact of the crisis on local budgets was, however, enhanced by the consolidation measures adopted by central authorities, which decided to successively reduce the quotas broken down from personal income tax allocated to local budgets (as the main component of local taxes on income) from 82% to 77% in January 2011 and 71.5% in December 2011, depriving local authorities of significant financial resources. Thus, as can be seen in figure 2, although the overall revenue collected from personal income tax increased in 2011 compared to 2010, the impact on local revenues continued to be a negative one, trend to be extended in 2012.

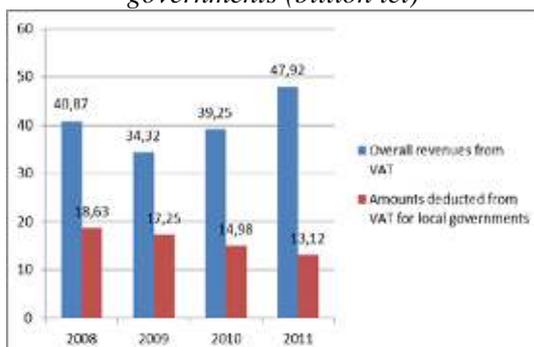

Figure 2. Overall personal income tax revenues and amounts and quotas broken down from personal income tax to local governments (billion lei)

Source: the authors, data from the Romanian National Institute of Statistics

The most important contribution to the reduction in local governments' tax revenues came from the taxes on goods and services (mainly VAT), which decreased from 19.67 billion lei in 2008 to 14.42 billion lei in 2011, with over 25% (table 2). Paradoxically, this effect occurred even against the controversial measure, in force since July 2010, to increase, in times of crisis and contrary to the conventional wisdom calling for tax cuts, the standard VAT rate from 19% to 24%, which should have led to a substantial increase of raised budgetary revenues. Although, as can be found in figure 3, such an increase of the overall VAT revenue raised to the central budget occurred, as it rose by nearly 40% in absolute figures in 2011 compared to 2009, this increase was not transmitted to local budgets due to the decision to constantly amputate the amounts deducted from VAT allocated to local communities, which decreased by almost 25% during the same 2 years timeframe. The effects are even more unfavorable as part of this revenue serves to the direct funding of expenditures with high impact on the future development of local communities and the nation as a whole, such as expenditures for roads or development of infrastructure in rural areas.

Figure 3: Overall revenues from VAT and amounts deducted from VAT for local governments (billion lei)

Source: the authors, data from the Romanian National Institute of Statistics

Compensating favorable effects on local budgetary revenues came from subsidies, mainly from the state budget, which increased by 1.24 billion lei from 2009 to 2011, and the amounts received from EU, either as refunds on previous expenditures or pre-financing of EU projects, which increased by 2.89 billion lei during the same timeframe (table 2). Basically, confronted

with tax revenue shortfalls and benefiting from increased expertise in managing European projects, local authorities turned to a greater extent to the non-refundable resources from EU funds and programs to ensure the financing of local development projects. However, compared to other CEE countries, the absorption rate is still quite low in Romania, which indicates the imperative of developing this source of funding, by reducing bureaucracy, providing sufficient resources for co or pre-financing etc. Local borrowing, with or without the guarantee of central government, might prove to be a good option, especially since the rules limiting the access to new local public borrowing [5] do not apply for loans aimed at co-financing or pre-financing projects benefiting from EU's financial assistance.

4. The impact of the economic crisis on Romanian local budget expenditures

Referring to local public expenditures, although they were expected to increase in times of recession, due to both the cyclical evolution of expenses sensitive to economic conditions (such as social protection ones) and to the economic stabilization measures that could and should be adopted not only by central but also by sub-national governments, they were reduced in varying proportions in all Central and Eastern European countries (table 3). In Romania, the decrease of local budget expenditures was the lowest compared to other countries of our analysis, of only 0.4% of GDP from 2009 to 2011, similar to that of Slovenia.

The above findings could mean that, facing diminishing financial resources, local authorities were effectively constrained to restrict public spending, the role they were assigned in national anti-crisis strategies being rather a modest one. This reaction was also driven, in most countries (among them Latvia, Estonia, Hungary, Lithuania, Slovakia and Romania [2]), by the existence of numerical fiscal rules applicable to local governments and forcing them to practice balanced or surplus budgets or limiting their access to alternative financial resources, such as loans. Also, in some countries, once budgetary consolidation strategies aimed at reducing overall budget deficits and ensuring public debt sustainability were launched,

constraints became even more severe, as local governments benefited from diminished central government financial support.

Table 3. Local budget expenditure in Romania and other Central and Eastern European countries (% of GDP)

Country	2008	2009	2010	2011
Bulgaria	7.3	8.6	7.0	6.7
Czech Republic	10.9	12.0	11.8	11.4
Estonia	10.9	11.5	10.0	9.7
Hungary	11.6	12.3	12.7	11.5
Latvia	12.6	12.8	11.8	10.8
Lithuania	9.3	10.8	11.3	10.1
Poland	14.1	14.8	15.1	14.1
Romania	9.9	10.1	9.6	9.7
Slovenia	9.1	10.1	10.1	9.7
Slovakia	6.0	7.2	7.3	6.6
EU average	11.6	12.4	12.2	11.9

Source: the authors, data from Eurostat

The analysis of changes in the functional structure of public expenditure generally indicates a quite rational approach of Romanian local authorities. It can be seen from the data in table 4 that, although social security and assistance expenditures from local budgets increased in 2008-2010, as expected, the increase was not significant and was kept under control, the trend reversing afterwards and the level of these expenditures being in 2011 even lower than in 2008. Also, local public spending cuts in 2009-2011 mainly concerned expenditures with less negative impact on economic growth, such as general public services or defense and public order, although their social negative impact is not to be neglected. Conversely, other public expenditures, such as those with economic affairs or development, housing and water supply, with a prominent economic content, increased significantly, in part as a result of a greater availability of EU financial grants for these purposes.

Table 4. The functional composition of local budget expenditure in Romania (billion lei)

Expenditures	2008	2009	2010	2011
General public services	5.67	5.82	5.24	5.18
Defence, public order and national security	0.61	0.66	0.53	0.49
Social and cultural	22.27	22.52	21.19	20.37

expenditures, out of which:				
Education	12.65	12.62	10.72	9.92
Social security and assistance	6.32	6.37	6.74	5.77
Public services and development, housing, environment and water supply	4.82	5.36	5.53	7.37
Economic affairs, out of which:	8.84	7.72	8.71	10.61
Transport	6.98	5.42	6.29	8.03
Total	42.21	42.07	41.21	44.00

Source: the authors, data from the Romanian National Institute of Statistics

However, we consider to be disputable the decision to reduce local public spending on education, since pre-university education financing in Romania is ensured, for the most part, at the level of local communities, from the shared amounts of certain state budget revenues (personal income tax before 2011 and VAT afterwards). The reduction of financial resources redistributed to local authorities by such means effectively passed on the availability of resources for education, an underfunded sector compared not only to other sectors but also the actual financing needs. The decision is even more disputable as it is generally recognized the critical role of such expenditures, together with the research, development and environment ones, in shaping a “smart” budgetary strategy, aiming at long-term economic growth and development.

Table 5. The economic composition of local budget expenditure in Romania (billion lei)

Expenditures	2008	2009	2010	2011
Current expenditures, out of which:	34.82	35.63	34.80	35.15
Compensation of employees	15.31	16.36	13.58	11.24
Goods and services	9.51	8.34	8.51	9.49
Social assistance	3.23	2.95	3.42	2.87
Capital expenditures	7.21	6.32	6.03	8.33
Other expenditures	0.18	0.12	0.38	0.52
Total	42.21	42.07	41.21	44.00

Source: the authors, data from the Romanian National Institute of Statistics

The changes in the economic composition of Romanian local public spending largely confirm the previously observed trends (table 5). Although local spending on social assistance rose in 2010 against the backdrop of deteriorating financial situation of many people and increased number of social assistance beneficiaries, the trend was reversed in 2011. Also, although declining in 2009 and 2010, capital expenditures increased even more in 2011, while public spending on the compensation of employees decreased continuously since 2009, due to both public wage cuts and the removal of some bonuses and other benefits. Though rational in kind, these measures were inconsistently and incoherently implemented, allowing for the affected public employees to contest them within the courts of law and win and thus leading to additional budgetary efforts in the coming years, when these obligations are due.

5. Conclusions

Similarly to other Central and Eastern European countries, the effects of the global economic and financial crisis were felt in Romania not only at the level of central but also local governments. A deterioration of their financial situation was registered, although not as sharp as in other countries.

The negative effects on local budget revenues did not come only from the direct impact of economic recession, but mainly from the discretionary measures adopted by central government. In the context of the budgetary consolidation strategy initiated in 2010, it successively amputated the revenues assigned to local governments as quotas and amounts deducted from some state budget revenues, thus depriving local authorities of important financial resources.

As for local public spending, although Romanian local authorities were effectively forced, just like in other countries, to cut expenditures in order adjust them to smaller revenues, the overall change was quite small. Basically, the reduction of some types of expenditure like general public services, public order or the compensation of employees, was offset at least in part by the increase of others, such as economic affairs or capital expenditures. Although such structural readjustments can only be

appreciated as they are, under the condition of ensuring high efficiency of such spending, consistent with the objective of economic growth, the adopted measures proved to also have significant shortcomings. It may be disputed, in this respect, the decision to cut some expenditure items such as on education, a real investment in human capital and a valued component, in our opinion, of a smart economic growth strategy.

The Effect of Working Capital on Profitability: Evidence from Romania

Boțoc Claudiu

West University of Timișoara,

Faculty of Economics and Business Administration

claudiu.botoc@feaa.uvt.ro

Abstract

The golden rule of financial equilibrium state the noncurrent resources should finance noncurrent assets and current resources should finance current assets. Managing working capital suppose to provide cash, which is indispensable for a company to run its day-by-day activities.

The main aim of this paper is to test for a sample of Romanian publicly companies if working capital is managed at an optimum level, and if companies hold too much or too less cash, which obviously would affect profitability.

The results suggest that in order to increase profitability managers from Romanian publicly companies could increase profitability by reducing the number of days cash conversion cycle and, as second result, companies do not hold too much cash.

Keywords: profitability, working capital, days of inventories, days of accounts receivable, days of accounts payable.

JEL code: G30, G31, G32

1. Introduction

Working capital management is one the most important integrated decision in corporate finance since cash holdings can make the difference between performance and failure at firm level. Managing working capital suppose to provide cash, which is indispensable for a company to run its day-by-day activities.

Statistics depict that firms has an average of 40% of its assets invested in current assets and CFOs spends about 80% of time in managing short term financial decisions. Deloof (2003) found that in 1997 13% of total assets for Belgium companies were

represented by accounts payable while accounts receivables and inventory were represent by 17% and 10% respectively.

Furthermore, it was found that in the UK corporate sector more than 80% of daily business transactions are on credit terms. According to Ernst & Young's working capital report, compared with 2010, in 2011 working capital performance for US companies has improved – with cash conversion cycle dropping by 3% - while for European companies remain unchanged.

There are several papers that have tested the effect of working capital on profitability for different samples, periods and environments but the conclusion was almost similar in all cases: there is a negative relationship between profitability and working capital.

Given the previous empirical works, the main aim of this paper is to continue carrying the working capital debate into emerging markets area. The paper contributes to the literature in at least two ways. First, it focuses on Romanian publicly firms, where few research has been done and without regression analysis [1]. Second, the empirical results validate the findings of previous researchers, in this respect adding substance to the theory for this topic.

Two hypotheses have been tested in this paper. First, the main hypothesis is that working capital affects profitability, either positive or negative. Second, is if companies hold too much or too less cash, which obviously would affect profitability. The results suggest that in order to increase profitability managers from Romanian publicly companies could increase profitability by reducing the number of days cash conversion cycle and, as second result, companies do not hold too much cash.

The paper is organized as follows. Section 2 briefly reviews the literature on working

capital management and profitability. Sample construction, data collection and model proposed are described in Section 3. Section 4 provides the results for the effect of working capital management and cash on firm value. Finally, Section 5 concludes the paper with a summary of its main findings.

2. Literature review

The golden rule of financial equilibrium state the noncurrent resources should finance noncurrent assets and current resources should finance current assets. For many decades the focus in corporate finance was rather on the long-term financial decisions such as optimal capital structure or dividends, by testing several profitability models through debt ratio, noncurrent assets ratio, investment decisions. Taking in account both statistics aforementioned and golden rule hypothesis will emphasize the importance of working capital management, as main issue of current liabilities – current assets relation.

The interest for working capital management is recently and enjoyed a substantial increase. Most empirical works use regression analysis but there are some studies based on a survey. A starting point in this topic is considered Shin and Soenen paper. They found a negative and strong relationship between cash conversion cycle firm profitability for US firms during 1975-1994 [2]. They also provide a suggestive example in this topic for two companies, Wal-Mart and Kmart. In 1994 both companies exhibit similar profile in terms of capital structure, but Kmart faced constraints and went bankrupt whereas Wal-Mart didn't. Kmart failure was related to poor working capital management since it had a cash conversion cycle of about 61 days. As a comparison, Wal-Mart set a shorter conversion cycle of 40 days.

In another study that include US companies from 1990 through 2004, it was confirmed the theory that firms over-invest in working capital. In addition, it was found that working capital policy is affected by determinants such as industry, size, expected growth sales, proportion of outside directors, CEO compensation and CEO's share ownership [3].

The theory that firms over-invest in working capital was confirmed too for companies from other countries, either developed or emerging. Thus, using a sample of Belgian companies during 1992-1996 Deloof found a significant negative relationship between gross operating income and cash conversion cycle, and also its components such as days accounts receivable, inventories or accounts payable [4]. Lazaridis and Tryfonidis conclude that in order to create profit managers from Greece companies should keep cash conversion cycle at an optimum level [5].

This conclusion was suggested too in an empirical work through UK companies listed at London Stock Exchange during 2006-2008 [6]. In addition, the researcher found that profitability is negatively related with liquidity and debt ratio and positively related with size. Gill et al. paper seek to extend Lazaridis and Tryfonidis model for US companies and find similar results [7].

A consistent body of research was conducted in this topic for companies from emerging countries such as India, Nigeria, Pakistan or Kenya. However, the conclusion was unanimous and unambiguous: managers can create value by decreasing cash conversion cycle.

In a survey research over UK firms, Ricci and Di Vito highlight that regarding international cash management often operations 68% use wire transfers, 52% pool cash, 61% transfer funds electronically and only 23% net payments.

Regarding international cash collections and credit management, the researchers conclude that open account sales is the most commonly method and use more secure techniques such as letter of credit and documentary collections only when they are unfamiliar with customers. Regarding the influence of international sales levels on the use of working capital management vehicles, the results suggest a little impact and could reflect the influence of corporate culture [8].

Another stream of the literature has focused on the relationship between level of cash and firm value. Pinkowitz et. al found that cash-value relation is influenced by corporate governance. Thus, in countries with low governance score cash holdings is less valued than in countries with high

governance score [9]. Autukaite and Molay integrated both working capital and cash holdings in a company value model for the case of French companies and the main conclusion was that these two variables do not explicitly create value [10].

3. Data and methodology

This section describes data collection, variables and empirical model for the relation between working capital and profitability. The sample is based on a database provided by Romanian Ministry of Finance that consists of main categories from financial statements of the Romanian companies.

The sample was constructed by including all listed companies at tier 1, 2 and 3 at Bucharest Stock Exchange (BSE) for the period 2001-2011. Furthermore, following standard practice, companies from banking and financial sector were dropped from initial database, resulting a final sample of 67 companies.

Profitability is measured by return on sales (ROS), which is defined as net income divided by total sales. This measure is rather an efficiency view for profitability, which determines if a company generates enough of a return compared to sales effort.

Cash conversion cycle (CCC) was used as a proxy for working capital and is defined as number of days inventory plus number of days accounts receivable minus number of days accounts payable. This is a comprehensive measure that reflects the time span between the expenditure for the purchases of raw materials and the collection of revenues for goods sold.

In order to improve the model and to remain consistent with the aim of the paper, it was used an additional control variables, natural logarithm of cash holdings (CASH). Cash holdings can be used to finance new investments and thus generate profitability or can reduce the likelihood of financial distress. However, a high level could be costly and decrease profitability.

The model uses a co-relational study and employ ordinary least squares (OLS) for panel data. In this respect, the model is built as follows:

$$ROS_{i,t} = \alpha + \beta_1 * CCC_{i,t} + \beta_2 * CASH_{i,t} + v_{i,t} \quad (1)$$

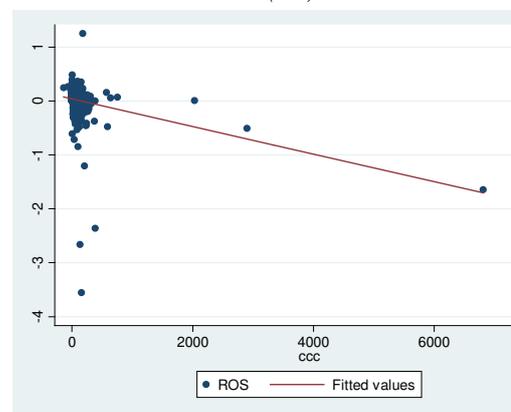

with $v_{i,t}$ the idiosyncratic error component.

First it was performed a OLS model with CCC as independent variable and after, a second OLS model was performed by adding CASH as second independent variable. By this step-by-step estimation, it can be tested if CCC effect over ROS is absorbed or not by CASH, as other variable that reflect liquidity issue.

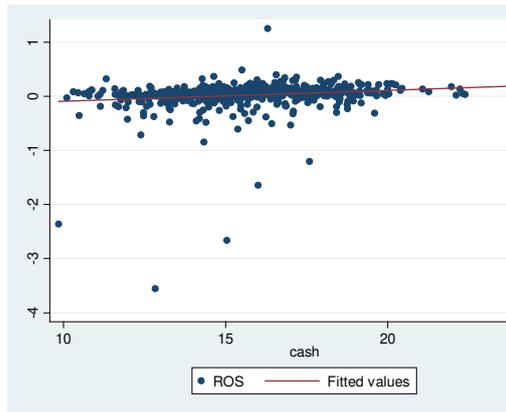

4. Results

The main hypothesis of this empirical work is that working capital affect profitability, either positive or negative. Secondary is if companies hold too much or too less cash, which obviously would affect profitability. The first step in this analysis requires a graphical inspection between each independent variable and dependent variable. The scatter diagram between ROS and CCC is reported in figure 1a, while figure 1b reports the scatter between ROS and CASH.

Figure 1 The relationship between performance and working capital (1a) and cash (1b)

(1a)

(1b)

Source: Author calculation

From Figure 1a it could be observed, a linear and negative relation between profitability and working capital. From this association several observations can be drawn. First, like companies from other countries, Romanian companies could increase profitability by reducing the cash conversion cycle. Second, linear model which includes OLS is suitable for testing the relation between working capital and profitability.

Figure 1b exhibit a linear and positive relation between profitability and cash holdings, suggesting that Romanian companies do not hold too much cash.

Next, regression analysis was used to investigate the impact of working capital on profitability, the results being reported in table 1. Model 1 includes only working capital as dependent variable, while model 2 adds cash holdings as a second independent variable.

Table 1 Results

VARIABLES	COEFFICIENTS	
	Model 1	Model 2
CCC	-0.256e-03*** (0.000)	-0.252e-03*** (0.000)
CASH		0.0190*** (0.004)
CONS	0.040*** (0.009)	-0.254*** (0.064)
R-squared	0.092	0.118
Adj R-squared	0.091	0.115
F-statistic	74.599	49.036
p-value	0.000	0.000
Root MSE	0.232	0.229

Firms	67	67
Observations	737	737

Notes:

Standard errors are shown in parentheses.

* $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

Source: Author calculation

Based on these results, suggest that both hypotheses are confirmed for Romanian companies, respectively a negative relation between CCC and ROS and a positive relation between CASH and PROF. The coefficient of cash conversion cycle is negative and highly significant in both models and implies that an increase by 1 day in number of days cash conversion cycle will lead to a slightly decrease by $25.6 \cdot 10^{-3}\%$ in return on sales. Furthermore, variable of interest added in model 2 is significant too and do not alter the results for variable of interest

According to these statistical results, it worth be noticed that in order to increase profitability managers could increase profitability by reducing the number of days cash conversion cycle. Regarding the debate of which level do investors place on cash holdings, the positive relationship suggest that Romanian companies do not hold too much cash, which could be costly for shareholders.

To sum up, the empirical results for Romanian companies confirm similar behavior with companies from other countries, either emerging such as Greece [5 Lazaridis and Tryfonidis, 2006] or developed such as Belgium [4], UK [6] or USA [7].

5. Conclusions

The main aim of this paper was to test what is the effect of working capital on profitability and if Romanian companies holds and optimum level of cash. Using a sample of 67 publicly companies, the results suggests that profitability is negatively related with working capital and positively with cash holdings. Thus both hypotheses considered were confirmed.

This topic still remains of great importance and further research is worth doing in looking for the relationship between profitability and working capital. A larger dataset could be used, both in terms of

companies and in terms of period number of companies or the model could be improved by taking in account other internal and external determinants of firm profitability.

Methods for Measuring the Impairment of Accounts Receivable

Bunea-Bontaş Cristina Aurora

*Constantin Brâncoveanu University of Piteşti, Faculty of Management Marketing of
Economic Affairs Brăila*

bontasc@yahoo.com

Abstract

Accounts receivable consists of amounts from customers. Companies are required to make ongoing estimates related to the collectability of accounts receivables and to maintain an allowance for estimated losses due to customers' inability to make the payments. Changes in economic conditions, in collection efforts or in trade credit policies may cause differences in estimates of uncollectible accounts. The article reviews the methods for measuring the impairment of accounts receivable: percentage of sales, percentage of receivables, aging schedule, and roll-rate matrix. Under these methods future expectations for bad debts are determined, based on historical level of credit losses and on judgements about the creditworthiness of the customers.

Key words: accounts receivable, impairment, uncollectible accounts, bad debt expense, expected loss

J.E.L. Classification: M41, G32

1. Introduction

Most businesses provide credit to their customers, either because it's not practical to require immediate cash payment or to encourage customers to purchase the company's products or services. Trade credit is generated through credit sales and managed through "receivables". Offering sales on credit is a common practice for most companies, thus receivables may be one of the most significant assets in the company's balance sheet. [1]

From the accounting perspective, receivables are financial instruments, explicitly financial assets based on contractual rights to receive cash or other financial assets from another entity.

An important part of the receivables are "trade receivables", which are claims against customers for goods and services that are an output of the entity's ordinary activities (i.e., accounts receivable and notes receivable). Accounts receivable are oral promises of the customers to pay for goods sold and services rendered. They represent "open accounts" resulting from short-term extensions of credit, being usually collected in 30-60 days [2]. Accounts receivable are almost always classified as current assets because their normal collection period, even if longer than a year, is part of the operating cycle [3].

When a receivable is accompanied by a formal promissory note, it is referred to as a note receivable. Notes receivable are written promises to pay a certain amount on a specific future date.

Considering the classification of financial assets under International Accounting Standard (IAS) 39 "Financial instruments: recognition and measurement" [4], accounts receivable fall into category of "loans and receivables", which are, basically, non-derivative financial assets with fixed or determinable payments that are not quoted in an active market. IAS 39 requires recognizing a financial asset in the statement of financial position when the entity becomes a party to the contractual provisions of the instrument. At the time of the initial recognition, loans and receivables will be carried at fair value, which, in the particular case of the accounts receivables, will be the invoiced amount. The original invoice amount is the exchange price agreed on by the buyer and seller. Subsequently, loans and receivables are measured at amortised cost using the effective interest rate method. The effective interest rate method spreads the interest income or expense over the life of the financial asset. Such a method is not considered relevant to accounts receivables where normally there is no interest payment

to spread [5]. Therefore IAS 39 allows short-term receivables with no stated interest rate to be measured at the original invoice amount, if the effect of discounting is immaterial.

2. Impairment valuation of accounts receivable

Companies report short-term receivables at cash realizable value that is the net amount they expect to receive in cash. Determining cash realizable value requires estimating both uncollectible (impaired) receivables and any returns or allowances for doubtful accounts. Such losses are a normal and necessary risk of doing business on a credit basis [6].

Companies are required to assess their receivables for impairment each reporting period. Under current IAS 39, the impairment guidance for accounts receivable relies on the “incurred loss” approach. The impairment assessment starts by considering whether objective evidence indicates that one or more loss events have occurred. These events are basically situations where the customer is unlikely to fulfil the repayment obligations as per contractual terms: significant financial problems of the customer; payment defaults; renegotiation of terms of the receivable due to financial difficulty of the customer; measurable decrease in estimated future cash flows from a group of receivables since initial recognition, although the decrease cannot yet be identified with individual assets in the group [7]; indications of customer filing for bankruptcy or insolvency proceedings [8]. A receivable is considered impaired when a loss event indicates a negative impact on the estimated future cash flows to be received from the customer.

Receivables that are individually significant should be considered for impairment separately. Receivables that are not individually significant may also be assessed individually. Any receivable individually assessed that is not considered impaired should be included with a group of assets with similar credit-risk characteristics and collectively assessed for impairment. Any receivables not individually assessed should be collectively assessed for impairment.

Accounting for bad debts is based on the allowance method, recording an adjusting

entry that debits bad debt expense and reduces accounts receivable indirectly by crediting a contra account (allowance for uncollectible accounts) to accounts receivable for an estimate of the amount that eventually will prove uncollectible. The net of the two accounts is the net realizable accounts receivable reported in the statement of financial position.

In practice, there are several methods used for estimating the amount that should be reported in the allowance account. The “percentage of sales” and the “percentage of receivables” approaches are examples of impairment testing used for the collective assessment of accounts receivable.

The percentage of sales is based on the income statement approach. Bad debt expense is estimated as a percentage of each period’s net credit sales. This percentage is usually determined by reviewing the company’s recent history of the relationship between credit sales and actual bad debts [9]. Under this method, the amount of the bad debt expense matches the expense with corresponding revenue. The journal entry debits the bad debt expense account and credits the allowance account for the same amount. The allowance balance is not the target of the calculation and, thus, is not computed to give the best measure of uncollectible accounts [10].

For the year ended December 31, 201X, the following information pertains to Company XYZ:

Credit sales (net of VAT)	CU75,000
Sales returns	CU 4,000
<u>Sales discounts</u>	<u>CU10,000</u>
Net credit sales	CU61,000

Based on prior experience it is estimated that bad debt expense should be approximately 8% of net credit sales, that is $CU61,000 \times 8\% = CU4,880$.

The adjusting journal entry to record bad debt expense for 201X will be as follows:

Bad debt expense	4,880
Allowance for doubtful accounts	4,880

The statement of financial position will show the following:

Accounts Receivable	CU61,000
<u>Allowance for doubtful accounts (CU4,880)</u>	
Net Accounts Receivable	CU56,120

The percentage of receivables is based on the balance sheet approach. Under this method future bad debts are estimated by

how an entity addresses the impairment of financial instruments, including:

- changes in the expectations of credit losses are always recognised in the overall provision for impairment that is recognised;
- the information that is considered in determining expectations of credit losses is broadened (i.e. to include reasonable and supportable forecasts);
- an increase in an entity’s judgements, assumptions, and estimates in relation to what constitutes a significant deterioration in credit quality, when such a deterioration has occurred, and the determination of the expected future cash flows;
- the above judgements, assumptions, and estimates are required to be applied on a continuous basis [13].

As a part of its project on accounting for impairment of financial instruments, IASB released a new exposure draft (ED) “*Financial Instruments: Expected Credit Losses*” on 7 March 2013. From the impairment measurement perspective, the model being developed uses two measurement objectives: “12 months’ expected loss”, and “lifetime expected loss”. When financial instruments are initially recognised, an entity would provide a credit loss allowance or provision equal to 12-month expected credit losses. Subsequently, the 12-month expected credit losses would be replaced by lifetime expected credit losses if the credit risk has increased significantly since initial recognition (the lifetime expected credit losses criterion).

The credit loss allowance or provision would revert to 12-month expected credit losses if the credit quality subsequently improves and the lifetime expected credit losses criterion is no longer met.

In case of trade receivables, a simplified approach is proposed: the loss allowance should be measured at an amount equal to lifetime expected credit losses at initial recognition and throughout the asset’s life for short-term trade receivables (that do not constitute a financing transaction) [14].

The guiding principle of the expected credit loss model is to reflect the general pattern of deterioration or improvement in the credit quality of accounting receivables. Over its life, an account receivable will evolve over several numbers of stages. The company would use its historical credit loss experience for trade receivables to estimate the expected credit losses that are possible in the next 12 months or over the remaining life of the assets as relevant. The expected credit losses on trade receivables may be calculated using a provision matrix or roll-rate matrix that captures this evolution.

The roll-rate matrix might specify fixed provision rates depending on the number of days that a trade receivable is past due. A roll-rate is the probability of passing from one stage to the next. The roll-rate from stage “s” to stage “s+1” is defined as the amount in stage “s+1” in period “t+1” divided by the amount in stage “k” in period “t”.

Table no. 2 presents the roll-rate calculation.

Table no. 2. Roll-rates calculation

Status	Balances 31.12.201X (CU)	Balances 31.01.201X+1 (CU)	Roll rate
Total current	40,200	41,000	-
- carried forward	x	34,170	$34,170/40,200 = 85\%$
- new invoices	x	6,830	-
60 - 90 days	7,600	4,200	$4,200/40,200 = 10\%$
90 - 120 days	5,100	2,500	$2,500/7,600 = 33\%$
120 - 180 days	3,300	2,000	$2,000/5,100 = 40\%$
Over 180 days	1,100	1,500	$1,500/3,300 = 45\%$
Write off	x	800	$800/1,100 = 73\%$

The bad debt provision is calculated by multiplying through the roll-rates for a given initial distribution of debt. The roll-rates calculated in table no. 2 are applied to the accounts receivables at the end of December

201X. It is possible to calculate the write-off receivables after a longer period of time, and also the provision corresponding to each stage (table no. 3).

Table no. 3. Application of roll-rates

Stage	Roll-rate	Dec.	Jan.	Feb.	Mar.	Apr.	May	Jun
Current	85%	40,200	34,170	29,044	24,687	20,984	17,837	15,161
60 - 90 days	10%	7,600	4,200	3,417	2,904	2,469	2,098	1,784
90 - 120 days	33%	5,100	2,500	1,386	1,128	958	815	692
120 - 180 days	40%	3,300	2,000	1,000	554	451	383	326
Over 180 days	45%	1,100	1,500	900	450	250	203	172
Write-off	73%	0	800	1,095	657	328	182	148
Cumulative write-off	-	0	800	1,895	2,552	2,880	3,062	3,210
Outstanding	-	57,300	44,370	35,747	29,723	25,112	21,336	18,135

The method can be generalised in case that accounts receivable pass between stages, because of partial payments, or stay in the same stage for several successive periods [15]. This is accomplished by treating the payment received as being separate from the state of the account. Assuming an account in stage “s” with a debit balance of CU5,000; the company receives a payment of CU1,000. In this case, CU1,000 passes to the “paid-back” stage, and the remaining CU4,000

passes to the current balance in stage “s+1”. Based on the portfolio of accounts receivable considered in table no. 2, it is further assumed that for accounts in stage 1 (60 – 90 days past due) the company receives payments of 20% to recover, for those in stage 2 (90 – 120 days past due) and stage 3 (120 – 180 days past due) receives 25% payment, and in stage 4 (over 180 days past due) a 30% payment is necessary (table no.4).

Table no. 4. One-month generalised roll-rates

January state	December state					Total carried forward	New invoices	January balance
	Current	60 - 90 days	90 - 120 days	120 - 180 days	Over 180 days			
Paid back	1,830	1,020	775	450	90	4,165	-	-
Current	34,170	4,080	2,325	1,350	210	42,135	6,830	48,965
60 - 90 days	4,200	0	0	0	0	4,200	-	4,200
90 - 120 days	0	2,500	0	0	0	2,500	-	2,500
120 - 180 days	0	0	2,000	0	0	2,000	-	2,000
Over 180 days	0	0	0	1,500	0	1,500	-	1,500
Write-off	0	0	0	0	800	800	-	800
Total	40,200	7,600	5,100	3,300	1,100	57,300	-	-
January outstanding	38,370	6,580	4,325	2,850	210	52,335	6,830	59,165

The company receives payments of CU4,165; other CU800 receivables are written-off and new invoices of CU6,830 are issued. The last column shows the structure of the receivables portfolio at the end of January. The total amount outstanding is CU59,165 of which CU48,965 is current. This takes account of new invoices and of the progression of accounts through various stages. Therefore, the generalised roll-rates give the possibility to estimate month by month the state of the receivables portfolio, the outstanding balances and risk structure [16].

3. Conclusions

Providing credit to customers in the form of normal trade receivables is usually a necessary activity. Companies that extend credit to customers are aware that it’s unlikely that all customers will fully pay their accounts. Bad debt expense is an inherent cost of granting credit, incurred by the company in order to make sales.

In practice, there are several methods used for estimating the impairment of receivables: percentage of sales, percentage of receivables, aging schedule, and roll-rate matrix. All these methods are based on the

past observations to determine future expectations for financial statements and bad debts, given the difficulties in knowing which customers will fail to pay back and which will make on their obligations.

As it's not expected that all accounts receivable will be collected, the statement of financial position reports only the expected net realizable value of the asset, that is, the amount of cash the company expects to actually collect from customers. Provisions for impaired accounts receivables are established based upon the difference between the receivable value and the estimated net collectible amount. Likewise, the expense is matched with sales revenue in the income statement for the same period.

Application of Autoregressive Models for Forecasting Marine Insurance Market

Burcă Ana-Maria

Abstract

The shipping industry represents an important component of the global economy. In the context of globalization the importance of marine insurance has increased more than even before. Without insurance, ship owners would be subjected to a wide range of risks that they would not be protected from.

Marine insurance facilitates global trade, ensures economic property, provides peace of mind, improves quality of life and provides social benefits. Taking in consideration all these advantages, it becomes essential to analyze and forecast the evolution of the marine insurance market.

Key words: marine insurance, gross written premiums, ARIMA models, forecasting

J.E.L. classification: C22, G22

1. Introduction

Marine insurance represents the oldest form of insurance and many clauses of the modern marine insurance contract have roots from centuries ago. Its origins can be traced right back to ancient Rome and Greece, but formally it was created in the fourteenth century when the powerful European states dominated much of the world's trade.

The marine insurance policies protect the assured against marine perils. Marine perils comprise perils of the sea, fire, war perils, pirates and rovers, thieves, captures, seizures, restraints and detainment of princes and people, jettisons, barratry and any other perils which are either of the like kind or may be specified by the policy.

Marine insurance is an area which

involves a lot of thought, straightforward and complex dealings in order to achieve the common ground of payment and receiving. But as much as complex the field is, it is nonetheless interesting and intriguing because it caters to a lot of people and offers a wide range of services and policies to facilitate easy and uncomplicated business transactions.

2. The marine insurance

Although marine insurance is small in volume, accounting a small share of the global non-life premium, it is highly specialized, representing a variety of risks. Most local marine insurers are organized in and represented by their national organizations, which again are organized in the International Union of Marine Insurance. The premiums of marine hull insurance are computed through a qualitative and quantitative combined analysis by taking in considerations factors such as individual fleet statistics, risk profile and available premium scales and claims statistics for a matching vessel portfolio.

The subject of marine insurance is very wide, which is why there is a definite categorization of various types of marine insurance and different types of marine insurance policies. The types of marine insurance available for clients benefits are many and all of them are viable in their own way. In order to enjoy the advantages provided by this type of insurance, a client can choose the appropriate marine insurance plan in accordance with its business profile.

The different types of marine insurance comprise[1]:

- Cargo Insurance protects specifically the

cargo of the ship and also the belongings of a ship's voyagers.

- Hull Insurance mainly deals with the torso and hull of the vessel along with all the articles and pieces of furniture in the ship. This type of marine insurance is mainly taken out by the owner of the ship in order to avoid any loss to the ship in case of any damage occurring.
- Liability Insurance provides compensation to any liability occurring on account of a ship crashing or colliding and on account of any other induced attacks.
- Freight Insurance provides protection to merchant vessels' corporations which stand a chance of losing money in the form of freight in case the cargo is lost due to the ship facing an accident. This type of marine insurance solves the problem of companies losing money because of a few unprecedented events and accidents occurring.

In addition to these types of marine insurance, there are also various types of marine insurance policies which offer flexibility to the clients when choosing the appropriate protection. The different types of marine insurance policies comprise:

- Voyage Policy is that type of marine insurance policy which is valid for a particular voyage.
- Time Policy is valid for a specified time period (usually a year).
- Mixed Policy is that kind of marine insurance policy which offers a client the benefit of both time and voyage policy.
- Open (or) Un-valued Policy: In this type of marine insurance policy, the value of the cargo and consignment is not put down in the policy beforehand. Therefore, reimbursement is done only after the loss to the cargo and consignment is inspected and valued.
- Valued Policy is the opposite of an open marine insurance policy. In this type of policy, the value of the cargo and consignment is ascertained and is mentioned in the policy document beforehand, thus making clear about the value of the reimbursements in case of any loss to the cargo and consignment.
- Port Risk Policy is taken out in order to ensure the safety of the ship while it is stationed in a port.

- Wager Policy is one where there are no fixed terms of reimbursements mentioned. If the insurance company finds the damages worth the claim, then the reimbursements are provided, else there is no compensation offered. Also, it has to be noted that a wager policy is not a written insurance policy and as such is not valid in a court of law.
- Floating Policy is a marine insurance policy where only the amount of claim is specified and all other details are omitted till the time the ship embarks on its journey. For clients who undertake frequent trips of cargo transportation through waters, this is the most ideal and feasible marine insurance policy.

3. Literature review

Kingston (2005) examines the nature of institutional change in the marine insurance industry in Britain and America during its critical formative period 1720-1844, identifying the effects which persist nowadays. Marine insurance had an important role in facilitating the expansion of trade during that period, but the industry evolved in different ways in different countries. The author examines how exogenous and endogenous changes in the political, legal and economic environment affected the evolution of these institutions over time[2].

Nieh and Jang (2006) investigate the determination of the underwriting margin of ocean marine insurance in US for the sample period 1951-2001, which is the vital component of the ocean marine insurance price. In an autoregressive distributed lag (ARDL) cointegration framework, the authors analyze the underwriting cycle in US ocean marine insurance market taking in consideration the fact that underwriting margins will shift dynamically between hard and soft markets back and forth. The importance of modeling and predicting underwriting cycles lies in the fact that insurers could improve their operations' volatility and reduce their capital costs. They conclude that the US ocean marine insurance market is a mature, efficient and competitive insurance line[3].

Marine insurance is considered to be the oldest type of insurance. Ceccarelli (2007)

investigates how late Medieval merchants were evaluating various factors of risk involved in the sea trade. His paper highlights that even though businessmen did not use probabilities in a strict statistical sense, their computations were based on various levels of probabilistic reasoning. Thus, late medieval underwriters were able to conceive an actuarial determination of the likelihood of an event. Moreover, they had adopted commercial strategies in order to reduce and redistribute risk as a practical solution in facing sea dangers, counting on a well established experience developed in years of deals and on the study of manuals and updated news reported by correspondents of firms spread around the major European seaports[4].

Li et al. (2009) perform a quantitative analysis of materiality in marine insurance in order to determine the factors that significantly relate to marine incidents. Through the step-wise random intercept model and panel data of total loss incidents during the period 1999-2007, the authors build a factor-weighted risk indicator, that may be used in the ex ante risk assessment of insured vessels. This risk index system is useful for measuring the risk level of a ship when the involved parties conclude the contract[5].

Wang and Liu (2010) analyze the relationship between maritime insurance and the development of shipping, finance and regional economy by applying partial correlations method. Their study is aimed to identify the key factors in local marine insurance development, concluding that Shanghai has advantages such as property insurance development and cargo handling capacity. In their opinion, these advantages could contribute to the marine insurance development, to the local economic development and to the improvement of the link between international shipping and finance development[6].

4. Data and methodology

In this study, we have used ARIMA models in order to estimate and forecast the evolution of the marine insurance segment. For the empirical study we have used the annual data series of real gross written premiums for the period 1996-2011. Data

were collected from IUMI (International Union of Marine Insurance) database and computed by applying the Chain-Ladder method. Finally, ARIMA models were built with EViews 7.

The general ARIMA model is called an ARIMA(p,d,q), with “p” being the number of lags of the dependent variable (the AR terms), “d” being the number of differences required to take in order to make the series stationary, and “q” being the number of lagged terms of the error term (the MA terms). An ARIMA(p,d,q) (AutoRegressive Integrated Moving Average with orders p,d,q) model is a discrete time linear equations with noise, of the form:

$$\left(1 - \sum_{k=1}^p \alpha_k L^k\right) (1-L)^d X_t = \left(1 + \sum_{k=1}^q \beta_k L^k\right) \varepsilon_t$$

Firstly, we have applied the ADF test (Augmented Dickey-Fuller) to verify the stationarity of our time series. From an economic point of view, shocks to a stationary time-series are temporary and over time, the effects of the shocks will be absorbed. We have estimated the existence of a unit root for the original data and the absence of a unit root for the second-difference data. Therefore, the variable is integrated of order 2 and denoted by I(2).

Table 1. The ADF test for second-difference data

Null Hypothesis: DD_GWP has a unit root		
Exogenous: Constant		
Lag Length: 0 (Automatic - based on SIC, maxlag=2)		
	t-Statistic	Prob.*
Augmented Dickey-Fuller test statistic	-4.356012	0.0060
Test critical values:		
1% level	-4.057910	
5% level	-3.119910	
10% level	-2.701103	

*Mackinnon (1996) one-sided p-values.

Source: own computations

If the probability is lower than the significance level (1%, 5% and 10%), the null hypothesis is rejected. We can notice that the second-difference data is stationary.

In order to select the appropriate ARIMA model, we will apply the Box-Jenkins approach, which is a three-stage method, comprising identification, estimation and diagnostic checking.

Once we have achieved time series stationarity, the next step is to identify the “p” and “q” orders of the ARIMA model. In

the identification stage, we will analyze the time plot of the series autocorrelation function and partial correlation function, which provide useful information regarding outliers, missing values and structural breaks in the data.

Table 2. Autocorrelation function and partial correlation function

Date: 04/04/13 Time: 13:08
Sample: 1996 2011
Included observations: 14

Autocorrelation	Partial Correlation	AC	PAC	Q-Stat	Prob
1		-0.265	-0.265	1.2080	0.272
2		-0.106	-0.190	1.4109	0.492
3		0.153	0.077	1.8951	0.594
4		0.075	0.139	2.0211	0.732

11		0.003	0.030	5.9128	0.879
12		-0.021	-0.093	5.9606	0.918

Source: own computations

From the table above we can see that there are two significant spikes on the ACF, and then all are zero, while there are also two significant spikes in the PACF, which then dies down to zero. This suggests that we might have up to MA(2) and AR(2) specifications. Thus, the possible models are the ARIMA(1,2,1), ARIMA(1,2,2), ARIMA(2,2,1) or ARIMA(2,2,2) models.

In the estimation stage, each of the tentative models is estimated and the various coefficients are examined. The estimated models are compared using the Akaike information criterion (AIC) and the Schwartz Bayesian criterion (SBC). We will choose the model with the smallest AIC and SBC values. The Box-Jenkins approach requires that the series is stationary and the model invertible. Therefore, the modulus of each AR coefficient has to be lower than 1, the sum of AR coefficients has to be lower than 1 and the modulus of each root has to be lower than 1. According to this criteria, only the ARIMA(2,2,1) model is stationary and invertible.

Table 3. Estimation of ARIMA(2,2,1) model

Source: own computations

In the last stage we examine the goodness of fit of the model. Thus, we will test the statistical significance of model's coefficients, autocorrelation of residuals, homoskedasticity and the absence of additional ARCH terms and the normal distribution of residuals.

Regarding the statistical significance of model's coefficients, AR(1) and AR(2) are insignificant due to the lack of data, while MA(1) term is statistically significant. According to the residuals' correlogram, there is no serial correlation of error terms.

Table 5. Correlogram of residuals

If the probability of Jarque-Bera test is higher than the significance level (1%, 5%, 10%), the null hypothesis of normal distribution is accepted. According to Figure 1, the residuals of our model have a normal distribution.

Figure 1. Distribution of residuals

Source: own computations

According to F-statistic and Obs*R-squared tests which are higher than the 10% significance level, the null hypothesis of absence of serial correlation of squared errors is accepted. Thus, there are no additional ARCH terms and we can notice the presence of homoskedasticity.

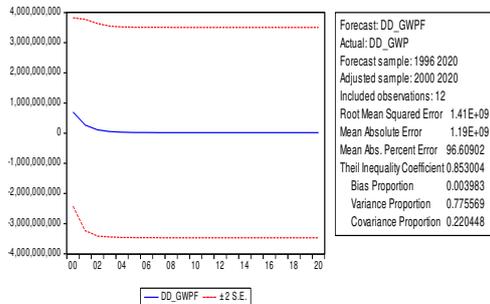

Table 6. Heteroskedasticity ARCH test

Source: own computations

Finally, by using our ARIMA(2,2,1) model, we will forecast the real gross written premiums of the marine insurance segment for the period 2012-2020. The following graphic highlights the dynamic forecast of gross written premiums values and their error margins.

Figure 2. Dynamic forecast of GWP

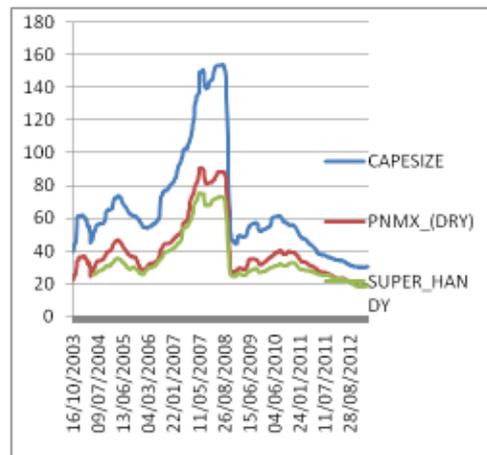

Source: own computations

5. Conclusions

We can notice that the marine insurance segment will record a slight decrease of gross written premiums during 2012-2020. These results are not astonishing, because starting from 2009 the value of ships has recorded a constant decline as we can notice from Figure 3. Furthermore, starting from next year, the number of ships will significantly decrease as a consequence of the increasing number of scrapped ships.

Figure 3. Evolution of ship prices

Abstract

The profitability of a bank is affected by numerous factors. These factors include elements internal to each bank and several important external elements shaping earnings performance. In order to withstand negative shocks and maintain financial stability, it is important to identify the determinants that mostly influence the overall performance of banks. This paper reviews the literature on bank performance studies and classifies the bank profitability determinants.

Keywords: banks, profitability, internal determinants, external determinants

J.E.L. Classification: G21, M20

1. Introduction

The banking system has undergone profound changes in the last years. Deregulation, technological change and the globalization of goods and financial markets have affected all aspects of the operation of banks, and accordingly have impacted on profitability. [10]

Because, as financial intermediaries, banks play an important role in the operation of most economies, literature attaches great importance to the analysis of their performance.

Perception of banking performance varies depending on the interests of users of financial information. For example, managers are oriented overall performance of the company, shareholders perceive performance in terms of profitability and profit, employees and customers are interested in the company's stability and solvency creditors. So, the first studies on banks' profitability examine regulation, ownership structure and the balance sheet structure.

More recent studies distinguish two sets of factors influencing profitability: bank specific and external determinants. On the other hand while some studies focus on the understanding bank profitability on a particular country [5], others concentrate their analysis on a panel of countries [13]; [9]; [1]; [15]. Also, a number of studies have analyze the profitability of banking sistem both in the developed and developing countries. In case of developed countries the attention has been focused on investigate the market structure and entry barriers, the degree of concentration, deregulation and their impacts on performance. [10] On developing countries the investigation was on impact of the bank reforms, the privatizations of the state banks, on entry foreign banks on market and their effects. [8]; [3]

The profitability of the banking system is a theme of interest both for the academic world, as well as for the authorities around the world. Therefore, further we make a review of the studies in the literature.

2. Literature review

In the literature, bank profitability, typically measured by the return on (average) assets and/or the return on (average) equity reported by a bank, is usually expressed as a function of internal and external determinants.

Internal determinants are factors that are mainly influenced by a bank's management decisions, which will definitely affect the operating results of banks. Among the internal factors are the bank specific financial ratios representing asset structure and asset quality, capital adequacy, size, efficiency and ownership structure.

External determinants contains macroeconomic and industry-specific factors which include tax rate, GDP growth, inflation rate, term structure of interest rate and stock

market capitalization. Although, they represent events outside the influence of bank, the management can anticipate changes in the external environment and try to position the institution to take advantage of anticipated developments.

2.1. Asset structure

Most researches agree that profitability is expected to increase as the loan portfolio grows. Usually a larger loan portfolio in a bank is associated with a higher risk of liquidity caused by the inability of banks to accommodate decreases in liabilities or to fund increases in assets side of the balance sheet. Therefore, a bank that has a lower proportion of liquid assets (with higher liquidity risk) is more likely to earn high profits.

Molyneux and Thornton [13], Goddard et al. [10], Iannotta et al. [11] and Pasiouras and Kosmidou [15] find a direct relationship between relative percentage of loans in bank assets and profitability and also, an inverse relationship between liquidity and profitability.

2.2. Asset quality

Poor asset quality resulting in non-performing loans. One would therefore anticipate that profitability is directly related to the quality of the assets on its balance sheet. This relation exists because an increase in doubtful assets involves an allocation of a significant part of the gross margin of provisions to cover expected credit losses, so profitability will be lower. Banks can therefore improve profitability by improving screening, monitoring and forecasting of credit risk facilities. Among studies showing a direct relationship between profitability and asset quality is that of Athanasoglou et al. [4].

2.3. Capital adequacy

In principle a bank's capacity to absorb unforeseen losses determines its level of risk. Several ratios are commonly used to proxy for risk, including the capital adequacy ratio and the liquidity ratio. High levels of capital imply that the bank is unlikely to earn high profits, but is also less liable to risk; therefore

shareholders should be willing to accept a lower return on equity. [9]

In their study of the determinants of banks' performance for 18 European countries for the period 1986-1989, Molyneux and Thornton [13] find that the capital ratio impacts banks' performance positively although such relationship is confined to just the state-owned banks. Demircuc-Kunt and Huizinga [9] concluded, in their study conducted in 80 countries between 1988-1995 years, that foreign banks have higher profitability than national in developing countries, while the opposite holds in developed countries. Their overall results shows existence of the positive relationship between the capital ratio and financial performance. Also, Berger [6] examines the relationship between the return on equity and the capital asset ratio for a sample of US banks for the 1983-1992 time period. He shows that the return of equity and capital to asset ratio tend to be positively related.

2.4. Size

Bank size is generally used to capture potential economies or diseconomies of scale in the banking sector. This variable controls for cost differences and product and risk diversification according to the size of the financial institution. Size is a result of a bank strategy, but the variable alone does not guarantee the earning of excess returns. Thus, some studies assumes that there is a direct positive relationship between size and profitability of banks. [11]

On other hand, the growth regressions utilised from Goddard, et al. [9] suggest that, as banks become larger in relative terms, their growth performance tends to increase further, with little or no sign of mean reversion in growth.

2.5. Efficiency

The advances in information, communications and financial technologies have allowed banks to perform many of their traditional services more efficiently. As a consequence the cost-to-income ratio, a proxy for operational efficiency, recorded decrease since banks have lower costs in providing products and services. Previous

studies suggest a positive and highly significant effect of efficiency on profitability [13]; [15]; [4]. On the other hand, Berger [7] concludes that managerial ability in controlling costs (the so-called Xefficiency) is consistently associated with higher profits.

2.6. Ownership structure

A considerable amount of studies has investigated the influence of ownership structure on banks' profitability. Molyneux and Thornton [13] suggest that government-owned banks are more profitable than privately owned banks. Furthermore, Altunbas et al. [2] tested whether there are differences in bank performance and bank efficiency for private, public and mutual ownership forms, using data between 1989 and 1996 in a sample of German banks. They find little evidence that private banks performed more efficient than their mutual and public counterparts did. Research of Iannotta et al. [11] indicates that mutual and governmental-owned banks are less profitable than privately owned banks.

Laeven & Levine [12] have made the first research towards regulation by incorporating ownership structure issues. On a sample of all ten largest publicly listed banks in the world between 1996 and 2001, they analyze effects of regulation and find that regulation has different effects on bank risk taking depending on the ownership structure. Findings suggest that bank risk taking increase when the owners have more voting power than banks owned and governed by managers or debt holders. Moreover, they find that regulation has different effects on bank risk taking depending on the ownership structure.

2.7. Interest rates

Interest rate is an important macroeconomic determinant of bank performance. When interest rate rise or fall, it exerts an impact on banks' profits through adjustment to revenues. An increase in market rates raises the amount of income which a bank can earn. Another effect could come through impact on the bank's decisions about which loans and securities to purchase and how much to hold in cash reserves. Findings

from Molyneux and Thornton [13] and Demirgüç-Kunt and Huizinga [9] indicate that high interest rate is positive associated with higher bank profitability. Demirgüç-Kunt and Huizinga [9] emphasize that this relationship is more so in developing countries.

2.8. Taxation

Corporate tax policy is government's policy on corporate taxes. Banks are subject to taxation by both direct tax and other taxes. Since consumers face an inelastic demand for banking services, most banks are able to pass the tax burden to the consumers. Demirgüç-Kunt and Huizinga [9] have found that corporate income tax has a significantly positive impact on bank profitability in developing and developed countries alike. Their finding suggests that, all over the world, banks in high-tax environments have to earn higher pre-tax profits to pay these taxes. Furthermore, banks' tax bills are at least partly passed on to their customers.

2.9. Stock market capitalization

Researches of Rajan and Zingales [16], Demirgüç-Kunt and Huizinga [9] show that banks have greater profit opportunities in countries having well-developed stock markets. The larger equity markets in these countries give the banks operating there in greater opportunities to expand their profits. Stock market development leading to increased profitability for banks which indicates complementarities between bank and stock market finance, growth and development. Also, as stock markets develop, improved information availability on publicly traded firms makes it easier for banks to evaluate and monitor credit risks associated with them.

2.10. Economic activity

When bad economic conditions exist the quality of the loan portfolio can worsen causing credit losses and increasing the provisions banks need to hold. In consequence the bank profitability is reducing. In contrast, an improvement in economic conditions, in addition to improving the solvency of borrowers,

increases demand for credit by households and firms, with positive effects on the profitability of banks. [4]

Finally, the effect of inflation is also another important determinant of banking performance. If the inflation rate is fully anticipated by the bank's management, the bank can adjust interest rates appropriately to increase revenues faster than costs, which should have a positive impact on profitability. In general, high inflation rates are associated with high loan interest rates and thus high income. [9]

Pasiouras and Kosmidou [15], Athanasoglou et al. [4], use macroeconomic variables such as inflation and growth of gross domestic product (GDP). Their findings show that macroeconomic conditions are significant.

3. Conclusion

It is generally agreed that a strong and healthy banking system is necessary for sustainable economic growth. The banking system has undergone major challenges in the dynamic operating environment over the past decade. In order to withstand negative shocks and maintain financial stability, it is important to identify the determinants that mostly influence the overall performance of banks.

Banks that desire to survive and thrive should pay attention to these variables. Most of them can be controlled by the management and board directors. Staffing issues, decisions about lending policy and attracting resources, expansion policy are within the scope of managerial decisionmaking.

Abstract

The XXIst century is the century of performance revolution, will predominate the management and the performance audit, the visionary and innovative management, the paradoxes management etc.

The fundamental objective of management and managers is to create a competitive vision, viable, for the organization.

For a long time it was considered that the public sector cannot be about performance, arguing that by the content of the very fundamental objective of public management is removed the possibility to accept this concept.

Limits of such way of thinking have long been exceeded in the public management of developed countries, after a good number of years the subject has been debated by theorists and practitioners.

This starts from an initial premise that public managers thinking shall be within somewhere at the border between social logic and competitive logic.

Keywords: audit, performance, public institution

JEL classification: H11, H83, M48

1. Introduction

The right of public sector auditors in the UK to impose economy to governmental departments was stated in 1888 belonged to the Controller and Auditor General (C & A.G) has urged the War Office to explain why a contract under which it purchased boots laces

for the price of 14 shillings was terminated and replaced by another shoelaces price was 20 shillings. War Office argued that this is administrative and not the C & A.G. Public Accounts Committee as a parliamentary committee at the time, claimed C & A.G and from then National Audit Office - similar institution of the Court of Accounts - extended horizon examination and the three Es (economy, efficiency, effectiveness) actually making a performance audit.

Public service „delivery” in terms of economy, efficiency and effectiveness and thus performance audit is also currently a major concern in the UK. In this context it is worth mentioning Thatcher government initiative in 1979 to establish a body attached to the Prime Minister called „Unit Efficiency” for the purpose of implementing and carrying out the audit module size reduction and achievement of government increased efficiency and effectiveness in public services. This was done partly by applying business management techniques from the private sector, by Sir Derek Rayner, First Counselor in the efficiency of Mrs. M. Thatcher, one of the largest retailers in the UK.

Enabling Efficiency Unit originally was to conduct „surveys Rayner” within departments, focusing on those with low efficacy opratiuni. Most recently, the role of the Unit has expanded and now includes responsibility for coordinating government programs for „testing market”, „efficiency development plans” for departments and agencies, multi-departmental review of the type of government program areas, the use of consultants in government and development

of improved financial management systems, inspired by experiences of best practices in public and private sectors. During 1979-1995, surveys and reviews Unity generated savings of 100 million pounds.

2. Contents

According to the Law on public internal audit nr.672/2002, measuring results against objectives are achieved in accordance with the three „E” that economy, efficiency and effectiveness.

Economics is a measure that provides for minimizing the cost of resources used in an activity without compromising the smooth implementation of its stated objectives (quality).

A public „econom” entity it purchases the appropriate quantity and quality at the lowest cost.

In the performance audit, a central issue is whether resources have been allocated, managed and used sparingly. The question refers to the means chosen such, that if it is the most economical use of resources.

For example, if the audited entity has made acquisitions will examine how to purchase, or if it is considered as „low cost relationship for a higher quality”, respecting the legislation.

Economics and also refers to the proper management of public money, however the difference between good and waste management is a matter that finally it is about auditor's judgment.

Efficiency is defined as the relationship between the goods and services produced and resources used to achieve them. An efficient public entity made up of services or products of human and material resources entering or minimize inputs needed to achieve the same amount in terms of quality of products or services, for the management to increase productivity on lower unit costs. In other words, efficiency is the ratio between results „outputs” and resources used to produce them „inputs”.

In an audit mission of efficiency, the focus is the examination of the resources used. Therefore, the main problem is the use of resources or, in other words, if the activity results, which correspond in terms of quantity and quality to our expectations, could be achieved with fewer resources.

The question which arises in the case of efficiency, namely: “ following the actions undertaken to achieve the best result in terms of quality and quantity? ” refers to the relationship between quality and quantity of goods and services, or the cost of resources used to obtain them.

Efficiency = Results (Outputs) / Resources used (Inputs).

So, if the ratio is equal to or greater than 1, the situation is favorable. An efficient activity maximizes the results obtained with the same amount of resources and minimizes the resources for a result set [8]. Jacques Renard calls for Anglo-Saxon terminology to illustrate the effectiveness of using the phrase meaning „doing the right things”

An efficiency audit can be undertaken by comparing similar activities conducted in different time periods.

The audit efficiency can be achieved by reference to specific standards and where problems are complex and there are no standards, examinations shall be based on the best available information and arguments, specifically based on best practice in this area.

For example, an audited entity who work with the public are examined that it had reduced the waiting time at no extra cost and without diminishing the quality of services offered, or to an audited entity which consists transport sector check that operating costs have been minimized and spare parts under the increased number of service vehicles and safety standards have been met in their operation.

Effectiveness express the degree of fulfillment of the stated objectives of a business and the relationship between the desired impact and the effect achieved. Effectiveness is presented in the format of the results of running a programmed activities and results.

Effectiveness = Results / Results Scheduled. This may be the real meaning of effectiveness and therefore it is necessary to obtain evidence showing that the achievements are really the result of actions taken by the audited entity towards its policy objectives (“doing the right things”).

For example, a public health entity shall examine whether the medical assistance program goals has succeeded in reducing waiting times for patients receiving care.

The effectiveness audit follows the extent to which the actions taken by the audited entity contributed to the objectives and can be approached from two perspectives: in a narrow sense, when are examined only the management and internal operations of the audited entity, or broadly when examining goes beyond hearing entity and the auditor assessment takes into account the impact of external variables (not connected with the audited entity).

An possible alternative to realize in practice is the evaluation of the responsibilities which the management policy is based on. [16]

The auditors could evaluate or appreciate the effectiveness, by comparing the results or the impacts, with the scopes provided through the management policy objectives

Also, in case of auditing the effectiveness, we could appreciate in what measure the management practices, contributed to the management policy realization. This approach assumes the obtaining of samples which proves that the management policy objectives were achieved through the management practices and were not influenced by other factors.

Otherwise, if the objective of the management policy for a governmental program, was reducing the number of the persons that pass the border illegally, the auditor must analyze if the reduced number of persons in this category was the result of that policy and was not influenced by the general improvement of the economic, social and political climate, which the audited entity had no contribution.

The measurement of the results, relative with the proposed objective, according to the „3E’s”, consist a necessity for the managers on all levels.

In general, the performance audit tries to respond at two basic questions:

- was the job done correctly?
- everything need to be done was done?

The first question refers, mainly, to the services supplier, and has the purpose of checking if the strategic decisions were properly implemented. In this case the auditor seeks to find if the general management had respected the regulations and demands of the established strategy, or operated according to the best practice in the field.

The auditors examination sphere, extends if continued with the second question, respectively „everything need to be done was done” in other words, if all the established measures were taken. This type of question refers to the effectiveness or the impact of the entity’s conducted activities, to achieve the unit’s objectives. The performance auditor can in fact, to note that one of his chosen measure is insufficient. So by making an audit of the performance, the auditor starts to question himself, if a public engagement is totally feasible. He will also has to be cautious and not to exceed his mandate and the objectives, established through extending the examination procedures.

Another essential part of the performance audit concept is represented by the „protagonists” of this process, namely: the audit officer, the audited manager and the auditor. It is useful to approach this concept, because these three parts are distinct, deeply interested in the audit process, but sometimes in a different way and antithetical especially regarding audit results.

The audited manager is the manager or the management team, whose performance on how the organization was run in the analyzed period is subject to audit. The auditor is the specialist, the expert, the multidisciplinary team who on an individual basis or collectively possess the necessary knowledge to assess, in terms of management performance. To be able to overcome the simple compliance audit, which is in fact an extension of the inspection in order to provide assurance to the audit ordinator that organization operates according to predetermined laws, the auditor should understand first the business in the sense of an organization seen as a system. This requires auditors with new skills and additional training different from that assumed when performing an audit of compliance. However, the compliance audit is absolutely necessary as a first step to establish that the legal regulations, internal or external to the organization, are respected and based on that to offer trust and fundament for an performant audit.

Returning to the auditors abilities involved in the performance audit, domain specialists, tries to analyze what differentiates the auditors conducting an audit of performance from others. This

approach attempts to determine those key features that should be subject to the training, and the methods used to demonstrate objective, coherent and globally, the fact that the desired level of competence was achieved. Thus, among the necessary features are found ability to provide a high level of information exchange, to formulate questions to clarify things and to summarize the findings. [16]

One of the main skills is to be able to form an overview of the functioning of the organization, and this requires a minimum level of managerial culture. Without this it is hard to suppose that it will appreciate the overall performance of the entity, as a matter to be evaluated in addition to the conformity audit because it is not enough to quote the rules, but you should know well what is the reasoning behind the rules. An important role in this case returns also to the auditing officer, who is the first interested to benefit of the results materialized in audit reports prepared by auditors with a high degree of competence.

To enable the auditor to express an opinion on the effectiveness and efficiency of programs and activities, the mandate given to explicitly cover all categories of entities involved in the programs and activities alleged by them, as well as the beneficiaries of such programs (if they are separate entities)[1].

In order to express an opinion and to make recommendations on efficiency and effectiveness, especially regarding sensitive issues strategically, it is necessary to have a legal framework requiring organizations associating clearly defined S.M.A.R.T. objectives - The internal audit objective design a program or activity should be: simple (S), measurable (M), current (A), achievable (R), temporal (T).

Performance audit does not question the goals set by each entity. It may be mentioned, however, the consequences resulting from the application of certain policies in setting goals, and also to identify and reveal shortcomings generated by the existence of some objectives that do not meet S.M.A.R.T. condition, contradictory and unclear.

• Freedom of choice in the areas of performance audit mandate. It is important that internal audit structure to maintain independence in the possibility of influencing the selection of areas within the mandate

granted to have an impartial approach to responsibilities and duties.

• However, both national law and international standards state that the auditor is independent, in fulfilling its mandate as well as in form opinions. [17] The auditor should be free to examine all actions, programs, activities and entities managing public funds. In this respect, it is necessary that the internal audit structure pay attention to selecting audit, it is absolutely necessary to follow a process in clear, logical and transparent.

• Ex-post character of performance audit. Performance audit program / objective is performed usually after implementation. It can be said, however, that performance audit, auditors must focus on current issues examinations and reported. They do this, in especially to formulate conclusions and recommendations that will enhance the value of future audit reports.

• Ensuring reasonable. A performance audit made in accordance with applicable auditing standards offer the possibility to provide reasonable assurance, meaning that the information and data represents the basis for formulating conclusions and recommendations do not contain errors.

Generally „reasonable assurance” depends on the context in which the audit is conducted, the nature and availability of evidence, the principles of procurement, audit evidence collection and interdependence, respectively the formulation of the conclusions and the recommendations.

The main concern of the internal audit structure is the responsibility for authorizing and not ultimately responsibility towards the citizen. Audit structure must ensure oronatorul audit of how economically, efficiently and effectively use their resources subordinated public entities and to identify sensitive areas that pose potential risks in the management of public funds. The audit structure must provide authorizing audit of how economically, efficiently and effectively use their resources the subordinated public entities and to identify sensitive areas that pose potential risks in the management of public funds.

Auditors must fulfill responsibilities honestly, with integrity and professional without being corrupt [9].

In the collection of audit evidence, auditors should always be prepared to motivate, explain and justify their actions. Auditors' findings must be made with reference to the criteria, standards set and enforced regularly.

Auditors should not be influenced in any way during the engagement especially in selecting audit, analyzes or reports.

Auditors must also be cooperative and polite, but resolute in the activities they undertake and should not be influenced by the auditee.

Regarding the reports, they must be objective, balanced (in content and tone), accurate (trusty) clear and convincing.

3. Conclusions

In the context of economic efficiency, management effectiveness has special significance, given its essential role in achieving high economic effects of resources and efforts minimized. Efficiency is associated with economy and efficiency and the concurrent approach is necessary both in theory as well as in the practice.

There is no doubt that performance-based public management represent fundamental mutation in international public management.

This mutation should be implemented in any system of public management that aims concomitantly satisfy public interests by considering economic criteria in general and the management in particular.

This requires, of course, an adequate information system, organizational structure developed by these coordinates and not least, new methods and management techniques that ensure the link between goals and performance.

So, performance audit can be implemented in any system, and therefore in the public institutions in Romania, where at least the following aspects are taken into consideration and addressed the fundamental premises:

- the existence of a general reference framework containing a number of common definition of performance, performance indicators and methodology for their application, without which it would not be possible comparable measurements;

- customize the approach to each area of the public sector and identify general and specific indicators to measure performance;

- adapting the methods of analysis to the diversity of services and contextual features at central and local levels;

- continuity in the application system performance indicators;

- developing a unified system of performance indicators, and nationally diversified approach and customize it for each local public institution;

- developing a national and regional monitoring, assistance and advice regarding public management performance evaluation.

In conclusion, the purpose and objectives of performance audit are:

- Ensure top management information assurance and independent opinions about achieving desired results and management approach used to achieve these results in terms of the "3E";

- Identify measures to improve organization performance and resource optimization.

Their infringement may have consequences for the functioning and organization of the public sector, can lead to failure to conform to the law and thus to bad management implications throughout society.

But any change is made in time. For management this is very important because to make a change should be the time to become a fundamental variable of our model of thinking.

Abstract

Today’s business environment is characterized by a number of pressures for a more effective risk management. The present paper highlights the perspectives of internal audit which should be considered as an important progress factor for current Romanian organizations. Our findings suggest that Romania has created the premises for the future development of internal auditing as a main function within companies which could help them become more efficient and competitive.

As it is demonstrated during our research, internal audit has a great impact on the effectiveness of corporate governance. By controlling risk management, auditors will be able to maximize audit’s positive results. Our findings propose some conclusions for improving internal auditing functions especially by effectively managing organizational and structural risks.

Key words: internal audit, risk management, compliance, risk based internal auditing

J.E.L.Classification: G34, M42, M49

Introduction

We consider that the current Romanian internal audit should be adapted to the changing expectations of market’s participants and aligned with companies’ new objectives and scopes. It is mandatory for internal audit to keep the balance into an effective equilibrium especially that between cost and value and also to show a great interest on risk management. In the current crisis and post-crisis context, internal audit is

responsible for providing adequate support, for evaluating and measuring risks by giving solutions and recommendations in order to control faced risks. It becomes vital for the present accounting and auditing systems to furnish real and relevant information and to avoid previous fraudulent errors. Therefore, auditors should improve control effectiveness within the organizations. However, in order to build an effective risk management, enterprises need reliable audit information.

This paper contains the first results of a more extensive research performed with the aim to build a doctoral thesis. Internal audit does represent a constant in the research work. Through an extended literature review, we have come to highlight the importance of an effective internal audit for Romanian companies. Internal audit should provide accurate and relevant information concerning the analyzed fields and add value to the organizations by offering adequate solutions for managing risks. As an important finding of our research work, we have understood that “audit has developed itself from an exhaustive verification of the transactions in order to detect frauds, to an investigation in order to detect the main entities risks and to evaluate internal control which is organized and exercised at this level” (Morariu, Mitea, Stoian and Crecana, 2009). [1]

Internal audit and its functions

During our research work, we have realized a literature review in order to highlight the existent and even potential internal audit functions. In the given context, our purpose is to discover those functions able to increase audit’s effectiveness.

According to the Institute of Internal

Auditors (IIA, 1991) [2], as well as according to Taylor and Glezen (1991) [3], internal audit is “an independent appraisal function, established within an organization to examine and evaluate its activities as a service to the organization”. Our findings prove that internal audit has developed constantly on the basis of social and economic evolution as well as of the newest needs of management (Wang, 1997). [4] However, in 2000, the IIA adopted a new definition of internal auditing function. According to it, this function “helps an organization to accomplish its objectives by bringing a systemic, disciplined approach to evaluate and improve the effectiveness of risk management, control and governance processes”. [5] Because of risks’ complexity, audit becomes commensurately complex. In the current economic risk landscape, internal audit should “adopt a strategic mindset that is responsive to risks and helps ready organizations for new threats and opportunities” (PWC, 2012). [6] In those circumstances, internal audit plays a vital role in monitoring companies’ main risks. Therefore, internal auditors should improve constantly their knowledge and skills for being able “to increase their level of contribution in the overall risk management effort”. [6] It is the moment for auditors to show a great focus on risks, identifying effective solutions without compromising objectivity. Meanwhile, other studies in the literature suggest that internal audit could influence also companies’ performance (Gordon and Smith, 1992). [7]

According to laws and regulation, companies that have to be audited, must organize within the internal control. In such a point, we state that internal control becomes one of internal audit’s functions. However, internal control risk could not be removed, although auditors are expected to find solutions for improving it. As Dumitrașcu and Săvulescu have recently proved (2012) [8], “determination of audit risk is fundamental to planning an audit properly”. Moreover, as it was stated by Radu (2012), internal audit is “one of the most powerful means of monitoring and promoting good governance system in a company”. [9] Our findings suggest that internal audit functions do have a valuable contribution to corporate governance. Some authors consider that these

functions consist in: providing information, making assurances, advice and expertise. There are also authors considering that internal audit functions refer to: consulting and advising managers, building control plans, evaluating and measuring business’ performances and losses, identifying risks. Botez (2012) has recently demonstrated that internal audit functions are supposed “to help the company in achieving its objectives and to add value and transparency, assisting at the same time the managers to enable it to better manage their activities”. [10]

As it was shown before, internal audit functions have changed. In such circumstances, the role of internal auditor has expanded to evaluating and improving management activities. Tabără and Ungureanu (2012) highlight in their study that some authors take into consideration the following current internal audit functions: performance evaluation, effective internal control, review of financial reporting process, fraud prevention and risk detection. The researchers mentioned above focus on another IIA’s definition concerning internal audit: it is “an objective activity certification and consultation which seeks streamlining the operations of an organization, but also processes of risk management, control and governance”. [11] Nowadays, internal audit functions include also assurance of risk management processes, a risk correctly evaluation and risks reporting. In the opinion of Narvaez and Bugalla (2012), “collaboration of risk-management and internal audit functions is helping organizations improve efficiency, decision-making and results”. [12] Both the Institute of Internal Auditors and the Risk and Insurance Management Society consider that collaboration between internal audit and risk management functions could lead to a stronger risk practice and could cover better the stakeholders’ expectations.

Our conclusion for this section of the paper is that internal audit functions should be adapted to companies’ risk management strategies in order to achieve positive audit results. Our findings suggest that internal auditors should be focused on risks, on their effective measurement and evaluation before creating appropriate risk management strategies. Therefore, we consider appropriate to study in the following section the

possibility of a close collaboration and even that of integration of the two functions: internal audit and risk management. We started from the perspective that those functions make a powerful team when they collaborate; they share skills, resources and experiences in order to cover risks.

Risk management and compliance

Internal audit functions have lately developed; they do not only identify existing economic, financial and managerial issues, but also anticipate and foresee risks. Auditors should focus audit resources on those activities that show companies' greatest risks. Risk management and compliance is the most misunderstood and misapplied concept but also the most vital for companies. At present, this is a critical component of managing and operating a business. Therefore, we consider that Romanian internal auditors should arrive to create the organization's overall risk profile in order to effectively manage it for better audit results.

In Northern Rock's operating and business review, the annual report for 2006 described organizations' risks as follows: credit risk, liquidity risk, operational risk and market risk. Within companies, internal audit could support managers in adopting a prudent stance in the management of risk. Although risk management frameworks could efficiently identify and measure different types of risks, there are not enough articles studying the specific duties that should be assigned and coordinated within the enterprises. Therefore our findings help us understand that companies need to review the effectiveness of internal control systems as well as to have an adapted process for identifying, measuring and managing the significant risks.

The issues determining accounting fraud risk are linked to the low distribution of internal audit functions together with an internal control system that does not completely meet the economic expectations of organizations and of market's participants. At this point, we consider that the most efficient tools customized in order to prevent fraud are the management of control as well as internal audit. The management of control represents the first line of defense in risk management, apart from the control risk and

risk insurance. Each of those lines plays distinct roles in corporate governance.

The Financial Regulatory Reform dating from 2012 highlights regulators' rising interest in risk management combined with sanctions for compliance failures. Specialists do wonder whether it is time for internal audit and risk management to come closer if not merge completely. Our suggestion would be to integrate internal audit, risk management and compliance and to align them to some extent in order to avoid conflicts or gaps, as well as to minimize risks.

In IIA's Position Paper dating from January 2013, specialists show that management, supported by internal auditors, could be able to establish effectively different risk management and compliance functions. [13] In our opinion, Romanian internal auditors should be prepared nowadays to support management policies and practices to provide risk management frameworks, to identify emerging issues and especially to assist management in developing processes and controls. Moreover, they should provide assurance on the effectiveness of governance and risk management. As we have just proved, internal audit functions consist nowadays in safeguarding companies' assets, assuring reliability and integrity of reporting processes, as well as compliance with laws and regulations and especially, risk identification, risk assessment and risk communication. Historically, internal auditing has consisted of audit compliance with internal financial procedures and regulations. At present, its role increases permanently. Recent survey data sustain that risk management practices are continuing to develop in most organizations. However, our findings suggest that internal audit will come to get bright future prospects. Internal audit should rethink risk management processes and revise them periodically. In today's business environment, internal auditors are required "to identify and correlate risks across multiple lines of business and functions" (IIA, 2009). [14]

We believe that it is not enough for the control function to exist, it is necessary to assign roles and effectively coordinate different groups within companies in order to prevent gaps in control. Therefore, management and auditors' responsibilities

should be integrally defined in order to understand the limitation of their functions as well as their role in risk management. Hence a coherent approach, a distinctive function of risk management is needed in order to build effective management methods for managing risks.

RBIA is one of the adequate tools provided in corporate governance. It supports the risk bearers in finding the risk exposure target and effective reporting on risk information within companies. As it was shown by Griffiths (2006), “Risk based internal auditing is the methodology which provides assurance that risks is being managed to within the organizations risk appetite”. [15] We sustain that an important management process is an internal control system reducing risks to a level that there are considered acceptable.

As a conclusion of this section, we sustain that it is very important for managers and auditors to evaluate and estimate effectively all kind of corporate risks. From a study conducted during 2011 by Ernst & Young, we have found that the information provided by internal auditors seems not to be able to truly gauge the health of organizations. We also assume that Romanian companies need a holistic view giving a balanced perspective of risks and control environment. Moreover, by taking a strategic approach to corporate governance, internal audit, risk management and compliance, companies could achieve competitive advantages. Our findings sustain that it is the moment for organizations to integrate all the above mentioned initiatives in order to add value to their activities.

Conclusions

The current business landscape is becoming more and more complex due to new structural changes and to the multitude of risks. All over the world, entities start to show a great interest to risk management. However our findings prove that implementing an effective risk management within Romanian companies, requires time, discipline, new skills and resources. We consider that it is the moment for internal auditors to play significant roles in risk management. Therefore, we think appropriate to mention that risk management appears as “some coordinated activities to direct and

control an organization with regard to risk” (Dickinson, 2010). [16] Meanwhile, internal auditing is seen by the above mentioned author as “an independent, objective assurance and consulting actively designed to add value and improve organizations’ operations”.

The problem treated during the present paper has a strong impact within the organizations. We consider that it has become really interesting for Romanian entities to show a deep interest on the current internal audit functions and on risk management. Building a professional internal audit activity completely adapted to nowadays’ needs and change’s challenges, it could be seen as an effective governance requirement for companies all over the world as well as for Romanian enterprises. We consider that this solution is not only important for great companies but also for medium-sized and smaller entities as they are currently facing various organizational and structural risks. In such circumstances, internal audit does influence actively corporate governance, contributing to its effectiveness.

The results of our research indicate that internal audit is a vital factor for an effective risk management and consecutively for the future success of organizations. We hope that our findings will open the appetite of researchers to study more deeply in the future different approaches to risk identification and risk rating, especially with unfamiliar areas that have not been traditionally reviewed.

The main conclusion of our study sustains that an internal audit activity based on risk management could arrive to increase internal audit credibility among all market’s participants. By leveraging a risk-based model, internal audit could also increase its own efficiency and could support effective risk coverage.

Abstract

Optimization of entities' activity is subject to a continuous process of collecting and processing information, process considered so that it contributes to assist decision-making process.

Managers manage the future and regularly report entity's present to it. Adopting timely decisions, based on the information provided by some specific tools of managerial accounting is increasingly desired by the managers of entities in the current uncertainty.

This scientific approach aims in parallel, in Romanian and French specialized literature, the meanings given to performance concept and to the importance of its knowledge and quantification by using a current management and monitoring tool, namely the dashboard.

Keywords: performance, decision, dashboard, manager.

Clasificare J.E.L.: M40, M41.

1. Introduction

Global assessment of an entity's performance proved insufficient even for external users of financial statements. Currently, there is a real need for more detailed documents, more analytical, more segmented: this need notably treats the formation of companies' result, especially if a group of companies has different activities.

Decision making process takes place at all entity's levels, covering both short-term and long-term decisions. Plans are activated by the decisions, and to a substantial number of

decisions it is necessary to have quantitative, qualitative and timely information block to enhance decision making. Ensuring optimal information needs of decision implies knowledge and performance measurement of an entity.

2. Performance and piloting performance

2.1. Ambiguity and clarity in performance concept

Modern management of today's entities is dominated by two concepts: value and performance. New weapons of modern management (total quality, value analysis and activity-based management) involve a total cost management [1].

Today, the term performance knows some imprecision in its use. Measuring performance is to assess the value knowing the value causes which means "to translate" performance [2].

Performance only makes sense in a specific context because it allows interpretations, but the term performance should be reserved for the description of results evolution on a period considered long enough for making the decision [3]. The performance takes the form of a comparison, and to be competitive means to reach or even exceed some proposed objectives.

The word performance is of Latin origin (*performare*, i.e. giving form to something), but its significance comes from English (*to perform*, or to do something regularly, and the noun *performance*, achieving a thing or an act in the same manner by which an organization achieves the objectives that have been set).

Performance concept refers to a judgment on a result and the manner in which this

result is achieved based on objectives and fulfillment conditions. Performance measurement is more than just finding it, it exceeds this limit and aims to decision making in order to improve performance conditions. Performance is the achievement of the objectives that are set by the company. It is defined not only by obtaining quantitative results, but by optimizing the means used by all its dimensions: economic, social, commercial, etc. [4]. In French literature, special attention is given to social performance concept, entities' managers being those who seek to use, in the most effective manner possible, depending on their skills and their costs, actors at all organizational levels [5] more precisely, entity human resources.

The concept of performance involves the following terms: **Performance = economy + efficiency + effectiveness**

Economy involves the procuring of resources at the lowest cost, efficiency requires maximizing the result and minimizing the amount of resources for a predetermined outcome, and effectiveness shows the ability of obtained results to meet the forecasts made.

Performance makes sense only in a specific context because it allows interpretations, however the term 'performance' should be reserved for the description of the evolution of results on a period considered long enough to make the decision [6]. The performance takes the form of a comparison and, to be powerful means to reach or even exceed some proposed targets.

In France there is a naturalized principle, i.e., performance is based on division of labor and its optimization, i.e. decomposition of the enterprise in units, grouping them by specialized skills, and optimizing the local performance to ensure overall performance, it involves implicitly an interrelation between weak and strong units, without any difficulty, for a superior standard [7].

2.2. Multiple meanings given to the concept of performance

The meanings given to performance, synthesized, can be identified as follows:

- depending on *the level of achievement of objectives*, the performance is not the result, but it is all that contributes to achieving

strategic objectives, its content being dependent on setting and achieving goals;

- depending on *the productivity and effectiveness of the entity*, questionable approach, performance should not be substituted or reduced to these terms. Effectiveness means the extent to which the objective is achieved by the means at stake, and productivity compares the achieved results to the employed means;

- according to *value creation*, supported by P.Lorino, performance, for the enterprise, is what helps to improve the value-cost couple, and not just what contributes to reducing the cost or increasing the value [8]. Value-cost couple represents the two pilot elements which explains how an entity creates and will create value, not only for shareholders but also for the *customer*, the latter having a key role in ensuring, maintaining and developing performance;

- based on *the entity's richest resource*, i.e. *the man*, this being a determinant factor of performance. The manner in which people communicate and work together determines the performance of an entity. Performance is that which allows the entity its specific differentiation from competitors, through a strong organization members' motivation.

- based on *entity's commitment to environment*, which should not be seen as an option, but as an obligation of common sense for commercial, moral, economic reasons.

Therefore, performance is a competitive status of the entity, which ensures its sustainable presence on the market, but it is built in time, it is not a momentary event, but involves future results arising from meeting strategic objectives. An entity is competitive if it creates value for shareholders, satisfies customers, takes employees' opinion into account and respects natural environment.

Performance should not be confused with its describing indicators, namely: profitability, efficiency and effectiveness. These notions are a multitude of indicators used to assess performance.

3. Cost seen as an arbitrator in measuring performance by ABC method

Knowing costs is essential for making operational decisions, with major implications for achieving the desired performance. Relevant cost calculation

allows a finer control over costs and application of new piloting means such as Activity Based Costing. ABC method is however difficult to implement and maintain, its application requiring time and high cost at first. Nevertheless, the activity accounting allows to obtain relevant and reliable costs, a better understanding of how to create value added, but its primary objective remains to improving decisions.

By mastering costs, ABC method is a means of knowledge of the enterprise, strategic piloting means that improves performance and decision making. It is part of the new methods of calculating the cost which, giving priority to the concept of work and the relationship between activity cost and volume, before production cost calculation based on consumption of these activities [9].

ABC method focuses on two objectives: responds to a deficiency of traditional methods and proposes an effective control tool, but there are many opinions showing that, to achieve a competitive system of improving costs, throughout the product life cycle, it has to go beyond ABC, by exploring AMB (the management of improving the value received by the customer and increasing the profits achieved from this perceived value).

The application of this approach is closely related to identifying the chain of causes that correlate consumption and products. Approach is not yet possible in the long term when anticipation (evaluation) of the links between products and supporting activities is known [10].

In specialized French literature, the notion of performance is linked to the notion of *quality*.

Quality is a double source of costs in the enterprise: on the one hand, all the resources used to achieve production quality in accordance with identified specifications, and on the other hand, all non-quality management costs [11]. In the category of quality costing models, four categories of traditional costs are included: preventing costs, detection costs, non-quality internal costs, non-quality external costs. Today's cost accounting has as subject modeling the enterprise and encrypting its performance [12], but this is not easy to achieve.

4. Performance measurement - an attribute of management control

Management control has its source in strategic field, but its role varies considerably [13]. Performance is inextricably linked to achieving the strategic objectives of any entity. Performance measurement is an attribute of management control that cannot be addressed outside the objectives prefigured by each organization [14].

In specialized French literature, and not only, specific to management control, performance is defined as an association between efficiency and effectiveness. Overall the performance of an enterprise responds to two control objectives: overall productive efficiency of its activities and particularly of its operational production of goods and services, and improving its market position [15].

Performance requires a comprehensive vision of all the factors of influence: quantitative, qualitative, human, financial, physical, and its measurement requires the use of three types of indicators: financial, monetary (quantitative and qualitative), nonprofit.

Also in specialized French literature, we encounter the idea that management control is, in fact that dynamic process that provides a comprehensive approach of piloting performance process and piloting means to treat carefully the performance objectives, and therefore clearly define its terms [16].

Any entity must have an information system capable of measuring performance by organizing management control, using one of the following management techniques:

- organizing and operating an information system, at a minimum cost, adapted to entity's analysis and synthesis processes (*cost-volume-profit* method);
- detecting the deviations between forecasts and achievements, explaining them and taking corrective measures (*standard cost method*);
- planning the *budgets* and analyzing internal and external information necessary for planning.

Performance is also dependent on the *information* already owned. Management control enables achieving economic rationalism. Such a quality parameter cannot be achieved without conveying large

quantities of information. In a world where the resources decrease and the needs increase, we must always capitalize the only inexhaustible resource, namely information [17]. Not the amount of information provides its value, but to dispose of them before competitors, so that the entity to act in a rational and efficient manner.

5. Using the dashboard to measure performance

An existing tool for monitoring and managing performance of an entity is the dashboard. It is an tool for conducting operations, used to tracking and predicting the process, allowing flexible adaptation of the actions.

The dashboard enables the management to lead “communicate” with the managed ones and aims at optimizing each function of the entity, by optimizing the operation of each component service, and developing analysis useful for entity strategies. Regrouping all predictions, output and accounting irregularities is an information basis that contributes to building an enterprise dashboard enterprise [18]. This must be sufficiently clear, synthetic and enlightening for managers’ information needs.

The more the management of an entity has useful, condensed and synthesized information, the better are the chances of exercising an effective entity management. The dashboard has become a modern management tool, designed to perform a systematic selection, concentration and centralization of information to support the decision making process. It is a working tool, indispensable to the operative management of the company, it is designed as a summary of information presented in a systematic, synoptic manner, related to the state and evolution of economic phenomena that characterize its fields [19].

With the dashboard help, a continuous informing of the decision makers is made, on how the phenomena specific to the conducted activity evolve, through which settling immediate objectives, aiming and validating predictions to be achieved, while accounting responsibility focuses on the extent to which, based on accounting and financial information, the objectives have been achieved.

The dashboard has a number of characteristics:

- it is a dynamic information tool designed to compare the results obtained in relation to the set objectives, or the results obtained in a previous period compared with the current period;
- it produces an operational information on all activities performed by the entity;
- provides comprehensive information on the state and evolution of the system, along with budget and management control tool.

At the basis of the dashboard elaboration, there is a number of principles such as:

- consistency, the dashboard is not identical for all of the hierarchical chain components, and to achieve a higher level aggregation, the dashboards of the departments with similar functions in the same hierarchical level must contain the same performance indicators;
- relevance, to be useful to the management, the dashboard should provide essential and timely information on key points in training performance, avoiding a rigid content of indicators and preferring an adaptive content to the hierarchical level;
- frequency depends on the life cycle of the decision, but takes into account the time limit for implementing the dashboards and their dissemination speed;
- efficiency takes into account its ability to lead to action, analyze deviations and to develop corrective actions;
- standardization refers to the set assumptions and performance, this being the basis for determination of deviations obtained at the departments level.

These principles can be completed with the following rules and basic principles in designing a dashboard: consistency with the information system, consistency with the objectives defined in the foreground and operational programs, hierarchical principle, synthetic principle, reactivity principle, the principle of systematic comparison to market criteria.

6. Conclusions

Performance measurement is currently done under risk and uncertainty conditions.

Risks, economic and financial, that affect the entity are also one of the key factors affecting the performance of the entity. Not all the risks are of negative nature, there are risks with positive effects on performance, all being influenced by risk management manner.

Consisting of a set of indicators presented in a synthetic manner at a correlated frequency, the dashboard allows the decision maker to know the need of information regarding the entity's performance and enables them to react quickly to the emergence of problems.

The Effects of Corporate Governance on the Net Interest Margin and the Solvency Ratio - Evidence from Romania

Chitan Gheorghe

Academy of Economic Studies, Bucharest

chitangheorghe@yahoo.com

Abstract

This study examines, based on empirical analysis, the relationship between corporate governance expressed by corporate structure, the structure of committees, the risk management and the internal control framework and the institutional transparency on bank performance in the Romanian banking sector. The results reveal a positive influence of corporate governance variables over the bank performance. It means that the banks that adopt more corporate governance measures tend to have higher solvency ratio, and hence more protection against unexpected loss.

Key words: bank performance, corporate governance, Romanian banking system

J.E.L. classification: G21, G32, G34, G38

1. Introduction

Financial crisis has opened a series of discussions on corporate governance. It was pointed out that the institutions free internal governance, supported by deregulation, led to weakening of the financial system, the banks being unable to assess their own risks. It returned to attention the need to establish rules of conduct through regulations, or by establishing a foreign governance framework to enable the possibility to avoid future financial instability. The current study, conducted at the level of Romanian banking system, examines how different individual aspects of internal governance framework may influence bank performance, expressed by the net interest margin (NIM) and the solvency ratio (SLV), being thus the first study addressing the solvency ratio. The paper is a complement to the study of the influence of individual components of corporate structure [1] and the one regarding

their aggregate influence [2] on ROA, ROE and distance to default.

The remainder of the paper is organized as follows. Section 2 reviews the literature and hypotheses' development. Section 3 describes the data and the variables. Section 4 describes the methodology and provides the empirical results. Section 5 concludes.

2. Literature review and the hypotheses' development

Corporate governance supports within an organization the achievement of the objectives and maintenance of financial stability. The concept of corporate governance (CG) is broad, the European Banking Authority (EBA) describing it as "the set of relationships between an institution, its management, its shareholders and other stakeholders" [3]. Banks operate under a unique system of public oversight in the form of bank supervisors and a comprehensive body of banking laws and regulations [4]. In pursuit of their own interests, this may induce the "agent problem" [5], [6] between shareholders and the regulator.

At the level of an institution a clear organizational structure with well defined responsibilities, risk management and efficient internal control should be in place, but also an informational transparency of governance mechanism should exist. Thus, for purposes of this study, we can distinguish the following components of corporate governance: corporate structure and organization (CSO), the risk management (RM) and internal control (IC) framework, specialized committees (Audit committee - AC, Risk committee - RC and Remuneration committee - RMC) and institutional transparency (T).

To express corporate governance, the previous studies used either the

caracteristics of the management body [7], [8], [9], [10], either the prudential regulatory framework [11], [12], some organizational aspects and measures adopted to mitigate risks being less considered. To express the bank performance it was also used the Tobin Q variable [8]; [10], ROA [10], [7], ROE [9] or NIM [11].

In case of CSO, before financial crisis, there was a strong expansion of the banking sector. This was accompanied by the dynamics of lending, privileged by decentralization of the credit approval competencies and by bonuses and incentives received for meeting the lending targets [1].

As regards *RM* and *IC* is in place the “theory of agent” [1], [2]. Laeven and Levine [13] found that the minimum capital requirements are in a positive relationship with risk taking, while other capital regulations and activity restrictions have a negative influence on the risk taking.

The existence of *committees and the independence of their members* (CS) is expected to improve activity” [1], [2]. In previous studies, Adams and Mehran [8], [14], found a negative influence of the number of committees on the Tobin Q variable, determined as the ratio of the entity’ market value to book value of its assets. Aebi et al. [9], reported to ROE, found a negative influence of RC, or lack of statistically significant influence of independence of its members. Between capital requirements, and NIM, Barth et al. [11] have not found a strong association.

The *T* is expected to prevent the accumulation of risks as market discipline would limit the funding of imprudent banks” [1], [2]. Barth et al. [11] found that policies requiring disclosure of accurate information strengthen the control of private banks sector and encourage private agents to exert corporate control.

Corporate governance measures are expected to improve risk assessment and risk management, leading thus to a better net result from interests and a higher value of the solvency ratio.

Based on these arguments and exposures, is considered the following hypothesis:

CSO, RM, IC, CS and T influences positively NIM and SLV.

3. Data and the variables

3.1. Specification of data and variables

Data were collected quarterly from the websites of Romanian banking institutions listed at Bucharest Stock Exchange, for the period 2004-2011, from the financial statements, independent auditor's reports, annual reports, corporate governance codes and reports, reports on transparency and disclosure requirements. To measure the bank performance, it is calculated net interest margin (NIM) calculated as the difference between interest income and interest expenditures and solvency ratio (SLV), calculated as the ratio between capital and total assets. To express the corporate governance are used five variables. These are dummy variables whose value is 1 or 0, 1 indicating the presence of the analyzed attribute and 0 the absence of it respectively.

The first component is the *CSO*, its value being the sum of the scoring applying for the following three variables: (1) is the organizational structure clear and transparent?; (2) are loans approved at the centralized level?; (3) don't they perform non-standard or non-transparent activities, namely complex derivative activities or under jurisdictions that impede transparency of operations - *offshore* -?.

The second component is the *RM*, whose value is determined by summing the scores awarded to the following five variables: (1) are exposure limits on loans established?; (2) are capital requirements for credit risk established?; (3) are capital requirements according to the internal procedures for risk assessment established?; (4) are remuneration policies based on risks established?; (5) are tests for highlighting the extreme conditions (stress tests) performed?.

The third component is the *IC*, whose value is the sum of scores obtained by the following three variables: (1) is there an internal control function?; (2) is there a compliance function?; (3) is there an internal audit function?.

The fourth component is the *CS*, its value being the sum of the scoring applying for the next six variables: (1) is there an AC?; (2) the members of the AC are independent?; (3) is there a RMC?; (4) are members of the RMC independent?; (5) is there a RC?; (6) has

external auditor been replaced after a maximum of 5 years period?

The fifth component is the T, determined by summing up the scores awarded to the five dummy variables used to assess whether the public has access to: (1) the financial statements, (2) the capital structure and committees, (3) the structure of incentives/remuneration, (4) the risk management policies and (5) the internal governance policy.

To adjust the dependence between the variables of corporate governance and bank performance are also used a range of financial indicators and variable expressing the nominal gross domestic product (NGDP) [15]. The financial indicators are used to express the size (*total assets – A*), the profitability (*return on assets- NIM/A*, calculated as the ratio between NIM and total assets; *return on equity - NIM/K*, calculated as the ratio between NIM and equity; *return on deposits - NIM/DEP*, calculated as the ratio between NIM and total deposits), the activity (*share of total loans in total assets - CRD/A*, calculated as the ratio between total loans and total assets, *share of total loans in total deposits - CRD/DEP*, calculated as the ratio between total loans and total deposits)

and the stability (*change in total assets - ΔA* , calculated as variation total assets between two consecutives periods, *change in share of total loans in total assets - $\Delta CRD/A$* , calculated as variation of share of total loans in total assets between two consecutives periods).

3.2. Descriptive statistics

The descriptive statistics of the value of the variables used are presented in Table 1. The values of the performance variables indicate a good bank stability. The implementation of the governance requirements for CSO, CS and IC are situated above the average. Regarding the implementation of RM and T requirements, these are situated approximately at the average level. The standard deviation value of RM illustrates the implementation of a part of risk management measures within a short period and for a time range smaller than that observed (e.g. setting capital requirements according to internal procedures for risk assessment, establishing remuneration policies based on risks, conducting stress tests).

Table 1: Descriptive statistics

Indicators	Minimum	Maximum	Mean	Median	Standard deviation
NIM (billion)	0.010	3.789	0.701	0.429	0.812
SLV	0.012	0.191	0.047	0.037	0.036

4. Methodology and results

For analysis of panel data, using the EViews software, is used the fixed effects

regression model and the Pooled Least Squares method to estimation the influence. By including the fixed effects, we limit both the effect of the omitted variables, allowing

us to take into account the heterogeneity of the sample, and the effect of the potential extreme values caused by the small number of cross-sectional units [6].

To emphasize the dependence between the variables expressing BP (dependent variables) and those expressing the corporate governance, is used multiple regression models presented below:

$$Y_{ijt} = \alpha_j + \beta_k * CG_{kjt} + \theta_n * F_{njt} + m * \ln(NGDP) + a_j + u_{jt}$$

where t = is the time period; j is cross-sectional observation unit; i is dependent variable; Y_{ijt} is the vector of dependent variables, i being in turn NIM and SLV; α_j is

the intercept term; k is independent variable of corporate governance; β_k is the coefficient of the independent variable of corporate governance; CG_{kjt} is the vector of the independent variables of corporate governance, k being in turn, CSO, RM, IC, CS and T; n is independent variable of financial indicator; θ_n is the coefficient of the independent variables of financial indicators; F_{njt} is the vector of the independent variables of financial indicators; m is the coefficient of the NGDP; a_j is the unnoticed effect of unit j; u_{jt} is the error term;

The results from regressions are synthetic reported in Table 2.

Table 2: Net interest margin (NIM) and solvency ratio (SLV) regressions.

Dependent variables	Independent variables					No. of obs.	R ²	Wald test, F stat

	RM (0.003)** (2.297)	Δ A 0.000** (2.088)	Δ CRD/A 0.171** (2.216)	NIM/K -0.011** (-2.058)	CRD/DEP 0.033 (1.505)	111	0.74	6.777**
	IC 0.016* (4.558)	LnA -0.034* (-7.505)	Δ CRD/A 0.118** (2.262)	NIM/DEP 0.144*** (1.673)		111	0.79	24.949*
	STR 0.005* (3.144)	LnA -0.029* (-6.372)	Δ CRD/A 0.118** (2.277)	NIM/DEP 0.172*** (1.839)		111	0.76	23.441*
	T 0.006* (3.069)	LnA -0.032* (-7.008)	Δ CRD/A 0.120** (2.267)	NIM/DEP 0.227** (2.612)		111	0.77	27.836*

Source: author’s computation. In all the regressions, the estimation of the parameter was made by adjusting the errors for heteroskedasticity. To test the significance associated to the estimated coefficients is used the Wald test [16], whose results emphasize that F-statistic is statistically significant. *, ** and *** indicates statistical signification of estimated coefficients and Wald test at a level of 0%, 5% and respectively, 10%. Figures in parentheses present the t-statistics.

Regarding the influence of corporate structure components on NIM can see that

they have a positive effect, allowing better management of resources. The same influences, except for the CSO variable, have on the SLV variable, helping to solidify bank.

Therefore, adopting new corporate governance measures increase the banks

5. Conclusions

The paper addresses the individual influence of components of corporate governance on NIM and SLV in the Romanian banking system.

The results indicate a positive relationship between corporate governance variables and the performance variables, meaning that corporate governance aids to improve solvency. However, to ensure financial stability, a good corporate governance should be accompanied by other measures, their identification and influence being the subject of future studies.

The Budget Deficit – A Reflection of the General Economic Imbalance

Chițiga Georgiana

Financial and Monetary Research Centre „Victor Slăvescu”, Bucharest, Romania
georgiana_chitiga@yahoo.com

Abstract

The budget deficit is a problem with modern states are faced in our times. It is not dangerous because of the disbalance between revenues and expenses, but because of the complexity of the elements that have caused it, as well as the economic and financial consequences it brings about.

The efficient management of the budget deficit may also lead to fiscal relaxation, considering that there must be a correlation between the expenditures which sustain the public dept and the increase of the financial resources of the states in order to pay it.

Key words: economic deficit, budget deficit, financial management, implications of the budget deficit, public expenses

Clasification J.E.L.:H61, H62

1. Introduction

The development of our society explains through itself the growth of expenses in a faster rhythm than the raise of the internal brute product and of incomes which naturally leads to the appearance and maintaining of budget deficits.

In order to understand the concept of budget deficit, we have to take into account the two components which create budget deficits : economic incomes and economic expenses. As a consequence of the faster growth of expenses compared with the raise of public incomes, budgets are made and are more often concluded with a deficiency which is the opposing term of budget excess characterized by the predominance of incomes over public expenses.

Budget deficit may generally be financed either by raising the currency basis, or by making governmental loans on the financial market. These two ways are not used to the same degree. From its statute of „golden

principle” of the budget, the rule of budgetary balance has gradually lost ground in favour of creating some deficits which could be used with the aim of raising economy. But above all these approaches, one must not neglect the fact that in general, budgetary imbalance is created based on some lack of balances in real economy, generating, perpetuating or deepening economic imbalances.

An efficient policy in the fiscal-budgetary domain should know and anticipate possible influences as way as their meaning in order to adopt on the run the measures of limiting and counteracting negative effects that may produce.

2. The typology of economic deficits

Determining factors which disturb economy in order to annihilate and prevent their further production, implies an in-depth analysis of the typology of economic deficits and of the criteria of classifying these.[3]

According to the report between the factual economic deficit and the planned economic deficit, we have:

- normal economic deficit – the deficit which is achieved in the limits planned for normal situations;
- super-economic deficit – the one which surpasses the normal economic deficit;
- under-economic deficit – the deficit which is lower than the normal established one.

According to the level of economic relevance on which it is produced, we have:

- macroeconomic deficit – the deficit which is produced at the level of national economy where there are taken into account both the private macroeconomic deficit and the public one because between these there are some interaction relations;
- mezo-economic deficit – the deficit recorded in a certain domain of the

national economy or in a certain geographical area;

- microeconomic deficit – the deficit which is produced at the level of a company or of a natural person.

Another criterion of classifying economic deficits is represented by the cause of their production:

- economic deficit recorded as a result of the drop of public incomes compared with the level which was expected;
- economic deficit produced as a result of the raise of public expenses compared with the level which was expected.

Another classification can be made according to the depth of the level on which economic deficit is recorded:

- circumstantial economic deficit (cyclic) – deficit generated by the cyclicity of some economic processes such as the quarterly collection of some tax income which are adjusted when the cycle ends;
- structural economic deficit – this deficit can be adjusted only after eliminating the causes which produced it because, it is due to some basic problems of the system and they maintain and even deepen as time goes by, being at the same time an inflation generator too;
- casual economic deficit – it has an unique character as a result of the production of some unexpected phenomena which at a certain moment affect the gathering or spending of budget resources and it has negative effects on economy.

According to the economic signification of the deficit, this can be of three types:

- conventional economic deficit – resulted as a difference between the total nominal expenses of the public budget and its total nominal incomes;
- primary economic deficit – it represents the deficit obtained after the drop of expenses with the payment of interests from the conventional economic deficit;
- operational deficit – it comes from the conventional deficit from which the effect of inflation over net interests was subtracted.

This classification is valid especially for the budget deficits, but it can also be made in the case of commercial deficits, payment deficits and private deficits.

According to the concrete economic object that the economic deficit refers to, we have:

- budget deficit – it comes from the difference between public expenses and the amount of public incomes and it is the deficit which the most frequently analyzed;
- commercial deficits – it is a result of the difference between the expenses which are made after an economic process and the incomes resulted from that activity;
- payment deficit – the deficit which results from the positive difference between the payment made by an unit and the collection from the existing claims of that unit.

Another criterion of classification is that of the direct or indirect character of economic deficit:

- direct or properly economic deficit – the fiscal deficit resulted from direct operations of collections and payments at the level of a public budget;
- indirect economic deficit – quasifiscal deficit obtained from indirect operations of collections and payments at the level of that public budget.

A final classification of economic deficits is that made after the nature of assets – liabilities:

- economic deficits regarding public assets – liabilities;
- economic deficits regarding private assets – liabilities.

3. Budget deficit and its implications

The unrolling in optimal conditions of the fiscal-budgetary activity may be influenced by the existence of some disturbing factors which may appear both at the entrances and at the exits from the fiscal-budgetary circuit which have as a base real economy and which can be influenced by political or social decisions that lead to the production of side effects.

There are various types of imbalances and disfunctions such as: *budget deficit*, tax evasion, overgrowth of tax pressure, giving subventions – phenomena which are common to countries that are in different stages of development. At the same time, there are also imbalances and disfunctions which are

typical to some transitional periods under the terms of some regulations less fundamental and in the case of a free market which is still developing: the arrears (including fiscal arrears), special funds, the low degree of collecting taxes (because of the deterioration of financial discipline).
