# Choosing the Appropriate Regression from Nine Different Mathematical Models 

Ovidiu Gherasim<br>"Gh. Zane" Institute of Economic and Social Research, The Romanian Academy, Iaşi Branch (ICES - ARFI), Romania<br>ogacadr@yahoo.com

#### Abstract

Choosing the most appropriate mathematical model for establishing a simple regression between two variables which represent two economic indicators or from other scientific fields is an approach that involves many and often quite difficult actions.

In the article we rigorously presented the stages to be followed in order to obtain the defining parameters for nine models: linear, power (double logarithmic), exponential, logarithmic, three hyperbolic models (the third is also a Törnqvist-type model) and two exponential-hyperbolic models.

The final stage in establishing the most appropriate model is less discussed in the paper. Thus, the simple regression for which the model has the highest Pearson correlation coefficient is chosen as optimal in the article.

Key words: simple regressions, power model, exponential model, logarithmic model, hyperbolic model
J.E.L. classification: C02, C24, C40, C50

## 1. Introduction

An important desideratum in conducting research in the economic field, as well as in many other scientific fields, is defined by the question "which mathematical model is the most appropriate to describe the connection between two indicators"?

Selecting the optimal regression from as many mathematical models as possible will result in a viable link between the two indicators.

The main objective of the paper is to describe, as concisely as possible and also as completely as possible, the way in which the parameters that define nine different mathematical models are obtained.

Starting from the linear model, described in detail in many papers in the literature, all the other eight power, exponential, logarithmic and hyperbolic models can be linearized if appropriate logarithmic operations and variable changes are applied.

After linearization, the mathematical relations of the linear model will be used through the substitutions corresponding to each model.

Another objective of the paper is the effective selection of the model that generates the optimal simple regression.

This objective is achieved by associating the nine correlation coefficients and marking the model that has the highest coefficient.

## 2. Literature review

The article is based upon the linear model for achieving a simple correlation.
The complete theoretical presentation of this model can be found in many works, both nationally and internationally.

Of these, we mention here, in chronological order, just as an example, the following works: (Schatteles, 1971), (Bărbat, 1972) (Moineagu, 1974), (Țarcă, 1979), (Trebici et al, 1985), (Jaba, 1986), (Gromîco, 1990), (Pecican, 1994), (Baron et al, 1996), (Biji et al, 2000), (Gherasim, 2021) and so on.

The other simple correlations used in the article are based upon power, exponential, logarithmic, hyperbolic models and combinations thereof.

In the literature these models are often only briefly mentioned and rarely presented completely, both theoretically and applied.

Also by way of example, we mention here only a few works in which curvilinear models are presented: (Schatteles, 1971, pp.127-128), (Moineagu, 1974, pp.40-43), (Țarcă, 1979, pp.61-62), (Jaba 1986, pp.205-206), (Gromîco, 1990, pp.140-143), (Pecican, 1994, pp.64-65), (Baron et al, 1996, pp.168-169), (Biji et al, 2000, pp.314-318) and so forth.

## 3. Research methodology

To establish a simple regression $y=f(x)$ between an independent variable $x$ and a dependent variable $y$ are considered given a sufficiently large number $n$ of value pairs of two economic-social indicators or in other fields: $\left(\mathrm{x}_{\mathrm{k}}, \mathrm{y}_{\mathrm{k}}\right)_{\mathrm{k}=\overline{1, \mathrm{n}}}, 30 \leq \mathrm{n} \in \mathbf{N}$.

By graphically representing these pairs in a two-dimensional space, a point cloud is obtained $\left\{\mathrm{P}_{\mathrm{k}}\left(\mathrm{x}_{\mathrm{k}}, \mathrm{y}_{\mathrm{k}}\right)\right\}_{\mathrm{k}=1, \mathrm{n}}$.

Throughout the article we used nine mathematical models for the type and shape of the regression function f :
(1) $y=a \cdot x+b$, linear model
(2) $\mathrm{y}=\mathrm{b} \cdot \mathrm{x}^{\mathrm{a}} \quad \rightarrow \quad \underset{\log }{ } \hat{\mathrm{y}}=\mathrm{a} \cdot \hat{\mathrm{x}}+\hat{\mathrm{b}} \quad$, power (double logarithmic) model
(3) $y=b \cdot e^{a \cdot x} \quad \rightarrow \quad \hat{\log }=a \cdot x+\hat{b} \quad$, exponential model
(4) $y=a \cdot \ln x+b \rightarrow y=a \cdot \hat{x}+b,(\ln x \rightarrow \hat{x}) \quad$, logarithmic model
(5) $y=\frac{a}{x}+b \quad \rightarrow y=a \cdot X+b,\left(\frac{1}{x} \rightarrow X\right) \quad$, hyperbolic model type 1
(6) $\mathrm{y}=\frac{1}{\mathrm{a} \cdot \mathrm{x}+\mathrm{b}} \quad \rightarrow \mathrm{Y}=\mathrm{a} \cdot \mathrm{x}+\mathrm{b},\left(\frac{1}{\mathrm{y}} \rightarrow Y\right) \quad$, hyperbolic model type 2
(7) $y=\frac{x}{b \cdot x+a} \rightarrow Y=a \cdot X+b,\left(\frac{1}{x} \rightarrow X\right),\left(\frac{1}{y} \rightarrow Y\right)$, hyperbolic model type 3
(8) $y=b \cdot e^{\frac{a}{x}} \underset{\log }{\rightarrow} \hat{y}=a \cdot X+\hat{b},\left(\frac{1}{x} \rightarrow X\right) \quad$, exponential-hyperbolic model type 1
(9) $y=e^{\frac{1}{a \cdot x+b}} \underset{\log }{\rightarrow} \quad Y=a \cdot x+b,\left(\frac{1}{\hat{y}} \rightarrow Y\right) \quad$,exponential-hyperbolic model type 2
(1)
where: $\ln \mathrm{w} \stackrel{\text { not. }}{=} \hat{\mathrm{w}}, \forall \mathrm{w}$.
Model (7) is also a Törnqvist model $\left(y=\frac{\alpha \cdot x}{x+\beta}\right)$, where: $\alpha=\frac{1}{b}$ and $\beta=\frac{a}{b}$.
Model (1) is linear and the other eight models become linear by logarithmic and variable changes presented in parentheses.

In order to determine the parameters that define the nine models, $\mathrm{a}_{(\mathrm{M})}, \mathrm{b}_{(\mathrm{M})}, \mathrm{M}=\overline{1,9}$ it is necessary to go through several stages.

In a first stage, relative to the coordinates $\mathrm{x}_{\mathrm{k}}, \mathrm{y}_{\mathrm{k}}$, logarithms, inverses, products and their amounts must be calculated:

$$
\begin{align*}
& \mathrm{S}_{\mathrm{x}}=\sum_{\mathrm{k}=1}^{\mathrm{n}} \mathrm{x}_{\mathrm{k}}, \quad \mathrm{~S}_{\mathrm{y}}=\sum_{\mathrm{k}=1}^{\mathrm{n}} \mathrm{y}_{\mathrm{k}}, \quad \mathrm{~S}_{\mathrm{xx}}=\sum_{\mathrm{k}=1}^{\mathrm{n}}\left(\mathrm{x}_{\mathrm{k}} \cdot \mathrm{x}_{\mathrm{k}}\right), \quad \mathrm{S}_{\mathrm{xy}}=\sum_{\mathrm{k}=1}^{\mathrm{n}}\left(\mathrm{x}_{\mathrm{k}} \cdot \mathrm{y}_{\mathrm{k}}\right), \quad \mathrm{S}_{\mathrm{x}}=\sum_{\mathrm{k}=1}^{\mathrm{n}} \ln \mathrm{X}_{\mathrm{k}} \\
& S_{\hat{y}}=\sum_{k=1}^{n} \ln y_{k}, S_{\hat{x} \hat{y}}=\sum_{k=1}^{n}\left(\ln x_{k} \cdot \ln x_{k}\right), S_{x \dot{y}}=\sum_{k=1}^{n}\left(x_{k} \cdot \ln y_{k}\right), S_{\hat{x} y}=\sum_{k=1}^{n}\left(y_{k} \cdot \ln x_{k}\right) \\
& S_{x \hat{y}}=\sum_{k=1}^{n}\left(\ln x_{k} \cdot \ln y_{k}\right), \quad S_{\frac{1}{x}}=\sum_{k=1}^{n} \frac{1}{x_{k}}, \quad S_{\frac{1}{y}}=\sum_{k=1}^{n} \frac{1}{y_{k}}, \quad S_{\frac{y}{x}}=\sum_{k=1}^{n} \frac{y_{k}}{x_{k}}, \quad S_{\frac{x}{y}}=\sum_{k=1}^{n} \frac{x_{k}}{y_{k}}  \tag{2}\\
& S_{\frac{1}{x x}}=\sum_{k=1}^{n} \frac{1}{x_{k} \cdot x_{k}}, \quad S_{\frac{1}{x y}}=\sum_{k=1}^{n} \frac{1}{x_{k} \cdot y_{k}}, S_{\frac{1}{\bar{y}}}=\sum_{k=1}^{n} \frac{1}{\hat{y}_{k}}, S_{\frac{x}{\hat{y}}}=\sum_{k=1}^{n} \frac{x_{k}}{\hat{y}_{k}}, S_{\frac{\hat{y}}{x}}=\sum_{k=1}^{n} \hat{x}_{k} \hat{y}_{k}
\end{align*}
$$

The relations by which the two parameters of the linear model are calculated are described in many works of which we give as an example: (Schatteles, 1971, pp.120-126), (T,arcă, 1979, pp.1125), (Jaba, 1986, pp.207-209), (Gromîco, 1990, pp.135-137) and so on.

For the other eight models linearized by the actions presented above (logarithmic and variable changes) the parameters $\mathrm{a}_{(\mathrm{M})}$ and $\mathrm{b}_{(\mathrm{M})}$ are deduced from the relations of the linear model:

$$
\begin{align*}
& a_{(1)}=\frac{n \cdot S_{x y}-S_{x} \cdot S_{y}}{n \cdot S_{x x}-S_{x} \cdot S_{x}}, \quad b_{(1)}=\frac{S_{x x} \cdot S_{y}-S_{x} \cdot S_{x y}}{n \cdot S_{x x}-S_{x} \cdot S_{x}} \\
& a_{(2)}=\frac{n \cdot S_{\hat{x} \hat{y}}-S_{\hat{x}} \cdot S_{\hat{y}}}{n \cdot S_{\hat{x} \hat{x}}-S_{\hat{x}} \cdot S_{\hat{x}}}, \quad \hat{b}_{(2)}=\frac{S_{\hat{x} \hat{x}} \cdot S_{\hat{y}}-S_{\hat{x}} \cdot S_{\hat{x} \hat{y}}}{n \cdot S_{\hat{x} \hat{x}}-S_{\hat{x}} \cdot S_{\hat{x}}}, \quad b_{(2)}=e^{\hat{b}_{(2)}} \\
& a_{(3)}=\frac{n \cdot S_{x \hat{y}}-S_{x} \cdot S_{\hat{y}}}{n \cdot S_{x x}-S_{x} \cdot S_{x}}, \quad \hat{b}_{(3)}=\frac{S_{x x} \cdot S_{\hat{y}}-S_{x} \cdot S_{x \hat{y}}}{n \cdot S_{x x}-S_{x} \cdot S_{x}}, \quad b_{(3)}=e^{\hat{b}_{(3)}} \\
& a_{(4)}=\frac{n \cdot S_{\hat{x} y}-S_{\hat{x}} \cdot S_{y}}{n \cdot S_{\hat{x} \hat{x}}-S_{\hat{x}} \cdot S_{\hat{x}}}, \quad b_{(4)}=\frac{S_{\hat{x} \hat{x}} \cdot S_{y}-S_{\hat{x}} \cdot S_{\hat{x} y}}{n \cdot S_{\hat{x} \hat{x}}-S_{\hat{x}} \cdot S_{\hat{x}}} \\
& a_{(5)}=\frac{n \cdot S_{\frac{y}{x}}-S_{\frac{1}{x}} \cdot S_{y}}{n \cdot S_{\frac{1}{x}}-S_{\frac{1}{x}} \cdot S_{\frac{1}{x}}}, \quad b_{(5)}=\frac{S_{\frac{1}{x x}} \cdot S_{y}-S_{\frac{1}{x}} \cdot S_{\frac{y}{x}}}{n \cdot S_{\frac{1}{x x}}-S_{\frac{1}{x}} \cdot S_{\frac{1}{x}}^{x}} \\
& \mathrm{n} \cdot \mathrm{~S}_{\mathrm{x}}-\mathrm{S}_{\mathrm{x}} \cdot \mathrm{~S}_{1} \quad \mathrm{~S}_{\mathrm{xx}} \cdot \mathrm{~S}_{1}-\mathrm{S}_{\mathrm{x}} \cdot \mathrm{~S}_{\mathrm{x}}  \tag{3}\\
& a_{(6)}=\frac{\frac{\bar{y}}{n} \cdot S_{x x}-S_{x} \cdot S_{x}}{n}, \\
& b_{(6)}=\frac{\frac{\bar{y}}{n} \cdot \frac{\bar{y}}{\mathrm{y}}}{\mathrm{n} \cdot \mathrm{~S}_{\mathrm{xx}}-\mathrm{S}_{\mathrm{x}} \cdot \mathrm{~S}_{\mathrm{x}}} \\
& \mathrm{n} \cdot \mathrm{~S}_{\underline{1}}-\mathrm{S}_{\underline{1}} \cdot \mathrm{~S}_{\underline{1}} \\
& \mathrm{~b}_{(7)}=\frac{\mathrm{S}_{\frac{1}{x x}} \cdot \mathrm{~S}_{\frac{1}{y}}-\mathrm{S}_{\frac{1}{x}} \cdot \mathrm{~S}_{\frac{1}{x y}}}{\mathrm{n} \cdot \mathrm{~S}_{\frac{1}{x}}-\mathrm{S}_{\frac{1}{x}} \cdot \mathrm{~S}_{\frac{1}{x}}} \\
& a_{(8)}=\frac{n \cdot S_{\frac{\hat{y}}{x}}-S_{\frac{1}{x}} \cdot S_{\hat{y}}}{n \cdot S_{\frac{1}{x}}-S_{\frac{1}{x}} \cdot S_{\frac{1}{x}}}, \quad \hat{b}_{(8)}=\frac{S_{\frac{1}{x x}} \cdot S_{\hat{y}}-S_{\frac{1}{x}} \cdot S_{\hat{y}}^{x}}{n \cdot S_{\frac{1}{x}}-S_{\frac{1}{x}} \cdot S_{\frac{1}{x}}^{x}}, \quad b_{(8)}=e^{\hat{b}_{(8)}} \\
& \mathrm{n} \cdot \mathrm{~S}_{\mathrm{x}}-\mathrm{S}_{\mathrm{x}} \cdot \mathrm{~S}_{\mathrm{t}} \\
& \mathrm{a}_{(9)}=\frac{\overline{\hat{y}}}{\mathrm{n} \cdot \mathrm{~S}_{\mathrm{xx}}-\mathrm{S}_{\mathrm{x}} \cdot \mathrm{~S}_{\mathrm{x}}} \text {, } \\
& \mathrm{b}_{(9)}=\frac{\mathrm{S}_{\mathrm{xx}} \cdot \mathrm{~S}_{\frac{1}{\hat{y}}}-\mathrm{S}_{\mathrm{x}} \cdot \mathrm{~S}_{\frac{\mathrm{x}}{}}^{\hat{y}}}{\mathrm{n} \cdot \mathrm{~S}_{\mathrm{xx}}-\mathrm{S}_{\mathrm{x}} \cdot \mathrm{~S}_{\mathrm{x}}}
\end{align*}
$$

To determine which of the nine models is more appropriate, we will associate the Pearson correlation coefficient with each model. (Baron et al, 1996, p.173), (Biji et al, 2000, pp.306-307) and so forth.

$$
\begin{equation*}
R_{(M)}=\sqrt{1-\frac{S_{u p}}{S_{\text {down }}}}=\sqrt{1-\frac{\sum_{k=1}^{n}\left(y_{k}-y_{\left(x_{k}\right)}^{(M)}\right)^{2}}{\sum_{k=1}^{n}\left(y_{k}-\bar{y}\right)^{2}}} \in[0,1], \quad M=\overline{1,9} \text {, where: } \quad \bar{y}=\frac{S_{y}}{n}=\frac{\sum_{k=1}^{n} y_{k}}{n} \tag{4}
\end{equation*}
$$

The value of M indicates one of the nine mathematical models presented at the beginning of the paragraph in the relations (1).

For a model in which, under the radical, the sum from the numerator is greater than the sum from the denominator ( $\mathrm{S}_{\text {up }}>\mathrm{S}_{\text {down }}>0$ ), we will consider that particular model totally inadequate and we will give the value 0 to the correlation coefficient of the respective model.

The model with the highest correlation coefficient, closer to the value 1 , is considered to be the optimal model.

## 4. Findings

In order to clarify how the mathematical relations in the previous paragraph are used, we will present a hypothetical case study and its solution.

In this respect, we generated nine groups of value pairs on the computer (nine clouds, each composed of 30 points): $\mathrm{P}_{\mathrm{k}}^{(\mathrm{a})}\left(\mathrm{x}_{\mathrm{k}}, \mathrm{y}_{\mathrm{k}}^{(\mathrm{a})}\right), \mathrm{P}_{\mathrm{k}}^{(\mathrm{b})}\left(\mathrm{x}_{\mathrm{k}}, \mathrm{y}_{\mathrm{k}}^{(\mathrm{b})}\right), \ldots, \mathrm{P}_{\mathrm{k}}^{(\mathrm{i})}\left(\mathrm{x}_{\mathrm{k}}, \mathrm{y}_{\mathrm{k}}^{(\mathrm{i})}\right), \mathrm{k}=\overline{1, \mathrm{n}}, \mathrm{n}=30$.

For each point cloud $\mathrm{P}_{\mathrm{k}}^{(\mathrm{L})}\left(\mathrm{x}_{\mathrm{k}}, \mathrm{y}_{\mathrm{k}}^{(\mathrm{LL})}\right), \mathrm{L} \in\{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}, \mathrm{e}, \mathrm{f}, \mathrm{g}, \mathrm{h}, \mathrm{i}\}$ the model that generates the optimal regression is desired to be determined.

For all nine groups, the values of the independent variable x are the same.
The computer-generated values are shown in tabular form below:
Table no. 1. Coordinates of the nine groups of points

| k | $\mathrm{x}_{\mathrm{k}}$ | $\mathrm{y}_{\mathrm{k}}^{(\mathrm{a})}$ | $\mathrm{y}_{\mathrm{k}}^{(\mathrm{b})}$ | $\mathrm{y}_{\mathrm{k}}^{(\mathrm{c})}$ | $\mathrm{y}_{\mathrm{k}}^{(\mathrm{d})}$ | $\mathrm{y}_{\mathrm{k}}^{(\mathrm{e})}$ | $\mathrm{y}_{\mathrm{k}}^{(\mathrm{f})}$ | $\mathrm{y}_{\mathrm{k}}^{(\mathrm{g})}$ | $\mathrm{y}_{\mathrm{k}}^{(\mathrm{h})}$ | $\mathrm{y}_{\mathrm{k}}^{(\mathrm{i})}$ |

We aim to determine for each of the nine groups of values (point clouds) $\left(x_{k}, y_{k}^{(L)}\right)$ , $\mathrm{L} \in\{a, b, c, d, e, f, g, h, i\}$ which model is more appropriate $y^{(L)}=f^{(L)}(x)$, where the function $f$ is chosen from the nine mathematical models presented at the beginning of the previous paragraph.

During the first stage, the 123 sums of the values of the coordinates from the previous table, the logarithms thereof, of the inverses and of the products between them are calculated:

$$
\begin{gathered}
\mathrm{S}_{\mathrm{x}}=2040, \mathrm{~S}_{\mathrm{y}}^{(\mathrm{a})}=20037, \ldots, \mathrm{~S}_{\mathrm{y}}^{(\mathrm{i})}=36136.4, \mathrm{~S}_{\mathrm{xx}}=174680, \mathrm{~S}_{\mathrm{xy}}{ }^{(\mathrm{a})} \\
\mathrm{S}_{\mathrm{xy}^{(i)}}=383269.6, \mathrm{~S}_{\hat{\mathrm{x}}}=121.13, \mathrm{~S}_{\hat{y}^{(2)}}=189.2, \ldots, \mathrm{~S}_{\hat{y}^{(i)}}=74.68, \ldots, \mathrm{~S}_{\hat{\mathrm{x}} \hat{\mathrm{x}}}=502.56, \ldots, \\
\mathrm{~S}_{\frac{1}{x}}=0.691, \mathrm{~S}_{\frac{1}{y^{(2)}}}=0.0745, \ldots, \mathrm{~S}_{\frac{y^{(a)}}{\mathrm{x}}}=290.53, \ldots, \mathrm{~S}_{\frac{x}{y^{(2)}}}=3.1065, \ldots, \\
\mathrm{~S}_{\frac{1}{\hat{y}^{(a)}}}=4.827, \ldots, \mathrm{~S}_{\frac{x}{\hat{y}^{(a)}}}=308.8, \ldots, \mathrm{~S}_{\frac{1}{x y^{(a)}}}=0.00327, \ldots, \mathrm{~S}_{\frac{\hat{y}^{(i)}}{}}=3.059 .
\end{gathered}
$$

All these amounts were calculated according to the corresponding relations (2).
During the next stage, the parameters are calculated according to relations (3) $a_{(M)}$ and $b_{(M)}$ which define the nine models.

For the first point cloud $\mathrm{P}_{\mathrm{k}}^{(\mathrm{a})}\left(\mathrm{x}_{\mathrm{k}}, \mathrm{y}_{\mathrm{k}}^{(\mathrm{a})}\right) \quad(\mathrm{L}=\mathrm{a}, \mathrm{k}=\overline{1,30})$, the nine models are:

$$
\begin{array}{cllll}
\mathrm{a}_{(1)}=10.052, \quad \mathrm{~b}_{(1)}=-15.606 & \rightarrow & \mathrm{y}_{(1)}^{(\mathrm{a})}=10 \cdot \mathrm{x}-15.6 & \mathrm{R}_{(1)}^{(\mathrm{a})}=0.9991 \\
\mathrm{a}_{(2)}=1.055, \quad \mathrm{~b}_{(2)}=7.751 & \rightarrow & \mathrm{y}_{(2)}^{(\mathrm{a})}=7.8 \cdot \mathrm{x}^{1.1} & \mathrm{R}_{(2)}^{(\mathrm{a})}=0.9990 \\
\mathrm{a}_{(3)}=0.019, \quad \mathrm{~b}_{(3)}=147.58 & \rightarrow & \mathrm{y}_{(3)}^{(\mathrm{a})}=148 \cdot \mathrm{e}^{0.02 \cdot \mathrm{x}} & \mathrm{R}_{(3)}^{(\mathrm{a})}=0.914 \\
\mathrm{a}_{(4)}=493.33, \quad \mathrm{~b}_{(4)}=-1323.94 & \rightarrow & \mathrm{y}_{(4)}^{(\mathrm{a})}=493 \cdot \ln \mathrm{x}-1324 & \mathrm{R}_{(4)}^{(\mathrm{a})}=0.951 \\
\mathrm{a}_{(5)}=-13346.4, \quad \mathrm{~b}_{(5)}=975.16 & \rightarrow & \mathrm{y}_{(5)}^{(\mathrm{a})}=975-\frac{13346}{\mathrm{x}} & \mathrm{R}_{(5)}^{(\mathrm{a})}=0.791 \\
\mathrm{a}_{(6)}=-0.0000545, \mathrm{~b}_{(6)}=-0.000273 & \rightarrow & \mathrm{y}_{(6)}^{(\mathrm{a})}=-\frac{1}{0.00005 \cdot \mathrm{x}+0.0003}=-\frac{20000}{\mathrm{x}+6} & \mathrm{R}_{(6)}^{(\mathrm{a})}=0 \\
\mathrm{a}_{(7)}=0.122, \quad \mathrm{~b}_{(7)}=-0.000316 & \rightarrow & \mathrm{y}_{(7)}^{(\mathrm{a})}=\frac{\mathrm{x}}{0.122-0.0003 \cdot \mathrm{x}} & \mathrm{R}_{(7)}^{(\mathrm{a})}=0.949 \\
\mathrm{a}_{(8)}=-32.475, \quad \mathrm{~b}_{(8)}=1157.83 & \rightarrow & \mathrm{y}_{(8)}^{(\mathrm{a})}=1158 \cdot \mathrm{e}^{-\frac{-125}{\mathrm{x}}} & \mathrm{R}_{(8)}^{(\mathrm{a})}=0.901 \\
\mathrm{a}_{(9)}=-0.000539, \quad \mathrm{~b}_{(9)}=0.1976 & \rightarrow & \mathrm{y}_{(9)}^{(\mathrm{a})}=\mathrm{e}^{\frac{1}{0.2-0.0005 \cdot x}}=\mathrm{e}^{\frac{2000}{40-\mathrm{x}}} & \mathrm{R}_{(9)}^{(\mathrm{a})}=0.560
\end{array}
$$

Since $\max _{M=1,9} R_{(M)}^{(a)}=R_{(1)}^{(a)}=0.9991$, for the first cloud the linear model that is marked above is appropriate.

For the second and third clouds ( $\mathrm{L}=\mathrm{b}$ and $\mathrm{L}=\mathrm{c}$ ), the most appropriate are the power model and the exponential model.

| $\mathrm{P}_{\mathrm{k}}^{(\mathrm{b})}\left(\mathrm{x}_{\mathrm{k}}, \mathrm{y}_{\mathrm{k}}^{(\mathrm{b})}\right), \mathrm{L}=\mathrm{b}$ |  | $\mathrm{P}_{\mathrm{k}}^{(\mathrm{c})}\left(\mathrm{x}_{\mathrm{k}}, \mathrm{y}_{\mathrm{k}}^{(\mathrm{c})}\right), \mathrm{L}=\mathrm{c}$ |  |
| :---: | :---: | :---: | :---: |
| $\mathrm{y}_{(1)}^{(\mathrm{b})}=9.7 \cdot \mathrm{x}-171$ | $\mathrm{R}_{(1)}^{(\mathrm{b})}=0.992$ | $\mathrm{y}_{(1)}^{(\mathrm{c})}=33.6 \cdot \mathrm{x}-1288$ | $\mathrm{R}_{(1)}^{(\mathrm{c})}=0.821$ |
| $y_{(2)}^{(b)}=0.46 \cdot x^{1.62}$ | $\mathrm{R}_{\text {(2) }}^{(\mathrm{b})}=0.997$ | $\mathrm{y}_{(2)}^{(\mathrm{c})}=0.004 \cdot \mathrm{x}^{2.8}$ | $\mathrm{R}_{(2)}^{(\mathrm{c})}=0.825$ |
| $y_{(3)}^{(b)}=44 \cdot \mathrm{e}^{0.03 \cdot \mathrm{x}}$ | $\mathrm{R}_{(3)}^{(\mathrm{b})}=0.817$ | $\mathrm{y}^{(3)}=6.65 \cdot \mathrm{e}^{0.054 \cdot \mathrm{x}}$ | $\mathrm{R}_{(3)}^{(\mathrm{c})}=0.988$ |
| $\mathrm{y}_{(4)}^{(\mathrm{b})}=460 \cdot \ln \mathrm{x}-1366$ | $\mathrm{R}_{(4)}^{(\mathrm{b})}=0.908$ | $\mathrm{y}_{(4)}^{(\mathrm{c})}=1387 \cdot \ln \mathrm{x}-4605$ | $\mathrm{R}_{(4)}^{\text {(c) }}=0.657$ |
| $y_{(5)}^{(\mathrm{b})}=764-\frac{11886}{x}$ | $\mathrm{R}_{(5)}^{(\mathrm{b})}=0.723$ | $y_{(5)}^{(\mathrm{c})}=1709-\frac{31012}{\mathrm{x}}$ | $\mathrm{R}_{(5)}^{(\mathrm{c})}=0.452$ |
| $y_{(6)}^{(\mathrm{b})}=-\frac{100000}{83 \cdot x+27}$ | $\mathrm{R}_{(6)}^{(\mathrm{b})}=0$ | $\mathrm{y}_{(6)}^{(\mathrm{c})}=-\frac{100000}{24 \cdot x+27}$ | $\mathrm{R}_{(6)}^{(\mathrm{c})}=0$ |
| $y_{(7)}^{(b)}=\frac{1000 \cdot x}{653-8 \cdot x}$ | $\mathrm{R}_{(7)}^{(\mathrm{b})}=0$ | $\mathrm{y}_{(7)}^{(\mathrm{c})}=\frac{100 \cdot \mathrm{x}}{224-3 \cdot \mathrm{x}}$ | $\mathrm{R}_{(7)}^{(\mathrm{c})}=0$ |
| $\mathrm{y}_{(8)}^{(\mathrm{b})}=1054 \cdot \mathrm{e}^{-\bar{x}}$ | $\mathrm{R}_{(8)}^{(\mathrm{b})}=0.874$ | $y_{(8)}^{(c)}=1639 \cdot \mathrm{e}^{-\mathrm{x}}$ | $\mathrm{R}_{(8)}^{(\mathrm{c})}=0.359$ |
| $\mathrm{y}_{(9)}^{(\text {b) }}=\mathrm{e}^{\frac{1}{0.26-0.0012 \cdot x}}=\mathrm{e}^{\frac{2500}{650-3 \cdot x}}$ | $\mathrm{R}_{(9)}^{(\mathrm{b})}=0$ | $y_{(9)}^{(c)}=\mathrm{e}^{\frac{10000}{4000-27 \cdot x}}$ | $\mathrm{R}_{(9)}^{(\mathrm{c})}=0$ |

The appropriate models for the two cases ( $\mathrm{L}=\mathrm{b}$ and $\mathrm{L}=\mathrm{c}$ ), were chosen because $\max _{\mathrm{M}=1,9} \mathrm{R}_{(\mathrm{M})}^{(\mathrm{b})}=\mathrm{R}_{(2)}^{(\mathrm{b})}=0.997$ and $\max _{\mathrm{M}=1,9} \mathrm{R}_{(\mathrm{M})}^{(\mathrm{c})}=\mathrm{R}_{(3)}^{(\mathrm{c})}=0.988$.

For the other six groups of value pairs (the cases $L \in\{d, e, f, g, h, i\}$ ) the optimal regressions are obtained by similar calculations and they are, in order, a logarithmic model, three hyperbolic models of type 1,2 and 3 and two exponentially-hyperbolic models of type 1 and 2.

At the end of the paragraph we should mention that the nine groups with value pairs (point clouds) had as appropriate regressions nine models of different shapes:

$$
\begin{array}{lll}
\mathrm{y}^{(\mathrm{a})}=10 \cdot \mathrm{x}-15.6 & \text { linear model } & \mathrm{y}^{(\mathrm{b})}=0.46 \cdot \mathrm{x}^{1.62} \\
\mathrm{y}^{(\mathrm{c})}=6.65 \cdot \mathrm{e}^{0.054 \cdot \mathrm{x}} & \text { exponential model model } \\
\mathrm{y}^{(\mathrm{e})}=198+\frac{1168}{\mathrm{x}} & \mathrm{y}^{(\mathrm{d})}=103 \cdot \ln \mathrm{x}-113 & \text { logarithmic model } \\
\mathrm{y}^{(\mathrm{f})}=-\frac{100000}{8 \cdot \mathrm{x}-27} & \text { hyperbolic model (type 1) } \\
\mathrm{y}^{(\mathrm{g})}=\frac{1000 \cdot \mathrm{x}}{1.2 \cdot \mathrm{x}+21} & \text { hyperbolic model (type 2) } \\
\mathrm{y}^{(\mathrm{h})}=57 \cdot \mathrm{e}^{\frac{36.6}{\mathrm{x}}} & \text { hyperbolic model (type 3). } \\
\mathrm{y}^{(\mathrm{i})}=\mathrm{e}^{\frac{10000}{90 \cdot x+69}} & \text { hyperbolic exponential model (type 1) } \\
& \text { hyperbolic exponential model (type 2). }
\end{array}
$$

## 5. Conclusions

In order to establish the validity and credibility of the method for obtaining the nine simple regressions, we represented each point cloud and the calculated optimal regression in nine different graphs.

Graph no. 1. The graphical representation of regressions: linear, power, exponential and logarithmic regressions

Graph no. 2. The graphical representation of the three forms of hyperbolic regressions

Graph no. 3. The graphical representation of exponential-hyperbolic regressions

Source: all nine graphics are made by the author

The previous graphs clearly show that the method used is valid. We believe that the technique applied throughout the paper can become a valuable tool available to all researchers both in the economic and social field and in other scientific fields.

In this regard, we hope that in the near future we will publish a paper with the logical scheme and the pseudo-code for the method applied in this paper, which are elements that will be the basis for the achievement of an application by the specialists in the field of IT.
